My dear Dr Engelmann.

The box of cuttings for you
referred to in the enclosed card
I have sent off to day without
opening. In their intended for
me and in a good, fresh
condition. I enclose some
seedlings raised from your
seed of Cattleya intermedia.
Either the person who collected
the seed made a mistake
it
or this is a variety of the ordinary

Asa Gray. who it does not even

deserve to be pursued.

But I rush to the first

supposition is denied, as in

two large pots of seedlings

I have not noticed a single one

with Entire leaves.

Where I see a most favorable

winter for all sorts of plants.

even the Earliest Spring I

remember.

Always faithfully yours,

C. S. Sargent.

3. Longiciri. glauca Colorado.
4. " Jam.
5. Stachyseis.

BOTANIC GARDEN,
HARVARD UNIVERSITY,
Cambridge, Mass. June 10 1878.

My dear Dr Engelmann.

I cant help ye much about
Abies microsperma. I have
never seen an old plant of it or indeed
any but very young ones. which as you know
is very small. There is no specimen
in herb. nor is there of A. Algoquiana.
nor
nor, by the way, of yours from Yakon
of A. subalpina. Heaven only
knows whether my plant is rightly
named. It came from some European
nursery. which is rather good proof
that it is not right. for when they
send out a plant with its right
name it is the exception when it comes.

the rule that such leaves are
habitually incorrect either through
ignorance or something worse.
Last 2 years' leaves
As you know last year leaves in
this plant were ◇. Are there
other year. Begin to appear ◇ ◇
while I go to St Petersburg
Dec 1st: Is this because they
are younger. and will they thicken
up into ○ as the season goes
on? This we must watch +
see. Notice that in this plant
the leaves have stomata above
+ below. but not very numerous
in either case. In Alcyonium
they are very numerous above
(of course) and none below.
why?

Judging by the leaves alone. they
can hardly be referred to the same
species as my A. microstemma.

Is A. Menziesii to Colorado.
the Stomata are on both sides
again: but more abundant above
than below. The leaves I enclose.
Show Stomata (Ithink) on both
sides but more above than below.

While those of Alaska. have none
below. but very numerous
above. On a plant I got some
years ago from Leiden of Gent
under the name of A. Hutchinsii
the Stomata are very numerous
above. and few below. May this
be the true A. Menziesii. Those

but a single plant of A. alcoquiana.
about six feet high. and never have
raised any seedlings - to my plant
I can pass no square name. or any
different. for those sent.

If Hooker. includes a Persons have an
imported Mexican. it must be
in the Prairie.. as no body has the
Rocky but plants. & sent from me. I think
I know of a plant in Newyork State &
have written for a specimen. If I get
it will send it. In regard of any of the
Agaves flowering. then yes. Maculosa
we grow
he grow very well. but not so Virginica
that does nothing. I should like more
of them much. if seeds. I have never flowered
it. Yucca Whitfolia in you used
in flower. & sent into garden annual.
I enclose a few seeds of A. Yezoensis.?
sent me for Japan.

Faithfully. C. S. Sargent

Dear Dr Engelmann,

I am very sorry to learn from yours of the 8th that you are sick. I fear it must be serious if it has kept you in bed for two weeks! I pray be careful! I will see in the future that you get seedlings of all the conifers we raise. I fear that now we have none of the genera you ask for. Young enough to be of any service. Strasburger is in the College Library. & Mr Watson has looked it through & notes in the enclosed his only references to the subject you refer to.

I don't understand about your aborn less *P. aristata*. I send you one of my cones. which is awned. but the awns are not as long as in Colorado specimens. The awns in the young cones. and even in the yearling cones. are much more proportionately developed. It would appear that they

do not grow proportionately with the cones. so that they must get knocked off from the mature cones. When I did make a single specimen of P. muricata contorta. in the Sierras. with two cones. the others I sent you. showing that it is not uncommon. The cone has often 3 of 4 scales that all look ripe. their seed at that date. as I saw in the shops look out for seed. This is a miserably named tree. as it is most rarely contorted. generally growing as a perfectly ~~symetrical~~ symmetrical pyramid. with all the outline of a Europeen Larch. hence the common name of Tamarack. I don't know why you call P. Muricata ~~common~~ rare in California.. At 7.- 8.000 ft alt. it is very common in the Sierras. where it is so much larger and finer tree than in Nevada.

Hoping to hear soon that you are entirely restored to your usual health.

Yours. Faithfully. yours. C. S. Sargent.

February 2d.

Dear Dr Engelmann.

Do you know that the young cones of Pinus Strobus are, at this season, not reflexed as they are at maturity but boldly upright? When do they make the change; or rather begin to make it. For Sculpture it is a gradual one.; and is there reason for them doing so. beyond the fact that the long stalks are not strong Enough to support

the heavy mature ones.

In looking yesterday at a white pine. I took occasion to Examine several trees of P. strobus. on some of which. only a single cluster one. All were often. but all such grow. This would show that the seasons character in the shoots is by no means general. a constant. I should like to know when it shoots its cones. in those cases where the cones often during the autumn. in which they come to maturity. Have both the Red & White Pines shot their cones in September. or soon in the

Cones mature. If the same

species is sometimes staminate

sometimes not as seems to be

the case with P. rigida & P.

Contorta. what is the reason for

this anomalous behavior?. What

does one pine gain over the

by producing its seeds. for one

to one loses. on the other

advantage to the tree ~~&~~ in making

its savings of seed at sufficient

times & seasons. why do not all

Pines have the same power.

~~Does~~ may not

the variations character

Cones in some localities & soil

a climate? But I started to
give you a hint about the B. P. Cross.
& Spruce I have written a long
letter, which may forgive
you the trouble.

My dear Dr Engelmann,

Yesterday Sereno's letter about
rather confuses me than otherwise
especially as to Pinus ponderosa.
Perhaps with the specimens
before you you can make head
or tail of what he means.
I send you to day a young
seedling of Abies concolor Bigelowii,
but unfortunately the catkins
had dropped before I ~~sent~~ went
to get it for you. The germination
is the same as in Encephalartos

of fruit I also send a letter

the under. The Cotyledons in the

Cucurbitaceae are developed under

ground. and that of which this

Enclosed in the hard seed. as

is the case in all Palms and

Cycadaceae. what I have seen

germinate. But I have not noticed

it in any other instance nor the

Comparable thickness of the

radicle. the object of which in this

case I do not understand.

The germinating Pine Enclosed

has sent to me from Para

Eduli.

I found it will be necessary for me to form a Special Herbarium for the Arnold Arboretum. what I can I know is situated 6 miles from that at Cambridge. and too far for reference. I propose to confine it (for many years at any rate) to trees & shrubs of N. North America. 2nd the whole temperate Zone. I shall keep it in my (at my house) own house. for the present. an entire proper accommodation at the Arboretum can be provided for it. My Library. Engravings. Pamphlets &c. &c. I must have an immediate accumulation. and nothing

besides duplicates. Some of these
I hope you will consent to make
over me. on some terms or other.
If you could employ Egypt or
some one else. to do the packing.
I should be only too glad to pay
for the work. I propose to employ
Egypt to purchase Letterman to
make collections of Jesup material
for us & should be me. and shall be
glad of any suggestions for one willing
to work. in this subject. I propose
to employ. in addition to the hands.
an Anthropological Museum. but the
labor & the Charges of such an undertaking
rather appal me.

Faithfully yours.

My dear Dr Engelmann.

Thanks for the grape cuts. I believe
we have plants of all those cuts
already growing: probably from cuts
that you have sent at different
times. I am glad, however, to get
these fresh cuttings. this Summer
I have planted at once. I have also

the Contorta cones. If they contain good seed there shall be carefully planted and the results recorded.

It seems hard to believe that four cones belong to the same species, which I saw on the Screw Mounds. Yours are all unequally globular at the base. as in the cones of P. rigida. Some thin brown natured in many of the Screw Cones. but

investigations. I should like Letterman
to buy me elsewhere to make for me a
complete set (flowers & fruits) of herbs
2 specimens of the leguminous plants of
Pro. For such a set, if started. with
the localities given. I am willing to
pay the market price. about 5 or
8 – 10 cts per specimen. I must care
especially for wood sections just
yet. so I dont want to undertake too
much at once. but when you told me
that Letterman was going to make a

set from you. I thought that he could
furnish a second set at very little
additional cost, and that the saving
between the two would make the work
less objectionable for us both. But I am
not particular. so on this point must
but not this in your hands.
now give any fixed order. but the hints
the enclosed kindly sent. Pray convey
thanks for the Wheeler. specs.

I should like much to see your P. arizonica.
but I confess there are but few of the species
you enclosed which I can say
that it appears that the lowest part
of the cone of P. ponderosa remains

Rec Oct 15

ARBORETUM, HARVARD UNIVERSITY,

DIRECTOR'S OFFICE,

Brookline, Mass., October 10 1879

My dear Dr Engelmann,

We got home a couple of days ago. When to my great regret I found your note of adieux. As I had hoped you would have lingered with the Summers till my return.

Since I have been gone I have looked assiduously if not successfully among the oaks. On the Hudson I found only the single plant of Q. Muhlenbergii. about 8 Stevens before. Quercus palustris is only found on the east bank (not on the west) - only two or three specimens seen. There is no Q. coccinea there. or about Rochester as up to

0 1 2 3 4 5 6 7 8 9 10

MISSOURI BOTANICAL GARDEN

down the valley of the Genesee.

If this species is southern, as I think, or the Atlantic seaboard species in Minnesota, without intermediate stations its distribution presents a problem I leave you to work at. I had while at Geneseo the opportunity to examine for the first time Q. macrocarpa. It grows there on the low rich bottom lands with Q. bicolor, and also equally well on the uplands with Q. alba. The more common form has leaves with incisions & lobes of Q. obtusiloba. both in the fruit and in the narrow deeply lobed leaves. I send you an acorn of the two forms. The bark is very

unmistakable. and on the old trees
easily distinguished. this bark from all
others. It is dark. and very deeply
furrowed. or ridged. Stands a short
time after there ridges. for an old
fallen stem. It is three inches deep.
and rather more wide. This same
tree measured across the stumps
[but 5 inches. and probably only
more. for on the tree bark broken
near the stumps when it fell it
has difficult to measure accurately.
This will do away with the "middle
age a tree" of the manual. If this
peculiarity of bark is common to
the species. of Hawks of course be
mentioned in the books. I saw a
piece of the stem of the famous

Hudsonville bark. which has destroyed many years ago by the carving in of the River bank. It was not a Macrocarpa. the bark showed & I suppose it must have been a b. color.* It claims it girthed 32 but at the ground. & may have been the largest specimen of the species. In the immediate neighborhood of the spot where the tree grew. are many other Swamp white oaks. girthing from 15 to 20 feet. so that this species, too, must be set down as of the 1st class.

Juglans. Nuttallensis. which I certainly expected to find common here. Looked for in vain. Juglans Pecan. which in the Hudson abounds hamburg. is one of the commonest trees

trees. grows sparingly in the valley
of the Genesee. always on high, dry
hill sides. and of very small size.
It is evidently there on its northern
limit. I only found one small
plant fruiting.

I found a few trees of a very
large fruited variety of Carya
tomentosa growing in the low
rich and overflowed bottom lands
of the Genesee. I send you some of
the nuts & a bud from same
which if you want it. The nut
is not only remarkable for its size.
but for its excellent quality. and

and the thinness of its shell.

The trees are every one known

to us. and are called "King

Nuts", and as such are sold

in the market. I dont remember

to have seen a Hickory nut as this.

and it should certainly be propagated.

I have sent to Bingham for

a good section of Juncus

effusus. Will you have me?

I send this letter with Thurber

Jun. Gryns plants. & I shall

proceed to have Jun bound up

in good Style.. But this letter

is already too long so good bye for

to day. Faithfully Yours,

C. S. Sargent.

MISSOURI BOTANICAL GARDEN

N.° 2036.

Smithsonian Institution
Washington D.C.

For Sale,

A collection of the birds of California, made chiefly at San Francisco, and mounted on the spot from fresh specimens. It embraces about 170 species and 280 birds, all mounted except a very few, all in excellent condition and good attitudes, requiring only a little adjusting of the feathers to remedy the derangement of packing.

This collection is very complete in the rarer birds of California, especially in the larger raptores, and all the water birds. Many of these are scarcely represented or not at all in any other collection in the country. The few deficiences consist chiefly in the commoner land birds of California, which can without difficulty be obtained. Among the more noteworthy birds are the Peregrine Falcon of the Tanallones, the California Golden Eagle 39; Harris Buzzard (40); the Blue Backed Hawk (16); the Squirrel Hawk (32); the Chaparral Cock (68); Cassin's Flycatcher (127); Maximilean Jay (431); Townsends Surf bird (511); Bachmans Oystercatcher (513); the Wandering Tatler (541); the Black Rail (556); the Brown Tree Duck (575); the Rocky Mountain Gurrot (594); the Black Stormy Petrel (643); the Western Plover, 509; Cassins Guillemot (724); and many others equally rare.

The following is a detailed list of the species, in a series of numbers referring to the Catalogue of North American Birds published by the Smithsonian Institution.
