

Universal Language Selector

Content language selection and
language settings integration

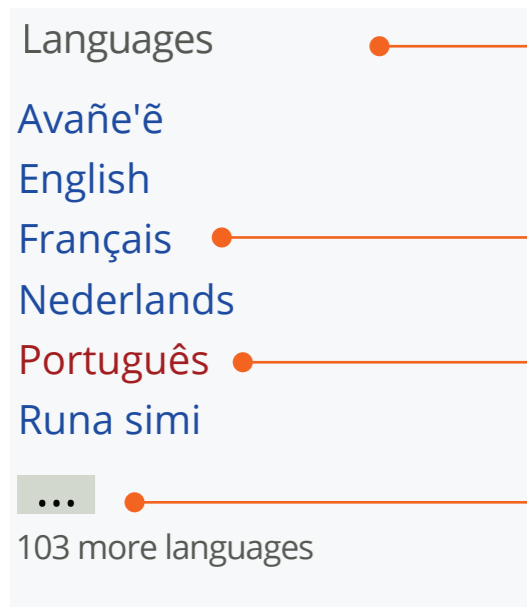

This document analyzes the integration of the
language selection and configuration tools on
different contexts:

- Wikipedia
- Wikidata

Approach 1: Integrate content selection and language settings in interlanguage links

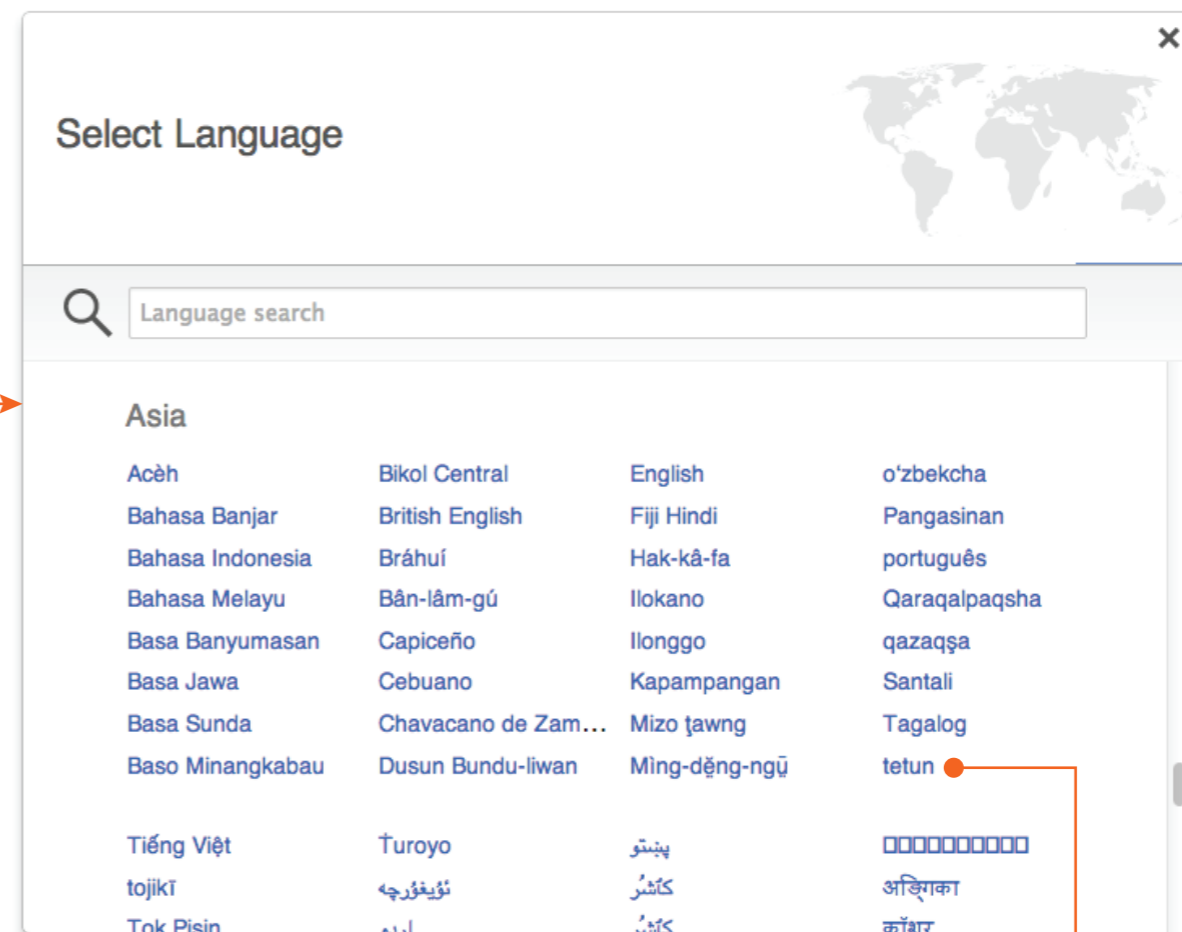

We propose to make the list shorter, show the most relevant languages, and provide help when you look for others

List based on geo-ip, previous choices and browser config.

This goes to the article in the French Wikipedia

Content lacking in one of the relevant languages (Optional: if we want to encourage page creation)

In the rare case you are looking for an unusual language, the language picker helps you to find it. The list includes only languages for which the content exist in that language.

This goes to the article in the Tetun Wikipedia

Alternatives for shortening the language list

Runa simi

108 languages

Different visual styles can be used to indicate that there are more elements than the ones currently shown in the list. The “...” button was selected since it can be located in a foreign language.

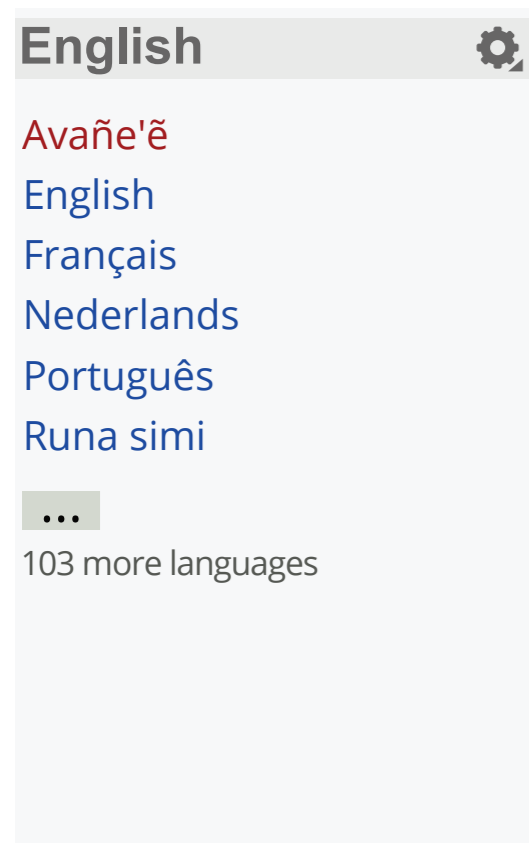

Language settings in Wikipedia

We propose to make the language settings discoverable (not hidden in general settings) since switching them is critical for some users. We present this settings in a less prominent way than content selection (which is the main usecase in this context) but close to it.

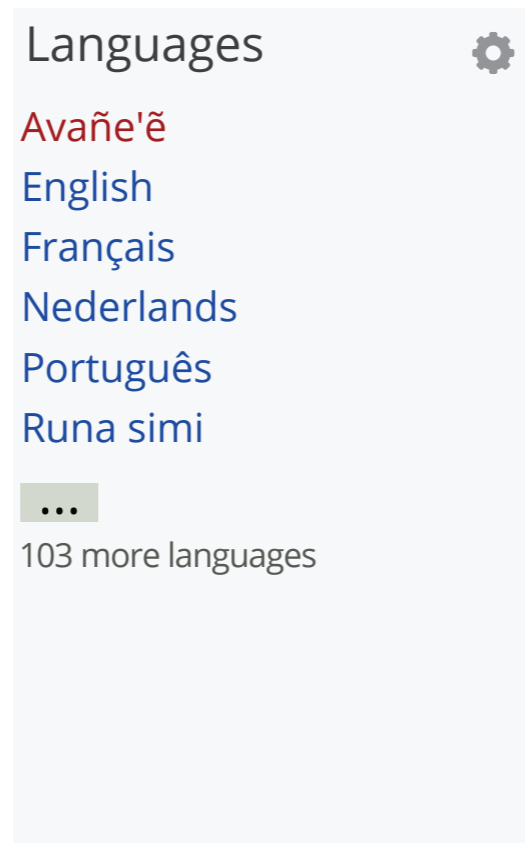

Alternatives for integrating language settings

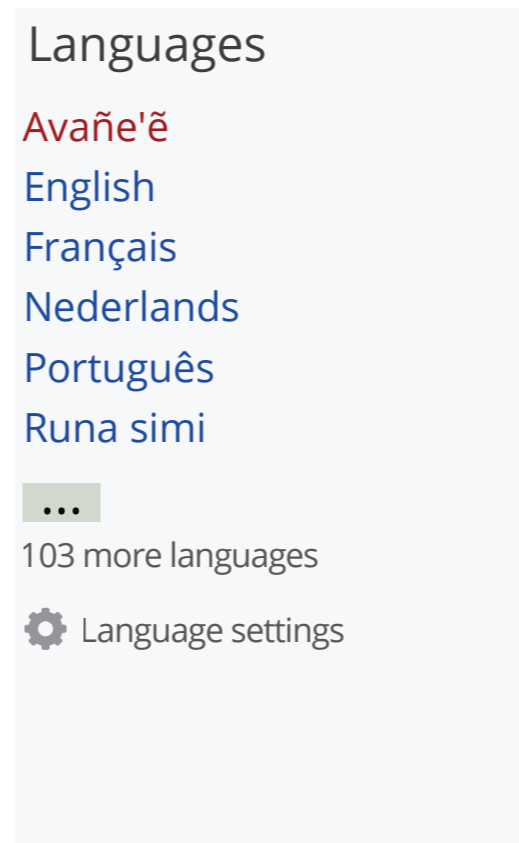

A

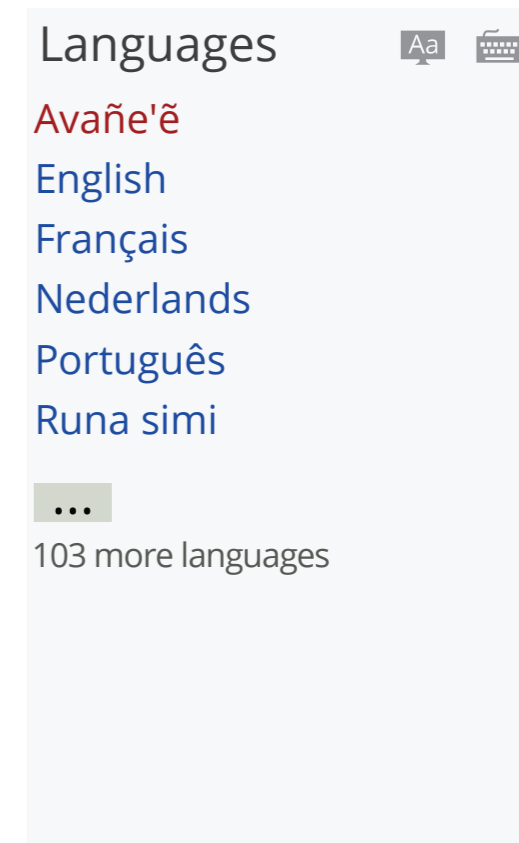

B

C

D

Explored possibilities:

- Include an indicator of current language
- Provide link to general language settings or specific display/input settings
- Show it on top or bottom of the list

Testing approach 1 with users

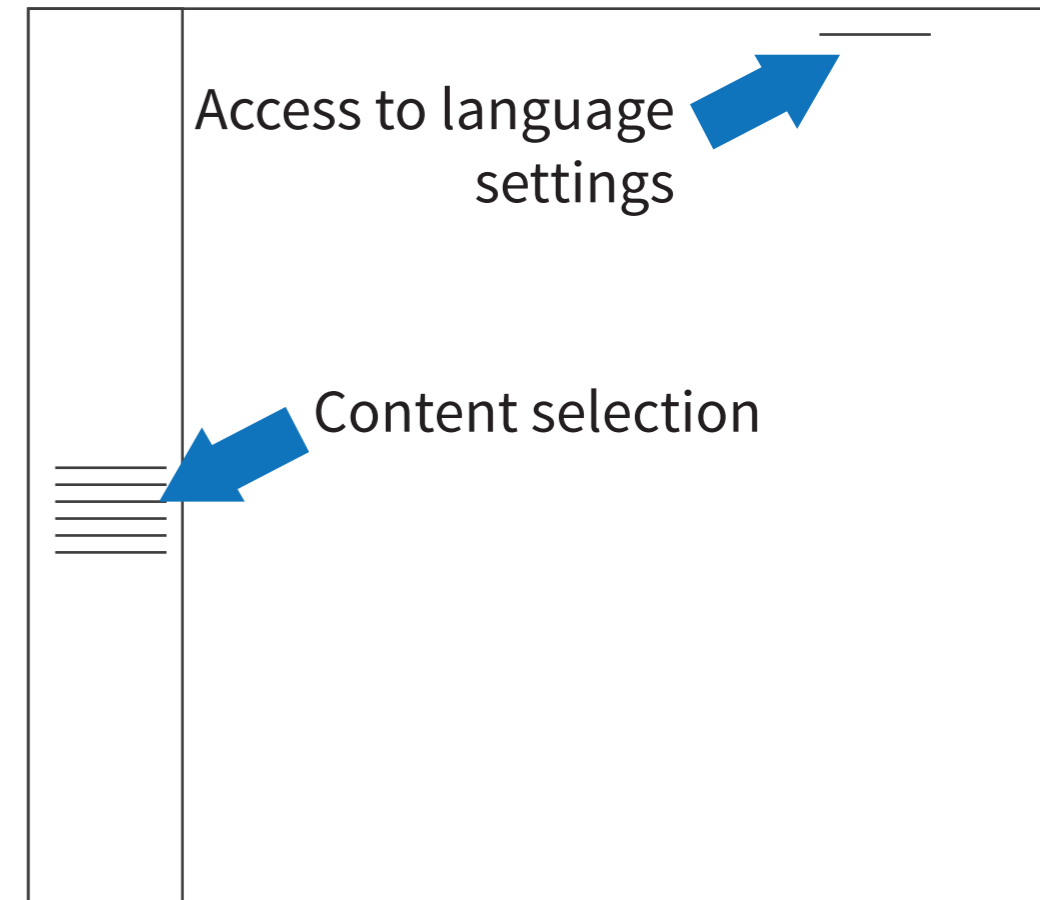

Users make use of the familiar language links to change content language, and are capable to discover the settings.

Example where the user switches to the Greek version of an article and adjusts the UI language to export it to PDF:

<https://www.youtube.com/watch?v=ibeeZ8T5fMg>

Approach 2: Provide language settings at top-right and keep interlanguage links

This approach is **not recommended** since it generates confusion to users to have two different language-related selections

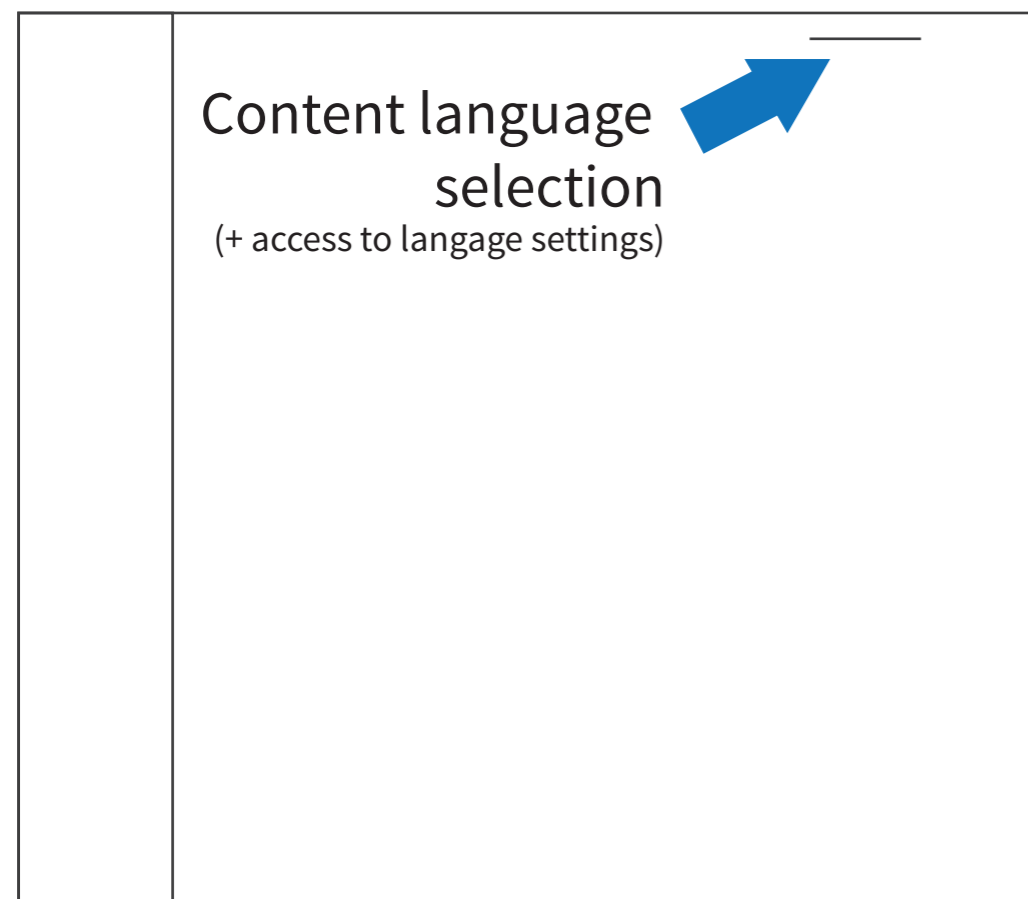

Example where the user tries to switch content language but opens the top-right selector and tries to select the content language there without success:

<https://www.youtube.com/watch?v=hkkz0qXeWxE>

Approach 3: Integrate content and language selection on top

This requires to remove the current interlanguage links, which is problematic in the specific case of Wikipedia but can be considered for Wikidata

Language selection in Wikidata

Currently there are two language selection mechanisms and there is little difference between UI and content in this case.

This screenshot shows the Wikidata main page. A blue arrow points to the language selection menu in the top right corner, labeled "Access to language settings". Another blue arrow points to the language selection menu in the main content area, labeled "Content language selection". The page includes a search bar, navigation tabs (Main Page, Discussion, Read, Edit), and a sidebar with various utility links.

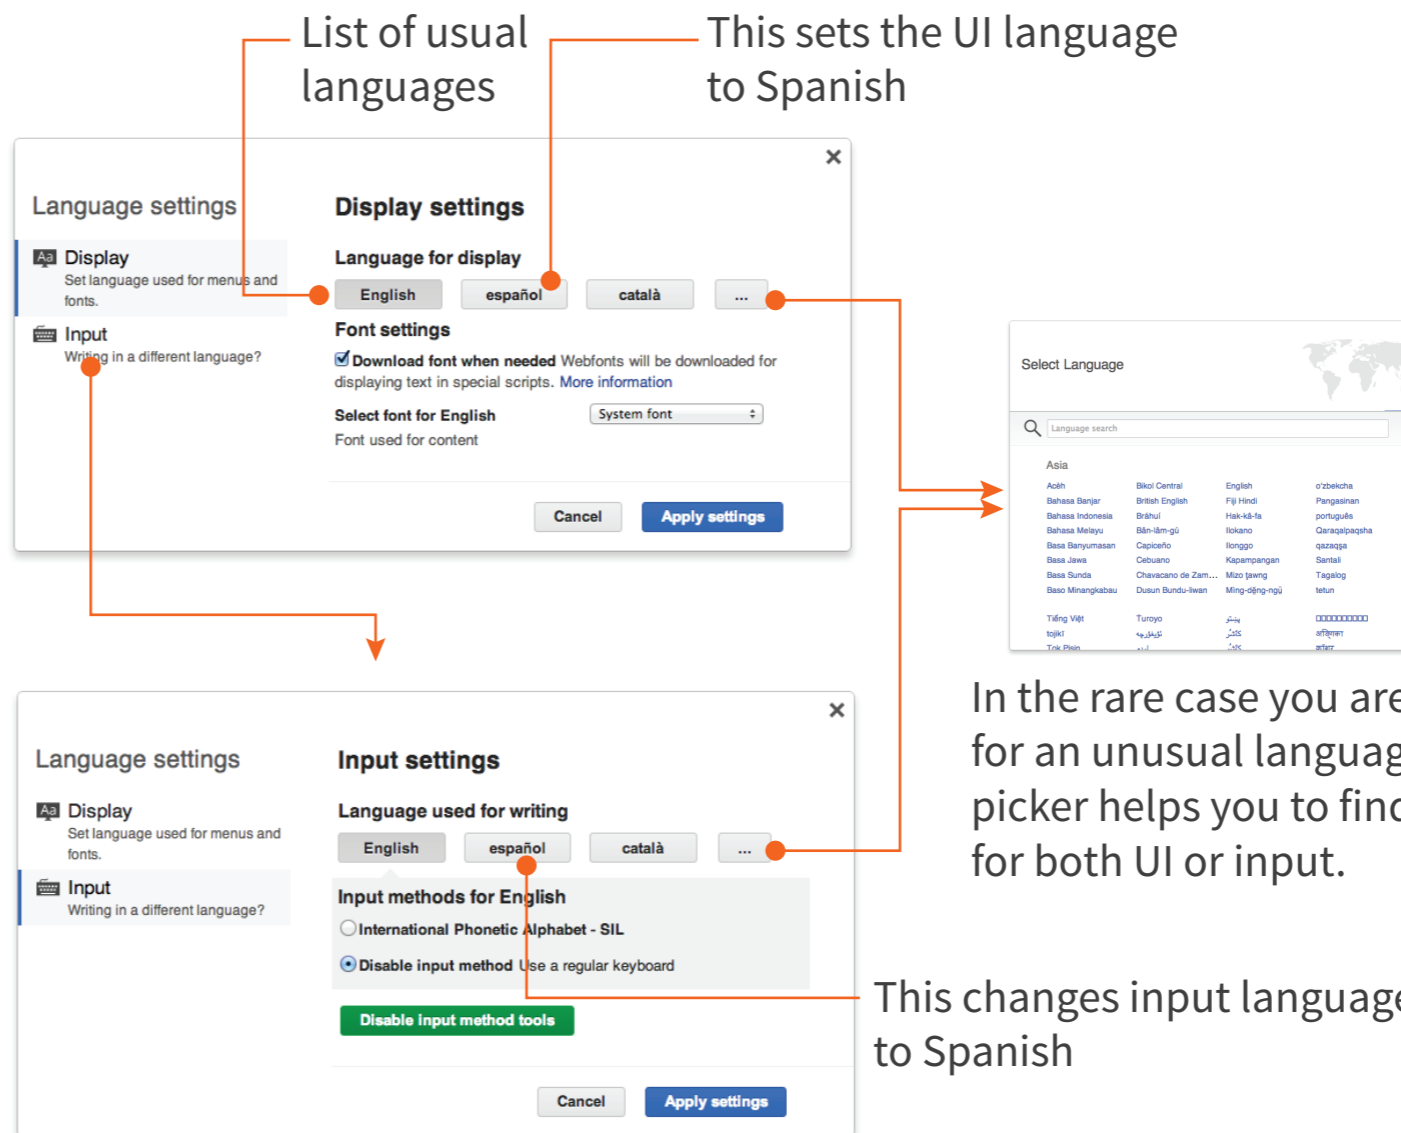

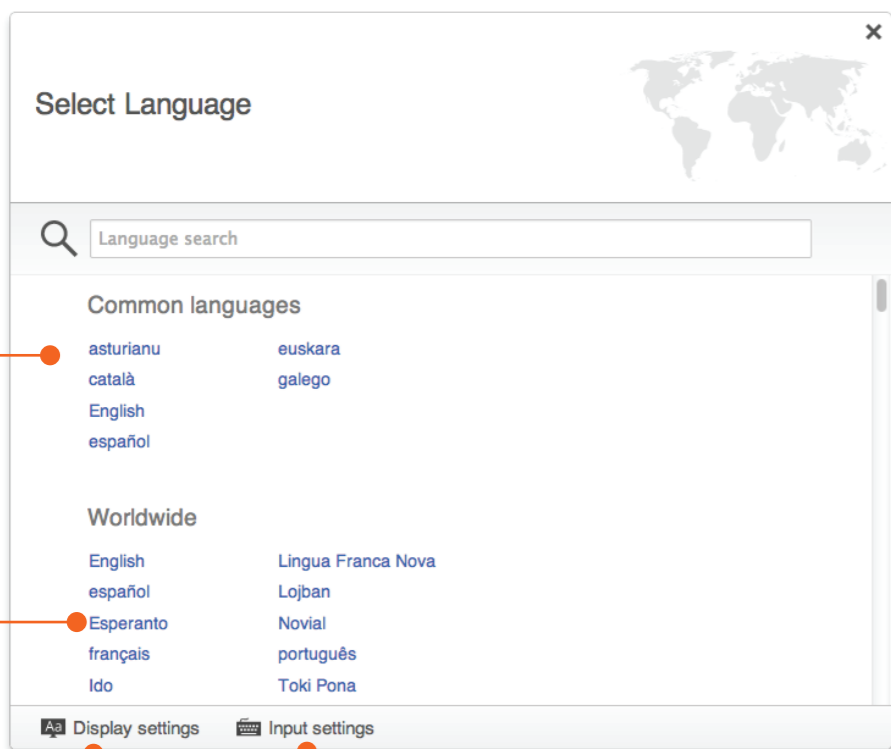

This screenshot shows the Wikidata page for the item "Morning". It features a navigation bar with "Item" and "Discussion" tabs, and a search bar. The main content area includes the item name "Morning", its description "period of time between dawn and noon", and a table of "Statements". A table titled "List of pages linked to this item (54 entries)" is also visible. Annotations include an orange line pointing to the "UI" label and another orange line pointing to the "Content" label. A third orange line points to the table of linked pages, with the text "Most of the real content is multilingual" below it.

Language	Code	Linked article
العربية	ar	صباح (وقت) [edit]
ᲞᲠᲣᲚᲗ	arc	(ᲞᲠᲣᲚᲗ) ᲞᲠᲣᲚᲗ [edit]
Aymar aru	ay	Arumanthi [edit]
azərbaycanca	az	Səhər [edit]
žemaitėška	bat-smg	Rīts [edit]
български	bg	Утро [edit]
català	ca	Matí [edit]
česky	cs	Ráno [edit]
danc	da	Morgen [edit]

Most of the real content is multilingual

Approach 3: Integrate content and language selection on top

The default selection will set content language, but also UI language (unless the user explicitly selected a UI language)

This will go to Wikidata with content and UI in Esperanto (the UI may be in a different language if previously setted by user)

List of usual languages

List of usual languages

This sets the UI language to Spanish

In the rare case you are looking for an unusual language, the language picker helps you to find it for both UI or input.

This changes input language to Spanish

Testing approach 3 with users

Users are able to discover the top-right corner and select the language from the first selector to “see things in language X”.

When they need a more advanced feature, can find settings.

Example of one user changing language on commons using the top-right selector to see the description of an image in Dutch:

<https://www.youtube.com/watch?v=d84f13kUTt8>

Language selection as input in Wikidata

When creating new wikidata entries, you need to indicate a language.

文言	zh-classical	畫	[edit]
粵語	zh-yue	朝頭早	[edit]
es		article	[save cancel] ?
estremeño (ext)			[add]

Search is not flexible (“español” not appears when searching for “es”) and the free-form input makes it unclear whether I need to write the whole language name or not.

Select language ▼ article [save|cancel]

Language search

Common languages

Azərbaycanca	Qaraqalpaqsha	Turoyo	贛語
Bân-lâm-gú	Qırımtatarca	Uyghurche	日本語
Bráhuí	Qazaqşa	Vepsän kel'	한국어
English	Santali		

Worldwide

English	Lingua Franca Nova
español	Lojban
Esperanto	Novial

A compact version of the language picker can be used.

Focus is on search bar so the user can start typing and benefit from flexible search (autocompletion, ISO codes, and language names in other languages)

Relevant languages (geo-ip, previous choices, browser config.) are presented on top to anticipate user needs.

español × article [save|cancel]

Selection can be undone

Further analysis on specific Wikidata needs may be needed to fully cover their usecases.
