Data supplied by
State Agricultural Experiment Stations

Compiled in the
State Experiment Stations Division
Agricultural Research Service
United States Department of Agriculture
Washington, D. C.

FOREWORD

The passage of the Pesticide Chemical Residues Amendment (Public Law 518, often called the Miller Amendment) to the Food, Drug and Cosmetic Act focused attention on the need for additional information on pesticide residues. To make the information available on the pesticide residue research in progress at the State Agricultural Experiment Stations, it was suggested that a list be prepared. To facilitate the assembling of this information, the State Experiment Stations Division, Agricultural Research Service, United States Department of Agriculture sent a form to each State agricultural experiment station asking that they list the pesticide residue research that was active at the station in 1956. The following is a compilation of the information received from the State agricultural experiment stations. The Pesticide Chemical Residues Amendment does not deal directly with pesticide residues in soil. However, pesticide residues in soil may be absorbed by the roots and enter into agricultural commodities in this manner. The close relationship between research on pesticide residues in soils and in agricultural commodities appeared to warrant its inclusion in this listing.

It is hoped that this list will facilitate the exchange of information on pesticide residues, methods of determining them and related subjects pertaining to pesticide residues. Any requests for further information should be directed to the station doing the research.
