That your *Sedulities* in the Reception of our Agent were so cordial and so egregious we both gladly understand, and earnestly exhort ye that you would persevere in your good Will and Affection towards us.

Sedum (sē'dum), *n.* [NL. (Tournefort, 1700), *< L. sedum, houseleek.*] *1.* A genus of petaloid plants, of the order *Crassulaceae*. It is characterized by flowers with a four- or five-lobed calyx, the same number of separate petals, twice as many stamens alternately adnate to the petals, and a number of small scales inserted beneath the four or

five ovaries, the latter containing numerous ovules and ripening into separate follicles. There are about 150 species, natives of north temperate and frigid regions, rare in America, where one occurs in Peru, and in the United States 16 or more, chiefly in the mountains, with 3 others naturalized in the east. They are usually smooth herbs, either erect or decumbent, often tufted or moss-like, and remarkable for their fleshy stems and leaves. The latter are of very varied shapes, usually entire or but slightly toothed, and either opposite, alternate, or whorled. The flowers are borne in cymes, usually white, yellow, or pink, sometimes purplish or blue. Many species are common in dry, barren, or rocky places where little else will grow. The 10 British species and some of the American are known as *stonecrop*. Many others, known in cultivation by the generic name, and favorites for ornamenting rockwork, filling vases, and covering walls, are valued for their persistence of their foliage, which resists drought. Several with stiff rosettes of thick leaves are used for bedding out in summer, or employed for decorative borders and to form permanent designs, mottos, and lettering. Many similar Mexican plants so used, and commonly confused with these, belong to the subgenus *Echeveria* of the related genus *Cotyledon*, and are distinguished by their united five-furrowed corolla-tube. A similar habit occurs in the related genus *Sempervivum*. Several other species are in cultivation for their pink, purple, or scarlet flowers, and others for their variegated leaves mottled with white or yellow. A few are dioecious, and have flat, thinner leaves, forming the subgenus *Rhodiola*, the *rhodiola* of medieval shops. (See *rosaroot* and *heal-all*.) Many species are remarkable for persistence of life, cut stems growing and even flowering when fastened on a wall, deriving nourishment from reserves in their lower leaves and succulent stem, especially *S. Telephium* (for which see *orpine*), also called *live-for-ever* and *livealong*, and known as *Aaron's-rod* because sometimes growing when pressed and apparently dried, and as *midwinter-men* because formerly used for divination on midsummer eve by setting up two stems to see if the one representing the lover will turn to the other. *S. acre*, the English wall-pepper, bird's-bread, creeping jack, or pricklet, an emetic and cathartic, is often cultivated in America as *moss*, *golden-moss*, or *love-entangle*, and *S. Sieboldii*, a Japanese species valued for its grayish-green whorled leaves, as *constancy*, *S. rupestre* is known in England as *jealousy*, and for *S. Anacampseros*, see *herb of friendship*, under *herb*. *S. album*, formerly esteemed in medicine and eaten cooked or as a salad, is known as *worm-grass* and *prickmadam*. *S. pulchellum* of the southern United States is sometimes cultivated under the name of *widow's-cress*. *S. ternatum*, the wild stonecrop of rocky places in Pennsylvania and southward, with white flowers and rounded ornamental leaves in threes, is also often cultivated. *S. telephoides*, from the Potomac southward, and the *rosaroot*, in the Rocky Mountains and arctic America, are conspicuous on account of their growth in multitudes on high ledges of dry mountain-cliffs.

2. [*l. c.*] A plant of the genus *Sedum*: extended by very early writers to the houseleek and other crassulaceous plants. Sometimes written *cedum*.

With water, and oon nyght til seede ther stepe,
And beestes wicke away thus may me kepe.

The first five express either the physical sight or the result of reflection; *witness* expresses sight only. *See* is the general word; it represents often an involuntary act; to *perceive* implies generally or always the intelligence of a prepared mind; to *observe* implies the purpose of inspecting minutely and taking note of facts connected with the object. *Notice* applies to the involuntary discovery of some object by the sight, or of some fact by the mind; it has also the meaning of *observe*: as, to *notice* the operation of a steam-engine. To *behold* is to look at a thing for some time, to see plainly, or to see that which is interesting, remark-

able, or otherwise worth seeing. To *witness* is to see a thing done or happening: as, to *witness* a surgical operation: hence, legally, to *witness* a signature is to certify that one saw it made.

2. The seat of a bishop, whether an ordinary bishop, or a bishop of higher rank (metropolitan, etc., patriarch, pope); the local center of a diocese and of diocesan authority, or of a diocese and other subordinate dioceses; the city or locality from which ecclesiastical jurisdiction is exercised; hence, episcopal rank, authority, and jurisdiction as exercised from a permanent local center. The word *see*, from meaning any seat of dignity, came to apply specifically to the cathedra, or episcopal throne, situated in a cathedral, thence to the city which contained the cathedral and was the chief city of a bishop's diocese, and so in modern usage to the diocese itself. It differs from *diocese*, however, in that *diocese* represents the territorial province for the care of which the bishop is responsible (that is, where his duties lie), whereas *see* is the local seat of his authority, dignity, and episcopal privileges. Both words differ from *bishopric*, in that *bishopric* represents the bishop's office, whether actual or nominal. See *throne*.

seed (sēd), *n.* [*ME. seed, sede, sed, sad, < AS. sēd, seed, sowing, offspring, = OS. sād = OFries. sād = MD. sād, D. zaad = MLG. sāt = OHG. MHG. sāt, G. saat = Icel. sæthi, sæth = Sw. sād = Dan. sād = Goth. *sēths (in comp. mana-sēths, mankind, the world), seed; with formative -d (-th), from the root of AS. sātcan, etc., sow: see sow¹.]* 1. The fertilized and matured ovule of the higher or flowering plants. It is a body within the pericarp or seed-vessel, containing an organized embryo, or nucleus, which, on being placed under favorable circumstances, develops into an individual similar to that from which it came. The reproductive bodies of the lower or flowerless plants (cryptogams) differ in their mode of germination and in other ways, and are not called true seeds, but *spores*. (See *spore*.) The seed-coats are those of the ovule—two, or rarely only one. The outer, answering to the primine, is the more firm and is not rarely crustaceous in texture, and takes the name of *testa* (also *spermoderm* and *episperm*). The inner, answering to the secundine, is called *tegmen* (sometimes *endopleura*); when present, it is always conformed to the nucleus, and is thin or soft and delicate in texture. The seed-stalk or podosperm, when there is one, is the pedicel or attachment of the seed to the placenta, and answers to the funiculus of the ovule. The chalazæ, raphe, and hilum of the ovule retain the same names in the seed. The foramen of the ovule is called the *micropyle* in the seed. The terms which denote the position of the ovule, such as *orthotropous*, *anatropous*, *amphitropous*, etc., also apply equally to the resulting seed. The nucleus may consist of the embryo alone, or of the embryo and the albumen, which is the nourishing substance upon which the developing plant is to feed until it is capable of maintaining itself. See the various terms, and cuts under *anatropous*, *campylotropical*, *Cruciferae*, *ovary*, and *plumule*.

= **Syn. 2.** *Seem, Look, Appear.* *Look* differs from *seem* only in more vividly suggesting the use of the eye, literally or figuratively: as, it *looks* (or *seems*) right. *Appear* is somewhat stronger, having sometimes the sense of coming into view or coming to seem. Each may stand for that which is probably true, or in opposition to that which is true: not to *seem*, but to be; the *seeming* and the *real*. *Should seem* and *would seem* are equally correct, but differ in strength. To say that a thing *should seem* to be true is to say that it ought to seem so or almost necessarily seems so; to say that it *would seem* true is to say that, while there are reasons for holding an opposite view, the preponderance of evidence is on the side of its being true.

 sidered a modified vertebra.

2. In *geom.*, a part cut off from
 any figure by a line or plane.
 A *segment of a circle* is a part of the
 area contained within an arc and its
 chord, as ACB. The chord is some-

times called the *base of the segment*. An angle in a seg-
 ment is the angle contained by two straight lines drawn
 from any point in its arc to the extremities of its chord or
 base.

3. In *her.*, a bearing representing one part only
 of a rounded object, as a coronet or wreath:
 usually a piece less than half of the circle.—
Abdominal, basilar, maxillary, postoral, etc., seg-
 ments. See the adjectives.—**Calcifying or calcific
 segment**. See *calcify*.—**Segment of a line**, the part
 included between two points.—**Segment of a sphere**,
 any part of it cut off by a plane not passing through the
 center.—**Similar segments of circles**. See *similar*, 3.

segment (seg'ment), *v.* [< *segment*, *n.*] **I.**
intrants. To divide or become divided or split
 up into segments. (a) In *embryol.*, to undergo seg-
 mentation, as an ovum or vitellus. See *segmentation*. (b)
 In *physiol.*, to reproduce by semiffission or budding.

Before this occurs, however, the vegetal unit, if it does
 not divide, may *segment* or bud; the bud grows into a unit
 similar to its parent, and this in its turn may also *segment*
 or bud. *Bastian*, The Brain as an Organ of Mind, l.

II. trans. To separate or divide into seg-
 ments: as, a *segmented* cell.

segmenta, *n.* Plural of *segmentum*.

segmental (seg'men-tal), *a.* [< *segment* + *-al*.]

1. Having the form of the segment of a circle;
 being a segment: as, a *segmental* arch.—

2. Of or pertaining to segments or segmenta-
 tion: as, a *segmental* formula; *segmental* parts;
segmental organs.—3. Specifically, in *embryol.*,

noting the primitive and rudimentary renal or-
 gans which occur in all vertebrates and some
 invertebrates, consisting in the former of
 branched tubules opening at one end into the
 somatic cavity and at the other by one or more
 main ducts into the cloaca or hindgut. The seg-
 mental organs of a vertebrate are divisible into three
 parts, anterior, middle, and posterior. The foremost is
 the head-kidney or *pronephron*, whose duct becomes a
 Mullerian duct. The next is the Wolffian body proper, or
mesonephron, whose duct is the Wolffian duct. The last
 or hindmost is the rudiment of the permanent kidney,
 whose duct is the ureter; this is the *metanephron*. The
 epithet *segmental* in this sense was originally used to
 note the kind of renal or excretory organs which annelids,
 as worms and leeches, possess, in more or fewer of the seg-
 ments of the body, whence the name; it was subsequently
 extended to the above-described embryonic renal organs
 of vertebrates which are replaced by permanent kidneys—
 these segmental organs being thus loosely synonymous
 with *primitive kidney*, *Wolffian body*, and *protonephron*.
 See cut under *leech*.

segmentally (seg'men-tal-i), *adv.* In a seg-
 mental manner; in segments: as, the spinal
 nerves are arranged *segmentally*.

These organs, being . . . *segmentally* arranged, are
 termed segmental organs or nephridia.

segmentary (seg'men-tā-ri), *a.* [< *segment* +
-ary.] Segmental; pertaining to or indicating seg-
 ments: especially noting in entomology col-
 ored bands, rings, or other marks on the abdo-
 men, corresponding to successive segments, as
 in many *Lepidoptera*.—**Segmentary geometry**. See
geometry.

segmentate (seg'men-tāt), *a.* [< L. *segmenta-
 tus*, ornamented with strips of tinsel, lit. hav-
 ing segments, < *segmentum*, a segment: see *seg-
 ment*.] Having segments; segmented. *Encyc.*
Brit., II. 292.

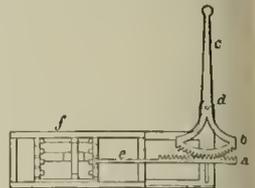

segmentation (seg'men-tā'shən), *n.* [< *seg-
 ment* + *-ation*.] The act of cutting into seg-
 ments; a division into segments; the condi-
 tion of being divided into segments; the man-
 ner in which a segmented part is divided.—
Segmentation cavity, in *embryol.*, the central space in-
 closed by the blastomeres of the embryo, before the for-
 mation of a gastrula by invagination; the hollow of a blas-
 tosphere; a blastocœle.—**Segmentation nucleus**, the
 nucleus of an impregnated ovum or germ-cell, result-
 ing from fusion of a male and a female pronucleus, and
 capable of undergoing segmentation.—**Segmentation
 of the vitellus**, in *embryol.*, yolk-cleavage; morulation;
 the first process of germination of the ovum of any metazoic
 animal, by which the original single cell of which the
 ovum primitively consists becomes converted, wholly or
 in part, into a mass of similar cells, constituting a morula
 or mulberry-mass. The cells thus formed are specified as
cleavage-cells, *blastomeres*, or *segmentella*. Segmentation
 goes on in different cases with some variations, chiefly
 due to the presence of food-yolk and the position of this
 yolk relatively to the formative yolk (see *centrolecithal*,
ectolecithal). Total segmentation is necessarily restricted to
 holoblastic ova; it is distinguished from the *partial*
 segmentation of meroblastic ova (see *holoblastic*, *meroblastic*),
 the terms meaning respectively that all, or that only some,
 of the yolk segments. Total segmentation is *equal* or *regu-
 lar* when the whole germ-cell divides into two similar
 cleavage-cells, and these into four, and so on, the result-
 ing gastrula being the archigastrula. Total segmentation is
unequal or *irregular* when the cleavage-cells are unlike
 one another; it results in the amphigastrula. The partial
 segmentation of meroblastic eggs is always unequal, and
 either *discoidal* with formation of a discogastrula, or *super-
 ficial* and forming a perigastrula. Total equal segmen-
 tation is also styled *primitive*, *primordial*, and *palinge-
 netic*, the modifications introduced in unequal and partial
 segmentation being described as *kenogenetic*. Other terms,
 descriptive rather than definitive, are used by different

writers; the foregoing is nearly Ilaeckel's nomenclature.
 See *egg*, *ovum*, *vitellus*, and cuts under *gastrula* and *gas-
 trulation*.—**Segmentation rhythm**, the rate of produc-
 tion of successive cleavage-cells, or their numerical ratio
 of increase, whether 2, 4, 8, 16, 32, etc., or any other mode
 of multiplication.—**Segmentation sphere**, a ball of
 cleavage-cells; a blastosphere; a morula.

segmented (seg'men-ted), *a.* [< *segment* +
-ed.] Divided into segments, segmenta, or
 segmentella; characterized by or exhibiting

 body of a vertebrate is *segmented* according to
 the number of vertebrae, whether any actual
 division of parts may be evident or not.

 sawed from the log.

 der of thin iron contains the
 bursting-charge, and this is

 which are either thrown in
 all directions on the burst-
 ing of the shell, or thrown

1. A Spanish dance, usually of a lively character, for two dancers. Three varieties are distinguished, the manchega, the bolera, and the gitana, the first being the most vivacious, and the last the most atately. If government, however, throws the expense of coinage, as is reasonable, upon the holders, by making a charge to cover the expense (which is done by giving back rather less in coin than is received in bullion, and is called "levying a *seigniorage*"), the coin will rise to the extent of the *seigniorage* above the value of the bullion. *J. Seines vary in size from one small enough to take a few minnows to the shad-seine of a mile or more in length, hauled by a windlass worked by horses or oxen or by a steam-engine. The largest known seine was used for shad at Stony Point on the Potomac in 1871; it measured 3,400 yards, or nearly 2 miles; the lines and seine together had a linear extent of 5 miles, and swept 1,200 acres of river-bottom; this net was drawn twice in 24 hours.

seismic (sîs'mik), *a.* [< Gr. *σεισμός*, an earthquake, + *-ic*.] Pertaining to or of the nature of an earthquake; relating to or connected with an earthquake, or with earthquakes in general. To a considerable extent, *seismic* takes the place of *earthquake* used as an adjective or in compound words. Thus *seismic center* is the equivalent of *earthquake center*, etc.—**Seismic area**, the region or part of the earth's surface affected by the shock of an earthquake.—**Seismic center**, or **seismic focus**, the point, line, or region beneath the earth's surface where an earthquake-shock is started or originated.—**Seismic vertical**, the

part of the earth's surface which is directly over or nearest to the seismic focus. Sometimes called the *epicenter* or *epicentrum*.

seismical (sîs'mi-kal), *a.* [< *seismic* + *-al*.] Same as *seismic*.

seismogram (sîs'mô-gram), *n.* [< Gr. *σεισμός*, an earthquake, + *γράμμα*, that which is drawn or written: see *gram*².] The record made by a seismograph or seismometer; the result of an earthquake-shock as exhibited on the instrument or instruments employed, these varying in character and in the manner in which the elements of the shock are recorded. See *seismometer*.

seismograph (sîs'mô-gráf), *n.* [< Gr. *σεισμός*, an earthquake, + *γράφειν*, write.] Same as *seismometer* (which see). The more complicated forms of instruments contrived for the purpose of recording the phenomena of earthquakes are sometimes called *seismographs*, and sometimes *seismometers*. The name *seismograph* was first employed in reference to the elaborate seismometer contrived by Palmieri and used at his station on Mount Vesuvius. This was called by him a "sismografo," and this name has generally been Englished as *seismograph*, which is also the designation most generally applied by the members of the Seismological Society of Japan to the seismometers there contrived and used within the past few years.

seismographer (sîs-mô-gráf'ér), *n.* Same as *seismologist*. [Rare.]

seismographic (sîs-mô-gráf'ik), *a.* [< *seismograph* + *-ic*.] Of or pertaining to seismography; connected with or furnished by the seismograph: as, *seismographic records*, observations, studies, etc.

seismography (sîs-mô-gráf'i), *n.* [< Gr. *σεισμός*, an earthquake, + *γραφία*, < *γράφειν*, write.] The study of earthquake phenomena, with the aid of seismographs, or instruments specially contrived for recording the most important facts regarding the direction, duration, and force of these disturbances of the earth's crust.

seismological (sîs-mô-loj'ik-al), *a.* [< *seismology* + *-ic*.] Relating to or connected with seismology, or the scientific investigation of the phenomena of earthquakes.

The object of all *seismological* investigation should be, primarily, to determine both the true direction and velocity of motion of the particles set in motion by the earthquake-wave. *Oldham*, *Cachar Earthquake*, p. 90.

seismologically (sîs-mô-loj'ik-al-i), *adv.* In a seismological aspect.

seismologist (sîs-mô-lôj'ist), *n.* [< *seismology* + *-ist*.] A scientific investigator or student of earthquake phenomena; one who endeavors, by the aid of seismometric observations, to arrive at the more important facts connected with the origin and distribution of earthquakes.

seismologue (sîs'mô-log), *n.* [< Gr. *σεισμός*, an earthquake, + *-λογία*, < *λέγειν*, speak: see *-ology*.] A catalogue of earthquake observations; a detailed account of earthquake phenomena.

The labour of collecting and calculating further and future *seismologies* will be in a great degree thrown away, unless the cultivators of science of all countries . . . shall unite in agreeing to some one uniform system of seismic observation. *R. Mallet*, in *Trans. Brit. Ass. for Adv. of Sci.*, 1858, p. 1.

seismology (sîs-mô-lô-jî), *n.* [< Gr. *σεισμός*, an earthquake, + *-λογία*, < *λέγειν*, speak: see *-ology*.] The branch of science which has for its object the investigation of the causes and effects of earthquakes, and, in general, of all the conditions and circumstances of their occurrence.

The objects and aims of *Seismology* are of the highest interest and importance to geology and terrestrial physics. *R. Mallet*, in *Admiralty Manual of Scientific Enquiry* (3d ed.), p. 327.

seismometer (sîs-mô-m'è-tér), *n.* [< Gr. *σεισμός*, an earthquake, + *μέτρον*, a measure: see *meter*¹.] An instrument by the aid of which the data are obtained for the scientific study of earthquake phenomena. The forms of instruments used for this purpose are varied, and more or less complicated, in accordance with the wishes and means of the observer. A common bowl partly filled with a viscid fluid, like molasses, which, on being thrown by the earthquake-wave against the side of the bowl, leaves a visible record of the event, is one of the simplest forms of seismometer which have been proposed, as giving a rude approximation to the direction of the horizontal element of the wave. Another simple form of seismometer consists of two sets of cylinders, each set numbering from six to twelve, and the individual cylinders in each uniformly decreasing in size. These are placed on end, one set at right angles to the other, on plates resting on a hard horizontal floor, surrounded by a bed of dry sand, in which the cylinders when overthrown will rest, exactly in the position originally given by the shock. This instrument is theoretically capable of giving the velocity of the horizontal component of the shock, its surface-direction in azimuth, or the direc-

tion of the horizontal component of the seismic wave, and also the direction of translation of the wave. In practice, however, the results given by this simple and inexpensive apparatus have not been found satisfactory. The seismometer now most generally used in large observatories, or those where accurate work is expected, involves Zollner's horizontal pendulum, the use of which was proposed many years ago, but which was put into the present practical form by Messrs. Ewing and Gray. The group of instruments constituting the seismometer of Prof. J. A. Ewing is arranged to give a complete record of every particular of the earthquake movement, by resolving it into three rectangular components—one vertical and two horizontal—and registering these by three distinct penitons on a sheet of smoked glass which is made to revolve uniformly by clockwork, the clock being started by an arrangement similar to that of the Palmieri seismoscope. To this is added another clock which gives the date of the shock and the interval which has elapsed since it took place. Another and simpler form of seismometer designed by Mr. Ewing, and called the "duplex-pendulum seismograph," does not show the vertical element of the disturbance, nor exhibit anything of the relation of time to displacement; but it is in other respects satisfactory in its performance. Of this latter form, fifteen sets were in use in Japan in 1886, and others were being made for other countries. Compare *seismograph*, and see *ent* under *seismoscope*.

Instruments which will in this way measure or write down the earth's motions are called *seismometers* or *seismographs*. *Milne*, *Earthquakes*, p. 13.

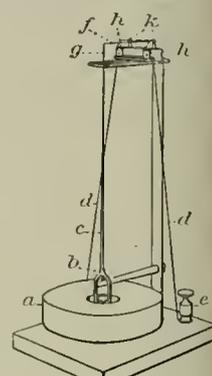

seismometric (sîs-mô-met'rik), *a.* [< *seismometry* + *-ic*.] Of or pertaining to seismometry or the seismometer; used in or made, produced, or observed by means of a seismometer: as, *seismometric instruments*; *seismometric observations*.

The theory and use of the seismometer; more generally, the scientific study of earthquake phenomena by the aid of observations made either with or without the use of seismometric instruments.

seismoscope (sîs'mô-skôp), *n.* [< Gr. *σεισμός*, an earthquake, + *σκοπεῖν*, view.] A name of the simpler form of seismometer. It is generally so arranged that the exact moment of passage is noted by stopping a clock, either by direct mechanical means or by the use of an electric current. The epoch may also be registered on a revolving cylinder or other similar device. The essential part of a seismoscope usually consists of a delicately suspended or balanced mass, the configuration of which is readily disturbed on the passage of the seismic wave.

Seismoscope.

a, heavy mass supported by loop, at point near center of gravity; *b*, point on which upper side of loop rests; *c*, long needle projecting from upper side of loop; *d*, conducting-wire; *e*, binding-post; *f*, long arm of lever pivoted at *g*; *g*, point where end of lever rests on end of needle; *h*, mercury-cup.

To construct an instrument which at the time of an earthquake shall move and leave a record of its motion, there is but little difficulty. Contrivances of this kind are called *seismoscopes*. *Milne*, *Earthquakes*, p. 13.

(c) In Gill's system, a class of ichthyopsid vertebrates characterized by the absence of dermal or membrane bones from the head and shoulder-girdle, the existence of a cartilaginous cranium, a well-developed brain, and a heart composed of an auricle and a ventricle. Selaginæ (sel-a-jin'ē-ē), n. pl. [NL. (Jussieu, 1806), < *Selago (-gin-) + -æ*.] A small order of gamopetalous plants, of the cohort *Lamiales*. It is characterized by flowers with a corolla of five or sometimes four equal or unequal spreading lobes, four didynamous or two equal stamens, one-celled anthers, and a superior one- or two-celled ovary, forming one or two small nutlets in fruit, often with a fleshy surface and corky furrowed or perforated interior, investing a pendulous cylindrical seed with fleshy albumen. It is distinguished from the related order *Scrophularinæ* by its solitary ovules, from *Labiata* and *Verbenacæ* by an embryo with a superior micropyle and radicle, and from its ally the *Myoporinæ* by habit and terminal inflorescence. It includes about 140 species belonging to 8 genera, of which *Selago* is the type. They are natives of the Old World beyond the tropics, chiefly diminutive heath-like shrubs of South Africa, with alternate, narrow, and rigid leaves, and small flowers grouped in terminal spikes or dense globular heads, commonly white or blue, rarely yellow.

Selago*, a genus separated from *Lycopodium (-gin-)*, leycopodium; see *Selago*.] A genus of heterosporous vascular cryptogams, typical of the *Selaginellacæ* and *Selaginellæ*. They have the general habit of *Lycopodium* (the ground-pine, club-moss, etc.), differing from it mainly by the dimorphic spores. The stems are copiously branched, trailing, suberect, sarmentose, or scandent; in shape they are more or less distinctly quadrangular, with the faces angled or flat. The leaves are small, with a single central vein, usually tetrastichous and dimorphous, and more or less oblique, the two rows of the lower plane larger and more spreading, the two rows of the upper ascending, adpressed, and imbricated; spikes usually tetrastichous, often sharply square, at the end of leafy branches; microsporangia numerous; macrosporangia few, and confined to the base of the spike. About 335 species have been described, from the warmer parts of the globe. Many species are cultivated in conservatories, and numerous forms have resulted. *S. lepidophylla* is well known under the name *resurrection-plant*, and is also called *rock-lily* or *rock-rose*.

Fertile Plant of *Selaginella lepidophylla*.

Selaginellacæ (sē-laj'i-ne-lä'sē-ē), n. pl. [NL., < *Selaginella + -acæ*.] A group of heterosporous vascular cryptogamous plants, by some called an order, by others raised to the rank of a class coördinate with the *Rhizocarpeæ*, *Lycopodiaceæ*, *Filices*, etc. It embraces only 2 genera, *Selaginella* and *Isoetes* (which see for characterization).

Selaginellæ (sē-laj-i-nel'ē-ē), n. pl. [NL., < *Selaginella + -æ*.] A group of heterosporous vascular cryptogams. By many writers employed as an interchangeable synonym with *Selaginellacæ*, by others regarded as an order under the class *Selaginellacæ*. It embraces the single genus *Selaginella*.

Selago (sē-lā'gō), n. [NL. (Linnæus, 1737), < *L. selago*, a similarly dwarf but unrelated plant, *Lycopodium Selago*.] A genus of gamopetalous plants, type of the order *Selaginæ*. It is characterized by flowers with a two- to five-lobed calyx, nearly regular or somewhat two-lipped corolla, four didynamous and perfect stamens, and a two-celled ovary which separates into two nutlets in fruit. There are about 95 species, all South African except one in tropical Africa and one, *S. muratis*, growing on the walls of the capital of Madagascar. They are dwarf heath-like shrubs, sometimes small annuals, often low and diffuse, and with many slender branchlets. They bear narrow leaves, commonly alternate and clustered in the axils, and sessile flowers in dense or slender spikes.

Selandria (sē-lan'dri-ä), n. [NL. (Leach, 1817); formation uncertain.] An important genus of saw-flies or *Tenthredinidæ*. They have a short thick body, costa of the fore wing thick and dilated before the stigma, and the lanceolate cell petiolate, open, and without a cross-vein. Their larvae are stout, slimy, slug-like creatures, and feed upon the leaves of various trees. That of *S. cerasi* is the pear- or cherry-slug, now placed in the genus *Eriocampa*, and that of *S. roseæ* is the rose-slug, now placed in the genus *Monostegia*. See cut under *rose-slug*.

(Swainson, 1831), < *Gr. σέλας, light, brightness, + φωρος, < φέρειν = E. bear¹*.] A genus of *Trochilidæ*; the flame-bearers or lightning-hummers. *S. rufus* is the red-backed or Nootka Sound humming-bird, notable as the species which goes furthest north, being found in Alaska. *S. platycercus* is the broad-tailed humming-bird. Both are common in western North America, and several others occur in Mexico and Central America.

3. In *biol.*, the separation of those forms of animal and vegetable life which are to survive from those which are to perish; the facts, principles, or conditions of such distinction between organisms; also, the actual result of such principles or conditions; also, a statement of or a doctrine concerning such facts; especially, natural selection. See phrases below.—**Artificial selection**, man's agency in modifying the processes and so changing the results of natural selection; the facts or principles upon which such interference with natural evolutionary processes is based and conducted. This has been going on more or less systematically since man has domesticated animals or cultivated plants for his own benefit. Such selection may be either *unconscious* or *methodical* (see below). It has constantly tended to the latter, which is now systematically conducted on a large scale, and has resulted in numberless creations of utility or of beauty, or of both, which would not have existed had the animals and plants thus improved been left to themselves—that is, to the operation of natural selection. Examples of artificial selection are seen in the breeding of horses for speed, bottom, or strength, or for any combination of these qualities; of cattle for beef or milk; of sheep for mutton or wool; of dogs for speed, scent, courage, docility, etc.; of pigs for fat pork; of fowls for flesh or eggs; of pigeons for fancied shapes and colors, or as carriers; in the cultivation of cereals, fruits, and vegetables to improve their respective qualities and increase their yield, and of flowers to enhance their beauty and fragrance.—**Methodical selection**, artificial selection methodically or systematically carried on to or toward a foreseen desired result; the facts or principles upon which such selection is based, and the means of its accomplishment. See above.

Methodical selection is that which guides a man who systematically endeavours to modify a breed according to some predetermined standard.

Darwin, Var. of Animals and Plants, xx. 177.

In the case of *methodical selection*, a breeder selects for some definite object, and free intercrossing will wholly stop his work. *Darwin, Origin of Species*, p. 103.

Natural selection, the preservation of some forms of animal and vegetable life and the destruction of others, in the natural order of such things, by the operation of natural causes which, in the course of evolution, favor some organisms instead of some others in consequence of differences in the organisms themselves. (a) The fact of the survival of the fittest in the struggle for existence—which means that those animals and plants which are best adapted, or have the greatest adaptability, to the conditions of their environment do survive other organisms which are less adapted, or less capable of being adapted, to such conditions. This fact rests upon observation, and is unquestionable. (b) The means by which or the conditions under which some forms survive while others perish; the law of the survival of the fittest; the underlying principle of such survival, and the agencies which effect that result. These seem to be mainly intrinsic, or inherent in the organism; and they are correlated, in the most vital manner possible, with the varying plasticity of different organisms, or their degree of susceptibility to modification by their environment. Those which respond most readily to external influence are the most modifiable under given circumstances, and consequently the most likely to be modified in a way that adapts them to their surroundings, which adaptation gives them an advantage over less favored organisms in striving to maintain themselves. Hence (and this is the gist of Darwinian natural selection) —(c) The gradual development of individual differences which are favorable to the preservation of the life of the individual, with corresponding gradual extinction of those peculiarities which are unfavorable to that end; also, the transmission of such modified characters to offspring, and so the perpetuation of some species and the extinction of others—a fact in nature respecting which there is no question, since we know that more species, genera, etc., have perished than are now living. (d) The theory of natural selection; any statement of opinion or belief on that subject, which may or may not adequately reflect the facts in the case. Ignorance alike of these facts and of this theory has been fruitful of misunderstandings and objections respecting the latter. Some of its supporters have made of the theory a cause of the facts which it is simply designed to explain; some of its opponents, unconsciously biased perhaps by such other extremists, have denied that the theory has any validity. Between these extremes, the author of the theory states explicitly that it neither originates variability, nor accounts for the origin of variations, in individuals, still less in species; but that, given the origination and existence of variations, it shows that some of these are preserved while others are not; that favorable variations tend to be perpetuated and unfavorable variations to become extinct; that those variations which best adapt an organism to its environment are most favorable to its preservation; and, consequently, that the

theory of natural selection is adequate to explain, to some extent, the observed fact of the survival of the fittest in the struggle for existence—that is, natural selection in sense (a) above. Natural selection, in so far as sex is concerned, is specified as *sexual selection* (see below). The facts and principles of natural selection, as recognized and used by man for his own benefit in his treatment of plants and animals, come under the head of *artificial selection* (see above). An extension of the theory of natural selection to the origination (as distinguished from the preservation) of individual variations has been named *physical selection* (see below).

This preservation of favourable variations and the rejections of injurious variations I call *Natural Selection*. Variations neither useful nor injurious would not be affected by *natural selection*, and would be left a fluctuating element, as perhaps we see in the species called polymorphic. *Darwin, Origin of species* (ed. 1869), iv.

Natural selection . . . implies that the individuals which are best fitted for the complex and in the course of ages changing conditions to which they are exposed generally survive and procreate their kind.

Darwin, Var. of Animals and Plants, xx. 178.

Physical selection, the law of origin for differential changes or modifications in organisms which have arisen through the action of physical causes in the environment, in habits, etc. It is distinguished from *natural selection*, which relates not to the origin but to the preservation of these changes. *A. Hyatt*.—**Sexual selection**, that province or department of natural selection in which sex is especially concerned, or in which the means by which one sex attracts the other comes prominently into play. Thus, anything which exhibits the strength, prowess, or beauty of the male attracts the female, and decides her preference for one rather than another individual of the opposite sex, with the result of affecting the offspring for the better; and this principle of selection, operative through many generations may in the end modify the specific characters of animals, and thus become an important factor in natural selection.

If it be admitted that the females prefer or are unconsciously excited by the more beautiful males, then the males would slowly but surely be rendered more and more attractive through *sexual selection*.

Darwin, Descent of Man (ed. 1881), p. 493.

For my own part, I conclude that of all the causes which have led to the differences in external appearance between the races of men, and to a certain extent between man and the lower animals, *sexual selection* has been by far the most efficient. *Darwin, Descent of Man* (ed. 1871), II. 367.

Unconscious selection, artificial selection effected unknowingly, or carried on without system or method; man's agency in unmethodical selection, or the result of that agency. See the extract.

Unconscious selection in the strictest sense of the word—that is, the saving of the more useful animals and the neglect or slaughter of the less useful, without any thought of the future—must have gone on occasionally from the remotest period and amongst the most barbarous nations.

element was so called (by Berzelius) because associated with *tellurium* (< L. *tellus*, earth.) Chemical symbol, Se; atomic weight, 79. A non-metallic element extracted from the pyrite of Fahlun in Sweden, and discovered in 1818 by Berzelius. In its general chemical analogies it is related to sulphur and tellurium. It is found in combination with native tellurium, as in selen-tellurium, with sulphur in selen-sulphur; also in very small quantity in some of the varieties of iron pyrites, and in several rare selenides, as clausthalite, or lead selenide, etc. When precipitated it appears as a red powder, which melts when heated, and on cooling forms a brittle mass, nearly black, but transmitting red light when in thin plates. When heated in the air it takes fire, burns with a blue flame, and produces a gaseous compound, oxid of selenium, which has a most penetrating and characteristic odor of putrid horse-radish. Selenium undergoes a remarkable change in electrical resistance under the action of light: hence the use of selenium-cells. See *resistance*, 3, and *photophone*.

self (self), *a., pron., and n.* [Also *Se. self*, *self*; < ME. *self*, *silf*, *soelf*, *sulf* (pl. *selfe*, *soelfe*, *selve*, *salve*, *soalre*, later *selves*; in oblique cases *selven*), < AS. *self*, *soelf*, *silf*, *siolf*, *syllf*, same, *self*, = OS. *self* = OFries. *self*, *selva* = OD. *self*, D. *self* = MLG. *self*, *sulf*, LG. *selv* = OHG. *selb*, MHG. *selp*, G. *selb* (inflected *selbst*, etc.), *selbst* (uninflected) = Icel. *sjálfir*, *sjálfir* = Sw. *själf* = Dan. *selv* = Goth. *silba*, same, *self*; origin unknown: (a) in one view (Skeat) the orig. form **selba* is perhaps for **seliba*, 'left to oneself,' < *se-*, *si-* (Goth. *si-k* = L. *se*, oneself, = Skt. *sva*, one's own self), + *lib-*, the base of AS. *līfan*, be left, *lāf* = Goth. *laiba*, a remnant, etc. (see *leave*¹, *life*, *live*¹). (b) In another view (Kluge) perhaps orig. 'lord, possessor, owner,' akin to Ir. *selb*, possession; cf. Skt. *patib*, lord, with Lith. *pats*, *self*; cf. also *own*¹, *v.*, *owner*, with the related *own*¹, *a.*, which in some uses is nearly equiv. to *self*. The use of *self* in comp. to form the reflexive pronouns arose out of the orig. independent use of *self* following the personal pronouns, and agreeing with them in inflection, in AS. as follows: *ic selfa* (*ic self*), 'I self' (I myself), *min selfes*, 'of me self' (of

myself), *mē selfum*, 'to me self' (to myself), *mē selfne*, 'me self' (myself), pl. *wē selfe*, 'we self' (we ourselves), etc.; so *thū selfa* (*thū self*), 'thou self' (thyself), *thū selfes*, 'of thee self' (of thyself), etc., *hē selfa* (*hē self*), 'he self' (himself), *his selfes*, 'of him self' (of himself), etc., the adj. *self* becoming coalesced with the preceding pronoun in the oblique cases *mine*, *my*, *me*, *our*, *thine*, *thy*, *thee*, *your*, *his*, *him*, *her*, *their*, *them*, etc., these being ultimately reduced in each instance to a single form, which is practically the dative *me*, *thee*, *him*, *her*, *them*, etc. (in which the acc. was merged), mixed in part with the genitive *mine*, *my*, *our*, *thine*, *thy*, *your*, etc., these orig. genitives in time assuming the appearance of mere possessives, and *self* thus taking on the semblance of a noun governed by them, whence the later independent use of *self* as a noun (see III.). The reflexive combination *me selfe*, *him selfe* (*selve*), etc., came to be used, as the dative of reference, to indicate more distinctly the person referred to — 'I (for) myself,' 'he (for) him self,' etc., thus leading to the emphatic use. The former (AS. ME.) adj. pl. *-e* has now changed to the noun pl. *-es* (*selves*, as in *wolves*, *wives*, etc.). *Itself* and *oneself* retain the original order of simple juxtaposition: *it + self*, *one + self*. In the more common *one's self*, *self* is treated as an independent noun.] I, u. 1. Same; identical; very same; very. [Obsolete or archaic except when followed by *same*. See *selfsame*.]

J. Arrowsmith, Paper-Hanger's Companion, p. 82.

II. *pron.* A pronominal element affixed to certain personal pronouns and pronominal adjectives to express emphasis or distinction, or to denote a reflexive use. Thus, for emphasis, I *myself* will write; I will examine for *myself*; thou *thyself* shalt go; thou shalt see for *thyself*; the writing *itself* shall be exhibited. "I *myself* will decide" not only expresses my determination to decide, but my determination that no other shall decide. Reflexively, I *abhor myself*; he admires *himself*; it pleases *itself*. *Himself*, *herself*, *themselves* are used in the nominative case as well as in the objective. When the elements are separated by an adjective, *self* becomes a mere noun: as, *my own self*, *our two selves*, *his very self*; so *one's self* for *oneself*. See III.

Now chese *yourselven* whether that you liketh.

Chaucer, Wife of Bath's Tale, l. 371.

Jesus *himself* baptized not, but his disciples. John iv. 2.

III. *n.*; pl. *selves* (*selvz*). 1. A person in his relations to that very same person. *Self* differs from *ego* as being always relative to a particular individual, and as referring to that person in all his relations to himself and not merely as given in consciousness.

Two distincts, division none; . . .

W. James, Prin. of Psychology, I. 400.

2. A thing or class of things, or an attribute or other abstraction, considered as precisely distinguished from all others: as, the separation of church and state is urged in the interest of religion's *self*.

3. Personal interest and benefit; one's own private advantage.

Smote the chord of *Self*, that, trembling, pass'd in music out of sight.

Tennyson, Locksley Hall.

4. In *hort.*, a flower with its natural plain color; a self-colored flower, as distinguished from one which has become "rectified" or variegated. Compare *self-colored*. [*Self* is the first element in numerous compounds, nearly all modern. It may be used with any noun having an associated verb, or with any participial adjective (in *-ing* or *-ed* or *-en*), or other adjective implying action. It indicates either the agent or the object of the action expressed by the word with which it is joined, or the person on behalf of whom it is performed, or the person or thing to, for, or toward whom or which a quality, attribute, or feeling expressed by the following word belongs, is directed, or is exerted, or from which it proceeds; or the subject of, or object affected by, such action, quality, attribute, feeling, and the like; and the meaning is frequently negative, implying that the relation exists toward self only, not toward others: as, *self-acting*, etc. Most of these compounds are of obvious meaning; only the more important of them are given below (without etymology, except when of early formation). In words compounded with *self*, the element *self* has a certain degree of independent accent, generally less than that of the following element, but liable to become by emphasis greater than the latter.] — **By one's self.** See *byl.* — **To be beside one's self.** See *beside.* — **To be one's self.** To be in full possession of one's powers, both mental and physical.

=Syn. *Self-denial, Self-sacrifice, Austerity, Asceticism, self-abnegation, self-forgetfulness.* The italicized words agree in representing the voluntary refusal or surrender of personal comfort or desires. *Self-denial* is to be presumed wise, necessary, or benevolent, unless indication is given to the contrary; it may be the denial of selfishness; it may be not only the refusal to take what one might have, but the voluntary surrender of what one has; it may be an act, a habit, or a principle. *Self-sacrifice* goes beyond *self-denial* in necessarily including the idea of surrender, as of comfort, inclination, time, health, while being also presumably in the line of a real duty. An assembly or council of citizens invested with a share in the government of a state. Especially—(a) In ancient Rome, a body of citizens appointed or elected from among the patricians, and later from among rich plebeians also, or taking seats by virtue of holding or of having held certain high offices of state. Originally the senate had supreme authority in religious matters, much legislative and judicial power, the management of foreign affairs, etc. At the close of the republic, however, and under the empire, the authority of the senate was little more than nominal apart from certain administrative functions, chiefly fiscal, and from its sittings as a high court of justice and as an appellate tribunal. The original senate of the patricians numbered 100; after the adjunction of the tribes *Tities* or *Sabines* and *Luceres*, the number became 300, and remained at this figure for several centuries, with the exception of some temporary changes, until the supremacy of Sulla. Julius Caesar made the number 900, and after his death it became over 1,000, but was reduced to 600 by Augustus, and varied under subsequent emperors. (b) The upper or less numerous branch of a legislature in various countries, as in France, Italy, the United States, and in all the separate States of the Union. The Senate of the United States consists of two senators from each State, and numbers (in 1898) 90 members. A senator must be at least thirty years of age, nine years a citizen of the country, and a resident of the State from which he is chosen. Senators are elected by the State legislatures, and sit for six years, but the terms of office are so arranged that one third of the members retire every two years. In addition to its legislative functions, the Senate has power to confirm or reject nominations and treaties made by the President, and also tries impeachments. The vice-president of the United States is the president of the Senate; in his absence a senator is chosen president pro tempore. The upper house of the Canadian Parliament is also called the Senate; its 81 members are appointed by the crown for life. Hence—(c) In general, a legislative body; a state council; the legislative department of a government.

1. A genus of composite plants, type of the tribe *Senecionideæ* and subtribe *Eusenecioneæ*. It is characterized by terminal flower-heads with a broad or cylindrical involucre of one or two rows of narrow bracts, numerous regular and perfect disk-flowers with truncate and cylindrical recurved style-branches and nearly cylindrical five- to ten-ribbed achenes, smooth or but slightly downy, and little or not at all contracted at the summit, which bears a copious soft white pappus of slender simple bristles. Some species have flower-heads calyculate with a few bractlets below, and the majority bear spreading pistillate rays, which are, however, minute in some and in others absent. This has been esteemed the largest genus of flowering plants, containing (including *Cacalia*, with Durand, 1888) at least 960 clearly distinct species; it is yet uncertain whether or not it is surpassed by the leguminous genus *Astragalus*, under which 1,300 species have been described, but perhaps not over 900 of these are genuine. The species of *Senecio* are mostly herbs, of polymorphous habit, either smooth or woolly, and bear alternate or radical leaves which are entire, toothed, or dissected. Their flower-heads are either large or small, corymbed, paniced, or solitary, and are in the great majority of species yellow, especially the disk-flowers. The genus is of almost universal distribution, but the range of individual species is remarkably limited. They are most abundant in temperate climates; probably about two thirds of the species belong to the Old World, and of these half to South Africa and over a fourth to Europe and the Mediterranean region. About 66 species are found in the United States, including the 9 species of *Cacalia* (Tournefort, 1700), separated by many authors; the others are chiefly low or slender herbs with bright-yellow rays, most numerous in the central States. American species are much more abundant in the Andean region, where they assume a shrubby habit and in three fourths of the species develop no ray-flowers, the reverse of the proportion elsewhere. Many of the Andean species grow close to the snow-line, and have leaves quite glossy and glutinous above and clothed with warm wool beneath; some gummy-leaved species have been used for firewood by the Bolivians under the name *tola*. In St. Helena and New Zealand a number of species become small trees. (See *he-cabbage-tree* and *puka-puka*.) (For the principal British and American species, see *raywort*, *Weroot*, and *jacobsaea*; for the original species, *S. vulgaris*, a weed sold for cage-birds in London under the names *bird-weed* and *chickenweed*, and also called *senecim* and *simsion*, see *groundsel*.) Several species have been in repute as remedies for wounds, as *S. Sarcococcus* (for which see *Sarcococcus*, under *Sarcoc.*) *S. patulous* is known as *bird's-tongue*, *S. hieracifolius* as *hawkweed*, and *S. Lyallii*, of New Zealand, as *mountain-marigold*. *S. tomentosus*, a tall and rather showy species of the southern United States, is known as *butterweed*, from its fleshy leaves. *S. Cineraria*, a bushy yellow-flowered perennial of Mediterranean shores from Spain to Greece and Egypt, is the dusty-miller of gardens, valued for its numerous long and pinnately cleft leaves, remarkably whitened with

close down; from it the native dusty-miller of the Atlantic coast, *Artemisia Stelleriana*, is distinguished by its short, roundish, less deeply cut leaves. *S. mikanioides*, Cape Ivy, a tender climber with smooth and shining bright-green angled leaves, from the Cape of Good Hope, is a favorite in cultivation. Several species are cultivated for their flowers under the generic name *Senecio*, as the orange *S. Japonicus*, and the purple and yellow *S. pulcher*, which reach nearly or quite 3 inches in diameter. *S. argenteus*, the silvery senecio, a dwarf 2 inches high, is valued for edgings, and several others for rock-gardens. The most important species, perhaps, are those of the section *Cineraria*, cultivated under glass, some of which have deep-blue rays, a color elsewhere absent from this genus as from most other composite genera.

2. [*l. c.*] A member of this genus.

It includes 4 subtribes, of which *Liabum*, *Trasylago*, *Senecio*, and *Othonna* are the types, and comprises 43 genera and about 1,300 species, which extend into all parts of the world. They are mainly annual and perennial herbs with alternate leaves and yellow disk-flowers, often also with yellow rays. Among other genera, *Petasites*, *Arnica*, *Doronicum*, and *Erechticum* are represented in the United States.

II. *n.* [*l. c.*] A dealers' name of the small African blood-finches of the genus *Lagonosticta*. They are tiny birds, averaging under 4 inches long, and would be taken for little finches, but belong to the spermistene group of the *Ploceidae* (not to *Fringillidae*). More than 20 species of *Lagonosticta* are described, all African; they are closely related to the numerous species of *Spermestes*, all likewise African, and of *Estrela* and its subdivisions, mainly African, but also Indian, some of which are known to the dealers as *amarantids*, *strawberry-finches*, etc. The

blood-finches (*Lagonosticta* proper) are so called from their leading color, a rich crimson, shaded into browns, grays, and black, and often set off with pearly white spots. Several different birds share the name *senegal*. That to which it specially pertains inhabits Senegambia; it is the *senegali* of the early French and the *fire-bird* or *fire-finch* of the early English ornithologists, the *Fringilla senegal* of Linnaeus, and the *Estrela senegal* of many writers; it is 3½ inches long, the male mostly crimson, with black tail and brown belly, and the back brown washed over with crimson. *L. minina* is scarcely different, but slightly smaller, and has a few white dots on the sides of the breast.

sensation (sen-sā'shōn), n. [*OF. sensacion*, F. *sensation* = Pr. *sensation* = Sp. *sensacion* = Pg. *sensação* = *It. sensazione*, < ML. **sensatio* (n-), < L. *sensatus*, endowed with sense: see *sensate*.] 1. The action, faculty, or immediate mental result of receiving a mental impression from any affection of the bodily organism; sensitive apprehension; corporeal feeling; any feeling; also, the elements of feeling or immediate consciousness and of consciousness of reaction in perception; the subjective element of perception.

Sensation has to be distinguished from *feeling* on the one hand, and from *perception* on the other. All are abstractions, or objects segregated by the mind from their concomitants, but perception is less so and feeling more so than sensation. Sensation is feeling together with the direct consciousness of that feeling forcing itself upon us, so that it involves the essential element of the conception of an object; but sensation is considered apart from its union with associated sensations, by which a perception is built up. Sensations are either peripheral or visceral. Among the latter are to be specially mentioned sensations of operations in the brain. No approach to a satisfactory enumeration of the different kinds of sensations, even of the peripheral kind, has been made. Those that make motion and sensation thus really the same, they must of necessity acknowledge that no longer motion, no longer sensation, . . . and that every motion or reaction must be a new sensation, as well as every ceasing of reaction a ceasing of sensation. Dr. H. More, Immortal, of Soul, II. i. 12. The perception which actually accompanies and is annexed to any impression on the body made by an external object, being distinct from all other modifications of thinking, furnishes the mind with a distinct idea, which we call sensation. Locke, Human Understanding, II. xix. 1. Sensation, so long as we take the analytic point of view, differs from perception only in the extreme simplicity of its object or content. . . . From the physiological point of view both sensations and perceptions differ from thoughts in the fact that nerve-currents coming in from the periphery are involved in their production. W. James, Prin. of Psychology, xvii. Impressions may be divided into two kinds, those of sensation and those of reflexion. The first kind arises in the soul originally, from unknown causes. Hume, Treatise of Human Nature, I. ii. The feelings which accompany the exercise of these sensitive or corporeal powers, whether cognitive or appetent, will constitute a distinct class, and to these we

may with great propriety give the name of *sensations*; whereas on the feelings which accompany the energies of all our higher powers of mind we may with equal propriety bestow the name of sentiments.

Sir W. Hamilton, Metaph., xlv. Unlucky Welsted! thy unfeeling master, The more thou ticklest, gripes his fist the faster. While thus each hand promotes the pleasing pain, And quick sensations skip from vein to vein. Pope, Dunclad, ii. 212.

3. That which produces sensation or excited interest or feeling; as, the greatest sensation of the day.—Muscular-sensations. See muscular.—Perverse temperature-sensations, the production of a sensation of heat by a cold body applied to the skin, and of cold by a hot body.—Sensation novels, novels that produce their effect by exciting and often improbable situations, by taking as their groundwork some dreadful secret, some atrocious crime, or the like, and painting scenes of extreme peril, high-wrought passion, etc.

sensational (sen-sā'shōn-əl), a. [*sensation* + -al.] 1. Of or pertaining to sensation; relating to or implying sensation or perception through the senses.

7. Capable of responding to very slight changes of condition; sensitive (in this sense the better word): as, a *sensible* thermometer or balance.

[*Rare.*]—8. Possessing or characterized by sense, judgment, or reason; endowed with or characterized by good or common sense; intelligent; reasonable; judicious: as, a *sensible* man; a *sensible* proposal.

To be now a *sensible* man, by and by a fool, and presently a beast! O strange!

O. W. Holmes, A Mortal Antipathy, iv.

Sensible caloriet, an old term for sensible heat.—**Sensible form, heat, matter**. See the nouns.—**Sensible horizon**. See *horizon*, 1.—**Sensible idea**. Same as *sensual idea*. See *sensual*.—**Sensible note or tone**, in music, same as *leading tone* (which see, under *leading*).—**Sensible perspiration, quality**, etc. See the nouns.—**Syn.** 1 and 2. **Sensible, Perceptible**. Literally, these words are of about the same meaning and strength, the difference depending chiefly upon the connection; for example, a *sensible* difference, a *perceptible* difference.—3 and 4. **Be Sensible, Be Conscious**, etc. See *feel*, 3 and 7. **Sensible, Sensitive, Sentient**. *Sensible* in its first meaning was passive, but is now quite as often active. As active, it is both physical and mental, and is unemphatic; as, to be *sensible* (that is, aware) of heat or cold, of neglect or injury. *Sensitive* means feeling acutely, either in body or in mind. A *sensible* man will school himself not to be too *sensitive* to criticism. *Sentient* is a physiologically descriptive word, indicating the possession or use of the sense of feeling: as, the fly is a *sentient* being.—6. **Observer, aware, conscious**.—8. **Sensible, Judicious, discreet, sage, sagacious, sound**. As compared with *judicious*, *sensible* means possessing common sense, having a sound and practical reason, while *judicious* means discreet in choosing what to do or advise; the one applying to the understanding and judgment, the other to the judgment in its relation to the will. **Sensible, Intelligent, Common-sense**. As compared with *intelligent*, *sensible* means possessed of the power to see things in their true light, the light of a correct judgment, a large, sound, roundabout sense, while *intelligent* means possessed of a clear and quick understanding, so as to apprehend an idea promptly and see it in its true relations. The relation between cause and effect is here so close that *intelligent* often seems to mean essentially the same as *well-informed*. Where the sense implied in *sensible* is thought of as peculiarly general or level to the experience, conclusions, or notions of the mass of men, *common-sense* is, by a new usage, sometimes employed: as, he was a *common-sense* person; he took a *common-sense* view of the matter. All these words apply both to the person and to his opinions, words, writings, etc.

It is widely diffused through the tropics, native at least in South America and naturalized in the southern United States. 4. In *gram.*, a form of words having grammatical completeness; a number of words constituting a whole, as the expression of a statement, inquiry, or command; a combination of subject and predicate. A sentence is either assertive, as *he is good*; or interrogative, as *is he good?* or imperative, as *be good!* Sentences are also classed as simple, compound, or complex; *simple*, if divisible into a single subject and a single predicate; *compound*, if containing more than one subject or predicate or both; and *complex*, if including a subordinate sentence or clause: as, *he who is good is happy*; *I like what you like*; *he goes when I come*. Sentences are further classed as independent and as dependent or subordinate (the latter being more often called a clause than a sentence); a dependent sentence is one which enters with the value of a single part of speech—either noun or adjective or adverb—into the structure of another sentence.

A period of seventy days.—2. [*cap.*] The third Sunday before Lent: more fully called *Septuagesima Sunday*. The original history of this name and of *Sexagesima* (applied to the Sunday following) is not known; and any direct reference to sixty and seventy in these periods of sixty-three and fifty-six days before Easter is not to be traced. The probability is that the use of *Quadragesima Sunday* for the first Sunday in *Quadragesima* or Lent, and the independent use of *Septuagesima* for the fifth day before Easter (both included), led to the extension of the series by the inexact application of the names *Sexagesima* and *Septuagesima* to the two Sundays preceding. Also called *Lost Sunday, Althwa Sunday*. *See Sunday.*

The Seventy—that is, the seventy (or more) persons who, according to the tradition, made a translation of the Hebrew Scriptures into Greek. The rounded legend is that the translation was made by seventy-two persons in seventy-two days. In another view, the Seventy were members of the sanhedrim (about seventy in number) who sanctioned the translation.

The *Septuagints* translation. *Minshew.*

2. A Greek version of the Hebrew Scriptures made by the Seventy (see def. 1): usually expressed by the symbol LXX ('the Seventy'). This version is said by Josephus to have been made in the reign and by the order of Ptolemy Philadelphus, King of Egypt, about 270 or 280 years before the birth of Christ. It is supposed, however, by modern critics that this version of the several books is the work, not only of different hands, but of separate times. It is probable that at first only the Pentateuch was translated, and the remaining books gradually; but the translation is believed to have been completed by the second century B. C. The Septuagint is written in the Hellenistic (Alexandrine) dialect, and is linguistically of great importance from its effect upon the diction of the New Testament, and as the source of a large part of the religious and theological vocabulary of the Greek fathers, and (through the Old Latin version of the Bible (see *Italic*) and the influence of this on the Vulgate) of that of the Latin fathers also and of all western nations to the present day. In the Greek Church the Septuagint has been in continuous use from the earliest times, although other Greek versions (see *Hexapla*) were anciently also in circulation, and it is the Old Testament still used in that church. The Septuagint contains the books called *Apocrypha* intermingled among the other books. It is the version out of which most of the citations in the New Testament from the Old are taken. Abbreviated *Sept.*

II. *a.* Pertaining to the Septuagint; contained in the Greek copy of the Old Testament. **Septuagintal** (sep'tū-aj-jin'tal), *a.* [*L. Septuagint + -al.*] Pertaining or relating to the Septuagint; contained in the Septuagint.

It is found upon experiment that hydrogen goes through a septum or wall of graphite four times as fast as oxygen. *W. K. Clifford, Lectures, I. 205.*

Specifically—(a) In *bot.*, any kind of a partition, whether a proper dissepiment or not: as, the *septum* in a seed; the *septum* of a spore. (b) In *anat.* and *zool.*, a partition; a wall between two cavities, or a structure which divides a part or an organ into separate portions; a dissepiment. In vertebrates the formations known as *septa* are most frequently situated in the vertical longitudinal median line of the body, but may be transverse or otherwise disposed. A number of them are specified by qualifying words. See phrases following. (c) In *corals*, a calcified mesentery; one of the six or more vertical plates which converge from the wall to the axis of the visceral space, dividing this into a number of radiating loculi or compartments. Each septum appears single or simple, but is really a duplicature of closely apposed plates, just as the mesentery itself is a fold. They are to be distinguished from the horizontal dissepiments, or tabulae, which may cut them at right angles. They are variously modified in details of form, may be connected by synapticulae, and are divided, according to their formation, into *primary, secondary, and tertiary*. (d) In *conch.*, one of the transverse partitions which separate the cavity of the shell of a cephalopod into chambers. (e) In *Vermetes*, a sort of diaphragm, a series of which

may partition a worm into several cavities. Cloquet, and better called *septum femorale*.—**Septum femorale**, the septum crurale. *H. Gray, Anat. (ed. 1888).*

—**Septum linguæ**, the partition of the tongue; a vertical median layer of fibrous tissue dividing the tongue into right and left halves. Also called *septum pellucidum, septum medium, septum ventriculorum, ventricular septum, septum medullare triangulare*. See *cut under corpus*.—**Septum narium**, the partition between the right and left nasal cavities or meatus of the nose. In man it is formed chiefly by the mesethmoid, or perpendicular plate of the ethmoid, the vomer, and the triangular cartilage of the nose.—**Septum nasi**. Same as *septum narium*. In zoology it is often restricted to the surface between the openings of the right and left nostrils, which may be of this or that character, deeply cleft as in the hare, hairy or naked, etc.—**Septum orbitale or orbitarium**, the orbital partition; any formation which separates the right and left eye-sockets. The term is less frequently used in relation to mammals, whose eyes are generally small and far apart, than among lower vertebrates, as birds, whose orbits are very large comparatively, and separated only by a thin vertical plate of bone, which may be perforated, or so far defective that the opposite orbits are thrown into one large cavity.—**Septum pectiniforme**, the pectinated septum of the penis, a median vertical partition between the right and left cavernous bodies of that organ. In man it is a dense, firm fibrous structure with many vertical slits, through which the blood-vessels of the opposite sides communicate freely, this comb-like appearance giving the name. It sometimes includes an ossification, as the os penis or penis-bone, as in the dog, racoon, etc. Also called *septum penis*.—**Septum pontis**, the septum of the pons Varolii.

—**Septum rectogoniale**, the wall which separates the rectal from the vaginal cavity.—**Septum scroti**, the partition between the right and left cavities of the scrotum.

Sequoia (sē-kwoi'ā), n. [NL. (Endlicher, 1847), named from *Sequoiah*, *Sequo* Yah (also called George Guess), an Indian of the Cherokee tribe, who invented an alphabet and taught it to his tribe.] A genus of coniferous trees, of the tribe *Abietineæ* and subtribe *Taxodineæ*. It is characterized by an oval cone, with persistent woody scales each bearing about five ovules, and dilated upward in fruit into a rhomboidal wrinkled and flattened slightly prickly-tip-

Part of one of the Big Trees (*Sequoia gigantea*), Mariposa Grove, California. (Diameter, 30 feet.)

ped apex. The flowers are monocious, terminal or axillary on young shoots, with their scales spirally set. The small and involucre staminate flower consists of an oblong column of united stamens, bearing crowded ovate connective scales, each with three to five anthers. The compressed seed bears a thick spongy margin, and contains four to six seed-leaves. There are but two species, both Californian, and ranking among the most remarkable of trees, growing straight, tall, and columnar, with short densely spreading branches, soft red wood, and very thick fibrous and spongy bark. They bear acute, compressed, and keeled decurrent narrow leaves, which are alternate and spirally inserted, or spread in two ranks on the younger branches. Their small cones ripen in the second year. For *S. sempervirens*, discovered by Menzies about 1794, see *redwood*. The other species, *S. gigantea*, by some formerly separated as a genus, *Washingtonia* (Winslow, 1854), and the *Wellingtonia* of English gardens, is the mammoth tree or big tree of California. It is a less graceful tree, with shorter branches, pendulous branchlets, paler appressed leaves, its wood a dull red, with thin white sapwood, its bark near the ground 1 to 2 feet thick, and its cones much larger (2 or 3 inches long). It forms a series of forests in Tulare county, California, isolated groves extending 260 miles northward, and it has been recently reported from southern Oregon. The tallest tree now known, one of the Calaveras grove, is 325 feet high; one in the King's River forest is 35 feet 8 inches in diameter inside the bark 4 feet from the ground, and its age is estimated at over 4,000 years. Both species were early classed under *Taxodium* (which see), their nearest American living relative; a closer ally, however, is *Athrotaxis* (Don, 1839), a genus of three Tasmanian trees distinguished by a cone with mucronate or umbonate scales; their other living relatives are a few distant and mostly monotypic genera of Japan and China. (Compare *Taxodiaceae*.) A very large number of fossil species are known with certainty, showing that the genus was much more abundant in late Cretaceous and Tertiary time than at present.

The coriaceous leaves are terminal and orbicular, deeply parted into many narrow two-cleft segments. serf (sɛrf), *n.* [*< OF. (and F.) serf*, fem. *serve* = *Pr. serf* = *Sp. siervo* = *Pg. It. servo*, *< L. servus*, a slave: see *serve*.] 1. A vassal; one of those who in the middle ages were incapable of holding property, were attached to the land and transferred with it, and were subject to feudal services of the most menial description; in *early Eng. hist.*, one who was not free, but by reason of being allowed to have an interest in the cultivation of the soil, and a portion of time to labor for himself, had attained a status superior to that of a slave.

The slave, indeed, still remained [in the fourteenth century], though the number of pure serfs bore a small proportion to the other cultivators of the soil. . . . But even this class had now acquired definite rights of its own; and, although we still find instances of the sale of serfs "with their litter," or family, apart from the land they tilled, yet, in the bulk of cases, the amount of service due from the serf had become limited by custom, and, on its due rendering, his holding was practically as secure as that of the freest tenant on the estate.

J. R. Green, *Short Hist. of Eng. People*, v. § 4.

The serf was bound to the soil, had fixed domestic relations, and participated in the religious life of the society; and the tendency of all his circumstances, as well as of

the opinions and sentiments of the time, was in the direction of liberation.

Encyc. Brit., XIX. 352.

2. A laborer rendering forced service on an estate under seigniorial prescription, as formerly in Russia.

In Russia, at the present moment, the aristocracy are dictated to by their emperor much as they themselves dictate to their serfs.

H. Spencer, *Social Statics*, p. 461.

The next important measure was the emancipation of the serfs in 1861. . . . The landlords, on receiving an indemnity, now released the serfs from their seigniorial rights, and the village commune became the actual property of the serf.

Encyc. Brit., XXI. 102.

3. Figuratively, an oppressed person; a menial. = *Syn. Serf, Slave*. The serf is, in strictness, attached to the soil, and goes with it in all sales or leases. The slave is absolutely the property of his master, and may be sold, given away, etc. like any other piece of personal property. See definitions of *peon* and *coolie*. See also *seritude*.

[In this sense the modern spelling is *serjeant*.] In England and Ireland, a lawyer of high rank. Serjeants at law are appointed by writ or patent of the crown, from among the utter barristers. While they have precedence socially, they are professionally inferior to queen's counsel; formerly, however, the king's (or queen's) premier serjeant and ancient serjeant had precedence of even the attorney-general and solicitor-general. Till the passing of the Judicature Act, 1873, the judges of the superior English common-law courts had to be serjeants; but this is not now required. No serjeants have been created since 1808, and the rank will in all likelihood soon become extinct.

It consisted originally of twenty-four persons, not under the degree of knight whose duty it was to be in immediate attendance on the king's person. One is assigned by the crown to attend each house of parliament. The lord chancellor, the lord treasurer, and on great occasions the lord mayor of London were each thus attended. One, usually the one attending the House of Lords, is an officer of the Supreme Court, to make arrests, etc.

For the bailiffes of a Cite purvey ye must a space,
A yemañ of the crowne, Serjeant of armes with mace.
Babees Book (E. E. T. S.), p. 187.

The custom seems to have existed since the fourteenth century. The rings were presented to the eminent persons who might be present, their value differing greatly: thus, in 1422, Sir John Fortescue mentions the most costly rings as being given to any prince, duke, or archbishop, and to the lord chancellor and lord treasurer of England, rings of less value to earls, bishops, and certain officers, of less value again to members of Parliament, and so on.—**Sergeant trumpeter**, an officer of the British royal household since the sixteenth century, originally charged with the direction of a band of sixteen trumpeters. [The two spellings *serjeant* and *serjeant* are both correct, and were formerly used indifferently. *Serjeant*, however, is more in accordance with modern analogies, and now generally prevails except in the legal sense, and as applied to feudal tenants, to certain officers of the royal household, and, in part, to officers of municipal and legislative bodies, where the archaic spelling *serjeant* is retained. See defs. 1-5, above.]

7. In systematic bot., according to Gray, the first group below kingdom and the next above class: equivalent to subkingdom or division (which see). In actual usage, however, this rule is by no means always observed. In Bentham and Hooker's "Genera" it is a group of cohorts with two stages between it and kingdom; and in the same and other good works it may be found denoting the first subdivision of an order, a tribe, a subtribe, a genus, and doubtless still other groups. It appears, however, always to mark a comprehensive and not very strongly accentuated division.

8. In zool., a number of genera in a family, of families in an order, etc.; a section or division of a taxonomic group, containing two or more groups of a lower grade: loosely and variously used, like grade, group, cohort, phalanx, etc.—9. The series is named from the Italian mathematician Fibonacci or Leonardo of Pisa (first part of the thirteenth century), who first considered it. Same as Gaussian series.—Indeterminate series. See indeterminate.—Infinite series, an algebraical expression appearing as a sum of terms, but differing therefrom in that the terms are infinite in number. The most usual way of writing an infinite series is to set down a few of the first terms added together, and then to append "... or + etc.," which is not addition, certainly, but is the indication of something analogous to the addition of the terms given. serpent (sēr'pent), *a.* and *n.* [*Orig. adj.*, but in *E.* first used as a noun; also formerly and dial. *sarpen*; *ME. serpent*, *OF. serpent, sarpent*, *F. serpent*, dial. *serpent, sarpan*, a serpent, snake, a musical instrument so called, = *Pr. sarpent* = *Sp. serpiente* = *Pg. It. serpente*, a serpent, *L. serpen*(-l-s), creeping, as a noun a creeping thing, a serpent (also applied to a louse), ppr. of *serpere*, creep, = *Gr. ἔρπειν*, creep, = *Skt. √ sarp*, creep (> *sarpa*, a snake); usually identified also with *L. repere*, creep (see *repent*?, *reptile*), the *√ sarp* being perhaps seen also in *E. salve*: see *salve*]. **I. a. 1.** Crawling on the belly, as a snake, or reptant, as an ophidian; of or pertaining to the *Serpentia*: correlated with *salient* and *gradient*.—**2.** Having the form or nature of a serpent; of a kind similar to that which a serpent has or might have.

3. Serpentine; winding; tortuous.

P. Fletcher, Purple Island, ii. 9.

II. n. 1. A scaly creature that crawls on the belly; a limbless reptile; properly, a snake; any member of the order *Ophidia* (which see for technical characters). *Serpent* and *snake* now mean precisely the same thing; but the word *serpent* is somewhat more formal or technical than *snake*, so that it seldom applies to the limbless lizards, many of which are popularly mistaken for and called snakes, and *snake* had originally a specific meaning. (See *snake*.) Serpents are found all over the world, except in very cold regions. Most of them are timid, inoffensive, and defenseless animals; others are among the most dangerous and deadly of all creatures. Some are very powerful in consequence of their great size and faculty of constriction, as boas, pythons, and anacondas. Those which are not venomous are known as *innocuous serpents*, or *Innocua*; those which are poisonous are *noxious serpents*, or *Noxua*, sometimes collectively called *Thanatophidia*. All are carnivorous; and most are

able, by means of their dilatible mouths and the general distensibility of their bodies, to swallow animals of greater girth than themselves. In cold and temperate countries serpents hibernate in a state of torpidity. They are oviparous or ovoviviparous, and in some cases the young take refuge from danger by crawling into the gullet of the mother, whence the common belief that snakes swallow their young. Most serpents can be tamed, or at least rendered gentle, by handling; others, as the rat-snake of India are almost domestic; but the more venomous kinds can be safely handled only when the fangs have been removed. There is a very general misapprehension respecting the comparative numbers of venomous and harmless serpents. Out of more than 300 genera of ophidians, only about 50, or one sixth, are poisonous, and more than half of these belong to the two families *Najada* and *Crotalida* (the cobra and the rattlesnake families). The true vipers (*Viperida*) and the sea-serpents (*Hydrophida*), all venomous, have six or eight genera apiece; and four other venomous families have but one to three genera apiece. The proportion of venomous to non-venomous species is still smaller than that of the genera, as the latter will average more species to a genus than the former. Poisonous serpents are mainly confined to tropical and warm temperate countries; they are more numerous and diversified in the Old World than in the New, and rather more forms are *Proterotypha* than *Solenotypha* (see these words). Serpents large enough to be formidable from their powers of constriction belong to the *Boida* and *Pythonida*. A few families contain very small species, worm-like in appearance and to some extent in habits. A majority of all serpents belong to one family, the harmless *Colebrida*. See cuts under the various popular and technical names.

2. [*cap.*] In *astron.*, a constellation in the northern hemisphere. See *Ophiuchus*.—3. A musical instrument, properly of the trumpet family, having a cupped mouthpiece, a conical wooden tube bent to and fro several times and usually covered with leather, and nine finger-holes very irregularly disposed. Its compass extended from two to four octaves upward from about the third C below middle C, and included more or less diatonic and chromatic tones according to the skill of the performer. Its tone was pervasive, though somewhat harsh. It is said to have been invented by a canon of Auxerre in 1590 for use in church music. It was retained in orchestras until the invention of the contrafagotto, and is still occasionally used in French churches.

4. A hydrous silicate of magnesium, occurring massive, sometimes fine, granular, and compact, again finely fibrous, less often slaty. It is usually green in color, but of many different shades, also red, brown, or gray, sometimes with spots resembling a serpent's skin. There are numerous varieties, differing in structure and color. The most important of these are—precious or noble serpentine, under which term are comprised the more or less translucent serpentines, having a rich oil-green color; foliated varieties, including marmolite and antigorite; fibrous varieties, as chrysotile (sometimes called *serpentine asbestos*) and metaxite. Other minerals more or less closely allied to or identical with serpentine are picrolite, williamsite, bowenite, retinalite, baltimorite, vorhausite, hydrophite, jenkinsite, villarsite, etc. Serpentine occurs widely distributed and in abundance, forming rock-masses, many of which were formerly regarded as being of eruptive origin, but which are now generally conceded to have been formed by the metamorphism of various rocks and minerals; indeed, it has not been proved that serpentine has ever been formed in any other way than this. The peridotites appear to have been peculiarly liable to this kind of alteration, or serpentinization, as it is called. Massive serpentine has been extensively used for both interior and exterior architectural and decorative purposes, but in only a few localities is a material quarried which stands outdoor exposure without soon losing its polish, and eventually becoming disintegrated. The serpentinous rock commonly called *verd-antique*, and known to lithologists as *ophticalcite*, is a very beautiful decorative material, and has been extensively employed for ornament in various parts of the world. See *verd-antique*.

Serranidae (se-ran'ā-dē), *n. pl.* [*NL.* (Richardson, 1848), *< Serranus + -idae.*] A family of

acanthopterygian fishes, typified by the genus *Serranus*, related to the *Percidae* and by most ichthyologists united with that family, and containing about 40 genera and 300 species of carnivorous fishes of all warm seas, many of them known as *groupers*, *sea-bass*, *rock-fish*, etc. (a) By Sir John Richardson, the name was applied in a vague and irregular manner, but his family included all the true *Serranidae* of recent ichthyologists. (b) By Jordan and Gilbert, the name was applied to all acanthopterygians with the ventral fins thoracic and perfect, the lower pharyngeal bones separate, scales well developed, pectoral fins entire, skull not especially cavernous, maxillary not sloping under the preorbital for its whole length, mouth nearly horizontal, and anal fin rather short. The family thus included the *Centropristidae* and *Ichthyocidae*, as well as true *Serranidae*. (c) In Gill's system, the name was restricted to serranoids with the body oblong and compressed and covered with scales, the head compressed and the cranium normal, the supramaxillaries not retractile behind under the suborbitals, the spinous part of the dorsal fin about as long as the soft or longer, and three anal spines developed. The family as thus restricted includes about 300 fishes, which chiefly inhabit the tropical seas; but a considerable contingent live in the temperate seas. It includes many valuable food-fishes. The jewfish or black sea-bass is *Stereolepis gigas*; the stone-bass is *Polyprion cernatum*. The groupers or gumpas are fishes of this family, of the genera *Epinephelus* and *Trisopterus*. Other notable genera are *Promicrops* and *Dules*. See cuts under *sea-bass*, *Serranus*, and *grouper*.

The maxillary is not supplemented with another bone, and the lateral canines are stronger than those in front. The type of the genus is the Mediterranean *S. scriba*. *S. cabrilla* is a British species.

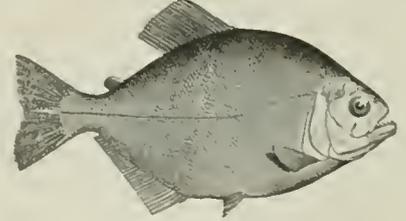

Smooth Serranus (*Serranus cabrilla*).

Among American species related and by some referred to *Serranus* may be noted *Centropristis atrarius*, the black sea-bass or blackfish, from Cape Cod to Florida, 12 inches long; the squirrel-fish or serrano, *Diplectrum fasciulare*, West Indies to South Carolina; *Paralabrax clathratus*, the rock-bass or cabrilla of California, attaining a length of 15 inches; and *P. nebulifer*, the Johnny Verde of the same region. fin like a salmon's, and the belly compressed and armed with scales projecting so as to give it a saw-like appearance: typical of the subfamily *Serrasalmoninae*. See *piraya*.

Serrasalmoninae (ser-ā-sal-mō-nī'nē), *n. pl.* [*NL.*, *< Serrasalmo* (*n.*) + *-inae*.] A subfamily of characinoid fishes, typified by the genus *Serrasalmo*. They have a compressed high body, with the belly sharply compressed and the scales developed to give a serrated appearance to it; the branchial apertures wide; the branchial membrane deeply incised, and free below; the dorsal fin elongated, and an adipose fin. The teeth are well developed and mostly trenchant. The species are characteristic of the fresh waters of tropical South America. Among them are some of the most dreaded and carnivorous of fishes. By means of their sharp teeth they are enabled to cut the flesh of animals as with a pair of scissors, and where they are found it is impossible for an animal to go into the water without danger. They are attracted by the smell of blood, and congregate from considerable distances to any spot where blood has been spilt. They are best known by the name of *caribe*. Many species have been

described, some of which attain the length of 2 feet, but most are much smaller. See *praya*.

serrate (ser'at), a. [= Sp. *serrata*, < L. *serratus*, saw-shaped, saw-like (cf. *serrare*, pp. *serratus*, saw, saw up), < *serra*, a saw, prob. for **scera*, < *scare*, cut, and thus akin to AS. *saga*, E. *saw*, from the same root: see *secant* and *saw*.] Notched on the edge like a saw; toothed; specifically, in bot., having small sharp teeth along the margin, pointing toward the apex: as, a *serrate* leaf. When a serrate leaf has small serratures upon the large ones, it is said to be *doubly serrate*, as in the elm. The word is also applied to a calyx, corolla, or stipule. A *serrate-ciliate* leaf is one having fine hairs, like the eyelashes, on the serratures. A *serrate-dentate* leaf has the serratures toothed. In zoology and anatomy *serrate* is applied to very many structures much unlike one another, but having more or fewer similar teeth.—**Serrate antennae**, in entom., antennae whose joints are triangular and compressed, presenting a serrate outline on the inner margin: sometimes the outer joints, usually three in number, are enlarged, forming a serrate club. The phrase is sometimes restricted to the interfrontal suture, the sagittal being called *dentate*, and the coronal *limbose*, but the difference is slight, if any, and holds for few animals besides man. See cuts under *cranium* and *parietal.*—**Serrate tibiae**, in entom., tibiae which have a row of sharp teeth along the greater part of the outer edge, as in the *Scolytidae*.—**Serrate unguis**, in entom., unguis or claws having a row of sharp teeth on the lower edge. See cut *J* under *Mordella*.

These polypites are invariably defended by little cup-like expansions called *hydrothecae*. The ecnosare generally consists of a main stem with many branches, and it is so plant-like in appearance that the common sertularians are often mistaken for seaweed, and are often called *sea-firs*. The young sertularian, on escaping from the ovum, appears as a free-swimming ciliated body, which soon loses its cilia, fixes itself, and develops a ecnosare, by budding from which the branching hydrosoma of the perfect organism is produced.

One who serves or attends, whether voluntarily or involuntarily: a person employed by another, and subject to his orders; one who exerts himself or herself, or labors, for the benefit of a master or an employer; an attendant; a subordinate assistant; an agent. The earlier uses of this word seem to imply protection on the part of the sovereign, lord, or master, and the notion of clientage, the relation involved being one in no sense degrading to the inferior. In modern use it denotes specifically a domestic or menial helper. (See *c*, below.) In law a servant is a person who, for a consideration, is bound to render service under the legal authority of another, such other being called the *master*. Agents of various kinds are sometimes included in the general designation of *servants*; but the term *agent* implies discretionary power, and responsibility in the mode of performing duty, such as is not usually implied in the term *servant*: as, the uniformed *servants* of a railway-company. See *master*, 2.

3. Compulsory service or labor, such as a criminal has to undergo as a punishment: as, penal *servitude*. See *penal*.

When you were a little familiar with colonial phraseology you at once understood that . . . Giles had "left his country for his country's good," not of his own free will, and was what was called a "free by *servitude* man"—i. e., a convict whose sentence of transportation had expired. *Nineteenth Century*, XXVI. 765.

—7. In law, the burden of an easement; the condition of a tenement which is subject to some right of enjoyment by another than the owner of the tenement, in virtue of his ownership of another tenement. (See *easement*.) In Roman law, a right to use or deal with, in a given and definite manner, a thing belonging to another. As to real estate, it is nearly equivalent or correlative to the easement of the common law, except that it also embraces rights to take the fruits of the servant estate, which in English law are not called *easements*, but *profits à prendre*.—**Affirmative servitude**. See *negative servitude*, below.—**Discontinuous servitude**, in law, an easement which consists in the right to perform a series of distinct acts, as a right of way or of common, or the servitude answering thereto, such as cannot be enjoyed but by the intervention of man: distinguished from a *continuous servitude*, which consists in a constant servitude, or in the reservation of some characteristic of the servant tenement, as a right of view or a right to a watercourse.—**Negative servitude**, a servitude or easement which consists in the right merely to restrict the enjoyment of the owner of the servant tenement, as distinguished from one which entitles one to do an act which without the existence of the easement would be a positive wrong to the owner of that tenement. Thus, the right to receive light and air by windows over the land of another is a *negative servitude*, whereas the right to discharge water upon the land of another is an *affirmative servitude*.—**Personal servitude**, a right constituted over a subject in favor of a person, without reference to possession or property.—**Predial servitude**, a right constituted over one subject or tenement enjoyed by the owner of another subject or tenement. Predial servitudes are either *rural* or *urban*, according as they affect land or houses. The usual *rural servitudes* are passage or road, or the right which a person has to pass over another's land; pasture; or the right to send cattle to graze on another's land; fall and divot, or the right to cut turf and peats on another's land; aqueduct, or the right to have a stream of water conveyed through another's land; thrilage, or the right to have other people's corn sent to one's own mill to be ground. *Urban servitudes* consist chiefly in the right to use a party-wall, or a common drain, or to have the rain from one's roof drop on another's land or house; the right to prevent another from building so as to obstruct the windows of one's house; the right of the flat beneath, etc.—**Syl.** 1. Serfdom, thralldom, vassalage, peonage.—2 and 3. *Servitude*, *Slavery*, *Bondage*. These words express involuntary subjection, and are in the order of strength. *Servitude* is the general word, its application to voluntary service being obsolete. *Slavery* emphasizes the completeness and the degradation of the state. *Bondage*, literally the state of being bound, is used chiefly in elevated style or figurative senses: as, *the bondage to appetite*; Egyptian *bondage*. *Servitude* is the only one of these words that applies to compulsory and unpaid service required as a legal penalty; the phrase *penal servitude* is very common. See *serf* and *captivity*.

The E. word is pronounced as if directly from the Gr. *σίσαμον*.] An annual herbaceous plant, *Sesamum Indicum* (S. *orientale*), widely cultivated and naturalized in tropical and subtropical countries. Its value lies chiefly in its seeds, from which is expressed the ginning, sesame, or til-oil. The seeds are also variously used as food. The oil in large doses is laxative, and the leaves when macerated yield a mucilaginous remedy, useful in cholera infantum, dysentery, etc. The plant is simple of culture, and thrives in sterile soil. Sesamoids may be developed at any joint, as the shoulder-joint of some birds. The so-called navicular bone of the horse's foot is a sesamoid. (c) In *entom.*, noting any part or ornament which is accompanied by another half as large, or much smaller—as (1) an ocellated spot having a smaller one close to it, the two being generally inclosed by a common ring of color (also called *sesquialter* and *sesquioellus*); (2) a colored band crossing both of the outspread wings, and accompanied on either the primary or the secondary wing alone by another band; or (3) a cell or areolet of the wing to which a much smaller one is appended.

3. The time, space, or term during which a court, council, legislature, or the like meets daily for business, or transacts business regularly without breaking up. Thus, a *session* of the legislature commonly means the period from its assembling to its adjournment for the year or season, in contradistinction to its *daily sessions* during that period. So a *session* of Parliament comprises the time from its meeting to its prorogation, of which there is in general but one in each year. Technically at common law it was held that a meeting of Parliament could not be called a *session* unless the sovereign passed an act. The *session* of a judicial court is called a *term*. Also applied in the United States to the daily or half-daily periods of work of a school.

The first and second divisions form what is called the *inner house*. sestina (ses-tè'nî), n. [It.: see *sestine*.] A poem in fixed form, borrowed from the French, and said to have been invented by the Provençal troubadour Arnaut Daniel (thirteenth century). It consisted originally of six stanzas of six unrhimed lines, with a final triplet or half-stanza, also unrhimed—all the lines being of the same length. The terminal words of stanzas 2 to 6 were the same as those of stanza 1, but arranged differently; and they were repeated in the triplet or envoy, partly at the end and partly in the middle of the lines. The modern *sestina* is written on two or three lines, and the formula for a two-rimed *sestina* is thus given in the "Vers Français et leur Prosodie" of the best French authority, M. de Gramont: 1, 2, 3, 4, 5, 6; 6, 1, 5, 2, 4, 3; 3, 6, 4, 1, 2, 5; 5, 3, 2, 6, 1, 4; 4, 5, 1, 3, 6, 2; 2, 4, 6, 5, 3, 1; triplet 2, 4, 6 at the end, and 1, 3, 5 at the beginning of the lines. In stanza 1, lines 1, 3, and 4 rhyme, and 2, 5, and 6 rhyme. *Sestinas* were written in Italy by Dante and Petrarch, in Spain and Portugal by Cervantes and Camoens, and in England by Brummond of Hawthornden (1555-1649). Mr. Swinburne (in "Poems and Ballads," 2d ser.) has achieved a double *sestina*.

A *sestina* is a poem written neither in rhyme nor blank verse, but in so-called six-line stanzas, each one of which has to take the last word of the stanza preceding it, and twist it about into some new and fantastic meaning.

Athenæum, No. 3141, p. 14.

In the sense 'sink,' as the sun or stars, it is partly of Scand. origin, < Icel. refl. *setask*, set, as the sun, etc. Many uses are highly idiomatic, the verb, like *put*, its nearest equivalent, and *do*, *make*, *get*, etc., having become of almost universal application, and taking its distinctive color from the context.] I, trans. 1. 5. In *law*: (a) The balancing or countervailing of one debt by another. (b) The claim of a debtor to have his debt extinguished in whole or in part by the application of a debt due from his creditor, or from one with whom his creditor is in privity. *Set-off* is that right which exists between two persons each of whom, under an independent contract, owes an ascertained amount to the other, to set off their respective debts, by way of mutual deduction, so that the person to whom the larger debt is due shall recover the residue only after such deduction. (*Kerr.*) *Set-off, counter-claim, and recoupment* are terms often used indiscriminately. *Counter-claim* is more appropriate of any cross-demand on which the claimant might if he chose maintain an independent action, and on which, should he establish it as a cause of action, either in such independent action or by way of counter-claim when sued, he would be entitled to an affirmative judgment in his own favor for payment of the claim except so far as his adversary's claim might reduce or extinguish it. This use of the word distinguishes it from such claims as may be set off in favor of a person, which yet would not sustain an action by him, nor any affirmative judgment in his favor. *Recoupment* is appropriate only to designate a cross-demand considered as dependent on the concession of plaintiff's demand, subject to a right to cut down the amount recoverable by virtue of it. In these, which are the strict senses of the words, a *recoupment* only reduces plaintiff's demand, and leaves him to take judgment for what remains after the deduction; a *set-off* extinguishes the smaller of two independent demands and an equal amount of the larger, but may leave the residue of the latter unenforced; a *counter-claim* is one that may be established irrespective of the adversary's success or failure in establishing his claim, and, although subject to be reduced or extinguished by the adversary's success, may otherwise be enforced in the same action.

(*See strict.*) Thus, a marriage settlement is usually a gift or conveyance to a wife or intended wife, or to trustees for her benefit or that of herself for life and her husband or children or both after her, in consideration of which she waives her right to claim dower or to succeed to his property on his death.

An agreement to make a marriage settlement shall be decreed in equity after the marriage, though it was to be made before the marriage.

Seven is a rare number in metrology, perhaps its only occurrence being in the seven handbreadths of the Egyptian cubit (for the probable explanation of which, see *cubit*), and in the seven days of the week, certainly early connected, at least, with the astrological assignment of the hours in regular rotation to the seven planets. This astrological association explains the identification by Pythagoras of the number seven with the opportune time (καρπός), as well as the fact that light was called seven by the Pythagoreans. That they termed it "motherless" may be due to the "seven spirits" of the Chaldeans—that is, the planets—being called "fatherless and motherless." The astrological association further explains why the number seven has so frequently been suggested by the conception of divine or spiritual influence, and why it was*

5. In law, separable and capable of being treated as separate from, though it may be not wholly independent of, another. Thus, a *several obligation* is one incurred by one person alone, as a bond by a single obligor, or concurrently with others, as in a subscription paper, in which latter case, though his promise is in a measure dependent on that of the other subscribers, the obligation of each may be *several*; while, on the other hand, in a contract by partners or an instrument expressed to be joint, the obligors are not at common law severally liable, but either has the right to have the others joined in an action to enforce payment. So a *several estate* is one which belongs to one person alone, and, although it may in a sense be dependent on others, it is not shared by others during its continuance. (See *estate*, 5.) A *joint and several obligation* is one which so far partakes of both qualities that the creditor may in general treat it in either way, by joining all or suing each one separately.

sex¹ (seks), *n.* [Cf. ME. *sexe*, *sex*, < OF. (and F.) *sexe* = Pr. *sece* = Sp. Pg. *sexo* = lt. *sexo*, < L. *sexus*, also *secus*, sex; perhaps orig. 'division,' i. e. 'distinction,' < *secur*, divide, cut; see *secunt*. A less specific designation for 'sex' was L. *genus* = Gr. γένος, sex, gender; see *gender*, *genus*.] 1. The character of being either male or female; the anatomical and physiological distinction between male and female, evidenced by the physical character of their generative organs, and the part taken by each in the function of reproduction; gender, with reference to living organisms. Sex is properly predicable only of male or female, those organisms which are neither male nor female being sexless or neuter. But the two sexes are often combined in the same individual, then said to be hermaphrodite or monœcious. Sex runs nearly throughout the animal kingdom, even down to the

protozoans, with, however, many exceptions here and there among hermaphrodites. The distinction of sex is probably the most profound and most nearly universal single attribute of organized beings, and among the higher animals at least it is accompanied or marked by some psychological as well as physical characteristics. The essential attribute of the male sex is the generation of spermatozoa, that of the female the generation of ova, accomplished in the one case by a testis or a homologous organ, and in the other by an ovary or a homologous organ. The act of procreation or begetting in the male is the uniting of spermatozoa to an ovum; the corresponding function in the female is the fecundation of an ovum by spermatozoa, resulting in conception or impregnation. The organs by which this result is accomplished are extremely varied in physical character; and various organs which characterize either sex, besides those directly concerned in the reproductive act, are known as secondary sexual characters. See *gender*, *generation*, *reproduction*, and quotation from Buck under *sexuality*, 1.

4. In *bot.*, the character or structure of plants which corresponds to sex in animals, there being, except in the lowest orders, a clear differentiation of male and female elements. In flowering plants the male organ is the stamen, the female the pistil; in cryptogams different designations are used according to the class of plants, as antheridium, archegonium, etc. See *male*, *a*, 2, and *n*, 2; *female*, *n*, 2 (*b*), and *a*, 2 (*b*); and *Linnean system*, under *Linnean*.—**The fair sex**, the gentle (or gentler) sex, the softer sex, the weaker sex, the female sex collectively; womankind. The circle is first divided into six sexages, the sexagene into sixty degrees, the degree into sixty minutes, the minute into sixty seconds, and so on. ing, for measuring the angular distance of two stars or other objects, or the altitude of a star above the horizon, the two images being brought into coincidence by reflection from the transmitting horizon-glass, lettered *b* in the figure. The frame of a sextant is generally made of brass, the arc *b* being graduated upon a slip of silver. The handle *a* is of wood. The mirrors *b* and *c* are of plate-glass, silvered. The horizon-glass *b* is, however, only half silvered, so that rays from the horizon or other direct object may enter the telescope *e*. This telescope is carried in the ring *d*, and is capable of being adjusted, once for all, by a linear motion perpendicular to the plane of the sextant, so as to receive proper proportions of light from the silvered and unsilvered parts of the horizon-glass. The figure does not show the colored glass shades which may be interposed behind the horizon-glass and between this and the index-glass *c*, upon which the light from one of the objects is first received, in order to make the contact of the images more distinct. This index-glass is attached to the movable arm *f*. The movable arm is clamped by the screw *i*, and is furnished with a tangent screw *j*. The arc is read by means of a vernier carried by the arm,

with the reading-lens *g*. In the hands of a competent observer, the accuracy of work with a sextant is surprising.

The first inventor of the *sextant* (or quadrant) was Newton, among whose papers a description of such an instrument was found after his death—not, however, until after its reinvention by Thomas Godfrey, of Philadelphia, in 1730, and, perhaps, by Hadley, in 1731.

Distinctive of sex, whether male or female; peculiar to or characteristic of either sex; genital; as, *sexual* organs; the *sexual* system.—3. Of the two sexes; done by means of the two sexes; reproductive; as, *sexual* intercourse; *sexual* reproduction.—4. Peculiar to or affecting the sexes or organs of sex; venereal; as, *sexual* disease or malformation.—5. Having sex; sexed; separated into two sexes; monoevous; the opposite of *asexual*; as, a *sexual* animal.—**Secondary sexual characters**, some or any characteristics, not immediately concerned in reproduction, which one sex has and the other sex has not; any structural peculiarity, excepting the organs of generation, which distinguishes male from female. Thus, the hair on a man's face and breast, the antlers of the

deer, the train of the peacock or any other difference in the plumage of a bird between the male and the female, the scent-glands of any male, the claspers of a fish, and many other features are regarded as secondary sexual characters, and are concerned in sexual selection.—**Sexual affinity.** (a) The unconscious or instinctive attraction of one sex for the other, as exhibited by the preference or choice of any one individual, rather than of any other, of the opposite sex, as a matter of sexual selection. In man such selection is often called *elective affinity* (after Goethe). (b) Such degree of affinity between the sexes of different species as enables these species to interbreed or hybridize. **Sexual dimorphism**, difference of form or of other zoological character in the members of either sex, but not of both sexes, of any animal. Thus, a species of butterflies whose females are of two sorts, exhibits sexual dimorphism. The term properly attaches to the adults of perfectly sexed animals, and not to the many instances of dimorphism among sexless or sexually immature organisms. Thus, the honey-bee is not a case of sexual dimorphism, as there is only one sort of perfect males (the drones) and one of perfect females (the queen), though the hive consists mostly of a third sort of bees (workers or undeveloped females). Sexual dimorphism is common among invertebrates, rare in the higher animals.—**Sexual method**, in bot., same as *sexual system* (b).—**Sexual organs**, organs immediately concerned in sexual intercourse or reproduction; the sexual system.—**Sexual reproduction**, reproduction in which both sexes concur; gamogenesis.—**Sexual selection.** See *selection*.—**Sexual system.** (a) In zool. and anat., the reproductive system; the sexual organs, collectively considered. It was known even before the time of Linnæus that certain plants produced two kinds of flowers, ordinary open, and minute closed ones; and this fact formerly gave rise to warm controversies as to the *sexuality* of plants.

Darwin, Different Forms of Flowers, p. 310.

Sex is a term employed with two significances, which are often confused, but which it is indispensable to distinguish accurately. Originally sex was applied to the organism as a whole, in recognition of the differentiation of the reproductive function. Secondly, sex, together with the adjectives male and female, has been applied to the essential reproductive elements, ovum and spermatozoon, which it is the function of the sexual organisms (or organs) to produce. According to a strict biological definition *sexuality* is the characteristic of the male and female reproductive elements (gamoblasts), and sex of the individuals in which the reproductive elements arise. A man has sex, a spermatozoon *sexuality*.

Buck's Handbook of Med. Sciences, VI. 336.

2. Recognition of sexual relations. [Rare.]

3. Shade within defined limits; the dark figure or image projected by a body when it intercepts the light. In optics *shadow* may be defined as a portion of space from which light is shut off by an opaque body. Every opaque object on which light falls is accompanied with a shadow on the side opposite to the luminous body, and the shadow appears more intense in proportion as the illumination is stronger. An opaque object illuminated by the sun, or any other source of light which is not a single point, must have an infinite number of shadows, though these are not distinguishable from each other, and hence the shadow of such an opaque body received on a plane is always accompanied by a *penumbra*, or partial shadow, the complete shadow being called the *umbra*. See *penumbra*.

LG. (also D.) *schacht*, a shaft (in a mine), a particular use, appar. in allusion to its being straight and narrow, of *schacht*, a shaft or rod (as of a spear): see *shaft*¹.] 1. In mining, a vertical or inclined excavation made in opening the ground for mining purposes. A shaft may be sunk vertically, without regard to the dip of the lode, or it may be sunk by an incline following the lode, either closely or approximately, according as its dip is more or less regular. When it is expected that extensive operations will be carried on, the shafts are usually sunk vertically, and connected with the lode at various depths by cross-drifts or levels. When, however, the dip of the lode is pretty uniform and its thickness considerable, all the shafts of the mine may be sunk upon it as inclines. This is the case with the largest mines on Lake Superior. Shafts have various forms, some being round, others oval; but the most common shape is rectangular. In large mines the shaft is usually divided into several compartments, one being used for the pumping-machinery, two or more for hoisting ore, and another for lowering heavy timbers. In the English coal-mines the shafts are mostly circular in section; in Belgium, polygonal; in the anthracite region of Pennsylv-

vania the winding shafts are always square or rectangular, and there the largest shafts have a length of from 44 to 52 feet, and a width of 10 or 12.

4. A trembling-fit; a chill; specifically, in the plural and with the definite article, the *shakes*, ague; intermittent fever; also, delirium tremens. [Colloq.]—5. In *music*, a melodic embellishment consisting of the rapid alternation of a principal tone with a tone one degree above it;

a trill: indicated by the mark *tr.*, with or without the sign *ss*. According to modern usage, the principal tone is sounded first, and receives the accent throughout; but in old music the reverse was the case. If the subsidiary tone is chromatically altered, this is indicated by a sharp or a flat added to the sign of the shake. A shake is usually concluded with a turn, and often preceded by a prefix of one or more tones; in the latter case it is said to be *prepared*. A shake occurring in two or three voice-parts at once is called *double* or *triple*. A succession of shakes is called a *chain*. A shake inserted in the midst of a rapid or flowing melody is called *passing*.

Nearly all exogenous woods are in some degree subject to this defect, which appears in several forms. *Heart-shake* is a fissure through the center or pith, slight or serious, in its simplest form running the length of the trunk in one plane, in some specimens twisted. Another cleft may cross at right angles. *Star-shake* consists of radial fissures, sometimes even reaching the circumference. *Cup-shake* consists of clefts between the concentric layers, occurring most often near the root. All these shakes are commonly called *wind-shakes*.

Its members call themselves "the United Society of Believers in Christ's Second Appearing," which they maintain took place in 1770 through Mother Ann Lee, their founder, and continued in those who embraced her testimony. They hold that God is male and female, and that he has given to man four revelations, through the patriarchs as the Great Spirit, through the law of Moses and the prophets as Jehovah, through Christ and the primitive disciples as the Father, and through Ann Lee and her successors as the Eternal Mother: the last is to be continuous. They practise oral confession, celibacy, and community of goods, and hold the doctrines of continence, non-resistance, and non-participation in any earthly government. 2. Am (is, are, was, etc.) to (do something specified by the infinitive); forming verb-phrases having the value of future and conditional tenses, and usually (and properly enough) called such. (a) *Shall* is used in direct assertion to form the first persons singular and plural of the future and future-perfect tenses, the second and third persons in these tenses being formed by *will*. In this connection *shall* simply foretells or declares what is about to take place: as, I *shall* go to town to-morrow; we *shall* spend the summer in Europe. The future tense of the verb *go* thus becomes

I <i>shall</i>	go;	We <i>shall</i>	go.
Thou <i>will</i>	go;	You <i>will</i>	go.
He <i>will</i>		They <i>will</i>	

"The use of *shall* instead of *will* in the first person is probably due to the fact that the act thus announced as about to take place ensues from the duty or obligation arising outwardly but contemplated inwardly as proper, and consequently as now about to take place in virtue of a tacit act of the speaker's will. *Should* the will or resolution of the speaker intervene, or be prominent in his mind, then *will* would be the proper word to express the futurity of the act: thus, 'I *will* go' means 'I am determined to go, 'I have made up my mind to go.' 'I *shall* go home this evening' announces a future event as settled by consideration outside of the speaker's self; 'I *will* go home this evening' announces a future event having both its cause and its accomplishment in the speaker's own mind." (*Dr. Beard*.) In indirect assertion *shall* may express mere futurity in the second and third persons: as, he says that he *shall* go; he said that he *should* go; in these sentences "he" refers to one and the same person, the one who "says." If it referred to any other person, *will* would be used and not *shall*.

That woman had to water her soup with her furtive tears, to sit of nights behind hearts and spades, and brood over her crushed hopes. If I contemplate that wretched old Niobe much longer, I *shall* begin to pity her.
Thackeray, Philip, II. xiii.

"Well, we *shall* all miss you quite as much as you will miss us," said the master.
T. Hughes, Tom Brown at Rugby, ii. 8.

I *shall* stay and sleep in the church.
George Eliot, Romola, xiv.

(b) In the second and third persons *shall* implies authority or control on the part of the speaker, and is used to express (1) promise: as, you *shall* receive your wages; (2) command: as, thou *shalt* not steal; (3) determination: as, you *shall* go.

My glass *shall* not persuade me I am old,
So long as youth and thou are of one date.
Shak., Sonnets, xxii.

Ne'er stare nor put on wonder, for you must
Endure me, and you *shall*.
Beau. and Fl., Philaster, i. 1.

break her heart for it. *Colman*, Jealous Wife, ii. (4)

(4) Certainty or inevitability as regards the future.
And if I die, no man *shall* pity me [that is, it is certain
no man will pity me]. *Shak.*, Rich. III., v. 3. 201.

(c) Interrogatively, *shall* or *will* is used according as the one or the other would be used in reply, and accordingly 'shall I go?' 'shall we go?' 'shall he go?' 'shall they go?' ask for direction, or refer the matter to the determination of the person asked—that is, 'shall I go?' anticipates the answer 'you shall go.'

Pan. But will you tell me? *Shall* I marry?
Troul. Perhaps. *Urquhart*, tr. of Rabelais, iii. 36.

I was employ'd in passing to and fro,
About relieving of the sentinels:
Then how or which way *should* they first break in?
Shak., 1 Hen. VI., ii. 1. 71.

(d) After conditionals, such as *if* or *whether*, and after verbs expressing condition or supposition, *shall* expresses simple futurity in all persons, the idea of restraint or necessity involved originally in the word *shall* being excluded by the context—thus:

If { I (or we) <i>shall</i>	} say.
Thou <i>shalt</i> , or you <i>shall</i>	
He (or they) <i>shall</i>	

If then we *shall* [that is, are to] shake off our slavish yoke,

York Plays, p. 152.

The London fleet of twenty sail (whose admiral *shall* be
Captain Philpot, a Kentish man, who heretofore fought a
duel between the two armies in the Low Countries), being
all ready, have this fortnight been suing for their despatch.
Court and Times of Charles I., l. 161.

Shall, like other auxiliaries, is often used with an ellipsis
of the following infinitive.

Men dreme of thing that nevere was ne *shal*.
Chaucer, Nun's Priest's Tale, l. 274.

It *shall* [sc. go] to the barber's with your beard.
Shak., Hamlet, ii. 2. 521.

From the Devil they came, and to the Devil they *shall*
[sc. assuredly go]. *Baker*, Chronicles, p. 58.

You have not pushed these diseased neither with side
nor shoulder, but have rather strewd their way into the
Palace with flowers, as you *should*.
Bunyan, Pilgrim's Progress, ii.

3. The past tense *should*, besides the uses in
which it is merely the preterit of *shall*, as above,
has acquired some peculiar uses of its own. In
some of these uses *should* represents the past subjunctive,
not the past indicative. It is not used to express simple
past futurity, except in indirect speech: as, I said I *should*
[was to] go; I arranged that he *should* [was to] go. *Should*
is often used to give a modest or diffident tone to a state-
ment, or to soften a statement from motives of delicacy or
politeness: thus, 'I *should* not like to say how many there
are' is much the same as 'I hardly like,' or 'I do not like,'
etc. Similarly, 'it *should* seem' is often nearly the same
as 'it seems.'

He is no suitor then? So it *should* seem.
B. Jonson.

Should was formerly sometimes used where we should
now use *might*.

The scribisand Pharisees aspieden hym that thei *schulden*
fynde cause whereof thei *schulden* accuse hym.
Wyclif, Luke vi. 7.

The distinctions in the uses of *shall* and *will* and of
should and *would* are often so subtle, and depend so much
upon the context or upon subjective conditions, that they
are frequently missed by inaccurate speakers and writers,
and often even by writers of the highest rank. There is a
tendency in colloquial English to the exclusive use of *will*
and (except after a conditional word) *would*. See *will*.

Cesar *should* [would] be a beast without a heart
if he should stay at home to-day for fear.
Shak., J. C., ii. 2. 42.

I will win for him an I can; if not, I *will* [shall] gain
nothing but my shame and the odd hits.
Shak., Hamlet, v. 2. 183.

Nay, if you find fault with it, they *shall* [will] whisper,
tho I did not like it before; I'll ha' no body wiser than
myself. *Wycherley*, Gentleman Dancing-Master, iv. 1.
= *Syn. Ought, Should*. See *ought* 2.

A plant with trifoliate leaves: the national em-

ten and Holland, "English Plant Names") the plant at
the present day most in repute as the true shamrock is
one of the hop-clovers, *Trifolium minus*, a slender trail-
ing species with small yellow heads, perhaps a variety of
T. pratense. It is in use in many counties of Ireland,
and forms a great part of the shamrock sold in London
on St. Patrick's day. The black medic, *Medicago lupu-
lina*, is also thus used; but the white clover, *T. repens*,
is widely understood to be the common shamrock. The
identity of the original shamrock which, according to tra-
dition, St. Patrick used to illustrate the doctrine of the
Trinity is uncertain. It has been variously supposed to
be the common white clover, *T. repens* (which, however,
is believed to be of late introduction in Ireland); the red
clover, *T. pratense*; the wood-sorrel, *Oxalis Aceto-sella*
(locally called *shamrock* in England); and even the water-

shark¹ (shärk), *n.* [Not found in *ME.* (the *ME.* name therefor being *hound-fish*): usually de-

rived < *L. carcharus*, < *Gr. κάρχαρις*, a kind of shark, so called from its sharp teeth, < *κάρχαρος*, jagged (of teeth); cf. *καρκινός*, a crab; *Skt. karkata*, a crab, *karkara*, hard. But the requisite *OF.* forms intermediate between *E. shark* and *L. carcharus* are not found, and it is not certain that the name was orig. applied to the fish; it may have been first used of a greedy man (see *shark*²).] A selachian of the sub-class *Plagiostomi*, of an elongate form, with the pectoral fins moderately developed, the branchial apertures lateral, and the mouth inferior (rarely terminal). Over 150 species are known as inhabitants of the modern seas, and sharks formed a very important or even predominant contingent to the fauna of early epochs. The internal differences manifested by species having a considerable resemblance externally are so great as to have led some naturalists to propose for them three distinct orders, which have been named *Anarthri*, *Proarthri*, and *Opistharthri*. Most living sharks belong to the first order and represent therein 15 families, while of the *Proarthri* only one family with 4 species is known, and of the *Opistharthri* two families with 6 or 7 species. Most sharks are carnivorous, and some of them eminently so; their dentition corresponds to this character, the teeth being often compressed, with trenchant and frequently serrated edges, arranged in many rows, and folded back on the jaw, leaving only the outermost erect for action. These rows of teeth successively come into functional position. In others, however, the teeth are flatfish and not erectile. In a few, also, which attain a large size, the teeth are extremely small, and the animal feeds upon very small animals, being not truly carnivorous. The skin is generally covered with small scales or plates firmly adherent to the skin and overlapping, forming shagreen. (See cut under *scad*.) But various deviations are manifested in different forms, and in one, *Echinorhynchus*, the surface is mostly naked, only some thorn-like plates being developed. Sharks inhabit for the most part tropical and warm waters; the larger ones live in the open sea, but a few species extend into high north and south latitudes. The largest shark is *Rhinodon typicus*, the whale-shark, said to attain a length of over 50 feet. Next in size is the great basking-shark, *Cetorhinus maximus*, which is reported occasionally to reach a length of 40 feet. (See *Cetorhinus*, and cut under *basking-shark*.) Another large species is *Carcharodon ron-*

H. Knight.*—**3.** A strain consisting of a compression in one direction with an elongation in the same ratio in a direction perpendicular to the first. Thus, in fig. 1, suppose a body in which the axis AC is compressed to *ac*. Suppose there is an axis of equal elongation, upon which take BD equal to *ac*, so that after elongation it will be brought to *bd*, equal to *ac*. Then, all planes perpendicular to the plane of the diagram and parallel either to AB or to AD will remain undistorted, being simply rotated into positions parallel to *ab* or *ad*. If the body while undergoing strain be so rotated that *a* and *b* remain in coincidence with A and B (see fig. 2), the shear will be seen

to be an advance of all planes parallel to a fixed plane in parallel lines in those planes by amounts proportional to their distances from the fixed plane. A shear is often called a *simple shear*, meaning a shear uncompounded with any other strain. Any simple strain may be resolved into a shear, a positive or negative elongation perpendicular to the shear, and a positive or negative expansion.

shears: see *shear*².] 1. A cutting- or clipping-instrument consisting of two pivoted blades with beveled edges facing each other, such as is used for cutting cloth, or of a single piece of steel bent round until the blades meet, the elasticity of the back causing the blades to spring open when the pressure used in cutting has ceased. The latter is the kind used by farriers, sheep-shearers, weavers, etc. Shears of the first kind differ from scissors chiefly in being larger. Implements of similar form used for cutting metal are also called *shears*. See also cuts under *clipping-shears* and *sheep-shears*.

[So called from its applicability to the manufacture of shears, knives, scythes, etc.] Blister-steel which has been fagoted and drawn out into bars under the rolls or hammer: a repetition of the process produces what is known as *double-shear steel*. The density and homogeneity of the steel are increased by this process, and it is generally admitted that a better result is attained by hammering than by rolling. See *steel*.

shear-structure (shēr'struk'tūr), n. In *geol.*, a structure superinduced in rocks by shearing; a structure varying from lamellar to schistose, somewhat resembling the so-called "fluxion-structure" often seen in volcanic rocks, but produced by the flowing, not of molten, but of solid material, as one of the consequences of the immense strain by which the upheaval or plication of large masses of rock has been accompanied.

sheartail (shēr'tāl), n. 1. A humming-bird of the genus *Thaumastura*, having a very long forcinate tail, like a pair of shears, as *T. cora*, *T. helenura*, etc. In the *cora* hummer (to which the

genus *Thaumastura* is now usually restricted, the others formerly referred to it being placed in *Doricha* the structure of the tail is peculiar; for the middle pair of feathers is so short as to be almost hidden by the coverts, while the next pair is suddenly and extremely lengthened, and then the other three pairs rapidly shorten from within outward. In *Doricha* (*D. hemicura*, etc.) the shape of the tail is simply forlinate, as the feathers lengthen from the shortest middle pair to the longest outer pair, like a

tern's. In all these cases the long feathers are very narrow and linear, or of about uniform width to their ends. The peculiar formation is confined to the males. *T. cora* has the tail (in the male) about 4 inches long, though the length of the bird is scarcely 6 inches: it is golden-green above and mostly white below, with a metallic crimson gorget reflecting blue in some lights, and the tail black and white. The female is 3½ inches long, the tail being 1½. It inhabits Peru. Five species of *Doricha* range from the Bahamas and parts of Mexico into Central America.

There are many species, mostly of the genus *Puffinus*, found on all seas, where they fly very low over the water, seeming to shear, shave, or graze it with their long blade-like wings (whence the name). Some of them are known as *hags* or *hagdens*. Three of the commonest are the greater shearwater, *P. major*; the Manx shearwater, *P. anglorum*; and the sooty shearwater, *P. fuliginosus*, all of the North Atlantic. sheep¹ (shēp), *n.*; pl. *sheep*. [*< ME. sheep*, *shep*, *sheep*, *schepe*, *scēap*, *scēp*, *scēp* (pl. *sheep*, *scheep*), < AS. *scēap*, *scēp* (pl. *scēap*, *scēp*) = OS. *scāp* = OFries. *schēp*, *schēp* = D. *schaap* = MLG. *schāp*. LG. *schaap* = OHG. *scāf*, MHG. G. *schaf*, sheep; root unknown. Not found in Goth., where *lamb* (= E. *lamb*) is used, nor in Scand., where Icel. *fær* = Sw. *får* = Dan. *faar*, sheep, appears (see *Fur-oese*).] 1. A ruminant mammal of the family *Bovidae*, subfamily *Ovisae*, and genus *Ovis*; specifically, *Ovis aries*, domesticated in many varieties, and one of the animals most useful to man. The male is a ram, the female a ewe, and the young a lamb; the flesh of the adult is mutton; of the young, lamb; the coat or fleece is wool, a principal material of warm clothing; the prepared hide is sheepskin, used for many pur-

poses; the entrails furnish sausage-cases, and are also dried and twisted into strings for musical instruments ("catgut"); the prepared fat makes tallow or suet; and the twisted horns of the ram are used in the manufacture of various utensils. The milk of the ewe is thicker than that of the cow, yielding a relatively greater quantity of butter and cheese. The sheep is one of the most harmless and timid of animals. The artificial breeds of *O. aries* are numerous; it is not known from what wild stock or stocks they are descended. The mouflon is a probable ancestor of some at least of the domestic varieties, especially those with short tail and crescentic horns. The principal English varieties of the sheep are the large Leicester, the Cotswold, the Southdown, the Cheviot, and the black-faced breeds. The Leicester comes early to maturity, attains a large size, has a fine full form, and carries more mutton, though not of finest quality, in the same apparent dimensions than any other; the wool is not so long as in some other breeds, but is considerably finer. The Cotswolds have been improved by crossing with Leicesters; their wool is fine, and their mutton fine-grained and full-sized. Southdowns have short, close, and curled wool, and their mutton is highly valued for its flavor; they attain a large size. All these require a good climate and rich pasture. The Cheviot is much harder, and is well adapted for the green, grassy hills of Highland districts; the wool is short, thick, and fine. The Cheviot possesses good fattening qualities, and yields excellent mutton. The black-faced is hardiest of all, and adapted for wild heathery hills and moors; its wool is long and coarse, but its mutton is the very finest. The Welsh resembles the black-faced, but is less hardy; its mutton is delicious, but its fleece weighs only about 2 pounds. The foreign breeds of sheep are numerous, some of the more remarkable being (a) the broad-tailed sheep, common in Asia and Egypt, and remarkable for its large heavy tail; (b) the Iceland sheep, having three, four, or five horns; (c) the fat-rumped sheep of Tataria, with an accumulation of fat on the rump, which, falling down in two great masses behind, often entirely conceals the tail; (d) the Astrakhan or Bucharian sheep, with the wool twisted in spiral curls, and of very fine quality; (e) the Wallachian or Cretan sheep, with very large, long, and spiral horns, those of the male being upright, and those of the female at right angles with the head. All the wild species of *Ovis* have the book-name *sheep*, and also particular designations. (See *argali*, *bighorn*, *mouflon*, *musimon*.) The only indigenous form in the New World is the Rocky Mountain sheep, or bighorn, *O. montana*. Certain *Ovisae* of modern genera detached from *Ovis* are called *sheep* with a qualifying term, as the aoudad, or Barbary sheep. See cuts under *aoudad*, *bighorn*, *merino*, *Ovis*, *quadriceorn*, and *Itimnanti*.

This bird is half-tamed in some places, like the eider-duck, and laid under contribution for its eggs. The ruddy sheldrake or Brahminy duck is *T. casarca*, or *Casarca rutula*, wide-ranging like the foregoing. Each of these sheldrakes is represented in Australian, Papuan, and Polynesian regions by such forms as *Tadorna radjah*, *Casarca talor-noides*, and *C. variegata*. A shell in one, two, or several pieces is so highly characteristic of mollusks that these animals are commonly called shell-fish collectively, and many of them are grouped as *Testacea*, *Conchifera*, etc. In some mollusks, as dibrancheate cephalopods, the shell is internal, constituting the pen or entle (see *calamary*); in others there is no shell. The shell is secreted chiefly by a mantle or folds of the mantle which are developed around the soft parts, and is usually composed of carbonate of lime. It is generally univalve and spiral, as in most gastropods. In chitons there are eight valves imbricated in a longitudinal series, bound together by a marginal band. In bivalves two shells are developed from and cover the sides of the animal, right and left. (See cuts under *bivalve*.) Some mollusks otherwise bivalve have accessory valves. (j) In *Termes*, the tube or case of a tubicolous worm, when hard, thick, or rigid, like a mollusk's shell: as, the shell of a serpula. (k) In some *Protozoa*, a silicious or calcareous test or lorica of any kind. Such shells are present under numberless modifications, often beautifully shaped and highly complicated, perforated, camerated, etc., as in foraminifers, radiolarians, sun-animalcules, many infusorians, etc.

Cf. *lowreeve*, *portreeve*.] The chief civil officer charged with administering justice within a county, under direction of the courts, or of the crown or other executive head of the state, and usually having also some incidental judicial functions. (a) In England, the chief officer of the crown in every county or shire, who does all the sovereign's business in the county, the crown by letters patent committing the custody of the county to him alone. Sheriffs are appointed by the crown upon presentation of the judges in a manner partly regulated by law and partly by custom (see *pricking*); the citizens of London, however, have the right of electing the sheriffs for the city of London and the county of Middlesex. Those appointed are bound under a penalty to serve the office, except in specified cases of exemption or disability. As keeper of the queen's peace, the sheriff is the first man in the county, and superior in rank to any nobleman therein during his office, which he holds for a year. He is specially intrusted with the execution of the laws and the preservation of the peace, and for this purpose he has at his disposal the whole civil force of the county—in old legal phraseology, the *pace comitatus*. He has also some judicial functions, less extensive now than formerly. The most ordinary of his functions, which he always executes by a deputy called *under-sheriff*, consists in the execution of writs. The sheriff performs in person such duties only as are either purely honorary, such as attendance upon the judges on circuit, or of some dignity and public importance, such as the presiding over elections and the holding of county meetings, which he may call at any time.

(b) In Scotland, the chief local judge of a county. There are two grades of sheriffs, the chief or superior sheriffs and the sheriffs-substitute (besides the lord lieutenant of the county, who has the honorary title of *sheriff-principal*), both being appointed by the crown. The chief sheriff, usually called simply the *sheriff*, may have more than one substitute under him, and the discharge of the greater part of the duties of the office now practically rests with the sheriffs-substitute, the sheriff being (except in one or two cases) a practising advocate in Edinburgh, while the sheriff-substitute is prohibited from taking other employment, and must reside within his county. The civil jurisdiction of the sheriff extends to all personal actions on contract, bond, or obligation without limit, actions for rent, possessory actions, etc., in which cases there is an appeal from the decision of the sheriff-substitute to the sheriff, and from him to the Court of Session. He has also a summary jurisdiction in small-debt cases where the value is not more than £12. In criminal cases the sheriff has jurisdiction in all offenses the punishment for which is not more than two years' imprisonment. He has also jurisdiction in bankruptcy cases to any amount. (c) In the United States, except in New Hampshire and Rhode Island, sheriffs are elected by popular vote, the qualification being that the sheriff must be a man, of age, a citizen of the United States and of the State, and a resident in the county; usually he can hold no other office, and is not eligible for reelection until after the lapse of a limited period. In all the States there are deputy sheriffs, who are agents and servants of the sheriff. In New York and some other States there is, as in England, an under-sheriff, who acts in place of his chief in the latter's absence, etc. The principal duties of the sheriff are to preserve peace and order throughout the county, to attend the courts as the administrative officer of the law, to guard prisoners and juries, to serve the process and execute the judgments of the courts, and to preside at inquisitions and assessments of damages on default.—**High sheriff**, the sheriff as distinguished from the under-sheriff and other deputies.—**Joint sheriff**, two persons jointly appointed sheriff, or one of such persons.—**Sheriff of Middlesex case**, a decision in 1840, noted in English constitutional history, on the relative powers of Parliament, to imprison for contempt and the courts to discharge on habeas corpus.—**Sheriff's jury**. Those who had not this decoration were called *sotto voce* in the school-room and yelled after in the grove, *Shig-shag!* this opprobrious epithet, when uttered at close quarters, being generally accompanied by three pinches. No boy who cared for his peace of mind and wished to save himself some "tips and twinks" would appear in school without at least an oak-leaf in honour of the day.

A vessel of considerable size adapted to navigation; a general term for sea-going vessels of every kind, except boats. Ships are of various sizes and fitted for various uses, and receive different names, according to their rig, motive power (wind or steam or both), and the purposes to which they are applied, as war-ships, transports, merchantmen, barks, brigs, schooners, luggers, sloops, xebecs, galleys, etc. The name *ship*, as descriptive of a particular rig, and as roughly implying a certain size, has been used to designate a vessel furnished with a bowsprit and three masts—a mainmast, a foremast, and a mizzenmast—each of which is composed of a lower mast, a topmast, and a topgallantmast, and carries a certain number of square sails. The square sails on the mizzen distinguish a ship from a bark, a bark having only fore-and-aft sails on the mizzen. gone far toward rendering this restricted application of the word of little value. Owing to increase of size, and especially increase in length, some sailing vessels now have four masts, and this rig is said to have certain advantages. Until recent times wood, such as oak, pine, etc., was the material of which all ships were constructed, but it is being rapidly superseded by iron and steel; and in Great Britain, which is the chief ship-building country in the world, the tonnage of the wooden vessels constructed is small compared with that of vessels built of iron. The first iron vessel classed at Lloyd's was built at Liverpool in 1835, but iron barges and small vessels had been constructed long before this. Four-masted vessels which are square-rigged on all four masts are called *four-masted ships*; those which have fore-and-aft sails on the after mast are called *four-masted barkes*. 'separate,' 'cut off,' a secondary form of *seccran, seccoran, seccrian*, cut off, shear; see *shear*¹. 2. A man belonging to "the shires" (which see, under *shire*).

Shire-man.—Any man who had not the good fortune to be born in one of the sister counties, or in Essex. He is a sort of foreigner to us; and to our ears, which are acutely sensible of any violation of the beauty of our phraseology, and the music of our pronunciation, his speech soon bewrays him. "Aye, I knew he must be a *shere-man* by his tongue." Forby, p. 290. *Hallwell.*

Cf. *folk-moot*, *witena-gemot*.] Formerly, in England, a court or assembly of the county held periodically by the sheriff along with the bishop of the diocese, and with the ealdorman in shires that had ealdormen.

The presence of the ealdorman and the bishop, who legally sat with him [the sheriff] in the *shire-moot*, and whose presence recalled the folk-moot from which it sprang, would necessarily be rare and irregular, while the reeve was bound to attend; and the result of this is seen in the way in which the *shire-moot* soon became known simply as the sheriff's court.

J. R. Green, Conquest of England, p. 230.

The *shíremoot*, like the hundredmoot, was competent to declare folkright in every suit, but its relation to the lower court was not, properly speaking, an appellate jurisdiction. Its function was to secure to the suitor the right which he had failed to obtain in the hundred.

Stubbs, Const. Hist., § 50.

He then proceeds to state, apparently as a corollary of what may be called his *bloody-shirt* principle, that our Revolution was not popular with what he terms the inferior classes. . . . But most assuredly the Americans did not want a visible signal to push them on; and he who should have displayed a *bloody shirt* for that purpose would have been followed by the contempt of the spectators, and saluted with stones by every idle boy in the streets.

(b) In *pathol.*, a condition of profound prostration of voluntary and involuntary functions, of acute onset, caused by trauma, surgical operation, or excessive sudden emotional disturbance (mental shock). It is due, in part at least, to the over-stimulation and consequent exhaustion of the nervous centers, possibly combined with the inhibitory action of centers rendered too irritable by the over-stimulation or otherwise.

A shock is a violent shaking, and may be produced by a collision, a heavy jolt, or otherwise; it may be of the nature of a concussion. The word is more often used of the effect than of the action: as, the shock of battle, a shock of electricity, the shock from the sudden announcement of bad news. A collision is the dashing of a moving body upon a body moving or still: as, a railroad collision; collision of steamships. Concussion is a shaking together; hence the word is especially applicable where that which is shaken has, or may be thought of as having, parts: as, concussion of the air or of the brain. Collision implies the solidity of the colliding objects: as, the collision of two cannon-balls in the air. A jolt is a shaking by a single abrupt jerking motion upward or downward or both, as by a springless wagon on a rough road. Shock is used figuratively; we speak sometimes of the collision of ideas or of minds; concussion and jolt are only literal.

shogun (shō'gōn), *n.* [*Jap.* (= *Chin. tsiang kün*, handle (or lead) the army), *sho* (= *Chin. tsiang*), take, hold, have charge of, or lead in fight, + *gun* (= *Chin. kün, kün*), army.] General: the title of the commander-in-chief or captain-general of the Japanese army during the continuance of the feudal system in that country. More fully called *tai shogun* ('great general'), or *sei-i-tai shogun*, 'barbarian-subduing-great-general'—the earlier wars of the Japanese (when this form of the title was first used) having been waged against the 'barbarians' or aboriginal inhabitants of the country. The office was made hereditary in the Minamoto family in 1192, when the title was bestowed on a famous warrior and hero named Yoritomo, and continued in that family or some branch of it until 1868, when it was abolished, and the feudal system virtually came to an end. From the first a large share of the governing power naturally devolved on the shogun as the chief vassal of the mikado. This power was gradually extended by the encroachments of successive shoguns, especially of Iyeyasu, founder in 1603 of the Tokugawa line, and in course of time the shoguns became the virtual rulers of the country—always, however, acknowledging the supremacy of the mikado, and professing to act in his name. This state of things has given rise to the common but erroneous opinion and assertion that Japan had two emperors—"a spiritual emperor" (the mikado), living in Kioto, and "a temporal emperor" (the shogun), who held court in Yedo (now called Tokio). In the troubles which arose subsequent to 1858 in connection with the ratification and enforcement of the treaties which the shogunate had made with foreign nations, establishing trade relations, etc., many of the daimios, tired of the domination of the shogun and disapproving of the treaties, sided with the emperor; this led in 1867 to the resignation of the shogun of the time, and in the following year the office was abolished, the reigning mikado undertaking to govern the country in person. See *daimio* and *tycoon*.

14. Not prolonged in utterance; less in duration than times or sounds called long: said of times, vowels, and syllables. Specifically — (a) In pros., not exceeding in duration the unit of time (taora, semelion), or so regarded. The ordinary short vowel of ancient pronunciation varied somewhat in actual duration, but seems to have usually been uttered as rapidly as was consistent with full distinctness of sound. (See long, n., 2.) Sometimes in metrical or rhythmical treatment a short syllable occupied less time in utterance than a normal short (was a diminished short, βραχέα μειωμένη), and in what is commonly known as elision the first of two vowel-sounds, although still audible, was shortened to such a degree as to be entirely disregarded in metrical composition. A syllable containing a short vowel was regarded as short unless the vowel stood in position (which see). Rhythmical or musical composition occasionally allowed itself the liberty of treating a prosodic short as a long (an augmented short, βραχέα ηνεμημένη), and vice versa. In metrical composition a short syllable usually did not take the ictus: hence, in modern versification, an unaccented syllable, whatever its duration, is said to be short. A short time, vowel, or syllable is marked by a curved line written independently or above the vowel: thus, —, á.

shorthand (shört'händ), n. and a. [Formerly also short-hand, short'hand; < short + hand.] I. n. The varieties of shorthand now in use are nearly all based on the phonetic principle. The system introduced by Isaac Pitman in 1837, and known as phonography (which see) from 1840, has, in its various modifications by its originator and others, a very wide currency wherever the English language is spoken. After the issue of the ninth edition of his work, in 1853, Pitman introduced extensive changes (especially in the vowel-system). The following is a comparative view of Pitman's later and earlier systems and that of a modification of them by J. E. Munson of New York (1866):

Pitman, Munson, and Pitman's Ninth Edition:
\p, \b, |t, |d, /ch, /j, —k, —g, \f, \v, (th, (dh), s), z, \sh, \zh, \m, \n, \ng, /l, /r.

Pitman: /w, /y, /h.
Munson: \w, \y, \h.
'9th Ed.: \w, /y, /h.

shot-gun (shot'gun), *n.* A smooth-bore gun used for firing small shot, as in the chase of birds and small quadrupeds; a fowling-piece: commonly called *gun* simply, in implied distinction from *rifle* or other small-arm. Some shot-guns are too heavy to be brought to the shoulder. (See *punt-gun*, *ducking-gun*.) Shot-guns are usually either single-barreled or double-barreled; rarely a third barrel is added; sometimes one of the barrels is rifled (see the quotation). Besides being smooth-bored, a shot-gun differs from any form of rifle in having no hind-sight and a simple pin as fore-sight. Shot-guns are also distinguished as *muzzle-loaders* and *breech-loaders*; the former are little used now. Though the bore is always smooth, it is often contracted toward the muzzle to concentrate the discharge. (See *choke-bore*.) The standard shot-gun now most used by sportsmen is the double-barreled breech-loader, of 7 to 10 pounds weight, about 30 inches length of barrel, length and drop of stock fitting the shooter, often with pistol-grip, caliber usually 10, 12, or 14, and taking corresponding sizes of paper or metal shot-cartridges (see *shell*) with center-fire primers or percussion-caps and an automatic ejector; such as have the cock or hammer concealed in the mechanism of the lock are specified as *hammerless*. The special makes are numberless, but decided variations from the standard pattern are rare. Shot-guns are seldom fitted with hair-triggers, but usually with rebounding locks, in which the hammer lies back to half-cock on delivering the blow on the plunger. A special form of shot-gun, used by naturalists, is described under *can-gun*.

shoulder-blade (shōl'dér-blād), *n.* [< ME. *schulderblad* = D. *schouderblad* = MLG. *schulderblat*, G. *schulterblatt* = Dan. Sw. *skulderblad*; as *shoulder* + *blade*.] The scapula (which see). The human shoulder-blade is somewhat peculiar in shape, and some of its parts are named in terms not applicable or seldom applied to scapulae in general. It is a compound bone, including a coracoid as a mere process, and develops from seven centers of ossification, two of which are coracoid. It is commonly said to have two surfaces, three borders, and three angles. Of these, the ventral surface, which lies upon the ribs, is the *center*; the other surface is the *dorsum*. This latter is unequally divided into two parts by the development of a high ridge, the *spine*, extended into a stout process, the *acromion*. The flat part above the spine is the *suprascapular fossa*; that below the spine, the *infrascapular fossa*; the center is also called the *subscapular fossa*. These three fossae indicate the primitively prismatic and rod-like character of the bone; and they correspond respectively to the *preacromial*, *postscapular*, and *subscapular* surfaces of a more general nomenclature. The spine being actually in the axis of the scapula, it follows that the long *vertebral border* (a_1 to a_2 in the figure) is the proximal end of the bone. The *glenoid fossa* is at the other end of the bone, at its confluence with the coracoid. The

axillary border is one edge of the primitive prism; the *superior border* is another; and the third is along the free edge of the spine. The *suprascapular notch* in the superior border (converted into a foramen by a ligament) denotes the passage there of the vessels and nerve called by the same name. The peculiarities of the human scapula result mainly from its extensive growth downward to the inferior angle (a_3), with consequent lengthening of the axillary border and of the so-called vertebral "border," and from great development of the spine and acromion. This bone, as usual in the higher vertebrates, has two articulations— with the clavicle and with the humerus; excepting the acromioclavicular articulation, it is attached to the trunk solely by muscles, of which sixteen (sometimes seventeen) arise from or are inserted into the bone. (Compare the shape of the rabbit's shoulder-blade, figured under *metacromion*, and of a bird's, under *scapula*.) See also cut under *shoulder*.

dle for the reception of the bobbin or pirn on which the weft is wound. The weft unwinds from this bobbin as the shuttle runs from one side of the web to the other. It is driven across by a smart blow from a pin called a *picker* or *driver*. There is one of these pins on each side of the loom, and the two are connected by a cord to which a handle is attached. Holding this handle in his right hand, the weaver moves the two pins together in each direction alternately by a sudden jerk. A shuttle propelled in this manner is called a *fly-shuttle*, and was invented in 1738 by John Kay, a mechanic of Colchester, England. Before this invention the weaver took the shuttle between the finger and thumb of each hand alternately and threw it across, by which process much time was lost. The shuttle has also a pair of under rollers, one at each end, and travels over the lower series of warp-threads through the shed, being pushed along by the carriage while the warp-threads are passed, without straining them, between the upper rollers of the carriage and the rollers of the shuttle.
