#### L O G I C.

**L**OGIC, *f.* [from λογος, Gr. discourse; in regard thinking is only an inward mental discourse, wherein the mind converses with itself.] The art of thinking justly; or of making a right use of our rational faculties, in defining, dividing, and reasoning; or, as it is defined by an excellent writer on this subject, *Logic* is the art of using reason well in our enquiries after truth, and the communication of it to others. *Watts.*

Talk *logic* with acquaintance,  
And practise rhetoric in your common talk. *Shakespeare.*

Logic is sometimes called *dialectica*; and sometimes the *canonical art*, as being a canon, or rule, for directing us in our reasonings.

As, in order to think aright, it is necessary that we apprehend, judge, discourse, and dispose, or methodise, rightly; hence *perception*, or apprehension, *judgment*, discourse, or *reasoning*, and disposition, whence results *method*, become the four fundamental articles of this art; and it is from our reflections on those operations of the mind that logic is, or ought to be, wholly drawn.

Lord Bacon divides logic into four branches, according to the ends proposed in each; for a man reasons, either to find what he seeks, or to judge of what he finds, or to retain what he judges, or to teach what he retains; whence arise so many arts of reasoning; viz. the art of *inquisition*, or invention; the art of *examining*, or judgment; the art of *preserving*, or of memory; and the art of *elocution*, or delivery.

Logic, having being extremely abused, is now in some disrepute. The schools have so clogged it with barbarous terms and phrases, and have run it out so much into dry useless subtilties, that it seems rather intended to exercise the mind in wrangling and disputation than to assist it in thinking justly. It is true, in its original it was rather intended as the art of cavilling than of reasoning; the Greeks, among whom it had its rise, being a people who piqued themselves mightily upon their being able to talk *extempore*; and to argue, by turns, on either side of the question. Hence their *dialectici*, to be always furnished with arms for such rencontres, invented a set of words and terms, rather than rules and reasons, fitted for the use of contention and dispute. Thus logic was only an art of words, which frequently had no meaning, but served rather to hide ignorance than to improve knowledge; to baffle reason instead of assisting it; and to confound the truth instead of clearing it. Much of that heap of words, and rules, which we have borrowed from the old logic, is of little use in life; and is so far out of the common usage, that the mind does not attend to them without trouble; and, finding nothing in them to reward its attention, it soon discharges itself, and loses all ideas it had conceived of them.

VOL. XIII. No. 883.

But logic, disengaged from the jargon of the schools, and reduced into a clear and intelligible method, is the art of conducting the understanding in the knowledge of things, and the discovery of truth. From its proper use we gain several very considerable advantages: for, 1. The consideration of rules incites the mind to a closer attention and application in thinking; so that we hereby become assured, that we make the best use of our faculties. 2. We hereby more easily and accurately discover and find out the errors and defects in our reasoning; for the common light of reason, unassisted by logic, frequently observes an argumentation to be faulty, without being able to determine wherein the precise failure consists. 3. By these reflections on the order and manner of the operations of the mind, we are brought to a more just and complete knowledge of the nature of our own understanding.

It is a prevalent opinion, that Aristotle was the first who investigated the principles of logic in a philological manner, and reduced it to a regular system. This opinion seems to receive some countenance from his own declarations. "Concerning the art of rhetoric (says he) the ancients have left us numerous treatises; but, previous to my own attempt, no author has ever treated of syllogism." This assertion, however, does not amount to any positive proof, that before his time the art of syllogizing was unknown in the different schools of philosophy established in Greece. An art or science may be perfectly understood, although its principles have never been digested and arranged by any author. Nay, it is even certain that, before the days of Aristotle, several sects were actually in possession of a regular system of logic. That this system received many important improvements from his surprising exertions, cannot at all be doubted: yet he cannot be regarded as the original inventor.

The system of logic, however, generally ascribed to Aristotle, and which was translated into Arabic many centuries ago, constitutes, no doubt, at this time, the logic of all the nations of Asia who possess the Mahomedan faith; yet this point had not been directly confirmed by translations from the oriental languages, till Mr. Balfour published, in the *Asiatic Researches* for 1805, some extracts, with a translation, of the *Tehzeeb ul Mantik*, or Essence of Logic, an Arabic treatise of considerable repute; which seem to place this question beyond doubt, by their close coincidence in every point with the system referred to Aristotle. Mr. Balfour moreover endeavours to vindicate the Stagyrice against the charge of lord Kaimes, and assigns to him that merit which has been attributed to the great Bacon: "From some of the extracts contained in this paper, it will appear, 1st. That the mode of reasoning by *induction*, illustrated and improved by the great lord Verulam, in his *Organum Novum*, and generally considered as the cause of the rapid progress of sci-

88

ence

ence in later times, was perfectly known to Aristotle, and was distinctly delineated by him as a method of investigation that leads to certainty or truth; and 2dly, That Aristotle was likewise perfectly acquainted, not merely with the form of induction, but with the proper materials to be employed in carrying it on—facts and experiments. We are therefore led to infer, that all the blame of confining the human mind for so long a time in chains by the forms of syllogism, cannot be fairly imputed to Aristotle; nor all the merit of enlarging it and setting it free, ascribed to lord Verulam. The vast extent of Aristotle's learning and knowledge, and the singular strength and penetration of his mind, having naturally encouraged him to undertake a complete analysis of all its powers, the doctrine of syllogism became of course a constituent and necessary part of his comprehensive system. And if succeeding philosophers, attracted by its ingenuity and beauty, have deserted the substance in pursuit of the shadow, the pernicious consequences of this delusion cannot justly be referred to him."

In the preface to this Arabic treatise, we have the following definition of its subject: "In the language of logicians, examination or inspection is the contemplation of the thing known, to obtain a knowledge of the thing unknown; that is to say, the contemplation of the known perceptible, and the known demonstrable, to obtain a knowledge of the unknown perceptible and unknown demonstrable; and, as mistakes often happen in this investigation, there is indispensably required some general rule to preserve the mind from falling into an error in the process of thinking. This rule is logic. From this discussion, therefore, it appears that the nature of logic may be defined, a general rule which guards the mind against errors in thinking."

The work is divided into two parts, the first treating of *Definition*, and the second of *Demonstration*. Part I. is subdivided into four sections: 1. Of Expression; 2. Of Ideas formed by the Intellect; 3. Of the Five Universal Ideas called Predicables; 4. Of the different kinds of Definitions. Part II. is arranged in five sections: 1. Of Propositions; 2. Of Syllogism; 3. Of Induction; 4. Of Analogy; 5. Of the Division of Syllogisms according to their Matter.

The section on Syllogisms being quoted by Mr. B. in the passage we have transcribed from his introduction, as a proof that Aristotle was acquainted with the method of pure investigation, we shall give it entire: "A syllogism is a sentence composed of propositions, and in such a manner, that there necessarily arises from this composition another sentence. Know then, that, having finished our investigation of propositions, on the previous knowledge of which all reasoning or demonstration depends, I shall now consider demonstration.—Demonstration, or reasoning, is the process of inferring something from the state of one thing to prove the state of another; and this is of three kinds, viz. Syllogism, Induction, and Analogy. *Syllogism* is that in which an inference is drawn from a general rule or class to a subordinate part or individual belonging to that class; which must of course partake of its general nature, or character. This species of argument affords certainty or truth. Take for example, "The world is changeable, and every thing liable to change was created;" thus they obtain the conclusion that the world did not exist from eternity, that is, was created. Be it then understood, that two sentences combined, from the nature of which there necessarily arises a third, constitute what is called *hecause*, or syllogism; and the third sentence thus obtained is called *metejeh*, that is, the conclusion. The subject and predicate contained in the conclusion of the syllogism described is called the *maddeh*, that is, the matter of the conclusion; and the order in which they are placed constitutes what is called *heiyet*, that is, the form or figure. If the matter and figure of the conclusion appear in the premises of the syllogism, then that syllogism is called conditional, because the conditional particle *leiken* must

be included in it. Take for example, "Whenever the sun shines, day must exist;" but the sun shines, which gives the conclusion, "Then day exists," which is materially and formally contained in the preceding syllogism. But, if the conclusion be not materially and formally expressed in the premises of the syllogism, then it is denominated *ikteraumi*, that is, simple or categorical; whether it be absolute or conditional. The *subject* considered in the conclusion of a simple syllogism is called *afzur*, that is, the minor; and the thing predicated of the subject is called *akbar*, that is, the major; and the proposition which contains the minor is called *fururi*, minor proposition; and the proposition which contains the major is called *akburi*, or major proposition; and the term with which the subject and predicate of the conclusion are both compared is called the middle term, or *huddi ofit*, or *ofit*, &c. &c. &c." We may just mention, that this oriental treatise of logic is of no high antiquity, as is evident from its adducing "the missions of the prophet Mahommed and Jesus Christ," as instances of traditions which cannot be supposed to be false.

It is certainly unreasonable to neglect the useful parts of logic, because many, who have written concerning it, have obscured and perplexed it by a profusion of mystical and elaborate arrangement: indeed, to use the words of a writer upon this subject, "to discard logic, because it might assist the views of the sophistical, is as silly as to prohibit good bills of exchange, because they may give occasion to forgery and fraud."

Of all the human sciences, that concerning man is certainly the most worthy of man, and the most necessary part of knowledge. We find ourselves in this world surrounded with a variety of objects; we have powers and faculties fitted to deal with them, and are happy or miserable in proportion as we know how to frame a right judgment of things, and shape our actions agreeably to the circumstances in which we are placed. No study therefore is more important than that which introduces us to the knowledge of ourselves. Hereby we become acquainted with the extent and capacity of the human mind; and, learning to distinguish what objects it is suited to, and in what manner it must proceed in order to compass its ends, we arrive by degrees at that justness and truth of understanding, which is the great perfection of a rational being.

The logic at present taught in our universities is comprised in a small volume bearing the name of Mr. Professor Duncan, of Marischal-college, Aberdeen. As this book is in the hands of almost every one who has any fondness for such pursuits, we shall, instead of copying what is so well known, present to our readers what has never before appeared in an English dress,—an *Universal Logic* founded on the discoveries of Immanuel Kant; for it is only by comparing new discoveries with the older systems that the sciences are ultimately perfected. We present this treatise in the same form in which we received it.

#### UNIVERSAL LOGIC.

*Prefatory Remark.* It is an unfortunate circumstance, that *that Science*, whose province it is to teach us to think and reason correctly, should be so much sunk in estimation at the present day. The fault does not lie in *the science itself*, but in the manner in which it has been taught; for it must be confessed that we have no work calculated to convey a distinct idea of the value of this science. So many considerations foreign to Logic have always been introduced into it, and it has been so much confounded with erroneous speculations in other sciences, that no *Universal Logic* could possibly be produced. The great discoveries of the *immortal Kant*, however, have at length enabled us, not only to confine logic within its proper limits, but to give to this important science its due rank as one among the very few that are capable of attaining a PERMANENT FORM which no time or circumstance can ever change. This

will greatly facilitate the student who engages in the CRITICAL PHILOSOPHY, the most sublime science ever offered to the consideration of man.

Should the following attempt, to render the ideas of Professor Kant intelligible to an English reader, be fortunate enough to succeed, the time and labour spent in this undertaking could not have been better employed; but, should the endeavour totally fail, it may still serve to induce some one better qualified, to do more ample justice to the merits of this truly great Philosopher.

68, St. James's Street,  
London; Oct. 15, 1813.

THOMAS WIRGMAN.

INTRODUCTION.

I. *Of Logic in general.*

That the human Understanding, in its right use, proceeds according to certain uniform laws, is a fact which does not admit of a doubt. These laws contemplated in the *abstract*, without regard to their application, constitute the Science of Logic.

As SENSE receives the *matter* of Knowledge; and as UNDERSTANDING forms conceptions, that is, gives *unity* or *form* to the received matter, (see vol. xi. p. 608.) it follows that CONCEPTION is the form of all Knowledge; REASON, by means of conclusions, furnishes us with *Ideas*, as the highest possible classes under which we can arrange our Knowledge. Logic has nothing to do with the *matter* of Knowledge, for this belongs to other Sciences; it regards only the *universal form* of all knowledge; but this *form* is properly speaking nothing but *Thought*. Logic therefore, as it only arranges our thoughts, is purely *regulative*.

When we exclude all the knowledge derived from objects, and attend solely to the use of Understanding and Reason in general, we discover the *absolutely-necessary* laws of Thinking, namely those laws without which no thinking whatever can take place. These laws may be thoroughly conceived *à priori*, that is, *independently of all experience*, as they are the conditions of the use of understanding in general, without distinction of objects. Hence it follows that the *universal necessary* laws of thinking in general regard only the *FORM*, and by no means the *matter*, of Thought.

*Logic, as a Science*, which treats of thinking in general without regard to the objects or matter of Thought, is,

1. The *Groundwork* of all other sciences, and the *propaedeutic* to all use of understanding.
2. It cannot be considered as an *Organon* of any particular science, because it abstracts from all objects. It is only an universal *Art of Reason*, to regulate our knowledge agreeably to the forms of understanding, which it purifies and corrects, but does not extend.
3. It is a *Canon* for the use of *Understanding* and *Reason* in general; and consists of pure laws *à priori*, that is, neither borrowed from the sciences, nor from common experience. Logic does not enquire how the understanding is constituted, which is the business of Metaphysics, but how it should proceed in thinking.

4. It is both in *matter* and *form* a Science of Reason. Since it has reason itself for its object, its rules therefore cannot be derived from experience. It is a self-knowledge of Understanding and Reason, not of their powers as constituting objects, but merely of their *formal laws* as regulating our thoughts. In Logic we do not enquire what sort of objects the understanding can know; this enquiry belongs to Metaphysics, and concerns the *material* use of understanding; the object of Logic is to ascertain the *formal* laws of understanding for the purpose of rendering it consistent with itself.

Since logic is a science of Reason *à priori*, and a Canon for the use of Understanding and Reason, it differs essentially from *Æsthetics*, which, as a mere critic of taste, have no canon (Laws), but only a *Normal* (a mere pattern or rule for judging), which consists in universal agreement. *Æsthetics* contain the agreement of knowledge with

the laws of SENSE. *Logic* the rules of the agreement of knowledge with the laws of UNDERSTANDING and REASON. *Æsthetics* have only empirical principles, and can therefore never become a Science, because their rules are derived *à posteriori*, that is, entirely from experience; and it is only by the comparison of objects that the empirical laws, according to what we observe the beautiful in nature, are rendered general.

Now, when we comprise all the essential marks which belong to a complete determination of the Conception of Logic, we obtain the following definition:

*Logic is a Science of Reason both in MATTER and FORM; a science A PRIORI of the necessary laws of thinking, not with regard to particular objects, but to all objects in general; therefore, a Science of the right use of Understanding and of Reason in general, not SUBJECTIVELY, i. e. according to empirical (psychological) principles, showing how the understanding is accustomed to think; but OBJECTIVELY, i. e. according to principles A PRIORI, which determine how it ought to think.*

II. *Chief Divisions of Logic.—Mode of treating it.—Use and concise History of this Science.*

Logic is divided into

1. *Analytic* and *Dialectic*.

The *Analytic* unfolds, by dissection, all the acts of reason which we exercise in thinking in general. It is therefore an analysis of the *Form* of understanding and reason; and is properly termed the *Logic of TRUTH*; because it comprises the necessary laws of all (formal) *truth*, without which our Knowledge, whatever be its object, is in itself untrue. It is therefore nothing more than a *Canon* for the judging act, (a rule for the formal correctness of our Knowledge.)

When we employ this merely theoretical and universal doctrine in a practical manner, i. e. as an organon, it becomes a *Dialectic*, a Logic of Appearance, (*ars sophistica disputatoria*.) This *Dialectic* arises entirely from a negligence in the use of the *Analytic*, being satisfied with the mere *appearance of truth*, instead of the *real truth*, which can only be obtained from an examination of the object. We accordingly divide Logic into two parts; *ANALYTIC*, which furnishes the formal *criterion of Truth*; and *DIALLECTIC*, which contains the marks and rules which denote that something is repugnant to the formal criterion of Truth, notwithstanding it has every appearance of agreement with it. *Dialectic* in this sense however has its advantage as a *Catharticon* of the understanding.

2. It is customary to divide Logic into, *Natural* or *Popular*, and *Artificial* or *Scientific*; (*Logica naturalis, Logica scholastica, five artificialis*).

But this division is inadmissible; for *Natural Logic*, or the Logic of *common sense*, is properly no Logic at all, but an anthropological science, which has only empirical principles, referring merely to the rules of the natural use of Understanding and Reason, which can only be known in the *concrete* without the consciousness of them in the *abstract*.

The artificial or scientific alone deserves the name of Logic, as a science of the necessary and universal laws of thinking, which can be known completely *à priori*, independently of the natural use of Understanding and Reason; although it can only at first be discovered by the natural use of these powers.

3. A still farther division of Logic is that into *Theoretical* and *Practical*; but this division is also unwarrantable.

UNIVERSAL LOGIC, which as a mere *Canon* abstracts from all objects, can have no practical part; for this would be a contradiction in terms. *Practical Logic* presupposes the knowledge of a certain kind of objects, to which it is applied. We might therefore term every science a *Practical Logic*; for every one must contain a form of thinking. Universal Logic, considered as practical, can be nothing more than a *technic* of learning in general. An *organon* of the scholastic method.

According to this division, therefore, Logic would have

have a *Dogmatical* and a *Technical* part. The former might be termed *ELEMENTARY DOCTRINE*, and the latter *DOCTRINAL METHOD*. The practical or technical part of Logic would be a logical art with respect to arrangement, terminology, and distinctions, for the purpose of assisting the understanding in its exercise. But in both parts, the technical as well as the practical, not the least attention should be paid either to the objects or the subject of thought. In the latter respect logic might be divided into

4. *Pure and Applied Logic.*

In *Pure Logic* we separate the understanding from the other faculties of the mind, and consider only what this faculty performs by itself. *Applied Logic* considers the understanding mixed with the other faculties of the mind, which influence its operations, and divert it from its proper course; so that it does not proceed according to those laws of whose rightness it must be itself the sole judge. Applied Logic cannot with propriety be termed Logic. It is a psychological science, wherein we consider how thinking has usually proceeded, not how it ought to proceed. Finally, it teaches what we must do, in order to make a right use of our understanding, under the multiplicity of subjective hindrances and restraints. We may also learn from it what promotes the right use of understanding, how it may be assisted or how logical mistakes and errors may be corrected. But still it is no *propaedeutic*; for Psychology, from which every thing in Applied Logic must be derived, is a branch of philosophy to which Logic must be the *propaedeutic*.

It is indeed said, that technical logic, or the manner of constructing a science, must be learned from applied logic. But this is completely erroneous; for this would be erecting an edifice before we had provided the materials. That is to say, giving a form where the matter is wanting. Every science must have its technic.

5. Lastly, with respect to the division of Logic into that of *Common Sense* and that of *Speculative Reason*, it must here be remarked, that this science can by no means admit of such a division.

*Logic is not a science of Speculative Reason*, or it would be an *Organon* for other sciences, and not a mere *propaedeutic* which treats of the use of Understanding and Reason in general.

As little can Logic be a *product of Common Sense*. Common Sense is that power which discovers the laws of knowledge in the *concrete*. But Logic is a science of the laws of thinking in the *abstract*.

With respect to the mode of treating of Logic, it may be either *scholastic* or *popular*.

It is *scholastic* when it is suited to those who are qualified and desirous to investigate it as a Science. But it is *popular* when it stoops to the capacities and wants of those who do not study Logic as a science, but wish only to use it in order to clear up their understanding. In the scholastic treatment, the laws must be represented in their *universality*, or in the *abstract*. In the popular they must be shown in their *particularity*, or in the *concrete*. The scholastic mode of treatment is the foundation of the popular; for no one can treat a subject even in a popular manner who is not able to treat it fundamentally.

From what we have already said of the nature and end of Logic, we can now judge of this science, and of the utility of studying it by a true and determinate standard.

Logic is certainly no universal art of inventing, no *Organon* of Truth; nor is it an Algebra, by whose assistance hidden truths can be brought to light.

It is however useful, and indeed indispensable, as a *Critic of the Form of Knowledge*, or for judging both of common and speculative reasoning, not to teach them, but to render them correct and consistent with themselves. For the logical principle of Truth is, the agreement of the Understanding with its own universal laws.

Finally, with regard to the History of Logic, we shall merely observe, that the present system of logic is derived

from Aristotle's Analytic. That philosopher may indeed be considered as the Father of Logic. He taught it as an *Organon*, and divided it into Analytic and Dialectic. His mode of teaching was extremely scholastic, as he attempted to develop the most general conceptions upon which logic is founded. Unfortunately we derived but little benefit from this logic, because almost every thing in it terminated in subtilities. We have however learned from it the different judging acts of Understanding and Reason.

Since the time of Aristotle, logic has received no addition to its matter; nor indeed does its nature admit of it. But it may improve in *accuracy*, in *precision*, and in *clearness*. There are but few sciences which can attain a permanent state that admits of no further change. Amongst these are *Logic* and *Metaphysics*. Aristotle omitted none of the powers of the understanding; we are only more accurate, more regular, and more methodical. Lambert's *Organon* was expected considerably to extend the science of Logic; but it only contains more subtle divisions, which, like all subtilities, tend to sharpen the understanding, but are of no essential use.

Leibnitz and Wolff are among the modern philosophers who have contributed to bring universal logic into notice. It cannot properly be said of Malebranche and Locke, that they have touched upon the subject; since they treated of the *Matter of Knowledge*, and of the origin of our conceptions. It must be confessed that the Universal Logic of Wolff is the best we have. Baumgarten concentrated Wolff's Logic; and on this account he has great merit.

With respect to Crusius, he certainly did not reflect sufficiently upon the nature of logic, and unfortunately mixed metaphysical principles with it. Thus has logic exceeded the bounds of the science.

We do not now require any new discoveries in logic, since it treats merely of the *Form* of thinking. It is extremely important to fix the absolute limits of the sciences, in order to prevent their principles from being confounded. By this precision we are now able to separate Logic entirely from Philosophy. *The former contains the formal rules of Thinking, without regard to the matter of Thought.* The latter comprehends the matter as well as the form of Knowledge; and may be termed the highest maxim of Reason in the choice of its ends. It is the only science which can procure us complete inward satisfaction; for it closes as it were the circle of Knowledge, reduces the sciences to perfect order, and gives them thorough connection. Its highest problems are comprised in the following questions:

1. What can I know?
2. What ought I to do?
3. What may I hope?
4. What is Man?

The first question is answered by *Metaphysics*; the second by *Morals*; the third by *Religion*; and the fourth by *Anthropology*. It must however be remarked, that Philosophy is never to be learnt; we must only learn by it to philosophize.

III. *Knowledge in general.—Intuitive and Discursive Knowledge.—Intuition and Conception, the Difference between them.—Logical and Aesthetic Perfection of Knowledge.*

All knowledge has a twofold reference. First, a reference to the *object*; and, secondly, to the *subject*. In the former it refers to the REPRESENTATION; in the latter to CONSCIOUSNESS, which is the universal condition of all knowledge. Properly speaking, *Consciousness* is a Representation of a Representation, or that a Representation has taken place.

In all knowledge we must distinguish the MATTER, i. e. the object; and the FORM, i. e. the mode in which the object is known. See vol. xi. p. 608. If a savage, for instance, sees a house at a distance, the use of which he is unacquainted with, he forms to himself a representation of the very same object which the civilized man represents to himself, who knows it to be a habitation for man. This knowledge differs in the two individuals with respect

spect

spect to its form. In the one it is a mere *intuition*, in the other an *intuition* joined to a *conception*; that is, *real Knowledge*.

All *real Knowledge* may be termed *intuitive*, as it rests upon *intuition*, which *immediately* refers to the object, without the mind. But, the moment our *sensitive faculty* is impressed by an external object, the *Understanding* instantly forms a conception of this object, and ranks it under its proper class: Thus, when we see a Tree, we proceed by *intuition* in the examination of its peculiar qualities, the leaves, bark, &c. and we determine this Tree to be an Oak, by uniting this particular intuition to our conception of an oak. It is then *real Knowledge*; and this is the process the mind pursues in forming Knowledge. For, the instant the intuition is placed in the conception, I become clearly conscious of the determinate object, and of the Knowledge which I have obtained from it. This Knowledge has now become actually my property by the exertion of my mental activity. It is a Representation, which I not only retain in memory, but can reproduce in my imagination as often as I please, either to communicate it to others, or to further my own progress in Knowledge. Thus, having frequently been impressed by St. Paul's Cathedral, and having with clear consciousness arranged the *intuition* of its various parts under their respective *conceptions*, as the number of the columns, the turrets, the dome, &c. I may now say that I possess an accurate Knowledge of that edifice, which is *real Knowledge* stored up in my mind, and which I can communicate to others either verbally or by giving designs of the various parts. But here we must particularly remark, that Knowledge so communicated is never *real Knowledge* to the individual that receives it; for it evidently wants the most essential part, namely, the *intuition*. Therefore this Knowledge can only be called *discursive*, as consisting only of conceptions, however accurately they may have been formed or faithfully described. Nothing can be more evident than the impossibility of communicating the *intuition*, which can only be obtained by placing ourselves within the reach of the object, and suffering our *sensitive faculty* to be impressed by it. All communicated knowledge is therefore properly enough termed *Discursive* or *Historical Knowledge*. Its inseparable condition is veracity in the Historian; otherwise what is considered as Knowledge may in fact be mere illusion. Who is there that will not say, he knows that the gallant Wellington defeated the French at Vittoria; confiding implicitly in the accounts given by that great general. Without this condition, his brilliant achievements might be considered as mere romance by all those who have had no intuition of them, nor in any manner witnessed their truth. The first requisite of discursive Knowledge is its possibility, the second its probability: for, that which contradicts itself cannot be true.

The difference in the form of Knowledge depends upon a condition which constantly accompanies all knowing, namely upon *Consciousness*, which is susceptible of degrees. I may either have a *clear* or an *obscure* consciousness.

As *consciousness* is the essential requisite of the logical form of Knowledge, Logic can have nothing to do with obscure representations. Logic does not teach us how our representations arise, but merely how they accord with logical forms. Neither can it treat of mere representations, and of their possibility; this it leaves entirely to Metaphysics. It is occupied only with the laws of thinking; that is, with *Conceptions*, *Judgments*, and *Conclusions*. Upon these, all thinking depends. Doubtless something takes place before a *Representation* acquires the form of a *Conception*; and this is nothing more than the *intuition* from which every conception must originate; (see vol. xi. p. 609.) or it can have no meaning whatever.

Although no knowledge whatever is possible without thinking, yet thinking alone can never constitute Knowledge. We here find that *mental forms* without matter never amount to Knowledge, but remain mere *thought*; and that, in order to possess Knowledge with clear consciousness, the *matter* must be given, to which alone these forms

can be applied. Hence *Representation* does not amount to Knowledge, notwithstanding it is always presupposed.

All *distinct* representations, to which alone logical rules can be applied, may be distinguished according to their *clearness* and *obscurity*. When we are conscious of the whole representation, but not of the parts which compose it, the REPRESENTATION IS OBSCURE.

We will elucidate THIS first in *Intuition*. Suppose, for example, we see an Edifice at a distance; in order to be conscious that the object perceived is a *house*, it is requisite that we should have distinct representations of the parts which compose this building, such as the windows, doors, &c. for, if we do not see the parts of the house, we certainly cannot say we see the house itself. We are conscious of the whole representation, but not of the parts of which it is composed; consequently our representation of this object is an *obscure representation*.

To illustrate this in *Conception*. Let us take the Conception of the Beautiful. Every one has a conception of beauty. This conception has various marks; in the first place, the beautiful object must affect our senses; secondly, it must please universally, &c. But, if we cannot distinguish these and the other marks of the Beautiful, our conception of it is *obscure*.

Some have termed an *obscure representation*, a *confused one*; but this is incorrect; for the opposite of confusion is not *distinctness*, but *order*. It is indeed true that distinctness is the effect of order, and obscurity the effect of confusion. Therefore all *confused* knowledge is at the same time *obscure*; but the converse of this position does not hold good, for obscure knowledge is not always confused; for instance, that which contains *no variety* of which we are conscious; here indeed it may be said that there is no *order*, but at the same time there can be no *confusion*.

This applies to all *simple representations*, which never can become *distinct*; not because there is any confusion in them, but because they contain no variety. They must therefore be called *obscure*, but not *confused*. For instance, a mathematical point.

And even in *complex representations*, in which a variety of marks may be distinguished, the want of distinctness may arise, not from confusion, but from the WEAKNESS OF CONSCIOUSNESS. A thing may be formally distinct, i. e. I may be conscious of the variety in the representation, but the matter will be indistinct, if the degree of consciousness be small, though every thing in it be in perfect order. This is the case in *abstract representations*.

*Distinctness* is of two kinds. First, *Sensible Distinctness*. This consists in the consciousness of the variety in the *intuition*. I see, for instance, the milky way as a whitish stripe. The rays from the several stars which compose it must necessarily strike my eye; but the representation of them is only rendered distinct by means of the telescope, which discovers to me the individual stars that compose the milky way.

Secondly, *Intellectual Distinctness*. Distinctness of conception or of understanding is the faculty of forming conceptions. See vol. xi. p. 609. This depends upon an analysis of the *Conception* with regard to the variety which it involves. Thus for example, in the conception of *Virtue* are contained as marks, first, the conception of *Freedom of the will*; secondly, the conception of *Dependance upon the Moral Law*; thirdly, the conception of *subjecting all our inclinations to this law of our will*. If we analyze in this way the conception of *Virtue* into its constituent parts, we thereby render it distinct. But this distinctness adds nothing to the contents of a conception; it only clears it up in point of *form*.

When we reflect upon the two essentially-different sources of knowledge, SENSE and UNDERSTANDING, the difference between *intuition* and *conception* presents itself. All knowledge thus considered is either INTUITION OR CONCEPTION. The former originates in SENSE; the latter in UNDERSTANDING. The logical difference between Understanding and Sense consists in this, that the latter furnishes nothing but *intuitions*, the former nothing but

conceptions. Both these fundamental powers may indeed be considered in another point of view, and be defined in quite another manner; namely, Sense as the power of RECEPTIVITY, and Understanding as the power of SPONTANEITY.

This mode of explanation is however not logical, but metaphysical; and is more fully given in vol. xi. p. 608. where the dissection of the Human Mind into its original and fundamental powers of REASON, UNDERSTANDING, and SENSE, is treated of. It is also customary to term Sense the inferior, and Understanding the superior, power; because Sense furnishes only the matter of thought; while the Understanding disposes of this matter, and arranges it under rules or conceptions.

Upon this distinction between *Intuitive* and *Discursive* Knowledge, or between intuition and conception, rests the difference between the ÆSTHETICAL and LOGICAL perfections of knowledge.

Knowledge may be perfect either according to the laws of Sense or to those of Understanding. In the former case it is æsthetically perfect, and in the latter logically. Æsthetical and logical perfection are therefore different in kind; the former relates to *sense*, the latter to *understanding*. The logical perfection of knowledge depends upon its agreement with the object, consequently upon *universally-valid laws*, and can therefore be judged of according to *norma*, or rules *à priori*. Æsthetical perfection consists in the agreement of Knowledge with the subject, and depends upon the peculiar *sensitiveness* of men. Hence æsthetical perfection has no universally-valid laws, in respect to which it may be judged of *à priori* in a universally-valid manner. However, as there are universally-valid Laws of Sense, not indeed OBJECTIVELY valid for thinking beings in general, but only subjectively so for each individual in particular, we can still form a conception of Æsthetical Perfection which contains the ground of a universal subjective pleasure, namely Beauty, *that which pleases the sense in the intuition*, and may therefore become an object of *universal delight*, because the laws of intuition are the universal laws of Sense.

By this agreement with the universal laws of sense, the *Beautiful*, which consists in *pure form*, is specifically distinguished from the *agreeable*, which only pleases in the feeling by stimulus or emotion; and for this reason can only produce an individual gratification. This pure æsthetical perfection is that which agrees best with the logical.

Æsthetical perfection, so far as regards the beautiful, is of service to logical perfection; but it is also disadvantageous to it, when we attend merely to the agreeable, which consists in our feelings, and has no reference to *pure form*, but only to the matter of sense. For feelings are the greatest enemies to the logical perfection of knowledge.

There is always a sort of strife between the logical and æsthetical perfection of knowledge, which cannot be perfectly removed. The Understanding demands to be instructed; Sense to be pleased; the former requires insight, the latter facility of apprehension. The beautiful, though superficial, will please the Sense, but not satisfy the Understanding; the profound, though dry, will interest the Understanding, but not gratify the Sense.

It is, however, extremely desirable to unite these two kinds of perfection, and to give an æsthetical form to all such knowledge as is susceptible of it; in order to render that popular which is scholastically accurate and logically perfect. But in this attempt to unite æsthetical and logical perfection, we must not forget that *logical perfection* is the basis of all other perfection, and must on no account be sacrificed to any other.

In order to show more clearly the difference between the *logical* and *æsthetical* perfections of our Knowledge, we will compare them with each other under the four heads of Quantity, Quality, Relation, and Modality.

Knowledge is perfect according to

1. Quantity when it is *Universal*;
2. Quality when it is *Distinct*;

3. Relation when it is *True*;

4. Modality when it is *Necessary*.

Considered in these points of view, Knowledge is logically perfect when it has *objective* Universality, *objective* Distinctness, *objective* Truth, and *objective* Necessity.

To these logical perfections of Knowledge, correspond the following Æsthetical Perfections under the same four heads; namely

1. *Æsthetical Universality*. This consists in the applicability of Knowledge to a variety of objects, which may serve as examples.

2. *Æsthetical Distinctness*. This is a distinctness by means of intuition, by which an abstract conception is viewed or illustrated in concreto; by an example.

3. *Æsthetical Truth*. A merely subjective truth, consisting in the agreement of our knowledge with the laws of the sensible phenomena. It is consequently nothing more than a general appearance.

4. *Æsthetical Necessity*. A necessity according to the evidence of the senses, as being confirmed by feeling and experience.

In the above-mentioned perfections two points always occur; the harmonious union of which constitutes perfection in general; namely, *variety* and *unity*. In Understanding, the *unity* lies in the conception; in Sense, in the intuition.

Mere Variety without Unity cannot satisfy us. TRUTH is therefore the highest of all perfections, since it is the ground of unity in the reference of knowledge to its object. Even in æsthetical perfection, Truth is after all the *conditio sine qua non*, the chief negative condition, without which nothing can universally please the taste. Hence no one can hope to succeed in the Fine Arts who has not laid as a foundation the logical perfection of his knowledge. It is in the greatest possible union of logical with æsthetical perfection, in those works which are designed both to instruct and please, that the true character of Genius is manifested.

#### IV. PARTICULAR LOGICAL PERFECTIONS OF KNOWLEDGE.

A. *Logical Perfection of Knowledge as to Quantity*.—*Extensive and Intensive Quantity*.—*Extent and Solidity of Knowledge*.—*Determination of the Horizon of our Knowledge*.

Quantity of Knowledge may be understood either as extensive or intensive. The former implies its multitude or variety, the latter its *contents* or *solidity*, which includes also its fruitfulness so far as it is a ground of numerous and important consequences. (Non multa, sed multum.)

In extending our Knowledge, or giving it the perfection of extensive quantity, it is proper to consider its agreement with our ends and capacities. This reflection refers to the determining the *Horizon of our Knowledge*; by which is to be understood, the proportioning the quantity of knowledge we collect to our capacities, and to the ends we have in view.

The Horizon of Knowledge may be determined,

1. LOGICALLY, i. e. according to the powers of the knowing Faculty, with a view to the *interest of Understanding*. We have here to determine how far we can proceed in knowledge in general, and how far we must proceed for the accomplishment of our chief end or design.

2. ÆSTHETICALLY, i. e. according to *Taste*, with a view to the *interest of Sense or Feeling*.—Whoever determines his horizon æsthetically, endeavours to regulate science according to a universal taste, that is to render it *popular*; and indeed to acquire such knowledge only as admits of universal communication, and may be interesting even to the illiterate.

3. PRACTICALLY, i. e. advantageously with respect to the *interest of Practical Reason or of the Will*. The practical horizon, when it is determined agreeably to the influence which knowledge has upon our Morals, is *pragmatical*, and is of the highest importance.

The Horizon of Knowledge therefore determines either what

what we can know, what we may wish to know, or what we ought to know.

As to the theoretically or logically determined horizon, in particular, we may consider it, either in an *objective* or a *subjective* point of view.

Considered *Objectively*, the Horizon is either *historical* or *rational*. The former is much more extensive than the latter; indeed our historical Knowledge has no bounds. The rational horizon, on the other hand, may be fixed, since, for example, it may be determined to what kind of objects mathematical knowledge cannot extend; and also how far reason can proceed *à priori* in philosophical knowledge independently of experience.

Considered *Subjectively*, the horizon is either universal and absolute, or particular and conditional. (Private Horizon.)

By the absolute and universal horizon is to be understood the congruence of the bounds of human Knowledge with those of human Perfection. And here the question arises, What can man know?

The determination of the Private Horizon depends upon a variety of empirical conditions and peculiar views; for instance, upon the age, the sex, the station, mode of life, &c. Each class of men has, therefore, according to its particular ends and views, and the peculiar powers of knowledge it possesses, a particular horizon. Each Mind, in proportion to its individual powers and views, has an horizon proper to itself. Lastly, we may conceive the idea of an horizon of *Common Sense* as distinguished from the horizon of *Science*, the latter of which requires *principles* to determine what can and what cannot be known.

What cannot be known is *above* our horizon, what need not be known is *out of* our horizon. The latter however must be understood *relatively*, that is, as referring merely to particular private aims, to the attainment of which some species of Knowledge may not only contribute nothing, but actually prove detrimental. For there is no knowledge that is absolutely and in all respects useless, though its utility may not always be apparent. Hence the reproach cast by superficial minds upon those great men who labour to cultivate the Sciences, in the question, *Of what use is this?* is as unwise as it is unjust. He who resolves to engage in the sciences must never for a moment propose this question to himself. If a science explains but one, even possible object, it is on that account alone sufficiently useful. All logically-perfect knowledge has always some possible use, which, though unknown to us, may perhaps be discovered by posterity. Had man in the culture of Science always attended to immediate advantage and utility, we should have had neither Arithmetic nor Geometry; but our understanding is so constituted, that it takes a greater delight in mere introspection than in all the advantage that can accrue from it. This Plato long ago observed. Man is here conscious of his pre-eminence; he feels what is meant by having understanding. Those who are not sensible of this may envy the beasts. The *external* value of Knowledge in its mere application must not be put in comparison with the *INTERNAL* worth which it possesses in its logical perfection.

In the extension and demarcation of our knowledge, the following rules may be useful.

1. To determine our own horizon at an early age, but not until we are able to fix it for *ourselves*, which seldom occurs before the age of twenty.
2. Not too frequently, nor for slight reasons, to change our horizon.
3. Not to measure the horizon of others by our own, nor to consider that as useless which is so merely to ourselves; it being rash to attempt to fix the horizon of others, since we are seldom sufficiently acquainted either with their views or capacities.
4. Neither too much to extend nor to contract our horizon. For he who seeks to know too much, in the end knows nothing; and on the contrary, he who believes

that certain things do not concern him may possibly deceive himself; as for instance, the philosopher who should believe that history is of no use to him.

5. To endeavour, previously, to determine the absolute horizon of the whole human race.

6. To determine the place which the science we have principally in view holds in the horizon of collective knowledge. Here the universal Encyclopædia may serve as a general Map of the Sciences.

7. Before we determine our own particular horizon, to examine carefully for what sort of knowledge we have the greatest capacity and inclination; to consider what may be more or less serviceable to our particular duties, and what may be incompatible with duties which are absolutely necessary.

8. And lastly, to endeavour at all times to extend our horizon rather than to contract it.

With respect to the extension of knowledge generally, we need not dread that we shall proceed too far in the pursuit of it; for nature has sufficiently circumscribed us. The Criticism of Reason, of History, and a general spirit directed to knowledge in the great, and not merely in the detail, will always contract its circumference without diminishing its contents. Thus is it cleared from the husk which is no longer necessary. In the progress of Natural History, of the Mathematics, &c. new and shorter methods will constantly be invented to reduce the multiplicity of books. Thus every thing will be more easily attained and with less burthen to the memory. He therefore who should discover the means of compressing History within a few permanent Ideas would have the merit of a genius.

Ignorance is opposed to the logical perfection of knowledge merely with respect to its extent. This negative imperfection is, on account of the limited nature of the Understanding, inseparable from all human Knowledge.

Ignorance may be considered either in an *objective* or *subjective* point of view.

1. OBJECTIVELY. Ignorance is either *material* or *formal*. The former consists in a want of Historical Knowledge, the latter in a want of Rational Knowledge. We ought not, in any department, to be entirely ignorant. But we may indeed limit our historical knowledge, the better to cultivate rational knowledge; and *vice versa*.

2. SUBJECTIVELY. Ignorance is either *learned*, *scientific*, or *common*. Whoever clearly perceives the bounds of knowledge, consequently where the field of ignorance begins; for instance, the *philosopher* who proves how little we can know of the nature of gold, for want of the necessary data; is learnedly ignorant. He, on the contrary, who is ignorant without perceiving the grounds of his ignorance, is *vulgarly ignorant*. Such a man does not even know that he is ignorant; for, to represent his ignorance to himself, he would require the aid of science. As a blind man can form no idea of darkness until he has seen the light.

The knowledge of our ignorance, therefore, presupposes science, and renders us modest; while an imaginary knowledge inflates. Thus the ignorance of Socrates was glorious, because, according to his own confession, it was properly a knowledge of his ignorance.

To be ignorant of those things which rise *above* our horizon is *irreproachable*, and may be allowed, though only in a relative sense, with respect to the speculative use of our knowing faculty, in as much as the objects are here, though not *above*, yet *out of*, our horizon. Ignorance is, however, *disgraceful* in such things as are essential, and at the same time easy to be known.

There is a difference between not knowing and not noticing a thing. It is advantageous to pass over many things that would be detrimental to our knowledge. Abstraction differs from both. We abstract from our knowledge when we consider it in the general, as a Principle. To abstract thus from all that is foreign to our object, is extremely useful.

Those who cultivate their reason most, are commonly deficient.

deficient in historical Knowledge. Historical Knowledge without determinate bounds is *Polyhistory*. It is liable to render men vain. Unlimited speculation is *Polymathy*. The extension both of Speculative and Historical Knowledge without determinate bounds is termed *Pansophy*. In Historical Knowledge is included the science of the implements of learning; *Philology*, or a critical Knowledge of literature and languages.

The mere Polyhistor is a Cyclops in literature who wants one eye, namely, the eye of philosophy. A Cyclops in Mathematics, History, Natural History, Philology, and Languages, is a scholar who is great in each of these departments, but considers all philosophizing upon them as superfluous.

The *Humanist*, by an acquaintance with the ancients, combines Science with Taste, polishes our rudeness, and promotes a spirit of communication and urbanity, in which indeed *Humanity* consists. If we would separate the mere Philologer from the Humanist, they may be thus distinguished. The former seeks in antiquity the implements of learning, the latter materials for forming the taste.

The *Pedant* cultivates the sciences merely for the schools, and thereby limits their *use*; the mere *fashionable writer* subordinates them to the purposes of general communication, and thus restricts them in their *matter*.

A just precision in forms is profoundness, i. e. scholastic perfection. Pedantry is therefore an affected profoundness; and the *fashionable style*, courting the sanction of Taste, is nothing but an affected popularity. For this extreme politeness seeks only to flatter the reader, and to prevent his being offended even by a single expression.

To avoid Pedantry, we must possess an extensive Knowledge, not only of the sciences themselves, but of their application. Hence the *true Scholar* alone can free himself from Pedantry, which always characterizes a man of confined abilities.

In endeavouring to give to our knowledge the two perfections, scholastic solidity and popularity, without falling into the affectation of either, we must direct our attention first to the scholastic perfection of our Knowledge, and afterwards consider how to render this knowledge truly popular, that is, easy of communication; for, in seeking to please the multitude, we must not sacrifice scholastic precision, without which all science would become trifling.

In order to acquire a truly popular style, we should study the finest works of the ancients, and those of the moderns who have enjoyed the greatest intercourse with the polite world, without which popularity is not to be attained.

The schools have their prejudices, as well as common sense: each may therefore serve to correct the other. Hence it is important to try our Knowledge upon the understandings of men who are not biased by any School.

That perfection of knowledge which renders it easily and universally communicable may be termed its *extensiveness*.

All kinds of Knowledge stand in a certain natural connection. If, in endeavouring to extend our knowledge, we do not observe this connection, it will become mere Rhapsody. It is advisable, therefore, to form some plan by which the sciences may be arranged suitably to the objects we have in view, and so as to render their attainment more easy. If we establish to ourselves a chief science as our main object, and consider all other knowledge only as the means to its attainment, we thus give to our knowledge a sort of systematic character. In order to proceed according to a well-regulated and adequate plan in extending our knowledge, we must endeavour to become acquainted with the connection of the different species of knowledge. It is the *Architectonic* of the sciences, which furnishes us with a System, according to *IDEAS* in which the sciences are considered as a whole, of knowledge interesting to mankind.

With respect to the *intensiveness*, that is, the *intrinsic va-*

lue and importance, of knowledge; we may offer the following remarks:

All such knowledge may be termed *logically important*, which promotes logical perfection according to *Form*. For instance, every mathematical position, every clearly-defined law of nature, every just philosophical explanation. Practical importance we can never foresee, but must wait until it is ascertained.

We must not confound importance with difficulty. Knowledge may be difficult without being important, and conversely. Hence the difficulty determines nothing either for or against the importance of knowledge. This depends upon the multiplicity of its consequences. The more consequences our knowledge has, that is, the more uses it is applicable to; the more important it is. Whenever Knowledge has no important consequences, it is termed a *Sophism*: such, for instance, was the Philosophy of the Schools.

**B. Logical Perfection of Knowledge as to RELATION.—Of Truth.—Material and formal, i. e. logical, Truth.—Criteria of logical Truth.—Falschhood and Error.—Appearance as the source of Error.—The means to avoid Error.**

A chief perfection of Knowledge, indeed the essential and indispensable condition of all its perfections, is **TRUTH**. Truth, it is said, is the agreement of Knowledge with its object. According to this *merely nominal explanation*, therefore, Knowledge, in order to be considered as true, must agree with its object. But I can only compare the object with my Knowledge of it, by knowing the object. Knowledge must therefore confirm itself; which however is far from being sufficient to Truth. For, as the object is without, and Knowledge is in the Mind; we can never do more than judge whether our Knowledge of an object agrees with our Knowledge of an object. Such an explanation in a circle, the ancients termed *Dialele*; and the Logician has always been reproached by the Sceptic for this Defect; a charge which is well founded; for the solution of the problem is absolutely impossible.

The Question now arises whether we possess sure universal *Criteria of Truth*. For this is the meaning of the Question, **WHAT IS TRUTH?**

In order to be able fully to answer this important question, we must clearly distinguish in our Knowledge, what belongs to its **MATTER**, and which refers to the *object*, from what concerns the mere **FORM**, as being the condition without which Knowledge would be no Knowledge at all. With respect to this Distinction between the **OBJECTIVE** or **MATERIAL** and the **SUBJECTIVE** or **FORMAL** reference, the above question is divided into the two following:

Is there, 1, a Universal *Material*; and, 2, a Universal *Formal*, Criterion of Truth?

A universal *material criterion of Truth* is impossible; it is actually a contradiction in terms. For, as a **UNIVERSAL CRITERION** applicable to objects in general, it must wholly abstract from all difference of objects in particular; and yet at the same time as a **MATERIAL criterion** refer precisely to this difference, in order to determine whether a Knowledge agrees with the particular object to which it refers, and not with the conception of an object in general: which indeed is saying nothing at all. But in this agreement of a Knowledge with the determinate object to which it is referred *material Truth* entirely consists. For, Knowledge which with respect to one object is true may with respect to another be false. It is therefore absurd to require a universal material criterion of Truth, that abstracts from all difference of objects, and yet at the same time does not abstract from this difference.

But, with respect to the question concerning *universal Formal criteria of Truth*, the answer is easy, that there are undoubtedly such. For formal truth consists entirely in the agreement of Knowledge with itself, completely abstracting from all objects in general and from all difference.

ence between objects. The universal formal criteria of Truth are therefore nothing else but the universal logical marks of the agreement of Knowledge with itself, or, which is the same, with the universal laws of Understanding and Reason.

These formal Universal Criteria are indeed insufficient to objective truth, but they are still to be considered as, the *conditio sine qua non* of objective Truth.

For, before we ask whether Knowledge agrees with the object, we must first enquire whether it agrees with itself (as to form) : and this is the business of Logic.

The formal Criteria of Truth in Logic are,

1. *The position of Contradiction,*
2. *The position of Sufficient Reason.*

By means of the former the *logical possibility*, and by means of the latter the *logical reality*, of a Knowledge is determined.

The logical Truth of a Knowledge requires, *First*, that it be logically possible; i. e. that it do not contradict itself. This mark of internal Logical Truth, is however only negative; for a Knowledge which contradicts itself is certainly false; but, though it do not contradict itself, it does not follow that it is true. *Secondly*, that it be logically grounded; i. e. that it have sufficient grounds, and no false consequences.

This second criterion of external Logical Truth, or of the rationality of Knowledge as to grounds and consequences, is *POSITIVE*. And here the following rules are to be observed :

1. *From the truth of the Consequence we may infer the truth of the Knowledge as the ground of it, but only negatively.*

If a false Consequence flows from a Knowledge, then the Knowledge itself is false. For, if the ground were true, then the consequence must also be true, since the consequence is determined by the ground.

We cannot, however, infer conversely, that, because no false consequences follow from a Knowledge, it is therefore true; for we may draw from a false ground true results.

2. *If all the Consequences of a Knowledge are true, the Knowledge itself is also true; for, if there were any thing false in a knowledge, some false consequences must result from it.*

From the consequences we may indeed infer a ground, but without being able to determine the ground. It is only from the aggregate of all the consequences that we can infer a determinate ground to be the true one.

The former mode of concluding, according to which the consequence can only be *negatively* and indirectly a sufficient criterion of the truth of a Knowledge, is termed in Logic *apagogical* (*modus tollens*).

This procedure, which is much used in Geometry, has this advantage, that we need only deduce one false consequence from a Knowledge to prove its falsehood. As for instance, to prove that the Earth is not a plane, I may, without positive and direct grounds, conclude in the following manner: Were the Earth a plane, the Polar Star would invariably be at the same height; but this is not the case; consequently the Earth is not a plane.

In the *positive* and *direct* mode of concluding, (*modus ponens*,) there is this difficulty, that the Totality of consequences cannot be apodictically known. Therefore by this mode of concluding we can only arrive at an apparent or hypothetically-true Knowledge, (*Hypothesis*,) upon the supposition, that, where many consequences are true, the remainder will also be true.

We are consequently here enabled to establish *Three Principles* as universal, though merely formal or Logical Criteria of Truth: these are,

1. *The Principle of Contradiction and Identity, (principium contradictionis et identitatis,)* by which the internal possibility of a Knowledge is determined for *Problematical Judgments*.

2. *The Principle of Sufficient Reason, (principium rationis sufficientis,)* upon which the (logical) actuality of a Knowledge rests, namely, that it is grounded; being the matter for *Affertorical Judgments*.

3. *The Principle of the Excluded Third, (principium exclusi medii inter duo contradictoria,)* upon which the (logical) necessity of a Knowledge is grounded; namely, that we must judge so, and not otherwise; i. e. that the opposite is false; for *Apodictical Judgments*.

The opposite to Truth is *Falseness*, which when taken for Truth is called *Error*. An *erroneous judgment* (for Error as well as Truth occurs only in judging) is consequently a judgment which confounds the appearance of Truth with Truth itself.

*How Truth is possible*; it is easy enough to conceive, since here the understanding acts according to the laws of its own constitution.

But how *Error*, in the formal sense of the word, that is, *how an irrational mode of thinking, is possible*, it is difficult to conceive, since we cannot imagine how any power should deviate from the laws of its own constitution. We must not, therefore, look to the Understanding and its own proper laws for the source of Error, any more than to the limits of our Understanding, which may indeed be the cause of *Ignorance*, but by no means of *Error*. If we had no other power of Knowledge than the pure understanding, we should certainly never err. But, besides *Understanding*, there is another indispensable source of Knowledge; namely, *Sense*, which furnishes the materials for thinking, and in so doing acts according to different laws from those of the Understanding. But from Sense alone no Error can arise, because Sense does not judge at all. The ground of all error lies in the secret influence of Sense upon the Understanding while it judges, causing it to mistake *subjective* for *objective* grounds, and consequently the mere *Appearance* of Truth for *Truth itself*. What makes Error possible is therefore this *appearance*.

In one sense indeed we may consider the Understanding as the origin of Error, since for want of the requisite attention to the influence of Sense it suffers itself to be misled by *appearance*, and to take that which is *true* according to the laws of Sense, as true also according to the laws of Understanding.

Again, Error cannot be said to lie in our Reason; for this faculty, like every other, is endowed with its proper powers and limits; and therefore, *cannot err*. But, in judging of the motives of our actions, we suffer our Feelings to work upon our Reason, and to drive it out of its course.

*Ignorance* indeed is occasioned by the limits of Understanding, for nature has denied us much Knowledge; but *Error* is attributable to ourselves. One source of Error is our proneness to judge and decide about things which are without the limits of our faculties.

All Error into which human Reason can fall is however only *partial*. In every erroneous judgment there must always be something true; for a complete error would be an entire contradiction to the laws of Understanding and Reason.

With respect to *Truth* and *Error*, it is necessary to distinguish between *accurate* and *inaccurate* Knowledge. Knowledge is *accurate* when it is adequate to its object, and there is not the least error in it. It is *inaccurate* when there are errors in it, yet without entirely defeating its object.

This distinction respects the *wider* or *narrower* determination of our knowledge; (*cognitio late vel stricte determinata*.) It is sometimes necessary at first to determine knowledge by very wide limits, particularly in history. But in rational knowledge there must be nothing vague; every thing must be strictly determined. It depends on the object of knowledge whether it ought to be determined *vaguely* or *strictly*. The wide determination leaves room for error, since it is frequently mistaken for a strict one.

A distinction may be made between *Strictness* as an *objective perfection* of knowledge, consisting in its entire agreement with its object, and *Subtlety* as a *subjective perfection* of knowledge.

The knowledge of a thing is *subtle* when something is discovered in it that has been commonly overlooked. It requires

requires therefore a higher degree of attention, and a greater exertion of the intellectual powers.

Many persons condemn all *subtily*, because it lies beyond their reach. But, considered in itself, it is always an honour to the Understanding; and, when applied to objects worthy of examination, it is even highly meritorious. When more intellectual attention and effort is bestowed upon an object than is necessary to its attainment, this is a fruitless labour, and leads to subtilities which are indeed difficult, but useless, (*nugæ difficilis.*) As the *strict* is opposed to the *vague*, so is the *subtile* to the *common*.

From the nature of *error* as above described, namely, falsehood with the appearance of truth, the following important rule, for the truth of knowledge, arises.

Error cannot be considered as absolutely unavoidable, though it may be so *relatively*. There are many cases where we are compelled to judge, even at the risk of erring. In order to avoid error, we must endeavour to discover and explain the *appearance* from whence it springs. But very few philosophers have accomplished this; they have only endeavoured to refute the errors themselves, without pointing out the *appearance* from whence they originated. The discovery and solution of the *appearance* is however much more beneficial to *truth* than the immediate exposure of the errors themselves; for this does not stop their source, nor prevent the very same appearance, in other cases, from leading us again into error. Though our error may have been shown to us, there still remains a doubt, however faint, that we might yet be able to justify it, so long as the appearance itself, which laid the foundation of the error, is not removed.

It is besides an act of fairness to explain to him who has erred the *appearance* which caused the error; for no one will allow that he has erred without some *appearance* of truth, which might perhaps have deceived a more penetrating mind, because here subjective grounds came under consideration.

An error, where the *appearance* is obvious to common sense, is called an absurdity. The reproach of absurdity is always personal, and ought always to be avoided, especially when we are refuting error. For to him who maintains an absurdity, the *appearance* itself is not obvious, although it is the ground of an obvious falsehood. We must first point out the *appearance* to him; and, if he still persists, he is indeed absurd, and nothing more can be done with him; for he thereby shows himself to be not only incapable, but actually unworthy, of all further explanation and refutation. Strictly speaking, there is no demonstrating to any one that he is absurd; for here all reasoning would be useless. In proving an absurdity, we no longer address ourselves to a man who remains in error, but to one who is attentive to reason. In that case the absurdity no longer exists.

An absurdity may be termed such an error as has not even an *appearance* to excuse it: for, as a gross error, it shows an ignorance in common affairs, and a want of common observation.

Error in principle is more prejudicial than in its mere accidental occurrence. The comparison of our own judgments with those of others, is an external test of truth, since what is *subjective* is not the same in all men, consequently the *appearance* may be thus detected. The disagreement of the judgments of others with our own may be considered as an *external* mark of error, and as a hint to us to re-examine our judgments; but not as a reason for immediately rejecting it. For we may perhaps be still right in the *matter*, but only wrong in the *manner*; that is, in the mode of treatment.

Common Sense is of itself indeed a touch-stone by which we may discover the defects of the speculative use of Reason. When we find the correctness of the speculative use of Reason sanctioned by common sense, this is termed to *orient one's self in thinking*.

The universal rules and conditions requisite for avoid-

ing error are; 1. To think for ourselves; 2. To consider ourselves in thought as in the place of others; 3. Always to think consistently. The maxim of self-thinking is called an *enlightened*, that of assuming in thought the situation of others an *enlarged*, and that of thinking consistently a *consequential* or *conclusive*, mode of thinking.

C. *Logical Perfection of Knowledge as to QUALITY.*—*Clearness.*—*Conception of a Mark in general; different Kinds of Marks.*—*Determination of the Logical Essence of a thing, and Distinction between this and the Real Essence.*—*Distinctness a high Degree of Clearness.*—*Æsthetical and Logical Distinctness.*—*Difference between Analytic and Synthetic Distinctness.*—*Scale of the Value of Knowledge.*

Human Knowledge considered on the Part of Understanding is *discursive*; that is, it makes that to be a ground of Knowledge which is common to many things; consequently it arises by means of marks. We know things therefore only by means of marks.

A mark is that in a thing which constitutes a part of the knowledge of that thing; or, which is the same, it is a partial representation considered as a ground of knowledge of the whole representation. All our conceptions are consequently marks; and all thinking is nothing else but a representing by marks.

Every Mark is,

1. A representation in itself.
2. It belongs, as a partial conception, to the whole representation of a thing, and is therefore a ground of knowledge of the thing itself.

All marks, considered as grounds of knowledge, are either of an *internal* or an *external* use. The *internal* use consists in *Derivation*, for the purpose of knowing the thing by means of marks as grounds of knowledge. The *external* use consists in *Comparison*, whereby we compare one thing with another according to the laws of *Identity* and *Diversity*.

There are many specific differences with respect to marks, upon which the following classification of them depends.

1. ANALYTIC and SYNTHETIC marks, (which regard the origin of a conception;) the former are *partial conceptions* of a real conception, (which are already thought therein.) The latter, on the other hand, are *partial conceptions* of the merely-possible whole-conception, (which can only arise by the synthesis of many parts.) All Rational conceptions are *Analytic*, and all *Empirical* conceptions are *Synthetic*.

2. CO-ORDINATE and SUBORDINATE marks, which regard the relation of one conception to another. Marks are called *Co-ordinate* when each of them is represented as an immediate mark of the thing. Their connection produces an *entire conception*, and is termed an *aggregate*; which however, with respect to synthetic empirical conceptions, can never be completed, but resembles an unlimited right line, to which more can always be added. Marks are called *Subordinate* when one is represented only by means of another in the thing. Their connection is termed a *series*, and one mark implies the other. This series of subordinate marks is *finite* on the part of the grounds (*à parte ante*), because at last we arrive at *simple conceptions*, which are insolvable, and admit of no further analysis. On the part of the consequences (*à parte post*), it is *infinite*, because we have indeed a HIGHEST GENUS, but have not a LOWEST SPECIES.

In the Synthesis of every new conception by the aggregation of co-ordinate marks, *extensive distinctness* is produced. By the *Analysis* of conceptions, in the series of subordinate marks, *intensive distinctness* is generated. This latter distinctness, as it necessarily tends to the solidity and conclusiveness of knowledge, is highly important in philosophy. But in metaphysics it is carried to the highest perfection.

3. AFFIRMATIVE and NEGATIVE marks. By the former we know what a thing *is*; by the latter what it is not. Negative

Negative marks serve to guard us against error: they are therefore unnecessary in those cases where error is impossible, and only necessary and important when they guard us against an important error into which we might easily have fallen. Thus for example, with respect to a being such as God, negative marks are of the utmost importance.

By *affirmative* marks our object is to *understand a thing*. By *negative*, into which all marks whatsoever may be converted, our aim is not to *misunderstand*, or *not to err*, though we should even learn nothing of a thing.

4. IMPORTANT and PROLIFIC, or BARREN and UNIMPORTANT, MARKS. A mark is important and prolific when it is a ground of knowledge which has very numerous consequences; either with respect to its *internal use*, that is *in derivation*, where it enables us to know a great deal of the thing itself; or with respect to its *external use*, *in comparison*, where it serves to point out the agreement and difference of things.

We must however distinguish here the *Logical* importance and fruitfulness from the *Practical*, that is, the *Utility*.

5. SUFFICIENT and NECESSARY, and INSUFFICIENT and ACCIDENTAL, MARKS. A mark is *sufficient* when it serves to distinguish the thing from all others. If it does not do this, it is *insufficient*; for instance, *Barking* as the mark of a dog. The sufficiency as well as the importance of marks is only to be understood relatively, with respect to the ends we have in view in our knowledge.

Necessary marks are lastly those which must always be met with in the thing represented; and are also termed *essential*, in opposition to the *unessential* or *accidental*, which may be separated from the conception of the thing.

There is still another distinction among necessary marks. Some of them apply to the thing as the grounds of other marks in the same thing; others only as the consequences of other marks, or as being derived from them.

The former are *primitive* and *constitutive* marks; that is to say, those which are not derived from any other marks in the conception. The latter are *attributes*, which only apply to the thing as being derived from the primitive marks in its conception. For instance: the three angles in the conception of a triangle are derived from there being three sides.

The *unessential* or *accidental* marks are again twofold; namely, they refer either to the *internal determination*, (*modi*) of a thing, or to the *external relation* (*relationis*.) As for example, *learning* is a mark that denotes an internal determination of man; but *master* or *servant* an external relation.

The *aggregate* of all the *primitive* marks of a thing, or the sufficiency of its marks according to *co-ordination* or *subordination*, constitutes ITS ESSENCE.

But in this explanation we must by no means think of the *real* or *natural essence* of things, which it is impossible ever to discover. Since logic abstracts from the *matter* of all knowledge, consequently from the thing itself; it follows that this science can only treat of the *logical essence* of things; and this we can easily obtain. For here nothing farther is required than a knowledge of all those predicates which determine the conception of an object. Whereas to the *real essence* of a thing (*esse rei*) is required the knowledge of those predicates on which depends whatever belongs to its *existence* as determining ground. Thus, in order to determine the *logical essence* of a body, we need not seek the *data* in nature; but only attend to the marks which originally constitute its fundamental conception, (*constitutiva rationis*.) For the *logical essence* is nothing but the primitive and fundamental conception of all the necessary marks of a thing, (*esse conceptus*.)

The first step requisite for perfecting our knowledge as to Quality is *clearness*. The second is a higher degree of clearness, namely *distinctness*, which consists in the clearness of its marks. *Logical distinctness* in general, must be distinguished from *æsthetical*. The logical depends upon

the *objective*, the *æsthetical* upon the *subjective*, clearness of marks. The former is clearness by *conception*; the latter clearness by *intuition*. *Æsthetical distinctness* consists in mere *liveliness* and *intelligibility*, that is, in a clearness of marks by examples in the *concrete*; (for many things may be intelligible which are not distinct, and many things may be distinct which are difficult to be understood, because they refer to remote marks whose connection with the intuition is only possible by a long series.)

*Objective distinctness* frequently occasions *subjective obscurity*, and conversely. Hence *logical distinctness* is frequently attainable only at the expense of *æsthetical*; and the latter is often injurious to the former, by examples and families ill-adapted, and only used according to analogy. Besides, examples are not marks, nor do they belong as parts to the conception; they are only intuitions which may assist in forming conceptions. *Distinctness* by examples, that is, mere intelligibility, is quite different from *distinctness* by conceptions as marks. In the union of *æsthetical* or *popular* with *scholastic* or *logical distinctness*, consists the power of representing abstract and profound knowledge in a clear manner, and adapting it to the capacity of common sense.

Logical distinctness in particular may be termed *complete distinctness*; for here all the marks taken together that constitute the whole conception must be rendered distinct. A conception may be completely distinct with respect to the totality of its *Co-ordinate* or of its *Subordinate* marks. (In the former consists the *extensive distinctness* of a conception, which is also termed its *ampleness*. In the latter the *intensive distinctness*, namely its *profundity*.) The extensive distinctness may also be termed the *external completeness*, and the intensive the *internal completeness*, of the clearness of marks. This latter completeness can only be obtained by Ideas of Reason and by arbitrary conceptions of *understanding*, but not empirically.

*Extensive quantity* of Distinctness, when it is not abundant, is termed *Precision*. The *ample* and the *precise* taken together constitute the *adequate*, (*cognitionum quæ rem adequat*.) When the *intensively-adequate* knowledge, that is, the *profound*, is combined with the *extensively-adequate*, that is, the *ample* and *precise*; they produce, according to quality, the greatest perfection of all human knowledge; (*consummata cognitionis perfectio*.)

Since it is the business of Logic to render *clear* conceptions *distinct*, we may now enquire, how this distinctness is produced?

The Distinctness of knowledge may be obtained in two ways: firstly, by *Analysis*, by which we discover all those marks that are already thought in a given conception; secondly, by *Synthesis*, where we trace all those marks which are added as parts of an entire possible conception. Hence there is an essential difference between *forming a distinct conception*, and *rendering a conception distinct*. In order to form a distinct conception, we commence from the parts, and proceed to the whole. At first there are no marks at all; but we obtain these by means of *synthesis*, and thus generate *synthetic distinctness*, which really extends the matter of the conception by that which is added to it as a mark from the intuition, (whether pure or empirical.) The mathematician and natural philosopher both use this *synthetical procedure* in forming distinct conceptions. For all distinctness, in what is purely mathematical as well as in experimental knowledge, depends upon an extension of its conception by the *synthesis* of marks.

In order to render a conception distinct, we begin with the whole, and proceed analytically to the parts, by which we do not in the least extend our knowledge. The matter remains the same, the form alone is changed; by which we are enabled to distinguish better, or to become clearly conscious of that which originally lay in the given conception. As by colouring a map we add nothing to it, but merely render its parts more distinct; so we clear up a conception by the analysis of its marks, without in the least increasing its contents. By a *Synthesis* of marks

the OBJECT is rendered distinct; by an *Analysis* of marks the CONCEPTION is rendered distinct. In the former we proceed from the parts to the whole; in the latter from the whole to the parts. It is the business of the PHILOSOPHER to render *given* Conceptions distinct; and of the Mathematician to produce distinct Conceptions.

This Analytic procedure, with which alone logic has to do, is the first and chief requisite for rendering knowledge distinct. The more distinct our knowledge is, the STRONGER and more EFFICACIOUS it is. We must however be careful in this Analysis not to proceed so far as at last to make the subject itself vanish.

With regard to the objective value of Knowledge in general, it may be arranged according to the following scale.

*The first degree of Knowledge* is—to represent something to one's self even without being conscious that it is a representation; i. e. to represent necessarily or instinctively.

*The Second*; To perceive, that is, to represent something to one's self with consciousness; (*percipere*.)

*The Third*; To know a thing *instinctively* (*noscere*); or to represent it in comparison with other things in respect to *Identity* and *Diversity*. Animals know objects in this way only, but not with consciousness.

*The Fourth*; To know something with *consciousness*, (*cognoscere*); this is not possessed by the brutes.

*The fifth*; To understand (*intelligere*); i. e. to form conceptions, or to conceive. This is very different from comprehending. We may conceive many things that we cannot comprehend; for instance a perpetual motion, the impossibility of which is proved in mechanics.

*The sixth*; To penetrate or *perceive* (*perspicere*); that is, to inspect something by means of Reason. We seldom accomplish this thoroughly; and the more perfect we render our knowledge as to its *matter*, the more we diminish it in *quantity*.

*The Seventh*; To comprehend (*comprehendere*); that is, to inspect by reason *à priori* in a manner sufficient for our purpose. All comprehending is merely relative, i. e. sufficient to a certain purpose; for we cannot comprehend any thing *absolutely*. Nothing can be more comprehensible than mathematical demonstrations; for example, that *All lines within a circle are proportionals*; and yet nothing can be more incomprehensible than that so simple a figure should possess such wonderful properties. The field of the *intelligible* is therefore much greater than that of the *comprehensible*.

D. *Logical Perfection as to MODALITY.*—*Certainty.*—*Conception of holding for True in general.*—*Modes of holding for True.*—*To be of Opinion—to believe—to be certain.*—*Conviction and Persuasion.*—*Reservation and Suspension of Judgment.*—*Preliminary Judgments.*—*Prejudices, their sources and chief kinds.*

Truth is an *objective* Property of Knowledge; the Judgment by which something is represented as true; that is, its relation to an understanding, and consequently to a particular subject, is the subjectively holding for true. Holding for true is either certain or uncertain. The certain holding for true is joined with the consciousness of necessity; the uncertain with the consciousness of contingency, or the possibility of the contrary. The latter is either objectively or subjectively insufficient, or it is objectively insufficient but subjectively sufficient. The former is termed *Opinion*; the latter *Belief*.

There are three kinds or modes of holding for true: *To be of Opinion, to believe, and to be certain.* The first is a *Problematical Judgment*, the second *Affertorical*, and the third *Apodictical*.

Thus for example, the taking *immortality* for true is merely *Problematical*, when we are only of opinion that we may be immortal; but *Affertorical*, if we really believe that we are so; and, lastly, *Apodictical*, when we are certain that there must be another life after this.

There is an essential difference between *Opinion, Belief, and Certainty*; which we shall here fully explain.

To be of *Opinion* is to hold something for true from reasons which are both subjectively and objectively insufficient, and may be considered as a preliminary Judgment, (*sub conditione suspensiva ad interim*;) which we cannot well dispense with. We must first be of opinion before we adopt and maintain the truth of any thing, always taking care not to hold *Opinion* for any thing more than mere opinion. Almost all our knowledge begins with opinion.

Now where can more *Opinion* properly have place? In none of those sciences which contain Knowledge *à priori*. Therefore neither in the *Mathematics*, in *Metaphysics*, nor in *Morals*; but merely in empirical Knowledge, in *Physics*, in *Psychology*, and the like. For to be of opinion *à priori* is in itself an absurdity. Nothing can be more ridiculous than to be merely of opinion in the *Mathematics*; here, as well as in *Metaphysics* and in *Morals*, we must actually demonstrate our Knowledge or confess our Ignorance. Very great injury accrues to the sciences from our merely being of Opinion where we ought to be certain. Matters of opinion always allow the possibility of the opposite being proved; as for instance, with regard to the ETHER which is supposed to fill celestial space, there exist opposite Opinions. This depends upon our faculties being confined within certain limits.

To *Believe*, is to hold something for true upon grounds which are indeed objectively insufficient, but subjectively sufficient. *Belief* relates to objects that never can be known, nay, of which we cannot form an opinion, or even pretend that they are probable. But, as belief is a subjectively-sufficient holding for true, we ought to be certain that our mode of conceiving objects of belief involves no contradiction, and that in a moral point of view the opposite can never be proved: for example, I may be fully certain that nobody can refute the position THERE IS A GOD! for from whence shall he obtain his arguments?

Objects of belief are therefore, First, *Not objects of Empirical Knowledge.* What is called *Historical Belief* is, strictly speaking, not Belief, since it may become Knowledge by means of the *intuition* from whence it originated. The holding for true upon testimony does not differ either in degree or kind from the holding for true from our own experience.

Secondly, *Not objects of Rational Knowledge*; that is, Knowledge *à priori*; neither *Theoretical*, as Mathematics and Metaphysics; nor *Practical*, as Morals.

Neither Mathematics nor Metaphysics in the least allow of uncertainty or belief; for every thing in them must be absolutely demonstrated, or nothing at all is accomplished. In the practical field, or in Morals, belief is equally inapplicable, for we must be perfectly certain whether the action we are about to perform is *Right or Wrong*; that is, conformable to duty or contrary to duty, permitted or not permitted. In morals nothing must be determined upon even at the risk of offending the MORAL LAW.

Thirdly, *Such objects only are matters of Belief with respect to which the holding for true is necessarily free*; that is, where it is absolutely impossible to establish the truth from grounds taken from the object, because it is beyond the reach of our faculties; as *God, the Soul, Immortality, &c.* Yet it is equally impossible for us to relinquish such objects. We are therefore constrained to believe them entirely from *subjective* grounds. This belief is however not inferior to any Knowledge, although it never can become Knowledge. The certainty that is obtained from Knowledge implies only that our senses have been impressed by *given matter*, and that the Understanding has been active in giving it a *form*; and thus an external fact has occurred in our consciousness; whereas, in the *consciousness* of the certainty that arises from belief, we discern that our Reason has been engaged in forming deductions, which, if logically correct, produce *as much conviction* in our minds as the testimony of the senses. Thus for example, who dares to doubt the validity of the MORAL LAW, or disregard the dictates of conscience, and still call himself a rational being?

*Moral Unbelief* is the rejection of that which, although it never can be known, is still morally necessary to be presupposed, in order that Reason should be consistent with itself. This moral unbelief arises from a want of moral incentives. The stronger the moral feeling, the more firm and lively is the BELIEF in those things which we are compelled to assume and presuppose in a *Practical point of view* for the sake of the moral interest. *Belief*, therefore, affords no conviction like *Evidence*, which can be communicated and command universal assent; but, as it rests entirely upon *subjective grounds*, it is as convincing and satisfactory to the subject as any knowledge could possibly be.

3. *To be certain, is to hold something for true from grounds that are both objectively and subjectively sufficient.* Certainty is either *empirical* or *rational*, according as it is grounded in Experience or in Reason. This distinction refers to the only two sources from whence all our Knowledge springs, namely, *Experience* and *Reason*.

*Rational certainty* is divisible into *Mathematical* and *Philosophical*: the former is *intuitive*, the latter *discursive*. *Mathematical certainty* is also termed *Evidence*, because *intuitive Knowledge* is clearer than *discursive*. Though the *Mathematical* and *Philosophical Knowledge* of Reason are equally certain, the kind of certainty in them differs.

*Empirical certainty* is *original*, when it is procured by our personal experience: it is *derived*, when it is obtained from the experience of others; which latter is usually termed *historical certainty*.

*Rational certainty* is distinguished from *Empirical* by the consciousness of the *Necessity* that always accompanies it. It is consequently *apodictical*, while *empirical certainty* is only *Affertorial*. We are rationally certain of that, which we might have known without any experience. Our Knowledge may concern objects of experience, and yet its certainty may be both *empirical* and *rational* at the same time; since an *empirically-certain position* may be known also by principles *à priori*. *Rational certainty* cannot be attained in all subjects; but, where it can, it is to be preferred to *empirical certainty*.

All certainty is either *immediate* or *mediate*; that is, requires proof, or is incapable of proof. Let never so much of our Knowledge be *mediately certain*, that is, certain because it is demonstrated; there is always at the bottom something *indemonstrable*, or immediately certain; for all our knowledge first springs from *immediately-certain positions*.

The proofs upon which all immediate certainty of Knowledge depends are either *direct* or *indirect*; which latter are also called *Apogogical*. When I prove a Truth by its grounds, I give a *direct* proof of it; but, when I conclude the Truth of a position from the falsity of its opposite, this is an *apogogical proof*, which requires that the positions be *Contradictorily* or *Diametrically* opposed. For two merely *contrary* positions may both be false. A proof which is the ground of *Mathematical certainty* is termed a *Demonstration*, and that which is the ground of *Philosophical certainty* an *Aeroamatical* proof.

From the preceding remark upon the nature and kinds of holding for true, we may draw this general conclusion; that all conviction is either *Logical* or *Practical*. When we know that the holding for true is sufficient, and that we are still free from all *subjective grounds*, then we are convinced *Logically*, or from *objective grounds*; that is to say, *The object is certain*.

A sufficient holding for true from *Subjective grounds*, which in a *practical reference* is as valid as the *objective*, is *Practical Conviction*, though not *Logical*. And thus *Practical Conviction*, or the *Moral Belief* of Reason, is often more firm than Knowledge itself. For in Knowledge we still attend to the *opposite reasonings*; but in Belief we do not, as it does not arise from *objective grounds*, but entirely from the moral interest of the subject. This *Practical Conviction* is therefore the *true moral belief* of Reason; and, although it never can become Knowledge, it cannot be invalidated by any Knowledge whatever.

Conviction is opposed to *Persuasion*, which is a holding

for true upon insufficient grounds, where we are uncertain whether they are merely *Subjective* or both *subjective* and *objective*.

*Persuasion* frequently precedes *Conviction*. In much of our Knowledge we have only a sort of consciousness, which does not enable us to judge whether the grounds of our holding for true are *objective* or *subjective*. Hence, to arrive at *Conviction* from mere persuasion, we must first reflect to what faculty a certain Knowledge belongs, and then investigate whether the grounds are sufficient or insufficient. Many persons are content with *Persuasion*; some arrive at *Reflection*; but very few proceed to *Investigation*. Whoever knows what is requisite to certainty, will not easily confound persuasion with conviction; and consequently will not be easily persuaded. There is always a ground which determines our assent; and this may be both *objective* and *subjective*; but it is seldom analyzed.

Though all *Persuasion* is, as to FORM, *false*, in as much as it gives to an uncertain Knowledge the appearance of certainty; yet, as to MATTER, it may be true. Here it differs from *Opinion*, which is also an *uncertain Knowledge*, but is always considered such.

The strength of a belief may be put to the test by *Wager* or by *Oath*. The former requires a comparative, the latter an absolute, sufficiency of objective grounds. But, in *Rational belief*, where there are no objective grounds, a *subjective sufficiency* of grounds is equally valid.

We frequently use the expressions to *adopt*, to *suspend*, to *defer*, and to *abandon*, a Judgment. These expressions seem to imply that there is something *arbitrary* in our Judgments. The question then is, *whether the Will has any influence upon our Judgments*.

The will has no immediate influence upon our holding for true; this would be highly absurd.

Had the will this influence upon our conviction, we should constantly form to ourselves the chimera of a happy state, and always consider it as true.

As, however, the will either stimulates the understanding to the investigation of truth, or withholds it, we must admit that it has an influence upon the exercise of understanding, and thus mediately upon conviction itself, which depends upon this exercise. With respect to the reservation of Judgment, this consists in the determination not to suffer a mere preliminary judgment to become a definitive one. A preliminary judgment is one, in which there are more grounds for than against the truth of a thing, but which grounds are not sufficient to an immediate and determinate Judgment. A Preliminary Judgment is therefore a *Problematical Judgment*, with the consciousness of its being merely *problematical*.

The suspension of a Judgment may occur from two motives; either for the purpose of investigating the grounds for a definitive judgment, or to avoid judging altogether. In the former case the Suspension is called *Critical* (*suspensio iudicii indagatoria*), in the latter *Sceptical* (*suspensio iudicii sceptica*). For the sceptic relinquishes judgment altogether; while the true philosopher merely suspends his judgment, because he has not yet sufficient grounds to hold something for true.

To suspend our judgment upon principle, requires the understanding to be versed in judging, which is the case only as we advance in years. Indeed to withhold our assent is always difficult; sometimes because the understanding is eager to judge and enrich itself by Knowledge, and frequently because we feel an inclination to some things in preference to others. Whoever has been often obliged to recall his assent, and has thereby become cautious and prudent, will not be apt to judge too hastily, for fear he should be compelled again to retract. This recantation is always mortifying, and renders us mistrustful of all our Knowledge.

We may still further remark, that to leave a judgment in doubt is different from leaving it in suspense. In the latter case we retain an interest in the thing; in the

former, it is perhaps not our intention to examine strictly whether it be true or not.

Preliminary judgments are very necessary, nay, indeed indispensable to the use of understanding, in investigation and meditation; for they serve to lead the understanding, and to furnish it with the various means necessary to its enquiries.

When we meditate upon an object, we must always form a preliminary judgment, and anticipate the Knowledge we are to derive from it; and, when we endeavour to *invent*, or make *discoveries*, we must always form some previous plan to prevent our thoughts from wandering at random. Hence, by preliminary judgments may be understood maxims to direct our investigations. They may also be termed Anticipations, since we anticipate our judgment of a thing before we arrive at it definitively. Such judgments have therefore an excellent use; and rules might even be given agreeably to which we ought to judge previously of objects.

Preliminary Judgments are to be distinguished from prejudices. Prejudices are preliminary judgments laid down as principles. Every prejudice is to be considered as a principle of erroneous judgment. We must therefore distinguish the false knowledge which springs from a prejudice, from the prejudice itself, which is its source. For instance, the interpretation of dreams is in itself no prejudice, but an error, which originates in the generally-received Rule, that, *that which sometimes comes true always comes true*, which is in itself a prejudice.

Prejudices are sometimes true as preliminary judgments; only it is wrong to lay them down as principles, that is, as definitive judgments. This mistake is caused by taking subjective grounds for objective, from a want of that reflection which ought always to precede judgment. We can admit much Knowledge without investigation; for instance, *all immediately-certain positions*. Here we need not examine the conditions of their truth; yet we cannot and ought not to judge of any thing without reflection, that is, without comparing our Knowledge with the faculty from whence it sprang, namely, SENSE or UNDERSTANDING. If then we attempt to form judgments without this necessary reflection, even where no investigation is required, Prejudices arise, that is, principles of judgment from subjective grounds, which are falsely taken as objective ones.

The chief sources of prejudice are, *Imitation, Habit, and Inclination*.

*Imitation* has an universal influence upon our judgment; for it is a strong reason to hold something for true, that it has been declared so by others. Hence the prejudice, that *what every body says must be true*. Those prejudices which are founded in *Habit*, require a length of time before they can be completely eradicated, as the Mind meets with many hindrances in weighing opposite reasons before it can relinquish its habit, and adopt an entirely new mode of Thinking. But, if a prejudice of *habit* is also founded in *imitation*, it is then indeed extremely difficult to cure. A prejudice of imitation may be considered as a proneness to the Mechanism of Reason, instead of an active exertion of its proper freedom.

Reason is an *active principle*, which ought to take nothing upon credit, or from the mere authority of others; and indeed, in its *pure use*, not even from experience. But the idleness of much the greater part of mankind induces them rather to tread in the footsteps of others, than exert their own understandings. Were this universally the case, there would be an end to improvement, and the world would ever remain in the same state. It is therefore highly necessary and important, not to educate youth, as is usually done, upon the principle of mere imitation.

There are many things which induce us to adhere to the maxim of Imitation, and thereby render Reason a fruitful soil of prejudice. Amongst these may be reckoned the following:

1. *Formula*: These are rules which serve as patterns

for imitation. They are also exceedingly useful as guides in intricate cases. The clearest heads have therefore endeavoured to discover them.

2. *Sayings*: Which express an important truth, with great accuracy; so that it seems impossible to convey it in fewer or better words.

3. *Sentences*: That is, propositions which are adopted, and frequently last for centuries; from the strength of thought which they contain, the result of a matured judgment.

4. *Canons*. These are general rules which serve as the groundwork of sciences, and denote something sublime and deeply considered. They may also be expressed in a sententious manner, which renders them much more pleasing.

5. *Proverbs*. These are popular rules of common sense to denote popular judgments, which serve only the vulgar, and are not met with among people of refined education.

From the three preceding general sources of prejudice, and chiefly from imitation, arise many particular ones; among which we shall notice the following.

1. *Prejudices of Authority*.

a. *Prejudice in favour of the Authority of Persons*. In matters which depend upon experience and testimony, to rest our Knowledge upon the authority of others is by no means a prejudice; for, as we cannot experience every thing ourselves, the authority of other persons must be the foundation of our Judgment. But, if we make the authority of others the foundation of our holding for true in Rational Knowledge, this is indeed a prejudice, for Rational Truth is valid, even though it be anonymous. Hence the question is not *Who has said it?* but *What has been said?* There is but one Truth; and, if we take the trouble, we shall discover it. It is of no importance to Knowledge to be nobly descended; and yet it is extremely common to respect great authorities, and to concur in their judgments without examination.

b. *Prejudice in favour of the Authority of the Multitude*. It is the vulgar who are chiefly inclined to this prejudice. For, since they cannot judge of the Merit, Capacity, and Knowledge, of a single person, they rather abide by the judgment of the many, on the supposition that what every body says must be true. However, this prejudice influences them only in matters of experience; for in religious affairs, in which they are themselves interested, they trust to the judgment of the learned. It is besides worthy of remark, that the ignorant are prejudiced in favour of learning, and the learned in favour of common sense. When the learned, after having nearly passed through the circle of the sciences, do not find that satisfaction which should reward their labours, they begin at last to lose their confidence in learning, especially with respect to those speculations, the conceptions of which cannot be rendered sensible, and whose foundations are wavering; as for instance, in Metaphysics. However, as they still believe that the Key to the certainty of the desired Knowledge is somewhere to be met with, they look for it in *Common Sense*, having so long sought for it in vain in scientific investigation. But this hope is very deceitful; for, when the *cultivated* Power of Reason can do nothing with respect to a certain Knowledge, the *uncultivated* will certainly not succeed better. In Metaphysics, the appeal to the decisions of common sense is besides wholly inadmissible, because here nothing can be admitted in the *concrete*. But in Morals the case is certainly different; here, not only all rules may be given in the *concrete*, but *Practical Reason* reveals itself in general more clearly and correctly by means of Common Sense than by means of *Speculative Reason*. Therefore Common Sense, on subjects of Morality and Duty, frequently judges with more correctness than Speculative Reason.

c. *Prejudice in favour of the Ancients*. We have certainly great reason to judge favourably of antiquity; but we often carry our admiration of the ancients too far, and thus raise the relative value of their writings to an absolute

lute value, trusting implicitly to their guidance. To over-rate the ancients in this way, is to put back the understanding to the state of infancy, and to neglect the use of our own talents. Besides, we deceive ourselves greatly if we believe that all the writings of the ancients were equally classical with those which have descended to us; for time sifts every thing, and only retains that which has an intrinsic value. We may therefore justly suppose that we possess only the best writings of the ancients.

There are various causes by which the prejudice in favour of antiquity is produced and maintained. When we discover any thing in the Ancients, which, considering the circumstances of the times they lived in, exceeds our expectation, we are filled with surprise and admiration. Besides a Knowledge of the Ancients is a proof of erudition and great reading, which are always esteemed, however trifling and unimportant the Knowledge may be which is obtained from that study. The obligation we are under to them for having introduced us to many Species of Knowledge, induces us to hold them in high esteem; but, in consequence of the time and labour we have bestowed upon them, we are apt to carry this too far. There is also a certain jealousy of our contemporaries, which leads some, who cannot cope with the moderns, to praise the ancients at their expense. We must however candidly acknowledge, that the ancient models of taste have never been equalled.

The opposite to this, is the prejudice in favour of Novelty. There have been times when the prejudice in favour of the ancients has sunk, particularly in the beginning of the 18th century, when the celebrated Fontenelle took part with the moderns. In experimental knowledge, which is always capable of being extended, it is very natural that we should place more confidence in the moderns than in the ancients. But this judgment must be considered as a preliminary judgment; for, if we change it into a definitive one, it then becomes a prejudice.

We must not omit to mention two very useful rules in judging: the one is, that comparisons illustrate, but do not prove: and the other, that ridicule exposes, but does not refute.

2. *The Prejudice of Self-Love*, or logical Egotism, is opposed to the Prejudice of Authority, as it manifests itself in a certain partiality to the offspring of our own understandings. But self-love is extremely laudable, as it induces us to be active for our own interest, and is even necessary to our existence. How, then, does it come to be the source of prejudice? This happens when we consult our self-love at the expense of our Reason. A strict attention to the following maxim, will eventually confine self-love within its proper limits, and thus prevent its ever amounting to a prejudice. We should always ask ourselves this Question: *Would every body judge as I have done? and, if this were to become a universal law for all reasonable beings, what would be the state of the world?*

To favour the prejudices of others, is nothing more than directly to impose upon them. Yet who would undertake to expose and remove them? Old and inveterate prejudices are difficult to be eradicated, being judges in their own cause. It is however very advisable to use every means to expose them, as much good may result from their extermination.

V. *Of Probability.*—Difference between Probability and Plausibility.—Mathematical and Philosophical Probability.—Doubt Subjective and Objective.—Scepticism, Dogmatism, and Criticism.—Hypothesis.—Of the Difference between Theoretical and Practical Knowledge.

When there is a majority of objective reasons in favour of a thing, it approximates to Certainty, and is termed Probability. For instance, if a medicine has cured ten and killed ten, there is then an equal chance; but, if it has cured twenty and killed ten, the reasons for are more than those against it. If it has cured a hundred and killed ten, the probability in its favour is greater; but, if it has

cured ten thousand and killed only ten, the probability of its effecting a cure is greatly increased. Hence it is evident that probability is susceptible of degrees.

The more perfect our conceptions of a thing are, the better we are able to judge of its probability: For example, suppose I throw two dice, what is it most probable I shall throw, ten or five? First, I have an accurate conception of the dice; they are cubes, with the numbers from one to six marked on each. In order to determine which throw is the most probable, I proceed to enumerate all the possible throws thus: Let A represent one Die, and B the other.

To throw	A	B	Cases	To throw	A	B	15
2	1	1	1	6	1	2	6
3	2	1	2	7	2	3	
	1	2		3	4	4	
4	3	1	3	6	5	6	5
	2	2		8	2	3	
5	4	1	4	3	4	4	4
	3	2		9	3	5	
6	2	3	5	6	6	4	3
	1	4		10	4	5	
	5	1		3	6	6	2
	4	2		4	4	5	
	3	3		11	5	6	1
	2	4		12	6	6	
	1	5					
			15				Cases 36

Now there are only thirty-six possible cases: And thus, by a complete analysis of our Conception of the Dice, we have obtained the exact number of possible cases to produce each throw; by which we perceive, that to throw five we have four possible cases, and to throw ten we have only three; consequently it is more probable to throw the former. Hence it is evident, that, the clearer our conceptions are, the more accurately we are able to judge, till at length we may count the different degrees of probability, which is of the utmost importance to the success of an undertaking.

Probability is not to be met with in the Mathematics, for there demonstration commands assent; nor in True Philosophy, (Criticism,) for here we must either believe or know. By the former is meant Rational belief, which is a subjectively-sufficient holding for true; and to know is to be fully certain. Probability is therefore only to be met with in experience.

By Probability is to be understood a holding for true on insufficient grounds, which however have a greater relation to the sufficient than to the opposite. In this explanation we distinguish Probability from mere Plausibility (verisimilitudo); that is, a holding for true upon insufficient grounds which have a greater relation to the insufficient than to the opposite. The grounds of holding for true may be either objectively or subjectively greater than those for the contrary. In order to discover which of the two is the case, we need only compare the grounds with the sufficient ground. In Probability, the ground of holding for true is objectively valid; in mere Plausibility, it is only subjectively so. In Probability, there must always be a standard by which it can be estimated; and this is Certainty; for, if we are to compare the insufficient with the sufficient, we must know what is sufficient, namely, the Certainty. In Plausibility there is no such standard; for here we do not compare the insufficient with the sufficient ground, but with the opposite.

The moments of Probability may be either homogeneous or heterogeneous.

*heterogeneous*. If they are homogeneous, as is the case in Mathematical Knowledge, they must be *numbered*. If they are heterogeneous, as in Philosophical Knowledge, they must be weighed, that is, estimated by their effects, or as they overcome obstacles in the mind. These obstacles have no relation to Certainty, but only such a relation as one Plausibility has to another. Hence it follows that in the Mathematics only the relation of the *insufficient* to the *sufficient* grounds can be determined. In Philosophy we must content ourselves with *Plausibility*, which is a mere subjectively and practically sufficient holding for true. For Probability cannot be estimated in philosophical knowledge, on account of the heterogeneity of the grounds. But of mathematical Probability we may say, that it goes more than half way towards Certainty.

Much has been said on the subject of a Logic of Probability; but this is impossible; for, if the degree of the relation of the insufficient to the sufficient grounds cannot be mathematically counted, all rules are useless. Besides we can give no other universal rules of probability, except these, that *error* does not wholly lie on one side, and that there must be a ground of agreement in the object; also, that, when error exists in equal quantity and degree in two opposite arguments, the truth lies between them.

Doubt is an opposite ground, or a mere obstacle to holding for true, which may be either *objectively* or *subjectively* considered. Doubt is either *subjectively* taken as the state of an irresolute mind; or *objectively*, as the knowledge of the insufficiency of the grounds of holding for true. In the latter sense it is an *objection*; that is, an objective ground for disbelieving a knowledge that is considered to be true.

*Scruple* is an opposite ground to the holding for true, which is only subjectively valid. In scruple we do not know whether the obstacle is grounded in the object or only in the subject, that is, whether it arises from inclination, habit, &c. We doubt without being able clearly to explain ourselves concerning the ground of doubt. In order to remove a scruple, it must be raised to the clearness and precision of an objection. For it is by means of objections that certainty is rendered clear and perfect; and we cannot be certain of a thing unless opposite grounds are stated by which it may be determined how far we are from or how near we are to certainty. It is not sufficient that each Doubt should have a reply; it must be *resolved*, that is, rendered conceivable how the scruple originated. If this is not effected, the doubt is only *repelled*, but not *removed*; and the seeds of doubt still remain. In many cases we cannot indeed determine whether the obstacle to holding-for-true has merely subjective or objective grounds; and therefore cannot remove the scruple by exposing the appearance, because we cannot always compare our knowledge with the object. It is therefore modest to propose our objections only as doubts.

There is a principle of doubt, which consists in the maxim, to consider all knowledge as uncertain, and to show the impossibility of attaining to certainty. This is *Scepticism*. It is opposed to *Dogmatism*, which is a blind confidence in the power of Reason, suffering it, on account of its apparent success, to extend itself *à priori*, without a *Critic*, by means of mere conceptions. Both Scepticism and Dogmatism, when universally applied, are erroneous. For in great part of our knowledge we cannot proceed dogmatically; and Scepticism, by renouncing all positive knowledge, puts a stop to all endeavours for the attainment of certainty. When, however, Scepticism is limited to that method, which, in the investigation of Truth, endeavours to reduce every thing to the greatest possible uncertainty, in order that we should not assume Appearance for Truth; it is then only a suspension of Judgment, which is highly beneficial to *Criticism*. The *Critical* method of Philosophizing is precisely that which establishes *Reason* as its leading principle, and rejects all that is unreasonable. Thus it extracts the pure truth which is contained both

in Scepticism and Dogmatism. For this astonishing discovery we are indebted to the immortal Kant, who has founded a Philosophy (see vol. xi. p. 605.) that must quiet for ever Speculative Reason, and clear Practical Reason from all charge of contradiction and absurdity, erecting upon this basis a perfect system of Morals. Criticism may therefore be said to attain the summit of all human culture; for it constantly criticises its own principles, and only adopts those which are susceptible of apodictical certainty and complete demonstration.

We have already stated, that Probability is a mere approximation towards Certainty. This is particularly the case in Hypotheses, by means of which we can never arrive at apodictical certainty, but only at a greater or less degree of Probability in our knowledge. *An Hypothesis is the holding for true of a Judgment, from the Truth of a ground, on account of the sufficiency of its consequences; or the holding for true of a presupposition as a ground.*

All holding for true in hypotheses depends upon this, that the presupposition, as ground, be sufficient to explain other knowledge as consequences. For, from the truth of the consequences we infer the truth of the ground. Since, however, this mode of inference affords a sufficient criterion of Truth, and can lead to apodictical certainty only when all the possible consequences of a given ground are true; it appears from hence that, as we cannot determine all possible consequences, hypotheses will always remain hypotheses; that is, presuppositions whose complete certainty never can be ascertained. The probability of an hypothesis may nevertheless go on increasing until it raises itself to an *Analogon* of certainty; that is, to that state where all the consequences that have hitherto presented themselves are capable of being explained by the presupposed ground; for in that case there is no reason why we should not suppose that all possible consequences may be explained by it. In this case we submit to the hypothesis as if it were completely certain, although it is only so by induction.

In every Hypothesis something must however be apodictically certain, namely;

1. *The Possibility of the Presupposition itself*. When, for instance, in order to explain Earthquakes and Volcanoes, a subterraneous fire is supposed, such a fire must in the first place be possible, if not as a flaming, yet as a heated, substance. But, on account of certain other appearances, to consider the earth as an animal in which the circulation of internal fluids produces this heat, is a mere fancy, and no hypothesis. For it is admissible to fancy a thing real; but not to fancy a thing possible: this ought to be certain.

2. *The Consequence*. This must flow correctly from the assumed ground, or the hypothesis produces merely a chimaera.

3. *The Unity*. It is an essential requisite of an hypothesis that it be only *one*, and that it do not require auxiliary hypotheses for its support. If we are obliged, for the sake of one hypothesis, to have recourse to others, it thereby loses much of its probability. For, the more consequences are derived from one hypothesis, the more probable it is. The hypothesis of Tycho Brahe was so inadequate to the explanation of many of the celestial phenomena, that he had recourse to several new hypotheses to supply its defects. From this it might easily have been perceived that it was not the true one. This has since been fully evinced. The Copernican System is an Hypothesis which explains every thing requisite, as far as our experience has hitherto reached. This needs no auxiliary hypothesis.

There are Sciences which do not admit of Hypotheses; for example, the Mathematics and Metaphysics. But in Natural Philosophy they are both useful and necessary.

With respect to the difference between Theoretical and Practical Knowledge, we may remark, that Knowledge is termed Practical when it is opposed, not only to *Theoretical* but to *Speculative*.

*Practical Knowledge* is therefore either,

1. IMPERATIVE; and so far opposed to Theoretical; or it contains,
2. *The Ground of possible Imperatives*, and is so far opposed to Speculative.

By IMPERATIVES in general, is to be understood, all those positions which express a possible FREE ACTION, by which a certain end may be realized. All Knowledge therefore which contains an Imperative is PRACTICAL, and is opposed to *Theoretical*. The latter expresses not what *ought to be*, but what *is*; and consequently has for its object, not acting, but BEING; while the former refers to ACTING, and to the realizing of what OUGHT TO BE.

*Practical Knowledge*, in opposition to *Speculative*, may however be termed *Theoretical*, provided *Imperatives can be derived from it*: in that case it is OBJECTIVELY PRACTICAL. Speculative Knowledge is such from which no rules of conduct can be derived, or which contains no grounds for possible Imperatives. Such merely-speculative positions occur frequently in Theology. Speculative Knowledge is always *Theoretical*, but not conversely all *Theoretical Knowledge* Speculative; for, taken in another point of view, it may at the same time be PRACTICAL.

Ultimately, every thing centres in the PRACTICAL; and the *practical worth* of all our knowledge consists exactly in this tendency of all Theory and Speculation finally to promote the practical. But this *worth* is only then unconditional, when the end, to which our exertions are directed, is an unconditional end. Now the only unconditional end to which all practical knowledge can refer is MORALITY. This is indeed the final end and scope of all our exertions. For *pure practical* reason lifts man out of Nature, and refers him to a MORAL WORLD, where he alone will allow himself to partake of happiness that has rendered himself worthy of it. Hence Morality is the only unconditional end, and on that account may be called *necessarily or absolutely Practical*. That part of Philosophy which treats of Morality must, by way of eminence, be termed PRACTICAL; though every other Philosophical Science may also have its practical part, namely, directions how to realize certain ends denoted by the theory.

DEFINITIONS AND FUNDAMENTAL PRINCIPLES.

1. REPRESENTATION, is a Variety in a Unity; it is an EFFECT resulting from the ACTIVE and PASSIVE faculties of the Mind; i. e. The representing subject is the CAUSE, as it is active in giving a form to the variety or matter received, which is the OBJECT; and, when this object or variety has been formed into a Unity, then arises the EFFECT, which is a Representation. This procedure must be accompanied with consciousness.

2. CONSCIOUSNESS is the act which refers that, in a Representation, which belongs to the mind, to the mind; and that to the external thing which is its produce.

3. SENSE, or RECEPTIVITY, is the passive faculty of the Mind, which receives the variety or matter of Representations, (and without which no representation whatever would be possible.) It may be termed the faculty of Receiving *immediate* representation of objects by *Sensation*, or the power of forming INTUITIONS.

4. SENSATION is the alteration that occurs when the *receptivity* is affected; or it is the impression of objects on our Senses, which is the ground of all INTUITIONS, both external and internal.

5. EXTERNAL INTUITION is that representation which *arises immediately*, in consequence of our receptivity being affected from without. It must always have the MATTER *present*, which consists of a variety of parts lying one without and near another; that is, it must occupy a determinate place in *space*, and fill up a portion of *time*; e. g. any external object, for instance, a Man.—It immediately refers to its object, which is completely determined, and is an individual Representation, determinable by NUMBER; i. e. it is a *Substance*.

6. INTERNAL INTUITION is that representation which *arises immediately* in consequence of our Receptivity being affected from within; (i. e. by the operations of our own faculties.) It must always have the matter *present*, which consists of a variety of parts, that never lie one near another, as in a plane; but strictly follow one after another, and occupy a portion of *Time only*; as for instance, any *emotion, action, or passion*, in Man. It immediately refers to its object, which has a beginning, middle, and end; and is an individual Representation. It is determinable by DEGREES, i. e. it is an *Effect* of a Substance, or a Reality in Time only.

7. TIME is a variety in general, whose parts strictly follow one after another, and are intimately connected; it is continuous, divisible *in infinitum*, and infinite. It is an INTUITION *à priori*, consequently universal and necessary. But the form of Internal Sense is a variety as above described. Therefore, TIME IS THE FORM OF INTERNAL SENSE. It is a Subjective Reality; has a larger sphere than Space; and has only one Dimension, namely, Duration.

8. SPACE is a variety in general whose parts lie one without and near another; i. e. co-exist; they are intimately connected. It is continuous, divisible *in infinitum*, and infinite. It is an INTUITION *à priori*; consequently universal and necessary. But the form of External Sense is a variety as above described; therefore SPACE IS THE FORM OF EXTERNAL SENSE. It is a subjective Reality, has a *smaller* sphere than time, and has three dimensions, *length, breadth, and height*.

9. PHENOMENON is another name for Intuition; it indicates that *intuitions* are merely APPEARANCES in time and space, and *not the things in themselves* as they exist independently of the operation of our faculties. For it is a fact, that the Mental activity exerted in forming an intuition is merely a RE-ACTION that takes place when we are affected by any external object, which *in itself* is called Noumenon.

10. NOUMENON is the Cause of the Phenomenon; or it is *the thing in itself* which is out of *Time and Space*, and of which we consequently know nothing.

11. PERCEPTION is also synonymous with Intuition; or, it is a representation of a thing of whose existence we are quite convinced; and in this respect it is opposed to *Conception*, which is a Representation of a thing of whose existence we are not convinced.

12. UNDERSTANDING, or SPONTANEITY, is the faculty to produce *mediate Representations*, or *Conceptions* which are abstracted from Intuitions. For this purpose it is furnished with 12 pure primitive and original Conceptions (called also Categories), which are the highest conceptions that can be formed, and under which it classes all the conceptions which it abstracts from intuitions.—It *judges immediately*, e. g. the grass is green; and finally, by uniting several representations into *One*, produces a unity of consciousness.

13. TO JUDGE is to apply a *Predicate* to a *Subject*. The Subject must always be an actual or possible Intuition, and the predicate a Conception; therefore, to judge is to comprehend an Intuition under a Conception: or a given variety under a unity.

14. CONCEPTION is a representation which refers *mediately* to its *object*, that is, by means of the intuitions from which it was produced; hence it is a representation that is common to many objects; i. e. a Universal Representation, or a Representation of a Representation. It is completely confined to Time and Space, for of things out of Time and Space we can have no conception.

15. TO THINK is to join one conception to another, which never amounts to Knowledge.

16. KNOWLEDGE is an *Intuition* joined to a *Conception*.

17. THE PERFECTIONS OF KNOWLEDGE are Truth, Clearness, and Universality.

18. IMAGINATION is a Spontaneity which acts blindly; F it

it has three powers, the *representative*, the *creative*, and the *retentive*.

19. The REPRESENTATIVE POWER of Imagination produces Intuitions.

20. The CREATIVE POWER produces new combinations from sensible materials.

21. The RETENTIVE POWER, or MEMORY, recalls to mind past objects by the *law of Association of Ideas*.

22. Reason is the highest degree of *Spontaneity*, the power which forms IDEAS; that is, it extends the conceptions of the understanding to absoluteness, or carries them beyond the limits of *Time* and *Space*; for this purpose it is furnished with *Six Primary and Original Ideas, formed out of the Categories of Understanding*, under which it classes all our *Knowledge*, and thus produces the greatest *Systematical Unity of Knowledge*. It judges *mediately* or by conclusion, deducing one judgment from another. It is the last test of TRUTH.

23. IDEA must be carefully distinguished both from *Conception* and *Intuition*. It is a Conception carried by Reason to absoluteness; and has nothing to do with Time and Space, consequently, it is not to be met with in experience; e. g. we have an Idea of God, the Soul, and a future state; but not the shadow of a *Conception* of any of these objects; much less can we pretend to have *Intuitions* of them. It is that which renders a conclusion possible.

24. CONCLUSION is a Judgment of Reason; it consists of *Predicate, Middle Term, and Subject*. Its highest proposition must be an *Idea*, or no conclusion is possible. It in-

fers from universals to particulars, a mode of inference which cannot err.

25. A PRIORI. All those objects which lie in the mind, antecedent to all representation, are *objects à priori*; also called *pure*. They are UNIVERSAL and NECESSARY; e. g. TIME and SPACE, 12 CATEGORIES, 6 IDEAS OF REASON.

26. A POSTERIORI. All those objects which do not lie in the Mind, but which come through the Senses, are *objects à posteriori*; also called *empirical*; e. g. every object of actual experience.

OBSERVATION. On analyzing *Perception, Conception, Thought, Knowledge, Judgment, and Reasoning*; we find that they consist of nothing but INTUITION, CONCEPTION, and IDEA, the products of Reason, Understanding, and Sense, variously compounded; for, what is Perception but an *External Intuition*? what Conception but the *form abstracted from Intuitions*? what is Thought but *one Conception joined to another*? and what indeed is Knowledge but an *Intuition joined to a Conception*? Lastly, what is Reasoning but an *Intuition comprehended under a Conception, and that Conception again under an Idea*; or the deducing one Judgment from another? Hence it is evident, that the ELEMENTS of every Perception, Conception, Knowledge, &c. may the very Elements of every thing that is cogitable, must be either INTUITION, CONCEPTION, or IDEA. It is on this account that the following Table is subjoined, as it is presumed that a thorough acquaintance with the Elements of Knowledge, may enable us to recognize them in their various Ramifications and Combinations.

TABLE  
OF THE  
ELEMENTS OF KNOWLEDGE.

AXIOM. All that MAN can KNOW, are Representations; but not the Objects which produce them.

GENUS.

REPRESENTATION IN GENERAL.

The Mind has a faculty to represent something to itself.

PROOF. The mind Thinks, i. e. it is active. Now there are only two ways possible, either to connect the objects of our thoughts or to create them. But the latter is absurd; therefore the Mind can only connect given matter into a Unity, which constitutes a Representation.

N. B. To Create, means to produce Something from Nothing, which is above human capacity. To Connect, means to give a form or unity to received materials; i. e. to produce a Whole.

SPECIES.

REPRESENTATION IN PARTICULAR.

I. INTUITION,	II. CONCEPTION,	III. IDEA,
1. is a Representation, where the MATTER is present. It includes the whole Sensible World; i. e. every thing which we can feel, see, hear, taste, or smell.	1. is a Representation, where the matter is absent. It is mere FORM abstracted from sensible things, and can be obtained in no other way.	1. is a Representation which is purely mental, and does not in the least partake of any thing sensible; for it is out of TIME and SPACE; i. e. it is <i>Supersensible</i> .
2. is produced by SENSE;	2. is produced by UNDERSTANDING;	2. is produced by REASON;
and arises immediately upon the receptivity being affected.	and arises mediately by means of Judgment.	and can only arise by means of a Syllogism.
3. is divisible into	3. is divisible into	3. is divisible into

External, Internal,      Time and Space in                      in Time and Time      themselves, which Space,                      are à priori, whose only.                      matter is Receiving in general, whose forms are the Modes of Re- ceiving, viz. 1. Succession; 2. Co-existence.	in Time, their matter is Intui- tion, to which they must all be reducible.	in Time, their matter is Con- ception, raised by Genus and Species to Ab- soluteness.
	the 12 Categories, which are out of Time and Space, and à priori, whose matter is Connec- tion in general, and whose forms are the 12 modes of connection.	the 6 Ideas, which are out of Time and Space, and à priori, whose matter is the Cate- gories, and whose forms are their connection into the 6 Unities.

PART I.

ELEMENTS OF PURE UNIVERSAL LOGIC.

Section I. OF CONCEPTIONS.

*Of Conception in general, and the difference between Conception and Intuition.*

1. All Knowledge, that is, all representations referred with consciousness to an object, are either *Intuitions* or *Conceptions*. An Intuition is an *individual* representation (representatio singularis). A Conception is a *universal* (representatio per notas communes) or a *reflective* representation (representatio discursiva). Knowledge consisting of Conceptions only, (without Intuitions,) is called **DISCURSIVE** or **HISTORICAL KNOWLEDGE**; for here we do not immediately refer our representations to the objects which produced them, but are content to take them upon the testimony of others.

*Remark (1.)* All union of *Conceptions*, without *Intuitions*, produces merely *Thought*; but never *Knowledge*, which absolutely requires the *Intuition*.

*Remark (2.)* *Conception* is opposed to *Intuition*; for it is a universal representation which is common to many objects. *Intuition*, on the other hand, is the *immediate* impression of a single thing. We can have no *Intuition* without *Sensation*, and no *Sensation* without the existence of some external body touching our senses. *Intuitions*, therefore, imply the existence of the external world.

(3.) It is mere tautology to talk of universal or common *Conceptions*. This fault arises from the improper division of *Conceptions* into *universal*, *particular*, and *singular*. The *Conceptions* themselves cannot be thus divided; this division regards only their use or application.

*Matter and Form of Conceptions.*

2. In every *Conception* there is to be distinguished *matter* and *form*. The *matter* of the *Conception* is its *object*, the *form* is its *universality*.

*Empirical and Pure Conceptions.*

3. A *Conception* is either *pure* or *empirical*. The former is that whose *matter* lies originally in the mind; the latter is that whose *matter* is derived from experience.

An **IDEA** is a *Conception* of Reason, whose object never can be found in experience.

*Remark (1.)* *Empirical Conceptions* spring from the senses by the comparison of objects of experience, and receive from the understanding merely the form of universality. The reality of these *Conceptions* rests upon actual experience. Whether there be *pure conceptions of understanding* which arise independently of all experience, it is the business of *Metaphysics* to investigate.

(2.) *Ideas* or *Conceptions* of Reason can never lead to real objects, because all real objects must be comprised in a *possible experience*. They serve, however, by means of Reason, to stimulate the understanding in experience, by showing that the objects we have experienced are not all that are possible, and that the principles of possibility do not apply to the things in themselves, nor to objects of experience as things in themselves, but merely as *phenomena*.

An *Idea* contains an *Archetype* of the use of understanding; for example, the *Idea* of the *Universe*, which is not necessary as a *constitutive* principle for the empirical use of understanding, but only as a *regulative* one, for the sake of its concatenation. An *Idea* is therefore to be considered as a necessary fundamental Principle of classification, either that it may be *objectively* completed, or considered as *unlimited*. Nor can an *Idea* be obtained by *composition*; for the whole is here considered before the parts. There are, however, *Ideas* which admit of approximation. This is the case with the *Mathematical Ideas*, which essentially differ from the *Dynamical*, which

are *heterogeneous*; the former differ only in quantity, but the latter in kind.

We can never give objective reality to *Theoretical Ideas*, or prove that they possess it; except indeed to the *Idea* of **LIBERTY**, and this only because it is the condition of the *Moral Law*, whose reality is an *axiom*. The reality of the *Idea* of **God** can never be demonstrated in a theoretical point of view; nor can it ever be got rid of in a *practical* one; for it would imply that there could be an *Effect* without a *Cause*.

*Given (à priori or à posteriori) and produced Conceptions.*

4. All *Conceptions*, with respect to their *matter*, are either given (*conceptus dati*), or produced (*conceptus factitii*). The former are either given *à priori* or *à posteriori*. All *Conceptions* given *à posteriori*, i. e. empirically, are *Experimental Conceptions*; those which are given *à priori*, are termed *notions*.

*Remark.* The form of a *Conception*, as a discursive representation, is always produced.

*Of the Logical Origin of Conceptions.*

5. The origin of *Conceptions*, as to mere *form*, rests upon *reflection*, and upon *abstraction* from the difference of things, which are denoted by certain representations. Hence the Question, What acts of Understanding are requisite to beget *Conceptions* from given representations?

*Remark (1.)* As *Universal Logic* abstracts from all matter of Knowledge and of Thought, it can consider a *Conception* only with respect to its form, that is, *Subjectively*; not how it, as a mark, determines an object, but merely as to its reference to several objects. *Universal Logic* does not enquire into the origin of *Conceptions*; nor how *Conceptions* arise as *Representations*; but merely how given *Representations* become *Conceptions* in our thoughts, whether these *Conceptions* contain something derived from experience, or imagined, or taken from the nature of Understanding. This logical origin of *Conceptions*, an origin as to mere *form*, consists in *reflection*, by which a representation common to several objects is produced. This form is requisite to Judgment. *Logic*, therefore, only considers the difference of reflection in *Conceptions*.

(2.) The origin of *Conceptions* with respect to their *Matter*, according to which a *Conception* is either *empirical*, *arbitrary*, or *intellectual*, is investigated in *Metaphysics*.

*Logical Acts of Comparison, Reflection, and Abstraction.*

6. The logical acts of Understanding which produce *Conceptions* with respect to their *form*, are,

(1.) *Comparison*, i. e. the comparing representations with one another, in reference to a unity of consciousness; i. e. discovering the difference of things.

(2.) *Reflection*, i. e. considering how different representations can be comprised in one consciousness, i. e. discovering the agreement of things; and lastly,

(3.) *Abstraction*, i. e. the exclusion of all that in which the given representations differ, or selecting all those marks which are found in each individual.

*Remark (1.)* In order to beget *Conceptions* from given *Representations*, we must be able to *compare*, to *reflect*, and to *abstract*; for these three logical operations of Understanding are the necessary and universal conditions of *Conception* in general. For instance, I see a fir, a willow, and a lime; first I *compare* these objects together, and I perceive that they differ from each other with respect to their trunks, their branches, their leaves, &c. I next *reflect* upon that in which they agree, or which is common to them, namely, a trunk, branches, and leaves. Lastly, I *abstract* from the size, figure, &c. of their different parts; and in this manner I obtain the *Conception* of a Tree.

(2.) The more differences of things are omitted in a *conception*, the more abstract it becomes; for example, if un-

der scarlet cloth I only think the red colour, I then abstract from the cloth; but, if I abstract from the red colour, and think scarlet as some material thing in general, my conception is by this means become *more abstract*. The conception *body* is properly no abstract conception; for, from body I cannot abstract any thing, or I should have no conception of it whatever; but I can abstract from the size, the hardness, the colour, the fluidity, &c. The most abstract conception is that which has nothing in common with others, and this is the conception of *Something*; for that which differs from it, is *Nothing*, and has consequently nothing in common with it.

(3.) Abstraction is only the *negative* condition under which the universal validity of representations can be produced. The *positive* are comparison and reflection. For by abstraction we do not obtain conceptions; it only perfects them, and confines them within determinate bounds.

#### Contents and Sphere of Conceptions.

7. Every Conception, considered as a partial Conception, is contained in the representation of the thing; but when considered as a ground of Knowledge, i. e. as a mark, the thing is contained *under* it. In the former respect every conception has *Contents*; in the latter, a *Sphere*. The Contents and Sphere of a conception are in an inverse ratio to each other. The more a conception contains *under* it, the less it has *in* it; or the more the *Contents* the smaller the *Sphere*, and conversely.

*Remark.* The universality or validity of a conception does not depend upon its being a *partial conception*, but on its being a *Ground of Knowledge*.

#### Extent of the Sphere of Conceptions.

8. The more things stand under a conception, and are thought by it, the greater is its sphere.

*Remark.* Thus, as we say of a *GROUND* in general, that it contains the *consequence* under it; so we may say of a conception, as a *ground of Knowledge*, that it contains all those things under it from which it was abstracted: for example, the conception *metal* contains under it gold, silver, copper, &c. For as every conception, as a universally-valid representation, contains that which is common to several representations of different things; thus all those things which in this respect are contained under it are representable by it. Indeed this constitutes the *utility* of a conception; for, the more things are represented by a conception, the larger is its sphere. For instance, the conception *body* has a larger sphere than the conception *metal*.

#### Superior and inferior Conceptions.

9. Conceptions are called *superior* when they have other conceptions under them, which in respect to the former are called *inferior*. A mark of a mark, or a remote mark, is a *superior* conception. The conception in reference to a remote mark is an *inferior* conception.

*Remark.* As conceptions are called Superior and Inferior only relatively, it follows that the same conception, in a different relation, may be at the same time Superior and Inferior; for example, the conception *Man* in relation to the conception *Negro*, is superior, but in relation to the conception *Animal*, inferior.

#### Genus and Species.

10. The superior conception, with respect to its inferior, is termed *Genus*; the inferior conception, with respect to its superior, *Species*. In the same manner as superior and inferior conceptions differ, so do consequently Genus and Species; not in their nature, but only with respect to their relation to one another in the logical subordination.

#### Highest Genus and lowest Species.

11. The *highest genus* is that which cannot be a species. The *lowest species* is that which cannot be a genus. But,

according to the law of continuity, there can never be a lowest species, nor a lowest but one.

*Remark.* If we form a series of subordinate conceptions, we must at last arrive at a Genus which is no longer a Species. For instance, Man, Animal, Creature, Object; which last is the highest possible genus, for it includes even the Idea of God himself, who is sometimes the object of our thoughts, and from this no further abstraction can be made, without all conception vanishing. But in this series no lowest conception, or species, is to be found, because such a one can never be determined. We may however admit of a comparatively-lowest conception by common consent, which implies that we have agreed not to investigate deeper. Hence the following rule: *There is a genus that can never become a species, but no species that cannot be again considered as a genus.*

#### Wider and narrower Conceptions.—Reciprocal Conceptions.

12. The superior conception is also termed a *wider conception*, the inferior a *narrower*. Conceptions having the same sphere are termed *reciprocal conceptions*.

#### Relation of inferior to superior, and of wider to narrower.

13. The inferior conception is not contained in the superior, for it contains more than the superior. But it is contained *under* it; because the superior contains the ground of knowledge of the inferior. Farther; one conception is not *wider* than another on account of its containing *more* under it, for this we cannot determine, but because it contains under it *the other conception*, and, besides this, *still more*.

#### Universal Rules for the Subordination of Conceptions.

14. With respect to the logical sphere of conceptions, we have the following Rules.

(1.) Whatever applies to or contradicts the superior conceptions, also applies to or contradicts all the inferior conceptions contained under them.

(2.) And conversely, whatever applies to or contradicts the inferior conceptions, also applies to or contradicts their superior conceptions.

*Remark.* Because that wherein things agree flows from their *universal* properties; and that wherein they differ from their *particular* properties. Thus we can never conclude that, what applies to or contradicts an inferior conception, also applies to or contradicts other inferior conceptions, which belong, together with it, to a higher conception. For instance, we cannot say, that what does not apply to men does not therefore apply to angels.

#### Of the arising of Superior and Inferior Conceptions.—Logical Abstraction and Logical Determination.

15. By continuing logical abstraction, higher and higher conceptions arise. By continuing logical determination, lower and lower conceptions arise. The greatest possible abstraction produces the highest or most abstract conception, from which no farther abstraction can be made. The most perfect determination would be a *thoroughly-determined conception*; that is, such a one to which no additional determinations can be thought.

*Remark.* As only single or individual things are thoroughly determined, consequently *thoroughly-determined Knowledge* can only be thought as *Intuition*, and not as *Conception*: for logical determination can never be completed in conceptions. (See Remark to 11.)

#### Use of Conceptions in the abstract and in the concrete.

16. Every conception can be used in the *universal* and in the *particular*; (*in abstracto et in concreto*.) In the abstract, the inferior conception is used with respect to its superior; in the concrete, the higher with respect to its inferior.

*Remark* (1.) The terms *abstract* and *concrete* do not relate to conceptions in themselves; for every conception is abstract;

fract; but rather to their use; and this use may have different degrees; that is, we may treat a conception as having more or fewer determinations. By abstraction we ascend towards the conception of the *highest genus*; in the concrete we approach the individual.

2. We cannot decide whether *abstraction* or *concretion* has the preference in point of use. For by abstract conceptions we determine *many things a little*; by concrete conceptions we determine *a few things much*. Consequently, what we gain on the one hand we lose on the other. A conception which has a large sphere is so far useful, that we can apply it to *many things*; but on that very account it contains so much the *less*. The conception *Substance*, for instance, does not contain so much as the conception *Chalk*.

3. To hit the proportion between the representation in the abstract and in the concrete in the same Knowledge, consequently between the conception and its exposition, is to obtain the *maximum* of Knowledge, both with respect to its sphere and contents. In this point also consists the art of Popularity.

Section II. OF JUDGMENTS.

Definition of Judgment in general.

17. Judgment consists of three parts; *Subject, Predicate, and Copula*. First, the *Subject* is the thing spoken of; secondly, the *Predicate* is something affirmed or denied of the subject; and thirdly, the *Copula* is the verb or word which joins the subject and predicate together. To judge is to comprehend a variety under a unity, or an intuition under a conception, e. g. Man is an Animal. Here the intuition Man is comprehended under the conception Animal. Judgments of understanding are immediately clear in our consciousness, e. g. the grass is green.

Remark. As it is not the business of Logic to enquire into the origin of our conceptions, but merely to investigate the relations they stand in one to another, it is evident that this science is nothing but *Dogmatical Philosophy*, which every where terminates in *unintelligibility*; for the very essence of *Dogmatism* is, that it does not search to the bottom for TRUTH; but is content to assume things, and consider them True. A thing may, for instance, be *logically possible*, but *really impossible*: thus, a space enclosed by two lines may be thought, though we know that two lines cannot enclose a space. Hence LOGIC has performed its duty when it has shown what relations our represen-

tations stand in to one another, or that there is no contradiction in our thoughts; and this may be termed *Criticising the Form of Knowledge*. But a much more important Duty remains to be performed, and that is to *Criticise the Matter of Knowledge*. This must be performed by TRANSCENDENTAL PHILOSOPHY, the only science that is fully competent to show whether our Knowledge in point of MATTER be intelligible, and whether it be sound and good Knowledge; or unintelligible, and mere speculation. —See *Critical Philosophy*, under KANT, vol. xi. and the article METAPHYSICS.

Matter and Form of Judgments.

18. Matter and Form are the essential constituents of every Judgment. The matter consists of the *given representations*, connected in the Judgment; the form in the determination of the mode how the various representations are connected.

Remark (1.) As the whole real and cogitable world consists only of three Things; namely, INTUITION, CONCEPTION, and IDEA; it is evident that all our Thoughts, Knowledge, and Judgments, can arise from nothing else but the combination of these three elements. In order therefore to obtain real Knowledge, it is absolutely necessary to have an intuition united to a conception; that is to say, that the Subject in the Judgment should be an Intuition, and the Predicate a Conception; e. g. This tree (at which I am now looking, see Def. 5.) is an oak.

(2.) If a Judgment is to terminate in mere thought, it is only necessary to have one conception united to another. This is mere speculation, and never amounts to Knowledge.

(3.) If one Idea is joined to another in a Judgment, it is evident that the result can only be an Idea. But, as an Idea (see Def. 23) has nothing to do with Time and Space, it is evidently out of the limits of experience and of all Knowledge; consequently, such a Judgment can be only mere Speculation.

Object of logical Reflection; i. e. the mere Form of Judgment.

19. As Logic abstracts from all real or objective Knowledge; it can neither concern itself with the matter of a Judgment, nor with the contents of a conception. It has therefore solely to show the difference of Judgments with respect to their mere form. Which may be thus exhibited at one view.

JUDGMENTS OF UNDERSTANDING.

Quantity.	Quality.	Relation.	Modality.
Singular,	Affirmative,	Categorical,	Problematical,
Particular,	Negative,	Hypothetical,	Affertorical,
Universal.	Infinite.	Disjunctive.	Apodictical.

I must now prove the completeness of this Classification; that is, show that it is neither *redundant* nor *deficient*. First, if we judge of any thing, we must either affirm or deny, or deny infinitely; and no other case is possible. This regards Judgments of *Quality*. Secondly, we can only affirm or deny with respect to the properties of a thing, the effects of a thing, or the parts of a whole; and no other case is possible. This respects *Relation*. Thirdly, we must either affirm or deny something of one thing, or of many, or of all; and no other case is possible. This regards *Quantity*. Fourthly, with respect to *Modality*; the thing judged of must be either possible, actual, or necessary; and here also no other case is possible. Hence it may be inferred that this classification is quite complete; for it is out of the power of any one to add another class; and if one be taken away the whole is destroyed.

Every Judgment must stand under the four classes of Quantity, Quality, Relation, and Modality, at the same time.

20. This may be elucidated in the following judgment, *The Bird sings*; this is a singular, affirmative, hy-

pothetical, judgment, with apodictical certainty. First it is considered under *Quantity*, as singular; *This bird sings*. Secondly under *Quality*, as affirmative; for we affirm of the Bird that it sings. Thirdly, under *Relation*, as hypothetical; for *Singing is an effect* produced by the bird. And, lastly, it is considered under *Modality*, as apodictical, or as a judgment of the greatest degree of certainty; for I have the testimony of my senses that the bird *actually sings*.

Quantity of Judgments; Universal, Particular, and Singular.

21. Judgments are, with respect to Quantity, either *Universal, Particular, or Singular*. The Universal unite a whole species to a conception; for instance, *All animals have life*. The Particular add a part or many; for instance, *Some men are learned*. The Singular add one individual thing; as, *Newton is the inventor of fluxions*.

Quality of Judgments; Affirmative, Negative, and Infinite.

22. Judgments according to Quality are affirmative, negative, or infinite. In affirmative Judgments the sub-

ject is thought as contained within the sphere of the predicate; in *negative*, it is placed out of the sphere of the predicate; and in *infinite*, the subject lies somewhere out of the sphere of the predicate, in an infinite sphere. These Judgments either add or exclude qualities or properties to or from a thing, and improve our Knowledge; for by affirming I increase my knowledge, by negating I purify it. They may also be either universal, particular, or singular.

*Relation of Judgments; Categorical, Hypothetical, and Disjunctive.*

23. According to Relation, Judgments are either categorical, hypothetical, or disjunctive. Here the given representations are one subordinated to the other, either as *Predicate to the Subject*, as *Consequence to the Ground*, or as *Members of Division to the Conception divided*. The Categorical adds qualities to an Intuition, the hypothetical adds effects, and the disjunctive adds parts to a whole, and may be affirmative or negative; universal, particular, or singular.

*Categorical Judgments.*

24. The *subject* and *predicate* in Categorical judgments constitute their *matter*. And the Relation between the *subject* and *predicate*, i. e. their agreement or contradiction, constitutes the *form*, and is determined by the *Copula*.

*Remark.* Categorical judgments indeed constitute the *matter* of both hypothetical and disjunctive; but they must not on that account be confounded with them. Nor must we think, as many logicians have done, that they are only different modifications of the Categorical, and consequently reducible to it. These three kinds of Judgment depend upon *essentially-different* logical functions, and must therefore be treated of separately.

*Hypothetical Judgments.*

25. The *Matter* of Hypothetical Judgments consists of two Judgments which are connected to one another as *ground* and *consequence*. The one of these judgments, which contains the ground, is the *antecedent*; the other, which is related to the former, the *consequent*; and the representation of this kind of connection of both judgments under one another to a unity of consciousness is termed the *consequence*, which constitutes the *form* of an hypothetical judgment.

*Remark* (1.) As the *Copula*, in a Categorical Judgment, constitutes its form, so does the *Consequence* in a Hypothetical Judgment.

(2.) It has been thought easy to change a Hypothetical into a Categorical Position; but this cannot be done, for they are in their nature entirely different. In the *Categorical* there is nothing *Problematical*, but every thing is *Affertorical*. Whereas in the Hypothetical the *Consequence only is Affertorical*. In the latter I may therefore connect *two false judgments* with one another; for *Logic* merely concerns itself with the correctness of the connection which constitutes the *form*, and is the *consequence* upon which the logical (or formal) truth of this judgment depends. There is an essential difference in the two positions: *All bodies are divisible*, and *If all bodies are composed then they are divisible*. In the former position, I maintain the thing *absolutely*; in the latter, only *problematically*, under a certain condition.

*Manner of Connection in Hypothetical Judgments; Modus ponens, and Modus tollens.*

26. The form of connection in hypothetical Judgments is two-fold. The *placing* (modus ponens), or the *taking away* (modus tollens.)

(1.) If the *Antecedent* be true, then the *Consequence* is also true, that is determined by it; and this is called the *modus ponens*.

(2.) If the *Consequence* be false, then the *Antecedent* is also false; and this is called the *modus tollens*.

*Disjunctive Judgments.*

27. A Judgment is *Disjunctive*, when the parts of the sphere of a given conception determine one another, as parts of a whole, or are considered as complements to a whole.

*Matter and Form of Disjunctive Judgments.*

28. The several given judgments of which the *disjunctive judgment* is composed, constitute its *matter*, and are called *members of disjunction* or *opposition*. The *form* of these judgments consists in the *disjunction itself*; that is, in the determination of the relation of the several judgments, as members of the whole sphere of a divided knowledge, mutually exclude each other or complete each other.

*Remark.* All disjunctive judgments therefore represent various judgments as *united in one sphere*; and each judgment is only produced by means of the limitation of the others with regard to the entire sphere. They determine therefore the *relation* of each judgment to the whole sphere; and thereby, at the same time, the relation which these disjunctive members have to one another. One member therefore determines every other only so far as they jointly stand in connection as parts of a whole sphere of knowledge, *out of which, in a certain reference, nothing can be thought*.

*Peculiar Character of Disjunctive Judgments.*

29. The peculiar character of Disjunctive Judgments, whereby they specifically differ from all other, and particularly from Categorical, consists in this, that the members of disjunction are altogether *problematical* judgments, of which nothing else can be thought, but that they, as parts of a sphere of knowledge, are each the others complement to a whole; and, taken all together, are equal to the sphere of the whole. Hence it follows, that in one of these problematical judgments the truth must be contained; or, which is the same thing, that *one of them must be assertorical*; because the sphere of the whole knowledge under the given conditions, comprehending nothing more than these members of disjunction, and they being opposed to one another, *one of them only can be True*.

*Remark.* In a *categorical* judgment, the thing whose representation is considered as a part of the sphere of another representation, is thought as being contained under this, its superior conception; consequently we here compare, in the subordination of the spheres, the part of a part with the whole. But in *Disjunctive* Judgments we proceed from the whole to all the parts together. What is contained under the sphere of a conception, must be contained under some one of the parts of this sphere. Agreeably to this, the sphere must be arranged. If I, for instance, form the following Disjunctive judgment; *A learned man is either an Historian or a Philosopher*; I thereby determine that these conceptions complete the sphere of learned; but are by no means parts of one another. The comparison between *Categorical* and *Disjunctive* judgments, may be rendered intuitive, thus,

In the *Categorical* Judgment, *Kant is Mortal*; let  $x$  represent the intuition *Kant*; this is contained under  $b$ , which represents the Conception *Man*; and this again is contained under  $a$ , which represents the Conception *Mortal*;

In the *Disjunctive* Judgment, Kant is either an *European*, an *Asiatic*, an *African*, or an *American*; let *x* represent the intuition Kant; let *a* represent the whole sphere of the Conception under consideration, namely, the world; and *b, c, d, e*, the members of Disjunction. Hence, as *x* is contained under *a*, it must consequently be found either in *b, c, d*, or *e*, which taken together complete the sphere of *a*.

Thus in *Disjunctive* Judgments, we think *many things* by one Conception; and in *Categorical* we think *one thing* by many Conceptions.

*Modality of Judgments, Problematical, Assertorical, and Apodictical.*

30. According to Modality, which determines the relation of the Judgment to the Knowing Faculty, Judgments are either Problematical, Assertorical, or Apodictical; the *Problematical* are accompanied with the consciousness of the mere *Possibility*; the *Assertorical* with the consciousness of the *Actuality*; and the *Apodictical* with the consciousness of the *Necessity* of the Judgment.

*Remark (1.)* Modality of Judgments, therefore, only shows the manner how, in any Judgment, something is either affirmed or denied; that is, in what manner we maintain the truth or falsehood of a Judgment. For instance, in the Judgment, *The Soul of man MAY be immortal*; the truth is here only *Problematically* determined, that it is possible. In the Judgment, *The Soul is immortal*; it is *Assertorically* determined, that it is actually so. In the Judgment, *The Soul MUST be immortal*; it is *Apodictically* determined that it must of necessity be so. This determination of the *possible*, the *actual*, and the *necessary*, *truth*, concerns therefore the judgment itself, and by no means the thing judged of.

(2.) Upon the difference between *Problematical* and *Assertorical* judgments, rests the true difference between *Judgments* and *Propositions*. These terms have hitherto been confounded. In a *Judgment*, is thought the relation of various representations to a unity of consciousness, but only *Problematically*. In a *Proposition*, this relation is thought *Assertorically*. A problematical proposition is a contradiction in terms; for before I obtain a proposition I must first of all judge, which I do in many cases without proving my judgment. But to establish a proposition I must prove my judgment. It is good to judge problematically before we determine a judgment *Assertorically*; indeed it is not always necessary to our purpose to have assertorical judgments.

*Exponible Judgments.*

31. Judgments, in which an affirmation and a negation are contained at the same time, but in a concealed manner, so that the affirmation is indeed evident, but the negation concealed; are *exponible* propositions.

*Remark.* In the *exponible* judgment, for instance, *Few men are learned*, lies, *first*, but in a concealed manner, the negative judgment, *Many men are not learned*; *secondly*, the affirmative, *Some men are learned*. As the nature of *exponible* propositions wholly depends upon the conditions of speech, which enables us to express in a concise manner two judgments at once; it is to be remarked, that, from the nature of language, many judgments occur which must be explained in grammar, and not in logic.

*Theoretical and Practical Propositions.*

32. A *Theoretical* proposition is that which refers to an object; and determines what does, or does not, belong to it. A *Practical* proposition, that which expresses the action as a necessary condition, whereby an object is possible.

*Remark.* Logic has only to treat of *Practical* propositions with respect to their *Form*, which are so far opposed to *Theoretical*. *Practical* propositions, with regard to their *matter*, belong to *morals*; and must again be distinguished from *Speculative*.

*Indemonstrable and Demonstrable Propositions.*

33. *Demonstrable* propositions are those which are capable of proof; *Indemonstrable*, those which are incapable of proof: the latter are also called *immediately-certain*, and therefore considered as *Elementary* propositions.

*Principles.*

34. *Immediately-certain* judgments *a priori* may be called *Principles*, when other judgments can be deduced from them, but no others substituted for them. They may on this account be called *Elements*.

*Intuitive and Discursive Principles, or Axioms and Acroams.*

35. *Principles* are either *intuitive* or *discursive*. The former can be viewed in the *intuition*, and are called *AXIOMS*; the latter can only be expressed by *conceptions*, and may be called *ACROAMS*.

*Analytic and Synthetic Propositions.*

36. *Analytic* propositions are such, whose certainty rests upon the *Identity* of their *conceptions* (i. e. of the predicate with the notion of the subject); e. g. *All bodies are extended*. For take away the predicate *extended*, and the whole vanishes. Propositions whose truth is not grounded upon the identity of conceptions, must be termed *Synthetic* propositions; e. g. *All bodies attract*. Take away the predicate *attract*, and the body still remains.

*Remark (1.)* *Synthetic* propositions increase our knowledge in point of *matter*; *analytical* improve it in point of *form*.

(2.) *Analytical* principles are *not Axioms*, for they are *discursive*. And *Synthetic* principles are only then *Axioms* when they are *intuitive*.

*Tautological Propositions.*

37. The *Identity* of *Conceptions* in *Analytical* Judgments may be either *explained* or *implied*. In the former case they are *Tautological Propositions*.

*Remark (1.)* *Tautological* propositions are virtually empty, for nothing can be deduced from them, they are therefore without use or advantage. This is the case, for instance, in the *tautological* proposition, *Man is Man*; for, by saying *Man is man*, I do not increase my Knowledge of man. *Implied* identical propositions are not virtually-empty, for they make the predicate clear, that is implied in the conception of the subject.

(2.) *Virtually-empty* propositions must be distinguished from *senseless*; the latter want intelligibility, because they concern the determination of *Occult Qualities*.

*Postulates and Problems.*

38. *Postulates* are *immediately-certain* practical propositions or principles, that determine possible actions; implying the manner of performing them with *immediate certainty*. *Problems* are *demonstrable* propositions requiring further direction; and expressing an action whose manner of performance is *not immediately certain*.

*Remark (1.)* There may be *Theoretical* *Postulates* for the advantage of *Practical Reason*. These are *theoretical* in a *practical point of view*, that is, necessary *Hypotheses*; for instance, *The existence of God*; *The Freedom of the will*; *A Future State*; &c.

(2.) To *Problems* belong, 1st, the *Question*, which contains what is to be done; 2dly, the *Solution*, which contains directions how the proposed thing can be done; and, 3dly, the *Demonstration*, which shows that, when we have proceeded according to the Directions, the Problem will be solved.

*Theorems, Corollaries, Lemmata, and Scholia.*

39. *Theorems*, are theoretical propositions, capable of, and requiring, proof. *Corollaries* are immediate consequences from preceding propositions. *Lemmata* are propositions borrowed from other sciences; with the presupposition that they have been demonstrated in the science to which they naturally belong. *Scholia* are merely explanatory propositions, which do not therefore constitute any part of the system.

*Remark.* The essential parts of every *Theorem* are the *Thesis* and *Demonstration*. We may remark a farther difference between *Theorems* and *Corollaries*; namely, that the latter are immediately concluded; whereas the former are inferred by a series of consequences from immediately-certain propositions.

*Judgments of Apprehension and of Experience.*

40. A judgment of *Apprehension* is merely *subjective*. But an *objective* judgment from *Apprehension*, is a judgment of *Experience*.

*Remark.* A Judgment from mere *Apprehension* is not easily possible; for here I contemplate my object without affirming or denying; for instance, if I think of a *Tower*, and think it *red*, I cannot affirm that it is *red*. The following judgment is a Judgment of *Apprehension*: *On touching a stone, I FEEL it warm*; and, if I assert that *the stone is warm*, this is an experimental Judgment. But we must be particularly careful in *experimental* Judgments not to attribute to the *object* what belongs merely to the *subject*.

### Section III. Of CONCLUSIONS.

*Conclusion in general.*

41. By *conclusion* is meant that act of thinking by which one judgment is deduced from another. A *conclusion in general* is therefore the deducing one judgment from another.

*Immediate and Mediate Conclusions.*

42. All conclusions are either *Immediate* or *Mediate*. An *immediate* conclusion is the deduction of one judgment from another, without the help of an intermediate judgment. A *mediate* conclusion is one which, besides the conception involved in the judgment, still requires others in order to deduce a consequence.

*Conclusions of Understanding, of Reason, and of Judgment.*

43. *Immediate* conclusions are also called *Conclusions of Understanding*. All *mediate* conclusions are either *Conclusions of Reason* or *Conclusions of Judgment*. We shall first treat of the *immediate*, or *Conclusions of Understanding*.

#### I. CONCLUSIONS OF UNDERSTANDING. See Plate II.

*Peculiar Nature of Conclusions of Understanding.*

44. The essential characteristic of all *immediate conclusions*, and the principle of their possibility, consists in this, that the mere *FORM* of *Judgment* undergoes a change, whilst the *matter* of the Judgment, that is, the *Subject* and *Predicate*, remain unchanged.

*Remark.* *Immediate* conclusions essentially differ from *mediate*. In the former the *form* only is changed; in the latter the *matter* is altered, for, in order to deduce a consequence, we add a new conception as a *middle term*. When I, for instance, conclude thus; *All men are mortal, therefore Kant is mortal*; this is no *immediate* conclusion, but is only possible by means of the intermediate conception, *Kant is a Man*; but, by the introduction of this new conception, the *matter* of the judgment is increased.

*Modes of Conclusions of Understanding.*

45. The conclusions of Understanding proceed through

all the classes of the logical functions of Judgment. They are consequently determined by *Quantity*, *Quality*, *Relation*, and *Modality*.

1. *Conclusions of Understanding as to QUANTITY; i. e. by SUBALTERNATE JUDGMENTS.*

46. In conclusions of understanding, *per judicium subalterna*, both judgments differ as to *Quantity*. Hence the *Particular* judgment is deduced from the *Universal* upon the following principle; *From the Universal to the Particular the conclusion is valid*.

*Remark.* A Judgment is termed *subalternate* when it is contained under another, as *particular under universal*.

2. *Conclusions of Understanding as to QUALITY; i. e. by Judgments OF OPPOSITION.*

47. Conclusions of understanding of this kind differ as to *Quality*, and may be considered in respect to their *opposition*, which is indeed threefold. In the first, the judgments are *Contradictorily opposed*; in the second, *Contrarily opposed*; and, in the third, *Subcontrarily opposed*.

*Remark.* Conclusions of Understanding by *equivalent* judgments are properly speaking not conclusions, for no consequences follow from them. They may rather be considered as a mere substitution of words which denote the same conception. For instance; *Not all men are virtuous*, and *Some men are not virtuous*. Both which express the same thing.

a, *Conclusions of Understanding from CONTRADICTORILY-OPPOSED Judgments.*

48. In judgments of understanding that are *contradictorily opposed*, which constitutes *real opposition*, the truth of one judgment is concluded from the *falsehood* of the other, and conversely. This takes place upon the principle of the *excluded third*. Viz. Two *contradictory* judgments cannot both be true; nor can they both be false, since a third judgment is impossible; consequently, when one is true, the other is false, and conversely.

b, *Conclusions of Understanding from CONTRARILY-OPPOSED Judgments.*

49. In *contrarily-opposed* judgments, one is universally affirmative, the other is universally negative. Now one of them expresses more than the other; and, as the *falsehood* may lie in the excess of the one beyond the mere negation in the other, they cannot both be true, but may both be false. With respect to these judgments, therefore, we conclude, *from the truth of the one, the falsehood of the other*; but not conversely.

c, *Conclusions of Understanding from SUBCONTRARILY-OPPOSED Judgments.*

50. In *subcontrarily-opposed* judgments, the one particularly affirms what the other particularly denies. As both may be true, but both cannot be false, we have the following conclusion, *that, when one of these positions is false, the other is true*; but not conversely.

*Remark.* In *subcontrarily-opposed* judgments, no *real* opposition takes place; for instance, in the following conclusion: *Some men are learned, consequently some men are not learned*. For what is affirmed of some men in the first judgment, is not denied of the same men in the second.

3. *Conclusions of Understanding as to RELATION; i. e. by CONVERSION of Judgments.*

51. *Immediate* conclusions by *Conversion* concern the Relation of Judgments, and consist in the *transposition* of *subject* and *predicate*; so that the subject in the one judgment becomes the predicate in the other, and conversely; e. g. *Some Men are learned, therefore some learned are men*.

*Pure and Altered Conversion.*

52. By *transposition*, the *Quantity* of a Judgment is either *altered*, or it remains *the same*. In the former case, the conversion is called an *altered* one, (*conversio per accidens*;) 2

# LOGIC.

## CONCLUSIONS OF UNDERSTANDING,

are

IMMEDIATE INFERENCES *and require no MIDDLE TERM:*

*the Matter of these judgments remains the same; the Form, only, is Changed.*

*they arise from*

*the CATEGORIES of*

Quantity,

Quality,

Relation,

Modality.

Subalternation.

Opposition.

Conversion.

Contraposition.

<sup>1</sup>  
*Contradictory.*

<sup>2</sup>  
*Contrary.*

<sup>3</sup>  
*Subcontrary.*

*The particular is deduced from the Universal.*

<sup>1</sup>  
*The Excluded Third. The Truth of one proves the falshood of the other, and Conversely.*

*The Subject in one becomes the Predicate in the other and Conversely.*

*The Quantity remains the same, the Quality is altered.*

<sup>2</sup>  
*The Truth of one proves the falshood of the other, but not Conversely.*

<sup>3</sup>  
*The falshood of one proves the truth of the other, but not Conversely.*

## CONCLUSIONS OF REASON,

*arise from the*

CATEGORIES of RELATION,

*and are*

*These increase the Matter of the Judgment, by the introduction of a*

MIDDLE - TERM.

Predicate.....*all Men are* MORTAL.

M.P.....*Major*

Middle-term.....*Kant is a* MAN.

S.M.....*Minor*

Subject.....KANT *is mortal*.

S.P.....*Conclusion*

*These have no Middle-term The Major is an hypothetical proposition, containing Antecedent and Consequent The Conclusion takes place, merely by Changing a Problematical condition into an Assertorical proposition.*

*These have no Middle-term The Major is a disjunctive proposition and must, therefore, have members of division, they conclude either, from the truth of one member, the falshood of all the rest, or, from the falshood of all the members except one, the truth of that one.*

idens;) in the latter it is termed *pure*, (conversio simpliciter talis.)

*General Rules of Conversion.*

53. With respect to conclusions of understanding by *Conversion*; we have the following rules.

1. *Universal-affirmative* judgments admit only of *altered conversion*; for the *predicate* in these judgments is the wider conception, and there is consequently only a part of it contained in the *subject*.

2. All *universal-negative* judgments admit of *pure conversion*; for by negation the *subject* is placed out of the sphere of the *predicate*.

3. All *particular-affirmative* judgments admit of *pure conversion*; for here a part of the sphere of the *subject* is classed under the *predicate*; consequently a part of the sphere of the predicate admits of being ranked under the *subject*.

*Remark (1.)* In *universal-affirmative* judgments, the *subject* is contained under the sphere of the *predicate*. We ought, therefore, for instance, to conclude thus; *All men are Mortal; therefore some of those beings who are mortal are Men*. The reason why *universal negative* judgments admit of *pure conversion* is, that two conceptions universally contradicting each other contradict themselves in equal extent.

(2.) Many *universal-affirmative* judgments admit indeed of *pure conversion*; the ground of this does not lie in the *form*, but in the particular quality of the *matter* of them. As for instance, *All that is unalterable is necessary, and all that is necessary is unalterable*.

4. *Conclusions of Understanding as to MODALITY; i. e. by CONTRAPOSITION of Judgments.*

54. *Immediate conclusion* by contraposition consists in that transposition whereby merely the *Quality* of the judgment is altered, but the *Quantity* remains the same. They concern only the *Modality* of judgments, since they change an *Affertorical* into an *Apodictical*.

*General Rule of Contraposition.*

55. All *universal-affirmative* judgments admit of *pure contraposition*. For if the *predicate*, as that which contains the *Subject* under it, be negated; then, as the whole sphere is negated, so must also a part of it, namely, the *Subject*, be negated.

*Remark.* The transposition of Judgments by *conversion* and *contraposition* are so far opposed to each other, that the former merely change the *Quantity*, the latter the *Quality*. This refers only to *Categorical Judgments*.

II. CONCLUSIONS OF REASON. See Plate III.

*Rational Conclusions in General.*

56. A *Rational Conclusion* is the knowledge of the *Necessity* of a *proposition*, in consequence of its condition ranking under a *Universal Rule*.

*Universal Principle of all Rational Conclusions.*

57. The universal principle, upon which the truth of all conclusion by Reason rests, may be thus formally expressed: *What stands under the Condition of a Rule, stands also under the Rule itself.*

*Remark.* A *Rational Conclusion* premises a *Universal Rule*, and a *subsumption* under the condition of the rule. Thus we obtain the *conclusion à priori*. For, that the individual stands under the universal, and is determinable by it, is precisely the principle of *Rationality* or of *Necessity*.

*Essential Constituents of all Conclusions of Reason.*

58. Every *Rational Conclusion* contains the three following parts.

1. A *Universal Rule*, which is called the *Major proposition*;

2. The *proposition* which ranks a knowledge under the condition of a universal rule, and is called the *Minor proposition*;

3. The *proposition* which applies, affirmatively or negatively, the *predicate* of the rule to the subsumpted knowledge; and is called the *Conclusion*.

The two former propositions in their connection with each other are termed the *Premises*.

*Remark (1.)* The above explanation is merely *logical*, but yet strictly correct; for it states that each conclusion consists of three distinct Judgments. In the *MAJOR* are compared the *Predicate* and the *Middle-term*; in the *MINOR* the *Subject* and the *Middle-term*; and in the *CONCLUSION* the *Subject* and the *Predicate*. It must however never be forgotten, that *Logic* is only a *Dogmatical Science*, which is content to assume things and take them as true; (see *Remark* to No 1.) It may therefore throw some light on this important subject to pursue the examination of *Conclusion* to its *real essence*: (see vol. xi. p. 613.) The general nature of a *Conclusion* is that it consists of three judgments; but, as every judgment comprehends a represented *variety* in a *Conception*, a conclusion will consist of three conceptions. Thus it comprehends an *intuition* under a *conception*, and a *conception* under a *higher conception*; arranging what is particular under what is general. For instance, *All men are mortal; Kant is a man*; therefore *Kant is mortal*. The sphere of the conception *Mortal* is the largest; *Man* is the next in extent, and is comprehended in the former; and the intuition *Kant* is contained in the conception *Man*. The highest conception under which the others are arranged must be strictly universal; that is, it must be an *IDEA*, otherwise no *Conclusion* is possible. Thus it will be evident, that, where the *predicate* in a Judgment does not immediately apply to the *subject*, it is not a *Judgment of Understanding*, but a *Judgment of Reason*, and requires a middle term, as the following figures may illustrate.

Predicate. Middle Term. Subject.

(2.) A *Rule* is an *assertion* under a *universal condition*. The relation of the condition to the assertion, namely, how the latter stands under the former, is the *Explanation* of the *Rule*. The knowledge that there is a condition is the *Subsumption*. The connection, of that which has been subsumpted under the condition, with the assertion of the *Rule*, is the *Conclusion*.

*Matter and Form of Conclusions of Reason.*

59. The *Matter* of a *Rational Conclusion* consists in the *Premises*; the *Form* in the *Conclusion*, in as much as it contains the *Consequence*.

*Remark (1.)* In a *Rational Conclusion* we must first prove the *truth* of the *premises*, and then the *correctness* of the *consequence*. We must never reject a rational inference, till we have found reason to reject either the *premises* or the *consequence*.

(2.) In every *Rational Conclusion*, the conclusion itself is given as soon as the premises and consequence are given.

*Division of Conclusions of Reason into CATEGORICAL, HYPOTHETICAL, and DISJUNCTIVE.*

60. As *Conclusions of Reason* can only regard the relations of things, it is easy to determine that there are but three classes of conclusions possible, under the head *Relation*, (see the *TABLE* of *JUDGMENTS*;) namely, the *Categorical*, the *Hypothetical*, and the *Disjunctive*. All rules (judgments) contain a variety connected into an objective unity of *Consciousness*; consequently, a condition under which one knowledge is connected with another in our consciousness. Now there are only three possible conditions of this unity. Either a knowledge must be the *subject* of the inherence of its marks; or one know-

ledge must be the *ground* of the dependence of another upon it; or, lastly, it must regard the connection of the parts into a whole; a *logical division*. Hence there can only be three sorts of Universal Rules, that is, *major propositions*, by which one judgment can be deduced from another.

*Remark (1.)* Rational conclusions cannot be distinguished according to *Quantity*, for every *major* is a Rule, consequently *Universal*; nor with respect to *Quality*, for it is indifferent whether they *affirm* or *deny*; nor, lastly, with respect to *Modality*, for the consequence is always accompanied with the consciousness of *Necessity*, and has the dignity of an apodictical proposition. It must be evident, therefore, that *RELATION* is the only possible ground of division of Rational Conclusions.

(2.) Some logicians have considered the *Categorical* Conclusions of Reason as the only *legitimate* ones; the other two as *illegitimate*. But this is extremely erroneous; for all *three* are equally correct, and essentially-different Functions of Reason.

*Peculiar Difference of CATEGORICAL, HYPOTHETICAL, and DISJUNCTIVE, Conclusions of Reason.*

61. The difference in the three sorts of Conclusions of Reason lies in the *Major proposition*. In *Categorical* conclusions, the major is a Categorical proposition; in *Hypothetical*, it is an Hypothetical or Problematical proposition; and, in *Disjunctive*, it is a Disjunctive proposition.

#### I. Categorical Conclusions of Reason.

62. In every Categorical Conclusion of Reason, there are *three principal Conceptions*, (termini;) namely.

1. The *Predicate* in the conclusion, which is called *Terminus major*, because it has a larger sphere than the subject;

2. The *Subject* in the conclusion, which is called *Terminus minor*; and,

3. An *intermediate conception*, which is called the *middle term*, because, by means of it, a certain knowledge is ranked under the condition of the rule.

*Remark.* The above-mentioned difference in terms occurs only in *Categorical Conclusions of Reason*; for these are the only ones that conclude by means of a *middle term*: the others by a proposition being represented *Problematically* in the major, and *Affertorically* in the minor.

#### Principle of Categorical Conclusions of Reason.

63. The principle upon which the possibility and validity of all *Categorical Conclusions of Reason* rests is this: *What applies to the mark of a thing, applies also to the thing itself; What contradicts the mark of a thing, contradicts also the thing itself.* (Nota notæ est nota rei ipsius; repugnans notæ, repugnat rei ipsi.)

*Remark.* From the preceding principle is easily derived the well-known rule of *Dictum de omni et nullo*; but, for that very reason, it cannot be the highest principle for rational conclusions in general, nor for categorical in particular. *Genus* and *Species* are universal marks for all those things which stand under them. Hence the following Rule: *What applies to or contradicts a Genus or a Species, that also applies to or contradicts all those objects which stand under that Genus or Species*; and this is the rule called the *Dictum de omni et nullo*.

#### Rules for Categorical Conclusions of Reason.

64. From the nature and principle of Categorical Conclusions of Reason, flow the following Rules.

1. In every Categorical Rational Conclusion there can be contained neither more nor less than *three principal conceptions*, (termini;) for here we must connect two conceptions (the subject and predicate) by a mediating mark, or middle term;

2. The premises cannot be *altogether negative*, (ex puris negativis nihil sequitur;) for the subsumption in the minor proposition must be affirmative, as it asserts that a certain knowledge stands under the condition of the rule;

3. Neither can the premises be *altogether particular*, (ex

puris particularibus nihil sequitur;) for then there would be *no rule*, that is, no universal proposition, from which a particular knowledge could be deduced;

4. *The conclusion always accommodates itself to the weaker part of a Ratiocination*; that is, either to the *negative* or *particular* proposition in the premises; (conclusio sequitur partem debiliorem;) therefore,

5. If either of the premises be a *negative* proposition, then the *conclusion* must also be *negative*; and,

6. If one of the premises be a *particular* proposition, then the *conclusion* must also be *particular*.

7. In all *Categorical Syllogisms*, the *major* must be a *universal* proposition, the *minor* an *affirmative* proposition. Hence, lastly,

8. The *Conclusion* must agree in respect to *Quality* with the *major*, and in respect to *Quantity* with the *minor*.

#### Pure and Mixed Categorical Conclusions of Reason.

65. A *Categorical* Rational Conclusion is *pure*, when no *immediate conclusions* are introduced into it, nor the regular order of the premises changed. Otherwise the conclusion is called *impure*, or *mixed*; (ratiocinium, five hybridum.)

#### Mixed rational Conclusions by Inversion of the Propositions.

66. To the *mixed* conclusions are reckoned those which arise by inversion of the propositions, and in which therefore the placing of these propositions is irregular. This takes place in the *three last* divisions of the *Table of Inversion of the Propositions* of Categorical Rational Conclusions: therefore the *first* is the only regular and legitimate mode of concluding.

#### Explanation of the Table of the four Figures of Conclusions.

67. By *figures* is to be understood the four modes of Concluding, whose difference consists in the particular placing of the premises and of their conceptions. The investigation of these figures is the more necessary, as logicians have dwelt much upon them, because they found that true consequences have followed from them, though in a *concealed and circuitous way*: for strict logical consequences can only flow *directly* from the first figure.

#### Ground of the Difference in the four Figures, by means of the different placing of the Middle Term.

68. Upon the proper placing of the *middle term* every thing here depends. It may occupy either, 1, in the *major* the place of the *subject*, and in the *minor* the place of the *predicate*; or, 2, in *both premises*, the place of the *subject*; or, 3, in *both premises*, the place of the *predicate*; and, or, lastly, 4, in the *major* the place of the *predicate*, and in the *minor* the place of the *subject*. By these four cases the difference of the four figures is determined. For instance, let S stand for *subject* in the conclusion, P for *predicate*, and M for *middle term*. Then the scheme of the four figures may be exhibited in the following Table:

M. P.	P. M.	M. P.	P. M.
S. M.	S. M.	M. S.	M. S.
S. P.	S. P.	S. P.	S. P.

#### Rules for the First Figure, as the only regular one.

69. The rule for the first figure, as the only regular and legitimate mode of Categorical Conclusion, is *That the MAJOR must be a universal proposition, the MINOR an affirmative*. And, as this must be the universal rule for all *Categorical Rational Conclusions*, hence it follows, that the first figure is the only regular one: it is the ground-work of all the others; so that, if any of them conclude rightly, they must be reducible to the first, by means of the *inversion*

version of the premises. Nothing can therefore be more clear than the uselessness of the three last figures, however much they may have been esteemed as original modes of concluding categorically; and a greater service cannot be rendered to the science of Logic, than to clear them entirely away, and thus prevent them from confusing arguments, which, when exhibited in the first figure in their perfect purity, must be convincing to every one; and, if logically correct, apodictically certain.

*Remark.* The first figure admits of a conclusion of any Quantity and any Quality. In the other figures conclusions of a restricted kind only can occur. This proves that these figures are not complete; but that certain limitations are to be met, which prevent their concluding universally, as in the first figure.

*Conditions of a Reduction of the three last Figures to the first.*

70. The reason why in the three last figures a right mode of concluding is possible, is this; that the *middle-term* is so situated, that, by means of *immediate conclusions*, it is placed orderly, agreeably to the rules of the first figure. Hence the following rules for the other three figures.

*Rule for the Second Figure.*

71. In the second figure the *minor is correct*, therefore the *major* must be *inverted*, but so that it still remains *universal*. This is only possible when it is *universally negative*: for, if it is *universally affirmative*, it must be done by *contraposition*. In both cases the conclusion will be negative (*sequitur partem debiliorem*).

*Remark.* The rule for the second figure is this; *What is contradicted by the mark of a thing, contradicts the thing itself.* Now I must first *invert* this, and say, *What is contradicted by a mark, contradicts this mark*; or I must convert the conclusion thus; *What is contradicted by the mark of a thing contradicts the thing itself*; consequently the thing is contradicted by it.

*Rule for the third Figure.*

72. In the third figure the *major is correct*, consequently the *minor* must be inverted; however, so that an affirmative position arises from it. But this is only possible when the affirmative position is *particular*, consequently the *conclusion is also particular*.

*Remark.* The rule for the third figure is this; *What agrees with or contradicts a mark also agrees with or contradicts SOME that are contained under this mark.* Here I must first say, it agrees with or contradicts ALL that are contained under this mark.

*Rule for the Fourth Figure.*

73. In the fourth figure, neither *major* nor *minor* are correct. If the *major* be *universally-negative*, it admits of simple *conversion*, but so that the *minor* is particular; consequently the conclusion negative. If the *major* is *universally-affirmative*, it admits either of *conversion* or *contraposition*. Therefore the conclusion will be either *particular* or *negative*. But, if the conclusion be not to be inverted, (P. S. changed into S. P.) then a transposition of the premises or a conversion of both must take place.

*Remark (1.)* The fourth figure concludes as follows. The *predicate* depends upon the *middle term*; the *middle term* upon the *subject* (of the conclusion); consequently the *subject* upon the *predicate*; which does not at all follow, but always the reverse. In order to render this possible, the *major* must be made *minor*, or *vice versa*; and the conclusion must be *converted*, because in the first change the *major* is turned into the *minor*.

2. We have dwelt purposely upon these three *false figures* of Categorical Rational Conclusions, with a view of facilitating the detection of them in complicated arguments, and thus rendering it easy to reduce them to the first figure, where the same consequences will flow in a regular and uninterrupted manner, without any *immediate conclusions* being introduced.

*General Result of the three last Figures.*

74. From the previously-explained rules of the three last figures, which we have proved to be *false modes of Conclusion*, it is evident,

1. That in none of them a *universally-affirmative* conclusion can occur, but that the conclusion is always either *negative* or *particular*.

2. That in all of them an *immediate conclusion* is *intermixed*, which, though not evidently expressed, is secretly understood; and, on this account,

3. These three modes of concluding are termed *impure conclusions*, (*ratiocinium hybrida, impura*;) since no pure conclusion can have more than three chief propositions, (*termini*.)

2. *Hypothetical Conclusions of Reason.*

75. An *Hypothetical Conclusion* is one which has an hypothetical proposition for its *Major*. It consists therefore of two propositions; first an *Antecedent*, and secondly a *Consequent*; and here the conclusion takes place either according to the *modo ponente* or the *modo tollente*.

*Remark (1.)* Hypothetical Conclusions of Reason have consequently *no middle-term*; for the inference of one judgment from the other is here *only denoted*. In the *Major* is expressed the inference of one proposition from another; the first of which is a *premise*, and the other a *conclusion*. The *Minor* is the changing a *problematical condition* into an *assertorical proposition*.

(2.) As an *Hypothetical Conclusion* consists only of two propositions without a *Middle-term*; it is clear that this is properly no conclusion of Reason, but an immediately-demonstrable conclusion from *Antecedent* and *Consequent*, either according to *Matter* or *Form*.

(3.) Every Conclusion of Reason must be a *Demonstration*. Now the *Hypothetical* contains in itself only the *Ground* of a *Demonstration*; consequently it is clear that it cannot be a *Conclusion of Reason*.

*Principle of Hypothetical Conclusions.*

76. The principle of Hypothetical Conclusions is the *proposition of a ground*; (*a ratione ad rationatum*; a *negatione rationali ad negationem rationis, valet consequentia*.)

3. *Disjunctive Conclusions of Reason.*

77. In *Disjunctive* conclusions, the *Major* is a disjunctive proposition, and must therefore have members of division. Here we conclude, 1, from the truth of one member of Disjunction upon the falsehood of the rest; or, 2, from the falsehood of all the members *except one*, upon the truth of this one. The former takes place by the *modus ponentem* (or *ponendo tollentem*); the latter by the *modus tollentem*, (*tollendo ponentem*.)

*Remark (1.)* All the members of disjunction *except one*, taken together, constitute the contradictorily-opposite of this one. Here therefore a *Dichotomy* takes place, agreeably to which, If one of the propositions be true, the other is false, and conversely.

(2.) All Disjunctive rational conclusions, consisting of more than two members of division, are properly *poly syllogistical*. For all true Disjunction can only consist of *two members*; and indeed the *logical division* consists only of *two members*; but the *membra subdividentia* are placed for the sake of brevity under the *membra dividenda*.

*Principle of Disjunctive Conclusions.*

78. The principle of Disjunctive Rational Conclusions is the *principle of the excluded third*. (*A contradictorie oppositorum negatione unius ad affirmationem alterius;—a positione unius ad negationem alterius—valet consequentia*.)

*Dilemma.*

79. A *Dilemma* is an *Hypothetic-disjunctive Conclusion* of Reason, or an *Hypothetical Conclusion* whose consequent is a disjunctive judgment. The *Major* is an *Hypothetical proposition*.

proposition whose consequent is disjunctive. The *minor* affirms that the *consequent* (per omnia membra) is false, and the *concluding* proposition affirms that the *antecedent* is false; (a remotione consequentis ad negationem antecedentis valet consequentia.)

*Remark.* The ancients considered the *Dilemma* of great importance, since it enabled them to perplex their antagonist by producing numerous obstacles to whatever opinion he might adopt. But it is a sophistical artifice, instead of directly refuting a position, merely to expose its difficulties, which may indeed be done in most cases. If we mean to assert that all is false which is difficult, it is extremely easy to overturn every thing. It is certainly right in argument to show the impossibility of the contrary; but there is something deceptive even in this, when we take the *inconceivableness* of the opposite for its *impossibility*. The *Dilemma* therefore requires great caution, although it concludes rightly; for it may be employed not only to defend but to controvert *true positions* by opposing difficulties to them.

#### Formally-expressed and hidden Conclusions.

80. A *formally-expressed* Rational Conclusion is one which contains every *requisite*, not only as to *matter*, but as to *form* also, correctly and properly expressed. To this is opposed the *hidden* conclusion (cryptica), in which either one of the premises is *inverted*, or one of them *omitted*; or lastly where the *middle term* alone is connected with the conclusion. A hidden conclusion of the second sort, in which one of the premises is not expressed, but only understood, is called *Enthymema*, or *Mutilated*; those of the third sort are termed *Contracted*.

### III. CONCLUSIONS OF JUDGMENT. See Plate IV.

#### Determinative and Reflective Judgment.

81. Judgment is twofold, both *determinative* and *reflective*. The former proceeds from *universal* to particular, the latter from *particular* to *universal*. This has only *subjective* validity; for the universal, to which it attains through the particular, has only an *empirical* universality, a mere logical *Analogon*.

#### Conclusions of (Reflective) Judgments.

82. Conclusions of Judgment are certain modes of Concluding from *particular* conceptions to *universal*. They are therefore not Functions of Determinative, but of *Reflective*, Judgment. They do not determine the *object*, but only the *manner of reflecting upon it*, in order to obtain a knowledge of it.

#### Principle of these Conclusions.

83. The Principle which constitutes the ground of Conclusions of Judgment is the following: *That many things cannot agree in one single point without a common principle; and that whatsoever applies to many things in this manner, must do so from a common principle.*

*Remark.* As Conclusions of Judgment rest upon such a principle; they cannot on that very account be considered as *immediate* conclusions.

#### INDUCTION AND ANALOGY the two Modes of Conclusions of Judgment.

84. Judgment, whilst it proceeds from particular to universal, in order to derive universal Judgments from experience, that is to say, not *à priori*, but empirically, concludes either from *many* things to *all* of one sort, or from *many* determinations and properties, in which things of one sort agree, to the *rest* of their determinations and properties, so far as they belong to the same principle. The first mode of concluding is called *Induction*; the other *Analogy*.

*Remark (1.)* *Induction* concludes therefore from the particular to the universal, according to a universally-constitutive principle; namely, *What applies to many things of one Genus applies also to the rest.* *Analogy* concludes from the particular similarity of some properties of two things

to their total agreement according to the principle of *specification*. Things of one genus, which agree in many properties, agree also in the rest. *Induction* extends the empirical objects from *particular* to *universal*, in respect to many objects; *Analogy*, on the contrary, from the given properties of one thing to more of the very same thing. If *one* property is found in many things, it exists in *all* of the kind (*Induction*). If *many* properties of one thing are also in another, consequently all the properties of the first will be found in the other (*Analogy*). Thus for instance is the proof of *Immortality*, from the complete development of the natural predispositions of every creature, a conclusion according to *analogy*. In conclusions of *Analogy*, the *identity of the principle* is not required; for we conclude according to analogy that there may be rational inhabitants in the Moon, not that they are men; neither can we conclude by analogy beyond the *tertium comparationis*.

(2.) Every Conclusion of Reason must possess necessity. *Induction* and *Analogy* are therefore not Conclusions of Reason, but only logical *presumptions*, or empirical conclusions. For by induction we obtain general but not universal propositions.

(3.) The preceding Conclusions of Judgment are both useful and indispensable for the purpose of extending our experimental knowledge. But, as they only produce empirical certainty, we must use them with great caution.

(4.) It might prevent much confusion if suitable words were adopted in general use to denote the *three* distinct acts of *concluding* or *inferring*; for instance, for *Conclusion of Understanding* or immediate conclusions, the term ILLATION, or IMMEDIATE INFERENCE; for *Conclusions of Reason*, SYLLOGISM, RATIOINATION, or CONCLUSION; for *Conclusion of Judgment*, INDUCTION and ANALOGY, which are particularly happy, and will always imply a Conclusion of Judgment or of Experience, where the inference proceeds either from a few particular experiments to all cases (*Induction*); or from the particular agreement of two things to the determination of all the rest of that species (*Analogy*). As the *Science of Mind* becomes extended, language will naturally improve with it, and more appropriate terms will be found to express determinately, and to separate distinctly, the various operations of the thinking faculties, which are at present treated of in a very loose and confused manner.

#### Simple and compound Conclusions.

85. A Rational Conclusion is termed *simple* when it consists only of *one*. Compound when it consists of *more* than one rational conclusion.

#### Poly-syllogistical Ratiocinations.

86. A compound conclusion, in which the various rational conclusions are connected together, not by mere co-ordination, but by *subordination*, i.e. as ground and consequence, are called *chain-syllogisms*.

#### Pro-syllogisms and Epi-syllogisms.

87. By *chain-syllogisms* we may conclude in two ways: either from the *ground* to the *consequence*, or from the *consequence* to the *ground*. The former are called *Epi-syllogisms*; the latter *Pro-syllogisms*. An *Epi-syllogism* is a conclusion where one of the premises is the *conclusion* in a Pro-syllogism.

#### Sorites, or Chain-Syllogisms.

88. A conclusion resulting from several abridged conclusions in a series, is termed a *Sorites*, or chain-syllogism; and may be either *Progressive* or *Regressive*, according as we ascend from the approximate to the remote mark, or conversely descend.

#### Categorical and Hypothetical Sorites.

89. *Progressive* as well as *Regressive* chain-syllogisms may be either *Categorical* or *Hypothetical*. The former consist

# LOGIC.

## CONCLUSIONS OF JUDGMENT,

are

*neither Immediate nor Rational,*

*but merely EMPIRICAL CONCLUSIONS, and,*

*their Universality is always Conditional:*

*They arise from*

### REFLECTIVE JUDGMENT.

#### INDUCTION

*Extends the particular to the Universal, thus: If one property be found in many things, it exists in all of the kind.*

#### ANALOGY

*Concludes thus: If many properties of one thing be found in another, all the properties of the one will also be found in the other.*

*They have only Subjective validity, for they do not determine the objects, but only our manner of reflecting upon objects in general.*

sift of Categorical propositions, as a series of *predicates*; the latter of Hypothetical, as a series of *consequences*.

*Fallacious Conclusions—Paralogisms—Sophisms.*

90. A Rational Conclusion, which according to form is false, though it has the appearance of a correct conclusion, is termed a *Paralogism*, when we deceive ourselves by it; a *Sophism*, when we endeavour to deceive others by it.

*Remark.* The ancients applied themselves greatly to the construction of such sophisms. Hence arose the various kinds of them; for instance, the *Sophisma figure dictionis*; where the middle term is taken in various significations, *fallacia a dicto secundum quid ad dictum simpliciter*; *sophisma heterozetiseos, elenchi, ignorationis*; and the like.

*Leap in Concluding.*

91. A Leap (*saltus*) in concluding or proving, is connecting one of the premises with the conclusion, while the other is omitted. Such a leap is legitimate when the *premise* is easily supplied; but *illegitimate* when the assumption is not clear; for here we connect a remote mark with a thing, without an intermediate mark.

*Begging the Question, and Proving in a Circle.*

92. By begging the Question is to be understood the using a position, by way of proof, as an immediately-certain one, though it is itself unproved. Proving in a Circle is, laying the proposition we intend to prove as the ground of its own proof.

*Remark.* It is often difficult to discover when we have proved in a circle; and this fault occurs most frequently in difficult demonstrations.

*Proving too much and too little.*

93. A proof may prove too much, and also too little. In the latter case, it only proves a part of what was to be proved; in the former, it applies to that which is false.

*Remark.* A proof that proves too little may be true; it is therefore not rejectable; but, if it proves too much, it proves more than is true, and must consequently be false.

PART II.

METHOD OF PURE UNIVERSAL LOGIC.

*Manner and Method.*

94. All Knowledge must be conformable to a rule, if it is to produce a whole; for irregularities are at the same time irrationalities. But this rule is either that of *manner* (free), or that of *method* (constrained).

*Form of Science.—Method.*

95. Knowledge, when considered as a science, must be planned according to a Method. For Science is a Whole of Knowledge, as a System; not merely as an Aggregate. It implies therefore Systematical Knowledge, which has been compiled agreeably to predetermined Rules.

*The Object and End of Method.*

96. As the *Elementary* Doctrine of Logic has for its object the Elements and Conditions of the Perfections of Knowledge; so the *Method* of Logic, as its second part, has to treat of the form of a Science in general, or of the manner and mode of connecting various Knowledge into a Science.

*Means of advancing the Logical Perfections of Knowledge.*

97. *Method* must inform us how we are to arrive at the Perfections of Knowledge. Now the most essential logical perfections of Knowledge consist in its *Clearness*, and in its systematic arrangement as a Science. *Method* will accordingly have to point out the means by which these perfections of Knowledge are advanced.

*Conditions of the Clearness of Knowledge.*

98. The *Clearness* of Knowledge, and its connection

into a Systematical whole, depends upon the clearness of conceptions, both with respect to what is contained in them and what is classed under them. The clear consciousness of the *Contents* of a Conception is advanced by *Exposition* and *Definition*. The clear consciousness of the *Sphere* of a Conception is advanced by *Logical Division*. We shall therefore first treat of the means to advance the *Clearness* of Conceptions with regard to their *Contents*.

I. *Advancement of the Logical Perfection of Knowledge by DEFINITION, EXPOSITION, and DESCRIPTION of Conceptions.*

*Definition.*

99. A Definition is a sufficiently clear and adequate conception; (*conceptus rei adequatus in minimis terminis; complete determinatus.*)

*Remark.* *Definition*, alone, is to be considered as a logically-perfect conception, for it unites in itself the two essential perfections of *Clearness* and *Perspicuity*; (that is, completeness and precision in clearness, or quantity of clearness.)

*Analytical and Synthetical Definition.*

100. All Definitions are either *Analytical* or *Synthetical*. The former are definitions of a *given* Conception, the latter of a *produced* one.

*Given and produced Conceptions, à priori and à posteriori.*

101. The *given* Conceptions of an *analytic* definition, are given either *à priori* or *à posteriori*; as the *produced* conceptions of a *synthetical* definition are produced either *à priori* or *à posteriori*.

*Synthetical Definitions by Exposition or Construction.*

102. The synthesis of produced conceptions, from whence arise *synthetical definitions*, is either that of *Exposition* (of the phenomena), or that of *Construction* (of the mathematical). The latter is the synthesis of *arbitrarily-produced* Conceptions; the former of *empirically-produced* Conceptions; that is, from given phenomena; (*Conceptus factitii vel à priori vel per synthesein empiricam.*) The arbitrarily-produced conceptions are the *Mathematical*.

*Remark.* All definitions of *mathematical*, as well as of *empirical*, conceptions, so far as the latter can take place, are *produced synthetically*. For in the empirical conceptions of Earth, Air, Fire, Water, &c. we have not to dissect what lies in these conceptions; but to learn by experience what *belongs* to them; consequently, all empirical conceptions must be considered as *produced* conceptions, whose synthesis is however not *arbitrary*, but *empirical*.

*Impossibility of Empirical Synthetical Definitions.*

103. As the synthesis of empirical conceptions is not *voluntary*, but *empirical*, (because in experience we may always discover more and more marks of a conception,) it follows that empirical conceptions never can be defined.

*Remark.* *Arbitrary* conceptions alone, therefore, can be synthetically defined. Such definitions of arbitrary conceptions as are both *possible* and *necessary*, and which must precede that which is expressed by an arbitrary conception, may be called *Declarations*; for we hereby declare our thoughts, or explain what is to be understood by certain *words*. This is the case in the Mathematics.

*Analytical Definitions of given Conceptions by Dissolution, both à priori and à posteriori.*

104. All given conceptions, whether given *à priori* or *à posteriori*, can only be defined by *Analysis*; for we can only render them *evident* by making their marks successively clear. If all the marks of a given conception are made clear, the conception is *perfectly-evident*. If it does not contain too many marks, it is *precise*. Thus arises a *definition* of a Conception.

*Remark.* As we never can be certain that we have obtained all the marks of a given conception by analysis, all analytical definitions must be considered as uncertain.

*Exposition*

*Exposition and Description.*

105. Conceptions do not all admit of being defined, nor is it necessary that they all should. There are, however, approximations to definitions of certain conceptions, which are either *Expositions* or *Descriptions*. The *Exposition* of a Conception consists in the successive representations of its marks so far as they are discoverable by Analysis. *Description* is the exposition of a certain conception so far as it is *precise*.

*Remark* (1.) We can give an exposition either of a *Conception*, or of *Experience* itself, which is an intuition joined to a conception. The former takes place by *Analysis*, the latter by *Synthesis*.

(2.) Exposition takes place only in *given* Conceptions, which are thereby rendered *perspicuous*; this must be distinguished from *Declaration*, which is a *perspicuous* representation of produced Conceptions. As it is not always possible to render *Analysis* complete, an incomplete exposition, as a partial definition, is nevertheless a true and useful representation of a Conception. Definition here is only the Idea of a logical perfection, which we must always endeavour to attain.

(3.) *Description* takes place only in *empirically-given* Conceptions. It has no determinate rules; and only contains the materials for Definition.

*Nominal and Real Definitions.*

106. By merely *nominal* definitions are to be understood those, which arbitrarily give a meaning to a certain name; and which therefore only denote the logical characteristic of their object; or serve to distinguish it from other objects. *Real* definitions are such as are sufficient to a knowledge of the object from its *internal* determinations, as they show the possibility of the object from *internal* marks.

*Remark* (1.) When a conception is *internally* sufficient to distinguish the thing, it is also *externally* sufficient. But it may be *internally insufficient*, and yet *externally sufficient*. However, absolute *external* sufficiency is impossible without the *internal*.

(2.) Objects of Experience admit only of *nominal* Definitions. *Logical Nominal Definitions* of given Conceptions of understanding, are derived from *Attributes*. *Real* Definitions are taken from the *essence* of the thing itself; that is, from the first grounds of possibility. The latter therefore contain what always applies to the thing, that is, to its real essence. Merely *negative* Definitions cannot be termed *Real* Definitions; for, though negative marks serve to distinguish one thing from another, as well as affirmative marks; yet they do not give any information as to the internal possibility of the thing itself. In moral subjects, we must always endeavour to obtain *real* definitions. The Mathematics abound in *real* definitions; for the definition of an arbitrary conception is always a *real* one.

(3.) A *Generic* definition is that which produces a conception, whose object may be represented *a priori* in the concrete. All *mathematical* definitions are of this class.

*Chief Requisites of a Definition.*

107. The essential and universal requisites for perfecting Definition in general may be considered under the four heads of QUANTITY, QUALITY, RELATION, and MODALITY.

1. According to *Quantity*, namely, what concerns the sphere of a definition, the *definition* and the *thing defined* must be reciprocal conceptions, and consequently the one neither *wider* nor *narrower* than the other.

2. According to *Quality*, the definition must be an *ample* and yet a *precise* conception; that is, it must be an *adequate* one.

3. According to *Relation*, the definition must not be *tautological*; that is, the marks of the definition as the *ground* must be different from the *thing defined*; and lastly,

4. According to *Modality*, the marks must be *necessary*; consequently not such as are obtained from experience.

*Remark.* The condition, that the *Generic* conception and the conception of the *Specific difference* are to constitute the definition, takes place only in *nominal* definitions by comparison, and not in *real* definitions by derivation.

*Rules for Proving Definitions.*

108. In order to prove definitions four things are to be attended to: we have to examine whether the definition,

1. Considered as a *Proposition*, be *true*; whether it,
2. Considered as a *Conception*, be *perspicuous*; whether it,
3. Considered as a *perspicuous Conception*, be also *ample*; and lastly, whether it be,
4. Considered as an *ample Conception*, at the same time *determined*; i. e. *adequate* to the thing itself.

*Rules for Forming Definitions.*

109. The very same things that are required for proving definitions are to be attended to in forming them. With this view we must search for, 1, True positions; 2, Such where the predicate does not already presuppose the conception of the thing; 3, Collect more of them, and compare them with the conception of the thing itself, to determine whether they be adequate; and, 4, whether one mark does not lie in another, or is not subordinate to it.

*Remark* (1.) It may indeed easily be observed, that, as these rules apply only to *Analytical Definitions*, and as we never can be certain that the thing has been completely analyzed, we must still consider the definition only as an attempt, and not use it as a definition. Under this limitation we may consider it as a true and *perspicuous* conception, and draw from it corollaries. For we may here observe, that what applies to the conception of the thing defined, applies also to the definition; but indeed not conversely, since the definition does not embrace the whole of the thing defined.

(2.) To employ the conception of the thing defined in the definition, or to lay the thing defined as a ground for the definition, is to define in a circle.

II. *Advancement of the Perfections of Knowledge by the Logical Division of Conceptions.**Conception of a Logical Division.*

110. Every conception contains a variety *under* it; so far they all agree; but in this also they differ; for, the determination of a conception in respect to all possible parts contained under it, in as much as they are opposed to one another, that is, differ from each other, is termed the *logical division of a conception*. The superior conception is called the *divided conception*; and the inferior conceptions, the *members of division*.

*Remark.* To *part* a conception is not to *divide* it. In the partition of a conception we perceive what is contained *in it* (by Analysis.) In the division we consider what is classed *under it*. Here we divide the sphere of a conception, and not the conception itself. It is a great error to take the division for the partition of a conception, since the members of division contain much more in them than the divided conception.

(2.) We may proceed from the inferior to the superior, and afterwards return from the superior to the inferior, by *division*.

*Universal Rules of Logical Division.*

111. In each division of a Conception,
  1. The *members of division* must exclude or be opposed to one another;
  2. They must be comprehended under a superior conception; and lastly,
  3. Taken all together, they must constitute the sphere of a divided conception, or be equal to it.

*Remark.* The *members of division* must be separated from one another by *contradictory* and not by mere *contrary* opposition.

*Co-division and Sub-division.*

112. The first divisions of a conception are called *Co-divisions*, and the divisions of these divisions are termed *Sub-divisions*.

*Remark* (1.) Sub-divisions can be continued to *infinity*, but they may be comparatively *finite*. *Co-divisions* proceed also to *infinity*, particularly in conceptions of experience; for we can never ascertain all the relations among conceptions.

(2.) We may also term co-division a division according to the different conceptions of the same object, (points of view;) sub-division a division of the points of view themselves.

*Dichotomy and Polyotomy.*

113. A division into two members is called *Dichotomy*, into more than two, *Polyotomy*.

*Remark* (1.) *Polyotomy* is empirical, *Dichotomy* is the only division from principles *à priori*; consequently, the only *primitive* division; for the members of division ought to be opposed to each other: now the opposite of A is simply *non A*.

(2.) *Polyotomy* cannot be taught in Logic; for it requires a *Knowledge of the Objects*; but *Dichotomy* requires only the position of contradiction, and not the knowledge of the Contents of the Conception which we intend to divide. *Polyotomy* requires either *intuition à priori* as in the Mathematics, (e. g. the division of the conic sections,) or *empirical intuition*, as in Natural Philosophy. However, the division from the *principle of synthesis à priori* is susceptible of *Trichotomy*; namely, 1, the Conception as the Condition; 2, the Conditioned; and, 3, the derivation of the latter from the former.

*Various Divisions of Method.*

114. We may still further remark on the subject of *Method*, in scientific Knowledge; that there are various kinds, which may be arranged under the following heads.

1. *Scientific and Popular.*

115. The *Scientific* or *Scholastic* method is thus distinguished from the *Popular*. The former proceeds from fundamental and elementary propositions; the latter depends on *Custom* and *Habit*. The former has for its object *Soundness*, consequently dispels every thing that is heterogeneous to it; the latter aims at entertaining.

2. *Systematic and Fragmentary.*

116. The *Systematic* is opposed to the *Fragmentary* or *Rhapsodical* Method. When we think according to a certain method, in which the transition from one position to another is perspicuously denoted, we treat Knowledge *systematically*. If, on the other hand, we think indeed according to a method, but have not arranged our thoughts, such a method may be called *Rhapsodical*.

*Remark*. The systematic mode of treatment is opposed to the fragmentary in the same manner as the methodical to the tumultuary. He who thinks methodically can treat a subject either in a systematic or fragmentary manner. The externally-fragmentary but intrinsically-methodical mode of treatment is called the *Aphoristical*.

3. *Analytical and Synthetical.*

117. The *Analytic* is opposed to the *Synthetic* method. The former commences from the conditioned, and proceeds to the condition, or to first principles (*a principiatis ad principia*); the latter proceeds from principles to their consequences, or from the simple to the composed. The former may be termed *Regressive*, and the latter *Progressive*.

*Remark*. The *Analytic* method is also called the *Inventive*; and is best suited to the end of popularity; the *Synthetic* is calculated for the scientific and systematic treatment of Knowledge.

4. *Syllogistic and Tabular.*

118. The *Syllogistic* is that method in which a science is propounded by a series of conclusions; the *Tabular* that which exhibits at once an entire system in its whole connection.

5. *Acroamatic and Erotematic.*

119. *Acroamatic* is that method by which we merely teach; *Erotematic* that by which we also question. The latter may be again divided into the *Dialogical* or *Socratic*; and the *Catechetical*, as the Questions are directed either to the *Understanding* or merely to the *Memory*.

*Remark*. We cannot teach *erotematically* otherwise than by the *Socratic Dialogue*, in which the Pupil and the Teacher mutually propose Questions and answer them; so that the pupil seems also to be a teacher, and is thus rendered attentive to the principles of his own reason. By the *catechetical* method we do not teach, but only examine what has already been taught by the acroamatic method. The *Catechetical*, therefore, can only be applied to empirical and historical knowledge; the *Dialogical* only to rational knowledge.

*Meditation.*

120. *Meditation* is thinking methodically, which should accompany all our reading and study. To this it is requisite that we make previous investigation, and afterwards reduce our thoughts to order, or connect them according to a certain method.

CONCLUSION.

That the preceding system is a *Pure Universal Logic* must be evident, as it concerns itself with the *form* of Knowledge only, and not at all with its *matter*. It can, therefore, be only of a regulative use; but, in this light, it must be allowed to be indispensable, since it contains the Rules of the Agreement of Knowledge with the Laws of UNDERSTANDING and of REASON.

But, as all Knowledge consists both of *matter* and *form*, and as logic can only criticize the FORM, it must be evident that *another science* is still requisite, in order to examine or criticize its MATTER: and this science is TRANSCENDENTAL PHILOSOPHY. Thus, in order to be certain that our Knowledge is genuine, we must absolutely examine it, both by the Rules of Logic, and by the Laws of Transcendental Philosophy, or of true METAPHYSICS. (See that article.) Without the latter, Logic may become a mere play of thoughts, which entangles itself in its own illusions. The distinction between the *Original* and *Logical* use of Understanding is more particularly explained in vol. xi. p. 616. in that view of the Critical or Transcendental Philosophy which accompanies the life of its author, the immortal KANT.

The Logic here given, has the great merit of exposing the false subtleties of the syllogistic figures, on which so much seeming learning has been lavished; and of establishing the only pure and legitimate Form of Categorical Conclusion, which is the highest principle of reasoning. Thus simplified, and confined within its proper limits, LOGIC may justly be expected to resume its rank among the useful sciences, and be again considered as an essential part of a liberal education.

**LOG'ICAL**, *adj.* Pertaining to logic; taught in logic.—We ought not to value ourselves upon our ability, in giving subtle rules, and finding out *logical* arguments, since it would be more perfection not to want them. *Ba-her*.—Skilled in logic; furnished with logic.—A man who sets up for a judge in criticism, should have a clear and *logical* head. *Addison*.

**LOG'ICALLY**, *adv.* According to the laws of logic: How can her old good man  
With honour take her back again?  
From hence I *logically* gather,  
The woman cannot live with either. *Prior*.

**LOGIC'IAN**, *f.* A teacher or professor of logic; a man versed in logic.—If we may believe our *logicians*, man is distinguished from all other creatures by the faculty of laughter. *Addison*.

Each staunch polemic stubborn as a rock,  
Each fierce *logician* still expelling Locke,  
Came whip and spur. *Pope's Dunciad*.

**LOG'IE**, a town of Scotland, in Rosshire: four miles south of Tain.

**LOG'IE**, a town of Scotland, in the county of Aberdeen: six miles south of Frazerburgh.

**LOG'IE**, a town of Scotland, in the county of Angus: five miles north-west of Montrose.

**LOGIERA'IT**, a town of Scotland, in the county of Perth: seven miles north of Dunkeld.

**LOGINOV'**, a town of Russia, in the government of Tobolsk, on the Irtysh: sixteen miles south-east of Tara.

**LOG'ISM**, *f.* [*logismus*, Lat.] In rhetoric, an inconclusive kind of argument; a kind of syllogism. *Bailey*.

**LOG'IST**, *f.* [*λογιστης*, Gr.] An expert accountant. *Scott*.

**LOGIS'TA**, *f.* The title of an officer at Athens, whose business was to receive and pass the accounts of magistrates when they came out of their office. The *logistæ* were in number ten; they were elected by lot, and had ten *euthyni*, or auditors of accounts, under them.

**LOGIS'TIC**, or **LOGISTICAL**, *adj.* Belonging to computation; belonging to the method of computation by sexagesimal fractions; logarithmic.

**LOGIS'TICS**, or **LOGISTICAL ARITHMETIC**, a denomination sometimes given to the arithmetic of sexagesimal fractions, used by astronomers in their calculations. It was so called from a Greek treatise of one Barlaam Monachus, who wrote about sexagesimal multiplication very accurately; and entitled his book *Λογιστική*. This author Vossius places about the year 1350; but he mistakes the work for a treatise of algebra. Shakerly, in his *Tabulæ Britannicæ*, has a table of logarithms adapted to the sexagesimal fractions; which, therefore, he calls *logistical logarithms*; and the expeditious arithmetic of them which is by this means obtained, and by which all the trouble of multiplication and division is saved, he calls *logistical arithmetic*. See the article **LOGARITHMS**, vol. xii. p. 902.

**LOG'GIUM**, *f.* [in old records.] A lodge, a hovel, an out-house.

**LOG'MAN**, *f.* One whose business is to carry logs:  
For your sake  
Am I this patient *logman*. *Shakespeare's Tempest*.

**LOGODÆ'DALIST**, *f.* [from the Greek *λογος*, a word, and *δαιδαλος*, an artificer.] An inventor of new words. *Scott*.

**LOGODÆ'DALY**, *f.* A fine flourish of words without much meaning. *Scott*.

**LOGODO'RI**. See **SASSARI**.

**LOGOGRAPHIC**, *adj.* [from the Gr. *λογος*, a word, and *γραφω*, to write.] An epithet applied to a method of printing, in which the types, instead of answering only to single letters, are made to correspond to whole words.

**LOGOGRAPHY**, *f.* A word coined to express the

above invention. It is little used at present; but the principle of it will be explained under the article **PRINTING**.

**LOG'OGRIPIH**, *f.* [from the Gr. *λογος*, a word, and *γριφος*, a net.] A kind of riddle. Verbal intricacy:

And weaved fifty tomes  
Of *logogriphes*, and curious palindromes. *B. Jonson's Undw.*

**LOG'OM**, a town of Hindoostan, in Vishapur: ten miles north of Poonah.

**LOGOM'ACHY**, *f.* [from the Gr. *λογος*, a word, and *μαχη*, a fight.] A contention in words; a contention about words.—Forced terms of art did much puzzle sacred theology with distinctions, cavils, quiddities; and so transformed her to a meer kind of sophistry and *logomachy*. *Howel*.

**LOGON'DIUM**, *f.* in botany. See **VITEX**.

**LOGO'NE**, a town of Hindoostan, in Vishapur: ten miles north of Poonah.

**LOGO'NI**, a town of Sardinia: nine miles east of Cagliari.

**LOGO'RAS**, a town of Syria: fifteen miles north of Antioch.

**LOGOTHE'TA**, *f.* An officer under the emperors of the East, who kept an account of the various branches of public and private expense. There were several kinds of them, distinguished by the particular branch they superintended: as the *logotheta re dromu*, or post-master general; *logotheta των οικιακων*, or master of the household, &c.

**LOGRO'NO**, a town of Spain, in Old Castile, on the Ebro. It contains five parishes, eight convents, and about 5000 inhabitants. The environs produce fruit, legumes, flax, hemp, excellent wine, oil, and silk. It is twenty miles north-west of Calahorra, and fifty-two east of Burgos. Lat. 42. 23. N. lon. 3. 24. W.

**LOGRO'NO**, a town of South America, in the province of Quito: forty miles east-south-east of Cuenza.

**LOG'STOR**, or **LIXTOER**, a town of Denmark, in North Jutland, on Lymford Gulf: twenty-one miles west of Aalborg. Lat. 57. N. lon. 9. 15. E.

**LOG'UIVY PLOU'GROS**, a town of France, in the department of the North Coasts: thirteen miles west of Guingamp, and twelve south of Lannion.

**LOGUR'**, a town of Hindoostan: twenty-eight miles west-north-west of Poonah.

**LOG'WOOD**, *f.* in botany. See **HAMOTOXYLUM**.—*Logwood* is of a very dense and firm texture; and is the heart only of the tree which produces it. It is very heavy, and remarkably hard, and of a deep, strong, red colour. It grows both in the East and West Indies, but nowhere so plentifully as on the coast of the bay of Campeachy. *Hill's Mat. Med.*—To make a light purple, mingle ceruse with *logwood-water*. *Peachment*.

The use of logwood in dying was established in this country by 13 & 14 Car. II. c. 11. before which time it was prohibited as a pernicious material. A considerable part of the soluble portion of the wood is taken up both by water and alcohol, but much more by the latter, and these menstrua become tinged by it of a deep purple-red or brown. If acids be added to the watery decoction, it is turned yellow; but alkalies give a very deep purple colour, without yielding any precipitate. Alum, added to the decoction of logwood, causes a violet precipitate, or lake; and the supernatant liquor also remains violet, and gives a fresh portion of lake on the effusion of an alkali. The salts of iron give an inky black with all the solutions of logwood, under the same circumstances as with galls, whence the presence of gallic acid in logwood is evinced. The solutions of tin form a very fine violet-coloured lake with the decoction of logwood, and wholly precipitate the colouring matter, so that the supernatant liquor is quite clear and colourless. In dying, logwood gives its own natural purple, with shades or variations according to the mordant used; or it heightens and improves the common black with iron and galls. In this latter way it gives

gives a peculiar gloss and lustre; on which account it is a very valuable dying material.

Logwood is used in miniature-painting to make a purple wash; which may be varied to a more red or blue colour by the addition or omission of Brazil-wood. The wash may be prepared by boiling an ounce of ground logwood in a pint of water, till one-half of the fluid be wasted; strain it then through flannel, while of a boiling heat; and add to it, when strained, about ten grains of pearl-ash. To make it more red, add half an ounce of Brazil-wood, or in proportion as the colour wanted may require; using in this case the pearl-ash very sparingly. This wood has a sweetish subastringent taste, but a remarkable smell. It gives a purplish-red tincture to watery and spirituous infusions, and tinges the stools, and sometimes the urine, of the same colour; but it does not appear to colour the bones of animals.

Besides its use among dyers, it is employed medicinally as an astringent and corroborant. In diarrhoeas it has been found peculiarly efficacious; also in the latter stages of dysentery, when the obstructing causes are removed, it serves to obviate that extreme laxity of the intestines usually superinduced by repeated dejections. *Extractum ligni campechensis* is ordered in the pharmacopoeias; and may be given in the dose of one scruple or two, repeated according to the urgency of the symptoms. The extract is obtained by inspissating the decoction. To promote the extraction, the wood should be reduced into a fine powder, which is to be boiled in the water, in the proportion of a pound to a gallon, till half the liquor is wasted. Some digest the powdered wood in as much spirit as will cover it to the height of about four inches, and afterwards boil it in water; the matters taken up by the watery and spirituous menstrua may be united into one extract, by inspissating the watery decoction to the consistence of honey, and then gradually stirring in the spirituous tincture.

The machines for reducing logwood, or other dying woods, to small chips or rasplings, that the colouring matter may be more readily extracted from them by the dyer, are of two kinds: One, by means of knives fixed to a large wheel, chips the wood across the grain into small fragments, which are afterwards reduced to a fine powder by grinding them beneath a pair of rolling stones; this is called a *chipping-engine*. The other kind operates by steel bars, with a great number of notches in the edge, which rasp and cuts the end of the wood into powder: this is called the *rasping-engine*. Both machines require an immense power to actuate them, and are generally worked by water-wheels or by steam-engines. A method of reducing logwood has been lately introduced by sawing it with a circular saw, which cuts off a flake from the end of a piece of wood, so that the jar of the saw shatters the flake all into powder. By this means at every cut the saw cuts away as much wood as its thickness in saw-dust, and the flake, which is as much more, is reduced at the same time; so that all the wood is reduced, though only one-half is cut; whereas, in the rasping-engine, every particle must be cut by the machine. This improvement merits the attention of the woollen manufacturers, whose numerous logwood-mills would be much improved by the adoption of this method.

**LOGWOOD COUNTRY**, a district of America, that lies north-west of the Mosquito shore, at the head of the bay of Honduras, and extends from Vera Paz to Yucatan, from lat. 15. to 18. N. The whole coast is overspread with islets, keys, and shoals; and the navigation is intricate.

**LOGWOOD LAGOON**, a bay or gulf on the north-east coast of Yucatan. Lat. 20. 57. N. lon. 88. 20. W.

**LOH**, a river of Silesia, which runs into the Oder five miles north-north-west of Breslau.

**LOHA**, a town of Algiers: twenty-eight miles east of El Callah.

**LOHARCA'NA**, a town of Nepal: ten miles south of Batgoa.

Vol. XIII. No. 385.

**LOHARINAPAU'L**, a town of Nepal: fifteen miles south of Catmandu.

**LOHARCO'**, a town of Hindooistan, in Doob: ten miles north-west of Pattiary.

**LOHE**, a town of Austria: twelve miles west-south-west of Crems.

**LOHEAC'**, a town of France, in the department of the Ille and Vilaine: seventeen miles north of Redon, and seventeen south of Rennes.

**LOHEBECK**, a river in the duchy of Sleswick, which runs into the North Sea sixteen miles south of Ripen.

**LOHEI'A**, a town of Arabia, in the province of Yemen, on the coast of the Red Sea, founded near the tomb of an Arabian saint, about three centuries ago. The territory near it is dry and barren. The harbour is so indifferent, that even the smallest vessels are obliged to anchor at a great distance from the city; and, when the tide is at ebb, laden boats cannot approach. Notwithstanding this disadvantage, a considerable trade in coffee is carried on from Loheia; the coffee is brought from the neighbouring hills, and exposed in one large heap for sale: it is not repated to be so good as that which comes from Beit el Fakih, and is shipped at Mokha and Hodeida: but coffee is to be purchased here upon more reasonable terms; and the carriage to Jidda costs less: on this account several merchants from Cairo live at Loheia, and others come annually hither to make purchases of that commodity. Loheia, although without walls, is not entirely defenceless: twelve towers, guarded by soldiers, stand at equal distances round it: only one of these towers, and that newly built by emir Farhan, is such as to admit of being defended by cannon. Several of the houses in Loheia are built of stone; but the greatest part are huts constructed in the fashion which is common among the Arabs: i. e. the walls are of mud mixed with dung, and the roof is thatched with a sort of grass. The water at Loheia is very bad, and is brought from a distance. Within six miles of the city is a small hill, which affords considerable quantities of mineral salt. This place is 375 miles south-south-west of Mecca. Lat. 15. 42. N. lon. 42. 49. E. *Niebuhr*, vol. i.

**LOH'MEN**, a town of Saxony, in the margravate of Meissen: ten miles east-south-east of Dresden.

**LOHN**. See **ISERLOHN**, vol. xi. p. 400. and **LAHN**, vol. xii. p. 87.

**LOH'NIN**, a town of Brandenburg, in the Middle Mark: ten miles south-east of Brandenburg.

**LOH'NINGEN**, a town of Swisserland, in the county of Schaffhausen: five miles west-north-west of Schaffhausen.

**LOH'NSTEIN**. See **LAHNSTEIN**, in the preceding volume.

**LO'HOCK**, *f.*—*Lohock* is an Arabian name for those forms of medicines which are now commonly called eclemmas, lambatives, or linctuses. *Quincy*.

**LO'HOCK**, *f.* [Scotch.] A loch; a lake. *Scott*.

**LOHORPOU'R**, a town of Hindooistan, in Oude: twenty miles south of Mahomdy.

**LOHR**. See **LAHR**, vol. xii.

**LOHR**, a town of Germany, in the county of Rieneck, on the Maine: twenty-one miles north-west of Wurzburg, and thirty-five east-south-east of Frankfort on the Maine.

**LOHR**, a town of the duchy of Wurzburg: two miles north-west of Ebern.

**LOHR**, a river of Franconia, which runs into the Maine at the town of Lohr.

**LOHR**, a town of Bavaria, in the territory of Rothenburg: three miles south of Rothenburg.

**LOHR HAUPTON**, a town of Germany, in the county of Hanau Munzenburg: twenty-two miles east of Hanau.

**LOHRY**, a town of Hindooistan, in Behker, on the Sinde: fifteen miles south of Behker.

**LOH'TO**, a town of Sweden, in the government of Wafsa: eighteen miles north-east of Gamla Karleby.

K **LOHURDEGA**,

LOHURDE/GA, a town of Bengal, in the circar of Nagpou: twenty-two miles north-north-west of Doesa. Lat. 23. 20. N. lon. 84. 51. E.

LOHUR'SEY, a town of Bengal. Here is a pass across mountains: eighteen miles north-north-east of Palamow.

LO'JA. See LOXA.

LO'BERSTORFF, a town of Austria: fourteen miles south of Vienna.

LO'BERSTORFF, a town of Austria: ten miles south-west of St. Polten.

LO'BL, a range of mountains between Carinthia and Carniola.

LO'CH-FISH, *f.* A class of fish including the cod, ling, lob, and some others; mentioned in stat. 31 Edw. III.

LOIGNO'N, a river of France, which runs into the Loire about twenty-four miles below le Puy.

LOIMAJOKI, a town of Sweden, in the government of Abo: thirty-two miles north-north-east of Abo.

LOIMOG'RAPHY, *f.* [from the Gr. *λοσμος*, the plague, and *γραφω*, to write.] A writer on the plague.

LOIMOG'RAPHY, *f.* A treatise on the plague.

LOIMOS, *f.* [Greek.] The plague; the pestilence.

LOIN, *f.* [*Λωιν*, Welsh.] The back of an animal carved out by the butcher:

So have I seen in larder dark

Of veal a lucid loin,

Replete with many a brilliant spark,

As wife philosophers remark,

At once both sink and shine.

*Dorset.*

Loins; the reins:

My face I'll grime with filth,

Blanket my loins.

*Shakespeare's King Lear.*

Thou slander of thy heavy mother's womb!

Thou loathed issue of thy father's loins! *Shakespeare.*

LOIN, a river of France, which runs into the Seine a little below Moret.

LO'JO, a town of Sweden, in the province of Nyland: thirty miles west of Helsingfors.

LOJO'BI, a town of Servia: sixteen miles south-south-east of Passarowitz.

LO'PERSTORFF, a town of Austria, on the Rusbach: six miles east-north-east of Entzerstorff.

LOIR (Nicholas), a French painter, born at Paris in 1624, was the son of a goldsmith. He was placed as a pupil under Bourdon, but adopted the manner neither of that master nor of any other. He visited Rome in 1637, where he laid in a large stock of ideas, so strongly impressed upon his memory, that he could recall them at pleasure. A great abundance of thoughts upon any given subject was therefore his characteristic, which gave facility and variety to his works, though without any thing that indicated superior genius. As a proof of these qualities, it is related that he laid a wager with some brother-artists, that he would in one day design twelve holy families, in which not one figure should resemble another; and won his bet. He drew correctly, grouped his pieces with elegance, was a good colourist, and painted all parts of his subjects equally well; figures, landscapes, architecture, and ornaments. He particularly excelled in his women and children. On his return from Rome, he was much employed at Paris, and became professor and rector of the academy of painting. He painted several ceilings for the palaces of Louis XIV. in which he adopted that monarch's favourite allegorical emblem of the sun, and gained a pension for the adulation of his pencil. Many of his works were allegorical; but his invention in this walk does not seem to have soared very high, if we may judge from a piece in which, to illustrate the maxim "Sine Cerere & Baccho friget Venus," he painted Venus warming herself at a fire, and Ceres and Bacchus retiring. Loir made a number of etchings from his own designs; and about fourscore engravings from his works by dif-

ferent masters attest the reputation he once possessed. He died in 1679. *Pilkington.*

LOIR, a river of France, which rises about six miles north-north-west from Illiers, in the department of the Eure and Loir; passes by Bonneval, Châteaudun, Cloye, Morée, Freteval, Vendosme, Montoire, Chartres, Le Lude, La Flèche, Durtal, &c. and joins the Sarthe about five miles above Le Mans; soon after which they both together join the Mayenne.

LOIR AND CHER, a department of France, so called from the two rivers which cross it; the former in the southern part, the other in the north. It is bounded on the north by the department of the Eure and Loir, on the north-east by the Loiret, on the east and south-east by the Cher, on the south by the Indre, and on the west by the Indre and Loire, and Sarthe. It is about sixty-six miles in length, and from twenty-five to thirty broad. Blois is the capital.

LOIRE, a river of France, which rises about eighteen miles north-north-west from Aubenas, in the department of the Ardèche, passes by or near to Le Puy, Bas en Basset, Aurec, St. Rambert, Feurs, Roanne, Marcigny, Les Nonains, Digoïn, Décise, Nevers, Charité, Cosne, Châtillon sur Loire, Gien, Jargeau, Orleans, Beaugency, St. Die, Blois, Amboise, Tours, Langeais, Saumur, Rochefort, Châlonne, St. Florent, Ancenis, Nantes, &c. and runs into the sea about thirty miles west from Nantes, in lat. 47. 12. N. lon. 2. 10. W.

We have the following more particular account of this river in Monf. Millin's Voyage dans les Départemens Méridionaux de la France. "The Loire, of which the Romans have preserved the Celtic name, *Liger*, has its source in mount Gerbier-le-Joux, on the frontiers of Velay; after having flowed through le Forez, its bulk increases so as to render it navigable; it then traverses part of Burgundy and the Nivernais, where it receives the waters of the Allier; it runs from east to west, from Orleans to Nantes, where its bed is enlarged; and, eleven leagues lower down, it empties itself into the sea. The benefits which it renders to commerce and industry are incalculable; hence it is bordered by rich and populous cities, and its banks announce fertility and abundance. For a long time they who inhabit its shores have done all in their power to promote the safety of its navigation; but the quantity of loose sand which it carries down, with fragments of quartz and coal, which are often mixed together, renders its course uncertain and deceptive, especially from Orleans to the sea. To prevent the dangers which may arise from shoals, which shift with the frequent variations of the current, watermen are constantly employed in placing little branches of willows on these shoals, and in preceding large barges, which are commonly united to each other in numbers more or less considerable: a little boat always attends them, with a pilot to lay down the buoys. As its course, though sinuous, does not double on itself, the vessels ascending the river avail themselves of those days in which the wind blows from the sea, and fills their large sails; but the variableness of the winds precludes any calculation of the length of time which will be employed in this navigation. To confine this capacious river to its bed, a large dyke has been constructed on both its banks, from Blois to Angers; which immense work is called *les levées*, or the causeways. Its origin is traced back to the time of Charlemagne; and from that period care has been taken to keep it in repair. The height of these causeways is twenty-five feet, and their breadth is forty; the middle is paved or gravelled, and the sides are protected by parapets of earth, which are in several places sadly damaged. It is easy to perceive that a road so winding and narrow, continued to so great an extent, must be dangerous; and it often happens that melancholy accidents occur in dark nights, during thick fogs, when the horses are frightened, and when, among the multitude of drivers with which the causeway is covered,

vered, some will be careless, and others are inexpert or imprudent."

The scenery on the banks of the Loire is described in a very animated manner by Mr. Pinkney, the American traveller. "Mauves, near Nantes, is most romantically situated on a hill, which forms one of the banks of the Loire. The country about it, in the richness of its woods, and the verdure of its meadows, most strongly reminded me of England; but I know of no scenery in England, which, together with this richness and variety of woodland and meadow, has such a beautiful river as the Loire to complete it in all the qualities of landscape. On each side of this river, from Nantes, are hills, which are wooded to the summit; and there are very few of these wood-tufted hills, which have not their castle or ruined tower. From Mauves to Oudon the country is still very thickly wooded and inclosed; the properties evidently very small, and therefore innumerable cottages and small gardens. These cottages usually consist of only one floor, divided into two rooms, and a shed behind. They were generally situated in orchards, and fronted the Loire. They had invariably one or two large trees, which are decorated with ribbons at sunset, as the signal for the dance, which is invariably observed in this part of France. The Arno, as described by the Tuscan poets, for I have never seen it, must bear a strong resemblance to the Loire from Ancennis to Angers; nothing can be more beautiful than the natural distribution of lawn, wood, hill, and valley, whilst the river, which borders this scenery, is ever giving it a new form by its serpentine shape. The favourite images in the landscapes of the ancient painters here meet the eye almost every league. From the earliest times of the French monarchy, the rising grounds of the Loire have been selected for the sites of castles, monasteries, abbeys, and chateaux; and, as the possessors have superadded art to nature, this natural beauty of the grounds has been improving from age to age. The monks have been immemorially celebrated for their skill, as well in the choice of situations as in their improvement of natural advantages; their leisure, and their taste, improved by learning, have naturally been employed on the scenes of their residence, on their vineyards, and their gardens. Innumerable are the still-remaining vestiges of their taste and of their industry. Towns, windmills, steeples, ancient castles and abbeys, still entire, and others with nothing remaining but their lofty walls; hills covered with vines, and alternate woods and corn-fields; all together form a landscape, or rather a chain of landscapes, which remind one of a poem, and successively refresh, delight, animate, and exalt the imagination."

LOIRE (Lower), a department of France, bounded on the north by the departments of the Morbihan and Ille and Vilaine, on the east by the Mayne and Loire, on the south by the Vendée, and on the west by the sea; about fifty-five miles in length, and from thirty to forty-four in breadth. Nantes is the capital.

LOIRE (Upper), a department of France, bounded on the north by the department of the Puy de Dôme, on the north-east by the Rhône and Loire, on the south-east by Ardèche, on the south-west by the Lozere, and on the west by the Cantal; about fifty miles from east to west, and thirty-five from north to south. Le Puy is the capital.

LOIRET, a river of France, which runs into the Loire three miles below Orleans. It is small, but gives name to a department.

LOIRET, a department of France, bounded on the north by the departments of the Eure and Loire, Seine and Oise, and Seine and Marne; on the east by the department of the Yonne; on the south by the departments of the Nievre, Cher, and Loir and Cher; and on the west by the Loir and Cher; about sixty miles from east to west, and forty-five from north to south. Orleans is the capital.

LOIRO'N, a town of France, in the department of the Mayenne: six miles west of Laval, and twelve north of Craon.

LOIS, [Greek.] The name of a woman. *2 Tim.* i. 5.  
LOISON, a river of France, which runs into the Meuse near Montmedy.

LOI'SEY, a town of France, in the department of the Meuse: five miles east of Bar le Duc, and twelve west of Commercy.

LOI'SY, a town of France, in the department of the Marne: three miles north-west of Vitry le François.

To LOI'TER, *f.* [*loteren*, Dut.] To linger; to spend time carelessly; to idle.—If we have gone wrong, let us redeem the mistake; if we have *loitered*, let us quicken our pace, and make the most of the present opportunity. *Rogers.*

Whence this long delay?  
You *loiter*, while the spoils are thrown away. *Dryden.*

LOI'TERER, *f.* A lingerer; an idler; a lazy wretch; one who lives without business; one who is sluggish and dilatory.—The poor, by idleness or unthriftiness, are riotous spenders, vagabonds, and *loiterers*. *Hayward.*

Give gloves to thy reapers a largess to cry,  
And daily to *loiterers* have a good eye. *Tusser's Husbandry.*

LOI'TERING, *f.* The act of delaying on a journey.

LOI'TSCH, or LOG'ATEZ, a town of Upper Carniola: fifteen miles west of Laybach.

LOITOM'BA. See SAINT DOMINGO.

LOITZ, a town of Anterior Pomerania: twenty-four miles south of Stralsund, and sixteen north of Treptow. Lat. 53. 56. N. lon. 13. 5. E.

LOI'TZENDORF, a town of Austria: four miles north-west of Aggspach.

LO'KACZ, a town of Poland, in Volhynia: thirty miles west-south-west of Lucko.

LOK'ALAX, a town of Sweden, in the government of Abo: twenty-seven miles north-west of Abo.

LO'KE, in mythology, the name of one of the deities of the northern nations, answering to the Arimanius among the Persians, whom they represent as at enmity both with gods and men, and the author of all the evils which desolate the universe. Loke is described in the Edda as producing the great serpent which encircles the world; which seems to have been intended as an emblem of corruption or sin: he also gives birth to Hela, or death, the queen of the infernal regions; and also to the wolf Fenris, that monster who is to encounter the gods and destroy the world.

LOK'ET. See ELNBOGEN, vol. vi. p. 478.

LOK'MAN, surnamed *Al-Hakim*, or the Wise, a philosopher in high repute among the eastern nations, to whom is attributed a collection of maxims and fables, which convey no inelegant specimen of the moral doctrine of the ancient Arabians. Mahomet gave his name to the thirty-first chapter of the Alcoran, in which he introduces God as thus speaking: "We have given wisdom to Lokman." According to some, he was the nephew of Job, by his sister, or the son of his aunt, and consequently his cousin; but, according to others, he was the great nephew of Abraham. The greater number of the Mussulman doctors, however, deny his claim to so high an antiquity, and make him a contemporary with David and Solomon. The latter all agree, that he was a native of Ethiopia, or Nubia, and in a servile condition; his occupation being either that of a tailor, a carpenter, or a shepherd. They relate, that, after having been a slave in different countries, he was at length sold among the Israelites. His wisdom they ascribe to divine inspiration; and the account which they preserve of the manner in which he received that gift appears to have been borrowed from the scripture history of Solomon. The anecdotes which remain concerning the life of Lokman, are found scattered in the writings of several of the orientals, who have introduced them as ornaments to their poems and other works. From the selection of them made by d'Herbelot, and in the notice prefixed to Marcel's edition of Lokman's fables, we shall present our readers with some specimens, from which they

they will be able to form an idea of the wisdom attributed to this celebrated character in ancient story.

Lokman was one day seated in the midst of a circle of auditors, when a man of high rank among the Jews, observing the attention with which they listened to him, asked him if he was not that black slave whom he had seen attending the flocks of a person whom he named? Lokman said he was. The other then asked him, how, in that low condition, he had acquired the knowledge of a sage and philosopher? Lokman replied, "By following exactly these three precepts: always speak the truth, without disguise; keep, inviolably, the promises which you have made; and never meddle with what does not concern you." Being asked, at another time, from whom he had learned that wisdom and discernment, which made him shine so conspicuously on every subject, he answered, "From the blind, who will believe nothing but what they touch with their own hands." It was Lokman who first said, that "the tongue and the heart were both the best and the worst parts of men." A caravan, in which Lokman was present, having been pillaged by robbers, who could not be moved to pity by the tears and lamentations of the sufferers, one of the plundered merchants said to Lokman, "Thou shouldest have given to these robbers lessons of wisdom and good conduct; perhaps they might then have been diverted from their purpose by thy advice and remonstrances, and would have restored to us our goods, or, at least, in part repaired the heavy loss which they have occasioned us." "It would have been a much greater loss," replied Lokman, "to have thrown away lessons of wisdom on villains incapable of understanding or appreciating them. No file can polish the iron, when the rust has entirely consumed it." Being repeatedly asked whence he had drawn that treasure of virtue and wisdom, which he possessed in so eminent a degree, he answered, "From the foolish and wicked; by observing their actions, and comparing them with the dictates of my own conscience, I have learned what to perform, and what to shun." Lokman's master having one day given him a bitter melon, or coloquintida, to eat, he immediately ate it all, without showing the least repugnance. Surprised at his ready obedience, his master said to him, "How was it possible for you to eat a fruit so disagreeable to the taste?" Lokman replied, "I have received so many sweets from you, that it is not surprising I should have eaten the only bitter fruit which you have ever given me." This generous answer so forcibly struck his master, that he immediately gave him his liberty.

Some idea of the high sense which the orientals entertain of the wisdom of our philosopher, may be understood from their common use of the proverb, "To teach any thing to Lokman," which is employed to express something absolutely impossible. It is also worthy of notice, that Mahomet in the chapter of the Alcoran to which his name is prefixed, puts into Lokman's mouth these maxims concerning the unity of God, which are repeated in almost every page of that book: "And Lokman gave this lesson to his son: O my son! associate no name with that of God; for it is a very culpable error to suppose an equal to the Almighty." In this passage Mahomet uses the authority of Lokman as a support for his own opinions; which shows the high degree of esteem in which he was held by the Arabs, at the time when the koran was made public. This esteem is not in the least diminished at the present day; and several of the Mussulman doctors give him the title of saint and prophet. Some writers assert, that he embraced the Jewish religion, and entered into the service of king David, who entertained a high esteem for him; and the author of the Tarikh Montekleb informs us, that he died in Judea, at a very advanced age; and that in his time his tomb was still to be seen at Ramlah, a small town in Syria, not far from Jerusalem.

Marcel maintains, that the fables of Lokman, with those of Pilpay, may be considered as the only original pieces of composition of this species; and of which the fables of

Æsop, most of those of Phædrus, and even many of la Fontaine, are only translations and copies. "If it be true," says he, "that Æsop is not a mere fictitious personage, at least he must have existed long after Lokman. Plutarch, Suidas, and Pausanias, agree in placing Æsop about the time of Cæsus king of Lydia, and Solon legislator of the Athenians; that is to say, some time between the 46th and 55th Olympiad. Now all the oriental writers, both the Arabian and Persian, agree in placing Lokman 500 years prior to Æsop, at the same period with the reign of David over the Hebrews, and Kaykhusru over the Persians. In this case, Lokman would be the original from whom Æsop borrowed his apologues; as the latter might easily have come to the knowledge of the Arabian fabulist, during the residence which he is said to have made in the courts of different princes of Asia. But the opinion the most generally received, and which indeed is much more probable than the former, is, that Lokman is the same person, whom the Greeks, not knowing his real name, have called, in their own tongue, Αἰώπιος, or *Æsop*, a term derived from that of Αἰθίοπες, or *Ethiopian*, by a slight change, which often occurs in a word while passing from one dialect to another." And he conceives that the particulars concerning Lokman, already given from the oriental writers, many of which are also related of Æsop, serve to establish the identity between them. His hypothesis carries with it an air of plausibility; but is attended with chronological difficulties, on which we are incapable of deciding. We therefore leave it, together with the opinion of other critics, that the work attributed to Lokman seems rather to be a collection of ancient fables than the production of any one writer, to the judgment of those who may think it worthy of farther investigation. The scanty relics of the fables of Lokman were published by Erpenius, in Arabic and Latin, at the end of his Arabic grammar, in 1636 and 1656, in 4to. and Tannaquil Faber presented them to the public in elegant Latin verse. A French translation of them was published by Galland, together with those of Pilpay, in 1714, in 2 vols, 12mo. and in the year 1803, we saw announced a notice of a new edition of them, in the original Arabic, accompanied with a French translation, by citizen J. J. Marcel. *D'Herbelot's Bibl. Orient. Monthly Mag.* vol. xiv.

LOK'MAN, a town of the Arabian Irak, on the Tigris: sixteen miles north of Bagdad.

LO'KO, a small island, on the east side of the gulf of Bothnia. Lat. 60. 51. N. lon. 20. 59. E.

LOKOHA'R, a town of Hindoostan, in Bahar: thirty-six miles north-east of Durbunga.

LOKTE'VA, a town of Russia, in the government of Kolivan: thirty-six miles south-west of Kuznetzk.

LOLBAZA'R, a town of Beugal: seventeen miles south-west of Beyhar.

LOLBINIE'RE, a town of Canada, on the St. Lawrence: twenty-five miles south-west of Quebec.

LOLDONG', a town and fortress of Almora: fifty miles north-west of Collipour; and eighty-five miles north-north-east of Delhi. Lat. 29. 47. N. lon. 78. 36. E.

LOLGUN'GE, a town of Hindoostan, in Oude: sixteen miles north-east of Manickpour.

LOLGUN'GE, a town of Hindoostan, in Benares: twelve miles south-west of Merzapour.

LOLGUN'GE, a town of Hindoostan, in Oude: twenty miles south of Azemgur.

LO'LIUM, *f.* [of uncertain derivation.] DARNEL, or RAY-GRASS; in botany, a genus of the class triandria, order digynia, natural order of gramina, graminæ, or grasses. The generic characters are—Calyx: receptacle common elongated into a spike, pressing the flowers distichally spiked to the angle of the culm. Glume univalve; opposite the shaft, awl-shaped, permanent. Corolla: bivalve; valvule inferior narrow-laccolate, convolute, sharp-pointed, the length of the calyx: valve superior, shorter, linear, more obtuse, concave upwards. Nectary: two-leaved; leaflets ovate, obtuse, gibbous at the base. Stamina: filaments

three,

three, capillary, shorter than the corolla; anthers oblong. Pistillum: germ top-shaped; styles two, capillary, reflex; stigmas plumose. Pericarpium: none; corolla cherishes the seed, gapes, lets it fall. Seed: single, oblong, convex on one side, furrowed-flat on the other, compressed. The sessile spikes are placed in the same plane with the culm; hence the stem bears the office of a second calycine valve, (deficient and opposite.)—*Essential Character.* Calyx one-leaved, fixed, many-flowered.

*Species.* 1. *Lolium perenne*, perennial darnel, or ray-grass: spike awnless; spikelets compressed, longer than the calyx, and composed of several flowers. Root perennial, creeping. Stems several from the same root, prostrate or oblique at the base, but the flowering stem upright, smooth, from six inches to eighteen, twenty, and twenty-four, inches in height, according to the soil; they have several joints near the base, at a small distance from each other, but on the upper part only one or two. On a great number of plants of a middling size, three joints, and never more than four, were counted by Mr. Professor Martyn, the flowering stem running up from eleven to fourteen inches above the last joint. They are frequently russet-coloured at the joints. Leaves four or five inches long, and from two to four lines wide, lengthened out into a point; the leaf on the stem above twice as broad as those next the root and on the runners. The sheath covers the stem for several inches above the upper joint; both that and the leaves are smooth. The flowers are in a spike, which is from four to six or seven, and even nine, inches in length, composed of many (ten to eighteen) spikelets, ranged at a little distance from each other, in two rows alternately along the rachis or common receptacle. The spike is generally flat, but sometimes nearly cylindrical; and it sometimes shows a disposition to become branched, particularly towards the bottom. The rachis is flexuose, or changes its direction in a curve line from one spikelet to another; and each spikelet, being lodged at the base in a hollow of it, has no occasion for an inner valve to the calyx for protection, and therefore is not provided with one. The number of flowers in each spikelet varies from three or four to six, seven, or eight, and even sometimes nine, ten, and eleven; but six or seven is the most common number. The valve of the calyx tapers to a point; and the terminating calyx is two-leaved. The two inner husks, which are the valves of the corolla, are both of the same length, or nearly so. The germ is placed between the upper of these, and two small white semi-transparent substances, which Linnæus calls the *nectaries*. The seed easily quits the chaff.

There are many varieties of this grass, differing in size or colour of the stem and spike, as well as the number of flowers in each spikelet. The flowers are now and then found with awns or beards. The spikelets also are sometimes clustered, and sometimes branched.

Perennial darnel is common in most parts of Europe, by way-sides and in pastures, flowering in June. It is called in English *ray-grass*, from the French *ivraie*, (tare,) which is their name for *L. temulentum*; and they call this *fausse ivraie*. It is corruptly called by farmers *rye-grass*; but this grass bears no resemblance to rye; and that is a name appropriate to a very different grass, *Hordeum pratense*. Mr. Ray names our *ray-grass red darnel-grass*; in some places it is called *crap*; in Devonshire, *eaver*; in Norfolk, *white nonfuch*. In German it has many names; as *perennirende* or *dauernde lolch*, *winter lolch*, *fusser lolch*, &c. In Danish, *raigræs*; in Swedish, *renvepe*, *Engelmans rjegræs*; in Italian, *loglio vivace*. In Spanish *ballico*, *vallico*; in Portuguese, *joyo vivace*; in Russian, *pschanez*.

How long *ray-grass* may have been in cultivation, we are not able to ascertain. We may, however, venture to fix the introduction of it after the middle of the last century. For not only Gerard in 1597, his republisher Johnson in 1633, and Parkinson in 1640, give not the least hint of any use to which this grass is applied; but none

of the writers on husbandry before the restoration, as Sir Hugh Plat, Googe, Markham, Sir Richard Welton, Hartlib, Gabriel Plattes, Blieth, or Yarranton, say a word in its commendation, or even insinuate that this, or any particular species of grass, properly so called, was sown in laying down land. The first mention made of it for cultivation is in Dr. Plot's Oxfordshire, printed in 1677. "They have lately sown, says he, *ray-grass*, or the *gramen loliacum*, by which they improve any cold, soft, clay-weeping, ground, for which it is best; but good also for drier upland grounds, especially light stony or sandy land, which is unfit for saint foyn. It was first sown in the Chiltern parts of Oxfordshire, and since brought nearer Oxford by one Mr. Eustace, an ingenious husbandman of Ilip, who, though at first laughed at, has since been followed even by those very persons that scorned his experiment; it having precedence of all other grasses, in that it takes almost in all sorts of poor land, endures the drought of summer best, and in the spring is the earliest grass of any, and cannot at that time be overstocked, its being kept down making it sweeter and better-beloved by cattle than any other grass; nay sometimes they have been known to leave meadow-hay to feed on this; but of all other cattle it is best for horses, it being hard hay; and for sheep, if unsound, it having been known by experience to have worked good cures on them; and in other respects the best winter grass that grows." Ray, in his History, (1688,) relates, that it is sown in a few places, and that it is excellent for fattening bullocks. In the third volume of the Oxford History of Plants by Morison and Bobart, (1699,) it is said, that the seeds are gathered and sown in stiff and moist land; and that it is much esteemed under the name of *ray-grass*, as food for sheep and other cattle. According to Stillingfleet, "it makes a most excellent turf on sound rich land, where it will remain. Many, he adds, are tempted, by the facility of procuring the seed of this grass, to lay down grounds near their houses, where they want to have a fine turf with it; for which purpose, unless the soil be very rich, a worse grass cannot be sown, as it will certainly die off in a very few years entirely." This gentleman thinks that *ray-grass* does not feed good venison; and presumes from hence that it is not proper for sheep, having always observed that the same kind of ground which yields good venison, yields also good mutton. If it be the natural produce of very strong or wet lands, this is easily accounted for. In such situations it is by no means unprolific of leaves; but in dry upland pastures it runs much to stalks or bents. It is not well adapted to form a lawn, its foliage being of quick growth, and its flowering stems continually shooting forth. Mr. Miller says, that *ray-grass* will succeed better than any other sort in strong cold land, and is an earlier feed in the spring; but that it is a very coarse grass, becoming very hard and wiry unless it be cut early, so that few cattle care to eat it. He remarks, that it has few leaves, and runs much to stalk or bents, or, as it is called in some counties, *ben-net*. When this grass is fed, therefore, he recommends the bents to be mown off. He adds, that there is another species (variety) called red darnel, which is of a worse nature than the other; the stalks growing hard much sooner, and having narrower leaves. It is very common in most pasture grounds; for, as it comes early to flower, the seeds are generally ripe before the hay is cut. This variety is the produce chiefly of dry pastures, where *ray-grass* certainly produces little else besides stalks.

How this species came to be selected originally for cultivation, we cannot say. If it was not accident, it was perhaps because it is common, and the seeds easily collected. That it should now be the only sort of seed which is to be had in any quantity in the shops, is a disgrace to us, since the best sorts have been so repeatedly pointed out by Mr. Curtis and others, and premiums offered for collecting them, during so many years, by the

Society for the Encouragement of Arts, Manufactures, and Commerce. See the article GRASS, vol. viii. p. 796, 8, 9, and Plate II. fig. 9.

2. *Lolium tenue*, or small darnel: spike awnless, round; spikelets three-flowered. This is smaller than the preceding. It is distinguished by the tenuity of the culm and spike; which last is cylindrical and awnless; the spikelets are three-flowered. It is generally looked upon to be no more than a starved variety of *L. perenne*. Native of France and Germany.

3. *Lolium temulentum*, annual darnel, or bearded ray-grass: spike awned; spikelets compressed, many-flowered. Root annual. Stems or culms from two to three feet in height, upright, round, especially near the spike, rough when stroked upwards, having three, four, or five, joints. Leaves flat, pointed, from nine inches to a foot or more in length, and three or four lines in breadth; the upper surface rough when stroked upwards, the lower smooth.

Annual darnel is a native of most parts of Europe, Japan, the Cape of Good Hope, &c. Though there can be no doubt of its being a distinct species from the perennial darnel, yet we are at a loss for specific distinctions; for that has sometimes awns to the flowers, and this, not unfrequently, has none. This however is annual, taller and larger in every respect, and of a paler hue. Its place of growth is also different; for it is a weed among corn, especially wheat and barley, and also among flax. It flowers in July and August, later than *L. perenne*.

The flour of the seeds, mixed with wheat-flour, produces disorders in the human body, as vomiting, purging, and violent cholics; but it has not a sensible effect, unless taken in considerable quantity, or, according to Linnæus, unless it be eaten hot. The seed, malted with barley, soon occasions drunkenness; hence (some say) the French name *ivraie*, and by corruption our English *ray*. In Yorkshire it is called *droke*; and in Ireland, *sturdy*. In Germany, *Jakrige lolch*, *germaie lolch*, *somme lolch*, &c. in Denmark, *heyre*, *heyregras*, *swingel*, *dude*; in Sweden, *darrepe*; in Italy, *loglio*, *gioglio*, *zizania*; in Spain, *joyo*, *cizana*, *zizana*; in Portugal, *zizania bastarda*; in Russia, *kukol*.

Ovid unites it with *tribulus*, infesting wheat:

*Lolium tribulique fatigant*  
Triticeas messes inexpugnabile gramen. Met. l. 5.

Virgil joins it with the wild oat, as a weed among crops in general:

Interque nitentia culta  
*Infelix lolium* & steriles dominantur avenæ. Georg. i. 153.

The epithet *infelix* is probably given it not only from its deleterious qualities, and as being a weed amongst corn, but probably alluding to an idea, long prevalent, that corn was transformed into it. This opinion of the change of one kind of gramineous plant into another, as wheat into rye, rye into barley, barley into darnel, darnel into bromegrass; and of the latter, by becoming oats or rye, in a fertile soil, returning again to a more improved state—all this, however absurd, was so generally believed, that Linnæus thought proper to write a dissertation against it. See *Transmutatio Frumentorum*, Amoen. Acad. v. 5. 106. The fact is, that in very wet seasons, and among very bad husbandmen, darnel has so far prevailed as to suffocate the wheat, and to take its place.

There is a variety of this without awns, and with a smooth culm, which withering makes a distinct species, under the name of *L. arvense*, or white darnel.

4. *Lolium bromoides*, or sea-darnel: panicle simple, pointing one way; spikelets awned. Root annual. Culms several, from six inches to a foot in height, oblique, round, smooth, somewhat branched. Native of England, on the sea-coast, in loose sand; flowering in May and June.

5. *Lolium distachyon*, or double-spiked Indian darnel: spikes in pairs, calyxes one-flowered, corollas woolly. Culms decumbent, branched at the base; the flowering ones rising a foot high, filiform, narrow, even. Native of Malsbar. Observed by Kœnig.

*Propagation and Culture.* Ray-grass is usually sown with clover, upon such lands as are designed to be ploughed again in a few years; and the common method is to sow it with spring-corn; but from many repeated trials, it has been found, that by sowing these seeds in August, when there has happened a few showers to bring up the grass, that the crop has answered much better than any which has been sown in the common way; for the grass has often been so rank, as to afford a good feed the same autumn; and the following spring there has been a ton and a half of hay per acre mowed very early in the season; and this has been upon cold sour land; so that this seems to be the best season for sowing these grasses, though it will be very difficult to persuade those persons to alter their practice, who have been long wedded to old customs. The quantity of seed to an acre is about two bushels, and eight pounds of the common clover, which, together, will make as good plants upon the ground as can be desired; but this is not to be practised upon lands where the beauty of the verdure is principally regarded, but is fit only for those who have profit in view. When this grass is fed, mow off the bents in the beginning of June, otherwise they will dry upon the ground, and have the appearance of a stubble-field all the latter part of summer; and will not only be disagreeable to the sight, but troublesome to the cattle, who will not touch them. By permitting them to stand, the after-growth of the grass is greatly retarded, and the beautiful verdure lost for three or four months, so that it is good husbandry to mow the bents before they grow too dry, and rake them off the ground; if they are then made into hay, it will serve for cart-horses or dry cows in winter.

Dr. Anderson affirms, that ray-grass requires a deep open loose deafish soil, tending to dampness, to bring it to full perfection. On a soil of this sort he has measured several stalks above six feet in length. He observes that foot, which does not promote the growth of clover, has a surprising effect upon that of ray-grass. Mr. Kent says, that ray-grass is sown with clover at the rate of a quarter of a peck to an acre, or by itself at the rate of two pecks to an acre, or in the proportion of a gallon to an acre, with eight pounds of clean trefoil; that all cattle are particularly fond of it in the spring, but towards midsummer the stalks become dry, and cattle then refuse them; that therefore this grass should be kept down by being constantly fed. When mixed with clover and mowed for hay, it may however be spring-fed, and is even the better for it, because it would otherwise be ripe before the clover. When sown with clover, its greatest advantage is experienced in the second and third years; for, as the clover declines, this increases in proportion. When mixed with trefoil, it is a very good grass upon light land, designed to continue several years in sheep-pasture.

In Norfolk, the second year's lay of ray-grass and clover is invariably pastured; the spring-shoot being usually expended in finishing or topping-up turnip-fed bullocks; for which purpose no vegetable is perhaps superior to ray-grass. Store-cattle follow the bullocks, and keep possession of the lays till they are broken up for wheat, in July, August, September, or October. Next to saintfoin, ray-grass is in the highest esteem with the Cotswold farmers. Not only the green herbage, but the hay, is there considered as superiorly nutritious. Bullocks are finished with ordinary barley and ray-grass hay; that is, not with the straw of ray-grass, but with the herbage cut in a state of succulency, and properly made. If suffered to stand too long before it be mown, the hay will of course be ordinary. If suffered to run up in the spring before stock be turned upon it, much of it will be left uneaten. If the seed sown be foul, the herbage will be of a bad quality. Under bad management the succeeding wheat-crop will be unprofitable. The seed should be winnowed, and freed from the seeds of weeds, as carefully as the seed of wheat or other grain.

If ray-grass be intended for pasturage, it ought to be broken as early in spring as the land will bear stock, which

ought to be so proportioned, that it never can get above a moderate bite. If it be shut up for hay, it ought to be mown as soon as the seed-stems are fully formed, before the flowers come out. If it be intended for seed, it ought to stand until the flowers be fully blown; but it must not be expected, in this case, that the straw will prove hay.

As a spring-feed, ray-grass is preferable to every other grass; and in autumn it renews its nutritious bite. This property, added to its productiveness, and to the facility with which its seeds may be collected in quantity, give it a decided pre-eminence to every other blade-grass at present known. But this, like other early grasses, remains in a great measure unproductive during the summer-months. This renders it improper to be sown alone, for pasturage; and white clover, the trefoils, or other summer-herbage, should be cultivated with it. In general, where prejudices have arisen against ray-grass, it has been because bad seed has been sown, or because the soil is improper for it, or that the management has been faulty.

Annual dandelion is very injurious to a wheat-crop; but may easily be avoided, as it is sown along with the seed, from which it may be separated by the sieve; and, not being a root-weed, it is unparadonable to suffer it to increase to any considerable degree. See *AGROSTEMMA* and *CYNOSURUS*.

To LOLL, *v. n.* [Etymology not known: perhaps contemptuously derived from *Lollard*, a name of great reproach before the reformation; of whom one tenet was, that all trades not necessary to life are unlawful.] To lean idly; to rest lazily against any thing.—So hangs, and lolls, and weeps, upon me; so shakes and pulls me. *Shakespeare's Othello*.

A lazy *lolling* sort  
Of ever-listless loit'ners.

*Dunciad*.

To hang out: used of the tongue hanging out in weariness or play:

The triple porter of the Stygian feat  
With *lolling* tongue lay fawning at thy feet. *Dryden*.  
With harmless play amidst the bowls he pass'd,  
And with his *lolling* tongue assay'd the taste. *Dryden*.

To LOLL, *v. a.* To put out: used of the tongue extended:

All authors to their own defects are blind;  
Hadst thou but, Janus-like, a face behind,  
To see the people, when they play mouths they make,  
To mark their fingers pointed at thy back,  
Their tongues *loll'd* out a foot. *Dryden's Persius*.

LOLLARDS. Most ecclesiastical writers affirm, that the Lollards were a particular sect, who differed from the church of Rome in many religious points; and that Walter Lollhard, who was burnt in the fourteenth century for heresy, was their founder. Dr. Mosheim, however, has shown in the most satisfactory manner, that the term *Lollhard* was not a surname appropriate to any particular individual, but applied indifferently to various religious communities.

The monk of Canterbury derives the origin of the word Lollard among us, from *lolium*, a tare; as if the Lollards were the tares sown in Christ's vineyard. Abelly says, that the word Lollard signifies "praising God," from the German *loben*, to praise, and *herr*, Lord; because the Lollards employed themselves in travelling about from place to place, singing psalms and hymns. Others, much to the same purpose, derive *lollhard*, *lullhard*, *lollert*, or *lullert*, as it was written by the ancient Germans, from the old German word *lullen*, *lollen*, or *lallen*, and the termination *hard*, with which many of the High Dutch words end. *Lollen* signifies "to sing with a low voice," and therefore Lollard is a singer, or one who frequently sings; and in the vulgar tongue of the Germans it denotes a person who is continually praising God with a

song, or singing hymns to his honour. The Alexians, or Cellites, were called *Lollards*, because they were public singers who made it their business to enter the bodies of those who died of the plague, and sang a dirge over them in a mournful and indistinct tone as they carried them to the grave. The name was afterwards assumed by persons that dishonoured it; for we find that, among those Lollards who made extraordinary pretences to piety and religion, and spent the greatest part of their time in meditation, prayer, and such acts of piety, there were many abominable hypocrites, who entertained the most ridiculous opinions, and concealed the most enormous vices under the specious mask of this extraordinary profession. And many injurious aspersions were propagated against those who assumed this name by the priests and monks; so that, by degrees, any person who covered heresies or crimes under the appearance of piety, was called a *Lollard*. Thus the name was not used to denote any one particular sect, but was formerly common to all persons and all sects who were supposed to be guilty of impiety towards God or the church, under an external profession of extraordinary piety. However, many societies consisting both of men and women under the name of *Lollards*, were formed in most parts of Germany and Flanders, and were supported partly by their manual labour, and partly by the charitable donations of pious persons. The magistrates and inhabitants of the towns where these brethren and sisters resided, gave them particular marks of favour and protection, on account of their great usefulness to the sick and needy. They were thus supported against their malignant rivals, and obtained many papal constitutions, by which their institute was confirmed, their persons exempted from the cognizance of the inquisitors, and subjected entirely to the jurisdiction of the bishops; but, as these measures were insufficient to secure them from molestation, Charles duke of Burgundy, in the year 1472, obtained a solemn bull from pope Sixtus IV. ordering that the *Cellites*, or *Lollards*, should be ranked among the religious orders, and be delivered from the jurisdiction of the bishops; and pope Julius II. granted them yet greater privileges in the year 1506. Mosheim informs us that many societies of this kind are still subsisting at Cologne, and in the cities of Flanders, though they have evidently departed from their ancient rules.

Walter, who was burnt at Cologne, is by some called a *Beggard*, by others a *Lollard*, and by others a *Minorite*. This Walter was a Dutchman by birth, who was distinguished for his eloquence, and became the chief leader and champion of the Beggards upon the Rhine. Having been driven by persecution from Upper Germany, he removed from Mentz to Cologne, where he was arrested by the inquisition. Being tried for heresy, and refusing to renounce the opinions of the mystics which he had embraced, he was condemned to the flames. To this cruel punishment he submitted, with the fortitude and cheerfulness of a primitive martyr, in the year 1322. We are told that Walter the Lollard and his followers rejected the sacrifice of the mass, extreme unction, and penances for sin; arguing, that Christ's sufferings were sufficient. He is likewise said to have set aside baptism, as a thing of no effect; and repentance, as not absolutely necessary, &c.

In England, the followers of Wickliffe were called, by way of reproach, *Lollards*, from some affinity there was between some of their tenets; though others are of opinion that the English Lollards came from Germany. They were solemnly condemned by the archbishop of Canterbury and the council of Oxford.

LOLLARDY, *f.* The doctrine of Lollards.—*Lollardy* was made a temporal offence, and indictable in the king's courts. *Blackstone*.

LOLLGUN'GE, a town of Bengal: twenty miles east-north-east of Purneah.

LOLLIA PAULLINA, a beautiful woman, who married Caius Cæsar, and afterwards Caligula. She was divorced and put to death by means of Agrippina. *Tacitus*.

LOLLIANUS

LOLLIANUS SPURIUS, a Roman general, proclaimed emperor by his soldiers in Gaul, and soon after murdered.

LOLLJEE, a town of Thibet: 110 miles north of Gorah. Lat. 30. 15. N. lon. 84. 23. E.

LOLLING, *f.* The act of lounging or leaning.

LOLLIUS, a companion and tutor of C. Cæsar, the son-in-law of Tiberius. He was consul, and offended Augustus by his rapacity in the provinces. Horace has addressed two of his epistles to him.

LOLLONADO, a town of the island of Cuba: 146 miles south-west of Havanna.

LOLOS, the name of a particular people dispersed through the province of Yun-nan, in China, distinct from the Chinese. They were formerly governed by their own sovereigns; but, upon submitting to the emperor of China, they obtained peculiar privileges. These people are well made, and inured to labour. They have a peculiar language of their own, (as hinted under the article LANGUAGE, vol. xii. p. 174.) and a mode of writing which seems to be the same with that of the bonzes of Pegu and Ava. These cunning priests have acquired an influence over the Lolos in the western part of Yun-nan, and have introduced among them the worship and religious ceremonies of their country; and they have even induced them to build large temples of a different architecture from that of the Chinese. The princes of the Lolos are absolute masters of their subjects, and have a right of punishing them, even by death, without waiting for the answer of the viceroy. These princes have many officers and men under their command; and their militia is composed of cavalry and infantry, who are armed with bows and lances, and sometimes muskets. The iron and copper mines which are lodged in their mountains, enable them to make their own armour. These mountains also abound with mines of gold and silver. The dress of the Lolos consists of plain drawers, a vest of cotton hanging to their knees, and a straw hat; their legs are bare, and they wear only sandals. The women have a long robe, covering the whole body down to the feet, above which they tie a small cloak that reaches no further than the girdle. In this dress they appear on horseback, at marriage-ceremonies, or when they pay visits, accompanied by the females in their train, who are also on horseback, and by several domestics. *Grolier.*

LOLPOUR, a town of Hindoostan, in the circar of Jyenagur: fifteen miles south-south-east of Jyepour.

LOM, a river of European Turkey, which runs into the Danube near Lomgrad in Bulgaria.

LOM, a town on the east coast of the island of Gilolo. Lat. 0. 16. S. lon. 128. E.

LOM-PIN, a town of China, of the third rank, in the province of Pe-tche-li: twenty-five miles north-east of Chunte.

LOM'ABLEM, or LOM'BLEM, an island in the Eastern Indian Sea, about 120 miles in circumference. Lat. 8. 18. S. lon. 123. 56. E.

LO'MAN, a river of England, which rises in Somersetshire, and runs into the Ex at Tiverton in Devonshire.

LOMA'RIA, a town of France, on the island of Belle-Ile: three miles south-east of Le Palais.

LOMA'TIA, *f.* [from *λωμα*, Gr. a border; because the seeds are terminated by a bordered ring.] In botany, a genus of the class tetrandria, order monogynia, natural order proteaceæ. *Brown*, 389. The generic characters are—Calyx: none. Corolla: petals four, irregular, distinct, oblong, obliquely twisted toward one side; their summits dilated, concave, bearing the stamens. Nectary: three glands at one side of the base of the stalk supporting the germen. Stamina: filaments four, extremely short, in the hollows of the petals; antheræ roundish, sunk in the said hollows. Pistillum: germen superior, stalked, half-ovate, erect; style permanent, incurved; stigma oblique, dilated, roundish, nearly flat. Pericarpium: follicle stalked, half-ovate, coriaceous, crowned

with the style of one cell. Seeds: many, imbricated in two rows, elliptical, compressed, with a terminal bordered wing, whose disk is without veins.—*Essential Character.* Petals four, irregular, stamens sunk in the cavities of the limb; three glands, on one side, at the base of the stalk of the germen; stigma oblique, flattish; follicle coriaceous, of one cell; seeds many, with a terminal bordered wing. The genus is hardly distinguished from EMBOTHRUM, which see, vol. vi. p. 499, 500.

*Species.* 1. *Lomatia filifolia*, or cut-leaved lomatia. See EMBOTHRUM filifolium.

2. *Lomatia tinctoria*, or colouring lomatia: leaves once or twice pinnatifid, or undivided, smooth; segments pectinate, single-ribbed, almost veinless, bluntnish, pointed; clusters elongated, smooth, unbranched. Gathered by Labillardiere and Brown in hilly places and fields at Van Diemen's Land. The stem is six feet high. Leaves very various, usually very neatly pinnatifid, with numerous, parallel, linear-lanceolate, sometimes subdivided, segments; more rarely undivided, slightly notched at the tip. The sulphur-coloured powder which covers the seeds, is said by Labillardiere to give out a rose-coloured dye to water.

3. *Lomatia ferruginea*, or rusty lomatia: leaves doubly pinnatifid, downy; segments ovate or lanceolate; clusters shorter than the leaves. Gathered by Louis Née at St. Carlos de Chiloe, South America, in places occasionally overflowed by the sea, flowering in February. The stem is ten or twelve feet high, rarely straight; branches downy. Leaves doubly pinnatifid, acute; the down of the young ones rusty, of the old ones grey. Petals red within; yellowish-green without.

4. *Lomatia polymorpha*, or various-leaved lomatia: leaves linear lanceolate; entire, toothed, or pinnatifid; downy, like the branches and flower-stalks, beneath; clusters corymbose, terminal; corolla somewhat hairy; pistil very smooth. Gathered on the southern hills of Van Diemen's Land, by Mr. Brown, who conceives this species to have been confounded by Labillardiere under our second, when he says "the leaves of that are sometimes besprinkled at their back with short rusous down." Two varieties of *L. polymorpha* are indicated: one whose leaves are undivided, their downiness grey, and their seed-vessels but half an inch long; the other with generally cut or pinnatifid leaves, rusty underneath, and their seed-vessels near an inch in length.

5. *Lomatia ilicifolia*, or ilex-leaved lomatia: leaves oblong-ovate, acute, with fine spinous teeth, reticulated, quite smooth, as well as their footstalks; clusters elongated, terminal. Native of barren fields at the sides of hills on the southern coast of New Holland, near Port Phillip, where Mr. Brown gathered it, after the flowers were fallen.

6. *Lomatia longifolia*, or long-leaved lomatia: leaves linear-lanceolate, elongated, smooth, distantly serrated; clusters axillary; flower-stalks and corolla rather hairy; pistil very smooth. Gathered by Mr. David Burton, as well as Mr. Brown, on the stony banks of rivers and rivulets near Port Jackson. This is a branched bushy shrub, with angular young branches, clothed with rusty hairs, as are also the flower-stalks, bractes, and in some degree the flowers. The leaves are numerous, alternate, on short broadish stalks, lanceolate, acute, veiny, three or four inches long, about half an inch broad, smooth, except the lower portion of their rib at the upper side; sharply and distantly serrated upwards, tapering and mostly entire in their lower half.

7. *Lomatia dentata*, or toothed lomatia: leaves oval, with tooth-like serratures, smooth, as well as their footstalks; clusters lateral, short; corolla hairy; germen downy. Native of woods and groves in Chili.

8. *Lomatia obliqua*, or oblique lomatia: leaves ovate, serrated, smooth; clusters axillary; flower-stalks and corolla hairy; stigma deciduous. Found on hills in the provinces of Chili and Puchacay. *Linn. Transf.* vol. x.

LOMA'ZY,

LOMA'ZY, a town of Lithuania, in the palatinate of Brzesc: thirty-six miles south-south-west of Brzesc.

LOMAZ'ZI (Giampaolo), an artist and writer, was a native of the Milanese, and born in 1538. He learned the art of painting from G. Battista della Cerra, and practised it with reputation in the branches of history, portrait, and landscape, at Milan, Piacenza, and other cities. He is, however, chiefly known for his work on painting, composed after he had the misfortune to lose his sight in his thirty-third year. It was printed at Milan, in 1584, with the title of *Trattato dell' Arte della Pittura*; to which in the following year was added in the title-page, *Scoltura ed Architetture*, though he says nothing of these two arts. Upon painting he has collected every thing belonging to the subject, both historical and preceptive; and his work still retains the reputation it first acquired. He wrote likewise, upon the same topic, *Idea del Tempio della Pittura*, and a work *Della Forma delle Muse*. Lomazzi had likewise a talent for poetry, and published seven books of *Rime*. He was fond of that kind of jocular verse, which at Milan is called *lingua facchinesca*, and was at the head of an academy formed for cultivating it, named Della Valle di Bregno. He appears to have been in good circumstances, since he is said to have had in his house a collection of four thousand pieces of the first painters. When he died is uncertain. Two medals struck in his honour are extant. *Tiraboschi*.

LOM'BA, *f.* in botany. See PIPER.

LOMBARD (Peter), a celebrated bishop of Paris in the twelfth century, and known among the scholastics by the title of *Master of the Sentences*, was a native of Novara in Lombardy, from which country he derived his surname. He commenced his academical studies at Bologna, where there was at that time a famous university, particularly noted for its eminent professors of civil law. But, as the French universities were in higher repute for their professors of divinity, which was principally the object of Peter's attention, he came to a determination to pursue his theological studies in that country. In this design he was encouraged by the bishop of Lucca, from whom he received a letter of recommendation to St. Bernard, who furnished him with the means of support while he studied at Rheims; and, when he afterwards removed to Paris, St. Bernard obtained for him the patronage of Gildin, abbot of St. Victor, who took the same care of his maintenance. In this university he soon acquired a high reputation for his learning as a divine, and was nominated to the chair of that faculty. He is also styled president of the university by contemporary writers. The first promotion which he obtained in the church was a canonry of Chartres; which was followed by his elevation to the episcopal dignity, for which he was indebted to the regard entertained for him by an illustrious pupil, Philip, son of king Louis the Gros. That prince, who was educated an ecclesiastic, and filled the post of arch-deacon of Paris in the year 1159, when a vacancy took place in the see of that city, was elected bishop by the chapter. With singular disinterestedness, however, Philip declined that dignity in favour of his old master, both out of respect for his extraordinary learning, and as a mark of his great personal regard for him. This dignity our prelate enjoyed but for a short period, since he died in the year 1164.

Lombard's celebrity for ages in the schools, and the title by which we have already seen he was distinguished, were derived from a work, entitled *Sententiarum Lib. IV.* in which, after the method of Augustine, he has endeavoured to illustrate the doctrines of the church, by a collection of sentences and passages drawn from the fathers, whose manifold contradictions he has attempted to reconcile. It may be considered as a complete body of divinity, according to that scholastic system of sophistry and chicanery, which had just before been introduced by the subtle Peter Abelard, and which perplexed and obscured the divine doctrines and precepts of the Gospel by a mul-

titude of vain questions and idle speculations. However, it was perfectly adapted to the taste of the dark age in which it made its appearance; and was not only received with almost universal applause, but acquired also such a high degree of authority, as induced the most learned doctors in all places to employ their labours in illustrating and expounding it: the abbé Fleury makes the number of commentators on it amount to two hundred and forty-four. The first edition of this work was published at Venice in 1477, in folio; and it afterwards underwent a multitude of impressions at different places. Cave observes, that John of Cornwall, a disciple of Peter Lombard, says that the latter was not a little indebted to the books of sentences of Peter Abelard, in compiling his work. And others add, that he made a very free use of the writings of Bandinus, an obscure and almost unknown divine, author of *Sententiarum Theologicarum Lib. IV.* published at Vienna in 1519. There certainly is a very striking resemblance between the two performances, the principal difference consisting in the greater prolixity of Lombard's work; but it is impossible to ascertain which of the two authors was the copyist of the other. Those who have any curiosity to examine this point, are recommended to consult Thomasius, *De Plagio Literario*, § 493—502. Peter Lombard was also the author of, 2. *Glossæ*, seu *Commentarius in Psalmos Davidis*, published at Paris, in 1551, folio; and, 3. *Collectanea in omnes Divi Pauli Epistolæ*, ex Ambrosio, Hieronymo, Augustino, aliisque *Scriptoribus contexta*, published at the same place in 1535, folio: in both which he has adopted the same method as in his book of sentences. *Maclaine's Mosheim. Cave's Hist. Lit.*

LOMBARDS, [or rather LANGOBARDS, which was their original name, deduced from the peculiar length and fashion of their beards.] A tribe of people who arose from an obscure and small beginning to occupy a considerable rank in Europe. The Scandinavian origin of these people is maintained by Paul the Deacon, contested by Cluverius, and defended by Grotius. It would be tedious, and also unsatisfactory to the reader, if we were to make an attempt at pursuing the migrations of the Lombards through unknown regions and marvellous adventures. About the time of Augustus and Trajan these fierce people were discovered between the Elbe and the Oder. They were fierce beyond the example of the Germans; and they took pleasure in propagating the tremendous belief, that their heads were formed like the heads of dogs, and that they drank the blood of their enemies whom they vanquished in battle. From the north they gradually descended towards the south and the Danube; and, after an interval of 400 years, they again appeared with their ancient valour and renown.

A nation called the *Lombards* is mentioned by Tacitus, Strabo, and Ptolemy; but these are different from the Lombards who afterwards settled in Italy, and are reckoned to be the same with the Gepidæ, whom the Italian Lombards almost exterminated. The Lombards who settled in Italy are first mentioned by Prosper Aquitanus, bishop of Rhegium in the year 379. That writer tells us, that about this time the Lombards, abandoning the most distant coasts of the ocean, and their native country Scandinavia, and seeking for new settlements, as they were overstocked with people at home, first attacked and overcame the Vandals in Germany. They were then headed by two chiefs, Iboreus and Aion; who, dying about the year 389, were succeeded by Agilmund, who is commonly reckoned the first king of the Lombards.

Before the time of Odoacer, the Lombard history affords nothing remarkable; in his time, however, they settled on the Danube, in the country of the Rugians, whom Odoacer had almost totally exterminated or carried into captivity. During their stay in this country, they rendered themselves formidable to the neighbouring nations, and carried on successful wars with the Heruli and Gepidæ. In 526, they were allowed by the emperor Justi-

nian to settle in Pannonia; and here they made war a second time with the Gepidæ. Alboinus, the Lombard king, killed the king of the Gepidæ with his own hand, put his army to the rout, and cut such numbers of them in pieces, that they ceased from that time to be a nation. Having caused the deceased king's head to be cut off, he made a cup of his skull, which he made use of in all public entertainments. However, having taken, among many other captives of great distinction, the late king's daughter, by name Rosamunda, he married her after the death of his former wife Clodisvinta, the daughter of Clotaire king of France.

By this victory Alboinus gained such reputation, that his friendship was courted by Justinian; and, in consequence of the emperor's application, a body of 6000 Lombards were sent to the assistance of Narfes against the Goths. The success of the Romans in this expedition has been detailed in the history of the GOTHs, vol. viii. p. 736, 7. and the invasion of Italy by the Lombards, and their successes in that country, under ITALY, vol. xi. p. 453. At last Alboinus, having made himself master of Venetia, Liguria, Æmilia, Hetruria, and Umbria, was slain by the treachery of his wife, in the year 575, the fourth of his reign. This princess was the daughter of the king of the Gepidæ, whom Alboinus had killed in battle, and made a cup of his skull, as above related. As he was one day feasting at Verona, with his chief favourites and principal officers, in the height of his mirth he sent for the queen, and, filling the detested cup, commanded her to drink merrily with her father. Rosamund, struck with horror, hurried out of the room; and, highly incensed against her husband for thus barbarously triumphing over the misfortunes of her family, resolved, at all events, to make him pay dear for such an inhuman and affronting conduct. Accordingly, she discovered her intention to Helmichild the king's shield-bearer, a youth of great boldness and intrepidity. Helmichild peremptorily refused to imbrue his hands in the blood of his sovereign, or to be any way accessory to his death; and in this resolution he persisted, till he was, by a shameful stratagem, forced by the queen to a compliance: for she, knowing that he carried on an intrigue with one of her ladies, placed herself one night in her bed, and, receiving the youth, indulged him as if she had been his own mistress in his amorous desires; which she had no sooner done, than, discovering herself to the deceived lover, she told him that he must now either put the king to death, or be put to death by him. Helmichild, well apprised, that, after what had happened, his safety depended upon the death of the king, engaged in the treason which he otherwise abhorred. One day, therefore, while Alboinus was reposing in his chamber after dinner, Helmichild, with some others whom he had made privy to his design, breaking in unexpectedly, fell upon the king with their daggers. Alboinus, starting up at their first coming in, laid hold of his sword, which he had always by him; but having in vain attempted to draw it, as the queen had before-hand fastened it in the scabbard, he defended himself for some time with a footstool; but was in the end overpowered, and dispatched with many wounds.

Rosamund had promised to Helmichild, that, as soon as he had dispatched the king, she would marry him, and, with her person, bestow upon him the kingdom of the Lombards. The first part of her promise she immediately performed; but was so far from being able to bestow the crown upon him, that both of them were obliged to save themselves by flight. They fled to Longinus the exarch of Ravenna, taking with them all the jewels and treasure of the late king. Longinus received her with the greatest marks of friendship and kindness, and assured her of his protection. She had not been long in Ravenna, however, before the exarch, judging that a favourable opportunity now offered of making himself king of Italy by her means, imparted his design to her, and declared his intention to marry her, provided, by some means or other, she dis-

patched Helmichild. Rosamund, highly pleased with the proposal, resolved to satisfy her ambition by getting rid of the person whom she had married in order to gratify her revenge. Accordingly, having prepared a strong poison, she mixed it with wine, and gave it to her husband as he came out of the bath, and called for drink, according to his custom. Helmichild had not half emptied the cup, when, by the sudden and strange operation which he felt in his frame, he concluded what it was; and, with his sword pointed at the queen's breast, compelled her to drink the rest. The poison had the same effect on both; for they died in a few hours. Longinus, on the death of the queen, laid aside all thoughts of making himself king of Italy, and sent the king's treasure to Constantinople, together with Albisinda, the daughter of Alboinus by Rosamund, whom she had brought with her.

After the death of Alboinus, the Lombards chose Clephis, one of the nobility, for their king. He was murdered after a short reign of eighteen months; upon which ensued an interregnum of ten years. During this time, they extended their conquests in Italy; but at last the Romans, jealous of their progress, resolved to put a stop to their victories; and, if possible, to drive them quite out. For this purpose, they designed not only to employ their own force, but entered into alliance with the Franks; which so alarmed the Lombards, that they re-established the monarchical form of government among themselves, and chose Autharis, the son of Clephis, for their king. This monarch, considering that the power of the *dukes*, who had governed Lombardy for the space of ten years, was during that length of time very much established, and that they would not probably be willing to part with the authority which they had so long enjoyed, allowed them to continue in their government; but obliged them to contribute one moiety of their revenues towards the maintenance and support of his royal dignity, suffering them to dispose of the other as they thought proper. He reserved to himself the supreme dominion and authority; and took an oath of the dukes, that, in time of war, they would assist him to the utmost of their power. Though he could remove the dukes at pleasure, yet he deprived none of them of their dukedoms, except in cases of treason; nor gave them to others, except when their male issue failed: and this was the origin of fiefs in Italy. Some, indeed, have imagined that fiefs were first introduced by the Lombards, and from them adopted by other nations; but it appears that fiefs had been introduced into Gaul by the Franks some years before the reign of Autharis, who first established them in Italy. All the customs and laws which were afterwards introduced and published concerning fiefs, are owing to the Lombards, who gave them a certain and regular form; so that, among all other nations, successions, acquisitions, investitures, and every thing else relating to fiefs, were regulated by the customs and laws of the Lombards. Hereupon a new body of laws sprang up, which were called *feudal laws*, and which continued in some provinces of Italy, and particularly in the kingdom of Naples, to be the chief part of the jurisprudence. Autharis, having settled matters with the dukes in the manner now mentioned, enacted several reasonable and salutary laws against theft, rapine, murder, adultery, and other crimes which at that time prevailed among his subjects. He was also the first of the Lombard kings, who, renouncing Paganism, embraced the Christian religion; and his example was followed by most of his subjects.

Autharis attained the strength and reputation of a warrior, as well as of a legislator. Under the standard of their new king, the Lombards withstood three successive invasions, one of which was led by Childebert, the last of the Merovingian race who descended from the Alps. The first expedition was defeated by the jealous animosity of the Franks and Alemanni. In the second they were vanquished in a bloody battle, with more loss and dishonour than they had sustained since the foundation of their monarchy.

archy. Impatient for revenge, they returned a third time with accumulated force; and Autharis yielded to the fury of the torrent. The troops and treasures of the Lombards were distributed in the walled towns between the Alps and the Apennine. A nation, less sensible of danger than of fatigue and delay, soon murmured against the folly of their twenty commanders; and the hot vapours of an Italian sun infected with disease those tramontane bodies which had already suffered the vicissitudes of intemperance and famine. The powers that were inadequate to the conquest, were more than sufficient for the desolation, of the country; nor could the trembling natives distinguish between their enemies and their deliverers. If the junction of the Merovingian and Imperial forces had been effected in the neighbourhood of Milan, perhaps they might have subverted the throne of the Lombards; but the Franks awaited six days the signal of a flaming village; and the arms of the Greeks were idly employed in the reduction of Modena and Parma, which were torn from them after the retreat of their transalpine allies. The victorious Autharis asserted his claim to the dominion of Italy. At the foot of the Rhetian Alps, he subdued the resistance, and rifled the hidden treasures, of a sequestered island in the lake of Comum. At the extreme point of Calabria, he touched with his spear a column on the sea-shore of Rhegium; proclaiming that ancient land-mark to stand the immoveable boundary of his kingdom. The *Columna Rhegina*, in the narrowest part of the Faro of Messina, one hundred stadia from Rhegium itself, is frequently mentioned in ancient geography.

From scenes of blood, we turn with pleasure to the adventurous gallantry of Autharis, which breathes the true spirit of chivalry and romance. After the loss of his promised bride, a Merovingian princess, he sought in marriage the daughter of the king of Bavaria; and Garibald accepted the alliance of the Italian monarch. Impatient of the slow progress of negotiation, the ardent lover escaped from his palace, and visited the court of Bavaria in the train of his own embassy. At the public audience, the unknown stranger advanced to the throne, and informed Garibald, that the ambassador was indeed the minister of state, but that he alone was the friend of Autharis, who had trusted him with the delicate commission of making a faithful report of the charms of his spouse. Theudelinda was summoned to undergo this important examination; and, after a pause of silent rapture, he hailed her as the queen of Italy, and humbly requested, that, according to the custom of the nation, she would present a cup of wine to the first of her new subjects. By the command of her father, she obeyed: Autharis received the cup in his turn, and, in restoring it to the princess, he secretly touched her hand, and drew his own finger over his face and lips. In the evening, Theudelinda imparted to her nurse the indiscreet familiarity of the stranger; and was comforted by the assurance, that such boldness could proceed only from the king her husband, who, by his beauty and courage, appeared worthy of her love. The ambassadors were dismissed: no sooner did they reach the confines of Italy, than Autharis, raising himself on his horse, darted his battle-axe against a tree with incomparable strength and dexterity: "Such," said he to the astonished Bavarians, "such are the strokes of the king of the Lombards." On the approach of a French army, Garibald and his daughter took refuge in the dominions of their ally; and the marriage was consummated in the palace of Verona. At the end of one year, it was dissolved by the death of Autharis, A. D. 590. but the virtues of Theudelinda had endeared her to the nation, and she was permitted to bestow, with her hand, the sceptre of the Italian kingdom.

These she gave to Agilulf, of whom we know little more than that he renounced the opinions of Arius, which had been countenanced by Autharis, and embraced the orthodox catholic faith. Agilulf was succeeded, A. D. 615, by his son Adalulf; who, being deposed, had for his suc-

cessor Ariovald, under whose government the Lombards enjoyed tranquillity both at home and abroad. Upon his death, A. D. 636, Rotharis ascended the throne, who is the first that gave *written laws* to the Lombards. Before his time they had been governed only by tradition; but Rotharis, in imitation of the Romans and Goths, undertook the publishing of written laws; and to those which he enacted, many were added by the succeeding princes. Grotius prefers the method which the Lombards followed in making laws, to that which was practised by the Romans themselves. Among the latter, the emperor was the sole lawgiver; so that whatever pleased him had the force of a law: but the Lombard kings did not assume that power to themselves, since their laws were enacted in public assemblies, convened for that purpose, after they had been maturely examined and approved of by all the lords of the kingdom: but from these assemblies were excluded the ecclesiastical order and the people; so that the legislative power was lodged in the king and nobles alone.

The reign of Rotharis is remarkable, not only for his introducing written laws among his subjects, but for the conquests he made, and the successful wars carried on with the exarch of Ravenna, whom he totally defeated in several engagements, and made himself master of some part of his territories. This monarch died in 652; and the affairs of the Lombards went on prosperously, till the ambition of Liutprand, or Luitprand, laid the foundation of the total ruin of his kingdom. He ascended the throne of Lombardy in 711, and watched all opportunities of enlarging his dominions at the expense of the emperor's. Of this, a fair opportunity offered in 716; for the emperor Leo Isauricus, who at that time reigned in the east, having by his famous edict, forbidden the worship of images, and ordered them to be every-where pulled down, the people were so provoked at this innovation, that, in several places, they openly revolted, and, falling upon the emperor's officers, drove them out of the cities. In the east, Germanus, patriarch of Constantinople, opposed the emperor's design with great warmth; but Leo caused him to be deposed, and Anastasius to be raised to that see in his room, ordering at the same time all the images in the imperial city to be pulled down and publicly burnt. He strictly enjoined his officers in the west, especially the exarch of Ravenna, to see his edict punctually obeyed in their respective governments. In compliance with these orders, Scholasticus, then exarch, began to pull down the images in all the churches and public places in Ravenna; which incensed the superstitious multitude to such a degree, that, taking arms, they openly declared they would rather renounce their allegiance to the emperor than the worship of images.

Thus a kind of civil war being kindled in the city, Luitprand thought he had now a favourable opportunity of making himself master of the seat of the exarch, not doubting but the conquest of such an important place would be followed by that of the whole exarchate. Having therefore drawn together all his forces, he unexpectedly appeared before Ravenna, and closely besieged it. The exarch little expected such a surprise, as a friendly correspondence had been maintained for many years between the exarchs and the Lombard kings. However, he defended the place with such courage and resolution, that Luitprand, despairing of success, broke up the siege, and led his army against Classis, at a small distance from Ravenna, which he took, plundered, and levelled with the ground. The loss of this place, and the severe treatment the inhabitants met with from the king, threw the citizens of Ravenna into the utmost consternation; which Luitprand being informed of, he resolved to take advantage of their fears, and, returning before Ravenna while the inhabitants were thus disheartened, to attempt once more the reduction of that place. Accordingly he led his whole army against it, and, by frequent attacks, tired the inhabitants and garrison to such a degree, that the exarch, finding they could hold out no longer, and despairing of relief,

relief, privately withdrew. Luitprand, informed of his retreat, attacked the town with more violence than ever; and, having carried it by storm, gave it to be plundered by his soldiers, who found in it an immense booty, as it had been for a long time the seat of the Roman emperors, of the Gothic kings, and the exarchs. The king stripped it of most of its valuable monuments of antiquity, and caused, among the rest, an equestrian statue of an emperor, of wonderful workmanship, to be conveyed to Pavia, where it is to be seen to this day. The reduction of Ravenna was followed by the surrender of several cities of the exarchate, which Luitprand reduced to a dukedom; appointing Hildebrand his grandson to govern it with the title of duke; and giving him, as he was yet an infant, Peredeus duke of Vicenza for his guardian.

The conquest of Ravenna and the greater part of the exarchate did not a little alarm Gregory II. bishop of Rome. He was then at variance with the emperor, whose edict against the worshipping of images he had opposed with all his might, and by that means provoked Leo to such a degree, that he had threatened to drive him from the see, and send him into exile. However, the pope, no less jealous of the power of the Lombards than all his predecessors had been, resolved, by some means or other, to put a stop to their conquests. The only prince in Italy to whom he could have recourse was Ursus duke of Venice, the Venetians making already no inconsiderable figure. To him accordingly he wrote a very pressing letter; conjuring him to assist his worthy son the exarch, and, for the love of the holy faith, to attempt with him the recovery of the exarchate, which the wicked nation of the Lombards had unjustly taken possession of. Ursus and the Venetians, moved with the pope's letter, and at the same time greatly alarmed at the growth of so powerful a neighbour, promised to assist the exarch with the whole strength of their republic; and accordingly fitted out a considerable fleet, pretending it was designed for the service of the emperor against the Saracens. At the same time the exarch, who had taken refuge in Venice, abandoning that place, as it were in despair of bringing the duke over to his party, raised, in the places still subject to the emperor, what forces he was able; and, having got together a considerable body, he marched with them towards Imola, giving out that he designed to besiege that city; but turning on a sudden towards Ravenna, as had been agreed on between him and the Venetians, he laid siege to it by land, while they invested it almost at the same instant by sea. Peredeus defended the town for some time with great courage and resolution; obliging all those who were able to bear arms to repair to the walls. But the Venetians having, in spite of all opposition, forced open one of the gates on the side of the sea, the city was taken, and Peredeus slain, while he was attempting, at the head of a choice body, to drive the enemy from the posts they had seized. As for Hildebrand, he fell into the hands of the Venetians; who, having thus recovered Ravenna to the emperor, returned home, leaving the exarch in possession of the city. Luitprand was then at Pavia; but the town was taken before he could assemble his troops to relieve it.

And now Gregory bishop of Rome, to whom the recovery of Ravenna was chiefly owing, persuading himself, that the emperor would, out of gratitude, give ear to his remonstrances and admonitions, began to solicit him with more pressing letters than ever to revoke his edict against the worship of images; but Leo, well apprised that the bishop, in all the measures he had taken, had been more influenced by a regard to his own interest than to that of the empire, instead of hearkening to his remonstrances, was still more provoked against him for thus obstinately opposing the execution of his edict. Being, therefore, resolved at all events to have it observed in Rome itself, and, on the other hand, not doubting but the pope would oppose it to the last with all his might; in order to remove all obstacles, he sent three officers to Rome, with private

orders, either to kill the pope, or to take him prisoner and convey him to Constantinople. At the same time, he wrote to Mauritus duke of Rome, secretly enjoining him to assist his three officers in their undertaking; but, no favourable opportunity offering to put their design in execution, the emperor, in the year 725, recalled Scholasticus, and sent Paul, a patrician, into Italy, to govern in his room, with private instructions to encourage the above-mentioned officers with the promise of great rewards, and to assure them of his protection.

But in the mean time the plot was discovered; and two of the conspirators were apprehended by the citizens of Rome, and put to death; the third having escaped into a monastery, where he took the monastic habit, and ended his days. Hereupon the exarch, in compliance with the emperor's orders, resolved to proceed no longer by secret plots, but by open force. Accordingly, he drew together a considerable body of troops, and set out at the head of them on his march to Rome, with a design to seize on the pope, and send him, as he had engaged to do, in chains to Constantinople. But, on this occasion, Luitprand, though highly provoked against Gregory for having stirred up the Venetians against him, yet resolved to assist him and the citizens of Rome against the exarch, in order to keep the balance even between them, and, by assisting sometimes the one and sometimes the other, to weaken both. Pursuant to this resolution, he ordered the Lombards of Tuscany, and those of the dukedom of Spoleto, to join the pope and the inhabitants of Rome; who, being by this reinforcement far superior in strength and number to the exarch, obliged him to return to Ravenna, and give over all thoughts of any further attempt on the person of the pope.

In the mean time, Leo, persisting in his former resolution of suppressing throughout his dominions the worship of images, sent fresh orders to the exarch Paul, strictly enjoining him to cause his edict to be put in execution in all the cities of Italy under his empire, especially in Rome. At the same time, he wrote to the pope, promising him his favour and protection if he complied with the edict; and declaring him, if he continued to oppose it, a rebel, and no longer vested with the papal dignity. But Gregory was so far from yielding to the emperor's threats or promises, that, on the contrary, he solemnly excommunicated the exarch for attempting to put the imperial edict in execution; and at the same time wrote circular letters to the Venetians, to king Luitprand, to the Lombard dukes, and to all the chief cities of the empire, exhorting them to continue steadfast in the catholic faith, and to oppose with all their might such a detestable innovation. These letters made such an impression on the minds of the people in Italy, that, though of different interests, and often at war with one another, they all united; protesting they would defend the catholic faith, and the life of the pope, in so glorious a cause, at the expense of their own; nay, the citizens of Rome, and the inhabitants of Pentapolis, now the Marche of Ancona, not contenting themselves with such a protestation, openly revolted from the emperor; and, pulling down his statues, they elected, by their own authority, magistrates to govern them during the interregnum.

However, the exarch Paul, having gained a considerable party in Ravenna, began, pursuant to the repeated orders of the emperor, to remove the images, as so many idols, out of the churches. Hereupon the adverse party, supported and encouraged by the pope, flew to arms; and, falling upon the *iconoclasts*, or image-breakers, as they styled them, commenced a civil war within the walls of Ravenna. Great numbers were killed on both sides; but, those who were for the worship of images prevailing in the end, a dreadful slaughter was made of the opposite party; and, among the rest, the exarch himself was murdered. However, the city of Ravenna continued faithful to the emperor; but most of the cities of Romagna belonging to the exarchate, and all those of Pentapolis, abhorring the emperor

emperor as an heretic, submitted to Luitprand king of the Lombards; who, pretending a zeal for the catholic religion, took care to improve the discontent of the people to his advantage, by representing to them, that they could never maintain their religious rights under a prince, who was not only an heretic, but a persecutor of the orthodox.

In Naples, Exhilaratus, duke of that city, having received peremptory orders from the emperor to cause his edict to be put in execution, did all that lay in his power to persuade the people to receive it; but finding all his endeavours thwarted by the bishop of Rome, for whom the Neapolitans had a great veneration, he hired assassins to murder him. But the plot being discovered, though carried on with great secrecy, the Neapolitans, highly provoked against the duke, tore both him and his son to pieces, and likewise put to death one of his chief officers, who had composed a libel against the pope. Luitprand, and Gregory at that time duke of Benevento, laying hold of so favourable an opportunity to make themselves masters of the dukedom of Naples, made joint endeavours to induce the Neapolitans quietly to submit to them. But the Neapolitans, bearing an irreconcilable hatred to the Lombards, with whom they had been constantly at variance, rejected every overture of that nature with the utmost indignation; and, continuing steadfast in their allegiance to Leo, received from Constantinople one Peter, who was sent to govern them in the room of Exhilaratus. Some writers suppose the Neapolitans, in this general revolt of the cities of Italy, to have shaken off the yoke with the rest, and to have appointed magistrates of their own election to govern them, in the room of the officers hitherto sent from Constantinople, or named by the exarch; but they are certainly mistaken; it being manifest from history that Peter succeeded Exhilaratus in that dukedom, and that the Neapolitans continued to live under the emperors, till they were conquered many years after by the Normans.

In the mean time, Leo, hearing of the murder of the exarch, and the general revolt of the cities, and not doubting but the pope was the chief author of so much mischief, sent the eunuch Euty chius into Italy, with the title and authority of exarch, strictly enjoining him to get the pope dispatched by some means or other, since his death was absolutely necessary for the tranquillity of Italy. The exarch spared no pains to get the pope into his power; but a messenger, whom he had sent to Rome, being apprehended by the citizens, and an order from the emperor being found upon him to all his officers in that city, commanding them to put the pope to death at all events, the pope's friends thenceforth guarded him with such care, that the exarch's emissaries could never find an opportunity of executing their design. As for the messenger, the Romans were for putting him to death; but the pope interposed, contenting himself with excommunicating the exarch.

And now the Romans, provoked more than ever against Leo, and, on the other hand, unwilling to live under the Lombards, resolved to revolt from the emperor, and appoint their own magistrates, keeping themselves united under the pope, yet not as their prince, but only as their head. This they did accordingly; and from these slender beginnings the sovereignty of the popes in Italy took its rise, though they did not then, as is commonly supposed by historians, but many years after, become sovereign lords of Rome.

Euty chius failed in his design upon the life of the pope; but, having brought with him from Constantinople a good number of troops, he easily quelled the rebellion in Ravenna, and severely punished the authors of the late disturbances. As for the rebellious Romans, he was well apprised he could never reduce them, so long as they were supported by the king of the Lombards; and therefore he employed all his art and policy to take off that prince from the party of the Romans, and bring him over to his own. Luitprand, for some time, withstood all his offers;

but, Thrasimund duke of Spoleto revolting at this very juncture, the exarch, laying hold of that opportunity, offered to assist the king with all his strength against the rebellious duke, provided he would, in like manner, assist him against the pope and the Romans. With this proposal Luitprand readily closed; and, a league being concluded upon these terms between him and the exarch, the two armies joined, and began their march towards Spoleto. At their approach, the duke, despairing of being able to resist two such powers, came out with a small attendance to meet them, and, throwing himself at the king's feet, sued, in that humble posture, for pardon; which Luitprand not only granted him, but confirmed him in the dukedom, after he had obliged him to take a new oath of allegiance, and give hostages for his fidelity in time to come. From Spoleto, the two armies marched, in pursuance of the treaty, to Rome; and encamped in the meadows of Nero, between the Tiber and the Vatican.

Gregory had caused the city of Rome to be fortified in the best manner he could; but, being sensible that the Romans alone could not long hold out against two such armies, and reflecting on the kind treatment the duke of Spoleto had met with upon his submitting to the king, he resolved to follow his example; and accordingly, taking with him some of the clergy, and the principal inhabitants of the city, he went to wait on the king in his camp; and there, with a pathetic speech, as he was a great master of eloquence, softened Luitprand to such a degree, that, throwing himself at his feet in the presence of the whole army, he begged pardon for entering into an alliance against him; and, assuring him of his protection for the future, he went with them to the church of St. Peter; and there, disarming himself in the presence of his chief officers, he laid his girdle, his sword, and his gauntlet, with his royal mantle, his crown of gold, and cross of silver, on the apostle's sepulchre. After this, he reconciled the pope with the exarch, who was thereupon received into the city, where he continued for some time, maintaining a friendly correspondence with the pope. At this time an impostor, taking the name of *Tiberius*, and pretending to be descended from the emperors, seduced a great many people in Tuscany, and was by them proclaimed emperor. The exarch resolved to march against him; but, as he had not sufficient forces to oppose the rebels, Gregory, who let no opportunity slip of obliging Leo, persuaded the Romans to attend the exarch in this expedition; by which means the usurper being taken in a castle, his head was sent to the emperor, and the rebellion utterly suppressed.

Luitprand died in the year 743. He was succeeded by Hildebrand, his grandson, who reigned only seven months; and from him the sceptre passed to Rachi duke of Friuli, who reigned in peace about as many years; but his successor Alolphus declared himself the equal enemy of the emperor and the pope. Ravenna was again subdued by force or treachery; and this final conquest (A. D. 752.) extinguished the series of the exarchs, who had reigned with a subordinate power since the time of Justinian and the ruin of the Gothic kingdom. Rome was next summoned to acknowledge the victorious Lombard as her lawful sovereign; the annual tribute of a piece of gold was fixed as the ransom of each citizen, and the sword of destruction was unsheathed to exact the penalty of her disobedience. The Romans hesitated; they entreated; they complained; and the threatening barbarians were checked by arms and negotiations, till the popes had engaged the friendship of an ally and avenger beyond the Alps.

In his distress, Gregory III. had implored the aid of the hero of the age, of Charles Martel, who governed the French monarchy with the humble title of mayor or duke; and who, by his signal victory over the Saracens, had saved his country, and perhaps Europe, from the Mahometan yoke. The ambassadors of the pope were received by Charles with decent reverence; but the greatness of his occupations, and the shortness of his life, prevented his

interference in the affairs of Italy, except by a friendly and ineffectual mediation. His son Pepin, the heir of his power and virtues, assumed the office of champion of the Roman church; and the zeal of the French prince appears to have been prompted by the love of glory and religion. But the danger was on the banks of the Tiber, the succour on those of the Seine; and our sympathy is cold to the relation of distant misery. Amidst the tears of the city, Stephen III. embraced the generous resolution of visiting in person the courts of Lombardy and France, to deprecate the injustice of his enemy, or to excite the pity and indignation of his friend. After soothing the public despair by litanies and orations, he undertook this laborious journey with the ambassadors of the French monarch and the Greek emperor. The king of the Lombards was inexorable; but his threats could not silence the complaints, nor retard the speed, of the Roman pontiff, who traversed the Pennine Alps, reposed in the abbey of St. Maurice, and hastened to grasp the right-hand of his protector, a hand which was never lifted in vain, either in war or friendship. Stephen was entertained as the visible successor of the apostle; at the next assembly, the field of March or of May, (A. D. 754.) his injuries were exposed to a devout and warlike nation; and he repassed the Alps, not as a suppliant, but like a conqueror, at the head of a French army, which was led by the king in person. The Lombards, after a weak resistance, obtained an ignominious peace, and swore to restore the possessions, and to respect the sanctity, of the Roman church. But no sooner was Astolphus delivered from the presence of the French arms, than he forgot his promise, and resented his disgrace. Rome was again encompassed by his arms; and Stephen, apprehensive of fatiguing the zeal of his transalpine allies, enforced his complaint and request by an eloquent letter in the name and person of St. Peter himself. The apostle is made to assure his adoptive sons, the king, the clergy, and the nobles, of France, that, dead in the flesh, he is still alive in the spirit; that they now hear, and must obey, the voice of the founder and guardian of the Roman church; that the virgin, the angels, the saints, and the martyrs, and all the host of heaven, unanimously urge the request, and will confess the obligation; that riches, victory, and paradise, will crown their pious enterprise; and that eternal damnation will be the penalty of their neglect, if they suffer his tomb, his temple, and his people, to fall into the hands of the perfidious Lombards. The second expedition of Pepin was not less rapid and fortunate than the first: St. Peter was satisfied, Rome was again saved, and Astolphus was taught the lessons of justice and sincerity by the scourge of a foreign master.

After this double chastisement, the Lombards continued about twenty years in a state of languor and decay. But their minds were not yet humbled to their condition; and, instead of affecting the pacific virtues of the feeble, they peevishly harassed the Romans with a repetition of claims, invasions, and inroads, which they undertook without reflection, and terminated without glory. On one side, their expiring monarchy was pressed by the zeal and prudence of pope Adrian I. on the other, by the genius, the fortune, and the greatness, of Charlemagne, the son of Pepin. These heroes of the church and state were united in public and domestic friendship; and, while they trampled on the prostrate, they varnished their proceedings with the fairest colours of equity and moderation. The passes of the Alps, and the walls of Pavia, were the only defence of the Lombards; the former were surprised, the latter were invested, by the son of Pepin; and, after a blockade of two years, Desiderius, the last of their native princes, surrendered his sceptre and his capital, (A. D. 774.) to Charlemagne, who had married and repudiated his daughter. *Gibbon*, ch. xlv. xlix.—See the article FRANCE, vol. vii. p. 654.

Thus ended the kingdom of the Lombards in Italy, after they had possessed that country for 206 years. Un-

der the dominion of a foreign king, but in the possession of their national laws, the Lombards became the brethren, rather than the subjects, of the Franks; who derived their blood, and manners and language, from the same Germanic origin.

During a period of two hundred years Italy had been divided between the kingdom of the Lombards and the exarchate of Ravenna. From Pavia, the royal seat, the kingdom of the Lombards was extended to the east, the north, and the west, as far as the confines of the Avars, the Bavarians, and the Franks of *Austrasia* and *Burgundy*. In the language of modern geography, it is now represented by the Terra Firma of the Venetian territory, Tyrol, the Milanese, Piedmont, the coast of Genoa, Mantua, Parma, Modena, Tuscany, and a large portion of the ecclesiastical state from Perugia to the Adriatic. The dukes, and at length the princes, of Beneventum, survived the monarchy, and propagated the name, of the Lombards. From Capua to Tarentum, they reigned near 500 years over the greatest part of the present kingdom of Naples. In process of time, the disposition and manners of the Lombards underwent a very important change. So rapid, indeed, was the influence of climate and example, that the Lombards of the fourth generation surveyed with curiosity and affright the portraits of their savage forefathers. The government of the Lombards was an elective monarchy; and the public revenues arose from the produce of land and the profits of justice. The Lombards were at first a cruel and barbarous people; but divesting themselves, by degrees, of their native ferocity and barbarity, especially after they had embraced the Christian religion, they governed with such equity and mildness, that most other nations envied the happiness of those who lived under their administration.

As they had no other kingdom nor dominions, Italy became their own country; whence the natives esteemed their kings as their natural princes, not thinking themselves governed, much less kept in slavery, by a foreign nation, as it happened to them afterwards, when, by frequent changes, they groaned under the heavy yoke, sometimes of one nation, and sometimes of another. "Under the government of the Lombards," says Paulus Diaconus, "no violence was committed, no one unjustly dispossessed of his property, none oppressed with taxes; theft, robberies, murder, and adultery, were seldom heard of; every one went, without the least apprehension of danger, whither he pleased." And indeed their many wholesome laws, restraining and severely punishing all sorts of crimes; the magnificent churches, and rich monasteries, with which they filled that part of Italy which was subject to them; the many bishoprics which they erected; the towns and cities which they either built or repaired, in most provinces of Italy; their generosity even to the bishop of Rome, their avowed enemy; and, finally, the great number of persons among them, whose sanctity and eminent virtues have been acknowledged by the popes themselves; must convince every impartial reader, that the Lombards were not such a savage, barbarous, and inhuman nation, as they are described by some of the popes, especially by Adrian, the chief author of the ruin of their kingdom. They were the only power in Italy capable of defeating the ambitious views of the bishops of Rome; and hence arose the inveterate hatred which the popes bore them, and could not help betraying in all their writings. But their laws are convincing proofs of their justice, humanity, and wisdom, and, at the same time, a full confutation of the many calumnies, with which the popes, and their partisans, have endeavoured to asperse them. Their laws were found so just and equitable, that they were retained in Italy, and observed some ages after their kingdom was at an end.

L O M B A R D Y, a country in the northern part of Italy, very much corresponding with the Cisalpine Gaul of the Romans. It derived its name from the L O M B A R D S, (see the preceding article,) who founded the kingdom in the middle

middle of the sixth century. This country was divided into several states, subject to the house of Austria, the republic of Venice, and the king of Sardinia: such as the duchies of Milan and Mantua, called Austrian Lombardy; —the Paduan, Veronese, Vicentin, Bressan, Comasco, and Bergamasco, belonging to Venice;—Montferrat and Nice, annexed to Piedmont, subject to the king of Sardinia;—together with many others, as the duchies of Modena, Reggio, Parma, Piacenza, Mirandola, and several smaller principalities and states. The vicissitudes which Lombardy has undergone, and more especially those which have occurred to it since the French revolution, are briefly detailed under CISALPINE REPUBLIC, vol. iv. HETRURIA, vol. ix. and ITALY, vol. xi. p. 464, 5.

LOM'BERS, a town of France, in the department of the Tarn: nine miles south of Alby.

LOM'BES, a town of France, and seat of a tribunal, in the department of the Gers; before the revolution the see of a bishop: ten miles south-west of Pisle en Jourdain, and sixteen south-east of Auch.

LOM'BOK, an island in the Eastern Indian Sea, about forty miles from north to south, and from eighteen to thirty broad, chiefly inhabited by Gentoos. Between this island and Cumbava is a passage, called the *Straits of Lombok*. Lat. 8. 30. S. lon. 116. E.

LOM'BOK, a town on the east coast of the island so called. Lat. 8. 42. S. lon. 116. 2. E.

LOMBUZ'SKOI, a small island in the Frozen Ocean, near the coast of Russia: 180 miles east of Kola. Lat. 67. 55. N. lon. 40. 14. E.

LOM'BY, a town of Hindoostan, in the Carnatic: twenty miles north-west of Tiagar.

LOME'IR (John), a learned Dutch protestant divine in the seventeenth century, concerning whose life we have seen no other particulars, than that he was pastor of the church of Dotekum, in Zutphen. He was the author of a curious little work, abounding in erudition and close research, in which he has undertaken to give an historical and critical notice of the most celebrated libraries in ancient and modern times. It is entitled, *De Bibliothecis Liber Singularis*, 12mo. 1669; and is divided into fifteen chapters. The first is preliminary; and the subsequent ones treat of preserving the memory of events before the time of Moses; of the libraries of the Hebrews; those of the Chaldeans, Arabians, Phenicians, Egyptians, &c. those of the Greeks and Romans; the libraries of the Christians before the dark ages; the state of libraries during the long night of barbarism; of libraries after the revival of letters; the most celebrated libraries in Europe; of the libraries in various other nations; of particular books in certain collections; of the keepers of libraries; of the proper situation, disposition, and ornaments, of libraries; and of the enemies to libraries. Under these heads the scholar will meet with much interesting and entertaining matter, though not clothed in a chaste style, and notwithstanding that the author will sometimes be found to have admitted small private collections into his list of important libraries. The author's plan afterwards gave rise to a larger work on the same subject, by Joachim-John Maderus, a learned German, who published at Helmstadt a treatise *De Bibliothecis*, in two volumes 4to. 1702 and 1705, in which he has inserted our author's piece. *Lomeri De Bibl.*

LOM'ELIN (Adrian), an engraver, was born at Amiens in 1637; but studied his art at Antwerp, where he lived till his death. He worked with the graver only, and handled it but indifferently; yet some of his portraits after Vandyke are not without merit, especially that of John-Baptista de Bithoven, a Jesuit of Antwerp.

LO'MENT, *f.* in botany, an oblong seed-vessel, not opening longitudinally like a legume, but separated by transverse partitions, and containing a single seed in each joint.

LOMONTACE'ZE, *f.* in botany, the name of the fifty-sixth order in Linnæus's Fragments; and of the thirty-

third in his Natural Orders. See the article BOTANY, vol. iii. p. 297.

LOMONTA'CEOUS, *adj.* in botany, belonging to plants with jointed seed-vessels.

LOMONTUM, *f.* [Latin.] A word used by the old writers on medicine to express a meal made of beans, or bread made of this meal, and used as a wash. Others have applied it to the French chalk, or morochthus, used by the scowerers of clothes, which is brought over in large cakes, resembling loaves or cakes of bread.

LOM'GRAD, a town of Bulgaria, at the conflux of the Lom and Danube: twenty miles south-south-east of Viddin.

LO'MI, a town of Russia, in the government of Irkutsk, on the Amur: sixteen miles north of Stretensk.

LOM'MATSCH, or LUMTSZCH, a town of Saxony, in the margravate of Meissen: seven miles north-west of Meissen, and twenty north-west of Dresden. Lat. 51. 11. N. lon. 13. 13. E.

LOM'MERSUM, a village and citadel of France, in the department of the Roer. This place with Kerpen formed a county, possessed by the count of Scaberg, which paid twelve florins for a Roman month. It is nine miles west-north-west of Bonne.

LOM'MIUS, or VAN LOM (Jodocus), a medical writer of reputation, was a native of Buren in Guelderland. His father, who was the town-clerk, caused him to be carefully educated; and he was master of the learned languages when he turned his studies to physic. Paris was the school from which he principally derived his professional knowledge. He was pensionary-physician to the city of Tournay in 1557; and settled at Brussels in 1560, when he was advanced in years. He was living in 1562, beyond which time there is no record of him. The works of Lommius, which are written in a pure, elegant, and clear style, and have been much read and esteemed, are the following: 1. *Commentarii de Sanitate Tuenda in primum librum C. Celsi*; Lovan, 1558: this is an ample commentary upon Celsus, entirely taken from the ancients. 2. *Observationum Medicinalium Lib. III.* Antw. 1560; many times reprinted and translated; this consists of analytic histories of diseases, with their signs and prognostics, and contains much accurate and useful observation. 3. *De Curandis Febris Continuis*; Antw. 1563; often reprinted and translated. *Halleri Bibl. Med.*

LOM'NITZ, a town of Bohemia, in the circle of Kouingratz: six miles north of Gitschin.

LOM'NITZ, a river of Silesia, which rises in the principality of Jauer, and runs into the Bober three miles east-south-east of Hirschberg.

LOM'NITZ, a town of Moravia, in the circle of Brunn: fifteen miles north-north-west of Brunn. Lat. 49. 24. N. lon. 16. 18. E.

LOM'OND. See BEN LOMOND, vol. ii. and LOCH LOMOND, vol. xii. p. 863.

LOMOND HILL'S, two beautiful conical hills situated in the county of Fife, Scotland. The Eastern one is by far the most beautiful, and rises 1650 feet above the level of the town of Falkland, which is placed at a short distance from its base. It appears to have been the seat of a fort in ancient times. On the very summit is a small lake, which has probably been the crater of an extinct volcano. On this hill a mine of lead has been lately opened, with good prospect of success to the proprietors. It likewise contains coal and limestone in considerable abundance; but neither of them are wrought. The other hill, which is called Western Lomond, from its situation with respect to the former, is much higher, and perhaps commands a more extensive view. On the top is one of those heaps or tumuli of stones which are denominated *cairns*.

LOMON'OZOF, a distinguished person in the scanty catalogue of Russian literati, and accounted the father of Russian poetry, was born in 1711, at Kolinogori, where

his father was a dealer in fish. He had the advantage, at that time unusual, of learning to read his native language; and he early caught a flame of poetical inspiration by perusing a translation of Solomon's Song into rude verse by Polotiki. His love for letters induced him to escape from his father, who wished him to marry, and take refuge in a monastery at Moscow. He there acquired the rudiments of Greek and Latin, and displayed such a promise of abilities, that he was chosen by the Imperial Academy of Sciences, in 1636, to be sent at its expense for improvement to the German university of Marburg. He continued there four years studying philosophy and rhetoric under Wolff, and other branches of science under the other professors. Of chemistry, which he pursued with great ardour, he obtained further knowledge under Kunkel, at Freyberg in Saxony. On his return to Russia he was elected adjunct, and the next year member, of the Imperial Academy, and professor of chemistry. In 1760 he was appointed inspector to the seminary attached to the academy; in 1764 he was honoured with the title of counsellor of state. His death took place in the same year. The reputation of Lomonozof in his own country is founded chiefly on his poetical compositions, which are numerous and various in their kinds. His odes are particularly admired for their spirit, variety, and sublimity, in which qualities he is said to rival Pindar himself. That they should have a mixture of turgidity and extravagance was to be expected in a country and language as yet so little disciplined by taste. In these and in his other poems he was the creator of various measures new to Russian verse, so that he justly ranks as its greatest benefactor. Among his poetical pieces are tragedies, idylls, epistles, and a fragment of an epic poem on Peter the Great. In prose he enriched Russian oratory with many translations from the Greek and Latin, and some original pieces. He likewise published some chemical and philosophical tracts, and two short works on the history of his country. *New Biogr. Dict.* 1798.

LOM'PAR, a small island in the Baltic, near the south-east coast of Aland. Lat. 60. 10. N. lon. 20. 9. E.

LOM'PRE, a town of France, in the department of the Forets: twelve miles east of Givet.

LOM'ZA, a town of the duchy of Warsaw, situated on the Narew: eighty miles north-east of Warsaw, and 120 south-east of Königsberg. Lat. 53. N. lon. 22. 40. E.

LON, or LOHN. See ISERLOHN, vol. xi. p. 400.

LON-CHAN-TCHING', a town of China, in Chan-tong: five miles east of Tci-nan.

LON-GAN', a town of China, of the third rank, in Kiang-si: forty-seven miles west-south-west of Kien-tchang.

LON-GAN', a town of China, of the third rank, in Chan-tong: twenty-two miles north-north-west of Toin-theou.

LON-YN', a city of China, of the second rank, in Quang-si: 1160 miles south-south-west of Pe-king. Lat. 22. 57. N. lon. 106. 39. E.

LONAS, *f.* in botany. See ATHANASIA annua, vol. ii. p. 463.

LONA'TO, or LONADO, a town of Italy, in the department of the Benaco; twelve miles east-south-east of Bressia. This town was taken by the French the latter end of June, 1796. Bonaparte, in the account of the battle of Castiglione della Stivera, says, 4000 Austrians soon after invested the town of Lonado, in which there were only 1200 French troops. Immediately on his arrival at that place, the Austrian commander sent a messenger to demand the surrender of the town. Bonaparte's answer to the summons was, that, if the Austrian general had the effrontery to take the commander-in-chief of the army of Italy, he had only to advance: that he ought to know, that the republican army was at that place, and that all the general officers belonging to the division should be responsible for the personal insult he had been guilty of towards him; and that, if his division did not, in the

space of eight minutes, lay down their arms, he would not show mercy to one of them. This answer produced the desired effect, and the whole column immediately surrendered.

LONCAR'TY. See LUNCARTY.

LON'CHAMP. See LONGCHAMP.

LONCHAUMOIS, a town of France, in the department of Jura: five miles north-north-east of St. Claude, and thirteen east of Orgelet.

LONCHITES, *f.* in astronomy, a kind of comet resembling a spear. *Astr.*

LONCHITIS, *f.* [from *λογχη*, Gr. a spear.] In botany, a genus of the class cryptogamia, order filices, natural order of filices, or ferns. The generic character is—the capsules disposed in lunulated lines lying under the sinuses of the frond.

*Species.* 1. *Lonchitis hirsuta*, hairy lonchitis, or rough spleenwort: fronds pinnatifid, blunt, quite entire; shoots branched, hirsute. This fern rises commonly to the height of four or five feet. Native of South America and Jamaica.

2. *Lonchitis aurita*, or eared lonchitis: fronds pinnate, the lowest pinnae two-parted; shoots undivided, prickly.

3. *Lonchitis repens*, or creeping lonchitis: fronds pinnate; pinnae alternate, sinuate; shoots branched prickly. Natives of South America.

4. *Lonchitis pedata*, or footed lonchitis: fronds pedate; pinnae pinnatifid, ferrulate. This fern rises by a simple stalk to the height of two or three feet, and then divides into three parts, whereof the middle is simple, but each of the lateral divisions is again parted into three simple branches of a proportionate length. Native of Jamaica, in the mountains of New Liguane.

5. *Lonchitis tenuifolia*, or thin-leaved lonchitis: arborescent; fronds decomposed; leaves pinnate; pinnae linear-oblong, ferrate; the lowest pinnatifid. Native of the isle of Tanna, in the South Seas.

*Propagation and Culture.* These ferns, being natives of very hot climates, must be planted in pots, and plunged into the bark-pit. They may be increased by parting the roots. In summer they should have plenty of free air, and be frequently watered. See ACROSTICHUM, ADIANTUM, ASPLENIUM, BLECHNUM, OPHIOGLOSSUM, OSMUNDA, POLYPODIUM, and PTERIS.

LONCHIURUS, *f.* [Gr. *lancet-tail.*] In ichthyology, the name of a genus of fish instituted by Bloch, but consisting of a single species, and now included among the surmulletts. See MULLUS lonchirus.

LON'DERSEEL, LONDERSEIL, or LONDERSEL (John), an engraver of some celebrity in the Low Countries, was born at Bruges in the year 1580. He worked entirely with the graver, in a stiff dry style, greatly resembling that of Nicholas de Bruin, whose disciple he probably was. However, his prints are not without some share of merit; and are sought after by connoisseurs. The following are the most worthy of the attention of the collector: 1. Faith, Hope, and Charity, personified by female figures, with a landscape back-ground. 2. The Five Senses characterised by figures, seated in a landscape. 3. A woody landscape with hunters. 4. The fable of Apollo and Daphne. 5. The disobedient Prophet devoured by a Lion. 6. Tobit journeying with the Angel. 7. Jacob tending the Flocks of Laban. 8. St. John in the Wilderness. 9. The good Samaritan. 10. The blind Warrior. 11. The Woman with the Hæmorrhage. 12. Abraham sacrificing Isaac. 13. Interior of the church of St. John de Lateran at Rome. 14. Saul anointed King of the Hebrews. 15. The Rape of Tamar. 16. The Prophet foretelling to Jeroboam the Division of his Kingdom. 17. Susannah and the Elders. 18. The Temptation in the Wilderness. 19. The Saviour praying on the Mount of Olives. 20. The Maries approaching the Holy Sepulchre. 21. Diana and Actæon. 22. The Pleasures of Summer. The latter is a meritorious landscape; and they are all of large folio sizes. His plates are marked sometimes *J. Lond.* or *J. Londer fec.*

and sometimes with his initials combined as in the first of the following ciphers.

LON'DERSEL, or LAND'FELD (Ahasuerus), an engraver, who, though not of first-rate talent, has been celebrated under two names. He appears to have been a native of Holland, born about the middle of the sixteenth century, and to have been chiefly engaged in the execution of letter-press engravings, in a neat and delicate style, and which are marked sometimes with one and at other times with the other of the two last monograms above. And it is not unlikely that these *two* marks may have given rise to the separation of his works into those of Ahasuerus Landfeld, and Ahasuerus Londerfel. That he was related to John Londerfel, the subject of the preceding article, is highly probable. From the smallness of his productions, of which the greater number adorn the books that were published at Antwerp about this period, he is classed among *the little masters*, but his engraving of the Last Supper is on a larger scale. Among the books which he thus decorated, are the 4to. edition, in the French language, of the Travels of Nicholas de Nicolay into Turkey, printed at Antwerp in 1576; and the large Herbal of Matthias de Lobel.

LONDINIE'RES, a town of France, in the department of the Lower Seine: seven miles north of Neuschâtel, and fifteen east-south-east of Dieppe.

LON'DON, the metropolis of Great Britain, is situated in  $51^{\circ} 31'$  N. latitude, and in longitude  $5^{\circ} 37'$  W. of Greenwich, where the royal national observatory is established, and from whence the longitude is taken in all our charts, maps, &c. The distance of London from the principal cities in Europe is as follows: from Amsterdam, 190 miles W. Paris, 225 N.N.W. Dublin, 338 S.E. Edinburgh, 395 S. Berlin, 540 W. Copenhagen, 610 S.W. Stockholm, 750 S.W. Vienna, 820 N.W. Lisbon, 850 N.E. by N. Madrid, 860 N.E. by E. Rome, 950 N.N.W. Peterburgh, 1140 S.W. Constantinople, 1660 W.N.W. Moscow, 1660 W.S.W.

#### INTRODUCTION.

If a traveller, setting out in search of antiquities, with a mind fraught with classical knowledge, feels elated with self-satisfaction, and thinks his labours well repaid, by the personal gratification he enjoys, when, after long investigations and assiduous inquiries, he finds a handful of coins, some remains of ancient architecture, fragments of columns, broken parcels of statues, and the slightest vestiges of long-forgotten towns; what ought not to be the astonishment and the feelings of a foreigner, when, entering this noble city, the most populous, the largest, the most commercial, and the richest, in the world, he finds it not only decorated with handsome buildings, aired by numerous and elegant squares, intersected by wide and convenient streets, watered every where, and nearly to the roofs of the houses, by subterraneous canals, but also animated by a most industrious and busy spirit of trade, and enlivened by citizens who, in both sexes, may boast of being without competition the handsomest in the world? He may assert, that, in the course of his travels, he has found, in several parts of the continent, *some* of these advantages in a high state of perfection; and his assertions cannot be denied. The cleanliness of the Flemish and Dutch; the spiritedness and vivacity of the French; the liveliness and mirth of the Italians; the departed wealth of Venice; the mouldering grandeur of Rome; the plodding quays of Amsterdam; recur powerfully to his mind: but no where did he find *all these* so happily combined and concentrated on a single spot, and brought to such an astonishing degree of perfection, that he may fairly be allowed to doubt whether he really sees what moves before his eyes, or does not indulge

in the delirium of an accidental dream. Ere the French revolution burst out like a most tremendous volcano, and not only broke all the ties of that monarchy, but shook afar the most distant nations; commerce, sciences, and the liberal arts, were thriving in other countries, and bringing wealth, comfort, and ornaments, to other towns and communities; but, since England remained the only state that had not caught the contagion of the new principles of destructive levelling, LONDON, the centre, the heart, the focus, of that life which animates the whole of the united kingdom, becoming consequently the refuge of the oppressed, shines at this moment the emporium of the world, and the safest and wealthiest point of the universe.

After these general considerations and comprehensive views, it must appear difficult indeed to give an adequate idea of the subject in contemplation. Pennant, in his usual interesting and pithy style, says, "He must be a Briareus in literature who would dare to attempt a history of our capital, on the great, the liberal, the elegant, plan which it merits." Although a great deal of respect is owing to an author who has gleaned so successfully on the Londonian field, it must be confessed that it is rather extraordinary that a complete and even voluminous description of London, decorated with all that typography and chalcography united can produce, has never been attempted according to that gigantic scheme; for it is beyond doubt that this wonderful city has fulfilled what an ancient poet of Great Britain has prematurely said:

Urbes terrarum facile Londonia vincit  
Ornatu, spatio, tempore, divitiis.

That is: "In ancienty, in extent, in beauty, and in wealth, London surpasses all the cities of the world." However, as far as the limits of our plan will allow, this article shall obtain that degree of fulness which its importance requires, and of attention and correctness which the best authorities and the strictest care are able to procure.

ETYMOLOGY.—It happens with famous cities as with ancient noble families; they seem to conceal their venerable heads in the clouds, or behind the veil of antiquity, with such obstinacy and reluctance against being brought to light, that the keenest and most industrious heralds and antiquaries generally find their labours and lucubrations lost in fruitless and tiresome searches, without arriving at the desired object of their enquiries. The fact is, that populous and trading towns, in countries whose histories have not been recorded by the able hands of contemporary writers, having often changed their governors, their inhabitants, and their language, as is the case with LONDON, have undergone in their denominations the most material changes. And hence the name of this metropolis has exercised the skill and imagination of numerous antiquaries, from the earliest ages of Christianity to the present. Some assert that it originated, and most probably it did so, from the Celtic language, supposed to have been spoken by part of Gallia and the whole of Great Britain, and now preserved among the Welch and the inhabitants of Low Britanny in France. *Lhongdin*, in that tongue, signifies "a town of ships;" and the correspondence of sounds, united to the situation of this city, militates considerably in favour of this derivation. The learned Camden brings, in its support, the words *Lhong* and *Dinas*, which he translates "the city of ships." Others propose *Lhaon*, full, and *Dyn*, man, "a city full of men;" but as this last denomination bears no characteristic analogy to the place in question, it does not deserve much credit, although it may be respected on account of the ingenuity of its authors. It is certain that the word *Don*, contracted from *Dowon*, and that of *Towon*, arising from the second and compressed into the first, (which the Romans, after their arrival in this country, rendered generally, or attempted to represent, by *Dunum*,) are of great antiquity in this land, and mean invariably a low place; that is, a situation between two or more hills, whose streams are naturally running. Water being one of the first necessities of life, as soon as men

met in society, and built places to reside in, their choice most prudently led to the sides or banks of rivers; and they therefore erected their simple and unadorned mansions in vales, or downs. The word *Lud*, which signified a Lord, or Prince, may have furnished the first syllable; and, indeed, it seems that, independently of being the name of an ancient king of the Britons, preserved in the denomination of some places still existing, as *Ludgate*, &c. the title of the chieftain of the Franks was *Lud*. *Clovis* was *Clodoveus*; and it is well known that the C or K<sup>l</sup> was not pronounced in this word, since that of *Ludovicus* or *Ludoix* arose from it. The testimony of ancient writers proves that London was the chief town of the Trinobantes, and most likely peculiarly favoured or inhabited by the king, or *lord*, of the nation. This ingenious etymon seems to carry with it a great deal of probability, and may satisfy the antiquarian, since no other brings more light on the subject. *Lud-down* might have easily been softened into *London*, "the City of *Lud*;" that is, the place mostly resorted to by the chief of the nation of the Trinobantes. The ancient Britons and Welch still call it *Lundayn*; the ancient Saxons, *Londonceaster*, or *Castrum Londini*. Tacitus, Ptolemy, and Antoninus, called it *Londinium*; Ammianus, *Lundinum*; Stephanus, *Lindonion*; Bede, *Lundonia*; and *Civitas Lundonia*. The name of *Augusta* was also conferred on this city, according to Ammianus Marcellinus; very probably on account of the traditional report that it was surrounded with walls by Constantine the Great, whose mother was styled *Helena Augusta*. The French have unaccountably added *res* to the first syllable, and pronounce it *Londres*; the Spaniards, *Londra*; the Portuguese, *Londre*; and the Dutch *Lunden*.

#### GENERAL VIEW OF LONDON, AND ITS DIFFERENT APPROACHES.

If we give credit to ancient writers, (and certainly many of them ought to be believed, since their relations perfectly agree with the ruins and vestiges of the places they describe,) the approach of Athens and Corinth, of Agrigentum and of Rome, besides several others, must have wrought a very lively impression on the mind of the traveller.—The distant aspect of the Athenian city, that for many centuries ranked among the most important of the states existing at that time; the proud Acropolis, crowned with the unparalleled Temple of Minerva, the famous Parthenion, overlooking the whole of Achaia, down to the celebrated isthmus, and the neighbouring hills fludded with white marble edifices, rising in amphitheatres above sacred groves of laurels and cypress; the entrance into the *Bimarem Corinthum*, situated between two gulfs, upon that narrow tongue of land dividing Greece from the Peloponnesus, with a distant view of the grey heights of Mount Athos, that courted and defied the wrath of the mighty kings of Persia; the entrance into that wonderful city, where the immense number of statues in marble, in stone, in ivory, and in bronze, were calculated to favour the strange surmise, that, at some distant period of time, all the inhabitants had been suddenly transformed into those works of art;—the avenue to the Sicilian Agrigentum, backed with the burning peak of Etna, and decorated with the tombs and cenotaphs of the worthies, and the venerable fanes of the gods;—the *Via Appia* leading to Rome through an interrupted line of elegant villas, sepulchres, and funeral monuments erected to the memory of emperors, dictators, vestals, consuls, and heroes; and, among a crowd of columns and obelisks, the distant view of the domineering Capitol, frowning from the brow of the Tarpeian rock, upon the conquered nations of Latium:—The remembrance of all this *past* splendour and magnificence vanishes at once before the *present* aspect of the British metropolis.—This assertion may seem, at first, bold and hyperbolic; but yet it is grounded upon truth, palpable evidence, and daily conviction; for, indeed, from whatever point of the compass we reach London,

the eye meets with a scene equally grand, interesting, and magnificent.

The entrance from the western counties, is enriched by an innumerable quantity of gentlemen's mansions, the neatness and elegance of which, raise a first idea of the wealth and splendour of the metropolis.—*Sion house*, the seat of the duke of Northumberland; the gardens and elysian groves of Richmond and Kew, on one side; the stateliness of the trees in Kensington Gardens, and the expanse of Hyde Park, on the other;—the view of St. James's and the Green Park, from the wide opening of Piccadilly, embracing Buckingham-house and the architectural wonder of Westminster-abbey, by the side of which the undulating screen of the Surrey hills binds the view; present an admirable prospect, animated by the rapid and fluctuating ingress and egress of equipages of the most fashionable form, resorting to the rides mostly frequented by the nobility of the west end of the town.

From the north, from the heights of Islington, resounding with the lowing of cattle, the bleatings of sheep, pacing slowly the sloping paths towards the populous cities they are doomed to feed; from those hills where tea-gardens and Sadler's Wells yield to the influence of the goddess of mirth, fast by the artificial stream of a New River;—the united cities of London and Westminster, with their extensive appendages, display themselves in astonishing and awful majesty, centred by the magnificent pile of St. Paul's, which, in gigantic mood, rises above a forest of spires, towers, and steeples, standing, seemingly in a line, from Shooter's Hill in Kent to Primrose Hill in the neighbourhood of Hampstead.

If the business of the traveller directs him to come up to London by water, his arrival from the east will be attended with still greater cause for curiosity and astonishment.—After he has saluted that monument of national gratitude towards the naval defenders of our rights on the seas, he will dash through an immense forest of ships of all shapes, forms, and sizes, decorated with the flying colours of all nations from the four quarters of the world, brought to the noble bosom of the Thames, by the hands of industry and trade, and lying there safe under the wings of protection and confidence. He will pass under the ancient walls of the Tower, whose origin is supposed to precede the Christian era; and the contents of which, he has been told, are most interesting and precious. He will gaze at the busy quays, at the stream covered with boats, craft, collier-vessels, wherries, and barges, above calculation, yielding willingly and cheerfully to the impulse of interest or pleasure, and crossing each other in all directions. He will reach, at last, the venerable pile of London-bridge, that divides two counties, and sits mightily on the swelling tide; and on the left side of which the Monument raises its lofty head to the skies. There he will forget all he has been told of the famous ports of the Phœnicians of old; Tyre and Sydon must dwindle in his mind into mere insignificance, whilst he heaves a sigh of generous pity for the departed glory of Amsterdam and Venice.

But if the foreigner, in his perambulations, chances to find his way to the metropolis by the southern road, then what pleasure, what enjoyment, what astonishment, will swell and delight his heart! In case he should not obtain a glance of Greenwich, however, the road on both sides will present, all along, such an admirable scenery, gliding swiftly before his sight; such a quantity of country boxes, seats, and villas, crowning the hills, dispersed in the valleys, peeping through the willow and poplar groves; so many seminaries and schools, backed by meadows rich with cattle, and by gardens and nurseries exhaling the aromatic perfumes of the east; that he will think of nothing but fairy visions and romantic enchantments.—He will meet, on his left, an admirable Asylum for the Deaf and Dumb, that will speak to his heart and rouse his nicest feelings; whilst it is contrasted by the loud and busy scene

at the Bricklayer's Arms on the right, a most frequented rendezvous for stages and coaches between London and the western cities, boroughs, and villages of Suffex and Kent. Perhaps he may see at a distance the verdant tops of the festive groves belonging to Vauxhall, where the eye is delightfully pleased with the glow of artificial and coloured lights; and soon he will meet the Hospital lately established for the Blind, just by the Philanthropic School. The Asylum for Unprotected Women, the stately building destined for the Lunatics, rising in majestic simplicity on his left; the Free Masons' Schools; the Magdalen, where lost virtue learns to blush again; and the Surrey Theatre, where vice, as in other playhouses, is very gently upbraided, whilst its votaries circulate, without any blushes, at the backs of the seats: all these will meet his exploring eyes in successive exhibitions. But the pen is incompetent to describe the feelings of the stranger, when, after walking or riding along the noble and wide "Surrey Road," he arrives at the foot of "Blackfriars Bridge," on the south side of the city.—All then is astonishment and enthusiasm:—the view displays itself in magnificent grandeur from Whitehall to the Tower, in an immense range of buildings and wharfs, adorned by Somerset House, the Temple Gardens, numerous extensive warehouses, the whole crowned by a forest of steeples and towers, in the centre of which the basilica of St. Paul, erected on the highest ground of the city, seems to raise the majesty of its dome above the clouds. This, perhaps, is the most interesting scene that may ever be circumscribed within the orbit of the human eye. The breadth and elegance of the bridge, the neatness of Albion and Chatham Places, the immense concourse of people, of horses, of carriages of all descriptions, must certainly fill the mind of the traveller with wonder, and make him surmise that he is on the threshold of the metropolis, not only of Great Britain, but of the whole world.

The Romans, who knew as well and perhaps (let it be said without disparagement to our modern patriots) better than we do how to fire the public mind, how to kindle the torch of enthusiasm, and bring into public and profitable action that which might have appeared to others merely private and trifling; the inhabitants of Rome, and their neighbours, made a goddess of their own city.—Indeed a form of worship was established in her honour; fanes were erected and temples dedicated to her name, not only on the banks of the Tiber, but also in conquered provinces, where, surely, the worship must have been as hypocritical as obsequious. We are not so far gone, in point of superstition, it is true; but the sacred and inextinguishable flame of our love for our city of London, the concern which her commerce, the veneration which her antiquity, inspire, will apologize for the poet who personified her in the following fragment:

— See how Augusta fits,  
 Britannia's eldest daughter, and her pride,  
 Fast by the wealthy banks of busy Thames  
 Magnificent—her temple-crowned brow  
 Elate, and half conceal'd in wond'ring clouds;  
 The bidden tributes of both hemispheres  
 Brought and unfurled at her silver feet;  
 Her feet, which, from the bosom of the main,  
 In swelling tides approaching twice a-day,  
 Old Ocean fondly kisses, and retires;  
 Whilst Industry and Trade, in sacred bands  
 United, fill her ample zone with gold,  
 And all the riches of the east and west,  
 Subservient to the brav'ry of her sons.  
 For her, proud Liban, in his scented groves,  
 Gives shelter to the silk-entombed worm,  
 And citron-forests breathe their sweets.—For her  
 Wild Africa works smooth the milk-white tusks  
 Of giant quadrupeds.—For her the canes  
 Ambrosial, press'd in fair Columbia's isles,  
 Profusely yield their nectar.—For her sake  
 The quick-ey'd Chinese plucks the emerald leaf

Of nice perfume, to grace the breakfast-board  
 In flow'ry cups his platic hands had form'd.—  
 For her the ruddy vintager has trod  
 The purple grapes whose juice high Teneriffe,  
 Or Burgundy, or Lusitania, sends,  
 Stores inexhaustible, to London marts;  
 The blessed spring of mirth, of quarrels oft;  
 Yet fraught with seeds of harmony and love.  
 By her the muses all the garlands weave  
 That genius, sciences, and wit, deserve,  
 And twist them round Augusta's lofty throne.  
 Meanwhile the Graces with her daughters play;  
 Fair Hebe knits the finews of her sons;  
 And, as a queen, she stoutly holds and wields  
 Her potent shield and sceptre o'er the world! Z.

INTROSPECTION OF LONDON.—Having been favoured with the perusal of a manuscript intended to give a complete view of the interior of the metropolis in the form of an itinerary, in order to enable every one to conceive a just and adequate idea of this immense bee-hive, we have obtained leave to extract some part of it, which may prove not only amusing, but interesting and useful, to our readers. The itinerant supposes himself at the top of Ludgate-street, ready to start for a perambulatory jaunt towards Temple Bar.

"Having carefully surveyed the whole of St. Paul's church-yard, I now stand upon the highest or nearly (if we attach any credit to the basso relievo and inscription in Panier-alley) the highest summit of the hill which gently rises on the north side of the Thames between *Walbrook* and *Fleet-ditch*, two rivulets which were originally the confined boundaries of Londinium; the first running on the east fast by the walls, the other rushing with great *fleetness*, from the western height where modern Holborn stands, down to the noble river. In this situation, looking toward the west, my view darts down to the bottom of the hill, as well, at least, as the serpentine windings of Ludgate hill and street accidentally permit. The first and most powerful impression which is then made on my mind is that numerous and clattering assemblage of carriages, chariots, chaises, hackney-coaches, stages, carts, and waggons, of all shapes, sizes, and descriptions, ascending and descending the hill, bustling and jostling against each other, struggling to pass; and flanked on both sides by a thick cloud of foot-passengers, running busily up and down on the *trottoirs* of the street, or walking leisurely and gazing at the shop-windows as they crawl along. Among these passengers I remark several who seem to have made a point of regulating their watches upon the oracular face of the metropolitan clock;—and there you will catch a most curious fund of entertainment. The clerk or stopman who has overslept himself looks up to the dial with wrinkled brows, then to his watch, and runs; the neat and correct man, who finds that his watch is right, gives but a glance, and slides along with a smile; whilst the plodding tradesman or lounging quality hardly takes notice of the finger of time. To stand a few minutes, and look at the various impressions wrought on the features of people, by the ever-moving hand of the clock, with respect to their corresponding concerns, would afford matter for a Theophrastes or a Lavater to write volumes upon.—The impatience of expectation, the impetuosity of desire, the indifference of idleness, the frown of disappointment, the smile of satisfaction, all regulated by the *silent teller* of the hours, pass so rapidly from one face to the other, that the whole scene assumes the appearance of a magic exhibition.

"The first house on the right in Ludgate-street, (anciently called *Bowyer Rowe*, says Stow, "on account of bowyers dwelling there in old time, but now worne out by mercers and others;") forming the north-west corner of the church-yard, presents the Juvenile Library, united with the Medicinal Repository, (so long known and accustomed under the name of Newbery;) a happy compound, which seems to imply at once the improving of the health

health of the mind as well as of the body. On the other side, the lively exhibition of carpets and other articles of upholstery makes a cheerful appearance; and leads the eye to the gay and elegant lottery-office a few houses below, which is set out with a great deal of taste, and consequently of expense. Nearly opposite on the right-hand, turning round by the pastry-cook's shop, opens *Ave-Maria-lane*, leading to *Warwick-lane*.—The names of this and several others about St. Paul's seem to have been adopted on account of the canons and prebendaries of the church, who most likely had their dwellings there, and recited those short prayers in their way to the church through those streets. Stow, however, starts an opinion somewhat different; for he says, speaking of *Paternoster-row*, the houses of which were first built by Henry Walleis, mayor in 1282; "This street is now called *Paternoster-rowe*, because of stationers or text-writers, that dwelled there, who wrote and sold all sorts of bookes then in use; namely, ABC, with the Paternoster, Ave, Creed, Grace, &c. There dwelled also turners of beads; and they were called *Paternoster-makers*, (the chaplet or rosary is composed of beads, upon which *Paters* and *aves* are recited,) as I read in a record of one Robert Nikke, Paternoster-maker, and citizen, in the reign of Henry IV. and so of other. At the end of this Paternoster-rowe is *Ave-Maria-lane*, so called upon the like occasion of text-writers and bead-makers then dwelling there."—*Creed-lane*, on the opposite side of Ludgate-hill, obtained its denomination from either of the causes above stated; but was previously called *Spurriers' Row*, from the number of spur-makers which were anciently the principal inhabitants of this narrow winding street. About eighteen years ago, the pavement of Great Carter-lane having been for a long period of time out of repair, Creed-lane was constantly filled with coal-waggon, drays, and other carriages, ascending from Blackfriars-bridge through St. Andrew's hill; but is now generally avoided, on account of its narrowness. A little below, on the same side of the way, may be seen the curious contrivance of the speaking-pipes, through which a constant and easy communication may be kept by words throughout all the apartments of a large house; a contrivance which at once explains the principle of the speaking figures with which the town has been occasionally amused and astonished. Opposite again, the church of St. Martin, Ludgate, makes an agreeable appearance; the steeple is of a curious form, stands on a square stone tower, and ends in a sharp spear, with a gallery at the bottom, the whole from the tower being covered with lead: over the door still remains the wingless head of a cherub, carved in stone, which retains some vestiges of good workmanship: the poor thing was clipped close about ten years since, and seems to bear on its melancholy visage marks of the sorrow occasioned by such treatment. Several most elegant shops of linen-draper, mercers, and silver-smiths, attract the attention of the itinerant on both sides of the way. Next to this church stands the London Coffee-house, one of the best of this kind, and generally frequented by the best company: the premises are most extensive, and the roof of the house stands on a level with that of St. Paul's below the dome. An archway on the other side leads to the Broadway in Blackfriars, and thence through Water-lane, or Union-street, to the bridge. This archway is called *Pilgrim-passage*; and from this point, whereabout the ancient Lud-gate stood, the view displays itself, and becomes more interesting.

"A side-glance a little lower down on the right takes in the whole of the Old Bailey, a distant view of Smithfield, the eastern part of St. Sepulchre's church, the pump, the Compter, Newgate, and the Sessions-house; but the traveller cannot help heaving a deep and melancholy sigh at the sad recollection of how many malefactors have from that quarter been "launched into eternity."

"If the traveller happens to come down the hill on a Sunday or Thursday night, or on the whole of Monday

or Friday, he will find his way considerably impeded by the rencontre of thousands of sheep and oxen going to and coming from Smithfield-market: the barking of dogs, lowing of cattle, bawling of drovers and butchers, and the screams of frightened females, will assault his ears with a most unharmonious concert; and he will hasten from a scene not only attended with danger, but also with regret at beholding so many victims doomed to bleed for our sustenance. But to this he will soon perhaps reconcile himself, when he reflects, that necessity here commands the destruction of animals for the subsistence of millions of men, whilst armies of our fellow-creatures are sacrificed to the ambition of a few.

"From these conflicting thoughts the mind will be diverted by the moving group of Cyprians who generally ply at the entrance of *Cock-court*, (exactly opposite the Old Bailey,) which leads also on the left to the Broadway, and on the right to a passage which seems to have been accidentally perforated through the ancient city-walls. The exhibition of prints and drawings at the corner window will interest the mind of the passenger, and gratify his taste.

"The same stream of elegance, richness, and splendour, which I have noticed before, runs down the hill, in the appearance of the houses, the fitting-up of the shops, and the exhibition of articles of sale. On the left side, *Dolphin-court*, leading to a public house which has borne this name for many centuries, will take you to a small lane running parallel with Ludgate-hill; and next to the court, the attention is called to the Hope Insurance-Office. A large stone figure of this second of the theological virtues; rather too short for its bulk, is placed over the main entrance, and has a good effect; her right hand points to heaven, and her left rests upon the anchor, an emblem of the business transacted in the house. Opposite is *Naked-boy-court*, the meaning of which I cannot easily ascertain or guess; unless I refer it to the unnatural act of exposing children, which, being perhaps less frequent and seen with more horror in ancient times than it is now, was deemed sufficient to stigmatize the place,

————— Where, with averted looks,  
And furtive hands, the guilty mother drops  
Th' unaction'd pledge of an illicit love,  
Her new-born, guiltless babe;—and leaves it bare  
To face the less inclement sky; till Heaven  
Sends gentle Pity down, to take it safe,  
And place it on the lap of Charity. Z.

"From this spot the view extends up to Fleet-street nearly as far as St. Dunstan's church. But, if we turn round just at this point, how grand, how majestic, is the appearance of St. Paul's on the brow of the hill! Although the fulness of the aspect is often intercepted by the elbowing and irregular south side of the hill, and the steeple of St. Martin, on the left, intersecting perpendicularly, but not precluding, the view of the splendid metropolitan Basilica; the grandeur of the edifice impresses upon the mind a strong sense of veneration and of awe.—Indeed, is there any thing equal to it? When, from their low and dirty streets, the Roman tribunes called up the attention of the deluded citizens to the venerable Capitol, had they such an object in view? St. Peter itself, the *chef d'œuvre* of Bramante, though built upon a much larger scale, yields to St. Paul's in point of situation and external appearance; and, when the silver rays of the moon, playing around the dome, dart, in a torrent of light, down the hill, and project on the greatest part of Ludgate-street the lengthened shadow of this noble edifice, the scene assumes such a solemnity, that I never can witness it without the liveliest emotions of devotion and respect.

"To return to my description; I must point out on one side at the bottom the elegant *Insurance-office* of the *Albion*, its neat and classical portico in Bridge-street, and the animated group of the far-famed knight *Monsieur St. George* slaying

*Church, from Westminster Bridge.*

slaying the dragon, spiritedly executed in stone; and facing the *Hand-in-Hand* office, a noble building erected for the same purposes on the opposite side.

"Arrived at the Obelisk, if the number of carriages, horse and foot passengers, droves of cattle, &c. and the impetuosity of the street-sweepers, allow me, I will stand a few minutes, and contemplate the noble bridge riding stately on the breadth of the river; the simple but elegant Chatham-place, with its nursery-maids and children; the Crescent; the façade of Bridewell newly repaired; and the street intersected in the middle by a long line of hackney-coaches; the whole contrasted, on the other hand, by the longitudinal view of Fleet-market, of the campanile and clock in the centre, and of the spacious wall of the prison, armed with chevaux-de-frise; and terminated, a few months ago, by the cloud-capt summit of the *Commercial Hall*, now in ashes!"

As it does not enter in our plan to follow the keen observer through all his perambulations, we must leave him here.

#### SITUATION AND EXTENT OF LONDON.

London is situated on a gentle slope on the north side of the Thames; where this grand estuary, by the diurnal oscillations of the immense body of its water, facilitates the reciprocal going up and down of the trading vessels from the wharfs to the sea, and at that precise point where the two banks of this noble stream could be first united by a bridge. Considered in the aggregate, London comprises the city and its liberties, together with the city and liberties of Westminster, the borough of Southwark on the southern bank of the river, and nearly thirty contiguous villages in Middlesex and Surry, which are now so connected with London, by an uninterrupted chain of houses and streets, that they appear to make inseparable parts of it.

The extent of London, from west to east, or from Knightbridge to Poplar, is full seven miles and a half; whilst its breadth, from north to south, or from Newington Butts to Islington, is nearly five miles. The circumference of the whole, allowing for various inequalities in the extension of streets, &c. at the extremities, cannot be less than thirty miles. Hence it may be fairly estimated, that the buildings of this metropolis cover at least eighteen square miles, or 11,520 square acres. Out of this must be deducted the space occupied by the river Thames, which extends about seven miles, or 12,320 yards, in length, by one quarter of a mile, or 400 yards, in width; making 1120 square acres.

Independently of various local and civil divisions, London may be said to consist of five distinguishing parts, or popular portions; viz. the west end of the town, the city, the east end of the town, Westminster, and the Borough. The "west end of the town," extending from Charing-Cross to Hyde-park, and from St. James's park to Paddington, is considered the best and most fashionable part; and is laid out in the two great thoroughfares, called Oxford-road and Piccadilly, with various handsome squares and streets, which are chiefly occupied by the town-houses of the nobility and gentry, and the most fashionable shops. The "city" includes the central part, and most ancient division of the metropolis. This is the emporium of commerce, trade, and business; and is occupied by shops, warehouses, public offices, and houses of tradesmen and others connected with business. The "east end of the town," and its inhabitants, are devoted to commerce, to ship-building, and to every collateral branch connected with merchandise. This division of London has assumed a novel character since the commencement of the present century, by the vast commercial docks and warehouses that have been formed and constructed here. The southern bank of the Thames, from Deptford to Lambeth, bears some resemblance to the east end of the town; being occupied by persons engaged in commercial and maritime concerns; docks, wharfs, and warehouses, being abundant. But this part

of London has one distinguishing feature from any other, as it abounds with numerous and various manufactories; iron-foundries, glass-houses, soap-boilers, dye-houses, boat-builders, shot and hat manufactories, &c. and many other similar establishments. From the great number of fires employed in these houses, and offensive effluvia arising from some of the works, this district is rendered extremely unpleasant, if not unhealthful; it is therefore mostly inhabited by workmen, labourers, and the lower classes of society. Many improvements have lately been made, and several respectable houses erected, in St. George's fields. In Westminster are the houses of lords and commons, the courts of justice, and many offices belonging to government. Another part of the metropolis, not hitherto noticed, but which may be considered as the last enlargement, and the most regular and systematic in its arrangement of squares, streets, &c. is the northern side of the town; comprehending a large mass of new buildings between Holborn and Somers-town, and in the parishes of Marybone and Paddington. The Regent's Park, a grand and most extensive conception, calculated to give a pleasing recess from business to men of trade, or a wholesome shelter to the gentry and nobility from the thicker atmosphere of the town, is now forming under the hands of the workmen, and will extend this part of London to the very foot of the well-known Primrose-hill and Hampstead. Nothing shows the increased and increasing growth of the English metropolis more decisively than the vast number of new squares, streets, rows, and places, that have been recently erected, and are now in the progress of building, all round the metropolis. London is computed to contain nearly 70 squares, and 8000 streets, lanes, rows, courts, &c. According to a census obtained in the year 1811, the population of London, Westminster, and their suburbs, was 1,099,104 persons; being an increase of 133,139 within the course of ten years. We may however assert that it is almost impossible to give a proper account of the extent of London; as every year, every month, every week, new edifices spring out of the earth as if by magic; and, from the good taste and elegance of their architecture, seem to be exotic plants transported from the gardens of Athens and Rome, and pullulating on British soil.

The lively fancy of ancient writers was curiously at work upon the general appearance of the city of London, including Westminster and the suburbs, when they conceived that it had the shape of a large fish: and, of course, the whale was the first, and the only one that could yield any thing like a simile, to depict the vast and increasing bulk of the metropolis. The winding of the river, from east to west, and by a sharp elbow from north to south, presented to their fantastic imagination, the embowed form of a large cetaceous monster laid on the strand. The head was supposed to be the city of Westminster; the mouth in St. James's park; the under jaw lying at Chelsea, the upper on the extensive streets of Marybone; the radiating eye was placed at the Seven Dials; the back at Bloomsbury-square; the indented prominences of the dorsal fin at the advancing buildings in the duke of Bedford's grounds; and the body in the city. With a modern stretch upon the same allusion, we might, and indeed ought to, place the heart at the Bank, the liver at the Stock Exchange, and the vent at the Tower. The intestines will naturally contain the whole of Wapping, and the London docks, and the tail spread itself towards the East and West India docks as far as the Isle of Dogs. Although this sort of hieroglyphical representation may at first appear caricatured, and perhaps (to some grave critics) ridiculous, yet, as it has been given out long before our era by the Londonographers, we have thought it not amiss to present an idea of it to our readers. It may, moreover, assist the memory of those who have visited London but once, and furnish those who never saw it with a topographic delineation of its tout-ensemble.

Some other authors have seen in the city of London and Westminster the shape of a laurel-leaf; and one of

them has expressed himself in the following quaint distich :  
 London is like a laurel-leaf ; may she  
 Be verdant still, and flourish like the tree.

*New View of Lond.* 1708.

This civic and patriotic wish has been accomplished in its fulness ; and, in spite of the demon of war, London will continue to flourish down to the end of time.

#### GENERAL HISTORICAL ACCOUNT.

It appears by Julius Cæsar's own words, in his Commentaries, lib. 5, that London was the *chief lieu*, or "seigneurie," of the Trinobantes ; but he does not expressly mention *London*, as he does *Lutetia*, the ancient name of Paris ; and his silence amounts nearly to a proof that he did not cross the river Thames. It appears also, that it was in the eighth year of the reign of Cassibelanus, uncle to Androgeus and Theomantius, sons of king *Lud*, that the landing of Julius Cæsar took place ; but as for the reveries of some fanciful historians, at the head of whom we may place Geoffrey of Monmouth, (who tells us a great deal about the dynasties of the British kings before the period just mentioned,) it would be loss of time to entertain our readers with them. The very names of the pretended heirs of Lud, being of Greek origin, are *prima facie* evidence against such statements. Indeed the whole of the events that took place before the second landing of the Romans under Claudius, are involved in such mists of obscurity, that the very situation of our town at that time is become little less than an insoluble problem.

By Ptolemy, and some other ancient writers of good authority, indeed, *Londinium* is placed in Cantium, or Kent, on the south side of the Thames ; and it is the opinion of some moderns, that the Romans probably had a station there, to secure their conquests on that side of the river, before they reduced the Trinobantes. The place fixed upon for this station is St. George's Fields, a large plat of ground situated between Lambeth and Southwark, where many Roman coins, bricks, and chequered pavements, have been found. Three Roman ways from Kent, Surry, and Middlesex, intersected each other in this place : this therefore is supposed to be the original *Londinium*, which it is thought became neglected after the Romans reduced the Trinobantes, and settled on the other side of the Thames ; and the name was transferred to the new city.

The situation of this city, as Mr. Pennant observes, was just such as the people would select according to the rule established among the Britons. An immense forest originally extended to the river-side, and even as late as the reign of Henry II. covered the northern neighbourhood of the city, and was filled with various species of beasts of chase. It was defended naturally by fosses ; one formed by the creek which ran along Fleet-ditch, the other afterwards known by that of Walbrook : the south side was guarded by the Thames : the north they might think sufficiently protected by the adjacent forest.

The Romans possessed themselves of London, on their second invasion in the reign of Claudius, about 105 years after their first landing under Cæsar. They had begun with Camalodunum, the present Malden in Essex ; and having taken it, planted there a colony consisting of veterans of the 14th legion. London and Verulam were next taken possession of about the same time. Camalodunum was made a *colonia*, or place governed entirely by Roman laws and customs ; Verulam (on the site of which St. Alban's now stands) a *municipium*, in which the natives were honoured with the privileges of Roman citizens, and enjoyed their own laws and constitutions ; and Londinium only a *præfectura*, the inhabitants, a mixture of Romans and Britons, being suffered to enjoy no more than the name of citizens of Rome, being governed by præfects sent annually from thence, without having either their own laws or magistrates. "It was even then of such concourse (says Mr. Pennant), and such vast trade, that the wise conquerors did not think fit to trust the in-

habitants with the same privileges as other places of which they had less reason to be jealous." But others observe ; that this is a mistake ; and that the Romans, in order to secure their conquest, and to gain the affections of those Britons who had already submitted to their authority, made London equally a municipium or free city with Verulamium.

It has been placed beyond doubt that the Phœnicians, and perhaps the Carthaginians, (and why not also the Massilienses, a colony of the Phœnicians, on the south of France, well known by the modern name of Marseilles ?) used to frequent the shores of Cornwall, whence they transported to several parts of the continent the *tin* which that country produces in abundance, a commodity so useful, and yet so scarce in other parts of the world. But it is not easy to ascertain what were the particular articles of trade between foreign nations and London at the period of the landing of Julius Cæsar. Strabo says, (lib. iv. p. 265.) Britain produceth corn, cattle, gold, silver, and iron ; besides which, skins, slaves, and dogs, (naturally excellent hunters,) are exported from that island. The two first, corn and cattle, were most probably exported from London, as well as slaves, skins, and dogs. The same author mentions also (ib. p. 309.) salt, earthen-ware, and works in brass ; polished bits of bones emulating ivory, horse-collars, toys of amber, glasses, and other articles of the same materials. But it does not appear that those traders ever went round the island at that period ; and, indeed, under the reign of Augustus, Great Britain was so little known, that it was supposed entirely separated from the continent, not by so narrow a channel as now exists between Calais and Dover, but by some larger expanse of the ocean—or else Virgil would not have said (Ecl. i. 67.)

Et penitus toto divisos orbe Britannos.

This ignorance of the Romans, or their neglect of Britain, causes a chasm in the history of London of ninety years duration. At length, in the year 43, they made a more effectual invasion in the reign of the emperor Claudius, who, in the year following, coming in person, vanquished and took Cinobellinus prisoner, in his residence of Camalodunum, or Malden, in Essex.

The first Roman historian who notices London appears to have been Tacitus, who lived some time in it, about fifty years after this invasion. He calls it *Londinium, copia negotiatorum et comæatu maxime celeberrimum* ; "London, famous for its many merchants, and the abundance of its provisions." This indicates that London was at that time of some antiquity as a trading town.

About the year 64, Suetonius Paulinus, the Roman general, being employed in the conquest of the Isle of Anglesea, in North Wales, received intelligence of the revolt of the Britons, who had flocked in great numbers from all parts to join Boadicea, queen of the Iceni, who inhabited the counties of Suffolk, Norfolk, Huntingdon, and Cambridge. He advanced with all speed to London ; but, finding himself unequal to its defence with his small army, he evacuated it to the fury of the enemy, after reinforcing his troops with all the natives who were fit to serve. The enraged Boadicea destroyed all who remained behind, without regard to age or sex, and burnt the place. Camalodunum had previously shared the same fate ; and Verulam speedily followed. In these three places seventy thousand of the inhabitants, Romans and Britons, are stated to have perished ; of which number, Mr. Maitland, on account of the great commerce of London, estimates one-half as belonging to it. In support of this opinion, he observes, "that the mighty Romans, its founders, upon their settling a colony, municipium, or emporium, brought together great numbers of their own citizens, for whom they erected houses ; and, by endowing the place with ample privileges and immunities, encouraged the natives, as well as confederate foreigners, to settle therein ; so that it is not in the least to be wondered at, especially with such an advantageous situation, that London should, in so short a space of time, become so populous."

It was not long before London recovered from this dreadful catastrophe, and increased so much, that Herodian, in his life of the emperor Severus, who reigned from 193 to 211, calls it "a great and wealthy city."

When the Romans became masters of London, they enlarged the precincts and altered their form. It extended, east and west, from Ludgate to Tower-hill; and in breadth, north and south, from the causeway near Cheapside to the river. Its northern boundary was accidentally discovered by sir Christopher Wren, in digging for the new foundation of St. Mary-le-bow, after the great fire in 1666, the steeple of which now stands upon an old Roman causeway, of four feet in thickness, formed of rough stone close and well rammed with Roman brick and rubbish at the bottom, for a foundation, and all firmly cemented. That its western extremity did not extend beyond Ludgate, may be inferred from a sepulchral monument having been dug up, about the same time, on the spot where Ludgate church is situated, of which sir Christopher Wren gives the following account: "On the west side of the causeway was situated the praetorian camp, which was also walled into Ludgate, in the vallum of which was dug up, near the gate, after the fire, a stone, with an inscription and figure of a Roman soldier; a sepulchral monument, dedicated to the memory of Vivius Mancianus, a soldier of the second legion, styled Augusta, by his wife, Januaria Matrina." This stone is still preserved at the theatre of Oxford. From this circumstance little doubt can remain with respect to the western boundary, since, by the tenth table of the Roman law, it is expressly forbidden to bury in cities, in these words, "Let no body be interred or burnt within the city;" and, it is admitted by all writers on the manners of the Romans, that this law was observed with great strictness. However we can hardly believe that the Londoners did not extend their structures down the hill to the brook which, at the bottom, ran rapidly to the river at low water, and felt the impression of the tide, when flowing as far as Holborn-bridge. Besides, although the laws of the Twelve Tables were in full force at Rome, it does not follow that they were so strictly observed in municipia and colonies; and the stone found, as stated above, might have made part of a cenotaph erected to the memory of a warrior who perhaps had been killed and buried at a great distance, or was drowned in the Thames.

It is also nearly impossible to fix the exact period when the walls were built. The Latin word *vallum*, which means merely an entrenchment barricaded with pieces of wood, a sort of strong palisades, with which the ancient Britons used to surround their strong holds, is perhaps derived from the more ancient word "wall;" and, if taken in that sense, we can easily suppose that London, or the place where it now stands, was *walled*, or entrenched, as soon as the natives chose to settle there. As for *stone-walls*, Maitland ascribes the building of them to Theodosius, governor of Britain in 369. But Dr. Woodward and Mr. Pennant, with more probability, suppose that Constantine the Great was the founder of them; and this seems to be confirmed by the number of coins of his mother Helena, which have been discovered under them, having been placed there by him in compliment to her.

From some of the coins of this emperor, it is evident that he had established a mint in London; and it is supposed by many, that he also erected it into a bishop's see, because it appears that the bishops of London and York, and another English bishop, probably of Caerleon, now Chester, were at a council held at Arles, in the year 314, against the schism of the Donatists. But there can be no doubt of its having been a bishop's see much earlier, since Camden, in treating of the division of Britain, says, "Whereas, therefore, Britaine had, in old time, three archbishops, to wit, of London, of York, and Caerleon in South Wales; I suppose that the province, which now we call of Canterbury (for thither the see of London was translated), made *Britannia Prima*; Wales, under the cite of Caerlon (Chester), was *Britannia Secunda*; and the province of York, which then reached unto the limit or bor-

ders, made *Maxima Caesariensis*." Now Lucias, on whose authority he grounds this fact, was pope in 252 and 253. It is therefore certain, that Christianity was introduced into Britain much earlier than the time of Augustine the monk, who converted the Saxons, and is said by Maitland and others to have constituted Mellitus the first bishop of the East Saxons, whose capital London at that time was, though perhaps, during the period in which the provincial Britons were overrun and almost extirpated by the Scots and Picts, it might have fallen into decay, from which it was not likely to recover, during the domination of the Saxons previous to their conversion in 600; a period of one hundred and fifty years.

We labour under the same difficulty, in endeavouring to discover at what precise time the Romans abandoned Britain, and consequently left the metropolis to its own government; but their recession seems to have happened between the year 422 and 448.

The ancient course of the wall was as follows: It began with a fort near the present site of the Tower; was continued along the Minories and the back of Houndsditch, across Bishopsgate-street, in a straight line by the street now called London-wall, to Cripplegate; then returned southward by Crowder's-Well Alley, (where several remnants of lofty towers were lately to be seen,) to Aldergate; thence along the back of Bull-and-Mouth street to Newgate, and again along the back of the houses in the Old Bailey to Ludgate; soon after which it probably finished with another fort, where the house, late the king's printing house, in Black Friars, now stands; from hence another wall ran near the river-side, along Thames-street, quite to the fort on the eastern extremity. The walls were three miles a hundred and sixty-five feet in circumference, guarded at proper distances on the land side with fifteen lofty towers; some of them were remaining within these few years. Maitland mentions one twenty-six feet high, near Gravel-lane, on the west side of Houndsditch; another, about eighty paces south-east towards Aldgate; and the bases of another, supporting a modern house, at the lower end of the street called the Vinegar-yard, south of Aldgate. The walls, when perfect, are supposed to have been twenty-two feet high, the towers forty. These, with the remnants of the wall, proved the Roman structure, by the tiles and disposition of the masonry. London-wall, near Moorfields, is now the most entire part left of that ancient precinct. And, on a small passage, leading from the Broadway, Blackfriars, to Bridge-street, there is at this moment a most venerable specimen of this ancient manner of building. It is a curious remnant, in which one may easily observe that the cement which was employed to bind the stones, has, by length of time and the nature of its intrinsic composition, acquired a greater degree of hardness than the very stones it was intended to unite together.

The gates, which received the great military roads, were four. The Praetorian Way, the Saxon *Walling-street*, passed under one, on the site of the late Newgate; vestiges having been discovered of the road in digging above Holborn-bridge; it turned down to Dowgate, or more properly *Dow-gate*, or *Water-gate*, where there was a *trajectus*, or ferry, to join it to the Walling-street, which was continued to Dover. The Hermin-street passed under Cripplegate; and a vicinal way went under Aldgate by Bethnal-green, towards Old Ford, a pass over the river Lee to Duroleiton, the modern Layton in Essex.

The influx of northern nations in Italy having forced the Romans to leave Britain, the Saxons, under their leaders Hengist and Horsa, landed in 448, having been invited over by the natives, as auxiliaries, to defend them against the Scots and Picts. They were received as friends; but, says Bede, "they minded to destroy the country as enemies; for, after they had driven out the Scots and Picts, they also drove the Britains, some over the seas, some into the waste mountains of Wales and Cornwall, and divided the country into divers kingdoms among themselves." *Stow's Survey*. 1633.

London fell into the hands of these invaders about the  
year

year 457; and became the chief city of the Saxon-kingdom in Essex. It suffered much in the wars carried on between the Britons and Saxons; but it soon recovered; so that Bede calls it a *princely mart-town*, under the government of a chief magistrate, whose title of *portgrave*, or *portreeve*, (for we find him called by both names,) conveys a grand idea of the mercantile state of London in these early ages, that required a governor or guardian of the port.

On the conversion of a considerable number of the Saxons to Christianity, Augustine, the monk, by order of pope Gregory, was ordained archbishop of England, in the year 600, by Etherius archbishop of Arles in France; he ordained Mellitus bishop of the East Saxons, who, in 610, had a cathedral church, dedicated to St. Paul, erected for him in London, the capital of East Saxony, by Ethelbert king of Kent. At this time the city of Canterbury, as being the residence of Ethelbert, to whom all the southern nations of the Saxons were vassals, appears to have been dignified with the title of the metropolis.

In the year 605, or, according to other authors, in 610, Sebert, king of the East Saxons, built a church or minister in the island of Thorney, situated to the west of London, which, at the desire of bishop Mellitus, was dedicated to St. Peter; but, according to Stow, it was founded in 614, by Mellitus, with the assistance of king Ethelbert. It was, however, destroyed soon after by the Danes.

Sebert was succeeded by his three sons, Sexred, Seward, and Sigbert, who, during the life of their father, professed themselves Christians; but, after his death, which happened about 616, they publicly returned to paganism, and expelled Mellitus their dominions; and, though the conversion of Eadbald king of Kent, their sovereign, obtained that good bishop's recall to his see, the Londoners, who chose to live in their pagan superstition, would not admit him.

During the heptarchy, the civil history of this country is so very defective, that no mention of the city of London is made from the year 616 to 764, a chasm of nearly a century and an half; but, the history of the church being recorded by the monks, who, in those ages of darkness, were the only men who could write or read, we are enabled to supply the defect, and fill these *lacunæ*.

After the expulsion of Mellitus, the see of London remained without a bishop till the year 653, when, Sigbert king of the East Saxons embracing the Christian religion, Cedda, or Chad, was advanced to the bishopric of this city. In 666, Wulpher, who acted as he pleased in the kingdom of Essex, gave the first instance of simony in England, by selling the bishopric of London to Wina, who had been driven from Winchester. He governed the church of Essex till his death, in 675. After the decease of Wina, the bishopric of this city was given to Erkenwald, son of Offa, king of the East Angles, who had been educated under Mellitus, the first bishop of London. Erkenwald was so distinguished by the sanctity of his life, and by several religious foundations, that, after his death, which happened at Barking, in Essex, the canons of St. Paul's and the monks of Chertsey, or, according to Rapin, of Barking, disputed the possession of his body; but the inhabitants of London, espousing the side of the canons, took away the remains of the bishop, and caused them to be honourably interred in his own cathedral, the revenues of which he had augmented, and enlarged its buildings. Erkenwald was succeeded by Walter, or Waldhere, in the reign of king Sebbi, who, being wearied with the cares of a crown, acquainted the bishop with his resolution to abdicate, and to assume the monastic life; he accordingly passed through the forms of a recluse; and, having received the habit from Waldhere, he gave that ecclesiastic a considerable sum of money, to be applied to the purposes of charity, and continued the monastic life to his death.

In the year 764 London suffered very considerably by fire; some time after which, in 798, it was almost wholly burnt down; and, the streets being very narrow, and the houses built of wood, numbers of its inhabitants perished

in the flames; nor was it rebuilt before many of the new houses were destroyed by a third conflagration, which happened in 801.

During the civil wars of the Saxons with each other, the Londoners had always the address to keep themselves neuter; and, about the year 819, when the seven Saxon kingdoms fell under the power of Egbert, London appears to have become the metropolis of England, which it has ever since continued; but Mr. Pennant says that it was made the capital of all England by Alfred.

In the year 833, Egbert king of the West Saxons, Ethelwulf his son, Witlaf king of Mercia, together with most of the bishops, and other great men of the realm, assembled at London, where they held a *witenagemot*, or parliament, in which they deliberated on the most effectual measures to be pursued, to prevent the invasions of the piratical Danes. Notwithstanding all their precautions, it was not long before London severely felt the effects of Danish cruelty; for, arriving with a large fleet of ships on the coast of Kent, they landed, and, having destroyed Rochester and Canterbury, they marched to this city, which they sacked, and, with a horrid rage of barbarity, murdered most of its inhabitants. This happened in the year 839. Flushed with the success of this and several other attempts, the Danes entertained serious thoughts of making a complete conquest of the whole island. With this view, they, in 851, shipped a large army on-board a fleet of three hundred and fifty sail; landed near London, which they soon reduced and plundered; and, thinking it a proper fortress from which they might make incursions into the kingdom of the West Saxons, they placed a large garrison therein; and, notwithstanding the most solemn oaths and treaties with king Alfred, they made perpetual inroads among the neighbouring states, which they robbed and harassed with the most unrelenting rage of diabolical fury.

There is not any certainty respecting the time or cause of the separation of London from the kingdom of Essex. Rapin notices, that in 872 it was in subjection to Mercia, where it has continued ever since, as part of Middlesex.

In 879, the Danes, notwithstanding they had concluded a peace with Alfred, made preparations for further inroads; to accomplish which, a Danish fleet came up the Thames, under one Hæsten, and wintered at Fulham; but, being disappointed of the assistance they expected, they returned in the following spring. Alfred, resolved to punish these infractors of the most solemn treaties, repaired all his old fortresses, erected new ones, and, in 884, laying siege to London, attacked that city with so much bravery, that the Danes were glad to capitulate, after a very faint resistance.

As soon as Alfred had thus possessed himself of London, he began to rebuild its walls, towers, and gates, which had been almost destroyed by the Danes; and, having driven out the Danish inhabitants who had settled there, he bestowed the government of the city on Ethelred duke of Mercia, who had married his daughter Ethelfleda, in hopes that it would afford him a secure retreat against both his foreign and domestic enemies. It appears that Ethelred was vested with powers superior to those of an ordinary governor; and it is probable that he held this city *in fee*, because, on his decease, Ethelfleda delivered it, with the city of Oxford, up to her brother, which, if her husband had been only an ordinary governor, she need not have done, since they would of course have fallen to her brother Edward, as heir to his father Alfred.

The ambition of conquering this kingdom still predominating in the breasts of the Danes, they were perpetually hovering about the coast of England; and at length, under the conduct of their general, Hæsten, landed in considerable numbers on the coast of Essex, a little below Tilbury; and, having erected a fort or castle at Beamfleete, now Southbemfleete, near the Isle of Canvey, they made perpetual excursions into the adjacent country, committing

ting great depredations wherever they went. Hereupon Alfred dispatched Ethelred, the governor of London, with a number of regular troops, which, being joined by a large body of the citizens, drove the ravaging Danes back to the castle, to which they laid siege, and took it and a very rich booty, at the same time taking prisoners the wife and sons of the Danish general Hæsten, whom they conducted to London. On this occasion the citizens distinguished themselves in such a manner as evinced at once their great courage and loyalty.

This part of the history of our celebrated metropolis being little known, on account of the causes stated before, we have been more prolix perhaps than other publications of the same kind; but, when we consider the interest which every one feels for ancient records concerning the origin of places, and the events locally connected with them, we are sure to have acquitted ourselves of a pleasing duty.

About the year 886, it appears that Alfred, having completely expugned the Danes, and forced them to retreat, caused many ships to be built, and let them, and money also, out to merchants, who traded to the East Indies, and brought from thence precious stones, &c. some of which remain still in the most ancient crown wherewith Alfred and his successors were wont to be crowned. But this traffic, says Rapin, could be no farther than the Levant; in which it is more than probable he judges right. Others say, that those ships sailed to Alexandria, and from thence their people, passing over the Isthmus, went down the Red Sea, to the coasts of Persia, &c. and this opinion seems to be countenanced by what William of Malmesbury relates of Sighelm bishop of Sherborn, who, being sent by Alfred to Rome with presents for the pope, afterwards travelled as far as the town of St. Thomas, in India, now called Meliapour, with gifts for the Christians there from that king, to whom he brought precious stones and spices; some of which remained in the cathedral church of Sherborne in Dorsetshire at the time in which he wrote.

Thus in the reign of Alfred, London began to recover from its ruinous state. In 893, however, he had the mortification to see his capital reduced to ashes by an accidental fire, which, from the houses being at that time built of wood, could not be extinguished; but the walls, being constructed of incombustible materials, withstood the destructive element. In the same year the Danes made another attempt upon London, by sending one division of their fleet up the Thames, while a descent was made in Kent by another; but, Alfred having built vessels longer, and higher out of the water, than those of the Danes, some of which had forty oars, and a kind of half-deck, they were discomfited, and compelled to retire.

At this time the city appears to have received for the first time a form of government for the better protection of the citizens, and the execution of the social laws, which, as the town increased, it became more necessary to enforce. According to several ancient chroniclers, Alfred instituted the important office of sheriff, or, as it was called in the Saxon language, *shire-reeve*; but there is no record remaining by which this fact can be ascertained with regard to the sheriff of London. It was also about this period that the inhabitants, having considerably suffered by fire, on account of the combustible materials of which their houses were composed, and being incited by the example of their king, Alfred, who had built several palaces of brick and stone, began to admit these more solid materials into the composition of their mansions.

King Ethelred, who began his reign in 979, and died in 1016, made laws, at Wantage, for the regulation of the customs on ships and merchandise, to be paid at *Blynesgate*, or *Billinggate*, in the port of London, then the only quay. They were as follows:

1. A small vessel arriving there was to pay one half-penny for toll.

2. If a greater one, bearing sails, one penny.

3. For a keele, or hulk, being a long and large capacious sort of a vessel, four pence.

4. Out of a ship laden with wood, one piece for toll.

5. A boat with fish, one halfpenny; and a bigger boat, one penny.

6. Those of Rouen, in Normandy, that came with wine, or *grampois*, (large pease,) and those of Flanders and Ponthieu, and others from Normandy and France, were wont to open their wares, and free them from toll; (i. e. I suppose, to pay toll.) Such traders as came from Liege and other places, travelling by land, opened their wares, and paid toll. The emperor's men, (i. e. Germans of the Steel-yard,) coming with their ships, were accounted worthy of good laws, and might buy in their ships; but it was not lawful for them to foretell the markets from the burghers of London. They were to pay toll, and, at Christmas, two grey cloths, and one brown one; with ten pounds of pepper, five pair of gloves, and two vessels of vinegar; and as many at Easter.

7. Bread to pay toll thrice a-week, viz. Sunday, Tuesday, and Thursday. Each pannier with hens to pay one hen for toll.

8. Butter and cheese traded in fourteen days before Christmas, one penny for toll, and another penny seven days after Christmas." *Howell's Hist. of the World.*

As the German merchants of the Steel-yard in London were very early settled there as a commercial society, it seems at least probable, that the tolls here named to be paid by the *emperor's men*, as they are called, at the two most solemn festivals, point that society out to us. For it must be meant of persons constantly or usually residing in London; and there never was any other society of German merchants resident in London, but those of the Steel-yard society. Fitzstephen, a monk of Canterbury, who wrote in the time of king Stephen, says, that merchants of all nations had, in his time, their distinct quays and wharfs in London. The Dutch had the Steel-yard; the French, for their wines, the Vintry, &c.

In 982, the Danes laid siege to London, and greatly damaged it, but could not make themselves masters of it. There were at this time but few houses within the walls of London, and those were scattered about in a very irregular manner: the greater number of buildings being to the west of Ludgate.

In the year 992, the Danes returned again to the coast of England; upon which king Ethelred, to hinder their landing, fitted out a very large fleet in the port of London, the command of which he gave to the ealdermen Thorod and Ealfric, and to the bishops Efstane and Ecurige. The English fleet coming up with that of the Danes, the traitor Ealfric, on the evening of the intended engagement, deserted with his ship to the enemy; but, as soon as this was known, a signal was made to pursue, and the English, coming up with the rear of the Danes, took one of their ships; and, a squadron of the Londoners falling in with one of the enemy's squadrons, a desperate engagement ensued, in which several thousands lost their lives, and the treacherous Ealfric narrowly escaped being taken.

In the year 994, Anlaf and Sweyn, kings of Norway and Denmark, attacked London with a fleet of ninety-four ships; but the valiant citizens gave them so warm a reception, that they were glad to raise the siege; but, full of revenge for the loss they had sustained, they committed the most dreadful outrages in Middlesex, Essex, Suffex, Kent, and Hampshire, murdering all that fell in their way, and burning their habitations to the ground.

The Danes, in the year 1009, having made an incursion as far as Oxford, burnt that city, and in their return committed the most shocking devastations on each side of the river Thames; but, being informed that an army of Londoners was marching to attack them, those on the north side of the Thames crossed over to Staines, and, both parties being united, they hastened through the county of Surry to their ships on the coast of Kent; and, having

refitted their vessels, they wintered in the Thames, and made frequent attacks on the city of London, but were constantly repulsed by the valour and military skill of the citizens.

But the tranquillity which their bravery had obtained for the city did not last long. In the year 1015, Canute king of Denmark, having invaded and plundered the counties of Dorset, Somerset, and Wilts, sailed up the Thames with two hundred ships, and laid siege to the city. The citizens continued faithful, notwithstanding the defection of the greatest part of the kingdom; and made such a brave resistance, that Canute thought fit to withdraw his army, leaving only his fleet to blockade the city by water, that, when he found a fair opportunity, he might renew the siege with better success. At last, however, being defeated in several battles by Edmund Ironside, he was obliged to call off his ships to cover his own army in case of necessity. In the compromise, however, which was afterwards made between Edmund and Canute, the city of London was given to the latter, and owned him for its lawful sovereign. We have a strong proof of the opulence of London even at this time, from the tax laid upon it by Canute in order to pay his army; this being no less than 10,500*l.* while the rest of the nation was at the same time taxed only at 72,000*l.*

Under the reign of Canute, a cut or canal was caused to be dug up on the south side of the river, of a depth and breadth sufficient to admit his ships to pass to the west side of the bridge. Authors are not agreed as to the extent of this canal. It is allowed on all hands that it began at Rotherhithe, or Redriff; but some fix its western extremity at the lower end of Chelsea Reach, while others assert that it returned into the Thames at St. Saviour's Dock. Mr. Pennant, whose discernment is well known, says, "Evidences of this great work were found in the place called the Dock-head at Redriff, where it began. Fascines of hazels, and other brush-wood, fastened down with stakes, were discovered in digging that dock in 1694; and in other parts of its course have been met with, in ditching, large oaken planks, and numbers of piles."

If Maitland is correct in describing the other parts of its course, it must have had a very circuitous and apparently unnecessary extension. He says, "Its outflux from the river Thames was where the great wet dock below Rotherhithe is situate; whence, running due west by the Seven Houses in Rotherhithe-fields, it continues its course by a gentle winding to the drain-windmill; and, with a west-north-west course, passing St. Thomas of Watering's, by an easy turning it crosses the Deptford-road a little to the southward of the Lock Hospital, at the lower end of Kent-street; and, proceeding to Newington Butts, intersects the road a little south of the turnpike; whence continuing its course by the Black Prince, in Lambeth-road, on the north of Kennington, it runs west and by south through the Spring-garden at Vauxhall, to its influx into the Thames, at the lower end of Chelsea Reach."

The first instance on record of the Londoners sending representatives to a parliament, or meeting of the great men of the nation, (for the term *parliament* does not occur, according to sir Robert Cotton's opinion, before the sixth year of king John,) happened in the year 1036, in settling the important and difficult succession to the throne after Canute's death. The English, in general, declared for Edward, son of Ethelred; or, if that could not be carried, for Hardicanute, son of Canute by queen Emma, and then absent in Denmark. The city of London espoused the interest of Harold Harefoot, also son of Canute, by queen Elgiva of Northampton. Edward's party soon declined; and the Londoners agreed, for the peace of the realm, that the two brothers should divide the kingdom between them; but, as Hardicanute did not return in time to England, a wittenagemote was held at Oxford, where earl Leofric, and most of the thanes on the north side of the Thames, with the *lidromen* of London, chose Harold for their king. Here, by *lidromen*, we must un-

derstand the directors, magistrates, or *leader-men*, of the city, and not the *mariners*, as it is rendered by the translator of the Annals; and this manifestly shows, that London was then of such consequence, that no important national business was transacted without the consent of its inhabitants; for in this case the Saxon Annals assure us, that "none were admitted into the assembly of election but the nobility, and the *lidromen* of London."

In 1041, prince Edward, afterwards surnamed the Confessor, was recalled from Normandy, to succeed Hardicanute, whose cruelty and inhumanity towards the remains of his brother Harold had entirely disgusted the citizens of London; and he was chosen king of England, in this metropolis, by the general and universal voice of the nation. Thus the Saxon line was restored to the British throne. It will be seen in the course of this article that the rebuilding of Westminster-abbey was among the last acts of his reign.

Floating upon the stream of time, that runs from us at every instant, ancient events recede from our sight, and, becoming less distinct, are consequently less easy to be ascertained; but, when we get hold of written records, then we stop the flight of time in a certain degree, and feel more steady on the ground we have to walk upon. The conquest of Great Britain by the Normans under the direction and command of their duke William, is one of those epochs, which in the history of our nation seem to take the lead; it is a sort of point d'appuy, or *fulcrum*, upon which the rest of our national events seem to lean, and a kind of new era, which throws light on the way of historiographers and antiquaries.

The Conqueror's pretensions to the crown of England, and his success in supporting them, are fully detailed in another part of this work. (See the article ENGLAND, vol. vi. p. 557.) It is therefore sufficient in this place to observe, that, on the death of Edward the Confessor, which happened in January 1066, Harold, son of earl Godwin, took possession of the throne; but lost it and his life in the battle that gave William the crown.

At this period, Edward and Morcar, who had escaped from the field of battle, proposed to the Londoners to place the crown upon the head of Edgar Atheling, as the most effectual method of saving the kingdom from falling a prey to the Norman conqueror. This proposal was adopted by the majority, and it was determined to defend the city against the duke of Normandy. William had, however, marched to prevent them from putting their design in execution; and was actually arrived in Southwark, when the Londoners sallied out upon him, and fought so resolutely, that, though they were repulsed by five hundred of the Norman horse, yet William was convinced that they would not be easily frightened into a submission. Thinking, therefore, that the winter season, which was now advanced, was an improper time to besiege a place of so much importance, he laid Southwark in ashes, and marched to reduce the western counties, having first prevailed on the clergy to espouse his cause, and to endeavour to engage the people in his interest. This scheme of William is a proof of his adroitness in managing his affairs; for indeed the influence of the clergy was so great, so powerful on the mind of the people, that they soon prevailed on the citizens to submit to the conqueror.

As soon as this defection was known to Edwin and Morcar, those noblemen consulted their own safety by retiring into the north of England; while the successful William began his march towards this city, into which he was received by the magistrates and principal citizens, who delivered to him the keys of the city-gates, acknowledged him their sovereign, and, in conjunction with the nobility and gentry, entreated his acceptance of the crown. The example of the capital was followed by the rest of the kingdom, so that in a short time William was in peaceable possession of the throne. Preparations were now made for the coronation of the new king, which was solemnized

temnized in Westminster-abbey, on Christmas-day, in the year 1066, by Aldred, archbishop of York. Having thus gained possession of London, he caused a strong fortress to be built, which he garrisoned with his best troops, in order to secure it and overawe the citizens; yet, when he made his public entry into the city soon after, he was received with the greatest acclamations and external signs of joy.

The conqueror soon after set out to visit his Norman dominions; and at his return from thence, in the second year of his reign, was received into London with a solemn procession; in return for which, and at the intercession of William (the Norman) bishop of London, he granted a charter to the citizens in their own language; a mighty favour at that time, when the French tongue began to prevail over all. This charter consists of four lines and a quarter, beautifully written in the Saxon character, on a slip of parchment of the length of six inches, and breadth of one, which is preserved in the city-archives as a very great curiosity. The seal is of white wax; and, being broken into divers pieces, they are sewed up and carefully preserved in an orange-coloured silken bag. On one side is the conqueror on horseback; and, on the reverse, he is sitting in a chair of state; the rim of the seal being almost gone, the only letters remaining are, M. WILL. But the writing of the charter being very fair, the following is an exact copy of it, as printed in Stow's Survey.

"William King greeteth William Bishop and Godfrey Portgrave and all the Burgesses within London, French and English: and I grant that they bee all their law worth, that they were in Edwardis dayes the King; and I will that each child bee his father's heire; and I will not suffer that any man doe you wrong. And God you keepe."

Some time after, the conqueror granted to the citizens of London another charter in the Saxon language, consisting of three lines finely written on a slip of parchment, of the length of six inches and a half, and breadth of three quarters of an inch, which is carefully preserved in the same round wooden box with the first charter above specified. The small seal of this charter is of white wax, like the former; but, being broken into divers pieces, they are sewed up and preserved in a silken bag. It is so much defaced, that all that can be made of the impression it bore, is something resembling a gate with some steeples or spires. However, the writing of the charter is very fair, and the contents as follow: "William the King greets William the Bishop, and Swegen the Sheriff, and all my Thanes (or Nobles) in East Saxony; whom I hereby acquaint, that, pursuant to an Agreement, I have granted to the People my Servants the Hide of Land at Gyddedune. And also, that I will not suffer either the French or the English to hurt them in any Thing."—It seems that, by the words "the people my servants," we are to understand the Londoners, who keep this deed, and got possession of the land at Gyddedune, or Godsdan, in Hertfordshire, by virtue thereof; though it is a most notorious example of the inadvertency of those days, to make a grant to any people, without a particular specification of their capacity and name; or so much as the date of the year, or of the king's reign, in either of these charters.

As a curious part of the ecclesiastical history of London answering exactly to this period of time, we must state, that in the year of our Lord 1075 there was a national council of bishops and abbots, where many other of the clergy were present, convened at London; in which was regulated the precedency of episcopal sees; and it was ordained, that every prelate should rank according to the priority of his consecration, excepting those, who, by ancient custom, had particular privileges annexed to their sees; and that the archbishop of York should be seated at the right hand of the archbishop of Canterbury; the bishop of London at his left; and the bishop of Winchester next to the archbishop of York. It was further ordained, that no bishop's sees should for the future be placed in villages or small towns, And accordingly, Her-

man, bishop of Shereburn, was ordered to remove his chair to Salisbury; Stigand to remove from Selsey to Chichester; and Peter of Lichfield to Chester. And it was further ordained, that no person, under the dignity of a bishop and abbot, should speak in the council, without leave from the metropolitan.

In the same year, the king promoted Hugo de Orivalle to the see of London, who had the reputation of a person of great abilities. For which reason, the conqueror joined him in commission with Aldred archbishop of York; who, with the assistance of twelve of the most sufficient and best-qualified in each county, were ordered to make search for a body of the old laws of England, called the Laws of St. Edward the Confessor. These two were appointed to receive the report of the twelve men in each county, and to set down in writing what they should deliver upon oath.

The Londoners held their deceased bishop, William, in such esteem, for the favours he did for them with the king, amongst which was their charter, procured by his interest at court, that they instituted an anniversary solemnity to his memory; for, being sumptuously entombed in St. Paul's cathedral, the magistrates of London used to go in procession to his tomb once a-year. From this ancient religious custom originates, perhaps, the several visits which the lord mayor, the sheriffs, and the court of aldermen, make yearly to the same church.

In the year 1077 happened the greatest casual fire, that till this time ever beset the city; whereby the major part of it was laid in ashes. About two years after, the conqueror caused the present great white square Tower of London to be erected (in the place where it is supposed he built his fort above-mentioned), for the more effectually keeping the citizens in obedience, whose fidelity at this time, it seems, he had some reason to suspect. The surveyor of the work was Gundulph bishop of Rochester; which effectually destroys the idle and absurd story of Fitzstephen the monk, who reports it to have been erected by Julius Cæsar.

In 1086, another very dreadful fire happened, which began at Ludgate, and consumed the greatest and best part of the city, with the cathedral of St. Paul; which, however, was soon rebuilt more magnificently than before.

In the reign of William Rufus also, London suffered considerably by fires, inundations, and hurricanes; and seems to have been greatly depressed by the tyranny of that prince. It is asserted by William of Malmesbury, that, having received very rich presents from the Jews of this city, who were brought from Rouen by his father, and settled in the place to this day called the Old Jewry; he was so transported with joy, as to encourage them to dispute with the Christians concerning their respective faiths; assuring them, that, if they obtained the victory, he would himself become one of their religion; but history does not inform us whether the debate was ever held.

All the historiographers of London agree, that a violent tempest happened in November of the year 1091, in which many churches, and upwards of six hundred houses, were blown down, and the Tower much damaged; but the most extraordinary circumstance is, that four of the rafters of the roof of the church of St. Mary-le-Bow, which was blown off, were pitched so deep into the ground of the street, that, although they were twenty-six feet in length, scarcely four feet remained above ground; "for," says James Howell, in particular, "the city of London was not paved, but a moorish ground." This inelegance was not peculiar to London in those times, but was common to many cities in foreign countries. A considerable part of this city was again destroyed by fire, in the year 1093, and this calamity was succeeded by a great scarcity of corn, and almost all the necessaries of life.

In the year 1097, William Rufus imposed grievous taxes on his subjects throughout the kingdom, to defray the charges of rebuilding London-bridge (which had carried away by a flood), of erecting a strong wall round the Tower of London, and building Westminster-hall

as it now stands. In the year 1099, the river Thames, by an extraordinary swelling of the sea, was driven westward with such violence, that it overflowed its banks in many places, by which several towns and villages were laid under water, many of the inhabitants were drowned, and the large estate of Godwin earl of Kent was encroached on by the sea, so that it could never afterwards be drained, but forms what is called, to this day, the Godwin Sands.

Since nothing can be more interesting to the citizens of any part of this kingdom, than to see the origin of their privileges, and the grounds upon which the monuments of their liberties were erected, the following charter granted by Henry I. to the Londoners ought to obtain a place here; it was given for the purpose of obtaining the assistance of the citizens of London to secure Henry upon the throne, of which he had unjustly deprived his eldest brother Robert; and consequently it was made peculiarly beneficial to them. The following is a faithful translation of it.

“Henry, by the grace of God, king of England, to the bishop of Canterbury, and to the bishops and abbots, earls and barons, justices and sheriffs, and to all his faithful subjects of England, French and English, greeting. Know ye, that I have granted to my citizens of London, to hold Middlesex to farm for three hundred pounds, upon account to them and their heirs; so that the said citizens shall place as sheriff whom they will of themselves; and shall place whomsoever, or such a one, as they will of themselves, for keeping of the pleas of the crown, and of the pleading of the same, and none others shall be justice over the same men of London; and the citizens of London shall not plead without the walls of London for any plea. And be they free from scot and lot, and daneguilt, and of all murder; and none of them shall wage battle. And if any of the citizens shall be impeached concerning the pleas of the crown, the man of London shall discharge himself by his oath, which shall be adjudged within the city; and none shall lodge within the walls, neither of my household nor any other, nor lodging delivered by force.

“And all the men of London shall be quit and free, and all their goods throughout England and the ports of the sea, of and from all toll, and passage, and lestage, and all other customs; and the churches, and barons, [i. e. freemen,] and citizens, shall and may peaceably and quietly have and hold their sokes with all their customs; so that the strangers that shall be lodged in the sokes, shall give custom to none but to him to whom the soke appertains, or to his officer, whom he shall there put. And a man of London shall not be adjudged in amerancements of money, but of one hundred shillings; (I speak of the pleas which appertain to money.) And further, there shall be no more mikkenning in the hustings, nor in the folkmote, nor in any other pleas within the city; and the hustings may sit once in a week, that is to say, on Monday. And I will cause my citizens to have their lands, promises, bonds, and debts, within the city and without; and I will do them right by the law of the city, of the lands of which they shall complain to me. And if any shall take toll or custom of any citizen of London, the citizens of London in the city shall take of the borough or town, where toll or custom was so taken, so much as the man of London gave for toll, and as he received damage thereby. And all debtors which do owe debts to the citizens of London, shall pay them in London, or else discharge themselves in London that they owe none; but, if they will not pay the same, neither come to clear themselves that they owe none, the citizens of London, to whom the debts shall be due, may take their goods in the city of London, of the borough or town, or of the county, wherein he remains who shall owe the debt. And the citizens of London may have their chaces to hunt, as well and fully as their ancestors have had; that is to say, in the

Chiltre, [a district near St. Alban's,] and in Middlesex and Surrey.

“Witness the bishop of Winchester, and Robert son of Richard, and Hugh Piggot, and Almer of Totnes, and William of Albs-prina, and Hubert Roger, chamberlain, and William de Mountfitchett, and Hangul Taney, and John Ballet, and Robert son of Steward of West.”

Before the grant of this charter, London seems to have been entirely subject to the arbitrary will of the king. But, their liberties being now guarded by so strong a fence, the citizens endeavoured to secure their customs, by converting them into written laws; and their arts and mysteries, which had hitherto been kept up by prescription only, were now strengthened by established fraternities and companies. However, the king reserved to himself the power of appointing the *portreeve*, or chief officer of this city.

It was probably about the close of the last or the beginning of this century, that merchant-guilds, or fraternities, which were afterwards filed *corporations*, came first into general use in many parts of Europe. Mr. Madox thinks, that “they were hardly known to our Saxon progenitors, and that they might probably be brought into England by the Normans; although they do not seem to have been very numerous in France in those days.” And in cap. x. sect. 20, he relates, “that the weavers and bakers were the two most ancient fellowships, or guilds, in London;” which is natural enough, since food and clothing are most immediately necessary to mankind. “In king Henry I's reign, between 1100 and 1135, the weavers of London rendered to the crown a rent, or *ferme* as it is called in the file of the Exchequer, for their guild; and had, in after times, great disputes with the city of London concerning their high immunities and privileges.”

In a council, which was held at Westminster, in the year 1126, by the pope's legate, cardinal de Crema, usury was prohibited to the clergy, who, if they practised it, were to be degraded; but it is to be understood that the term *usury*, as it was at that time applied, meant only interest, or *use*, for money in general, and not exorbitant or extravagant interest, which it now implies.

During this reign, the monstrous licentiousness of the Normans, which, from the protection afforded them by the two Williams, had attained a dangerous height, was put a stop to by a proclamation, published at London, commanding that thenceforward, all who should be convicted of such excesses should have their eyes pulled out, or their hands or feet cut off, as the ministers of justice should think fit. This effectually checked the insolence of the Normans.

About this time a spirit of devotion began to manifest itself in religious foundations in and about London. In the year 1081, Alwin Child, citizen of London, founded at Bermondsey a monastery for the monks of the congregation called *Cluny*, from the *chief lieu* in France. In 1090, Alfune built the church of St. Giles, near Cripplegate. In 1102, Rahere, the king's minstrel, founded the priory of St. Bartholomew, and the hospital annexed to it; among the privileges he obtained for it, is mentioned Bartholomew fair for three days; and indeed most of the religious houses which existed at the reformation under Henry VIII. had their origin about this period of our history. But, if on one hand the rage for building and endowing pious edifices multiplied so considerably their number in the metropolis, on another hand the dissolution of manners and habits had come to its greatest height; for about this and the following reigns the Londoners were arrived at such a pitch of licentiousness, that their prosperity seemed a curse rather than a blessing. The sons of the most eminent and wealthy citizens entered into confederacies to commit burglaries, and to rob and murder all that came in their way in the night-time. The king took an opportunity from these irregularities to enrich himself. He demanded several loans and free gifts; till

till at last the Londoners, to prevent further inquiries into their conduct, paid into the exchequer 5000*l.* in three years. These disorders, however, were at last stopped by the execution of John Senex; who, though a very rich and reputable citizen, had engaged in these enterprizes. He offered 500 pounds weight of silver, a prodigious sum in those days, for his pardon, but was refused. The king, however, still continued to drain the citizens of their money by *free gifts*; and at last fined every separate guild, fraternity, or company, that had presumed to act as bodies corporate without the royal letters-patent.

It cannot be denied that London suffered greatly during the civil wars; and, besides, from a most terrible casual fire, which broke out near London-bridge, destroyed it, and raged in the most horrible manner, as far westward as St. Clement Danes. They had also to bear patiently the revenge of Matilda, till they received her into their city with great pomp and solemnity; but, forgetting soon their submission and forbearance, she treated them with the utmost arrogance and severity. However, that spirit of freedom, and impatience of unjust means, which animated them, and glows still in the breast of the citizens of London, obliged her to leave the city privately, and to seek for refuge out of the kingdom.

Gold and silver, and even brass and copper, must have been uncommonly scarce under these reigns; for we read, that, in the year 1145, the price of an ox in London was three shillings; as much corn was sold for one shilling as would suffice 100 people for a day; a sheep could be bought for a groat; and a like sum would fill the manger of twenty horses with corn and hay for twenty-four hours. In the 30th year of Henry II. thirty-three cows and two bulls were sold for 8*l.* 7*s.* and 500 sheep cost but 22*l.* 10*s.* or about 10*d.* per sheep.

On the death of Henry II. the title of the first magistrate of London was changed from *portreve* to that of *bailliff*; and in 1189 he claimed and acted in the office of *chief butler* at the coronation of Richard I. In 1191 this monarch permitted the bailliff, named *Henry Fitz-Alwine*, to assume the title of *mayor*. In 1192, we find certain orders of the mayor and aldermen to prevent fires; whereby it was ordained, that "all houses thereafter to be erected in London and the liberties thereof, should be built of stone, with party-walls of the same; and covered either with slates or tiles, to prevent those dreadful calamities by fire, which were frequently and chiefly occasioned by houses built of wood, and thatched with straw or reeds." And for this purpose, it was also provided by the discreeter men of the city, "that twelve aldermen of the city should be chosen in full hustings, and there sworn to assist the mayor in appeasing contentions that might arise among neighbours in the city upon inclosure betwixt land and land; and to regulate the dimensions of party-walls, which were to be of stone, sixteen feet high and three feet thick; and to give directions about girders, windows, gutters, and wells." Such confidence also did Richard put in the wisdom and faithfulness of the city of London, that, when it was resolved to fix a standard for weights and measures for the whole realm, his majesty committed the execution thereof to the sheriffs of London and Middlesex, whom he commanded to provide measures, gallons, iron rods, and weights for standards, to be sent to the several counties of England.

At the coronation of Richard I. a dreadful massacre of the Jews took place, occasioned by the following circumstance: For some cause they were forbidden to appear at the ceremony; many, however, prompted by curiosity, attempted to get into Westminster abbey, but were repulsed by the attendants; and, a rumour being spread among the populace, that the king had given orders for their entire destruction, the mob, in the most barbarous manner, attacked these defenceless people; and, not satisfied with murdering all who were unfortunate enough to fall in their way, proceeded to the city, where, with the most diabolical fury, they robbed their house massa-

cing all the inhabitants they could find, and then set fire to them.

While Richard was in Palestine, John his brother, afterwards king, with the archbishop of Rouen, the bishops, earls, and barons, and the citizens of London, met in St. Paul's cathedral, to deliberate upon the mal-administration of William Longchamp, bishop of Ely, chancellor, and one of the regents of the kingdom, who, by an unanimous resolution of the convention, was degraded from all his offices, for his tyrannical government and contumacious deportment. Here, according to Dr. Brady, a new charter and community was granted to the city of London, to be a corporation, for their ready concurrence in the above resolution. In return for this recognition of their privileges, for it was no more, the citizens swore to be true and faithful to their sovereign, king Richard, and his heirs; and that, if he died without issue, they would receive his brother John as king. This is an additional proof that no measure of consequence to the state was undertaken without asking the concurrence of the Londoners.

Under this reign a great disturbance took place in London, occasioned by the sedition of William Fitz-Osbert, a man whose person was deformed, and who was nicknamed Longbeard on account of his letting his beard grow to an unusual length, partly from an affection of gravity, partly in derision of the Norman custom of shaving the face. He was, however, a man of powerful elocution; and he became so extremely popular, by having frequently pleaded the cause of the poor before the magistrates, that the lower orders of the people were entirely and universally at his command and devotion. Matters being thus situated, Fitz-Osbert began to act more openly, and made use of all his rhetoric to incense the people against a certain aid or tallage, which was to be raised for the service of the public. He insisted that this tax was proportioned in a very unjust manner; for that the poor were to bear the burden of almost the whole, while the rich were in a manner exonerated; and this insinuation wrought so powerfully on the minds of the people, that a tumult ensued near St. Paul's church, in which many of the citizens were killed. Advice of this insurrection being transmitted to Hubert archbishop of Canterbury, who was the king's justiciary, that prelate summoned Fitz-Osbert to appear before him, at a fixed time and place. Fitz-Osbert obeyed the summons, but was attended by such a numerous crowd of his adherents, that the archbishop, instead of seizing his person, thought it necessary for his own safety to dismiss him with a gentle reproof, and his advice not to appear in any unlawful assembly for the future. The more wealthy among the citizens, however, being greatly terrified at the proceedings of Fitz-Osbert and his party, it was at length agreed that a number of men should lie in wait to seize him at a time when he had but few attendants; and an opportunity of this kind soon offered; but Fitz-Osbert, with the few friends he had with him, made a most desperate defence; and, having possessed themselves of the church of St. Mary-le-bow, in Cheap-side, they fortified the steeple, with a full determination of defending themselves till further assistance should arrive. The situation of Fitz-Osbert and his friends was no sooner known, than the populace from all parts in and near the city, assembled in Cheap-side, with the view of setting their champion at liberty; but the magistrates used such persuasive arguments, that the people were at length prevailed on to disperse. Matters were in this situation, when a resolution was formed of setting fire to the steeple, so that Fitz-Osbert and his abettors had no chance, but to force their way through the flames, and fight for their lives, or be burnt on the spot. They chose the former expedient, as the less dreadful of the two; wherefore, making an impetuous sally, they endeavoured to seek their safety by wading through the blood of their opponents; but, being overpowered by superior numbers, Fitz-Osbert and eight of his adherents were made prisoners, and committed to the

Tower of London. The next morning they were brought to their trial; and, sentence of death being passed upon them, on the following day they were drawn by the feet through the city to a part of Smithfield then called the Elms, where they were publicly executed, and then hung in chains.

But the disturbances were not wholly appeased, and the tempest of sedition was rather hushed than suppressed. The body of Fitz-Osbert being taken down and carried away, a report was immediately propagated by a priest, who was a kinsman of the deceased, that several miracles had been wrought at the place of his execution. Hereupon vast numbers of people resorted to Smithfield, many of whom picked up and carried away, as holy relics, pieces of the earth on which the blood of their champion had been spilt, while others continued there the whole night in the utmost fervor of devotion; nor did they quit the place till a military guard was sent, by whom they were at length, though with great reluctance on their part, dispersed to their respective habitations. It was now thought necessary, in order to undeceive the deluded populace, to make public the life of Fitz-Osbert, which was accordingly done by authority; his relation, the priest, was excommunicated for attempting to deceive the people, who thereupon applied quietly to their respective occupations, and all the riots and tumults subsided.

King Richard in the eighth year of his reign granted a charter by which the citizens of London were empowered to remove out of the river Thames all weirs that might impede the navigation of this incomparable stream; and, as a farther encouragement, the king resigned all his rights and pretensions to the annual duties arising thereby, which were paid to the officers of his Tower of London. The charter is in Latin, and begins as follows: "Dom. Ricardus Rex, filius Regis Henrici Secundi, concessit et firmiter præcepit, ut omnes kidelli (weirs) qui sunt in Thamisía amoveantur, ubicunque fuerint in Thamisía, &c." From this deed the city of London claims its jurisdiction and conservancy of the river Thames.

King Richard was succeeded, in 1199, by his brother John, who favoured much the city of London, and granted the citizens three charters. The first was a recital and confirmation of those granted by Henry I. and II. with the farther privilege of being free from toll and every other duty or custom in his majesty's foreign dominions; for which they paid the sum of 3000 marks. The second was a confirmation of that granted by king Richard, and by which the citizens of London had the jurisdiction and conservancy of the river Thames; with a clause to extend that jurisdiction, and the powers therewith granted, to the river Medway; and with another clause to enable the said city, as conservators of the Thames and Medway, to inflict a penalty of 10l. upon any person that should presume to erect a weir in either of these rivers. The third charter contains a fee-farm rent of the sheriffwicks of London and Middlesex at the ancient rent, of which they had been deprived by queen Maud; granting them also the additional power of choosing their own sheriffs. This charter was given by way of conveyance from the crown to the citizens for a valuable consideration, by which the sheriffwick became their freehold; and this is the first covenant or conveyance we find on record, with the legal terms of *to have and to hold*, which are at this time accounted an essential part in all conveyances of property.

Besides these signal favours of king John, we find that in the very beginning of his reign he continued the good practice he had begun under his brother, and persisted in it notwithstanding his numerous follies and misfortunes; this was the erecting his demesne-towns into free burghs, which prepared the way for the gradual diffusion of commerce through his dominions. Instead of the king's collectors having the power, as formerly, of levying sundry tolls, taxes, and customs, from towns, there was now only one annual sum paid, which was called the fee-farm rent of each respective burgh: this sum was raised by the corporation, by a general assessment. Before his time, the

crowns had also always appointed a chief officer, who ruled them, sometimes arbitrarily enough, and raised the several taxes. King John gave the townsmen the privilege of electing their chief officer, annually, out of their own body. From this privilege arises the present annual magistracy of corporations.

In the third year of his reign he granted the city a fourth charter, by which, "at the request of the mayor and citizens of London, the guild of weavers shall not from thenceforth be in the city of London, neither shall be at all maintained." It does not appear, either by this charter, or by any other document now in existence, what occasioned this request of the citizens; for it is absurd to suppose, with some historians, that the addition of two marks to the royal revenue could have procured it. It is much more probable that the difference in the value of money occasioned the alteration, the sum paid to the exchequer by the weavers being then eighteen marks; and that required of the city, as a compensation for the loss of it, being but twenty.

From Madox's History of the Exchequer we learn that, in 1204, Guy de Von stood indebted to the crown in the sum of one thousand and sixty-six pounds eight shillings and fourpence, for arrears of rent of the *Cambium*, or Exchange of London, which had been let upon lease to him for a term of years. This is a satisfactory proof that the trade of London must have been very considerable at that time.

The city of London may, in some measure, be said to have been first made a free city by king John, in the year 1207, when, according to some authors, they had liberty to choose a mayor out of their own body, annually, which office had been before for life; but sir Richard Baker places this event in the tenth year of his reign, or two years later, though probably his fifth charter, which will be inserted in its place, was the original grant.

In 1209, the king's purveyor having bought a quantity of corn in London, Roger Wincheffer and Edmund Haddell, the sheriffs, would not permit him to carry it off; which so highly incensed the king, that he sent a positive command to the council of the city (which consisted of five-and-thirty members) to degrade and imprison the sheriffs; which being done, in obedience to the royal precept, the council sent a deputation to the king at Langley, to intercede for their unfortunate sheriffs; and to assure his majesty that what they had done was not out of any disrespect to him, but purely to prevent an insurrection, which was then threatened, and, at that critical juncture, might have proved dangerous to the royal affairs; which reason proved so satisfactory to the king, that he gave orders for their immediate discharge.

The king, however, by the intrigues of several partisans of the church of Rome, incurred the displeasure of his loyal citizens of London, who joined the barons in the defence of national interests. The public safety growing every day more dubious, the citizens began in 1211 to strengthen their walls with a deep ditch, two hundred feet wide, which was finished in two years; being somewhat retarded by an extraordinary accident of fire on London-bridge, about four years after the bridge had been finished, on the 10th of July, 1212, in the night, which began in Southwark; where, the flames taking hold of St. Mary Overy's, then called Our Lady of the Canons, communicated, by a strong south wind, to the north end of the bridge, which interrupted the passage, and stopt the return of the multitude that had run from London to extinguish the fire; and, while the confused multitude were attempting to force a passage through the flames at the north end of the bridge the fire broke out at the south end also. Thus they were enclosed between two raging fires; and above three thousand people either perished in the flames, or were drowned by overloading the boats that ventured to their assistance. The bridge was greatly damaged, and a great part of the city was consumed.

Another cause of displeasure was the king's command

to destroy Baynard's castle, at the south-west end of Thames-street; and the stately palace of Robert Fitz-Walter, castellan and standard-bearer of the city, who, having taken part with the malcontent barons, and refused to give security for his fidelity to the king, had fled to France.

His majesty then, in 1213, summoned a convention of the states of the kingdom at St. Paul's cathedral, where he made, or rather renewed, before Nicholas, the pope's legate, that infamous subjection of his crown, which he had formerly made to the pope, before his legate Pandulph; and agreed to pay an extraordinary sum of money to the pope for taking off the national interdict; towards which, the citizens of London were obliged to pay two thousand marks. But, to prevent as much as possible those murmurs which he had but too much reason to apprehend, he granted the citizens his fifth and last charter, a copy of which we have subjoined.

"John, by the grace of God, king of England, duke of Normandy, Aquitain, and earl of Anjou; To his archbishops, bishops, abbots, earls, barons, justices, sheriffs, rulers, and to all his faithful subjects, greeting. Know ye, that we have granted, and by this our present writing confirmed, to our barons of our city of London, that they may choose to themselves every year a mayor, who to us may be faithful, discreet, and fit for government of the city, so as, when he shall be chosen, to be presented unto us, or our justice (if we shall not be present;) and he shall swear to be faithful to us; and that it shall be lawful to them, at the end of the year, to remove him and substitute another, if they will, or the same to retain, so as he be presented unto us, or our justice, if we shall not be present. We have granted to the same our barons, and by this our present charter confirmed, that they well and in peace, freely, quietly, and wholly, have all their liberties, which hitherto they have used, as well in the city of London as without, as well by water as by land; and in all other places, saving to us our chamberlainship. Wherefore we will and freightly command, that our aforesaid barons of our aforesaid city of London may choose unto themselves a mayor of themselves, in manner and form aforesaid; and that they may have all the aforesaid liberties well and in peace, wholly and fully, with all things to the same liberties appertaining, as is aforesaid. Given by the hands of Mr. Richard Harpister, our chancellor, at the New Temple, London, the nineteenth day of May, in the sixteenth year of our reign."

However inimical the other parts of this king's conduct may have been to the liberties of the subject, the charters granted by him to London, and every other town of consequence in his dominions, laid the foundation of that secure intercourse, without which, commerce will unavoidably be cramped, if not wholly annihilated. Thus we find, that, as soon as this charter was obtained, many fraternities were formed in London, which continued and flourished for a long time before they were incorporated by charter.

Under this reign a civil war raged in several parts of the kingdom; the city was taken possession of by the barons, whose followers soon began to plunder the houses of royalists and Jews; they then besieged the Tower, which bold attempt the king considering, together with the increasing number of the insurgents, he consented at last to grant the famous charters called "Magna Charta" and "Charta de Foresta," in the former of which it is expressly stipulated that "the city of London shall have all its ancient privileges and free customs as well by land as by water."

These broils caused a great deal of anxiety to the Londoners, who, at the instigation of the barons, offered the crown to Louis, the elder son of Philip king of France, if he would bring a sufficient force to preserve them from ruin, and swear to maintain them in their ancient laws, rights, and privileges; this proposal was eagerly accepted by Philip.

In the interim, John advanced to the attack of the city,

but, on the approach of his forces, the citizens, instead of being intimidated, opened their gates, and marched out to give them battle, choosing rather to die bravely in the field than to perish within their walls. This resolution was followed by the most complete success; the advanced party of the royal army was entirely routed, with a considerable loss in killed and wounded, among whom was their general, Savarie de Malleon. This rough reception convinced the king of the impracticability of the attempt; and he preferred withdrawing his army to risking a general engagement with the brave and resolute Londoners.

About this time the citizens fitted out a powerful fleet, to clear the coast of numerous pirates, who infested the mouth of the river Thames, so that the trade of the city was almost entirely lost; and, having engaged and defeated these combined robbers, took and destroyed sixty-five of their ships: hence we may judge of the formidable state of the city at that time, when it was not only capable of defending itself against the king, though then in possession of all other parts of the kingdom; but likewise at the same time to send out so potent a navy, as was able to destroy such a mighty band of confederated and desperate pirates.

Louis, on hearing of the bravery of the Londoners, sent a messenger with a letter of thanks, exhorting them to persevere, and promising them speedy and powerful assistance. Soon after this, he arrived at Sandwich, with a fleet of six hundred ships, from whence he proceeded to London with his army, and on his march attacked and reduced the castle of Rochester. On his arrival, the citizens gave him a most magnificent and pompous welcome; and, at the same time, he received the homage of them and the barons, to whom he swore to restore good laws, and their lost estates. The Londoners never departed from this engagement; but, upon the demise of king John, William earl of Pembroke, who took the part of Henry his son, and had him crowned, prevailed with forty of the barons to desert their protector Louis, and to submit to the young king. This defection, with the decrease of the French army, in a long course of hard service, obliged Louis to agree to a truce; in which time he went to France, and returned with fresh supplies to London. The king's troops had already taken the field, and sat down before the castle of Mount Sorel, in Leicestershire; for the relief of which he detached 20,000 regular troops, and 600 knights, who obliged the earl of Chester to raise the siege. They then marched to Lincoln; where they were defeated by the king's forces; which, with the loss of a powerful supply cut off at sea by a fleet from the Cinque Ports, obliged Louis to shut himself up in London. And, though he was there blocked up both by land and water, he would not treat of peace without such conditions as were consistent with his honour, and the safety of those who invited him over; and, in particular, he took care that the ancient rights and privileges of the city should be confirmed. The Londoners, on their part, gratefully acknowledged this generosity, by lending him 5000 marks, to discharge his debts, before he departed for France.

During the reign of Henry III. the city of London was oppressed in many different ways. In 1218, he exacted a fine of forty marks for selling a sort of cloth not two yards within the lifts; and a fifteenth of the citizens' personal estates for the enjoyment of their ancient rights and privileges. In 1221, he commanded by proclamation all the foreign merchants to depart the city; which drew thirty marks from the Hanseatic company of the Steelyard, to have seisin of their guild, or hall, in Thames-street. But it was the wrestling-match at St. Giles's in the Fields that brought on their greatest burden. In the year 1221, on St. James's day, the citizens of London having carried off the victory from the people of Westminster and other neighbouring villages, the steward of the abbot of Westminster, meditating revenge against the Londoners, proposed another wrestling-match with them, and gave a ram for the prize. The citizens resorted to the place at the  
time

time appointed; but were unexpectedly assaulted by a great number of armed men, who killed and wounded many, and dispersed the rest. This raised a great commotion in the city. The populace breathed revenge; and, by the instigation of Constantine Fitz-Arnulph, a great favourer of the French party during the troubles in king John's reign, they proceeded to Westminster, and pulled down the houses both of the steward and abbot. Hearing afterwards that the abbot was come into the city with his complaint to Philip Daubney the king's counsel, they pursued him, beat his servants, took away twelve of his horses, and would have murdered him, had he not escaped by a back-door. Upon this tumult, Hubert de Burg, then chief justiciary, summoned the mayor and many of the principal citizens to attend him in the Tower of London; and, inquiring for the authors of the riot, Constantine, the ringleader, boldly answered, that "he was one; that they had done no more than they ought; and that they were resolved to avow what they had done, let the consequence be what it would." In this he was seconded by his nephew and one Geoffrey; but the justiciary, having dismissed all the rest, detained these three, and ordered them to be hanged next morning, though Constantine offered 15,000 marks for his pardon. Hubert then, coming into the city with a strong guard, caused the hands and feet of most of the principal rioters he could seize to be cut off, and their bodies to be burnt: all which was executed without any legal proceedings or form of trial. After these arbitrary cruelties, he degraded the mayor and all the magistrates; placed a *custos* over the city, and obliged thirty persons of his own choosing to become securities for the good behaviour of the whole city. Several thousand marks were also exacted by the king, before he would consent to a reconciliation.

This arbitrary behaviour alarmed the whole nation. The parliament of 1224 began to be uneasy for themselves, and addressed his majesty that he would be pleased to confirm the charter of liberties which he had sworn to observe; and the consequence of this application was a confirmation of Magna Charta in the full parliament at Westminster in the year 1225. At this time also, the rights and privileges of the citizens were confirmed. They were exempted from prosecution for *burels*, i. e. listed cloth; and were granted the right of having a common seal. The necessitous circumstances of this monarch, however, made him often exact money arbitrarily as long as he lived.

We find, however, that under his reign the extent of the city increased considerably, by the disforesting of part of Middlesex; and that the sheriffs received the king's order to repair the prison of Newgate; from which it should appear, that Newgate was not at that time under the management of the city. It is remarkable, that, according to the most ancient custom, prisons were erected near the gates of cities, most likely in order that they might be at hand to receive those who had been condemned at the tribunal of the judges, who generally sat at the gates of cities from all antiquity, as we read in the scriptures. From this time also we may date the origin of pipes being employed to supply the city with water; and in 1235 began the memorable custom of tendering six horse-shoes, with the nails thereunto belonging, by the sheriffs of London and Middlesex, at the time of their being sworn into their office before the chief baron of the Exchequer. This custom arose from the possession of a piece of ground in the Strand, within the parish of St. Clement Danes, to which they had a right by a grant from Walter de Bruin, a farrier, who, in this year, purchased the same of the crown for erecting a forge, on condition of paying the said number of shoes and nails annually into the Exchequer. This piece of ground is not now in the possession of the city.

Besides several hardships which the Londoners had suffered under the extorting and oppressing sceptre of Henry III. in 1258, the price of corn was so excessive, that a famine ensued; and, according to the chronicles

of Evesham, 20,000 persons died of hunger in London only. In 1264, another massacre of the Jews took place; on a plea that one of that persecuted race had taken more than legal interest; and upwards of five hundred Jews were put to death by the populace, and their houses and synagogues destroyed. See the article *Jew*, vol. x. p. 808, 9.

The beginning of king Edward's reign promised great happiness to the city, when civil discussion broke out amongst the Londoners about the choice of a mayor; which, under a sovereign less disposed to moderation and justice, might have proved fatal to their liberties. But Edward only interposed as a friendly moderator, when parties ran so high as to admit of no compromise, and appointed a *custos* till they could be brought to reason. However, this convinced the citizens of the danger of their intestine broils; and so far wrought upon their passions, that they unanimously chose sir Walter Harvey, in a folkmote, for mayor, rather than the king should have an excuse to intermeddle with their civil government. This Harvey was the very man set up by the populace, in opposition to the regular choice of Philip de Tylour. But they were soon convinced of his bad practices, and had the resolution not only to degrade him from the office of an alderman, but to render him incapable of sitting in the city council, and to make him give sufficient security for his quiet and peaceable behaviour for the future.

The gross frauds and impositions which prevailed at this period in the sale of provisions, rendered legislative interference necessary, particularly with respect to the bakers and to the millers, for giving short weight and bad measure. The king therefore commanded the mayor and sheriffs to enforce the new laws made for the prevention of such evils in future. By these laws, the baker, for his first offence, was to forfeit his bread; for the second to suffer imprisonment; and for the third, to be pilloried. Fraudulent millers were to be punished by being drawn through certain streets, in a tumbrel, or dung-cart, exposed to the derision of the populace. The magistrates were also commanded to regulate the price of provisions, especially of poultry and fish, which had been engrossed by a few rapacious hucksters. Accordingly an ordinance was issued by the magistrates of the city in the following form:

"By the command of the lord the king, and with the assent and consent of the gentlemen of the kingdom, and citizens aforesaid; That no huckster of fowl (or poulterer) go out of the city to meet them that bring poultry into the city, to make any buying from them; but buy in the city, after the buyers of the lord the king, of the barons, and the citizens, have bought and had what shall be needful for them, namely, after three o'clock, and not before. And then let them buy thus:

Ditto, at other times of the year	-	0	4 0

It was also ordained, "That no huckster of fish, (or fishmonger,) who sells fish again to others, go out to meet those that bring or carry fish to the city, to make a forefall thence; nor have any partnership with a stranger who brings fish from sea to the city; but let them seek for fish in their own ships, and permit foreigners to bring it, and to sell when they are come, in their own ships; because, by such partnership, they who are of the city, and have known the state of the city, and the defect of vic-tuals, will hold the fish at a greater dearness than fo-reigners, who shall not have known it; and also, that they who are of the city, when they cannot sell as they will, lay it up in cellars, and sell dearer than the strangers would do, if they came without partnership, and knew not where they might be harboured; nor let them buy any thing in the city, until the king's servants, &c. have bought, and not before three o'clock. And, if they who have brought fish shall come after three o'clock, let them not sell that day, but let them sell on the morrow morning. And, if they expect more, let the fish be taken into the lord the king's hands; and let them keep no fish, except salt fish, beyond the second day of their coming; which if it shall happen to be found, let them lose their fish, and be at the mercy of the lord the king [to fine them]. And thus let the huckster of fish buy, that they afford,

We have inserted the whole of this curious tariff, in VOL. XIII. No. 222.

order that the reader may judge of the difference which an influx of gold, silver, and brass, and lastly the immense sums issued in paper-money, have created in the price of provisions since the reign of Edward I. but he must recollect at the same time, that a day's labour was paid in proportion, which was about two-pence, the usual price for a nice chicken; a proportion which has existed ever since to this day, when a chicken costs between four and five shillings, the sum which a journeyman receives in general for his day's labour.

In 1284, Lawrence Ducket, a goldsmith, having wounded Ralph Crepin, in Cheapside, then called West-cheap, took sanctuary in Bow-church steeple; Crepin's friends surprised him in the night, and hanged him so artfully in one of the windows, that the coroner's inquest gave their verdict *felto de se*, and ordered the body to be drawn by the feet, and buried in a ditch without the city. However, a boy, who lay with Ducket that night, and had concealed himself during this barbarous action, at last gave information against the murderers. Many were apprehended, of whom sixteen were hanged; and a woman, the contriver of the murder, was burnt alive: other persons of distinction concerned therein were amerced in pecuniary fines; and the disgraced body was taken up, and buried decently.

The following year was remarkable for the division of the city into twenty-four wards, or districts; each ward retaining the right to choose their own alderman, and certain of the inhabitants to be of council to them. These regulations did not prevent the Londoners from indulging themselves in riots and robberies, or even in committing atrocious murders, to such a degree, that it occasioned a statute enjoining that "none be found in the streets, either with spear or buckler, after the curfew-bell of the parson of St. Martin's le Grand rings out, except they be great lords and other persons of note; also that no tavern, either for wine or ale, be kept open after that bell rings out, on forfeiture of forty pence; nor any fencing-school be kept in the city, or non-freeman be resident therein."

The reign of Edward II. was marked with strong features of severity against London from the beginning; yet the good city often gave this monarch substantial marks of attachment and loyalty, by paying his debts and lending him money. At this period, 1315, a great scarcity of provisions took place; and a famine so dreadful followed, that, according to Stow and Speed, parents ate their own children, and malefactors devoured each other in prison; and this was, in the common course of nature, accompanied by such a pestilence and mortality, that the living were scarcely sufficient to bury the dead. The bosom of the city was torn by dissensions at the latter end of this reign; and these broils ended in the resignation of the king, and the murder of the Spencers his favourites; the head of the younger of whom was sent to London, where it was received with brutal triumph, and stuck upon the bridge. In spite of these horrid commotions, commerce still flourished; and the increase of gold and silver in England, as well as the decline of the feudal system, are evident proof of its influence every where, but especially upon the city.

King Edward III. on the commencement of his reign, granted to the city two charters; by the first, all the ancient privileges were confirmed and additional ones bestowed; by the other, the village of Southwark was granted to the citizens in perpetuity. In 1348, the terrible pestilence, which, breaking out in India, spread itself westward through every country on the globe, reached England. Its ravages in London were so great, that the common cemeteries were not sufficiently capacious for the interment of the dead; and various pieces of ground without the walls were assigned for burial-places; amongst these was the waste land now forming the precinct of the Charter-house, where upwards of 50,000 bodies were then deposited. This destructive disorder did not entirely subside

till 1357. In 1361, the plague having again broke out in France, every precaution was taken to prevent its spreading into England, but without effect; the pestilence reached London, and its ravages were so destructive, that upwards of 2000 persons fell victims in two days.

The year 1378 is memorable in the city annals for the expedition fitted out by an individual, John Philpot, against Mercer, the Scottish pirate, who, taking advantage of the inattention of government to naval affairs, carried off all the shipping from the port of Scarborough; and, continuing to infect the northern coast, frequently made considerable prizes. The complaints of the merchants were but little regarded by the council; when Philpot prepared a fleet at his own expence, with a thousand men well armed, went himself on-board as commander-in-chief, and failed in pursuit of the pirate. A long and desperate engagement ensued; but Philpot obtained the victory, and obliged the pirate to surrender, with most of his ships, among which were fifteen Spanish vessels richly laden.

The next point of interest which may attract our curiosity is the extraordinary commotion which was occasioned by the act of parliament, in the fourth year of Richard II. ordering a poll-tax on every person in the kingdom, male or female, above the age of puberty; which tax was most impolitically exacted with the greatest rigour, and caused a most dangerous insurrection, which first began in Essex, and during which the metropolis particularly suffered. The insurgents took the route of Maidstone, and were there greatly encouraged and augmented by the preaching of one Ball, an excommunicated priest, imprisoned for sedition, whom they released from a long confinement in the county gaol. Ball's text was:

When Adam delv'd, and Eve span,  
Who was then a gentleman?

From which words he insisted, that all mankind were upon an equality in power and riches; and exhorted the insurgents to go to the king and demand liberty, and to use force, if it could not be otherwise obtained.

It is worthy of remark, that at all times, and in all nations, whenever the people feel oppressed, they may be compared to the palm-branch, which yields obediently to the pressure or pull that brings it to the ground, but soon returns, with elasticity, to its former position. Ideas of equality and unrestrained independence flush in their minds; and, impatient of moderation and controul, they defeat their own plans and spoil their cause by excess and extravagance; as if Liberty held in her hand a poisonous cup, a single drop of which is enough to intoxicate.

Not unlike the famous centurion L. Virginius, Walter Hilliard, commonly called *Wat Tyler* from his trade, finding that his daughter had been indecently treated by a collector, and less brutal perhaps than the Roman, who snatched his daughter from the grasp of the decemvir by stabbing her, put the collector to death; and, being supported by the insurgents, placed himself at their head. His death, and the conclusion of this insurrection, have been already related under the article ENGLAND, vol. vi. p. 602. We have only therefore to add, that, in speaking of this transaction, and of sir William Walworth, Stow says, "True it is, that this William Walworth, being a man, wife, learned, and of an incomparable manhood, arrested Wat Tyler, a presumptuous rebel, upon whom no man durst lay hand, whereby hee delivered the king and kingdome from most wicked tyrannie of traytors. The maior arrested him on the head with a sounde blow, whereupon Wat Tyler furiously stroke the maior with his dagger, but hurt him not, by reason he was well armed: the maior, having received his stroke, drew his basilard, and grievously wounded Wat in the necke, and withal gave him a great blow on the head: in the which conflict an esquire of the king's house, called John Cavendish, drew his sword, and wounded Wat wife or thrife, even to the death; and Wat, spurring his horse, cried to the commons to revenge him. The horse bare him about 80

foote from the place, and there hee fell downe halfe dead; and by and by they which attended on the king environed him about, so as he was not seene of his companie; many of them thrust him in diverse places of his bodie, and drew him into the hospitall of S. Bartholomew, from whence again the maior caused him to be drawn into Smithfield, and there to be beheaded. It hath also been, and is now grown to a common opinion, that, in reward of this service done by the said William Walworth against the rebell, king Richard added to the armes of this citie (which was argent, a plaine crosse gules) a sword or dagger, (for so they terme it,) whereof I have read no such recorde; but, to the contrarie, I find, that, in the fourth yeare of Richard II. in a full assembly made in the upper chamber of the Guildhall, summoned by this William Walworth, the maior, as well of aldermen as of the common counsell in every ward, for certaine affaires concerning the king, it was there by common consent agreed and ordained, that the olde seale of the office of the maioralty of the citie, being very final, old, unapt, and uncomely for the honor of the citie, should be broken, and one other new should be had, which the said maior commanded to be made artificially, and honourable for the exercise of the said office thereafter in place of the other; in which new seale, besides the images of Peter and Paul, which of old were readily engraven, there should be, under the feet of the said images, a shield of the armes of the saide citie perfectly graved, with two lions supporting the same, with two sergeants of armes, on either part one; and two tabernacles, in which above should stand two angels, between whom, above the said images of Peter and Paul, shall bee set the glorious Virgine. This being done, the old seale of the office was delivered to Richard Odiham, chamberlaine, who brake it; and in place thereof was delivered the new seale to the said maior, to use in his office of maioralty, as occasion should require. This new seale seemeth to bee made before William Walworth was knighted, for he is not here intituled sir, as afterwards he was; and certaine it is that the same new seale then made is now in use, and none other, in that office of the maioralty; which may suffice to aunswere the former fable, without shewing of any evidence sealed with the olde seale, which was the crosse and sworde of Saint Paule, and not the dagger of William Walworth."

London was not long in recovering from the miseries the citizens had experienced; for, in 1390, the king appointed a tournament to be held in London, and sent heralds to proclaim his intention to all the principal courts of Europe, whence many princes and nobles came to attend the spectacle, which was continued with the greatest splendour for four days; open house being kept at the king's expence for all persons of distinction. The vast expence which this and similar festivities occasioned, frequently reduced Richard to great pecuniary difficulties; his enormous profusion led him to a system of oppression and extortion, which eventually caused his deposition and death.

Wine during this reign was uncommonly cheap, if we may believe Stow, who states, that the price of Gascon wines, that is claret and other sorts that come from France by way of Bourdeaux, was fourpence per gallon; and that of German wines, which came by the Elbe, Rhine, and other rivers, generally denominated Rhenish wines, was sixpence per gallon. The different tolls on roads leading to the metropolis were higher comparatively than they are now, and bore no proportion to the price of provisions. A proclamation for cleansing the streets of London, a grand tournament in Smithfield, a fund established for orphans, and the completion of Westminster-hall, are points upon which the historian would willingly dwell, had not more important events claimed a place in these columns.

The latter end of the year 1399 witnessed the coronation of Henry IV. at Westminster. A large and splendid entertainment was provided in the hall, to celebrate the joyful event; and the lord-mayor and aldermen were admitted

mitted to their seats next the sideboard, in right of chief butler of England. The parliament meeting on the day after this solemnity, several useful and favourable laws were passed for the city of London, and several others, which were vexatious, entirely abrogated.

Ancient historiographers inform us, that, in the year 1409, the parish-clerks acted a play concerning the Creation of the World, which they repeated eight days successively at a place called Skinner's Well, (which thence acquired the name of *Clerkenwell*;) with great applause. On the subject of these early dramas, called *mysteries*, we shall enlarge in another place.

At the death of Henry IV. his eldest son was immediately proclaimed king by the name of Henry V. Soon after, the dangerous conspiracy of Whitlock, who pretended that Richard II. was alive, took place. By the exertions of Thomas Falconer, mayor of London, Whitlock was apprehended with several of his conspirators, and sent to the Tower; but he escaped by the connivance of the constable, and by the help of one of the wardens, who was executed as a traitor.

The lord-mayor in the year 1415 received, on the day of his entering into office, the pleasing news of the king's victory over the French at Agincourt, which was delivered to him by one of the king's messengers as he was riding to Westminster to qualify himself for the high office. In his return from Westminster, accompanied by the bishop of Winchester, the lord chancellor, &c. they proceeded to St. Paul's cathedral, and attended the *Te Deum*, sung with great solemnity; and next day the queen, nobility, clergy, mayor, aldermen, and several guilds or fraternities, formed a solemn procession, and went on foot from St. Paul's cathedral to Westminster-abbey; where this illustrious company made a great oblation at the shrine of Edward the Confessor, and returned in a triumphant manner.

Two years after this, Holborn was first paved, as appears from an order in the *Fadera*, in which Henry V. taking notice, "that the high-way named Holborn, in London, was so deep and miry, that many perils and hazards were thereby occasioned, as well to the king's carriages passing that way, as to those of his subjects; he therefore ordained two vessels, each of twenty tons burthen, to be employed at his expense, for bringing stones for paving and mending the same." This shows the gradual improvement of London and its suburbs. About this time also the citizens of London began to have their town illuminated by lanterns, which every one was ordered to set up over his door, or at any part of the front of his house, for the safety of the streets; but this order does not seem to have produced much effect, for the lighting of the streets did not become general till the seventeenth century. See the article *LAMP*, vol. xii. p. 121.

In the year 1419, sir Richard Whittington served the office of lord-mayor for the third time. We cannot pass by the name of Whittington, without noticing the stories which tradition has attached to it. In the first place it must be observed, that, whenever antiquity has dropped her veil over the existence of any worthy who by his good deeds has deserved the veneration of his contemporaries and of posterity, imagination, enlivened by that very sense of admiration which always brings respect in the rear, generally contrives to eke out some curious anecdotes, some prodigies, or mysterious facts, still more to raise the repute of, and increase the consideration for, the object of her praise. In the second place, why should we not take care lest time, the arch-destroyer, should make more havoc than he ought? It is by the contemptuous neglect of *traditional tales*, as we style the handing-down of facts, that we lose, too often, the chain of historical events; and, as there is no danger in relating those unauthenticated stories, when we note them down fairly as *doubtful*, why should they be condemned still to float on or sink in the stream of oblivion?

Displeased with the treatment he had received at the

hands of his master, (the tradesman to whom young Dick Whittington had been bound an apprentice,) we are told that he ran away from the shop, and, sulking along the road towards Highgate, sat down upon a stone, and began to ponder on his situation.—Whether the irksomeness of travelling alone, or the fatigues of walking, already brought his mind to a better sense of his own interest, cannot be known; but tradition says, that at that particular and critical moment, a peal of bells was rung in some part of the city (some believe them to have been those of Bow-church), and that he interpreted their prophetic sounds in the following distich:

Come again, come again, Whittington,  
Thrice lord-mayor of London-town.

Although he had a proverb against him, (unless he may have been himself the occasion of the saying; "As the bell chinks, so the fool thinks;") he however thought it much more wise to return to the shop, and, by making proper apologies to his master, resume his place behind the counter, and jog on as before. The stone, upon which he sat when he took counsel within himself, has mouldered down, but has been successively replaced by another; and one is there still with the name of Whittington upon it.

Fortune had not called him back to abandon him, and leave him in the drudgery of an obscure shop, but presented him with an opportunity of getting higher in the world.—It is reported, that the master of a trading vessel on the point of leaving the river for foreign countries, being by accident at Whittington's master's house, asked the lad jocosely, whether he had a *venture* to send, as it was customary at that time.—Dick was possessed of nothing except a favourite cat; he offered Pufs to the seafaring chap, and she was carried away. The vessel happened to touch at a place where no member of the old family of Grimalkin had ever been before, and where rats and mice undisturbed enjoyed full liberty of plaguing the islanders. Pufs was soon put in requisition, and did her duty most amazingly. Gold, precious stones, &c. were offered as an equivalent for the rat-and-mice destroyer; and, faithful to his charge, the captain bringing the price of poor Pufs to her master, Whittington saw at once the skies clear up over his head. Industry and attention to business, economy, and strict honesty, contributed soon to increase both the respectability and wealth of Richard Whittington, who filled the civic chair three times, and left a name consecrated by the blessings of his fellow-citizens; thankful for the useful establishments and foundations which he made, augmented, and protected, during his mayoralties.

We find in Pennant's London the following passage: His good fortune was not without parallel; for it is recorded, "How Alphonso, a Portuguese, being wrecked on the coast of Guinea, and being presented by the king thereof with his weight in gold for a cat to kill their mice, and an ointment to kill their flies, which he improved, within five years, to 6000l. on the place, and returning to Portugal, after fifteen years traffic, becoming the third 'man in the kingdom.'" It is more than probable that the anecdote of our countryman may have given rise to the story which Mr. Pennant found in a "Description of Guinea," published in 1665.

After all, some are of opinion that the story of Whittington's *Cat*, like that of the *Minotaurus* and others, originated from the name of the vessel on-board of which Whittington had sailed in search of fortune and trade—and indeed, in one of his farces, our comic writer and actor Foote introduces this idea with a great deal of humour and jocularly.

The state of the coinage in this reign may be learnt from Stow, who says, that "in the year 1421 was granted to Henry V. a fifteenth, to be paid at Candlemas and at Martinmas, of such money as was then current, gold or silver, not overmuch clipped or washed; to wit, that, if the noble were worth five shillings and eight pence, then the king

king should take it for a full noble of six shillings and eight pence; and, if it were of less value than five shillings and eight pence, then the person paying that gold to make it good to the value of five shillings and eight pence; and, if the noble so paid be better than five shillings and eight pence, the king to pay again the surpluse that it was better than five shillings and eight pence. This year was such a scarcity of white money, that, though a noble were so good of gold and weight as six shillings and eight pence, men might get no white money for them."

An estimate of the public revenues and ordinary expenses, probably intended to be submitted to parliament, is preserved in the *Fœdera*, by which it appears, that the annual revenue amounted to 55,754*l.* 10*s.* 10½*d.* and the expenditure to 52,235*l.* 16*s.* 10½*d.* leaving a number of articles unprovided for, and many debts unpaid. It is worthy of remark, that the duties on wool alone amount to upwards of 30,000*l.* more than half the revenue.

On the thirty-first of August, 1422, king Henry V. died in France, from whence his corpse was brought to England, and carried through London in a pompous manner, on an open chariot drawn by four horses, to St. Paul's cathedral, where the funeral obsequies being performed, the body was taken to Westminster, and deposited among the remains of his royal progenitors. At this funeral, James king of Scotland assisted as chief mourner, and was attended by the princes of the blood, almost all the nobility, and the principal gentry of the kingdom.

The son of Henry, though not nine months old, succeeded his father by the name of Henry VI. and, in the month of November following, the young monarch was carried through the city, in his mother's lap, in an open chair, to the parliament then sitting at Westminster.

Soon after the young king's accession to the throne, in the year 1423, a petition was presented to the king in council, for permission to remove the prisoners out of Newgate, in order to rebuild that prison, in conformity to the will of sir Richard Whittington, late lord-mayor of London; and, the petition being granted, the work was performed under the inspection of sir Richard's executors.

In this year sir John Mortimer, a victim to the jealousy of the house of Lancaster against that of York, was executed at Tyburn. He was put to death on a fictitious charge, by an *ex-post-facto* law, called the Statute of Escapes, made on purpose to destroy him; and thus, says Pennant, was Henry VI. stained with blood even in his infancy, and began a bloody reign with slaughter, continued to the end of his life by ambition and cruelty not his own.

About the year 1426, the bishop of Winchester, who was great uncle to the king, formed a design of seizing the protectorship into his own hands; and, as the most likely method to accomplish his ends, determined to surprize the city of London. The duke of Gloucester, who was protector, having received intelligence that this bold plan was intended to be carried into execution in the night succeeding lord-mayor's day, when the citizens were engaged in festivity, he sent an order to the lord-mayor to raise such a number of citizens as might be sufficient to defeat the attempt. Sir John Coventry, the mayor, obeyed this order so effectually, that, when the bishop's archers and men at arms attempted to force a passage at London-bridge, they were easily repulsed; and the insurrection was wholly suppressed, with very little damage on either side.

On the young king's return to England from France, where although his power began to decline, the duke of Bedford had him crowned at Paris, the citizens of London gave him a mark of loyalty by the pompous reception which he met at their hands. On the 20th of February, 1431, the mayor of London, dressed in crimson velvet, with a large furred velvet hat, a girdle of gold about his middle, and a baldric of gold about his neck,

waving down his back, attended by three horsemen, on stately horses, clothed in scarlet bespangled with silver, and by all the aldermen in scarlet gowns with sanguine hoods, and a vast company of citizens in white gowns and scarlet hoods, the symbol of each trade and mystery embroidered richly upon their sleeves, and all on horseback, sumptuously accoutred, met his majesty on Blackheath, and preceded him to London. The city, on this occasion, was decorated with rich silks and carpets; and on the bridge, and streets through which the cavalcade passed, were erected a variety of stately pageants, filled with persons representing the lares, graces, and sciences; who, by their curious orations and charming melodies, added very much to the elegance of the procession. Two days after, the mayor and aldermen attended the king at Westminster, and presented him with a golden hamper, containing a thousand pounds in nobles.

The long quarrels between the company of fishmongers of this city and foreign retailers of fish were at last put an end to, in favour of the latter, by an act of parliament, enacting that no person whatsoever should presume to hinder or obstruct any fisherman, either foreign or domestic, from disposing of his fish as he should see convenient, upon the penalty of ten pounds.

Some idea may be formed of the rate of living at this period, from bishop Fleetwood's *Chronicon Preciosum*, who, under the year 1439, says, "At this time a single clergyman might support himself with decency for five pounds per annum." It must not, however, be overlooked, that five pounds at that time contained as much silver as ten pounds of the present currency; so that living may be estimated at about five times as cheap as in our days. And this opinion is corroborated by an act of parliament passed in this year for regulating the qualifications for justices of the peace in counties, which was to be "twenty pounds yearly, in lands or tenements," a sum very nearly equivalent to the present qualification of one hundred pounds.

Superstition is incessantly at work, and will be so to the end of time; that is, as long as knaves and fools shall be found among men. The year 1440 was remarkable for the hoax played upon the public mind by the vicar of Barking. Sir Richard Wick, vicar of Hermetworth in Essex, was burnt on Tower-hill, on account of his religious tenets; and, as he had the reputation of being a man of remarkable sanctity, the vicar of Barking embraced this opportunity of imposing upon the people, by mixing a quantity of odorous spices with some ashes, which he privately strewed on the place where Wick had been burnt, in order to induce the people to worship him, as a martyr to the faith. This trick drew numbers of people to the spot, who began to invoke the deceased as a saint, and offer statues of wax, and money, at his shrine, which the impostor repaid, by presenting them with the ashes as sacred relics, and supplying the place with fresh ashes during the night. After this farce had been carried on for about a week, the vicar was seized and imprisoned, and, in a short time afterwards, the whole cheat was discovered by his own confession.

The votaries of the law, as well as those of religion, gave dangerous specimens of their zeal, and of their propensity for broils and commotions; for, in August 1442, a fray began between the students of the inns of court, headed by one Harbottle of Clifford's Inn, and the neighbouring citizens, in which many were wounded and killed on both sides; but it was happily quelled before the morning by the citizens, headed by the mayor and sheriffs. But the attempt of the merchant-tailors to set aside the lord-mayor at the next election had like to have proved of much worse consequence to the city. They demanded Ralph Holland, a member of their company, to be chosen by the court of aldermen, in opposition to Robert Clopton, a draper, upon whom the choice had already fallen. And the merchant-tailors became so outrageous, that sir John Paddesley, the mayor, was obliged to exert his authority; who, by committing some of the rioters to Newgate, removed

moved the present obstacle to Clopton's election; and punished the prisoners in an exemplary manner for their riotous proceedings.

This affair, however, did not end here; for the merchant-tailors' party made no scruple of declaring that they would oppose the next election; whereupon the king was applied to, who issued a letter to the following effect: "That whereas the mayors of London used to be chosen by the aldermen, and certain more discreet persons of the said city, especially summoned and warned for that purpose; yet some that had not, nor ought to have, any interest in such elections, came, and with their noise and clamour disturbed them, with an intention to choose such who might afterwards favour their evil-doing and errors: his majesty therefore, willing to provide for the quiet and peace of his subjects, and to apply a suitable remedy on this behalf, did command and firmly enjoin the mayor and sheriffs, to make proclamation through all the city and liberty, before the time of the election of a mayor, strictly forbidding, that none be present at such election, or any way, or under any colour, thrust himself into it, but such as by right, and according to the custom of the city, ought to be there; and that such election be made by the aldermen and other of the more discreet and able citizens, especially warned and summoned, according to the custom aforesaid; letting them know for certain, that if any, some other way elected, were presented to him, or his treasurer, and barons of the exchequer, they would by no means admit him; and that they should arrest and commit to prison all those who should act contrary to the said proclamation and prohibition." We have inserted the whole of this letter, not only on account of its being intimately connected with the history of the time when it was written, but also to show how strongly the court interfered in order to secure the freedom and purity of election to the citizens of the metropolis in the choice of their first magistrate.

We begin now to find a considerable increase in the prices of provisions. In 1444, the Chronicon Preciosum states them as follows:

	l.	s.	d.
Wheat, per quarter	0	4	4
A fat ox	1	11	8
A hog	0	3	0
A goose	0	0	3
Pigeons, per dozen	0	0	4

Another act of parliament for permitting the exportation of grain was passed in this year, which fixes the exportation-prices of wheat at 6s. 8d. rye 4s. and barley 3s. per quarter.

In the following year we have another table of prices in the same book, by which it appears, that wheat remained at the above price, and other articles as under:

	l.	s.	d.
Ale, per gallon	0	0	1½
Hay, per load	0	3	6½
A young swan	0	0	3
A goose	0	0	3
Stock-fish, one hundred for	0	17	6
Red herrings, three thousand for	1	11	0
Bullocks and heifers (probably calves) each	0	5	0
Fine linen, for surplices and the altar, per ell	0	0	8

About this period the public schools for the education of youth had so far gone to decay, that the grossest ignorance prevailed among the people in general. To remedy this defect, four clergymen petitioned parliament for leave to set up schools in their respective parishes, with liberty to their several successors to continue the said schools. As this petition may be supposed to have been drawn up by men of learning, with their greatest care and ability, we have transcribed it correctly from the records in the Tower, where it is still preserved, as a curious specimen of the language and manner of spelling at that period.

"To the ful worthie and discrete Communes in this present Parlement assembled; to conside the grete nom-

bre of gramer scholes that sometyme were in divers parties of this realme, beside those that were in London, and how few ben in these dayes, and the grete hurt is caused of this, not oonly in the spirital partie of the chirche, where oftentyme it apperith to openly in som perones with grete shame, but also in the temporal partie; to whom also it is full expedyent to have competent congruite for manie causes, as to your wisdomes apperith.

"And forasmuche as to the cite of London is the common concourse of this land, som for lake of schole-maistres in their own contree, for to be enfourmed of gramer ther, and som for the grete almecs of lordes, merchants, and others, that which is in London more plenteuously, sooner than manie other places of this reaueme, to such pouere creatures as never should have be brought to so greet vertu and counyng as thei have, ne had hit been by the meane of the almecs above said: Wherefor it were expedyent, that in London were a sufficient number of scholes, and good enfourmers in gramer; and not, for the singular avail of two or three perones, greuously to hurt the multitude of young people of al this land. For, wher there is grete nombre of lerners and few techers, and al the lerners be compelled to go to the few techers, and to noon others, the maistres waxen rich of monie, and the lerners pouerer in counyng, as experyence openlie shewith ayeñst all vertu and ordre of well publik.

"And these premisses moven and sturen, of grete devocon and pitee, Maistre William Lycchefeld, person of the parich-chirche of Al Hallowen the More, in London; Maistre Gilbert, person of St. Andrewe, Holbourne, in the suburbs of the said citee; Maistre John Cote, person of Saint Petre, in Cornhul, of London; and John Neel, maistre of the hous or hospital of Saint Thomas of Acres, and person of Colchirche, in London; to compleyne unto you, and for remedie besechyn you, to pray the king our sovereign lord, that he, bi the advys and assent of the lords spirital and temporel in this present parlement assembled, and bi autoritie of the same parlement, will provide, ordeyne, and graunt, to the said Maistre William and his successors, that they in the seid parich of Al Hallowen; to the said Maistre Gilbert, and his successors, that they in the seid parich of Saint Andrew; to the said Maistre John and his successors, that they in the seid parich of Saint Petre; and to the seid John Maistre (of the seid hospital,) and his successors, that they within the aforesaid parich of our Ladie of Colchirche, in the which said houe of Saint Thomas is sette; may ordeyne, create, establish, and set, a person sufficientlie lerned in the gramer, to hold and exercise a schole in the same sciencie of gramer, and it there to teche to al that will learn. And that everiche of the said maistres such schole-maistre so bi him sett, and everche of their successors such schole-maistre bi him or bi any of his predecessors so established and sett, speciallie as is above rehercid, may in his own parich or place remove, and another in his place substitute and sett, as any of the said perones or their successors semeth, [and] the cause reasonable so requireth. And so to do ich of the said perones and their successors, as often as it happenyth any of the said scholes to be voyd of a schole-maistre in any manner wyse, to the honour of God, and increasyng of vertu."—This petition met no objection, and the king placed the execution of his will concerning it under the direction of the archbishop of Canterbury.

In the year 1450, began the rebellion of Jack Cade, which was suppressed chiefly through the bravery of the citizens of London, as related under the article ENGLAND, vol. vi. p. 615.

The custom of the lord-mayor elect being rowed in a barge to Westminster, in order to qualify himself for his office, took its rise in the year 1454, when John Norman, the new mayor, built an elegant barge at his own expense; and his example was followed by the several city-companies, who attended him in their respective barges, magnificently painted, and decorated with flags and streamers.

This fight is very magnificent; and, when we witness this civic procession on the water, our minds are transported to the lively shores of the Adriatic, (making some allowance for a November-day and for the difference of climate,) where the Venetian doge used to espouse the sea with great solemnity.

About this time the city was distracted with rebellions and riots, partly occasioned by the increase of foreign merchants on the London mart; but, to the everlasting glory of the chief magistrate of London, peace was restored: the rebels either punished or forgiven; and trade, hand in hand with tranquillity, resumed its sway. Several useful regulations were also established, which have consolidated that union, which exist among the citizens to this moment, and constitute their happiness.

This period may also be called the dawn of the arts in London; for it appears that John Carpenter, town-clerk of London in the reign of Henry V. caused, at a great expense, to be curiously painted upon board, about the north cloister of St. Paul's, a monument of Death, leading all estates, with the speeches of Death, and the answer of every state. This famous picture, which was preserved until 1549, was called the Dance of Death. It contained the figures of persons in all the different ranks of life, in their proper dresses. The verses, which were in French, were translated by John Lydgate, the poet of Bury. Whether Holbein, who treated the same subject at Basil in Switzerland, had seen this painting, it is difficult to ascertain; but it is probable he had, since he was in England before the destruction of this curious device.

Of the five artists who were employed in erecting the monument of the earl of Warwick, who died in 1439, and adorning it with images, four were Englishmen; the other was a Dutch goldsmith. The number of the images was thirty-two, besides the great image of the earl. These were all cast of the finest latten, by William Austin, founder, of London. This monument was erected in the chapel of Our Lady, in St. Mary's church, Warwick, which was also built about the same time. The expense of painting this monument and chapel was considerable; the paintings were of different kinds, and performed by different artists.

We read also in Dugdale, that "John Purde, glazier in Westminster, engaged to glaze the chapel with glass from beyond the seas, of the finest colours, of blue, yellow, red, purple, sanguine, and violet, and of all other colours that shall be most necessary and best, to make rich and embellish the matters, images, and stories, that shall be delivered to him, by patterns on paper, afterwards to be newly traced and pictured by another painter, in rich colour, at his charges. The glass and workmanship cost one hundred and eight pounds. John Brentwood, steyner, of London, covenanted to paint fine and curiously, on the west wall of the chapel, the dome of our Lord God Jesus, and all manner of devices and imagery thereto belonging, of fair and rightly proportion, for which he was to receive thirteen pounds six shillings and eight pence. Christian Colburne, painter in London, covenanted to paint in most fine, fairest, and curious, wise, four images of stone, ordained for the new chapel in Warwick; whereof two principal images, the one of Our Lady, the other of St. Gabriel the angel; and two less images, one of St. Anne, and another of St. George; these four to be painted with the finest oil-colours, in the richest, finest, and freshest, clothings that may be made, of fine gold, azure, fine purple, fine white, and other finest colours necessary, garnished, bordered, and powdered, in the finest and curiousest wise."

Time has entirely effaced these works, and it is therefore impossible for us to decide upon their merit; but, by comparing in our mind the taste of contemporary artists on glass, we cannot say much in favour of those who painted in oil at that time.

The bloody conflicts excited at this time by the ambitious claims of the rival houses of Lancaster and York,

shook the whole of the kingdom, and of course affected the tranquillity of the metropolis, but were not able to disturb its commerce, which increased considerably, owing to the wise regulations above-mentioned.

The low price of corn in 1463, occasioned the passing of an act of parliament to prevent the importation of that article; the rates of which, at London, according to bishop Fleetwood, were as follows: viz. wheat, two shillings; barley, one shilling; oats, one shilling; and pease, three shillings and fourpence, per quarter.

The manufacturers and tradesmen of London, and other parts, having made heavy complaints against the importation of foreign manufactured wares, which greatly obstructed their employment, an act of parliament was passed in the same session, "prohibiting the importation of woollen caps, woollen cloths, laces, corsets, ribbands, fringes of silk and of thread, laces of thread, silk twined, silk in any wise embroidered, laces of gold and of silk and gold; saddles, stirrups, or any harness pertaining to saddles; spurs, bosses for bridles; irons, gridirons, locks, hammers, pinsons, fire-tongs, dripping-pans, dice, tennis-balls, points, purses, globes, girdles, harness for girdles, of iron, latten, steel, tin, or of alchemine; any thing wrought of any tawed leather, any tawed furs, buscanes, shoes, galoches, corks, knives, daggers, wood-knives, bodkins, shears for taylors, scissors, razors, chessmen, playing-cards, combs, pattins, pack-needles, painted ware, forcers, caskets, rings of copper or of latten gilt, chafing-dishes, hanging candlesticks, capping-balls, facing-bells, rings for curtains, lades, scummers, counterfeit basons, ewers, hats, brushes, wool-cards; black iron thread, commonly called and named white wire;—upon forfeiture of the same, one moiety to the king, and the other to the informer. Irish manufactures are, however, excepted, and also such as should be taken at sea, or by wreck. Magistrates of cities and towns are authorized to search for defective and unlawful wares, which shall be forfeited. Excepting, however, the liberty of the dean of the free chapel of St. Martin's-le-Grand, in London, and its precinct." We have inserted this long catalogue of merchandise, in order to give an idea of the manufactures which were at that time brought to any perfection, and also of some of the domestic wants of our ancestors.

Early in the reign of Edward IV. an incident happened, which proves the high idea the magistrates of London entertained of their dignity. On a call of new serjeants at law, a grand entertainment was given at Ely-house, Holborn; to which the mayor, aldermen, sheriffs, and many of the principal citizens, were invited. On sitting down to table, the lord-treasurer, baron Ruthen, took the most honourable place; this the lord mayor disputed with him, insisting that, as the king's representative, he had the pre-eminence of all persons within the liberties of the city. The treasurer, however, remaining inflexible, the mayor resented it with becoming spirit, by withdrawing, and immediately returning to the city, where he provided an elegant repast for the entertainment of his fellow-citizens.

In the year 1463, several of the London jury, having taken bribes to favour a prisoner, were apprehended and tried before the lord-mayor for wilful and corrupt perjury; and, being convicted on the clearest evidence, they were sentenced to ride from Newgate to Cornhill, with paper mitres on their heads, where they were exposed on the pillory to the derision of the public, and then carried back in the same manner to Newgate.

Throughout the whole of the reign of Edward IV. we shall find scarcely any interesting fact immediately relating to the metropolis, except the circumstance of the parliament, which was summoned to meet at Westminster, adjourning to St. Paul's, where it continued to sit from the 20th of November till Christmas.

The veil of darkness which had been heavily spread over the human mind, was rent asunder, and destroyed for ever, by the introduction of the art of printing, brought

into England in the year 1472 by William Caxton, a mercer of London, and first practised in Westminster-abbey. What little learning hitherto existed remained in the hands of the clergy, who perverted it to suit their own purposes. Few books were written except idle legendary tales to preserve a spirit of superstition; and manuscript copies bore too high a price to be purchased by the common people. The first book printed by Caxton, in London, was a treatise on the Game of Chess, translated by himself from the French; it was not completed and published until 1474. He was patronized by the earl of Rivers, who, translating "A Collection of the Dictes and Sayings of the Philosophers," gave it to Caxton; and it is reputed to have been the second book printed. It is said that a fair manuscript of this translation is preserved in the archbishop's library, at Lambeth; with an illumination representing the earl of Rivers introducing Caxton to Edward IV. his queen, and the prince. This art soon got into great repute; for, previous to Caxton's death, which took place in 1491, we find Theodore Rood, John Lettou, William Macheline, and Wynkin de Worde, foreigners, and Thomas Hunt, an Englishman, all printers in London. See the article PRINTING.

Caxton's opinion of the youth of London in his time, though not very flattering, may be presumed to be correct. He says; "I see that the children that ben borne within the sayd cyte encrease and prouffyte not like their faders and olders; but for the molte parte, after that they ben comeyn to their perfight yeres of discretion, and rypenes of age, how well that faders have lefte to them grete quantite of goodes, yet scarcely amonge ten two thrive. O blessed Lord! when I remembre thys, I am al abashed. I cannot judge the cause; but fayrer, ne wyfer, ne bet bespoken, children in theyre youthe, ben no wher than ther ben in London; but at thyr ful ryping there is no carnel, ne good corn founden, but chaff for the most part." *Ames's Hist. of Printing.*

In the month of September, 1479, a dreadful pestilence broke out in London, which continued till November in the next year, during which unhappy visitation an incredible number of citizens fell victims to it.

The power of the city magistrates, at this time, was raised to a very high pitch. In the midst of this dreadful plague, Robert Byfield, one of the sheriffs, having presumed to kneel close to the lord-mayor, before St. Erkenwald's shrine, the mayor complained to the court of aldermen of having been rudely treated; wherefore the sheriff was fined fifty pounds, to be applied to the repairs of the city conduits. One Robert Deyns, having, in the year 1480, married an orphan in the city, without license of the magistrates, was adjudged, by the court of lord-mayor and aldermen, to pay a fine of twenty pounds for the said offence. In the same year a remarkable punishment was inflicted on four persons, who, having been tried for robbing of churches, and convicted, were sentenced to be hanged on Tower-hill, and their bodies burnt to ashes, together with the gibbet on which they were hanged; which sentence was accordingly carried into execution.

About this period, the king, to evince his regard for the corporation of London, invited the mayor, aldermen, and chief citizens, to a grand hunt on Waltham-forest, in which several deer were killed, and the entertainment was concluded with a sumptuous and splendid feast, which the king caused to be provided in a beautiful arbour erected on the occasion. Shortly after, to show that he also wished to preserve a good understanding with the city ladies, his majesty sent a present of two harts, six bucks, and a ton of wine, to the lady-mayorefs, who entertained the aldermen's ladies and others with this royal donation at Drapers' hall.

The proclamation of Richard III. at Castle Baynard's, where he resided, was attended with a great deal of finesse played upon the mayor and citizens of London; but we still find, even at that moment, when power and its influence had entirely turned the scale of justice in favour of

the usurper, a deep sense of loyalty in our ancestors. They resisted, till they were overthrown. See the article ENGLAND, vol. vi. p. 623. Richard made the lord-mayor of London, sir Edmund Shaw, a privy-counsellor, and admitted his claim to act as chief butler at the coronation.

To Richard III. succeeded Henry VII. (in 1485,) whose reign began by the visitation of a most extraordinary disease, called the *sweating sickness*, which raged with great violence in London. The patients were seized with a most unnatural perspiration, which, waisting out of the body all the nourishment, and even the substance of the blood, caused death within four-and-twenty hours. It continued its rage for a whole month before any method of cure was discovered; and, in the mean time, destroyed many thousand people; among whom were two lord-mayors, six aldermen, and three sheriffs.

Among other regulations at this time, 1486, an act of common-council was passed to prevent improper persons obtaining the freedom of the city; the import of which was, that no apprentice should be taken, nor freedom given, except to such as were gentlemen born; agreeable to that clause of the freeman's oath, which says, "Ye shall take none apprentice but if [except] he be free-born, that is to say, no bondman's son, nor the child of any alien." According to the *Chronicon Preciosum*, wheat sold, this year, for one pound four shillings per quarter.

Few or no events of great import characterize the reign of this monarch. Some regulations relative to apprentices, the restoration of Cheapside Cross, the prohibition against citizens trading at fairs out of the city, many instances of extortions on the side of the crown, and of loyalty on the side of the people, the improvements at Fleet-ditch to make it navigable, but particularly the foundation of St. Paul's school, by Dr. John Collet, dean of St. Paul's, which still flourishes with honour to itself and benefit to the metropolis,—are the only notable features of that reign.

Henry VII. died on the 22d of April, 1509, at his favourite palace of Richmond, leaving one million eight hundred thousand pounds sterling, in money, jewels, and plate, locked up in the vaults of his palace.—That such a sum of money should have been hoarded by this weak and superstitious king, in order to enable him to order masses to be said for the salvation of his soul, favours the surmise, that he intended to carry heaven not by force, (Matth. xi. 12.) but by pecuniary seduction.—However, his funeral was conducted with the utmost magnificence. His body was brought from Richmond to the painted chamber at Westminster, where, resting three days, a solemn mass and dirge were sung by a mitred bishop; whence being removed into the hall, the same service was performed there, the like space of time; as also in the chapel three days longer; and at every place was a hearse, adorned with banners, escutcheons, and pennons, with mourners attending. From thence, on Wednesday, the 9th of May, it was put into a chariot, covered with cloth, black and gold, drawn by five beautiful horses, covered with black velvet, ornamented with escutcheons of fine gold; with his effigy, apparelled in rich robes, the crown on his head, and sceptre and ball in his hands, laid on a cushion of gold, and environed with banners of the arms of all his dominions, titles, and genealogies; a great number of prelates praying, with his servants, and others, in black, before the body; and nine mourners, with about six hundred torches, following. In this order it was attended to St. George's Fields, near Southwark; and there met by the religious of the several orders in or about the city, with the lord-mayor, aldermen, and common-council, in black. It was then brought through the city to St. Paul's, and placed in the choir, in a stately hearse of wax; whence, after a solemn mass, and a sermon preached by the bishop of Rochester, it was the next day, with the same state, conveyed to Westminster, sir Edward Hayward, with the king's coat of arms, bearing his banner, on a horse trapped with the arms of the defunct; and there,

there, by six lords, taken out of the chariot and set under a most curious hearse, full of lights, the effigy lying on the coffin, on a pall of gold; about which the mourners being set within the first rail, knights bearing banners within the second, and officers of arms without the same, Garter king of arms cried aloud, "For the soul of the noble prince Henry VII. king of this realm;" when the choir, beginning with *Placebo*, and ending with *Dirige*, closed the solemnities of that day. The next day three masses were solemnly sung by bishops, at the last of which were offered the banner, horse, coat of arms, sword, target, and helmet; the nobility likewise offering their rich palls of cloth of gold. When the choir had sung *Libera me*, the corpse was interred, in the chapel built by the deceased in Westminster-abbey, the treasurer and comptroller breaking their staves into the grave; when Garter having called with a loud voice, "Vive le roy Henrie le huitiesme, roy d'Angleterre & de France, syere d'Ireland," the mourners, with those of the household, departed to the palace, where they were sumptuously entertained.

In giving a full account of these royal obsequies, we enable our reader to compare the magnificence and pomp which three hundred years ago animated the minds and fired the zeal of the citizens of London and Westminster, for the preservation of the royal person when alive, at the same time as they show their veneration for the relics of the dead monarch; bearing always in view, that the metropolis, the heart of the nation, did always beat first in testimony of loyalty, a sentiment which may be shortly and appropriately expressed in the following line from an ancient inscription: *Est mihi nunc eadem quæ fuit ante fides.*

"I still retain and show  
The faith I once did vow."

For, although we always find the city steady, staunch, and vigorous, in resisting any attacks upon her rights and liberties, yet no part of the kingdom is ever more ready to come forward in support of the king and constitution.—The city is, as it seems, in possession of the palladium of Great Britain; and her safety, her honour, her welfare, are so intimately connected with the rest of the nation at large, that the word *London* is become nearly synonymous with *United Kingdom*.

The first acts of Henry VIII. were very popular. He evinced, at the beginning of his reign, a decided taste for magnificence and show. His marriage with his deceased brother's widow was solemnized with extraordinary pomp and expense. The drefs of the king and queen are thus described by Hall: "His grace wared in his upperst apparell a robe of crimson velvet, furred with armyns; his jacket or cote of raised gold; the placard embroidered with diamonds, rubies, emeraudes, great pearles, and other rich stones; a greate bauderike about his necke, of large balasses. The quene was appareled in white satin embroidered, her hair hanging downe to her backe, of a very great length, bewtefull and goodly to behold; and on her hedde a coronall, set with many riche orient stones."

Having given above the ceremonial of a royal funeral, we must place under the eye of the reader, as a counterpart, the description of one of those pageants our ancestors were so fond of, and which may afford some idea of the manners and taste of the time. In the year 1510, Henry, disguised in the habit of a yeoman of the guard, went into the city, on the eve of St. John, to see the grand cavalcade of the city-watch. He was so highly pleased with the sight, that he returned on St. Peter's eve, with his royal consort, attended by the principal nobility, and stood in Cheapside, where they saw the stately march. This ceremony was performed twice every year, viz. on the eve of St. John Baptist, and the eve of St. Peter and Paul. The manner of conducting this nocturnal parade was as follows: The city-music followed by the lord-mayor's officers in party-coloured liveries; the sword-bearer on horseback, in beautiful armour, before

the lord-mayor, mounted on a stately horse richly decorated, attended by a giant and two pages on horseback, three pageants, morrice-dancers and footmen; after these came the sheriffs, followed by their officers in proper liveries, and attended by their giants, pages, &c. then a considerable body of demi-lancers in bright armour, on stately horses; these were followed by a great number of carabineers in fustian coats, with the city-arms on their backs and breasts; then marched a division of archers, with their bows bent, and by their side sheaves of arrows; after these a great number of halberdiers, preceded by a party of pikemen, with croffets and helmets; and the rear was brought up by a party of billmen with aprons and helmets of mail. The whole body consisted of about two thousand men in different divisions, in each of which were properly fixed musicians, drums, standards, and ensigns. The march began at the conduit, the west end of Cheapside, and passed through Cheapside, the Poultry, Cornhill, and Leadenhall-street, to Aldgate; from whence it returned through Fenchurch-street, Gracechurch-street, Cornhill, and so back to the conduit again. The procession was illuminated by nine hundred and forty large lanterns, fixed at the ends of poles, and carried on men's shoulders; two hundred of which were provided at the expense of the city, five hundred at that of the companies, and two hundred and forty by the city-constables; exclusive of these, a great number of lamps were hung against the houses on each side the way, decorated with flowers and greens made into garlands. The whole formed a very pleasing sight, and gave the highest satisfaction to the royal pair.

It is also to be remarked, that the year 1512 was the first year that the Italian form of masquerade was introduced into this nation; when king Henry, on Twelfth-night, with eleven more, disguised with long flowing garments, wrought all in gold, and with masks and caps of gold tissue, preceded by six gentlemen also in masquerade, with silk garments, and torches in their hands, entered the ball-room after supper, and each took out a lady to dance; and thus continued the rest of the evening.

In the year 1514, the land-holders about Islington, Hoxton, and Shoreditch, had inclosed their grounds so that the citizens were debarred from their accustomed exercises and sports in these fields, or if they pursued them were indicted as trespassers. The populace, irritated at this treatment, and instigated by a fellow who ran about the streets, in a merry-andrew's coat, calling for spades and shovels, assembled in great numbers, and with these implements soon levelled the fences. On this the king sent commissioners into the city to inquire into the cause of this tumult, who, being met in the convent of the Grey Friars, summoned the lord-mayor and aldermen before them to give an account of the matter; when they reprimanded these magistrates for not being more careful of the peace of the city, and strictly enjoined them to prevent such occurrences in future.

Fabian says, that, in 1515, the Thames was frozen so hard that carriages of all sorts passed between Westminster and Lambeth upon the ice.

It was an ancient custom, says Hall, in his Chronicle, for the citizens of London to celebrate May-day, by diverting themselves in the neighbouring woods and meadows; and, continues this historian, this diversion was become so great a fashion, that it engaged the king and queen, this year, attended by their nobles, to ride a-maying, from Greenwich to the top of Shooter's hill, on May-day in the morning. In this excursion, their majesties were designedly met by two hundred yeomen, clothed in green, with green hoods, and bows and arrows, under a captain named Robin Hood. Robin intreated the king to stop and see his men shoot, which they performed most dextrously at once, at his whistle; and their arrows were so contrived in the heads, that they also whistled, when shot off, with a strange and loud noise, that greatly delighted his royal gueits, whom Robin afterwards conducted to the

the green-wood, and entertained plentifully with wine and venison, under arbours made of boughs and decked with flowers; as related more fully under the article *GAME*, vol. viii. p. 203.

The more we consider these anecdotes, the more we become acquainted with the characteristic manners of our ancestors, the inhabitants of London, a knowledge of which Time would have deprived us by mowing down monuments and archives, had not the care of divers historiographers saved them from the fury of his all-levelling scythe. See the article *GAME*, vol. viii.

On account of a commotion that took place in London respecting the number of foreign traders, and chiefly Dutchmen, who brought numerous articles ready manufactured, to the injury of the citizens, cardinal Wolfey sent for the mayor, and advised him to be on his guard, and prevent the like disturbances for the future. To effect this, he summoned the aldermen, about four o'clock in the afternoon preceding May-day, to meet him at Guildhall immediately. The assembly being met, they, with the approbation of the cardinal, came to the following resolution: That every man should be commanded to shut up his doors, and keep his servants within. In consequence of which, an order was made and published by the alderman of each respective ward, that no man, after nine o'clock, should stir out of his house, but keep his doors shut, and his servants within, till nine o'clock in the morning. Before this order was properly dispersed, it unluckily happened that sir John Mundy, in his way home, was rudely treated by two young men playing at bucklers in Cheap, one of whom he ordered to be sent to the Compter. Many 'prentices who were by, rescued the young man from the alderman, crying out, "'Prentices! 'prentices! Clubs! clubs!" on which so great a body assembled with clubs and other weapons, that the alderman was put to flight. These were increased by a number of serving-men, watermen, and others; and, by eleven o'clock at night, there assembled in Cheap about seven hundred, and in St. Paul's church-yard three hundred. They proceeded in a body to the Compter, which they broke open, and released the rioters who had been committed there by the mayor for assaulting foreigners; after which they went to Newgate, and took out Studley and Betts, committed for the like offence. A proclamation was issued by the mayor and sheriffs, in the king's name, but without effect. The mob increasing, they threw sticks and stones at many strangers as they passed, particularly one Nicholas Dennis, a serjeant at arms, who, being much wounded, cried out, "Down with them." This heightening their resentment, they broke the windows and doors of the houses in St. Martin's-le-Grand, and plundered the house of one Mewtas, a Frenchman, in Leadenhall-street, whom they intended, had they met with him, to have destroyed. Early in the morning they dispersed, from an apprehension of being overpowered by the forces preparing to march into the city, under the command of the earls of Shrewsbury and Surry.

At length, by the diligence of the mayor, three hundred of them were taken, and committed to the Tower, Newgate, and the Compters; and about five o'clock in the morning the riot subsided. Among those committed to the Tower was Dr. Bell, for preaching a seditious sermon. A commission of oyer and terminer was immediately made out for the trials of the offenders, on the 2d of May, at Guildhall. On their arraignment they pleaded Not guilty, and their trials were postponed till the 4th of May. The commissioners appointed for this purpose were, the lord-mayor, the earl of Surry, and the duke of Norfolk, who came into the city escorted by thirteen hundred men; and the prisoners, to the amount of two hundred and seventy-eight, some men, some lads not exceeding fourteen years of age, were brought through the city tied with ropes. On the first day, John Lincolne and several others were indicted and found guilty; and the next day thirteen were condemned to be drawn, hanged, and quartered. For this purpose, and to strike a greater terror, ten pair of gal-

lows were set up at the following places: Aldgate, Blanchapelon, Grafs-street, Leadenhall, opposite each Compter, Newgate, St. Martin's, Aldersgate, and Bishopsgate. They were made to run on wheels, for the better convenience of removing them to such places as might be properly adapted for the execution of so many rioters. Some little time after sentence was passed, Lincolne, Sherwin, and the two brothers named Betts, were drawn upon hurdles to the standard in Cheapside. The first was executed; but, as the others were near being turned off, a reprieve came from the king, to the universal joy of the populace, who unanimously cried out, "God save the king."

On the 11th of May, the lord-mayor, aldermen, and recorder, dressed in mourning gowns, waited on the king, who then resided at Greenwich; and, being admitted to the door of the privy-chamber, from whence his majesty came, attended by several of his nobles, the recorder, in the name of the rest, falling on his knees, addressed the king in the following words: "Most natural, benign, and our sovereign lord! We well know that your grace is highly displeased with us of your city of London, for the great riot done and committed there; wherefore, we assure your grace, that none of us, nor no honest persons, were condescending to that enormity; yet we, our wives and children, every hour lament that your favour should be taken from us; and, so far as light and idle persons were the doers of the same, we most humbly beseech your grace to have mercy on us for our negligence, and compassion on the offenders for their offences and trespasses."

The king, in his answer, accused them of negligence in opposing the rioters, and conniving at their proceedings: "Therefore," said he, "we will neither grant you our favour nor good will, nor to the offenders mercy; but resort to our lord chancellor, and he shall declare to you our pleasure."

The king being expected at Westminster on the 22d of May, they, by the direction of the chancellor, resolved to wait upon him. Accordingly, on that day, the lord-mayor aldermen, and principal commoners, attended in their liveries; when his majesty, being seated under a canopy of state at the upper end of the hall, ordered the prisoners to be brought before him. They were accordingly brought in their shirts, bound together with ropes, and halters about their necks, to the number of four hundred men and eleven women; which sight had such an effect on the principal part of the nobility, that they warmly solicited the king for their pardon. Silence being proclaimed, and the city magistrates and commonalty ordered into the king's presence, the cardinal-chancellor reprimanded them for their negligence; and, then addressing himself to the prisoners, said that for their offences against the laws of the realm, and against his majesty's crown and dignity, they had incurred the punishment of death. On the close of these words, the people, with piteous lamentation, cried out, "Mercy, gracious lord! mercy!" This wrought so effectually on the king, that he yielded to the intreaties of his courtiers, and pronounced their pardon. Their halters were immediately taken off, and the people universally shouted, "Long live king Henry VIII." Before they were dismissed, the cardinal exhorted them to preserve loyalty and obedience to the king; which they faithfully promised, and expressed the most unbounded thanks for the clemency they had received. The day on which this riot happened, was long known by the name of *Evil May-day*; and this circumstance greatly diminished the May-games, which were before exhibited on setting up the great shafte, or May-pole, in Leadenhall-street, before the church thence termed the church of St. Andrew Under-shaft. See the article *GAME*, vol. viii. p. 202, 3.

The city magistrates were soon after restored to the king's favour, through the mediation of cardinal Wolfey, who had an entire ascendancy over the king, and was supposed to have been amply rewarded for his services on this occasion.

The Court of Requests, otherwise called a Court of  
U  
Conscience;

Confidence, was erected in the year 1518. At this time the city in particular, and the whole kingdom in general, were visited again with that most dreadful epidemical disease, termed the  *sweating sickness*. The effects were very sudden; for it proved fatal in three hours after the patient was affected. When it first began, the king's court was exceedingly splendid and numerous, on account of the queen of Scotland being in London upon a visit to her brother; but the dreadful havoc which the sickness made soon thinned it. That prince retired to Berwick; the law-terms were adjourned; and the king, to keep the infection as much as he could from his family, reduced his officers and domestics to a very small number. It was computed, that in some towns half, and in others one third, of the inhabitants died of this dreadful distemper.

The act for licensing practitioners in physic, passed a few years before, having brought the faculty into better repute, the most able physicians now sought to keep ignorant pretenders entirely out of the profession, and, for that purpose, applied to the king for a charter of incorporation, to enable them to frame proper regulations for practitioners. Henry complied with their request, and granted them a charter in this year, which was confirmed by parliament in 1523, with additional privileges.

When we consider that the city-ditch, which ran and spread its mephitic exhalations from Aldgate to the postern on Tower-hill, cost no more than 95l. 3s. 4d. this year to be entirely cleaned, and compare it with the enormous expense attending such works in our days, we may esteem as near as possible the difference between the value of the representative coin of that age with our's, and the salary of labourers. The chief ditcher had seven-pence per day, the second sixpence, and the others five-pence each; the vagabonds (for that was the term applied to the labourers, not with any view of contempt, but because they used to go and get work independently from one place to another, from the Latin *vagari*, "to go about,") had only one penny, and meat and drink at the charge of the city. Yet, when we recollect that three half-pence could buy a fat capon, then we find the equilibrium still holding fast between the price of labour and that of provisions.

The city of London, in 1622, was roused to the enjoyment of parades and shows, of which large communities of men are generally so fond, by the arrival of the emperor Charles V. in England on a visit to Henry VIII. who met him at Dover, and conducted him to Greenwich, where he was received by the queen, attended by the principal nobility. On their entrance into the city, the lord-mayor, aldermen, and sheriffs, received them in their formalities, attended by the principal citizens on horseback, richly accoutred; on which occasion the streets were decorated with the most pompous ornaments, and a variety of magnificent pageants. The emperor was conducted to Blackfriars, the place appointed for his residence, and the princes and nobility of his retinue to the new palace at Bride-well. The emperor staid six weeks in England, and, before his departure, was installed a knight of the order of the garter.

This year also, Henry received a visit from Christian king of Denmark, and his queen. On their arrival, they were received by the mayor and citizens, who conducted them with great pomp to the bishop of Bath's palace, the place appointed for them during their stay. St. Peter's eve happening before their departure, their majesties, attended by the principal nobility, went to see the pompous march of the city-watch; for which purpose they were conducted to the King's Head, in Cheap-side, where they were highly pleased with the novelty of the sight, and afterwards elegantly entertained by sir Thomas Baldry, the mayor.

The war with France, which began about this time, forced the king to demand a loan of 20,000l. from the good and ever-loyal city of London. Some resistance was made; but, the king granting an obligation for repay-

ment signed by himself and the cardinal, the matter was easily adjusted.

The low rate of house-rent at this time shows, that, even in London, there was but little wealth, compared with the present times. Howell, in his *Londinopolis*, p. 110, says, "That an ancient grammar-school in Bow church-yard, being decayed, the school-house was let out for rent, about this time, at four shillings yearly, a cellar at two shillings, and two vaults under that church, both for fifteen shillings."

Much about this time, says Howell, in the same work, soap began first to be made in London; "before which time, that city was served with white soap from beyond sea; and with grey soap, speckled with white, very sweet and good, from Bristol, sold here for a penny the pound, and never above a penny-farthing; also black soap for a halfpenny the pound."

By an act of parliament, of the fourteenth and fifteenth of Henry VIII. cap. 2. for settling how many apprentices and journeymen (not denizens) should be kept by foreign trademen in London, &c. great powers were given to the corporations of handicrafts over the workmanship of these foreigners, there being, in those times, smiths, joiners, coopers, &c. who were foreigners, and had seals or stamps put on their works, after being examined by the wardens of those corporations. The jurisdiction of the London corporations was, by this act, to extend two miles beyond the city, viz. "within the town of Westminster, the parishes of St. Martin in the Fields, and our Lady in the Strand, St. Clement's Danes without Temple-bar, St. Giles's in the Fields, St. Andrew's in Holborn, the town and borough of Southwark, Shoreditch, Whitechapel parish, St. John's-street in Clerkenwell, and Clerkenwell parish, St. Botolph without Aldgate, St. Catharine's near the Tower of London, and Bermondsey-street."

This is an authentic view of the suburbs of London in 1524. We are not, however, to imagine that they were all contiguous to each other, as at present: the Strand was then chiefly taken up with the capital dwellings of the nobility, which had large gardens adjoining; and a considerable part of the parishes of St. Martin and St. Giles were literally in the fields, as was the northern part of St. Andrew's in Holborn, and a great part of Westminster, Clerkenwell, Shoreditch, Whitechapel, and Southwark.

The re-appearance of the plague, and the disputes about foreign traders, filled up the ensuing year. In 1527, cardinal Wolfey being appointed ambassador extraordinary to the court of France, on his way thither he rode through the city in the greatest pomp, attended by a numerous train of the chief nobility, gentry, and prelates, who, together with his and their domestics, formed a body of twelve hundred horsemen. This magnificent cavalcade was preceded by sixty sumpter-horses and mules, and eighty baggage-carriages, which were followed by a great number of gentlemen, three in a rank, richly dressed in velvet, with large golden chains about their necks; then followed two gentlemen, each carrying a very large silver cross; next came two others, with a stately silver column each, followed by two other gentlemen, one carrying the great seal of England, and the other the cardinal's hat; after them rode a gentleman, carrying the cardinal's port-manteau of scarlet, richly embroidered, with a cloak therein; then came the cardinal, gorgeously apparelled, mounted on a stately mule, followed by a led horse, and a mule trapped with crimson velvet; then came the nobility, gentry, and clergy, followed by his and their domestics, all clothed in dark orange-coloured coats, with T. C. that is, Thomas, Cardinal, embroidered on them.

In the same year, two ambassadors extraordinary from the court of France made their public entry into London, attended by a great number of their countrymen of the first quality. Apartments were provided for them and their retinue in the bishop of London's palace; where each of them was presented by the mayor, in the name of

the corporation, with five fat oxen, twenty sheep, twelve swans, twelve cranes, twelve pheasants, four dozen of partridges, twenty loaves of sugar, eight hogsheds of wine, and all sorts of spices, fruit, &c.

Corn was at this time so scarce, that many of the poorer fort perished for want, and a general famine was apprehended. This dreadful calamity was, however, stopped in London, by a supply of a thousand quarters of corn given by the king, and by the importation of vast quantities of grain from the continent; while, by the diligence and care of the mayor and sheriffs, in preventing the bakers' carts coming from Stratford from being plundered, the Londoners were better provided, and sooner relieved from their distresses, than any other part of the nation.

In 1528 the sweating sickness broke out again with such violence as to carry off vast numbers of its victims after an illness of five or six hours; which occasioned the adjournment of the term, and prevented the annual solemnity of the marching of the city-watch; the latter, on account of its expense to the city, was afterwards forbidden by the king, and was discontinued until the 2d of Edward VI.

The following year was particularly remarkable for the proceedings on account of the divorce of Henry from queen Catharine. The collateral consequences of this divorce, were the fall of Wolsey, and the great work of the REFORMATION. See that article; and the article ENGLAND, vol. vi. p. 635-639.

The behaviour of the Londoners, who in every instance obeyed the king's pleasure, and concurred with his majesty in his measures to cast off the Romish yoke, pleased him so, that he expressed his regard and grateful affection for them by cancelling the letters patent, granted by himself to sir William Sidney, on the 18th of June, in the thirteenth year of his reign, relating to the great beam and common balance, and restoring the citizens to the tronage, or right of weights and beams, as it had been granted them by king Edward II. and king Henry IV. and had been ratified and confirmed by his own charter to the citizens, dated on the 12th of July, in the first year of his reign.

The delicate business of the divorce of Henry from Catharine having been ultimately settled by Cranmer, who, on the 28th of May, 1533, gave judgment on the marriage with Anne Boleyn, which had been privately celebrated six months before, and declared it to be good and valid;—the king ordered the lord-mayor to make all preparations necessary for conducting her from Greenwich to the Tower by water; and also that the city might be decorated on her proceeding from thence to Westminster. Thus the fantastic mind of the monarch, doting upon the present object of his unruly passion, decorated the future victim of his fickleness and cruelty with all the pageantry he was able to exact from the ever-loyal city of London. However the lord-mayor, in compliance with the royal mandate, ordered all the city companies to attend him on the 29th of May, at Billingsgate, with their barges properly decorated, and good bands of music. In consequence of this, fifty barges were prepared, and about one o'clock set off to attend the lord-mayor's barge, which was richly ornamented; with strict orders to keep at a proper distance from each other during the procession. The city-barge was covered with gold brocade and silken sails, with two rich standards of the royal arms at the head and stern; and a great variety of streamers and flags, containing the arms of the lord-mayor's company, and those of the merchant-adventurers. Before the city-barge was one mounted with ordnance, carrying figures of savages, dragons, and other creatures, vomiting out fire and smoke, and making an incessant noise. On the left of the city-barge was one representing a mount, on which stood a white falcon crowned, perched on a golden stump, encircled with red and white roses; and round the mount sat beautiful vir-

gins, singing and playing melodiously on instruments of music. After these followed all the companies' barges in their proper order; and the whole formed a most beautiful and splendid appearance. The queen was highly pleased with the magnificence of the procession; and, on her arrival at the Tower of London, she returned the mayor and citizens her sincere thanks for their pompous attendance.

On the 31st of May, being the day appointed for her majesty's procession to Westminster, she was received at the Tower-gate, by the lord-mayor in a gown of crimson velvet, and a rich collar of SS. attended by the sheriffs and two domestics in red and white damask. From the Tower to Temple-bar the streets were new gravelled, and railed on each side; within which, in Gracechurch-street, stood the company of Hanseatic merchants; and next to them the several corporations of the city, in their respective formalities, reaching to the aldermen's station at the farther end of Cheap-side. On the outside were placed the city-constables, dressed in silk and velvet, with staves in their hands to keep off the crowd and prevent disturbances. Goldsmith's Row, in Cheap-side, was hung with velvet and gold brocades; and Gracechurch-street, and Cornhill, with crimson and scarlet cloth.

Twelve of the French ambassador's servants preceded the procession; they were dressed in blue velvet, mounted on horses trapped with blue sarsnet, interspersed with white crosses; after whom marched those of the equestrian order, two and two, followed by the judges in their robes; after them the knights of the bath, in violet gowns trimmed with miniver; then the abbots, barons, bishops, earls, and marquises, in their robes, two and two; after these the lord-chancellor, the Venetian ambassador, and the archbishop of York; next, the ambassador of France and the archbishop of Canterbury, followed by two gentlemen who represented the dukes of Normandy and Aquitaine; then proceeded the lord-mayor of London, with his mace and coat of arms; then the duke of Suffolk, lord high steward, and the lord Howard as deputy-marshal of England. Next followed all the other great officers of state, in their robes, carrying the symbols of their several offices; these were followed by the nobility, in crimson velvet, and all the queen's officers in scarlet, followed by her chancellor uncovered, who immediately preceded his mistress sitting in a litter or chair covered with tissue of silver, and drawn by two beautiful pads, clothed in white damask, and led by her footmen. The charming young queen was dressed in a silver brocade, with a mantle of the same, furred with ermine: her hair hung loose, and on her head was a chaplet adorned with jewels of inestimable value. Over the litter was a canopy of cloth of gold, supported by sixteen knights alternately, four at a time, with a silver bell hanging at each corner. Her majesty's chamberlain followed next, and after him her master of the horse, leading a stately pad with a side-saddle and trappings of silver tissue; next to these came seven ladies in crimson velvet, faced with gold brocade, and mounted on beautiful horses richly trapped with gold; these were followed by two chariots covered with cloth of gold, in which were the duchess of Norfolk and marchioness of Dorset in the first, and in the second four ladies in crimson velvet; next came several ladies in the same apparel on horseback, adorned with beautiful trappings; then a third chariot all in white, carrying six ladies in crimson velvet; then a fourth all in red, in which were eight ladies in the same dress; then thirty gentlewomen, attendants on the ladies of honour, on horseback, dressed in silks and velvets; and the whole was closed by the guards, well mounted and elegantly accoutred.

On her majesty's arrival in Fenchurch-street, she stopped at a beautiful pageant, crowded with children in mercatorial habits; who, in a studied address, congratulated the queen on her happy arrival. She then proceeded to Gracechurch corner, where was erected a magnificent pageant, representing Parnassus, with the fountain of Helicon, in  
white

white marble, from which were four springs issuing out Rheneish wine, which centered in a small globe at the summit, and continued running plentifully all day; on the mount sat Apollo, and at his feet Calliope; under whom were the rest of the muses playing on musical instruments; and at their feet were inscribed, in letters of gold, epigrams adapted for the occasion. At Leadenhall was another stately pageant, representing a hillock encompassed with red and white roses; above which was a golden stump, and a little higher a tippe, with a celestial rose, from which descended a white falcon, which perched on the stump; this was soon followed by an angel in a celestial choir, who put a crown of gold upon his head. On the hillock, a little lower, sat St. Anne, surrounded by her progeny, one of whom addressed the queen in a speech, wishing her majesty blessed with a happy issue.

At the conduit in Cornhill, the Graces sat enthroned, with a fountain before them incessantly playing with wine, and underneath a poet describing their peculiar qualities, and presenting the queen with their several presents. The great conduit opposite Mercers' hall, in Cheapside, was beautifully painted with a variety of curious emblems, and which, for the entertainment of the populace, ran all day with a diversity of rich wines. The standard in Wood-street was beautifully ornamented with royal portraits, encompassed by a number of flags, on which were painted coats of arms and trophies; and above was a fine concert of music, both vocal and instrumental. When her majesty arrived at the aldermen's station, near the little conduit, at the upper end of Cheapside, John Baker, the recorder, after addressing her with an elegant speech, presented her, in the name of the citizens, with a purse of gold tissue, containing one thousand marks, which her majesty gratefully received. On the little conduit, in a rich pageant, were seated Pallas, Juno, and Venus; before whom stood Mercury, who, in their names, presented the queen with a golden ball trebly divided, representing the three gifts of wisdom, riches, and felicity. At the gate of St. Paul's a stately pageant presented itself, in which three ladies, sumptuously dressed, with chaplets on their heads, exhibited various inscriptions adapted for the occasion. As her majesty passed St. Paul's school, she was highly entertained with verses made by the scholars in praise of herself and the king.

The prison of Ludgate was beautifully ornamented, and on the top were men and boys singing a concert during the procession. A handsome tower, with four turrets, was erected at the end of Shoe-lane, Fleet-street; in each turret stood a cardinal virtue, with its symbols; these, addressing themselves to the queen, promised never to forsake her, but be always her constant attendants. The conduit ran the whole time with variety of wines, and in the tower was a fine concert of music. At Temple-bar her majesty was again entertained with songs in concert by men and boys; and, proceeding from thence to Westminster, she there dismissed the lord-mayor, returning him her sincere and hearty thanks for his good offices, and those of the citizens, on this occasion.

The following day being appointed for her majesty's coronation, the lord-mayor, dressed in crimson velvet, with his collar of SS, attended by the aldermen and sheriffs in scarlet, repaired to Westminster, where they performed their several offices belonging to that ceremony; and, on the Wednesday following, the king sent for the mayor and aldermen to Westminster, who attending accordingly, his majesty returned them thanks for their good services both to himself and the queen.

A short time before this, a grand entertainment was given at Ely House, by eleven gentlemen of the law, on their promotion to the dignity of the coat. The guests were the king, the foreign ministers, the pages, master of the rolls, masters in chancery, and sergeants at law; the lord-mayor, aldermen, sheriffs, livery-men, and principal merchants; and the entertainments lasted for four days. A part of

the bill of fare, which is preserved, will show the disparity between the prices of provisions at that period and at this time; it is as follows:

	l.	s.	d.
Twenty-four large oxen, each at	-	-	8
The carcass of a large ox	-	1	6
One hundred sheep, each at	-	0	2
Fifty-one calves, each at	-	0	4
Thirty-four hogs, each at	-	0	3
Ninety-one pigs, each at	-	0	6
Ten dozen capons of Greece, each at	-	0	1
Nine dozen and a half of Kentish capons, at	-	0	1
Nineteen dozen of common capons, at	-	0	6
Seven doz. and nine of grose, or heath-cocks, at	0	0	3
Fourteen doz. and eight common cocks, at	0	0	3
The best pullets, at	-	-	2 $\frac{1}{2}$
Common ditto, at	-	-	2
Thirty-seven dozen of pigeons, per dozen	-	0	10
Three hundred and forty doz. of larks, per doz.	0	0	5

By an act of the twenty-fourth of Henry VIII. cap. 5. beef, pork, mutton, and veal, were first directed to be sold by weight; no person to take above one halfpenny for a pound of beef or pork, nor above three farthings for mutton or veal. On this occasion, James Howell, in his Londonopolis, remarks, that the number of butchers in London and its suburbs, did not then exceed eighty, each of whom killed nine oxen weekly. But this law was afterwards repealed, and the regulation of the prices referred to a committee of the privy-council.

About this time Mr. Tindall and others translated and published the New Testament in the English tongue; but Stokesley, bishop of London, procured as many copies of it as he could, and caused them to be burnt at St. Paul's cross. One Pavier, town-clerk of London, destroyed himself about this time, according to Hollinghed, who affirms that he had heard him say "with a great oath," that rather than live to see the Scripture set forth in English, he would cut his own throat.

In or about the years 1511 and 1512, to 1534, the trade of London began to extend itself towards the south and the east in the Mediterranean Sea; for Hakluyt tells us of "tall ships that had then an usual trade to Sicily, Candia, and Chios; and sometimes to Cyprus, to Tripoli, and Baruth in Syria." They exported sundry sorts of woollen cloths, calf-skins, &c. and imported silks, camblets, and rhubarb; malmsey, muscadell, and other wines; oils, cotton-wool, Turkey carpets, galls, and India spices; yet, in those days, they were generally twelve months in those voyages, as were two ships going this year from London to Candia and Chios; which voyage was found so hazardous and dangerous, that one of these ships was put into Blackwall-dock, and never more went to sea. In the next year a ship of three hundred tons, with one hundred persons on-board, went from London on the same Levant voyage, and returned in eleven months, having settled factors in those places.

In 1537, coals were sold at Newcastle at two shillings and two-pence per chaldron; "wherefore," says Maitland, "I imagine that they were then sold in this city at about four shillings."

At this time also, several religious establishments were suppressed, preparatory to the general dissolution of monasteries. The black, white, and grey, friars, and the Charter-house monks, underwent the same fate.

About the year 1539, the stews, which had been hitherto licensed on the Bank-side, in Southwark, were put down by the king's proclamation and sound of trumpet.

On the arrival of Anne of Cleves, Henry's fourth bride, she was met on Blackheath, on the 3d of January, 1540, by the Hanseatic merchants, and those of Genoa, Florence, Venice, and Spain, resident in the city of London, together with a number of the principal citizens, common-councilmen, and aldermen, to the number of one hundred and sixty, richly dressed in velvet, with chains of gold, and

and mounted on stately horses, and accompanied by the king, divers foreign princes, the nobility, and the lord-mayor, was conducted in great magnificence to the royal palace at Greenwich. The marriage was solemnized on Twelfth-day; and on the 4th of February, being the day appointed for their majesties' removal to Westminster, the lord-mayor and aldermen, in the city-*barge*, attended by the twelve principal companies, in their respective barges, most pompously equipped, repaired to Greenwich, whence they conducted the king and queen by water to Westminster.

The metropolis was at this period the unfortunate witness of the wanton cruelties committed by Henry in his unruly, fickle, and ferocious, humour; for several of the squares and streets of London reverberated the flames kindled to devour promiscuously papists and protestants, the victims of his infernal passion.—*Tros rutulysve fuat, nullo discrimine habetur.*—Dr. Barnes, who had made a figure in an embassy to the German princes; Thomas Gerard, a reforming minister; and William Jerome, vicar of Stepney, who had been, unheard, attainted of heresy by the parliament; were now condemned to the stake; but, when they came there, neither they nor the sheriff knew for what they suffered. Along with them Gregory Buttolph, Adam Damplip, and Clement Philpot, (all papists,) were hanged, drawn, and quartered, for denying the king's supremacy. To increase the absurdity of this indiscriminate cruelty, they were drawn to the place of execution on three hurdles, a catholic and a protestant on each. This horrid scene caused a foreigner, who was a spectator of it, to exclaim; "Good God! how unhappy are the people of this country, who are hanged for being papists, or burnt for being enemies to popery."

In the year 1541 also, much blood was shed on the scaffold, and many persons of different ranks were executed. The most illustrious of these victims was the aged countess of Salisbury, the last of the royal race of the Plantagenets. This venerable matron had been attainted by parliament in 1539, and had been kept in prison from that time. Without regard to her sex, her age, or her royal descent, she was brought to a scaffold in the Tower, on the 27th of May, to be beheaded, where, though in her seventieth year, she behaved with wonderful spirit and magnanimity. When desired to lay her head upon the block she obstinately refused, saying, "I am no traitor; I have done nothing to deserve death; if you will have my head," shaking her grey locks, "you must get it as well as you can." In consequence of this, she was rather butchered than beheaded. *Herbert.*

But let us draw a veil over these scenes of blood, and seek in the pages of the history of our metropolis for some more pleasing subjects.—The improvements made in the city, at this time, were very considerable, and most conducive to the comforts and happiness of the Londoners. Robert Brocke, chaplain to the king, invented a method of making leaden pipes for conveying water more easily and less expensively, under ground, without using solder. Robert Cooper, a goldsmith of London, was the first who made them, and put the invention in practice. An act of parliament was passed in this year for paving the following streets in London; viz. the street leading from Aldgate to Whitechapel-church; the upper part of Chancery-lane; the way leading from Holborn-bars, westward, towards St. Giles's in the Fields, as far as any habitation was on both sides of the said street; Gray's-inn-lane, Shoe-lane, and Fetter's-lane, now Fetter-lane; the two last being thorough-fares and passages from Fleet-street into Holborn.

On the 12th of February, 1542, Catharine Howard, king Henry's fifth wife, and her confidante lady Jane Rochford, were beheaded on a scaffold, erected within the Tower of London. This new act of cruelty seemed to have called down the vengeance of the Almighty upon earth; for we find that about this time the price of meat was so considerably increased by a great mortality among

the cattle, that the mayor and common-council made a sumptuary law to restrain luxurious feasting, wherein it was ordained, that the lord-mayor should not have more than seven dishes at dinner or supper; the aldermen and sheriffs were limited to six, the sword-bearer to four, and the lord-mayor's and sheriff's officers to three; upon penalty of forty shillings for every supernumerary dish. It was likewise enacted, that neither the lord-mayor, aldermen, nor sheriffs, should buy cranes, swans, or bustards, after the ensuing Easter, under the penalty of forty shillings for every bird so bought; but the purchaser was at liberty to clear himself by his own oath.

Considering these laws with attention, it occurs to our mind, that the manner of private living at those times must have been very different from what is the case at this moment; for, except in some particular instances, two dishes often constitute the bill of fare of the best tables in the city, when no company is either invited or expected; a dish of fish and a piece of boiled or roasted meat make the whole of the dinner; as to pies and puddings, it is not to be supposed that they were understood or included in the tenor of the law. The French, who are fond of many dishes, seem to have been at that time the model for furnishing English tables; but, since we have returned to our ancient simplicity in that particular, we have certainly improved our moral and corporal strength; yet we do not mean to set up the citizens of London as examples of Lacedemonian self-denial. As to the clause about swans, cranes, and bustards, this law became obsolete as soon as the refined palate of our ancestors rejected the coarseness of those fowls, and adopted the use of more delicate food.

The improvements about the paving of the streets of London, and the regulations concerning them, were at this period in great vigour; and, to what we have noticed before, may be added, that it was ordained by an act of parliament, that the lord-mayor, aldermen, &c. of London, "shall have power to inquire into, hear, and determine, the defaults of paving and reparation of streets; and that any three justices in London, whereof the mayor to be one, may set fines upon such as do not pave and repair any street or lane in London, or the liberties thereof, to be levied by distress or action, &c. by the chamberlain, to the use of the mayor and commonalty of the said city." And it was further enacted, "That the conduits of London should be made and repaired, for the better watering of the city and its liberties; and that the mayor and citizens should have power to bring water to the said conduits from Hampstead-heath, Marybone, Hackney, and Muswell-hill, upon their indemnifying the owners of lands for damages that might be done by the said water-courses, &c."

The plague raged so violently in London during this year, that a great number of the citizens fell victims to it, and the term was adjourned to St. Alban's.

Sir John Allen, who had served the office of lord-mayor in 1535, and was honoured with the rank of a privy-counsellor, died this year. By his will he gave a rich collar of gold to be worn by future lord-mayors, and five hundred marks to be a stock for sea-coal; he also directed the rents of his lands, purchased of the king, to be distributed yearly to the poor in each ward for ever; besides many other liberal benefactions to the prisons, hospitals, leazar-houses, and the poor of other parts within two miles of the city. He was buried in a chapel belonging to St. Thomas of Acres, which he had built.

In the year 1545, the twelve city-companies advanced the king 21,263l. 6s. 8d. upon a mortgage of crown-lands, towards the charges of his war with Scotland. This, however, being found insufficient, his majesty afterwards sent commissioners into the city to assess the Londoners, in an arbitrary manner, by way of *benevolence*. Alderman Richard Read not only objected to this illegal proceeding, but positively refused to pay the sum demanded of him; for which Henry, whose tyrannical spirit would en-

sure no opposition, enrolled him as a foot-soldier, and sent him to Scotland with the army, where he was taken prisoner; and, after undergoing very severe hardships, was obliged to pay a considerable sum for his liberty.

The following anecdote, being not unlike several supposed facts which we have heard of in the last and present centuries, will be acceptable to our readers; to those who are fond of the marvellous, as well as to the suspending mind that seldom believes until conviction puts her seal upon the deed. Stow says; "In the year 1546, the 27th of April, being Tuesday in Easter-week, W. Foxley, pot-maker for the Mint in the Tower of London, fell asleep, and so continued sleeping, and could not be awakened with pricking, cramping, or otherwise burning whatsoever, till the first day of the next term, which was full fourteen days and fifteen nights, for that Easter-term beginneth not afore seventeen days after Easter. The cause of his thus sleeping could not be known, though the fame were diligently searched for by the king's physicians and other learned men; yea, the king himself examined the said W. Foxley, who was in all points found at his wakening to be as if he had slept but one night; and he lived more than forty years after in the said Tower, to wit, until the year of Christ 1587, and then deceased on Wednesday in Easter-week."

Edward VI. succeeded to the crown, by the demise of his father, in the 9th year of his age. The first act of his power was exercised in knighting the mayor of London; for, on the 6th of February, 1557, the lord-protector, the duke of Somerset, having knighted the young monarch in the presence of the lord-mayor and many other lords and gentlemen; immediately after, the king, standing under his canopy of state, took the sword from the lord-protector, and conferred the honour of knighthood on Henry Hoblethorn, the lord-mayor.

In this year, according to Howell, in his *Londinopolis*, the price of Malmsey wine, the only sweet wine then imported, and that by the Lombards alone, was but three halfpence the pint; for which he quotes the church-wardens' accounts of St. Andrew Underhaft, from which it appears that they had "paid ten shillings for eighty pints of Malmsey, spent in the church."

Some regulations about labourers were found necessary at this time; and, as they were peculiarly calculated to keep peace and order in the metropolis, we must find place for them here. The combinations and conspiracies which were daily concerted by the journeymen and other workmen, being found very detrimental to trade, the parliament, among other things, enacted, "that, if any artificers, workmen, or labourers, do conspire, covenant, or promise together, that they shall not make or do their work but at a certain price or rate, or shall not enterprise or take upon them to finish that work which another hath begun, or shall do but a certain work in a day, or shall not work but at certain hours or times;—that then every person so conspiring, covenanting, or offending, being thereof convicted by witnesses, confession, or otherwise, shall forfeit, for the first offence, ten pounds, or have twenty days imprisonment; for the second offence, twenty pounds, or pillory; and for a third offence, forty pounds, or to sit on the pillory, and have one ear cut off, besides being rendered infamous, and incapable of giving evidence upon oath." In this act are included butchers, bakers, brewers, poulterers, cooks, &c. And all justices of the peace, mayors, bailiffs, &c. in their sessions, leets, and courts, have full power and authority to inquire, hear, and determine, all and singular the offences against this statute, and to cause offenders to be punished.

In the year 1548, the march of the city-watch, which had been discontinued by command of king Henry VIII. was revived by sir John Gresham, the mayor. The procession received an additional splendour from three hundred light horsemen, which had been raised by the citizens for the service of the king.

On St. Peter's day, Gardiner bishop of Winchester, a

zealous catholic, preached before the king, at Whitehall. He had been warned not to speak on controversial subjects, and the answer he gave was moderate and satisfactory; but, when in the pulpit, he forgot his promises, and warmly supported the real presence in the sacrament. The effect of this ill-judged conduct was grossly indecent. Each party, although in the church, and before the king, cried out aloud, and with vehemence, to support or to insult the preacher; and, on his leaving the pulpit, the impolite orator was taken to prison.

London was again visited by the plague in the month of July of this year, which carried off a great number of its inhabitants.

From Strype's Ecclesiastical Memorials, we learn, that, in this year, wheat sold at six shillings and eight pence per quarter; barley, malt, and rye, at five shillings; and pease and beans, at four shillings. And, by an act of parliament for regulating the purveyors of the king's household, the rate of post-horses was fixed at one penny per mile. House-rents must have been very low at this time; for archbishop Nicholson, in his Historical Library, says, "a house, in the very precincts of king Edward VI's court, in Chancel-row, Westminster, was let to no less a person than the comptroller of that king's household, for the yearly rent of thirty shillings." At a time like the present, when the above articles are so extravagantly advanced in price, owing to various circumstances, the reader will find amusement and interest in the foregoing account, by comparing the causes and the effects in the impartial balance of his judgment.

In the year 1550, the Thames at London-bridge was observed to ebb and flow three times within nine hours, occasioned by a strong easterly wind repelling the ebb before it could perform its natural course.

In this year a captain Bodenham made a trading voyage from London to the isles of Candia and Chios, in the Levant, from whence he loaded home with wines, &c. and returned in the following year.

The first parliament in Edward's reign having given all the lands and possessions of colleges, chantries, &c. to the king, the different companies of London redeemed those which they had held for the payment of priests' wages, obits, and lights, at the price of twenty thousand pounds, and applied the rents arising from them to charitable purposes.

The butchers of London having greatly enhanced the price of meat, owing to a combination between the graziers and fawsmen, the king and council, to restrain the like imposition for the future, fixed the prices of cattle sold in the different seasons, in the following manner:

<i>From Midsummer to Michaelmas.</i>		<i>l.</i>	<i>s.</i>	<i>d.</i>
The best fat ox, to be sold at	- - -	2	5	0
The best steers and runts	- - -	1	5	0
The best heifers and kine	- - -	1	2	0

<i>From Hollowmas to Christmas.</i>		<i>l.</i>	<i>s.</i>	<i>d.</i>
The best fat ox	- - -	2	6	8
The best steers and runts	- - -	1	6	8
The best heifers and kine	- - -	1	3	0

<i>From Christmas to Shrovetide.</i>		<i>l.</i>	<i>s.</i>	<i>d.</i>
The best fat ox	- - -	2	8	4
The best steers and runts	- - -	1	8	4

<i>From Shearing-time to Michaelmas.</i>		<i>l.</i>	<i>s.</i>	<i>d.</i>
The best fat wether at	- - -	0	4	4
If shorn	- - -	0	3	0
The best fat ewe	- - -	0	2	6
If shorn	- - -	0	2	0

<i>From Michaelmas to Shrovetide.</i>		<i>l.</i>	<i>s.</i>	<i>d.</i>
The best fat wether	- - -	0	4	4
If shorn	- - -	0	3	0

A great dearth happening the same year, the following prices of provisions were also fixed by the king and council:

	<i>s.</i>	<i>d.</i>
White wheat, the quarter, at	13	0
Red		

	s.	d.
Red ditto	11	0
All other sorts of ditto	8	0
The best malt, the quarter	10	0
Second sort ditto	8	0
The best barley, the quarter	9	0
Second sort	7	0
The best rye, the quarter	7	0
Second sort	6	0
The best beans and pease, the quarter	5	0
Second sort ditto	3	0
Oats, the quarter	4	0
The best sweet butter, the pound, at	0	1
Essex barrelled butter, the pound	0	0 $\frac{1}{2}$
All sorts of other barrelled butter	0	0 $\frac{1}{2}$
Essex cheese, the pound, at	0	0 $\frac{3}{4}$
All other sorts of ditto	0	0 $\frac{1}{2}$

On St. Barnaby's day, according to Howes's Chronicle, the high altar at St. Paul's church was pulled down, and a table placed where the altar stood, with a veil drawn beneath, and steps; and, on the next Sunday, a communion was sung at the same table; and, shortly after, all the altars in London were taken down, and tables placed in their room.

In 1551, the sweating sickness broke out again in London, and carried off a great number of people: "Eight hundred," says the above chronicler, "died in the first week: seven honest householders did sup together; and, before eight of the clock in the next morning, six of them were dead!"

The citizens of London having purchased of the king the manor of Southwark, with all its appurtenances, they became possessed of an hospital dedicated to St. Thomas the Apostle; which being greatly decayed, they repaired and enlarged the same at a considerable expence, for the reception of poor, sick, and helpless, objects. King Edward VI. also, but a short time before his death, founded Christ's Hospital in the Grey-Friars convent, for the relief and education of young and helpless children; and incorporated the governors by the title of "The mayor, commonalty, and citizens, of the city of London, governors of the possessions, revenues, and goods, of the hospitals of Edward VI. king of England, &c." He also gave the old palace of Bridewell to the city for the lodging of poor way-faring people, the correction of vagabonds and disorderly persons, and for finding them work.

The city having appointed Christ's hospital for the education of poor children, and St. Thomas's in Southwark for the maimed and diseased, the king formed these charitable foundations into a corporation; as appears by a charter granted for that purpose, wherein it is declared as follows: "And, that our intention may take the better effect, and that the lands, revenues, and other things, granted for the support of the said hospitals, houses, and poor people, may be the better governed, for the establishment of the same, We do will and ordain, that the hospitals aforesaid, when they shall be so founded, erected, and established, shall be named, called, and stiled, The Hospitals of Edward VI. of England, of Christ, Bridewell, and St. Thomas the Apostle; and that the aforesaid mayor, commonalty, and citizens, of London, and their successors, shall be stiled, the governors of the said hospitals of Bridewell, Christ, and St. Thomas the Apostle; and that the same governors, in deed, and in fact, and in name, shall be hereafter one body corporate and politic of themselves for ever. And we will that the same governors shall have perpetual succession."

On the sixth of July, 1553, Edward VI. died at Greenwich, and was buried in the chapel of his grandfather, at Westminster, with great funeral pomp, and the unfeigned mournings of an affectionate people. On the third of August following, queen Mary made her public entry into London, preceded by the lord-mayor in a crimson velvet gown, carrying a golden sceptre in his hand. A stage was erected without Aldgate, on which stood the

poor children of Christ's hospital, one of whom made an oration. On the last day of that month, the queen rode in great state from the Tower to Westminster; on which occasion many stately pageants were erected, the conduits ran with wine, and she was every where received with such respect by the citizens, that, on her alighting at Whitehall, she gave the lord-mayor her thanks. On the following day, she was crowned with the greatest magnificence; the lord-mayor, assisted by twelve of the citizens, officiating as chief butler; for which service the mayor received a gold cup and cover, weighing seventeen ounces, for his fee.

Nearly the whole of this reign exhibited the most disgusting scenes of persecution. The queen often promised toleration, and continually revoked her promises, or paralyzed them with such *provisos* as to distort entirely the intended effect.

The proposed marriage between Mary and Philip of Spain was announced to the council in the beginning of the year 1554; and, the very day after, the lord-mayor and aldermen were sent for to attend the court, and to bring with them forty of the principal commoners, to whom the lord-chancellor declared the queen's intention, requiring them to behave like good subjects on the occasion. Such was even then the high importance of the city of London, and of its magistrates, such their influence upon the mind of the rest of the nation, that the marriage of the queen was solemnly communicated to them, as if their approbation or disapprobation must be expected to have a sensible effect upon that of the nation in general.

The rebellion of sir Thomas Wyatt found the city in a strong attitude of defence. The citizens not only placed a considerable guard at every one of the gates, but raised five hundred men to march against Wyatt; this they did with such expedition, that, in two days after, they were sent down to Gravesend under the command of Alexander Bret, an experienced officer; where they were joined by the duke of Norfolk, and with him marched to Rochester, at which place Wyatt was, and had fortified the bridge. He and his men were offered a general pardon on their submission; but, this not being complied with, the duke advanced to attack him. On which captain Bret, who commanded the Londoners, drew his sword, and addressed them in the following words: "Gentlemen, nothing can be more barbarous and unjust than for us to fight against our friends and countrymen; especially considering that they are engaged in defence of the rights and liberties of our dear country, in opposition to the proud and imperious Spaniards, from whom, if the intended match succeeds, we can expect no other than to become their slaves. Therefore, as that worthy patriot, sir Thomas Wyatt, has laudably undertaken to protect and prevent us from being imposed upon by those lordly foreigners, I am humbly of opinion, that, instead of opposing, we ought, in duty to our country, to join him, for the more early obtaining so salutary an end." The Londoners were so highly pleased with this speech, that they not only cried out, A Wyatt, a Wyatt! but effectually turned their ordnance against the queen's forces, insomuch that they were obliged to retreat so precipitately as to leave their ammunition and cannon to be a prey to Wyatt, who marched the next day to Deptford, in his way to London. The citizens were so alarmed on this near approach, and the court thrown into such confusion, that even the judges and counsellors sat and pleaded in armour.

In this state of affairs, her majesty repaired to Guildhall, attended by the mayor, aldermen, and sheriffs, where she harangued them in a long and soothing speech, in which she accused Wyatt and his adherents of seeking nothing less than the total subversion of all good government. She insisted on her right to the crown, and declared she was wedded to the realm and to the laws of the country, which she loved as affectionately as a mother doth her children. She said she had no desire to marry any man, much less a prince who might hereafter be detrimental to the welfare

of her subjects. That, notwithstanding a match had been proposed, by her council, with the king of Spain, yet she was determined not to listen thereto without the concurrence of the parliament; and concluded with exhorting them to stand fast against these rebels. She knew that Wyatt had many friends in London; and therefore put the care of the city into the hands of the mayor and lord Howard.

On the 3d day of February, Wyatt and his army arrived in Southwark, when he was joyfully received, and supplied with all necessaries for his men. His intentions were to march into the city; but these were frustrated by the gates being shut, and the drawbridge cut down. He then marched to Kingston in order to pass the river, that he might attack them on the land-side; but the bridge was broken, and the opposite shore guarded by two hundred men. These he soon drove away with his ordnance; and ordered some sailors, who were under his command, to wade the river, and bring the barges that were moored on the other side; with which he so expeditiously repaired the bridge, that he was able to pass his army over it the night after. Having had the promise of his friends in London to join him, and to admit him into the city at a certain hour, he continued his march, with an intention to reach Whitehall the next morning by break of day. This scheme was rendered abortive by the carriage of one of his guns breaking at Turnham-green, where he was obliged to halt. The time he stopped there proved his destruction; for he lost the opportunity of joining his friends in London, who had promised to admit him into the city. This disappointment occasioned Harper, who had been very instrumental in bringing over Bret and his Londoners, to desert him; after which he discovered the whole design of Wyatt to the court. The example set by Harper was followed by many others; inasmuch that, in a few hours, he found himself forsaken by near one half of his army. Notwithstanding this, he continued his march, and, with the remains of his forces, arrived at St. James's. He there mounted his artillery on an eminence, and, having detached two companies, under the command of Cudbert Vaughan, to Westminster, left the principal part of his army with the artillery, and, at the head of five companies only, hastened away for London. At Charing-cross, he was attacked by sir John Gage, with a superior force; whom he not only repulsed, but obliged him to take shelter in the palace of Whitehall, where he left him, and continued his march towards the city. In his way thither, the earl of Pembroke, with his cavalry, harassed his rear, and cut off several of his men; and, when he arrived at Ludgate, instead of the easy entrance he expected, he found the gate shut, and lord Howard, who commanded within, scoffed at and reproached him. Thus circumstanced, and surrounded by enemies, who continued to assemble from every quarter, he attempted to retreat; but Pembroke's horse intercepted his return to Temple-bar. His men would have fought their way; but at that instant Clarenceux king at arms arrived from the queen with a promise of pardon for him and his men, if they would lay down their arms. Trusting to this, he surrendered to sir Maurice Berkeley; but the promised mercy was withheld, and Wyatt was shortly after executed on Tower-hill; his head was stuck upon the gallows at Hay-hill, near Hyde-park, and his quarters hung up in different parts of the city. A dreadful scene of persecution followed the suppression of this revolt; much blood was shed upon the scaffold; and so determined were the queen and her advisers that none of their victims should escape, that the jurors on the trial of sir Nicholas Throckmorton, who was tried at Guildhall, on the 17th of April, having acquitted the prisoner, they were commanded to appear before the council, and fined five hundred pounds each. For other victims, in consequence of this insurrection, see the article ENGLAND, vol. vi. p. 647.

The sumptuous and extravagant manner of living of the city-magistrates had gradually risen to such a height,

that many of the principal citizens retired from the city, rather than incur the enormous expense of serving the city-offices. To remedy this growing evil, an act of common-council was passed in this year, whereby it was enacted, That thenceforth the mayor should have but one course, either at dinner or supper; and that, on a festival, being a flesh-day, to consist of no more than seven dishes, whether hot or cold; and on every festival, being a fish-day, eight dishes; and on every common flesh-day, six dishes; and on every common day, seven dishes, exclusive of brawn, collops with eggs, fallads, pottage, butter, cheese, eggs, herrings, sprats, shrimps, and all sorts of shell-fish and fruits.—That the aldermen and sheriffs should have one dish less than the above-mentioned; and all the city-companies, at their several entertainments, to have the same number of dishes as the aldermen and sheriffs; but with this restriction, to have neither swan, crane, nor buffard, upon the penalty of 40s.—That all the sergeants and officers belonging to the mayor or sheriffs, on flesh-days to have three, or fish-days four, dishes. But, when any foreign ministers or privy-counsellors are invited to any of the city-entertainments, then the regulations or additions to be left to the discretion of the mayor; provided always, that no other entertainment be given after dinner, except ipocras and wafers. And the annual feasts, on the three days after Whitsunday and Bartholomew-tide, were entirely laid aside. It was also enacted, in consideration of the great annual expense of the mayor and sheriffs, in providing a sumptuous entertainment at Guildhall, on lord-mayor's days, for the honour of the city, that every subsequent mayor should be paid one hundred pounds, out of the chamber of the city, in alleviation of that charge.

The year 1557 was remarkable for glass having been first manufactured in London. The finest sort was made in the place called Crutched-friars; and the fine flint glass, little inferior to that of Venice, in the Savoy-house, in the Strand.

This was a year both of dearth and of plenty. Before harvest, wheat was sold at 2l. 13s. 4d. the quarter, malt at 2l. 4s. beans and rye 2l. and pease 2l. 6s. 8d. the quarter; but after harvest, wheat was sold at 5s. malt at 6s. 8d. and rye at 3s. 4d. the quarter; "so that," says Howes, "the penny wheat-loaf, that weighed in London, the last year, but eleven ounces troy, weighed now fifty-six ounces troy, according to the assize set down by the mayor at the time."

Mary died, unregretted, on the 17th of November, 1558; and the city of London expressed their joy at the accession of queen Elizabeth in a most loyal manner.—She was, at the time of her sister's death, at Hatfield in Hertfordshire, from whence she repaired the next day to London, and was met at Highgate by the lord-mayor, aldermen, and sheriffs, who, with great pomp and the acclamations of a large multitude, conducted her majesty to the Tower of London. On the 14th of January, 1559, the queen rode in grand procession through the city of London to Westminster. At the west end of Cheapside, the recorder addressed her majesty in an affectionate speech, and at the same time presented her, in the name of the citizens, with a velvet purse, richly embroidered, containing a thousand marks of gold. Her majesty thanked the citizens for this token of their affection, promised to continue their good and gracious sovereign, and that she would not hesitate to shed her blood for their protection. But nothing endeared their new sovereign more to them than her acceptance of an English Bible, richly gilt; which was let down from a pageant in Cheapside, by a child representing Truth. The queen received the book with both her hands, and, having kissed it, laid it to her breast, and assured the city, that she esteemed that gift more than all the sumptuous presents they had made her. The next day she was crowned in Westminster Abbey.

The new queen resumed the work of reformation which had been begun by her father, and supported by her brother Edward. On the first Sunday after her accession, by  
virtue

virtue of a proclamation for that purpose, the English Liturgy was read in all churches throughout the city of London; and the Epistle and Gospel for the day were read in the English tongue. The citizens encouraged her majesty to persevere in this great work, by exhibiting a specimen of the strength and forces they could raise in a case of emergency; for, on the 2d of July, the twelve principal corporations of London sent out twelve companies, consisting of fourteen hundred men, to be mustered in Greenwich-park before the queen; eight hundred of whom were pikemen in bright armour, four hundred harquebushiers, in coats of mail and helmets, and two hundred halberdiers, in German rivets; these were accompanied by twenty-eight whiffers (drums and fifes,) richly dressed, and led by the twelve principal wardens of the aforesaid companies, well mounted and dressed in black velvet, with six ensigns in white fatten, furred with black farfnet, and rich scarves.

This year died sir William Hewet, the lord-mayor, who was a cloth-worker, and possessed of 6000*l.* per annum. He had three sons and one daughter. The following remarkable story of his daughter is represented in a painting, carefully preserved in the family of the duke of Leeds. Sir William, her father, lived at this time on London-bridge; and, as the maid-servant was diverting the infant on the edge of an open window, it accidentally slipped out of her hands, and fell into the Thames. An apprentice of sir William's, whose name was Osborne, and one of the ancestors, in a direct line, of the present duke of Leeds, seeing the child drop, immediately jumped out of the shop-window into the river, and, to the great joy of its parents, brought it out unhurt. When she arrived at the age of maturity, she had many suitors, among whom was the earl of Shrewsbury; but sir William, her father, rejected all their proposals, and gratefully betrothed her, with a very large fortune, to him who had saved her life at the risk of his own; declaring that, "as Osborne did save her, Osborne should have her."

On the 4th of June, 1561, the metropolis was visited by a most dreadful storm. An immense quantity of rain fell in torrents, and deluged the streets; incessant claps of thunder rent the clouds; and St. Paul's steeple was struck by a thunderbolt, within a yard of the top; at first a little fire appeared, resembling the light of a torch, which soon communicated itself to the weather-cock, that it fell down in eight minutes after; the wind being high, within an hour the fire destroyed the whole steeple down to the battlements; there, receiving the timber that fell from the spire, it burnt so violently, that the iron and bells were melted, and fell down upon the stairs in the church; and the roof, catching fire, was entirely destroyed before twelve o'clock at night. To stop its progress, many houses were pulled down in the church-yard, near the north door; and a pinnacle, on the east-end, fell on a house, in which were many people, but luckily no one received any hurt.

When we compare our own times with those which are long gone by, we have abundant cause to be thankful to Providence, that that most destroying monster, the *plague*, has not visited us for many years. Although we are far, very far, from denying our warmest thanks to God for sparing us in his mercy, yet we must acknowledge that the several regulations relative to cleanliness, under the direction of the lord-mayor and common-council, whose attention is particularly directed to this economical part of the city, have kept aloof the contagion, and saved the people from its destructive fangs. In the year 1563, the plague again broke out violently in London; and, on the 5th of July, the lord-mayor, by her majesty's command, ordered the master and wardens of the Company of Clerks to inquire the number of those who died of this dreadful distemper within their respective parishes, and to make a certificate thereof; and that the curates and churchwardens should give notice to them of such houses where the plague appeared, and forbid every person in such a house

coming to church for the space of one month following after the plague had been in it; and to fix a blue cross on the door of every house where the plague was, with a writing underneath, signifying that the infection was there, and to avoid it. It was farther ordered, on the 9th of July, that every housekeeper, in each street or lane, should make a bonfire three times a-week, on Mondays, Wednesdays, and Fridays, till the infection should cease. In the beginning of August the lord-mayor issued a proclamation for killing all dogs that should be found in the streets, either by night or day. The number of people that died in this year in the hundred and eight parishes within the city of London, was 20,372; whereof 17,404 died of the plague; and in the eleven out-parishes the whole number of deaths amounted to 3288; and of these, 2732 died of the plague.

Some authors are of opinion, that knives began to be made in London for the first time about this period; (see *KNIFE*, vol. xi. p. 784.) But, in opposition to that statement, others recollect, that Chaucer in his "Reve's Tale," written near two hundred years before, makes use of the following line: "A Sheffield whittle bare he in his hose;" and, interpreting the word *whittle*, a knife, contend that, in his time, Sheffield was already known for its manufactory of hardware. It seems also, that the dawn of the useful trade of auctioneering, which is at this moment so much disputed upon, began to rise upon the commercial horizon, and that an out-crier was appointed to proclaim through the city, household-goods, leases of houses, &c. and that for his trouble he was to receive one farthing in the pound.

Ever fond of shows and pageants, the citizens of the metropolis were eager to renew the famous show called the *WATCH* on St. Peter's eve; the origin of which cannot easily be traced, unless it was instituted in commemoration of the deliverance of this apostle from prison by an angel; the watch and guards being then asleep; in order to show that those to whom the guardianship and custody of London had been entrusted, did not prove "such drowly and lazy folks." However, it appears that in this year "it did only stand in the highest streets, as Cheape, Cornhill, and so forth to Algate; which watch was, to the commons of the citie, as chargeable, as when, in times past, it had bene commendable done;" from which we may conclude that the expense was the same as "in past times," but the pageantry not so pompous and amusing.

The year following, on New-year's day, the Thames was frozen, and crowded with more foot-passengers than the most public streets of London on a fine summer's day. Several instances, and more frequent than of late years, have been recorded of our noble river being chained by the icy hand of winter. Whether it is owing to an alteration in the atmosphere of our island, or some other cause, it is not our province at this moment to discuss.

The year of our Lord 1566 ushered in the dawn of commerce and learning in the metropolis, with increased brightness, by the laudable foundations of sir Thomas Gresham. He was an opulent merchant of London, (see the article *GRESHAM*;) and erected at his own expense a commodious building for merchants to meet for the purpose of transacting business, which is called to this day the Royal Exchange; but originally was denominated *The Burse*, from the French *bourse*, meaning a *purse*, in allusion to the business done in a place to which traders of all nations resort, to make the best use they can of the contents of their respective *purses*, now converted into pocket-books, or note-cases. Thus far the benevolent citizen had employed his thoughts and pecuniary power in making his fellow-merchants comfortable, and in procuring a suitable spot for their speculative conversations. His patriotic mind went farther: he planned, and provided for by his will, a college of sciences, in which (as will be seen under his life, vol. ix. p. 19.) the university of Cambridge feared a future rival. See also the article *COLLEGE*, vol. iv. p. 776. We may just observe, that, had this

this old foundation been properly encouraged, and kept up, it might have obviated the necessity of creating new institutions, which, being grounded upon no other basis than the temporary effect of fashionable subscriptions, may become, in time, more expensive and less effective than keeping up the old system might have been.

Now Fortune began to shake the morrice-bells of Folly over the heads of the metropolitans, and introduced that pernicious sort of madness which has been for many centuries the making of a few, and the ruin of thousands; we mean the **LOTTERY**, that enticing fairy, who, in her magic glass, shows comfort to the poor, increase of wealth to the rich, and hope of gain to all; whilst Chance, though blindfolded, laughs at all the votaries.—The drawing of the first lottery mentioned in English history began on the 11th of January, 1569, at the west door of St. Paul's, and continued day and night, without intermission, till the 6th of May. The number of *lots*, or tickets, was forty thousand; the prizes were of plate, and the profits were appropriated to the repair of the havens of the kingdom. See the article **LOTTERY**.

An order of common-council was made in this year, for the beadles belonging to the hospitals to take up all sturdy beggars and vagrants, and to carry them to Bride-well; all sick, lame, blind, and aged, to be carried to St. Bartholomew's, or St. Thomas's; and all children-beggars, under the age of sixteen, to Christ's Hospital; appointing to the beadles of each hospital their proper circuit or district, with severe penalties upon their neglect of duty. But this act had not its effect. The streets, next year, swarmed again with beggars, vagrants, and maimed soldiers. It was then resolved to appoint a city-marshal, who, in a more effectual manner, might deliver the citizens from the disgrace and mischief of being overrun with sturdy beggars, &c. And the committee, to whom this appointment was given in charge, chose William Sympson and John Read, two able persons, (for the consideration of six shillings and eight pence a-day for them and their horses, and six persons a-piece, of their own choosing, to attend on each day, at twelve-pence each,) whose office was to take some course with those vagrants and wandering people, so as to clear the streets of them, and to deliver them to their several places and punishments, if they deserved it. And for the more ready executing this office, it was ordered, that one month's pay, of twenty-eight days to the month, should be paid to them beforehand; and accordingly the aldermen, by way of loan, disbursed the same, amounting to thirty-five pounds nine shillings and four-pence. And it was also thought convenient, that twelve fair partisans, suitably and conveniently armed, should, at present, be provided by the chamberlain for this service, at the charge of the city; and coats, or mandilions, for the attendants upon the marshals. The office of *city-marshal* originated in this regulation. But the execution of this most useful and high office was naturally attended, as it existed then, with so great an expense to the citizens, that it became a death-blow to the famous and pompous "watch," which for many years had been a great burthen to the higher class of citizens; whilst the non-contributing populace gazed at, and enjoyed, the useless show. However, from this change, arose insensibly the regular nightly watch, nearly similar to what exists at present.

The plague appeared again in the summer of this year—a most unwelcome visitor; and, in consequence of it, the city, eager to prevent its returning fury, ordered, among other regulations, that the ditch, from Aldgate to the postern of Tower-hill, should be cleansed, and a new sewer constructed.

Soon after this, the river Lea was made navigable; the citizens were called out to be trained to arms; and several other regulations took place; among which we must notice the first paving of the eastern suburbs of London, as far as Whitechapel-bars.

Upon all occasions the metropolis was regarded by the sovereign as a place of the highest importance; and, as it

has been hinted before, like the heart or focus of life, for the rest of the kingdom. Acting upon this conviction, the queen, intending to make a progress through the counties at this time, sent a letter to the lord-mayor, enjoining him to have a special regard to the good government and peace of the city during her absence; for the better accomplishment of which, she appointed certain of her privy-counsellors to be his advisers and assistants, with whom he was ordered to consult once a-week, or oftener.

In the year 1573, the price of wheat was raised to two pounds six shillings the quarter; beef was sold for one shilling and ten pence the stone, and all other flesh and white meats at an excessive price. This increase in price was not occasioned by any deficiency of produce, but by the secret exportation of provisions to the Netherlands, then laid waste by civil wars; wherefore, the lord-mayor sent a remonstrance to the lord-treasurer, "that, unless the ministry would see redress thereof in time, the scarcity must shortly be felt more powerfully, even by those in the highest stations of life." At the same time an act of common-council was passed to prevent the excessive consumption of provisions at the feasts of the companies and at the magistrates' tables.

The plague again broke out at London in 1574; on which account the queen, to prevent the concourse of people from spreading the contagion, desired the lord-mayor not to give any entertainment at Guildhall on the anniversary of his entering on his office.

The exhibition of stage-plays and interludes, which had been occasionally practised by ingenious tradesmen and gentlemen's servants, was now become a regular profession; and the different places for these exhibitions, which were large rooms in inns, were become common nurseries of vice and lewdness. To suppress which, the common-council passed an act, wherein it was ordained as follows: "That no play should be openly played within the liberty of the city, wherein should be uttered any words, examples, or doings, of any unchastity, sedition, or such-like unfit and uncomely matter, upon pain of imprisonment for fourteen days, and five pounds for every such offence. That no inn-keeper, &c. shall show or play, or cause to be shown or played, within his house, or yard, any play which shall not be first perused and allowed by order of the lord-mayor, and court of aldermen. And that no person shall be allowed to play, but shall be thereunto admitted by the lord-mayor and aldermen. And that every person to be licensed shall pay to the use of the poor in the hospitals of the city, or to the poor visited with sickness, certain sums to be agreed upon, on pain of forfeiting his said license. And that all sums and forfeitures incurred by any offence against this act, shall be employed to the relief of the poor of the hospitals, or of the poor infected or diseased in the city; to be sued for and recovered by the chamberlain in the court of the outer chamber of Guildhall, London, called the Mayor's Court." The public performers petitioned the queen and council for license to act as usual; but, after a full hearing, they could not obtain permission except under the restrictions of the above act of common-council, and of another act, made in the mayoralty of Hawes, by which they were enjoined not to play on Sundays, nor on holidays till after evening-prayers; and not to act after dark, but to conclude at such time, that the audience might return to their dwellings before sun-set.

Although we must, under another head, enter more at large into the origin and progress of theatrical performances, yet we have thought necessary just to notice these early dispositions, in which we find the first stamina of the dramatic establishments now existing, and, in some measure, the reason why no theatre has been erected as yet within the boundaries of the city.—The last article of these ordinances will raise a smile at the present day, viz. that the play should conclude at such time, that the audience might return to their dwellings before sun-set.

At this time the lord-mayor, recorder, and other magistrates

gistrates of the city, exerted themselves so effectually in executing the laws against vice and immorality; that, at the assizes then held for the city of London, there was not one criminal to be tried. The reason of this is set forth in a most curious letter, from William Fletewood, recorder of London, to the lord-treasurer, then with the court at Buxton; of which the following is an extract: "The only cause that this reformation taketh so good effect here about London, is, that when, by order, we have either justly executed the law, or performed the council's commandment, we were wont to have either a great man's letter, a lady's ring, or some other token from such other inferior persons, as will devise one untruth or other to accuse us of, if we perform not their unlawful requests. But now *the court is far off*; and here we are not troubled with letters, neither for the reprieve of this prisoner, nor for sparing that fray-maker. We nip vice in the bud, we punish petty thieves; and, when the assize cometh, we have no great ones to try."

The two following articles, extracted from Howes's Chronicle, p. 680, under the date of 1576, will contribute to show, that, in point of ingenuity and patience, our fellow-citizens are second to no individuals in any nation.

"A strange piece of work, and almost incredible, was brought to pass by an Englishman, born within the city of London, and a clerk of the chancery, named Peter Bales, who, by his industry and practice of his pen, contrived and writ, within the compass of a penny, in Latin, the Lord's Prayer, the Creed, the Ten Commandments, a prayer to God, a prayer for the queen, his poy, his name, the day of the month, the year of our Lord, and the reign of the queen: and at Hampton-court he presented the same to the queen's majesty in the head of a ring of gold, covered with a crystal, and presented therewith an excellent spectacle, by him devised, for the easier reading thereof, wherewith her majesty read all that was written therein, and did wear the same upon her finger."

"Also, about the same time, Mark Scaliot, blacksmith, born in London, for trial of workmanship, made one hanging-lock of iron, steel, and brass, a pipe-key filed three-square, with a pot upon the shaft, and the bow with two SS, all clean wrought, which weighed but one grain of gold, or wheat-corn; he made also a chain of gold of forty-three links, to the which chain the lock and key being fastened and put about a flea's neck, she drew the same; all which, lock, key, chain, and flea, weighed but one grain and a half."

The name of Fletewood, recorder of the city, will never be forgotten as long as we are sensible of gratitude; for by his exertions he did not only amend the morals of the Londoners our ancestors, but kept away the plague, which made its appearance in the Temple in the year 1577; at which time Mr. *Wm. Lamb* deserved also the thanks of his countrymen, by conveying the water through leaden pipes from the upper end of Red-lion-street to Snow-hill. This conduit was taken down in 1746, to make room for the erection of the Foundling Hospital.

About this time, the queen issued an order, for again ascertaining the number of foreigners in London; when, on the report being made, it appeared that they amounted to 6462, nearly three times as many as in 1567, viz. Dutch, 2302; French, 1838; Italians, 116; English, born of foreign parents, 1542; other nations, 447; persons not certified, 217. This considerable increase of foreigners in the metropolis was productive of a remonstrance from the lord-mayor and aldermen, against the *vast increase of new buildings, and number of inhabitants*, within the city and suburbs of London, chiefly occasioned by the great resort of people from abroad, and all parts of the kingdom, to settle there; which it was imagined would prove of dangerous consequence, both to London and to the whole nation, if not timely remedied. Wherefore her majesty issued a proclamation, by which it was forbidden to erect any new buildings within three miles from the city-gates, where no former house could be

remembered to have been by any one living; and also to suffer any more families than one only, to be placed or to inhabit in any one house; with power to the lord-mayor to commit offenders against this proclamation, or to hold them to bail. And when sir John Branch, the next lord-mayor, went to take the oath in the Exchequer, the lord-treasurer charged him strictly to enforce the said proclamation, because, said he, "there will, from an increase of people, arise an excessive price of victuals and fuel; and danger of plague and infection."

On the 21st of June, 1581, the populace taking offence at the images with which the cross in Cheapside was decorated, they attempted to pull the whole down, but, failing in their design, they broke and defaced the images; and, notwithstanding the offer of a reward of forty crowns, the offenders were never discovered.

The Turkey or Levant Company was incorporated in this year, and the first governor was sir Edward Osborn, an alderman of London. See the article COMPANY, vol. iv. p. 874.

In the year 1582, the luxury of the times having greatly prevailed among people of all degrees, in their apparel, particularly apprentices, the lord-mayor and common-council enacted, 1. That no apprentice whatsoever should presume to wear any apparel but what he receives from his master. 2. To wear no hat, nor any thing but a woollen cap, without any silk in or about the same. 3. To wear neither ruffles, cuffs, loose collars, nor any thing but a ruff at the collar, and that only of a yard and a half long. 4. To wear no doublets but what are made of canvas, fustian, sackcloth, English leather, or woollen, without any gold, silver, or silk trimming. 5. To wear no other coloured cloth, or kersey, in hose or stockings, than white, blue, or russet. 6. To wear no other breeches but what shall be of the same stuff as the doublet, and neither stitched, laced, or bordered. 7. To wear no other than a plain upper coat, of cloth or leather, without pinking, stitching, edging or silk, about it. 8. To wear no other furtout than a cloth gown or cloak, lined or faced with cloth, cotton, or baize, with a fixed round collar, without stitching, guarding, lace, or silk. 9. To wear no pumps, slippers, or shoes, but of English leather, without being pinked, edged, or stitched; nor girdles, nor garters, other than of crewel, woollen, thread, or leather, without being garnished. 10. To wear no sword, dagger, or other weapon, but a knife; nor a ring, jewel of gold nor silver, nor silk in any part of his apparel; on pain of being punished at the discretion of the master for the first offence; to be publicly whipped at the hall of his company for a second offence; and to serve six months longer than specified in his indentures for a third offence. 11. No apprentice to frequent any dancing, fencing, or music, schools; nor keep any chest, press, or other place, for holding of apparel, or goods, but in his master's house; under the penalties aforesaid.

An ingenious German, named Maurice, submitted a scheme to the lord-mayor and aldermen, in this year, for supplying the city with Thames water, by means of a machine, to be worked by the stream of the tide, under London-bridge. The scheme being approved, the city granted Maurice a lease of one arch, and a place for fixing his engine, at the north end of the bridge, for the term of five hundred years, at a rent of ten shillings per annum. Two years after, he obtained a lease of a second arch; and, from the utility of, and improvements in, the invention, Maurice and his posterity acquired considerable wealth. It continued in their hands till 1701, at which time the wheels occupied four arches, when it was sold to Richard Soams, a goldsmith, for thirty-six thousand pounds. Immediately after the purchase, Soams obtained a confirmation of Maurice's lease, at the yearly rent of twenty shillings, and a fine of three hundred pounds; after which, he divided the undertaking into three hundred shares, at five hundred pounds each.

The custom of the nomination of sheriffs, by the lord-mayor

mayor drinking to them, is first noticed in 1583; a practice which, originating in the old manner of pledging with the cup to insure safety during the time of drinking, is still observed in our days.

In the month of July 1585, the magistrates of London, alarmed at the increase of thieves and robbers who infested the city and its suburbs, took great pains to discover their haunts and the nests of those miscreants and cut-purses, and the disorderly houses that harboured them. Among the rest, a regular school for the instruction of pick-pockets was found at Smart's key, near Billingsgate. The method of teaching this *lucrative* and *liberal* art was as follows:—In the centre of a large room was a pocket with counters in it, and a purse with silver, both of which were suspended, and small bells fixed round them.—The test of proficiency was, of course, to pick the pocket, or take the silver out of the purse, without causing the bells to jingle: The house where this *honourable school* was held was suppressed; and the *professors*, as well as the man who kept it, fined and imprisoned.

The following year, Ludgate, with a prison for debtors who were freemen of the city, was rebuilt, and cost about one thousand five hundred pounds.

Alarmed at the vigorous preparations made by the Spaniards for the reduction of England, the queen sent a letter to the lord-mayor of London, requesting that ten thousand able men, furnished with armour and weapons convenient, should be put in readiness; out of which number six thousand were to be enrolled under captains and ensigns, and to be trained at time convenient. The request was most readily granted; and, to give an idea of the respective populations of the wards of the city, we have inserted the number of men raised in each of them.

Besides this proof of loyalty, the good city of London presented the queen with sixteen of the largest ships in the river, and four frigates, which were immediately fitted out, and supplied with all necessaries.—The number of ships was afterwards increased to thirty-eight; the whole expense being defrayed by the city.

The zeal and alacrity of the citizens, in this and the following year, contributed greatly to the security of the independence of the nation; but, great as these were, the assistance the state derived from the influence of the London merchants, was infinitely more important. By their means, Philip was compelled to defer his threatened attempt until the next year, when the preparations for defence were, consequently, much more effectual; for Thomas Sutton, esq. who afterwards founded the Charter-house, assisted by sir Thomas Gresham, and some others, found means to get all the Spanish bills of exchange which were drawn on the merchants of Genoa, to supply Philip with money for carrying on his preparations, protested. Bishop Burnet, in the first volume of the History of his Life and Times, p. 313, says, "A merchant of London, being very well acquainted with the revenue and expense of Spain, and of all that they could raise; and knowing also, that their funds were so swallowed up, that it was impossible for them to victual and fit out their fleet but by their credit on the bank of Genoa; he undertook to write to all the places of trade, and to get such remittances made on that bank, that he might have so much of the money in his own hands, as there should be none cur-

rent there equal to the great occasion of victualling the Spanish fleet. He reckoned, that the keeping of such a treasure dead in his hands, until the season of victualling was over, would be a loss of forty thousand pounds; and he managed the matter with such secrecy and success, that the fleet could not set out that year."

The subsequent failure and total defeat of this formidable expedition, are well known to every reader of English history; it will therefore be unnecessary to dwell upon it here. See the article ENGLAND, vol. vi. p. 658, 9.

A public thanksgiving being ordered to be made on the 24th of November, the queen came in great state to St. Paul's, to perform that solemn duty; on which occasion, eleven banners or ensigns, taken from the enemy, were hung up in the body of the church, as trophies of their defeat.

In 1592, the plague raged with great violence, and swept away no less than 10,675 citizens. Soon after, 1595, the licentiousness of the populace, who drew in the London apprentices to join them, produced such repeated and alarming riots, that it was thought necessary by the mayor to lay the case before the lord-treasurer, for her majesty's direction. In consequence of which, on the 4th of July, a proclamation was issued, wherein her majesty appointed a provost-martial, with power to apprehend all rioters, and such as might be refractory to the officers of justice, and, by order of martial law, to punish them accordingly. Sir Thomas Wilford, who was appointed provost-martial, patrolled the city, with a numerous attendance on horseback, armed with pistols, and apprehended many of the rioters, whom he took before the justices appointed for their examination. On the 22d of July, they were tried at Guildhall; and five of them, being condemned, were, two days after, agreeable to their sentence, executed on Tower-hill. This example had the desired effect; for the rest were so intimidated, that they immediately dispersed; and peace was again restored in the city.

In the year 1596, while the mayor and aldermen were attending a sermon at St. Paul's cross, they received a message from the queen, ordering them to raise one thousand able-bodied men, for immediate service; in compliance with which, they suddenly left their devotion, and applied so diligently, that, before eight o'clock at night, they obtained the complement required, who were completely armed, and ready to march, before next morning. They were destined for the relief of the French in Calais, against the Spaniards; but, some unexpected intelligence arriving from that place, their appearance became unnecessary, and this little army was disbanded before it had existed twenty-four hours. The court, however, being again alarmed, on Easter-day, in the morning, sent another message to the lord-mayor and aldermen, commanding them to raise the like number of men as before; in obedience to which, they, with their proper officers, repaired to the different churches in their respective jurisdictions, during the time of divine service, and, causing the doors to be shut, they selected the number of men required, who, being properly armed, with all possible expedition, began their march, the night after, for Dover, in order for their embarkation for France; but, advice being received of the reduction of Calais, they were ordered home, after a week's absence, and immediately disbanded. These are most substantial proofs of the readiness which the city of London has ever evinced in support of the monarch and the constitution.

All sorts of spices having grown to an exorbitant price, in consequence of the war with Spain; the queen, in the year 1600, granted a charter to George earl of Cumberland, and two hundred and fifteen knights, aldermen, and merchants, under the denomination of "The Governor and Company of Merchants of London trading to the East Indies." From small causes great effects sometimes arise; considering the extensive power, dominion, and wealth, of the East-India Company, who would ever suppose that its existence is owing to the trifling circumstance of pep-

per being sold at eight shillings per pound in London? It was not till the reign of king William, that this company obtained the name of the *English East-India Company*. See the article COMPANY, vol. iv. p. 875; and, for its progress, the articles ENGLAND and HINDOOSTAN.

The trade and navigation on the English coasts being greatly interrupted by the depredations of Spanish privateers, the queen, in 1601, ordered a number of ships to be fitted out to cruise against them; and, on this occasion, no less than five-fifteenths were assessed upon the citizens of London, towards defraying the expense of the armament: and a proclamation was issued for discharging all such debtors in the gaols of London as were willing to enter on-board the said ships.

In the year 1602, the trade of the city of London having been greatly injured by the increase of hawkers and pedlars, the common-council enacted, "That no citizen or other inhabitant of London, for the future, should, under any pretence whatsoever, presume to let, before his, her, or their, house, any stall, stand, or perpressure, upon the penalty of twenty shillings. And that all hawkers offending against the tenor of this act, should not only forfeit all their goods so offered to sale, but likewise pay a fine of twenty shillings for every such offence."

Early in the year 1603, the citizens of London, by the queen's command, fitted out and maintained two ships and a tender, at the annual expense of six thousand pounds. This was the last demand made by Elizabeth on the citizens; and it is remarked by historians, that, during the long reign of that princess, and considering the readiness with which the citizens of London always answered her demands, she did not grant them any new charter of privileges, or even so much as confirm those which had been given by her predecessors.

On the death of queen Elizabeth, which happened March 24, 1603, James VI. of Scotland was proclaimed in Cheapside by the lord-mayor, with the usual pomp and ceremony. Great preparations were made by the citizens for the reception of their new sovereign; but the plague continued to rage so violently, that it was found advisable to postpone the ceremony to the following year; when James made his public entry into London, and was received in the most sumptuous manner. The suppression of fairs in and within fifty miles of the metropolis, was one of the effects of the contagious disorder, which carried off 30,578 persons within the space of twelve months.

The court of requests, which had been originally established by an act of common-council, was found so beneficial, that an act of parliament was obtained in the first year of king James's reign, to confirm the power and jurisdiction of it.

In the year 1605, James granted the citizens his first charter, by which he recognized all their ancient rights and privileges, and also adjusted the disputes which had frequently taken place between the corporation and the lieutenant of the Tower, respecting the metage of coals, &c. which the latter claimed as his right; but the king, by this charter, finally determined that it was vested in the corporation of London. For the history of the gunpowder-plot, which occurred this year, see the article ENGLAND, vol. vi. p. 662, 3.

On the 3d of July, 1606, his majesty paid a debt of sixty thousand pounds, contracted by queen Elizabeth, who had borrowed that sum of the citizens of London, and left it unpaid at her decease. But in the following May, the king, wanting money, applied to the citizens, who readily advanced him the sum of sixty-three thousand pounds. In acknowledgment for this favour, his majesty soon after granted the citizens a second charter; by which, he not only confirmed their ancient rights, liberties, and immunities, in the most ample manner, but also added the precincts of Duke's Place, St. Bartholomew's the Great and Less, Black and White Friars, and Cold-harbour, to the bounds of the city, and jurisdiction thereof.

VOL. XIII. No. 299.

In the year 1609, his majesty offered the whole province of Ulster, in Ireland, to the citizens of London, on condition that they would engage to settle an English colony there; which offer being accepted, the common-council passed an act to raise twenty thousand pounds, to carry the design into execution; and a committee was appointed, of six aldermen and eight commoners (since increased to twenty), to be annually chosen for the government thereof. The cultivation of this province went on with such rapidity, that, in the year 1616, two capital towns were colonized, by the names of Londonderry and Coleraine; the first of which the king formed into a city, and the latter into a corporate town, under a mayor. Soon after which, by a special commission from the king and the city of London, sir Peter Proby, alderman of London, and governor of the colony, attended by several principal citizens, went over to Ireland, and presented each of the before-mentioned places with a rich sword of state, to be carried before their chief magistrates.

The bringing of the New River to London was effected in the year 1613: See CANAL NAVIGATION, vol. iii. p. 675. It appeared at first a most doubtful undertaking; but was brought at last to the entire completion of the wishes of the parties concerned, and of the whole city, to the wholesomeness and cleanliness of which it highly contributed. The account is interesting to every one, and particularly to those who benefit by it; and we will give it in the very words of Stow:

"The worke began the 20 day of February, An. Dom. 1608; and in five yeers space was fully accomplished. Concerning the conveyance of it along to London, from Chadwell and Amwell, I myselſe (by favour of the gentlemen) did divers times ride to see it, and diligently observed that admirable art, paines, and industry, were bestowed for the passage of it, by reason that all grounds are not of a like nature, some being ozie and very muddy, others againe as stiffe, craggy, and stony.

"The depth of the trench, in some places, descended full thirty foot, if not more; whereas in other places it required a sprightfull art againe, to mount it over a valley in a trough, betweene couple of hills; and the trough all the while borne up by wooden arches, some of them fixed in the ground very deepe, and rising in height above 23 foot.

"Being brought to the intended cisterne, but not (as yet) the water admitted entrance therinto, on Michaelmasse day, in anno 1613, being the day when sir Thomas Middleton, knt. (brother to the said sir Hugh Middleton) was elected lord-mayor of London for the yeare ensuing; in the afternoon of the same day, sir John Swinerton, knt. and lord-mayor of London, accompanied with the said sir Thomas, sir Henry Montague, knight, and recorder of London, and many of the worthy aldermen, rode to see the cisterne, and first issuing of the river therinto; which was performed in this manner: A troope of labourers, to the number of 60 or more, well appparelled and wearing greene Monmouth caps, all alike, carryed spades, shovels, pickaxes, and such-like instruments of laborious employment, marching after drummers, twice or thrice about the cisterne, presented themselves before the mount, where the lord-mayor, aldermen, and a worthy company beside, stood to behold them; and one man, in behaife of all the rest, delivered this speech:

"Long have we labour'd, long desir'd and pray'd  
For this great work's perfection: and, by th'ayd  
Of Heaven and good men's wishes, 'tis at length  
Hapily conquer'd by cost, art, and strength.  
And, after five yeeres deare expence in dayes  
Travaile and paines, besides th'infinite wayes  
Of malice, envie, false suggestions,  
Able to daunt the spirits of mighty ones  
In wealth and courage; this, a worke, so rare;  
Only by one man's industrie, cost, and care,  
Is brought to blest effect, so much withstood;  
His onely ayme, the city's gen'ral good.

And

And where (before) many unjust complaints,  
 Curiously feated, caused oft restraints,  
 Stops, and great crosses to our master's charge,  
 And the work's hindrance; favour now at large  
 Spreads itself open to him, and commends  
 To admiration both his pains and ends.  
 (The king's most gracious love,) perfection draws  
 Favour from princes, and from all applause.  
 Then, worthy magistrates, to whose contente  
 (Next to the state) all this great care was bent;  
 And for the publike good (which grace requires)  
 Your loves and furtherance chiefly he desires  
 To cherish these proceedings, which may give  
 Courage to some who may hereafter live,  
 To practise deedes of goodnesse and of fame,  
 And gladly light their actions by his name.  
 Clarke of the worke, reach me the booke, to show  
 How many arts from such a labour flow.

*All this he readeth in the clark's book.*

First, here's the overseer, this tride man  
 An ancient souldier, and an artizan.  
 The clarke, next him mathematician;  
 The master of the timber-worke takes place  
 Next after these; and the measurer, in like case;  
 Bricklayer and enginer; and after those  
 The borer and the pavier; then it shoves  
 The labourers next; keeper of Amwell-head,  
 The walkers last: so all their names are read.  
 Yet these but parcels of six hundred more  
 That (at one time) have beene employed before.  
 Yet these in fight, and all the rest will say  
 That all the weeke they had their royall pay.

*At the letting open the sluice.*

Now for the fruits then: flow forth, precious spring;  
 So long and dearly fought for, and now bring  
 Comfort to all that love thee: loudly sing,  
 And with thy crystal murmurs strook together  
 Bid all thy true *wel-wishers* welcome hither."

In the year 1617 his majesty caused certain rules to be published, under the title of "The Book of Sports;" by which the people were tolerated to exercise recreations and diversions on the sabbath-day. The lord-mayor and citizens, together with many of the clergy, so far opposed it, that they incurred the resentment of the high-commission court. Notwithstanding which, the lord-mayor persevered so strongly, in showing his contempt at such an unchristian license, that he even caused the king's carriages to be stopped as they were driving through the city in the time of divine service. The matter being related to his majesty with the most aggravating circumstances, he swore, in a great rage, "He thought there had been no more kings in England than himself." After the heat of his passion had subsided, he sent a warrant to the mayor, commanding him to let them pass; which he obeyed, with this declaration: "While it was in my power, I did my duty; but, that being taken away by a higher power, it is my duty to obey." This well-timed concession was highly pleasing to the king, and the mayor was acquitted of the breach of the royal orders, with great reputation.

From the above transaction it will naturally be inferred, that James, though a strenuous assertor of orthodox opinions, was yet a latitudinarian in morals; and the inference is strengthened by his common profane discourse, and by the grant he gave to Clement Cottrel, esq. groom-porter of his household, to license gaming-houses for cards, dice, bowling-alleys, and tennis-courts. In London and Westminster, including their respective suburbs, were then twenty-four bowling-places; four in Southwark; in St. Catharine's one; one in Shoreditch, and in Lambeth two. Within these limits were also tolerated fourteen tennis-courts, and forty taverns or ordinaries for playing at cards and dice. The motives of this indulgence were expressed in the grant in the following terms:

"For the honest and reasonable recreation of good and civil people, who, by their quality and ability, may lawfully use the games of bowling, tennis, dice, cards, tables, nine-holes, or any other game hereafter to be invented."

We have to congratulate ourselves that this sort of diversion has retired from the public into private houses, and that the "good people" are less inclined to cards and dice than they appear to have been formerly. Besides this whimsicality, the king exhibited most curious specimens of incoherence and instability of mind in some edicts, the motives of which cannot be ascertained. In 1621 he issued a proclamation to enforce the prohibition of flesh during Lent; an ecclesiastical law, the severity of which seemed to have been done away with at the time of the reformation. By this order the magistrates of London were enjoined to examine the servants of all innholders, victuallers, cooks, alehouse-keepers, taverners, &c. who sell victuals, concerning any flesh sold by them in Lent. And, in the following year, he ordered all the lords, spiritual and temporal, and gentlemen who have seats in the country, privy-counsellors and the servants of the king and prince excepted, to leave London forthwith, to attend their service in their several counties, and to celebrate the feast of Christmas. And in a second proclamation he enjoins them, not only to remain at their seats during Christmas, but always till his further pleasure be known. Widows of distinction were included in this order; and all whose law-business required their attendance in London were commanded to leave their families in the country.

The year before James's death, the city raised two thousand men out of ten required by the king for the support of his son-in-law the elector palatine; and an act of parliament was passed for making the Thames navigable from Oxford, for the conveyance of free-stone to the city of London.

King James died on the 27th of March, 1625. The public entry of Charles I. and his bride, to whom he had been lately married, was postponed until the 2d of February in the following year, on account of the plague, which then, as at the beginning of the preceding reign, raged most violently in London.

Hackney-coaches had their rise in the first year of Charles I. See the article COACH, vol. iv. p. 702. This troublesome reign could not help affecting the tranquillity of the city, and the comforts of the citizens. They were obliged to refuse Charles's arbitrary demand of money; and were punished for their firmness by being ordered to fit out twenty of the best ships in the river, well manned and stored with ammunition and provisions for three months; and several of the principal merchants were imprisoned. It was not long, however, before a pretence was found for obtaining a sum of money from the city with more colour of justice. One Dr. Lamb, a favourite of the king, and the suspected adviser of these arbitrary proceedings, being discovered in the city, was attacked by a mob, who loaded him with the most bitter invectives, and dragged him about the streets, beating and kicking him, till at length he died under their inhuman treatment. The king, hearing of the tumult, hastened into the city in time to have saved his life, had his authority been sufficiently great, or his body-guard strong enough to have rescued him from the exasperated citizens, who, in reply to the king's intreaties, and promises that he would suffer the law to take its course if Lamb could be judged guilty of any offence, said, "they had judged him already." The king was so incensed, that he amerced the city in a fine of six thousand pounds, which was afterwards mitigated to fifteen hundred marks, on the committal of several of the rioters.

About this time ordinances were properly issued by the common-council, in order to clear the streets and lanes of stalls and stands with which they were generally encumbered, to the great annoyance of the passengers.

A law-mill, or engine for sawing timber, was erected,

in this year, on the river Thames, opposite to Durham-yard; but so little was the advantage of a saving of labour then understood, that it was shortly after suppressed, "left our labouring people should want employment."

The clouds, which were hovering over the atmosphere of London, began to thicken; and the city felt strongly the commotions which agitated the whole kingdom. In 1640 it was called upon by the privy council to raise twelve hundred men, to be sent against the Scots. This was performed, and the men shipped at Blackwall, though not without great discontent on the part of the populace, who could scarcely be kept within bounds; and, on the 11th of May, the apprentices and others, invited by a paper stuck up in the Royal Exchange, assembled at night, to the number of five hundred, and marched to Lambeth, with an intent to plunder the palace, and murder the archbishop, whom they accused of being a principal instigator of all the ministerial oppressions. But the prelate, being apprised of their coming, had provided such a defence, that their intentions were frustrated, and they were obliged to retire. The following day, upwards of two thousand of the populace rushed into St. Paul's, at the time the high-commission court was sitting, where they tore down all the benches, crying out, "No bishop! No high commission!" These outrages greatly alarming the court, the privy-council sent an order to the lord-mayor, to provide a double watch, and to oblige every house-keeper to keep his apprentices and servants at home, and not suffer them to go out of their houses at any hour, till further orders. The lord-mayor strictly obeyed these orders; notwithstanding which, so turbulent and enraged were the citizens in general against the court and ministry, for their despotic government, that they stuck up papers in various parts of the city, exciting the people to a general insurrection. This occasioned another order from the privy-council, commanding the lord-mayor to draw forth the city trained bands, the more effectually to suppress all disorderly and riotous meetings.

In consequence of a petition which the citizens of London presented to the king, and in which they detailed their grievances, his majesty, in a letter dated the 22d September, promised them that a new parliament should be immediately called to take their complaints into consideration. But this cup of favour was not without dregs of bitterness; for it was accompanied with a gentle request for a loan of two hundred thousand pounds, which was accordingly negotiated. The king, however, faithful to his word, summoned a parliament, which met on the 3d of November; but, after petitions upon petitions, the business ended in insults offered to the Spanish ambassador, the burning of his private chapel in Bishopsgate-street, and the tumultuous proceedings against the earl of Strafford; during which the mayor and citizens evinced great firmness and loyalty united with prudence.

About this time, a dispute arose between the lord-mayor and commonalty of the city, about the right of choosing one of the sheriffs, which the former claimed by a prescription of three hundred years, without the approbation and confirmation of the latter; the commonalty admitted of the mayor's nominating a person proper for that office, but insisted he should not serve unless by their assent. The lord-mayor and aldermen applied to the king to determine the controversy; but, as he did not choose to interfere personally, in so critical a time, when his own power was publicly disputed, he referred them to the house of lords. The peers, at first, recommended an accommodation among themselves; but, this not proving sufficiently effectual, their lordships thought proper (with a salvo on each side) to issue the following order: "That, for this time, the commonalty shall forthwith proceed to the nomination and election of both their sheriffs for the year following; hoping that, for the first of the two sheriffs, they will make choice of that party that was nominated by the lord-mayor; and their lordships do further declare, that this order shall be no way prejudicial to any

right or prerogative claimed by the lords, the mayors of the city of London, for the time being; nor yet to any right or claim made by the commons or citizens in this matter, now in question amongst them."

After these internal broils, a sort of cordiality appears to have reigned between the king and the citizens, who treated him most sumptuously at Guildhall, where he dined with the queen, the duke of York, and the princess Mary. So pleased was the monarch at this treatment, and at the acclamations of the people, that the next day, an address being presented from the city, he made the lord-mayor a baronet, and knighted *all* the aldermen who attended.

But the seeds of discontent lurked beneath these flattering appearances, and in a few days began to be perceptible. The king, having discharged sir William Belfour from the lieutenantancy of the Tower of London, appointed colonel Lunsford, a person very obnoxious to the house of commons, to succeed him. This removal so highly displeased the citizens, whose interest was inseparable from that of the commons, that they drew up and presented a petition to the house, the substance of which was, "That the Tower of London was more especially intended for the defence of the city of London, which had lately been put into fears of some dangerous design from that citadel. That sir William Belfour, a person of honour and trust, is displaced from the office of lieutenant; and the same is bestowed upon colonel Lunsford, a man outlawed, and most notorious for outrages, &c. May it therefore please this honourable assembly to take the premises into such consideration as may secure both the city and the kingdom against the mischiefs which may happen, &c." This petition occasioned the commons to request a conference with the lords; but the latter refused joining with them to address his majesty for the removal of Lunsford; alledging, that they conceived it would be an infringement on his majesty's prerogative. The lord-mayor, however, on the Sunday following, waited on the king at Whitehall, where he represented the dissatisfaction of the people, at the promotion of the said Lunsford, and informed him of a general insurrection being intended by the citizens, should Lunsford be continued in the lieutenantancy of the Tower. On which his majesty was graciously pleased to remove him from the said office. Before this was publicly known, the citizens and apprentices, who had petitioned against Lunsford and the bishops, assembled in a large body, and proceeded to Westminster, crying out, "No bishops! No bishops! No popish lords!" This so irritated the bishop of Lincoln, who was then passing to Westminster, that he imprudently seized one of the most active in the mob; but the populace immediately rescued their comrade, and, after dinning his ears with "No bishop! No bishop!" permitted the terrified prelate to depart. One captain Hyde, with some of his friends, being fired with indignation at such treatment of a bishop, was still more imprudent; for he drew his sword, and threatened to cut the throats of those round-headed dogs who bawled against the bishops; for which he was seized by the apprentices, and carried before the house of commons, who not only immediately committed him to prison, but declared him incapable of ever serving his majesty after. Colonel Lunsford, going to Westminster the same day, was so irritated at the insolence of the mob, that he also drew his sword; on which a scuffle ensued, and several persons were wounded. This commotion soon reaching the city, the lord-mayor and sheriffs took such precautions as prevented any considerable number from getting out of the gates of the city. After which, his lordship patroled the streets all night, and, in the morning, raised the trained bands to preserve the peace.

Five members of parliament, against whom a prosecution had been commenced by the attorney-general, having retired for security into the city of London, the king came in person on the 5th of January, 1643, to demand the assistance of the Londoners to find them out. On his way thither, the people cried out, in a tumultuous manner,

manner, "Privileges of parliament!" And one of them threw into his majesty's coach a paper, on which was written, "To your tents, O Israel!" for which he was immediately apprehended, and committed to prison. His majesty being arrived at Guildhall, where the court of common-council, by his order, was assembled, he addressed himself to them, saying he came to demand persons already accused of high treason, and to desire their assistance to bring them to a legal trial. He then made new professions of his zeal for the protestant religion, and his determination to prosecute all such, either papists or separatists, who should oppose the laws and statutes of the kingdom. Having finished his harangue, he left the hall, and, after dining with one of the sheriffs, returned to Whitehall, without receiving that applause which he expected, or gaining any satisfaction in his inquiries. On the contrary, the members were still protected in the city, and, on the day of the meeting of parliament, went to Westminster in great state, guarded by forty long-boats armed with small pieces of ordnance, and were received on landing by the city trained-bands. When the committee and members were safe arrived, the sheriffs, and those who had conducted the boats, were called into the house, and were thanked for their services, and indemnified from future question for their conduct; after which, the house ordered that two companies of the trained-bands should attend the house daily; and, for the security of the stores in the Tower, the sheriffs were ordered to place a sufficient guard round it, both by land and water.

In the midst of these tumults, the city could not help taking a great part in the dissensions which at that time were tearing the kingdom into different parties. About this time an order was made for shutting up all the shops in London, that the shopkeepers and apprentices might be at greater freedom to attend to the defence of the kingdom. And an ordinance was published, for the encouragement of apprentices to enlist; in which they were promised security against the forfeiture of indentures, bonds, or franchise; and that, when the public service was ended, their masters should be compelled to receive them without punishment or prejudice. The masters were also promised satisfaction for whatever losses they might sustain by the absence of such apprentices.

The common-council, about this time, passed an act for the better defence of the city, by fortifying it with outworks at certain places. It was also enacted, that all the passages and ways leading to the city should be shut up, excepting those entering at Charing-cross, St. Giles's-in-the-Fields, St. John's-street, Shoreditch, and Whitechapel; and that the exterior ends of the said streets should be fortified with breast-works, musket-proof; that all the sheds and buildings contiguous to London-wall without, be taken down; and that the city-wall, with its bulwarks, be not only repaired and mounted with artillery, but likewise that divers new works be added to the same at places most exposed to danger. This work was immediately begun, and prosecuted with such dispatch, that a rampart, or wall, with bastions, redoubts, &c. was in a short time erected round the cities of London and Westminster, and the borough of Southwark; and, in order to defray the expense attending it, the common-council imposed eight fifteenths on the several wards of the city, which was afterwards confirmed by an ordinance of parliament.

The king, finding at last that the Londoners were more strongly attached to the parliament, and that his obtaining their friendship was impracticable, issued a proclamation, "forbidding all commerce with London." On which the common-council, the day following the date of the said proclamation, made an act for raising the sum of fifty thousand pounds by way of loan, on the security of the city-seal, to be employed in defence of the city; and at the same time passed an order to move the parliament for an ordinance, to compel all moneyed men, within the bills of mortality, to advance money on this occasion, in proportion to their respective abilities.

A rumour prevailing at this time among the citizens,

that the parliament was disposed to accommodate matters with the king, the lord-mayor summoned a common-council, who presented a petition to the house of commons, in the strongest terms, against a reconciliation. When his lordship presented the above petition, he was attended by such a prodigious concourse of citizens, that many of the members withdrew from the house through fear; and those who continued, and received the petition, requested his lordship to prevent such riotous proceedings for the future. The petition was approved of; and the propositions of peace with the king were rejected. Such weight had the city of London in the scale of public affairs; such influence had her example or advice upon the rest of the kingdom!

The rage for petitioning was so great at this time, that, on the 9th of August, 1643, some thousands of the meaner sort of women, with white ribbons in their hats, carried up a petition, which was entitled, "The humble Petition of many civilly-disposed Women, inhabiting in the Cities of London and Westminster." The purport of it was very reasonable, namely, "That God's glory, in the true reformed religion, might be preserved; the just prerogatives of king and parliament maintained; the true liberties and properties of the subject, according to the known laws of the land, restored; and all honourable ways and means for a speedy peace endeavoured." The commons returned them for answer, That they were no enemies to peace; and that they hoped, in a short time, to answer the ends of their petition. But, this not satisfying them, they continued about the house, and, before noon, increased to upwards of five thousand; among whom were several men dressed in women's clothes. They crowded about the house, calling out, "Peace! peace!" and demanding the traitors who were averse to it; particularly, "that dog, Pym." At length, these *civilly-disposed women* became so outrageous, that it was found necessary to oppose them by force. A party of the trained-bands were therefore sent for; but, instead of being intimidated at their appearance, the mob assailed them with such fury, that they were forced to fire in their own defence; when several being killed, and others wounded, the rest thought it prudent to withdraw.

At the beginning of the year 1644, the city sent two regiments of auxiliaries, to join the parliament-army under sir William Waller, who gained a victory over the royal forces shortly after. In the battle, the troops belonging to the city behaved with the greatest courage and intrepidity; and the victory was considered of such importance, that a public thanksgiving was ordered to be observed, on the 9th of April, throughout London and the bills of mortality.

On the 16th of May, the lord-mayor, aldermen, and common-council, presented an address or petition to the parliament, thanking them for the great care they had taken for the preservation of the public good, and exhorting them to perseverance. They particularly thanked them for their especial care of the Tower of London and the castle of Windsor; but expressed some dissatisfaction at the discontinuance of the committee of parliament, at the want of execution upon delinquents, the not putting Tilbury Fort into safe hands, and at the endeavours of divers members of parliament to gain re-admittance, after having betrayed their trust by bearing arms against the parliament. The commons returned a full and satisfactory answer to all these points; and concluded with declaring, that they would, in a most particular manner, be mindful of the merit of the city, which, upon all occasions, they should acknowledge, and would endeavour to requite. The Londoners, however, kept up a good understanding with the army, and became the mediator between them and the parliament. The army required that no forces should be raised in the city; to which the citizens agreed, and promised to move the parliament for their better payment, that they might be removed to a greater distance.

The city was, at times, thought a safe and secure shelter

ter for those who were obnoxious to either of the parties; and, at other times, those who had taken refuge there were obliged to leave it. Many of the members of the two houses of parliament, intimidated by the violence of the presbyterians, retired from London, and sought protection from the army. Every movement of Fairfax's army added new fears, or new hopes, to the citizens, who, divided unfortunately among themselves, were either for or against his entering the metropolis. However, as soon as he arrived, London withdrew the militia, and delivered up the fortifications, without waiting for any attack, and therefore without resistance. The lord-mayor and aldermen met the general at Hyde-park, and congratulated him on his arrival; and he was saluted in the same manner by the common-council, who waited for him at Charing-cross. Thus the army possessed themselves of the city and parliament. It is not improper here to remark, that, in all popular commotions, the army plays always the chief part in the drama, and the general eventually becomes the hero of the piece. These proceedings were very similar to what happened at Rome in the time of the emperors, and in France a few years ago; for, had not the present ruler of that country been a favourite with the army, he would never have been received at Paris, at his return from Egypt, with the acclamations of the people.

Soon after the arrival of the army, a loan of fifty thousand pounds was demanded from the city, for their services; which not being complied with, the parliament passed a vote for demolishing the fortifications round London, Westminster, and Southwark.

In this state of affairs, with a divided capital, an insolent army, and an imprisoned sovereign, it cannot be matter of surprise, that confusion and licentiousness should characterize the people. Riots and conspiracies were almost daily occurrences; nor does the history of the times offer any topics of a more agreeable nature. At length, the army bore down all opposition; the measures which were in agitation between the parliament and the city, to restore tranquillity and re-instate the king, were frustrated by the army, who took possession of London and Westminster on the 4th of December, 1648; demanded forty thousand pounds of the citizens; and, when that sum was not procured so speedily as they expected, the general sent two regiments of foot to take up their quarters in the city, and to secure the treasures in Goldsmiths', Weavers', and Haberdashers', halls; from the latter of which they carried off twenty thousand pounds.

The remainder of this political tragedy, which ended in the death of the king, is sufficiently detailed in the article ENGLAND.

During the protectorate of Oliver Cromwell, the city of London, intent upon trade, does not appear to have been shaken by any sort of commotion; a loan of one hundred and twenty thousand pounds was consented to, which sum the citizens advanced; and thus, the parliament and city being once more on good terms, the former gave Richmond Park to the citizens, and a thousand pounds in money for the use of the poor. The lord-mayor and aldermen, with the recorder, in their scarlet gowns, the mayor carrying the city-sword, attended the ceremony of Cromwell's installation at Westminster; and a few days after he was entertained by the corporation at Grocers' Hall, with all the formalities used at the reception of a crowned head; for which mark of respect and tacit allegiance, he returned his warm thanks to the citizens, and knighted the lord-mayor.

In 1655, an ordinance was passed by the protector, to limit the number of hackney-coaches to two hundred, and to place them under the care and government of the lord-mayor and court of aldermen. He also gave them a license to import four thousand chaldrons of coals, annually, for the use of the poor, duty free.

Three years after, Cromwell died; his son succeeded him; but the protection of the city could not prolong

his protectorate; and a general cry for a free parliament, originating in London, spread itself through the kingdom.

The citizens of London took a great share in accomplishing the restoration of the royal family to the kingdom and throne. They chose Monk major-general of their forces, and by his advice disarmed all who were suspected of favouring the rump-parliament; and kept a strong guard for the peace and quiet of the city, till the meeting of a free parliament, which was now resolved upon, in order to restore the monarchy, the royal family, and the church.

The new parliament being assembled, and all things ripe for the restoration, Charles sent letters to them and to general Monk. The parliament immediately appointed a committee to prepare an answer, which was forwarded the next day, inviting him to return and take possession of his crown and dominions. With the letters to the parliament, the king sent one to the lord-mayor, aldermen, and common-council, of the city, expressive of his satisfaction with their conduct and good intention to assist in the work of his restoration, and promising to manifest his particular regard for the city, not only by renewing their charter, and confirming all their ancient privileges, but also by adding to them, and granting any new favours which might advance the trade, wealth, and honour, of his native city.

The citizens were so elated on the receipt of this letter, that they presented the messengers with three hundred pounds; and deputed fourteen of the common-council to proceed immediately to Holland, with a present of ten thousand pounds to his majesty, and to assure him of their fidelity and most cheerful submission, and that they placed all their future hopes of prosperity and happiness in the assurance of his royal grace and protection, for the deserving of which their lives and fortunes should be always at his disposal.

Four days after this, the common-council made an order, that Richmond Park, lately given to the city by Cromwell, should be presented to his majesty on his return to England, with assurances that they had kept it with no other view than to preserve it for the royal interest.

The day following his majesty was proclaimed king at the usual places in London, with the greatest solemnity, in the presence of the lord-mayor, aldermen, recorder, and sheriffs, amidst the universal and joyful acclamations of the citizens.

His majesty landed at Dover on the 26th of May, 1660; and, on the 29th, he made his public entry into London, where he was received with every testimony of joy. The streets were lined with the trained-bands, and the city-companies in their liveries; the houses were adorned with the richest silks and tapestries; and a vast concourse of spectators crowded upon scaffolds, and in windows and balconies; while the lower orders were equally eager to express their satisfaction by tumultuous acclamations and loud huzzas. In short, every thing was conducted with the greatest appearance of unanimity and contentment.

In the year 1663, his majesty, in return for several tokens of loyalty shown by the citizens to his person and government, and for their effectual aid in restoring him to his throne, granted them a charter, in which, after reciting all the charters obtained from his predecessors, he ratifies and confirms them in the most ample manner.

This year is also distinguished by the institution of the Royal Society; that name being conferred by the king on a society of learned men, in London, who assembled weekly for the improvement of natural knowledge.

In the following year the citizens advanced the king a loan of one hundred thousand pounds. This, however, not being sufficient, they shortly after advanced the like sum; this ready concurrence was so well received by the parliament, when it assembled, that a vote of thanks was sent to the common-council by a deputation from both houses.

In the year 1665, about the beginning of May, there broke out, in London, the most dreadful plague that ever infected this kingdom, which swept away 68,596 persons, which, added to the number of those who died of other distempers, raised the bill of mortality, in this year, to 97,306. And the mortality raged so violently in July, that the houses were shut up, the streets deserted, and scarcely any thing to be seen therein but grass growing, innumerable fires for purifying the air, coffins, pest-carts, red crosses upon doors, with the inscription, "Lord have mercy upon us!" and continual cries of "Pray for us;" or the melancholy call of "Bring out your dead." The cause of this dreadful calamity was ascribed to the importation of infected goods from Holland, where the plague had committed great ravages the preceding year. And it was observed, during the whole time of its continuance, that there was such a general calm for many weeks together, that not the least wind could be perceived; the fires in the streets were kept burning with difficulty for want of a supply of air, and the very birds panted for breath.

It is probable that the numbers who died of this dreadful pestilence were greatly under-rated in the bills of mortality for that year; one parish, that of St. John the Evangelist, Watling-street, appears from them to have been wholly exempt from it, which is not to be credited when its situation is considered.

Affliction is well adapted to draw forth and display extraordinary instances of virtue. In this period of distress, Sir John Laurence, the lord-mayor, with equal humanity and intrepidity, faced every danger, in order to give assistance to those who stood in need of it. Too many, influenced by fear, acted in an opposite manner. Forty thousand servants were turned into the streets to perish, whom no one would receive; nay, the villagers drove them away with pitch-forks and fire-arms. Sir John, like the good Samaritan, took those wretched fugitives under his protection, relieved them with his own fortune till it was exhausted, and then solicited subscriptions for their support. The conduct of George Monk, duke of Albemarle, and William earl Craven, deserves also to be recorded. They assisted the civil magistrate in alleviating the evil, and terminating its progress. They, who had been accustomed to the terrors of war, behaved with the greatest heroism in the more trying scenes of death-beds, which neither courage nor wisdom could avert. The piety of the Christian, and the magnanimity of the hero, were also displayed by archbishop Sheldon. He continued in his palace at Lambeth whilst the contagion lasted, preserving, by his charities, multitudes who were sinking under disease and want; and, by his pastoral exertions, procured benevolences to a vast amount. Such benefactors are an honour not only to their own nation, but to human nature, and are the models we should endeavour to imitate.

In the midst of this dreadful calamity, the magistrates of London did not slacken from their usual activity in providing for the comforts of their fellow-citizens. Regulations were made about carmen and the prices of carriage; and others for the better management of the sale of coals, and the securing a regular supply of that important article. The last may be interesting, particularly at a time when so much imposition has been practised in that department of trade.

That the poor might be constantly supplied with coals in times of scarcity, and to defeat the combination of dealers therein, the several city-companies undermentioned were ordered to purchase and lay up yearly, between Lady-day and Michaelmas, the following quantities of coals; which were to be vended in such manner, and at such prices, as the lord-mayor and court of aldermen should, by written precept, direct; so that the coals should not be sold to loss.

By the same act all retail dealers in coals were prohibited from meeting the vessels, or by their agents contracting for coals, before the ships were arrived in the port of London; on the penalty of five shillings for every chaldron of coals so forestalled, or bought by pre-contract. Why these excellent regulations are become obsolete it would be worth while to enquire; but it would be much better to revive them.

The most extensive and dreadful conflagration that ever afflicted the city of London, broke out about one o'clock in the morning of the 2d of September, 1666, in Pudding-lane; and, there not being a sufficient aid either of engines or of water, the flames, fomented by a violent easterly wind, soon got the better of the weak efforts made use of to put it out; and, in about thirty hours, they spread to Gracechurch-street towards the north-west, and to the Three Cranes, in the Vintry, towards the south-west, including Cannon-street, and the lanes, alleys, and courts, in the way; and, either by communication or the flakes from such a vast body of fire kindled by old timber houses, or by any of the other means which have been suspected, the flames burst out in divers and distant places; and the conflagration became so general, that there was not a building left standing, from the west end of Tower-wharf, in the east, to the Temple-church, in the west; nor from the north-end of Mincing-lane, in Fenchurch-street, from the west end of Leadenhall-street, and from the south-west end of Bishopsgate-street, as far as the entrance into Thread-needle-street, to Holborn-bridge, on the west, in a direct line; besides the damage done in Throgmorton-street, Lothbury, Coleman-street, Basinghall-street, Cateaton-street, Aldermanbury, Addle-street, Love-lane, Wood-street, Staining lane, Noble-street, and Silver-street; as length, it stopped at Pye-corner, near West Smithfield.

By this horrid conflagration, many thousand citizens were compelled to retire to the fields, destitute of all necessaries, and exposed to the inclemency of the weather; till a sufficient number of huts could be erected for their relief: his majesty immediately ordered a great quantity of naval bread to be distributed among them, and gave orders for the encouragement of the bringing of all sorts of provisions for their use.

This dreadful and destructive fire laid waste and consumed the buildings on four hundred and thirty-six acres of ground, four hundred streets, lanes, &c. thirteen thousand two hundred houses, the cathedral church of St. Paul, eighty-six parish-churches, six chapels, the magnificent buildings of Guildhall, the Royal Exchange, Custom-house, and Blackwell-hall, many hospitals and libraries, fifty-

fifty-two of the companies' halls, and a great number of other stately edifices; together with three of the city gates, four stone bridges, and the prisons of Newgate, the Fleet, the Poultry and Wood-street Compters; the loss of which, by the best calculation, amounted to 10,730,500. And, notwithstanding all this destruction, only six or eight persons lost their lives.

The irregularity of the buildings, the dark ill contrived wooden houses, and the narrow, crooked, and incommodious, streets of the city, had always been a subject of complaint. The extent of the conflagration now put it in the power of authority to rebuild London with greater uniformity and security; and such was the immediate attention of the court on this occasion, that his majesty issued a proclamation, while the ruins were yet smoking, to prohibit the rebuilding of houses, till public care might be taken for its re-edification with greater magnificence and uniformity than before, and with such materials as might most effectually prevent such another occurrence.

The parliament assembled with all speed; and, on the 13th of September, passed an act for erecting a court of judicature, for settling differences between landlords and tenants, respecting houses burned down and demolished by the late fire; and appointed the justices of the courts of King's Bench and Common Pleas, and the barons of the Exchequer, to be judges of the said court; who conducted themselves with such admirable impartiality and strict justice, that they gave universal content; and, in token of the general esteem of the citizens, their portraits were ordered to be hung up in Guildhall, where they remain to this day.

Soon after, an act of parliament was passed for rebuilding the city, which laid down rules and directions for all persons concerned therein.

It is a strange coincidence, that, as the fire began at Pudding-lane, it was stopped at Pye-corner, near Smithfield. The figure of a grossly-fat boy, with an inscription attributing this calamity to the sin of gluttony, placed on a house at Pye-corner, alludes no doubt to this circumstance; while the inscription on the Monument with equal absurdity imputes it to the Roman catholics.

The good consequences of this tremendous disaster, in preventing the returns of the plague, which for a series of ages had so frequently visited the capital, may teach us, that what we call calamities are frequently blessings in their effects. This terrible disorder has never appeared in London since the rebuilding of the city; which, under Providence, may partly be attributed to the enlargement of the streets, and the present attention to cleanliness. That great architect, sir Christopher Wren, exerted his fine genius in forming plans for rebuilding the city in the most noble and elegant manner; but private interest interfered, and obstructed the execution of his magnificent design. He was, however, permitted to display his taste in the erection of many public edifices, particularly a fine Doric pillar, two hundred and two feet high, called the Monument, raised near the spot where the conflagration began, in memory of the event.

On the 29th of October, 1675, when sir Robert Viner entered into his mayoralty, his majesty honoured the corporation with his company at Guildhall, and accepted the freedom of the city, in the chamberlain's office, from the hands of sir Thomas Player, then chamberlain. The lord-mayor, aldermen, and common-council, to show their sense of this instance of condescension, on the 18th of December following, waited on his majesty, at the Banqueting house, Whitehall, and presented him with a copy of his freedom, in a large square box of massy gold, with a seal inclosed in another box of the same metal, beautifully enriched with diamonds of immense value.

This cordiality did not last long. The frequent prorogations of the parliament began to raise an universal discontent, which was considerably increased by an opinion, that this and other unpopular measures were produced by the influence of the duke of York in the cabinet. He

was known to be a rigid papist; and, as one of the businesses most eagerly pursued by the parliament, when they did meet, was the bill for excluding him from the parliament, and indeed from the succession to the throne, the uneasiness of the people was manifested by numerous and repeated petitions to the throne; and the sense of the citizens of London, on this subject, was so strongly expressed in a petition presented to the king from them, as to give great offence to his majesty, whose answer purported, that "he looked upon himself to be the head of the government, and the only judge what was proper to be done in these cases."

The citizens were resolute to their purpose; and, accordingly, on Midsummer-day, 1679, Bethel and Cornish, two men on whom they could depend, were nominated for sheriffs, and, on a show of hands, elected by a considerable majority; but, a poll being demanded in favour of the court-candidates, a tumult ensued, which was represented by the mayor, and other supporters of the duke of York, as a riot; and the king issued a commission, on the same evening, for the trial of the rioters.

But, far from being over-awed by this exertion of authority, they persevered with more ardour than before in their opposition to papacy; and having, on the dissolution of parliament, which took place shortly after, re-elected their former representatives, in despite of every artifice made use of to procure the return of members devoted to the ministry, they gave them a paper of instructions, in the name of the citizens in common-hall assembled; in which, after thanking them for their unwearied endeavours in furthering their views during the last two parliaments, and more especially for promoting the bill for the exclusion of the duke of York; they conclude, by expressing their confident assurance, "that the said members will never consent to granting any money-supply, till they have effectually secured them against popery and arbitrary power."

From the sudden dissolution of parliament, the bill of exclusion, the darling object of the citizens, was lost; yet they chose every opportunity of showing their dislike to their future sovereign. An instance of this occurred shortly after, on occasion of an entertainment given, at Merchant-tailors' Hall, by the Artillery-company, to him, as their captain general. To lessen the gratification the duke might derive from this public mark of distinction, as much as was in their power, the anti-courtiers fixed on the same day for a public dinner, at Haberdashers' Hall, to be preceded by a sermon; the invitation to which ran in the following form: "It having pleased Almighty God, by his wonderful providence, to deliver and protect his majesty's person, the protestant religion, and English liberties, hitherto, from the hellish and frequent attempts of their enemies, the papists; in testimony of thankfulness herein, and for preserving and improving mutual love and charity among such as are sensible thereof, you are desired to meet many of the loyal protestant nobility, clergy, and citizens, on Friday, the 21st instant April, 1682, at ten of the clock, at St. Michael's church, in Cornhill; there to hear a sermon, and from thence to go to Haberdashers' Hall, to dinner; and to bring this ticket with you."

This scheme gave great offence to the court, it being represented to them as a matter of very dangerous tendency; to prevent which, an order of council was made, on the 19th of the same month, strictly charging the lord-mayor and aldermen, as they should answer the contrary at their peril, "to take immediate and effectual care to prevent and hinder the said meeting, as an unlawful assembly."

Party-diffensions now ran very high, and each side used their utmost efforts to secure the sheriffs of London and Middlesex in their interest. The lord-mayor, who was on the court-side, insisted on his right of nominating one, by drinking to him; a ceremony, by which it was understood, that the person so drunk to was put in nomination, subject to the election of the common-hall. But, depend-

ing on the strength of the lord-mayor's right to appoint, North, the person drank to, attended the court of aldermen some time before the day of election, and entered into bond to serve the office; and the lord-mayor issued his precept for holding the court on Midsummer-day, for confirming the appointment of North, and electing the other sheriff. This new form of the precept occasioned much confusion among the companies; some summoning their members to meet and choose sheriffs, &c. as formerly; some for confirmation and election; and some for choosing city-officers generally. On the day previous to the election, the opinion of the recorder being taken in the court of aldermen on the right of election, he declared, that it was vested in the commonalty, and that the sheriffs were judges of the poll, if there was one; in which opinion the court unanimously concurred. But, on Midsummer-day, the common crier, by direction of their mayor, proclaiming, "You gentlemen of the livery, attend your confirmation," the hall resounded with, "No confirmation." After a long and violent dispute, the mayor and aldermen retired, and left the livery at liberty to proceed to the election; when Papillion and Dubois had a considerable majority on the show of hands; but a poll was demanded and granted. At seven in the evening, the lord-mayor returned, and made an attempt to adjourn the court; but the sheriffs continued to take the poll till nine o'clock, when they adjourned it. The lord-mayor, disliking the proceedings of the sheriffs, made complaint to the king and council, of his having been grossly insulted; in consequence of which, the lord-mayor, with the aldermen and sheriffs, were ordered to attend the privy-council on the Monday following; when, being severally examined concerning the disturbance, the two sheriffs, Pilkington and Shute, with alderman Cornish, were committed prisoners to the Tower; and, at the same time, orders were given to the attorney-general to prosecute, with the utmost severity, all who should be found to have been promoters and encouragers of the late tumult.

On the ensuing Friday, the prisoners were, by a writ of habeas corpus, admitted to bail; and on the 1st of July, they called a common-hall; where, in defiance of the lord-mayor's order to the recorder to adjourn the hall to the 7th, they proceeded in the poll, and declared Papillion and Dubois duly elected. This so irritated the lord-mayor, that he and his party met at Guildhall on the 14th, when his lordship produced an order of council to begin all the proceedings anew. This order was vigorously opposed by many of the most eminent citizens, as an innovation of their rights and privileges; the lord-mayor, however, declared North duly elected by him, without the sanction of the common-hall, and proceeded to poll for the other; but, as none of those who had voted for Papillion and Dubois at the former election would vote at this, to give it a sanction, Box, another candidate, put up by the court, was elected without opposition. Box, however, finding his election could not be legally justified, declined serving the office; on which Mr. Peter Birch was chosen, and, with North, sworn in before the lord-mayor; while Papillion and Dubois were left to seek their remedy at law.

These arbitrary proceedings sufficiently evinced the determination of the court to carry their point by any means; and, the citizens being equally resolute in supporting their privileges, a more decisive blow was meditated, by which the king would become master, not only of the city of London, but also of every corporation. Accordingly, in Michaelmas term, a writ of *quo warranto* was issued against the city, to try the validity of its charter; in which it was asserted that the liberties and privileges of the city were usurped.

Notwithstanding all the arguments used by the citizens to support their conduct, and resist this infringement on their dear-bought liberties and privileges, yet the ministry were determined, at all events, to crush them. Accordingly, in Trinity term, 1683, the *quo warranto* being argued and determined, justice Jones pronounced the fol-

lowing sentence: "That a city might forfeit its charter; that the malversations of the common-council were acts of the whole city; and that the points set forth in the pleadings were just grounds for the forfeiting of a charter. Upon which premises the conclusion seemed to be, that, therefore, the city of London had forfeited its charter."

These unjust and arbitrary proceedings greatly alarmed the citizens; a court of common-council was summoned to deliberate on what measures were to be resorted to, in which the court-party prevailed so far as to procure an act of submission, which amounted to a voluntary surrender of the city's liberties, since it deprived them of the means of having the judgment reversed. The lord-mayor, with a deputation from the court, attended the king at Windsor, on the 18th of June, to acknowledge their misgovernment, solicit pardon, and beg for his majesty's commands and directions. Conditions were then proposed to them by the lord-keeper, and they were told that immediate compliance with them was the only way to stop entering up the judgment of the court, but that, on their submission, this measure should be abandoned. In the common-council called to receive the report of this deputation, the question for submission was carried by a majority of eighteen; but, after the king had thus compelled the citizens to submit to terms of his own proposing, on pretence that they had not tendered him a formal submission, he ordered the judgment upon the *quo warranto* to be entered up. This was no sooner done, than, by a commission under the great seal, the office of mayor was granted to sir William Pritchard, the present lord-mayor, and the office of sheriffs to Peter Daniel and Samuel Dashwood, during his majesty's pleasure. At the same time, sir George Treby, the recorder, was removed in favour of Thomas Jernier, who was knighted on the occasion. Eight of the aldermen, in the country or whig interest, were degraded, and the remaining sixteen made justices of the peace. Soon after, eight new aldermen were appointed; and, on the 20th of October, the king, in virtue of his assumed power, constituted sir Henry Tulse (one of the informers against alderman Pilkington) lord-mayor during his pleasure. The charter was not restored till the following reign.

It was in or about the year 1683 that the useful conveyance of letters and parcels by the *penny-post* was first set up in London and its suburbs, by a private undertaker, named Murray, an upholsterer by trade; who afterwards assigned the same to one Dockwra, who carried it on successfully for a number of years, until the government laid claim to the project, as being connected with the general post-office, which was a part of the crown-revenue; and a yearly pension of two hundred pounds was settled on Mr. Dockwra for his life.

In 1685, the manufactures and population of London received a considerable increase in the refugees who fled from France in consequence of the revocation of the edict of Nantes. The number of industrious artisans thus forced from their homes is stated to have amounted to eight hundred thousand, a great proportion of whom settled in the suburbs of London, particularly about Spitalfields, Soho, and St. Giles's, where their descendants still reside. To them London is indebted for either a knowledge of, or improvements in, the manufactures of silks, linen, paper, glass, hats, watches, cutlery, toys, &c. many of which are now brought to a state of unrivalled perfection. It is an observation worthy of attention, that these refugees have continued to speak the French language of the time at which their ancestors left France, and have preserved much of the native character and manners to this day. Their church-service is still, though protestant of the calvinistical persuasion, performed in French; and several of their preachers have been much admired, and regularly followed by those who wished to improve themselves in the French language. The descendants of these refugee-families, almost to the present day, have been very anxious to preserve the French language among them, by sending their children to the  
different

different chapels, and the poorer sort by gaining admittance for them into the French Protestant School in Windmill-street, Tottenham-court road. But at length the race is nearly exhausted; that is, they are become English; their chapels are nearly deserted; and their school, wherein 80 children were formerly boarded, clothed, and well-educated, is now reduced, by the failure of contributions, to 18 girls only. Hogarth's picture of "Noon" represents their principal chapel, called the Greeks, in Crown-street, Soho, with the congregation coming out after morning-service: it is a most admirable representation, and the principal figures are portraits of well-known French protestants in that quarter about sixty years ago. At this chapel they use the liturgy of the church of England, very correctly translated into French, with the Psalms of old Clement Marot. About twenty years ago, while the Greeks could still boast a congregation respectable as to numbers, it was proposed to have a selection of the psalms translated into modern French verse, and set to new tunes. This was a thing of great importance in a small community, and could not be accomplished without a general agreement of the congregation, and a subscription to defray expenses. But the matter was soon put at rest by the observation of some very worthy old ladies, that it would be much better to leave the psalms and tunes "*comme le roi David les avoit écrits.*"

The death of Charles, which took place on the 6th of February, 1685, did not put an end to the arbitrary measures of the latter part of his reign. James II. had long governed in the king's name; and it was with a view to the introduction of popery that he had devised the plan of seizing the charters of corporate bodies, which he dreaded as the most effectual bars to his designs; so that the Londoners were placed in a worse situation, by his accession, than they had been in before. Alderman Cornish, who, when sheriff in 1680, had exerted himself to detect the popish plot, was singled out as a sacrifice to the new king's resentment. On the 13th of October, 1685, he was apprehended and committed to Newgate, without the use of pen, ink, or paper; and, on the Saturday after, received notice that an indictment for high treason was prepared against him, on which he was to be tried on the following Monday. It was in vain he applied for time to prepare for his defence; he was answered by the attorney-general, that he had not deserved so well of the government. He was tried on the appointed day, and, although the two evidences produced against him could not prove any fact to affect him, he was condemned, and, on the 23d of the same month, hanged, drawn, and quartered, facing his own house, at the end of King-street, Cheapside.

Long before James's accession to the throne, he had lost the affections of the people of every rank and station, and his subsequent conduct was so preposterous, that it hastened a revolution which prudence might have delayed, or perhaps prevented. When, at length, he found the increasing discontents had arisen to such a height, as to threaten the loss of his crown, he attempted conciliatory measures; but it was too late. Among other symptoms of his ill-timed repentance, he, on the 26th of October, 1688, restored the city-charter, by the hands of his chancellor Jefferies; in consequence of which, the *custos*, sir John Chapman, was constituted mayor until the ensuing feast of St. Simon and St. Jude; and the sheriffs were continued till the next day of election. A court of common-council was held on the following day, though it was Sunday, at which an order was made for restoring the liverymen of the several companies, that were on the livery at the time when judgment was given against the city; which order was immediately entered on the books of each company.

The prince of Orange landed at Torbay, on the 5th of November; and James left London, with an intention of marching against him with his army; but the defection became so general, that he speedily returned to the capi-

tal; where, agitated every moment with fresh proofs of the universal discontent, and not daring to repose confidence in any one, he precipitately embraced the resolution of withdrawing to France.

As soon as the king's flight was known, the lords spiritual and temporal met at Guildhall, and signed and published their declaration, to apply to the prince of Orange, and to assist his highness to obtain a free parliament, and to be ready to do all other matters that should tend to the public good. This was followed, the same day, by an address from the lord-mayor, aldermen, and common-council; and by another from the lieutenantancy of the city of London to the prince of Orange; in which they expressed similar sentiments.

Though the greatest precautions were used, it was impossible such an event should pass without some acts of violence. The populace, considering the papists as the authors of their late misfortunes and present distractions, plundered and burnt the mans-houses lately erected in the metropolis and its suburbs; and also attacked and plundered the houses of the Spanish and Tuscan ambassadors, where some of the most wealthy papists had deposited their valuable effects for safety. The losses of the ambassadors were, however, made good by the next parliament. Jefferies, the chancellor, being discovered about the same time, concealed in a sailor's dress, at Wapping, was seized by the mob, and treated with such severity, that he died shortly after of his bruises.

Being arrived at the period of the revolution, we may pause a moment to notice the surprising difference between the healthiness of London at present, notwithstanding its great increase of population, and what it was during the seventeenth century. At present the number of inhabitants in London, and the contiguous villages, which in fact make a part of it, is 1,099,104. We do not know exactly what it was in the seventeenth century; but, as it has been increasing ever since, and as, in the year 1753, the number of inhabitants did not exceed 750,000, we shall not probably err very much if we reckon the inhabitants of London, in 1688, at about half a million. Yet, in the years 1685, 1686, and 1687, the births and deaths were to each other as follows:

Years.	Births.	Deaths.
1685 - -	14,730 - -	23,222
1686 - -	14,694 - -	22,609
1687 - -	14,951 - -	21,460

So that, at this period, the deaths exceeded the births by no less a quantity than 7639, or more than one half of the whole births. At present the number of births exceeds that of the deaths. We shall instance only three years, as before:

Years.	Births.	Deaths.
1810 - -	19,923 - -	19,893
1811 - -	20,645 - -	17,043
1812 - -	20,404 - -	18,293

This diminution of deaths in so increased a population must be owing to the different mode of living, and the improvement in the width of the streets, and in cleanliness. The same improvements having taken place in every part of Great Britain, there can be no doubt that the value of human life is rather increased in this island; a circumstance very essential to be considered in the calculation of life-annuities, and in other matters of statistics and politics.

One of the first acts of authority performed by the prince of Orange, was to apply to the lord-mayor and common-council for a loan of two hundred thousand pounds; and the citizens cheerfully voted the money, which was raised in a short time. In the parliament which met on the 20th of March, 1690, the citizens of London received a fresh assurance of his majesty's great regard to the rights of the corporation, by his signing an act, declaring the proceedings of the former reigns, on the *quo warranto*, illegal and arbitrary. Every judgment given and recorded, for seizing the franchises of the city,

B. b were,

were, by this act, reversed and made void. The mayor, commonalty, and citizens, of London, were declared to remain for ever a body corporate and politic. They were to have and enjoy all their rights and charters; and all charters, letters patent, &c. concerning any of the liberties, lands, and tenements, rights, titles, &c. made in consequence of the said judgment, were thereby declared void.

To prevent the recurrence of many disagreeable controversies in the nomination of aldermen, and the election of common-councilmen, an act of common-council was made, in 1691, by which it was enacted, that none but freemen, being householders, paying scot and bearing lot, should be entitled to vote on such occasions.

The city, being indebted to their orphans' fund, in the sum of 747,500*l.* occasioned by various accidents and public calamities, applied to parliament for relief in 1694; and obtained an act, by which a fund was established for the re-payment of the debt. This act, however, was procured by bribing some of the leading members of the house of commons; among other sums distributed on this account, sir John Trevor, the speaker, received a thousand guineas; which being discovered, he was, in the next session, expelled the house for corruption and breach of trust; as was another, who had received twenty guineas for the same purpose.

This year is distinguished, in the annals of London, by the institution of the Bank of England. See the article BANK, vol. ii. p. 672.

In the year 1697, king William being returned from Holland, after the conclusion of the treaty of Ryfwick, he was earnestly requested, by the lord-mayor and citizens, to make his public entry into the city. In compliance with which, on the 16th of November, his majesty set out from Greenwich, attended by his royal highness the prince of Denmark, the principal officers of state, and a great number of the nobility and gentry. His majesty was received at St. Margaret's hill, in Southwark, by the lord-mayor, aldermen, &c. in their formalities, on horseback; who, after congratulating him on the joyful occasion, conducted him through the city to Whitehall, amidst the acclamations of a prodigious concourse of spectators. The procession was solemn, and the city was embellished with the most pompous decorations.

Billinggate was opened on the 10th of May, 1693, by virtue of an act of parliament, as a free-market for the sale of fish, six days in a week; with permission to sell smackrel on Sundays, before and after divine service. Billinggate was once a small port, where almost every article of commerce was landed; and it now continues to be the only place in the metropolis to which the fishing-smacks bring their cargoes. It is also the chief resort of small vessels laden with oranges, lemons, Spanish onions, and nuts; and, in consequence, many orange-merchants live in the neighbourhood. From a list of the fish brought to market in the time of Edward I. it appears that several kinds, then probably esteemed dainties, are now condemned as unfit for food: amongst these may be reckoned the conger, the porpoise, and the seal. Great quantities of salmon are sent from the north fisheries to Billinggate, packed in ice, which is preserved for that purpose, throughout the year, in ice-houses. The fair ladies of this place are proverbially famous for the faculty of scolding: a Billinggate fishwoman is generally an adept in the science, and out-hectors all the sisterhood of vixens. Here a foreigner may learn the English language in all its purity, unadulterated by modern refinements.

King William died on the 8th of March, 1702: in consequence of which the princess Anne, daughter of the late king James, succeeded to the crown, to the universal joy and satisfaction of the nation. The great successes obtained over the French in the preceding campaign occasioned the queen to appoint the 12th of November for a public thanksgiving; on which day her majesty went in grand procession to St. Paul's cathedral, whither she was attended by both houses of parliament; and the citizens

exerted their utmost abilities to render that day more pompous and brilliant than had ever been done on any other occasion.

On the 16th of November, 1703, there happened the most dreadful storm of wind that had ever been known in the memory of man. It began about ten o'clock at night, and continued to rage with the greatest violence till about seven in the morning, when it gradually abated. During the course of the night the people were under the most dreadful apprehensions, fearful of being killed by the ruins of their habitations. About eight in the morning the wind was sufficiently moderate to admit them to look out at their doors, when the destruction that had been made struck every beholder, whose first consideration was to inquire after their friends and relations; and the next day afforded sufficient employment in viewing the universal havock all over the city and suburbs. Upwards of two thousand stacks of chimneys were blown down in and about London; the streets were covered with tiles and slates from the roofs of houses; the lead on the tops of several churches was rolled up like skins of parchment; and at Westminster-abbey, Christ's Hospital, St. Andrew's, Holborn, and many other places, it was carried off from the buildings. The roof of the guard-room at Whitehall was carried entirely away, and the great weathercock blown down. Two new-built turrets on the church of St. Mary Aldermay, one of the spires of St. Saviour's, Southwark, and the four pinnacles at St. Michael's, Crooked-lane, were entirely blown down; the vanes and spindles of weathercocks in many other places were bent; several houses near Moorfields were levelled to the ground; as were about twenty other whole houses in the out-parts, with a great number of brick walls, and the gable ends of houses out of number. Twenty-one persons were killed by the fall of the buildings, and about two hundred greatly maimed in the ruins, besides those drowned in the river. The loss sustained by the city of London alone, was estimated at two millions. The damage at sea, however, far exceeded that by land; for, in that dreadful night, no fewer than twelve men of war were lost, and upwards of eighteen hundred men perished; besides the loss of a great number of merchant-ships, computed at a much greater value. All the ships in the river, four excepted, were driven from their moorings, and thrown on-shore, between Shadwell and Limehouse, in the greatest confusion. Upwards of five hundred wherries were entirely dashed to pieces; above sixty barges were found foul of London-bridge; and as many more sunk or staved between that and Hammersmith. In short, the prospect on the river afforded a sight equally dismal with that on the land. It is not generally known that every year, on the same day, a sermon is preached at a meeting-house in Little Wild-street, Lincoln's-inn Fields, to commemorate and deprecate the return of so dreadful a visitation.

In the year 1704, an act of common-council was passed for regulating the nightly watch of the city, by which it was ordained, that a number of strong able-bodied men should be provided by each ward; and also that the deputy and common-council of every ward should have power to oblige every person occupying any house, shop, or warehouse, either to watch in person, or to pay for an able-bodied man to be appointed thereto by the said deputy and common-councilmen; the said watchmen to be provided with a lantern and candle, and well and sufficiently armed with halberts; and to watch from nine in the evening till seven in the morning from Michaelmas to the 1st of April, and from ten till five from the 1st of April to Michaelmas. The total number of watchmen appointed by this act was five hundred and eighty-three.

In 1708, the fiery zeal of contending parties broke out into a most violent flame at the prosecution of Dr. Henry Sacheverel, chaplain of St. Saviour's, Southwark, before the house of lords, on an impeachment of high crimes and misdemeanors by the commons, for preaching two sermons. The populace were persuaded by the Tories, that

instead

instead of the doctor's ruin, that of the church was intended; and, believing the same to be a contrivance of the presbyterians, breathed destruction to them and all other dissenters. Thus spirited up, they attacked the meeting-house of Mr. Burgefs, a presbyterian minister, in Newcourt, Little Lincoln's-inn Fields, and, breaking it open, stripped it of its doors, casements, sconces, wainscot, pews, and pulpit, which they carried into Lincoln's-inn Fields; and, while they were erecting the same into a pile, a party was sent to surprize Burgefs at his house, in order to have burnt him in his pulpit on the top of the same; but he luckily avoided their fury by escaping out at a back window. After this, they divided into different parties, and destroyed the meeting-houses in St. John's Square, Newstreet, Drury-lane, and Leather-lane. But before next morning this dangerous tumult was suppressed by her majesty's guards, sent for that purpose. The trained-bands were continually kept on duty during the trial of the doctor, who at last was condemned not to preach for three years, and his two sermons to be burnt at the Royal Exchange by the common hangman.

The number of houses and inhabitants being greatly increased in the city of London and its suburbs, the churches were thereby rendered insufficient for their accommodation; wherefore the parliament, in 1710, enacted, that "fifty new churches should be erected in or near the populous cities of London and Westminster, or suburbs thereof." For which purpose they laid a duty of two shillings upon every chaldron or ton of coals that should be brought into the port of London. This circumstance was egregiously mistaken by a foreign Londinographer, who asserts that St. Paul's and many other churches were built on "sea-coal mines."

Many irregularities being complained of in the coal-meter's office, in the city, a committee was appointed to inquire into them: whose report being approved of, the court of lord-mayor and aldermen made an order for their future regulation, in conformity to the ancient method and usage.

In the year 1713, peace being made with France, it was publicly proclaimed in London on the 7th of July; on which occasion both houses of parliament attended a general thanksgiving at St. Paul's. Her majesty, being ill of the gout, was unable to be present at the solemnity. She died on the 1st of August, 1714; when George-Lewis, elector of Hanover, was proclaimed king of Great Britain, and soon after made his public entry into London, accompanied by his son, prince George. In a few days after, the city and lieutenancy addressed his majesty, in form, at St. James's; who, in reply, said, "I take these addresses very kindly. I have lately been made sensible of what consequence the city of London is, and therefore shall be sure to take all their privileges and interests into my particular protection."

His majesty having received an invitation from the city, to dine at Guildhall on the approaching lord-mayor's day, he was graciously pleased to accept of the same; at which time, his majesty and the prince and princess of Wales, attended by a numerous train of nobility, went to the usual place of standing, opposite Bow-church, in Cheap-side, and, after having beheld the pompous cavalcade, were conducted by the sheriffs to Guildhall, where they were sumptuously entertained by the citizens, who exerted the utmost of their abilities to convince them of their loyalty and affection for his majesty's person and government. And, the lord-mayor having the honour to present the first glass of wine to the king, his majesty was pleased to order a patent to be passed for creating his lordship a baronet of this kingdom; and, at the same time, ordered a thousand pounds to be paid to the sheriffs, for the relief and discharge of poor people imprisoned for debt.

The king having informed the parliament of his receiving certain advices from abroad, of an intended invasion in favour of the pretender, the corporation of Lon-

don, and the merchants and other traders of the same city, presented separate addresses to his majesty on the occasion, containing the strongest assurances of their loyalty and support, in defence of his royal person and government. This threatened invasion, however, soon afterwards turned out to be an open rebellion, fomented and brought about in Scotland by the earl of Mar, who raised the pretender's standard at Braemar, on the 9th of September; but this rebellion was of short duration.

The winter of this year is remarkable for a hard frost, which began in the last week of November, and continued, with some short intermissions, until the 9th of February, 1716. The severity of it was greater than any man living could remember; the Thames having been frozen, nearly the whole time, so strongly, that all sorts of wares were sold on it; and, on the 19th of January, two large oxen were roasted whole upon the ice. The vast quantities of snow that fell, at different times, during this frost, made the streets of London almost impassable.

The most prominent of the transactions of the year 1720, never had, nor, it is to be hoped, ever will have, its parallel, in the annals of the metropolis, and may serve as a perpetual memento to legislators, of the danger of suffering the honest industry of a nation to be diverted from its regular course, by fallacious speculations and visionary projects. See BUBBLE, vol. iii. p. 467.

Advice being received, in the year 1722, of another conspiracy in favour of the pretender, viscount Townshend, one of the principal secretaries of state, by his majesty's command, wrote a letter to the lord-mayor, acquainting him with this circumstance. A very loyal and dutiful address was presented on the following day by the lord-mayor, aldermen, sheriffs, and recorder, of London, which was very graciously received. On the same day a proclamation was published for putting the laws in force against papists and nonjurors, commanding all papists and reputed papists to remove from the cities of London and Westminster, and all places within ten miles of the same. This was accompanied with every precaution a wise and able government could suggest. Amongst other things, the privy-council ordered the several lieutenancies, within the bills of mortality, to return a true and just account of the number of horses found within their several jurisdictions; when the sum total did not amount to more than 17,601, including saddle-horses, coach-horses, and draught-horses: but in this account there is no mention made of the borough of Southwark, nor of any part on that side of the river Thames. This conspiracy came to nothing.

The vast increase of buildings in the western suburb of London requiring a greater supply of fresh water than the existing works could furnish, an act of parliament was passed in this year, authorising a newly-erected company, called the Chelsea water-company, to dig basons, reservoirs, &c. for the better supply of the city and liberties of Westminster, and parts adjacent, with water.

The election of lord-mayor for the city of London, this year, coming on, as usual, at the common-hall, on the 29th of September, sir Gerard Conyers and sir Peter Delme, both of great fortune and merit, and also the two aldermen next the chair, were put in nomination, and declared to have the majority of hands. But a poll was demanded, and granted, for sir George Mertins and sir Francis Forbes; which began on the first of October and ended on the third. And next day the sheriffs declared that they had cast up the poll, and that the majority of votes had fallen upon sir Gerard Conyers and sir Peter Delme; who being returned to the court of aldermen, they made choice of the former; which, in all probability, brought on the following application to parliament. On the 14th of December, 1724, many citizens of London petitioned the house of commons, setting forth several grievances they laboured under in the said city, and praying, "That, for promoting the welfare, for preserving the liberties, peace, and tranquillity, of the said city, and for settling elections on a just and lasting foundation, the house would take the premises."

premises into consideration, and give the petitioners such relief as the house should think fit." Whereupon a bill was ordered to be brought in, for regulating elections in the city of London; and for preserving the peace, good order, and government, of the said city. This bill created a great ferment in the city, and was strongly opposed in the house of commons by three of the city-representatives, who received the thanks of the court of common-council for their strenuous endeavours to prevent it from passing into a law. As soon as the citizens knew that the bill was sent up to the house of lords, a great number of them petitioned the house against it, as being injurious to their liberties. The bill was passed into a law; but the fifteenth clause, by which a negative in passing acts of common-council was given to the lord-mayor and aldermen, was afterwards repealed.

George II. was proclaimed king on the 15th of June, 1727; and, having been invited, soon after, by the corporation of London, to dine at Guildhall on the approaching lord-mayor's day, his majesty came into the city, assisted at the dinner, which was most sumptuously served, and honoured the ball with his presence till eleven o'clock in the evening.—At his departure, he ordered the sum of one thousand pounds to be paid to the sheriffs, for the relief and discharge of poor insolvent debtors. The expense of this entertainment, as it is recorded in the chamber of London, amounted to 4889l. 4s.

In the year 1728, a daring project was concerted to rob the queen on her return at night from the city, as was afterwards confessed by one of the gang when under sentence of death. This scheme, however, was happily frustrated by the villains being busily employed, at the time her majesty passed, in robbing sir Gilbert Heathcote, an alderman of London, as he was returning in his chariot from the house of commons. This circumstance, together with the great number of robberies which had been committed in the most daring manner within the cities of London and Westminster, greatly alarmed both the court and city; and letters were immediately sent from the secretaries of state to all the magistrates, enjoining them to use their utmost endeavours to suppress such villainies, and to bring the offenders to justice.

An idea may be formed of the state of the commerce of London at this period by the number of vessels which arrived at its port between Christmas, 1727, and Christmas, 1728; viz. from foreign ports, British vessels, 1839; foreign ships, 213; coasters, 6837: total, 8889 vessels. To compare this with recent times, see the article ENGLAND, vol. vi. p. 803-805. and GREAT BRITAIN, vol. viii. p. 823-825.

On the last day of December, in the year 1731, the tide in the river Thames rose so high, that it overflowed Wapping, Tooley-street, and many other places; and did incredible damage by filling cellars and warehouses, and spoiling great quantities of different sorts of merchandise.

In the year 1734, the chamberlainship of the city of London being vacant, a great contest arose between the citizens and the ministry, respecting the election of a proper person into that office. The candidates were Mr. John Bosworth, a tobacconist, of Newgate-street; Mr. William Selwin, a silkman, in Paternoster-row; and Mr. John Thomas, a fishmonger, near the Monument. Mr. Thomas, making no show of hands in the common-hall, declined; but the numbers appeared so equal for each of the other candidates, that a poll was demanded by the friends of Mr. Selwin against Mr. Bosworth, who was declared to have the majority of hands. The poll was managed with all the dexterity and influence that can be imagined; and, though both the candidates were personally well respected by their fellow-citizens, and were looked upon to be equally qualified for the discharge of that important trust, yet the contest, for seven days, was the warmest ever known; the citizens being determined to preserve their freedom of election against any ministerial opposition whatever.

On the close of the poll, however, the numbers appeared so equal, that a scrutiny was demanded; and when the declaration was made, they stood as follows:

For Mr. Bosworth,	-	-	-	3212
Mr. Selwin,	-	-	-	3208

In consequence of which, to the great satisfaction of the citizens, Mr. Bosworth was declared duly elected, and chamberlain of the city of London. The ministry, however, so highly resented this strenuous opposition to a candidate of their choice, that they conferred the office of receiver-general of the land-tax, which had generally been annexed to the chamberlainship, on their disappointed friend, Mr. Selwin, who had obtained the ill-will of the independent voters of the city of London, by having unadvisedly solicited the ministerial party to oblige all their dependents to vote for him.

In the year 1735, the inhabitants of the precinct of Blackfriars claiming a privilege of exemption from the jurisdiction of the city of London, in right of the ancient monastery dissolved there by king Henry VIII. occasioned the lord-mayor and aldermen to ascertain their right thereto; which they did by a trial in the court of King's Bench, on the 10th of July; wherein John Bosworth, esq. chamberlain of the city of London, was plaintiff, and Daniel Watson, shalloon and druggot-feller, defendant. The action was brought against the latter, for opening a shop in Blackfriars, and retailing his goods there, without being a freeman of the city. The counsel for the plaintiff alleged, that Blackfriars actually belonged to the city of London when it was a monastery, and before trades were ever occupied there; to prove which, they produced several ancient records, viz. a charter of Edward I. and a record, 2 Richard II. calling it the *Friary of London*; and another, 21 Hen. VIII. mentioning a parliament, held at the Friars-preachers of the city of London, Nov. 3, 1530; and other records of this kind; they likewise cited a parallel case to this, 15 Car. I. when an action was brought against one Philpot, a shoemaker, of Blackfriars, for opening a shop, and vending shoes there, without being free of the city. After a fair trial, by an equal and indifferent jury of the county of Hertford, a verdict was given for the city, with five shillings damages. In consequence of this decision, Blackfriars became a precinct of the ward of Farringdon Within, and sends two members to represent it in the common-council of this city.

An act of common-council was passed, in November, for the better regulation of bakers; in which it was enacted, that, in addition to the fine, the name and place of abode of every baker, convicted of making bread under weight, shall be published.

The streets of London being greatly infested with robbers and house-breakers, owing to the insufficiency of the lights in the night, application was made to parliament, by the lord-mayor and common-council, to enable them to light the streets in a more effectual manner; in compliance with which, an act was passed, empowering the lord-mayor, aldermen, and commonalty, to erect a sufficient number of such glass lamps, and in such places, as they shall judge proper, to be kept burning from the setting to the rising of the sun, throughout the year; and giving them power to make a rate, to defray the expense thereof.

The city, in 1739, petitioned the house of lords against the Spanish convention, by which they found themselves aggrieved.—It was on this occasion that sir Robert Walpole took the liberty to call the citizens of London *sturdy beggars*; and, for the purpose of propagating a mean opinion of them, and taking off the weight of their petitions in matters of national concern, he circulated printed lists of the common-councilmen of London, with the addition of their several trades, or companies, to insinuate, that they were a contemptible body of tradesmen or mechanics:

chanics. The citizens, on their part, took every opportunity of showing their dislike to the minister's conduct; and, discovering that sir George Champion, the senior alderman next the chair, and member for Aylesbury, had voted in favour of the convention, they rejected him from the office of lord-mayor, and ever after held him in the greatest contempt.

On the 10th of September, about seven o'clock in the evening, there fell a most violent storm of thunder and lightning, accompanied with very heavy rain, which continued till near twelve at night. Though the thunder was not very violent, yet the flashes of lightning were as quick, and at the same time as strong, as perhaps were ever known in this part of the world. This tempestuous night was remarkable for the destruction of a large aviary of sparrows, which had for many years rooted in a grove of high trees adjoining to Mile-end turnpike. Such numbers of them were killed by the lightning, that, the next morning, the ground, within the circumference of the trees, was covered with their dead bodies. The Rev. Mr. Entick, in his History of London, asserts, that he was an eye-witness of this circumstance.

The winter of the year 1739 was a season of the greatest distress to the poor, in consequence of a most severe frost, which began on Christmas-day, and continued till the end of February. Its intenseness and bad effects exceeded all others ever remembered. The river Thames was so solidly frozen, that great numbers of people dwelt upon it in tents, and a variety of booths were erected for the entertainment of the populace. A few days after it began, a very high wind arose, which did considerable damage to the shipping: several vessels laden with corn, others with coals, &c. were sunk by the ice; many had holes beat in their sides by falling on their anchors: several lighters and boats were confined under the ice: in short, a more dismal scene presented itself on the river Thames than had ever been beheld by the oldest man living. The damage done between the Medway and London-bridge was computed at one hundred thousand pounds, besides many persons who lost their lives from the severity of the weather. The watermen and fishermen were entirely disabled from earning their livelihood, as were the lower classes of labourers, whose employment is in the open air; and the calamity was rendered more severe by coals and other necessaries being advanced in their price in proportion to the intenseness and continuance of the frost. Happily for the poor, the hand of liberality was never more extended; great benefactions were given by those of opulent fortunes, and considerable collections were made in most of the parishes in London; by the assistance of which, many families were preserved, that must otherwise have inevitably perished.

At the election for lord-mayor in the year 1740, the court of aldermen first chose the junior alderman returned to them by the livery, who requested permission to decline; which being granted, the livery returned the senior alderman again, with one who had passed the chair. The aldermen again rejected the senior alderman; and Humphrey Parsons, esq. the object of their choice, having consented to serve a second time, a motion was made in the court of common-council to return him their thanks; and, an amendment being proposed, a long and very warm debate ensued upon the right of the aldermen to vote separately, and put a negative upon any question; and the claim being persisted in by its supporters, some of the aldermen and a considerable number of the common-council left the court, protesting against the exercise of the right. At length, on the 11th of November, this question was finally determined, against the right, in both the courts of aldermen and common-council, by a considerable majority. Mr. Parsons did not live above four months; and on his death, which took place on the 21st of March, 1740, alderman Lambert was chosen to succeed him in the mayoralty for the remainder of the year; who, being accepted by the lord-chancellor on the even-

ing of his election, went next day in great state to the Tower, attended by the twelve companies, &c. and was sworn into his office by lord Cornwallis, the constable, in a booth erected for that purpose without the west gate, agreeable to ancient custom, when the barons of the Exchequer are out of town.

The election of an alderman for Broad-street ward was soon after attended with great trouble and expense. The candidates were Charles Ewer, esq. and Mr. Eggleton. On the close of the poll, a scrutiny was demanded; and, the numbers appearing to be exactly equal, the lord-mayor held a wardmote at Drapers' Hall for a new election; at which Charles Ewer, esq. meeting with no opposition, was declared duly elected. In consequence of this, Mr. Eggleton petitioned the court of aldermen, setting forth his right to the election. On the day following, a rule was made in the court of King's Bench, to show cause why a mandamus should not be granted to swear in Mr. Eggleton, alderman of Broad-street ward; and, on the twenty-eighth, the court of aldermen, by consent of both parties, returned that neither party was duly elected. So that, the determination of the election being left to the court of King's Bench, it was tried in the Michaelmas-term following, and decided in favour of Charles Ewer, esq. who was accordingly sworn in.

An accurate account of the number of houses in every precinct of the twenty-five wards within the bars, or limits of the lord-mayor's jurisdiction, Bridge-ward without not being included, was published, in 1741, by Mr. John Smart, of the Town-Clerk's Office; by which account it appears that the number of houses amounted, at that time, to twenty-one thousand six hundred and forty-nine.

From the great increase of the metropolis since the date of the charter of Charles I. by which the lord-mayor, recorder, and such of the aldermen as had served the office of mayor, and also the three senior aldermen who had not passed the chair, were constituted justices of peace for the city and its liberties, it was found necessary to extend this privilege to the whole body of aldermen; and a charter, dated August 15, 1741, was obtained to that effect.

In Michaelmas-term, 1742, a cause was tried before lord-chief-justice Willes, in which the Company of Weavers were plaintiffs, and Mr. Thomas Handyside defendant. Mr. Handyside was free of the weavers' company; but, not being free of the city, had refused to take up the livery when he was called upon for that purpose. It appearing, however, to the court, that every member of a company is eligible to the livery, though not free of the city, a verdict was given in favour of the plaintiffs.

The same day another cause was tried on an action brought by Anthony Wright against William Ayres, the lessee of the toll of London-bridge, who had received, and insisted upon a prescriptive right to receive, two pence for the passage of each cart laden with one ton weight, or upwards, passing over London-bridge. It appearing, however, by the evidence, that the usage had been to take one penny only for a cart with two horses, although laden with a ton or upwards, a verdict was given in favour of the plaintiff.

On the 25th of February, 1744, a proclamation was issued, commanding all papists to depart the cities of London and Westminster, and within ten miles of the same; for confining papists and reputed papists to their habitations; for seizing the arms and horses from such as refuse to take the oaths, &c. and for putting the laws in execution against the instigators of tumultuous proceedings. The kingdom of France having countenanced the pretender's son in an intention to invade Great Britain, gave rise to this necessary act of intolerance; and, in this, as in several cases, the innocent, we must confess, were involved with the guilty, and suffered the same severity of the law. The fear of their joining a prince of their own

religious persuasion was not groundless, and it apologized sufficiently for the rigour of the measure. War was proclaimed against France on the 31st of March following.

The journeymen staymakers and tailors having entered into a combination, and ceased to work, in order to obtain better wages than established by the law, the following resolution was passed by the justices at their meeting on the 26th of September of the same year, viz. "That, if any journeyman should refuse to work for the wages settled by act of parliament, he should be committed to hard labour for two months; and, that the master that paid more than the act allowed should forfeit five pounds." This resolution was no sooner published than it produced the desired effect; the combination ceased, and the journeymen returned quietly to their respective employments.

The streets of the city of London were at this time so pestered with street-robbers, that it induced the lord-mayor and aldermen to petition his majesty for "a speedy, rigorous, and exemplary, execution of the laws upon the persons of offenders, as they shall fall into the hands of justice." In consequence of this petition, on the 9th of January following, his majesty issued a proclamation, promising a reward of one hundred pounds, over and above all other rewards, for the apprehending of every person found guilty of robbery or murder.

The eagerness of the remains of the Stuart family to recover the throne which they had lost in the person of their ancestor James II. induced the two sons of the pretender to erect their standard in Scotland. A number of disaffected persons surrounded it in open rebellion; and a general dread began to prevail. Upon this occasion the city of London was very prompt in defence of the house of Hanover. The lord-mayor, aldermen, and common-council, attended by the sheriffs, recorder, and all the city-officers, waited upon his majesty at Kensington, with their address, as the representative body of the city of London; in which they congratulated his majesty on his safe return to his British dominions, and on the conquest of Cape Breton; and conclude, "The rash and daring attempts of the professed enemies of this nation, in favour of a popish and abjured pretender, have filled the hearts of us, your loyal citizens, with the utmost abhorrence and detestation; and we beg leave to give your majesty the most solemn assurance, that we will be ready upon all occasions to sacrifice all that is dear and valuable to us, in defence of your majesty's royal person and family, and in support of our happy constitution, both in church and state." The next day the merchants of London presented a most dutiful and loyal address on the same occasion. And so anxious were they for supporting the public credit, that above eleven hundred of the most considerable merchants, traders, and proprietors of the public funds, subscribed their names to the following agreement: "We, the undersigned merchants, and others, being sensible how necessary the preservation of public credit is at this time, do hereby declare, that we will not refuse to receive bank-notes in payment of any sum of money to be paid us; and we will use our utmost endeavours to make all our payments in the same manner." In consequence of this resolution, the demands, which had been very considerable at the bank a few days before for cash, began greatly to diminish. These hasty demands were said to have been occasioned by the papists and jacobites, with a design to hurt public credit as much as possible, and to get gold to send to the rebels; but in this they were disappointed by the directors ordering all payments to be made in silver, which also made the business of paying money go on very slow, and gave time for credit to recover itself. The run upon the bank continued but a few days.

Besides the associations formed for the defence of the city of London, as noticed under the article ENGLAND, vol. vi. p. 719, a large subscription was raised out of the chamber of London for such soldiers as were, or should thereafter be, employed in his majesty's service, during the winter sea-

son, in order to crush the rising rebellion. But, on the other hand, new acts of severity were exercised against popish priests resident in or within ten miles of London. It is easy to conceive how in these troublesome times the minds of all men in the metropolis must have been agitated; when at length the victory of Culloden put an end to their anxious suspense. See the article ENGLAND, before quoted.—The loyalty of the citizens prompted their gratitude towards their first magistrate; and sir Richard Hoare, who was lord-mayor in this troublesome year, received the particular thanks of the court of common-council and court of lieutenancy, for his diligence and steady attachment to his country, during the late time of imminent danger; for his constant readiness to call those courts together; and, in particular, for his personal attendance on all occasions.

In 1747, a bill, in consequence of a petition from a court of common-council, was brought in and passed, by which the duty of sixpence per chaldron, on coals and culm, was continued for thirty-five years longer, on the following conditions: First, that out of the produce of the said imposition, the city should pay three thousand pounds per annum to the Mercers' company; and, secondly, that the residue should be applied to the Orphans' fund; for the benefit of which, all the city manors, lands, &c. should stand charged with the yearly sum of two thousand pounds, over and above the eight thousand pounds applied by the former statute. It was also enacted, that, as the fund for raising the four per cent. interest on the Orphans' capital stock had produced a very large surplus, (including the sum of 21,735l. 17s. 9d. due from the citizens to the said fund;) to make good the yearly sum of two thousand pounds, which ought to have been raised on their personal estates, this surplus should be applied to pay off the principal sum of the Orphans' debt. Soon after the obtaining of this act, a committee was appointed to deliberate on the discharge of the Orphans' debt, and to consider what savings might be necessary, to enable the citizens to pay the additional sum of two thousand pounds per annum to this fund, which was to commence at Michaelmas 1750. This committee reported, that, in order to discharge the Orphans' debt, it would be necessary to borrow the sum of twenty-five thousand pounds; which was agreed to by the court of common-council, who empowered the committee to treat for the loan, at three pounds six shillings per cent. interest. From the sum thus borrowed, the chamberlain, on the 20th of June, 1751, was ordered to discharge the above sum of 21,735l. 17s. 9d. due to the fund from the city, and place it to the credit of the Orphans' fund, in discharge of the debt. In conformity to the terms of the before-mentioned statute, the corporation, from that time, constantly raised the sum of two thousand pounds per annum.

The patriotic and loyal zeal which animated the city of London, as we stated above, was evinced with so much liberality, for the encouragement of the soldiers employed in suppressing the late rebellion, that the surplus then remaining in the hands of the committee amounted to three thousand three hundred pounds; which sum was disposed of to public charities, in the following manner:

To St. Bartholomew's Hospital	- - - -	£1000
To St. Thomas's Hospital	- - - -	1000
To the Hospital at Bath	- - - -	1000
To the London Infirmary	- - - -	100
To the Westminster Infirmary	- - - -	100
To the Infirmary at Hyde-park Corner	- - - -	100

		£3300

In the morning of the 25th of March, a fire broke out in Exchange-alley, which, notwithstanding a plentiful supply of water, and every possible assistance, consumed one hundred and eighteen houses before noon. Four lives were lost; and the property destroyed was valued, by the lowest computation, at upwards of two hundred thousand

fund pounds. A contribution was immediately set on foot for the relief of such of the sufferers as were objects of charity; whose claims amounted to eight thousand pounds; the sum collected on this occasion was 5,774l. 19s. 4d. the whole of which was divided among the claimants; and, for the more expeditious re-building of the houses destroyed by this accident, the common-council permitted as many non-freemen as might be found necessary, to be employed in the work.

The following regulations, being entirely municipal, seem to require a full detail in an account of the city of London. At a court of common-council, held the 7th of April, a bill passed for repealing all former acts of that court, touching the nomination and election of sheriffs of the city of London and county of Middlesex, and for regulating such nominations and elections for the future; in which it was ordained, That the right of electing persons to the office of sheriffalty shall be vested in the liverymen; and that the general election-day shall be the 24th of June, except it be Sunday, and then on the following day. That the person or persons elected to the said office, shall take the same upon him or them on the vigil of St. Michael the archangel, next following the said election, and hold the same for and during the space of one whole year, from thence next ensuing, and no longer, when some other persons shall be duly elected, and sworn into the same office in their stead. That, at the general elections for sheriffs, all the aldermen, who have not served, shall be put in nomination, according to their seniority, before any commoner. That the lord-mayor may, between the 14th day of April and the 14th day of June, in every year, nominate, in the court of lord-mayor and aldermen, nine persons, free of this city, who shall be put in nomination for the said office, before any other commoner, and in the same order as nominated by the lord-mayor. That, if any so nominated shall, within six days after notice, pay four hundred pounds to the chamberlain, and twenty marks towards the maintenance of the ministers of the several prisons, together with the usual fees, every such person shall be discharged from serving the said office, except he shall afterwards take upon him the office of an alderman. That any two liverymen, having a right to vote at the election of sheriffs, may nominate any person, free of the city, for the said office. That no freeman shall be discharged from such election or nomination, for insufficiency of wealth, unless he voluntarily swears himself not worth fifteen thousand pounds, in lands, goods, and separate debts; and the same be attested, upon oath, by six other freemen of credit and reputation. That every person elected shall, at the next court of lord-mayor and aldermen, give one thousand pounds bond to the chamberlain, that he will take upon him the said office on the 28th of September next following. That the person elected, who does not give bond to serve, shall, if an alderman or commoner of the lord-mayor's nomination, forfeit and pay six hundred pounds; but, if nominated by liverymen, he shall forfeit and pay only four hundred pounds, to be recovered by action of debt, in the name of the chamberlain of London, and to be applied to the use of the lord-mayor, commonalty, and citizens, of London, subject to the orders and resolutions of the court of common-council; except one hundred pounds to each of the new sheriffs, if two fines happen to be paid, or fifty pounds to each of the said sheriffs, should there be only one fine paid. That no person who has fined shall be ever after eligible, except he takes upon him the office of an alderman; neither shall any person be compelled to serve the said office more than once.

We have been witnesses, in our time, of several hoaxes played upon the credulity of the public; but perhaps none ever was so decidedly laughable and unaccountable, and showed so strongly the *gullibility* of all large cities, since the building of the *otiosa Neapolis* down to our enlightened days, as that performed in the year 1749. About the middle of January, an advertisement appeared in the

newspapers, informing the public, that, on the 16th instant, a person would appear at the new theatre in the Haymarket, who, after playing the music of every instrument in use, upon a cane belonging to any of the spectators, would walk into a common quart-bottle, placed upon a table in the middle of the stage, in sight of the audience, and would sing in it; and, during his stay in the bottle, any person might examine it, and be satisfied that it was a common wine-bottle. Some other feats were to be exhibited, equally entertaining; and, although it might be supposed impossible that mankind, even in a state of gross ignorance, could be so egregiously imposed upon, yet it is unquestionably true, that the scheme did take effect in the British capital, and in the middle of the eighteenth century. On the evening of the exhibition, the house was crowded with the nobility and gentry of both sexes, who sat very patiently for a considerable time, without the amusement even of a single fiddle; at length the audience grew tired and clamorous, and a fellow came from behind the curtain, and bowing said, if the performer did not appear, the money should be returned; at the same time, some person in the pit called out, that, if the ladies and gentlemen would give double price, the conjuror would get into a pint bottle. This was the signal for a riot: the greater part of the audience hurried out of the theatre, with the loss of cloaks, hats, wigs, and swords; part remained behind, who, being joined by the mob from without, tore up the benches, broke the scenes, pulled down the boxes, and entirely demolished the inside of the theatre; all of which they carried into the street, preceded by the curtain, fastened to a pole, as a flag of triumph; where they converted them into a large bonfire. A strong party of the guards was sent for, but did not arrive in time to save any part of the property. No material injury was sustained by any of the spectators, from the confusion in the house.

Had we not seen how easily the people are imposed upon even in the most common transactions of life; how we are decoyed in the streets by smugglers, and in shops by the exhibition of goods sworn to be what they are not; we could hardly, at this time, give credit to a most improbable fact of sixty-six, or more, years standing: for it is indeed astonishing that the *prima-facie* impossibility of the thing, viz. that a man (had he been as small as Bêbé, the dwarf of Frederic II.) could jam himself into a quart bottle, did not strike the dullest mind of the collected audience. But curiosity, that Tantalus-like passion, which is never satisfied, and lives and feeds upon the scanty food of expectation, though lashed, all the while, by the whip of disappointment;—curiosity was the acting spring, the *primus mobile*; and the example of two or three gulls, first caught, naturally brought, by multiplying confidence, immense quantities of the same species. Thus a crowd is gathered, before any suspicion arises whether the thing is possible or not. Strolling quacks, in country towns, often promise, in order to keep the crowd together and sell their nostrums, to show an animal not bigger than the thumb, weighing more than fifty pounds; and the gazing but disappointed assembly as often retires with the consoling hope of the phenomenon's appearance, without fail, the next day.

Some sailors having been ill treated by women of the town, in a house near the New Church in the Strand, a considerable body of them assembled, on the evening of the 1st of July, armed with cutlasses and bludgeons, and proceeded to the house, where they destroyed all the furniture and wearing-apparel, and turned the women into the street. On the following night, they attacked two more houses in the same manner; and, on the third day, they made a similar attempt upon one in the Old Bailey, from which the owners, apprehending their design, had previously removed the goods. It was at last found necessary to call in the assistance of the military, to suppress these dangerous proceedings; and several of the rioters were apprehended and committed for trial. This

was followed by a circumstance, which proves that the firmness and temper of a civil magistrate may frequently render the interposition of the military unnecessary. Fifteen criminals were ordered for execution on the 18th of October, among whom was one Bosavern Penlez, a young man convicted of being concerned in the aforesaid riot in the Strand. A rescue being apprehended in favour of Penlez, a party of foot-guards attended at Holborn-bars, to guard the prisoners to Tyburn; but Mr. Sheriff Janssen, for the dignity of the city and his office, mounted on horseback, when the criminals were put into the carts at Newgate; and, having provided a sufficient guard of the civil power, very genteelly dismissed the officer and his men at Holborn, and conducted the malefactors to the place of execution without their assistance. A great number of sailors, armed with bludgeons and cutlasses, attended at the gallows, and became very clamorous, from an apprehension that the body of Penlez would be delivered to the surgeons; but, Mr. Janssen assuring them it should not, they were pacified, and the criminals were executed without the least obstruction.

This year finished with a remarkable cause tried in the lord-mayor's court, between a club of free journeymen painters, plaintiffs, and Mr. Row, citizen and master-painter, defendant, for employing a person, not free, to work for him in the city. The defendant pleaded, and made it appear by evidence, that, from the want of free journeymen of the trade, it was not possible for the summer business of the city to be done without the assistance of at least an equal number of non-freemen; and that no freeman was ever refused, or could sometimes be got, on any terms. To which the counsel for the plaintiffs replied with a very learned argument upon a by-law made by the city in the reign of queen Anne. The jury went out at two o'clock in the afternoon, and returned twice without agreeing on their verdict; and being sent out again, and continuing a long time, the court ordered them to be locked up in the room, without fire, candle, or any sustenance, by an officer sworn to observe the same, and to attend them; in which situation they continued till six o'clock next morning, when they brought in a verdict for the plaintiffs. The masters of the several handicraft trades, finding themselves greatly aggrieved by this verdict, petitioned the common-council for liberty to employ *foreigners* (as non-freemen are called), under certain restrictions. This produced a counter-petition from the journeymen; the consideration of which was deferred till the 8th of February, when a committee of six aldermen and ten commoners met to adjust these disputes. At this meeting, a day was appointed for hearing depositions from the masters and journeymen; and, after several adjournments, the committee reported their opinion to the court: who, on the 28th of November, resolved, that the court of lord-mayor and aldermen be empowered to grant permission to any freeman, who could not procure a sufficient number of free-journeymen, to employ foreigners, provided he has one apprentice, or has had one within twelve months before making application for the license; and, in case no court of lord-mayor and aldermen is held, the lord-mayor may, on any Tuesday, grant such license, for a term not exceeding six weeks. A power is, however, reserved to the court of lord-mayor and aldermen, to revoke any license, though the time for which it is granted be not expired.

Our observations upon the credulity of the public are also applicable to the following fact. On the 8th of February, 1750, between twelve and one o'clock at noon, a smart shock of an earthquake was felt through the cities of London and Westminster, and parts adjacent; and, on the 8th of March, between five and six in the morning, the town was alarmed with another shock, much more violent, and of longer continuance, than the first. Many people, awakened from their sleep, ran terrified into the streets without their clothes; a great number of chimneys were thrown down; several houses were considera-

bly damaged; and, in Charter-house square, a woman was thrown from her bed, and her arm broke. The panic of the people, in consequence of these earthquakes, was greatly increased by the ridiculous prediction of a wild enthusiastic soldier in the life-guards, who boldly prophesied, that, as the second earthquake had happened exactly four weeks after the first, there would be a third exactly four weeks after the second, which would lay the whole cities of London and Westminster in ruins. Though this prognostication appears too ridiculous to merit the least attention, yet it produced the most astonishing effect on the credulous and already-terrified people. A day or two before the expected event, multitudes of the inhabitants abandoned their houses and retired into the country; the roads were thronged with carriages of persons of fashion; and the principal places within twenty miles of London were so crowded, that lodgings were procured at a most extravagant price. On the evening preceding the dreaded 5th of April, most of those who staid in the city sat up all night; some took refuge in boats on the river, and the fields adjacent to the metropolis were crowded with people; all of whom passed the night in fearful suspense, till the light of the morning put an end to their apprehensions, by convincing them, that the prophecy they had been weak enough to credit had no other basis than that of falsehood. Although the predicted time was now elapsed, yet the terror of the people did not thoroughly abate till after the eighth day of the month, because the earthquakes had happened on the eighth day of the two former months. When this time also passed, their fears vanished, and they returned to their respective habitations. The false prophet, who had been the instigator of such general confusion among the people, was committed to a place of confinement.

This year, the lord-mayor, sir Samuel Pennant, some of the aldermen, two of the judges, the under-sheriff, and many of the lawyers who had attended the March sessions in the Old Bailey, most of the Middlesex jury, and a considerable number of the spectators, died of the gaol-distemper, caught from the prisoners. In consequence of this disaster, a machine was soon after put upon the top of Newgate, to supply it with fresh air, the prison was well cleansed, and every other precaution taken to preserve the health of the prisoners.

On the 22d of October, 1752, a cause was heard before the lord-mayor and court of aldermen, about laying open the port of London for bringing in foreign oats, pursuant to a statute, 1 James II. empowering that court, in April and October, to determine the common market-prices of middling English corn, by the oaths of two substantial persons of Middlesex and Surry, being neither merchants, cornfactors, mealmen, nor factors for importing corn, nor interested in the corn, and each having a freehold estate of twenty pounds, or a leasehold estate of fifty pounds, per annum, and by such other ways as to them shall seem fit; and, if the same shall appear to be above sixteen shillings a quarter, they are to certify the same, with the two oaths annexed, to the commissioners of the customs, to be hung up in the custom-house. The persons that made the application were several masters of livery-stables, and inn-keepers; and their opponents were the cornfactors. After a hearing which lasted ten hours, it was decided for the cornfactors; five aldermen being for laying open the port, and five, with the lord-mayor, who threw in his casting vote, against it.

A subject of an extraordinary nature occurred in the beginning of the year 1753. A young woman, named Elizabeth Canning, pretended that, on the 1st of January, as she was returning home at night, she was attacked under Bedlam-wall by two men, who robbed her of part of her clothes, gagged her, and dragged her along to the house of one Wells, near Enfield Wash, where she was confined in a cold damp room for a month, without any sustenance but a few stale crusts of bread and about a gallon of water; but that, having at last made her escape out of a window, she returned almost naked to her mother,

ther, who lived near Moorfields. The story, notwithstanding its improbability, operated so powerfully on the passions of many, even of the best informed classes, that large subscriptions were raised for the prosecution of the supposed delinquents; and the mistress of the house at Enfield, her servant, and an old gipsy-woman, whom Canning charged with having robbed her of her stays, were apprehended and tried. Wells was acquitted of the felony, but was punished as a bawd. Hall, the servant, being intimidated by the magistrate who examined her, turned evidence for Canning; and Squires, the gipsy, was convicted of the robbery, though she produced the most convincing evidence that she was at Abbotsbury, in Dorsetshire, on the night it was said to have been committed. During the course of the trial, Canning and her witnesses contradicted themselves in many particulars; but the prepossession in her favour was so great, that the most palpable falsehoods advanced by her and her adherents were admitted as incontrovertible truths; while the witnesses for Squires were either so overawed by the rabble that they durst not appear in court, or, if they had sufficient resolution to give evidence in her favour, were insulted in such a manner, that their lives were sometimes endangered.

Sir Crispe Gascoigne, who was at this time lord-mayor of London, conducted himself in this affair with the greatest justice and impartiality. Considering the improbability of the charge, and the heat, passion, and furious zeal, with which it was prosecuted, and being convinced of the old woman's innocence by a great number of affidavits, voluntarily sent up from the country by persons of undoubted veracity, he, in conjunction with some other worthy citizens, determined to oppose the torrent of popular prejudice. Application was made to the throne for mercy. The affair was referred to the attorney and solicitor general, who, having examined the witnesses on both sides, made their report in favour of Squires, who was first repited, and afterwards received his majesty's free pardon.

A bill of indictment was preferred by the lord-mayor against Elizabeth Canning for perjury. Her friends did the like against the witnesses from Abbotsbury in favour of Squires. The Abbotsbury people appeared; but, no evidence coming against them, they were acquitted. Canning, being admitted to bail, at first absconded, but afterwards surrendered to take her trial, which continued by adjournment five days; when she was convicted of perjury, and committed to Newgate. When she was brought up to receive sentence, a new trial was moved for on the affidavit of two of the jurors, who swore, that, although they believed her guilty of perjury, they did not believe it to be wilful and corrupt. The decision of this point was put off till the next sessions; and, on the 30th of May, 1754, it was adjudged by five judges then on the bench, that the verdict was good, and agreeable to evidence. After which the court passed judgment, that she should suffer one month's imprisonment, and then be transported for seven years. Her supporters, however, made such diligent applications in her favour, that they obtained permission for her to transport herself; and she went to America, in a private ship, with every accommodation money could procure her, and means were used to secure her a favourable reception on her arrival. So truly sensible were the citizens of London of the rectitude of sir Crispe Gascoigne's conduct in this affair, that, at the expiration of his mayoralty, thanks were voted to him by the common-council "for his steady perseverance in the cause of justice; his generous protection of the distressed, and his remarkable humanity."

A very important cause was tried in Michaelmas term, in the court of King's Bench, Guildhall, on an action brought by Mr. Richard Holland, a leather-seller, in Newgate-street, against the collectors of toll, in Smithfield, during the time of Bartholomew-fair; when Mr. Holland's witnesses were examined; but, no person appearing on the

other side, a verdict was given in favour of Mr. Holland, on fifteen issues, with costs of suit. By which determination, all the citizens of London are exempted from paying toll at the said fair for the future. In support of the ancient privilege of the citizens of London, to be exempt from toll for their goods throughout all England, Mr. Holland had also applied for, and obtained, a certificate, from the lord-mayor and court of aldermen, in the mayoralty of sir William Calvert, by which the privilege of exemption was not only allowed to him, but extended to every freeman of the city of London. The public-spirited example of this gentleman was immediately followed by the freemen residing in the several markets of the city, who determined to oppose the oppressive demands of the farmers of them, in exacting toll. In consequence of this determination, twelve different actions were brought by the farmers of Newgate-market, against the housekeepers around it, for refusing to pay the toll they had been accustomed to demand and receive; and in July, 1754, one of the issues was tried in the court of Common Pleas, at Guildhall, and the plaintiffs were nonsuited; ever since which, the people have continued free and unmolested.

An act of parliament was passed, on the 20th of March, 1755, to prevent the holding of a market in the Borough High-street; which was soon followed by another, on the petition of the inhabitants of Southwark, to hold a market on a spot of ground, west of the High-street, called the Triangle.

The fishery of the river Thames has always been an object of care for the magistrates of the city of London. A beautiful and productive river, which, while its surface carries, in innumerable ships, the treasures of the world, harbours in its watery recesses, and in the free and extensive body of its waters, all sorts of wholesome and delicious fish, is certainly worthy of the most strict and provident attention. The lord-mayor and aldermen were empowered, by an act of parliament of this year, to make rules and ordinances, from time to time, for the government of all persons concerned in that fishery.

In the year 1758, London-bridge underwent a thorough repair, and the houses, which had continued thereon for at least three hundred and fifty years, were entirely removed. When this bridge was originally founded is not known with any accuracy. We read in Stow's Survey, that "in the yeere of Christ 994, Sweyn king of Denmarke besieging the cite of London, both by water and by land, the citizens manfully defended themselves and Ethelred (king of Kent), so as part of their enemies were slaine in battaile, and part of them were drowned in the river of Thames, because in their hastie rage they took no heed of the bridge." Surely this observation cannot give us any great idea of that wooden fabric; for, had it been of any height or consequence, the Danes could not have overlooked it. However, it appears to have been built between the years 993 and 1016; for in the former of these years, Unlaf the Dane, according to the Saxon Chronicle, sailed up the river as far as Staines; and in the latter, Canute king of Denmark, when he besieged London, caused a channel to be formed on the south side of the Thames, about Rotherhithe, for conveying his ships above the bridge. According to traditional accounts, London was indebted for the ancient wooden bridge to the last prior of St. Mary Overy's convent; though it seems more probable that the monks only gave their consent to the erection of the bridge, on receiving a recompense for the loss of the ferry, by which they had been supported; and that this conjecture is not without foundation, appears from the appropriation of lands for the support of London-bridge at so early a period as the reign of Henry I. "In the yeere 1114, the 14 of Henry I. the river of Thames," says Stow, "was so dried up, and such want of water there, that between the Tower of London and the bridge; and under the bridge, not only with horse, but also a great number of men, women, and children, did wade over on foot;" which we may suppose to have happened at neap-tides, whilst a

strong western wind, blowing into the face of the tide, suspended its coming up; as the same thing has occasionally happened since; but particularly on the 13th of December, 1711.

In the year 1136 the bridge was consumed by fire; and in 1163 it was in such a ruinous state as to be rebuilt under the inspection of Peter, curate of St. Mary Colechurch in London, who was celebrated for his knowledge in architecture. At length, the continued and heavy expense which was necessary to maintain a wooden bridge becoming burthenome to the people, (who, when the lands appropriated for its maintenance proved inadequate to their object, were taxed to supply the deficiency,) it was resolved, in the year 1176, to build one of stone, a little to the west of the other; and this structure was completed in the year 1209. The same architect was employed, who died four years before it was finished, and was buried in a beautiful chapel, probably of his own construction, dedicated to St. Thomas, which stood on the ninth pier from the north end, and had an entrance from the river, as well as the street, by a winding staircase. In the middle of it was a tomb, supposed to contain the remains of its architect. This bridge, with the chapel over it, is the subject of the annexed Plate.

Of this chapel, the same author (Stow) gives us the following interesting account: "King John gave a certain void place in London to rebuild on, the profits thereof to remain towards the charges of building and repaying of the same bridge. A mason, being master-workman of the bridge, builded (from the foundation) the large chappell on that bridge of his own charges; which chappell was then endowed for two priests, foure clarkes, &c. besides chantries since founded by John Hatfield and others. After the finishing of this chappell, which was the first building upon those arches, sundry houses (at times) were erected, and many charitable men gave lands, tenements, or summes of money, towards the maintenance thereof; all which was sometimes noted, and in a table faire written for posterity, and remaining in the chappell, till the same chappell was turned to a dwelling-house, and then [this writing was] removed to the bridge-house. We find that the sum paid for one whole year, from Michaelmas 22 Hen. VII. amounted to 81*l.* 17*s.* 2*d.* for repairs and allowances; by which account then made may be partly guessed the great charges and discharges of that bridge at this day, when things be stretched to so great a price." The tower, which was at the north end of the drawbridge, was built in the year 1426, and shared the same fate as the houses, as will be mentioned below. There was another over the gate at the fourth end towards Southwark. The whole fell down in 1436; but, by the contributions of several wealthy and well-minded citizens, it was rebuilt, and thirteen houses more were added.

But, though so much art and expense were employed in building the bridge with stone, it suffered very much from a fire in the streets at each end; so that, from this accident and other circumstances, it was in such ruinous condition, that king Edward I. granted a brief to the bridge-keeper to ask and receive the benevolence of his subjects towards repairing it. At this time, as our Engraving will show, there were no houses on the bridge, nor probably for two hundred years afterwards, as we read of tilts and tournaments being held there in 1395. The houses were erected at the beginning of the fifteenth century, and were not removed till the time we are speaking of, 1758.

The Thames, in this part of it, is 915 feet broad, which is the length of the bridge. The street that covered it consisted, before the houses fell to decay, of lofty edifices, built with some attention to exterior regularity; it was twenty feet wide, and the buildings on either side about twenty-six feet in depth. Across the middle of the street ran several lofty arches, extending from side to side; the bottom part of each arch terminating at the first story, and the upper part reaching near the tops of the houses;

the work over the arches extending in a right line from side to side. They were designed to prevent the buildings from giving way, and were therefore formed of strong timbers, bolted in the corresponding wood-work of the houses that flanked them. Thus the street on the bridge had nothing to distinguish it from any narrow dark street in the city but the high arches just described, and three openings, guarded with iron rails, which afforded a view of the river. But the appearance from the water baffled all description, and displayed a strange example of curious deformity, as is generally the case when houses are erected upon bridges. Nineteen arches, of different heights and breadths, with stielings increased to a monstrous size by frequent repairs, served to support a range of houses as irregular as themselves; the back part of which, broken by hanging closets and irregular projections, offered a very disgusting object; while many of the buildings overhung the arches, so as to hide the upper part of them, and seemed to lean in such a manner as to fill the beholder with equal amazement and horror. In one part of this extraordinary structure there had formerly been a draw-bridge, which was useful by way of defence, as well as to admit ships to the upper part of the river, and it was guarded by a tower. It prevented Fauconbridge the Bastard from entering the city in 1471 with his armed followers, on the pretence of liberating the unfortunate Henry from his imprisonment in the Tower. It also checked, and indeed seemed to annihilate, the ill-conducted insurrection of sir Thomas Wyatt, in the reign of queen Mary. In the time of civil dissension, which rendered this kingdom a continual scene of turbulence and bloodshed, this tower was employed to expose the heads of traitors; and an old map of the city, in 1597, represents this building as decorated with a sad and numerous exhibition of them.

In the year 1746 the corporation of London came to the resolution of taking down all the houses on the bridge, and enlarging one or more of its arches to improve the navigation beneath it; but it was ten years before this resolution was carried into effect. In the course of the repair and enlargement, when it was begun, it was found necessary to construct a temporary passage over the river, to preserve the communication between London and Southwark uninterrupted during the alteration and repair of London-bridge. For this purpose, a wooden bridge had been erected alongside of it, bending at each end, and opening into the entrances of the stone-bridge. Great was the astonishment of the citizens, when, on April 11th, 1758, about eleven o'clock at night, this timber bridge appeared in flames. It continued burning till noon the next day, when the ruins fell into the river; and thus a total stop was put to all trade that depended upon the intercourse between London and the opposite shore, excepting what could be carried on by boats. The inhabitants of Southwark were much distressed by the destruction of the troughs that conveyed water to them over the bridge during its repair. How this fire happened was never known. The lord-mayor licensed forty boats extraordinary to work on the three succeeding Sundays as ferry-boats, whose stations were advertised in the public papers; and great numbers of workmen were employed to make a present passage over the remains of the old bridge. The common-council immediately ordered another temporary bridge to be erected with the utmost dispatch; and so diligently was this order executed, that it was completed, and opened for carriages in less than a month. It was upon this occasion that an act was passed to amend the former act for the repair of London-bridge; which granted 15,000*l.* for that purpose; repealed the late tolls imposed for passage over and under the bridge; and declared that persons wilfully attempting to destroy any part of the bridge, or of the works belonging to it, should suffer death without benefit of clergy; this was because it had been suspected that the temporary bridge had been set on fire maliciously.

from the bridge, according to the plan, it was expected that St. Magnus' church, the tower of which stood in a direct line with those houses, must have been taken down also, in order to continue the foot-path; but, very fortunately, the distinguished architect of that beautiful edifice had foreseen, that the time must arrive when the improved taste of the metropolis would demand the alteration which was now at length to take place; and the workmen soon discovered that he had providently formed an arch under the tower, and had filled it up with rubbish: nothing therefore was required but to open the arch, and the church remained untouched. The repair and enlargement of the bridge were at length completed, in 1758, at the expense of nearly 100,000*l.* but without answering its principal object, which was, to diminish the fall at the ebbing of the tide, and consequently to lessen the danger of a passage which has proved a watery grave to so many people. Instead of making repairs, it is the opinion of good judges that the whole ought to have been removed, as a very magnificent structure might have been erected: at a much less expense; and it has been said that this is intended to be done; but that, previously, a new and very handsome bridge is to be erected from the bottom of Queen-street, Cheap-side, on a line with King-street and the Mansion-house. A view of London-bridge, in its present state, is given on the ARCHITECTURE Plate XXXVIII. vol. ii. and, for a few particulars relating to the water-works, see p. 83 of this article.

Though London-bridge was now completed, and opened to the public, another bridge had been for some years thought necessary, in consequence of the increased trade of the city with its suburbs and with the country-towns beyond the Thames. Several plans having been proposed to the committee appointed for managing the construction of a new bridge near Black Friars, the preference was given to the conception and drawing of Mr. Mylne, a Scotch architect; and the first pile for the bridge was driven in the middle of the river, on the 7th of June, 1760. At the same time many of the streets of the city, particularly that leading to the intended bridge, were considerably widened and improved, pursuant to resolutions passed in the common-council, and confirmed by an act of parliament. And, amongst other regulations under that act, it was thought proper to pull down the city-gates. In consequence of which, the committee of city-lands sold Aldgate for 177*l.* 10*s.* Cripplegate for 91*l.* and Ludgate for 143*l.* to be pulled down and taken away by the purchasers within a limited time.

This act relative to the gates may be said to have closed the late king's reign, as far as the city of London is concerned. We shall therefore, in this place, present the reader with an historical account of those ancient bulwarks and boundaries, accompanied with engravings of such as no longer subsist.

Previously to the discovery of gun-powder, and the nearly irresistible strength of modern artillery, the gates of cities were generally strongly fortified, flanked with towers, armed with barbicans and portcullises, defended by drawbridges over ditches and fosses, in order to withstand the assaults of an enemy. The gates of ancient towns are celebrated by poets and historians, both sacred and profane. Samson carried off the gates of Gaza, and Milo those of Crotona; and left both places without defence.

There appears to have been anciently but four gates in the wall of the city of London; and these were placed nearly according to the division of the compass on the four cardinal points of the horizon, east, north, west, and south, as we learn from Fitzstephen. Their names were; Ealdgate, or Aldgate, on the east; Aldersgate, on the north; Ludgate, on the west; and Bridgegate, on the south. "But," says the same ancient chronicler, "in the reign of Henry II. there were seven double gates in the wall of this city;" and Stow supposes the three others to have been, the Postern upon Tower-hill, Newgate, and Bishopf-

gate. These openings were contrived in process of time to facilitate the ingress and egress of goods in and out of the city, and for the accommodation of citizens who cultivated their fields and gardens in the pomerium around the wall.

1. *Ealdgate*, now *Aldgate*, so called, it seems probable, from its great antiquity, and not from its eastern situation, as some authors have been pleased to suppose, is reckoned the first of the four original and principal gates of London. "It has had," says Stow; "two pairs of gates, though now but one; the hooks of them both remaine." He adds, that there had been two portcullises, the place of which, and grooves in the masonry to let them down, were still manifest in his time. The earliest mention we find of this gate, is in a charter of king Edgar, about 967. Being in a very ruinous condition, it was pulled down in the year 1606, and rebuilt; but it was not completed till 1609. In digging the foundation, several Roman coins were discovered, resemblances of two of which, being of the time of Trajan and Dioclesian, Mr. Bond, one of the surveyors of the work, caused to be cut in stone, and placed on each side of the east front, where they remained till the demolition of the gate. In a large square, on the same side of the gate, was placed the statue of James I. in gilt armour, with a golden lion, and a chained unicorn, both couchant at his feet. On the west side of the gate was a figure of Fortune, gilt, and standing on a globe, with a prosperous sail spreading over her head; under which was carved the king's arms, with the motto *Dieu et mon Droit*, and a little below it *Vivae Rex*: somewhat lower, on the south side, stood Peace, with a dove perched on one hand, and a gilded wreath in the other. On the north side was the figure of Charity, with a child at her breast, and another in her hand. On the top of the gate was a vane, supported by a gilt sphere; on each side of which stood a foldier holding a bullet in his hand, on the top of the upper battlements. Over the arch of the gate were carved the following words:

Senatus Populusque Londinensis  
Fecit, 1609,

HUMPHREY WELD, *Mayor*.

There were two posterns through this gate; that on the south side of which was made as late as the year 1734. There were likewise apartments over the gate, which were appropriated to the use of one of the lord-mayor's carvers, but had, of late years, been used as a charity-school. We must observe, that the figure of this gate, given in Plate III. does not agree with the above description, on account of the drawing having probably been made when the ornaments mentioned above had already fallen to decay; but the two medallions after the coins are conspicuously preserved.

2. *Aldersgate* was the second of the four original gates, as Stow supposes, although Maitland could find no mention of it before the conquest. As to the etymon of this gate, authors considerably vary. We are of opinion that it originated from one or a group of alder-trees, growing naturally and thriving by the side of this entrance; the probability of which is strengthened by the well-known preference which these trees give to wet, fat, and marshy, soils:

Crassique paludibus alni

Nascuntur. *Virg. Georg. II.* 110.

And the circumstance of a deep well on the east side of the gate, the water of which rose nearly level to the ground, is a proof of the great moisture and humidity of the spot. We cannot agree with Stow, who believes that this, as well as the preceding gate, were both called Old-gate, which is repugnant to good sense and invariable custom.

This gate being in so ruinous a condition as to be in danger of falling, the lord-mayor, aldermen, and common-council, ordered it to be taken down, which was accordingly done in the year 1616, when it was rebuilt in a substantial manner; Mr. William Parker, merchant-tay-

lor, having bequeathed a thousand pounds towards the expense of a new edifice. In a large square over the arch of the gate was the figure of James I. on horseback. Above his head were quartered the arms of England, Scotland, and Ireland. In a niche on the east side was the prophet Jeremiah, with the words of the 25th verse of the 17th chapter of his book. In a niche on the west side stood the prophet Samuel, with the 1st verse of the 12th chapter of the 1st book of that prophet. On the south side was the effigy of James I. in his royal robes, sitting in a chair of state, done in relief. This gate was very much damaged by the great fire in 1666; but was repaired and beautified, at the expense of the city, in the year 1670. The apartments over the gate were appropriated to the use of the common-crier of the city; and by the sides of the gate were two posterns for the convenience of foot-passengers.

3. *Ludgate*, according to Geoffrey of Monmouth, quoted by Stow, derived its name from king Lud, a Briton, who, according to the former, built it about sixty-six years before the Christian era; and at p. 50 it will be seen, that London itself may probably owe its existence to the same king, or chief. On the other hand it has been urged, that the ancient Britons had no walled towns; and that the name therefore, might, with much greater appearance of probability, be derived from the rivulet Flood, Flud, Vloat, Fleote, or Fleet, which ran into Fleet-ditch; and it was very probably called Ludgate, instead of its original name, *Fludgate*.

Our favourite chronicler tells us, that in 1215, during the warm contentions between the barons and king John, this gate was the passage through which the army made its entry into London, pillaged the houses of the richest Jews in the city, and destroyed them: but soon after the damage caused to the gate and adjoining wall was repaired by the leaders of the army, and with the very stones from the Jewish houses that had been pulled down. In confirmation of this, we are told that a stone was found in 1586, when this gate was rebuilt, upon which the following inscription appeared easily legible and in Hebrew characters: "This is the dwelling-place of Rabbi Moses, the son of Rabbi Isaac."

In the year 1260, this gate was repaired, and beautified with images of Lud and other kings; but under the reign of Edward VI. these unfortunate statues, being mistaken for popish idols "by those who," says Stow, "judged every image to be an idol," had their heads smitten off; but in the reign of queen Mary, by a contrary wind that blew the flame of zealotism the other way, these statues were repaired, "as by setting new heads upon their old bodies." Being then old friends with new faces, they were not much regarded, and remained quiet in their niches till a general decay of the whole fabric called for a new building; and in 1586, the 28th of Elizabeth, this gate was rebuilt. Old Lud took his former station; so did the other kings on the east side; whilst the statue of the reigning queen adorned the west front. At the pulling down of this gate in 1758, the statue was preserved, and placed at the east end of St. Dunstan's church, Fleet-street, where it still remains, and affords no bad specimen of the statuary of that time.

In the year 1373, this gate was constituted a prison for poor debtors who were free of the city; and it was afterwards greatly enlarged by sir Stephen Forster. This gentleman, we are told, had been a prisoner there, and was begging at the gate, when a rich widow, passing by, asked him what sum would procure his discharge; and, on his answering twenty pounds, (which at that time was a considerable sum,) she generously advanced the money. His liberty being thus obtained, his kind benefactress took him into her service, in which, by his indefatigable application to business, and his obliging behaviour, he gained the affections of his mistress, and married her; after which he had such great success in trade, that he became lord-mayor of London, and obtained the honour of

knighthood. In his prosperity, sir Stephen thought of the place of his confinement, and, acquainting his lady with a design he had formed of enlarging the prison, she also determined to contribute to the execution of so benevolent a plan. Hereupon, they caused several of the houses near the gate to be pulled down, and in their stead erected a strong square stone building, containing the following rooms, viz. the porch, the paper-house, the watch-hall, the upper and lower lumberies, the cellar, the long ward, and the chapel; in the last of which were the following inscriptions: "This chapel was erected and ordained for the divine worship and service of God, by the Right Honourable Sir Stephen Forster, knight, some time lord-mayor of this honourable city, and by dame Agnes his wife, for the use and godly exercise of the prisoners in this prison of Ludgate, anno 1454.

Devout souls that passe this way,  
For Stephen Forster, late maior, heartily pray,  
And dame Agnes, his spouse to God consecrate,  
That of pitie this house made for Londoners in Ludgate—  
So that for lodging and water prisoners here nought pay,  
As their keepers shall all answer at dreadful domes-day."

These venerable founders not only settled a salary for a chaplain of this prison, but ordered that all the rooms in these additional buildings should be for ever free to all unfortunate citizens, and that they, on providing their own bedding, should pay nothing at their discharge for lodging or chamber-rent; but the avaricious disposition of the keepers broke through this appointment, and, for many years, they took rent for the rooms, contrary to the express order of the generous donor. Ludgate-prison, however, which is now removed to the north side of Giltspur-street Compter, still retains some privileges and advantages, which are claimed by citizens of London only.

4. *Bridgegate*. This last of the four original gates was of great importance to the city, as it stood exposed to the attack of enemies on the south or Surry side. In the year 1436, this gate with the tower upon it fell down; and, being rebuilt, was burnt, in the year 1471, by some riotous mariners of Kent. The gate erected after this, being greatly damaged by fire in 1726, was soon afterwards taken down and rebuilt; it was completed in 1728, two posterns being added for the convenience of foot-passengers. Over the arch, on the south side, were the king's arms, with the following inscription underneath: "This gate was widened from eleven to eighteen feet in the mayoralty of Edward Bacher, knt. S.P.Q.L."

Stow, and later writers also name a considerable number of gates on the river side, viz. Dowgate, Wolfgate, Ebgate, Oistergate, Botolphgate, Billingigate, &c. But they appear to have been only wharfs, or places for landing goods. None of these were of any note except Dowgate, called properly *Dar* or the *water-gate*, where there was a trajectory, or ferry, in the Watling-street, which crossed the Thames at this place, and was continued to Dover.

The Four Original City Gates are represented on Plate III. in the order we have described them; and, if they should be found not to answer fully to the descriptions, it must be recollected, that, as they are no longer in existence, accurate drawings could not be made. We have always been of opinion, that, before any valuable relics of antiquity are destroyed, accurate drawings and descriptions of them should be taken by authority, for the information of future historians.

5. *Bishopsgate* was situated one thousand four hundred and forty feet north-west from Aldgate. Though the building of this gate is dated by some as early as the year 300, by others A. D. 675, Stow could find no mention of it earlier than the year 1210, when William Blount, one of the sheriffs of London, sold his land and gardens, *without Bishopsgate*, to the wardens of London-bridge. Henry III. granted several privileges to the Hanseatic merchants, for which they were bound to keep this

*Bishopsgate.*

*Moorgate.*

*Cripplegate.*

*City Gates; No. 2 Newgate.*

gate in repair; and also to defend it whenever it should be attacked by an enemy. It was elegantly rebuilt by them in 1479. On the south side, over the gateway, was a stone image of a bishop with a mitre on his head; he had a long beard, eyes sunk, and an old mortified face, and was supposed to represent St. Erkenwald. See Plate IV. On the north side was another figure of a bishop with a smooth face, reaching out his right hand to bestow his benediction, and holding a crozier in his left, who is thought to have been bishop William the Norman. This last was accompanied by two other figures in stone, supposed to represent king Alfred, and his son Eldred earl of Mercia. In the year 1551, the above-mentioned merchants prepared stone for rebuilding the gate; but, that company being dissolved about this period, a stop was put to the work, and the old gate remained till the year 1731, when it was quite taken down, and rebuilt at the expense of the city. When it was almost finished, the arch fell down; but, though it was a great thoroughfare, and this accident happened in the middle of day, no person was hurt. Over the gateway was a carving of the city-arms, supported by dragons, and on each side was a postern for the convenience of foot-passengers. The rooms in the ancient gate were appropriated to the use of one of the lord-mayor's carvers; but, in the stead thereof, he has been of late years paid twenty pounds per annum by the city.

Near this gate (says Mr. Weever) was buried Nennius, duke of Locria; the son of Hely, brother to Lud and Cassibelan kings of Britain. Nennius was, it appears, a great warrior, and displayed most extraordinary courage in the course of the Roman invasion. With his own hand he killed Labienus the tribune; and routed Julius Cæsar himself; but not before he had received a wound of which he died: His body was rescued by the Britons. He still grasped the sword of Cæsar, which, with every funeral honour, was placed by his side in his coffin. Nennius is said to have been buried near Bishopsgate; but it will be recollected, that, at the time of the battle in which he is supposed to have been killed, which was soon after the Roman legions passed the Thames, and marching from the west environed the north side of Trinovant, this town had neither gates nor walls; nor had the island any bishops: the civic walls were built by Constantine the Great about A. D. 300. at which time it is supposed by some that Bishopsgate was erected by Restitutus bishop of London, a prelate who assisted at the council of Arles, and subscribed after the bishop of York. But, although the northern side of the metropolis was a thick forest, there is, from the antiquities discovered in the part of it that we are now contemplating, reason to believe that it was a cemetery of the ancient Britons, as it afterwards certainly was of the Anglo-Romans, who used to erect their funeral piles, and inter the ashes of their dead, without the gates of their cities; whence *fanum* has, in contradistinction to *templum*, been supposed to signify a cemetery. That Nennius was buried in this field, or burial-place, is therefore very probable, because at remote periods, even when the first sewer was formed, there was found in or near the spot alluded to several coffins of stone evidently of British and Saxon manufacture, containing the bones, as appeared by their vehicles, of eminent persons; and also, scattered in different parts, many human bones which it was supposed had been buried in coffins of wood. To the east of the Hospital of St. Mary Spital, and in a field called Lalefworth, it happened about the year 1576, when the earth was excavated for the purpose of making bricks for the new erections in Spital-fields, that many earthen urns were found, containing ashes and burned bones, evidently of the Roman inhabitants of the district.

6. *Moorgate*. In the year 1415, the wall of the city was broken near Coleman-street, and a postern built, which was afterwards called Moorgate, from its vicinity to Moorfields. In 1511 this postern was rebuilt, dikes and bridges were made, and the ground levelled, and made more commodious for the citizens to pass to their adjacent fields and

gardens. The late edifice, which was one of the most magnificent gates of the city, was erected in the year 1647, and consisted of a lofty arch, and two posterns for foot-passengers. The upper part of the gate was adorned with Corinthian pilasters, supporting their proper entablatures, and with a round pediment, in which were the city-arms; and the apartments over the gate were appropriated to the use of one of the lord-mayor's carvers.

About the year 1636, the city-wall between Bishopsgate was broken down opposite Winchester-street, and a postern-gate made there for the accommodation of foot-passengers; but this has been taken away, and the foot-way considerably enlarged. In the year 1635 the posterns of Basinghall and Aldermanbury were erected; but these also have been taken away, by order of the lord-mayor, aldermen, and common-council; and the several passages through London-wall to Fore-street are now open, elegant, and commodious.

7. *Cripplegate*. At the distance of one thousand and thirty-two feet to the west of Moorgate, stood Cripplegate, so named from a number of cripples who formerly begged there. The great antiquity of this gate cannot be doubted; for, in the history of Edmund king of the East Angles, written by Albas Floriacensis, and since that by John Lydgate, it is asserted, that, in the year 1010, the Danes ravaging the kingdom of the East Angles, Alwin bishop of Helmeham caused the body of king Edmund the martyr to be conveyed from Bury St. Edmund's, through the kingdom of the East Saxons, and into London, by the way of Cripplegate, where it is pretended that the body wrought miracles, making some of the lame walk upright, praising God. Its antiquity likewise appears from the charter of William the Conqueror, confirming the foundation of the college in London called St. Martin the Great, in which are these words: "I do give and grant unto the same church, and canons, serving God therein, all the lands, and the moor without the postern, which is called Cripplegate, on either part of the postern." This gate was formerly used as a prison, to which debtors, and persons charged with trespasses, were committed. In the year 1244, this gate was rebuilt by the company of Brewers of London; and, in the year 1483, Edmund Shaw, mayor of the city, bequeathed by his will four hundred marks, which, with the remains of the old gate, was to build a new one; and this was accordingly performed in the year 1491. The last account we have of any reparation of this gate is in the year 1663, when the following inscription was placed upon it; "This Gate was repaired and beautified, and the foot-postern new made at the charge of the city of London, the fifteenth year of the reign of our sovereign lord King Charles II. and in the mayoralty of Sir John Robinson, Knight and Baronet, Lieutenant of the Tower of London, and Alderman of this Ward; A. D. 1663."

This gate, which was a plain solid edifice, and void of all ornament, had more of the appearance of a fortification than any other gate of the city. The rooms over it were occupied by the water-bailiff of the city; and the gate had only one postern. Mr. Maitland has given it as his opinion, that, in the year 1010, this was the only gate in the north wall of the city, as it stood more convenient for one of the original gates than Alderfgate; and he thinks that this gate was originally erected over the Roman military way which was called the Ermine-street, and led from London to Hornsey. It is not impossible that the custom of reading proclamations at the end of Wood-street, in Cheap-side, may have arisen from the circumstance of its having been one of the old Roman military ways.

8. *Newgate* was situated at the distance of one thousand and thirty-seven feet south-west from the spot where Alderfgate stood; and it is the opinion of most of our antiquarians, that it obtained its name from being erected in the reign of Henry I. several hundred years after the four original gates of the city. Howel dissent from this opi-

nion, and asserts that it was only repaired in the above-mentioned reign, and that it was anciently denominated *Chamberlain-gate*; but, if this be true, it is very extraordinary that this gate is not once mentioned before the conquest. It appears, however, from ancient records, that it was called Newgate, and was a common jail for felons taken in the city of London, or the county of Middlesex, as early as the year 1218; and that so lately as the year 1457, Newgate, and not the Tower, was the prison for the nobility and great officers of state. Newgate, being much damaged by the fire of London in 1666, was repaired in the year 1672. The west side of this gate was adorned with three ranges of Tuscan pilasters, with their entablatures, and in the intercolumniations were four niches, in one of which was a figure representing Liberty, having the word *Libertas* inscribed on her cap; and at her feet a cat, in allusion to the story of sir Richard Whittington. (See p. 67.) The east side of the gate was likewise adorned with a range of pilasters, and in three niches the figures of Justice, Mercy, and Truth. Newgate stood across the east end of Newgate-street; and was removed in the year 1777; at which time the present Newgate was built on one side of the scite, and Giltspur-street Compter on the other.

These four ancient Gates are represented on Plate IV.—We now have but one non-existing gate to mention, which is,

9. *The Postern-gate.* This stood at the east end of Postern-row, on Tower-hill; and, by a part of it which was remaining when Stow wrote his Survey of London, appeared to have been a strong, handsome, arched gate. It was erected soon after the conquest, partly with Kentish stones, and partly with stones brought from Caen in Normandy. The destruction of this gate commenced in the year 1190, when William Longchamp, bishop of Ely, and chancellor of England, (the favourite of Richard I.) caused a part of the city-wall to be broken down to enlarge the Tower of London, which he then encompassed with a wide ditch, and an embattled wall, which is the outer wall of the Tower at this time. The Postern-gate, being thus deprived of the support of the city-wall on one side, fell down in the year 1440, and was never rebuilt; but in the place of it was erected a mean building of timber, lath, and loam; which is likewise decayed, and all remains of it totally removed. In the place where this gate stood, posts are now set up to prevent the passage of carts and coaches, room being left, between the posts, for foot-passengers. Adjoining hereto was till lately a double descent, by steps on each side protected by railing, to an excellent spring of water, called the Postern-spring. On the 4th of June, 1763, (the king's birth-day,) a dreadful accident happened here. It had long been a custom to exhibit fireworks upon these occasions, at the public expense, on Tower-hill. At this time the concourse of people was so great, that a vast number were pressed against this railing, and it gave way: of the multitude which were precipitated to a depth of near thirty feet, six were taken up dead, fourteen more died of their bruises, and many others were much hurt. The fireworks were never afterwards repeated; and the railing was replaced by a dwarf-wall. This has, however, been since removed, the cavity filled up, and a pump erected on the scite.

10. *St. John's Gate.* It is a well-known fact, that St. John's Gate, as it is called, near the end of St. John's street, was not originally a city-gate, but the solemn entrance to the famous priory of the Knights of St. John of Jerusalem or Knights Hospitallers. This foundation came into the possession of great wealth, and attained to the honour of being the chief seat of the Knights Hospitallers in England. Their prior ranked as the first baron in the realm, and lived in royal splendour. The rebels under Wat Tyler, determining to mortify their haughty luxury, burnt their house to the ground; but it was soon restored in a grander style than before. It was suppressed by Henry VIII. who appropriated it to the use of a repository for martial stores and the royal hunting-equipage. In the

following reign, the protector Somerset destroyed the church, with its fine steeple, (which was beautifully sculptured, gilt, and enamelled,) with the design of applying the materials towards erecting his own palace, in the Strand. Queen Mary partly restored this priory; but her protestant successor, Elizabeth, entirely suppressed it. It soon after went to decay, and the remaining gate became a public way from Clerkenwell into the city through Smithfield. This old building consists of a lofty Gothic arch, and on each side over the gate were not long since several escutcheons, which are engraved in Pennant's London, but are now entirely undistinguishable. The arms were carefully carved, and had inscriptions under them. This remnant offers a plain but grand idea of what the whole of the monastery may have been in its flourishing state. From this gate the Gentleman's Magazine first issued into the world in the year 1731; and has continued ever since to exhibit a view of the place in the front of every number.

11. *Temple Bar.* Neither was this a city-gate till the year 1670. By it the Strand is divided from Fleet-street, and the western limits of the city finally marked. Before the building of it, that is, before the fire of London, in 1666, nothing but posts, rails, and chains, intercepted the road. On the side towards the east, are, in niches, the statues of James I. and Anne of Denmark his queen, or, as others say, of queen Elizabeth; which has been conjectured because, in that case, the gate would present the effigies of four successive sovereigns; as Charles I. and Charles II. during whose reign it was built, are in the niches towards the west. The whole architecture, according to the style of the time, is good and elegant. The fabric is of Portland stone, and the work of John Bulliel, who died in 1701. The supporters of the king's arms, the lion and the unicorn, are placed on each side of the pediment as appropriate ornaments; and the height of the arch is about twenty feet. On this gate has been the sad exhibition of the heads of those who fell victims, in 1746, to principles now fortunately extinct and nearly forgotten. The improvements that have taken place of late on the western side, by laying open the area between the Bar and St. Clement's church, and the enlargement of the space on each side that ancient and curious church, do honour to those who planned and executed them. The houses thereabout are of an uncommon height, and add grandeur to the spot.

Near Temple-Bar stood, till within a few years, the Devil Tavern, so called from its sign, of St. Dunstan seizing the old gentleman by the nose with a pair of tongs. Ben Jonson has immortalized it by his *Leges Conviviales*, written for the regulation of a club of wits, who assembled here in a room called the Apollo.

We have now the satisfaction of entering upon the reign of his present majesty. No accession to the throne, either in Great Britain or in any other state of Europe, was ever more auspicious. Born an Englishman, though of a foreign race, George III. received the reins of government under more happy circumstances, or amidst more universal applause from his subjects, and in particular from the citizens of London, than any of his predecessors. The spirit of the Whigs and Tories was worn out, and the Brunswick dynasty most securely seated upon the throne. The torch of superstition was waning apace; and the tumultuous din of war was soon to be exchanged for the charming voice of peace. The whole of the metropolis shouted with rapturous joy on the day of the king's proclamation, at which the lord-mayor and aldermen, with a great number of persons of the first distinction, surrounded by a vast concourse of spectators, were present.

On the 28th of October, 1760, the lord-mayor and aldermen of London attended his majesty, at Leicester-house, with compliments of condolence and congratulation; an address was presented to him by the citizens, in their corporate capacity; as also another to the princess-dowager of Wales, his mother. This example was followed by the merchants and traders of the city, the clergy of London

and Westminster, and all the bodies politic and corporate in the three kingdoms.

Lord-mayor's day happening this year on a Sunday, Sir Matthew Blackiston, the mayor elect, was not sworn into his office till the day following; when, on account of the recent death of the king, who was not yet interred, the usual ceremonies were omitted, and he went privately in his coach, attended by the aldermen, to be sworn into his office.

About this time, two causes were tried in the court of King's Bench, Guildhall, respecting the right of the city to take toll for provisions exposed to sale before houses in the markets. They were tried before a jury of non-free-men; and the parties in the first were, the Citizens of London, plaintiffs, and Edward Smith and Ralph Twyford, salesmen, in Newgate-market, defendants. The other parties were the same plaintiffs, and John Cope, a salesman, defendant, for the sale of provisions in White-Hart-freet, an avenue or passage leading to Newgate-market. In each of these causes, the jury gave a verdict for the city; by which the citizens ultimately established their right to the tolls, not only in the markets, but also in the avenues or passages leading thereto.

Among the acts of parliament passed during this first session, was one for laying an additional duty on strong beer. Loud clamours were excited by this tax among the class of labouring people, especially in the metropolis, where some few publicans attempted to raise the price double the amount of the tax; but, as they did not act in concert, those houses in which the experiment was made were immediately abandoned by their customers. The streets resounded with the noise of vulgar discontent, which did not even respect the young sovereign; and, if the price of strong beer had been actually raised to the intended amount, in all probability some dangerous tumult would have ensued.

The business of the session being brought to a close, the parliament was dissolved on the 20th of March, 1761; and writs were issued out for the election of a new one.

A treaty of marriage having been concluded between his majesty and the princess Charlotte-Sophia of Mecklenburgh-Strelitz, the nuptials were solemnized by the archbishop of Canterbury, on the 18th of September, in the presence of the royal family, and the principal part of the nobility. The whole nation united in testifying their joy on this occasion; the amiable character of the princess promising future felicity both to her royal consort and his subjects. The lord-mayor, aldermen, and common-council, presented their congratulations to the royal pair on their nuptials; as also to the princess-dowager of Wales. It was on this occasion that the common-council appeared in mazarine-blue silk gowns, agreeable to an order of that court, made a short time before; which greatly contributed to heighten the solemnity and grandeur of their public appearance.

On the 22d of the same month, his majesty's coronation was performed in the abbey-church, at Westminster, with the usual solemnities. Their majesties and the princess-dowager went, in the morning, through the park, from St. James's, in chairs, and their attendants in coaches, to Westminster-hall; from thence they walked, about twelve o'clock, in grand procession, to the abbey. After the ceremony, which lasted six hours, they returned to the hall, where they dined most magnificently, in the presence of numberless spectators richly dressed. All the way of the procession was lined with crowded scaffolds, and the abbey also was as full and splendid as possible. On the queen's entrance into the hall, three thousand wax tapers were all lighted in less than five minutes. The royal standard was hoisted at the Tower, the ships in the river displayed their flags, the streets were universally illuminated, and all kind of business was entirely laid aside. A little before the procession began, proceeded that of the princess-dowager of Wales, from the house of lords, across Old Palace-yard, on a platform erected for that

purpose, to the south-cross of Westminster-abbey. She was led by the hand by prince William-Henry, dressed in white and silver. Her train, which was of silk, was but short, and her hair flowed down her shoulders in hanging curls. The rest of the princes and princesses, her royal highnesses's children, followed in this order: Prince Henry-Frederic, also in white and silver, handing his sister, the princess Louisa-Anne, dressed in a slip with hanging sleeves; then prince Frederic-William, in the same dress, handing his youngest sister, the princess Caroline-Matilda, dressed also in a slip with hanging sleeves. The other persons who made up this procession were those who had not a right to walk with their majesties; and the procession was closed by three Mahometan ambassadors, in the proper dresses of their country, having turbans of fine muslin on their heads, and long gowns of flowered and laced silk; their sashes were crimson, and in each of them were enclosed a dagger and poniard. The great diamond in his majesty's crown fell out in returning from the abbey to Westminster-hall, but was immediately found and restored.

The nation in general, and the corporation of London in particular, being greatly discontented at the measures of the court, and particularly at the resignation of Mr. Pitt, whose conduct in administration they highly esteemed, the court of common-council, on the 22d of October, unanimously resolved to instruct the city members on the sense of the citizens respecting the present critical conjuncture. Accordingly, instructions were drawn up and delivered to the four members; the principal articles in which were: To endeavour at a repeal or amendment of the late act for the relief of insolvent debtors, in respect of the inconveniences arising from the compulsive clause; (which was accordingly done by stat. 2 Geo. III. c. 2.) To promote all necessary measures for the establishing good economy in the distribution of the national treasure. To oppose all attempts for giving up such places as might tend to lessen our present security, restore the naval power of France, and expose us to fresh hostilities; particularly to preserve our sole and exclusive right to our acquisitions in North America, and its fisheries; and lastly, to concur in prosecuting the war with the utmost vigour, so as to obtain a safe and honourable peace.

At the same time another motion was made, that the thanks of the court be given to the Right Hon. Mr. Pitt, for the many and important services rendered to his king and country. And a third motion was made, that the committee, in their thanks to Mr. Pitt, do lament his resignation, &c. These motions, with the exception of the last, on which there was a division, were carried unanimously.

According to ancient custom, the lord mayor who is first elected to that office after a coronation invites the king and queen to dine at Guildhall on lord-mayor's day. Sir Samuel Fludyer, being chosen to that office, had the honour of entertaining their majesties on this occasion. The ceremonial was conducted with the greatest magnificence, all ranks striving to manifest their loyalty and attachment. The pageants and decorations were more pompous than had been on any former occasion; and the entertainment was elegant, sumptuous, and well conducted. His majesty and all the royal family expressed their entire approbation of it; and the nobility and foreign ministers acknowledged it to have been far beyond any they had ever seen. At a court of common-council, held on the 18th of November, it was resolved that a statue of his majesty should be erected in the Royal Exchange; and that his picture, with that of the queen, should be put in Guildhall. Their majesties, having been acquainted with the intentions of the court, condescended to sit for their pictures, which were soon after placed over the bustings in Guildhall; and the statue of the king was placed beside that of his grandfather in the Exchange.

We should be wanting in attention and regard to the spirit and manners of the times now under consideration, were we not to take notice of an impotence of the moit  
flagrant

flagrant impudence that ever was played upon the curiosity and credulity of the Londoners. It was carried on at the house of one Parsons, clerk of the parish of St. Sepulchre, and resident in Cock-lane, Smithfield. His daughter, a girl of ten years of age, being tutored for the purpose, pretended to be visited by the spirit of a young woman who had formerly lived in the house, and had died about a year and a half before this period. This woman, who went by the name of *Fanny*, had lived with a Mr. Kent, a broker, who had been the husband of her sister, and would willingly have taken Fanny to wife; but, this union being forbidden by the canon-law, the parties agreed to dispense with the ceremonies of the church, and lived together, until, to the great grief of her lover, she died of the small-pox. Kent, it seems, had incurred the resentment of Parsons by pressing him for the payment of some money he had lent him; and this is supposed to have been the source of this diabolical contrivance. His daughter, who had been a favourite of Fanny's, pretended to see her spirit; she was seized with apparent fits and tremblings; strange noises of knocking, scratching, whispering, fluttering, &c. were heard in the presence of the girl; and a woman, who lived in the house, and was an accomplice in the scheme, pretended to explain these different noises; all of which tended to show that she had been poisoned by her admirer. The circumstances of this strange visitation being reported, with many idle exaggerations, interested the public to such a degree, that nothing was talked of in all assemblies, from the highest to the lowest, but the *Cock-lane ghost*; to which there was a continual flux and reflux of people of all ranks; even some of the dignitaries of the church lent a countenance to the fraud, by joining in the superstitious throng who daily flocked to hear it. To such a height did this silly infatuation at length arrive, that all the suggestions of reason proved ineffectual to stop it; the most glaring inconsistencies were reconciled in support of the supernatural visitation, while the unfortunate object of it was universally detested as an infamous murderer; who, having robbed a poor girl of her innocence, and become fatiated with her person, had consigned her to an untimely end. In vain he published the affidavits of the physician and apothecary who attended her in her last illness; in vain he availed himself of the testimony of those who were with her in her last moments, and saw the tender parting between her and the man whom her spirit was now supposed to impeach. The more pains he took in his own justification, the more deeply were the people impressed with the conviction of his guilt. Under this dreadful persecution, he had recourse to the protection of the law, by commencing a suit against the father of the child, an ecclesiastic who had been very instrumental in promoting the imposture, and some others who had been more or less active in ruining his reputation and fortune. They were indicted for a conspiracy, and tried before lord-chief-justice Mansfield, who resisted an attempt that was made to prove that the visitation was supernatural: he treated such a supposition with the contempt it deserved, and pronounced the whole to be an infamous imposture, contrived and carried on to effect the ruin of an innocent person; and the jury before whom it was tried convicted all the parties of the conspiracy. Parsons was condemned to stand in the pillory three times in one month, and to be imprisoned for two years; his wife was imprisoned for one year; the woman who acted as interpreter was committed to Bridewell, to be kept to hard labour for six months; and the clergyman and another person who had been active in the transaction were dismissed with a severe reprimand, after having compromised the affair with the prosecutor, to whom they paid a considerable sum of money, as a reparation for the injury he had sustained.

On the 5th of July came on at Guildhall, a cause which had been long depending between the city and the dissenters, concerning the eligibility and obligation of the latter to serve the office of sheriff; when, after several learned

pleadings, the judges gave their opinion, that dissenters were not obliged to serve that office. This determination was afterwards confirmed by the house of lords.

On the 27th of September, it appeared, that, by the rains which fell for some days past, a high tide in the river Thames, and a strong gale of wind at north, the rivers within twenty miles of London were so raised, that the like had never been known in the memory of man; and the damage that was sustained, more especially on the river Lea, was almost incredible. In less than five hours, the water rose twelve feet in perpendicular height. About Stratford, West Ham, Plaistow, Waltham-abbey, and along the marshes, they were very fatal to the inhabitants. Most of their cattle in the fields were carried off; likewise stacks of hay and wood, with the loss of the hogs that were in their sties and yards, together with all the horses that were in the stables. In some parts of Stratford, the flood reached the chamber-windows, and the face of the waters was covered with the bodies of the heats that perished. From the nearest computation that could be made, not less than five thousand hogs perished in this flood, together with all the horses and other cattle that were in the meadows, whose numbers were very considerable. The flood extended itself over all the causeways, and several people were lost in the high roads: a woman and horse, and a gentleman in a post-chaise, with the horses and post-boy, all perished in the water; and three of the passengers in the Bury machine, with two of the horses, were also drowned. The china-works, beyond Bow-bridge, were overflowed in such a manner, that the current rushed through the great arch like the tide through the arches of London-bridge. The calico-grounds, in the neighbourhood of Bow and Stratford, were overflowed, and great quantities of linen carried off. The houses, from Bow-bridge to Stratford, were under water; and the inhabitants were compelled to take refuge by getting out of their windows.

The negotiations for peace, which had been some time in hand, having been brought to an issue, the secretary of state sent, on the 8th of November, to inform the lord-mayor, that the preliminaries of pacification were signed on the 3d instant; in consequence of which, a cessation of arms was proclaimed at London on the 1st of December; and, on the 22d of March, 1763, the definitive treaty, which had been signed at Paris, on the 10th of February, was proclaimed at the usual places in London; but so dissatisfied were the citizens with the terms of it, that the common-council could not be prevailed on to address; and that which was obtained from the aldermen, was carried up by eight of that body, with a *locum tenens* at their head. For the contents of this treaty, see the article ENGLAND, vol. vi. p. 735.

Ever conspicuous in deeds of charity, and ready to help the distressed, the city offered her protection, in the month of August, 1764, to about six hundred Palatines, and other German protestants, who were landed at the port of London in the greatest distress. They had been induced to quit their own country, by a German officer, on a promise of settlements in America, with, as he stated, the concurrence of the British court. This promise he was unable to perform; and, as it afterwards appeared, no authority had been given to him to make any such agreement. On the arrival of these poor deluded people, they found themselves in a strange country, without money or friends. Some who had the means of paying for their passage were permitted to land; but such as had not were kept on-board the ships; and both were in a starving condition. In this deplorable state they experienced the benevolence of Britons; their case being made known to the public by the Rev. Mr. Wachsel, minister of the German Lutheran church in Ayliffe-street, a subscription was instantly opened for their relief; food, clothing, and medical assistance, for their immediate necessities, were supplied by the inhabitants of the neighbourhood in which they were; tents, for their reception,

were.

were given by order of the king; and, at length, they were sent by the government to South Carolina, with every thing necessary for them during the voyage, and proper means for their comfortable establishment on their arrival.

At this time the silk-weavers experienced great distress, but an act passed for their relief put an end to several riotous proceedings which had for some time alarmed the city. The importation of French silks had been the cause of these disturbances, and the assurances to the master-weavers that it would be discontinued, aided by the timely interference of the magistrates and of the parliament, brought the whole to a peaceable accommodation.

A dreadful fire broke out on the 1st of June, 1765, in a maff-yard, near Rotherhithe church, which, in a few hours, destroyed two hundred and six houses, together with a brig and several lighters in the river. The wind carried the flames to a considerable distance; but luckily they were driven from the Thames, otherwise the consequence to the shipping must have been very fatal. These losses were computed at ten thousand pounds; but the unhappy sufferers, many of whom had not insured their property, were relieved by the munificence of the public, who raised such contributions as greatly exceeded the estimates of the claimants.

This and many other fires which happened during the course of the year, appear to have been either produced, or greatly increased, if they occurred accidentally, by evil-minded persons; for, about this time, many incendiary letters were dropped in different parts of London, and several trains, laid for this desperate purpose, were discovered and defeated within a few weeks. Notwithstanding this, another dreadful conflagration took place on the 7th of November, about three o'clock in the morning, at the house of one Rutland, a peruke-maker, in Bishopsgate-street, next door to the corner-house in Leadenhall-street. The wind being high, the flames spread to the corner-house, and from thence to the opposite side; when these, for want of water and proper assistance, soon communicated to the other two, so that the four corner-houses were all on fire at the same time. The house, which formed the corner of Gracechurch-street and Cornhill, was only damaged, but the other three were all destroyed; as were also all the houses from the corner of Cornhill, next Bishopsgate-street, to the church of St. Martin Outwich, at the corner of Threadneedle-street. The church and parsonage-house, as well as the back part of several houses in Threadneedle-street, were greatly damaged. All the houses in White-Lion-court were entirely destroyed; among which was the White-Lion-tavern, that had been bought but the evening before for between two and three thousand pounds. The back part of Merchant-Taylors' Hall was greatly damaged; five houses on the Exchange-side of Cornhill were entirely consumed, as were several others in Leadenhall-street. Near a hundred houses were destroyed or damaged; and the loss was computed at 100,000*l*. Several lives were lost, not only by the fire, but by the falling of chimneys and walls. A gentleman, who ventured among the ruins next day, thinking that some persons might be still alive under the rubbish, waved his hat, to engage the attention of the spectators, and declared that he was sure many were actually under the spot on which he stood. Upon this, the firemen went immediately to work with their pick-axes; and, on removing the rubbish, they drew out, alive, two men, three women, and a child about six years old. The following day, as some of the workmen were clearing away the rubbish from the cellar of one of the houses, a stack of chimneys suddenly fell down; by which accident eight persons were killed, and several others had their limbs crushed in a shocking manner. Many of the sufferers by this fire not being insured, a subscription was opened for their relief, which soon produced a handsome sum; one thousand pounds of which was subscribed by his majesty. The Grocers' and Ironmongers' companies each

subscribed a hundred pounds, and the lord-mayor fifty; a part of which was distributed among the unfortunate widows and children of the men who were killed by the falling of the stack of chimneys.

The annals of the city present us, at this period, with several regulations, issued from the court of common-council, by which the rights of the citizens, and the support of the poor were considerably improved. At a court held the 23d of January, 1767, it was unanimously resolved, that, on account of the distresses of the poor, (which at that time were very great, occasioned by the inclemency of the season,) one thousand pounds should be subscribed out of the chamber of the city; and that a subscription-book should be opened in the chamberlain's office, for the donations of all well-disposed persons; which money should be appropriated to the relief of such poor persons, inhabiting within the city and liberties, as did not receive alms of the parishes; and a committee was appointed, consisting of the lord-mayor, and all the aldermen, and fifty-two commoners, who immediately withdrew, and began a subscription among themselves; to which the lord-mayor gave one hundred pounds, and the rest of the gentlemen very liberally. By this noble plan great numbers of people were happily relieved from the most abject state of distress.

On the 14th of September, 1767, Elizabeth Brownrigg (wife of James Brownrigg, painter, in Fetter-lane, Fleet-street) was executed at Tyburn, for the murder of Mary Clifford, her apprentice. The child's death was occasioned by a series of such uncommon barbarities, as, had they not been well attested on the trial, would have appeared almost incredible. The husband and son, who were in some degree concerned, were acquitted of the murder, but afterwards tried for an assault; of which being found guilty, they were sentenced to be imprisoned in Newgate six months, and to enter into recognizance for their good behaviour for seven years. Before the left Newgate, her husband and son took an affectionate leave of her in the cell. She appeared very penitent in the way to, and at, the place of execution; where the number of spectators was so great, that many persons were considerably bruised by the pressure of the crowd.

The year 1768 began with a very severe frost, which greatly contributed to the calamity of the lower sort of people, who were already much distressed from the exorbitant price of provisions. On the 9th of January, the river, below bridge, bore all the appearance of a general wreck; ships, boats, and small craft, lying in a very confused manner, some on-shore, and others sunk, or overset by the ice. A fishing-boat was discovered, near Deptford-creek, jammed in by the ice, and all the people in it frozen to death; one of whom, a youth about seventeen, was found sitting erect, as if alive.

Dreadful affrays happened at this time, between coal-heavers and sailors; which ended in the execution of two of the former for the murder of one Battie.

In the same year, the king of Denmark being on a visit to his majesty, the citizens of London were desirous of showing their respect to him; in consequence of which it was resolved in a court of common-council to invite him to an entertainment at the Mansion-house, which being accepted, the 23d of September was the day appointed for receiving the royal guest, who intimated his desire of coming to the city by water. In consequence of this, on the appointed day, the city-barge, attended by the companies' barges, proceeded to New Palace-yard, where the king embarked; and, in order to give him a more extensive view of the banks of the river, a circuit was made as high as Lambeth, and then down to the Steel-yard, after which they returned to the Temple-stairs, and, on landing, were conducted to the Middle-Temple Hall, where an elegant collation was prepared by the benchers of the two societies. From the Temple his majesty was conducted to the Mansion-house in the city state-coach, followed by the noblemen of his suite, and the aldermen

and sheriffs in their carriages; on alighting, he was received by the committee appointed to manage the entertainment, in their mazarine-gowns; and, being conducted into the great parlour, received the compliments of the city, to which his majesty returned a very polite answer. The dinner, which was exceedingly magnificent, was served in the Egyptian-hall; the galleries of which were filled with the ladies of the common-council, elegantly attired; and an excellent band of music was stationed in an orchestra erected for the occasion. His majesty took leave of the corporation about eight o'clock, having expressed his highest satisfaction at the elegance of the entertainment. The procession was very grand, the entertainment sumptuous; and at a court of common-council held on the 10th of October, the freedom of the city was unanimously voted to his majesty, to be presented in a golden box of two hundred guineas value: he was admitted into the Grocers' company; and his freedom, being afterwards given to his ambassador here, was by him transmitted to Copenhagen.

On the 3d of January, 1769, the election for alderman of the ward of Farringdon without came on at St. Bride's church; the candidates were Mr. Wilkes and Mr. Bromwich; but, on the close of the first day's poll, the disparity of numbers was so great, that the latter gentleman declined the contest, and the lord-mayor declared Mr. Wilkes duly elected. Some doubts, however, were started respecting the legality of closing the books before the time appointed for that purpose; and a second wardmote was held for a new election on the 27th, when, no opponent appearing, Mr. Wilkes was again declared duly elected. That distinguished patriot was at this time in confinement for the causes detailed at length in our article ENGLAND, vol. vi. p. 736, 741, 744, 768. This reward, therefore, and that of the chamberlainship subsequently bestowed, were intended to evince the high sense which the city had of his exertions in protecting them from the oppression of *general warrants*, and his other efforts in the cause of freedom. And accordingly, upon his liberation, which took place on the 24th of April, 1770, he was sworn in alderman of the ward of Farringdon without, and took precedence from the time of his election.

Soon after this, Mr. Beckford, who was lord-mayor for the second time, attended by the sheriffs and several of the aldermen, went in state to the Old Bailey, and laid the first stone of the prison called Newgate. This was the last transaction of this worthy magistrate's life. The citizens of London, honouring him for his firmness and intrepidity in defending their rights against the undermining workings of the ministry, passed a resolution, in the first common-council after his death, for erecting a statue to his memory in Guildhall. See vol. ii. p. 842, 3.

The opposition to the impress-service was carried to such a height, in the city of London, at this period, that, on the 15th of January, 1771, a motion was made in the court of common-council, to censure Mr. Alderman Harley for having backed the warrants; and, on the 22d, the following resolution was carried: "That if any person shall be impressed within this city or liberty into his majesty's service, by virtue of any warrant granted or backed by any of his majesty's justices of the peace for this city, this court will immediately direct their solicitor, at the city's expense, to prosecute, in the name of the person so impressed (if he desires it), not only the justice of the peace who granted or backed the said warrant, but the constable or peace-officer who executed the same." This question, however, was put to rest by a letter from the secretary of state to the lord-mayor, informing him that the dispute between the two governments was amicably adjusted.

During this session of parliament was passed the famous *paving-act*. The stat. 10 Geo. II. c. 22. had established a system of paving, lighting, cleansing, and watching, the city of London; and other regulations had been made from time to time, particularly an act of parliament in 1762, which occasioned the removal of the large sign-frames

which went all across the streets; but the statute which totally and finally removed signs and sign-posts, balconies, spouts, gutters, and those other encroachments and annoyances which were felt as grievances by the inhabitants, did not pass till this year. The stat. 11 Geo. III. c. 29. contains a complete and masterly system of that branch of the police which is connected with municipal regulations; and may be considered as a model for every large city in the empire. This statute extends to every obstruction by carts and carriages, and provides a remedy for all nuisances which can prove, in any respect, offensive to the inhabitants; and special commissioners, called commissioners of sewers, are appointed to ensure a regular execution. This statute was afterwards improved by stat. 33 Geo. III. c. 75. by which the power of the commissioners is increased, and some nuisances, arising from butchers, dustmen, &c. further provided against.

The custom of hanging signs over the door, or at any other part of the house, is of ancient date; for the Romans used them, as appears from Quintilian, who says, *Tabernæ erant circa forum, et scutum illud signi gratiâ positum*; "There were shops around the market-place, and this shield hung there as a sign." A bush of ivy or a bunch of grapes was often used for the same purpose; and hence the proverb, Good wine needs no bush.

In England, signs originated by law in the time of Charles I. but they had partially subsided long before; for the very charter of that king, whereby the citizens were directed to "hang out signs for the better finding of their respective dwellings," is a proof that in many instances such indications were already pendant over shops in the city and elsewhere. The rage for these gaudy, and too-often tawdry, pensile works of the brush, had at length risen to such a pitch, that the streets of London and Westminster (aped by the country-towns) exhibited as many and various paintings as any famous sale at Christie or Phillips's rooms. Expense was not spared on the occasion; and the *envie de métier* among tradesmen was such, that one generally wished to outshine another. Indeed, we are told, that a young man, opening his shop for the first time, was often at a loss to find money for the sign-post, upon the *beautiffulness* of which his future welfare and success considerably depended.—The choice of a witty device, or splendid *enluminure*, was therefore of great consequence; and indeed, if we may relax from the indispensably-serious tenor of our annals, by relating a few anecdotes upon this subject, we shall evince that these *silent advertisers* were of great import to their proprietors.

Although the following anecdote originated in a foreign country, we do not think it foreign to our purpose; and have no doubt, we are even sure, that it has its counterpart in many places of our island.—An inn-keeper at Cassel, having considerably profited by his numerous customers under the sign of "the Grey Ass;" supposing himself well established in his trade and house, began to be tired of the vulgar sign which hung over his door. The arrival of the landgrave of Hesse furnished him with an opportunity of making, as he thought, a very advantageous change.—In an evil hour, the Grey Ass was pulled down and thrown aside, and a well-painted and faithful likeness of the prince substituted for it, as a most loyal sign. A small and unfrequented house in the same town immediately took up the discarded device, and speculatively hoisted "the Grey Ass." What was the consequence?—Old codgers, married men with scolding wives at home, straggling young fellows, (*potus et exlex*,) all the fraternity of free toppers, resorted to the house, filled the tap-room, crammed the parlour, assailed the bar; the Grey Ass had the run and the vogue, whilst the venerable *Prince of Hesse* swang mournfully and deserted at the other place, and enticed no visitors, foreign or domestic; for it is to be observed, that the Grey Ass had such reputation all over Germany, that every foreign nobleman or gentleman who came to Cassel was sure to order his coach or chaise to be driven to the inn of that name; and this order of

course was still continued; for how was it to be known, by travellers coming from Vienna, or from Hungary or Bohemia, that a certain inn-keeper at Cassel had altered his sign? "Honour and wealth, what are ye but a name!" To the inn, therefore, which was named the Grey Afs, they still went. What could the deserted inn-keeper do?—To deface the fine portrait of his master would have been high-treason, yet losing his customers was downright starving. In this cruel dilemma he dreamt of a new scheme, and had it executed: the portrait was preserved; but he wrote under it, "*This is the real original Grey Afs.*"

The same rivalry for signs existed in London, and indeed sign-painting became an important trade. Harp-alley was the common mart for them, where they could be bought from five shillings to five pounds. In the year 1743, a most beautiful representation of "good Queen Bess" hung in Ludgate-street to the gaping admiration of the passers; and the Three Pigeons in the same street is still remembered. No expense was grudged for these ornaments; and indeed there was such a profusion of gold every where, that a wag wittily remarked at the time, that sign-painters seemed to possess the faculty of Midas, since they turned every thing they touched into gold. The Golden Crown, the Golden Sugar Loaf, the Golden Leather Bottle, and even the Golden Half-moon, were to be gazed at every where.

The devices of or upon signs were often allusive to the trade of the house.—A cook of the name of *Lebec* (the beak), and another of the same profession of the name of *Brawn*, hung their own effigies over their shops, in allusion to their calling. One of those punning signs exhibited the head of Henry VIII. a fish, and a white ball, because the name of the master below was *Henry Whiting*. The Swan, with one or two necks, was a pun brought from France, where the word *Cygne*, a swan, sounds like that of *Signe*, a sign. They had there a swan with a cross, which they called *Le Signe de la Croix*, "the Sign of the Cross." Yet, some one will ask, how do you account for the two necks bestowed on the swan? This *Swan*, or *Sign*, of the *Cross*, had a cross entwined with his neck; and, at the time of the reformation, the popish figure of the cross having been brushed away, the painter twisted another neck in its stead. The *Last*, a very common sign for a public-house, and now generally understood to be an invitation to shoemakers, or a designation that shoemakers frequent it, originated from some publican writing over his door "This is the *Last*;" viz. the last house in the street or town where you can get any thing to eat or drink; with an *inuendo*, that, if you do not stop here, you run risk of dining with duke Humphrey. This trick was not confined to London, for we recollect to have seen in several towns of France, public-houses, or *cabarets*, with a sign exhibiting the motley group of a *He-goat*, an *Owl*, and a *Mound*, or globe. To guests what it meant was not an easy thing; but, placing the French words, *Bouc*, "a he-goat," *Duc*, "an horned owl," and *Monde*, "a mound," one after another, it was then discovered that it signified *Le Bout du Monde*, or "the World's End." The cunning publican insinuating by his enigmatical device, that his house was the *last* on the road.

Many public-houses in London and in the country, have on the door-posts or windows several squares of different colours, like a draught-board; and, if they have no other sign, this serves for one, and is called the Chequers. This practice originated from the earl of Warren, whose arms were "chequed or and blue," having the disposal of licenses for houses of that description.—The *Angel*, meaning "a messenger," suited, as a sign, the places of resort for carriers and errand-men. We should be sorry to suppose that the *Goose and Gridiron* alluded to the saint who suffered martyrdom on that culinary utensil; yet we doubt not but the *Flower-pot*, in Bishopgate-street, preserves some remains of "the Annunciation;" the Virgin being generally painted with a vase replete with lilies and other

flowers. The transient blast of superstition, under the denomination of puritanism, blew off the *Virgin* and the *Angel*, and permitted the less-obnoxious nosegay to remain. On the eve of days consecrated to the Virgin Mary, anciently in this, and even now in foreign countries, her statues were adorned with garlands of flowers, and surrounded with wax tapers. A serenade with musical instruments used to close the religious scene at the corner of the street. The house was called either the *Annunciation* or the *Salutation*.

We shall mention a few more punning signs.—The *Bull and Mouth* is a corruption of *Boulogn Mouth*. The *Bear* was a pun for *Beer*; the *Brown Bear* for *Brown stout Beer*; and, when it appeared with a bunch of grapes in its mouth, it was a sure sign that, besides malt-liquor, wine was sold in the house.

The *Bell Savage* has been resolved into the pun of a wild man, or savage, striking on a bell. If we make it feminine, *Belle Sauvage*, it means "a cruel fair;" and some think it was merely a contraction of *Arabella Savage*, the name of the landlady. But *Belle Sauvage* signifies also a wild woman; and in conformity with this is the account given in the *Spectator*, No. 28. who derives it from a most beautiful woman described in an old French romance as being found in a wilderness in a savage state. The story and its poetical recitation are well-known there, and the tune is of great sweetness and simplicity. The fact is related in this manner: Genevieve, wife to one of the ancient dukes of Brabant, having resisted the insult of the steward, was accused by him of adultery. She was condemned to death by her husband; but found means to escape with her child, and ran to the forest des Ardennes, where she concealed herself and brought up her little boy by the help of a hind, whom, wondrous to tell! she had so tamed as to make her suckle the infant whose natural food had been dried up by grief and want of suitable nourishment. Seven years after her disappearance the steward died, having first made a full confession of his guilt; and, not long after, the duke, following the hind whom he had pierced with an arrow, discovered his innocent consort, who was then covered entirely with her hair, and in a wild state. The romance to which this gave occasion dates of the 15th century; and is, in style, similar to our *Chevy Chase*. But to come from romance to history; it appears by some ancient records, that the erection which occupied the ground on which this inn now stands was called *La Belle Savoyarde*, alluding perhaps to Eleanor queen of Henry III. who was a daughter of the count of *Savoy*.

The *Spectator* mentions another sign, "The Cat and the Fiddle," in which he finds a conceit; perhaps between the strings of the instrument and the guts of the quadded, or, more likely, between the mewings of Grimalkin and the ear-torturing scrapings of a bad fiddler.

The *Three Nuns and a Hare* was a common sign in his time; the *Three Nuns* remain to this day by the Seven Dials, but *Puss* has run away.—He was scandalized at the sign of a *Goat* over the door of a *perfumer*, and at the *French King's Head* (alas! was it a sort of prognostication?) at a *sword-cutter's*; but he laughs heartily at a Frenchman, who, near Charing Cross, hoisted for his sign a *Punch-bowl*, and *Two Angels* squeezing a lemon into it. The *Spectator* does not give us the key of this curious device; but we may easily conceive that the *tasteful* foreigner, who had seldom, if ever, drunk good punch in his own country, found it here so heavenly a liquor, that he thought angels must have had a hand in the making of it.

The Sun, the Rising Sun, owes its blazing appearance on sign-posts to the alluding motto, which was generally, "The best drink (under the Sun.)" In the year 1739, there was on the Hounslow road a little alehouse, with this moving inscription: "Poor Jack striving to live;" and we doubt not but the unassuming motto drew customers to the tap-room.—The following curious inscription is at the sign of the *Snail* in the King's Road:

The snail is slow,  
And I am low!  
What d'ye think?—  
Pray stop and drink.

This sort of dialogical invitation, we remember to have met with often in Picardy and Normandy, in the road to Paris. To save travellers the trouble even of thinking, the publican, or *cabaretier*, has in large letters, not always very correctly spelt, these words: *Où irons-nous?—Entrons ici—Chez Pierre Le Roux, &c.*—"Where shall we go? Let's in here, &c. &c."

The following couplet was very common under sign-posts eighty years ago:

Drink here and drown all sorrow;  
Pay to day, and trust to-morrow.

A caution of some import to several ambulant tipplers.

The Pope's Head and Cardinal's Hat taverns, in Cornhill, date a century at least before the reformation; for Stow mentions them both as existing at the time of Henry VI. He says that "at that time the wine-drawer of the Pope's Head tavern (standing without door in the High-street) used to sell a pint of wine for a penny, with bread allowed free."

The Magpye and Stump, is a manifest invitation to good fellows to walk in, and, their elbow "leaning on the beechen table," to chatter away as the well-known bird does on the stump of a tree.—The *Dolphin* is of a very ancient date, as ancient perhaps as the year 1213, when Louis, *Dauphin* of France, was invited over to England: we have seen, in p. 63 of this article, that Louis and the Londoners were good friends to the time of his departure. Perhaps, however, this sign is connected with the proverb, "He drinks like a fish;" and a sort of stimulating address to the customer; an invitation to come in and drink as fishes do; without harm and without ceasing.—The Mermaid may have emerged out of the same conceit.—The Saracen's Head reminds us of the crusades; and the Blue-coat-Boy of Edward VI. and his munificent foundation. The Pewter Platter, Bunch of Grapes, and Bush, may range under the invitatorial signs.

It appears that, when a man married a woman who lived under a sign, he adopted and impaled the device, as we do coats of arms; hence the heterogeneous compounds which we often remark in the remains of that ancient custom—as the Kings and Keys, Cat and Bagpipes, Cow and Snuffers, &c. &c.

A very ingenious author, in an essay inserted in the *Gentleman's* and *London Magazines* for the year 1738, observes, that "whoever takes notice of the signs in England, will find that they all, or nearly all, tend to exemplify national bravery; and that he who contrives the most heroic sign is sure of most custom. Some hang out the heads of great commanders, such as Monk, Marlborough, or Ormond; others exhibit the machines and requisites of war, as Ships, Guns, Cannons, and Castles. The very sign, or, to speak more properly, (for *signum*, from which we derived *sign*, means in Latin the warlike standard, the colours, of a regiment or legion,) the arms of England, display the undaunted temper of the people: the Lion, the Unicorn, and the Horse, lately added to the quarterings."

This leads us to speak of the badges of princes or states which have been used as signs. Thus, the Falcon was the badge of Edward III. the White Hart, with a ducal coronet and chain or, alluded to Richard II. the Blue Boar to Richard III. the Swan to Henry IV. two Ostrich-feathers to Henry VI. the Sun to Edward IV. the Black Bull to the same; the Red Rose was the badge of the house of Lancaster, the White Rose distinguished that of York; the Greyhound was the symbol adopted by Henry VII. the Royal Oak reminds us of Charles II. and the White Horse, being the badge of the electorate of Hanover, is used, as well as the George, in compliment to the present reigning family.

Near Drury-lane, was a public house with the sign of the Queen of Bohemia's Head; a sort of immortality, says Pennant, given by the heroic William lord Craven to his admired mistress, whose battles he first fought, animated by love and duty.—The same author mentions the Falcon near St. Bride's church, as being the sign of Wynkyn de Worde's house, or inn; and adds, that he printed his "*Frutye of Times*" at the sign of the *Sonne*.

The Dragon has been adopted as a sign by some Welsh publican in commemoration of his Cambrian origin, the dragon being a badge of the principality of Wales.—The Green Dragon may allude to the event related under the article KNIGHTHOOD, vol. xi. p. 793. and, perhaps, took its station over the door of some inn in the neighbourhood of the houses belonging to the knights of St. John of Jerusalem. There is in Bishopgate-street a most excellent carving of this fabulous animal, in a very spirited attitude, at the bottom of the yard of an inn well known by that name.—The Goat in Jackboots seems to be also of Welsh origin.

The *Dun Cow* reminds us of an old story of the famous Guy earl of Warwick.—We are told, that the first sign-post which strikes the sight at the landing on the quay of Dublin, is that belonging to the inn called "The Cow;" and that, by a curious *nationality*, the sign really bears a stronger likeness to a *Bull*. Whether this mistake alludes or gave origin to the denomination of *bull*, generally applied to those blunders which are generated by rapidity of thought overcoming the facility of utterance, we leave others to decide.

The Three Balls, exhibited at the shops of pawnbrokers, by the vulgar humorously enough said to indicate that it is two to one the things pledged are never redeemed, were originally nothing but *pills*, as the following statement will prove. It is a well-known fact in the history of Europe, that the first money-lenders were some inhabitants of Lombardy, who spread themselves all over Europe, and obtained a sort of settlement in almost every considerable city, as appears by the streets which bear still their name; viz. *Lombard-street* in London, *Rue des Lombards* at Paris, &c.—The most natural way to indicate their dwellings was to hang over their doors, as a sign, the arms of their sovereign, the illustrious house of the *Medici*: now these very arms are nothing but balls, bolusses, or pills, red and blue upon a gold ground, in allusion to the name *Medici*, which means "Physicians," from one of which profession this family had its rise. The original colour was kept up for a long time, and gave a denomination to several *Blue-ball-alleys*, where these money-lenders used to hide their usurious practices; but they have since found it necessary to gild their pills, as a better decoy for their needy customers.

Another sign appertaining to a particular profession was Abfalom hanging to a tree by his hair, and king David lamenting at a distance. This was adopted by a wig-maker, who caused a label to issue from David's mouth, containing these words:

O Abfalom, my son, my son;  
Hadst thou but worn a peruke, thou hadst not been undone.

This sign was exhibited, a few years since, in Union-street, Borough; and is not uncommon in France.

In Fleet-market, on the eastern side, were small houses with a sign-post representing *two hands conjoined*, with "Marriages performed within" written beneath, whilst a dirty fellow assailed the ears of the passengers with the iterated and loud compellation of "Sir, will you be pleased to walk in and be married;" as if the dread of any stoppage in the trade of conjugality was threatening mankind with premature extinction. The parson was seen walking before his shop, as an ambulant sign, "ready (says the same author) to couple you for a dram of gin or a roll of tobacco." The Stat. 26 Geo. II. c. 33, (anno 1752.) at length put an end to this most scandalous practice.

The Good Woman (without a head.) Some persons, whose reading and experience have brought them in contact rather with bad women than good, and who perhaps have read the story of a woman who spoke very well without a tongue, (a story which is attested by Wilcox bishop of Rochester, and was read before the Royal Society in a letter from Lisbon, dated Sept. 3, 1707; and which gave occasion to the following epigram:—

*Qu'une femme parle sans langue,  
Et même fasse une harangue;  
On le dit, et je le crois bien!  
Mais qu'avec une langue elle puisse taire,  
Oh! ma foi, voilà le mystère!  
En vérité je n'en crois rien.*

That without tongue a woman could  
Chat and prattle, talk aloud;  
As a fact I must receive it.—  
But, that a woman with a tongue  
Could hold her peace, and hold it long;  
Pshaw! I can't believe it. (Z.)

Some such persons, we say, have been of opinion, that a woman never could be absolutely good unless her head were entirely off; and hence have deduced the origin of the sign, which is still to be seen at an oil-shop in St. Giles's, midway between the church and Tottenham-Court Road; at another in Bishopgate-street; and at another in London Road. But, when the reader is told, that this sign has never appeared but at an oil-shop, and that it is commonly believed that the first-mentioned house has been in the same trade, and with the same sign, or something like it, ever since the days of Charles I. he will perhaps agree with us, that the sign was originally, at that distant period, nothing but an Italian oil-jar, which, being very badly painted, and become much worse by decay, might have been likened by the customers to an headless old woman with her arms a-kimbo; and might really have been as much like one as what it was intended for. Then we may suppose the next occupier of the house, either deceived himself, or humouring the mistake of others, might, when he renewed his sign, really turn it into a woman without a head. Or, even supposing the mistake to have been made by the sign-painter, from being unable to distinguish the figure he had to copy from; this will not appear so very absurd, when we have given, as below, a representation of a jar and an old woman side by side.

We have read of stranger metamorphoses, and of stranger errors in drawing; for one of which we shall cross the Atlantic, and go to North America. A certain great shopkeeper, or merchant, of New York, who had never learned to write, used notwithstanding to keep his own accounts. His practice was, to make a gross representation, in his book, of the article he had sold, with certain marks for dates and prices. Mr. Landseer, in his Lectures on Engraving, strongly objects to the word *copying* as applied to the reduced drawing of a large picture or other object: he prefers the word *translating*. Our merchant, therefore, when he sold any article, did not *copy* it into his book—no, he *translated* it; and it is well-known that most things suffer by translation: so it was in the instance we are going to relate. A neighbour called in one morning to settle an account. Our merchant opens his draw-

ing-book: On such a day, says he, you had a cask of vinegar, on such a day a side of bacon, on such a day a cheese. The debtor protested he never had had any cheese, but the creditor was positive; for (says he) here it is in my book. The debtor, after some consideration, says; I cannot recollect having had any thing of you near that time, except indeed a *grindstone*. "You are right," says the merchant; "a grindstone it was; the mistake was mine; for I did not leave a hole in the middle of it, to distinguish it from a cheese."

In spite of the entertainment which these motley exhibitions afforded, they were doomed to be taken down in the year 1762 and 1771. The danger of their falling upon the heads of the passengers, the interruption they created to the sight in the streets, and their disagreeable creaking by day and night in high winds, united for their destruction, to the no small disadvantage and regret of several artists in that line; for it was a lucrative, though inferior, branch of the art of painting, and furnished employment to many clever hands. Sometimes men of superior talents condescended to employ their brushes upon sign-posts, which, though in high situations, were not always in high esteem, but brought nevertheless a great profit to the performers. Mr. Wale, a royal academician, was occasionally a sign-painter; the principal sign which he painted was a whole-length of Shakespeare, about five feet high, which was displayed before the door of a public-house, the north-west corner of Little Ruffel-street, in Drury-lane: it was enclosed in a most sumptuous carved-and-gilt frame, and suspended by rich iron-work: but it happened that this splendid object was not long exhibited; for the act we are speaking of was passed very soon after, and caused it to be removed: it was then sold for a trifle to a broker, at whose door it stood for several years, till it was totally destroyed by weather and other accidents.—Van Somer was another sign-painter of reputation, who put any price he liked on his works.—In the beginning of his present majesty's reign, among the most celebrated practitioners in this branch of the profession, was a person of the name of Lamb, who possessed a considerable degree of ability; his pencil was bold and masterly, well adapted to the subjects he treated, and the best colourist, in fact the *Titian*, of his brotherhood. We have seen and admired some of his performances, preserved, out of curiosity, by a most respectable sign, herald, and house, painter of our time, Mr. Thornton, of Carter-lane, who has himself evinced a great deal of proficiency in a branch of the chromatic art, now reviving under a less gaudy and more chaste regulation than in former times.

It was observed at the time, that the citizens of London were very loath to part with their signs. Being obliged to remove them from the sign-posts which obstructed the foot or horse pavement, they stuck them commonly against their houses, at the risk of darkening a window or two, where many of them remained till they were quite decayed, when of course they were not renewed, the numbering of the houses making them quite unnecessary. We ourselves have perhaps partaken of the unwillingness of the owners to part with these ornaments, and have therefore detained the reader longer than we intended. Proceed we now with our annals.

On Sunday the 23d of March, 1772, a violent storm of hail, thunder, and lightning, happened in London and its neighbourhood, during divine service in the afternoon. The congregations, in many churches, were struck with the utmost consternation; particularly at St. John's, Horseleydown, where, the hailstones breaking some of the windows, a great part of the people, in the midst of the sermon, precipitately ran out, and the remainder were thrown into the utmost confusion. At Lambeth-church, every one fled from the windows, the charity-children were frightened into a general outcry, and the service was, for some time, stopped. On the morning of the 23d of December, in the same year, there happened one of the greatest fogs in London, that had ever been remembered; by

which great damage was done. The darkness was so great, that the carriages of the nobility and gentry were attended by lights, the same as at midnight. Many accidents occurred during the continuance of this fog, which lasted through the night; and, in the morning, several people were found dead in the fields round the metropolis, who, not being able to find their way, were supposed to have perished from the inclemency of the weather. The excessive rains that fell in the course of the month of March following, (1774.) raised the waters in many rivers (but principally those westward of London) to a greater height than had been known in the memory of man. The levels, on the sides of Chelsea and Battersea, were entirely overflowed, and considerable damage done to the gardeners' grounds and young plantations. The force of the current in the river was so strong, that two west-country barges were carried out of the channel, and left in Battersea-fields when the flood abated. Many of the western roads were rendered impassable; and the towns in general, adjoining to the rivers, received considerable injury from the violence of the inundation.

The election of a chamberlain was warmly contested in the beginning of 1776. Sir Stephen Janssen having signified his intention of resigning that office, a common-hall was held, on the 20th of February, for the choice of his successor; when aldermen Wilkes and Hopkins were put in nomination as candidates. The show of hands appeared to be greatly in favour of Mr. Wilkes; but, a poll being demanded in favour of Mr. Hopkins, it began on the same day, and was finally closed on the 27th; when the numbers were, for Mr. Alderman Hopkins, 2887; and, for Mr. Alderman Wilkes, 2710: in consequence of which, the former was declared duly elected. The contest was renewed between Mr. Hopkins and Mr. Wilkes every Midsummer-day till the death of the former, but always without success on the part of the latter, who now seems to have lost some of his popularity; for, on the 19th of November, 1777, when a motion was made in the court of common-council, that an annuity of five hundred pounds per annum be paid by the chamberlain to John Wilkes, esq. alderman, during the pleasure of the court; it was carried in the negative by a great majority. And a motion was then made, and seconded, "That it is the opinion of this court, that the granting any annuity to John Wilkes, esq. or the paying any of that gentleman's debts, out of the city-cash, whether contracted in his mayoralty or not, would be an improper application thereof, and a most dangerous precedent;" which question was carried in the affirmative.

At a court of aldermen, held on the 15th of March, Mr. Hopkins resigned his gown, as alderman of Broad-street ward; and at a wardmote, held at Drapers' hall, on the following day, Richard Clark, esq., the present chamberlain, was unanimously elected in his stead. This was the twentieth vacancy in the court of aldermen within seven years, viz. from the 24th of April, 1769; when Mr. Wilkes was elected, on the death of Sir Francis Gosling. The annals of the metropolis do not afford a similar succession of changes within the same period.

The legality of pressing freemen of the city of London, was a fertile source of discord between the administration and the citizens. In the latter part of the year 1776, the lord-mayor had claimed an exemption for the watermen of his barge; the city claimed an exemption from pressing within its jurisdiction; but the court of King's Bench held, that these claims were not supported by adequate proof.

While this dispute continued, several naval officers were taken into custody, charged, by men whom they had impressed, but without getting them out of the city-jurisdiction, with assaults; the consequences were, that the impressed men were discharged, and, in some cases, the officers were held to bail. But the most prominent circumstance of this description was in the case of one Millachip. When he was impressed, alderman Bull wrote to

the secretary of the admiralty-board, requesting his discharge, on the ground of his being a freeman and liveryman of London. The answer returned, was, that the lords of the admiralty did not apprehend that this exempted him from being impressed, if otherwise liable. In consequence of this, a common-council was held, in which a letter to the admiralty, in the name of the court, was read and agreed to; and a resolution passed, that, if Millachip's discharge was not granted, legal measures should be taken to procure it; and the city-solicitor was ordered to follow the directions of a committee appointed for that purpose. This application being equally ineffectual with the former, a writ of *habeas corpus* was obtained from the court of King's Bench, by virtue of which Millachip was brought from on-board the admiral's ship, and discharged. In a few days after this, as he was going down the river in his lighter, he was again taken by a press-gang, and put on-board a man of war; in consequence of which, the committee met, and came to resolutions to apply for another *habeas corpus*, and to bring actions against the lieutenant and regulating captain, for detaining him; but the question never came to a legal decision.

The American war, which had been, from the beginning, very unpopular, was expressively deprecated by the court of common-council, held on the 3d of March, 1778, in an address and petition to his majesty against the farther prosecution of that war; and it is incalculable what advantages might have arisen, if the minister had lent an ear to the representations of that most reputable body.

Freedom of opinion is always dear to an Englishman, but especially to a citizen of London. An instance of this is recorded on the 19th of November, when a motion was made in the usual form, to give the thanks of the court to Sir James Esdaile, for his conduct during his mayoralty; but, after warm debates, it passed in the negative, and a motion for censuring him was carried by nearly two to one. The court of aldermen, however, were of a different opinion from the livery; and, on the 25th of the same month, voted their thanks to him, for his careful, prudent, and impartial, discharge of that high office.

The year 1779 was ushered in with one of the most destructive hurricanes that ever affected the metropolis. Almost every public or private building, in or near town, sustained some damage from it; while most of the ships in the river were driven from their moorings, and ran foul of each other; some were driven on-shore, and filled with water, and great damage was done among the small craft. Several houses were entirely blown down, a very great number were stripped of their roofs, and the stacks of chimneys destroyed were almost innumerable; among others, one belonging to Buckingham-house broke through the roof into the apartments of three of the young princes, who were in bed, but they received no hurt. All were not so fortunate; many lives were lost, and a vast number of persons terribly maimed, by the fall of buildings, in different parts of the town; and the accounts from every part of the kingdom were equally melancholy.

A cause was tried in the court of King's Bench, on the 5th of August, respecting the right of a claim, set up by the city of London, to a duty of six-pence per load, on hay sold in Smithfield, not the property of freemen of London. This was disputed by the inhabitants of Finchley, who pleaded an exemption in favour of the bishop of London and his tenants, granted by King John; but, as it did not appear that the manor of Finchley belonged to the bishop at the time of the grant, a verdict was given for the city of London.

On the 22d of November, 1779, Mr. Hopkins being dead, Mr. Wilkes was at last, by a great majority, elected chamberlain of the city. He had served the office of lord-mayor in 1774; and in the place he had long sought for, as a retirement and honourable recess from litigiousness and the torments of a political life, he died in the year 1797. It is well known that he was a man of uncommon talents, of a mind staunch and firm in resolution, as well as quick  
and

and keen in apprehension; of ready wit and most entertaining conversation; not without a propensity to sarcasm, but always ready to give up his opinion when his opposer was able to bring arguments or facts which could produce conviction. Of his moral character the less that is said the better; but no one ever discharged the duties of chamberlain more respectably: he was better qualified to give advice than to take it.

The month of June of the year 1780 (Kennet mayor) was stigmatized by a most tremendous insurrection, which threatened the total destruction of the cities of London and Westminster, and the memory of which will live long in the minds of men as a detestable specimen of what stern intolerance and blindness of religious zeal can do. *Tantum religio potuit suadere malorum!* Lucr. B. i.

Although we have given a general account of this unfortunate transaction under ENGLAND, in our sixth volume, yet in the present article we think it will be expected of us to be somewhat more particular.

The dreadful scene of riot and confusion commenced on the 2d of June. On the morning of that day, in consequence of an advertisement from the Protestant Association, a vast number of people assembled in St. George's Fields, to proceed to Westminster, in a body, with a petition to the house of commons, for the repeal of a law passed in the preceding session for the relief of the Roman catholics. About eleven o'clock, they were joined by their president, lord George Gordon, who, having made a short speech to them, recommending a peaceable deportment, formed them into four divisions; in which order they marched over London-bridge, through Cornhill, Fleet-street, and the Strand, following their respective banners, on which was expressed the name of the division, with the words "No Popery!" At Charing-Cross they were joined by fresh numbers of their own body, who proceeded with them to the house of commons. On their arrival at New Palace-yard, they found their president and the committee, who had taken the route of Westminster-bridge, waiting to receive them. By this time their numbers were increased so much, that the two Palace-yards, Westminster-hall, and all the avenues to both houses of parliament, were entirely filled with them. In this situation they waited the arrival of the members, many of whom were grossly insulted by them. The archbishop of York was the first attacked; the bishop of Lichfield had his gown torn; the wheels were taken off the bishop of Lincoln's carriage, and his lordship narrowly escaped; lord Bathurst, president of the council, was treated very roughly; the windows and pannels of lord Mansfield's coach were broken to pieces; the duke of Northumberland lost his watch; the lords Townshend and Hillsborough came together, and were greatly insulted; lord Stormont's coach was broken to pieces, and himself in the hands of the mob for near half an hour; lords Ashburnham and Boston were treated with the utmost indignity, particularly the latter, who was so long in their power, that it was proposed to the house to go in a body, and endeavour, by their presence, to extricate him; but, in the interim, his lordship escaped. Many others of the peers were personally ill-treated; and Wellbore Ellis was obliged to take refuge in Westminster-hall, whither he was pursued, the windows broken, the doors forced, and Mr. Justice Addington, with all the constables, expelled. Mr. Ellis escaped with the greatest difficulty.

During these unwarrantable proceedings, lord George Gordon came several times to the top of the gallery-stairs, and harangued the mob, informing them of the bad success their petition was likely to meet with, and pointing out the members who opposed it. It was considered by some as a mark of pusillanimity in the house of commons, that, upon the arrival of the guards, at night, they did not commit one of their own body, who had so shamefully violated their privileges, and brought them into such disgrace and danger, to the Tower; but it is doubtful whether such an attempt, on that day, would not have in-

creased the fanatic fury of the populace to a height which might have overpowered every endeavour to restrain it.

Before the rising of the house of commons, several parties of the rioters had filed off, and proceeded to the demolition of the chapels belonging to the Sardinian and Bavarian ministers. The guards had been ordered out to protect the two houses of parliament; and were now sent for to check the destructive rage of the mob, but did not arrive until every thing moveable was taken into the street, and burnt; however, thirteen of the rioters were apprehended at the Sardinian chapel.

On the following day (Saturday) the riots had apparently subsided, no material depredations having been committed; but on Sunday, in the afternoon, the rioters assembled again, in large bodies, and attacked the chapels and dwelling-houses of the catholics in and about Moorfields. They stripped their houses of furniture, and their chapels, not only of the ornaments and insignia of religion, but they also tore up the altars, pulpits, pews, and benches, and made fires of them, leaving nothing but the bare walls. About nine o'clock a party of the guards arrived; on which the populace dispersed, but not without some accidents occasioned by the greatness of the crowd. The lord-mayor, with the aldermen Clarke and Peckham, and the sheriff Pugh, had before endeavoured to stop the riot, but to no purpose.

On Monday the rioters collected again, in Rope-makers-alley, Moorfields, where they demolished the school-house and three other houses. A second party went to Wapping, where they destroyed the catholic chapels in Virginia-lane and Nightingale-lane, and committed many outrages; and a third party did the same in the Borough. Mr. Rainsforth, tallow-chandler, of Stauhope-street, Clare-market, and Mr. Maberley, of Little Queen-street, Lincoln's-inn-fields, who had appeared as evidences against some of the rioters on their examinations before the magistrates, had their houses stripped, and the contents committed to the flames. Sir George Saville's house, in Leicester-fields, underwent the same fate, because he had prepared and brought the bill into parliament for the relief of the catholics.

All the military in town were ordered upon duty on Tuesday; but, notwithstanding every precaution, lord Sandwich was wounded in attempting to go down to the house of peers, his carriage was demolished, and he was rescued, with difficulty, by the military. About six o'clock in the evening, one party went to the house of Mr. Justice Hyde, in St. Martin's street, Leicester-fields, which they destroyed; another party paraded through Long Acre and Holborn, to Newgate, declaring, as they went along, that they would release the confined rioters. When they arrived at the prison, they demanded their comrades of Mr. Akerman, the keeper; but he persisted in his duty, and refused; on which the mob broke the windows; some battered the doors and entrances into the cells with pick-axes and sledge-hammers; others climbed the walls with ladders; while several collected fire-brands, and whatever combustibles they could find, and flung into his dwelling-house. The flames spread from Mr. Akerman's house to the chapel, and thence through the whole prison; in consequence of which, all the prisoners, to the amount of three hundred, among whom were four ordered for execution on the following Thursday, were released.

Even this was but a moiety of the mischief of this terrible night. Not satiated with the destruction of this great building, a party was sent among the catholics in Devonshire-street, Red-lion-square; another to the house of Mr. Justice Cox, in Great Queen-street, which was soon destroyed: a third broke open the doors of the New Prison, Clerkenwell, and turned out all the confined; a fourth destroyed the furniture and effects, writings, &c. of Sir John Fielding; and a fifth desperate and infernal gang went to the elegant house of lord Mansfield, in Bloomsbury-square, which they, with the most unrelenting fury, set fire to, and consumed. The loss here was immense,

both to lord Mansfield, as an individual, and to the public. A most valuable collection of pictures, some of the scarcest manuscripts said to be in the possession of any private person in the world, with all his lordship's notes on great law-cases and the constitution of England, were sacrificed; and lord and lady Mansfield were with difficulty preserved from their rage, by making their escape through a back-door, a few minutes before these miscreants broke in and took possession of the house. The military was sent for, but arrived too late; they were obliged, however, to fire in their own defence, and six men and a woman were killed, and several wounded. Not contented with the havoc and destruction they had been guilty of in Bloomsbury, they went from thence to his lordship's country seat, at Ken-wood, which would certainly have shared the same fate, had they not been repelled by a party of horse, which had been sent thither for the preservation of this delightful place. The inhabitants were obliged, this night, to illuminate their windows.

It is impossible to give any adequate description of the events of Wednesday. Notice was sent round to the public prisons of the King's Bench, Fleet, &c. by the mob, at what time they would come and burn them down. The same kind of infernal humanity was exercised towards Mr. Langdale, a distiller, in Holborn, and several other Roman catholics. Three boys went through the streets, and, in particular, down Holborn, in the middle of the day, with iron bars got from the railing before lord Mansfield's house, extorting money at every shop, huzzaing, and shouting "No Popery!" and, though numbers were passing and repassing, the inhabitants durst not refuse them money, nor attempt to secure them. Small parties, of the like daring nature, were formed in other parts, and the whole city was laid under contribution. One man, in particular, was mounted on horseback, and refused to take any thing but gold. Two men, in the broad day, not contented with the former mischief, got into Mr. Maberley's house, in Queen-street, and staid for upwards of an hour, knocking down the wainscoting, and every bit of wood-work they could with safety to themselves; and, though a great many peaceable well-dressed people looked on, no one molested them. In the afternoon, all the shops were shut, and bits of blue silk, by way of flags, hung out, at most houses, with the words "No Popery" chalked on the doors and window-shutters, by way of deprecating the fury of the insurgents, from which no person thought himself secure; insomuch that a certain foreigner, well known for his excellent action at Sadler's Wells and elsewhere, thought it safest to write up "No Religion."

As soon as the day was drawing towards a close, one of the most awful and dreadful spectacles this country ever beheld was exhibited. The mob had not only declared their resolution of firing the prisons, and some private houses, but had avowed their intention to destroy the Bank, Gray's Inn, the Temple, Lincoln's Inn, the grand arsenal at Woolwich, and the royal palaces. An universal stupor had seized the minds of men; they looked at one another, and waited, with a resigned consternation, for the events which were to follow. Government, indeed, had exerted itself to the utmost, as far as their power, under the direction of the civil magistrates, would extend. Now, however, it was become necessary to make use of the royal prerogative, and give discretionary power to the military. Nothing could convey a more awful idea of the mischief which was dreaded, than the strong guard which was placed in the Royal Exchange, for the protection of the Bank; as nothing, perhaps, could have equalled the national desolation, had the diabolical purposes of the insurgents, upon this place, succeeded. Besides this, soldiers were distributed at Guildhall, in the inns of court, in almost every place tenable as a fortification, and in some private houses; and the cannon was disposed to the best advantage in St. James's Park.

With minds thus pre-disposed to terror by so many objects of devastation, and in a city, which, but a few days before, enjoyed the most perfect tranquillity, let those, who were not spectators, judge what the inhabitants felt, when they beheld, at the same instant, the flames ascending, and rolling in vast and voluminous clouds, from the King's Bench and Fleet prisons, from New Bridewell, from the toll-gates on Blackfriars-bridge, from houses in every quarter of the town, and, particularly, from the bottom and middle of Holborn, where the conflagration was horrible beyond description. The houses that were first set on fire, at this last-mentioned place, both belonged to Mr. Langdale, an eminent distiller, and contained immense quantities of spirituous liquors. It is easy to conceive what fury these would add to the flames; but to form an adequate idea of the distress of the neighbouring inhabitants, or, indeed, of the inhabitants in every part of the city, is not so easy. Men, women, and children, were running up and down with beds, glasses, bundles, or whatever they wished most to preserve. In streets where there were no fires, numbers were removing their goods and effects at midnight. The tremendous roar of the insatiate fiends who were the authors of these horrible scenes was heard at one instant; and, at the next, the dreadful report of soldiers' muskets, firing in platoons, and at various places; in short, every thing that could impress the mind with ideas of universal anarchy, and approaching desolation, seemed to be accumulating. Sleep and rest were things not thought of: the streets were swarming with people; and uproar, confusion, and terror, reigned in every part.

It is hardly possible to collect, in one point of view, the havoc of this night. Had half the mischief the mob had threatened been effected, nothing less than national bankruptcy and destruction could have ensued; that they were prevented at those places, on the safety of which the very existence of the empire might be said to depend, was owing, not to their want of will, but of power, and to the exertions of government. They made two attempts upon the Bank; but were so much intimidated by the strength with which they beheld it guarded, that their attacks were but feebly conducted. They were led on to the first by a brewer's servant on horseback, who had decorated his horse with the chains of Newgate, but were repulsed at the first fire from the military; and their second succeeded no better. They made an effort to break into the Pay-office, likewise, and met the same fate. Several of them fell in these skirmishes, and many more were wounded; as the importance of these places made it necessary to show but little lenity.

It is impossible to ascertain the number of unhappy wretches who lost their lives in the course of this dreadful night. The attacks of the military were not so fatal to them as their own inordinate appetites. Numbers died with inebriation, especially at the distilleries of the unfortunate Mr. Langdale, from whose vessels the liquor ran down the middle of the street, was taken up by pailfulls, and held to the mouths of the besotted multitude, many of whom killed themselves with drinking non-rectified spirits, and were burnt or buried in the ruins. Eight or nine of these miserable wretches were found, and dragged out. The same scenes of beastly drunkenness happened in many other places; as at Mr. Cox's, at lord Mansfield's, &c. At Newgate, likewise, many had made so free with the liquor, that they could not get away, and were burnt in the cells. In the streets, men, were lying upon bulks and stalls, and at the doors of empty houses, drunk to a state of insensibility, and to a contempt of danger: boys and women were in the same condition, and some of the latter with infants in their arms.

On the following day, the metropolis presented the image of a city recently stormed and sacked: all business at a stand; houses and shops shut up; the Royal Exchange, public buildings, and streets, possessed and occupied by troops; smoking and burning ruins, with a dreadful void

and silence, where, so lately, all had been hurry, noise, and business. The arrangement of the military, on this day, produced so good an effect, that there was no riot or disturbance in any part of the town during the night; and the next day (Friday) peace and tranquillity were restored; the only uneasiness felt, was, that the metropolis was under martial law. To calm the minds of the inhabitants on this subject, a hand-bill was circulated in every quarter of the town, to inform the public, that the prisoners would not be punished by martial law, but by the ordinary tribunals.

A council was held on Friday morning; in consequence of which, a warrant was issued by the secretary of state for apprehending lord George Gordon. He was brought to the war-office in the evening, where he underwent a long examination before several of the lords of the privy-council, and, at half-past nine o'clock, was committed close prisoner to the Tower. The guards that attended him were by far the most numerous that ever escorted a state-prisoner. A large party of infantry was in the front: his lordship followed in a coach, in which were two officers; behind the coach was general Carpenter's regiment of dragoons; after which came a colonel's guard of the foot-guards; and, besides these, a party of militia marched on each side of the coach.

Though the ill-judged assembling of the Protestant Association, by collecting an immense concourse of idle dissolute people, may be considered as the origin of this dreadful insurrection, it would be unjust to charge the great body of them with the intention of carrying their point by such means. On the contrary, as soon as they found the evil consequences of their meeting, and the use made of their name, a circular letter was sent to every member, earnestly requesting him not to wear the blue cockade, which had been assumed by the mob, and, by every means in his power, to prevent tumults, which must inevitably impede the accomplishment of their wishes.

The want of method, so conspicuous in the proceedings of the rioters, saved the city, and, we may add, the country; for, had they, in the first moments of dismay, attacked the Bank and public offices, instead of the chapels, and houses of individuals, national ruin must have followed; for there can be no doubt that they would have succeeded, when the supineness of the civil power, in the first days of the riots, is considered. Though parties of soldiers were continually dispatched to the assistance of the magistrates, these were too much intimidated to act with effect; and the officers of the military durst not take the responsibility upon themselves. This negligence became a subject of complaint; and the lord-mayor was ordered to attend the privy-council, to account for his inactivity; before whom he made no scruple of acknowledging, that "the rioters were so violent, and such was his temerity, that he thought death would be his portion." His conduct, on this occasion, called forth Mr. Burke's ironical talents; who pleaded, in his lordship's behalf, in the house of commons, "that all men were not made alike: the lord-mayor, he supposed, was of a timid nature, and without the natural courage and capacity that fit some men to act a wise and decided part in trying situations; neither had he made up the disadvantages of his natural infirmity and timidity, by study and culture. As he never dreamt, in his younger days, of filling so important a station as that of lord-mayor of the city of London, it was probable he had neglected those talents that might be requisite, in certain emergencies, to discharge the duties of it: for these reasons, he hoped they would have mercy on the poor lord-mayor, in consideration of his natural weakness, and total want of education!"

Shortly after the suppression of the riots, special commissions were issued for trying the rioters, in London and the Borough. The total number executed in London was eighteen.

At a court of common-council, held on the 8th of July, a motion was made to address his majesty, thanking him

for his care and attention to the citizens of London, in granting them such aid as became necessary to subdue the late dangerous riots; they being too formidable for the control of the civil authority; which, after long and violent debates, was carried in the affirmative, by a small majority. By this apparent reluctance, it might seem as if the city had not felt grateful towards the government for sending military aid in order to restore peace and quiet within the walls of London and its liberties; but, upon consideration, we shall find that it arose from the well-ordained jealousy which the corporation always feels at seeing a military force, not commanded by themselves, within their precincts.

The trial of lord George Gordon for high treason took place in the court of King's Bench, on the 5th of February, 1781; when he was acquitted; and, as a counter-judgment, Mr. Alderman Kennet (the lord-mayor) was found guilty of not using all the means in his power to quell the rioters in Rope-makers' Alley, Moorfields, and for not reading the riot-act. The trial took place at Guildhall, before lord Mansfield (who had smarted under the hands of the rioters) and a special jury.

At the end of this year, a petition, address, and remonstrance, to the king, was voted in common-hall, and the usual deputation appointed to wait upon his majesty to know when he would receive it. This produced a letter from the lord-chamberlain to the lord-mayor, informing him, that his majesty would not receive the remonstrance on the throne. In consequence of which, a common-hall was held on the 1st of February, 1782, in which it was resolved, "That whoever advised the king to deviate from the accustomed mode of receiving the *livery of London* sitting on his throne, is an enemy to the rights and privileges of the citizens of this great capital of the British empire:" and a committee was appointed for the purpose of obtaining a restoration of those rights.

A cause was tried at Hicks's Hall, in the month of March, of considerable importance to the rights of the freemen of the city-companies. The prosecution was instituted by one of the companies against a tradesman, admitted to his freedom by themselves, for carrying on his trade without having served an apprenticeship to it, contrary to the statute of queen Elizabeth. On the trial, however, it was proved that, although the defendant had not served a regular apprenticeship, he had acquired a sufficient knowledge of the trade to enable him to exercise it with skill, which was held to be within the meaning of the statute; and a verdict was given for the defendant.

A court of aldermen was held on the 8th of October, to receive the report of the committee appointed to examine the merits of a petition from the company of shipwrights, praying to be allowed their livery. The report stated that the free shipwrights were an ancient company, they having traced the enrolment of an apprentice as far back as the reign of Richard II. and that, therefore, it was the opinion of the committee, that they ought to have livery; with which opinion the court coincided, and precepts were ordered to be issued accordingly in future.

About this time the depredations committed in and about the metropolis, by footpads and street-robbers, had increased to such a height, and were attended with such peculiar circumstances of atrocity, that severe measures were found necessary to check them. Accordingly, a letter was sent from the secretary of state to the recorder, directing him to report all cases of robbery, accompanied by acts of cruelty, to his majesty, immediately after conviction, who had determined to grant no pardon or respite to such offenders, on any solicitation whatever.

Great discontents prevailed among the sailors in the month of March, 1783, on account of the numbers of foreigners who, having been taken into the merchant-service during the war, and being still continued therein, prevented the men discharged from the king's service from procuring employment. Being thus deprived of the means of obtaining a livelihood, they attacked some vessels in

the river, and unrigged them, and at length assembled in a considerable body, determined to proceed to the Admiralty, and afterwards to St. James's, to seek redress. On their approach, all the entrances into the Park were shut and guarded; but about seven hundred of them scaled the walls on the Westminster side. As soon as they were discovered in the Bird-cage walk, a detachment of the guards was ordered to meet them. On their approach near each other, a conversation took place between some of the sailors, Mr. Justice Addington, and the officer of the guard; when the sailors informed them, that they fought only for some means of future employment, and this they meant to do peaceably: on which the magistrate informed them, that the meeting of such large bodies was dangerous and illegal; but that, if they would draw up a clear account of their wants and grievances, he would endeavour to get them redressed; with which they appeared to be perfectly satisfied, and retired with regularity and order.

At a court of aldermen held on the 22d of July, the recorder and common-jeffant made a report on the long-pending cause referred to their consideration respecting the Jews, whether they can legally claim the freedom of this city, and exercise the rights and franchises of freemen. Their opinion was, that Jews publicly baptized, and conforming to the laws of the country, may, after the renunciation of their errors, be entitled to the privileges of citizens of London.

On the 29th of August, a letter was sent by the secretary of state to the lord-mayor, informing him that the definitive treaties of peace were to be signed on the 3d of September; and, on the arrival of the news that this event had actually taken place, a second letter was sent, in order that public notice thereof might be given in the city; and, on the 6th of October, peace was proclaimed with the usual solemnities, amidst an innumerable concourse of people, who testified their joy by loud and reiterated acclamations.

The mode of executing criminals at Tyburn had long been complained of as tending rather to introduce depravity, by a want of solemnity, than to operate as a preventive of crimes, by exhibiting an awful example of punishment to the dissolute. To remedy this serious evil in the police of the metropolis, both the place and manner of execution were changed. A temporary scaffold was constructed, to be placed as occasion required in the open space before the debtors' door of Newgate, having a moveable platform for the criminals to stand on, which, by means of a lever and rollers, falls from under them. The whole of this building is hung with black; and the regulations observed on these mournful occasions are calculated to produce that impression on the minds of the spectators which is the true end of all punishment. The first execution here took place on the 9th of December.

The end of this year was remarkable also for the entrance of Mr. Pitt into the important offices of first lord of the treasury and chancellor of the exchequer. From this period until the month of March, 1784, was exhibited the singular spectacle of a minister in a constant minority, yet retaining his situation through the support of the king and the nation, in despite of reiterated petitions and representations from the house of commons to the throne to procure his dismissal. In such a conjuncture, the city of London could not be expected to be inactive; and accordingly, an address of thanks, from the lord-mayor, aldermen and common-council, to his majesty for dismissing his late counsellors, was presented, on the 16th of January; containing the strongest assurances of their determination to support him in the constitutional exercise of his prerogatives. This address was very graciously received. Similar addresses were presented from the merchants and traders of London, the city of Westminster, the borough of Southwark, the county of Middlesex, and many other places. The freedom of the city was also presented to Mr. Pitt; and, on the 28th of February, an elegant entertainment was provided for

him at Grocers' Hall, of which company he had accepted the freedom; to which he went in procession, attended by the committee appointed to present him with the freedom of the city, the sheriffs, and the town-clerk. At Temple-bar, they were met by the city colours, and those of the Grocers' Company. In the evening there was an illumination: many windows were broken by the mob, on his return from the city; and, in St. James's-street, an affray happened between them and some chairmen at Brookes's, in which the latter proved victorious, and Mr. Pitt was obliged to quit his carriage, and retire to White's for protection. His coach was much injured; and, in revenge, the mob that dragged it went and broke Mr. Fox's windows, in St. James's Place.

The great and memorable contest, between administration and the house of commons, having been so far determined in favour of the former, that a long mutiny-bill was passed, without which a dissolution of parliament could not have taken place; it was thought most advisable to have recourse to that measure, in order to get at the true sense of the nation. Accordingly, the parliament was dissolved on the 25th of March. In the general election which followed, the ministry gained a most complete majority; and Mr. Pitt set forward in his political career with the brilliant assurance that court and the people were equally his friends.

The grandest musical performance ever attempted in any country, was exhibited in Westminster-abbey, in May and June of this year, in commemoration of Handel. It originated in a conversation between some amateurs, in which it was lamented, that no public occasion existed for collecting all the vocal and instrumental performers of eminence into one band, which would produce a performance on so grand and magnificent a scale as no other part of the world could equal. The birth and death of Handel, the former of which was a complete century, and the latter exactly a quarter of a century, before this period, were immediately recollected as offering a desirable opportunity for making the attempt. The plan was speedily communicated to the different musical societies in the metropolis; and, coming at length to the knowledge of the king, was honoured with his sanction and patronage. Westminster-abbey, where the remains of the great musician were deposited, was thought the properest place for the performance; and it was determined to appropriate all the profits arising from it to charitable purposes. No sooner was the project known, than the greater part of the practical musicians in the kingdom manifested their zeal for the enterprise; and many of the most eminent professors, waving all claim to precedence, offered to perform in any subordinate station. The first performance took place on the 26th of May; the number of performers amounted to five hundred and twenty-two, and that of the audience to nearly five thousand; of which at least two thirds were ladies. Feathers and all extraneous ornaments being forbidden, the neatness and simplicity of their dresses added to their natural charms, and produced such an assemblage of beauty as no other country in the universe could boast of. There were five performances in the whole, the second of which was at the Pantheon; and the total amount of the receipts for tickets, including two rehearsals, was eleven thousand eight hundred and forty-two guineas: after payment of the expenses, which amounted to about five thousand pounds, the remainder was given to charities, as follows; to the Musical Fund, six thousand pounds; to the Westminster Hospital, one thousand pounds.

The attention of the metropolis was excited in a high degree, on the 15th of September, by the first aerial voyage ever undertaken in this kingdom. Mr. Lunardi ascended from the Artillery-ground, with a balloon thirty-three feet in diameter, amidst the admiration and dread of an immense concourse of spectators, about two o'clock in the afternoon; and, after a voyage of three hours, descended

scended in a meadow, five miles beyond Ware in Hertfordshire. See the article AIR-BALLOON, vol. i. p. 218-221.

It is with pleasure that we adduce a new instance of the strenuousness of the city of London to preserve its original rights, privileges, and prerogatives. In the month of June, 1785, a bill was introduced into the house of commons, for regulating the police of the metropolis, which was understood to be the production of a gentleman who had taken uncommon pains with it, and had consulted those best enabled to assist in maturing such a plan; but it was not fortunate enough to obtain the approbation of the corporation of the city of London. A petition was presented from the court of aldermen, complaining in high terms of the projected measure. Their alarm was represented, by one of their body, to be equal to that which would have been excited if a general conflagration had been begun in the city of London. The petition stated, that, under colour of correcting abuses, the bill overturned the forms established by the wisdom of our ancestors, and effected an entire subversion of the chartered rights of the greatest city in the world. It was in vain urged, that the commissioners appointed by the bill would have no power within the jurisdiction of the corporation of London; that it was expressly provided, that no warrant from them should be executed in the city, until it was backed by the lord-mayor, or one of the aldermen; and that, when executed, the person apprehended in virtue of it was ordered to be carried before some of the city-magistrates: nothing could allay the apprehensions of a body so tenacious of their privileges; and, in the end, their opposition proved fatal to the bill.

The long-contested question, relative to the power of the court of aldermen to remove one of their body, was finally determined in the court of King's Bench, on the 11th of June. Some years before, in consequence of several accusations brought against alderman Woodbridge, repeated summonses were sent to him, to attend in his place in the court of aldermen, to answer to them; all of which being unattended to, he was declared to have forfeited his seat, and a wardmote was held for the election of an alderman in his stead. At a subsequent period he attended, and claimed to be received as alderman: which being refused, he obtained a *mandamus* from the court of King's Bench, to be restored; the return to this *mandamus* had been argued in November preceding, but the court required further time to decide upon it; and, on this day, the final argument was heard, when the court unanimously pronounced judgment in favour of the city, declaring their opinion, that the court of aldermen had the power to remove one of the aldermen, upon a just and reasonable cause; and that, in the present instance, their exercise of that right was perfectly legal.

A cause was tried at the Lent assizes for the county of Surry, which lasted three days, and ended in the condemnation of a shipwright at Rotherhithe, who, by erecting a floating dock, had obstructed the navigation of the Thames, and encroached upon the rights of the corporation of the city as conservators of the river. Long debates also took place concerning the rights of the corporation over the town and borough of Southwark; and resolutions were taken against foretellers, by whose nefarious practices, in buying up the cattle before they arrived at Smithfield market, the price of provisions had considerably increased. An application to the legislature was recommended, in order to prevent the continuance of these evils.

A commercial treaty with France was in the course of negotiation in the latter part of this year, by some of the provisions of which, the right of package, scavage, and balliage, of the city of London, would have been taken away, as well as the rights of the fellowship and all other free porters, free watermen, lightermen, &c. On the discovery of this, a committee of the court of aldermen were appointed to make the necessary representations on the subject to Mr. Pitt, who gave them an assurance, that, although their rights would have been unintentionally in-

vaded and taken away if this application had not been made; yet, being now fully possessed of them, he should certainly think it his duty to protect them in the most ample manner.

The shop-tax, which had always been obnoxious to the traders and citizens of London, attracted again the serious consideration of the court of common-council, whose annals are fraught with resolutions most conducive to the welfare of the rest of the community; and a petition to the house of commons, with another concerning the slave-trade, were prepared in February 1788. The shop-tax was soon after repealed; but the slave-trade continued throughout the whole of Mr. Pitt's administration, and was not got rid of till the year 1807. It was observed, that Mr. Pitt made some very eloquent speeches in favour of the repeal, but always suffered himself to be out-voted. It was not until it was made a government-measure, which was during the last short administration of Mr. Fox, (though that excellent statesman did not live to complete his work,) that it met with success.

In the year 1788 also, an uncommon fall of rain deluged the streets of London to a most alarming degree; during which a ball of fire burst about the middle of George-street, and damaged several houses. And the ensuing winter was remarkable for a very severe frost, which began on the 25th of November, and lasted exactly seven weeks. The greatest cold was on the 5th of January, 1789, when the thermometer stood at eleven degrees below the freezing point, in the middle of the city. During this frost, the Thames was completely frozen over below London-bridge, and was covered with booths, puppet-shows, and wild beasts, so as to have the appearance of a fair. The watermen, being deprived of their usual means of obtaining a livelihood, broke the ice close to the shore, and laid planks across the openings, which they suffered no one to pass without paying. On the thaw, which came very suddenly, the scene was dreadful beyond example; the large bodies of ice floating on the river made it necessary to moor all the ships to the shore; many however drifted; and one, lying off Rotherhithe, was so pressed by the strength of the tide and the weight of ice, that it carried away the beams of a house to which it was fastened, and levelled it with the ground, by which accident five persons were killed in their beds.

During this inclement season, the distresses of the poor were not forgotten. Liberal subscriptions were entered into by the affluent for their relief; and a court of common-council met on the 13th of January, to take the state of the poor into consideration, when the sum of fifteen hundred pounds was ordered to be paid out of the city-cash, for the relief of such poor inhabitants as did not receive alms of the parish. At this court, a letter was read from the prince of Wales's treasurer to the chamberlain, inclosing his royal highness's draft for one thousand pounds, to be applied in the same manner as his majesty's bounty had usually been; but which, from the unfortunate state of the king's health, was this year delayed. On which it was unanimously resolved to return the grateful acknowledgments of the court to his royal highness, for his spontaneous and truly-princely beneficence.

The city of London, sympathising with the rest of the kingdom, had to deplore at this period a visitation of the most severe kind which afflicted our beloved monarch, and was but a prognostic of the unfortunate situation in which he has since continued for so long a period: but, listening to the fervent and sincere prayers of his royal family and his people, Providence ordered that this dreadful disease should, for that time, retire from him, and that he should be restored to the love and respect of a feeling and grateful nation.

The 10th of March, 1789, was the day appointed for making an official declaration of his majesty's complete recovery. In the morning, the bells rang in all the churches; and, at noon, the Park and Tower guns were fired. On the river, every vessel was decorated with the

colours of the nation to which it belonged: French, Spanish, Dutch, Portuguese, Prussian, Russian, Dane, and Swede, vied with each other in exhibiting tokens of joy; many of them had devices on their streamers, with the words "Long live the King," in large capitals, either at the mast-head or on the bowsprit. Of the illuminations at night, it is impossible to give an adequate description. They were literally general: all the inhabitants seemed to strive who should give the most beautiful and picturesque devices, and testify their loyalty in the most conspicuous manner. In short, so general was the tribute of affection to our beloved monarch, that, could he have surveyed the splendour, and witnessed every accompanying demonstration of gladness, he would have quitted the scene with feelings as proud as ever animated the bosom of a king. It was a trophy that reflected as much true dignity on the sovereign as it did honour to the nation.

On the 19th, the city-addresses of congratulation to the king and queen were presented. It was his majesty's particular request that, on this occasion, when the pressure of the national business bore heavy upon him, the numerous attendance of the court of common-council might be dispensed with; in consequence of which, the court came to a resolution that the addresses should be presented by the lord-mayor and sheriffs, assisted by the recorder. Addresses to their majesties, on this happy event, were also voted in a common-hall, held on the 7th of April.

The 23d of April being appointed, by royal proclamation, to be observed as a day of general thanksgiving, his majesty was pleased to go in public to the cathedral-church of St. Paul, accompanied by the queen, the royal family, both houses of parliament, the great officers of state, and the whole corporation of London. The universal joy and loyalty which pervaded the cities of London and Westminster, the grandeur of the spectacle exhibited, in the more than triumphant, the religious, entry of our beloved sovereign, filled the mind with the most sublime and awful ideas.

The procession began a quarter before eight, by the house of commons, in coaches (167 members attending), followed by the speaker, in his robes, seated in his state-coach, with his mace-bearer and chaplain, from Palace-yard; and, passing through the entrance at the Horse-guards into St. James's Park, went out at the Stable-yard, and ranged along Pall Mall and Charing Cross, followed by three knights-marshalmen, the clerk of the crown, masters in chancery, and the twelve judges, in the capacity of assistants to the house of peers. After them, the peers in coaches, in the order of precedence, as they were marshalled by the black rod; beginning with lord Malmesbury, as youngest baron, and ending with the duke of Norfolk, the premier duke. The lord high chancellor, in his robes of office, and in his state-coach, closed this part of the procession.

Soon after the members of both houses had passed, the male branches of the royal family appeared in different carriages, in due order of precedence. Their majesties set out from the queen's palace soon after ten, in the order previously arranged by his majesty himself. Between eleven and twelve the king's carriage arrived at Temple-bar, where the lord-mayor was in waiting, attended by six delegates from the corporation; viz. Sheriffs Curtis and Hammett, as aldermen, and deputies Leekey and Birch, with Messrs. Wadd and Dixon, as commoners. The lord-mayor and his associates came thither in coaches soon after nine; and were politely accommodated, by the banking-house of Mr. Child, in the great room immediately over the Bar, till, on notice of the king's approach, they all mounted their beautiful white palfreys, which were richly caparioned, the saddles and bridles new for the occasion, silver-tipped, silver roses, and silk reins; the furniture blue and gold, with tassels of gold fringe; the fronts of the bridles richly embroidered with the words "God save the king!" white fur caps to the holsters, richly wrought with gold; and each horse decorated with three

dozen of favours, blue and white. The lord-mayor was in a rich gown of crimson velvet; the two aldermen in their scarlet gowns, and the four commoners in their mazarine gowns, dressed uniformly in dark-blue coats, white waistcoats and breeches, with purple roses in their shoes and at their knees. Each of them had a walking page, carrying a hat adorned with a beautiful cockade of purple and gold, inscribed, "Long live the king!" After they had taken horse, the lord-mayor dismounting in form, surrendered the city-sword to his majesty; who having graciously returned it, the lord-mayor, on horseback, carried it bare-headed before the king to St. Paul's. The sheriffs and four commoners rode also bare-headed.

Nothing could exceed the magnificence of the procession from Temple-bar. Immediately after the lord-chancellor's carriage, the movement was as follows:

The High Bailiff of Westminster.

The Master of the Horse.

The Dukes of Cumberland and Gloucester.

The Duke of York.

The Prince of Wales.

Attendants. Six Pioneers.

Colonel Sir Watkin Lewis, on horseback.

The Artillery Company.

Music. Two Pair of Colours.

Fifteen of the Toxophilites, or ancient Society of Archers, dressed in a green uniform, with their bows in their hands, and elegant belts to their quivers; on which were embroidered, "Long live the king!"

The City Arms.

City Marshal, four Common-Councilmen, and the Sheriffs, on horseback.

The Lord-mayor on horseback.

His mace-bearer on foot; and six servants, in rich liveries of purple and silver.

The City Council.

Their MAJESTIES, drawn by eight cream-coloured horses, attended by six pages, and six footmen; in a private carriage, pannels and front of glass, instead of leather.

The Princesses in two carriages.

Attendants in two coaches.

The different guards of honour in the procession were formed from the Oxford Blues; and the whole was closed by a troop of the royal regiment of Horse Guards.

The charity-children of the different schools entered the church at the north and south doors, by seven o'clock in the morning, and remained till the church was cleared. They had a place appropriated for their appearance, much in the same manner as at their anniversary meeting. This was at the particular desire of her majesty; and added greatly to the impressiveness of the scene.

The clergy, with the minor canons, and their friends, entered the church, at the Dean's Gate, at eight o'clock.

The aldermen, with their ladies, and the principal city-officers, between eight and nine, proceeded from the Mansion-house, along Cheap-side, to the fourth entrance of St. Paul's church.

The corporation were represented in the procession from Temple-bar, as we have already stated, by a deputation. The other members of the body corporate assembled, at eight o'clock, in Guildhall, whence, in about half an hour, they began to parade on foot, in their mazarine gowns, through Cheap-side, Newgate-freet, the Old Bailey, and Ludgate-freet. They were in two divisions, each attended with a suitable standard, and an excellent band of music. Entering the church at the north-west gate, they remained in the morning prayer-chapel, until the king's arrival was announced; when they ushered his majesty into the choir, and immediately took their seats. The peers and members of the house of commons soon after entered the west door of the church.

The female nobility, gentry, and others, came down Holborn, proceeded along Snow-hill and Newgate-freet, down Warwick-lane, along Paternoster-row, and were set down at Cannon-alley, opposite to the north door of the church,

church, where an awning was erected; their carriages then proceeded to the end of Paternoster-row, turned round to the left into Newgate-street, and down St. Martin's-le-Grand into Aldersgate-street, where they waited.

Their majesties were met at the west door of St. Paul's, by the bishop of London; the dean of St. Paul's, (bishop of Lincoln;) the canons residentiary; Garter king of arms, and the rest of the heralds; the band of gentlemen-pensioners, and the yeomen of the guard. The sword of state was carried before his majesty by the marquis of Stafford into the choir, where the king and queen placed themselves under a canopy of state, at the west end of it, opposite to the altar.

The peers had their seats in the area, as a house of lords; and the commons were in the stalls. The upper galleries were allotted to the ladies of the bedchamber, the maids of honour, and such ladies of distinction as attended on the occasion. The foreign ministers were placed in the two lower galleries next to the throne; and the lord-mayor and aldermen, with their ladies, in the lower galleries, near the altar.

Immediately on their majesties being seated, divine service commenced. The sermon was preached by the bishop of London; after which, an anthem, selected for the occasion by the king, was sung by the gentlemen of the choir. The whole was finished about three o'clock, when their majesties returned with the same state to Buckingham House.

The streets through which the procession passed were filled with rejoicing spectators. Before most of the houses were placed temporary galleries, crowded with beauty and fashion. Every precaution which prudence could suggest was taken to guard against the accidents which might have been expected from such a numerous assemblage of people; but they were unnecessary; good humour had so completely taken possession of every individual, that the military, who were stationed to keep the multitude in order, had nothing to do but to see the procession, with their fellow-citizens in the rear.

As soon as was dusk, a general illumination took place throughout London and Westminster, which, for splendour and magnificence, surpassed all former exhibitions. All the public offices, the houses of the nobility and gentry, as well as many of those of private individuals, were decorated with transparencies, or elegant designs in coloured lamps; while even in the humble garret of the indigent, the gleam of loyalty and affection twinkled as cheerfully, if not as brightly, as in the splendid mansion of the opulent.

A dreadful fire consumed the Opera-house on the night of the 17th of June. The performers were rehearsing a ballet on the stage, when they were suddenly alarmed by flakes of fire falling on their heads. In a few minutes after, the whole building was in a blaze, which, from the vast quantity of combustible materials on the premises, and the calmness of the evening, rose in a spiral column to an extraordinary height. The light was so powerful that, for a few minutes, the whole western front of St. Paul's cathedral was as minutely visible as at noon day.

On the 25th of February, 1790, a common-council met for the special purpose of taking into consideration the steps taken by the Dissenters and Roman Catholics to procure the repeal of the corporation and test acts. After a calm and dispassionate investigation of the subject, the following resolutions were passed, which we insert in order that our readers may be enabled to compare the disposition of mind prevailing at that time, and the general feeling at this moment:

Resolved, I. That it is the indispensable duty of this court, to support the rights and privileges of the church of England, as by law established; they being essentially connected with, and forming a part of, our happy constitution.

II. That a full, perfect, and free, toleration, in the exercise of religious duties, must be the wish and glory of

every liberal mind; but, to remove the two bulwarks of our sacred constitution, in church and state, by a repeal of the corporation and test acts, would tend to produce that civil anarchy, which at first pointed out to the legislature the necessity of making such wise and salutary restrictive laws.

III. That this court do consider themselves called upon to strengthen the hands of those friends to the established church, in the house of commons, who have, twice, successfully opposed the repeal of the corporation and test acts, by expressing their public thanks for such conduct; and to solicit the members of this court, who have seats in parliament, strenuously to resist every attempt that shall be made to obtain that repeal.

On the discussion of the question in the house of commons, the motion, which last year was lost by only 20, was now negatived by 189. See vol. xii. p. 588-601. and 724.

Soon after this period, the streets of the metropolis were infested by a villain of a non-descript species in this country, and, for that reason, known by the appellation of the *Monster*. It was his practice to follow some well-dressed lady, whom he found unaccompanied by a man; and, sometimes after using gross language, sometimes without saying a word, to give her a cut with a sharp instrument, concealed in his hand, either through her stays, or through her petticoats, behind. Several ladies had been thus attacked and wounded by this fellow, who had always the address to escape undetected; when, on the 13th of June, a Miss Porter, who had been assaulted by him in the manner described, was walking in the Park, in company with a gentleman, and met him. She immediately exclaimed, "The wretch has just passed us!" and pointed him out to the gentleman, who followed and apprehended him. On the 8th of July, he was brought to his trial at the Old Bailey, and found guilty upon the clearest evidence; but the judge reserved the sentence upon a point of law. The decision of the judges on this point being that the indictment was defective in form, he escaped the capital part of the charge; but was afterwards tried for this and two other assaults, and, being convicted of the whole of them, was sentenced to six years imprisonment.

A cause was tried, in the sheriff's court, at Guildhall, on the 21st of October, in which John Wilkes, esq. as chamberlain of the city of London, was plaintiff, and John Pardoe, esq. defendant. The action was brought to recover the penalty of six hundred pounds, which is ordained, by a bye-law of the court of common-council, to be paid for declining to serve the office of sheriff, to which Mr. Pardoe had been elected, in the year 1783, but refused to serve, on the ground of his being incapacitated. As it appeared that Mr. Pardoe, when he was chosen sheriff, was sixty-nine years of age, in an infirm state of health, and totally unfit to serve the office, the jury, which was special, gave a verdict in his favour.

The month of December was remarkable for two violent storms of wind. The first was on the morning of the 15th, by which considerable damage was done; and the second, which was much more destructive, began between four and five o'clock in the morning of the 23d, and was attended with successive flashes of lightning, and continued rolls of loud thunder. Part of the copper roofing of the new stone-buildings, in Lincoln's Inn, was blown over the six-clerks' office, into Chancery-lane, and some pieces of it over the roofs of the houses on the opposite side of the lane, so that it must have been carried upwards of a hundred feet through the air. Many houses were much damaged by stacks of chimneys falling through the roofs, and some lives were lost; and, in the country, the effects of the storm were equally violent: its severity was also felt in France.

A very curious case was decided in January 1791, upon a writ *de essendo quietum de telenio*, (of being quit or free from toll,) brought by the city of London to assert the right of their citizens to be exempted from a toll of corn demanded by the corporation of Lynn in Norfolk; the issue was in favour of the Londoners.

In the afternoon of the 2d of February, there was the highest flood in the Thames that ever was known. Above Westminster-bridge, it overflowed the banks on both sides. It was near two feet deep in Palace-yard; and ran into Westminster-hall, so as to prevent people from passing for two hours. Boats came through the passage from Old Palace-yard to the Thames, and rowed up to Westminster-hall gate. The inhabitants of Milbank-street were conveyed to and from their houses in boats. The two Scotland-yards, and Privy-Gardens, were entirely under water, and impassable in many places, for some hours. The damage done in the warehouses on the wharfs was immense; they were overflowed, almost without exception. The water rose above the Custom-house quay, Tower-wharf, Bankside, Queenhithe, Wapping High-street, Thames-street, Tooley-street, &c. and filled all the adjoining cellars; and most of the gardens and fields, between Blackfriars-road and Westminster-bridge, were overflowed.

On the night of the 30th of May, there was an alarming insurrection in the King's Bench prison; an attempt being made by the greater part of the prisoners to escape. Much mischief was done to the inner part of the building; and the outer door would have been forced, had not a party of horse and foot arrived, very opportunely, to restore order, which they effected, happily, without bloodshed, before eleven o'clock. The principals in this riot were removed to Newgate on the following day.

The long-depending cause between the magistrates of Surry and the city of London, was argued before the court of King's Bench, on the 19th of November, on a special verdict. The facts were, that a general meeting of the justices of Surry had been held on the 4th of September, for the purpose of granting licenses to publicans; that the magistrates of London did not attend this meeting, but met on a subsequent day, and granted licenses to certain publicans who had been refused them by the justices of Surry. For this conduct the magistrates of London were indicted, and the question for the decision of the court was, "Whether the city of London had an exclusive jurisdiction to grant licenses in the borough of Southwark, or possessed only a concurrent jurisdiction with the justices of Surry?" After the case had been argued on both sides, the court determined, that the city of London had not an exclusive, but a concurrent jurisdiction, and therefore had acted illegally. This question was therefore determined against the city.

Between one and two o'clock in the morning of the 14th of January, 1792, a fire broke out in one of the new buildings which had been added to the Pantheon, to enlarge it sufficiently for the performance of operas. Before any engines reached the spot, the fire had got to such a height, that all attempts to save the building were in vain. The flames, owing to the scenery, oil, paint, and other combustible matter in the house, were tremendous, and so rapid in their progress, that not a single article could be saved. Fortunately, the height of the walls prevented the conflagration from spreading to the adjoining buildings.

An attempt was made to set the house of commons on fire on the 9th of May, which was happily rendered abortive by the diligence of the watchman of the house. On perceiving a smell of something burning, he communicated his suspicions to Mr. Bellamy, who caused a search to be made, and found the ceiling of a water-closet, immediately under the house, had been broken, and a pair of worsted breeches, stuffed with combustible matter, burning between the joists. But for this providential discovery, it is probable that both houses of parliament, with the whole of Westminster-hall and the Court of Requests, would, from the quantity and dryness of the timber contained in them, have fallen a sacrifice to this destructive element.

A very dangerous riot took place on the 5th of this month, in Mount-street, Grosvenor-square, occasioned by the apprehension of a number of servants who had as-

sembled at a public house in the neighbourhood to make merry on the king's birth-night, by a dance. On the following morning, a mob assembled in front of the watch-house, and demanded their release; which not being complied with, they broke the windows. In the mean time some magistrates met at the watch-house, and examined the servants, all of whom were discharged, except six, including the publican and the fiddler. The mob continuing to increase, the military were sent for; and, the riot-act being read, the crowd dispersed. Tranquillity appearing to be restored, the soldiers were ordered away in the afternoon. In the evening the mob assembled again, and attacked the watch-house, which they broke into; and began to demolish, throwing the benches and furniture into the street. A party of guards reached the spot in time to prevent the total destruction of it, but had much difficulty to disperse the rabble, who proceeded immediately to the attack of a house in Audley-street, belonging to one of the constables, where it was also necessary to require the assistance of the military, to prevent mischief. Happily the tumult ended here without bloodshed; for those who assembled on the following day appeared to have no motive but curiosity, to see the devastation of the former night.

It had been long acknowledged that some reformation in the police of Westminster was wanted, though the mode of effecting it, so as to unite general security with general liberty, had not been hit upon. With a view to accomplish this most difficult of the labours of legislation, a bill was introduced into parliament, early in the month of March, in pursuance of which, regular offices were to be established for the administration of that branch of justice, which falls within the jurisdiction of a justice of peace. Three justices to be appointed to each office, with fixed salaries, and the fees taken in all the offices to be consolidated in one fund, for the payment of them; and, to annihilate that reproach to the magistracy, known by the name of *trading-justices*, no person in the commission of the peace was to receive any fees except at the established offices. Some opposition was made to this bill in its progress; but, as it was only proposed for an experiment, being limited in its duration, and parliament would be enabled to judge of its expediency at the expiration of the term, and continue it or not as the result should warrant, it was passed. The act was carried into execution, on the 21st of August, being extended to the other suburbs of the metropolis; and the following offices were appointed: viz. Queen-square, Westminster; Great Marlborough-street; Hatton-garden; Worship-street, Shoreditch; Lambeth-street, Whitechapel; High-street, Shadwell; and Union-street, Southwark: all of which have been since continued. The Bow-street office subsisted before; and has now a kind of jurisdiction over the rest. The Thames police-office, in Wapping-street, has been added since, upon the suggestions of Mr. Colquhoun, a very active magistrate, and author of a Treatise on the Police of the Metropolis. This gentleman defines *police* to be the system of regulations used in any state for the prevention and detection of crimes, and those other functions which relate to the well-ordering and comfort of civil society. According to this idea of police, it may truly be said, that in this country it is of very novel institution; and the backwardness of it is manifest in the insecurity not of property only, but it may be said of even life itself. But why police, in this sense of the word, should have been so neglected in a country which, for so many ages, has been distinguished from other European nations by unremitting attention to the acquisition and security of political liberty, is not perhaps easily to be explained; since it is indisputable that liberty itself is a blessing of subordinate value, when unaccompanied by those regulations which protect property and life from the violations to which both are liable in society, from the fraud, malice, and oppression, of individuals. It should seem, indeed, as if that very jealousy of the encroachments of power and prerogative,

gative, which guards the liberty of a people against the arbitrary will of their rulers, were in some measure incompatible with those restrictions which a well-regulated police has been found to require. Experience appears to warrant this idea; since it is under the most arbitrary and despotic governments, that the system of internal police has been carried to the highest degree of perfection. Whether this notion be true or false; whether it be that we have tamed that high spirit of freedom, which prefers the liability to private risk and injury to the chance of losing a particle of public liberty; or whether it be that we have become wiser than our ancestors, and have discovered that the restrictions of a more severe police are not really inconsistent with the highest degree of rational freedom; it is certain that we have at length begun to think seriously of means of restraining, by *prevention* rather than by *punishment*, that spirit of cheating, rapine, and violence, which in large societies will always be created by the wants and the passions of men. More has been done within the last ten years, in this way, than had been effected perhaps for a century before; and, for the advances which have already been made, as well as for those which we may yet attempt, we are greatly indebted to the intelligent and active labours of the author of the above work; since, though he then disclosed details of fraud, depredation, and general delinquency, which must have astonished the public, yet the most attentive consideration of the principles and the result of his calculations, combined with the experience of those ten years, instead of convicting Mr. Colquhoun of error or exaggeration in his estimate of the general mass of crimes, seems fully to have confirmed it.

Indeed the increase of crimes and the depravity of manners in the metropolis form a subject of frequent declamation; but, though the fact is universally acknowledged and severely felt, there seems, in tracing the cause of this growing evil, to be a great diversity of opinion; and perhaps the sentiments of men, on this as well as on almost every other subject, may receive a tincture from their modes of life, habits, and peculiar cast of disposition. The humane and tender-hearted, shocked at the numerous executions with which foreigners too justly reproach us, are apt to ascribe the growth of the evil to the severity of our penal laws; and many plans have been suggested for commuting the punishment of death, and substituting temporary or perpetual servitude. At the head of this well-meaning party stands the marquis of Beccaria; whose book on crimes and punishments has been universally read, and generally approved. The work, indeed, is written with eloquence and feeling, and the author's reasoning is for the most part just, and always plausible: but, if we appeal to experience, which is the surest test of human wisdom, we shall perhaps find that, as far as we have adopted the marquis's plan, in the hulks of Woolwich, Portsmouth, and Langton, we have no reason to boast of our success; for very few (if any) of the convicts who have been sent to those seminaries, have returned thence reformed by their education. These and other considerations may have induced men of a rigid and inflexible character to look, on the other hand, for the source of crimes in the ill-judged lenity of our laws, the feeble administration of justice, and the frequency of pardons; and many arguments may be alleged in favour of *this* opinion. In our courts of justice, perhaps too much tenderness is sometimes shown to the criminal; which gave occasion to the discerning Henry Fielding to observe, that our laws seemed rather made for the protection of rogues against honest men, than for the safety of honest men against rogues. It is certainly to be lamented that the difficulty and expense of conviction should deter many people from prosecuting offenders: it is likewise the disgrace of our country, that numberless low retailers of the law should support themselves, and even acquire fortunes, by protecting criminals from the punishments which they have merited; and, if we consider the practices which they adopt to obtain their end, (such as hiring persons to swear an

alibi, cajoling, threatening, and bribing witnesses to suppress or mutilate their evidence, on the day of trial,) the mind starts back with astonishment and horror at such an accumulation of wickedness.

The difficulty of an attempt to reform these abuses may terrify the weak and timid; but it should excite to a greater degree of exertion those who are blest by nature with a sufficient strength of mind; and who, from the circumstances of their situation in life, are supposed to be best qualified to trace the evil to its source, and to mark the various gradations of fraud, with their consequences, immediate or remote, on the peace and happiness of society. No writer that we have hitherto perused appears to us to have examined the subject so accurately as Mr. Colquhoun. As a magistrate, he doubtless had the best means of information; and we must confess ourselves astonished and shocked at the extent of the evils set forth in his work.

Engaged in a war, the event of which is uncertain, and loaded with taxes for the support of government, added to the consequent dearth of provisions, it is certainly incumbent on our rulers to prevent, as much as is possible, the depredations committed on public and private property. These depredations, according to our author, amount to the incredible sum of 2,000,000*l.* annually; which he arranges under the following heads:

1. Small thefts	-	-	£710,000
2. Thefts upon the rivers and quays	-	-	500,000
3. Thefts in the dock-yards and on the Thames	-	-	300,000
4. Burglaries, highway robberies, &c.	-	-	220,000
6. Coining base money	-	-	200,000
6. Forging bills, swindling, &c.	-	-	70,000

Total estimate £2,000,000

“Crimes of every description have their origin in the vicious and immoral habits of the people; in the want of attention to the education of the inferior orders of society; and in the deficiency of the system which has been established for guarding the morals of this useful class of the community. Innumerable temptations occur in a great capital, where crimes are resorted to in order to supply imaginary wants and improper gratifications, which are not known in lesser societies; and against which the laws have provided few applicable remedies in the way of prevention.

“The improvident and even the luxurious mode of living which prevails too generally among various classes of the lower ranks of the people in the metropolis, leads to much misery and to many crimes. The chief consumption of oysters, crabs, lobsters, pickled salmon, &c. when first in season, and when prices are high, is by the *lowest* classes of the people. The middle ranks, and those immediately under them, abstain generally from such indulgences until the prices are moderate.

“Assailed also by the numerous temptations held out by fraudulent lotteries, and places of public resort and amusement; and, above all, by the habit of spending a great deal of valuable time as well as money unnecessarily in public-houses; and often allured, by low gaming, to squander more than they can afford;—there is scarce an instance of accommodating the income to the expenditure, even in the best of times, with a considerable body of the lowest orders of the people inhabiting the capital; and hence a melancholy conclusion is drawn, warranted by a generally-assumed fact; ‘that above twenty thousand individuals rise every morning in this great metropolis, without knowing how or by what means they are to be supported during the passing day, or where they are to lodge on the succeeding night.’

“Poverty is no-where to be found clothed in so great a degree with the garb and emblems of the extremest misery and wretchedness, as in London. Develop the history of any given number of these miserable fellow-mortals, and their distresses will be found, almost in every instance, to have been occasioned by extravagance, idleness, profligacy.

gacy, and crimes; and that their chief support is by thieving in a little way.

"Allured and deceived by the facilities which the pawn-brokers and the old-iron-shops hold out, in enabling the labouring people, when they marry, and first enter upon life in the metropolis, to raise money upon whatever can be offered as a pledge or for sale; the first step with too many is generally to dispose of wearing-apparel and household goods, which is frequently done upon the least pressure, rather than forego the usual gratification of a good dinner or a hot supper. Embarrassments are speedily the consequence of this line of conduct, which is too often followed up by idleness and inactivity. The ale-house is resorted to as a desperate remedy, where the idle and the dissolute will always find associates, who, being unwilling to labour, resort to crimes for the purpose of supplying an unnecessary extravagance. It is truly melancholy to reflect upon the abject condition of that numerous class of profligate parents, who, with their children, are constantly to be found in the tap-rooms of public houses, spending in two days as much of their earnings as would support them a week comfortably, in their own dwellings; destroying their health; wasting their time, and rearing up their children to be prostitutes and thieves before they know that it is a crime."

The sixth chapter of Mr. C's work treats on coinage, and the circulation of base money, and contains a great variety of very curious information. The systematic manner in which this infamous trade is carried on, the incredible profits arising from it, its vast extent, and the numbers of people concerned in it, cannot be contemplated without horror. This naturally leads to the consideration of the various kinds of forgeries and frauds committed in the metropolis. The author justly observes, that gaming is the source whence have sprung up all that race of cheats, swindlers, and sharpers, whose nefarious practices he endeavours to expose. So early as the reign of queen Anne, this abandoned and mischievous race of men seem to have attracted the notice of the legislature in a very particular degree; for the act of the 9th of her majesty recites, "that divers lewd and dissolute persons live at great expenses, having no visible estate, profession, or calling, to maintain themselves; but support these expenses by gaming only; and enacts, that any two justices may cause to be brought before them, all persons within their limits whom they shall have just cause to suspect have no visible estate, profession, or calling, to maintain themselves by, but do for the most part support themselves by gaming; and, if such persons shall not make the contrary appear to such justices, they are to be bound to their good behaviour for a twelvemonth, and, in default of sufficient security, to be committed to prison, until they can find the same; and, if security shall be given, it will be forfeited on their playing or betting, at any one time, for more than the value of twenty shillings."

By the 12th of George II. "the games of faro, hazard, &c. are declared to be lotteries, subjecting the persons who keep them to a penalty of two hundred pounds, and those who play to fifty pounds." One witness is only necessary to prove the offence before any justice of the peace, who forfeits ten pounds if he neglect to do his duty; and by the 8th of George I. "the keeper of a faro-table may be prosecuted for a lottery, where the penalty is five hundred pounds." Such has been the anxiety of the legislature to suppress faro-tables and other games of chance, that the severest penalties have been inflicted, founded on the fullest impression of the pernicious consequences of such practices; and yet, to the disgrace of the police of the metropolis, houses are opened under the sanction of high-sounding names, where an indiscriminate mixture of all ranks is to be found, from the finished sharper to the raw inexperienced youth; and where all those evils exist in full force which it was the object of the legislature to remove. When a species of gambling, ruinous to the morals and to the fortunes of the younger parts of the

community who move in the middle and higher ranks of life, is suffered to be carried on in direct opposition to a positive statute; surely, blame must attach somewhere!

"The idle vanity of being introduced into what is supposed to be genteel society, where a fashionable name announces an intention of seeing company, has been productive of more domestic misery, and more real distress, poverty, and wretchedness to families, in this great metropolis, (who but for their folly might have been easy and comfortable,) than many volumes could detail. A mistaken sense of what constitutes human happiness, leads the mass of the people who have the means of moving, in any degree, above the middle ranks of life, into the fatal error of mingling in what is erroneously called *genteel company*; if that can be called such where faro-tables and other games of hazard are introduced in private families; where the least recommendation (and sharpers spare no pains to obtain recommendations) admits all ranks who can exhibit a genteel exterior; and where the young and the inexperienced are initiated in every propensity tending to debase the human character, and taught to view with contempt every acquirement connected with those duties which lead to domestic happiness, or to those objects of utility which can render either sex respectable in the world.

"When such abominable practices are encouraged and sanctioned by high sounding names; when sharpers and black-legs find an easy introduction into the houses of persons of fashion, who assemble in multitudes together for the purpose of playing at those most odious and detestable games of hazard which the legislature has stigmatized with such marks of reprobation; it is time for the civil magistrate to step forward; and to feel, that, in doing that duty which the laws of his country impose on him, he is perhaps saving hundreds of families from ruin and destruction, and preserving to the infants of thoughtless and deluded parents that property which is their birth-right; but which, for want of an energetic police in enforcing the laws made for the protection of this property, would otherwise have been lost, leaving nothing to console the mind but the sad reflection, that, with the loss of fortune, those opportunities (in consequence of idle habits) were also lost of fitting the unfortunate sufferer for any reputable pursuit in life, by which an honest livelihood could be obtained."

These excellent observations are followed by an accurate description of the various kinds of sharpers, cheats, and swindlers, with which the metropolis swarms; and these are divided into twenty-one different classes. It might perhaps have mortified the pride of a late celebrated nobleman,—who, in his letters to his son, seemed to regard external manners, and what he termed the graces, as of more importance than moral qualification,—to have been told, that the great quality and leading indispensable attributes of a sharper, a cheat, a swindler, or a gambler, are to possess a *genteel exterior, a demeanour apparently artless, and a good address*.

We are at length arrived at a most critical period of the annals of Europe—the French revolution. The standard of liberty and equality, two words which, though hardly understood by the lower class of society, are always sure to raise numerous partisans, was hoisted, not only in France, but in all the neighbouring states: Italy, Germany, had caught the infection; and England was warmly tempted and nearly debauched into that pernicious system; which for five-and-twenty years has now wrought the most lamentable effects upon Europe. We are sorry, yet obliged to confess, that many of our fellow-citizens were deluded and led astray by that *ignis fatuus*, that levelling folly, which, had it not been for the staunchness of the minister, for his foresight and intrepidity, seconded by the heads of the London magistracy, would perhaps, like the crafty scheme of the perfidious Sinon, have destroyed in a few months the noble fabric of a constitution which neither the lapse of time nor the fury of external and intestine war had been able to impair: *Non anni domusre decem,*

*non mille carinæ.* The societies formed, in order to give more extension to the new doctrines, were rapidly uniting and coalescing into one body, under the name of "the Corresponding Society."—Since, by the special favour of Providence, who gave our civic government strength to save themselves by prudential resistance, and to save others by their example of loyalty, the long miseries of this revolution seem to be at an end, it will be acceptable to our readers to find here the resolutions of the court of common-council on the 29th of November, 1792, where the lord-mayor, sir James Sanderfon, in a speech replete with sound argument, and delivered with manly firmness, urged the necessity of supporting the king and constitution. It was resolved as follows:

I. That it is the duty of all corporations to preserve their fidelity to their sovereign, to be watchful for the safety of the sacred constitution of the country, and to maintain, to the utmost of their power, the peace, the property, and the personal security, of every freeman living under its protection; as it is equally the duty of every freeman to bear true allegiance to the king, and be obedient to the existing laws of the land.

II. That this corporation, regarding the blessings which the subjects of the British empire enjoy, under the present mild and happy government, as inestimable, will strengthen its exertions by every possible means, to suppress all unlawful and seditious assemblies within this city, and to bring to justice every disturber of the public tranquillity.

III. That this corporation, in the most solemn manner, doth hereby call upon every good citizen to co-operate with them to the same salutary end; to discourage every attempt which may be made to excite the fears of the metropolis, by weak and designing men; and each, in his own person, to be ready, at all times, to accompany and assist the magistrates of the city, in the suppression of every tumult.

IV. That this court doth remind their constituents, the freemen of London, of the oath by which they are bound, to this purpose; viz. the first, second, and last, clauses of a freeman's oath: "Ye shall swear that ye shall be good and true to our sovereign lord, king George. Obedient and obedient ye shall be to the mayor and ministers of the city. Ye shall also keep the king's peace in your own person. Ye shall know no gatherings, conventicles, nor conspiracies, made against the king's peace, but ye shall warn the mayor thereof, or let it to your power."

V. That it be recommended to the aldermen and common-council, in their respective wards, to consider of the best means of preserving tranquillity, and of securing obedience to the laws.

VI. That these resolutions be printed in all the public papers of the united kingdoms, signed by the town-clerk.

VII. That the thanks of this court be given to the Right Hon. Sir James Sanderfon, lord-mayor of this city, for the wise and timely caution taken by him to prevent any breach of the peace, by the assembling of persons under the pretence of publicly debating on a political subject; and that this court will, to the utmost of their power, give every assistance to his lordship, to carry into effect his majesty's most gracious proclamation.

The last resolution alluded to a transaction which had occurred a short time before. Among other modes resorted to by the inciters of discontent, was that of propagating their insidious doctrines through the medium of debating societies, political lectures, &c. where, though the nominal subject related to some event in the ancient history of Greece or Rome, or was drawn from those which had recently happened in France, such allusions were made as were evidently designed to bring the government of this country into disrepute. Such a meeting was publicly announced, to be held at the King's-arms tavern, in Cornhill, on the evening of the 27th; but, when the orators and their auditory assembled, they found

the place in the occupation of the peace-officers, who denied them admission. This occasioned some slight tumult; and it was found necessary for the lord-mayor to attend, with the city-marshal, for the purpose of dispersing the crowd.

The apprehension of some sudden insurrection was, at this time, so strong, that government thought it expedient to make preparations for the defence of the Tower, by opening entrenchments, raising parapets, and mounting cannon on the walls. All the breaches were filled up; and, on the west side of the Tower, some hundreds of old rum-puncheons, filled with earth, were placed as a barricade. At the same time the Bank was doubly guarded; the villages, in the environs of the capital, were filled with soldiery, sufficient to protect the lives and property of the inhabitants of the metropolis, in case of a sudden alarm; and the court of lieutenancy of the city ordered a company of the London militia to be on duty at the Artillery-ground, night and day, to be ready at a moment's notice.

Without entering into more particulars upon a subject, which is still in the recollection of several of our contemporaries, we will assert that the city of London constantly showed a general disposition to support the constitution and the reigning order of things, and prudently put aside the poisonous cup which deluded France invited her to taste.

Preparations being made for war against the French republic, the city of London, true to the professions which they had made of supporting the king and government, took an early opportunity of proving their sincerity, by unanimously voting a bounty of forty shillings for every seaman, and twenty shillings for every landman, who would enter himself at Guildhall for the service of his majesty's navy. On the 12th of February, 1793, an address to the king was unanimously agreed to, in order to thank his majesty for his paternal care in the preservation of public tranquillity, and to express their abhorrence of the late atrocious acts at Paris; and assuring him of their readiness to support the honour of his crown and the welfare of his kingdoms against the ambitious designs of France. The address was presented and most graciously received on the 16th of the same month.

The most trifling incident was sufficient, at this moment of dissatisfaction and turbulence, to occasion commotions and riots.—Early in the morning of the 23d of June, a dreadful affray took place in the neighbourhood of Oxford-freet. A large party of labouring people had been collected at a house in Oxford-buildings, on occasion of a child's death; a dispute arose among them, which terminated in a general battle; the victors, not satisfied with their triumph over their opponents, began to commit outrages in the neighbourhood. The watchmen were beaten, and the captain of the patrol so severely wounded, that he died shortly after. A party of the guards arrived about three o'clock in the morning, and were immediately assailed with brick-bats; they, however, succeeded in securing fifty-four of the rioters, after which tranquillity was restored; but it was found necessary to keep the soldiers on guard at the watch-houses in the neighbourhood all the following day and night.

The whole of the warehouses at Hawley's wharf, near the Hermitage, with several adjoining houses, three vessels, and some small craft in the dock, and a great quantity of sugars, rum, and hemp, were entirely destroyed by fire on the 2d of December. During this conflagration a new and astonishing phenomenon struck every beholder with awe: the united mass of upwards of a thousand casks of sugar, melted by the irresistible heat, burst into a flame, and flowed through the streets in one bright stream of liquid fire.

On the 3d of February, 1794, the eagerness of the people to enter the pit-door of the little theatre in the Haymarket, where his majesty was to be present, was the

cause of a most melancholy accident: fifteen bodies were taken out lifeless, having been squeezed to death in the passage by the pressure of those out of doors who wanted to get admittance; among the sufferers we find two members of the Herald's Office, Messrs. Brooke and Pingo. Several others suffered material injury by bruises and broken limbs.

On the 17th of May, the colours taken at Martinico were deposited in St. Paul's cathedral; and on the 13th of June, news of the splendid victory obtained by lord Howe over the French fleet, on the 1st of that month, reached London. On the three following nights the cities of London and Westminster, and the borough of Southwark, were illuminated with great splendour. An address of congratulation was voted to his majesty; and the freedom of the city, in a gold box of a hundred guineas value, presented to lord Howe. Five hundred pounds were also provided for the wounded, and the widows and children of those who fell in the action.

Our annals must now take notice of the greatest fire that ever happened in London or its suburbs since the year 1665.—On the 23d of July, about three o'clock in the afternoon, a fire broke out at Ratcliffe, which consumed more houses than any one conflagration since the great fire of London. It was occasioned by the boiling-over of a pitch-kettle at a barge builder's, from whose warehouses it communicated to a barge laden with saltpetre, and from that to the salt-petre warehouses belonging to the East-India Company. The scene was dreadful; the wind blowing strong from the south directed the flames towards Ratcliffe High-street, which, being narrow, took fire on both sides, and prevented the engines from being of any service. From hence it extended towards Stepney, until, having reached an open space of ground, it stopped for want of materials to consume. About ten o'clock at night its devastations on the side next Limehouse were checked by the great exertions of the firemen and inhabitants. It was a very remarkable circumstance, that an extensive building, the dwelling-house of a Mr. Bere, standing almost in the centre of the conflagration, remained uninjured, not even a single pane of glass being cracked.

On making a survey of the extent of the damage, it appeared that out of one thousand two hundred houses, of which the hamlet consisted, not more than five hundred and seventy were preserved. About four hundred families were deprived of their all, and thrown on the public benevolence. In this distress, government sent a hundred and fifty tents from the Tower, which were pitched in an enclosed piece of ground adjoining to Stepney churchyard, for the reception of the sufferers; and provisions were distributed among them from the vestry. A subscription was also immediately opened at Lloyd's coffee-house for their relief; and some of the gentlemen in the neighbourhood attended at the avenues leading to the desolated scene, for the purpose of soliciting the benevolence of those whom curiosity might lead to witness the distresses of their fellow-creatures; and it may be recorded among the instances of the universal charity peculiar to this nation, that the collection from the visitants, on the Sunday following, amounted to upwards of eight hundred pounds; four hundred and twenty-six pounds of which was in copper, and thirty-eight pounds fourteen shillings in farthings. The total sum collected was upwards of sixteen thousand pounds.

The oldest inhabitant of London never witnessed so dreadful a storm as that which took place on the 7th of August, about four o'clock in the afternoon. The rain fell in torrents, and was accompanied by long and tremendous peals of thunder, and vivid flashes of lightning. One of these was seen to come down, and strike the street on the east side of Temple-bar, producing an effect similar to an explosion of gunpowder; every particle of straw, mud, and even the water, being completely swept from

the pavement, while the houses on both sides of the street were violently shaken, and the doors of some of them forced open: fortunately, the rain had driven every person from the street. Among other damage done by the violence of this storm, the centre beam of the roof of Lloyd's coffee-house was split, and great part of the ceiling fell into the coffee-room, followed by a torrent of rain, which in a few minutes covered the whole floor. Many balls of fire fell in the streets, particularly at the west end of the town; by which several people were thrown down, but only one person was killed.

Some riots at Charing Cross and St. George's Fields, on account of real or supposed kidnapping, occurred during the summer, and roused the vigilance of the magistrates. The recruiting-houses were the object of the fury of the populace; and nothing could quench the increasing evil but the presence of large bodies of horse and foot guards, directed by the moderate, but firm, conduct of the magistrates.

At length, by the unwearied exertions of its leaders, the Corresponding Society, as it was called by the founders of that most dangerous and undermining association, had assumed a formidable aspect, being composed of an immense number of the middling and lower classes of the community, who, not only in their meetings, but also in common conversation, were equally free in their censures of the war, and in their wishes for the success of the French. The avowed object of their association was, a reform in parliament; but they were charged with views of another kind; with a design of destroying the constitution, and introducing a republican form of government; and that this accusation, so far as it regarded some of the leading members, was well founded, cannot be denied, though the indiscriminate application of it to all was certainly wrong. The circumstance, however, which rendered them principally obnoxious, was the intimate connection they held with the convention that assembled in Scotland, some of the principal leaders of which had been tried, and found guilty of high-treason.

In this dangerous state of things, it was at last determined by government to apprehend the leading members of the Corresponding Society, and on the 12th of May of the same year (1794), Thomas Hardy, their secretary, was taken into custody. Soon after, Daniel Adams, secretary to the society for Constitutional Information, the celebrated John Horne Tooke, the Rev. Mr. Joyce, domestic tutor to lord Mahon, and John Thelwall, were apprehended, examined before the privy-council, and committed to the Tower. On the 25th of October, they were brought to trial, before a special commission at the Old Bailey; a bill of indictment having been previously found by the grand jury. The first person tried was Thomas Hardy: his trial lasted eight days; but, the evidence not being sufficient to substantiate the commission of such an *overt act* as is required to constitute the crime of high-treason, he was acquitted. Mr. Tooke was next tried, and acquitted for the same reason; as was Mr. Thelwall, whose trial followed; after which the other prisoners were brought to the bar, *pro forma*; but no evidence was adduced against them.

Thus ended a business, which, if considered in itself, was at first of an insignificant nature; a plot in which two clergymen and a shoemaker were the most formidable engines, not being calculated to inspire much terror in a government where the landed property is mostly in the hands of those who wisely think that their safety is inseparable from that of the constitution, and *vice versa*: but, if this association be considered as to its extent, its connections, its secret machinations, practices, and clandestine workings, fostering a contrary power in the very bosom of public and private establishments, and undermining, by surreptitious means, the authority of civil magistracy, we cannot wonder at the warm and effective part that the city of London took on the occasion. Had not the genius of our protection, and the bold measures of Mr. Pitt, interfered,

interfered, London, in whose very lap these vipers had been unknowingly nurtured, might have fallen a victim to their evil intentions.

The minds of the lower class of people still continued to be poisoned by inflammatory harangues and resolutions at different meetings of the Corresponding Society, one of which was held on the 26th of October, 1795, in the fields near Copenhagen-house, Illington, to vote an *address to the nation*, on its critical and calamitous state; a *remonstrance to his majesty*, for the neglect and contempt shown to a former address; and a string of resolutions, applicable to the alarming crisis, all of which were adopted by the acclamation of the multitude. The events which followed, showed the state of irritation these proceedings had created.

On the 29th, the king went in state to open the parliament, on which occasion a crowd assembled, ten times as numerous as that usually produced; for they amounted to at least two hundred thousand. From the time that his majesty left the palace, he was hissed and hooted at by a gang of ruffians, but no violence was offered until he arrived opposite the Ordnance-office, when a bullet from an air-gun perforated the glass pannel of the coach, but most happily failed to accomplish the diabolical purpose it was evidently intended to effect. In Palace-yard, a stone was thrown which shattered one of the side-windows; and on his majesty's return, followed by the same gang, another stone was thrown opposite to Spring-garden terrace, which struck the wood-work of the coach, but without doing any injury. After his majesty had alighted at St. James's, the mob attacked the state coach with stones and bludgeons, by which every particle of glass belonging to it was demolished, and considerable injury done to the carved-work and pannels. In a short time, the king went in his private coach from St. James's to Buckingham-house; and, in the park, was attacked by sixteen or seventeen ruffians, who broke out from the mass of the crowd; but, fortunately, the horse-guards arrived to his rescue, just as one of them was attempting to force open the door.

This daring outrage excited the horror and detestation of all ranks of people, and was followed by loyal and affectionate addresses of congratulation from every part of the kingdom: that from the city of London was presented on the 6th of November, and most graciously received. The trial of Kyd Wake, a printer, one of the gang who followed his majesty's coach, hissing and otherwise insulting him, came on in the court of King's Bench, on the 20th of February, 1766; when, the facts charged in the indictment being fully proved, the jury, without hesitation, returned a verdict of guilty. The judgment of the court, which was pronounced by lord Kenyon, was very severe; viz. "to be imprisoned and kept to hard labour in Gloucester gaol for five years; and to stand on the pillory, in one of the public streets of Gloucester, on a market-day, within the first three months of his imprisonment; at the expiration of which, he was to find security, in one thousand pounds, for his good behaviour for ten years." This unfortunate man, after his liberation, opened a shop in the Old Bailey, where he sold books and braces, pamphlets and garters, political essays and nightcaps; and met his death on the 13th of March, 1807, in Paul's Chain, being crushed by a cart against one of the posts of that much-too-narrow street.

On the meeting of the new parliament, the king having informed them, that the steps he had pursued had opened the way to an immediate and direct negotiation for peace, the common-council of London thought themselves called upon to address his majesty, to thank him for his communication, and to assure him that, in the event of his being unable to obtain a just, honourable, and solid, peace, it was the united determination of the citizens of London to support and assist him with increased vigour and activity. In his answer, his majesty thanked them for these fresh assurances of attachment, and promised an unremit-

ting attention to the welfare and happiness of the city of London.

The negotiations for peace came to nothing; and the city of London evinced its loyalty in subscribing eagerly to a voluntary loan of eighteen millions; but a difference of opinion arose between the livery and the common-council on account of money having been advanced to the emperor of Germany by ministers during the recess, and therefore without the sanction of parliament. The resolutions of the common-hall tended expressly to censure the administration; whereas the common-council agreed to a motion approving the opportune and pecuniary aid granted to one of our allies, in order to open a fairer prospect of obtaining an honourable peace for Great Britain and her allies.

The stoppage of the cash-payments at the bank is the first feature of the year 1797. It excited at first surprise and anxiety; but, having soon received the sanction of the bankers and most opulent merchants of London, the steady credit of the nation supporting that of paper-money, bank-notes were received with confidence instead of cash; and subsequent events have confirmed the prudence and utility of the measure. See the article BANK, vol. ii. p. 676.

Another transaction which engrossed a great deal of the public attention was the right which the livery of London claimed to have their petitions and addresses presented to the king *on the throne*, a privilege which could not materially affect the possible issue of their demands, but which, had they obtained it, would have confounded the rights of civil dignity; this prerogative belonging only to the city in its corporate capacity. A common-hall was held on the 23d of March, in which a petition to his majesty, praying him to dismiss his ministers, as the first step towards obtaining a speedy, honourable, and permanent, peace, was voted; and the sheriffs, with the city-representatives, were requested to present it to his majesty on the throne. On the 1st of April, the lord-mayor laid before the livery a letter he had received from the sheriffs, acquainting him that his majesty would receive the petition on the next or any other levee-day; but, as it did not come from the city in its corporate capacity, he would not receive it on the throne. On this, the livery directed the sheriffs, attended by the remembrancer, to demand a personal audience of his majesty, to know when he would be pleased to receive their address and petition on the throne. They accordingly obtained an audience, and delivered the message directed by the livery; to which they received an answer from his majesty, refusing to receive it upon the throne, for the reasons already given, and repeating his readiness to receive it at the levee, provided the number of persons presenting it did not exceed the usual number of ten. This report being read at another common-hall, held on the 12th, two resolutions were passed, declaratory of the rights of the livery; and another was offered, which, not being specified in the summons, the lord-mayor declared he could not put, consistently with his duty to the livery, who might thus be surprised into measures, for which they were not previously prepared. After much altercation, the lord-mayor ordered the insignia of office to be taken up; and the hall was, of course, dissolved. A fourth common-hall was held on this subject, on the 11th of May, when several strong resolutions were entered into, relative to the rights of the livery, and the misconduct of his majesty's ministers, for the dismissal of whom their representatives were directed to move an address in parliament; after which, a vote of censure was passed against the lord-mayor, for dissolving the last common-hall, and convening this for purposes short of those specified in the requisition. A counter-declaration was, however, signed, by two thousand and ninety-six liverymen, expressive of their dissent and disapprobation of the violent proceedings at these common-halls; and of their aversion and abhorrence of all proceedings tending to excite discord, or to sanction measures

of turbulence. And a meeting of the livery was held, at the London-Tavern, on the 26th of May, in which it was resolved, that the above-mentioned declaration "is a noble vindication of the character of a great and respectable body of men, who have been among the foremost in defence of true constitutional freedom;" and the resolution concluded by approving the conduct of the lord-mayor, the censure against whom was declared to be unmerited, and highly indecent.

The circumstance of a peer, the earl of Lauderdale, becoming a candidate for the office of sheriff, greatly excited the attention of the public; he had joined the oppositionists; and his failure manifested the strength of the court-party.

Now began again a course of successes and of naval victories over our enemy. The 19th of December was appointed to be held as a day of thanksgiving, for the three great naval victories achieved by lords Howe, St. Vincent, and Duncan; on which occasion their majesties attended divine service at St. Paul's cathedral. The procession, on this day, began with two colours taken from the French, three from the Spaniards, and four from the Dutch, labelled "June 1794," "February 1797," and "October 1797." They were carried on artillery-waggons; each set followed by a party of lieutenants of the navy, who had served in the several engagements in which they were won. After these came a large detachment of marines, with music playing; and then the following admirals, in carriages: Lord Duncan, Sir C. Thompson, Sir R. Onslow, Sir A. Gardner, Sir T. Pasley, Sir R. Curtis, Sir Horatio (afterwards Lord) Nelson, Lord H. Seymour, Caldwell, Waldegrave, Hamilton, Goodall, Young, Lindsay, Gambier, Bazeley, and Captain Sir H. Trollope. The naval part of the procession was followed by the two houses of parliament, the royal family, and then their majesties, in a similar manner to the procession on the king's recovery. Lord Nelson, in friendly conversation with Mr. Pitt, stood under the dome, on the very spot where the remains of the former have since been deposited;—two of the greatest men that ever graced a century and the nation that gave them birth.

A few days after, John Wilkes, esq. a man who had also made much noise, but in a different way, died, and was succeeded by the very respectable officer who is at this moment chamberlain of the city. Mr. Clarke was opposed by sir Watkin Lewis, who declined when he found the numbers of the poll to be 393 to 48.

In the year 1798 began the very useful measure of arming the citizens and teaching them the use of arms. In consequence of a conference the lord-mayor had had with the duke of York, and a letter he had received from the secretary of state, in relation to forming armed associations in the several wards of the city, a court of common-council was held, on the 19th of April, to take the proposed measure into consideration, which met with general approbation; and, after a conversation of some length, on the means of carrying it into effect, it was agreed to request the lord-mayor to convene his brethren, the aldermen, for the purpose of submitting the plan to them. When they met, they came to an unanimous resolution, to call meetings of the inhabitant householders in each ward; which was done on the 1st of May. The propositions were the same in each ward; viz. for the inhabitant householders, that were able men, to learn the use of arms; those not capable of bearing arms to be appointed special constables; to be commanded by their own aldermen; to choose a committee, to form regulations, and recommend officers; and, in case of need, to be united into one body, under the direction of the lord-mayor and court of aldermen. These propositions were unanimously adopted. While these measures were pursued in the city, parochial and district meetings were general in every part of the metropolis; and a *volunteer force* was shortly established, which relieved government from much care, and enabled it to make a much more advantageous disposition of the regulars, in case of necessity.

On the 4th of October, the Hon. Capt. Capel waited on the lord-mayor, with the sword of the French admiral, M. Blanquet, which was surrendered in the naval action at the Nile, and intended by sir Horatio Nelson as a present to the city of London, accompanied by the following letter.

*Vanguard, Mouth of the Nile, Aug. 3.*

"My Lord, Having the honour of being a freeman of the city of London, I take the liberty of sending to your lordship the sword of the commanding French admiral (M. Blanquet), who survived after the battle of the 1st, off the Nile; and request that the city of London will honour me with the acceptance of it, as a remembrance that Britannia still rules the waves; which, that she may ever do, is the fervent prayer of your lordship's most obedient servant,  
H. NELSON."

This letter and the sword were laid before a court of common-council on the 10th, who referred it to a committee, to consider the best manner of disposing of the sword, and report to the next court. It was then unanimously resolved to address his majesty on the glorious victory over the French, off the Nile, on the 1st of August, by his majesty's fleet, under the command of Sir Horatio, now Baron Nelson, of the Nile; which was presented on the 24th, and very graciously received. The report from the committee was laid before the court, on the 16th, and unanimously agreed to. It was, that they had come to the following resolution, "That the sword, delivered up to our gallant hero, lord Nelson, by the French admiral, M. Blanquet, be put up in the most conspicuous place in the common-council chamber, with the following inscription, engraved on a marble tablet: The sword of Mons. Blanquet, the commanding French admiral, in the glorious engagement of the Nile, on the 1st of August, 1798; presented to the court by the Right Hon. Rear-admiral Lord Nelson." The lord-mayor was then requested to communicate to lord Nelson the high sense which the court entertain of this invaluable present. After which, the thanks of the court, with a sword of two hundred guineas value, were voted to lord Nelson; and also the thanks of the court to captain Berry, the captains, officers, and seamen, for their important services; and the freedom of the city was voted to captain Berry, to be presented in a box of one hundred guineas value. At a court of common-council, held on the 23d of January, 1799, the lord-mayor produced a letter from the Hon. Mrs. Damer, offering her services to execute, and present to the court, a bust of lord Nelson, either in bronze or marble; which were accepted, and the thanks of the court unanimously voted for her liberal proposal.

The anniversary of his majesty's birth-day displayed this year a spectacle rather new in this country, and unknown in others; a grand review of sixty-six corps of volunteers, who, from motives of the purest patriotism, had formed themselves into military associations, in order to maintain the independence of their native country. It took place in Hyde-park, and the actual amount was 8,989 men in uniform; and the crowd assembled on the occasion was estimated at no less than a hundred and fifty thousand, although the weather was very unfavourable.

A dreadful fire broke out in the King's-bench prison in the evening of the 13th of July, which raged with such fury, that between eighty and a hundred of the prisoners' rooms were destroyed before it was extinguished.

The increasing price of provisions made it again necessary to attend to the wants of the industrious poor. A meeting was therefore held at the London Tavern, on the 6th of December, to take into consideration the means of giving them assistance during this pressure; when it was agreed to open a subscription similar to that in 1795, from the application of which such advantages had been derived at a comparatively small expense. While the liberality of the affluent was thus exercised, the wisdom of government was employed in seeking remedies for the evil, and the means of preventing its extension. With

this

this view, and in order to prevent an useless expenditure of wheaten flour by the consumption of new bread, a bill was passed, in February 1800, prohibiting any baker in London or Westminster, or within ten miles of the Royal Exchange, from selling bread until it had been baked twenty-four hours, under a penalty of five pounds for every loaf fold.

A most alarming and extraordinary circumstance occurred at the theatre royal Drury-lane, on the evening of the 15th of May. At the moment when his majesty entered the box, a man in the pit stood up, and fired a pistol at him. The house was immediately in an uproar, and the cry of "Seize him!" burst from every part of the theatre. The king, apparently not the least disconcerted, came forward in the box; and the man who committed the crime was conveyed from the pit. The indignation of the audience could not be tranquillized until after repeated assurances that the culprit was in custody. On his examination, he proved to be insane. He had been a soldier in the 15th light dragoons, and had received eight wounds in his head, from which it was believed his malady arose. He was tried for the offence, on the 26th of June, and acquitted on the ground of insanity; after which he was conveyed to a mad-house, to be taken care of.

Soon after the prorogation of parliament, which took place on the 29th of July, apprehensions of tumult and riot alarmed many of the inhabitants of London. About the middle of August a refractory spirit had manifested itself among the felons in the prison in Cold-Bath Fields. This was attributed to various publications on the state of this prison, which had appeared a short time before: however this may be, their turbulence, at length, assumed a serious aspect; and, on the evening of the 14th, when the bell rang as the signal for locking up, instead of retiring to their cells, they collected together, appearing to have some design in agitation. After a trifling resistance, they were compelled to separate, and submit to being locked up. Immediately they began the most dismal exclamations of "Murder! Starving!" &c. which collected a considerable mob round the prison, who answered them with loud shouts. Thus encouraged, they continued their cries, beseeching the mob to force the gates and pull down the walls to release them. In this dilemma it was found necessary to apply for assistance from the civil magistrates and the military associations in the neighbourhood, by whose exertions tranquillity was at length restored.

The end of this year witnessed a considerable degree of turbulence and disaffection among the people. A certain dangerous ferment, fanned by the blast of ungrounded complaints, caused hand-bills to be posted every-where, and worded in the most seditious style. But the vigour and promptitude of the magistrates, seconded by the firmness and humanity of the *volunteers*, prevented the mistaken multitude from effecting any greater mischief than the breaking of windows and lamps; and tranquillity was happily restored without bloodshed.

Another attempt was made in this year, to get a petition from a common-hall, received by his majesty upon the throne, but without success; on which a resolution was passed, on the 9th of October, "That whoever advised his majesty to persist in refusing to his faithful subjects free access, in these times of peculiar difficulty and distress, is equally unworthy of his majesty's confidence, and an enemy to the rights and privileges of the citizens of London."

A court of common-council was held, on the 14th, when an address, to the same purport as the petition of the livery, praying his majesty to convene the parliament, on account of the excessive price of every article of life, was agreed to. This address was presented to the king on the 16th; but it was rendered unnecessary, by directions having been previously given to summon the parliament for the dispatch of business.

On the 3d of December, his majesty in council, in compliance with the request of the two houses, issued his royal proclamation, exhorting all persons, who had the means

of procuring other food than corn, to use the strictest economy in the use of every kind of grain, by abstaining from pastry, and reducing the consumption of bread in their respective families; and also, all persons keeping houses, especially those for pleasure, to restrict their consumption of grain, as far as circumstances would admit.

Considerable loss and inconvenience was experienced by the underwriters and merchants of London, towards the conclusion of the year, by an unexpected embargo being laid on all the British shipping in the ports of Russia. No less than a hundred and five vessels were detained at Peterburgh, seventy-one at Riga, and a considerable number in the other ports, the greater part of which were from London; and all the seamen belonging to them were marched in small parties to a great distance up the country. The distress and anxiety of the wives and families of these men were, however, something alleviated by a liberal subscription, entered into by the principal merchants concerned in the Russian trade, for their relief, who also agreed to continue the pay of the men till they should be liberated and permitted to return.

The last event we have to notice at the close of the eighteenth century, as affecting the commerce of the city of London, is the commencement of the wet docks, in different places, for the greater accommodation of vessels employed in its trade. Nothing can show more strongly the necessity that existed for extending and improving the conveniences of the port of London, than the following statement of the increase in the number of vessels, and their tonnage, engaged in the trade of the river Thames, in the course of the eighteenth century:

	Vessels.	Tons.
Increase in the coasting trade, -	4613	927,550
— in the foreign trade,		
— British vessels, - - -	587	250,352
— Foreign ditto, - - -	1347	149,861
Total	6547	1,327,763

At the close as well as at the beginning of his career, the historian finds himself attended with equal difficulties. At setting out, surrounded with thick clouds of doubts which antiquity has blown over the scarcity of events that are the objects of his labours, he can hardly see his way; and, in these obscure paths and defiles, his steps are vacillating and slow. At the end of his race, he is dazzled by the blaze of truth and evidence, by an innumerable quantity of brilliant facts which crowd upon him, and boldly claim the preference for a place in his annals; whilst the embarrassment of his course is increased by the difficulty of selection; and the danger of deviating from, or running against, standing opinions and unconquerable prejudices. Hurried and lashed along the *stadium* by the fear of appearing lax and prolix in relating with too much minuteness several facts either too well known or too recent; he feels, at the same time, his activity retarded by the dread of omitting momentous particulars, or of appearing neglectful of entertainment or careles of interest. Perfectly aware of the duties we have to perform, we shall continue to bestow the most sedulous attention upon events which have distinguished the morning of the 19th century; and proceed steadfastly in our career, with the hope of finding the deserved meed at the end, the approbation of the public.

The eighteenth century began under the mayoralty of sir William Staines; and the first day, being also that of the union with Ireland, was ushered in by the ringing of bells; at noon the Park and Tower guns were fired, and the new standards, hoisted at the steeples of churches and other public places, floated in the air over the vast extent of the cities of London and Westminster. Yet these rejoicings were not without their drawback; for the very high price of flour, being at that moment a cause of alarm and distress, the sale of fine wheaten bread was prohibited after the 2d of February, and household bread forced into general consumption. Upon entering into office, sir

William Staines found this necessary article of life at 7s. 5½d the quarter loaf. During his magistracy, it had a great increase, for it arrived at the exorbitant price of 1s. 10½d. but, at his leaving the civic chair to sir John Eamer in November 1801, the quarter loaf was reduced to 10½d.

The long-depending cause between the parishioners of St. Gregory, London, and the warden and minor canons of St. Paul's cathedral, was determined in the court of Exchequer, on the 27th of April, in favour of the latter. The parishioners contended, that from time immemorial they had been accustomed to pay no more than ninety pounds per annum as a composition in lieu of tythes, and that, therefore, they were not within the provisions of the statute of the 17th of Henry VIII. The jury, however, decided against their plea, and that they were liable to the payment of two shillings and ninepence in the pound, making in the gross about thirteen hundred pounds per annum, from the year 1795, the time at which the claim was set up.

A court of common-council was held at Guildhall, on the 14th of May, to receive the report of the committee of ways and means, on the return to be made to the commissioners under the income-act. The report stated that the income of the city, for the last year, had amounted to 92,062l. 9s. 8d. and its expenditure to 87,828l. 7s. 4d. leaving a balance of 4234l. 2s. 4d. on which it was ordered that the sum of 423l. should be paid to the commissioners, for the income-tax of the city.

The Paddington Canal was opened on the morning of the 10th of July, with a grand procession of boats, to Bull's Bridge, near Uxbridge, where they arrived about noon; and, being joined by the city-shallop, with the sub-committee of the Thames, and several pleasure-boats, the procession returned to the great dock at Paddington.

Preliminaries of peace, between his majesty and the French government, were signed at lord Hawkebury's office, in Downing-street, on the 2d of October, and on the 10th general Lauriston, Bonaparte's first aide-de-camp, arrived with the ratification. In his passage through the town to Mr. Otto's residence, his carriage was followed by a numerous concourse of people, who afterwards took the horses from it, and drew him and Mr. Otto to Downing-street, with expressions of the most tumultuous joy. On the ratifications being exchanged, the Park and Tower guns were fired; and at night there was a general illumination through the metropolis, which was repeated on the following evening.

Peace was proclaimed in the cities of London and Westminster, on the 29th of April, 1802; and, notwithstanding the ardour with which the preliminary articles had been received, was considerably abated by the insidious conduct of France, during the interval that had elapsed since that period; yet, generally speaking, the most lively sensations of joy were excited on the present occasion. The streets were crowded at a very early hour, by persons of almost every rank, impatiently waiting for the procession; and the vast number of strangers from the country, whom curiosity had attracted, added much to the bustle of the scene. The procession was formed at St. James's Palace; and the ceremony commenced at twelve o'clock, by Francis Townsend, esq. Windfor Herald, reading the proclamation of peace for the first time; after which the procession moved forward along Pall Mall to Charing Cross, where it halted, and the reading of the proclamation was repeated by another herald. It then proceeded along the Strand to Temple Bar, where it arrived at one o'clock. On its approach to the Bar on the Westminster side, the horse-guards filed off, and lined both sides of the way. The beadles and constables of Westminster, and the officers of the high-bailiff, did the same, and made a lane for the knight-marshal and his officers to ride up to Temple Bar, the gates of which were shut. The junior officer of arms, Francis Martin, Blue-mantle pursuivant, then coming out of the rank, between two trumpeters, and preceded by

two horse-guards, rode up to the gate; and, after the trumpets had sounded thrice, knocked with a cane. Being asked by the city-marshal from within "Who comes there?" he replied "The officers of arms, who demand entrance into the city, to publish his majesty's proclamation of peace." The gates being opened, he was admitted alone, and the gates were shut again. The city-marshal, preceded by his officers, conducted him to the lord-mayor, to whom he showed his majesty's warrant, which his lordship having read, he returned, and gave directions to the city-marshal to open the gates, who attended the officer of arms on his return to them, and, on leaving him, said, "Sir, the gates are opened." The trumpets and guards, being in waiting, reconducted him to his place in the procession, which then moved on into the city, the officers of Westminster retiring as they came to Temple Bar, and the city-procession fell in behind the kings of arms in the following order:

- |   |   |  |
|---|---|--|
| Four Constables together.                                 |   |  |
| Six Marshalsmen, on foot, three and three.                |   |  |
| Six Trumpeters, three and three.                          |   |  |
| Two City Marshals on horseback.                           |   |  |
| Sheriffs Officers on foot.                                | { | Sheriffs Officers on foot.   |
|   | { | Two Sheriffs on horseback.   |
|   | { | Sword and Mace bearers on horseback.   |
| Porter in a Black gown with a Staff.                      | { | Beadles.   |
|   | { | LORD MAYOR on horseback, bearing the ancient sceptre of the city, which is of gold and glass, ornamented with pearls and precious stones round the coronet, and surmounted with the national arms. |
| Household on foot.  |   |  |
| Six Footmen in rich liveries, three and three.            |   |  |
| State Coach, with six horses decorated with ribbands, &c. |   |  |
| Aldermen in seniority, in their coaches.                  |   |  |
| Carriages of the Sheriffs.                                |   |  |
| Officers of the City in Carriages according to seniority. |   |  |
| Horse Guards.   |   |  |
| The Volunteer Corps of the City.                          |   |  |
| The Artillery Company.                                    |   |  |
| The East India Volunteers.                                |   |  |

The proclamation was read at the bottom of Chancery-lane; after which the procession moved on through Fleet-street, Ludgate-hill, and St. Paul's-church-yard, to Cheap-side. At the end of Wood-street, the cavalcade halted till the proclamation was again read; and, when the procession reached the Royal Exchange, it was read for the last time. The procession then passed along Cornhill and Leadenhall-street to Aldgate; and doubled back along Fenchurch-street, Gracechurch-street, and Cornhill, to the Mansion-house; from whence the horse-guards escorted the heralds to their college in Doctors' Commons; and afterwards proceeded to St. James's, with the knight-marshal and his men.

Illuminations of the most splendid nature succeeded the ceremonial of the day. The Mansion-house, the Bank, the India-house, the public offices, and theatres, as well as the houses of many individuals, were particularly distinguished, for the taste and splendour of their decorations; but the object of universal attraction, was the French minister Mons. Otto's house, in Portman-square, which was most brilliantly illuminated with coloured lamps disposed in the form of a temple of the Ionic order, and having in the centre a large transparency, representing England and France, with their various attributes, in the act of uniting their hands, in token of amity, before an altar dedicated to Humanity, above which appeared the word PEACE, with olive-branches around it. It may be worth while to mention, as characteristic of the national feelings, a circumstance which occurred here a few days before the illumination. Immense crowds were daily attracted, by the preparations for the magnificent display which afterwards took place. At length the word CONCORD was formed in coloured lamps, on the entablature of the temple; the reading of John Bull was, however,

CONQUERED;

CONQUERED; and his inference, that it was intended that Britain was conquered by France. Disturbance and riot were about to commence, when Mr. Otto, after some fruitless attempts at explanation, prudently conceded, and the word AMITY was substituted. But it did not end here, for some sailors found out that the initials G. R. were not surmounted as usual by a crown: this they peremptorily insisted should be done, and a lamp-formed diadem was immediately put up. For the particulars of the treaty of Amiens, and causes which led to a renewal of the war, see the article ENGLAND, vol. vi. p. 795.

Parliament was prorogued on the 28th of June, and on the following day a proclamation was issued for calling a new one; and the 16th of November, the day appointed for the meeting of this new parliament, was distinguished by the providential discovery of a horrid conspiracy, to overturn the constitution, get possession of the different branches of the royal family, and murder our beloved sovereign. The persons concerned in this diabolical scheme were under the guidance and command of colonel Despard, and consisted, principally, of labourers and the lower class of citizens, amongst whom were three soldiers of the guards. They were apprehended at an obscure public-house in Lambeth, and, after several examinations before the privy council, colonel Despard and fourteen of his followers were fully committed to take their trial for high treason. In the beginning of February 1803, they were tried before a special commission, when Despard and nine others were convicted. Three of the latter were respited, and afterwards pardoned: the other seven were executed on the 19th of February, on the top of the new gaol in Horsemonger-lane. After the conviction of the conspirators, addresses from both branches of the legislature, and from most of the corporate bodies in the kingdom, were presented to his majesty. That from the city of London was presented on the 2d of March, 1803.

It has been seen, in the page just now quoted of our article ENGLAND, that, within a few months after peace had been signed with France, disputes arose between the two countries, which our ambassador, lord Whitworth, was in vain striving to accommodate. While the public mind was in the greatest anxiety upon that important subject, a most extraordinary forgery was practised in the city. At an early hour in the morning, a man delivered a letter at the mansion-house, which he said he had brought from the secretary of state, and requested it might be delivered immediately; it was accordingly given to the lord-mayor, and soon after the following literal copy appeared in front of the mansion-house: "Lord Hawkebury presents his compliments to the lord-mayor, and has the honour to acquaint his lordship, that the negotiation between this country and the French republic is brought to an amicable conclusion. Downing-street, eight o'clock, May 5, 1803." Printed notices were then posted round the custom-house, declaring the embargo to be taken off salt-petre, &c. In consequence of this delusion, the consols experienced an immediate rise from 63 $\frac{3}{4}$  to 71 $\frac{1}{4}$ . A real treasury-messenger soon arrived, however, to announce the deception; on which the genuine communication was read in the public streets by the city-marshal. The confusion which ensued was beyond all description: the Stock-Exchange was immediately shut, and the committee came to a resolution that all bargains made that morning should be void; and the consequence of the detection of this artifice was a rapid fall in the funds to their first price in the morning.

A similar attempt was made two days after through the medium of the Times, a morning paper notoriously in the interest of government, in which a paragraph appeared, stating the amicable termination of the differences with France. The committee for managing the Stock Exchange, however, in order to guard against a second imposition, would not allow the doors to be opened until the truth of the report could be officially ascertained. At their instance, the lord-mayor addressed a note to lord Hawke-

bury, soliciting information, and stating the occasion of his application. To this note the chancellor of the exchequer, in the absence of lord Hawkebury, returned an answer, signifying that no information had been received by government which could be the subject of a public communication, and cautioning the lord-mayor against receiving reports through unauthorized channels. An extract of this answer being made public, the Stock-Exchange was opened, and business went on as usual. The public uncertainty relative to the negotiations was terminated in a few days by a declaration of war, on the part of Great Britain against France, being laid before parliament, by order of his majesty.

In the afternoon of the 9th of June, a most singular phenomenon happened in Panton-street, Haymarket. The inhabitants were alarmed by a violent and tremendous storm of rain and hail, which extended only to Oxendon-street, Whitcomb-street, Coventry-street, and the Haymarket, a space not exceeding 200 acres. For about seven minutes the torrent from the heavens was so great, that it could only be compared to a cataract rushing over the brow of a precipice. In the midst of the hurricane an electric cloud descended in Panton-street, which struck the centre of the coachway, and sunk in to a great depth, forming a complete pit, in which not a vestige of the materials which had before occupied the space could be found. The sulphureous odour from the cloud was so powerful, that, for several seconds, the persons near the spot were almost suffocated. No farther damage was done, except filling the neighbouring kitchens and cellars with water, which soon escaped through the gulph formed by the electric fluid. We must beg leave here to observe, that, in the case of a thunder-storm, the electric spark is either emitted from the impending cloud, or elicited from the spot of earth just under it. If the earth is loaded with electric fluid in greater proportion than the cloud, the spark issues from the earth, and *vice versa*; but, the effect being generally the same, and the flash exceedingly brisk, our organs cannot distinguish from what place the dreadful shock issues.

From the statements made by us under the article FRANCE, vol. vii. p. 851-858. we think it will appear evident that the continual encroachments and unreasonable conduct of the first consul, Bonaparte, were the cause of the rupture of the peace of Amiens. This was the general opinion in England; and hence all parties were united in a desire to strengthen the hands of government for the prosecution of the present war. Accordingly, a meeting of the merchants, bankers, ship-owners, traders, and other inhabitants, of the metropolis, was held upon the Royal Exchange, on the 26th of July, for the purpose of expressing their sentiments in support of the king and constitution, and of the honour and independence of the country. Between four and five thousand of the most opulent and respectable of the mercantile interest filled the area; while those who were more immediately instrumental in convening the meeting occupied a temporary booth erected within the walk on the east side. Jacob Bosanquet, esq. was unanimously called to the chair; and after having, in a manly and energetic speech, entered at large into the cause of their assembling, proposed to them the following declaration, which was agreed to without a dissenting voice. "We, the merchants, bankers, traders, and other inhabitants, of London, and its neighbourhood, deem it our bounden duty, at the present momentous period, to make public our unanimous determination to stand or fall with our king and country. The independence and existence of the British empire; the safety, the liberty, the life, of every man; is at stake. The events, perhaps, of a few months, certainly of a few years, are to determine whether we and our children are to continue freemen and members of the most flourishing community in the world, or whether we are to be the slaves of our most implacable enemies—themselves the slaves of a foreign usurper! We look on this great crisis without dismay. We have the most

most firm reliance on the spirit and virtue of the people of this country. We believe that there exists a firmer, as well as nobler, courage than any which rapine can inspire; and we cannot entertain such gloomy and unworthy apprehensions of the moral order of the world, as to think that so admirable a quality can be the exclusive attribute of freebooters or slaves. We fight for our laws and liberties—to defend the dearest hopes of our children—to maintain the unspotted glory which we have inherited from our ancestors—to guard from outrage and shame those whom nature has entrusted to our protection—to preserve the honour and existence of the country that gave us birth.—We fight for that constitution and system of society, which is at once the noblest monument and the firmest bulwark of civilization!—We fight to preserve the whole earth from the barbarous yoke of military despotism!—We fight for the independence of all nations, even of those who are the most indifferent to our fate, or the most blindly jealous of our prosperity. In so glorious a cause—in defence of these dearest and most sacred objects—we trust that the God of our fathers will inspire us with a valour which will be more than equal to the daring ferocity of those who are lured, by the hope of plunder, to fight the battles of ambition.—His majesty is about to call upon his people to arm in their own defence. We trust, and we believe, that he will not call on them in vain—that the freemen of this land, going forth in the righteous cause of their country, under the blessing of Almighty God, will inflict the most signal chastisement on those who have dared to threaten our destruction—a chastisement, of which the memory will long guard the shores of this island; and which may not only vindicate the honour, and establish the safety, of the empire, but may also, to the latest posterity, serve as an example to strike terror into tyrants, and to give courage and hope to insulted and oppressed nations. For the attainment of these great ends, it is necessary that we should not only all be unanimous, but a zealous, an ardent, and unconquerable, people—that we should consider the public safety as the chief interest of every individual—that every man should deem the sacrifice of his fortune and his life to his country as nothing more than his duty—that no man should murmur at any exertions or privations which this awful crisis may impose upon him—that we should regard faintness or languor in the common cause as the basest treachery—that we should go into the field with an unshaken resolution to conquer or to die—and that we should look upon nothing as a calamity compared with the subjugation of our country. We have the most sacred duties to perform—we have most invaluable blessings to preserve—we have to gain glory and safety, or to incur indelible disgrace, and to fall into irretrievable ruin. Upon our efforts will depend the triumph of liberty over despotism—of national independence over projects of universal empire—and, finally, of civilization itself over barbarism. At such a moment we deem it our duty solemnly to bind ourselves to each other, and to our countrymen, in the most sacred manner, that we will employ all our exertions to rouse the spirit, and to assist the resources, of the kingdom—that we will be ready with our services of every sort, and on every occasion, in its defence—and that we will rather perish together, than live to see the honour of the British name tarnished, or that noble inheritance of greatness, glory, and liberty, destroyed, which has descended to us from our forefathers, and which we are determined to transmit to our posterity.” We have recorded the above declaration, as an interesting display of British feeling and patriotism, which the world and posterity must contemplate with admiration. Such an expression of zeal and loyalty as was exhibited in the whole conduct of the meeting was, perhaps, never paralleled at the most glorious era of the histories of Greece or Rome, or of any other nation.

In consequence of the negligence of some of those whose duty it was to see the lights put out, Aikley's Amphitheatre, near Westminster Bridge, was destroyed by fire early in the morning of the 2d of September. The immense quantity of inflammable materials it contained caused the flames to rage with such fury, that nearly forty houses were consumed before the fire could be got under. An accident of the same kind, and in the same place, had occurred on the night of the duke of York's birth-day, August 16, 1797.

The 26th and 28th of October displayed a most gratifying spectacle to the patriotic heart of every citizen of London and Westminster; and indeed to the satisfaction of every Briton, and the admiration of the whole world. We mean the splendid reviews of the volunteers in Hyde-park, occasioned by the threats of the ruler of France to try his power and that of his allies in order to effect the invasion of this country. Although his rodomontading menaces did not cause much alarm to our government, yet they were sufficient to lead the minister to cautious measures. We have before noticed (p. 128) a review of volunteers amounting to nearly nine thousand; upon the present occasion they amounted to 27,077.

The last day of the year 1803 was remarkable for two extraordinary tides in the river Thames. That in the afternoon, which was the highest, although a neap-tide, stood eight inches above the level of the usual spring-tides; it was not, however, so high as the great tide in February 1791. (See p. 122.) Much damage was done on the banks of the river, by the water filling warehouses, cellars, &c. and Westminster hall would have been again inundated, but, since 1791, a new floor had been laid on arches, which raised it out of the reach of these floods.

On the 28th of January, 1804, a beautiful tessellated pavement was discovered opposite to the East India-house, in Leadenhall-street, by some workmen employed to repair the water-pipes. When entire, it formed a square of nine feet, in the centre of which, within an elegantly-adorned circle of about three feet in diameter, is a figure of Bacchus in a green mantle, holding in his left hand a thyrsus decorated with ivy, and in his right a goblet, sitting on a tiger at full speed, with his head, which is also adorned with ivy, inclined to the neck of the beast, who is looking backwards at his rider. The circle is surrounded by three borders of different patterns; and in each angle is a cup with two handles. It was found about ten feet below the surface of the street; and some fragments of an urn which had contained bones were found near it. It is preserved in the East-India-house.

A case was heard at Guildhall on the 11th of January, 1805, relative to the right of freemen of the city of London, carrying the goods of non-freemen for hire, without paying the city toll; when it was determined, that, under such circumstances, a freeman was not entitled to the full exemption; and the defendant was therefore adjudged to pay half-toll.

The London Docks were opened on the 30th of January. On the 1st of March, the directors of the West-India-Dock Company agreed on a petition to parliament to enable them to raise a further sum of sixty thousand pounds, for finishing the canal at the Isle of Dogs; which was presented the same day, and an act of parliament was afterwards passed in conformity to the prayer of it. This contrivance, which tended to shorten the way for ships round the Isle of Dogs, where the river, by its curious winding, makes that place a sort of peninsula in front of Greenwich Hospital, and which, we have no doubt, will, in the space of a few years, be covered with villas and houses erected for those whose daily employ calls to that spot; this very proper and wonderfully-useful contrivance has been since fully completed. See ISLE OF DOGS, vol. xi. p. 408.—The foundation-stone of the East-India Docks, at Blackwall, was laid on the 4th of March.

On the 21st of April, a dreadful fire destroyed the whole of the water-mills at the northern extremity of the cut from the Thames to the river Lea. A great quantity of corn and flour was consumed by the flames; and, had it

not been for a sudden and providential change of wind, the conflagration would have involved the whole village of Bromley in the common calamity.

The most violent storm that had occurred in or near the capital for many years, took place on the morning of the 6th of September, between five and seven o'clock. The thunder was uncommonly loud and awful, and the lightning resembled red and glowing balls of fire. Many persons felt shaken in their beds; and in some instances light articles were moved as if by an earthquake. The greatest violence of the storm was felt near Kensington Gore, where several trees were split by the lightning. A house on the road-side was struck by a fire-ball, which demolished the whole stack of chimneys, and passed through the kitchen; part of the park-wall was also thrown down.

In the month of October, part of the hospital of Bethlem was pulled down, and the site and materials sold. The lunatics were removed to St. Luke's, where they remained until the new hospital, now erecting, on a very enlarged scale; near the Asylum in St. George's Fields, shall be completed.

News of the glorious and decisive victory of the British fleet, commanded by lord Nelson, over the combined fleets of France and Spain, off Cape Trafalgar, on the 21st of October, in which nineteen ships of the line were taken or destroyed, arrived in London on the 6th of November. See the article GREAT BRITAIN, vol. viii. p. 818-20. The joy arising from this important event was, however, considerably allayed by the intelligence that the triumph had been purchased with the life of the intrepid commander by whom it had been achieved; and so powerful were the sensations of regret for this melancholy catastrophe, that, with very few exceptions, the public demonstrations of exultation were withheld on the evening after the arrival of the dispatches; and it was not until the following night that an illumination took place throughout the metropolis.

An address of congratulation on this occasion was presented to his majesty, by the corporation of London, on the 21st of November; and on the 26th the court of common-council came to a resolution to erect a monument in Guildhall, to the memory of lord Nelson; and voted a sword, of the value of two hundred guineas, to admiral Collingwood, his second in command; and swords, of the value of one hundred guineas, to admirals lord Northesk, the third in command, and sir Richard Strachan, who, with a small squadron of observation stationed off Ferrol, had been so fortunate as to fall in with and capture four ships of the line which escaped from the action off Cape Trafalgar. At the same court a letter was read from the Hon. Mrs. Damer, offering to execute the monument upon such a model as the court should approve; upon which the thanks of the court were voted to her; but, by subsequent regulations, another design was adopted at a court of common-council, where several models were presented; and the one which was accepted by plurality of votes has been executed, and now stands on the north side of Guildhall. The whole has a striking rather than a pleasing appearance. The general suite is there—Britannia, the City of London, and Old Neptune in an attitude which commands respect and astonishment; on the basis, a very excellent bas-relief represents the famous and dear-bought victory of Trafalgar; and in two small niches on each side two young sailors are cut with much spirit, and a mellowness of touch which does great honour to the artist. Had the invention and composition been as faultless as the manual execution, the monument would have received the full meed of our praise. The inscription, which, though rather long, does not express all we should feel for the hero who had, by his exertions, the loss of his limbs, and lastly by that of his life, prepared the opening perspective of general peace and happiness which at this moment salute our eyes; the inscription is said to have been written by Mr. Sheridan. It is elegant, copious, harmonious, true; yet it might have been shorter, and thereby

more certain of producing the desirable effect. A national tribute, however, was paid to him in a public funeral, or rather in a funeral triumph, of which we cannot refrain from giving some particulars.

On Wednesday, the 8th of January, 1805, the heralds and naval officers, who were to assist in the procession by water, assembled at the governor's house in Greenwich Hospital, where they were met by the lord-mayor, aldermen, and committee appointed by the corporation of London, and proceeded to their several barges. The body was then carried from the Saloon, where it had lain in state, through the Great Hall, out at the eastern portal, round the Royal-Charlotte Ward, to the North Gate, and placed on-board the State Barge. The coffin was covered with a velvet pall, adorned with escutcheons. During the procession from the Great Hall to the barge, a very noble band of music played the Dead March in Saul; minute-guns were fired; and the bells tolled in unison.

The body being embarked, the Funeral-barge was rowed by sixteen seamen belonging to the Victory; the other barges by picked men from the Greenwich pensioners. They had all their flags hoisted half-staff high; and, as the procession passed the Tower, minute-guns were there fired. Not a vessel was suffered to disturb the procession. The decks, yards, rigging, and masts, of the numerous ships on the river, were all crowded with spectators; and the number of ladies was immense. During the procession up the river, a lady of the name of Bayne was so affected at the scene, that she fell into hysterics, and died a few minutes after.

The Navigation-barge, which is usually stationed at Kew for excursions up the river, and which, though as long as a 74-gun ship, draws but two feet water, was, on this occasion, for the first time, brought through Westminster-bridge, and moored opposite the Temple, for the accommodation of such Members of the Corporation (in deep mourning and violet gowns) as were not actually engaged in the procession.

At a quarter before three, the procession approached Whitehall-stairs; the King's, Admiralty, Lord-mayor's, and City, Barges, immediately drew up in two lines, through which the barge with the body passed. All the oars were advanced, and the trumpets and other bands played the Dead March in Saul, the gun-boats firing minute-guns all the time. Exactly at three the Funeral-barge began to disembark its charge. A procession then commenced from Whitehall-stairs to the Admiralty, on foot. Every necessary preparation had been made at the Admiralty for receiving the body. The Captain's room, in which it was placed, was hung with superfine black cloth for this solemn occasion. The room was lighted with wax tapers, placed in sconces on the sides. Here the body remained, guarded by the officers of the house, till the ceremony of its removal to St. Paul's commenced.

On Thursday the 9th, an hour before day-light, the drums of the different volunteer corps in every part of the metropolis beat to arms; and, soon after, these troops lined the streets, in two ranks, from St. Paul's church-yard, to the Admiralty. The life-guards were mounted at their post in Hyde Park by day-break, where the carriages of the nobility, &c. with the mourning coaches appointed to form a part of the procession, began to be assembled at eight o'clock, in a line from Hyde-Park Corner to Cumberland Gate. By ten, one hundred and six carriages were assembled, of which number near sixty were mourning coaches, principally filled with naval officers; all of which, under the direction of the proper officers, were marshalled in their due order of precedence, and drove into St. James's Park, to be in readiness to fall into the procession on the proper signal. In St. James's Park were drawn up all the regiments of cavalry and infantry quartered within 100 miles of London, who had served in the glorious campaigns in Egypt, after the ever-memorable victory at the Nile; and a detachment of flying artillery, with eleven field-pieces, and their ammunition-tumbrils. At eleven

the procession commenced from the Admiralty, with the march of the several regiments, led by his Royal Highness the Duke of York, attended by his aides de-camp and staff, in the following order:

1. A detachment of the 10th Light Dragoons.
2. Four Companies of Light Infantry of the Old Buffs, with the band playing Rule Britannia, drums muffled, as an advanced guard.
3. The 92d and 79th Regiments, in sections, commanded by the Hon. Major-general Charles Hope; their Colours honourably shattered in the campaign of Egypt, which word was inscribed upon them, borne in the centre, and hung with crape.
4. The rear-guard formed by a detachment of the 92d, preceded by their National Pipes, playing the Dead March in Saul.
5. The 31st and 21st Regiments, commanded by the Hon. Brigadier-general Robert Meade, with their bands playing as before.
6. The 14th, 10th, and 2d, Light Dragoons, and the Scotch Greys, two squadrons of each, commanded by Major-general William St. Leger. The Trumpets at intervals founded a solemn Dirge, and performed the Dead March.
7. The Royal Horse Artillery, with 11 field-pieces. The whole of the Military were under the command of General Sir David Dundas, K. B. and Lieut. Gen. Henry Burrard.
8. Six Marshalmen, on foot, to clear the way.
9. Messenger of the College of Arms, in a mourning cloak, with a badge of the College on his shoulder, his staff tipped with silver, and furled with sarfnet.
10. Six Conductors in mourning cloaks, with black staves headed with Viscount's Coronets.
11. Forty-eight Pensioners from Greenwich Hospital, two and two, in mourning cloaks, with badges of the Crests of the Deceased on their shoulders, and black staves in their hands.
12. Forty-eight Seamen and Marines of his Majesty's ship Victory, two and two, in their ordinary dress, with black neck handkerchiefs and stockings, and crape in their hats.
13. Watermen of the Deceased, in black coats, with their badges.
14. Drums and Fifes. 15. Drum Major. 16. Trumpets. 17. Serjeant Trumpeter.
18. Rouge Croix, Pourfuiwant of Arms (alone in a mourning coach), in close mourning, with his tabard over his cloak, black silk scarf, hatband, and gloves.
19. The Standard borne in front of a mourning coach, in which were a Captain and two Lieutenants of the Royal Navy, in their full uniform coats, with black cloth waist-coats, breeches, and black stockings, and crape round their arms and hats.
20. Trumpets.
21. Blue-Mantle, Pourfuiwant of Arms (alone in a mourning coach), habited as Rouge Croix.
22. The Guidon, borne in front of a mourning coach, in which were a Captain and two Lieutenants of the Royal Navy, dressed as those who bore and supported the Standard.
23. Servants of the Deceased, in mourning, in a mourning coach.
24. Officers of his Majesty's Wardrobe, in mourning coaches.
25. Gentlemen. 26. Esquires.
27. Deputations from the Great Commercial Companies of London.
28. Physicians of the Deceased, in a mourning coach.
29. Divines, in clerical habits.
30. Chaplains of the Deceased, in clerical habits; and Secretary of the Deceased, in a mourning coach.
31. Trumpets.
32. Rouge Dragon and Portcullis, Pourfuiwants of Arms, (in a mourning coach,) habited as before.
33. The Banner of the Deceased as a Knight of the

Bath, borne in front of a mourning coach, in which were a Captain and two Lieutenants of the Royal Navy, dressed as those who bore and supported the Guidon.

34. Attendants on the Body while it lay in state at Greenwich; viz. Rev. A. J. Scott (Chaplain to his Royal Highness the Prince of Wales), Joseph Whidbey and John Tyfon, Esquires, in a mourning coach.

35. Knights Bachelors. 36. Serjeants at Law.

37. Deputy to the Knight Marshal on horseback.

38. Knights of the Bath.

39. A Gentleman Usher (in a mourning coach), carrying a carpet and black velvet cushion, whereon the trophies were to be deposited in the church.

40. Comptroller, Treasurer, and Steward of the Household, of the Deceased, (in a mourning coach,) in mourning cloaks, bearing white staves.

Next followed the carriages of the different degrees of Nobility and Great Law-Officers, who attended to show their respect to the memory of the Deceased, beginning with the younger sons of barons, and ending with the following distinguished personages:

Duke of Norfolk, Earl Marshal.

Earl Camden, K. G. Lord President of the Council, Archbishop of Canterbury.

His Royal Highness the Duke of Cambridge.

His R. H. the Duke of Suffex.

His R. H. the Duke of Cumberlan.

His R. H. the Duke of Kent.

His R. H. the Duke of Clarence.

His R. H. the Duke of York, Commander in Chief.

His Royal Highness the Prince of Wales.

The Prince of Wales, Dukes of Clarence, Cambridge, and Suffex, were in coaches and six.

The Duke of York and his staff, with the Dukes of Kent and Cambridge, and the Colonels of Volunteers, followed the Funeral Car on horseback.

41. Richmond Herald (alone in a mourning coach), habited as the other Officers of Arms.

42. The Great Banner, borne in front of a mourning coach, in which were a Captain and two Lieutenants of the Royal Navy, dressed as those who supported the Banner.

43. Gauntlet and Spurs; Helm and Crest; Target and Sword; Surcoat; in front of four mourning coaches, in which were York, Somersct, Lancafter, and Chester, Heralds, habited as before.

44. A mourning coach, in which the Coronet of the Deceased, on a black velvet cushion, was borne by Norroy King of Arms (in the absence of Clarenceux), habited as before, and attended by two Gentlemen Ushers.

45. The six Lieutenants of the Victory, habited as before, with the bannerolls, in two mourning coaches.

46. The six Admirals, in like habits, who were to bear the Canopy, in two mourning coaches.

47. The four Admirals, in like habits, to support the Pall, in a mourning coach.

48. The BODY,

placed on a Funeral Car, or open Hearse, decorated with a carved imitation of the head and stern of his Majesty's Ship the Victory, surrounded with Escutcheons of the Arms of the Deceased, and adorned with appropriate mottos and emblematical devices; under an elevated Canopy, in the form of the upper part of an ancient Sarcophagus, with six sable Plumes, and the Coronet of a Viscount in the centre, supported by four Columns, representing Palm-trees, with wreaths of natural laurel and cypress entwining the shafts; the whole upon a four-wheeled carriage, drawn by six led Horses, the Caparisons adorned with Armorial Escutcheons. The head of the Car was ornamented with a figure of Victory. The stern, carved and painted in the naval style, with the word "Victory," in yellow raised letters on the poop. Between the Escutcheons were inscribed the words "Trinidad," "Bucentaur," "L'Orient," and "St. Josef." The Coffin, placed on the quarter-deck, with its head towards the stern, with an English jack pendant over the poop, and lowered half-staff.

staff. The corners and sides of the Canopy were decorated with black ostrich-feathers, and festooned with black velvet, richly fringed, immediately above which, in the front, was inscribed, in gold, the word "Nile," at one end. On one side the following motto; *Hoste devicto, requievit*; behind the word "Trafalgar;" and on the other side the motto, *Palnam qui meruit ferat*. The black velvet Pall, adorned with six Escutcheons of the Arms of the Deceased, and the six Bannerolls of the Family Lineage, were removed from the Hearse, in order to afford an unobstructed view of the Coffin containing the remains of the gallant Admiral.

49. Garter, Principal King of Arms, in his official habit, with his sceptre, (in his carriage, his servants being in full mourning,) attended by two Gentlemen Ushers.

50. The Chief Mourner, in a mourning coach, with his two Supporters, and his Train-bearer; all in mourning cloaks.

51. Six Assistant Mourners (in two mourning coaches), in mourning cloaks as before.

52. Windsor Herald, acting for Norroy King of Arms, (in a mourning coach,) habited as the other Officers of Arms, and attended by two Gentlemen Ushers.

53. The Banner of Emblems, in front of a mourning coach, in which were two Captains and two Lieutenants of the Royal Navy.

54. Relations of the Deceased, in mourning coaches.

55. Officers of the Navy and Army, according to their respective ranks; the seniors nearest the body: the whole in 50 mourning coaches.

56. The Private Chariot of the Deceased, empty—the blinds drawn up—the coachman and footman in deep mourning, with bouquets of cypresses.

The whole moved on in solemn pace, through the Strand to Temple Bar, where the Lord Mayor of London waited to receive the Procession, accompanied by the Aldermen, Recorder, Sheriffs, and twelve Gentlemen, selected from the Committee appointed by the Corporation for arranging their attendance at the Funeral.

On the arrival of the Military preceding the whole, the Lord Mayor had a short conversation with his Royal Highness the Duke of York.

As the Procession advanced, the Deputation of the Common Council, in six elegant chariots, and in their violet gowns, fell in, as had been previously adjusted, before the Physicians of the Deceased; and were preceded by seven select Sailors from the Victory, who had accompanied the Committee in their Barge, bearing the Union Jack, and Pendant, of the ship; whose honourable tatters attracted universal attention.

The Aldermen, in their scarlet gowns, fell in before the Masters in Chancery; and (by an especial Sign Manual) the Lord Mayor on horseback, bearing the City Sword, attended by the Sheriffs, rode between his Royal Highness the Prince of Wales and the Heralds at Arms.

On the arrival of the Procession at St. Paul's (which was filled at an early hour by all those who could obtain places), the Cavalry marched off to their barracks; the Scotch regiments drew up in the area fronting the Church, and marched in at the Western Gate.

The 48 Greenwich Pensioners, with the 48 Seamen and Marines from the Victory, entered the Western Gate, ascended the steps, and divided in a line on each side under the great Western Portico.

On the arrival of the Body and the Funeral Car at the Great Entrance, it was drawn up without the Western Gate. The Body was taken from the Car, covered with the Pall, and borne by 12 men; and was received within the gate by the Supporters and Pall-bearers, who had previously alighted for its reception. The remainder of the Procession entered the Church, and divided on either side according to their rank; those who had proceeded first remaining nearest the door.

Immediately after the Great Banner, near the entrance of the Church, the Dean and Chapter fell into the Pro-

cession, attended by the Minor Canons and Vicars Choral; &c. of St. Paul's Cathedral, assisted by the Priests and Gentlemen of his Majesty's Chapels Royal, and the Minor Canons and Vicars Choral of the Collegiate Church of St. Peter, Westminster, and others, who sang the first part of the Burial Service, set to music by Dr. Croft.

The Body was borne into the Church and Choir, preceded by Richmond Herald; the Great Banner borne by a Captain; and the Gauntlet and Spurs, Helm and Crest, Target and Sword, and Surcoat, by four Heralds as before.

The Coronet by Norroy King of Arms.

The BODY,

with the Supporters of the Pall and Canopy.

Garter, King of Arms.

Chief Mourner, and Assistant Mourners.

Windsor Herald.

The Banner of Emblems.

Relations of the Deceased; viz. Horatio Nelson, esq. commonly called Viscount Merton, nephew; G. Matcham, esq. nephew; G. Matcham, esq. brother-in-law; William earl Nelson, sole brother and heir; T. Bolton, esq. nephew; T. Bolton, esq. brother-in-law. Rev. R. Rolfe, T. T. Berney, esq. Hon. H. Walpole, Hon. G. Walpole, cousins.

The remainder of the procession followed in the order as before marshalled.

The Officers of Arms, and the Bearers of the Banners, with their Supporters, entered the Choir, and stood within, near the door; and all above and including the rank of Knights Bachelors, as well as the Staff-Officers, and the Naval Officers who attended the procession, had seats assigned to them in the Choir. The Chief Mourner, his two Supporters, and Train-bearer, were seated on chairs near the Body, on the side next the Altar; and the six Assistant Mourners, four Supporters of the Pall, and six Supporters of the Canopy, on stools on each side; the Relations also near them in the Choir; and Garter was seated near the Chief Mourner. The Prince of Wales, and his six Royal Brothers, were at the east end of the prebendal stalls, on the south side of the Choir. The Duchefs of York was also seated in the Choir; her Royal Highness was conducted to her seat by the Bishop of Lincoln. The Officers of the Navy, and the Staff Officers commanding the troops, were seated near the altar. The Lord-mayor, Aldermen, Recorder, and Sheriffs, were in their accustomed seats (the prebendal stalls), at the east end of the north side of the Choir; their Ladies in the closets over them; and the Deputation of the Common-council in the seats immediately under the Aldermen.

The Body, when placed in the Choir, was not covered with the Pall, nor the Canopy borne over it; the rule in that respect being dispensed with, for the reason before mentioned. The Bannerolls were borne on each side the Body. The Carpet and Cushion (on which the Trophies were afterwards to be deposited) were laid by the Gentleman Usher who carried them on a table placed near the Grave, which was under the centre of the Dome, and behind the place which was to be there occupied by the Chief Mourner. The Coronet and Cushion, borne by Norroy King of Arms (in the absence of Clarenceux), were laid on the body.

The Gentlemen of the three Choirs ascended into a gallery on the east side of the organ, from which the Evening Service was performed. At the conclusion of the service in the Choir, a procession was made thence to the Grave, with the Banners and Bannerolls as before; during which was performed on the Organ a grand solemn Dirge, composed and played by Mr. Attwood; the Officers of Arms preceded with the Trophies; the Gentlemen of the Choir of St. Paul's accompanying the Body; the Gentlemen of the Chapels Royal and Westminster stationing themselves in a gallery on the West side of the Organ; the Body borne and attended as before.

The Chief Mourner, with his Supporters, and near them Garter, had seats at the East end of the Grave; the

Train-

Train-bearer stood behind the Chief Mourner, and near him the Relations of the Deceased. At the opposite end sat the Right Reverend the Lord Bishop of Lincoln, Dean of the Cathedral, attended by the three Canons Residentiaries. A Supporter of the Pall stood at each angle; the Assistant Mourners, Supporters of the Canopy, and Bearers of the Bannerolls, on either side. On the right of the Dean were the Chaplains; on the left the Officers of the Household of the Deceased. The Great Banner was borne on the North, the Banner of the Deceased, as a Knight of the Bath, on the South of the Grave; the Standard and Guidon behind the Dean; the Banner of Emblems behind the Chief Mourner; the Trophies in the angles. The Royal Dukes, Foreign Ambassadors, and Naval Officers, had seats reserved for them in the front of the South side of the Dome. The Lord-mayor, Aldermen, and the whole of the Common Council, with their Ladies, were seated in the front of the North side of the Dome.

At the Grave was sung, "Man that is born of a woman," &c. The remainder of the Burial-Service was then read by the Dean; and after the first Collect an Anthem was sung, selected from Handel's Grand Funeral Anthem. There was an excellent contrivance for letting down the Body into the Grave. A Bier was raised from the oblong aperture under the Dome, for the purpose of supporting the Coffin, by invisible machinery; the apparatus being totally concealed below the pavement. This contrivance prevented all those disagreeable circumstances which too often occur at the funerals of the great.

Upon a signal given from St. Paul's that the Body was deposited, the troops being drawn up in Moorfields, the Artillery fired their guns, and the Infantry gave volleys, by corps, three times repeated. The service of the interment being over, Garter proclaimed the style; and the Comptroller, Treasurer, and Steward, of the Deceased, breaking their staves, gave the pieces to Garter, who threw them into the Grave. The Interment thus ended, the Standard, Banners, Bannerolls, and Trophies, were deposited on the table behind the Chief Mourner; and the Procession, arranged by the Officers of Arms, returned.

It is a curious and singular circumstance, that the design of the Car, exactly as it was executed, and as it stands now in the Painted Hall at Greenwich, was invented and made by a French gentleman well known at the Herald's office. The occasional motto, *Hofte devicto, requievit*, was given by the same person. The idea of letting down the coffin, by means of flings, was suggested also by him to Mr. Wyatt two days before the funeral; and the obelisk, in black, erected by Mr. Milne, entirely removed on that account. We thought it but just to show that real merit and patriotism have every-where a claim to respect; and that foreigners themselves, in or out of this country, could not refuse their tribute of admiration to such a man as Nelson.

The vast space under the dome of the cathedral was illuminated by a temporary lantern, the contrivance of Mr. Wyatt, consisting of an octagonal framing of wood, painted black, and finished at top by eight angles, and at bottom by a smaller octagon. On it were disposed about 200 patent-lamps; and it was suspended by a rope from the centre of the lantern. When drawn up, it illuminated the whole church, and had a most impressive and grand effect, contributing greatly to the magnificence of the spectacle.

During the whole of this solemn ceremony, the greatest order prevailed throughout the metropolis; and, as the remains of the much-lamented hero proceeded along, every possible testimony of sorrow and of respect was manifested by an immense concourse of spectators of all ranks. From the Admiralty to the Cathedral, the streets were lined with the several Volunteer Corps of London and Westminster, the Militia, and many other military bodies both cavalry and infantry.

The Lord Mayor and Corporation of London are entitled to the grateful acknowledgments of the public (who profited by their attention throughout every department),

not only for the effectual manner in which they provided for the peace of the city, but for the comfortable access afforded, under their direction, to all who entered it. And it must not be forgotten, that the spirited exertions of the lord-mayor, now Sir James Shaw, bart. preserved on this occasion the right of the first magistrate to claim precedence, at a procession in the city, above even the princes of the royal blood. Long discussions took place between the court and the lord-mayor; at length, upon the representation and conciliating interference of Garter Principal King of Arms, to whom the preservation of all rights of precedence is entrusted, the affair was settled by a warrant from the king, assigning, *pro hac vice*, a place to the lord-mayor according to the pretensions of his office.

This behaviour of the lord-mayor was so agreeable to the corporation, that, at a court of aldermen, held on the 28th of January, it was *Resolved unanimously*, "That the thanks of this court be given to the Right Honourable the Lord-Mayor, for his judicious arrangement of this city's part of the Public Processions on the 8th and 9th instant, in honour of the late Lord Viscount Nelson; for that manly, temperate, and persevering, conduct, which procured him a warrant, under the King's Sign Manual, to hold in the procession of the 9th instant, within the city, the place due to the chief magistrate; viz. that of the first subject of the realm; for the perfect concert in which he acted with the committee of the other branch of the corporation; for his excellent disposal and brilliant display of the military force of this city; for his polite attention to all the members of this court, and to every other person with whom he had intercourse upon that solemn occasion; and for his liberal entertainments, particularly that at his Mansion-house on the 9th instant; when his hospitable table was attended by the municipal authorities of the city, and honoured by an assemblage of eminent persons, rendered dear to their fellow-citizens, by the great services they have performed to their country, in the honourable professions of the navy and army."

The four vergers of St. Paul's are said to have made more than a thousand pounds, by the daily admission to see the preparations for the funeral of lord Nelson, and by showing the coffin for several days after the obsequies. The money taken at the door amounted to more than 40l. each day.

The tears of the country were still flowing on the tomb of Nelson, when death deprived the nation of another of her great men. Mr. Pitt died on the 23d of January, 1806; and was buried the 22d of February following. Great difference of opinion prevailed in the corporation of London, in respect to the measures to be adopted in consequence of that event. The subject of discussion was a motion, in the court of common-council, on the 6th of February, "That this court, deeply impressed with a sense of the inflexible integrity, transcendent ability, and splendid virtue, of the late illustrious minister, the Right Hon. W. Pitt; do cause a monument to be erected within the Guildhall of this city, to perpetuate his memory, with a suitable inscription, expressive of their veneration for so pre-eminent a character, and of the irreparable loss this nation has sustained by the death of so exalted and disinterested a statesman." After a very animated debate, the question was determined in the affirmative by a majority of six only; but, when an attempt was made on the 28th of the same month to procure a reversal of the vote, the motion was lost, and the former vote confirmed, by a majority of thirty-six.

The monument having been determined upon, several models were presented for the choice of the corporation; and the one which was ordered to be erected is placed opposite to that of lord Chatham, and is no disparagement to it as a companion. On a rock arising from, and surrounded by, the waves of the sea, in allusion to the natural situation of Great Britain, the figure of Mr. Pitt stands aloft, before a marble pyramid, in the attitude of speaking, and in the costume of Chancellor of the

Exchequer. On the right, upon a lower ground, Apollo, holding the lyre, and his eyes fixed on the celestial regions, exemplifies, as the god of invention, of the high sciences, and of the liberal arts, the sublimity of the son of lord Chatham's transcendent genius; and, as the dispenser of light, reminds us of the brightness and strength of Mr. Pitt's irresistible argumentation. It appears as if the sculptor had clothed the inferior parts of this figure with a plain yet elegant drapery, purposely to intimate that, in his discourses, as well as in his conduct through public and private life, this great character adhered constantly to the strictest rules of decorum, and to an exemplary purity of morals.—On the other side, Mercury, holding a roll of paper in his left hand, as the god of eloquence, and the caduceus in his right, as the patron of commerce, and of that mutual and friendly intercourse among nations which tends to unite and bless all the classes of society, looks up, with approbation and complacency, to so distinguished an orator, and so profound a statesman. Below, and in the centre of the group, counterpoising with pleasing effect the three figures above, Britannia, ready to hurl the thunder of war, rides a sea-horse upon the submissive and tributary waves, and over the wreck of the enemy's naval power, alluded to by an ancient galley half sunk in the sea. Her helmet is adorned with branches of oak most delicately wrought, and with the prow of a ship, on which Victory is represented offering the triumphal wreath of the brave sons of Albion, and pointing allegorically to the brilliant exploits achieved by our navy, and to the wonderful increase of our maritime power, under the administration of Mr. Pitt.—A striking mixture of intrepidity and meekness, of loftiness and affability, animates the features of the female, emblem of our nation; and brings to mind this beautiful line, so expressive of the British character: *Parcere subjctis, et debellare superbo;* "To spare the conquer'd, and subdue the proud." The inscription upon this monument is from the pen of Mr. Canning, and has been much admired.

Mr. Pitt was the very soul of the government, which he had directed for so many years. As soon as it left that body, a change was naturally expected; and of course, those who had most strenuously blamed his plans, and opposed his measures, became the warmest candidates to fill the places of a new administration. The failure of a strong and lasting combination among our continental allies against the common enemy, and several other causes, among which we may reckon the system of exclusion, which had become unpopular, inasmuch as people are soon cloyed with a repetition of the same modes of acting, and even with the faces of the actors, would, even on the supposition that Providence had prolonged the life of Mr. Pitt, have required a material alteration. But the difficulty of composing a new ministry was felt in all its bearings. The opposition had split itself into several branches; and the court was averse to deposit the helm of government in the hands of men who had so little confidence in each other. An offer was therefore made to lord Hawkebury of the offices and situation vacant by the death of Mr. Pitt. This dazzling proposition, flattering as it was, deprived not the noble secretary of his habitual prudence. Fully sensible of the value of the gift, but aware also of the difficulties and responsibility attached to it, he requested time for deliberation. Had the circumstances of the moment been less unfavourable, he would probably have caught with eagerness at the high situation proposed to him; and, had he accepted of it, such is the prodigious influence of the crown, when exerted in good earnest, and managed with ability, that, unless he had fallen a victim to unfounded fears, or a sacrifice to antiquated scruples, or suffered from the treachery of some associate who had access to the royal ear, he could hardly have failed to maintain himself in his post against all the efforts of opposition, however numerous, respectable, and popular. But the present time was less favourable for such a struggle on the part of the crown than any period that had occurred since the end of the

American war. However, considering the state of parties, and particularly after consulting his friends, lord Hawkebury declined to take upon himself the government of the country. His refusal, when made known to the public, communicated universal satisfaction; and men were disposed to give him credit for forbearance and self-denial as well as for prudence, till they were informed, that he had obtained for himself a grant of the wardenship of the Cinque-Ports, and had procured the warrant, conferring on him that lucrative appointment, to be passed with unusual expedition through the public offices, as if he were afraid that it might be stopped, and the propriety of the grant questioned.

After long discussions on the point of taking lord Sidmouth into the administration, the plan, being at length arranged, was submitted to the king on the 31st of January, 1806, soon after which the following appointments took place: Lord Erskine, lord chancellor; earl Fitzwilliam, president of the council; viscount Sidmouth, lord privy seal; lord Grenville, first lord of the treasury; lord Howick, first lord of the admiralty; earl of Moira, master general of the ordnance; earl Spencer, Mr. Fox and Mr. Windham, secretaries of state; lord Henry Petty, chancellor of the exchequer; and lord Ellenborough, lord chief justice, with a seat in the cabinet. The duke of Bedford went as lord-lieutenant to Ireland, and Mr. Elliot accompanied him as secretary; Mr. George Ponsonby was appointed chancellor and keeper of the seals in Ireland, and sir John Newport chancellor of the Irish exchequer. So thorough and complete a change in all the departments of the state had not been seen since the year 1784.

The mind of the public was much interested at this period by the trial of brigadier-general Thomas Picton, late governor of the island of Trinidad, for putting Louisa Calderon to the question, or torture.

Mr. Garrow thus related the circumstances of the case: "The island of Trinidad surrendered to sir Ralph Abercrombie in the year 1797; and he entered into a stipulation, by which he conceded to the inhabitants the continuance of their laws, and appointed a new governor, until his majesty's pleasure should be known. In December 1801, when this crime was perpetrated, Louisa Calderon was of the tender age of ten or eleven years. [It has since appeared that she was four years older.] At that early period, she had been induced to live with a person of the name of Pedro Ruiz, as his mistress; and, although it appears to us very singular that she should sustain such a situation at that time of life, yet it is a fact, that, in that climate, women often become mothers at twelve years old, and live in a state of concubinage, if, from their condition, they cannot form a more honourable connection. While she lived with Ruiz, she was engaged in an intrigue with Carlos Gonzalez, the pretended friend of the former, who robbed him of a quantity of dollars. Gonzalez was apprehended, and she also, as some suspicions fell upon her in consequence of the affair. She was taken before the justice, as we, in our language, should denominate him; and in his presence she denied having any concern in the business. The magistrate felt that his powers were at an end; and, whether the object of her denial were to protect herself or her friend, is not material to the question before you. The extent of his authority being thus limited, this officer of justice resorted to general Picton; and I have to produce, in the hand-writing of the defendant, this bloody sentence: *Liftick the torture upon Louisa Calderon.*—You will believe there was no delay in proceeding to its execution. The girl was informed, in the gaol, that, if she did not confess, she would be subjected to the torture; that under this process she might probably lose her limbs or her life; but the calamity would be on her own head, for, if she would confess, she would not be required to endure it. While her mind was in the state of agitation this notice produced, her fears were aggravated by the introduction of two or three negroes into

her prison, who were to suffer under the same experiment, for *witchcraft*, and as a means of extorting confession. In this situation of alarm and horror, the young woman persisted in her innocence, the punishment was inflicted, improperly called picketing, which is a military punishment, perfectly distinct. This is not picketing, but the torture. It is true, that the soldier, exposed to this, does stand with his foot on a picket, or sharp piece of wood, but, in mercy to him, a means of reposing is afforded on the *rotundus major*, or interior of the arm. This practice, I hope, will not in future be called *picketing*, but *pickoning*, that it may be recognized by the dreadful appellation which belongs to it. Her position may be easily described. The great toe was lodged upon a sharp piece of wood, while the opposite wrist was suspended in a pulley, and the other hand and foot were lashed together, so that it was impossible she could afford herself any relief from the anguish she suffered. In this state of agony, she confessed that Carlos Gonzalez had stolen the property; but was continued in this dreadful situation, under the inspection of a magistrate, during the space of fifty-three or fifty-four minutes by a watch, which was provided, from some supposed notion, that the torture could not be inflicted for more than an hour at a time; and that the pleasure of seeing the victim might not occasion it to be continued longer than the personal security of the officer rendered prudent. The first punishment not being sufficient, the horrid ceremony was again repeated." [The learned counsel here produced a drawing in water-colours, in which the situation of the sufferer, and the magistrate, executioner, and secretary, was described. He then proceeded:] "It appears to me, that the case, on the part of the prosecution, will be complete when these facts are established in evidence; but I am to be told, that, though the highest authority in this country could not practise this on the humblest individual, yet, by the laws of Spain, it can be perpetrated in the island of Trinidad. I should venture to assert, that, if it were written in characters impossible to be misunderstood, that, if it were the acknowledged law of Trinidad, it could be no justification of a British governor. Nothing could vindicate such a person but the law of imperious necessity, to which we must all submit. It was his duty to impress upon the minds of the people of that colony the great advantages they would derive from the benign influence of British jurisprudence; and that, in consequence of being received within the pale of this government, torture would be for ever banished from the island. It is, therefore, not sufficient for him to establish this sort of apology; it is required of him to show, that he complied with the institutions under the circumstances of irresistible necessity. This governor ought to have been aware, that the torture is not known in England; and that it never will be, never can be, tolerated in this country. The trial by rack is utterly unknown to the law of England, though once, when the dukes of Exeter and Suffolk, and other ministers of Henry VI. had laid a design to introduce the civil law into this kingdom as the rule of government, for a beginning thereof, they erected a rack for torture, which was called in derision the Duke of Exeter's Daughter, and still remains in the Tower of London, where it was occasionally used as an engine of state, not of law, more than once in the reign of queen Elizabeth. But when, upon the assassination of Villiers duke of Buckingham by Felton, it was proposed in the privy council to put the assassin to the rack, in order to discover his accomplices, the judges, being consulted, declared unanimously, to their own honour, and the honour of the English law, that no such proceeding was allowable by the laws of England. Such are the observations of the elegant and learned author of the Commentaries on the Law of England on this subject; and, as the strongest method of showing the horror of the practice, he gives this question in the form of an arithmetical problem: The strength of the muscles and the sensibility of the nerves being given, it is required to

know what degree of pain would be necessary to make any particular individual confess his guilt. But what are we to say to this man, who, so far from having found torture in practice under the former governors, has attached to himself all the infamy of having invented this instrument of cruelty? Like that called the duke of Exeter's daughter, it never existed until the defendant cursed the island with its production. I have incontestible evidence to show this ingenuity of tyranny in a British governor; and, the moment I produce the sanguinary order, the man is left absolutely without defence. The date of the transaction is December 1801, and in 1802, the ministry directed a commission to conduct the government of Trinidad. Among the persons appointed to this important situation, was colonel Fullarton. In the exercise of his duties in that situation, he obtained knowledge of these facts; and, with this information, he thought it incumbent on him to bring this defendant before you; and, with the defendant, I shall produce the victim of this enormity; and you will learn that she at this moment bears upon her the marks of the barbarity of the defendant."

*Louisa Calderon*, attended by a Spanish interpreter, was then sworn, and examined by Mr. Adam.

Were you at Trinidad in 1801?—Yes.

Were you acquainted with Pedro Ruiz?—Yes.

Did you live in his house?—Yes.

Do you remember a robbery committed in the house of Pedro Ruiz?—I do.

Were you suspected of committing that robbery?—I was, and also Carlos (Gonzalez).

Do you remember his being apprehended?—Yes.

Were you, and your mother, also taken up?—Yes, the same night.

Before whom were you carried?—Before governor Picton.

Did he order you to be committed to prison?—Yes.

Before you were sent there, what did the defendant tell you?—That if I did not confess, the hangman was to put his hand upon me.

Do you know a person of the name of Beggarrat?—Yes.

Is he an alcalde (magistrate)?—Yes; he came to me in prison, and examined me frequently as to the robbery.

Was there an *escrivano* (notary) of the name of Francisco de Castro, who also attended?—Yes.

After some examinations, were you carried into a room where there was a picket erected in the gaol?—Yes.—[The witness was here desired to give a description of this instrument of torture, and of the manner in which it was applied to her person, which she did nearly in the way in which it was explained in the opening of the learned counsel. When the drawing above-mentioned was handed to her, representing, in a striking manner, her situation, surrounded by her judges and executioners, she gave a shudder expressive of horror, which nothing but the most painful recollection of her situation could have excited; on which Mr. Garrow expressed his concern, that his lordship was not in a position to witness this accidental, but conclusive, evidence of the fact.]

How long did you remain tied up in this situation?—Three quarters of an hour.

Were you upon the spike all that time?—Yes.

Were you at any time drawn up by the rope connected with the pulley?—Yes.

Had you seen any persons in the same unhappy condition before?—Yes, two others.

What was the effect of this torture?—I was in great agony, and, after it, my wrist and foot were very much swelled.

Were you asked to make confession of the robbery, before you were tied up?—Yes; Beggarrat enquired if I would declare who took the money.

Were you sworn before the torture was applied?—No; but the holy cross was held up before me.

Did you confess?—Yes; after I was suspended, I said Carlos took the money.

Where

Where did you go after you left the gaoler's room?—To the same apartment where I had been suspended. I was kept there all night.

Were you put in irons?—Yes, in *grillos*, (fetters for the legs.)

Describe what these *grillos* are.—They are formed of an iron bar, fastened to the ground, to which are attached two rings to receive the legs. [A drawing of this instrument was then produced, which the witness said was an exact representation of the *grillos*.]

Were you put upon the picket next day?—Yes, upon the same instrument, and in the same manner; it was in the morning.

How long were you kept upon it?—Twenty-two minutes. There was a watch to show the time; Alvarez Beggarrat, Francisco de Castro, and Rafael an alguazil (constable), were present.

With which arm were you tied up the second day?—With each, one after the other; and I was so suspended, that I could just touch the spike by extending my toe.—(My feet were without shoes or stockings, she said, in reply to a question by lord Ellenborough.) She then described, that she was seized with a fainting fit, and that she knew nothing of the time or circumstances of her recovery.

Were you again put in irons?—Yes, in the *grillos*, the same evening.

How long were you in this state?—All the time I was in prison, *during eight months*.

Are there any marks of the injury you received now apparent on your person?—On my wrists there are, but none on my feet. [The witness now exposed the seam or callus, formed on her wrists in consequence of the torture.]

To some questions, on the cross-examination by Mr. Dallas, she said that she did not know how long she had been released before she was brought over; that she came with colonel Fullarton, and that she had been maintained by Mr. White, of the treasury.

*Don Rafael Shando*, also assisted by the interpreter, said, that he was an alguazil in the island of Trinidad in the year 1801; that he returned from the interior of the country on the 22d of December, and saw Louisa Calderon in gaol; that they were then giving her a glass of water, after bringing her down from the torture. She was supporting herself on a table; it was about seven o'clock in the evening. Beggarrat desired witness to bring Carlos up, and told her that she must repeat to Carlos what she had said to him. After this interview, at which nothing transpired, she was instantly put in the *grillos*, and in the same room in which she had suffered the torture. The apartment was like a garret, with sloping sides, and the *grillos* were so placed, that, by the lowness of the room, *she could by no means raise herself up during the eight months of her confinement*. On the 23d of December she was again put to the torture, between eleven and twelve in the morning, and she remained in this situation twenty-two minutes by the watch.

[The witness here examined the drawing, and described the position much in the way it had been before represented, and then added,] She fainted twice in his arms.—Beggarrat sent vinegar to the executioner, to administer to her in this situation. There was no advocate appointed to attend on her behalf, and no surgeon to assist her. No one but a negro belonging to Bullo the gaoler, to pull the rope. As soon as she was taken down, she was put into the *grillos*. The witness had seen her sister bring her visitors, but never noticed the admission of her sister or her friend into the gaol. The witness had been four or five years in the post of alguazil. He never knew the torture inflicted in the island until the arrival of the defendant. *There had been before no instrument for the purpose*.

*Don Juan Montes* said, that he was acquainted with the hand-writing of the defendant, and proved the document containing the order of the torture expressed in these

terms: "*Aplicase la question a Louisa Calderon*. (Signed) THOMAS PICTON."

After some observations from Mr. Dallas, which were answered by Mr. Garraw, the lord chief justice ruled, that the application of the *alcalde Beggarrat*, which led to the issue of this order, should be read. Mr. Lowten then read the representation of this officer, advising that slight torture should be applied, stating that his own authority was incompetent to do it, without the orders of the governor, and giving the result of the proceedings, in the course of the examinations Louisa Calderon had undergone. The instrument was countersigned by Francisco de Castro.

Mr. Harrison now proceeded with the testimony of Don Juan Montes, who said he had known the island of Trinidad since 1793; that the torture was never introduced until after the conquest of the island, and was then practised by order of the defendant.

Mr. Dallas, for the defendant, rested his defence upon the following statements:—1st. By the law of Spain, in the present instance, torture was directed; and, being bound to administer that law, he was justified in its application. 2dly. The order for the torture, if not unlawfully, was not maliciously, issued. 3dly. If it were unlawful, yet, if the order were erroneously or mistakenly issued, it is a complete answer to a criminal charge.—The learned counsel entered at considerable length into these positions, during which he compared the law of Spain, as it prevailed in Trinidad, with the law of England as it subsisted in some of our own islands; and he contended, that the conduct of general Picton was gentleness and humanity, compared to what might be practised with impunity under the authority of the British government. After a long interlocutory discussion, several items of the examination taken on the island, for the purpose of this cause, were read by the clerk of the court. The next testimony adduced was that of Mr. Gloucester, the attorney-general of his majesty in the island, who deposed to the authenticity of several books on the laws of the island, among which were the *Erizondo*, the *Curia Philippica*, the *Bobadilla*, the *Colom*, and the *Recopilacion de Leyes*. Various passages in these books were then referred to, and translated, for the purpose of showing that torture was not only permitted in certain cases, but in the particular instance before the jury.

On the part of the prosecution, Don Pedro de Vargas was then called to contradict these authorities. He said that he had studied the law of the West-India Islands under the dominion of Spain seven years, and that he had practised it two years. In the course of his enquiries and experience, he had never known any book of authority cited to justify the application of torture. It was true, an ancient edict, as early as the year 1260, mentioning torture, had been referred to by some learned persons in colonial law; but this authority had long been considered obsolete and nugatory, so that nothing now remained either to support the principle or the practice. After the cross-examination of this witness.

Lord Ellenborough. "The single question for your consideration is, Whether, by the Spanish laws observed in Trinidad, the defendant was justified in inflicting torture upon the prosecutrix? I would advise you by all means to divest yourselves of every thing that may inflame your minds, so that you may give impartial attention to the present case. The inquiry for you to make is, What was the subsisting law by which Trinidad, at the time it was taken by sir Ralph Abercrombie, was governed? The various authorities upon the subject of the distribution of justice in Spanish courts do not mention the infliction of torture; and therefore the right of applying it, if it can be applied at all, must depend upon authorities before us, or upon the jurisdiction of the judge. Depositions of witnesses have been read, who have known the island for 32 years, and one of them was born there, and swears torture was never administered. Mr. Nugent also

says, he knew Trinidad for twenty years, and never saw the torture inflicted, or had ever seen the instruments; and therefore it is absolutely without any proof to support it. Mr. Gloucester speaks to books of authority, which he stated to be in use when he was in the island; but the existence and reference to them can certainly not extend beyond the period when he himself was acquainted with them." His lordship, having made some farther observations respecting the different authorities produced, concluded as follows:—"The question, then, resolves itself into this, viz. Whether, in the absence of usage for 32 years, you will infer that the law of Old Spain is necessarily involved that of Trinidad, as to induce you to believe, that, as the practice of torture is allowed by the one, it is also by the other. If you are of opinion that it does, you will be so good as to say so, that it may be inserted in the special verdict; if not, you will find the defendant generally guilty."

The jury immediately returned, "That they were of opinion that no such law did exist which would authorise the defendant in inflicting the torture;" in consequence of which general Picton was found *Guilty of every charge*.—A new trial was afterwards granted; and this judgment was reversed.

But this was not the only accusation brought against the governor of Trinidad by colonel Fullarton. In the colonel's printed "Statement, which was submitted to the consideration of the Lords of his Majesty's most honourable Privy Council," the following charges, military and criminal, are stated.

*Military Charges*.—1. For issuing orders, after the 12th of February, 1803, directing the military officers under his command to refuse all aid and protection to the civil government, and to the inhabitants of Trinidad.

2. For unlawful endeavours to intimidate persons supposed capable of giving evidence or information in support of the charges exhibited against him; in particular, for employing black soldiers belonging to the 9th or 12th West-India regiments, in his majesty's service, to seize and imprison in the common gaol, Joseph Timbrel, esq. surgeon to the royal artillery, because he declined answering questions, respecting a declaration imputed to him on the subject of Hugh Gallagher, a soldier belonging to the royal artillery, who was hanged at Port of Spain in the month of May, 1797, by order of governor Picton, *without any form of trial*.

3. For employing officers and soldiers in his majesty's service to assist in directing or applying torture to different persons.

4. For employing soldiers on his own estate, and for his own advantage, when their services were requisite in garrison, or with their corps.

5. For granting to Mrs. Rosetta Smith, a woman of colour, who lived with him, a contract for supplying the soldiers barracks with wood, and other articles.

6. For illegally employing soldiers to seize and eject from the estate of Orange-Grove, John Dawson, esq.

7. For illegally employing soldiers to eject from her own house, Mrs. Griffith and her three daughters; and for putting Mrs. Rosetta Smith, who lived with him, in possession of Mrs. Griffith's property, by means of military force.

8. For illegally employing soldiers and others, *without any form or specification of offence*, to seize and drag to prison, and to detain in an ignominious manner, the following persons: Messrs. Higham, Redhead, Rutherford, Bradshaw, Minchin, Hargrove, Sullivan, Dubois, Savignon, D'Espina, Dowding, and many others: directly violating, by military force, all forms of civil judicature established by the capitulation, and granted to the colony under his majesty's authority.

9. For violating the king's civil government, by issuing a proclamation on the 27th of April, 1803, declaring the first commissioner (Col. Fullarton) to be no longer considered as officiating in his public situation, and by direct-

ing, as commandant of the troops, that all military as well as civil persons should conduct themselves accordingly.

10. For disobeying the orders of the king, dated the 23d of April, 1803; and for preparation of military force and actual resistance to his majesty's civil government, and to the first commissioner, on his return to Port of Spain, on the 6th of June, 1803, at a time when B. G. Picton held no civil authority, but still continued as military commandant until the 14th of June, when he was removed by order of Gen. Grinfield.

11. For numerous misrepresentations, transmitted to the colonial department, and to other public offices, in a manner unbecoming the character of an officer and a gentleman, with a view of attempting to repel the serious charges which had been preferred against him.

*Criminal Charges*.—1. The case of *Hugh Gallagher*, who was hanged without any trial, by order of governor Picton, on the 27th or 28th of May, 1797, upon the mere assertion, without oath, that he had robbed and ill-treated a negro woman. The chief-justice Nihell, to whom this woman first complained, considered, *from her own story*, that it was so trifling and ludicrous, that he took no other notice of it (the man being a soldier also), but sent her to colonel Picton, whom he thought would be amused at such a complaint from a negro-woman, as they are, on the contrary, the continual pests of the barracks; never imagining more could happen than confinement to the guard-room; but to his horror and surprise, he found, in his afternoon's walk, this untried folder hanging from the gallows.

When this poor fellow was ordered for execution, he innocently laughed, thinking that the *threat* alone was to be his punishment; nor would he believe it possible that he really was to be hanged, until, upon supplicating the governor to be heard, he was forbidden; and, upon asserting his innocence, the governor told him "he was going to hell with a lie in his mouth," and ordered his immediate execution, to the great dismay and distress of the British merchants and numerous other spectators. This poor man would have been proved innocent if he had been tried, as his comrade *Kenny*, who was one of the party when this negro-woman was met by them, acknowledged, on his death-bed, the innocence of Hugh Gallagher, owning himself to be the person blameable, as far as there was any crime. Gallagher's alleged fault was not mutiny, or desertion, or disobedience; and, therefore, precipitate execution was inexcusable; and to inflict death without trial was still more so.

2. The case of *Jean Baptiste Richard*. All that was alleged against him was, that two passengers, who came from the Spanish Main in his boat, but who never received any punishment, were disaffected persons. This unfortunate man was executed without trial, leaving an aged mother, a wife, and three infants, to lament his fate; and, to add the more poignancy to their domestic affliction, the governor conducted the crippled and aged father-in-law, upon his crutches, into the gallery of the government-house, and there showed him the husband of his daughter suspended from the gallows!

3. *Goliath* is another case of a capital nature; his death was caused by being "cut up under the gallows," in conformity to the words of the threat of governor Picton, as sworn before the privy-council, by Mr. Dawson of Liverpool, the owner of this slave, and by Mr. Dawson, jun. The only fault alleged against this man was, that he was a *runaway*. None but the owner had a right to blame such a conduct, if it had been true; and, on the contrary, the owner declares against his being a *runaway*, for that he was only on the road coming from church; and the punishment, of which he died, was not for the negro's fault, but, as stated in the words of colonel Picton, because Mr. Dawson did not pay sixteen dollars for seizing this innocent negro, and conducting him to gaol.

4. *Pierre Warner*. He was the slave of Francis Macnamara and John Falkes, owners of the *Elcurial* estate;

no crime was alleged against this slave, but that he also was a runaway. This was also the business of the owners, and not of the governor; but Mr. Macnamara, like Mr. Dawson, was not beloved by colonel Piñton; and without prosecution, and against the wish of Mr. Macnamara, this slave's ears were cut off, when he was shortly after seized with violent spasms, his jaws being locked, and he died in less than an hour after the operation.

5. Alarcon was the fifth case before the privy-council. He was hanged by order of governor Piñton, in the spring of 1799, for an alleged crime upon the high seas, therefore at any rate not within the jurisdiction of colonel Piñton, who at all events hanged him without a trial, upon the voluntary declaration, made on oath, at Cariacou and Martinique, of the captain of a vessel, who, by his own confession, had killed and thrown overboard two of his crew, who he says, with Alarcon, mutinied, insulted him, and got drunk. The captain deposes, that he left Alarcon in gaol, at Cariacou, an English island, while he went to Martinique. Now it is clear, that a sailor could not be committed to gaol in an *English* island, but by regular process before a magistrate; and no magistrate would have enlarged him, or have sent him on-board again, if there had been sufficient ground upon which to try him for the crime alleged. His being allowed to leave the gaol, by this magistrate, was *prima facie* judicial evidence of the charge not being established before an *English* tribunal; for no English magistrate would commit or enlarge a prisoner at the mere desire of any man; but, after being thus sent away from Cariacou, not by any writ of *habeas corpus*, nor by any other legal authority, colonel Piñton, of his own will and pleasure, did what a British magistrate would not do; he hanged Alarcon without farther trial, and only upon the declaration of the captain, who, as before stated, had by his own story killed two of his seamen, and who therefore certainly had cause to apprehend the accusation of murder from Alarcon, who, by being thus illegally executed himself, was effectually prevented from accusing the man that had killed two of his shipmates; and who had in the mean time threatened to charge the captain with killing these people.

6. The sixth case is that of a *Guyacaree Indian*, who was shot without trial. The excuse for this execution was, that the boat (of which this Indian was patron, or captain, in the present voyage) had, in the previous voyage, when the owner was with the boat, carried away three German deserters to the Spanish Main. This Indian, therefore, knew nothing concerning the alleged crime, nor was it at any rate a capital offence. He was, however, put to the torture for a considerable time, and more than once; and, while being tortured, his life was repeatedly offered him if he would but accuse somebody of the crime so falsely laid to his charge; but he was not only innocent himself, but also ignorant who was guilty; and, though a false accusation of any body else would have saved his life, he suffered the torture to the last extremity, asserting his own innocence, and his total ignorance of the affair. No evidence did or could appear, to swear to any concern this man had had in the desertion of the soldiers; and yet colonel Piñton, who attended at the execution himself, finding this captain deny till the last all knowledge of the affair, told him, "Now I'll make you know that you carried them away;" and, waving his hand, the unfortunate Indian was immediately shot, and directly buried under the gallows. As the *Guyacaree* Indians are a distinguished race, the governor of Margarita interested himself in behalf of this poor fellow, and sent up a dispatch to a gentleman of Trinidad, with documents to show the innocence of, the poor sufferer, by proving that the man who was in fault had remained behind, instead of going back with the launch. But the colonel uttered some coarse expressions against the Spanish commandant, saying, he would hang him also, if he could get hold of him; and that the documents were of no consequence; since the man was already executed.

7. The seventh case substantiated by evidence before the privy-council, was the case of *Celestino*, whose only crime was getting drunk; and upon this occasion, in his drunken state, he made a disturbance about the door, and at length staggered into the house, of an old Spanish woman, called Perez, making a noise there. To get rid of him, she applied to the deputy commandant to turn him out; but, the drunken man being insolent, the deputy sought for assistance; and, not finding it at the commandant's house, applied at the barracks for some soldiers, who proceeded to the old woman's house, which, before their arrival, Celestino had left, and was found in the neighbouring house of a coloured woman. Celestino was put in the stocks, from whence he was sent by the commandant to town, with a letter to colonel Piñton, recommending him to send Celestino off the island as a troublesome person. The relations and associates of Celestino, well knowing the severity of colonel Piñton, apprehended the fatal consequences, and requested the master, for whom Celestino usually worked, to go to the governor and interfere in his behalf. This gentleman arose from his bed, to which he was confined by sickness, mounted his horse, and proceeded to town; the friends of Celestino anxiously hurrying thither in the mean time. But, in consequence of this gentleman's infirmity, he was tardy in getting ready, and slow in proceeding; and, having seven miles to ride, he could not travel with a rapidity equal to the promptness with which the governor executed his sentences; for, instead of Celestino's being banished at the request of the commandant, colonel Piñton had recourse to a less troublesome mode of getting rid of him; for the event was announced on the road to the horror-struck master, whose ears were assailed by the shrieks and lamentations rending the air from the returning friends of the departed Celestino, who was already hanged, and buried under the gallows.

These are the seven cases that were substantiated upon oath before the council, not by documents, but by *viva-voce* evidence, which has very generally spread itself abroad.

In addition to these cases, he was charged with the torture, mutilation, and death, of the following people, upon the absurd pretexes of *sorcery, divination, witchcraft*, and the *black art*, and poisoning by means of *charms*; viz. La Fortune, Ambinot, Louis Cæsar, La Rose, Pierre Francoise, Bougui, Leonard, Thisbe, Felix, Antoine, Louifson, Theoliste, Nicholas Julie, Manuël, Michel Gardon, Joseph Fautin; also for cruel severities inflicted on Benoit, Pyrame, Petit George, Serpent, Elizabeth, and Rachel, detained in prison under circumstances tantamount to torture, although upon their trials no evidence appeared to condemn them.

Fourteen German soldiers were executed in 1797 *without trial*—not for deserting, but only under the suspicion of attempting to desert.

One case must be added here, which was given in to the privy-council; but, only one evidence being present, nothing was done therein; another evidence arrived afterwards from Trinidad, who could prove all the facts of the case. Present, a negress belonging to Mr. Thomas Kenny, merchant, had been absent from her owner some time, but was brought in some months after the capture of the island. The governor, being at dinner at the time, Mr. Kenny put off his application till next morning; which, however, was too late, for she was hanged at sun-rise. No complaint was made from Mr. Kenny, the owner of this unfortunate slave; and no man had a right to rob him of his property, or the slave of her life, unless she had been charged and convicted of a capital crime; which was not the case.

All these charges were submitted to the privy-council; but the council did not advise his majesty to institute any proceedings thereon. Colonel Fullarton's death soon relieved Mr. Piñton from any farther accusations; and he has since (1808) been promoted to the rank of major-general, and created K. B. having served with distinction un-

der marquis Wellington. It is but justice to observe, that brigadier-gen. Picton received a high character for integrity and good government from some of the chief proprietors in the island of Trinidad, and from baron de Montalembert, general Maitland, and general Grinfield; and previous to that time he had distinguished himself in the most honourable manner.

On the 27th of February, 1806, the will of Mr. Pitt was proved by D. Adams and W. Huskisson, esquires; and is as follows, in three separate schedules: "I owe Sir Walter Farquhar one thousand guineas, from October 1805, as a professional debt. 12,000. with interest, from October 1801, to Mr. Long, Mr. Steele, lord Carrington, bishop of Lincoln, lord Camden, Mr. Joseph Smith; and I earnestly request their acceptance of it. I wish, if means can be found for it, of paying double the wages to all my servants who were with me at my decease. I wish my brother, with the bishop of Lincoln, to look over my papers, and to settle my affairs. *I owe more than I can leave behind me.* W. PITT."—As this last circumstance was pretty well known, 40,000l. had been voted by parliament (Feb. 3.) for the payment of his debts. A monument was voted also to be erected in Westminster-abbey, which is at length completed, and stuck up over the inside of the west door. Whether the principal figure resembles Mr. Pitt, very few persons can tell; for it is impossible to distinguish the face except when the sun shines in a particular direction, which is not for more than two hours in a day; and, as for the attitude, it appears to be addressing some persons over and beyond the top of the organ.

In the month of March, the public interest was much excited by the trial of Richard Patch, who was indicted for the murder of Isaac Blight, a ship-broker, at Deptford. Although none but circumstantial evidence could be produced, he was found guilty. The jury and the public were satisfied with the sentence; yet, had a full confession of his guilt been wrung from him by the exertions made for that purpose, his apparent contrition would have entitled him to some commiseration; but, in the multitude which attended his execution, only one sentiment, that of abhorrence at his guilt, seemed to prevail. He was about thirty-eight years of age, and of a fullen disposition. Mr. Blight was his benefactor and friend; and no reason wherefore he perpetrated the foul deed could be ascertained.

The following circumstance is worthy the attention of the reader.—In 1724, Mr. Samuel Travers inserted in his will the following clause: "I will and bequeath a sufficient sum of money to purchase and erect, in St. James's Square, an equestrian statue in brass to the glorious memory of my master, king William the Third." In the subsequent year (1725) an act of parliament was passed for adorning the said square; but the bequest appears to have been totally forgotten, until the money was found this year (1806) in the list of unclaimed dividends. The matter has been seriously taken in hand since this discovery, and the noble square has received this its additional ornament from the well-tried hand of Mr. Bacon. The equestrian statue did not, however, meet the general approbation; as several criticisms appeared in the public prints pointing out defects in this piece of foundery.

The pen of the historiographer shudders in recording that, on the 22d of May, the Rev. Mr. Wood, second master of St. Paul's school, put a period to his existence by hanging himself.—At Brompton, after a short illness, died Mr. Palmer, aged 44 years. He was a man of uncommon corpulency, and was induced, about three weeks before, to go to London, in order to see that prodigy of bulk and fatness, Mr. Lambert. Mr. Palmer weighed about twenty-five stone, or 350 pounds; and although five men, of moderate size, have been buttoned in his waistcoat, he was comparatively diminutive size when placed by the side of Lambert. The windows of the room were obliged to be taken out in order to admit of the corpse being got out of the house; from which to the place of inter-

ment it was carried in a waggon, as no hearse could be procured which would have been sufficiently capacious to admit the coffin into it. See LAMBERT, vol. xii. p. 98, 9.

The destruction and temporary disappearance of the Key, a noted house of bad fame, happened on the 5th of June. This house was a bagnio of a very fashionable kind, and the most frequented of any in the metropolis. The following circumstances came out before the coroner's jury, sitting on the body of a gentleman who perished in the flames. The waiter stated, that the deceased, with a lady, came to the house at twelve at night, on the 4th of June; the gentleman appeared to be very much inebriated; and, after having been a short time in the house, supper was served up in a bed-room. After the cloth had been cleared, the gentleman said he should go; but the bell rang soon after, for the chambermaid to assist in undressing the lady. The deceased, on the maid's entering the room, was lying prostrate on the floor, by the bed-side. The chambermaid left the room at a quarter before three o'clock; and, a quarter after three, witness heard a violent screaming. He repaired to the landing-place on the first floor, where the lady, in her *chemise* only, was standing with a candle, the bed-room being in one entire blaze. She begged of the witness to save the gentleman; but the flames issued so rapidly from the room, that he durst not attempt to enter. The house was divided; and in that part where the fire broke out, none but the deceased and his companion slept, except a domestic in the attic story. It was some time before the other part of the house caught fire; and consequently the other companies had time for flight.

Jane Devaynes (who stated her name to be so, but who had for several years been known about the theatres by the names of Kemble and Stirling) stated, that she was the lady in company with the deceased at the Key. Her first acquaintance with him was accidental, on Whit-Monday last; since which time he had almost daily visited her, at her apartments in York-street, Marybone. He came to her residence at ten o'clock at night, on the 4th inst. and was then inebriated. He insisted on sending for three bottles of wine, one of which was drunk; witness had put the other two on her side-board, thinking her companion had had enough. In the evening, they took a coach, and repaired to the Key, which house, the deceased said, he was well acquainted with. She then related the circumstances of her going to bed, and being alarmed, as described by the waiter. Witness said she knew nothing of the deceased's name, nor where he lived. He had a great deal of paper property about him, which he had shown to her in the evening. She always considered him to be a clergyman. Mrs. Clark (the late hostess of the Key) only knew the deceased personally. There being no further evidence to throw any light upon the subject, the jury returned a verdict of *Accidental death*.—It has been since stated, and it is feared with too much truth, that the gentleman who was thus burnt to death was a Mr. Garner, who kept an academy in Brompton-row, on the high road leading to Fulham. Mr. Garner was a widower, and, it is said, had paid his addresses to a young lady of considerable pecuniary expectations; but, meeting with a repulse, it is supposed that the disappointment affected his intellects, as his subsequent conduct evinced symptoms of derangement.

The administration evinced at this period an indefatigable attention to correct abuses, remedy evils, and bring into the whole system more wholesome regulations.—Mr. Windham distinguished himself by introducing a bill for enlisting soldiers for a limited time only; an excellent measure, but which we lament to say has since been rendered almost nugatory. Several other acts were also passed; among which the property-tax bill began to undermine the popularity of the new ministers.

On the 4th of July, a singular robbery was discovered to have been committed in the British Museum. A person who had been in the habit of visiting that place for

upwards.

upwards of a year, had stolen, at different times, from the portfolios, a number of scarce and valuable engravings, by the Dutch masters, to the value of 1500*l*. He sold them to printfellers. A committee investigated the particulars of the robbery, and came to a resolution that Mr. Dighton, who was charged with being concerned in taking the valuable articles, should not be prosecuted, on condition that he restored the whole of the property that was missing. Mr. Beloe, in whose department it happened, was dismissed for negligence.

On the 11th of July, at a session of the Court of Admiralty, held at the Old Bailey, Acow, a Chinese sailor, was indicted for the wilful murder of another Chinese, of the name of Anguin, on the 24th of May, on-board the East-India ship Travers, on her voyage home, near the Azores. The principal evidence was Robert Oliver, second mate of the ship, who stated, that on the 24th of May last, between two and three o'clock in the morning, as he was on watch, he heard a person moaning in great distress; he called up two men, who, on going below, cried out, "O God! a man is murdered!" Others came up, who saw the prisoner standing with a knife in his hand, which was covered with blood: the deceased was lying near him. The prisoner made no resistance; but, when they took him into custody, he said, "Me kill Anguin—Anguin tell me lie—China fashion—me kill Anguin, me kill Anguin—you hang me." The head was nearly severed from the body. There were two mortal stabs, one of which had penetrated the heart, the other the loins. There were in all nine wounds. The other witnesses corroborated this account. It did not appear that the prisoner and the deceased had any quarrel on-board, but they had some dispute on-shore. The prisoner, by his interpreter, said he must be hanged by the English law, and did not desire to live; he said he cut the man's head off.—The jury having found him guilty, Sir W. Scott pronounced sentence of death upon the prisoner, who seemed to be but little concerned at it. He was hanged at Execution Dock.

On the same day, a tremendous storm of thunder, lightning, and rain, commenced at eight o'clock in the morning in the metropolis, and lasted till eleven, without intermission. It excited universal terror. The lightning entered a house under repair in East-street, Manchester-square; the blaze was so violent, that every one apprehended that the whole house was on fire; but no injury was sustained, except the breaking of a few panes of glass. Two persons, in the house adjoining, were struck with the lightning. A ball of fire fell into the area of the lottery-office, in Somerset Place; it forced open the door, and drove Mr. Pearce, the secretary, who was standing at the window, with a person who was with him, to the opposite side of the room. Another ball fell in the Thames, opposite Arundel-street.—In the country its effects were fatal. On the north-east side of Harrow-Weald Common, near Stanmore, Middlesex, a thatched hovel, where thirteen persons, of both sexes, had taken shelter, was set on fire by the lightning; and a woman, with a child at her breast, was killed, whilst the infant miraculously escaped. At Portsmouth, about half past ten, the brig William, captain Denning, from London, bound to Jamaica, coming into St. Helen's, was destroyed by the lightning, which struck the head of the maintop-gallant-mast, passed through that, down the top-mast, main-mast, and pierced the decks into the hold, where it set the cargo on fire. The captain and crew escaped. At Deal the lightning was very vivid and quick; it struck the maintop-gallant-mast of his majesty's bomb Prospero, shivered to pieces the top-mast, and damaged the main-mast; one man was killed, and several other of the people were knocked down, but recovered. A corn-mill, belonging to Mr. John Croft, of Caistor, Lincolnshire, was much damaged, and a boy in the mill killed, by the lightning. Nine sheep, belonging to Mr. Sibsey, of Basingham, near Carlton le Moorland, were also killed. At Gainsborough, there was a very uncommon fall of rain, accompanied with loud claps of thun-

der, and vivid flashes of lightning. Three pigs were struck dead at Morton; and two fine horses, in a close near Lea, were killed. At Peterborough it was extremely violent, and the inhabitants were much alarmed by a fire-ball bursting in the market-place. In Rutland, at Ashwell, a hay-stack, belonging to Mr. Chamberlain, was burnt. At Langham, Mr. Sherrard had a sheep killed, and a cow belonging to Mr. Ellicot was also killed, by the lightning. The hail came so violent at Teigh, as to break many windows. A boat belonging to the Sheerness tender, lying in Hull Roads, was sent to Sunk Island, with seven hands, to bring on-board lieutenant and Mrs. Fox. Between nine and ten they had proceeded but a short distance from the shore, when W. Mazarello, the cockswain, aged about nineteen, standing erect, was struck dead by the lightning, and fell overboard. Mr. and Mrs. Fox were much stunned; and the rest, except one man, were all struck down, but soon recovered. The body of Mazarello was soon afterwards picked up: his clothes were burned to rags, and the case of his watch was melted. The old blockhouse-mill, at Hull, was struck by the lightning, and one of the main timbers split. William Curtis, labourer, of Patrington, was next day found dead in a field near that town, having, it is supposed, experienced the fatal effects of the lightning: the hoe with which he was at work is supposed to have operated as a conductor. Near Exeter the effects were extraordinary; in Moreton church-yard, the earth was torn from several graves, and human skulls thrown to a considerable distance; and, near Bow, about fifty trees were cut in two, as if done with a saw. The report of the thunder was like that of artillery fired in regular succession. About two, the inhabitants of Ipswich were much alarmed, as the crashes of thunder shook many houses; and at the hill-barracks it was still more awful, as the electric fluid communicated with a range of stables, and struck down nine horses, two of which were killed. The stables were also set on fire, but it was soon extinguished. Near twenty persons were struck down by the lightning, but none killed. A barn, at Framlingham, belonging to S. Kilderbee, esq. of Ipswich, was burnt down by the lightning. The storm was truly awful in Birmingham and its neighbourhood. The lightning split the crane at the canal-office in that town. Its effects in the country adjoining were dreadful. A man was killed by the lightning at Telford. At Dumfries the peals were loud, and the flashes uncommonly vivid. The lightning struck the house of James Kirk, at Mains Riddell, Colvend, shattered the chimney-head, and, descending the chimney, broke the hearth-stone to pieces. Two cows were killed by the lightning, while grazing in a field near Ecclefechan.

On the 2d of August, at the Sussex assizes, which were held at Lewes, the following cause (for *cruelty to a dog*) came on: Hicks *v.* Collard. The declaration set forth, that the plaintiff had a valuable dog; that the defendant beat him, and rubbed his sides with a caustic liquid; in consequence of which it became necessary to destroy the animal. To this the defendant had pleaded, that the dog trespassed upon his premises, and that he beat him to keep him away. The plaintiff was a stable-keeper at Brighton, and the animal was his yard-dog. The defendant was a druggist and chemist, who had a bitch in his house, to which the dog paid occasional visits. In one of those visits the defendant secured the dog, most cruelly poured on him oil of vitriol, and turned him out. In the course of the next day, it corroded the flank of the poor creature until his bowels actually dropped out, and it became necessary to put the animal out of its misery. It was stated in confirmation by a witness, that the morning after the liquid had been applied, about five o'clock, he first saw the dog; it was then running about the yard in great agony. The hair on the back was hard, as if burnt; but on the sides, where the dog had licked himself, the flesh was torn away, and there was but a thin skin between that and the bowels. The tongue of the animal, by licking

itself, was burnt as hard as a coal, and was so stiff that it appeared as if it had been bent. About twelve o'clock, the skin on the flank was eaten in holes, and the bowels dropped out on the ground. In this state they shot the dog. Two other witnesses proved to the same effect. At the conclusion of the examination of witnesses, the judge (baron Macdonald) observed, that his feelings had been so deeply lacerated by what he had heard, that he could not recapitulate the evidence. Such an act of wanton wickedness and cruelty, he said, he had never before heard of, and he hoped that he never should again. He regretted that the law would not permit him to punish such a miscreant as he deserved; but advised the jury to give the most ample damages that the law would allow. The damages were only laid at five guineas, the value of the dog, consequently the jury could give no more. Five guineas were therefore awarded.—We have related this trial at full length, in order to impress upon the minds of our fellow-citizens in the metropolis, the distress and horror we feel every day when we witness the cruelties which are exercised upon dumb animals in the streets of a town, the capital of a nation which knows no equal for tenderness of feeling and general humanity.

The Stock Exchange has often been, and will most likely be in future times, as it is now, the scene of imposition and fraud.—On the 20th of this month, (being settling-day,) a most atrocious specimen of that sort of nefarious transaction was played off by a foreign Jew, of the name of Joseph Elkin Daniels, who had for a long time been a conspicuous character in the alley. Finding that, in consequence of the great fluctuation of omnium, he was not able to pay for all that he had purchased at an advanced price, he hit upon a scheme to pocket an enormous sum of money, and with which he decamped: 31,000*l.* omnium was tendered to him in the course of the day; in payment for which he gave drafts on his bankers, amounting to 26,816*l.* 5*s.* which were paid into the respective bankers of those who had received them, to clear in the afternoon. Having gained possession of the omnium, he sold it through the medium of a respectable broker, received drafts for it, which he cleared immediately, and set off with the produce. On his drafts being presented, payment was refused, he having no effects at the bankers'.

On the 12th of September died lord Thurlow, a profound lawyer, a powerful orator, a dignified judge, and an independent statesman. See the article HERALDRY, vol. ix. p. 581, 2.—On the following day died Mr. Fox, one of those worthies who are born for the honour of Great Britain and the admiration of Europe.

Mr. Fox had received from nature an uncommon vigour of constitution; and, notwithstanding the irregularities of his youth, he had enjoyed uninterrupted health till about two years before his death, when the seeds of the disorder, to which he fell afterwards a victim, were probably formed. Having, in the summer of 1804, made too free use of the waters of Cheltenham, he was soon after seized with a pain in his right side, which from its consequences was probably occasioned by an affection of the liver; and, though he soon got apparently well from that attack, he never enjoyed again his former health, but was subject to frequent invasions of a disorder of his bowels. In the beginning of 1806 he attended the funeral of lord Nelson; and, being then exposed for many hours to the cold, he was seized with a return of his complaint, and was never entirely free from it afterwards for any length of time. In this state of health he was called to take a principal part in the direction of his majesty's councils; and, besides his office of secretary of state for foreign affairs, he was prevailed upon to undertake the fatiguing duty of daily attendance in the house of commons, as leader in that assembly on the part of government. The labour and anxiety of these avocations probably accelerated the progress of his disease, and certainly prevented him from having recourse in time to the measures necessary for his

recovery. At length, about the middle of June, he became so seriously indisposed, that he was forced to discontinue his attendance in parliament. Symptoms of both general and local dropsy declared themselves; and, so rapid was the progress of his complaint, that, after the middle of July, though informed of every step taken by his colleagues in the negotiations with France, he could seldom be consulted by them on that or any other public measure, till they had been carried into effect. It was at length thought necessary by his physicians to have recourse to the usual operation for his relief, which was accordingly performed for the first time on the 7th of August, and repeated again on the 31st. After both operations he fell into a state of languor and depression; but his medical attendants never absolutely despaired of his case till Monday the 7th of September, when he sunk into an alarming state of lowness, in which he languished till the evening of Saturday the 13th, when he expired. He retained to the last his senses and understanding; and till a very short time before his death he continued to have confident hopes of his recovery. The cause of his death was ascertained to have been a scirrhus affection of the liver.

Thus died, within a few months after his illustrious rival, one of the most eminent statesmen and distinguished assertors of public freedom who has appeared in England. The most prominent feature of this great man's character was an ardent love of liberty, and generous detestation of cruelty, hypocrisy, and oppression. Never was his voice raised in defence of violence or injustice, nor his aid refused to any one who implored his assistance against oppression or persecution. But, while his heart was generous and forgiving, his understanding was of the highest order. To the other qualities of a great statesman and political leader, he added the rare endowment of a truly philosophical genius, which impelled him, in every subject that occupied his mind, to investigate its principles, and trace them in their consequences and effects. It was this turn of mind, which gave their peculiar value to his speeches in parliament. The quickness and clearness of his apprehension; the fulness and accuracy of his memory; the comprehensiveness of his views and reasonings; the acuteness and soundness of his logic; the sprightliness and pleasantry of his wit; the warmth and sincerity of his feelings; the simplicity, force, and variety, of his language; eminently qualified him for public debate; but it was to the general principles, unfolded and illustrated in his speeches, that they owed their distinguishing merit of being the best sources of constitutional knowledge, and the profoundest lessons of political and practical wisdom.

Mr. Fox was of the middle stature, and for many years had been much encumbered with corpulence and obesity. His complexion was very dark, his nose well formed, and his mouth, according to Lavater's system, expressive of good-nature and a love of pleasure. His eye-brows were not only remarkably thick and black, but were peculiarly shaped; not being arched, but rising upward at a considerable angle from the temples towards the middle of the forehead. The whole expression of his face and person has been said, by one of his panegyrists, to have formed a perfect specimen of the English character; but his dark beard and fallow complexion were by others thought to give him much the appearance of a native of a more southern climate. His countenance was manly, bold, and open; and the bust of him by Nollekens is grand and impressive. His temper was kind, and in private equable; his manners were the most affable and engaging; no one had more personal friends, and there never was a man whose friendships were more lasting, or whose enmities were less rooted.

Mr. Fox's funeral took place on Friday, Oct. 10. The procession was grand and simple; it was not a spectacle ordered by the state, conducted according to the etiquette of the Heralds' College; it was the spontaneous effusion of popular feeling; every thing that could favour of paganry

gaunty and ostentation was avoided, while every thing was done consistent with dignified simplicity. Never, on any such occasion, were seen so many persons of eminence freely and intimately mixing with the people of every class in the same expression of sorrow, and penetrated by the same sentiment of reverence. The absence of the prince of Wales was a disappointment to the people in general. It is, however, justice to his royal highness to say, that he came to town on purpose to pay the last tribute to his deceased friend; but he found that court-etiquette forbade his attendance at a private funeral. Lord Holland, therefore, was chief mourner.

The streets, through which the procession was to pass, were gravelled over; the passages leading into Pall-mall, Charing-cross, Parliament-street, &c. were fenced up by a temporary railing and gateways. The Royal Westminster, Col. Robertson; the Loyal City of Westminster, the Hon. Col. Eden; the St. James's, Col. Lord Amherst; the Royal York Mary-le-bone, Col. Lord Viscount Duncannon; the Prince of Wales's, Col. M. P. Andrews; the Loyal British Artificers, Col. Burton; and several other Corps of Volunteers; paraded at an early hour, and lined the streets quite from the Stable-yard to the Abbey. A band of music was stationed at St. James's Palace, one at Carleton House, one at the Admiralty, and one at the entrance of the Abbey, which played solemn airs as the procession passed. This was done in preference to their marching, as having less the appearance of pageantry.

At two o'clock the procession set out from the Stable-yard. It was nearly two miles in length, and moved amidst an awful silence, the truest mark of general grief and veneration. The hearse which bore the body presented a spectacle every-way appropriate to the dignity of the occasion. It was an open lofty carriage, of spacious dimensions; from the base or platform of which rose an oblong pyramidal altar, ascending by four steps covered at top by an arched canopy, supported by four pillars at the corners; the whole richly hung with black velvet, ornamented with the armorial escutcheons of the deceased; and the whole surmounted by a rich and superb plume of ostrich-feathers.—At the top of the altar was placed the body, in a coffin covered with black velvet, ornamented in a style of simple elegance, with silver gilt nails and escutcheon-plates.

Immediately after the hearse followed in mourning coaches, each drawn by six horses,

Lord HOLLAND, Chief Mourner, supported by Earl Fitzwilliam and Lord Howick.

Train-bearer, Mr. Trotter (Mr. Fox's Private Secretary.)  
*Pall-bearers.*

Lord Chancellor,	Earl of Thanet,
Duke of Norfolk,	Earl of Carlisle,
Duke of Devonshire,	Earl of Albemarle,

*Other Mourners in Coaches.*

Earl Spencer,	Earl Moira,
Lord Ellenborough,	Lord Henry Petty,
Lord Grenville,	Mr. Windham,
Lord Sidmouth,	Mr. T. Grenville.

*Mourners on Foot.*

Earl Cowper,	Mr. Byng,
Lord G. Cavendish,	Lord Wm. Russell,
Lord J. Townshend,	Lord R. Spencer,
Mr. Curran, M. R. I. A.	Solicitor General,
Mr. Whitbread,	Mr. Adam,
Mr. Sheridan,	Attorney General,
Lord Cholmondeley,	General Walpole,
Marquis of Hartington,	General Fitzpatrick,
Earl Percy,	Mr. Plumer,
Marquis of Tavistock,	Mr. W. Wynne,
Earl of Beborough,	Mr. Tierney,
Lord Duncannon,	Mr. Giles,
Earl of Jersey,	Mr. Fonblanque,
Earl of Barrymore,	Mr. Jervis,
Duke of Leinster,	Sir Thomas Miller,
Mr. W. Smith,	Dr. Parr.

It was impossible to obtain a correct list of the other nobility and members of the house of commons who attended on the occasion.

The whole proceeded up Pall-mall, down Cockspur-freet, Charing-cross, Whitehall, and to Westminster-Abbey, in very slow time; the trumpets sounding, at intervals, a solemn dirge; and the regimental bands, with muffled drums and fifes, alternately playing the Dead March in Saul, and the German Funeral Hymn. The procession did not reach the abbey until half past four; when it was received by the clergy, and conducted to the grave in the north transept, where the service was performed in the usual manner. The ceremony concluded soon after five o'clock; and the whole of the company and attendants then dispersed, as there was no return of the procession. The streets were immensely crowded; and the windows, and even the house-tops, throughout the whole line of progress, thronged with spectators.

At the period of Mr. Fox's death, the strength and popularity of the administration were much inferior to what they had been at the time of its accession to power. The country had expected from the talents and reputation of its members, either the restoration of peace, or a more successful prosecution of the war; and in both expectations it had been disappointed. It had looked to important reforms in public expenditure, and to a rigid inquiry into past malversations and abuses. It was not satisfied with the exertions of ministers in regard to the first; and, with respect to the second, its hopes had been grievously damped by the acquittal of lord Melville, which was very generally construed into a proof, either of weakness that was unable, or of connivance that was unwilling, to punish him. The coldness with which the prosecution of lord Wellesley was viewed by one part of the government, and the indecent warmth with which his defence was undertaken by another part, had disgusted and offended a numerous and respectable part of the community, to whom that nobleman was particularly obnoxious. The increase of the income-tax was universally felt; and the suppression of exemptions, however profitable to the exchequer, had added severely to its pressure on the poor and industrious. The additional allowance to the princes of the blood had made a great impression on the public mind, not on account of the magnitude of the sum, but because the proposal originated with those, whose professions of economy were still fresh in its recollection. The reform of the army was the justest claim to popularity, which the administration had yet to offer; but the art of their political opponents had contrived to represent its author as an enemy and contemner of the volunteers, and to excite against him, in the minds of that numerous and respectable body of men, feelings of general resentment and indignation. By similar arts, the American intercourse-bill, a measure which had no other fault but that of doing nothing, was represented to the shipping-interest as infallibly calculated for their destruction. In addition to these causes of unpopularity, the feeble and injudicious management of the patronage of government, by which the friends of administration had been disgusted, and its enemies encouraged without being conciliated, had weakened the usual influence of government, strengthened the jealousies and suspicions among its partisans, and excited the hopes and increased the boldness of its opponents. From the union of these causes there was a general spirit of discontent and dissatisfaction spread over the nation, at the moment when the death of Mr. Fox seemed to loosen the bonds that held together the different members of the administration.

So sensible was the opposition of the declining power and popularity of the ministry, that, during Mr. Fox's illness, some of its leaders are understood to have made private overtures to the court, for taking back the reins of government, which they had suffered to drop from their hands some months before. How these overtures, if actually made, were received, we are unable to communicate.

to our readers. That they were followed by no immediate effects, does not surprize us. It was still uncertain whether Mr. Fox might not recover; and, in case of his death, it is not improbable, that hopes were entertained of being able to form, without a struggle, a new administration, in which his friends would be left out. The account of his death was received at court with coldness and indifference; and such inquiries into the particulars of that event as curiosity dictated, were studiously addressed to those who, from the recentness of their connection with him, were the least likely to receive from them gratification, or consider them as marks of an interest in his fate. No haste was expressed to fill up the vacancy occasioned by his death. It was rather desired, that due consideration should precede the formation of the new ministerial arrangements which that event rendered necessary. But if expectations were harboured, that lord Grenville, on whom the suggestion of the new arrangements naturally devolved, would take this opportunity of separating from Mr. Fox's friends, they were completely disappointed. That nobleman seems, on the contrary, to have taken pains to show, that his attachment to his new associates had been strengthened, instead of being impaired, by their connection; and that even an event like this, which left him the choice of his future partners in the government, was insufficient to detach him from them. He recommended lord Howick to succeed Mr. Fox in the foreign office; Mr. Grenville to be first lord of the admiralty, in the place of lord Howick; Mr. Tierney to be president of the board of controul, in the place of Mr. Grenville, who had succeeded to that office, with a place in the cabinet, on the appointment of lord Minto to the government of Bengal; lord Sidmouth to succeed to the presidency of the council, from which lord Fitzwilliam, on account of bad health, was desirous to withdraw; and lord Holland to succeed lord Sidmouth as lord privy seal. In these appointments, it is worthy of remark, that lord Holland, the nephew of Mr. Fox, was the only new member brought into the cabinet. When these arrangements were submitted to his majesty, he was graciously pleased to acquiesce in them.

The new ministry found it necessary to dissolve the parliament; and the returns to the new one were such as greatly to add to the weight and influence of the friends of administration in the house of commons. The whig party, which had been driven out of the representation of Yorkshire in 1784, recovered one of the seats for that great and independent county. In Norfolk, after a hard-fought contest, both members returned were whigs. One of the seats for Liverpool was carried by the abolitionists against the traffickers in human flesh. But, on the other hand, a friend of administration was turned out of the representation of Southwark, and another lost the city of Norwich. Westminster was the scene of a most violent contest between a friend of government and a discontented whig; and one of the seats for Middlesex was lost to the popular party, by an attack of sir Francis Burdett on the memory of Mr. Fox.

Ireland enjoyed tranquillity during the greater part of the present year, under the mild and conciliatory government of the duke of Bedford. Towards the close of the year, disturbances broke out in the north-west of Ireland, occasioned by a banditti, who went about in the nighttime under the name of Threshers, committing every sort of crime and outrage. Strong applications were made to the viceroy, to have these disturbances put down by the insurrection-law, the usual remedy in Ireland on such occasions; but the duke of Bedford refused to have recourse, without necessity, to so violent a remedy; and, by proper use of the ordinary and regular authority of government, he succeeded in repressing and putting a stop to these excesses.

On the 24th of November, about six o'clock in the morning, the debtors confined in Newgate were alarmed by hearing something fall into the yard, and afterwards a faint groaning, as if from a person in distress. A turn-

key went into the debtors' yard, where he discovered the two men, who had been employed to watch at the top of the gaol during Sunday night, in a situation too shocking to describe. One of them, of the name of William Lee, had fallen upon an iron bar, which had taken off the top part of his skull, and dashed his brains out, which were scattered upon the pavement; the other, Robert Simpson, had, if possible, suffered a still more shocking death, for he had fallen upon some iron spikes, one of which entered the thick part of his thigh, and penetrated a considerable way into his body! The only possible mode of accounting for this melancholy accident is, that there is a small division at the top of the gaol, which they had to cross; and Simpson, the constant watchman, and who had been watchman at Newgate ever since it was built, had that night unfortunately left his lantern at home; and it is supposed that, in going round the gaol, they must have forgotten this division, and their miserable death was the consequence.

Some philosophers have divided the functions of the human mind into perception, judgment, memory, volition, &c. and others have classed them in different ways, according to their various ideas on the subject; but few, if any, have ever mentioned two modifications, or affections, which are nevertheless most prominent: namely, the prurient desire of knowing, or *curiosity*, and the unquenchable thirst after unmotivated belief, or *gullibility*; the latter being the natural consequence of the former. Not only in England, but in all the nations, the descriptions of which have come hitherto, in rotation, under our pen, we have had frequent occasion to remark how easy of belief is man in general, and how prone to acquiescence and blind devotion, whenever he loses sight of the unerring torch of dispassionate reason which Providence has placed before him, like the Pharos to guide the mariner. We have never found this propensity (we were going to call it a brutal appetite after the nauseous food of lies and deception) more strongly marked, more nefariously practised upon, more absurdly ridiculous, than in religious matters.—Conjurors, and Cock-lane ghosts, are but common tricks, and hackneyed hoaxes now—the stomach is low—the wonted appetite recedes, and wants stimulating—and this circumstance gave rise to the tremendous, yet harmless, prophecies of a Brothers; and to the monstrous spiritual pregnancies, and blasphemous abortions, of a Joanna Southcott. The modern enemies of revelation have often observed, with a triumphant sneer, that the heathen authors did never mention the life and miracles of Christ; and, by a negative argument, wish to destroy facts which the rest of the world had affirmed. It has been properly urged, in reply, that it was neither the business nor the interest of pagan writers to mention Jesus in their respective productions; and that, if they have done so, the raging jealousy and zeal of the heathens soon found ways of destroying these inimical evidences at a time when printing was unknown. However, lest the partisans of the prophets Joanna Southcott should suppose that we are actuated by the same invidious motives, we shall give our readers some interesting strictures upon the subject, and thus endeavour to raise a smile upon human extravagance, as a digression from the serious duties of the chronicler. The seal of secrecy shall not be pressed upon her fame, and she shall be held up on high for the admiration or scorn of the people. The account is taken from a work professedly translated from the Spanish, but with greater probability supposed to be an original English work.

In the early part of the thirteenth century there appeared an English virgin in Italy, beautiful and eloquent, who affirmed that the Holy Ghost was incarnate in her for the redemption of women; and she baptized women in the name of the Father, and of the Son, and of herself. Her body was carried to Milan, and burnt there. Joanna Southcott neither boasts of the charms of her forerunner, nor needs them. Instead of having an eye which can fascinate, and a tongue which can persuade to error by glos-

ing it with sweet discourse, she is old, vulgar, and illiterate. In all the innumerable volumes which she has sent into the world, there are not three connected sentences in sequence; and the language alike violates common sense and common syntax. Yet she has her followers among the educated classes, and even among the benefited clergy. "If Adam," she says, "had refused listening to a foolish ignorant woman at first, then man might refuse listening to a foolish ignorant woman at last;"—and the argument is admitted by her adherents. When we read in romance of enchanted fountains, they are described as flowing with such clear and sparkling waters as tempt the traveller to thirst; here, there may be a magic in the draught, but he who can taste of so foul a stream must previously have lost his senses. The filth and the abominations of demoniacal witchcraft are emblematical of such delusions; not the golden goblet and bewitching allurements of Circe and Armida.

This woman was born in Devonshire about the middle of the last century; and seems to have passed forty years of her life in honest industry, sometimes as a servant, at others working at the upholsterers' business, without any other symptom of a disordered intellect than that she was zealously attached to the methodists. She mentions in her books a preacher who frequented her master's house, and, according to her account, lived in habits of adultery with the wife, trying at the same time to debauch the daughter, while the husband vainly attempted to seduce Joanna herself. This preacher used to terrify all who heard him in prayer, and make them shriek out convulsively. He said that he had sometimes, at a meeting, made the whole congregation lie stiff upon the floor till he had got the evil spirits out of them; that there never was a man so highly favoured of God as himself; that he would not thank God to make him any thing, unless he made him greater than any man upon earth, and gave him power above all men; and he boasted, upon hearing the death of one who had censured him, that he had fasted and prayed three days and three nights, beseeching God to take vengeance upon that man, and send him to eternity. Where such impious bedlamites as this are allowed to walk abroad, it is not to be wondered at that madness should become epidemic. Joanna Southcott lived in a house which this man frequented, and where, notwithstanding his infamous life, his pretensions to supernatural gifts were acknowledged, and he was accustomed to preach and pray. The servants all stood in fear of him. She says, he had no power over her, but she used to think the room was full of spirits when he was in prayer; and he was so haunted that he never could sleep in a room by himself, for he said his wife came every night to trouble him. She was perplexed about him, fully believing that he wrought miracles, and wondering by what spirit he wrought them. After she became a prophetess herself, she discovered that this gentleman was the false prophet in the Revelations, who is to be taken with the Beast, and cast alive with him into a lake of burning brimstone.

Four persons have written to Joanna upon the subject of her pretended mission, each calling himself Christ! One Mr. Leach, a methodist preacher, told her to go to the Lord in his name, and tell the Lord that he said her writings were inspired by the devil. These circumstances show how commonly delusion, blasphemy, and madness, are to be found in this country, and may lessen our wonder at the phrensy of Joanna and her followers. Her own career began humbly, with prophecies concerning the weather, such as the popular English almanacs contain; and threats concerning the fate of Europe, and the successes of the French, which were at that time the speculations of every newspaper, and of every alehouse politician. Some of these guesses having chanced to be right, the women of the family in which she then worked at the upholstering business, began to lend ear to her; and she ventured to submit her papers to the judgment of one Mr. Pomeroy,

the clergyman whose church she attended in Exeter. He listened to her with timid curiosity, rather wanting courage than credulity to become her disciple; received from her certain sealed prophecies which were at some future time to be opened, when, as it would be seen that they had been accomplished, they would prove the truth of her inspiration; and sanctioned, or seemed to sanction, her design of publishing her call to the world. But in this publication his own name appeared, and that in such a manner as plainly to imply, that, if he had not encouraged her to print, he had not endeavoured to prevent her from so doing. His eyes were immediately opened to his own imprudence, whatever they may have been to the nature of her call; and he obtained her consent to insert an advertisement in the newspaper with her signature, stating that he had said it was the work of the devil. But here the parties are at issue: as the advertisement was worded, it signifies that the clergyman always said her calling was from the devil; on the other hand, Joanna and her witnesses protest that what she had signed was merely an acknowledgment that he had said, after her book was printed, the devil had instigated her to print his name in it. This would not be worthy of mention, if it were not for the very extraordinary situation into which this gentleman has brought himself. Wishing to be clear of the connection in which he had so unluckily engaged, he burnt the sealed papers which had been intrusted to his care. From that time all the Joannians, who are now no inconsiderable number, regard him as the arch-apostate. He is the Jehoiakim who burnt Jeremiah's roll of prophecies; he is their Judas Iscariot, a second Lucifer, son of the Morning. They call upon him to produce these prophecies, which she boldly asserts, and they implicitly believe, have all been fulfilled, and therefore would convince the world of the truth of her mission. In vain does Mr. Pomeroy answer that he has burnt these unhappy papers:—in an unhappy hour for himself did he burn them! day after day long letters are dispatched to him, sometimes from Joanna herself, sometimes from her brother, sometimes from one of her four-and-twenty elders, filled with exhortation, invective, texts of scripture, and denunciations of the law in this world, and the devil in the next; and these letters the prophetess prints, for this very sufficient reason—that all her believers purchase them. Mr. Pomeroy sometimes treats them with contempt; at other times he appeals to their compassion, and beseeches them, if they have any bowels of Christian charity, to have compassion on him and let him rest, and no longer add to the inconceivable and irreparable injuries which they have already occasioned him. If he is silent, no matter; on they go, printing copies of all which they write; and, when he is worried into replying, his answers also serve to swell Joanna's books. In this manner is this poor man, because he has recovered his senses, persecuted by a crazy prophetess, and her four-and-twenty crazy elders, who seem determined not to desist, till, one way or other, they have made him as ripe for Bedlam as they are themselves.

The books which she sends into the world are written partly in prose, partly in rhyme, all the verse and the greater part of the prose being delivered in the character of the Almighty! It is not possible to convey an adequate idea of this unparalleled and unimaginable nonsense by any other means than literal transcript. Her handwriting was illegibly bad; so that at last she found it convenient to receive orders to throw away the pen, and deliver her oracles orally; and the words flow from her faster than her scribes can write them down. This may be well believed, for they are words and nothing else: a mere rhapsody of texts, vulgar dreams and vulgar interpretations, vulgar types and vulgar applications:—the vilest string of words in the vilest doggerel verse, which has no other connection than what the vilest rhymes have suggested, she vents, and her followers receive, as she dictates.

of immediate inspiration. A herd, however, was ready to devour this garbage as the bread of life. Credulity and Vanity are foul feeders.

The clergy in her own neighbourhood were invited by her, by private letters, to examine her claims, but they treated her invitations with contempt; the bishop also did not choose to interfere;—of what avail, indeed, would it have been to have examined her, when they had no power to silence her blasphemies! She found believers at a distance. Seven men came from different parts of the country to examine—that is—to believe in her; these were her seven stars; and when at another time seven more arrived upon the same wise errand, she observed, in allusion to one of those vulgar sayings from which all her allusions are drawn, that her seven stars were come to fourteen. Among these early believers were three clergymen, one of them a man of fashion, fortune, and noble family. It is not unlikely that the woman at first suspected the state of her own intellects: her letters appear to indicate this; they express an humble submission to wiser judgments than her own; and, could she have breathed the first thoughts of delusion into the ear of some pious confessor, it is more than probable that she would have soon acknowledged her error at his feet, and the phrensy which has now infected thousands would have been cut off on its first appearance. But, when she found that persons into whose society nothing else could have elevated her, listened to her with reverence, believed all her ravings, and supplied her with means and money to spread them abroad, it is not to be wondered at if she went on more boldly;—the gainfulness of the trade soon silencing all doubts of the truth of her inspiration.

Some of her foremost adherents were veterans in credulity; they had been initiated in the mysteries of animal magnetism, had received spiritual circumcision from Brothers, and were thus doubly qualified for the part they were to act in this new drama of delusion. To accommodate them, Joanna confirmed the authenticity of this last fanatic's mission, and acknowledged him as King of the Hebrews,—but she dropt his whole mythology. Her heresy in its main part is not new. The opinion that redemption extended to men only, and not to women, had been held by a Norman in the sixteenth century, as well as by the fair English heretic already mentioned. This man, in a book called *Virgo Veneta*, maintained that a female Redeemer was necessary for the daughters of Eve, and announced an old woman of Venice of his acquaintance as the Saviour of her sex. Bordonius, a century ago, broached even a worse heresy. In a work upon miracles, printed at Parma, he taught that women did not participate in the atonement, because they were of a different species from man, and were incapable of eternal life. Joanna and her followers are too ignorant to be acquainted with these her prototypes in blasphemy; and the whole merit of originality in her system must be allowed her, as indeed she has exceeded her forerunners in the audacity of her pretensions. She boldly asserts that she is the Woman in the Revelations, who has the moon under her feet, and on her head a crown of twelve stars; the twelve stars being her twelve apostles, who with the second dozen of believers make up her four-and-twenty elders. In her visitation it was told her, that the angels rejoiced at her birth, because she was born to deliver both men and angels from the insults of the devil. Let it be lawful for me to repeat these blasphemies, holding them up to merited abhorrence. The scheme of redemption, she says, is completed in her, and without her would be imperfect; by woman came the fall of man, by woman must come his redemption; woman plucked the evil fruit, and woman must pluck the good fruit; if the tree of knowledge was violated by Eve, the tree of life is reserved for Joanna. Eve was a bone from Adam; she is a bone from Christ, the second Adam. She is the bride, the promised seed who is to bruise the serpent's head; she it is who claims the promise made at the creation, that woman should be the

helpmate of man; and by her the Creator fulfils that promise, and acquits himself of the charge of having given to man the woman in vain. The evening-star was placed in the firmament to be her type. While she arrogates so much to herself, she is proportionately liberal to her followers; they have been appointed to the four-and-twenty elderships: and to one of them, when he died, a higher character was more blasphemously attributed; she assured his relations that he was gone to plead the promises before the Lord; that to him was to be given the key of the bottomless pit, and that the time was at hand when he should be seen descending in the air,—for they knew not the meaning of our Saviour's words when he said, "Ye shall see the Son of Man coming in the clouds, in power and great glory."

The immediate object of her call is to destroy the devil: of this the devil was aware; and, that it might not be said he had had foul play, a regular dispute of seven days was agreed on between him and Joanna, in which she was to be alone, and he to bring with him as many of the Powers of Darkness as he pleased: but he was not to appear visibly; for, as he did not choose to make his appearance on a former occasion when some of her elders went to give him the meeting, but had disappointed them, he was not to be permitted to manifest himself bodily now. The conditions were, that, if she held out with argument against him for seven days, the woman should be freed and he fall; but, if she yielded, Satan's kingdom was to stand, and a second fall of the human race would be the consequence. Accordingly, she went alone into a solitary house for this conference. Joanna was her own secretary upon this occasion, and the process-verbal of the conference has been printed, as literally taken down; for she was ordered to set down all his blasphemies, and show to the world what the language of hell is. It is by no means a polite language;—indeed the proficiency which Satan displays in the vulgar tongue is surprising.

Of all Joanna's books this is the most curious. Satan brought a friend with him, and they made up a story for themselves which has some ingenuity. "It is written," said they, "Be still, and know that I am God;" this still worship did not suit Satan; he was a lively cheerful spirit, full of mirth and gaiety, which the Lord could not bear, and therefore cast him out of heaven. This, according to Apollyon's account of heaven, could have been no great evil. "Thou knowest," he says, "it is written of God, he is a consuming fire, and who can dwell in everlasting burnings? Our backs are not brass, nor our sinews iron, to dwell with God in heaven." The heaven therefore which men mistakenly desire, is in its nature the very hell of which they are so much afraid; and it is sufficient proof of the truth of all this, that the devil invites them to make themselves happy and lead a gay life, agreeably to his own cheerful disposition; whereas religion enjoins self-denial, penitence, and all things which are contrary to our natural inclinations. Satan accounted to Joanna for her inspiration by this solution: an evil spirit had loved her from her youth up; he found there was no other access to her heart than by means of religion; and, being himself able to foresee future events, imparted this knowledge to her in the character of a good spirit. This spirit, he said, was one which she had been well acquainted with; it was that of one Mr. Follart, who had told her, if she would not have him for a husband, he should die for her sake; and he died accordingly. But this deception had now been carried so far, that Satan was angry, and threatened, unless she broke her seals and destroyed her writings, he would tear her in pieces.

The conference terminated like most theological disputes. Both parties grew warm. Apollyon interfered, and endeavoured to accommodate matters, but without effect, and Joanna talked Satan out of all patience. She gave him, as he truly complained, ten words for one, and allowed him no time to speak. All men, he said, were tired of her tongue already; and now she had tired the devil.

devil. This was not unreasonable; but he proceeded to abuse the whole sex, which would have been ungracious in any one, and in him was ungrateful. He said no man could tame a woman's tongue—the sands of an hour-glass did not run faster—it was better to dispute with a thousand men than with one woman. After this dispute she fasted forty days; but this fast, which is regarded by her believers as so miraculous, was merely a catholic lent, in which she abstained from fish and flesh.

The moon, which is under her feet in the Revelations, typifies the devil; for the moon, it seems, having power to give light by night but not by day, is Satan's kingdom, and his dwelling-place; he, I conclude, being the very person commonly called the man in the moon, a conjecture of my own, which, you must allow, is strongly confirmed by his horns. Once, when the Lord made her the same promise as Herod had done to Herodias, she requested that Satan might be cut off from the face of the earth, as John the Baptist had been. This petition she was instructed to write, and seal it with three seals, and carry it to the altar when she received the sacrament! and a promise was returned that it should be granted. Her dreams are usually of the devil. Once she saw him like a pig with his mouth tied; at another time skinned his face with her nails after a fierce battle; once she bit off his fingers, and thought the blood sweet—and once she dreamt she had fairly killed him. But neither has the promise of his destruction been as yet fulfilled, nor the dream accomplished.

This phrensy would have been speedily cured in our country, (Spain;) bread and water, a solitary cell, and a little wholesome discipline, are specifics in such cases. Mark the difference in England. No bishop interferes; she therefore boldly asserts that she has the full consent of the bishops to declare that her call is from God, because, having been called upon to disprove it, they keep silent. She, who was used to earn her daily bread by daily labour, is now taken into the houses of her wealthy believers, regarded as the most blessed among women, carried from one part of England to another, and treated every where with reverence little less than idolatry. Meantime, dictating hooks as fast as her scribes can write them down, she publishes them as fast as they are written; and the Joannians buy them as fast as they are published. Nor is this her only trade. The seals in the Revelations furnish her with a happy hint. She calls upon all persons “to sign their names for Christ's glorious and peaceable kingdom, to be established and to come upon earth, and his will to be done on earth as it is done in heaven, and for Satan's kingdom to be destroyed, which is the prayer and desire of Joanna Southcott.” They who sign this are to be sealed. Now if this temporal sealing, which is mentioned by St. John in the Revelations, had been understood before this time, men would have begun sealing themselves without the visitation of the Spirit; and, if she had not understood it and explained it now, it would have been more fatal for herself and for all mankind than the fall of Eve was. The mystery of sealing is this: whosoever signs his name receives a sealed letter containing these words: “The Sealed of the Lord, the Elect, Precious, Man's Redemption, to inherit the Tree of Life, to be made Heirs of God, and Joint-heirs with Jesus Christ. Signed *Joanna Southcott.*” I know not what the price of this initiation is; but she boasts of having sealed above eight thousand persons, so that the trade is a thriving one.

We shall conclude with a few flowers of infernal eloquence from *The Dispute with the Powers of Darkness*. Satan says to her, “Thou infamous b—ch! thou hast been flattering God, that he may stand thy friend. Such low cunning art I despise.—Thou weening devil! stop thy d—mn'd eternal tongue; thou runnest on so fast, all the devils in hell cannot keep up with thee.—God hath done something to choose a b—ch of a woman that will down-argue the devil, and scarce give him room to speak.”—It

may truly be said, in Joanna's own words, “*If the woman is not ashamed of herself, the devil cannot shame her.*”

Although Great Britain is separated from the rest of the continent by a small arm of the sea, she holds nevertheless a momentous preponderance in the scale of continental powers; and consequently the city of London, which is undoubtedly the heart of the united kingdom, whence the arteries and veins of commerce convey and bring back the treasures of the East and West;—whence the rays of knowledge in all sciences and arts diffuse themselves through the rest of the world;—and wherefrom, through the political ramifications of interest, she dictates laws, subsidises allies, and appals the enemies of the country with her frowns;—the city of London cannot but take an active part in the affairs of Europe, though she appears to repose in conscious security. Indeed, at all times, the word LONDON has been synonymous with that of ENGLAND; and, when the mind or the eyes of foreigners turn to the island of Albion, London is the spot they invariably fix upon. This wealthy and most populous metropolis being so intimately connected with the rest of the known world, all transactions militate for or against her, and therefore become part of her own history. Impelled by these considerations we have enlarged in this article upon the affairs of Europe, particularly when they have appeared directly or indirectly to affect the welfare of the city of London; and we request our readers to consider this article as a companion and supplement to those of ENGLAND, FRANCE, and GERMANY, in our 6th, 7th, and 8th, volumes.

The state of Europe in the beginning of the year 1807 was most critical. Every eye was fixed on the coasts of the Baltic: it was there that the destinies of Europe were to be decided, as they had been in former periods on those of the Mediterranean. The genius and the resources of the north were brought into conflict with those of the south. A mighty contest was to be decided between Alexander emperor of Russia, and the king of Prussia, on the one part, and, on the other, Bonaparte emperor of France and king of Italy. The latter derived support from the nations whom he had subdued or intimidated—Italy, Spain, Holland, and a great part of Germany: the former depended on the aid of Sweden, and the cordial and vigorous co-operation of Great Britain. There was another ally, more powerful than either of the two just mentioned, on which the Russians might, and no doubt did, reckon; namely, a rigorous climate, to which they themselves were inured, but which might prove fatal to soldiers from France, Spain, and Italy. The enemy too, in proportion as he should advance into Poland, or beyond it, would be drawn into difficulties and dangers on the line of his operations, in territories with the nature or ground of which he could not be well acquainted, and farther and farther removed from supplies and reinforcements. The Russians, on the contrary, would receive reinforcements and stores both by land and sea from Russia, Sweden, and England. The young and heroic king of Sweden, emulating his ancestor the great Gustavus Adolphus, with the aid both of a subsidy and troops from England, might march an army through Lower Saxony, from Dantzic and Colberg, as far as Hamburg. This army, augmented in its progress by insurgents, in Hesse, Hanover, and the Prussian dominions, might pass the Elbe, and establish a war in the centre of Germany; where, if he should be able to maintain himself for any length of time, he might reasonably expect to be joined by the Austrians. Such, it may be presumed, were the considerations that encouraged and determined the court of St. Petersburg to undertake and to persevere in the war with France. The battle of Pultusk, though bloody and obstinately contested, was indecisive; and it must be admitted that if the nations, on whose favour and co-operation the Russians depended, had understood and pursued their respective as well as their common interest, and harmoniously joined

in one well-concerted plan of action, their design might not have proved abortive.

It is, however, not physical but moral force that governs the world: bold conception, a just discrimination between difficulty and impossibility, profound combination, unity of design, promptitude and rapidity of action. It was not physical force, but sublime genius and an ascendancy over the minds of men, that gave energy and success to the measures of Alexander of Macedon, Hannibal, and Julius Cæsar. All great results spring from small, and at first imperceptible, origins; one constant impulsion, constantly and uniformly accelerating. In confederations there is generally something that misgives; something false and hollow. It is seldom even possible for the confederating parties to form, as emergencies arise, a concert of wills in time, and seldom so full that they submit without reserve to the will of one dictator. The fragility of confederations had been proved by three coalitions against the ruler of France; and the issue of a fourth was now to be added to the number.

The position and strength of the French and Russian armies, were threatening a most bloody conflict; and, after the battles of Jena, Bergfried, and Hoff, the great defeat at Eylau shook the continent, and rebounded to the very centre of London, by damping the hopes of trade, and raising new fears of the common enemy.

The character and result of this last battle seem to be exhibited with great candour in a letter written by a Russian officer of the army, three days afterwards. "Our army has performed prodigies of valour; though our loss has been very great. It is generally agreed, that it was a miracle we did not lose more; which is ascribed to the excellent discipline and order that prevailed even in the hottest of the action, and in the midst of such a fire as was never perhaps witnessed before. For these three days we have been enquiring of each other, on which side the victory lay. This question may appear singular; but in truth it is impossible for me to say which of the two armies fought with the greatest courage and obstinacy, and did the greatest mischief to the other." It is a very remarkable circumstance in the battle of Eylau, that there was little or no engagement between the infantry of the two armies. The battle was fought by the artillery and cavalry. The following day presented a horrid scene of dead and dying men: to bury all the dead, required immense labour. A great number of Russian slain, were found with the insignia of their orders. Forty-eight hours after the battle, there were still upwards of 5000 wounded Russians, whom the French had not been able to carry off. Brandy and bread were carried to them, and they were successively borne away to the *ambulance*, or train of carriages. On the space of a square league were seen 9 or 10,000 dead bodies; 4 or 5000 horses killed; whole lines of Russian knapsacks; broken pieces of muskets and sabres; the ground covered with cannonballs, howitzer-shells, and ammunition; twenty-four pieces of cannon, near which lay the bodies of their drivers, killed at the moment when they were endeavouring to carry them off. All this was the more conspicuous, as the ground was covered with snow. The 5000 wounded Russians were all conveyed in sledges to Thorn, and to the French hospitals on the left bank of the Vistula. The surgeons observed with astonishment, that the fatigue of this conveyance did no harm to the wounded. At the same time that marshal Davoust attacked the elevated ground, the possession of which was so warmly disputed, marshal Ney came round by Altorf, driving before him the same column which he had attacked at Deppen, and, in the evening, occupied the village of Schoneditton. The Russian general therefore, harassed on his flanks by Davoust and Ney, who threatened to cut off his rear-guard, ordered several battalions of grenadiers to make an attack on Schoneditton; which was accordingly done at eight o'clock at night, but without effect. The next day, (February 9,) the Russians were pursued as far as the ri-

ver Frischeling, while they retreated behind the Pregel. The French Gazette says in conclusion: "This expedition is ended. The enemy is beaten and driven back eighty leagues from the Vistula. The French army is going to return to its winter-quarters."

That the main body of the Russian army—not absolutely the whole, as will presently appear—was forced to fall back eighty leagues from the Vistula, is true; but it is also true that Bonaparte did not find himself in a condition, at this time, again to attack them, and hazard another battle. The Russian army, without any material loss, effected its retreat to Konigsberg. Bonaparte was now only a short distance from Konigsberg, a grand depository of the enemy. The steeples of this place, which had been held out as a rich prey to the French soldiers, were seen from the heights of Eylau. Nothing could have been more desirable than to take a place which would at once have been a most advantageous military position, furnished abundance of provisions and stores, and gratified the army by pillage. And that the reduction of Konigsberg was accordingly, in fact, his object, appears from a letter addressed to the empress Josephine, by Berthier prince of Neufchatel, the most confidential minister of Bonaparte, on the evening before the battle, dated at Great Glandau, 7th February: "At the approach of his imperial majesty, the Russian army fell back. On the evening of the 6th it had passed Landberg, with the intention of continuing a retreat during the night. The emperor, who commanded the advanced guard, ordered an attack on the rear of the Russians, which had been lately re-inforced. It was unable to resist the vigour of an attack conducted by his majesty in person. *To-morrow we shall be at Konigsberg.*" And an attempt on Konigsberg would, no doubt, have been made, if, after the battle of Eylau, Bonaparte had conceived that he possessed means for accomplishing his object. But this was, in truth, a drawn battle; and the severest check he had received since the commencement of his career, which was in Italy, in 1796.

It was not, however, without some degree of plausibility that both sides claimed the victory, or at least a discomfiture of the design of their opponents. It was the design of Bonaparte to take Konigsberg: he was forced to fall back on the Vistula. It was the design of the Russians to drive the French back beyond the Vistula, to retake Elbing and Thorn, and to force them to raise the sieges of Colberg, Graudenz, and Dantzic: by a series of successive actions, they had been driven back by the French as far as Eylau, and, on the day after the battle, beyond the Pregel. The French had buried the Russian dead; collected and taken care of the greatest part of their wounded; taken a number of their cannon dismounted in the action; and, finally, remained seven or eight days on the field of battle.

According to his usual policy, Bonaparte after this success made pacific overtures; but they were rejected, and the demon of war raged with new fury in the north of Germany upon the very frontiers of the Russian empire. The fall of Dantzic and Stralsund gave great advantages to Bonaparte; and the defeat of the Swedes seemed at one time to seal the slavery of Germany under the French emperor. But while Gustavus, who had come down to Stralsund after the French had left the place, was employed in reviewing and promoting his brave and loyal Swedes, he was himself not a little animated, it may be presumed, by the arrival at Stralsund of the English general Clinton, with assurances of speedy succours of all kinds from the British government, in the administration of which, there had been, on the 24th of March, a great change. The ministers of England, who were desirous, above all things, of peace, and who had been amused with a negotiation by Bonaparte until he was prepared to take the field at the close of September 1806, were exchanged for others, better disposed, it was generally imagined, to afford succour and co-operation with the confederacy against the tyranny, and still growing ambition, of the ruler of France.

On the 21st of January, 1807, the house of commons went into a committee of supply; and Mr. Windham moved the army-estimates; which, he said, with very few exceptions, were conformable to those of the last year. They were classed under 26 heads; namely,

	Number.	Charge.

This authentic and curious statement cannot fail interesting the public, as it gives our readers an opportunity for comparing the estimate of the English forces at that period with the present situation of the army and navy, to which the city of London is known to yield comparatively the greatest contribution.

Whilst the whole of the continent, and in particular the provinces of Germany, were overrun by the French armies, threatening slavery every-where, and fostering the bitter fruit of foreign dominion, under the perfidious shade of their half-rotten tree of liberty, the British government was deeply engaged in a cause, which will do eternal honour to the goodness of the British heart, which, knowing well the blessings of freedom, had long sighed after the happy hour when the chains of nearly the half of mankind should be ultimately broken for ever. The tears of the sable sons of Africa had been overlooked, their cries unheard, by other nations; it was reserved for us to dry those bitter tears, to put an end to that anti-christian traffic, through which innumerable slaves were bought in order to labour and groan under the arbitrary government of ungovernable tyrants; and eventually to set millions of men at liberty by a single decree from the British parliament. So illustrious, so generous, an example, given to the rest of the world, cannot be too much praised; and we shall therefore present the fact to our readers with all the particulars that may be interesting. It was in the bosom of one of the cities which we are now describing that the transaction took place; and consequently we ought to relate it as part of the History of London and Westminster.

Two resolutions had been passed by both houses, in the preceding session of parliament: the one declaring, "that the African slave-trade, being contrary to the principles of justice, humanity, and sound policy, ought to be abolished with all practicable expedition;" and the other, to address his majesty, beseeching him "to take such measures as might appear most effectual for obtaining, by negotiation, the concurrence and concert of foreign powers, in the abolition of the slave-trade, and the execution of the regulations adopted for that purpose."

In pursuance of these resolutions, lord Grenville, on the 2d of January, brought into the house of peers, a bill for abolishing the slave-trade. Lord Eldon wished to know whether the bill was meant to extend to the slave-trade in general, both in the West-Indies and on the coast of Africa, or if it was the African slave-trade only that was to be abolished. Lord Grenville said that the bill extended to the African trade only. The bill was read a first time, and printed.

January 12th, on the motion of lord Grenville for appointing a day for the second reading of the bill, lord Hawkebury moved an address to his majesty, praying, "that he would be graciously pleased to order to be laid before the house, copies of all communications which had passed between his majesty and foreign powers, respecting the abolition of the slave-trade, in consequence of the address of that house." Lord Grenville said, that, with respect to France, the fact was, that, during the late negotiation with the government of that country, communications on this subject did take place, to the production of which he saw no objection. As to Spain and Holland, no communications had or could have taken place with those powers. Communications respecting the slave-trade had passed between the plenipotentiaries of this country, and the United States of America; and an agreement on this subject actually formed one of the articles of the treaty which had been signed by one of those plenipotentiaries. With respect to Portugal, it was not thought expedient to make any communication on the subject, during the negotiation with France.—These five were the only powers materially interested in the slave-trade.

On the 4th of February, counsel was heard, pursuant to order, before the house of lords, on behalf of the West-India merchants, and for the merchants of Liverpool, against the bill.

On the 5th of February, lord Grenville, having given a copious detail of the principal arguments on which the principle or spirit of the bill was founded, concluded with moving, "that the bill be now read a second time." Lord Grenville's motion was supported by the duke of Gloucester, the earl of Selkirk, lord King, the earl of Roslyn, lord Northesk, the bishop of Durham, lord Holland, and the earl of Suffolk. It was opposed by the duke of Clarence, the earl of Morton, the earl of Westmoreland, lord Sidmouth, lord Eldon, and lord Hawkebury. It was suggested, on the present subject, by lord Sidmouth, that churches should be built for the negroes in the West-India islands, agreeably to the advice of Mr. Burke, and that they should be instructed in the morality, and also the peculiar doctrines, of the Christian religion. To Mr. Burke's advice, lord Sidmouth made an addition that merits the most attentive consideration: he recommended that the negroes should be also united by the ties of matrimony, as the first step towards civilization, and the future improvement of their condition. With these advantages, and the blessing of being protected by our laws, he thought that the time would arrive for emancipating them.—The second reading of the bill was carried by a hundred voices against thirty-six.

The report of the bill being brought up, on February 9th, lord Grenville stated, that it had been thought advisable to fix the same period in all the clauses of the bill for the abolition of the slave-trade; namely, the 1st of May, 1807; and to introduce a proviso, allowing vessels employed in the trade, which had cleared out from the ports

ports of this country for Africa previously to that day, to complete their cargoes in Africa, and trade with them to the West-Indies, and other parts of America, until the 1st of January, 1808, at which period the trade should be finally abolished. The amendments proposed by his lordship were agreed to.

On the question being put for engrossing the bill, the bishop of London rose, and expatiated on the moral and religious consequences that might be expected to accrue from that salutary and humane act of legislative justice. But he lamented that the number of clergymen was so small, when compared with the great population of the blacks. In the island of Jamaica, where there were from 2 to 300,000 negroes, there were only 20 clergymen, whose time was almost entirely taken up in religious instruction, and exhortation, administering the sacraments, and performing other duties of their function, to the whites.

Earl St. Vincent, who had on former occasions set his face in the most decided manner against the bill, embraced this last opportunity of entering his protest against its adoption; the consequences of which, he was fully persuaded, would prove fatal to the best interests of this country. (As soon as France should make peace with this country, and she would hasten a pacification in consequence of this measure,) her first object would be to get complete possession of the slave-trade; and, if she succeeded in that object, it would soon appear that she had got possession of an engine that would work the downfall of the naval superiority of this country. Such was his conviction, and he uttered it now for the last time. His lordship then immediately withdrew from the house. The different clauses of the bill were then agreed to, and the bill engrossed.

Another naval commander of still greater celebrity was as decided an anti-abolitionist as lord St. Vincent, as appears from the following passage, which is part of a letter from lord Nelson, to Mr. Simon Taylor, Jamaica; dated Victory, off Martinico, June 10. "I have ever been, and shall die, a firm friend to our colonial system. I was bred, you know, in the good old school, and taught to appreciate the value of our West-India possessions; and neither in the field, nor in the senate, shall their interest be infringed, while I have an arm to fight in their defence, or a tongue to launch my voice against the damnable and cursed doctrine of \*\*\*\* and his hypocritical allies; and I hope my birth in Heaven will be as exalted as his who would certainly cause the murder of all our friends in the colonies. I did not intend to go so far; but the sentiments are full in my heart, and the pen would write them."

Next day, the order of the day for the third reading of the bill being read; lord Redefdale rose, not, he said, to detain their lordships with a speech, but to declare his conviction that the present measure would be the means of producing all the horrors of a revolution that could possibly be imagined. The abolition of the African trade should have gone hand in hand with the abolition of that in the West-Indies. Had the object of the bill been a gradual and general abolition of the slave-trade, it would have had his hearty concurrence—but he would not enter into any debate. Any attempt to withstand the present enthusiasm on the subject would be in vain. But he could not help remarking, that, when a legislature acted enthusiastically, they did not always act wisely; and he did not think, that, in the faithful and conscientious discharge of their duty, the opposers of this bill had much to answer for.—The earl of Buckinghamshire said, in reply, that mere enthusiasm was not calculated to last for twenty years, during which period this measure had been under discussion. When a member of the house of commons in the year 1792, he had voted for a gradual abolition, conceiving that persons concerned in the trade ought to have sufficient notice. Now, however, he had no doubt that the trade ought immediately to be abolished, not only because that trade was contrary to justice and humanity, but also because the abolition was the only means of pre-

venting those evils which must otherwise necessarily result from the multiplication of slaves in the west.—The duke of Norfolk approved of the bill, and expressed a confidence that the planters, by a moderate treatment of their slaves, would contribute to bring about that state of the colonies which was so much to be desired.—The earl of Westmoreland was at a loss to understand on what principle of logic it was to be proved, that, if the slave-trade was contrary to justice and humanity, it was not also contrary to justice and humanity to keep the negroes, who had been procured by means of the trade, in a state of perpetual slavery. Not that he was so mad as to think that freedom ought to be given to the slaves in the West-Indies, but that, on the principles on which the abolition-bill was now founded, emancipation ought also to follow.—Lord Grenville said, that, in abolishing the slave-trade, justice would be done to the inhabitants of Africa, who were the parties aggrieved; but that liberty to the slaves on the islands would be to them, in their state of ignorance and barbarism, a baleful poison.—The bill was then read a third time, passed, and ordered to be sent to the commons, for obtaining the concurrence of that house.

The bill being laid on the table of the house of commons, a motion was made by lord Howick, for reading it a first time. This was opposed, in what is called a maiden, or first, speech in parliament, by Mr. George Herbert. He was particularly anxious to impress on the minds of all the members, that they were not a mere *comitium*, or popular assembly, nor yet a mere organ of the voice of the multitude; but a deliberative body, limited in their number, that they might deliberate calmly, without any mixture of popular prejudice, enthusiasm, or passion; bound to maintain the rights, and to consult the interests and the wishes, of the people; but bound also to decide, according to their consciences, for the good of the whole, after full and free discussion. He was determined to oppose, at every step, a measure which he believed to be grounded on a delusive promise of good which it would never accomplish, and to be pregnant with inevitable, immediate, and extensive, mischief.—Captain Herbert too thought that the abolition of the slave-trade would become the ruin of the British colonies in the West-Indies, and consequently of our finances in that part of the world.—General Gascoyne also entreated the house to give the measure before them the fullest and most serious consideration. Every measure, he said, that invention or artifice could devise, had been resorted to on the present occasion. The church, the theatre, and the press, had laboured to create a prejudice against the slave-trade. It was not his intention, however, to speak at present on the general subject, as he should consider it as disrespectful to the lords, if any bill that came down from their house should not at least be read a first time.—Lord Howick, and Mr. W. Plumer, declared, that, if any artifices had been practised for raising a popular clamour against the slave-trade, they were wholly unknown to them. Lord Howick knew, he said, that there had been a most laudable and persevering attention on the part of the honourable gentleman (Mr. Wilberforce) with whom the measure originated. This attention, however, had never been used to mislead any one, but merely to make the matter generally understood.

The bill was then read a first time, and ordered for the second reading on the 20th of February. On that day, counsel was heard against it, as in the lords; but evidence was not allowed to be called to speak on the subject of *compensation* to the planters and others concerned, because, lord Howick observed, that would be a question of future consideration. Those who demanded compensation might hereafter submit their case to the house, who were never backward in listening to the claims of justice.—General Gascoyne could not forbear expressing his satisfaction that the principle of indemnity seemed to be acknowledged by the noble lord.—Lord H. said that he had only stated a general principle.—Sir P. Francis was not willing

to allow the possibility of a case in which the public ought to make compensation to an individual for any losses that might arise from the abolition of such iniquitous practices.—Mr. R. Thornton thought that few cases would be found entitled to compensation. Those engaged in commercial concerns were necessarily exposed to risks; and sufficient warning had long been given to those who were engaged in this abominable traffic.

Lord Howick moved the commitment of the bill; and the debate on that motion was adjourned till Monday, February 23.—Lord Howick then rose, and said, that, though the question had been so often agitated, that every honourable member must be acquainted with its details, yet he could not reconcile it to himself to bring forward a measure of such vast importance in that new parliament, without stating those facts and that evidence on which alone this question ought to rest. His lordship then entered into a copious recapitulation of those facts; and contended, from a review of the whole of these, and of the various topics insisted on in the discussions of the question, that the abolition of the slave-trade was founded not only in justice, but on the true principles of sound and liberal policy.—Lord Howick was followed on the same side of the question by Mr. Roscoe, Mr. Lushington, Mr. Fawkes, lord Mahon, lord Milton, the Solicitor-general, sir John Doyle, Mr. Manning, and lord Percy. On the other side, there appeared general Gascoyne and Mr. Hibbert.—Mr. Bathurst and Mr. H. Addington, though they approved of a gradual, were not prepared to go to the length of an immediate, abolition; but recommended a tax on the importation of fresh negroes, which would ultimately lead to a total abolition.—Mr. Wilberforce replied to the principal arguments that had been urged against the bill, and referred to Mr. Park's book to show the evils that the slave-trade created in Africa. He adverted also to another recent publication that had drawn considerable attention, namely, Mr. Malthus's Essay on Population. It had been contended that in that essay Mr. Malthus had favoured the slave-trade. But Mr. Malthus had called upon him that day, and expressed his surprise to have learned, that in some of the publications of the day he was regarded as a favourer of the slave-trade. He declared that his meaning had been misunderstood, and that he had just prepared a short appendix to his work in order to explain his ideas on the subject. Mr. Wilberforce concluded with an elegant eulogium on the display of both moral sentiments and talents which the house had that night witnessed on the side of humanity and justice, particularly on the part of the younger members; whose lofty and liberal sentiments, recommended and enforced by the elevation of their rank and purity of their form, must tend to produce the happiest effects on all classes of the community. Such an indication of mind and feeling would show to the people, that their legislators, and especially the highest orders of their youth, were forward to assert the rights of the weak against the strong; to vindicate the cause of the oppressed; and that, where a practice was found to prevail inconsistent with humanity and justice, no consideration of profit could reconcile them to its continuance.

Mr. Wilberforce himself, every one acknowledged and felt, was, above all others, entitled to the highest degree of praise for his unwearied exertions, and the ability and prudence he had displayed in bringing the great measure before the house to a successful issue; for it was now evident that it would not meet with any effectual opposition. He was complimented on the occasion by different speakers, particularly by the Solicitor-general. When he looked at the man now at the head of the French monarchy, surrounded as he was with all the pomp of power, and all the pride of victory, distributing kingdoms to his family, and principalities to his followers, seeming, when he sat upon his throne, to have reached the pinnacle of earthly happiness; and when he followed that man into his closet, or to his bed, and considered the pangs with

which his solitude must be tortured, and his repose banished, by the recollection of the blood he had spilled; and when he compared with those pangs of remorse, the feelings that must accompany his honourable friend (Mr. W.) to his home, after the vote of the night should have confirmed the object of his humane and unceasing labours; when he should retire into the bosom of his happy and delighted family; when he should lay himself down on his bed, reflecting on the innumerable voices that would be raised in every quarter of the world to bless him: how much more pure and perfect felicity must he enjoy in the consciousness of having preserved so many nations of his fellow creatures, than the man with whom he had compared him, on the throne to which he had waded through oppression and slaughter!

The question being loudly called for, the house divided: Ayes 283, noes 16. The house then resolved itself into a committee *pro forma*, and at half-past four adjourned to Friday, 27th February; when, after several observations from the principal leaders on both sides of the question, the bill was committed, and, with some amendments, passed on the 16th of March, without a division.—On Wednesday, the 18th, lord Howick, accompanied by Mr. Wilberforce and others, carried the bill to the lords. Lord Grenville, on receiving it, moved that it should be printed; and that, if this process could be finished by Monday, it should be taken into consideration on that day. The reason of this extraordinary haste was, that his majesty, displeased with the introduction of the Roman-catholic-officers' bill into the commons, had signified his intention to the members of the existing administration, that they were to be displaced. The uneasiness, which, a few days before, had sprung up among the friends of the abolition, on the report that this event was probable, began now to show itself throughout the kingdom. Letters were written from various parts, manifesting the greatest fear and anxiety on account of the state of the bill, and desiring answers of consolation. Nor was this state of the mind otherwise than what might have been expected upon such an occasion; for the bill was yet to be printed—being an amended one, it was to be argued again in the lords—it was then to receive the royal assent—All these operations implied time; and it was reported that the new ministry was formed; among whom were several who had shown a hostile disposition to the cause.

On Monday, the 23d, the house of lords met. Such extraordinary diligence had been used in printing the bill, that it was then ready. Lord Grenville immediately brought it forward. The earl of Westmoreland and the marquis of Sligo opposed it. The duke of Norfolk and the bishop of Llandaff (Dr. Watson) supported it. The latter said, that this great act of justice would be recorded in heaven. The amendments were severally adopted without a division. But here an omission of three words was discovered, namely, "country, territory, or place," which, if not rectified, might defeat the purposes of the bill. An amendment was immediately proposed and carried. Thus the bill received the last sanction of the peers. Lord Grenville then congratulated the house on the completion, on its part, of the most glorious measure that had ever been adopted by any legislative body in the world. The amendment, now mentioned, occasioned the bill to be sent back to the commons. On the 24th, on the motion of lord Howick, it was immediately taken into consideration there, and agreed to; and it was carried back to the lords, as approved of, on the same day.

But, though the bill had now passed both houses, there was an awful fear throughout the kingdom, lest it should not receive the royal assent before the ministry was dissolved. This event took place the next day; for on Wednesday the 25th, at half past eleven in the morning, his majesty's message was delivered to the different members of it, that they were then to wait upon him to deliver up the seals of their offices. It then appeared that

a commission for the royal assent to this bill, among others, had been obtained. This commission was instantly opened by the lord chancellor (Erskine), who was accompanied by the lords Holland and Auckland; "and, as the clock struck twelve, (says Mr. Clarkson,) just when the sun was in its meridian splendour to witness this august act, this establishment of a magna charta for Africa in Britain, and to sanction it by its most vivid and glorious beams, it was completed. The ceremony being over, the seals of the respective offices were delivered up; so that the execution of this commission was the last act of the administration of lord Grenville, an administration, which, on account of its various exertions in behalf of the oppressed African race, will pass to posterity, living through successive generations, in the love and gratitude of the most virtuous of mankind. Thus ended one of the most glorious contests, after a continuance for twenty years, of any ever carried on in any age or country. A contest, not of brutal violence, but of reason. A contest between those, who felt deeply for the happiness and the honour of their fellow-creatures, and those, who, through vicious custom and the impulse of avarice, had trampled under-foot the sacred rights of their nature, and had even attempted to efface all title to the divine image from their minds." *Clarkson's History of the Abolition of the Slave trade.*

To a dispassionate reader, if he peruse with attention the different arguments and reasonings of the abolitionists and of their antagonists, it will appear plain that the latter generally united in their minds the emancipation of the slaves as they now exist in our West-Indian colonies, with an entire cessation of the slave-trade. The former plan would have been most egregiously deprecated by any man of sense, whereas the other could not fail obtaining an abettor in every feeling heart. The abolition of the slave-trade was founded upon *justice*. The emancipation of the slaves already bought, besides many other reasons against it, would have been an *injustice* committed against the proprietors who were *bona fide* purchasers. This feeling was evident by the fate of lord Percy's motion, on the 23d of March, for leave to bring in a bill for the *gradual abolition of slavery* in his majesty's colonies in the West-Indies.—Lord H. Petty deprecated any discussion of this subject at the present moment. He entreated most respectfully, but most strongly, his noble friend either to withdraw his motion, or to concur in the previous question, which he should feel it his duty to move.—Sir C. Pole also deprecated the discussion; but was glad the motion had been made, as it would open the eyes of all who were interested in the West-India islands, to the dangers which threatened them.—Mr. Wilberforce declared that both he, and they who acted with him, were satisfied with having gained an object which was to be obtained with safety. The sole point they had in view was, the abolition of the slave-trade, and not the emancipation of the slaves. The enemies of the abolition had always confounded these two objects; the friends of the abolition had always distinguished them.—Mr. Hibbert said, if there remained a ray of hope that the colonies might be saved, it must be decidedly shown, and clearly understood, that the house would not for a moment listen to any proposal for emancipation.—But Mr. Sheridan, who, on the preceding night, had considered the bill then passed as only a prelude to the ultimate measure of emancipation, expressed his hope that the young nobleman, who had done his feelings so much credit by the proposition which he had that evening made, would stand to his ground. If he persevered in the pursuit of his object with the same zeal as his right honourable friend Mr. W. had done, he had no doubt but he would meet with the same success. He trusted that the planters might be induced to lead the way to emancipation; and, were they themselves always resident on their estates, he should have good hopes. But the negro-drivers would not soon forget their fixed habits of brutality, or learn to treat the unhappy wretches in their charge with clemency and compassion. Slavery would not

wear itself out. It would become more rigid, unless the legislature should become more vigilant, and remind the planters of the new duty that had fallen upon them, of rearing the young slaves in such a manner as that they may be worthy of freedom.—After a conversation between Mr. Wilberforce and some other members, the house, which had become very thin, was counted, and, there being only 35 members in it, it was immediately adjourned, and the question was dropped.

The abolition of the slave-trade was indeed an act of legislation sufficiently bold of itself, without its being followed immediately by another for even a gradual emancipation. It was sufficient that we at length put an end to a traffic which had long disgraced mankind, and had caused those intestine wars, the principal object of which, among the African princes, was to get slaves for the purpose of selling them. A modern author expresses himself in the following manner in regard to the benefit which the African nations will reap from the act:

On Niger's sedge banks,  
Or where, from rock to rock, rude Senegal,  
Athwart the burning sands, unfurls and rolls,  
In thund'ring majesty, his awful waves;  
When first he heard the ten-times welcome news,  
The negro knelt, and blest'd such pow'r unknown  
As bids him stay unfold, and now secure,  
Where freedom, hardly check'd by nature's laws,  
Smiled, and play'd, and strung his infant limbs  
To chase the wild goat, or the gazell course  
Along the desert shores, but not to lend  
His manly vigour to the pamper'd sons  
Of avarice.

This measure has stamped with immortal honour the short administration of the *Foxites*; and will be long remembered in all countries of the world. Nor does it appear that our commerce, or the prosperity of our West-India islands, has been eventually affected by the abolition of this horrid traffic; but, even if it had been injured in some degree, still let us endeavour to impress the nobler truth, that national greatness depends more on virtue than on commerce:

Is commerce all? shall her omnific word  
Impart its valour to the hero's sword?  
Has she a gale as pure as honour's breath,  
Through life unfulfilled, and serene in death?  
Know, virtue only can the strength create  
That clothes in native majesty a state;  
Virtue alone that sacred spirit pours  
With which the hero springs, the patriot soars;  
Virtue, thou breath of life untam'd by time,  
Thine is the impulse and the power sublime;  
The firm unconquerable will is thine,  
Force passing strength, the energy divine.  
Know, Commerce follows Nature's social laws  
As peace or charity her blessing draws.  
Still shall she bear from Africa's genial plains  
Their native wealth, though man untouch'd remains.  
Let Britain's sons the fruitful coast explore,  
And kindly bless the race they wrong'd before;  
With gentle promises invite to toil,  
With precious gifts endow the docile soil;  
Till Africa's race in grateful reverence bend,  
And hail the teacher where they find the friend.

*Mrs Benger's Poems.*

The history of a great nation does not always consist in the relation of the wars, which the wages against the enemies of her honour, security, or interest. The character and morals of the people in civil, political, and religious, concerns, constitute also an integral part which the writer ought not to neglect. The following fact will give the reader an opportunity of estimating to what a pitch the religious zeal for preaching was brought at this time.—At the Middlesex sessions, on the 17th of January, three

men, one a *shot-maker*, another a *brush-maker*, and the third a *sailor*, severally applied to the court, that the oaths might be administered to them to qualify them to preach the Gospel. The chairman asked these candidates for ecclesiastical fame, whether any of them had received the necessary education at either of the universities, Oxford or Cambridge, or at any public school; or whether they were deeply read in theology? They replied in the negative. The chairman observed, they must necessarily entertain very wild and extravagant ideas in regard to religion; and he wished to learn the inducements they had to become preachers. They replied, that they had no objects of lucre or gain in view; but were actuated by a strong and vehement inclination to promulgate the Gospel of God, for the purpose of contributing, as far as in them lay, to the salvation of souls. They intended to exercise their holy functions entirely within the county of Middlesex. The chairman granted their application, and they withdrew to the office of the clerk of the peace. Similar applications of unlettered apostles are not unfrequent.

On the 23d of February, a most dreadful accident happened at the execution of two men for the murder of Mr. Steele. The crime was perpetrated on the 6th of November, 1802; and it was not till this year that the guilty were brought to condign punishment. This horrid transaction excited such interest in London, that, on the north side of the Old Bailey, the multitude to see the execution was so immensely great, that, in their movements, they were not unaptly compared to the flow and reflux of the waves of the sea, when in troubled motion. Just before the culprits mounted the scaffold, the feelings of the spectators were agitated to a most alarming degree, by the deplorable and pitiable situation of a very great number of persons in the crowd, who, from the extraordinary pressure and other causes, were every moment in danger of being suffocated or trampled to death. In all parts there were continued cries of Murder! murder! particularly from the female part of the spectators and young boys; some of whom were seen expiring, without the possibility of the least assistance being afforded them; every one being employed in endeavours to preserve his own life. The most affecting scene of distress was seen at Green-Arbour-court, nearly opposite the Debtors' door. The terrible occurrence which took place near this spot is attributed to the circumstance of two pie-men attending there to dispose of their pies; and, one of them having his basket overthrown, which stood upon a sort of stool with four legs, some of the mob, not being aware of what had happened, and at the same time severely pressed, fell over the basket and the man at the moment he was picking it up. Those who once fell were never more able to rise, such was the violence of the crowd. At this fatal place, a man of the name of Hetherington was thrown down, who had in his hand his youngest son, a fine boy about twelve years of age. The youth was soon trampled to death; the father recovered, though much bruised. A woman, who was so imprudent as to bring with her a child at the breast, was one of the number killed; whilst in the act of falling, she forced the child into the arms of the man nearest to her, requesting him for God's sake to save its life; the man, finding it required all his exertion to preserve himself, threw the infant from him, but it was fortunately caught at a distance by another man, who, finding it difficult to insure its safety or his own, got rid of it in a similar way. The child was again caught by a person who contrived to struggle with it to a cart, under which he deposited it until the danger was over, and the mob had dispersed. In other parts the pressure was so great, that a horrible scene of confusion ensued, and seven persons lost their lives by suffocation in one spot. It was shocking to behold a large body of the crowd, as in one convulsive struggle for life, fight with the most savage fury with each other: the consequence was, that the weakest, particularly the women, fell sacrifices. As fast

as the mob cleared away after the execution, and those on the ground could be picked up, they were conveyed in carts and on boards to St. Bartholomew's Hospital, where every attention was shown, and every assistance afforded, to those who exhibited signs of life. As soon as the bodies of the deceased were washed, and in a fit state to be exposed, they were laid out in the Elizabeth-ward, in order to be claimed by their friends. No language can describe the anguish of the scene when the people first recognized these mutilated remains; some found a brother, some a son, and others a father. A young woman, who found amongst the dead an only brother, was so strongly affected, that she went into violent fits, and continued in that state throughout the whole day, and great doubts were entertained of her recovery. It was truly affecting to see the persons who had missed their relatives, so strongly agitated between hope and fear, as they entered the room to view the dead. Some had not resolution sufficient to convince themselves of that which they wanted to know. Many who had missed their friends or relatives came too late to view the dead, and were almost raving when they were told they could not see the bodies till the next day. Every person about the hospital was employed in this melancholy duty from nine o'clock in the morning until nearly five in the afternoon, at which time the ward that contained the dead bodies was locked up. As fast as the bodies were owned, they were put into shells, with the names of the parties upon them, to the number of twenty-eight. The coroner's inquest sat at Bartholomew's Hospital for four successive days. Their verdict was to this effect; viz. "That the several persons came by their death from compression and suffocation."

Another distressing occurrence, arising from the pressure of a crowd, comes naturally to be spoken of here, though some intervening matters must be noticed afterwards.—In the audience-part of Sadler's Wells, on Thursday night, the 19th of October, about ten o'clock, some one called out "a fight;" which was mistaken for "fire." The fatal catastrophe which followed was produced by the violent pressure of persons who had quitted the gallery of the theatre on the first alarm, endeavouring, when they found it to have been groundless, to return to their places; but a number of others, who were still pressing to get out, being on the staircase, occasioned such a concussion between the two parties, as to produce the fatal suffocation by which eighteen lives were lost.

A coroner's jury was convened next morning in the drawing-room of the dwelling-house of Mr. Dibdin, adjoining to this place of public entertainment. They first examined the bodies of the eighteen deceased persons, which were exposed in the music-room and in the kitchen. They were extended at length, dressed in the clothes in which they appeared at the theatre, with their legs only bare, and their apparel somewhat loosened for the greater facility of inspection. It was a remarkable fact, that, of all these persons, not a single limb was broken, although many had received violent contusions; and a prodigious number of wounded persons, who had escaped with life, suffered from the most terrible fractures. Of the dead bodies, some had undergone a material change, from the rapid progress of putrefaction, so that the age of one of them could not be ascertained within twelve or fourteen years; and the countenance of another was unknown to her companion; she could only be recognized by her dress.

Besides those we have mentioned, a great many others were conveyed into the apartments appointed for the reception of the dead, who were supposed to have been deprived of life, but who, after bleeding, and a short interval of repose, recovered. We cannot avoid noticing one instance of this kind:—A husband and a wife were both carried for dead into this place. On breathing a vein of the wife; there was no emission; but, on a like incision being made in the arm of the husband, the blood burst forth, and, after a few minutes of suspended animation, his senses returned, and the first object which attracted his

eyes was his own wife, a corpse by his side. A paroxysm of frenzy was the immediate consequence, and he was borne off from the scene of death in this dreadful situation.

After the jury had inspected the bodies of the deceased, they proceeded to the theatre to assist their judgment in ascertaining the cause of this distressing occurrence. Not the least symptom of conflagration was to be seen in any part of the premises, either before or behind the curtain; and throughout the building not a plank had given way, excepting the front of the orchestra, which had been broken down by persons attempting to escape in that direction. After they had thus satisfied their minds with respect to these particulars, the jury again returned to the drawing-room, where Mr. Hodgson, the coroner, having taken the chair, they proceeded to the interrogation of witnesses.

Little or no interest can attach to the examination of one set of witnesses, being merely the parents or other relations of the deceased, or friends who had accompanied them to the theatre, and were separated from them in the crowd. The following, however, is worth notice: Benjamin Price, deceased, was identified by his mother, who stated that he resides at No. 31, Lime-street, Leadenhall-street; the deceased was eleven years of age; he obtained leave to accompany some neighbours to Sadler's Wells. About half past ten, his little sister, who was at home, went into the kitchen, where she saw her brother, who she thought was at the play. She called him, but he immediately disappeared. She then became alarmed, and said it certainly was her brother's ghost, and she was sure he was dead. Witness, being alarmed at the story told by her daughter, hastened with a friend to Sadler's Wells, where she found her boy a corpse.

The next series of witnesses deposed to the attention paid to the unhappy sufferers, and to the diligence and humanity of the proprietors of the theatre and others, to prevent, as much as possible, the fatal consequence of the general alarm and confusion.

Mr. George Smith, a performer, deposed, that he was, the preceding night, upon the stage, when he noticed a considerable disturbance. He saw two men, in particular, fighting in the middle of the gallery. He then heard a cry of fire, and some women were pressing over the front of the orchestra. He leaped into the orchestra to assist them. They were wounded and bruised. The front of the orchestra was broken down by the pressure. The witness then went to undress; when near his dressing-room, he found a boy lying on the ground, for whom he procured the attendance of Mr. Knight, a medical gentleman; the witness thought the first cry was "fight," although afterwards it was "fire." He exerted himself, exclaiming, there was no fire. All the doors were thrown open for the escape of the audience.

Jones, a lame young man, was brought in next. He said, he was in the gallery; that two men at first jumped up, and struck several blows at people. One of them gave him a violent knock on the shoulder; on which he fell, crying out, "I am robbed!" He remained on the stairs until he was picked up. A young woman was with him; she had not returned home; and he did not know where she was. The witness could not describe the men, but thought he should know them if they were shown to him. They were somewhere about the middle of the gallery.

John Dobson, chemist and druggist, in Coleman-street, deposed, that he was in the pit, standing on the benches near the door, where there were seven or eight men, with two girls, handsomely dressed, quarrelling among themselves. About ten o'clock, they were most riotous. It was a benefit-night, and the pit was very full. These men and girls tried to affront several people, who would take no notice of them.

Mr. Reeve, one of the proprietors, and a musician, said, that every thing was done, by the use of the speaking-trumpet, and otherwise, to appease the general alarm. He was in the orchestra during the whole of the last piece.

About a quarter past ten there was a little disturbance, which seemed to begin with a fight. The noise rapidly increased; a cry of fire was raised, and the ladies in the side boxes lifted up their hands and screamed, so as greatly to alarm the crowd in the gallery. Then it was that the confusion above stairs became general. He saw many persons dropping down from thence into the pit, where they made their way into the orchestra, and leaped upon the stage. The cry of fire was now vociferated on all sides, and the witness exclaimed "No fire! No fire!" in vain.

The evidence being terminated, the coroner observed upon it as follows: "Gentlemen of the Jury, There is little to be said on this occasion, since it is impossible to attach any thing criminal. It can only be *casual death*; although it might have been otherwise, if a design had been proved to knock any person down, or to commit similar violence. Riot is a misdemeanour, but would not constitute, in a case of this nature, the crime of murder; nor can it, in these circumstances, come under the distinction of manslaughter. If a charge of riot can be fixed upon any party, it is a misdemeanour of which the law takes cognizance; but we cannot do so here." The verdict, after the names of the deceased had been read, was immediately given; "Killed casually, accidentally, and by misfortune."—Mr. Hodgson then added, "No blame is attached to the theatre; they have done all that humanity could dictate; nothing has been neglected." The jury unanimously concurred in this observation.

We turn from these scenes of woe to commercial and political transactions.—The Grand Surry Canal Basin at Rotherhithe, which had so long been an object of attention in the mercantile world, was opened for the reception of shipping and craft on the 13th of March. The ceremony took place in the presence of a numerous assemblage of spectators, composed principally of the proprietors and their friends, together with a large company of ladies, who all appeared much gratified on this interesting occasion. At two o'clock the ship intended to take the lead in entering began to dress in the colours of various nations; and the remaining ships also followed the example, though in a plainer style. About the same time the company assembled on the insular wharfage, where marquees and a cold collation were prepared for their accommodation. At length the tide rose to a level with the water in the basin; the gates were thrown open, and guns were fired as a signal for vessels to enter. About half past three o'clock, the *Argo*, a fine brig of 242 tons burthen, the property of Mr. John Hall, made her entry amidst the acclamations of the spectators. She was saluted by a discharge of cannon on-shore, which was returned by the vessel; whilst a band of martial music on the deck played God save the King, and Rule Britannia. Four other vessels, all handsomely ornamented with colours, immediately followed. The whole made a very interesting appearance.

The next event to be noticed in the order of time is the change of the ministry.—We have already noticed (p. 154) their last public act; and we lament that a set of men, combining so much integrity and talent, who had honoured themselves by introducing limited service into the army—by the most strenuous endeavours for peace—and by the abolition of the slave-trade—should have been induced to propose and insist upon a measure, to which, had it been carried through the house, the king neither would nor ought to have given his assent. It was entitled "A Bill for enabling his Majesty to avail himself of the Services of all his liege Subjects in his naval and military Forces;" and the preamble stated, that this was "for the maintenance of the rights of his crown, and of the interests, honour, and independence, of Great Britain." The intent of it, however, was to admit Roman Catholics into every rank of the navy and army. Upon this subject, which has been much agitated since, we beg to refer our readers to the article LIBERTY OF CONSCIENCE, vol. xii. p. 589 & seq.

The following is a list of the ministry which at this time superseded those characters which had been called, exultingly by their friends, sneeringly by their enemies, "all the talents." Those with a star formed the cabinet-council.

Prefident of the Council	-	Earl Camden.*
Lord Chancellor	- - -	Lord Eldon.*
Lord Privy-seal	- - -	Duke of Westmoreland.*
First Lord of the Treasury	-	Earl of Portland.*
First Lord of the Admiralty	-	Lord Mulgrave.*
Master-general of the Ordnance	-	Earl of Chatham.*
Secretary of State, Home Department	-	Lord Hawkebury.*
-----, Foreign Affairs	} Right Hon. G. Canning.*	
-----, War and Colonies	} Lord Castlereagh.*	
Lord Chief Justice	-	Lord Ellenborough.*
Chancellor of the Exchequer	-	Right Hon. S. Perceval.*
A seat in the Cabinet without an Office	-	Earl Fitzwilliam.*
Prefident of Board of Controul for India	-	Right Hon. R. S. Dundas.
----- of Board of Trade	-	Earl Bathurst.*
Chancellor of the Duchy of Lancaster	-	Right Hon. S. Perceval.*
Secretary at War	- - -	Sir James Pulteney, Bart.
Treasurer of the Navy	- - -	Right Hon. George Rose.
Joint Paymaster-general	-	{ Lord Charles Somerset.
		{ Right Hon. Charles Long.
		{ Earl of Chichester.
		{ Earl of Sandwich.
		{ William Huskisson, Esq.
Secretaries of the Treasury	-	Hon. Henry Wellesley.
Master of the Rolls	- - -	Sir William Grant.
Attorney-general	- - -	Sir Vicary Gibbs.
Solicitor-general	- - -	Sir Thomas Ploner.
Lord Lieutenant of Ireland	-	Duke of Richmond.
Lord Chancellor, ditto	-	Lord Manners.
Chief Secretary	- - -	Sir Arthur Wellesley.
Chancellor of the Exchequer	-	Right Hon. John Foster.

The city of London, upon this as upon other like occasions, evinced its patriotism and loyalty by an address, which was presented to his majesty at the Queen's Palace, on the 23d of April, by a deputation of the corporation, consisting of the lord-mayor, twelve aldermen, the recorder, sheriffs, and twelve commoners. It was as follows:

"Most gracious Sovereign; We, your majesty's most dutiful and loyal subjects, the lord-mayor, aldermen, and commons, of the city of London, in common-council assembled, approach the throne with our warmest and most unfeigned gratitude for the dignified and decided support and protection recently given by your majesty to the protestant reformed religion, as by law established; and for the firm and constitutional exercise of your royal prerogative to preserve the independence of the crown. Deeply sensible, as your majesty's faithful citizens of London at all times are, of the great and substantial blessings we enjoy under your majesty's paternal government, we should justly incur the imputation of criminal indifference, as the first municipal body in your majesty's dominions, were we lightly to consider the scrupulous regard and fervent zeal which have invariably guided your majesty for the preservation of our religion, laws, and liberties, more particularly at this interesting conjuncture, or silently to withhold our loyal acknowledgments due to the best of kings, for his wise and steady resolution to secure inviolate our glorious constitution in church and state. We contemplate, sire, with the warmest affection, and most profound veneration, the exercise of those unextinguishable principles in the royal breast, which protect in every situation the religious interests of your people, and provide for the happiness and freedom of posterity, by guarding the protestant succession in your majesty's royal house on the throne of the united kingdom. Your majesty's

faithful citizens of London, feel it no less their pride and exultation, than their bounden and indispensible duty, to express the sentiments of satisfaction which animate their hearts, at the wise and dignified measures pursued by your majesty, securing the glorious independence of the crown as one of the three estates of our well-tempered and invaluable constitution. That your majesty may be long spared to us by an over-ruling Providence, and that the people of this land may be long sensible of the blessings of your majesty's most auspicious government in the protection of every thing dear to them, is the ardent prayer of your majesty's loyal citizens of London."

To which address his majesty was pleased to return the following most gracious answer: "I receive, with the greatest satisfaction, the assurances you give me of your concurrence in those principles which have governed my conduct on the late important occasion. It has ever been my object to secure to all descriptions of my subjects the benefits of religious toleration; and it affords me particular gratification to reflect, that during my reign these advantages have been more generally and extensively enjoyed than at any former period. But, at the same time, I never can forget what is due to the security of the ecclesiastical establishment of my dominions, connected as it is with our civil constitution, and with all those blessings which, by the favour of Providence, have hitherto so eminently distinguished us amongst the nations of the world."

The new ministry thought fit to advise his majesty to dissolve the parliament; it had sat but four months and fourteen days.

On the 5th of May, a duel was fought between the people's idol, sir Francis Burdett, and his quondam friend Mr. Paull, a candidate for Westminster. They discharged two pistols each: the second shot fired by Mr. Paull wounded sir Francis in the thigh; the second pistol fired by sir Francis wounded Mr. Paull in the leg. Thus the affair ended; but Mr. Paull destroyed himself, in the April following, by cutting his throat.

The election being over, the 29th of June was the day appointed for chairing sir Francis Burdett. The procession commenced from Covent-garden at twelve o'clock, when a great number of electors were assembled; thence they proceeded to the house of sir Francis in Piccadilly, who ascended a car, constructed for his reception, precisely at three o'clock. The vehicle was intended as an imitation of the ancient triumphal car, and was not unclassically constructed. It was mounted on four wheels, superbly ornamented. On the more advanced part was the figure of Britannia, with a spear crowned with the cap of liberty. In the centre were the *saces* firmly bound, the emblem of union; and on the posterior part of the platform was a pedestal, on which was placed a gothic chair for the hero of the day. He sat with his head uncovered, and his wounded limb resting on a purple cushion, while the other was sustained on a sort of imperial footstool, under which the monster Corruption was seen in an agonizing attitude. On different parts of the car were depicted the arms of the city of Westminster, and also the insignia of the United Kingdom. Ornamental draperies of crimson velvet and purple silk were distributed in various parts, and banners embroidered with gold gave to the whole a splendid effect. This equipage was drawn by four milk-white horses, richly caparisoned, and decorated with purple ribbons. The procession was composed of a numerous body of the electors, who preceded the car; and Mr. Jones Burdett, lady Burdett, colonel Boffville, and a number of the friends of the baronet, who followed. We understand that more than 1500 persons dined at the Crown and Anchor on this occasion.

The election for the representation of the city of London, which began early in May, and threatened as severe a contest as had ever been known, found a termination as awful as it was unexpected. Mr. Alderman Hankey, one of the candidates, at the moment when he might be supposed to be flushed with the hopes of success, and when

the fairest promises of it were before him, was called away from all concerns of human life. He died of an inflammation in the bowels on the second day of the poll. The first symptoms of his complaint appeared about eight on the preceding evening. At an early period his approaching fate was announced to him; and he called for his four children, the eldest of whom was about nine years of age, and took an affectionate farewell of them.—The popular custom of pouring brandy into the shoes or boots, with a view of preventing the effects of cold, was the occasion of the death of this gentleman. Feeling his feet damp and cold after canvassing, he was induced, at the recommendation of some friend at the hall where he had been dining, to pour a glass of brandy into his shoes, in which state he walked homewards. He was almost immediately seized with an inflammation and consequent obstruction in the bowels, which in a few hours terminated fatally. This practice is adopted from the supposition, that, because spirits, when swallowed, excite universal warmth, and restore the circulation in the extremities, they must do the same when applied to the extremities themselves. But the very reverse happens. Fluids, when evaporating, produce cold; and, the lighter or more spirituous the fluid, the more quickly it evaporates, and the greater is the degree of cold generated. This may be proved by a very simple experiment: If one hand be wetted with spirits, and the other with water, and both are held up to dry in the air, the hand wetted with spirits will feel infinitely colder than the other. Or, if the bulbs of two thermometers be so treated, the mercury will be observed to fall much more rapidly and extensively in the one case than in the other. Whatever danger, therefore, arises from cold and damp feet, it is greatly enhanced by the practice alluded to. If such a remedy is to be at all employed, it ought undoubtedly to be taken into the stomach not into the shoes.

Mr. Samuel Birch was chosen an alderman in the room of the gentleman who so unfortunately sacrificed himself to a vulgar error.

The duchess of Brunswick, sister to his present majesty and mother to the princess of Wales, having migrated to this country; on the 8th of August, the lord-mayor, attended by four other aldermen and about eighty of the common council, proceeded in state from Guildhall to Montague-house, Blackheath, where they presented the following address:

“May it please your royal and serene highness; We, the lord-mayor, aldermen, and commons, of the city of London, in common council assembled, most humbly entreat your royal and serene highness to accept our sincere congratulations on your safe arrival in this imperial country. The return to her native land of an illustrious princess, so nearly and dearly allied to our beloved sovereign, and to the royal and amiable consort of the heir apparent to the throne of this united kingdom, cannot but renew the most lively sentiments of affection in the hearts of his majesty's loyal subjects, and a warm participation of those feelings which a meeting so interesting to the royal family must have occasioned. Deeply impressed, madam, as we are, by the extraordinary events which have occasioned your return, we trust that your royal and serene highness will permit us to express the sincere joy we feel at your restoration to the shores of a free and loyal people, not more attached to a good and venerable king, by duty to his supreme and august station, than by affection to his sacred person and family.”

To which her royal highness returned the following answer: “My Lord, I return your lordship and the aldermen and commons of the city of London my grateful thanks for an address which has given me the most heartfelt satisfaction. It affords me an additional instance of the loyal attachment of the city of London to the king, and of their affectionate regard for his majesty's royal family.”

Her royal highness continued here till her death, which

took place on the 23d of March, 1813, in the 76th year of her age. She was the last surviving sister of our sovereign. She was born on the 31st of July, 1737; and on the 17th of January, 1764, was married to the late duke of Brunswick Wolfenbuttle, by whom she had issue three sons and three daughters.

In the October following (1807) we received a still more illustrious refugee. On the 29th of that month, Louis XVIII. king of France, landed with his suite from the Swedish frigate Freya, at Yarmouth, under the title of Count de Lille, by which only he will be recognized during his stay in England. He came on-shore in admiral Douglas's barge, in the most private manner. On his landing, he was received by admirals Douglas and Essington, captain Curry of the flag-ship, and Mr. Brooks, of the alien-office, London. The party immediately assembled at the house of admiral Douglas's secretary, which stood contiguous to the spot. Here the count had his first interview with his brother (the count d'Artois). The scene was truly interesting and affecting. The carriages of admirals Douglas and Essington were shortly ready to convey the count and suite to the house of admiral Douglas, to breakfast; where the illustrious guests received a hearty welcome, and were treated with that true English hospitality so congenial to the feelings and heart of a British seaman. The party were joined at breakfast by admiral Ruffell, sir Samuel Hood, and several captains. The count seemed highly gratified at finding himself surrounded by so many brave men. To admiral Douglas and his family, he more than once expressed his gratitude for the attention and hospitality shown him. While at breakfast, the count gave a striking proof of his gallantry; presenting a rose to Miss Douglas, he made a happy simile between the sweetness and delicacy of the flower and the corresponding accomplishments of the young lady.—This unfortunate prince has continued ever since to partake of British hospitality, we believe, at Gosford, the seat of the marquis of Buckingham.

In November died Mr. Abraham Newland, chief cashier of the Bank, in his 78th year, sixty of which he had been employed in that establishment, having been first received as a clerk in February 1748. Distinguishing himself by that regularity and integrity so essential in money-concerns, he rose through the various gradations of service, and was appointed chief cashier in January 1775, which office he resigned only about two months before his death. He was a most faithful and upright servant of the public; nor were his labours unprofitable to himself: he left behind him 200,000*l.* in funded property, and estates to the value of about 1000*l.* per ann. When his funeral passed the Bank and Royal Exchange, there was a momentary suspension of all business, every one standing to contemplate the remains of a man so extensively known.

Mr. Newland was succeeded in his office of cashier by Mr. Henry Hase, whose name now stands to our bank-notes, with a *Promise to pay*, which we hope that gentleman will soon have an opportunity to fulfil.

While the British parliament was employed in debates respecting the means of quieting, or opposing, the growing ambition of France, Bonaparte pursued his career of conquest, triumphing over the vanity of subsidies, the futility of detachments and expeditions, sent at different times, to different places, against one compacted and mighty power, and the imbecility of confederations; and showing to all nations, that it is on the *direction*, not the *existence*, of military force, that the issue of campaigns and the fate of empires depend.

When Bonaparte was raised to the dictatorship of France, it was doubtful whether he would pursue a system of war and conquest, or of conciliation, peace, and all good arts. He was at first careful to appear in the light of a good, as well as a great man. He was solicitous to be considered as the patron of religion, good morals, the arts and sciences, and all manner of improvement: and, for what concerned France in relation to foreign countries, he professed “an emulation

emulation of only great actions and useful enterprises; and was determined to perpetuate a peace, that should constitute the happiness of the French, and the happiness of humanity." This indeed would have been true policy, and true glory. And there were not a few who entertained sanguine hopes that Bonaparte would have exhibited as illustrious an example of moderation and justice, as he had done of bravery, skill, and success in war. But it soon appeared that he was actuated only by the vulgar spirit of domination, which he pursued, both by arms and political intrigue. Peace was always in his mouth, war in his heart. Where the interests and the rights of men are consulted, though war may be resorted to in cases of necessity, the uniform end is peace. When tyranny and the lust of conquest prevail, though peace may occasionally be made the means, the end constantly in view is war. This system, unfortunately for the nations of Europe, was the system adopted by Bonaparte.

After the battle of Jena, a proposition was made, either by Russia in concert with her allies to the ruler of France, or by the ruler of France to Russia and her allies, for a congress of all the belligerent powers, to be held for the purpose of a general pacification. The Russian government, keeping a steady eye on Constantinople, objected to the admission of the Turks into the congress. Bonaparte insisted on the admission of the grand-signior as the friend and ally of France, in return for which, Russia would be permitted likewise in the congress to make common cause with England. Though the negotiation had been interrupted by a series of hot actions, and the king of Prussia, and the Russian generalissimo, had declined to enter into any treaty for an armistice, or peace, as noticed at p. 150, after the battle of Eylau; Bonaparte, on the fall of Dantzic, made a direct proposal for renewing the negotiation to the emperor Alexander, accompanied by a declaration, that he was desirous of peace above all things, and ready to listen to any reasonable overtures for that end.

The secret history of the negotiation for peace, the circumstances that determined the Russians to avoid a general action before the fall of Dantzic, and yet to make a vigorous attack on the French fifteen days after the capitulation of that place, time has not yet disclosed. On the 5th of June, the campaign began, and was concluded on the 15th; in the course of which ten days, were fought the battles of Heilsberg and Friedland, which will make a prominent figure in another article. On the 19th of June, 1807, at two o'clock P. M. Bonaparte with his guards entered Tilsit, the second town in Prussia, after Konigsberg; containing ten thousand inhabitants. The Russians, pursued after the battle of Friedland by the grand duke of Berg, crossed the Niemen, burned the bridge of Tilsit, and continued their retreat eastward. The emperor of Russia, who had remained three weeks with his Prussian majesty at Tilsit, left that place along with the king in great haste. On the 19th, an armistice was proposed to the *chiefs of the French army*, by the Russian commander-in-chief. In consequence of this, an armistice was agreed on at Tilsit, on the 22d of June, in which the Prussian armies were included. The first interview between Bonaparte, or the Emperor Napoleon as he was now called, and the Emperor Alexander, took place, on the 25th of June, on a raft constructed for the purpose, on the Niemen, where two tents had been prepared for their reception by the French. Alexander and Bonaparte landed from their boats at the same time, and embraced each other. Great were the mutual courtesies and expressions of kindness and respect that ensued among French, Russians, and Prussians, of all ranks; visiting, feasting, and all kinds of entertainment and festivity that could be thought of. Human nature gladly relaxed from the miserable rage of war, and indulged, and was eager to acknowledge, and emphatically to express, every sentiment of social and generous affection. A magnificent dinner was given by Napoleon's guards to those of Alexander

and the king of Prussia. At this entertainment they exchanged uniforms; and were to be seen in the streets in a motley kind of dress, partly Russian, partly Prussian, and partly French. A stranger to the ways of Europe, witnessing, at Tilsit, such ardent love among those different tongues and nations, from the highest to the lowest, might have wondered what could possibly have impelled such good-natural and tender-hearted people to the most horrid scenes of war and bloodshed.

A treaty of peace was concluded, between his majesty Napoleon, styling himself Emperor of the French and King of Italy, and his majesty the Emperor of all the Russias, at Tilsit, July 7th. The great sacrifice to peace, was, of course, the kingdom of Prussia, which was reduced at once from the rank of a primary to, at best, that of a secondary power of Europe, and all that had been done for the augmentation and aggrandizement of the monarchy by the great Frederic in the course of twenty years undone in one day. The king of Prussia, by the peace of Tilsit, together with an immense territory, lost near the half of his yearly revenues, and five millions of his subjects. For particulars we must refer our readers to the articles PRUSSIA and RUSSIA. On the whole, Prussia was brought back nearly to the state in which it was on the 1st of January, 1772, before the first partition of Poland.

Mr. Arbuthnot, the English minister at the Porte, who had observed, that, ever since the great victories obtained by the French over the Prussians, the influence of the French at Constantinople had increased, and that of Russia and England been proportionably diminished, did not fail to write home to our government the state of affairs there; and intelligence to the same effect was communicated to the British government by the Russian ministers at Petersburg, accompanied with a recommendation to send a British fleet, with a large military force, which might defeat the ascendancy of the French counsels at the Porte, and cause a powerful diversion of the force of France in favour of Russia. A negotiation for peace with the Porte was commenced by the Russian in conjunction with the English government. To give weight to this, a fleet, under the command of sir Thomas Duckworth, was sent to force the passage of the Dardanelles, and, if certain terms should not be acceded to by the Turkish government, to bombard Constantinople. The fleet consisted of seven ships of the line, besides frigates and bomb-ships. Two of the ships of the line were three-deckers, three carried 84 guns, and two 74. This naval force cast anchor at the Isle of Tenedos about the middle of February, where it was joined by the frigate on-board of which Mr. Arbuthnot had made his escape from the personal violence of which he had been in apprehension at Constantinople; he carried along with him all the English residing in that city.

Our fleet passed the Dardanelles on the morning of the 19th. A Turkish squadron, consisting of a 64-gun ship, four frigates, and several corvettes, had been for some time at anchor within the inner castles. Orders were given to commodore sir Sidney Smith, who was well acquainted with those seas, having been stationed there, with a naval force under his command, in 1799, to bear up with three ships of the line, and destroy them, if any opposition should be made to their passage. This division was followed closely by the other ships. At a quarter before nine o'clock, the whole of the squadron had passed the outer castles, without having returned a shot to the Turkish fire, which did our ships but little injury. This forbearance was intended to express the pacific disposition and amity of our sovereign and government towards the Sublime Porte. But, in passing the narrow strait, between Sestos and Abydos, our squadron sustained a very heavy fire from both castles. A tremendous fire was therefore opened by our ships of war on the castles, with such effect, that the firing of the Turks was in a great measure slackened when they were passed by the sternmost vessels of the squadron. The small Turkish

squadron.

Squadron within the inner castles was attacked by sir Sidney Smith, driven on-shore, and burnt; and the guns of a formidable battery, to the number of more than thirty, on a point of land which our Squadron had yet to pass, called Point Pesquiez, were spiked by a detachment of marines.

On the 20th of February, in the evening, the English Squadron came to anchor near the Isles of Princes, at the distance of eight miles from Constantinople. A flag of truce was immediately sent to the seraglio, with a letter from Mr. Arbuthnot to the Turkish government, recapitulating the efforts that he had made, by an amicable negotiation, to preserve the relations of peace and friendly intercourse between the Sublime Porte and Great Britain; and various considerations of interest, and former habits of mutual good-will and confidence, that were calculated to restore the same good understanding between the two powers, that had been unfortunately interrupted through the intrigues of a party inimical to both. At the same time, a letter in the same spirit was sent by the admiral sir Thomas Duckworth, to the reis effendi. After many conciliatory observations, he said, that, perceiving the change that had taken place in the disposition of the Sublime Porte, and having it in his power to destroy both the capital and ships of all descriptions, the line of conduct to be pursued in these circumstances lay clearly before him. Nevertheless, as he was convinced that the prince he had the honour to serve was far from being disposed to punish any others than the guilty; and being also persuaded that neither the sultan, nor his people, were disposed by any means to go to war with Great Britain, and that the measures complained of were to be ascribed solely to the base and pernicious intrigues and suggestions of the French; he would feel the utmost reluctance to involve so many innocent persons in the miseries and horrors of war, and the ruin and destruction of every object that was valuable and dear to them in life. The vice-admiral, moved by these considerations, proposed to the Turkish government, as a condition of peace and amity, *to deliver into his hands all the ships and vessels of war, belonging to the Sublime Porte, with all necessary stores and provisions; in which case the British Squadron would not, in any shape or degree, molest the city, but immediately retire beyond the Dardanelles.* He allowed the space of half an hour, after his note should be translated into the Turkish language, for the divan to deliberate and decide upon his proposition; protesting that, if he should be reduced to the hard necessity of seizing the ships by force, and proceeding to the work of destruction, for the accomplishment of which, he possessed ample means, the blame would lie on the Sublime Porte, not on the king, his master.

The vessel, bearing the flag of truce, was dispatched with these notes by break of day, on the morning of the 21st. But the officer who had charge of them, was not permitted to land; wherefore Mr. Arbuthnot sent back the flag of truce, with a short additional note, stating that, from an anxious desire of peace, it had been thought proper to make a second effort for the delivery of those sent before to the reis effendi, and expressing, in a few words, the substance of those notes, which was, to give the Sublime Porte the option of declaring itself either on the side of the French or the English; and that, if it should prefer the former alternative, still the British admiral would spare the city, *on the condition of surrendering to him the whole Turkish fleet, with sufficient naval stores.* In the middle of the night, between the 21st and 22d of February, Mr. Arbuthnot wrote another note to the reis effendi, stating that the English officers had discovered, by means of telescopes, how the time was employed that had been allowed the Sublime Porte for coming to a decision on the subject of the former notes, from himself and the British admiral. It had been observed, that the subjects of the Porte were busily engaged in withdrawing the ships of war from their usual stations, to places more capable of defence, and constructing batteries all along the coast. If those defensive measures

were not immediately stopped, the British ships of war would act in such a manner, as might be most conducive to British interests. His highness, the sultan, might give an assurance in two words, written with his own hand, that the good understanding between the Porte on the one part, and Great Britain and Russia on the other, would be renewed. The celerity with which the British fleet had passed the Dardanelles, was a proof that the determination announced would be carried into execution.

Early on the morning of the 24th, the English admiral received a letter from the reis effendi, signifying the disposition of the Porte to enter into a negotiation for a definitive treaty of peace immediately; and requested that a person, invested with full powers of treating on the part of the English, might be sent to meet the plenipotentiary who had been chosen by the Sublime Porte.—A correspondence now ensued, concerning the place where the conference should be held. The Turks proposed Dadi-koi, on the coast of Asia. The English admiral, either one of the Isles of Princes, or his own ship, the Royal George, or the Endymion frigate, which had been sent forward, bearing a flag of truce, and lay at anchor before Constantinople, while the ships of the line and bomb-ships kept at the distance already mentioned. The admiral, having previously apprised the Turkish government, moved the Squadron four miles nearer the city, but still kept without cannon-shot.

Threats were still intermixed with professions and tokens of amity; but in the mean time the fortifications of which the English complained were not interrupted, but continued night and day, with unremitting activity and vigour, at many different points, and on both the European and Asiatic sides of the canal of Constantinople. The flames of the small Turkish Squadron, destroyed on the 19th of February by sir Sidney Smith, did not intimidate the Turks, but roused and united them in a determination to resist aggression, and to preserve the city from destruction, and the contamination of infidels. The grand signior himself, conducted by the French ambassador, Sebastiani, appeared at the places most proper for the construction of redoubts and batteries. Men, women, and children, Turks, Armenians, Greeks, Ulemas, Sheiks, and Dervises, lent their aid. The Greek patriarch, and a number of his clergy, put their hands to the pick-axe and wheel-barrow. Thousands of workmen flocked from different quarters. The works were carried on under the direction of certain officers of the corps of engineers, and of artillery that had arrived opportunely from Dalmatia. The members of the divan, and other grandees, remained on the busy scene night and day, each of them at one battery, for encouraging the labouring people, and forwarding the work. They took the necessary repose in small tents. The grand signior too slept in a tent; and every day made the round of all the batteries, encouraging the workmen by kind looks and words, and the distribution of money. At the end of four days, batteries, with excellent breast-works, were mounted with 500 pieces of cannon and 100 mortars.—Such are the effects that may be produced by unanimity and zeal, among the inhabitants of a great city, in the public service!

Sir Thomas Duckworth was of opinion that, notwithstanding this enthusiasm of the populace, there was a sincere disposition to negotiate for peace, on the part of the Turkish government, up to February 27th; but, had there been no hopes of successful negotiation, it was not in his power to act otherwise than he did; for, from the moment of the Squadron's casting anchor, till that of its weighing anchor to repass the Dardanelles, which it did on the morning of the 1st of March, such was the unfortunate state of the weather, that it was not at any time in the power of the admiral to have occupied a station that would have enabled the Squadron to commence offensive operations against Constantinople. The fire of the two inner castles on our ships in their inward passage had been severe; but the effect they had on them in their return proved

proved them to have been doubly formidable. Bullets, or blocks of marble, of immense weight and size, were fired at our ships, from huge mortars. One of these, weighing 800 pounds, cut the mainmast of the Windsor man-of-war in two; and it was not without much trouble and pains that the ship was saved. Our loss of men in this unfortunate expedition, amounted, in killed and wounded, to about 250. Sir John Duckworth appears to have done every thing that was possible, to effect the object of the expedition; but the expedition itself was so ill contrived, that success was not to be expected. It was generally condemned, not only as being injudicious and weak, but silly and childish. Indeed one may say of this expedition, what the Turkish envoy to Charles VII. of France said of a grand tournament, exhibited for his amusement; "that, if it was in good earnest, there was not enough done; but, if it was in jest, too much."

The failure of our attempt on the capital of the Turkish empire seemed for some little time to have been, in no small degree, compensated by the possession of Alexandria.—On the 6th of March, a military force of about 5000 men, including three companies of artillery, with two engineers, was sent against that city, by general Fox, from Messina, under the command of major-general Mackenzie. On the night of the 17th, the Apollo frigate, with nineteen transports out of thirty-three which conveyed the troops, parted company; and the other fourteen, with the Tigre, came to an anchor, to the westward of Alexandria, on the 16th. When our squadron approached the land, a vessel was dispatched by major Misset, (who appears to have resided at Alexandria in the character of British consul, and with whom the general was directed by his instructions to consult as to the best plan of operations,) with a letter to him, earnestly recommending him to land the troops immediately, as the inhabitants were well affected to the English; and expressed his hopes that they should be able to get possession of the city, without firing a shot. The general stated the diminution of his force, in consequence of the separation of the nineteen transports. The major still urged his immediate landing. The troops were landed, part on the 17th, part on the 18th. The general, finding his situation, from the increased height of the surf and appearance of the weather, to be very precarious, both with respect to getting provisions or stores on-shore, or having any communication with the transports, determined, at all hazards, to force his way to the western side of the city, where he could receive supplies from Aboukir-bay, at the same time to advance into the town with the small force he had, and push his way, if possible, into the forts that commanded it. He therefore moved forward, about eight o'clock in the evening of the 18th. In their way, the British forced a pallisadoed entrenchment, with a deep ditch in front of it, that had been thrown up as a defence against the Mamalukes and Arabs, on the western side, stretching from Fort des Bains, on its right flank, mounting thirteen guns. This they effected with very little loss, though under a heavy fire of cannon and musquetry; and proceeded within a few yards of Pompey's Gate, where they found the garrison prepared to receive them, the gate barricadoed, and the walls lined with troops and armed inhabitants. This, added to the smallness of the British force, not much exceeding 1000, determined the general to proceed to the westward. In the morning of the 19th, he took up his position on the ground which the British troops had occupied in the action of the 21st of March, 1801; and immediately sent detachments to take possession of Aboukir-castle, and the cut between the lakes Mahadie and Mareotis, by which communication a reinforcement of Albanians was expected in Alexandria. In both these designs they succeeded.—The next day, the 20th, the general sent in by a friendly Arab, that had stolen out of the town, and joined the English, a manifesto addressed to the inhabitants, warning them of the danger of an assault, in the horrors of which friends would be involved with foes, and urging them to force the government to

capitulate. This had the desired effect: A flag of truce was agreed to and signed. The religion, the laws, and the property, of the inhabitants were respected. The vessels belonging to government, and all public property, to be given up to the British forces. The crews to be sent to a port of Turkey, with the arms and baggage of individuals; but to consider themselves as prisoners of war, and not to take up arms against the British forces or their allies, until exchanged. The garrison of Alexandria, before its surrender, consisted of 467 men; soldiers, gunners, sailors, and marines. The loss of the British, in this reduction of Alexandria, was no more than one officer, six rank and file, killed; one officer, one serjeant, eight rank and file, wounded. The Apollo, with the nineteen missing transports, came to anchor in Aboukir-bay on the morning of the 20th; and sir John Duckworth's squadron arrived there on the 22d.

In consequence of a strong representation, by major Misset, our resident at Alexandria, as just mentioned, that the inhabitants of Alexandria ran a risk of being starved, unless Rosetta and Rhamanie were occupied by British troops, general Frazer, with the concurrence of admiral Duckworth, March 27th, detached the 31st regiment, and the chasseurs Britanniques, amounting together to about 1500, under major-general Wauchope and brigadier-general Meade, for that purpose. Our troops took possession of the heights of Abermandour, which command the town of Rosetta, without any loss. But the general, instead of keeping his post there, penetrated, with his whole force, into the town, without any previous examination of it; when our men were so briskly fired on, and otherwise annoyed, from the windows and tops of houses, without ever seeing their enemy, that, after a loss of about 300 men in killed and wounded, they retired, in good order, to Aboukir, without molestation; from whence they were directed to return to Alexandria. Apprehensions of famine being still strongly declared both by our resident, major Misset, and the *forbagi*, or chief magistrate, in the name of the people, without the occupation of Rosetta, another corps, about 2500 strong, was sent for the reduction of this important place, under the command of the honourable brigadier-general Stewart and colonel Oswald. This force took post opposite the Alexandrian gate of Rosetta on the 6th of April, and, after a summons to the town to surrender was treated with defiance, began to form their batteries. Great fires had been laid by the British commander on assistance promised by the Mamalukes; and their appearance was now daily, or even hourly, expected. Lieutenant-colonel Macleod, with a detachment from the main body of our little army, was sent to seize an important post, at the village of El Hammed, for the purpose of facilitating a junction with the expected succour. No succour, after an anxious expectation of many days, nor intelligence of any succour, was received. Early on the morning of the 22d of April, sixty or seventy vessels were seen sailing down the Nile; and there could not be a doubt that this was a reinforcement sent to the enemy from Cairo. Orders were immediately dispatched to colonel Macleod to retreat from his position to the main body; but these orders were unfortunately intercepted. The detachment at El Hammed was completely cut off; and general Stewart, overpowered by so large a force, retreated, fighting all the way, to Alexandria.—Our loss in this unfortunate expedition was not less than 1000 men, in killed, wounded, and missing. This rash enterprise was deeply regretted, when it was afterwards found that the apprehensions of famine were altogether groundless. There was no scarcity of provisions at Alexandria; great quantities of rice, so great was the plenty, had been lately exported; while, at the same time, a quantity equal to a year's consumption of rice, and six months of wheat for the inhabitants, six months for the army, and four for the navy, remained on hand. Indeed, while the British garrison remained in Alexandria, provisions of all kinds became every day more and more plentiful.

Had this expedition against Egypt been planned by the new ministry, they would, no doubt, have supported it, by reinforcements from Messina or Malta. But they did not approve of it; and their disapprobation of it was not, it may be presumed, kept a secret from generals Mackenzie and Frazer, who, threatened with expulsion, by the disaffection of the inhabitants, and a formidable force of infantry and cavalry on its march from Cairo against Alexandria, abandoned the idea of making any defence. On the approach of the enemy, he sent out a flag of truce, announcing that, on the condition of the delivery of British prisoners, the army under his command should immediately evacuate Egypt; which condition was accepted without hesitation. The British troops, setting sail from Alexandria on the 23d of September, returned to Sicily; where they set free a part of our troops stationed there for the protection of that island. The troops thus liberated were brought to Gibraltar, with a view to co-operate in securing the retreat of the royal family of Portugal, from Lisbon; an object, however, which, as will by-and-by be related, was happily effected without the necessity of employing them.

Another expedition, still more unfortunate than those against Constantinople and Alexandria, had been undertaken, not by order of government, but by individual commanders on their own responsibility, against a nation bearing no small resemblance in their political state and relations to the subjects of the Ottoman Porte; a nation in its decline, prone to peace, and above all, though the government had been brought under the influence and power of Bonaparte, at peace with England. A combined military and naval force, under the command of general Beresford, and commodore sir Home Popham, proceeding from the Cape of Good Hope to the great river of La Plata, took the town of Buenos Ayres, the capital of a great province or government, without much resistance. It was soon retaken. But a re-inforcement of British troops from the Cape, towards the close of 1806, took post at Maldonado. Farther re-inforcements were expected; and farther operations on the Rio de La Plata projected.

During the years 1806 and 1807, and perhaps for some time before, there was an obvious want of system, connection, and dependency, among some of the measures of the British government; an air of improvidence, unsteadiness, and vacillation. It sufficiently appears, from documents published in an edition of sir Home Popham's trial, authenticated by himself, that his design on Buenos Ayres was countenanced by Mr. Pitt and lord Melville. Yet the same ministers had very nearly, at the same time, encouraged the design of general Miranda, conceived in quite a different spirit; a spirit of conciliation, concord, and conciliation.

General Miranda, with the knowledge and a good understanding between him and the British government, set out from England for the purpose of carrying into execution, if possible, his long-cherished project of emancipating Spanish America. He proceeded to the United States of America, for the purpose of procuring that assistance, which, from the assurances he had received while in this country, he had every reason to expect, particularly at a period when there was every prospect of a war between the United States and Spain, on account of a dispute about Louisiana. But, on his arrival, he had the mortification to find that the dispute about Louisiana was compromised; and that, although the wishes of the American, like those of the British, government were for him, he could not expect their avowed assistance. The general, however, animated by that persevering ardour which is inspired into great minds by great designs, induced, on terms agreed on, Mr. Ogden, a merchant of New York, to fit out a ship, the *Leander*, captain Lewis, with two hundred young men of great respectability, who volunteered their services; and to proceed with her to St. Domingo, for the purpose of being joined by a second vessel, the *Emperour*, commanded

by another captain Lewis, brother to the master of the *Leander*. Unfortunately, soon after the departure of the *Leander* from New York, the American government, giving way to the urgent solicitations of the French and Spanish ambassadors, brought an action against Mr. Ogden, and a colonel Smith, a zealous friend to the cause of general Miranda, on the plea, that the equipment of the *Leander* was unauthorized and illegal. The parties prosecuted were honourably acquitted. But the first consequences of the trial were of incalculable detriment to general Miranda's expedition; for, the master of the *Emperour* having heard, while at St. Domingo, that an action had been brought against the parties just mentioned, absolutely refused to proceed on its destination. It now became necessary to engage, instead of the *Emperour*, two small schooners. The general, however, though thus cruelly disappointed in his expectation of being joined by the armed ship *Emperour*, of about thirty guns, proceeded with his little squadron for the coast of Caraccas; where, as he supposed that the Spanish government still continued ignorant of his movements, he hoped to effect a landing without opposition. The Spanish ambassador, however, having obtained information of this enterprise, sent advice thereof to the governor of Caraccas; where general Miranda, instead of meeting, as he expected, with none but friends apprised of his approach, had the mortification to learn that the government of Caraccas had given the necessary orders for taking measures of defence, and where his two schooners unfortunately fell into the hands of the Spanish guarda costas. In these circumstances, general Miranda failed directly for Trinidad, for the purpose of procuring a British auxiliary force. Admiral Cochrane, then commanding on the windward station, assured the general of support, in both ships and men; and immediately ordered some sloops of war and gunboats to proceed with him on the expedition. Thus reinforced at Trinidad, the general set sail from thence, on the 24th of July, 1806, again for the coast of Caraccas, with his little fleet, now consisting of about fifteen vessels in all, and having on-board about five hundred officers and men, all volunteers. On the morning of the 2d of August, his little army effected its landing at a place called *Vela-de-Coro*. But, the disembarkation having been delayed by a gale of wind, and the ignorance, perhaps the treachery, of the pilot, for thirty-six hours, the agents of the Spanish government had time for spreading the alarm along the coast, and preparing for defence. The boats, with the troops on-board, however, rowed boldly, in the dark, for the shore; where upwards of 500 Spanish soldiers, and about 700 Indians, were drawn up to oppose the landing. The Spaniards kept up a heavy but ineffectual fire on the boats, as they approached; but, without returning the fire, they quickly gained the shore; when, on general Miranda and his troops advancing on the enemy, and exchanging a couple of volleys, which wounded a few on both sides, the Spaniards fled in every direction, and the Indians, released from the presence of their late masters, flocked in crowds around their new victors, and, learning the object of their arrival, cried out, "Success to general Miranda!" Two forts, and upwards of twenty guns, intended to protect the port of La Vela, immediately surrendered, with their stores and ammunition. And general Miranda, assured of the friendly disposition of the inhabitants of *Vela-de-Coro*, who amounted to upwards of 3000, set out, a few hours afterwards, on his march for the city of *Coro*, situated about fifteen English miles up the country, and containing a population of about 12,000 persons. He entered *Coro* before day-break next morning. From *Vela-de-Coro*, general Miranda, under the title of Commander-in-chief of the Columbian Army, issued a proclamation to the inhabitants of Columbian America, in which he says, "Brave countrymen and friends! In obedience to your wishes, and the repeated requests and calls of the country to whose service we have cheerfully consecrated the greater

part of our lives, we have disembarked in this province of Caracas. The opportunity, and the time, appear to us highly favourable for the completion of our designs; and all persons composing the army are your friends and countrymen—all resolved to sacrifice their lives, if necessary, for your liberty and independence, under the auspices of the British navy. The innocent Indians, and other men, will consider us all as brother-citizens, and that precedence belongs only to merit and virtue; in which belief, they will primarily obtain, most certainly, military and civil recompenses, the reward of merit alone." An arrangement was announced for carrying the plan of emancipation into execution, with due security and efficacy. The principles and views with which the little Columbian army had landed on the shores of South America, were also unfolded in other proclamations, and in letters to the city council of Coro, and the bishop of Merida. "Their principal object was the independence of the whole Columbian continent, for the benefit of all its inhabitants, and the inhabitants of the human race." The members of this council, who, on the approach of general Miranda to Coro, had retired to Buena Vista, a few miles from town, kept up a secret correspondence with the general for several days; during which time, the most friendly civilities were interchanged between the general and all the respectable families of the place. But the smallness of his force prevented confidence in his success. The people dreaded the cruel vengeance of the Spanish government, in the event of his defeat; and, as the captain-general of Caracas was collecting troops, general Miranda retired from Coro, and removed his head-quarters to the shore; having previously assured the people, in a proclamation, of his just and friendly intentions, and that "it was not in the cities, but in the field, that he and his army wished to fight with the oppressors alone of the Columbian people." From thence, general Miranda dispatched an officer (captain Ledlie) to our naval and military commanders on the Jamaica station, to represent his prospects, the absolute necessity there was for a force sufficient to give confidence to the South-American people, and to request that this aid might be sent to him without delay. Sir Eyre Coote and admiral Dacres regretted that they were precluded from giving the assistance which his views demanded, as they had not received any official instructions from home on this subject. Admiral Dacres, however, gave orders to his cruisers to afford every possible protection. Captain Ledlie immediately returned with this answer to general Miranda; who, after dispatching that officer to Jamaica, had proceeded himself with his troops to Araba, a few leagues from Vela-de-Coro, with an intent to seize the strong post of Rio de la Hache, and there wait the arrival of succours. Soon after, admiral Cochrane sent him a ship of the line, and two frigates, with reiterated assurances of support. But, erroneous reports having reached the West-Indies, that preliminaries of peace between Great Britain and France had been signed by lord Lauderdale at Paris, and these reports accompanied with an intimation that admiral Cochrane would consequently be obliged entirely to withdraw the aid of the naval force, general Miranda found himself under the necessity of abandoning all farther operations on the Spanish Main, and retired with his companions in arms to Trinidad.

Had general Miranda been seasonably supported by the co-operation of a British auxiliary force, as he had reason to expect, his success would have been complete. The grand design in which he and his worthy companions were engaged, was not marred and disgraced by any selfish and dishonourable considerations of personal gain. On the contrary, his chief care was to direct the views of his officers and men to the grandeur and glory of the object before them, and to inspire them with a sense of the necessity of constantly observing a suitable conduct towards the people whom they had come to emancipate; while, at the same time, he used all possible means to convince his

countrymen of the beneficence of his views, as well as of the equitable and conciliatory measures by which he hoped to attain them. In short, the expedition to Caracas, under Miranda, conceived in a spirit the most liberal and generous, formed a direct contrast with that which was on foot about the same time to the Rio de La Plata, which appears to have originated in a spirit of rapacity and plunder.

The commander of the land-troops in this last expedition (brigadier-general Beresford) displayed, in his conduct, military skill, promptitude of decision, and cool courage; and also the noblest generosity and winning affability towards the inhabitants of Buenos Ayres, and all men. And, although he was not authorized to have recourse to the conciliatory measures by which he might have united the interests of Great Britain with those of Spanish America, the lives, the property, and the prejudices, of the people who had fallen under his power, were respected; and the attachment of the inhabitants of Buenos Ayres to his person, was won by many disinterested and generous acts of kindness. It was the success of the expedition, a secure and permanent footing on La Plata, that was his object, not personal gain and plunder. The military eye of the general pointed to Monte Video, as the first object of attack, not Buenos Ayres; but, with too much facility, he gave way to the earnest desire of the naval commander of the armament, who was seconded by all the captains of ships, to advance immediately against Buenos Ayres, the depôt of so much public and private treasure. It unfortunately happened that the commodore, with equal inhumanity, it must be owned, and impolicy, had sent on-shore 200 Spaniards, the crews of some vessels that had fallen into his hands, on the island of Lobos, in La Plata, several leagues distant from Maldonado, that he might not be incumbered with so many prisoners, leaving them to the danger of perishing from famine. The men subsisted some time on the flesh of seals and shell-fish. At length, a number of them, with the assistance of the skins of seals, formed into somewhat that assisted them in swimming, as bladders do, made their way to the shore; when a vessel was sent to the desert isle, consisting of little else than a ledge of rocks, to fetch their companions. These men came to Buenos Ayres, and, by relating what had happened to them, inspired the inhabitants with sentiments of indignation, aversion, and horror. The deportment of the commodore, at a meeting with the cabildo, was not of a nature to do away the prejudice that was contracted against him: it was haughty and insolent, and altogether that of a proud conqueror; though, when our troops took possession of Buenos Ayres, the commodore was at a very considerable distance. An incident happened, of a kind somewhat ludicrous, that marked how much sir Home, in this expedition to Buenos Ayres, was bent upon plunder. At a time when general Beresford was involved in a conflict with the Spaniards, a black boy arrived with a letter from sir Home Popham to the general, informing him that in a certain church he would find a very considerable treasure. When matters had grown worse and worse with the British at Buenos Ayres, and the general wished to concert with the naval commander some measures for extrication, sir Home was in a great haste to break up the conference, and get on-board a frigate that carried him to his squadron, at anchor a great way down the river, as far as Monte Video. This abrupt retreat had greatly the appearance of forsaking the army, and running away; and every one said that the commodore had shown more anxiety about securing the plunder, than co-operating with the army, by taking such positions with the ships under his command as might have tended to intercept the passage of Spanish troops from Monte Video to Colonia de Sacramento, and from thence to the right bank of the Rio de la Plata, on which Buenos Ayres is situated, to the haven of Las Conchas.

This unauthorized expedition, instigated and undertaken by sir Home Popham, was not more dishonourable and disadvantageous

disadvantageous to the British government than it was detrimental to a very great number of individuals. Sir Home Popham wrote home to the society at Lloyd's coffee-house, and to the principal manufacturing towns in Britain, setting forth how fine a market had been opened to a great variety of English goods. And the ministry, as soon as they heard of the conquest of Buenos Ayres, sent thither a ship of war with a convoy of merchantmen. The market was overflocked; many London merchants suffered great loss, and some were ruined. The *conduct* of Sir Home Popham was generally attributed to rapacity; his *success*, as far as his own interest was concerned, in his projects, to a very plausible, eloquence, and address in operating on the particular characters, prejudices, interest, and passions, of men, and bodies of men. His *conduct* was declared by a court-martial, held in March 1807, to be highly reprehensible in a British officer, and leading to a subversion of all military discipline, as well as subordination to government; and he was reprimanded accordingly.

It was not greatly to be wondered at, that the British ministry did not show much promptitude in supporting an expedition unauthorized by government, and originating in such views as that of Sir Home Popham's enterprise against Buenos Ayres. Besides, the views and hopes of Mr. Fox were wholly pacific. He was not disposed, it may be presumed, to send out an armament to the Rio-de-la-Plata, so long as there was any hope that all differences with France might be settled by negotiation. His inviolable attachment to peace was perhaps the noblest feature in his public character. Even his most determined enemies lamented his death, when they saw the negotiations which had owed their birth entirely to him expire as our only minister of peace expired.

In October 1806, the very month after Mr. Fox's death, a reinforcement was sent to La Plata, from England, under the command of Sir Samuel Auchmuty, and convoy of Sir Charles Stirling, in the Ardent ship of war, who was appointed to supersede Sir Home Popham in the naval department. The transports were such bad failers, that they were obliged, in their voyage, to go into Janeiro for water. He there received intelligence of the recapture of Buenos Ayres; but of our having possession of Maldonado, near the mouth of the river. The general, on his arrival at Maldonado, found our troops were without artillery, without stores of any kind, with only a few days' provision, and without any prospect of procuring more, unless by detaching a large force many miles into the country, exposed to the insults of a corps of 400 horse, that hovered round the English to intercept supplies. Maldonado was an open town, and so situated, that with a small force it could not be rendered tenable. The only point that appeared assailable with propriety, as it had also done to general Beresford, was Monte Video. He conceived his resources equal to the enterprise; but he found it a most arduous undertaking. He had not entrenching-tools sufficient to make approaches; and, after a few days' firing, the whole powder in the fleet was reduced to 500 barrels, about four days' consumption; to add to his difficulties, 4000 picked troops, with 24 pieces of cannon, were rapidly approaching him. He therefore determined, if possible, to take the place by assault; in which design, though with a heavy loss, he happily succeeded. The number of British troops employed in the reduction of Monte Video amounted to upwards of 4000, of which 1200 were engaged in the storm; that of the Spaniards to 6000. The loss of the British, which fell chiefly on the storming column, was 600. The loss of the enemy was very great; about 800 killed, 500 wounded, and upwards of 2000 officers and men, including the governor, prisoners. The merit of our soldiers was greatly enhanced by the bravery of their opponents. Sir Charles Stirling, in his letter to Mr. Windham, dated Monte Video, Feb. 8, says, "It has been much the custom to speak slightly of the resistance to be expected from the Spaniards in this country, and with confidence of the facility which has been given to

naval operations by a prior knowledge of the river; but the battles lately fought prove the former opinion to be erroneous; and experience proves that all the information hitherto acquired had not prevented the most formidable difficulties."

Before intelligence was received of the recapture of Buenos Ayres, in August, by the Spaniards, it was hoped by the British ministry, that an expedition to the west might meet with the same success which, it was yet believed, had attended his majesty's arms on the east coast of South America. With a view to this object, and to the opening and facilitation of a commercial intercourse with the interior of the country, a force of 4200 men was sent out, under the command of brigadier-general Craufurd, at the end of October 1806, accompanied with a competent naval force under that of admiral Murray. The choice of the course to be steered, whether to the eastward, by the way of New South Wales, or to the westward, round Cape Horn, was left to admiral Murray, who, it appears, proceeded in the eastern direction as far as the Cape of Good Hope. It was explained to the general, that the object of the expedition was the capture of the seaports and fortresses, and the reduction of the province of Chili. If the general should succeed in obtaining possession of Valparaiso and St. Jago, or establishing any other sufficient footing in Chili, he was instructed to take the earliest possible means of appointing brigadier-general Beresford thereof, and of concerting with him the means of securing, by a chain of posts, or in any other adequate manner, an uninterrupted communication, both military and commercial, between the provinces of Chili and Buenos Ayres.

But, when intelligence was received of the recapture of Buenos Ayres by the Spanish soldiery assisted by the townsmen, the Fly sloop of war was dispatched with orders to general Craufurd to proceed, not to Chili, but to the Rio de la Plata, to join the British force under the command of Sir Samuel Auchmuty. The sloop fortunately, as was then supposed, arrived before the general left the Cape of Good Hope. He set sail from the Cape in April, and arrived in La Plata on the 14th of June. After this junction between the two generals, the whole British force in La Plata was computed at 9500 men. "As it had been thought advisable, (to use the words of the secretary of state for the department of war and colonies,) that an officer of high rank, as well as talents and judgment, should be sent to take the command of such of his majesty's forces as were at that time employed, or likely soon to be employed, in the southern provinces of South America, it was his majesty's pleasure to make choice for that purpose of *general Whitelocke*." The general accordingly set sail for his destination early in March, carrying an additional force of 1630 men; of which there was a troop of horse-artillery to the number of 130, dismounted, with harness and appointments. The service intrusted to his care, was the reduction of the whole province of Buenos Ayres.

General Whitelocke arrived in La Plata on the 9th of May: on the 11th, he took the command of the troops; one division of which, consisting of the troops that had arrived with general Craufurd, was stationed at Colonia, opposite to Buenos Ayres, and one at Monte Video. Transports were ordered for the reception of troops for their passage to Buenos Ayres. On the 28th of June, a force was assembled near Encenada de Barragon, amounting to 7822 rank and file; including 150 mounted dragoons. It was provided with eighteen pieces of field-artillery, and 206 horses and mules for their conveyance, and for that of small-arm ammunition. There was, besides, a large quantity of ordnance-stores embarked, and a reserve-artillery of heavy pieces, mortars and howitzers. There were entrenching-tools for 1000 men, six pontoons with their carriages, &c. &c.

After some fatiguing marches, through a country much intersected by swamps and deep muddy rivulets, the army reached Reduction, a village about nine miles distant from the

the bridge over the Rio Chuelo; on the opposite bank of which, the enemy had constructed batteries, and established a formidable line of defence. The general, therefore, resolved to turn this position, by marching in two columns from his left, and, crossing the river higher up, to unite his force in the suburbs of Buenos Ayres. He sent directions at the same time to colonel Mahon, who, with two regiments, was bringing up the heavy artillery, to wait for further orders at the village of Reduccion. Major-general Gower, having the command of the right column, crossed the river at a ford called Passo Chico, and, falling in with a corps of the enemy, attacked and defeated it. Next day, general Whitelocke, with the main body of the army, having joined general Gower, formed his line by placing sir Samuel Auchmuty's brigade on the left, extending it towards the convent of the Recoletta, from which it was distant two miles. Two regiments were stationed on its right. Brigadier-general Craufurd's brigade occupied the central and principal avenues of the town, being distant three miles from the great square and fort; three regiments on his right extended in a line towards the Residencia.

The town was thus nearly invested; and this disposition of the army, and the circumstances of the town and suburbs being divided into squares of 140 yards each side, together with the knowledge that the enemy meant to occupy the flat roofs of the houses, gave rise to the following plan of attack: Brigadier-general sir S. Auchmuty to take possession, with a regiment, of the Plaza de Toros, and the adjacent strong ground, and there to take post. Four other regiments, divided into wings, were ordered to penetrate into the street directly in its front. The light battalion divided into wings, and each followed by a wing of the 95th regiment and a three-pounder, was ordered to proceed down the two streets on the right of the central one, and the 25th regiment down the two adjoining; and, after clearing the streets of the enemy, this latter regiment was to take post at the Residencia. Two six-pounders were ordered along the central street, covered by the carabineers and three troops of the 9th light dragoons; the remainder of which regiment was placed as a reserve in the centre. Each division was ordered to proceed along the street directly in its front, till it arrived at the last square of the houses next the river Plata; of which square it was to take possession, forming on the flat roofs, and there wait for further orders. Two corporals with tools were ordered to march at the head of each column, for the purpose of breaking open the doors. The whole troops were unloaded; and no firing was to be permitted until the columns had reached their final points and formed. A cannonade in the central streets was the signal for the whole to come forward.—The issue of the conflict which ensued, was such as was to be expected from a plan so weak, and indeed ludicrous. Our troops moving forward in the appointed order, with their unloaded muskets and iron crows, were assailed by a heavy and continued shower of musketry, hand-grenades, bricks, and stones, from the tops of the windows of the houses, the doors of which were barricaded in so strong a manner, as to render it almost impossible to force them. The streets were intersected by deep ditches; and cannon, planted on the inside of these, poured volleys of grape-shot on our advancing columns. They were saluted also with grape-shot at the corners of all the streets. Every householder, with his negroes, defended his own dwelling, which was in itself a fortress. Yet, in the midst of all this assaillance, and while the male population of Buenos Ayres, by the means of destruction just mentioned, was employed in its defence, sir S. Auchmuty, after a most spirited and vigorous attack, in which his brigade suffered much from grape-shot and musketry, made himself master of the Plaza de Toros, took 82 pieces of cannon, an immense quantity of ammunition, and 600 prisoners; which served as a place of refuge to some other regiments that were overpowered by the enemy. Brigadier-general Craufurd with his bri-

gade, being cut off from all communication with any of the other columns, was obliged to surrender; so also was lieutenant-colonel Duff, with a detachment under his command. Still, however, the result of this day's action left general Whitelocke in possession of the Plaza de Toros, a strong post on the enemy's right, and the Residencia, another strong post on his left; whilst general Whitelocke himself occupied an advanced post on his centre. But these advantages had cost about 2500 men in killed, wounded, and prisoners.—This was the situation of our army on the morning of the 6th of July, when general Linieres addressed a letter to the British commander, offering to give up all his prisoners taken in the late affair, together with the 71st regiment, and others taken with brigadier-general Beresford, on the condition of his desisting from any further attack on the town, and withdrawing his majesty's forces from the river Plata; intimating, at the same time, that, from the exasperated state of the populace, he could not answer for the safety of the prisoners if he persisted in offensive operations. General Whitelocke, influenced by this consideration (which, he says, he knew from better authority to be founded in fact), and reflecting of how little advantage would be the possession of a country the inhabitants of which were so absolutely hostile, resolved to forego the advantages which the bravery of his troops had obtained, and acceded to a treaty of peace, on the basis that had been proposed by the Spanish commander.

At a general court-martial, held at the hospital of Chelsea, on the 28th of January, 1808, and continued by adjournments until the 18th of March, lieutenant-general John Whitelocke received the following sentence: "That the said lieutenant-general Whitelocke be cashiered, and declared totally unfit and unworthy to serve his majesty in any military capacity whatever."

The plan of attack on Buenos Ayres adopted by general Whitelocke, it would appear, was none of his own contrivance, but one proposed to him by lieutenant-general Gower. This was declared by the general himself in his defence; and general Gower admitted in his evidence, that the basis of the plan adopted by general Whitelocke was very much like his. Indeed, general Whitelocke appears, from his trial, to have been very undecided and wavering in his conduct, and in that state of mind which reposes on the counsels of others. Towards the end of the trial, public curiosity was less excited to know its issue, than the interest or means by which general Whitelocke had obtained his important appointment.

After the battle of Friedland and the peace of Tilsit, all the continent of Europe lay prostrate before Bonaparte. But the island of Great Britain, mistress of the seas, still defied his power, and threatened to harass his extended coasts with never-ceasing aggression, which she seemed still able to continue by means of the resources opened by her vast commerce. It was against this commerce, that Bonaparte had now to make war; and, as he could not do this at sea, his fleets having been almost annihilated, he conceived the extravagant design of doing it at land, by shutting it out, not only from the ports of France, Italy, and Holland, but from all the ports of Europe.

By a decree, dated at Hamburgh, November 11, 1807, and another at Milan, the 27th of December, declaring the whole island of Great Britain to be in a state of blockade, he in a great degree compelled all the other continental powers, even Portugal for a time not excepted, to prohibit commerce with any of the dominions of his Britannic majesty. No nation was allowed to trade with any other country, in any articles, the growth, produce, or manufactures, of any of the British dominions, all of which, as well as the island of Great Britain itself, were declared to be in a state of blockade. He appointed commercial residents in every trading country; and no ship was to be admitted into any of his ports without a

*certification of origin*, that is, of the nature of the goods they carried, and that no part of these was English.

The wants of men, not the less importunate that they were luxurious or artificial, having opened back-doors to various English articles, both manufactures and colonial produce, he enforced the execution of his decrees against English commerce, by means of new regulations, with greater and greater rigour. In consequence of these decrees, the English commerce, during the months of August, September, and October, 1807, that part of the year in which the Berlin decree of November, 1806, was carried into full effect, was not only greatly cramped, but lay prostrate on the ground, and motionless, until a protecting and self-defensive system was interposed by our orders in council. An order of council, January 7th, 1807, containing a measure of mild retaliation, had been evaded, and turned to the advantage of the enemy, in carrying on a circuitous trade to this country. Therefore new orders of council were issued on the 11th and 21st of November, allowing neutrals to trade with countries not at peace and amity with Great Britain, on the condition of their touching at the ports of this country, and paying the customs or taxes imposed by the British government. The neutrals were thus placed between confiscation and confiscation. If they went to an enemy's port without first paying duty here, they were to be captured by our cruisers; and, if they came here and paid the duty, then they would be confiscated if they went to the ports of the enemy. The options were both of them hard. It was a system that ran into great complexity; order upon order in explanation, was issued respecting various cases. But, on the whole, immediately after the orders of council were issued, trade began again to lift up its head, and to flourish: not perhaps so greatly as at its best former period; for the injurious and violent system of the enemy, though counteracted by the orders of council, could not be wholly fruitless.

A treaty of amity had been made by lord Grenville, with America, on the 31st of December, 1806; but it was not ratified by the president of the congress. For an unauthorized act of force, committed against an American ship of war, spontaneous reparation had been made by Great Britain. But with this particular case the American government attempted to connect the general question, respecting the right of searching for British seamen and deserters; to abandon which, was considered by the British government as inconsistent with the maritime rights of Britain.

To balance, in some measure, the discouragements arising to our commerce from the misunderstanding with the United States, which was every day growing worse, a commercial and friendly intercourse was established between Great Britain and general Christophe, who, having defeated and destroyed the emperor Dessalines, governed a great part of the island of St. Domingo, under the more modest title of President of Hayti. See the article *HISPANIOLA*, vol. x. p. 204.—Christophe appears to have possessed, in a very eminent degree, the virtues of humanity, and a regard to the true interests of his country, as well as good sense, and military skill and courage. He declared it to be the great object of his government, to repair the havoc and devastation of Hayti, by the establishment of just laws, social order, freedom of trade, and, above all, a commercial and friendly alliance with the only people that had stood forth in support of regular government and law, in so many countries subverted, and every-where shaken. He had great confidence, and a predilection, for the personal character of the English. He spared the lives of the crowds of prisoners that had fallen into his hands; took great care of the sick and wounded; and assured all men, peaceably disposed, of his protection.

Christophe, with the assistance of other men of enlarged views, had been employed for some time, in the formation of a new constitution for Hayti; which was proclaimed on the 17th of February, 1807, the fourth year

of independence. The whole of the code of Christophe displays patriotism, moderation, firmness, and political wisdom. The tenth head, guaranteeing the neighbouring colonies, was a masterly stroke of policy: "The government of Hayti declares to the powers possessing colonies in the neighbourhood, never to interfere in the government of those countries. The people of Hayti make no conquests beyond their own isle, and content themselves with the conservation of their own territory."

A number of turbulent persons in the southern part of Hayti had formed designs of revolt and revolution in Jamaica, and had sent emissaries there for that purpose. But general Christophe, who had been informed of the plot, and who were the principal individuals concerned in it, immediately denounced them, and they were arrested.—It was impossible for the British government to be otherwise than on good terms with such a neighbour. An order of council was issued at the court of St. James's, February 1807, authorizing all British merchantmen bound for Buenos Ayres and La Plata, to proceed to any port in the island of St. Domingo not under the power of France or Spain, there to dispose of their cargoes, to take the produce of the country in return, and either to bring such cargoes directly to any port of the united kingdom of Great Britain and Ireland, or to ship them on-board neutral vessels, to be sold at any of the colonies of the enemy; the owners of the cargoes to return with the proceeds of such adventures on-board the neutral vessels to any of the ports of the united kingdom.—This measure was certainly wisely calculated both for encouraging the trade of Hayti, and of Great Britain and Ireland.

Another event, fortunate for the British commerce, happened on the 1st of January, 1807. The island of Curaçoa was taken by a squadron of British frigates, commanded by captain Brisbane, under the orders of vice-admiral Dacres, with the loss of only three men killed, and fourteen wounded. Yet the harbour was defended by regular fortifications, of two tiers of guns; Fort Amsterdam alone mounted 66 pieces of cannon. The entrance was only fifty yards wide; and across it were moored two frigates, and two large schooners of war. A chain of forts on the commanding heights of Mideburg, and Fort Republique, deemed nearly impregnable, was within distance of grape-shot, and enfiladed the whole harbour. Soon after day-break, the British frigates made all possible sail in close order of battle. The vessels appointed to intercept their entrance were taken by boarding; the lower forts, the citadel, and town of Amsterdam, by storm. The port was entered at a quarter after six in the morning. Before ten a capitulation was signed. The British flag was hoisted on Fort la Republique. And the inhabitants of the town, to the number of 30,000, swore allegiance to the British government.

In contemplating the events of this year, the mind is forcibly impressed by a very general, and, as it should at first sight appear, a very calamitous, extension of the war in which our country had been for so many years, almost uninterruptedly, engaged. We call this extension *apparently* calamitous, because, although we see powers hitherto neutral, and some of them the allies of Great Britain, reversing their respective relations, and engaging in hostilities against her; yet, on a slight view of the means of annoyance possessed by those powers, and on reference to what has actually happened, it will be seen also, that, in reluctantly submitting themselves to the dictates of the French ruler, they have forced upon us contests for the most part bloodless, in which the pen rather than the sword has been the arbiter of our differences. Austria, Russia, the Ottoman Porte, Prussia, and Denmark, had, in the present year, been added to the already-formidable host of our enemies; and it cannot escape observation, with what indifference so large an accession of hostile agency was received by the British public, and, we may also add, by the government into whose balance the weight

of it was thrown. The excitement of the national sensibility was chiefly reserved for the Danish war: a circumstance highly creditable to the national feelings and character, as it must be recollected, that Denmark was, with one exception, the weakest of our new adversaries, and that it was from hostilities against her only that Great Britain derived those advantages by which she succeeded in counteracting the designs of the more powerful of them.

The war with Denmark, and the military and naval measures by which it was commenced, offering the first grand feature of active and successful warfare that occurred in this year, as well as the first specimen of the politics of the new administration, it is our duty to present this subject to our readers in one connected view; in order to which, we must take a short retrospect of preceding events. In the course of the negotiations which, from the unfortunate peace of Presburg, and the still more lamentable policy of the Prussian cabinet, terminated in the conclusion of the treaties of Vienna and Paris, between Prussia and France, repeated intimations were given by Bonaparte, when he found that the tide of fortune continued to run in his favour, that one of the first and principal uses he should make of his success, would be, to cut off those channels of communication which Great Britain still preserved with the continent. As the concurrence, and even the co-operation, of Prussia was necessary for this purpose, to her were these intimations first addressed. She was not long in acceding to those measures, which, ere many months elapsed, proved the cause of her own downfall: she took forcible possession of the King's German dominions, and excluded the British flag from her own ports, and from others to which her power or influence extended.

Denmark offered yet a feeble obstacle to the wishes of Bonaparte: it was to overawe her that he next turned his attention. To engage her by fair or foul means to shut the ports of her German provinces, and to attempt to obstruct the commerce of England in its passage through the Sound, was the next step in his restless career. This was announced in no unintelligible terms, by the many official and unofficial agents, which his active diplomacy employed in every court of Europe: the public newspapers were sometimes made the expounders of his will upon these topics. The court of Denmark could not be the last informed of what was passing; her own interests, and the desire of Bonaparte, that she should at once learn his determination, and the success he had met with in binding Prussia to it, speedily put her in possession of what she was to expect. She took the alarm. In hopes, perhaps, of obtaining some consolatory information, or in the still more delusive expectation of deriving some assistance by which to avert the impending storm, count Bernstorff, the Danish minister for foreign affairs, undertook a journey to Berlin. That court, divided as it had been, for some months, between the honest but feeble endeavours of one minister and the infamous intrigues of another, had not yet thrown itself into the gulf. Its final and official consent to Bonaparte's proposal had not been given; and the well-intentioned part of the Prussian ministry was still in hopes of preserving their own and their country's honour. To these men count Bernstorff directed his attention—on them his hopes rested; and, as they did not despair of maintaining their own independence, they allowed him to believe that they would assist in the support of that of Denmark. He accordingly did not hesitate to assert, that Denmark would resist any attempt upon her independence, from whatever quarter it came. At that time, possibly, he believed it; and the events of the summer of 1806 rather tended to confirm him in this belief. The battle of Jena, however, and its immediate consequences, dissipated the delusion. Then Bonaparte became the absolute disposer of all the north and north-east of Germany: he placed garrisons in the Hans-towns; he violated the neutrality of the Danish territory, and assumed, for the winter, a position so bordering upon it,

held himself, and by his agents, such language, and authorized acts of such magnitude, that there could no longer remain, in the mind of any unprejudiced man, a doubt as to his future intentions.

Such was the state of things, when the British government, having kept an attentive eye upon the transactions which led to it, determined to send to sea a powerful military and naval armament, consisting of about 20,000 men, and a fleet of 27 sail of the line, with vessels of all other descriptions, to the number of near ninety pendants. But such had been the secrecy attending these preparations, that the whole force was nearly ready for sea before the extent of it was known to the public; and it had actually left the ports of England many days before its destination was even suspected. A division of the fleet, under the immediate direction of commodore Keats, was detached to the Great Belt, with instructions to allow no military force whatever to enter Zealand. That enterprising and judicious officer led his line-of-battle ships through a little-known and intricate navigation, without the smallest accident; and stationed his whole squadron in such a manner, as that, by the vessels being within telegraph-distance of each other, nothing could attempt to pass them without a certainty of interception. The communication was entirely cut off between Zealand, the adjacent isle of Funen, and the main land of Holstein, Sleswic, and Jutland. No troops from any of the latter could pass into Zealand; which was thus placed, as to any military succour, in a complete state of blockade—a wise and humane precaution, calculated at once to ensure the success of our enterprise, and to render it as bloodless as possible, if it should be ultimately necessary to have recourse to arms. The British army accompanied the main body of the fleet to the Sound, where it was reinforced by the troops that had been for some time employed at Stralsund and the isle of Rügen, as auxiliaries to the king of Sweden. Lord Cathcart, who was with those troops, was appointed to be the chief command of the whole land-force. Admiral Gambier, one of the lords of the admiralty, commanded the fleet.

Hitherto the warlike preparations of our government appear as the most prominent feature of this undertaking. Much of its success was indeed expected to be derived from them; but it was, at the same time, understood, that, with the exception of the above-mentioned eventual and precautionary order to obstruct the passage of any troops across the Belt, the whole of our armament was to remain, in the first instance, inactive. No offensive operations were to be undertaken, until the result of a negotiation was known, which was, at the same time, to be opened with the court of Denmark, in order to obtain, without hostility, and by an arrangement equally advantageous to both countries, the object which was considered of paramount importance to Great Britain.

To conduct this negotiation, his majesty's ministers selected Mr. Jackson, who had, for several preceding years, resided at the court of Berlin, as envoy from this country, and who was supposed to have become peculiarly well acquainted, in that and other high diplomatic situations, with the general politics of the North of Europe. The details of that gentleman's mission to the Danish court have not been, as practised on many similar occasions, laid before parliament. But the substance of his instructions, which were themselves offered to be produced when the subject was discussed in the house of commons, was very generally known; and we have been able, from good and authentic sources, to collect the following particulars of what passed upon that occasion. Upon the ground of Bonaparte's design to shut the ports of Holstein against the British flag, and forcibly to employ the Danish navy against this country, Mr. Jackson was instructed to repair to the residence of the prince-royal of Denmark, and to enter into immediate and unreserved explanation with his royal highness respecting the views and sentiments of the British government. He was to use every argument in his

power to induce the prince regent to enter into these views and sentiments, as no less conducive to his royal highness's own interests and safety; and he was to endeavour, by every means, to establish, on terms of friendly accommodation, the measure which was to be the main object of his whole proceedings. This measure was the *delivery of the Danish fleet into the possession of the British admiral*, under the most solemn stipulation that it should be restored at the conclusion of the war between this country and France.

This demand was to be steadily adhered to; and the British negotiator was directed, after having exhausted every endeavour to obtain the prince royal's consent to it, as the foundation of a treaty of alliance and general co-operation between the two countries, to announce unequivocally to his royal highness the determination of this court, to enforce it by the operations of the powerful armament assembled in the Sound. In presenting this alternative, every possible stipulation was to be advanced, by which the present and future interests of the crown of Denmark were to be fostered by all the resources of the British empire. Permanent alliance; guarantee, and even aggrandisement, of their actual possession; every thing that the fleets and armies, and the treasury, of England could afford, both for immediate support and for future safety, was to be put at the prince royal's disposal. Specific proposals were made to this effect; and whatever other conditions the Danish government might suggest, would, it was declared, be readily listened to, and, if possible, admitted, on his majesty's part. If they feared the effects which an appearance of connivance at our views might produce in France, we had an imposing force at hand, which would give to acquiescence an air of constraint, rather than of free will; and the extent of our armament was well calculated to put that construction upon it. In short, every possible stipulation, whether public or secret, that could be devised by either party, for the purpose of rendering the proposed measure acceptable to the feelings of Denmark, and propitious to her permanent interests, was to form a part of the agreement to be entered into upon this occasion; but, in the last resort, the prince royal was to be informed, that, if he failed to agree to them, the British commanders would forthwith proceed to hostilities.

Under these instructions, and with a charge to bring his negotiation to a speedy termination, Mr. Jackson left England on the 1st, and arrived at Kiel on the 6th, of August. On the day following, he announced the purport of his instructions to count Bernstorff, and requested an audience of the prince royal, to whom he was directed to address his overture personally.—It is understood, that the Danish minister exhibited much warmth of temper, and violence of expression, in the discussion; and that he inveighed with unusual vehemence against the general policy of England, which he described with the most unqualified terms of reprobation.—The prince, his master, on the contrary, is said to have remained calm and unruffled during a long interview with the British minister; to have argued upon the proposals made to him with dignity, and in terms of strong but decorous resistance; and finally to have declared his determination to reject them, and to adhere to the line of policy which he had hitherto pursued.—It was then that Mr. Jackson had to execute the delicate and painful task of announcing the immoveable determination of his court, to employ means of coercion. The next day he was informed by count Bernstorff, that the prince had set out for Copenhagen, and that any proposals Mr. Jackson might have to make in the name of his court would be sent there after him. Mr. Jackson deemed it however most conducive to the interests entrusted to him, whether with a view to the feeble hope he might still entertain of coming to a friendly accommodation, or to the more awful alternative of a rupture, to follow the prince to his capital, and to make, without the necessary interruption and delay of distant communica-

tions, a last effort to avert the calamities of war. He accordingly embarked in the bay of Kiel, with a prospect of reaching Copenhagen as soon as his royal highness; but a storm, and an extraordinary continuance of tempestuous weather, baffled this hope; and, after a day and a half contending with contrary winds, he landed, and undertook the journey to Copenhagen through the duchies.

In the afternoon of the 12th of August, Mr. Jackson reached Copenhagen; it was no doubt satisfactory to perceive that the secrecy with which the measures of his court had been hitherto pursued, and the vigilance of the squadron stationed in the Belt, had been so successful, that no progress whatever had been made in assembling an army in Zealand. The few militia-men that accompanied him were the first that had come from without; some dozens were on the road from different parts of that island; a levy had been made in Copenhagen from amongst the populace; but without the walls of that city, and of Elsinour, there was not throughout the whole island a battalion of troops of any description. Not a gun was mounted on the ramparts of Copenhagen. Some fermentation prevailed amongst the inhabitants, occasioned by the prince royal's sudden arrival there, the cause of which had not become generally or accurately known, although the appearance of our men-of-war and transports in the Sound, and the secession of the French minister, and of others whose courts were dependent upon France, were thought to indicate that the pressure of the moment came from the side of England.

Count Joachim Bernstorff, in the absence of his brother, who had not accompanied the prince royal from Kiel, was charged, in the capacity of under secretary, with the direction of the foreign department. To him the British negotiator had been referred by the principal minister, and to him therefore he applied as soon as he reached the Danish capital, in order to renew his intercourse with the prince royal, and to ascertain exactly what could be yet expected to result from his royal highness's determination. He was admitted without delay to an interview; but informed, at the beginning of it, that the prince had stayed but a short time at Copenhagen, and was returned to Sleswic, whither he had directed all communications to be forwarded to him. The intention of the Danish government now became evident; their plan could only be to gain time, to amuse the British minister by an appearance of negotiation, the particulars of which, when he was at Kiel, were to be sent for decision to Copenhagen, and, when he was at the latter place, to be returned back to Kiel. This sort of equivocating conduct, on the part of the Danish government, could not fail to be regarded as an undoubted symptom of a studied disposition to avoid negotiation, and, at the same time, to prevent the British minister from forming that conclusion upon which the operations of the British forces were to be regulated. It therefore became necessary for him to state the case pointedly to count Joachim, and to require an unequivocal answer, whether or not the prince royal had left him any power and authority to negotiate upon the basis on which alone it was known to his royal highness that a rupture could be prevented. No distinct answer was, we understand, for a long time given to this question; but, upon being closely pressed, the Danish minister was under the necessity of acknowledging that he was at liberty only to receive the overtures that might be made to him, and to transmit them to Kolding; and that he had no authority whatever to conclude any arrangement upon terms at all compatible with Mr. Jackson's instructions. Upon this point then the negotiation broke off; and Mr. Jackson, having taken his leave of the Danish minister, and being furnished by him with the necessary passports, repaired that same evening on-board the advanced frigate of the British squadron, at anchor within a few miles of the port of Copenhagen. The next morning the British commanders were informed that all hope of a friendly accommodation had been frustrated, and that they were at liberty

erty to proceed in their operations according to the instructions with which they were for that case provided.

The army accordingly landed without opposition, at the village of Vedbeck, on the morning of the 16th of August; and, after some ineffectual attempts of the Danes to annoy its left wing by the fire of their gun-boats, and to impede its progress by sallies which were always repulsed with loss, it closely invested the town on the land-side. The fleet, removing to an advanced anchorage, formed an impenetrable blockade by sea; at the same time, a proclamation was issued by the commanders, notifying to the inhabitants of Zealand the motives of their undertaking; the conduct that would be observed towards them; and an assurance, that, at any time when the demand of his Britannic majesty should be acceded to, hostilities should cease.

On the evening of the 2d of September, the land-batteries, and the bomb and mortar vessels, opened a tremendous fire upon the town, and with such effect, that, in the course of a very short time, a general conflagration appeared to have taken place. The fire was returned but feebly from the ramparts of the town, and from the citadel and crown-batteries. On the night of the 3d, the British fire was considerably slackened. This has been variously accounted for; some supposing that it was owing to the great expenditure of ammunition on the preceding night, and the apprehension that enough would not remain for the prosecution of the siege; others, that the British general expected that the impression already made would produce proposals for capitulation. It was probably because the enemy adopted the first of these suppositions, that the second was not realised: they on the contrary conceived some hope, and were encouraged in their resistance, by the relaxation of our fire, which was, however, resumed with so much vigour and effect on the night of the 4th, that the next morning a trumpeter appeared at the British out-posts with a letter from the commandant of the town, containing the proposal of a truce for twenty-four hours, to give time to negotiate a capitulation, which he was willing to conclude on the basis of 100 British troops being admitted within the city of Copenhagen. It should seem, however, either that that basis was not at first considered as admissible, or that it was accompanied by some other objectionable condition: for we find, that the capitulation was not signed until three days afterwards, viz. the 8th of September, when the British army took possession of the citadel, dock-yards, and batteries dependent upon them. The British admiral immediately began rigging and fitting-out the ships that filled the spacious basons where they were laid up in ordinary; and, at the expiration of the term limited in the capitulation, they were all, together with the stores, timber, and every article of naval equipment found in the arsenal and store-houses, conveyed to England, where, with the exception of one line-of-battle ship, that grounded on the isle of Huen, and was destroyed, they all arrived safely in the last days of the month of October.

The following instance of domestic affliction took place during our attack upon Copenhagen: A citizen, who resided with his family, a son and three daughters, near the walls of the city, saw his house so much exposed to the fire of the British artillery during the siege, that he resolved to draw his children from the dangers of their situation, and conduct them if possible to a place of security. While he was in the act of removing them from his battered abode, a shell burst near them, killed one on the instant, and so dreadfully wounded the other two, that they expired in the course of the night. The father, frantic with rage and despair, flew to the city-walls, and in vain sought the fate of his unhappy children. He was, however, reserved for more accumulated miseries; and the same night his son was shot dead by his side. The wretched parent now sunk under his misfortunes, and was carried from the ramparts in a state of apparent death. The next day a detachment of the British troops marched

into the city to take possession of the citadel; the bodies of the unfortunate sufferers were lying in the open streets; the agonized and heart-broken old man pointed to the scene of ruin, fell on the lifeless bodies of his children, and expired.

In the capitulation, no notice whatever had been taken of the large quantity of shipping and naval stores that were in the merchants' docks; the consequence of which neglect was, that we had scarcely left the waters of Copenhagen, before a considerable number of armed vessels was prepared to act against us; and we have been informed, that they actually drew up in line of battle, in front of the port of Copenhagen, when admiral Gambier's flag-ship was still in sight of the town. The losses suffered by our commerce, from this newly-created species of Danish naval force, were very considerable; and they were the more sensibly felt, because, under the apprehension of the turn which might be given, during the ensuing winter, to the politics of Russia, large purchases of hemp, timber, and other naval stores, had been made; these were sent home in single ships, in the confident expectation of having no danger to fear till they cleared the Categat, or that they would obtain ample protection before they reached the Sound; instead of which, they were for the most part captured by small privateers from the isle of Bornholm; and those which escaped in that quarter fell into the hands of the Danes off Draco Point, where no adequate force had been stationed for their protection.

As soon as the effect of the operation of our forces was known in England, a declaration was published by his majesty's government, setting forth the grounds on which the expedition was undertaken, and the sentiments which were still entertained towards Denmark by his majesty. This declaration was afterwards laid before parliament, and became the ground-work of the defence set up by ministers when attacked, as they were most vigorously, on the policy of the whole undertaking. We must refer our readers to the debates upon this subject, which will be found in the daily newspapers, where the sentiments and feelings of the different parties are sufficiently developed. As for ourselves, we conceive that the intention of Bonaparte, being in unison with his interest, pointed immediately to the junction of the Danish forces to his own, in hostility to these kingdoms; and that of the execution of this intention there could be no other doubt than that which might attend its practicability. But, if there could remain, in the mind of any politician, the smallest difficulty in acquiescing in this proposition, it surely must be removed by the overtures that were made to the prince-regent of Portugal, and which he had the fairness to communicate to the British government. In these, the adhesion of Denmark to the French system, was announced both as the means, and as a motive, for obtaining that of Portugal; and to both countries it was notified, that measures must be immediately taken to exclude the British flag and manufactures from their respective ports.—These overtures were, with equal good faith and propriety, made known by the Portuguese government to that of England, as soon as they were received; and, as there is strong reason to believe that they were simultaneously made to the court of Denmark, the concealment of them, by that court, furnishes of itself no slight ground for suspecting that her disposition towards England partook of much of the hostility in which they originated.—These reflections naturally bring us to notice the last political occurrence of this eventful year; namely, the emigration of the court of Portugal to South America.

The treaty of Tilfit was hardly concluded, when Bonaparte turned his eyes towards the west of Europe, and resolved on the subjugation of Portugal and Spain. Or, perhaps, it was at first his design, not directly or formally to subvert the thrones of these kingdoms, but, under the veil of alliance and union, to reduce them to the same

total dependence on himself as the Confederation of the Rhine, Holland, Switzerland, and Italy. However this may be, we find, that, very soon after the signing of that treaty, Bonaparte demanded of the court of Lisbon, 1. To shut up the ports of Portugal against England. 2. To detain all Englishmen residing in Portugal. 3. To confiscate all English property; denouncing war in case of a refusal. And, without waiting for an answer, he gave orders for detaining all Portuguese merchant-ships that were in the ports of France. The prince-regent of Portugal, hoping to ward off the storm, acceded to the shutting up of his ports; but refused to comply with the other two demands, as being contrary to the principles of the public law, and to the treaties that subsisted between the two nations. The court of Portugal then began to adopt measures for securing its retreat to the Portuguese dominions in South America. For that purpose, the prince-regent ordered all ships of war fit to keep the sea to be fitted out; and also gave warning of what was intended to the English, directing them to sell their property and leave Portugal; in order thus to avoid an effusion of blood, which, in all probability, would have proved useless. He resolved also to comply, if possible, with the views of the emperor of the French, in case he should not allow himself to be softened down to more moderate pretensions. But Bonaparte peremptorily insisted, not only on the shutting up of the ports, but on the imprisonment of all British subjects, the confiscation of their property, and a dereliction of the project of a retreat to America. The prince-regent, when he had reason to believe that all the English, not naturalized in the country, had taken their departure from Portugal, and that all English property had been sold, and even its amount exported, adopted the resolution to shut up the ports against England, and even to comply with the other demands of France; declaring, however, at the same time, that, should the French troops enter Portugal, he was firmly resolved to remove the seat of government to Brazil, the most important and best-defended part of his dominions.

It had been frequently stated to the cabinet of Lisbon by the English ambassador, lord Strangford, that the king of Great Britain, in agreeing not to resent the exclusion of British commerce from the ports of Portugal, had gone to the utmost extent of forbearance; that, in making this concession to the peculiar circumstances of the prince-regent's situation, his majesty had done all that friendship could justly require; and that a single step beyond this line of modified hostility must necessarily lead to the extremity of actual war. Nevertheless, the prince-regent, in the fond hope of preserving Portugal by conciliating France, on the 8th of November signed an order for detaining the few British subjects, and the very inconsiderable portion of British property, that yet remained at Lisbon. On the publication of this order, lord Strangford removed the arms of England from the gates of his residence, demanded his passports, presented a final remonstrance against the recent conduct of the court of Lisbon, and proceeded, November 17, to a British squadron, commanded by sir Sidney Smith, who immediately, on the suggestion of lord Strangford, established a most rigorous blockade at the mouth of the Tagus. A few days after, the intercourse between the court of Lisbon and the British ambassador was renewed. Lord Strangford, under assurances of protection and security, proceeded to Lisbon on the 27th; when he found the prince-regent wisely directing all his apprehensions to a French army, which had entered Portugal, and was on its march to Lisbon; and all his hopes to an English fleet. The object of this march he was at no loss to understand; for Bonaparte had declared in his journals, "That the house of Braganza had ceased to reign." Lord Strangford promised to his royal highness, on the faith of his sovereign, that the British squadron before the Tagus should be employed to protect his retreat from Lisbon, and his voyage to the Brasils. A decree was published, November 28,

in which the prince-regent announced his intention of retiring to the city of Janeiro until the conclusion of a general peace, and of appointing a regency to administer the government at Lisbon during his royal highness's absence from Europe.

On the morning of November 29, the Portuguese fleet set sail from the Tagus, with the prince of Brasil and the whole of the royal family of Braganza on-board, together with many of his faithful counsellors and adherents, as well as other persons attached to his present fortunes. The fleet consisted of eight sail of the line, four large frigates, several armed brigs, sloops, and corvettes, and a number of Brasil ships; amounting in all to about thirty-six sail. While they passed through the British squadron, our ships fired a salute of twenty-one guns, which was returned with an equal number. The friendly meeting of the two fleets, at a juncture so critical and important, was a most interesting and affecting, as well as a grand, scene. Four English ships of the line were sent by the British admiral to accompany the royal family to Brasil, where they arrived in safety, after a remarkably fine and quick passage.

The prince-regent landed at Rio de Janeiro, with the other branches of the royal family, amidst the acclamations of his subjects, on the 8th of January, 1808; and the first acts of his government were to form arrangements very favourable to the commerce of Great Britain; that is, had our London merchants acted with prudence and foresight, instead of precipitation and folly. From a region thus newly settled and thinly peopled, our countrymen, had they been well-informed, would not have expected an extensive and immediate consumption of British manufactures. But, the moment permission was obtained, our merchants poured in cargo on cargo, as if the market of Brasil knew no limits. Never was the exaggerated estimate, which we are apt to form of distant objects, more surprisingly exemplified. The civilized population of Brasil, which is fitted to use and able to pay for European goods, may amount to half a million, and the warehouses of Rio de Janeiro are adapted to the limited supply which they require: but our vessels succeeded each other with a rapidity which surpassed the means of accommodation both in the town and the custom-house, and made it necessary to pile our goods along the beach. Prices fell forthwith one hundred per cent. and the deceitful practice of selling goods, apparently damaged, on the account of the insurer, was often adopted. This fraud, so much dreaded at Lloyd's, and so little comprehended by persons out of business, becomes practicable to a great extent in a town which possesses but few respectable merchants. The insurer being, by the terms of his contract, bound to make good all lots arising from damage, a fraudulent merchant can often, in the case of an unfavourable market, ascribe to damage the diminished price which was in fact produced by a very different cause. The safety of the underwriter consists chiefly in the respectability of the gentlemen who are called to examine the ostensible damage; and hence the disadvantage under which he labours in a country that is not likely to afford witnesses of undoubted character.

The immense loss on our shipments to Brasil arose from a double cause; the ridiculous excess of quantity, and the still more ridiculous unsuitness of many of the articles for the intended market. One speculator, of wonderful foresight, sent large invoices of stays for ladies who never heard of such armour; another sent *staves*, for the use of a people who are totally uninformed that water can become ice; a third sent out a considerable assortment of coffin-furniture, not knowing that coffins are never used by the Brasilians, or in the neighbourhood of La Plata. To these absurd speculations may be added numerous others, particularly in articles of taste; elegant services of cut glass were little appreciated by men accustomed to drink out of a horn or a cocoa-nut-shell; and brilliant chandeliers were still less valued in a country where only lamps

that

that afforded a gloomy light were used. Superfine woollen cloths were equally ill-suited to the market; no one thought them sufficiently strong. An immense quantity of high-priced saddles, and thousands of whips, were sent out to a people as incapable of adopting them as they were of knowing their convenience. They were astonished to see Englishmen ride on such saddles; nor could they imagine any thing more insecure. Of the bridles scarcely any use could be made, as the bit was not calculated to keep the horse or mule in subordination: these articles were of course sacrificed. Great quantities of the nails and ironmongery were useless, as they were not calculated for the general purposes of the people. Large cargoes of Manchester goods were sent; and, in a few months, more arrived than had been consumed in the course of twenty years preceding. No discrimination was used in the assortment of these articles, with respect either to quality or fineness; so that common prints were disposed of at less than a shilling a yard, and frequently in barter. Fish from Newfoundland met with a similar fate; also porter, large quantities of which, in barrels, arrived among a people, of whom a few only had tasted that article as a luxury. How the shippers in London, and other British ports, could imagine that porter would at once become a general beverage, it is difficult to conceive, especially when sent in barrels. These cargoes, being unsaleable, were of course warehoused, and of course spoiled. Many invoices of fancy-goods, and such as do not constitute a stable trade, were sold at from sixty to seventy per cent. under costs and charges, and others were totally lost. What must have been the delusions of those traders who sent out tools, formed with a hatchet on one side and a hammer on the other, for the convenience of breaking the rocks, and cutting the precious metals from them, as if they imagined that a man had only to go into the mountains, and cut as much gold as would pay for the articles he wanted!

This evil led to another of equal magnitude; a ruinous loss by the Brazil produce received in barter. The young men, who were sent out in such numbers from London as supercargoes, found themselves placed in a new sphere, and were obliged to take goods in return, of the quality of which they were unfitted to judge. Hides and Brazil-wood are principal articles of export from this part of the world; but, with regard to hides, the London purchaser was ill-qualified to discern the injury received in the drying; and, as to wood, he learned, when too late, that the kind growing around Rio de Janeiro is greatly inferior to that of Pernambuco, on which the favourable character of Brazil-wood has been founded. Other objects of speculation proved still more unfavourable. Precious stones appeared to offer the most abundant source of riches; the general calculation was made upon the price at which they sold in London; but every trader bought them, more or less, at the price at which they were offered; invoices of goods were bartered for some, which in London would sell for, comparatively, a trifle, as they were taken without discrimination as to quality or perfection; tourmalines were sold for emeralds, stained crystals for topazes, and common stones and vitreous paste were bought as diamonds to a considerable amount. Both gold and diamonds were well known to be produced in Brazil; and their being by law contraband was a sufficient temptation to eager speculators, who had never before seen either in their native state. False diamonds were weighed with scrupulousness, and bought with avidity, to sell by the rules stated by Jefferies. Gold-dust, as it is commonly called, appeared in no inconsiderable quantity, and, after being weighed with equal exactness, was bought or bartered for. But previous to this many samples underwent the following easy and ingenious process: The brass pans purchased of the English were filed, and mixed with the gold in the proportion of from five to ten per cent. according to the opinion which the seller formed of the sagacity of the person with whom he had to deal; and

thus, by a simple contrivance, some of our countrymen repurchased at three or four guineas per ounce the very article which they had before sold at 2s. 6d. per pound.

Amid this scene of folly and misfortune, numerous litigations could not fail to arise; and it is a consolation to reflect that, as far as the interference of the Portuguese governor and the British ambassador could go, the evil was prevented from expanding in its course. A judge of great respectability was appointed for the determination of all cases concerning the English; and the latter, in consideration of being strangers, were allowed certain privileges similar to those of the nobility of Portugal. They were permitted to claim the occupancy of such houses as could be spared, exempted from rise of rent, and indulged with long delay in case of embarrassment in their affairs. Hence arose a current saying among the Portuguese, "That, to live comfortably in Brazil, it was necessary to become an Englishman." So great was the over-stock of British goods, and such the miserable fall in their value, that, for one-fourth part of the quantity sent to Brazil, we should have obtained an equal return by keeping the market at a fair and steady rate. A recurrence of this evil may be prevented by carefully attending to the articles which are adapted to the consumption of the country, and which may be thus enumerated: hard-ware, low-priced cotton goods, hats, boots, shoes, earthen-ware, glass, cheap furniture, shot, drugs, fancy-articles, common woollen cloths, and salt either from Liverpool or the Cape de Verd islands. A time will arrive, and is probably fast approaching, when the intercourse of Rio de Janeiro with India will be greatly increased. It may become a kind of half-way station between Europe and Asia; and, if Brazil on the one hand be freed from the colonial restrictions of the Portuguese, while India, on the other, is laid open to the enterprise of British merchants, we may safely conclude that the extension of trade would proceed with great rapidity. *Mauve's Travels in Brazil*, 4to. 1812.

The British parliament was opened by commission on the 31st of January, 1808. The speech from the throne turned, as usual, on the great public questions that would come under discussion during the session; the most important of which, was the expedition to Copenhagen. In the house of peers, the address was moved by the earl of Galloway, who recapitulated, with great strength and clearness, the most prominent features of the speech. But the duke of Norfolk, not completely satisfied with the measure adopted against the Danes, and wishing some information as to the necessity of the expedition, moved that the clause in the address respecting the Baltic should be omitted. This amendment was seconded by lord Sidmouth, and supported by lord Grenville and the earl of Lauderdale; but strenuously opposed by the earl of Aberdeen, lord Hawkebury, and lord Mulgrave; and at length was rejected. A similar motion was made in the house of commons, and met with the same fate. Perhaps these acrimonious debates were more peculiarly excited by the fresh and still-bleeding wounds which the late administration had received in leaving their places. Like the Parthians, they shot their arrows as they retired, as a sort of consolation in their flight; but this conduct is not new, and we have witnessed it at almost every change of the ministry. The possession of authority and of the management of affairs has such charms, that the loss of it is always accompanied with a bitter draught, which introduces into the mind of the losers some vindictive elements that they are always sure to combine in order to vex and persecute their successors: however, to a philosophical mind, these actions and reactions appear to be ultimately useful to the people in general, since they conduce to preserve the balance of power between the governors and the governed.

The next interesting object which occupied the attention of parliament, was the state of our relations with Russia, and the necessity of producing on the table sundry papers relative to that subject. After this, Mr. Whit-

bread, on the 29th of February, rose to make his announced motion, for entering immediately into a negotiation for peace. After some prefatory observations respecting the acknowledged danger of the present crisis, he said, that his present intention was to take a review of the information now before the house, respecting the conduct of ministers in refusing to enter into negotiation with France; thereon to ground a resolution expressive of what the state of the country might have been, had a different course been pursued. He had, a month ago, stated some of the symptoms of the present crisis of the country. Since that time, several petitions had been presented to the house, of which the statements were most distressing, the prayer most moderate, and the general tone most patriotic. He did not bring forward the motion he was about to make, in consequence of these petitions; but he was not sorry that they had been presented, because he was a friend to petitioning. Much good had been produced by petitions. It was by the petitions of the people, that an end had been put to the American war; and, if the petitions of the people had been attended to in the early part of the last war against France, our situation now would have been far different from what it was. All projects were at length given up of obtaining indemnity for the past, of dictating a constitution to France, or of curbing the power and ambition of Bonaparte. Our only aim now, was to defend ourselves. And what probability was there of obtaining a more honourable peace than might be concluded at the present moment? He called the attention of the house to the present situation of the country with regard to foreign powers. The peace of Tilsit had been treated in his majesty's declaration, and in the speech of the commissioners, as most disastrous to Russia, and represented as the effect of despondency and alarm. But Mr. W. contended, that this peace had prevented the Russian army from being totally and completely extinguished. Before the peace of Tilsit, however, was concluded, an offer had been made by Russia, to mediate a peace between Great Britain and France; an offer which he had always considered as an effusion of Alexander's heart towards this country. Here Mr. Whitbread entered into a detailed analysis of the papers which had been laid on the table, relative to this offer on the part of Russia, and the refusal of ministers to accept of it. Mr. W. after exposing the delusive hopes of conquering France through her finances, proceeded to show the futility of another delusion; namely, that Bonaparte would be hated by the people and the army, and that the mass of the population of the different countries he should enter would rise against him. All this had been proved to be completely unfounded. The last point he would touch upon was the allegation that Bonaparte had sworn the destruction of this country. He asked, where and when he had done so? Was it during his consulate? Was it after he became emperor of France? No. For then, also, he had made an offer of peace; yet it might be said that in all this he was insincere. This might be the opinion of some; but, before that opinion could be rendered general or universal, it would be necessary to enter into a negotiation to prove it. He concluded by moving the following resolutions: That it is the opinion of this house, that the conditions stipulated by his majesty's ministers for the acceptance of the mediation offered by the emperor of Russia, were inexpedient and impolitic. That it is the opinion of this house, that the conduct of his majesty's ministers on the subject of the mediation of the emperor of Austria, was unwise and impolitic, and not calculated to ascertain how far the restoration of the blessings of peace might or might not have been attainable through the means of such mediation. That this house feels it incumbent on itself to declare, that there is nothing in the present circumstances of the war, that ought to preclude his majesty from embracing any fair opportunity of acceding to, or commencing, a negotiation with the enemy, on a footing of equality, for the termination of hostilities,

on terms of justice and honour.—After long and animated debates, the house divided upon each of the resolutions: upon the first, the numbers were, ayes 70, noes 210; upon the second, ayes 67, noes 211; upon the third, ayes 58, noes 217.

The metropolis, being the centre to which all the branches of trade naturally resort, was much affected by the decrees of the emperor of the French declaring the whole island of Great Britain to be in a state of *blockade*, a most curious application of a word which really means the preventing ingress and egress in and out of any fortified place. However this was really a sort of passive blockade, since nearly all the ports of the continent were as if hermetically shut against English traders. By a sort of *représailles*, a protecting and self-defensive system was interposed by our orders in council; and trade began again to flourish: yet there was no measure of administration discussed in the present session that occupied so great a portion of the time and attention of parliament, or occasioned such keen and pertinacious debates, the Baltic expedition alone, perhaps, excepted. On both these subjects the members in opposition had the advantage of standing not only on what they maintained to be political expediency, but the plausible ground of justice and the law of nations; though there was not now, *in fact*, any law of nations, or at least any such law in force. Bonaparte, who swayed a sceptre of iron on the continent, acknowledged no law but that of superior force. It was very generally remarked, that during the present session the opposition to ministry was unusually keen, vigilant, and persevering. The present ministers were not supposed to possess much ability—on the whole, there was allowed to be a superiority of powers, of both reasoning and oratory, among their opponents; who, fully sensible of this, seized every opportunity of hanging on the skirts of ministers, and distracting and worrying them with incessant debates. Those concerning the orders of council possessed very little interest, were universally accounted dry, and at length became tiresome at the time. They cannot appear more interesting now. See p. 165, 6.

The transactions in the east, were next a subject of animadversion; the interest of the British empire at the mouth of the Ganges was deeply felt in Leadenhall street, and seriously canvassed in St. Stephen's chapel. The conduct of the marquis of Wellesley, relative to the nabobs of Oude and Arcot, was minutely scrutinized; and the spirit of party, assuming the awful character of defender of the rights of nations, rose to impeach the late governor of India.

The question concerning the transactions of lord Wellesley with the nabob of Oude, gave rise to very long debates; which began on the 9th of March, and were continued by various adjournments to the 15th. On the side of the prosecution there appeared Mr. Charles Grant, Mr. Lushington, sir Thomas Turton, lord Milton, Mr. Sheridan, and Mr. William Smith. On that against it, and in defence of the marquis of Wellesley, Mr. Whitshed Keen, sir John Anstruther, colonel Allan, Mr. Wallace, Mr. Henry Wellesley, lord Castlereagh, and sir James Hall.

Colonel Allan (member for Berwick), in a maiden speech, of considerable length, defended the marquis of Wellesley with ability and with spirit. Other members also spoke warmly in his praise: but that which made the greatest impression, and probably decided the vote, was the speech of sir John Anstruther, who, to the weight of his own character and abilities, added the advantage, on the present question, of having resided for many years in a high and important situation in Bengal. Sir John entered fully into the subject, and, in a speech clear and convincing, showed, that the conduct of lord Wellesley was in perfect conformity to the wishes, intentions, and tenour, of that kind of conduct approved by his employers; and, that the security of Bengal imperiously required and demanded it. The question being put on the resolution of censure on the

marquis's

marquis's conduct, the house divided: for the motion, 31; for the previous question, 182.—Sir John Anstuther then moved, "That it appeared to that house, that the marquis of Wellesley, in his arrangements in the province of Oude, was actuated by an ardent zeal for the service of his country, and an ardent desire to promote the safety, interests, and prosperity, of the British empire in India." On this motion the house divided: for the motion, 189; against it 29.

Notwithstanding this decision of the house, the same question was again brought forward, in another shape, on the 31st of March, by lord Archibald Hamilton, who moved a series of resolutions; the purport of the last of which was, "That it appeared to the house, that the British government was bound in honour to reconsider and revise the treaty of 1801, with the nabob of Oude, with a view to an arrangement more favourable to the nabob." A short debate ensued; and, on a division, there appeared, for the resolution 20, against it 80.

A question of a similar nature was again brought before the house on the 17th of May.—Sir Thomas Turton moved his promised resolutions, respecting the deposition of the nabob of the Carnatic. He had every disposition to think well of the politics of the marquis of Wellesley, who had been educated in the same school with Mr. Pitt, and had for some time followed his steps; but, at the same time, he had no hesitation to declare, that, if he was guilty of the acts detailed in the papers before them, he was a most improper minister for this country. When sir Thomas came into parliament, he found the Carnatic-question still floating; and did every thing in his power to induce some other member to bring it forward, preferring to be the seconder rather than the mover. No choice, however, was left him. The gentleman (Mr. Sheridan) to whom he had particularly looked, had found himself, after the change of the ministry, in circumstances that prevented his urging the question, as it might have greatly embarrassed those with whom he acted. He had no doubt, however, but that gentleman was convinced, that he had just grounds for what he had done in the business. The baronet then gave a brief historical view of the progress of the company's interference with the Carnatic, from the beginning of the war that ended in 1754, when they supported one candidate for the musnud, in opposition to another supported by the French, down to the treaty of 1796, with Omdut ul Omrah, by which the payment of a certain kist was secured to the company. That treaty continued till the death of Omdut ul Omrah in 1801, when those disgraceful transactions commenced which the gentleman opposite (Mr. Sheridan) had not coloured more strongly than they deserved. Sir Thomas, having also painted them in glowing colours, concluded with moving a series of resolutions, containing a recital of facts relative to the assumption of the Carnatic, reprobating the deposition of the nabob, and declaring, that the British parliament will never countenance an act of injustice and oppression in India; and stating the propriety of appointing a committee, to inquire into the best means of indemnifying the family of Mahomed Ali, and of ensuring the safety of our Indian possessions.

A very long debate ensued, which was continued by adjournment to the 1st of June. The defence of lord Wellesley, made with great ability and eloquence by Colonel Allan, Mr. Lushington, and Mr. Wallace, consisted chiefly of three points: That the nabob was not an independent prince, but our vassal; that the government of the Carnatic was badly managed; and that a treasonable correspondence had been carried on by Wallajah and Omdut ul Omrah, with our enemies. All the resolutions moved by sir Thomas Turton were negatived by vast majorities. The house having divided on the 4th resolution, directly criminating the conduct of the marquis of Wellesley, the numbers for the resolution were ayes 15, noes 124.

Mr. Wallace said, that, after the complete defeat which

the cause of the honourable baronet had sustained, he might well forbear moving any resolution of approbation; for what approbation could be stronger, than that testified by the majorities with which the resolutions had been rejected? but he would read the resolution with which he intended to close the business. "Resolved, that it is the opinion of this house, that the marquis of Wellesley and lord Clive, in their conduct relative to the Carnatic, were influenced solely by an anxious zeal and solicitude to promote the permanent security, welfare, and prosperity, of the British possessions in India." Which resolution was, of course, agreed to.

The following article will show how much original MSS and records are valued in this country. The Lansdown library of manuscripts was purchased by parliament for the British Museum, at an average of the valuation made by three parties, being 4925*l*. Mr. Planta, the principal librarian of the Museum, estimated their value in the following manner:

Burleigh and Cecil papers, 120 lots, at 10 <i>l</i> . per lot	£1200
Sir Julius Cæsar's papers, 50 vols. at 10 <i>l</i> . per vol.	500
27 volumes of original Registers of Abbeys, at 10 <i>l</i> .	270
150 volumes, at 5 <i>l</i> .	750
985 ditto, at 2 <i>l</i> .	1970
40 Numbers of Royal Letters, at 5 <i>l</i> .	200
Eight volumes of Chinese Drawings, at 10 <i>l</i> .	80
	<u>£4970</u>

Our merchants having been so unsuccessful in their speculations of trade to Buenos Ayres and the Brasils, (see p. 164, 170.) and the ports of Europe being nearly all shut against us, Mr. Perceval thought fit to hold out a lure to moneyed men, to employ a part of their funded stock in the way of life-annuities, the principal to go towards paying the national debt as the lives should fall. Mr. Perceval opened his plan in a committee of the whole house on the 12th of May. He began by observing, that the operation of the sinking fund had recently very much increased the price of stocks. There was every reason to believe, that, by the continuance of that operation, they would still further increase in price. It was not to be doubted, that, if the measure were consistent with public faith, it would be extremely desirable to give the nation an opportunity of discharging the whole of the national debt at the present price of the stocks, because that would preclude the effect which any future advance in the price must have in retarding the operation of the sinking fund. There were two objects which the sinking fund had in view: the one to provide for the final redemption of the national debt; the other to keep up the price of stocks in the market, so as to enable government, whenever the exigencies of the state might require it, to make an advantageous loan for the public. These objects, however, were in some degree inconsistent. In some degree they counteracted each other. Whatever measure raised the funds, and thus enabled government to borrow on the best terms, prevented the commissioners for the reduction of the national debt from reducing that debt on the best terms. Now the measure proposed would combine both these objects. It would tend to increase the price of stocks, and it would at the same time secure the redemption, at a low price, of so much stock as might be transferred antecedently to the rise produced. Every person who transferred his stock to the commissioners would be entitled to such an annuity as would be equivalent to the value of the stock and of his life; the calculation proceeding on the principle that the sum which he would otherwise have received as interest, the additional sum granted as an annuity, and the compound interest on the whole, would redeem the sum originally transferred, within the period to which his life will be calculated as likely to extend. A great deal of conversation ensued about the principle and mode of calculating the value of lives, and the probable rise or fall of stocks; and apprehensions were entertained by some of the members, that the price of the funds, instead

instead of rising, would fall, in consequence of a defalcation of revenue arising from a stagnation of trade. But, besides the objections to the measure proposed, drawn from the calculations of political arithmetic, there was one much insisted on of an ethical nature.

Mr. Windham observed, that there was this obvious and fundamental objection to it, that it would tend in a greater or less degree to vitiate the morals of the lower orders of the people. He was afraid that too many parents would be found who would be very willing to sacrifice the future interests of their children to their own immediate gratification. The system of annuities was too generally attended with such consequences, and he saw nothing in the plan now proposed, to obviate such effects in the present instance.—Sir John Newport, too, deprecated the holding out any inducements to the lower classes to speculate in annuities. If there were vices in a country, government ought not to partake of them. In France, in the time of the *rentes viagères*, there had been many instances of persons who sacrificed the interests of their posterity for their own immediate gratification. This was not consonant to the feelings of the people of this country; and he should deprecate any measure that would have the effect of assimilating the habits and morals of this country to those of France.—Neither could Mr. W. Smith abstain from bearing his testimony to the immoral tendency of this plan. He looked upon these annuities as a moral poison, which should not be circulated.

Mr. Hukisson defended the plan of his right honourable friend. It gave no *bonus* to persons for investing their capitals to the prejudice of their families. The scale was calculated upon the usual principles of the probabilities of life. And, as to the effect it might have on the morals of the people, it should be recollected that the short annuities which had lately fallen in, to the amount of 4 or 500,000*l.* per annum, had been in the market without producing any such effect, though, upon the principles of the gentlemen opposite, they were much more dangerous, as they required a greater proportion of capital to be sunk.

The debate was resumed on the 27th of May; when Mr. Tierney made a variety of calculations intended to show the inefficacy and inutility of the plan. He objected to it as interfering with the sinking fund, and with the faith of the country, pledged in consequence of that measure; of which faith he considered it as a direct infraction. He dwelt particularly on the extravagant inducement which this measure held out to a man of 70 years of age, to leave his family and relations destitute; seeing he could thus raise his own income in the proportion of 12 to 3; or, instead of 100*l.* could procure for his own life 400*l.* per annum.—Lord Petty thought the plan altogether objectionable in a political, moral, and financial, point of view. Would it be proper, would it not on the contrary be dangerous in the extreme, if the great bulk of the property of this country were allowed to be thrown into annuities?

Mr. Davies Giddy thought that the plan now proposed would have the effect of encouraging a greater degree of frugality in the lower classes, by affording them an opportunity of applying their savings with perfect security to the increase of their incomes; and that in this point of view the benefit would overbalance any evil that might arise from it.—Mr. Biddulph did not think there could be any sound objection to this plan; on the contrary, he was friendly to its adoption; because, in a free country like this, there should be as great a diversity as possible of option afforded to persons wishing to lay out their capital with security. And, as a proof how much he approved the measure, he proposed that the annuities should be rendered more marketable by facilitating the insurance of the lives of the nominees; which would be effected by taking off the tax on the policies of insurance upon such lives.

The resolutions were agreed to, and afterwards carried

into effect by acts of parliament; for the particulars of which, and the Tables for calculating the annuities, see the article LIFE-ANNUITY, vol. xii. p. 647–650.

The establishment of a local militia was proposed in the house of commons, and after long and interesting debates was passed on the 21st of June.—The necessity and advantages of it on one side, the danger of arming the people, exemplified by the French revolution, on the other, were forcibly urged; but the imperiousness of circumstances gave strength to the partisans of the bill, and it became a law.

It has been generally acknowledged, that the criminal code of Great Britain requires alteration in several points, but most particularly on account of capital punishments being appointed for so many crimes, whilst the convict generally escapes the severity of the law by a commutation of punishment, viz. transportation instead of death, and perhaps a temporary penance at Woolwich, instead of transportation. Sir Samuel Romilly, who unites to a profound knowledge of our national laws a feeling heart and a discriminating mind, made a motion on the 18th of May, in the house of commons; and said, that, in common with others, he had always lamented, that, by the criminal law of the country, capital punishments were appointed to be inflicted for so many crimes. He said “appointed,” because, in fact, they were not so frequently executed, although no principle was better established, than that the *certainty*, not the *severity*, of punishment, rendered it efficacious. This principle had long been proved, and published to the world by the marquis of Beccaria. But the admiration which his work produced in Great Britain had not produced any change in our system, which was directly the reverse of that noble writer’s; for with us punishments were *most severe*, and *most uncertain*. Having illustrated the truth of this proposition, he said, that, for the present, he would confine his observations and his motion to one class of those crimes, which, as he had before stated, seldom received the punishment the law had appointed for them; a class on which the law inflicted extraordinary severity of punishment, without any well-founded motive to that severity. He meant those cases where the capital part of the charge depended on the amount. By a statute of William and Mary, privately to steal from a person to the value of five shillings, was rendered capital. In queen Anne’s reign, to steal to the value of forty shillings in a dwelling-house, was rendered capital; and, by a statute of queen Elizabeth, a theft of so small a sum as twelve-pence, under certain circumstances, was made a capital offence. As the necessities, the conveniencies, and the luxuries, of life, had become dearer, the severity of the laws occasioned the frequent non-execution of them. He therefore moved for leave to bring in a bill to repeal so much of the act of queen Elizabeth as related to taking away the benefit of clergy from persons stealing privately from the persons of others. Leave was given to bring in the bill; and sir Samuel Romilly met with great applause for turning his enlightened mind to the consideration of such subjects as those on which he had that evening addressed the house. In a committee of the whole house, June 24, the solicitor-general proposed a clause, declaring that stealing without a person’s knowledge, whether privily from the person or not, as contradistinguished from robbery, should be punished by transportation for life, to be reduced at the discretion of the judge to any period not less than seven years; leaving it, however, optional with the judge, if the case should seem to merit it, to commute the punishment into imprisonment for any period not exceeding three years. The bill was passed with this amendment. See the article LARCENY, vol. xii. p. 241.

Several bills were also proposed during this session, for the better administration of justice in SCOTLAND, (see that article;) and for the enforcing the residence of spiritual persons in IRELAND on their benefices.

Though the petition of the Roman-catholics of Ireland

for complete emancipation from all disabilities whatever, civil or military, was, after the usual discussions, rejected; a grant of 9520*l.* was made for the current year for the support of the Roman-catholic college of Maynooth. In the course of the discussions that took place on this subject, Dr. Duigenan, a well-known champion against the popish children of Hibernia, read the oath of the catholic priests, in order to show that they paid an-obedience to the pope which was inconsistent with the king's supremacy. The provisions for the education of the established clergy, he observed, fell short of those proposed to be granted to the papists. There were in the university of Dublin 30 poor scholars *who got but a dinner once a-day, and 72 scholars of the house that got a dinner once a-day, but no lodgings.* [The doctor, we suppose, meant one meal a-day, which was their dinner; for the fellows of Oxford and Cambridge, as far as we have been informed, dine but once a-day.] The doctor described the catholics as bad subjects and hostile to the state; and declared, that, if any one would move to withdraw the public aid altogether from Maynooth, he would second the motion.

The original grant to the Roman-catholic college at Maynooth was 8000*l.* In addition to this sum, the last parliament had voted 5000*l.* making in all 13,000*l.* Before this vote, however, could be carried into effect, that parliament was dissolved; and, when the new parliament met, his majesty's present ministers wished to resort to the former sum. But, finding that the trustees had acted upon the faith of receiving the larger, they had, for that one year, carried into execution the intention of their predecessors. The sum of 9250*l.* now proposed, was a kind of compromise between contending opinions.

Mr. Grattan, and other members on the same side of the question, contended, that a provision for the education of 250 students would be insufficient to supply the vacancies that would occur in the catholic clergy by deaths or casualties. By reducing the grant of 13,000*l.* a-year, though some addition had been made to that of 8000*l.* the house would secure the ignorance and prejudices of a great portion of the catholics.

The Chancellor of the Exchequer observed, that the memorial of the catholics, which had led to the establishment at Maynooth, claimed no pecuniary aid. The catholics promised to defray the whole expense themselves; and, though the government and parliament gave them 8000*l.* in aid of the object, that was no reason why the country should be subject to constantly-increasing demands, for a purpose of which there was no precedent in any age or country, that of educating, at the public expense, the priesthood of a religion differing widely from the established one. He thought it was as much as could reasonably be asked, to educate 250 persons at the public expense; who, with 111 educated in a private manner, were an abundant supply for the catholic ministry. It was no part of religious toleration, Mr. Perceval added, to make provision for the education of the clergy of the tolerated sect. If it were so, the ministers of the methodists, anabaptists, sandemanians, &c. would on that ground have as good a claim to education as the catholic clergy. The house divided on the question: when there appeared for the grant of 13,000*l.* 58; for 9250*l.* 93.

Among the most important and generally-interesting laws enacted in this session of parliament, a distinguished place is occupied by the act to prohibit the distillation of spirits from corn or grain for a limited time. In the last session of the last parliament, earl Temple had moved, in the house of commons, the appointment of a committee to consider of the possibility and propriety of permitting sugar and molasses to be used in distilleries and breweries; not to the exclusion of grain, but on principles of fair competition. A committee was appointed; and it was stated by lord Binning, chairman of the committee, in the house of commons, May 19, that it had become necessary to ascertain how far the restriction of the distilleries to the

use of sugar and molasses would affect the agriculture of the country. This investigation, he stated, had led to the knowledge of facts which established the wisdom and necessity of the restriction, exclusively of all consideration whatever of the interests of the West-India islands; though the two questions could not indeed be separated. The committee, finding that this country was generally dependent for a sufficient supply of corn and flour upon foreign countries, and that this supply in the present state of Europe was cut off, without any prospect of a sufficient resource in the last year's crop of this country, thought it right, as a precaution against famine, to stop the distillation of corn, with a view to a ready and immediate, as well as a more ample and satisfactory, supply of sustenance for the people. He entered into a variety of calculations to show, that the saving by the prohibition of the distilleries would cover more than half the deficiency created by the stoppage of importation, and more than the whole importation of oats! Lord Binning concluded with moving, that the report of the committee of inquiry be referred to a committee of the whole house; and he anticipated, from the moderation and good sense of the gentlemen present, that the wishes of the committee would be carried into effect.

A great alarm was excited amongst the agriculturists throughout the whole country, and many petitions were presented against the bill. In both houses of parliament it was opposed warmly, and not without plausible arguments; the most solid of which, in our judgment, was the tendency of the measure to prevent that accumulation of grain in the hands of the farmers, which in this country supplies the place of the magazines established in so many other countries. It tended, if long continued, or frequently repeated, to deprive the agriculturist of that market, which, by creating a demand for more grain than the mere support of the population requires, induces him to raise more; to which superabundance, in case of a comparative failure of the crop, recourse can be had for supplying the extreme and claimant wants of the people. The bill, after a great struggle, was read a third time in the house of lords, and passed, on the 2d of July.

At this period, Britannia, the friend of the oppressed, and therefore the metropolis, whose commercial connections with the peninsula are of the greatest import to the trade of our merchants, felt deeply interested in the affairs of Spain. The ruler of France, by his threats, had forced the family of Braganza to seek for peace, refuge, and more tranquil climes, beyond the Atlantic Ocean; and now his object was to subject the whole of Spain to his despotism. From the Vistula to the Tagus his eagles had flown, and proved victorious. The court of Madrid was enslaved to the sceptre of the Corsican; and the chivalrous spirit of the old Castilians was still awed or lulled to sleep by the Circean cares, or the menaces, of Bonaparte.

This national torpor was not, however, to last. Tyranny walks on dangerous ground: the mind of the most abject slave feels, by starts, an elastic reaction, and will show itself as opportunity offers. Free, like the air we breathe, the mind of man may be confined and compressed; but, the longer the confinement, the closer the compression, the more dreadful will be the explosion. As soon as the Spaniards, that brave and ancient race, so well known, not only in the peninsula, but in the Austrian Netherlands, where the *bandes noires* were long the dread of all military antagonists; as soon as they found that the perseverance and gallantry of the English army had freed Portugal, and broken the French yoke on the rocks of Cintra, they began to awake, and saw, at a distance, a glimmering dawn of liberty.—“Let us also be free!” they exclaimed; and this spark of national enthusiasm communicated nearly at once to all parts of Spain.

We shall not give here minute details of all the transactions which took place this year and the following in the peninsula; but, as they are indirectly connected with our

plan, we will present a few sketches of the policy and treachery of Bonaparte in respect to the royal family of Spain.

According to the famous principle in politics, *Divide et impera*, "Divide to command," which he had so egregiously put in practice in Germany, and to which, as much as to his military talents and the bravery of his troops, he owes the ensanguined laurels he culled in the fields of Jena and Eylau, Bonaparte thought that the most easy manner of obtaining supremacy of power beyond the Pyrenees, was to cast secretly the baneful seeds of dissension around the throne of Spain. His faithful and dexterous emissaries prepared the canvas; and the ruler of France went easily to work. Had he foreseen the reverse he experiences at this moment, (Jan. 1814.) had he suspected that fortune might once desert him, and victory fly over to the tents of his opponents; he would have contented himself with the rich and beautiful provinces enclosed between the Alps, the Pyrenees, and the Rhine; and have been thankful to that Providence, who had taken him up from the barren rocks of Corsica to place him at the head of a nation once so famed for her love and submission to her sovereigns, and who seemed eagerly prone to transfer to him that blind obedience she had long vowed to the ancient race of her kings. But the demon of ambition swelled his heart, and must ultimately be the cause of his fall. From the perfidious drama performed at Bayonne in 1808, the present catastrophe originated; and from act to act, and through the divers scenes which naturally followed, may be traced, to the present hour, the events which appall Bonaparte, and astonish the world. One of the most powerful motives which excited Bonaparte, and one more stimulative even than his usual lust of conquest, was his unwillingness that the sovereignty of a neighbouring, rich, and extensive, peninsula, should reside in a branch of the house of Bourbon, from which he could never expect sincere political friendship, much less any thing bearing the name of affection. The reduction of that noble country under his own power, appeared to him necessary for the security of the thrones he had already usurped, and even for his personal safety. Who can expect to be loved by those whom he hates? Measuring the feelings of others by his own, Bonaparte did always, and always will, entertain some sort of suspicion of the powers which existed in the system of Europe ere a tempest hurled him on the throne of France, as the convulsions of other spheres are said to send meteors and stones into our own atmosphere.

The divisions and distractions in the royal family of Spain seemed a most plausible pretence to deluge the neighbourhood of Madrid with torrents of French troops; and the word *protection* was used to veil the real intention of that crafty politician. In this awful situation, the royal family of Spain began to show a disposition to abandon both the metropolis and the peninsula, and to emigrate to Mexico; but this would not have answered fully the plan and wishes of Bonaparte. The Spanish people, alarmed at the idea, exhibited strong marks of discontent; and the delay gave time to set in motion the secret machines which the French ruler intended to make use of for the conquest of Spain.

The first scene was the imprisonment of Godoy, the favourite, who without the title of king had exercised all the functions of royalty; and who favoured the scheme of emigration, in the hope of withdrawing himself and some portion at least of his enormous treasures. This step was soon followed by the abdication of the king in favour of his son and heir, the prince of Asturias; an event which surprised Bonaparte so much, and seemed to disturb his settled combinations so strangely, that he ordered Murat, grand duke of Berg, to advance with his army towards Madrid; which he soon entered, and where he began, without a moment's delay, to play the old and successful game of sowing the seeds of discord among the grandees and the people. In this state of things, the

new king, Ferdinand VII. made his public entry into Madrid, without any other parade than the most numerous concourse of the capital and its environs, the strongest expressions of love and loyalty, and acclamations which sprung from the joy and enthusiasm of his subjects; a scene truly grand and impressive. Of this scene the grand duke of Berg was a witness; but, far from abandoning his plan, he resolved to persevere in it with greater ardour. The experiment upon the royal parents produced the desired effect. But, whilst Ferdinand, the idol of the nation, was present, it was impossible to carry the plan into execution. It was therefore necessary to make every effort to remove this prince from Madrid. To accomplish this object, the grand duke was extremely assiduous in spreading reports of the arrival of a fresh courier from Paris, and that the emperor might be expected speedily in the Spanish capital. He set himself, in the first place, to induce the infant Don Carlos to set out to receive his imperial majesty Napoleon, on the supposition that his royal highness must meet him before he should have proceeded two days on his journey. His majesty, Ferdinand, acceded to the proposal. The grand duke had no sooner succeeded in procuring the departure of Don Carlos, than he manifested the most anxious desire that the king should do the same, leaving no means untried to persuade his majesty to take this step, assuring him that it would be attended by the happiest consequences to the king and the whole kingdom.

After useless hesitation and unavailing reluctance, the royal family, attracted like moths by the faithless glare of the emperor of the French, who was posting to Bayonne, left their palace, their capital, their kingdom, to place themselves, in a foreign country, in the hands of a man whose ambition and perfidy, whose thirst after power and desire of sway, were too well known not to be suspected of inimical intentions.—Scarcely had Ferdinand set foot on the French territory, when he remarked, that no one came to receive him, until, on his arrival at St. Jean de Luz, the mayor, attended by the municipality, made his appearance. The carriage stopped; and the mayor addressed his majesty in the most lively expressions of joy, at having the honour of being the first to receive a king who was the friend and ally of France. Soon after he was met by the deputation of three grandees, who had been sent off by Ferdinand before to meet the French emperor; and their representations, with respect to the intentions of Napoleon, were not of the most flattering nature. He was now, however, too near Bayonne to think of changing his course; he therefore continued his journey. There came out to meet the king, the prince of Neufchatel, and Duroc marshal of the palace, with a detachment of the guard of honour, which the citizens of Bayonne had formed to attend his majesty Napoleon; and they invited his majesty to enter Bayonne, where a place had been prepared for his residence; which he did on the 20th of April. The residence prepared for the king appeared to all, and was in reality, but little suited to the guest who was to occupy it. This remarkable and expressive neglect formed a striking contrast to the studied magnificence with which the king had prepared for the reception of his ally at Madrid. While the king was taken up with doubts concerning the meaning of a reception he so little expected, he was informed that the emperor was on his way to pay him a visit. His imperial majesty arrived, accompanied by a number of his generals. The king went down to the street-door to receive him, and both monarchs embraced with every token of friendship and affection. The emperor of the French staid but a short time with his majesty, and they embraced again at parting. Soon after, marshal Duroc came to invite the king to dine with the emperor, whose carriages were coming to convey the king to the castle of Marrac, about the distance of a mile and a half from Bayonne, where his imperial majesty resided, which accordingly took place. Napoleon came as far as the steps of the coach to receive his majesty; and,

and, having embraced him again, led him by the hand to the apartment provided for him.

Although the history of all absolute monarchies presents many instances of sudden and surprising elevations to great power and wealth, and as sudden and unexpected falls, there is perhaps none so striking as that of Don Manuel Godoy. His story is not unlike that of Don Roderigo Calderona, the favourite of the duke of Lerma, prime minister to Philip III. Godoy was called The Prince of the Peace, and was accounted by far the wealthiest and most powerful subject in Europe. Indeed he had all the power, and in a great measure all the wealth, of the Spanish monarchy at his command. While several of the old imposters had come to be alienated from the crown, and were impropriated by certain great families, through the improvident and profligate favour of the court, the people were oppressed with new and arbitrary taxes, burthenfome in themselves, and rendered more so by the mode of their collection. But the odium of the common people against the prime minister and favourite would never have wrought his fall, if there had not been a very general combination against him among the nobility, whom he so greatly eclipsed in splendour, patronage, and favour, and to whom a predominant favourite at court is a greater nuisance, perhaps, than to the nobles of any other country in Europe. He had been disgraced a short time before the king resigned the crown to his son; and the joy that was excited in all the provinces of Spain, by the imprisonment of this prime minister, with his principal officers, is not to be described. At Salamanca, and several other towns, the bells of the churches were rung; and at Salamanca six hundred monks, and as many licentiatees, danced in the market-place; young women, married women, and old men, mixed with the monks in this extravagant demonstration of their joyful transports. The Spanish newspapers, which had begun to assume a tone of great freedom, styled Don Manuel the Prince of Injustice, the Generalissimo of Infamy, and the Grand Admiral of Treason. Don Manuel, in his retreat, was accompanied by an escort of two hundred horsemen, which appeared necessary for his protection from the fury of the people. He arrived at Bayonne on the 26th of April. A castle in the environs of Bayonne was appointed for his residence; and he was in all respects treated by Bonaparte as a person of distinction and consequence.

The determined interference of Bonaparte for the liberation of Godoy, was owing to the resolution of the king and queen not to quit Spain for France, though called thither by Bonaparte, unless the favourite should be permitted to do so also, and to proceed on his journey before them. King Charles IV. and his queen Louisa arrived on the 27th of April at Burgos, and on the 28th at Vittoria. A detachment of the body-guards who had accompanied the prince of Asturias to Bayonne, happening to be in this town, placed themselves, according to custom, in the palace to be occupied by their majesties. But, when the old king set his eyes on them, with a degree of energy that surprised every one, he ordered them to be gone: "You betrayed your trust at Aranjuez; I want none of your services, and I will have none." The guards were obliged to retire. On the 29th of April, their majesties remained all night at Tolosa; on the 30th they came, about noon, to Irun, where they received letters from Bonaparte; and two hours after entered the walls of Bayonne, where they were received with all public respect and honour.

When the roaring of cannon announced the arrival of the old king and queen of Spain, Ferdinand, with his brother, Don Carlos, went to meet them. All the Spaniards that were at Bayonne also waited on their majesties, and went through the ceremony of kneeling and kissing hands. It was a scene of constraint and awkwardness on both sides; the king seemed as much dissatisfied with them as he had been with his body-guards at Vittoria. He did not speak a word to any one but count Pignatelli de Fu-

entes, an unprincipled and supple courtier, whom Bonaparte had appointed to insinuate himself into the confidence of the prince of Asturias, for the purpose of watching and betraying him. When the ceremony of kissing hands was over, their old majesties, being fatigued, retired to their apartments; the prince of Asturias was going to follow them; but the king stopped him, saying, "Prince, have you not yet sufficiently outraged my grey hairs?" The prince, and the Spaniards who had accompanied him to Bayonne, at these words were thunder-struck, and withdrew in great perturbation. At five o'clock, their majesties were visited by the emperor Napoleon, who remained with them a long time. The conversation turned on the injuries that had been done to the king and queen, the perils in which they had been involved, the ingratitude of men on whom they had lavished favours, and above all on the ingratitude and rebellion, as they said, of their son. The officers of king Charles's household were appointed by Bonaparte; all of them were Frenchmen.

Another engine was now set to work. The abdication of Charles IV. in favour of his son and heir Ferdinand, was published and abused in all the French newspapers, as unconsented to, and even compulsory; and thus the crown of Spain, holding neither to the hand of the old king nor to that of the new one, seemed as it were in abeyance, till a stronger power should seize upon it. The consequence of this necessarily followed from the premises. Like the lawyer in the fable, who settled the dispute between two travellers about an oyster, by swallowing it, and giving a shell to each of the parties; Bonaparte soon insisted upon Ferdinand VII. and all his family renouncing the crown of Spain and of the Indies. Unable to resist, the father yielded first; Ferdinand showed symptoms of resistance; but he was soon made sensible that he was in a state of arrest, and therefore obliged to submit to the iron hand of necessity. Meanwhile the queen gave to the world the most wretched example of feminine passion and wickedness, by bastardizing her own son in the presence of Bonaparte and her own husband: *Notumque furens quid femina possit.*

The scene in which this horrid and degrading declaration took place, deserves to be exhibited. After a conference which was continued above an hour, Ferdinand was called in; and the queen, in a transport of passion, said to him; "Traitor, you have for years meditated the death of the king; but, thanks to the vigilance, zeal, and loyalty, of the prince of the peace, you have not been able to effect your purpose; neither you, nor any of the infamous traitors who have co-operated with you for the accomplishment of your designs. I tell you to your face, that *you are my son, but not the son of the king*; and yet, without having any other rights to the crown than those of your mother, you have sought to tear it from us by force. But I agree and demand, that the emperor Napoleon shall be umpire between us; Napoleon, to whom we cede and transfer our rights, to the exclusion of our own family. I call on him to punish you and your associates, as so many traitors; and abandon to him the whole Spanish nation."

This scene of the queen bastardizing her own legitimate son in the presence of the king, his legitimate father, and proclaiming her own infamy before her husband, is something so new, so surprising, and so singular, that it would not have gained universal and undoubted credit, as it has done, if it had not been attested by many witnesses. It has been supposed, on no improbable grounds, not to have been merely an effusion of passion, but to have been preconcerted between the queen and Bonaparte.

The queen was raving in such a fit of madness, that there seemed to be no end to her reproaches and abuse; when, enjoying secretly, like Satan in Eden, the mischief he had done, Napoleon interrupted her, by saying, "No! I give to Ferdinand the crown of Naples; and to Carlos that of Etruria; with one of my nieces in marriage to

each of them. Let them declare if they are willing to accept this offer."—After a short silence, Don Carlos replied, "Emperor, I was not born to be a king, but an infant of Spain." Ferdinand was silent, and Bonaparte, after a short pause, said, "Prince, you must choose, abdication or death." Six hours were allowed him for coming to a determination. King Charles, seconding the threat of Bonaparte, ordered his son to make an absolute resignation of the crown, under pain of being treated with all his household as an usurper of the throne, and a conspirator against the life of his father. To this proposition, Ferdinand, being desirous not to involve in his misfortunes the number of persons comprehended in the threat of Charles IV. assented; and next day, in a letter to his father, after stating the circumstances of constraint in which he was placed, he made the resignation which was commanded. After this, Ferdinand was deprived of his coach of state and sword of honour. He had no other attendant than the commander of the party that watched him; a Jew, belonging to the militia or national guards of Bayonne.

The natural consequence of all this most perfidious machination, was a treaty of abdication, in which promises, never to be performed, were set before the eyes of the apparently-deluded Ferdinand and the rest of his family. The junta at Bayonne tamely took the oath of allegiance to Bonaparte; and, to close the drama, the Spanish princes were carried into the interior of France, there to deplore their own folly, and to experience the peculiar nature of Napoleon's promised affection and kindness. There we must leave them, as, indeed, there they remain to this day; while we return to the kingdom they so unfortunately quitted.

Providence, which sometimes permits nations to be exposed to the scourge, is ever inclined to mercy. Thus it was in regard to Spain. After a short time of pressure under French dominion, the nation began to emerge; to seek for means of revenge; and the French name became abominable to the ears of a Spaniard. The kidnapping of their kings at Bayonne—their imprisonment in France—a new constitution forced upon a free people—all contributed to rouse them from their temporary slumber; and the counter-revolution began in most of the Spanish provinces. A long struggle ensued; and it was then that Mr. Sheridan, on the 15th of June, rose in the house of commons, and seemed to be nothing less than the solemn organ of the public sentiments. In calling the attention of the legislature to the affairs of Spain, and their utmost exertions to the assistance of the Spaniards; "I am far," said he, "from wishing ministers to embark in any rash or romantic enterprise in favour of Spain; but, if the enthusiasm and animation, which now exist in a part of Spain, should spread over the whole of that country, I am convinced that, since the first burst of the French revolution, there never existed so happy an opportunity for Great Britain to strike a bold stroke for the rescue of the world. But, I wish to declare, that, in my opinion, we must not deal in dribblets; we must do much or nothing. Why do I make this declaration? Because no cabinet which has hitherto existed in this country—not even excepting that with which I had the honour of being connected—has pursued simply and plainly one clear and distinct object. Instead of striking at the core of the evil, the administrations of this country have hitherto contented themselves with nibbling at the rind. I wish, therefore, to let Spain know, that we are resolved fairly and fully to stand up for the salvation of Europe. If a co-operation with Spain be expedient, it should be an effectual co-operation. I repeat, that I am far from prompting his majesty's government to engage in any rash romantic enterprise; but if, upon ascertaining the state of the popular mind in Spain, they find it is warmed by a patriotic and enthusiastic ardour, then all I ask is, that that feeling should be met here with corresponding energy and enthusiasm. Bonaparte has hitherto run a most victorious

race. Hitherto he has had to contend against princes without dignity, and ministers without wisdom. He has fought against countries in which the people have been indifferent as to his success; he has yet to learn what it is to fight against a country in which the people are animated with one spirit to resist him. So far from bringing forward a motion prematurely to embarrass his majesty's government, I solemnly declare, that, if the opportunity to which I have alluded of a vigorous interference on the part of England should arise, the present administration shall have from me as cordial and as sincere a support as if the man whom I most loved were restored to life and power.—Is this a vain discussion? Let those who think so look at the present state of Europe. Will not the animation of the Spanish mind be excited by the knowledge that their cause is espoused, not by ministers alone, but by the parliament and the people of England? If there be a disposition in Spain to resent the insults and injuries, too enormous to be described by language, which they have endured from the tyrant of the earth, will not that disposition be roused to the most sublime exertion, by the assurance that their efforts will be cordially aided by a great and powerful nation? I think this a most important crisis. Never was any thing so brave, so generous, so noble, as the conduct of the Asturians. They have magnanimously avowed their hostility to France, they have declared war against Bonaparte; and now they have no retreat; they must conquer, or perish in the grave of the honour and the independence of their country. It is that the British government may advance to their assistance with a firmer step, and with a bolder mien, that I have been anxious to afford this opportunity to the British parliament, of expressing the feelings which they entertain on the occasion. I move, therefore, that an humble address be presented to his majesty, that he will be graciously pleased to direct that there be laid before this house, copies of such proclamations as have been received by his majesty's secretary of state for foreign affairs, and which have been issued since the arrival of the French army at Madrid; whether by the Spanish government, the French commander-in-chief, or by persons since claiming to act on behalf of the Spanish nation."

The duke of Norfolk, in the house of lords, spoke most eloquently to the same purpose, on the 30th of the same month; and the consequence was, that, on the 4th of July, when the lord-chancellor, in his majesty's name, prorogued the parliament, the concluding and indeed the greater part of the speech turned, as was natural, on the Spanish nation, loyally and nobly struggling against the tyranny and usurpation of France, and therefore no longer to be considered as an enemy, but as the ally of Great Britain.

The avowed protection of the British government animated the Spanish patriots, and created an enthusiasm which was evinced in several actions, and more especially at the siege of Saragossa; and enabled them to become so formidable, that king Joseph was obliged, for the first time, to learn the art of flying, an useful art which he has since had occasion to recur to. Like the kings of a strolling band of mountebanks, Bonaparte's crowned heads seem to be indifferent as to what sort of boards they perform upon, so long however as they are allowed to perform the trumpery parts of would-be sovereigns. The hope of a peace with Spain, after its deliverance from French subjugation, became every day more and more interesting to the trade of the metropolis, and therefore the liveliest attention was excited by the news which came from the peninsula.

On the 4th of August a grand dinner was given to the Spanish deputies, by the merchants and bankers of the metropolis, at the City of London Tavern.—This sumptuous feast, indicative of the sympathy which England felt (and still feels) in the glorious cause of Spain, was attended by a company of noblemen and gentlemen, comprehending a very large proportion of the mercantile wealth

wealth of the British metropolis. No former occasion within our memory, was more distinguished by the respectability and opulence of the company. It was not a party-meeting; for men of all parties were equally ardent and zealous in the cause of the people of Spain. And we saw, therefore, the heads of all the great companies of the first mercantile and banking houses, together with several ministers of the country, statesmen out of place, foreign ministers, and other illustrious characters—all eager to testify to the illustrious deputies from Spain, the interest which they felt in the deliverance of their country. The company did not sit down to dinner till seven o'clock. There were six tables lengthways, and one cross-table in the large room, in which 328 noblemen and gentlemen sat down; and in the adjoining room there were 72, making together 400 persons; and it is not an exaggeration to say, that their united property was not less than fifteen millions of money.—The decoration of the head-table was splendid. The parterre, or sand-work, represented, in one place, Britannia offering her assistance to Spain; in another, Fame supporting a medallion, on which were inscribed the names of the different provinces of Spain which stood foremost in resisting the common enemy; in another, the figure of Time crowning the Spanish patriot's flag with laurel; in another, the figure of Hope leaning on the rock of Justice; in other parts, the arms and standards of Spain intermixed with those of England, with different mottos, such as "Venceró morir," "Success to the Spanish Heroes," &c. &c. The ornaments stood from seven to eight feet high; portraying, in one part, the battle of the Nile, with the blowing up of l'Orion; in another, trophies of flags, &c. &c. at the tops of all, the royal standards of England and Spain; the whole finished with garlands and bouquets of flowers, China figures, vases, &c. &c.

That generous spirit, which always evinces itself in the metropolis whenever opportunity occurs, soon suggested a subscription in favour of the Spaniards. A numerous and respectable meeting of the merchants and traders of London, was held on the 9th of December, at the same tavern, for the purpose of instituting a subscription in aid of the patriotic armies in Spain. The lord-mayor was called to the chair; who, on taking it, observed, that the cause for which they had met together was of so glorious and meritorious a nature, and spoke so powerfully for itself to the hearts of all present, that little or nothing was left for him to say, further than to express the pride he felt in presiding over so highly respectable a meeting, and the interest which, he was persuaded, every true Englishman took in its success.—Mr. Rowcroft thought it necessary to inform the meeting of some circumstances which had occurred relative to it. Those who had proposed to call it, had, in the first place, considered the popular feeling which prevails so strongly in favour of Spain, and which would, he trusted, be made manifest by the measure which was now recommended. They had also ascertained that government would see with pleasure such a manifestation of the public mind respecting the Spanish cause, and that such a measure would be very pleasing to the Spanish deputy in this country, admiral Apodaca, who would thankfully receive, and speedily transmit to his own country, whatever sums should be subscribed for its use. Due notice was then given of the meeting, which had drawn the attention of ministers, who were anxious that every appearance should be avoided which would seem like a reflection cast upon them, for omitting any exertion that it was in their power to make in aid of the Spanish cause. This feeling had induced Mr. Perceval, the chancellor of the exchequer, to write a letter to the lord-mayor (which had been received only a few hours), explanatory of the aids which government had already furnished, or were now furnishing. He then read the letter, which was to the following effect:—"My Lord; Understanding that a meeting is to be convened under the sanction of your lordship, for the purpose of promoting a sub-

scription for the purchase of shoes, clothes, and other necessaries, for the Spanish army, I feel it necessary to furnish you with the fullest information of what has been already done, and what is now doing, by government for those objects. I hope I shall not be so far misunderstood, as to be supposed desirous of repressing any proof which the city of London may be disposed to give, of that sentiment which is felt so generally in this country; but I feel apprehensive, that, unless great caution be used, some injury might be done to that cause which it is the object of this meeting to promote. I therefore think it necessary to inform you, that, as to the purchase of shoes, which is stated as the first object of the subscription, government have taken every means of procuring an abundant supply. From the orders they had given, not only in England, but in Ireland and Scotland, they expect to be furnished with 40 or 50,000 pair a-month for the British and Spanish armies. If the zeal of individuals were to go farther, there would be a great danger that it would create a competition, which would raise the price, and be otherwise injurious. The same observation would also apply to a subscription for the purpose of buying uniforms or clothing. With regard to arms, ammunition, and field-equipment, it is unnecessary for me to make any remark, as I understand that such articles are not within the contemplation of those gentlemen who are about to promote the subscription in view. The money, however, which may be subscribed might be applied to the purchase of other articles, which could not interfere with those on which government are occupied, and which would have the advantage of manifesting unequivocally to Spain, that, besides the government of this country, she has with her the strong wish and general feeling of the people."—A committee was appointed; and the subscriptions quickly amounted to a very large sum.

When the real state of affairs in Spain became manifest to all Europe by the flight of king Joseph from Madrid, and the concentration of the French forces on the desiles of Biscay, and on the Ebro, Bonaparte's sarcasms against the insurgents, and his misrepresentations of facts, were interrupted for a long time, as well as his military operations. Not a word was said of Spain. Even the *Moniteur* was silent. The world entertained great curiosity to know what face would be put on the flight of Joseph, and the inactivity of the French in Spain. It was given out by the French government at Madrid, that the king found it necessary to retire for a time from that city, *for the benefit of his health*; which was every-where made a subject of ridicule. But nothing at all was said on the matter in the newspapers of France, Italy, or Germany. It was evident to Bonaparte, that the Spanish insurrection was of too serious and formidable a nature to be treated lightly in respect of either words or actions. It was manifestly not to be crushed but by a very large force, and a larger one too than any he could march against it, if the Germans should avail themselves of so inviting an occasion to throw off his yoke; and, above all, if the emperor of Russia should swerve from the treaty of Tilsit. Orders were transmitted from Paris to the members of the Confederation of the Rhine, to call out their respective quotas. Of the German troops of this confederation, 80,000 were taken into the pay of France, clothed in the uniform of French soldiers, and sent into France to garrison the towns quitted by French regiments sent to reinforce the French army in Spain. By this manœuvre, it was his object to render it impossible for the German princes to revolt from him to Austria, while at the same time he stationed a force in France better for some of his purposes, such as that of enforcing the conscription, than that which it replaced; inasmuch as Germans would not be so likely as the French regiments to sympathise and coalesce with the people. But, whatever might be the inclinations or the attempts of the Germans, they were not to be considered as formidable, if the Emperor of the North, as Bonaparte had affected to style him, should abide by his engagements.

Alexander, at this moment, held in his hand the balance of Europe, the fate of many nations; their condition, whether as independent states, or as submissive provinces of a great and domineering empire, probably for many centuries! Into whichever of the scales the czar should throw his weight, that must inevitably preponderate. To confirm and fix the resolution of Alexander was a matter of the last importance, and what Bonaparte did not think it prudent to commit to the agency of any of his ministers. He determined to have a personal interview with the emperor of the north; on whose mind it would appear he was perfectly confident he should maintain an ascendant. The place appointed for a meeting and conference between Alexander and Napoleon, was Erfurth, a city in the circle of the Lower Rhine, belonging to the electorate of Mayence. Here they met on the 27th of September. Each was attended by a very numerous and brilliant suite; and kings, sovereign princes, and other persons of high distinction, came day after day to do homage to the great Emperor of the West. Among others who attended Alexander, were his brother the grand duke Constantine, whom it was the policy of Bonaparte to flatter with the hope of reigning at Constantinople; count Romanzow, and the two counts Tolstou, one of whom was the Russian ambassador at Paris. The suite of Bonaparte was composed of Berthier, Talleyrand, Caulincourt, Champagny, Maret, the principal writer of official reports, and the generals Lannes and Duroc, all of them bearing their new titles of princes, dukes, and counts, and in short all the staff-officers belonging to the French army cantoned in Bavaria. The kings and sovereign princes of Germany waited for the most part on Bonaparte in person. The Austrian general, count St. Vincent, arrived at Erfurth, on the 28th of September, with an apology from the emperor of Austria for not attending the conference, and no doubt the strongest and most sincere assurances of friendship towards both the French and Russian emperors. Count St. Vincent was closeted a long time with Bonaparte. Great was the pomp and ceremony, and splendid the feasts and other entertainments, that took place on the occasion of this imperial and royal convention. The little town of Erfurth was astonished to witness a magnificence that might have been admired at Paris. The first dinner was given by Bonaparte. Napoleon and Alexander held their conferences every day at ten o'clock. These being over, they rode out together, either in the same carriage or on horseback, to take a view of the adjacent country. In one of these rides, Alexander consented to traverse, together with Bonaparte, the whole field of Jena, the burying-ground, or grave, it may be called, of the ally to whom he had sworn eternal friendship over the ashes of the great Frederic. Bonaparte little thought that one day this very emperor and the king of Prussia would invade his "sacred territory," and threaten the eastern provinces of France with an army of 200,000 men.

It was the great object of Bonaparte, in the conferences and convention at Erfurth, to conciliate the good will of all parties there, that he might be enabled, having secured quietness in his rear, to bear with all his disposable force on Spain and Portugal. Insignificant as the German powers had become, combinations might be formed by which they might distress him greatly in the present moment. Any concession, therefore, that would secure their connivance at his projects in the west, it would be prudent in him, in the present circumstances, to make; fully aware that, if he succeeded in Spain, it would be an easy task again to reduce the countries in Germany which he now occupied. But, at the same time that he found himself under the necessity of recalling his troops from Germany, he wished to hide as much as possible the weakness therein implied, and avert the designs to which a full conviction of that weakness might give birth. He therefore dexterously contrived to give the withdrawing of his troops the appearance of being the result of a negotiation; an act of favour to the sovereigns of Russia and Prussia.

A negotiation was entered into at Erfurth, under the mediation of Alexander, in consequence of which Napoleon engaged to evacuate the Prussian territory as soon as the contributions should be paid up, which he graciously reduced to one-third of their total amount; and he wrote a letter to the queen of Prussia, with his own hand, in which he promised her the completion of all her wishes. He also relaxed in the severity of his restrictions and imposts on the commerce of Holland.

Another notable effect of the meeting at Erfurth was an offer of peace on the part of Russia and France to the British government. A flag of truce, with two officers, one a Frenchman, the other a Russian, arrived on the 21st of October at Dover. The Frenchman, by orders of lord Hawkebury, who happened then to be at Walmer-castle, was detained. The Russian messenger was allowed to proceed, on the 22d, to London.

It was thought to be the object of Bonaparte, in this overture, to lull the British government into a neglect or delay of sending assistance to Spain, and to excite a distrust of England in her allies. It was proposed to his Britannic majesty, to enter into a negotiation for a general peace, in concert with his majesty's allies; and to treat either on the basis of *uti possidetis*, or on any other basis consistent with justice. The king of Great Britain professed his readiness to enter into such a negotiation in concurrence with his allies; in the number of whom he comprehended the Spanish nation. In the reply returned by France, the Spanish nation was described by the appellation of the "Spanish insurgents;" and the demand, for admitting the existing government of Spain as a party to any negotiation, was rejected as inadmissible and insulting. A declaration, therefore, by his majesty, was published on the 15th of December, concluding as follows: "His majesty deeply laments an issue by which the sufferings of Europe are aggravated and prolonged. But neither the honour of his majesty, nor the generosity of the British nation, would admit of his majesty's consenting to commence a negotiation by the abandonment of a brave and loyal people, who are contending for the preservation of all that is dear to man, and whose exertions in a cause so unquestionably just his majesty has solemnly pledged himself to sustain."

We must now turn our attention, and fix our eyes, on the banks of the Tagns, where we shall witness the same hatred of the French, and the same desire of shaking off the Napoleonic yoke, manifesting itself in all the Lusitanian provinces; we shall find the Portuguese patriots going hand in hand, and having the same object in view, with those of their neighbouring and kindred Spaniards.—The inhabitants of Lisbon, overawed by the army of Junot, had been restrained at first from expressing their joy, otherwise than in private and confidential conversation. The public voice of Portugal was first heard at Oporto. This town, besides the circumstance of being situate at a considerable distance from the force under Junot, possessed another advantage. It had been occupied by about three thousand Spanish troops, who, before their departure to join the patriotic standard in Spain, took the French general under whose orders they were, and all his staff, prisoners, and delivered up the government of the city to Louis d'Oliveira, who had filled that office before the arrival of the French. The treachery of this man, his attachment to the French, and the measures he took for restoring the authority of the French, roused the indignation and rage of the people to such a pitch, that he found it impossible to avert their threatened vengeance otherwise than by yielding up his authority. They rose, on the 18th of June, in one body; broke open the depots of stores; and, having supplied themselves with arms, proceeded to destroy every vestige of French power, and to imprison every person suspected of being in their interest. The bishop of Oporto, who, with most of the other priests, had been incessant in his efforts to rouse the people to arms, was appointed governor of the city, and the most  
vigorous

vigorous measures were adopted for defending it against any force. General Loison, with about 3000 men, advanced against the insurgents as far as Amiraute; but, on being made acquainted with the determined spirit of the people of Oporto, he retreated on Lisbon. Nearly the whole of the northern provinces of Portugal rose in arms against the French. The south of Portugal was restrained from coming forward so generally, or in so open a manner, by their vicinity to the army of Junot, and also by a strong and numerous French party among themselves. Notwithstanding the terror, however, of Junot, a friendly intercourse was maintained between Lisbon and sir Charles Cotton.

The French being expelled from the northern provinces of Portugal, provisional juntas were formed, similar in their character and functions to those of Spain. Of these, that of Oporto exerted itself with the most zeal and effect, in heightening and directing the patriotic enthusiasm of the people, and in the establishment of such orders and regulations as were required by the peculiar circumstances of the country. Oporto, in this respect, was the Seville of Portugal. The junta, having taken such measures for raising and supporting an army as circumstances admitted, naturally looked for support and assistance to England; nor were their hopes disappointed. An army, under the command of sir Arthur Wellesley, (now field-marshal marquis Wellington,) destined for Portugal, where it ultimately landed, was, in the first instance, offered to the Spaniards. This army, consisting of about 10,000 men, set sail from Cork on the 12th of July, and arrived at Corunna on the 20th. The battle of Medina del Rio Seco had taken place a few days before, and the Spaniards were retreating fast in different directions; one division of them adhering to Cuesta, proceeded to Salamanca; another, under general Blake, made for the mountains. In consequence of this intelligence, combined with his instructions, sir Arthur Wellesley offered the assistance of the force under his command to the junta of Galicia. The junta replied, that they did not want men; and that they wished for nothing from the British government except money, arms, and ammunition. But they expressed their firm conviction that his army might be of infinite service both to the Portuguese and their own nation, if it were employed to drive the French from Lisbon. In the north of Portugal, and consequently at no great distance from Galicia, the French were still in force. Against them, in the first place, sir Arthur might direct his attack with every probability of success, and with the certainty of relieving the province of Galicia, if the insurrection at Oporto still existed, or could be revived when he reached that city. Sir Arthur Wellesley, leaving Corunna, proceeded to Oporto. On his arrival there, the bishop, who was the governor, informed him that the Portuguese force was sufficient to deter the French from making any attacks, or, if not, to repel them. Sir Arthur, however, that he might be the better enabled to judge what was best to be done, left his forces at Oporto, in order to have a conference with sir Charles Cotton, off Lisbon; with whom he consulted about the practicability and the prudence of forcing the entrance of the Tagus, and attacking the forts in the near vicinity of that capital.

In the mean time, while he was on-board the *Hibernia*, the admiral's ship, he received a letter from general Spencer, who was then, with about 6000 men, off Cadiz. This force was destined to be employed either in co-operating with the Spanish forces under Castanos, in their operations against Dupont, or in conjunction with the expedition under sir Arthur Wellesley. As the junta of Seville did not deem the aid of general Spencer's corps at all necessary towards the reduction of Dupont's army, and as sir Arthur was decidedly of opinion that his own army, and that of general Spencer, could be but of little avail towards the expulsion of the French from Portugal while they acted separately, he gave orders to general Spencer to join him.

The English general, having made himself acquainted, as accurately as he could, with the numerical strength and disposition of the French army, determined to carry his forces into Mondego-bay, where he would be able to effect a landing, and form his army into order, without any opposition from the enemy; while, at the same time, he should be assisted and supported by the Portuguese army which had advanced to Coimbra. Before he landed the troops, he received advice from the British government, that 5000 men, under general Anstruther, were proceeding to join him; and that 12,000 more, under sir John Moore, would speedily be dispatched for the same purpose. He was also informed of the surrender of Dupont; and that the army of Junot was considerably weakened by the necessity of sending about 6000 men, under general Loison, to quell an insurrection that had broken out in the south of Portugal. This information induced sir Arthur to disembark his troops without delay. Soon after the disembarkation was effected, the corps under general Spencer also landed; and on the 9th of August the advanced guard marched forward on the road to Lisbon. On the 12th the army reached Legria. On the 15th the advanced guard came up with a party of the French at Obidos, where a slight action took place, occasioned principally by the eagerness of the British to attack and pursue the enemy. On the 16th the army halted; and on the next day the general came to the determination of attacking the French under general Laborde at Roleia. The enemy was defeated, but retreated in good order. By this victory the road was cleared to Lisbon. On the day after the battle the British army moved to Lourinha, to protect the landing, and facilitate the junction, of the troops under general Anstruther; and on the 21st they resumed their march.

General Junot, duke of Abrantes, having been informed of the large reinforcement expected under the command of sir John Moore, determined to attack the British army before the reinforcement should arrive. For this purpose he left Lisbon with nearly the whole of the forces under his command, and came up with sir Arthur on the morning of the 21st of August at the village of Vimeira. A hard-fought battle ensued. The French, with fixed bayonets, attacked the British with their usual impetuosity: they were driven back by our troops with the bayonet. They renewed their attacks, in different columns, again and again; and were as often driven back with cooler intrepidity and greater strength of arm. At last they fled from the charge. In this battle the French lost 13 pieces of cannon, 23 ammunition-waggons, and about 3000 in killed, wounded, and missing. Our loss in killed, wounded, and missing, amounted to nearly a thousand.

After the dispositions for the battle of Vimeira had been made, sir H. Burrard arrived at the scene of action, but declined to take upon himself the command of the army. On the 22d, sir Hew Dalrymple, who had been called from his situation of lieutenant-governor of Gibraltar, to take the command of all the different corps sent by the British government into Portugal, reached Cintra, the place to which the British army had moved after the battle. Within a very few hours after his arrival, a flag of truce came in from Junot, proposing a cessation of hostilities, in order that a convention might be settled, by which the French should evacuate Portugal.

When intelligence was received in England, that, in the words of sir Arthur Wellesley, "the whole of the French force in Portugal, under the command of the duke of Abrantes in person, had sustained a signal defeat;" there was an universal expectation, that it would be followed up with other victories, and ultimately lead to some solid advantage. That such an advantage had in fact been obtained, was firmly believed, when, on the arrival of the next dispatches from the army, the firing of the Park and Tower guns was heard, and that too, at a time of night very unusual, if not quite unprecedented.

But how great was the surprise of the public, when it was understood that the discharge of the Park and Tower guns related to a convention, signed at Cintra, by which it was, among other stipulations, agreed on, "That the English government should be at the expense of transporting the whole of the French army to any of the ports between Rochfort and l'Orient. When the army arrived in France, it was to be at liberty to serve again immediately. All the property of the army, as well as the personal property of the individuals of the army, was to be sacred and untouched. It might either be carried off into France or sold in Portugal. In the latter case, full security was to be given by the British to the purchasers, that the property they had would not be taken from them, nor they themselves molested on account of the purchase."

The regret and indignation of the British nation were raised by this convention to a painful height. The throne was besieged, as it were, with petitions from all parts of the kingdom, calling loudly for an inquiry into that transaction. The answer to the petition from the city of London, "that for the institution of an inquiry there was no need of their interference," was universally deemed ungracious. An inquiry was set on foot. The board in their report, after giving a well-arranged, and not altogether an uncircumstantial, account of sir Arthur Wellesley's expedition, declared, "That, on a consideration of all circumstances, as set forth in the report, they most humbly submitted their opinion, that no further military proceeding was necessary on that subject: because, however some of them might differ respecting the fitness of the convention in the relative situation of the two armies, it was their unanimous declaration, that unquestionable zeal and firmness appeared throughout to have been exhibited by lieutenant-general sir Hew Dalrymple, sir Harry Burrard, and sir Arthur Wellesley; as well as that the ardour and gallantry of the rest of the officers and soldiers, on every occasion during the expedition, had done honour to the troops, and reflected lustre on his majesty's arms."

Sir Arthur Wellesley, who, ultimately, by his prudence, courage, and perseverance, has not only set the whole of Portugal and Spain at liberty, but has now planted the British standard on French ground, had strenuously recommended a pursuit of the French; and great pains were taken by his friends at home to screen him from the odium of both the armistice and convention; with which sir Arthur appears indeed to have expressed much dissatisfaction to his friends in private, though he had not hinted any disapprobation when in consultation with the other generals. But the board unanimously approved the judgment of sir Harry Burrard, in abstaining from pursuit. "A superior cavalry," they observed, "retarding our advance, would have allowed the enemy's infantry, without any degree of risk, to continue their retreat in the most rapid manner, till they should have arrived at any given and advantageous point of rallying and formation: nor did sir A. Wellesley, on the 17th of August, when the enemy had not half the cavalry he had on the 21st, pursue a more inconsiderable and beaten army with any marked advantage." In short, the report of the board was an indirect censure on sir Arthur; but more justice has been done him since; and his arduous campaigns in Portugal and Spain have established his character as the greatest general we have had since the days of Marlborough.

As the defeat of Junot and the deliverance of Portugal were only mediate, and not the ultimate objects of the British army, it marched from Lisbon, but not till the 27th of October, nearly two months after the convention of Cintra, under the command of general sir John Moore, to the assistance of the Spanish patriots.

The enthusiasm of Spanish patriotism was not confined behind the Pyrenean mountains; it spread itself through the whole continent, and was admired and hailed as the dawn of a new order of things, and as an ominous star to the power of Napoleon.—By a well-combined plan, concerted between Keats, the British admiral in the Baltic, and Romana, ten thousand of the Spanish troops sta-

tioned in Funen, Langland, Zealand, and Jutland, emancipated themselves from the French yoke, and, under the protection of the British fleet, were conveyed, with their stores, arms, and artillery, to Spain, where they landed at Corunna on the 30th of September. The marquis of Romana himself returned home by the way of London, where he arrived on the 16th of September, for the purpose of having a conference with the British ministry, and British military officers. But one Spanish regiment, near two thousand strong, in Jutland, was too distant, and too critically situated, to effect its escape. And two in Zealand, after firing on the French general Frison, who commanded them, and killing one of his aid-de-camps by his side, were disarmed. While Frison was in the act of haranguing these troops, for the purpose of engaging them to declare for king Joseph, one of the soldiers, burning with indignation, and regardless of consequences, stepped forth from the ranks and fired a pistol at him, which, missing the general, killed the aid-de-camp.

The marquis de la Romana was kept in profound ignorance of the glorious events that had taken place in his country; and various attempts had been made on the part of the British government, to communicate the tidings to him, and to devise means for his escape with the troops under his command, without effect. At length a Swedish clergyman was found, in whose honour, good sense, and enterprising disposition, the firmest confidence could be placed. This gentleman, disguised as a travelling pedlar, went by the way of Heligoland, and, having overcome many obstacles with the utmost patience, prudence, and fortitude, at length arrived at the place where the marquis and his troops were stationed. Having ascertained the person of the marquis, he was obliged to watch incessantly for an opportunity of addressing him, without exciting the suspicion of the numerous spies by whom he was surrounded. The venerable agent at last was obliged, as if by accident, to jostle the marquis in the street, in order to attract his attention. Having done so, he apologized, as if ignorant of the person whom he addressed, and concluded with offering to sell him some excellent coffee. The marquis treated this offer with contempt; and signified, that he supposed he was speaking to a smuggler. The minister of the gospel, however, persevered in recommending his coffee, and in the course of the conversation, found means to intimate, that he was not a smuggler, but a gentleman. "We'll soon see that," said the marquis; and then asked him if he could speak Latin. The minister answered in the affirmative; and a conversation ensued, apparently about coffee, as the gestures of both were calculated to deceive all who might observe them. The marquis was then duly informed of every thing that had occurred in Spain, of the assistance the British government had rendered, and of the readiness of his Britannic majesty to adopt any measure that might be thought practicable for effecting the rescue of himself and his troops, that they might join their heroic countrymen in resisting the base attempts of France to enslave them.

Previous to the famous interview of the two emperors at Erfurth, while the French army lay inactive on the Ebro and the passes into the mountainous province of Biscay, and while Bonaparte was employed in averting danger to his cause on the side of Germany and Russia, the provincial juntas of Spain had leisure to resolve themselves into one supreme and central junta. This supreme and central junta was formed by deputies nominated by the respective juntas, and was installed at Aranjuez on the 25th of September. The president per interim was the venerable count Florida Blanca. Among the members we find two other distinguished names; viz. Don Francisco Palafox, one of the deputies from Arragon; and Don Melchior de Jovellanos, one of the two from Asturias. After hearing mass, which was celebrated by the primate of Laodicea, also archbishop, and one of the members of the junta for Seville, the following oath, administered on the holy evangelists, was taken by all the deputies:—"You swear by God, and all the holy Evangelists, and by Jesus Christ crucified, whose sacred image

is before you, that, in the exercise of the supreme and sovereign central junta, you will defend and promote the conservation and advancement of our holy, catholic, apostolical, and Roman, religion; that you will be faithful to our august sovereign Ferdinand VII. and that you will maintain his rights and his sovereignty. That you will concur in the support of our rights and privileges, our laws and customs, and, above all, those concerning the succession of the reigning family, according to the order established by the laws aforesaid. In short, that you will give your vote for every measure calculated for the general good, the prosperity of the kingdom, and the amelioration of its customs. That you will observe secrecy in all cases where secrecy is proper. That you will protect the laws against all malevolence, and prosecute their enemies, even at the expense of your life, your personal safety, and your fortune." The formula of assent was, "I swear this." The following sentence was subjoined: "If you do this, may God help you. If not, may he punish you, as having sworn in vain by his holy name." The subscriber said, *Amen*.

After a solemn Te Deum, the deputies walked between two lines of troops to the royal palace, a hall of which was consecrated to their sessions. On the opening of the gates of the palace, that had been so long shut, the sad foliage of the magnificent mansion of their kings, and the recollection of the epoch at which, and of the reasons for which, the gates had been shut, drew tears from every eye, and an universal cry of vengeance against the authors of so profound calamities and such pungent sorrows.

The supreme central junta was acknowledged by the council of Castile, and all the other constituted authorities in the kingdom. Its first efforts were directed to setting in motion all the troops in Andalusia, Grenada, and Estremadura, as well as the new levies; to the transportation of Dupont's army, agreeably to treaty; and to furnishing the English army, that had vanquished Junot, with the means of marching from Portugal to join the Spaniards. In the midst of these cares, they sent envoys to demand succours from Britain. The forces of the patriots, including now the army of Romana, and the Spanish regiments that had been confined in hulks of ships by Junot, were divided into three, and disposed in such a manner as to form together, towards the end of October, one grand army. The eastern wing was commanded by Palafox; the north-western, by Blake; the centre, by Castanos.—The number under general Blake was computed at 55,000; that under general Castanos at 65,000; and that under the orders of general Palafox, at 20,000. Castanos was commander-in-chief. Besides these, there was a small army in Estremadura, and another in Catalonia.

Bonaparte, having ordered a levy of 160,000 conscripts, put troops in motion for Spain, and provided for all that might be demanded by the contingencies of war, set out from Paris for Spain without waiting for an answer to the overture for a negotiation with the British government, in like manner as he had hastened to meet the Prussians, leaving lord Lauderdale to dispute with his ministers about the basis of a negotiation, in the autumn of 1806. With his usual celerity, having set out from Rambouillet on the 30th of October, he arrived at Bayonne on the 3d of November; and on the 5th, accompanied by a reinforcement of 12,000 men, he joined his brother Joseph at Vittoria.

It would not serve any purpose either of amusement or instruction to enter into a detail of the means by which the first military commander in the present, and one of the greatest of any age, at the head of a numerous, well-equipped, and veteran, army, accustomed to conquer, defeated armies scarcely yet organized, chiefly composed of new levies, without being properly equipped, without regular supplies of provisions, and extended over too large a space of ground without sufficiently strengthening the

line of their communication. Suffice it to say, that marshal Ney, duke of Elchingen, with his division, passing the line of the Ebro, and dashing forward with great celerity in separate columns, took the Spanish post at Logrono and Colahorra, threw the whole country into alarm and confusion, and cut off the communication between the armies respectively under the command of general Blake and of general Castanos.

In a series of actions from the 31st of October, the army under general Blake was driven from post to post; from Durango to Guenas; from Guenas to Valmaseda; from Valmaseda to Espinosa. Blake, with the remains of his broken army, took refuge in Asturias. What remained of the corps of the marquis of Romana, that had formed part of the Galician army, fled first to St. Andero, and afterwards to Asturias. The Spaniards were pursued closely by marshal Soult, duke of Dalmatia; the van of whose army entered St. Andero on the 16th.

In the mean time the Estremaduran army, under the command of count Belvedere, a young man, was permitted, without opposition, to advance to Burgos, of which he took possession without resistance. Here the French fell on him with superior numbers, and routed his army, after a gallant resistance for twelve hours, and almost annihilated it. The count, with the small remains of his army, fled to Lerma, and from thence to Aranda.

The French, having routed and dispersed the armies of the north of Spain and of Estremadura, next fell on the central army under Castanos; and an engagement ensued at Tudela, 23d of November, which fixed the fate of the campaign. Seven standards, thirty pieces of cannon, twelve colonels, three hundred officers, were taken; four thousand Spaniards were left dead on the field of battle, or driven into the Ebro. While a part of the fugitives retired to Saragossa, the left wing of the Spanish army, which had been cut off, fled in disorder to Tarragona and Agreda. Five thousand Spaniards, all troops of the line, were taken prisoners in the pursuit. No quarter was given to any of the peasants found in arms.

By the battle of Tudela the road was laid open to Madrid. On the 29th of November, a division of the French army, under the command of general Victor, duke of Belluno, arrived at the pass of the Sierra Morena, called *Puerto*. It was defended by 13,000 men of the Spanish army of reserve, under the orders of general San Juan. A charge made by general Montbrun, at the head of the Polish light horse, decided the contest. The Spaniards fled, leaving behind them their artillery and standards; and, as the French bulletin states, their muskets; but this, from subsequent events, appears not to have been truth. Advanced parties of the French cavalry appeared, on the 1st of December, before Madrid. At this period, the inhabitants of this city were busily employed in raising palisades, and constructing redoubts, breathing a determined spirit of resistance. The enemy was beaten back from certain gates several times; but, on the third, they were in possession of the gate of Alcala; and also of the Retiro, the reduction of which place cost the assailants very dear, in the loss, it was computed, of near 1000 men in killed and wounded. The junta then hoisted a white flag. The people of Madrid pulled down the flag, and persisted in their design of defending the city; but this enthusiasm soon began to subside, for want of leaders to keep it up and to direct it; and, when they learnt for certain that the French were fortifying themselves in the Retiro, they began to retire to their respective houses. During the night of December the 3d, a Spanish officer who had been taken prisoner in the affair of Somosierra, brought a message from general Berthier, summoning for the second time Madrid to surrender. The marquis of Castellar, captain-general of Castile, sent in answer a letter to Berthier, demanding a suspension of hostilities, that he might have time for consulting the superior authorities. But there was no need or use in this; the superior authorities,

thorities, who appear plainly to have had a secret correspondence with the enemy, had already come to a determination on the subject. Madrid was undoubtedly given up through treachery.

Napoleon now addressed a manifesto to the Spanish nation, in which he promised them all good things if they received Joseph for their king sincerely and with all their heart. If not, he would put the crown on his own head, treat them as a conquered province, and find another kingdom for his brother; for God had given him both the inclination and the power to surmount all obstacles.—The troops that had fled from the Puerto, or Gate, of Guadarama, having arrived, on the 3d of December, almost under the walls of Madrid, demanded with loud cries to be led to its defence. Their commander, count St. Juan, who opposed so dangerous an attempt, was massacred.

The supreme junta, in conformity with the uniform intentions of the provincial juntas, had declared that the colonies in Asia and America should not be considered as dependent provinces, but enjoy all the privileges of the metropolis and mother-country. This was also declared in the new constitution framed for Spain by Bonaparte. But in the Canaries, in Mexico and the Floridas, in Cuba and the other islands, and throughout the whole of South America, every Spaniard, as if animated by the same soul, breathed the same sentiments of devotion to the king, and detestation of the monster who wished to usurp his throne. In the Floridas, the French were so apprehensive of falling victims to the vengeance of the Spaniards, that they fled with their effects into the territories of the United States. But the moderation, wisdom, and justice, of men in authority, restrained the fury of the populace. The proclamations of the Spanish governors in the colonies, for sense, reason, and justice, equal those of Old Spain, and for a fervent eloquence perhaps even exceed them. The proclamation of Marcus Gomerelos, commander-in-chief of the land-forces, and governor of Cuba, dated on the 18th of July, exhorts the natives to repress the natural impetuosity of their character, and to let the peaceable French, who had sought an asylum amongst them from oppression, find protection. The marquis of Villa Vicensis, commander-in-chief of the marine, in one of the same date, says, "Let us swear, that, if every Spaniard in our mother-country should fall, which ought not and cannot be feared, Spain, notwithstanding this, shall not cease to exist. Is not this country also Spain? Are not we also Spaniards? And shall not Ferdinand VII. and his successors reign over us?—Remember!—The French in Cuba are not mercenary assassins! Not servants or subjects of Napoleon." General Linieres, governor of Buenos Ayres, a Frenchman, in his proclamation upon the state of affairs, after recommending concord, said, "Let us imitate the example of our ancestors in this happy land, who wisely escaped the disasters that afflicted Spain in the war of the succession, by awaiting the fate of the mother-country, to obey the legitimate authority occupying the sovereignty." Hostilities were every-where else declared against France, and the most liberal and prompt contributions remitted to the patriots in Old Spain. This year the French were driven out of the islands of Porto Rico, Defeada, and Marie Galante.

The great affairs of Europe in 1808 are exhibited in the contest between Spain and Portugal, with their ally Great Britain, on the one part; and the ruler of France, aided by his vassal princes and kings, on the other. The annals of other countries sink almost into provincial history. To what concerns France, it may be proper to add, that in the beginning of the year Bonaparte, as a preparation for the farther extension and consolidation of his empire, annexed to France, and took possession of, the military posts of Kehl, Wesel, Cassel on the Rhine, and Flushing. It was probably with similar views that he established and endowed a Greek bishopric in Dalmatia.

Sweden, in the beginning of the year, might have made her peace with France and Russia. The king, with the

general voice of the nation, chose a braver, but more impolitic, part. After the basest attempts on the part of the Russians, tutored, it would seem, in the school of their allies the French, to seduce the Swedish nation from their allegiance to their king and their duty to their country, and a rapid succession of the most sanguinary battles, where the Swedes were bending and ready to fall under the overwhelming power of Russia, the Swedish government signed a convention on the 7th of November, by which Finland, the granary of the kingdom, was virtually given up to Russia. The heroic king of Sweden was not deserted in this extremity of fortune by his ally, Britain. A naval force under admiral Keats drove the Russian squadrons into their ports, where they were held in a state of blockade. A land-force of 10,000 men, under the command of sir John Moore, was sent, in the month of May, to assist Sweden against a combined attack from Russia, France, and Denmark. On the 17th of May this army reached Gottenburgh, but was not permitted to land. Sir John Moore repaired to Stockholm to communicate his orders, and to concert measures for the security of Sweden. He there found, to his surprise, that, though the Swedish army was quite insufficient for even defensive operations, his majesty's thoughts were wholly intent on conquest. It was first proposed, that the British should remain in their ships till some Swedish regiments should be collected at Gottenburgh, and that the combined forces should land, and conquer Zealand. Upon an examination of the plan, it was found and admitted, that the island of Zealand, besides several strong fortresses, contained a regular force far superior to any that could be brought to bear against it; and also, that the island of Funen was full of French and Spanish troops, which could not be prevented from crossing over in small parties. It was next proposed that the British alone should land on Finland, storm a fortress, and take a position there. But sir John Moore represented, that ten thousand British troops were wholly insufficient to encounter the principal force of the Russian empire, which could quickly be brought against them at a point so near Peterburgh.—Sir John escaped from the resentment of his Swedish majesty in disguise, and, conformably to his instructions, brought back his little army to England.

In Italy the most prominent events were the transference of the crown of Naples to Murat grand duke of Berg, Bonaparte's brother-in-law; the usurpation of the papal throne, and annexation of Rome, with all the ecclesiastical states, Placentia, Parma, and Anconia, to the French empire. The cardinals were banished from Rome, but allowed considerable pensions. The person of his holiness was secured in a state of confinement. Bonaparte said, that he only took back what had been given to the church for the support of religion and promotion of piety; but, as the munificent donations of his predecessor, Charlemagne, had been used for very different purposes, it was very fit that they should be recalled. The kingdom of Christ, he observed, like a sound divine, was not of this world.

The same pope, Pius VII. that had gone to crown Napoleon at Paris, and agreed to the subversion of the Gallican church, and the diminution of the apostolical power, by the establishment of the concordat, in this terrible crisis assumed the courage and the character of a martyr. He protested, by a public manifesto, against the irreligious and unjust proceeding of the emperor of the French towards the holy apostolical see. He formally excommunicated him. In proclamations addressed to the Spanish, Portuguese, and all other Catholic nations, he exhorted them to the defence of the altar and the throne, at the hazard of their lives, as well as the expense of their fortune. The affecting passage in the evangelists, describing the remorse of the disciple and apostle Peter, at having denied his Saviour, was applied by the Roman-catholics to Pius VII. See Luke xxii. 61, 2.

It seemed matter of astonishment to many, that so subtle

etc and refined a politician as Bonaparte should incur the hazard of exciting indignation, and a spirit of resistance to his aggressions, in all catholic countries, by the spoliation and imprisonment of the pope. But Bonaparte's power had by this time risen to so enormous a pitch, that he did not think it necessary to keep any terms with the opinions and prejudices of men or nations. His general plan was, to arm and direct one half of the world against the other, and to make every thing bend under the weight of military despotism. It is a maxim of Machiavel's, that, when a prince wants to establish his power on changes, he should leave nothing of the old system, but make all things new. Bonaparte, no doubt well acquainted with the *Italian* politician, appears not to have considered himself as secure until all the venerable institutions of society had been trodden under foot. The foundation of Bonaparte's empire was military force and ingenious combination; the spoils of proprietors distributed among military adventurers; and the efforts of states and kingdoms against one another, dextrously turned to the destruction of the whole. But this career of destruction seems to be calculated, by its very nature, to come, at no great distance of time, to a termination; if indeed it be not terminated at the moment we are writing.

The altar indeed was restored, in some fashion, by the concordat, but not religion. Lucien Bonaparte and Portalis, recommending the concordat to the assembly, said, that "Religion was an useful instrument in the hands of government, as well as a consolation to *weak minds and timorous consciences*." Can such a nation as the French venerate a system of pomp and ceremony, avowedly adapted merely to such purposes, and considered by the legislature itself as mere mummery? But the Roman-catholic clergy have been vilified and brought into contempt; not by the ruling powers of France, but by themselves; by swearing, abjuring, and swearing again, according to circumstances, and by the blasphemous adulation of so many bishops and archbishops, who in their pastoral letters, as well as their sermons on public occasions, did not hesitate to call Bonaparte "a new Cyrus whom God has chosen and supports for the accomplishment of his impenetrable designs—whom God brought back from Egypt, in order to make him the man of his right-hand. This is the Lord's doing, and it is marvellous in our eyes."

A few domestic occurrences of this year remain to be noticed.—On the 7th of January, a fire broke out at the printing-office of Messrs. Nichols, in Red-Lion Passage, near Fleet-street. It is supposed to have begun from a snuff of a candle having been dropped in the ware-room. The whole of that very extensive concern was consumed, and valuable works that had been accumulating for many years (particularly a large stock of the Gentleman's Magazine) were entirely lost. Messrs. Nichols and son were insured to the amount of 12,000*l.* but that sum was by no means equal to cover their loss. The Red-Lion public-house, Mr. Edwards's printing-office, the Scottish Hospital, and some other adjacent places, sustained partial injury.

On the 20th of September, about four o'clock in the morning, Covent-Garden theatre was discovered to be in flames; and so fierce and rapid was the fire, that no exertions could stop its course. Within less than three hours the whole of the interior was destroyed: nearly all the scenery, wardrobe, musical and dramatic libraries, and properties of all kinds, were a heap of smoking ruins. The books of accounts, deeds, and the receipts of the preceding night's performance, were fortunately preserved. A considerable number of engines promptly attended; but there was a total want of water for some time, the main pipe having been cut off with the intention of laying down a new one; and above an hour elapsed before some of the engines could be supplied. During the time that there was no supply of water, the most essential as-

sistance for the neighbours was derived from the pumps of the Bedford coffee-house. The engines afterwards played with the utmost effect for upwards of an hour, when the roof of the theatre fell in with a dreadful crash, and thus announced the destruction of the interior of this elegant building. The fire raged with most violence at the upper end of Bow-street; on the western side of which, the houses No. 9—15 were completely destroyed; and Nos. 16 and 17 seriously damaged, though not entirely consumed. In Hart-street, the flames communicated to the houses opposite the theatre, and four caught fire at the same moment; but, by the great activity of the firemen, they suffered little more damage than a severe scorching. As to the theatre itself, it was totally consumed; and, on the Hart-street side, not even the walls were left standing.

The most painful part of this dreadful event remains to be described. At an early stage of the fire, a party of firemen broke open the great door under the Piazza; and, having introduced an engine belonging to the Phoenix fire-office into the passage, they directed it towards the galleries, where the fire appeared to burn most fiercely; when, dreadful to relate, the burning roof of the passage fell in and buried them, with several others who had rushed in along with them, in the ruins. It was a considerable time before the rubbish, which now blocked up the door, could be cleared away. When it was effected, a miserable spectacle presented itself; the mangled bodies of dead and dying appearing through the rubbish, or discovered in each advance to remove it. Eleven dead bodies were carried into the church-yard of St. Paul, Covent-Garden. Some were sent to St. Bartholomew's, and others to the Middlesex Hospital, miserably mangled, with broken limbs and dreadful bruises.

The insurances on the theatre scarcely exceeded 60,000*l.* and the savings from the premises amounted to 3500*l.* more, which, upon the whole, was not more than one-fourth part of the sum requisite to replace the loss. Besides the usual stock of scenery, there was an additional quantity for a new melo-drama, which was shortly to have been brought forward. Of the originals of the music of Handel, Arne, and many other eminent composers, there are no copies; and of many other pieces of music, only an outline had been given. Some excellent dramatic productions, the property of the theatre, have also been forever lost. It is supposed, with some probability, that the calamity was occasioned by the wadding of the gun fired during the performance of Pizarro, having lodged in one of the scenes. The Bedford and Piazza coffee-houses escaped the flames, owing to a wall which had been erected by the proprietors of the theatre, a short time before, to insulate the theatre from the back of those premises. Too much praise cannot be bestowed on the prompt attendance and active exertions of the volunteer corps, which prevented many depredations; who were afterwards relieved by parties of the life and foot guards.—The organ, left by Handel as a legacy to the theatre, stated to be worth upwards of 1000*l.* and which was played only during the Oratorios, was consumed.—The beef-steak club also, which held its meetings at the top of the theatre, (in addition to their stock of wines, valued at 1500*l.*) had to regret the loss of the table-service and dinner-implements. Mr. Ware, the leader of the band, lost a violin of 300*l.* value, which he had left behind him that night for the first time in two years; Mr. Munden, his wardrobe, which could not be replaced under 300*l.* Miss Bolton, her jewels; and the other performers property, in the aggregate, to a considerable amount.—It is almost too painful to describe the situation of those persons who were dug out of the ruins alive; they were, in general, so dreadfully burned as scarcely to be recognized by their nearest relations; and their flesh, in several instances, literally peeled from off the bone. The dead bodies taken from the same place were nearly shapeless trunks.—Another accident happened the next day by the falling of a

wall in Hart-street, which killed one man and bruised several others. A subscription was opened, and liberally patronised, for the relief of the sufferers. The Opera-house was, with much liberality, offered by Mr. Taylor to Mr. Harris; and the Covent-Garden company, a few days after the event, performed there.

No time was lost in clearing away the rubbish, and in beginning to rebuild; and on the 31st of December following the foundation-stone of the new theatre was laid by his Royal Highness the Prince of Wales, as grand-master of the Free-Masons. The spectacle was unusually interesting, as it is not recorded that so distinguished an honour was ever conferred by any prince of Wales upon a similar edifice. The preparations and arrangements were every-way worthy of the event. Detachments of horse and foot guards were stationed to prevent the influx of the populace, and clear the avenues to the ground. The disposition upon the site of the building, both for the ceremonial and for the accommodation of the spectators, was extremely judicious. At the north-east corner of the intended stage of the theatre, the foundation-stone, containing nearly sixty cubic feet, and weighing three tons, was suspended over a basement-stone. On the west side, a covered and extensive awning, with a parapet in front, and inclosed behind, furnished with ranges of seats, was appropriated for the reception of the spectators, who filled it before twelve o'clock. On the opposite side, and parallel to Bow-street, another inclosed awning was constructed for the numerous deputation of free-masons. Near the stone was erected a spacious marquee for the illustrious grand master and his suite. On an elevated platform, parallel to Hart-street, were placed the military bands of the two regiments of horse-guards, the Coldstream and 3d regiments of foot-guards, and that of the city light-horse in full uniform. The grenadier-company of the 1st regiment of guards, with their colours and band, were stationed near the Bow-street entrance, as a guard of honour. At the angles of the ground were hoisted naval and military flags; and, near the stone, the royal standard of England. Upwards of seven hundred workmen, employed in the building, were placed on surrounding scaffolds. At twelve o'clock the grand officers of the several free-masons' lodges, with the principals of the craft, amounting to near four hundred, decorated with their paraphernalia, entered, the chevalier Ruspini bearing the sword before them, as grand tiler, and a band preceding; these took their stations in the gallery. The several bands now played alternately till one, the hour fixed for the arrival of the prince of Wales; at which time his royal highness, accompanied by the duke of Suffex, attended by general Hulse and colonels M'Mahon and Bloomfield, arrived under an escort of horse-guards. His royal highness was received, on his entrance at the Bow-street door, by earl Moira as deputy-grand-master; the detachments of guards saluting with grounded colours, and beating the grenadiers' march. The arrival was announced by loud plaudits of the people, and the discharge of a royal salute of artillery. The prince was dressed in blue with a scarlet collar, and decorated with the insignia of his office as grand-master. As he proceeded uncovered, with his suite, over a railed platform spread with green cloth bordered with scarlet, the company all rose and gave him three cheers, the united bands playing God save the king. Mr. Harris and Mr. Kemble, having paid their respects to his royal highness, ushered him to the marquee. Mr. Smirke, the architect, now presented a plan of the building to his royal highness, who, attended by all the grand masonic officers, then proceeded to the ceremonial. On a signal given, the stone was raised several feet; his royal highness advanced to the north-east corner of it, and deposited in a space cut in the basement a brass box, containing the British coins of the year, and a bronze medal bearing a likeness of the prince, with this inscription on the reverse—*Georgius princeps Walliarum Theatri Regis insaurandi, auspiciis, in Hortis-Benedictinis Londini*

*sua manu locavit M.DCCC.VIII.*—Another medal also accompanied the above, with the following inscription: "Under the auspices of his most sacred majesty George III. king of the united kingdoms of Great Britain and Ireland, the foundation stone of the Theatre, Covent Garden, was laid by his royal highness, George prince of Wales, M.DCCC.VIII." On the reverse of this medal is inscribed: "Robert Smirke, architect."

Six hod-men now conveyed the necessary quantity of cementing-mortar, which was spread on the base-stone by the same number of workmen. His royal highness then, as grand-master, finished the adjustment of the mortar with a silver trowel presented to him by earl Moira; the stone was then lowered to its destined position, all the bands playing Rule Britannia, and the people applauding with the most animating cheers. The prince then tried the work by the plumb, the level, and the square, which were presented to him by the proper masonic officers, and then finished laying the stone by three strokes of his mallet; three silver cups were then successively presented to him, containing the ancient offerings of corn, wine, and oil, which he poured over the stone with impressive solemnity. His royal highness then restored the plan of the building into the hands of the architect, desiring him to complete the structure conformably thereto; and, addressing Mr. Harris and Mr. Kemble, wished prosperity to the building and the national objects connected with it. Thus closed the ceremony; and his royal highness, who performed his part with dignity, and whose manners during the whole time were highly captivating, retired to his carriage under another salute of artillery, and amidst the acclamations of the multitude.

The metropolis has seldom witnessed a more tremendous gale of wind than that which commenced on Monday, the 10th of April, and raged with uncommon violence from ten till near three o'clock. Several ships in the river drove from their moorings. About one o'clock a large sheet of lead was raised, by the violence of the wind, from off the top of a house in Ludgate-hill, and thrown down on the pavement: in its way it broke a part of the parapet wall, which fell on the ground with a terrible crash. The hand of Providence was never more visible than in this instance; for, though the street was crowded with passengers, yet none received the smallest injury.

The summer of this year proved remarkably hot. From Hayes in Middlesex we have a particular account of the heat, as observed in a north open aspect by two thermometers, quite detached. On Tuesday the 12th of July, at two P. M. both stood at 87°; at midnight, 69; at half past eleven in the morning, 90; and at one had fallen to 88. The hot Sunday and Tuesday, in the year 1790, only amounted to 83 degrees in open shaded situations. The average heat of the West Indies is about 82 degrees. The thermometer, which is always exposed at the optician's under the northern entrance of the Royal Exchange, was on Thursday at noon, at 87. The thermometer in the shade at a window in the open air, opposite St. James's Park, without any reflection of heat, was on the Tuesday at three o'clock P. M. at 88, and on Wednesday at 94. In a transparent glass thermometer at a window in the Strand, on Wednesday afternoon, it was 101.—The heat of the atmosphere in the north-eastern parts of Lincoln, on Wednesday the 13th, exceeded what it is stated to have been in any other part of the kingdom. A thermometer, hanging in the shade, in a north aspect, at Gainborough, at one o'clock in the day stood at *ninety-four degrees* (ten degrees higher than the meteorological records of this country state it to have ever been before). Human efforts were paralysed under such a temperature, and many of the brute creation died. A respectable correspondent assures us, that a large quantity of sheep was found dead at Burgh in the Marsh, and in the neighbourhood of Spillby, which had perished by the heat.

Lord Eldon has informed us, from the woollack, that "the virtue and morality of the higher orders alone keep

us together as a nation."—In the Sheriff's Court, July 19, an inquisition was held to assess damages in an action brought by lord Boringdon against sir Arthur Paget, for criminal conversation with lady Boringdon. The defendant had first pleaded the general issue; afterwards he withdrew that plea, and suffered judgment to go by default.

Mr. Parke, on the part of the plaintiff, addressed the jury. He stated that the noble plaintiff was a person of the highest rank, who complained against the defendant for one of the greatest injuries which a man could suffer in civil society. The defendant was also a person of *high rank*, and was the second son of a noble family, and had been entrusted by his sovereign with high official situations. The plaintiff and defendant had been at college together, and were co-students on the same foundation; which was a circumstance, as he thought, of great aggravation. The lady, to whom the plaintiff was united, was the second daughter of the earl of Westmoreland; he became acquainted with her in May 1804, and in the June following they were married; the lady at that time not being much more than eighteen years of age. They continued to live together in a state of the utmost harmony and felicity, as he should prove by many witnesses of the highest respectability, until the period when her affections were seduced by the artifices of the defendant. When or at what period the criminal intercourse took place, he was not prepared to prove; but it had been remarked, that sir Arthur Paget was very constant in his visits to the lady, and those visits were always when the plaintiff was from home. Lord Boringdon was in the habit of strictly attending to his parliamentary duties; and, as soon as he had left the house, the defendant came there; so that he must absolutely have been upon the watch, to avail himself of the moment of his lordship's absence. Lady Boringdon was also in the habit of going to Kensington-gardens in the morning, and sir Arthur Paget as regularly met her there; as soon as they met, she parted from her nurse and her child, and walked away in private with the defendant. This intercourse continued for some time before it came to the knowledge of the plaintiff; but at last he received an intimation of the frequency of the defendant's visits during his absence, which induced him at length to mention the fact to the lady, and enquire into the occasion of them. The result of this was, that on the next day, the 10th of May, the lady quitted her husband's house, and had from that time been living *under the protection* (as it was called) of the defendant. The province of the jury now was, to determine what damages they would give the plaintiff as a recompense for the injury sustained; and surely no injury could be greater, nor had ever man deserved it less. His lordship defied the world to show any spot on his character, either as a husband or as a man; and, with respect to his conduct to his wife, her own letters would show how fondly attached to him she was before her affections were seduced. The learned counsel here read extracts from two letters, dated in 1804 and 1806, replete with expressions of fondness and affection; in one of which she apologizes for not going to church, according to his orders, on the ground of her ill health; and in the other she lamented the delay of his company for a single day. Having concluded these topics, Mr. Parke said he demanded such a verdict, as justice, reason, and religion, required.

Several witnesses fully proved the facts stated by Mr. Parke; after which, Mr. Garrow, on the part of the defendant, addressed the jury. He insisted on the known inability of sir Arthur to pay large damages; and attributed the lapse of the lady to the fashion of high life, which leaves a woman exposed to the attacks of a seducer, and that she falls frequently before she is aware of her danger. The jury, after some consideration, found a verdict for the plaintiff—Damages, *Ten thousand pounds*.

On the 12th of May following (1809), the sheriff was again called upon to assess damages in an action Henry

Wellesley, esq. against lord Paget, (now earl of Uxbridge;) the defendant having, as in the former case, suffered judgment to go by default, thereby acknowledging the adulterous intercourse.

Mr. Garrow, with great eloquence and feeling, depicted the previous state of happiness enjoyed by the plaintiff and his wife, and recounted the numerous offspring, the fruit of their connubial intercourse. He then drew an afflicting picture of the mental distress into which the incontinence of his lady had plunged him. Nor was he less eloquent in describing the misconduct of the defendant, who, he said, had courage enough to conquer every other enemy but his own passions. This speech was followed by evidence of the facts; and a speech in mitigation of damages by Mr. Dallas: when the jury found a verdict for the plaintiff—Damages, *Twenty thousand pounds!*

The elopement of lady Charlotte Wellesley with lord Paget, which gave occasion to the above action, took place in the afternoon of Monday, the 6th of March. Mr. Henry Wellesley, who was secretary of the treasury, had spoken, it seems, more pointedly than ever to lady Charlotte, on the very marked and constant attentions of lord Paget, which (though, from the long and confidential friendship which had subsisted between the families, he did not apprehend to be dishonourable) might affect her reputation in the world. Lady Charlotte was *indignant at the idea of reproach*, and hurried out with her servant to take the air in the Green Park. She desired him to remain at the gate, as she should walk for a short time; and it appears that her ladyship took a hackney coach, and sent a note to lord P. at Uxbridge-house. They met; and, in this state of irritated feelings, and probably on the consciousness of guilt, they set off together. As she did not return to dinner, inquiries were made. The servant had continued at the gate of the Green Park till a late hour; and, on his return home, being questioned, he gave the above account. The melancholy truth was confirmed by a letter, which lord P. wrote to his father, in which he acknowledged his trespass—and that he had in vain, in the heat of battle, sought a refuge from the agonies of a distracted mind. It is certain that on every occasion in Spain, he exposed himself in a way which got him the reputation of a rash and adventurous gallantry; as it could not be imagined that a nobleman apparently gifted with all the means and objects of happiness could be in reality unhappy. The two sisters, lady Charlotte and lady Emily Cadogan, married two brothers, Henry and William Wellesley. Lord Paget was married to one of the beautiful daughters of lady Jersey, by whom he has a numerous family. This lady, the very next year, sued out a divorce from his lordship, on the score of adultery; and she then (November 29, 1810.) married the duke of Argyll.—Thus we hope we have made out lord Eldon's position, as to the virtue and morality of the higher orders. If not, we shall be obliged, in our account of a leading transaction in the year 1809, to go still higher, from the officer to the commander-in-chief.

In the quarter which ended on the 10th of October, the produce of the consolidated fund fully justified the expectations upon which the estimates of the last session were founded, the surplus was the largest that had been known in any preceding quarter: it amounted to 2,714,117l. In the quarter ending the 10th of October, 1807, it was 2,310,000l. Such was the condition of the permanent revenue. With respect to the war-taxes, accounts were not less favourable; their whole amount, in the quarter ending the 10th of October, was 6,403,705l. In the quarter ended 10th October, 1807, it was 6,179,073l. The property-tax alone produced, in the year ending October 1808, 11,851,000l.

1809. The principal features of this year, and the two most important objects which fixed the attention abroad and at home, were, on one side, the expedition of sir John Moore, and its unexpected failure; and, on the other, the attack upon the duke of York, and its result.

After the most important events in the peninsula during the summer of 1808, namely, the surrender of Dupont, the flight of Joseph Bonaparte from Madrid, and the convention of Cintra, the French army retired from Madrid, and repassed the Ebro, expecting reinforcements, and surveying at their ease the unconnected movements of the Spaniards. At the same time it was reported here and in Spain, that the insurrection there was universal; and this belief was so prevalent, that, in a memorial transmitted for the information of sir John Moore by the British secretary of state, it was stated, that the French armies could not enter the defiles of Asturias without exposing themselves to be destroyed even by the armed peasants. In the month of September it was considered as most probable, that the Spaniards alone would soon drive the French out of the peninsula. Lord William Bentinck was directed to make enquiries respecting the intentions of the Spanish government, on the expulsion of the French; and directions were given, under particular circumstances, to urge the invasion, with a combined British army, of the south of France. Such was the flattering picture presented to the view of sir John Moore, before he commenced his march, and was enabled to judge for himself.

The glorious events which have since taken place, prove, that this sanguine expectation, if premature, was not ungrounded; and, if not founded upon immediate probability, was however supported by the idea of eventual possibility. However, to execute the plans of the ministers, sir David Baird arrived at Corunna on the 13th of October, but was not permitted to land till the 31st, by which time advices had been sent, and orders received, from the junta at Madrid. This intelligence, which was communicated to sir John Moore previously to his leaving Lisbon, gave him some idea of the fort of co-operation and assistance he had to expect from the Spanish government.

The British army, in its march through Portugal, had experienced sometimes the cool civility to allies whose assistance was acceptable, but oftener a constrained hospitality towards guests whom it would be dangerous to refuse. The people, entirely destitute of public spirit, took no part whatever in public affairs. They were, besides, slothful, and altogether uninformed of what was passing in the world, and even of the political and physical circumstances of their own country. Of their ignorance, sir J. Moore had a striking proof in the accounts they had given him of their own roads, which he found, on his arrival at Atalaia, to be practicable for artillery; a discovery which, if it had been sooner made, would have been of the utmost importance, in sparing general Hope's circuitous course by the Escorial, and thus enabling the various columns more speedily to effect their junction. These circumstances were not calculated to give the English any favourable prepossession of the people they were sent to defend. Better things, however, were to be expected from the Spaniards; and, with this impression, the army looked towards the elevated site of Ciudad Rodrigo, where it was received with shouts of *Viva los Ingleses*, and a greater degree of enthusiasm than had yet been witnessed. But, according to stated fact, we have to deplore the oblique conduct and tardy co-operation of the unsettled junta, which governed the Spaniards at this time; and, whatever energies might exist among the people, sir John Moore had reason to complain, that no measures were taken by the government to call them forth into action.

When the three armies destined to cover the junction of the British forces had been defeated, one after the other, as related in p. 183, the question with the British army was no longer how it might serve the Spaniards, but how provide for its own safety. It was, whether 29,000 British troops should be opposed to the undivided attack of 200,000 French; or whether, by retiring upon their resources at Lisbon, they should preserve themselves for more fortunate times. Sir John Moore was not a moment undecided. He wrote immediately to sir David Baird to retire upon Corunna, and from thence to join him by sea

at Lisbon. General Hope, who had advanced to the neighbourhood of Madrid, received orders, according to circumstances, either to rejoin the main body or retire upon Guadarama. Sir John Moore, then, assembling his general officers, and communicating both the intelligence he had received and the plan he had in consequence adopted, told them, "that he had not called them together to request their counsel, or to commit themselves by giving any opinion on the subject: he took the responsibility entirely upon himself; and he only required that they should immediately prepare for carrying it into effect." This plan of retreating was, however, afterwards abandoned by sir John Moore, on account of his receiving intelligence that the remains of Castaños's army were coming up to join him; and that general St. Juan, with 20,000 men, had twice defeated the enemy; and, lastly, that Bonaparte was at Burgos. But this intention did not last long; for contrary reports soon forced sir John Moore to revert to his first resolution.

It is almost impossible to conceive what hardships of all descriptions, and from all quarters, the prudent and brave sir John Moore had to endure. Our soldiers detested and despised the Spaniards for refusing to open their doors to the allies and defenders of their beloved Ferdinand. They were disappointed and soured at retreating from the approach of the enemy; and this they attributed to the cowardly conduct of the Spaniards, by whom they considered themselves to have been betrayed. The Spanish peasantry and villagers, again, poor and destitute of every thing beyond mere necessaries, were but ill disposed to share their pittance with men whom they hated and even abhorred as heretics, whom they dreaded as guests, and whom they now conceived to be abandoning them to all the fury of an enraged enemy. Such wants and sentiments on either side engendered all the bitterness which marked the intercourse of the two nations during the remainder of the campaign.

Aided by lord Paget and general Crauford, general Moore prevented the duke of Dalmatia, who had crossed the Eslar at Mansilla, from occupying Astorga before the arrival of the British army. Soon after this, the British commander, uniting his army with the division of sir David Baird from Valencia, proceeded, on the 30th of December, on Villa Franca and Lugo. At Astorga all the superfluous camp-equipage was destroyed, and all the sumpter mules, hories, &c. that could not keep up with the columns, abandoned. On the march from hence the military chest was sacrificed: barrels full of dollars were staved, and precipitated over rocks, into ravines, dens, and rivers. From Astorga to Lugo the road lay for the most part through bleak mountains covered with snow, affording so scanty a supply of provisions, that the troops were sometimes two days without taking any food. During this march, the extremes of vice and misery seemed to meet. In some of the villages the unburied dead bodies of the inhabitants lay outstretched before the doors of their own houses, from which they had been driven by the unrelenting soldier, urged by his own necessities, to perish with cold and hunger. In others no traces of inhabitants were to be found. Stragglers from different corps plundered the different magazines, commissariat-stores, and cellars, and afterwards lay intoxicated by the way-side, mixed with the sick and those overcome with fatigue, to be trampled under foot or mangled by the sabres of the enemy's cavalry. Besides the terrible example noticed in a letter from sir John Moore to the marquis of Romana, of a soldier shot at Villa Franca, other warnings were held up by the general, not less impressive: several stragglers, who had been hacked and hewed by the French troopers, were led through their respective corps as examples of the consequences of drunkenness and disobedience to orders.

Bonaparte, having been joined by the duke of Dalmatia at Astorga, after reviewing his troops to the amount of 70,000 men, had dispatched three divisions, under three marshals,

marshals, in pursuit of the English army. The tardiness of the junta expressed by Mr. Frere in his letter to sir John Moore, the indecisive fluctuations of the government as to the means of defending the country, and several other imperious motives, suggested to the British commander the necessity of abandoning a country and a people who seemed to think so little of themselves, that they could hardly be persuaded to do any thing for their own security.—A retreat, therefore, was determined upon.

On the 11th of January, 1809, the British army marched from Betanzos to Corunna; having now traversed two hundred and fifty miles of mountainous and difficult country, in the face of an enemy immensely superior in numbers; very often without food or shelter, drenched with rain, and worn out with cold and fatigue; yet still unbroken, presenting every where an undaunted front to the enemy, who had not to boast of having won a single trophy. As yet, however, they were not in safety; very few transports having arrived from Vigo, owing to contrary winds. The position of Corunna was bad; and the enemy were assembling on the heights which surround it. There were not wanting generals who advised sir John Moore to offer terms to the duke of Dalmatia, for the purpose of being allowed to embark in safety. But the British general was determined not to accept of any terms, which (to use his own expression) would be in the least dishonourable to the army or to the country.

The peninsula of Betanzos, sir John Moore had reason to hope would afford a position for defending the embarkation; and was also so much nearer, that, had not contrary winds detained the transports two days longer at Vigo, the army would have embarked unmolested. As this was not the case, the general prepared for action, by occupying a small chain of hills, a short distance from Corunna. The enemy occupied a more extended chain in his front; and a valley, with the village of Elvina, separated the two armies. From the 13th to the 15th, the embarkation of the sick, the artillery, horses, &c. was going on; the enemy, in the mean time, gradually drawing round, and skirmishing with our out-posts.

On the 16th of January, when orders had been issued for the embarkation of the whole army, general Hope reported from his post, that the enemy's line were getting under arms. Sir John flew to the field, where the pickets were engaged, and beheld the French descending from the hills in four columns, two of which threatened the right of the British line, composed of sir David Baird's division; upon whose right the rifle-corps formed a chain across the valley, which united it with general Frazer's division; the whole stretching in an oblique direction towards Corunna. Sir John Moore, perceiving that the great effort of the enemy would be directed against lord W. Bentinck's brigade, and general Manningham's, which composed sir David Baird's right wing, had ordered general Frazer to move up, and general Paget to support lord W. Bentinck with the reserve. The 50th and 42d, which composed the remainder of lord W. Bentinck's brigade, charged gallantly, and drove the enemy from the village of Elvina with great slaughter. Sir John Moore was in the act of ordering up the guards to support the brave Highlanders, when he received his death-wound by a cannon-ball on the shoulder, and was conveyed from the field, in a blanket, by six soldiers of the 42d. Sir David Baird had already left the scene of action from a severe wound in his arm. The soldiers, however, undismayed by the loss of their leaders, maintained the advantages they had gained on the right, and continued to repel the repeated attacks of the enemy on their centre and left, until night left them masters of the field. Not more than 15,000 British were engaged, of whom about 7 or 800 were killed or wounded. The French engaged in this battle were estimated at 20,000; and consisted, in part, of the regiments sent back from Portugal to the ports of France nearest to Spain, by the convention of Cintra; their loss was reckoned at about 2000. General Hope, on whom the chief command de-

veloped, took advantage of the success which had been obtained to embark the army, before it should be overwhelmed with the increasing numbers of the enemy. The boats were all in readiness, and the previous measures were so well concerted, that nearly the whole army were embarked during the night.

While general Moore was conveyed in the manner above-mentioned from the field, captain Harding, observing that his sword incommode him, attempted to unbuckle it: "It is as well as it is," said he, calmly; "I had rather it should go out of the field with me." He was so sensible of his approaching dissolution, that he said to the surgeons who offered their assistance, "You can be of no service to me: go to the soldiers, to whom you may be useful.—You know," said he to his friend colonel Anderson, "that I have always wished to die this way. I hope the people of England will be satisfied: I hope my country will do me justice." The remainder of his moments were consecrated to tender remembrances, and enquiries about the fate of his friends.—He was buried in his uniform upon the ramparts of Corunna; where a monument to his memory has been since raised by the marquis Romana. A monument also, in consequence of an address to his majesty by the house of commons, was ordered to be erected to his memory in the cathedral church of St. Paul, London.

The consequence of these defeats in Spain was, that Joseph Bonaparte was again conducted safe to Madrid, where he was crowned towards the end of January 1809; after he had been previously acknowledged and proclaimed in the principal towns throughout the country, with the exception of those of Arragon, Murcia, Grenada, and Andalusia. The ceremony was performed with the utmost pomp, and attended by persons who assumed the character of deputies from the different kingdoms of Spain. Bonaparte himself returned to Paris on the 22d of January, 1809.

After the reduction of Madrid, a large force was sent by Bonaparte to Talavera del Reyna, with the view of reducing Cordova, Seville, Cadiz, and Lisbon. Marshal Soul took possession of Oporto, though occupied by a garrison three times his number, without any resistance. Ney, strongly reinforced by Kellerman, with Mortier and Bonnet at Lugo, made progress in Galicia, Asturias, and Biscay. Ferrol, as well as Corunna, Bilboa, and St. Andero, and all places of most importance on the northern coast of Spain, fell into the hands of the French. On the whole, it was evidently the design of Bonaparte, after having obtained possession of Madrid and the fortresses on the frontier, to subdue the whole peninsula by sending corps or columns, according to the nature and strength of the different territories, against the most important towns, and into all the valleys, great and small, of the country. But it appears from the whole tenor of his conduct, both military and political, that it was amongst his leading maxims, never to carry on more than one arduous design at the same time; but to bear with his main force and undivided attention on one object. Wherever the main strength of his enemy lay, thither he bent his most strenuous efforts. If that were once broken, secondary objects would fall into his hands of course: if that were suffered to remain entire, no conquest could be other than precarious and transient. When, therefore, it became evident to Bonaparte, that a war with Austria was altogether unavoidable, the war in Spain assumed a new form. Instead of pushing forward detachments into unsubdued provinces or districts, the first care of the French, for the present, was to provide for their own security by concentration. The march on Cadiz and Lisbon was suspended: the French were every-where seen drawing nearer and nearer up the Tagus towards Madrid; or creeping near the frontier fortresses of Catalonia and Navarre; or concentrating their force in the northern provinces of Galicia, Asturias, and Biscay. To retain a sure footing in Spain by keeping open the communication between Bayonne and Madrid; retaining

retaining possession of the capital and other towns in the interior of Spain; the northern provinces, together with Navarre and Catalonia; and to complete the conquest of all that lay on the east side of the Ebro, by reducing the fortified cities of Saragossa and Gerona; were the objects that seemed to bound the views of the French in Spain during the first part of the year 1809.

But, while hostilities were carried on with alternate success in Asturias and Biscay, and several important places were taken and retaken by the joint exertions of the Spanish patriots, supported by English ships of war, a line of which extended from Cape Finisterre to the Garonne, the French were, at the close of June, obliged to evacuate both Ferrol and Corunna. St. Jago de Compostella, the capital of Galicia, fell into the hands of the patriots. Vigo too, garrisoned by 1400 French, surrendered to the Galicians, supported by two English frigates. The French were afterwards driven from the towns of Tuy and Viana.

Three armies were formed for acting, it would seem, in concert (rather in conjunction) with each other, against the French, and even advancing on Madrid. One of these armies was commanded by general Cuesta, another by general Venegas, and the third, which was the auxiliary British army, by sir Arthur Wellesley. Cuesta had under his immediate orders about 38,000 men, of which 22,000 were cavalry; the right wing, commanded by Venegas, was 26,000 strong; and the left, under sir Arthur Wellesley, 30,000.

On the side of Portugal, general Beresford, with the rank and title of field-marshal, was appointed generalissimo, and was employed with great activity and success in organizing and disciplining a Portuguese army. Chaves, a frontier town of Portugal, in the province of Tral-os-montes, a most important military station, and garrisoned, it was said, by upwards of 10,000 French, was besieged by a numerous force of Spanish patriots, under the command of general Silveira: the citadel of Chaves surrendered by capitulation on the 25th of March.

On the other hand, a complete victory was gained, on the 28th of March, by marshal Victor over general Cuesta. Victor, with about 20,000 infantry and 3000 cavalry, was drawn up in front of Medellin, a town on the Guadiana, in the province of Estremadura. The flanks of his infantry were covered by the cavalry; and in their front were raised six batteries. Cuesta advanced with great steadiness and gallantry, notwithstanding the tremendous fire from the batteries in front of the enemy. The left wing of the Spanish infantry advanced within pistol-shot of the French. The first battery was already taken. The French cavalry made a charge, in order to regain possession of it. Two regiments of Spanish cavalry and two squadrons of chasseurs were ordered to oppose them; but, instead of executing this order, the whole, both cavalry and chasseurs, immediately wheeled round, fled before the enemy, and threw the left wing of the Spanish army into confusion. General Cuesta did every thing in his power for the restoration of order in his left wing, and to check and repel the attack on his centre and right. His efforts were in vain: he was obliged to retreat. The French, under Victor, immediately entered Merida, where, and between which place and Badajoz, they remained for a considerable time stationary; after which they marched from the Guadiana to the Tagus; and, having forced the bridge of Alcantara, proceeded down the river with their face towards Abrantes and Lisbon.

Sir Arthur Wellesley, who had arrived at Lisbon on the 22d of April, proceeded on the 28th to join and take the command of the army, whose head-quarters were at Coimbra, and advanced against Oporto. At the same time, marshal Beresford, at the head of a body of Portuguese, marched to the Upper Douro. Soult, who commanded there, knowing how unequal he was to its defence against an English army of superior force, the forces under general Beresford, and the spirit of the country, determined

to evacuate Oporto, and proceed through Leon to join the other French corps in Galicia, according to the general system of concentration adopted after the certain and immediate prospect of an Austrian war, as already stated. The marshal, that he might effect his retreat with the least danger of being overtaken by the English, adopted a curious stratagem, which was found not to be altogether unsuccessful. While he talked loudly of defending Oporto to the last extremity, he sent out one detachment of his army after another, on pretence of exercising. The commanding officers of these alone were entrusted with the secret orders, to send back a few companies, by way of a blind, but to march the main body, with all possible expedition, in an opposite direction. Thus the marshal stole away from Oporto. On the night of May 11th, his rear guard crossed the Douro, destroyed the bridge, and were closely pursued by our army, which also crossed the Douro, notwithstanding all the endeavours of the French to oppose it, at the ferry of Oventas. About four or five miles above the towns of Oporto and Villa Nova, our troops, after sustaining repeated attacks, made their appearance on both the left and right flanks of the French, who then retired, as the dispatch to our government states, in the utmost confusion towards Amaranthe, leaving behind them five pieces of cannon, eight tumbrils of ammunition, and many prisoners. They were pursued by the British to a short distance, and some skirmishing took place between our advanced guard and the rear of the enemy, in which it was stated we had uniformly the advantage; Soult, however, made good his retreat, it would appear, with very little molestation, though it was said, that, in order to render his flight more rapid and successful, he was under the necessity of abandoning the greater part of his artillery and baggage. He was pursued by general Beresford as far as Orense. When sir Arthur Wellesley's letter to lord Castlereagh, giving an account of these and other particulars respecting the evacuation of Oporto, and what had been done by our army, arrived, his lordship ordered the Park and Tower guns to be fired.

Sir A. Wellesley, after he gave up the pursuit of Soult, immediately commenced his march to the south of Portugal, where his presence had become necessary to watch the motions of Victor.

Marshal Ney, having evacuated Corunna, at first took the road towards Vigo. Thither also a body of Spaniards, under the conde de Norona, were on their way, with the twofold view of obtaining supplies, of which they stood greatly in need, and occupying an advantageous defensive position. On the 7th of June the opposite armies met at the bridge of St. Payo, on the small river of Soto-major, within three leagues of Vigo. The Spaniards were 9000 in number, whereof 6000 only were armed; and they had some small field-artillery, with two 18-pounders. The number of the French was 8000, of which 2500 was cavalry; for artillery, they had only five 12-pounders. After repeated attacks on the Spaniards, on both the 7th and the 8th, the French retreated to St. Payo, from whence also they were driven back farther, throwing their dead bodies in great heaps into pits and wells.—The Spaniards, in these actions with the French, were very materially assisted by four gun-boats, sent up the river by the British commodore at Vigo. The loss of the Spaniards, in the encounters at the bridge of St. Payo, did not exceed 110 in killed and wounded.

In the north-east of Spain, after the fall of Saragossa, a Spanish army under the command of general Reding, employed chiefly in attempts to raise the siege or else to throw succours into Gerona, was exposed to the whole force of the enemy. Two conflicts were sustained by the Spaniards with great valour. The strength and the resolution of the opposite armies seemed to be nearly balanced; but the French received a reinforcement of 8000 men, which turned the scale in their favour. Thus encouraged, they made a third attack, when the patriots were completely routed; and general Reding, who had received

five severe wounds, was conveyed from the field of action to Tarragona. The general, in his dispatches to the junta, gave a faithful account of what had passed, without saying a word of what he had personally suffered. He was afterwards joined by the army under general Blake, and both were employed in opposing the progress of the French in Catalonia.

On the 19th of May, the joint army of Valencia and Arragon, under the command of general Blake, proceeded against Alcaniz, a town of Arragon, near the frontiers of Catalonia, which was occupied by the French; drove them in great disorder from that important post, and afterwards routed and forced smaller parties of French from other places. On the 15th of June, general Blake made an attack on Saragossa, but was repulsed with great loss. For two successive days he was attacked by Suchet, in the neighbourhood of Belhite, when the enemy was repulsed. On the third day the battle was renewed in the valley of Almonazir, when the whole of the Spanish army, without firing a shot, though opposed by only one-third of their numbers, suddenly took flight, and left their general attended by only six or seven officers. This army not only abandoned their baggage, but threw down their arms. Nine pieces of cannon, immense quantities of provisions, stores, and ammunition, fell into the hands of the French, together with 3000 prisoners.

The corps or armies of the French generals Victor and Sebastiani, after long retrograde marches, the former on the shores of the Tagus, the other through the deserts of Castille, had united their forces at a short distance from Toledo. Their united force, with the reinforcement brought by king Joseph from Madrid, has been computed variously, from 34 or 40 to 50,000. It was stationed in the neighbourhood of Talavera del Reyna, and along the banks of the river Alberche.

In the mean time sir Arthur Wellefley, after his return from the pursuit of Soult, had remained long inactive in the vicinity of Lisbon; not by any means from his own disposition, which was full of activity and ardour in the cause, and forward and adventurous in quest of personal reputation; but because it was necessary that some plan of co-operation should be concerted between him and the Spanish generals, particularly general Cuesta. When this was effected, the British and Spanish generals began their march towards Madrid. A complete junction of their armies was effected on the 20th of July, and immediate measures were taken for carrying into effect the plan of operations agreed on. Sir Robert Wilson, who commanded a corps of Portuguese to the number of three or four thousand men, which he had brought into a state of excellent discipline, was ordered to proceed to Escalona, on the river Alberche, and the corps under Venegas advanced to Argonda. The main strength of the allied army marched on towards Ollala, where the enemy was posted.

On the 26th of July, Cuesta's advanced guard was attacked near Torrijos, and obliged to fall back to the left bank of the Alberche. The French army remained still at Ollala, thereby indicating an intention to try the result of a general action. For this, the best position appeared to sir Arthur Wellefley to be in the neighbourhood of Talavera del Reyna, a town half-way between Placentia and Madrid, and about sixty or seventy miles distant from both; and, Cuesta having consented to take up this position, on the morning of the 27th the British general Sherbrooke was ordered to retire with his corps to its station in the line, leaving general Mackenzie, with a division of infantry and a brigade of cavalry, as an advanced post in the wood on the right of the Alberche, which covered the left flank of the allies.

The position taken up by the troops at Talavera extended rather more than two miles. The ground was open upon the left, where the British army was stationed, and it was commanded by a height, on which there was drawn up in echelon, and in second line, a division of in-

fantry under major-general Hill. Between this height and a range of mountains still farther to the left, there was a valley which was not occupied, as it was commanded by the height just mentioned; and the range of mountains appeared too distant to have any influence on the expected action. The right wing of the allied army, consisting of Spanish troops, extended immediately in front of the town of Talavera down to the Tagus. This part of the ground was covered by olive-trees, and much intersected by banks and ditches. The high road leading from the bridge over the Alberche, was defended by a heavy battery in front of a church, which was occupied by Spanish infantry. All the avenues to the town were defended in a similar manner, and the town itself was occupied.

At about two o'clock on the 27th, an attack was made on the division under general Mackenzie, who gradually fell back in good order, though not without some loss, on the left of the position of the combined armies. Towards the evening the French made an attempt to overthrow the Spanish infantry which formed the right wing of the army, but without success. In the dusk of the evening the enemy commenced a general attack on the allies, by a cannonade on the left of their position, and by an attempt with his cavalry to overthrow the Spanish infantry; which attempt entirely failed. A division was then pushed along the valley on the left of the height occupied by major-general Hill, of which the French gained a momentary possession; but major-general Hill instantly regained it by an attack with the bayonet. This attack was repeated in the night, and again at daylight in the morning of the 28th, by two divisions of infantry, but was repulsed by our division under major-general Hill. Nor was the enemy more successful in their attack on general Campbell. They were completely repulsed by that officer, supported by a regiment of Spanish cavalry and two battalions of Spanish infantry, and lost their cannon. General Sherbrooke's division, which formed the left and centre of the first line of the army, was next attacked. They immediately charged with bayonets, and drove back the enemy with great slaughter. The brigade of guards, which formed part of this division, in their eagerness to pursue the enemy, advanced too far, and were thrown into a temporary confusion, having exposed their left flank to the fire of a battery. A part of general Cotton's brigade of cavalry, on observing this, pushed forward, and covered their retreat towards their original position. The enemy, being thus foiled in all his attempts against the allied army, and having lost twenty pieces of cannon and a few prisoners, retreated in complete order across the Alberche. Their loss in killed and wounded was never calculated with any degree of exactness. Sir A. Wellefley was inclined to estimate it at 10,000. The French said that our loss was greater than theirs, owing to the greater number of cannon they had brought to play against us. The loss of the British, in killed, wounded, and missing, amounted to nearly 6000.

As the Spanish troops were only partially engaged, their loss was comparatively small, not exceeding 1000 in killed, wounded, and missing. The Spaniards, we are told, formed the right wing of the allied army; and that an attempt was made to overthrow the Spanish infantry, which entirely failed. And in another part of his dispatch, sir Arthur says, "the Spanish commander-in-chief, his officers and troops, manifested every disposition to render us assistance; and those of them who were engaged *did their duty*." But in a letter to his brother the marquis, dated at Merida, August 2, 1809, he wrote as follows: "In the battle of Talavera, in which almost the whole of the Spanish army was engaged, whole corps threw down their arms in my presence, and saved themselves by flight, although they were neither attacked nor menaced with an attack, but merely frightened, I believe, at their own fire. Those base soldiers in their flight from Talavera pillaged every thing that came in their way, even the baggage of the English army, which was at that very time fighting

in their cause." We must leave our readers to reconcile these two accounts as well as they can.

The joy of victory was of short duration. The victorious quickly found itself in the situation of a vanquished army. On the 2d of August intelligence was received, that Soult, Ney, and Mortier, having formed a junction, had advanced through Elframadura to fall on the rear of the British; and that the French, in two columns, had already entered Placentia. As Victor, though repulsed at Talavera, would again advance against the allies as soon as he should hear of the junction and march just mentioned, there was no time for doubt or delay. The allied army was now to be saved, in the words of sir Arthur Wellesley, only "by great celerity of movement." On the 3d of August, therefore, the British army marched to Oropesa. In the evening of that day advice was received, that the French, slated to be 30,000 strong, having advanced from Placentia, had got between the British and the bridge of Almaraz; and, nearly at the same time, that general Cuesta was on the point of leaving Talavera, letting most of the wounded and sick fall into the hands of the French, from the want of means of conveyance. On the other side, there was reason to expect, as soon as general Cuesta's march should be known, the advance of Victor's corps, 25,000 strong, (after leaving 10,000 to watch Venegas,) to Talavera. Our army, if unsuccessful in a contest with either Victor, or Soult and Ney, would have been without retreat; and if Soult and Ney, avoiding an action, had retired before it, and waited the arrival of Victor, it would have been exposed to a general action with at least 50,000 men, and equally without a retreat. Sir A. Wellesley, in these circumstances, judged it advisable to retire to the bridge of Arzo Bispo, where he crossed the Tagus on the 4th of August; from whence he continued his route to Deleytosa, and from thence to Badajoz. General Cuesta too retreated by the bridge of Arzo Bispo, where he crossed the river on the night of the 5th. About half the number of the sick and wounded were brought away from Talavera; the other half remained there, and were treated by the French with great humanity.

A great majority of the supreme and central junta was composed of weak and feeble characters, chosen, not on account of their personal merit, but by the preponderating influence of great families; and were very ill qualified to call forth, combine, and direct, the energies of the country. The English ministry were not insensible how necessary it was both to arouse the exertions of the Spaniards, and to give and urge, as far as could be done without offence, advice for their proper direction; and for this purpose they made choice of marquis Wellesley, than whom a fitter person indeed could not have been chosen. But this was not done in time. The appointment of the marquis as ambassador extraordinary to Spain did not appear in the London Gazette until the 1st of May, nor did he arrive at Cadiz till the 31st of July; two months after the British general had taken the field, and exactly at the moment when that general, for whom the British ambassador had come to concert a plan of operations, victorious in battle, but defeated in the war, began his retreat on Portugal. This long delay between the appointment of the marquis and his arrival in Spain, did not arise from any inclemency of weather, or any other accident by land or sea; for he arrived at Cadiz on the seventh day from his embarkation at Portsmouth. It was occasioned by the private contentions of ministers about the great offices of state, to one of the most important of which the marquis had an eye, and which he afterwards obtained. But, though marquis Wellesley did not arrive in Spain in time for influencing the issue of the campaign of 1809, which was in fact decided by the retreat of the British army, he gave the most important and excellent advice to the junta, which this council appeared to be disposed to follow; of which they gave earnest in the recal of that refractory and capricious man, Cuesta, from the command of the army, and by greater exertions to furnish both to

the British and their own armies provisions, stores, and the means of transport. It appears from some of sir Arthur Wellesley's letters in August and September, 1809, that, while Cuesta was in the habit of intercepting occasionally convoys of provisions designed for the English army, and applying them to the use of his own, he on several occasions refused to the entreaties of the British general the means of conveyance or transport, mules, carts, and cattle for drawing them.

Sir Arthur Wellesley was created Baron Duero and Viscount Wellington of Talavera; which title, on account of the hasty retreat that followed the battle, did not pass without notice in the *Moniteur*. It was, however, very easy to justify his retreat from the interior of Spain; not so easy to vindicate the propriety of his advancing thither, without having any idea of the force opposed to him, and at the risk of being starved out of it. The corps of Soult, Ney, and Mortier, which lord Wellington estimated, at first, at 10 or 12,000 men; and afterwards, when he determined to cross the Tagus at the bridge of Arzo Bispo, at 30,000 men; were found afterwards to have amounted to not less than 70,000.

In the beginning of August, while so great a part of the French forces in Spain was drawn down the valley of the Tagus in pursuit of the allied army, general Venegas, with not fewer, it was said by the French gazettes, than 30,000 men, descending from the Sierra Morena, took up, on the 10th of August, a strong position on certain heights amidst broken ground near Almanacid, a town in Old Castile, three leagues south-east from Toledo, where he was attacked on the 21st by a corps of French under Sebastiani. Being driven from post to post, he drew up his troops on a plain, extending his line on either hand, with a view of turning the flanks of the enemy, to as great a length as possible. This line was penetrated in different places by some squadrons of French cavalry. The Spaniards, throwing down their arms, and abandoning their artillery, ammunition, and baggage, fled, every one by himself or in small parties, becoming still smaller and smaller as they proceeded in their flight, in a variety of directions towards the mountains. They were pursued by the French for about two leagues; but so completely were they dispersed, that the French cavalry, not being able to set their eyes on any other than handfuls of men in one place not worth pursuing, gave over the pursuit.

In the command of the army of La Mancha, general Venegas was superseded by the marquis of Ariezaga. It was strongly reinforced, and abundantly provided with artillery, stores, provisions, and the means of carriage. In numbers it amounted to 50,000 men, infantry, and cavalry. Ariezaga conceived the bold design of quitting his strong ground in the Sierra Morena, marching on Madrid, and bringing on a general engagement with the French, the issue of which might reduce them to the necessity of quitting that city. The French army, consisting of three corps headed by king Joseph, waited for the Spaniards in a strong position near Toledo. The Spaniards, on finding this, prudently repassed the Tagus: the French followed them. The Spaniards concentrated their force near Ocana, a city of La Mancha, situated on an eminence at the entrance of the vast plain of Mesada Ocana. About nine o'clock in the morning of the 19th of November, the advanced parties of the French came in sight of the Spanish army. At eleven o'clock the action commenced, and in two hours it was decided in favour of the French. The loss of the Spaniards was terribly great, and the victory complete. The French newspapers allowed that the Spaniards, encouraged by the superiority of their numbers, made a vigorous resistance. The Spanish newspapers stated, that for a considerable time victory was expected by the patriots, and that acclamations of triumph were heard from the ranks, when one disgraceful incident turned the tide of fortune in favour of the enemy. A single regiment of cavalry, which in an advantageous position

situation covered a large body of Spanish infantry, shamefully took to flight at a critical moment, and spread disorder and consternation among the Spaniards. The confusion and alarm became instantly general; and the superior tactics of the French enabled them to take advantage of such a situation.

The battle of Ocana was quickly followed by the reduction of Cordova and Seville; and a road was opened to Cadiz.

While these and other subordinate operations were going on, sieges were carried on by the French against Saragossa and Gerona. The siege of Saragossa commenced early in the month of January; and, on the 21st of February, in the midst of ruins and dead bodies, it was compelled, by all that could assail and overcome human nature, to capitulate. When Augereau summoned the town, declaring that, if it did not surrender on that day, he would storm it and put all the inhabitants to the sword, Palafox assembled his troops and the armed inhabitants of the city in the churches, where they solemnly swore to defend the place to the last; and, rather than surrender, to be buried in its ruins. An unsuccessful sortie was afterwards made; the Spaniards were defeated with great loss; and the French entered the town along with those who escaped slaughter. A sanguinary contest then took place in the streets, in which the French had again the advantage. Some of the inhabitants in despair sprung a mine, the explosion of which destroyed a considerable part of the city, and produced a dreadful carnage. The number who perished, French and Spaniards, was estimated at several thousands. The remainder of the Spaniards defended themselves for some time in works erected in another part of the town; but at last surrendered at discretion, the French commander having refused a capitulation. But, immediately on obtaining possession of the posts, he issued a proclamation containing a general pardon, in the name of king Joseph; and a stop was put to all hostile acts on the part of the French troops. The personal heroism that was displayed by the Spaniards in the siege of Saragossa, and that of Gerona, equalled, if they did not exceed, that of the 15th and 16th centuries.

Gerona capitulated on the 10th of December, and the French on the 11th entered the city, where they found eight standards and 200 pieces of cannon. By the capitulation, the garrison was to evacuate the city with all the honours of war, and be conducted prisoners of war to France. The inhabitants were to be respected; that is, both their persons and property were to be safe; and the catholic religion was to be continued and protected.

Thus at the close of 1809, all the fortresses of Spain had fallen into the hands of the enemy, and all her principal armies been defeated and dispersed; and, by dispersion, for a time annihilated. The grand cause was undoubtedly the senselessness, the ignorance, the contracted views, and the paltry intrigues, among the supreme junta, who were more attentive to the preservation of their own power than to the defence of the country. They neither knew how to infuse energy where it was wanting, nor to direct it where it existed.

Towards the end of the year, Bonaparte poured fresh troops into the peninsula; and resumed the design, which the war with Austria had suspended, of reducing Cadiz, the most important point in Spain, and planting his eagles on the towers of Lisbon.

The aspect of affairs became now more alarming than ever; and the junta, whether from a consciousness of their own imbecility and want of authority, or an apprehension that the public dissatisfaction with their management, for it can scarcely be called government, might burst into some fatal explosion, issued a proclamation for the meeting of the Cortes. The first of January, 1810, was fixed for the assembling of the Cortes, and the first of March following for entering on their functions.

We now turn from the peninsula to the continent.— At the same time that the correspondence between court

Metternich and Champigny betrayed the utmost jealousy and mistrust on the part of both France and Austria, Bonaparte proclaimed daily in his newspapers in France, Italy, and Spain, that the most perfect harmony and cordiality prevailed between the courts of the Tuilleries and Vienna. And in his German and Polish newspapers again, he represented the cause of the Spanish insurgents, as he called the patriots, as quite desperate; their tumultuous parties as broken and dispersed. He stated that Saragossa was reduced some weeks before it actually surrendered; and that Lisbon, in the beginning of 1809, was in the hands of the French. He wished to discourage the Austrians by his account of the state of affairs in Spain; and to dishearten the Spaniards by precluding all hopes of co-operation from the Austrians.

War was declared by Austria against France in the form of a proclamation of the archduke Charles, glowing with sentiments the most fitted to rouse indignation against the French, and awaken all their love for their own country, dated at Vienna, April 6, 1809. Proclamations in the same strain were also issued; one by the emperor Francis to the Austrian nation, April 8; and another of the same date by the archduke Charles to the German nations. These proclamations were followed by a manifesto, detailing the various causes of just offence, provocation, and alarm, which Austria had received from France.

The state and distribution of the Austrian forces, in the beginning of April 1809, was as follows: The whole of the army was divided into nine corps, each corps consisting of 30 or 40,000 men. The first six of these corps were under the immediate orders of the archduke Charles, as commander-in-chief. Under the archduke, the count de Bellegarde was at the head of the first corps; count Kollowrath of the second; the prince of Hohenzollern of the third; the baron of Rosenbergh of the fourth; the archduke Louis of the fifth; and general Hiller of the sixth. The seventh corps was sent under the archduke Ferdinand into Poland; and the eighth and ninth to Italy, under the archduke John. The lieutenant-general of the eighth corps was the marquis of Chastellar; of the ninth corps, general Guilay. Besides these corps, there were two of reserve; one of 25,000 men, commanded by prince John of Lichtenstein; the other of 10,000 under the orders of general Kinmayer; and troops to the number of 25,000 in the Tyrol, Croatia, and in small parties acting as partisans on the confines of Bohemia. In addition to all these, there was a kind of militia in the interior of the Austrian kingdoms and provinces, called the *land-wehr*. So that it was computed, that, when the archduke Charles entered on the campaign, he had at his disposal not much fewer than 400,000 men.

The main Austrian army passed the Inn on the 9th of April; and, on the 10th, the Isar at Munich, driving the French and Bavarians before them to and from Landshut. Corps arriving by the way of Pilsen from Bohemia drove the French garrison left by Davout from Ratisbon, and secured to the Austrians that important passage of the Danube, which it was necessary to preserve until the arrival of the army under Bellegarde, which covered the frontier of Bohemia towards Saxony and Franconia. For this purpose it was necessary to cover the post at Ratisbon from the armies of France that had begun to advance rapidly along the course of the Danube; and at the same time not to advance a step farther than was absolutely necessary for securing that object. It was with a view to this that the archduke extended his front from Landshut on the Isar as far as the town of Abensberg, near which his right wing rested on the Danube. This right wing was advanced about fifteen English miles beyond, that is, farther up, the Danube than Ratisbon, on which it had a safe retreat, being flanked all along by the Danube. The extent of the whole Austrian line, from the Isar at Landshut to the Danube at Newstadt, was about twenty-eight English miles.

Bonaparte, having learned by the telegraph, late in the evening of the 12th of April, that the Austrians had passed the Inn, set out early in the morning of the 13th from Paris. At Dillingen, on the 16th, he had an interview with the old elector of Bavaria; when he promised in the space of a fortnight to restore him to his capital, to revenge the affront that had been given to his family, and to make him a greater sovereign prince than any of his ancestors had been. On the 17th he arrived at Donauwerth, where he established his head-quarters. On the 19th the different corps of the French began to unite; and general Oudinot, having advanced from Augsburg, arrived at day-break at Pfaffenhoffen, attacked and drove from thence 3 or 4000 Austrians, and took some hundred prisoners. At Pfaffenhoffen too Massena arrived with his corps the day after: on which day, the 20th, marshal Davoust with his corps quitted Ratisbon to march to Newstadt, and draw near to Ingolstadt. Then it was that the plan of Bonaparte was unfolded; which was to manœuvre on the enemy, whose line was extended, as just noticed, from the near vicinity of Newstadt to Landshut; and to attack him at the moment when, supposing himself to be the assailant, he was on his march to Ratisbon; to break the line of the grand Austrian army, according to his usual mode of warfare; and to come between the archduke Charles and the corps commanded by his brothers. Such was the strength, and such the designs and views, with which the campaign on the Danube, of 1809, was opened, by the archduke Charles on the one part, and Bonaparte on the other; the two first generals of their age, and at the head of greater numbers of disciplined troops than had ever met in Europe! We shall just notice the principal circumstances and events on which the fate of the campaign turned.

A great battle was fought at Abensberg, April 20, in which Bonaparte appeared in person at the head of his Bavarians and Wirtembergers, against the two Austrian corps commanded by the archduke Louis and general Hiller; and another, with four Austrian corps under the archduke Charles, on the 22d, at Eckmühl; in which two battles, according to the French accounts, 40,000 Austrians were taken prisoners, and 100 pieces of cannon. The archduke was forced to cross the Danube at Ratisbon, in order to form a junction with general Bellegarde, who did not arrive at that river before the 24th or 25th of April. Some scattered divisions of the Austrians endeavoured to make a stand at Ratisbon, which the archduke had ordered to be covered with cavalry. But, after three successive charges, they gave way, and were all either cut to pieces or obliged to flee across the Danube. Ratisbon was taken; the Austrian garrison was either cut to pieces, or taken prisoners, or saved themselves by flight. The archduke, when he found the current of war running strongly against the Austrians on the right bank of the Danube, and was under the necessity of passing over to the left, sent a strong corps under general Hiller to the Inn, to join the other troops to be assembled for the protection of Vienna; it was expected by the archduke to rejoin the corps under Hiller at Linz. The French, however, by the rapidity of their movements, got there before them.

Bonaparte, following the course of the Danube, advanced rapidly towards Vienna; before which he appeared on the 10th of May. For upwards of a century the fortifications of this city had been neglected. In the city, properly so called, there were not more than 80,000 people; but in the suburbs, which were composed of eight divisions, the number of inhabitants was computed to be 220,000. The city was defended by about 3 or 4000 regular troops, as many armed citizens, and a few battalions of the land-wehr, the whole under the command of the archduke Maximilian. There was for about twenty-four hours some show of resistance. When, however, the French had dislodged the Austrians from the islands adjacent, and threatened to cut off all communication with

the left bank, it was thought prudent to surrender the city; but not, however, till the regular troops had effected their retreat by the bridge of Tabor, to which, when they had passed it, they set fire. The emperor of Austria, after the misfortunes that had befallen the army of the archduke Charles, and the rapid advance of the French, left his capital, and retired to Znaim in Moravia.

In the mean time the archduke Charles, who had by incredible activity re-inforced his army to the number of 75,000 effective men, having learned the fall of Vienna, moved down on the left bank of the Danube, for the purpose of watching the movements of the enemy, and checking any attempt that might be made to cross the river. He fixed his head-quarters, on the 16th of May, at Ebersdorf. The chain of his out-works extended, on the right, as far as Krems, while lower down the river some battalions occupied Presburg. The advanced guard was pushed forward near to the Danube; and the cavalry was posted along the banks of a small rivulet, on ground covered and partly concealed by bushes. Bonaparte, having resolved to attack the archduke in his position, marched his army along the south bank of the Danube, till it had reached the distance of about six miles from Vienna. Here the breadth and rapidity of the Danube are broken by two islands. From the south bank to the smaller island on that side the distance is about 1000 fathoms; from this smaller island to the larger island, called the isle of Lobau, the distance is 120 fathoms; from the isle of Lobau to the north or left bank of the Danube, the distance is only about 70 fathoms. At this favourable point Bonaparte determined to cross the Danube. As soon as the engineers had established two bridges across from the south side to the smaller island, and from the smaller island to the larger, Bonaparte fixed his head-quarters in the latter, and in less than three hours threw a bridge of pontoons from it to the north bank. As the French advanced, the archduke retreated, and permitted them to extend themselves along the north bank of the river. Bonaparte, left at liberty to fix on the field of battle, posted the right wing of his army on the village of Eßling, and the left on the village of Aspern. The archduke, who in his retreat had halted when he came to a favourable position, on the 21st of May at day-break called his troops to arms, drew them up in the order of battle, and communicated his plan of attack to his generals.

For a particular account of the two dreadful battles that ensued on the 21st and 22d of May, we must refer our readers to the Supplement to the London Gazette of the 11th of July. They were both of them most sanguinary and destructive, and harder fought, even by considerable odds, than that of Prussian Eylau in 1807. The battle of the 21st was terminated only by the darkness of the night. The French had by this time been driven from Aspern: they still retained possession of Eßling; but the general position of their army was nearer the Danube than it was at the beginning of the engagement. The morning of the 22d saw Aspern again in possession of the French; but by repeated attacks, after repeated repulses, the French were driven from both Aspern and Eßling. In the night between the 22d and 23d they effected their retreat from the left bank of the Danube, and took up a position in the island of Lobau. In these two battles, obstinate and bloody, hitherto perhaps beyond example in military annals, the intrepidity and perseverance of the soldiers, as well as the cool courage and presence of mind of the generals and other officers, on both sides, were astonishing. Both the archduke and Bonaparte exposed their persons wherever circumstances called for their presence. The archduke, being entreated not to endanger himself by exposing so very much his own person, replied, "I am resolved to terminate this contest, or to die in the streets of Vienna." The hostile parties combated each other with bayonets and sabres, in every street of Aspern, in every barn and every house, and even amidst the flames of Eßling. The loss on both sides was very great; but few prisoners

prisoners were taken by either party, both being determined to conquer or die. The loss of the French was immense: it amounted in killed, wounded, and prisoners, according to a computation founded on the most probable data, to not less than 30,000 men: five of their generals were killed, eight wounded, and two taken. The loss of the Austrians was also very great: eighty-seven officers of rank, and above 4000 subalterns and privates, killed; and from 2 to 3000 officers and privates wounded.

There was a general expectation that this repulse of Bonaparte would be quickly followed by more disasters, and that the glorious achievements of the Austrians would immediately be followed up by farther successes. But day elapsed after day, and week after week. No intelligence of any farther operation on one side or other: an unequivocal sign that both parties were excessively weakened and exhausted. While the archduke Charles contented himself with recruiting his army by new levies, as well as some garrisons in Moravia and Bohemia, and strengthening his position on the left bank of the Danube by new works and entrenchments, Bonaparte was allowed, for the space of six weeks, to restore the spirits, and to reinforce his army by troops called from different quarters, and to make every other preparation for crossing the Danube; and with a greater force, and greater wisdom or skill too, derived from the experience of the two former battles, to attack the Austrians.

After the disastrous battles of Eckmühl and Ratisbon, the archduke John was recalled with his army from Italy, where he had at first met with rapid success, to form a junction or to co-operate with the main Austrian army under the command of the archduke Charles on the Danube. He had taken Padua and Vicenza, crossed the Adige, and threatened Venice; but he was stopped in his career by Eugene Beauharnois, viceroy of Italy, who, reinforced by 10,000 men from Tuscany, retook Padua and Vicenza, and pursued them in their retreat across the Tagliamento. Two engagements took place, and several skirmishes; and, on the 14th of June, the anniversary of the battle of Marengo, the two armies came to a third, and that a very severe and important, engagement near Raab. The numbers of Beauharnois' army, according to the French bulletins, was 35,000, and that of the archduke John 50,000. According to the Austrian accounts, the combined Austrian army was not more than 36,000 strong, while that of the French was 50,000. The battle began about two o'clock in the afternoon: victory was long doubtful; but in the space of four hours it was decided. That part of the archduke's army which consisted of the undisciplined troops of the Hungarian insurrection, and formed the greater part of the right wing, gave way before the impetuous attack of the French soldiers and the dreadful fire of the French artillery. The loss of the Austrians, according to the French, was 3000 killed and 3000 prisoners, while their own did not exceed 900 in killed and wounded. The Austrians stated that the loss of the French was 2000 killed or wounded, and 400 taken prisoners; their own loss they admitted, in killed or wounded, was 1300 men. But it is of no importance to calculate the exact numbers either of those engaged or those lost in this action on either side: the French were decidedly victorious; the Austrians were forced to save themselves by flight. On the 26th of May, the most advanced parties of the French army of Italy came up with the most advanced posts of the grand French army, and early in June their junction was completed. The French army occupied a long line from Lintz to Raab.

On the 4th of July the different divisions were called in, and the whole of the French army concentrated in and about the island of Lobau. Never did the strength and resources of Bonaparte's mind, whether in planning campaigns, or giving orders for battle, or improving to his own advantage every occurrence or accident in the heat of action, appear in so striking a light as during the so-

lemn pause that intervened between the battles of Aspern and Esling, and the great and decisive engagement that took place there six weeks after. The first step towards an ascendancy over other men, is to acquire the perfect command of one's self. Bonaparte commanded his own passions, restrained the natural fire and impetuosity of his temper, assumed not only a calm but cheerful aspect, and set himself to recover and raise the spirits of his discomfited army by a series of bulletins, in which he made no scruple to vilify the Austrians, whose successes he affected to ascribe to the great swelling of the river, which he styled *General Danube*. He exaggerated the losses which the Austrians had sustained from the opening of the campaign to the battle of Raab; congratulated them on the junction that had been formed with the army of Italy; and confidently predicted complete success in his intended attack, as general Bertrand (he said) would soon triumph over the only general at all formidable to the French, namely General Danube. In an incredibly-short time, general count Bertrand raised three bridges between the island he occupied and the left bank of the river. In order to protect them against fire-ships, stockadoes, raised on piles, were placed 250 fathoms higher up the river. Besides these bridges formed on piles, a bridge of boats was constructed. Each of the bridges was covered and protected by a *tête-de-pont* [a bridge-head] 160 fathoms long, formed of redoubts, and surrounded by palisadoes, chevaux de frise, and ditches filled with water. Magazines of provisions, 100 pieces of cannon, and 20 mortars, were stationed in the island of Inder-Lobau. In the mean time the Austrian army was strongly entrenched on the left bank of the Danube.

Besides the bridges just mentioned, another was thrown over to the left of the Danube, from a small island on the side of the river opposite to Esling, not with a view of facilitating the passage of the French, but of diverting the attention of the Austrians from that quarter where it was really intended. The manœuvre succeeded. On the night of the 4th of July, when the Austrians were expecting an attack on their right, a heavy fire was opened upon the village of Enzersdorf, which supported the left wing of their army. In the short space of two hours the French army crossed the river, and appeared in the morning of the 5th drawn up in order of battle, on the Austrian left flank. In consequence of this masterly disposition, the archduke was obliged to change his front, and quit his entrenched camp, or to march forth and give battle to the enemy on ground which the enemy had chosen. Bonaparte, instead of being confined as before within the limits of a number of small villages, where he had to fight corps to corps, division to division, column to column, and even man to man, (a species of warfare in which the Austrians were fully a match for the French,) had now the vast plain of Enzersdorf on which to manœuvre; and, what was of all the most important consideration, he had rendered it impossible for the archduke, in case of a defeat, to fall back upon Hungary, and to effect a junction with the army under the command of his brother the archduke John.

The forenoon of the 5th was passed principally in manœuvring, the result of which was, that the archduke was compelled to give up his entrenchments, and the whole of the old field of battle from Enzersdorf to Aspern, and to abandon the country between Enzersdorf and Wagram. On the morning of July 6th the battle was renewed, each of the two armies acting upon their respective and opposite systems. Bonaparte had passed the night in accumulating his force towards the centre. The archduke, on the contrary, weakened his centre, in order to secure and augment the strength of his two extremities, where was planted a great proportion of his artillery. This disposition of the Austrian army appeared so strange (according to the French bulletin) to Bonaparte, that he suspected at first some stratagem; but he soon perceived that it was a blunder, and immediately took advantage of it. The battle had become general in every part of the line.

line. In every attack, whether made by the French or the Austrians, with the arms or the bayonet, the latter had rather the advantage. But Bonaparte, concentrating almost the whole of his artillery, battered one single point of the Austrian line towards the centre, as if it had been a fortress. To this tremendous thunder there was nothing of the same kind to oppose. The Austrian artillery, as just observed, was placed at the two extremities of the line. The centre of the Austrians was driven back two or three miles out of the line: the right wing, alarmed at the danger in which it was now placed, gave way, but fought while it retreated. So also did the left, which was attacked in flank by marshal Davoust. The Austrians, thus routed in all quarters, retreated towards Moravia.

It was observed in the French bulletins, that, in the decisive and ever-memorable *battle of Wagram*, from 3 to 400,000 men, with from 12 to 1500 pieces of cannon, contended for grand interests, on a field of battle chosen on the most mature deliberation, and fortified more and more by the Austrians for several months. In this battle the French took 20,000 prisoners, among whom were nearly 400 officers. The field of battle was covered with dead bodies. On the whole, the official accounts of the French calculated that the battle of Wagram had reduced the Austrian army to 60,000 men.

After the battle of Wagram, all serious thoughts of resistance to Bonaparte were given up. Proposals for an armistice were carried from the emperor Francis to Bonaparte, by prince John of Lichtenstein, on the 12th of July, which was agreed to, and signed immediately. All the strong places and positions which might be advantageous to the French, in case of the war being renewed, were delivered up to them; and by one article it was expressly stipulated that the Austrians were not to afford any succour or assistance to the inhabitants of the Tyrol and Vorarlberg, who were to remain under the government of Bavaria.

The armistice between Austria and France was followed by a definitive treaty of peace, three months afterwards. By this treaty, which was dated at Vienna, October 14, 1809, Austria ceded all her sea-coast to France; and the kingdoms of Bavaria and Saxony were so much farther enlarged as to become efficient checks on the future growth of the power of Austria, and thereby to confine her within the limits which Bonaparte had assigned her. Russia obtained so much of the territory of Galicia as should contain four hundred thousand souls. The emperor Francis agreed to acknowledge Joseph Bonaparte as king of Spain.

In the beginning of June, sir John Stewart, who commanded the British army in Sicily, embarked with 15,000 British troops for the south of Italy and the capture of the city of Naples; and he was soon afterwards joined by a body of Sicilian troops, under the command of one of the royal princes. A brigade was dispatched by the British general to reduce Lower Calabria, and afterwards to join him over land. This brigade took possession of the line of posts which the French had formed directly opposite Messina, and of which therefore it was of considerable importance to deprive them. But the first point to be attacked by the main army was the island of Ichia. The batteries, by which the shores of this island were fortified wherever accessible, were turned by the British troops, and successively deserted by the enemy, who retired into the castle: on the 6th day after which, the French garrisons of both Ichia and Procida surrendered to the British. The reduction of Procida led to the destruction or capture of forty heavy gun-boats in their attempt to pass in their voyage from Gaeta to Naples. By the capture of the two garrisons and part of the flotilla, 1500 regular troops were made prisoners, and 100 pieces of ordnance were taken.

The Neapolitans were led, by the proclamations of sir J. Stewart, to believe, that the principal object of the expedition was to re-establish Ferdinand IV. on the throne

of Naples: but sir John, in his official dispatches, discovered that his leading and paramount object was a diversion in favour of our Austrian allies. This object was accomplished in some small degree, and for a short time; for, on the first appearance of the English on the coast of Naples, a considerable body of men, who had been sent to reinforce the army under the command of the viceroy in Upper Italy, were recalled, as well as the whole of the troops, who, after the dethronement of the pope, had taken possession of the papal territories. But it was soon found that the projected attempt on the territory and city of Naples must be abandoned; for king Joachim had formed and embodied a large corps of national guards, besides the great regular force which he had assembled for the protection of his dominions and capital. After a good deal of fighting for the possession of the castle of Scylla, which was taken and retaken several times, the British were forced to abandon the slight footing they had obtained on the continent, as well as the two islands.

Another expedition, and one of a more formidable nature, was prepared by the British government to invade the dominions of France in Holland, partly with a view to the attainment of British objects, but collaterally for the purpose of operating, as well as that from Sicily, as a diversion in favour of the Austrians. Preparations began to be made early in May. Towards the end of July, troops were collected to upwards of 40,000 men, supported by the powerful aid of 39 sail of the line, besides 36 frigates, and a great number of gun-boats, bombs, and small craft. The present age had not witnessed so numerous a body of British soldiers, marines, and sailors, assembled for the purpose of invading the continent. The number of the whole amounted to about 100,000 men. The expectations of the nation were raised to the highest pitch. The fleet, while it lay in, or was leaving, the Downs, was a spectacle grateful to the pride, and flattering to the hopes, of Britain. Dover, Deal, Ramsgate, and Margate, were full of visitors, of persons of the most respectable classes of both sexes, come to see the sailing of this great armament. Among these was lord Castlereagh, accompanied by his lady and a number of his particular friends, contemplating with delight a work of his own creation, from the success of which much glory was anticipated. There was another visitor also, who attracted much notice by the pomp of his appearance, or what may be called his equipage: this was sir William Curtis, bart. an alderman of London, who was wafted to the Downs in a yacht, either of his own, or hired for the purpose, or borrowed, beautifully painted, adorned with a streamer bearing devices prognosticating victory and glory, and carrying delicate refreshments of all kinds to the principal officers, military and naval.

The object of the expedition was "the occupation of Flushing, and the destruction of the French ships of war, arsenals, and dock-yards, in the Scheldt." This, it was thought, might be accomplished, by so overwhelming a force, with so little difficulty, that the command of the army was entrusted to the earl of Chatham, a man reputed to possess an excellent understanding, but whose very name was almost proverbial for enervation and indolence. The naval part of the expedition was placed under the orders of sir Richard Strachan.

On the 28th and 29th of July, the armament failed in two divisions. On the arrival of the army in the islands of Walcheren and South Beveland, it was found that the enemy was not disposed to make any resistance except at Flushing, which was invested on the 1st of August. On the 13th, the batteries were completed; and, the frigates and smaller vessels having taken their respective stations, the bombardment immediately commenced. The town suffered dreadfully, especially from Congreve's rockets. On the 14th of August, the line-of-battle ships cannonaded the town for some hours. The enemy's fire ceased. On the 15th, general Monnet, who commanded the garrison of Flushing, demanded a suspension of arms, which

was succeeded by the surrender of the town. The garrison, amounting to about 6000 men, were made prisoners of war.

Though the attack on Flushing was thus ultimately successful, it had been impeded in its progress by the want of skill and vigour on the part of those who conducted it. The batteries and trenches were constructed one after another without method or arrangement; all was anarchy and confusion; neither officers nor soldiers in the engineer department knew their situations. In consequence of this want of arrangement in the distribution of the working-parties, the works proceeded with extreme slowness. Our troops were posted within range of the enemy's guns before any of the stores necessary for the attack were even landed, and without the advantage of confining him to his fortifications. The soldiers at work on the trenches were generally without any sort of covering-party in their front, while the enemy's advanced parties were frequently on their flank. The French piquets indeed were suffered to remain in many places within two musket-shots of our men during the whole of our operations; so that a wooded and enclosed country, which is generally thought advantageous to the besiegers, proved a benefit to the French, and a loss to the British. The island of Cadzand, the only place from whence the enemy could receive supplies or reinforcements, was left unoccupied; and, as the smaller armed vessels had not yet intercepted the communication, advantage was soon taken of the neglect; and on the 4th, 5th, and 6th, of August, three thousand of the enemy passed over from Cadzand to Flushing. The dykes had been cut, and the inundation had begun seriously to impede the operations in the low ground; but the attack was carried forward on to the flanks of Flushing along the dykes.

In the mean time a very numerous French army, composed of the national guards of the Belgic provinces and the nearest provinces of France, was assembled in the neighbourhood of Antwerp; the forts on the Scheldt were well manned, and every other preparation made for opposing the passage of both our army and navy. An immense quantity of naval stores, deposited in the arsenal of Antwerp, was either removed or got ready for speedy removal; and preparations were made for conveying the ships so high up the river as to be out of our power, either naval or military, in case of a successful attempt to force a passage. All ideas of pushing up the Scheldt for the reduction of the fleet, and destroying the arsenal and dock-yards of France at Antwerp and Terneuse, were presently abandoned; and lord Chatham, with the greater number of the troops under his command, returned on the 14th of September, to England. It was deemed necessary with the remainder to keep possession of the Isle of Walcheren, for the purpose of blockading the Scheldt, and enabling our merchants to introduce British manufactures and the produce of our colonies into Holland. But it appeared, that in this marsh British troops would have been exposed, not only to the fire and sword of the enemy, (against which, in such an insular position, they might have been enabled to defend themselves,) but to the rage of pestilence. Towards the middle of September, when the distemper was at its height, the average number of deaths in our army in Walcheren was from 200 to 300 a-week.

The opinion of the British government about the expediency of retaining or abandoning this dreadful island, was in a state of fluctuation. No serious exertions were made for renewing the defences or improving the fortifications of Flushing till the middle of September, when a requisition was made for 500 of the peasantry of the island to be employed in thickening the parapets, and otherwise strengthening the ramparts of Flushing. For the same end, and also the repair of the barracks, 100 artificers arrived from England with large supplies of brick and lime at the end of October. Towards the middle of November they began to demolish the works and naval basin of Flushing, as far as might be done without destroying the lives and property of the inhabitants. This was done;

and on the 23d of December the island of Walcheren was completely evacuated by the British army, nearly one half of which, according to a return made to the house of commons, was either lost or sick.

Our operations were, as usual, more prosperous at sea and in islands than on the continent of Europe. A French fleet, consisting of nine or ten sail of the line and some frigates, lay in the roads of Aix under the protection of the forts of that island. In the evening of the 11th of April, lord Cochrane, who was under the orders of admiral lord Gambier, proceeded to attack this fleet thus stationed, with a number of fire-ships, frigates, and other vessels, under a favourable strong wind from the northward, and the advantage of flood-tide. On the approach of our squadron to the ships of the enemy, it was discovered that a boom was placed in front of their line for a defence. This, however, the weight of the Mediator fire-ship soon broke; and the usual intrepidity of British seamen, led by such a commander as lord Cochrane, advancing under the fire of both the forts and the ships, overcame all difficulties. The greater part of the French ships cut or split their cables, and, the anchorage being confined, avoided explosion by running on-shore. These, however, were afterwards either destroyed or rendered unfit for service, while four ships of the line were taken and blown up at their anchorage. At daylight, lord Cochrane communicated to admiral lord Gambier by telegraph, that seven of the enemy's ships were on-shore, and might be destroyed. The admiral immediately made the signal for the fleet to unmoor and weigh, intending to proceed with it to effect their destruction. The wind, however, fresh from the northward, and the flood-tide, rendered it, in the judgment of the admiral, too hazardous to run into the shallow waters of Aix Roads; he therefore cast anchor again at the distance of about three miles from the forts of the island. This was afterwards made a subject of accusation by lord Cochrane against admiral Gambier.

In the Mediterranean, towards the end of October, a French squadron, consisting of three sail of the line and four frigates, with twenty large transports, from Toulon for the relief of Barcelona, was destroyed by a division of the fleet under lord Collingwood. The transports, separating from the ships of war, ran for shelter to the bay of Rosas; where they, too, though under the protection of some armed ships and gun-boats, were attacked and destroyed.

Nearly about the same time, a small squadron detached from lord Collingwood's fleet, with 1600 troops sent from Sicily, under the command of brigadier-general Oswald, took the islands of Zante, Cephalonia, Ithaca, and Cerigo. The French garrisons in those islands surrendered to the British arms after a very faint resistance. The government of the Seven Islands was declared to be restored.—In the Indian ocean, the Isle of Bourbon surrendered to a British force on the 21st of September.

In the West Indies, the island of Martinico and the city of St. Domingo were added to our numerous possessions in that part of the world. The city of St. Domingo surrendered without resistance. The dispatch from major-general Carmichael to lord Castlereagh, announcing this conquest, is a striking burlesque on that intolerable minuteness which has long, and that religious cant which has lately, become fashionable in the dispatches of both our generals and admirals: "With humble submission to the Almighty Disposer of events, full of confidence in a just cause, and British hearts to maintain it, I wrote a letter," and proceeded to make dispositions for the reduction of the city of St. Domingo. The zeal, abilities, courage, and indefatigable exertions, of the officers under his command, are extolled at great length—yet there was no fighting. The enemy did not make any resistance. "A continual fire of musketry from the walls was indeed heard for a short time, even when the white flag was up; and the general moved forward with a party of dragoons to demand the cause. The French general assured his

aid-de-camp that the inhabitants were firing at immense numbers of wild pigeons that were flying over the walls, but that they should instantly be stopped!"

In North America, the embargo-act was repealed by one prohibiting all intercourse either with France or Great Britain; but, in case either France or England should so revoke or modify her edicts, as that they should cease to violate the neutral commerce of the United States, the trade suspended might be renewed with the nation so doing. A treaty for restoring amity and commerce between Great Britain and America, after a good deal of negotiation, was signed by Mr. David Erskine, envoy and minister plenipotentiary from London; and American vessels in great numbers poured into the ports of England. But the proceedings of Mr. Erskine were disfavoured, as altogether exceeding his powers, by the British government. No loss, however, was suffered to accrue to the American merchants or captains of ships who had proceeded to England under the idea that Mr. Erskine had clearly understood the object of his mission, and the terms on which he was authorized to conclude a treaty of amity and commerce.

During the last three months of 1809, the affairs of Europe were not regarded by the people of England with much interest or concern, at least not with any emotions that might render them objects of pleasing and voluntary attention. Austria was completely subdued. The British army had been in part withdrawn, or in part lay languishing in the pestilential marshes of Holland. Battles had been gained in Spain, but the objects of the campaign had been lost. In a word, the war on the continent had ceased either to feed our hopes or amuse our leisure. In these circumstances, the legislative assembly of France was convened on the 3d of December; when Bonaparte stated, with his usual brevity, the conquests he had made since their last adjournment, and what had been done, and was further intended, for the good of the empire. Among other particulars he observed, that three months had seen the origin and the result of this fourth puny war. That the genius of France had conducted the army of England, which had terminated its projects in the marshes of Walcheren. The conquest of the Illyrian provinces had extended the limits of his great empire as far as the river Save; by which means he was enabled to watch over his commercial interests in the Mediterranean, the Adriatic, and the Levant; and to protect or to punish the Ottoman Porte according to the relations it should maintain with England. Intimation was given of an intended change in Holland, by which it would become a part of the French empire, "to which indeed it naturally belonged, as it was nothing else than an alluvion of the Rhine, the Meuse, and the Scheldt, the great arteries of the empire."

Towards the close of the year, a grand meeting of Bonaparte's brothers, and other relatives, princes and princesses, and vassal kings, began to discover a secret article in the treaty of Vienna. To this meeting Bonaparte represented the necessity of providing an heir to that throne on which Providence had placed him. For this purpose his present marriage must be dissolved; and that which had been for fifteen years a source of happiness to him, he must sacrifice to the welfare of France. Still his present comfort should hold the rank of an empress, and be treated by him as his best and dearest friend. Josephine returned her thanks to him for his generous goodness in exalting her to a throne, expressed her consent to a measure necessary for the country, and declared that she should always look to him as her great benefactor and best friend, and exult in the sacrifice thus made of their mutual affections. A note was taken of the whole transaction, signed by Napoleon, Josephine, and all the kings, queens, princes, and princesses, present; and on the 16th of December it was laid before the senate, which agreed that the marriage should be dissolved, the title of empress-queen be retained, an annual revenue of two millions of francs accompanying it.

The loss of Pomerania and Finland, the severe distress in which the Swedish nation was involved by the war with

the overwhelming power of Russia, aggravated by the ravages of a contagious distemper, and the knowledge of the army that it was the fixed purpose of the king, notwithstanding the armistice of November 1808, to renew a war, altogether hopeless and desperate, with Russia, backed by France; (see p. 184.)—these circumstances naturally and almost necessarily led to the deposition of the king, which took place on the 13th of March. This is one of the least, if not the very least, violent of political revolutions that we meet with in history: it was effected without the loss of a single life. The duke of Sudermania, the king's uncle, assumed the government under the title of regent, and was afterwards chosen by the states king, in the room of his nephew. This unfortunate monarch is now an exile with his family, for even his son is declared unfit to reign. However we may lament that he should engage in a contest to which he was by no means equal, we must in justice observe, that, from the very beginning of Bonaparte's career, Gustavus was ever his most resolute opponent; and, had the other continental powers acted with the same undeviating firmness, and stood by each other, (of which they have just now found out the necessity,) the disgrace of the emperor Napoleon would not have been deferred till the year 1813; nor would a French adventurer have been declared heir to the Swedish crown.—Though Gustavus had been dethroned for persisting in an unequal contest against Russia and France, still the new king declared his determination not to consent to any peace with Russia that should be disgraceful to Sweden, or oblige her to take up arms against her faithful ally Great Britain. The war between Russia and Sweden was accordingly renewed. The courage and gallantry of the brave Swedes were opposed in vain to the courage and the numbers of the Russians. Peace between Sweden and Russia, purchased by great sacrifices of territory on the part of the former, was concluded on the 17th of September. Peace was also concluded between Sweden and France, but not till the 6th January 1810. By this, Swedish Pomerania, with the principality of Rügen, and their dependencies, were restored to Sweden. The former commercial relations between the two countries were restored. France was to have the right of establishing an emporium at Gothenburg. The king of Sweden promised to adopt the continental system, and to exclude from his ports the English commerce. The treaty was declared to be common to their majesties, the kings of Spain and the Indies, of the two Sicilies, and of Holland, and to the Confederation of the Rhine.

About this time was published a list containing the titles bestowed upon the family of Bonaparte, and upon his principal generals, favourites, and courtiers. This will be found extremely useful for the ready understanding of the London newspapers in their accounts relating to France, since the proper names have yielded to the dignified denominations. It is remarkable that most of the dukedoms are situated in Italy, where the titled marshals have little chance ever to settle their ennobled families; and that no part of the French territory has ever been assigned as an *apanage* to any of Napoleon's friends and co-operators; as if he could call every part of Europe his own, except the very kingdom which he is in possession of.

Napoleon	- - -	Emperor of France, King of Italy, &c.
Joseph Bonaparte	-	King of Spain.
Louis Bonaparte	-	King of Holland.
Jerome Bonaparte	-	King of Westphalia.
Paulina Bonaparte	-	Princess Borghese.
Eliza Bonaparte	-	Grand Duchess of Florence.
Eugene Beauharnois,	}	Viceroy of Italy.
step-son to Napoleon		
Infant daughter of do.	}	Princess of Bologna.
Joachim Murat, brother-in-law to Napoleon		
Cardinal Fesch, uncle to Napoleon	}	Archbp. of Lyons, and Primate of the Confederation of the Rhine.
Charles Theodore		
	-	King of Bavaria.

Frederic Charles Wm.	King of Wurtemberg.
Frederic Augustus	King of Saxony.
C. M. Talleyrand	{ Prince of Benevento, in the king- dom of Naples; Vice-Chancellor.
Marshal Bernadotte	{ Prince of Ponte Corvo, (now Crown Prince of Sweden.)
—— Berthier	- - Prince of Neuchatel, (Switzerland.)
—— Marmont	- - Duke of Ragusa, (Dalmatia.)
—— Junot	- - Duke of Abrantes, (Portugal.)
—— Savary	- - { Duke of Rovigo, (Italy, near Ven- ice.) Minister of Police.
—— Davoust	- - Prince of Eckmuhl, D. of Auerstadt.
—— Angereau	- - Duke of Castiglione, (in Italy.)
—— Bessieres	- - Duke of Istria.
—— Kellerman	- - Duke of Valmy.
—— Arrighi	- - Duke of Padua, (near Venice.)
—— Caulincourt	- - Duke of Vicenza, (near Venice.)
—— Duroc	- - Duke of Friuli, (north of Venice.)
—— Victor	- - Duke of Belluno, (near Venice.)
—— Soult	- - Duke of Dalmatia.
—— Lefebre	- - Duke of Dantzic.
—— Moncey	- - Duke of Corneigliano, (in Italy.)
—— Mortier	- - Duke of Treviso, (near Venice.)
—— Mafena	- - Duke of Rivoli, Prince of Essling.
—— Ney	- - { Duke of Elchingen, (Germany, circle of Swabia.) Pr. of Moskwa.
—— Lasnes	- - Duke of Montebello, (Italy) killed.
—— Suchet	- - Duke of Albufera.
—— Oudinot	- - Duke of Reggio.
Monf. Cambaceres	{ Duke of Parma, and Arch-Chan- cellor.
—— Lebrun	- - { Duke of Placenza, and Arch- Treasurer.
—— Lacul	- - Count Seffac.
—— Clark	- - Duke of Feltre, Count Huenberg.
—— Fouche	- - Duke of Otranto, Gov. of Rome.
—— Champagny	{ Duke of Cadore, and Minister for Foreign Affairs.
—— Maret	- - Duke of Bassano, Sec. of State.

We must now return to the beginning of the year, to notice some important proceedings in the British parliament, which was opened by commission on the 13th of January. The speech contained several points which naturally led to serious debates: the renewal of his majesty's engagements with the Spanish nation, in the form of a treaty of alliance; his disappointment caused by the convention of Cintra; and the augmentation of the regular army. The address was moved by the earl of Bridgewater, and seconded by lord Sheffield. Earl St. Vincent opposed it most strenuously. He observed, that the manner in which the opposition to the enemy had been conducted in the peninsula, excited both sorrow and indignation: he would assert it in the face of the country, and in the face of the world, that it was the greatest disgrace that had befallen Great Britain since the days of the revolution; and this he openly declared, whether he took into consideration the manner in which the war was carried on in Portugal, or the way in which our troops had been sent there. Transports were hired, and great merit was to be attributed, forsooth, to ministers in providing these transports. But he wished to notice the important services to which these transports were eventually applied; "why truly," said his lordship, "they were at last employed to convey the rascally ruffians whom Junot commanded, to that part of France which was nearest the boundaries of Spain, that they might, as speedily as possible, be again brought into action, with more effect, against our soldiers. So that those devils," added his lordship, "are at this moment harassing the rear of our retreating army." He reproved with great acrimony the convention of Cintra; and said, that, if the house did its duty, they would immediately proceed to the foot of the throne, and there tell the sovereign the bold truth, that, if he did not remove the present ministers, he would lose the country. These were the sentiments of his heart: he spoke them as a solemn duty,

which he found himself bound to express. It was probably the last time he should trouble their lordships; "and with that," said the noble admiral, "I wish your lordships a good night." (At these words, the noble earl walked out of the house.)

Earl Grosvenor approved the intention and determination of assisting the Spaniards powerfully; but could not help expressing his disapprobation of the convention of Cintra; and would have had troops sent to the foot of the Pyrenees rather than to the heart of Spain, avoiding by this means the disgrace of a retreat.—Lord Grenville also disapproved of the sending troops to the interior of Spain of an inadequate strength to meet the enemy; and reprobed, with great warmth and at a great length, the conduct of the ministers, in which he found neither wisdom nor vigour.

The earl of Liverpool defended the address in all its points.—Earl Moira disapproved of many paragraphs in the address, but would still refrain from moving any amendment.—The address was agreed to.

On the same day the address was moved in the house of commons, after a number of prefatory observations on the different subjects touched on or alluded to in the speech, by the hon. Frederic Robinson; and seconded by Mr. S. B. Lushington.—Mr. Ponsonby, in a long and elaborate speech, touched upon all the principal objects: and, as to the convention of Cintra, expressed himself in the following words: "The convention of Portugal having taken place, his majesty's ministers thought proper to cause the Tower-guns to be discharged, in token of the satisfaction they felt, until they found that all the rest of his majesty's subjects entertained a contrary feeling upon the transaction. The public displeasure was loud and general; every patriotic heart felt the stain cast upon his country's honour; every tongue uttered the complaint. It did so turn out, too, that the first city in the empire, the city of London, sympathising with the national feeling, approached the throne with their sentiments; and a most vigorous reception they did meet with indeed. The corporation tell his majesty, that they think the convention disgraceful, dishonourable to the British arms, and injurious to his majesty's interests: they call for investigation, and the punishment of the guilty. In answer to this application, his majesty's ministers advise his majesty to tell the citizens of London, that *their interposition was unnecessary*, and that it was inconsistent with British justice to pronounce judgment before investigation. Really, though the gentlemen opposite may think their responses not only wise but oracular, I am at a loss to know what the difference is between British justice, and that justice which, in every variation of time or place, is immutable. Feeling the profoundest respect in every case in which his majesty appears to act, I still must say, that his advisers put into his mouth upon that occasion, an answer as little congenial to the spirit of the British constitution as it was ill suited to the dignity of the throne. Ministers may talk with flippancy themselves, they may pun and epigrammatise; but, when unfortunately the king of this country feels it his duty to hint his displeasure to his people, or convey to them a rebuke for their conduct, there ought to be a dignity and decorum observed in the language of reproof from the throne, which would make displeasure more severely felt by those for whom it was intended. But I can easily conceive that ministers might have been a little irascible on receiving that remonstrance, because, notwithstanding the usual complacency of the city of London to their measures, it had within the last year on two important occasions opposed them; first on the reversion-bill, and lastly on this disgraceful convention."

Lord Castlereagh vindicated the conduct of government; after which various strictures were made on the address, which, however, was not on the whole opposed, by Mr. Whitbread. A long reply was made by Mr. Canning: Mr. Tierney, Mr. G. H. Rose, and Mr. A. Ba-

ring, entered at very considerable length into our commercial disputes with America; and Mr. Alderman Combe animadverted in severe terms on the answer returned by his majesty's ministers to the address of the city of London on the convention of Portugal: a topic which had been also touched on, though more briefly, by all the speakers opposite to the treasury-bench. The question was then put, and agreed to *nem. con.* when a committee was appointed to prepare and draw up the address.

On the 23d of January, the earl of Liverpool moved the thanks of the house to lieutenant-general sir A. Wellesley, K. B. for the skill, valour, and ability, displayed by him on the 17th and 21st of August of the preceding year, and particularly in the battle of Vimeira. After encountering potent resistance from several lords, the motion was agreed to. The same subject, having been brought into the house of commons by lord Castlereagh, was also agreed upon; as well as a vote of thanks to the officers, and the approbation of the conduct of the non-commissioned officers and privates; so that all the brave co-operators in this victory partook of the gratitude of their country, of which both houses were the natural and impartial organs.

Yet, after these debates, the minds of the anti-ministerial party were not satisfied as to the policy and necessity of the convention of Cintra. Lord Henry Petty inveighed most strongly against the conduct of the ministers, and moved the following resolutions: 1. That the convention concluded at Cintra, on the 30th of August, 1808, and the maritime convention concluded off the Tagus on the 3d of September, 1808, appear to this house to have disappointed the hopes and expectations of the country. 2. That the causes and circumstances which immediately led to the conclusion of those conventions, appear to this house, in a great measure, to have arisen from the misconduct and neglect of his majesty's ministers.

Lord Castlereagh, after vindicating the conduct of government, moved the previous question on the first resolution, declaring that he would take the sense of the house on the second.—General Tarleton thought that there was something rash in the action of the 17th of August, and something wrong in that of the 21st.

Sir A. Wellesley explained his views and motives of action throughout the expedition. He had given it as his opinion, and it was still his opinion, that the operations in favour of Spain could not be carried on with any chance of success, otherwise than in conjunction with the people and public authorities of that country; and therefore it was necessary, before the commencement of the campaign, to come to a right understanding with the juntas. When he communicated on the subject with the juntas of Galicia and Asturias, it was conceived, that the best service that could be done to the cause of Spain, by the British troops, would be the expulsion of the French from Portugal. The British army, in possession of Portugal, might be a link between the northern and southern armies of Spain, which had then no point of union. When he landed in Portugal, he had the choice of two lines of march; and, for obvious reasons, had chosen that along the coast. Besides the troops which he had under his command at the time, he had reason to expect re-inforcements under general Ackland, sir H. Burrard, and sir J. Moore. But he was so well satisfied of the efficiency of his own force to execute his object, that he did not intend to have employed the corps under general Ackland in the field at all, but in the siege of Peniche. And, as to sir J. Moore, it was his plan to have sent him forward to Santarem, with a view to intercept the enemy, who, in sir Arthur's opinion, would endeavour to cross the Tagus. That plan was feasible, not only in his opinion, but in that of all the general officers who had given evidence at the court of inquiry, and even of the court itself. He farther observed, that there were two parts of the action of the 17th; the one in the mountains, and the other in the plains. In that part of the action which took place in the plain, the enemy had retreated in good order. Af-

ter the battle of the 21st, they had retreated in great disorder. And the good order of the retreat in one instance made all the difference. If the enemy had been vigorously followed up on the 21st, he was satisfied in his own mind, that there would have been no reason for concluding the convention which had given so much offence. He added, that he had done every thing in his power to forward the objects of his superior officers, though he differed from them in opinion. This was what he considered to be the greatest distinction between military and civil inferior situations. If, in a civil office, the inferior differed materially from the superior, he ought to resign; but, in military appointments, it was the duty of the inferior officer to assist the commander in the mode in which that commander might deem his services most advantageous.

The gallant general, who defended himself so clearly in the house, having since, by a long series of victories, expelled the French from the peninsula, we have thought it most interesting to state his own words, in order to show what were his ideas and conception of the matter, even at a time when the complete liberation of Spain existed more in our wishes than in our hopes.—Mr. Windham, however, contended that the statement, though satisfactory for the justification of sir A. Wellesley, was no justification of his majesty's ministers.—After several speakers had given their opinions at length, the house divided: for the previous question, 203; for lord H. Petty's resolution, 153.

We have already hinted, that the investigation into the conduct of the duke of York and Mrs. Clarke would form a prominent article in the parliamentary transactions of the year 1809.

When the woman caught in adultery was brought before Christ by the scribes and pharisees, the Saviour was probably far from being inclined to forgive the guilty; but, considering the zealous ardour with which young and old sinners were stimulated to accuse others, marking their eager desire to punish, and scrutinizing their secret views against his own person, he made the well-known address to them: "*He that is without sin among you, let him first cast a stone at her.*" An act of mercy towards the woman, yet also an act of justice towards her accusers; but, above all, the finest and most impressive lesson that ever was given to mankind, and a just and appropriate application of one of the first and most equitable laws of nature; "Do not to others that which you would not wish to be done to you." Had the prosecutors of H. R. H. the duke of York considered this maturely and seriously before they went to work, more recent events prove that they might have hesitated at the very threshold. Those who sat in judgment upon the accused did not fail to enter into the respective characters of the accusers: some thought that reform of abuses was the pretext, but not the main spring; whilst ministers were fully aware that this engine was set to play to tempt them that they might have to accuse them. Yet for all this the investigation went on; so that, not only this nation but the world at large ought to be impressed with admiration and respect for the impartiality of our constitutional laws, and be convinced that wherever corruption dares to show her hideous head, whether from the stall of the cobbler or from under the footstool of majesty, a thousand voices are ready to hoot her, a thousand hands ready to punish her, without the least regard either to rank, wealth, or power.

We should be sorry to give the reader to understand, by these preliminaries, that the investigation ought not to have taken place. We are of a very different opinion: for we hold as perfect truth, that, if the spring is contaminated at its head, all the ramifications will be stained with impurity, and the whole will be corrupted.—The higher the station, perhaps, the less mercy ought to be shown; the scandal of the example enhancing the heinousness of the crime. *Corruptio optimi pessima.*

In the house of commons, on the 27th of January, Gwyllim Lloyd Wardle (colonel of militia) stated, that, "unless

"unless the system of corruption that had so long prevailed in the military department should be done away, this country might fall an easy prey to the enemy." The first point in the case he had to state related to the half-pay fund, which was an establishment under the direction of the present commander-in-chief. This fund arose out of the sale of commissions vacant by death—by the promotion of officers not allowed to sell—or by dismissals from the service. The power of the commander-in-chief over this fund was constituted and intended for the reward of merit, either by the appointment of meritorious officers to the commissions which so became vacant, or by selling them, and applying the produce of such sales to the redemption of half-pay commissions, or to the compassionate fund. Here the power of the commander-in-chief over such produce ceased. If the commissions he had described were otherwise disposed of, the authority vested in the commander-in-chief was abused, and the objects of the half-pay fund abandoned. Now, if he could show that those commissions were appropriated to very different purposes, it would, of course, appear, that such abuse and abandonment did take place—that merit was not rewarded—that the half-pay list was not reduced—that the compassionate fund was not assisted. For the purpose of showing this, it was necessary to call the attention of the house to another establishment of the commander-in-chiefs, which was quite of a different complexion from that which he had just mentioned. This establishment, which consisted of a splendid house in Gloucester-place, a variety of carriages, and a long retinue of servants, commenced in the year 1803; and at the head of it was placed a lady of the name of *Clarke*. As this lady formed a principal party in several of the facts which he had to cite, he was under the necessity, however reluctantly, to mention her name, as well as that of others, in order to make out a fair parliamentary basis for his motion, and to satisfy the house, that he had not brought it forward upon light grounds.

The first case to which colonel Wardle called the attention of the house, was that of captain Tonym, of the 48th regiment of foot, who had been promoted to a majority in the 31st regiment; for which promotion he was indebted to the influence of Mrs. Clarke. The terms of agreement were, that Mrs. Clarke should be paid 500l. upon captain Tonym's being gazetted. Major Tonym was gazetted on the 2d of August, 1804; and the 500l. was paid to Mrs. Clarke. The positions that colonel Wardle held to be clearly deducible from this case were, First, that Mrs. Clarke possessed the power of military promotion. Secondly, that she received pecuniary consideration. And, thirdly, that the commander-in-chief was a partaker in the benefit arising from such pecuniary consideration. The truth of this case would be established by witnesses, whose names he mentioned.

The second case colonel Wardle had to adduce related to exchanges. On the 25th of July, 1805, an exchange was concluded between lieutenant-colonel Brooke, of the 56th regiment of infantry, and lieutenant-colonel Knight, of the 5th dragoon guards, through the influence of Mrs. Clarke. Mrs. Clarke wanted some money to defray the expenses of an excursion in the country. She therefore urged the commander-in-chief to expedite the exchange, as she was to receive 200l. for it. This urgent request was made on a Thursday, and its influence was such, that the exchange was actually gazetted on the Saturday following. Mrs. Clarke, in consequence, received from the agent negotiating the transaction, 200l. The witnesses to this case he named.

Another case colonel Wardle had to adduce referred to major John Shaw, of colonel Champagne's Ceylon regiment. Major Shaw was appointed deputy barrack-master of the Cape of Good Hope, on the 3d of April, 1806. It was known that this officer by no means enjoyed the favour of the duke of York: that, in fact, his royal highness entertained some prejudice against him. But these obstacles Mrs. Clarke readily undertook, on conditions, to

overcome; and it was agreed to pay her 1000l. for the major's appointment. The appointment was therefore made; and the major himself paid Mrs. Clarke 300l. Soon after 200l. more was sent to Mrs. Clarke by major Shaw's uncle. The remaining 500l. however, was not paid; and, when it was found not to be forthcoming, Mrs. Clarke was enraged, and threatened revenge. She actually complained to the commander-in-chief of Mr. Shaw's breach of contract; and the consequence was, that the major was soon after put upon half-pay. This case of major Shaw was the only instance colonel Wardle could find of such an officer being reduced to half-pay. The case of this officer then demonstrated, First, that Mrs. Clarke's influence extended to appointments on the staff, as well as to promotions and exchanges in the army itself. Secondly, that the commander-in-chief punished an individual by reducing him from full to half pay for non-performance of a nefarious contract with his mistress. Thirdly, that the commander-in-chief was a direct party to the whole of this nefarious transaction. Witnesses named.

Mr. Wardle now came to, what he called, the very novel case of colonel French and his levy. This officer was, through the influence of Mrs. Clarke, appointed by the commander-in-chief to conduct a levy in the years 1804-5. The colonel was introduced to Mrs. Clarke by captain Huxley Sandon; and the condition upon which he obtained his appointment was, that Mrs. Clarke should have one guinea out of the bounty of each man raised, together with the sale or patronage of a certain number of the commissions. The agreement being concluded, it was communicated to, and approved by, the commander-in-chief. Colonel French was accordingly sent, by Mrs. Clarke, to the Horse Guards; and, after many interviews, the levy was set on foot. As the levy proceeded, Mrs. Clarke received several sums of money from colonel French, captain Huxley Sandon, and a Mr. Corri. She also received 500l. from a Mr. Cockayne, a known solicitor in Lyon's Inn, and a friend of captain Huxley Sandon's.—Mr. J. Donovan, a surgeon, of Charles-square, (who had also borne a hand in the promotion of major Tonym,) was acquainted with an old officer, a captain Tuck, whom he very strongly recommended to seek promotion; and, in order to encourage him by a display of the facility with which it might be attained, he sent him a written scale of Mrs. Clarke's prices for different commissions, which, in stating them, he begged leave to contrast with the regulated prices of the army:

	<i>Mrs. Clarke's Prices.</i>	<i>Regulated Prices.</i>
A majority	£900	£2600
A company	700	1500
A lieutenantcy	400	550
An ensigncy	200	400

From this scale, colonel Wardle said, it appeared, that the funds he had before alluded to, lost, in an enormous ratio, to the gain of Mrs. Clarke, or any other individual acting upon the same system.

Here, said colonel Wardle, the scene closed upon Mrs. Clarke's military negotiations; and in what followed the commander-in-chief stood alone. It appeared, that his royal highness required a loan of 3000l. from colonel French; and that Mr. Grant, of Bernard's Inn, promised to comply with the request in procuring the money, provided the commander-in-chief would use his influence and obtain payment to colonel French of a balance due to him by government on account of the levy. This was promised; but, the commander-in-chief failing to fulfil his part of the condition, the loan he required was not advanced, and 3000l. still remained due from government to colonel French. The case of this levy showed, First, that Mrs. Clarke, in addition to promotions in the army, to exchanges, and appointments on the staff, possessed the power of augmenting the military force of the country. Secondly, that in this case, as in all others, she was allowed to receive pecuniary considerations for the exercise of her influence. Thirdly, that the commander-in-chief endeavoured

endeavoured to derive a pecuniary accommodation to himself, independent of Mrs. Clarke's advantages.

The last case with which colonel Wardle would at present trouble the house, was that of captain Maling. This gentleman was appointed to an ensigncy in the 87th regiment on the 28th of November, 1805; to a lieutenantcy in the same regiment on the 26th of November, 1806; and to a captaincy in the royal African corps, under the command of the duke of York's own secretary, colonel Gordon, on the 15th of September, 1808. This gentleman's promotion was effected through the influence of the favourite agent, Mr. Greenwood, in whose office Mr. Maling was a clerk, remaining at his desk while advanced in the army by such an extravagant course. Mr. Maling had also, while so promoted, some appointment of a pay-master in Ireland; a course which interfered with the interests, which superseded the rights, of many meritorious officers who had long served in the army, who had fought and bled for their country. Was it tolerable, that such an accumulation of favours should be conferred on any individual, without any claim of professional merit, and merely through the operation of undue influence, while so many hundreds of truly-deserving men were overlooked and slighted? Was it possible that our arms could prosper—that its spirit could succeed, or its character be advanced, while such injustice was tolerated?

There were a few other points, though of very trifling importance, that were brought forward in accusation of the duke of York, not on the present occasion, but afterwards; and this, for the sake of order, that the alleged amount of the duke's offending may be seen at once, seems the proper place for stating them.—Mrs. Clarke had stated, that Samuel Carter was her footboy, and went behind her carriage. He went into the army direct from her service. In this statement she was corroborated by several witnesses. Another additional case: Mr. Dowler had stated, that Mrs. Clarke had first suggested to him, that she could procure him a situation in the commissary-department. Mr. Dowler, who obtained the appointment, had never taken any step to expedite the business, nor applied to any other channel than that of Mrs. Clarke, to whom he had paid 1000*l.* for her influence, and she told him the duke knew of his doing so. Colonel Wardle then mentioned the existence of a public office in the city for the sale of commissions; and concluded with moving for the appointment of a committee “to investigate the conduct of his royal highness the duke of York, commander-in-chief, with regard to promotions, exchanges, and appointments to commissions in the army, and in raising levies for the army.”—Sir Francis Burdett seconded the motion.

The Secretary at War rose, but not, he said, to oppose the motion. He felt, as he said, great satisfaction that an opportunity was afforded of instituting an effectual inquiry into the grounds of the various calumnies and misrepresentations, which had of late been so industriously circulated against that *illustrious personage*. The facts which the honourable gentleman had brought forward were of a very serious nature, and well deserved the attention of the house. Charges clearly and distinctly stated, his royal highness was ready and even desirous to meet. With regard to the private transactions stated by colonel Wardle, he would say nothing, having never heard of them before. But he could contradict those that were stated to have occurred at the Horse Guards. It had been universally allowed, that, to make courage available in the day of battle, discipline was necessary; and it was well known how much the commander-in-chief had attended to that object. Extreme order and regularity had also been introduced into the office of the commander-in-chief, which the inquiry would prove.

Sir Arthur Wellesley spoke nearly to the same purpose, and ended by an encomium upon the discipline and example afforded by the illustrious person at the head of the army.

Mr. Yorke said, that he had never listened to a charge

more serious; and that he had heard it with the greatest possible concern, both on account of the commander-in-chief, and the honourable gentleman who had brought it forward, thus taking upon himself so heavy a responsibility. But he was glad that the house could at last reach, *in a tangible shape*, some of those libels against the duke of York, which had for some time past been more assiduously and pertinaciously circulated than ever libels had been at any former period in this country, so prolific in libels. He hoped the house would do its duty to itself, to the country, and to the royal house of Brunswick; and that, if there was no ground for these accusations, justice might be done to the commander-in-chief. Mr. Yorke, for his own part, believed, that a conspiracy of the most atrocious and diabolical kind existed against his royal highness, founded on the jacobinical spirit which appeared at the commencement of the French revolution, though it did not show itself now in exactly the same form. It appeared to be the design of the conspirators, by means of the press, the liberty of which was so valuable, and the licentiousness so pernicious, to write down the military system through the commander-in-chief; the army through its generals; and other establishments through the persons most conspicuous in each. Let blame fall where it ought. But the house ought to consider the illustrious person against whom the charge was directed: they ought to consider his high station, and the eminent service he had rendered to the country, in the state to which he had brought the army. What was the state of the army when he became commander-in-chief? it scarcely deserved the name of an army; and it was now found by experience to be, in proportion to its numbers, the best army in the world. He had said, that he believed a conspiracy to exist. If the house could go along with him, and suppose that this was actually the case, he threw out for their consideration, whether a parliamentary commission, with power to examine on oath, was not preferable to a committee.

Sir F. Burdett, in a moderate address to the house, sincerely hoped that the facts alleged originated in error; but, as the charge was public, his firm opinion was, that the inquiry should be public, and that the investigation could no-where be conducted more properly, more effectually, and more constitutionally, than in a committee of the whole house.—Mr. Wilberforce thought that an investigation at the bar could not be conducted with impartiality, in consequence of the interference of party-spirit; and conceived that justice could be most satisfactorily obtained by an inquiry, private in its progress, but public in its result.

The Chancellor of the Exchequer coincided with the unanimous sentiment of the house, that, to the most solemn and serious accusation brought forward that night, the most solemn and serious inquiry ought to be accorded. He could state, on the authority of the duke of York himself, given him at the only opportunity he had of consulting with him on the subject, that the most ready course of prosecuting the inquiry would be the most agreeable to him, and that he deprecated nothing so much as a course that would impede the final result. That illustrious personage wished, like any other subject, to be put publicly on his trial, and to stand acquitted or convicted upon the case that might be made out; at the same time that he had a thorough conviction that he should exculpate himself from all charge. He would stake his reputation upon it, that it was impossible that, after the result of the inquiry, any suspicion could be entertained of his royal highness. Mr. Wardle had stated a circumstance, which particularly involved the character of his majesty's government; that two members of the cabinet were concerned in an agency for the disposal of government-patronage. This was a topic on which he must require the fullest information. It was for the option of Mr. W. to determine whether he would afford it in that house, or by a private communication to some of the responsible servants of the crown.

But

But he was convinced, that, as there was nothing so discreditable to government, so there was nothing more false, than the idea that money was paid to persons high in office for such transactions. For the distinct manner in which the honourable gentleman had submitted the question to the house, he conceived him entitled to its thanks.

Mr. Wardle stated, that the office where the agency was transacted, was in a court in Threadneedle street. The names of the agents in that office were, Heylop and Pullen. They had stated various situations purchased in the island of Jamaica; and that the two members of the present cabinet, for whom they acted in such situations, and to whom he alluded in his speech, were, the lord-chancellor, and the duke of Portland.

Mr. Canning observed, that, in whatever view the house should consider the transactions stated by Mr. W. whether they were substantiated or refuted, "*infamy must attach somewhere; either upon the accused or the accuser.*" Of this unguarded and strong expression, Mr. Canning was afterwards often reminded, and sorely badgered about it on every occasion. Certainly, where there are probable grounds of suspicion in a case of great public importance, accusation is excusable, and even laudable, though it should not be substantiated.

After a few observations by Mr. Wardle, it was resolved that the inquiry should be made in a committee of the whole house, and that they should enter upon it on the 1st of February following.

The whole attention of the metropolis was awakened by this most important case, wherein the second son of our sovereign, a married prince, a man having attained the meridian of life, and whose conduct as commander-in-chief was praised even by his enemies, was accused, not only of conniving at the most nefarious practices behind the scandalous curtain of adultery, but also of sharing, either directly or indirectly, the profits arising from them. Indeed, the whole country felt a deep concern in the transaction; and, although accounts of the trial were published at the time in a great variety of forms, we find ourselves called upon to give a sufficient sketch of it, in order that those of our present or future subscribers, who may not have had an opportunity of reading it anywhere else, may not feel disappointed at the chasm which the absence of it would necessarily leave in our annals.

The inquiry lasted from the 27th of January to the 20th of March; and the whole may be divided into two heads: 1st, The connection of Mrs. Clarke with the persons who paid or promised to pay her sums of money for promotions or other appointments. 2dly, The acquaintance of the commander-in-chief with the secret transactions of Mrs. Clarke with those persons, and his participation with her in the gain arising from that financial system.

The first of these points was proved beyond a possibility of doubt, by an immense mass of evidence.—As to the duke's knowledge of Mrs. Clarke's manoeuvres, and his sharing in the returns, this is a fact; the proof of which depended solely on the evidence of Mrs. Clarke; for this kind of commerce must, from its nature, have been confined to the two parties concerned; no third person could interfere in it. The testimony of Mrs. Clarke, abandoned to licentiousness from her youth, and become almost a prostitute by profession, is scarcely to be accounted of any weight at all, especially as she acted under the influence of revenge against his royal highness, and a strong desire to please Mr. Wardle, who, as afterwards appeared, had promised to compensate in a very liberal way any service she might be of to him in substantiating his charges against the duke. But there was throughout the whole of her close and long examination at the bar, an air of unconstraint and ease, and a readiness of reply, that seemed to bespeak a disposition to answer the questions that were put to her truly. For every why, she had a wherefore. She was caught in falsity; but not often, nor in very important cases; nor could she by any means be charged,

on the whole, with prevarication. At the same time it is to be observed, that she was under no temptation to prevaricate: the great mass and weight of her evidence was intended, not to conceal, but clearly to expose, her bargaining with place and promotion hunters. And, as for what was alleged to have passed privately on that subject, it could only be known to the duke and herself. No one could prove a negative.

There were, however, two circumstances that wore on their face a direct inculpation of the commander-in-chief.

First, captain Sandon said, that, when major Tonyn became impatient for his promotion, he (Sandon) went to state the circumstances to Mrs. Clarke, who sent him back to inform him, that she had received a note from the duke of York respecting his case; which note was shown by captain Sandon to major Tonyn. The note was; "I received your note, and Tonyn's case shall remain as it is. God bless you." This note was intended to show, that the person to whom it was written had influence; and, in consequence, major Tonyn consented to let his security remain. The existence of this note was regarded as the more-weighty evidence, since it had been extorted, without Mrs. Clarke's knowledge or interference at all in the matter, from captain Sandon, who at first pretended that he had destroyed it, and who was therefore sent to Newgate for prevarication. When major Tonyn was gazetted, captain Sandon was directed to show him another note, purporting to have been written by the duke of York, and saying, "Tonyn will be this night gazetted." This note was not afterwards given back. When the first note was shown to his royal highness, he utterly denied all knowledge of the matter, and declared the note to be a forgery. As to the note relating to the appearance of major Tonyn's name in the gazette, his royal highness could not be positive: he could not state that he might not have written such a note, in answer to a note which might have been addressed to him; he could not call the circumstance to mind. The other note, however, his royal highness most positively denied having written. When Mrs. Clarke (who was ignorant of what was passing in the house) was called in, and shown the note, which was addressed to George Farquhar, esq. she said, "I suppose I must have seen it before, for it is his royal highness's writing. I do not know how it could have got into that man's possession, unless I gave it to him. It was a direction I used very often to get from his royal highness." This evidence being rebutted by the duke of York's positive denial of the fact, several witnesses were called from the bank and post-office to give their opinion upon it. And they all, with only a single exception, general Brownrigg, decided, that the note was in the same hand-writing as other letters acknowledged to be his. It is also to be observed, that the circumstance of the note was not brought forward by the chancellor of the exchequer till it was believed that the note itself was destroyed. Thus the affair of the note had an effect quite opposite to what was intended. To justify his royal highness, general Clavering made a voluntary attempt; the consequence of which was, that he himself was committed, as well as captain Sandon, to Newgate, for prevarication. But after all, this circumstance of the note, supposing its authenticity, only showed, that his royal highness suffered Mrs. Clarke to talk, and write, and put questions, respecting military appointments, which the duke does not seem to have affected to deny or conceal. For it has just been seen, that when the note, "Tonyn will be this night gazetted," was shown to him, he admitted that he might possibly have written such a note, though he did not recollect the matter.

The other circumstance, wearing on its face a direct inculpation of the commander-in-chief, was the following.—Miss Mary-Anne Taylor, who was in the habit of visiting Mrs. Clarke, when she was under the duke's protection, very frequently, stated, that she heard the duke of York speak to Mrs. Clarke about colonel French's levy; and that what passed, as nearly as she could recollect, was

as follows: "I am continually worried by colonel French. He worries me continually about the levy-business, and is always wanting something more in his own favour." Turning then to Mrs. Clarke, (Miss T. thinks,) he said, "How does he behave to you, darling?" or some such kind words as he was wont to use. Mrs. Clarke replied, "Middling, not very well." On which the duke said, "Master French must mind what he is about, or I shall cut up him and his levy too."

After the examination of witnesses was closed, on the 23d of February, the Speaker rose, and stated, that since he had come to the house he had received a letter, the contents of which related to the inquiry now pending before the house respecting the conduct of his royal highness the duke of York, and he wished to know whether it was the pleasure of the house that he should read it. [*A general exclamation of Read! read! read!*] The right honourable gentleman then announced that the letter came from his royal highness the duke of York, was signed "Frederic," addressed to the Speaker, and dated "Horse Guards, February 23, 1809." The contents were as follow:

"Sir, I have waited with the greatest anxiety, until the committee, appointed by the house of commons to inquire into my conduct, as commander-in-chief of his majesty's army, had closed its examinations; and I now hope, that it will not be deemed improper to address this letter through you to the house of commons. I observe with the deepest concern, that, in the course of this inquiry, my name has been coupled with transactions the most criminal and disgraceful; and I must ever regret and lament, that a connection should have existed, which has thus exposed my character to animadversion. With respect to any alleged offences connected with the discharge of my official duties, I do in the most solemn manner, *upon my honour as a prince*, distinctly assert my innocence; not only by denying all corrupt participation in any of the infamous transactions which have appeared in evidence at the bar of the house of commons, or any connivance at their existence, but also the *slightest knowledge or suspicion that they existed at all*. My consciousness of innocence leads me confidently to hope, that the house of commons will not, upon such evidence as they have heard, adopt any proceedings prejudicial to my honour and character; but if, upon such testimony as has been adduced against me, the house of commons can think my innocence questionable, I claim of their justice, that I shall not be condemned without trial, nor be deprived of the benefit and protection which is afforded to every British subject by those sanctions under which alone evidence is received in the ordinary administration of the law. I am, sir, yours,  
FREDERIC."

On the 8th of March, Mr. Wardle, after an elaborate examination of the evidence, moved a resolution to the following effect: "That an humble address be presented to his majesty, stating, that information had been communicated to them, and that evidence had been examined to prove, that various corrupt practices and abuses had for a long time existed in the different departments of the military administration; and that the evidence which had been given had been entered on the records of parliament; that his majesty's faithful commons had most carefully examined the evidence, not only of the witnesses produced at their bar, but also of the written and official documents; and that it was with the utmost concern and astonishment that they felt themselves obliged to state, that the result of their diligent and laborious inquiry was such, as to satisfy them, that the existence of those corrupt practices to a very great extent was fully established. That it was the opinion of his majesty's faithful commons, that such abuses could not have continued to such an extent, for so long a time, without the knowledge of the commander-in-chief; but if, contrary to all probability, it should be presumed, that the commander-in-chief was ignorant of these transactions, that presumption would not warrant

the conclusion, that it was consistent with prudence that the command of the army should remain any longer in his hands. His majesty's faithful commons, therefore, humbly begged leave to submit to his majesty, *that the duke of York ought to be deprived of the command of the army.*"

Lord Folkestone seconded the motion; immediately after which, Mr. Burton rose to speak, and drew the most respectful attention of the whole house, which was continued from the beginning of his speech, which was long and elaborate, to the end. He was above eighty years of age, and had become blind. In Wales he held the office of judge in a court of law. Having both attended the whole of the examinations, and had the evidence read over to him two or three times, he took a critical review of all the cases in the order in which they were exhibited in the inquiry, without omitting any circumstance of importance. He began as follows: "Mr. Speaker, I should not thus early obtrude myself on the attention of the house, if it were not through the fear of being too much exhausted to deliver my sentiments at a late hour. The habits of my life, during the last thirty years, having engaged me pretty much in the investigation of criminal causes, I have thought it my duty to bestow my best attention upon the present important case. I have done so the rather, that few persons are so unconnected as myself with the commander-in-chief, now under accusation. I never had the honour of exchanging a word with him; and it so happens, that I have not in the army any relation, any friend, or even any intimate acquaintance, nor any one for whom I have ever received, or can expect to receive, a single favour. With his accuser I have had the honour of some acquaintance about twenty years, and had frequent occasion to admire the military talents and valour he displayed under the intrepid commander of a regiment that distinguished itself not a little during the unhappy rebellion in Ireland. I had also listened, perhaps too much, to the current reports concerning the object of this inquiry. I certainly, therefore, sat down to the consideration of it without any bias upon my mind in favour of the accused; but, divesting myself of every prejudice, I determined to pursue the strict line of duty, by considering the case of the duke of York as calmly and temperately as I would that of one of the meanest subjects in the court where I have the honour to hold a seat."—After this interesting exordium, Mr. Burton entered on a consideration of the case, having first stripped it of all matters extraneous or foreign to the point or points in question. He displayed, throughout the whole of his comprehensive speech, all the perspicuity, precision, and minute attention to every circumstance, which men of good natural parts derive from long experience in the profession of the law; a profession which is more calculated to rouse and to whet the intellectual faculties, perhaps, than any other. On the subject of French's levy, and Miss Taylor's evidence, Mr. Burton said, Surely, the evidence of Mrs. Clarke's constant companion ought to be received with great caution. The duke of York, speaking to Mrs. Clarke of colonel French, complained that French was continually worrying him about the levy. This troublesome importunity had made a strong impression on the duke's mind; for he mentions this *teazing, or worrying*, twice—"I am continually worried by colonel French. He worries me continually about the levy-business." Then, turning to Mrs. Clarke—Miss Taylor *thinks*, (only *thinks*, he said,) "How does he behave to you, darling?" To my understanding, said Mr. Burton, the question obviously means, Does he worry you as he does me?—On the case of major Tonyn, Mr. Burton observed, that, though 200l. was paid to Mrs. Clarke, that transaction was unconnected with the commander-in-chief. As to the note from his royal highness, conceding it to be genuine, why was it necessary or probable that this should refer to any corrupt agreement? Mrs. Clarke, with all her desire to impute guilt to his royal highness, had no remembrance of this note; which circumstance alone might be considered as  
powerful

powerful evidence that it had no reference to any such agreement. As an irrefragable proof that, in fact, it had no reference, Mr. Burton observed, that, according to captain Sandon's account, the note was produced in an envelope, bearing the Dover post-mark; and that he received it from the hands of Mrs. Clarke herself, for the purpose of satisfying captain Tonyn that it was of the duke's hand-writing. From the date of this envelope (for the note itself was without date), compared with the date of the Gazette, it appeared that the note could not have been delivered till five days after his actual appointment to the majority, and consequently far too late to answer its intended purpose, namely, to excite captain Tonyn's apprehensions that his appointment would be either frustrated or retarded. "Thus then," said Mr. Burton, "out of the mouth of one of these associates against the commander-in-chief, have you a plain refutation of one of their own charges; nor is there any other evidence to support it."—On the subject of the appointment of Samuel Carter to an ensigncy, and the charge for this generous act against the commander-in-chief, Mr. Burton expatiated more, in exculpation of the duke, than was at all necessary. This, in fact, did honour both to the duke and Mrs. Clarke. This young man, Carter, was a son, though illegitimate, of a very worthy captain of the army. It did not appear that his mounting behind the carriage of Mrs. Clarke was known to the duke; and, certainly, though he waited at table, he never wore Mrs. Clarke's livery. A good deal of pains had been taken on his education, which was far from being lost on the young man; as appeared from several letters of his, produced in the course of evidence. We shall only extract the first and the last sentences of Mr. Burton's speech on the charge of Samuel Carter's appointment: "I confess it to have been my hope, that the honourable member (colonel Wardle) would have yielded, on this point, to the entreaties of even Mrs. Clarke."—"God forbid that this house should so far forget its duty, as to censure the appointment of such a person to a commission in the army; or that it should carry an address to the throne against the duke of York, for an act proceeding from the purest motives—the dictates of humanity."

Mr. Burton, having gone through the separate charges, made a few observations on the probabilities or improbabilities of the case or charge in general. It had been presumed, that the duke of York knew and connived at the corrupt proceedings of Mrs. Clarke, because by such alone Mrs. Clarke could have been enabled to carry on her extensive establishment. But persons of high birth, and not in the habits of comparing income with expenditure, found it most difficult to render the one conformable to the other, or indeed to form any judgment upon these matters. He remembered to have been told, near forty years ago, by one of the preceptors of the duke of York and his royal brother, that, though they were quick at learning, he could never teach them the value of money; so impossible it was to inculcate this knowledge without the daily and ordinary means of practical experience. The existence of the conspiracy, and that the duke was a party to it, being once supposed, how was it probable that there should have been any distress for money, when there was a mill for making it continually at work? There were then in the army as many as 10 or 11,000 officers; numerous changes were going on every day in the year; and such was always the eagerness for promotion, that there never could exist a deficiency of persons ready to give ample premiums above the regulated price. Where then would have been the difficulty, through the management of such a woman as Mrs. Clarke, with her subordinate agents, to relieve her from the pressure of her pecuniary difficulties, and to gratify her vanity and extravagance to the utmost? This argument of Mr. Burton seems to us to amount almost to a demonstration that, however much the duke of York might be to blame for suffering Mrs. Clarke to interfere at all in mat-

ters of military promotions or appointments, it never was any plan, on the part of his royal highness, to provide for the maintenance of his mistress by a deliberate system of bribery and corruption.

The Chancellor of the Exchequer, after speaking for many hours in defence of the duke of York, proposed a resolution, expressive of *the conviction of the house of his royal highness's innocence*; and that, after the insertion of this resolution in an address to his majesty, the address should proceed as follows: "And his majesty's faithful commons think it their duty farther to state to his majesty, that, whilst this house has seen with satisfaction, in the course of this inquiry, the unexampled regularity and method with which the business of the commander-in-chief has been conducted under the direction of his royal highness; and also the many salutary and efficient regulations which have been introduced into the army, during his command of it; some of which regulations have been specially directed to prevent those very abuses which, in the course of this inquiry, have been brought under the notice of the house of commons;—they could not but feel the most serious regret and concern, that a connection should ever have existed, under the cover of which, transactions of a highly criminal and disgraceful nature have been carried on, and that an opportunity has been afforded of falsely and injuriously coupling with such transactions the name of his royal highness, whereby the integrity of his conduct in the discharge of the duties of his high office has been brought into question. That it is, however, a great consolation to this house to observe the deep regret and concern which his royal highness has himself expressed on the subject of that connection; as, from the expression of that regret on the part of his royal highness, this house derives the confident assurance that his royal highness will henceforth invariably keep in view that bright example of virtuous conduct which the uniform tenor of his majesty's life, during the course of his whole reign, has uniformly afforded to his subjects, and which has so much endeared his majesty to the affections of every rank and description of his people." Such was the course which the chancellor of the exchequer recommended to the house, instead of the address proposed by colonel Wardle, for removing his royal highness from his office; and, having thus put the house in possession of what he intended to submit to it, he yielded to its impatience, and moved an adjournment of the debate till the next day, which was agreed to.

The chancellor of the exchequer then (March 9.) resumed his speech, which lasted for several hours; and was followed by Mr. Bathurst, Mr. Whitbread, the attorney-general (sir Vicary Gibbs), and Mr. Bankes.—Mr. Bathurst, having urged his objections to both the addresses, proposed respectively by Col. Wardle and Mr. Perceval, thought it his duty to propose other terms of an address for the house, more consistent with the circumstances of the case, and more congenial with the feelings of the illustrious personage under whom the army had flourished for many years. Without, however, intruding his proposition at present, he should only suggest what he thought would be most proper upon such an occasion; namely, "That, while this house acknowledges the beneficial effects of the regulations adopted and acted upon by his royal highness, in the general discharge of his duties as commander-in-chief, it has observed, with the deepest regret, that, in consequence of a connection the most immoral and unbecoming, a communication on official subjects, and an interference in the distribution of military appointments and promotions, has been allowed to exist, which could not but lead to discredit the official administration of his royal highness, and to give colour and effect, as they have actually done, to transactions the most criminal and disgraceful." The house sat till half-past four in the morning.

Next day, March 10, Mr. Bankes proposed an amendment on the amendment of Mr. Bathurst, and several

speakers manifested their opposite sentiments on the subject: but, on the 13th of the same month, the Secretary at War, the Master of the Rolls, and the Solicitor-general, opposed the address as proposed by Mr. Bankes; which was defended by sir F. Burdett, sir Samuel Romilly, and Mr. H. Smith. On the 14th, the question being loudly called for, the house divided: for Mr. Bankes's amendment, 199; against it, 294. A second division afterwards took place on the Chancellor of the Exchequer's amendment on Mr. Wardle's address: for the amendment, 364; against it, 123. And, on the 17th, after several observations, the Chancellor of the Exchequer announced his intention to withdraw his own resolution, and to alter it to the following effect; "That this house, having appointed a committee to investigate the conduct of his royal highness the duke of York, as commander-in-chief, and having carefully considered the evidence which came before the said committee, and finding that personal corruption and connivance at corruption have been imputed to his said royal highness, find it expedient to pronounce a distinct opinion upon the said imputation; and are accordingly of opinion, *that it is wholly without foundation*.—A long debate ensued; after which the house divided: for this amended amendment, 278; against it, 196.

Three days after this decision, (March 20.) the Chancellor of the Exchequer stated a fact which, he hoped, might induce Mr. Bathurst to forego the motion which he had promised to bring forward that evening. His royal highness the duke of York, on Saturday morning, of his own accord, had waited on his majesty, and tendered to him his resignation of the chief command of the army, which his majesty had been graciously pleased to accept. The communication made by his royal highness to his majesty upon tendering his resignation, was read to the house by Mr. Perceval at full: of this communication it is sufficient for our purpose to extract the first sentence. "The house of commons having, after a long and full investigation of the merits of certain allegations against him, passed a resolution of his innocence, he might now approach his majesty, and venture to tender to him his resignation of the chief command of his majesty's army, as he could no longer be suspected of acting from any apprehension of the result, nor be accused of having shrunk from the extent of an inquiry which, painful as it had been, he trusted he should appear, even to those who had been disposed to condemn his conduct, to have met with the patience and firmness which could arise only from a conscious feeling of innocence."

After a few words from Mr. Bathurst, lord Althorpe moved the following resolution: "That his royal highness the duke of York, having resigned the command of the army, this house does not *now* think it necessary to proceed any farther in the consideration of the evidence before the committee appointed to inquire into the conduct of his royal highness, as far as relates to his royal highness." The insertion of the word *now* was intended to express the opinion of the house, that the duke of York should not, at any time hereafter, be restored to his late situation, as commander-in-chief; and consequently, that, if he should, the house would resume their proceedings on the charges against him. On a motion by the chancellor of the exchequer, that the word "*now*" should be left out of lord Althorpe's amendment, the house divided: Ayes, 235; noes, 112.

Though the inquiry into the conduct of the duke of York was confined to his official acts, respecting commissions, exchanges, and promotions in the army, and did not extend to mere recommendations to offices or emoluments *not in the army*, otherwise than as they might throw light on the question before the house; it may be proper to take notice of a few of those curious facts, which were disclosed in the course of the examination, and which, though not of a nature to fix the imputation of any corrupt practices on the duke of York, serve to show the extent to which corrupt practices did prevail; and the still

wider extent of the opinion, that there was nothing so important in the state, or sacred in the church, that was not to be procured by bribery. The inquiry exhibits a thousand circumstances tending to illustrate, in an accurate and impressive manner, a view of the ways of the world in London, and of the state of public morals and religion in England, at the commencement of the nineteenth century. It will be recollected that Mr. Wardle had stated, that the two members of the cabinet to whom he alluded, as concerned in a corrupt traffic in patronage, were the lord-chancellor and the duke of Portland. Some of our readers, no doubt, may have entertained a greater curiosity to know on what this charge could be founded, and how it would terminate, than any of the other allegations in the whole course of the examination. Mrs. Clarke, on her examination February 10, being asked through what person she held herself out as having influence enough to procure a certain situation, said, "I do not think any one was held out. I fancy they guessed the duke of York, but no one was held out; and I think it is very likely that Mr. Donovan supposed the duke of Portland. But I mean here to say, that the duke is not at all connected with the office for disposing of government-patronage. Of the office that Mr. Wardle mentioned in the city, I know nothing. I was very sorry that Mr. Wardle had mentioned such a thing; because every one who knows the lord-chancellor, must know that, besides being one of the highest, he is one of the most honourable, men in England; and, if there are any insinuations about the duke of Portland, Mr. Maltby is the duke of Portland. He is my duke of Portland. I mean entirely to clear myself of holding out any insinuation against the duke's character."

Mr. Wardle was not the only person who believed, at one time, that Mrs. Clarke had influence with the duke of Portland. The marquis of Tichfield, (the duke of Portland's son,) a member of the house of commons, being called upon to state every thing he was acquainted with, as to an application from the reverend Mr. Bafely to the duke of Portland, stated, that Mr. Bafely called upon the duke on the 3d of January, and, not being able to see him, left the following letter for him. "My lord duke; I wished particularly to see your grace on the most private business. I cannot be fully open by letter. The object is, to solicit your grace's recommendation to the deanery of Salisbury or some other deanery, for the most ample pecuniary remuneration for which I will instantly give a draft to your grace. For Salisbury three thousand pounds. I hope your grace will pardon this, and instantly commit these lines to the flames. I am now writing, for the benefit of administration, a most interesting pamphlet. Excuse this openness; and I remain, your grace's most obedient and obliged servant,  
J. BASELY."

This note the duke of Portland transmitted to the bishop of London, in whose diocese he understood that Mr. Bafely possessed one or two chapels. (He was, in fact, one of the bishop's chaplains.) The bishop, in a letter in answer to the duke, dated Fulham-house, January 5, 1809, said; "It is too true that this wretched creature, Bafely, has one if not two chapels in my diocese. I have long known him to be a very weak man; but, till this insufferable insult upon your grace, I did not know he was so completely wicked, and so totally void of all principle; and, as your grace is in possession of the most incontestable proofs of his guilt, you will, I trust, inflict upon him the disgrace and punishment he so richly deserves."

Mrs. Clarke, in her evidence of the 9th of February, stated that a Dr. O'Meara applied to her in 1805 to get him made a bishop. He made an offer of pecuniary remuneration; and he brought a testimonial in his favour, under the hand of the archbishop of Tuam, stating that the writer had received the most satisfactory assurances that the doctor was "a gentleman of most unexceptionable character in every respect, of a good family and independent

pendent fortune." This letter was produced to the house of commons. Mrs. Clarke gave Dr. O'Meara a letter of introduction to the duke of York. On the 13th of February, she brought to the bar a letter of his royal highness, written to her from Weymouth, telling her, that Dr. O'Meara had applied to him in order to be allowed to *preach before royalty*, and that he would put him in the way of it, if he could. Dr. O'Meara did preach before royalty; and an article appeared in the Morning Post, under the date of Weymouth, October 3, 1809, stating, that "the Rev. Dr. O'Meara preached on Sunday an excellent sermon, from Rom. chap. xii. ver. 5. on universal benevolence. He expatiated with great eloquence on the relation which the public and private affections bear to each other, and their use in the moral system. He inveighed with peculiar energy against the savage philosophy of the French deists. We with our young ecclesiastics would arouse themselves, and shake off that mental languor which oppresses them in the pulpit, and show themselves in earnest. Sacred eloquence is, in this country, certainly feeble and unimpressive. No other excellence can supply the want of animation. That sweet charm, that celestial unction, which Christian oratory demands, this gentleman certainly possesses in an eminent degree: *his lips are touched with the live coal from the altar*. The king was very attentive, and stood during nearly the whole of the sermon, which we never before observed; and expressed his high approbation to the earl of Uxbridge and others; whilst the queen and princesses, and the whole audience, were melted into tears." The public was at no loss to conjecture who was the author of this newspaper-puff. But, after all this alleged attention and approbation of his majesty, Mrs. Clarke declared in her evidence, that, after communicating the doctor's offer, with all his documents, to the duke of York, the issue of the business, as reported to her by his royal highness, was, that the king did not like the great O in his name. The Rev. Dr. O'Meara became as general a subject of ridicule as the Rev. Mr. Bowles.

During this inquiry, which was continued without intermission for seven weeks, Mrs. Clarke, the principal evidence, and as it were the heroine of the accusing party, was examined at the bar again and again; and, by the readiness and smartness of her answers to an infinity of questions, sometimes gave a degree of relief to the long and wearisome sittings of a protracted examination. She seemed to be very much at home, and to reckon with confidence on the complacent regards of a great part, at least, of the members of the house of commons, and to be well pleased in the possession of so splendid a theatre for displaying the attractions of both her mind and person. She carried, however, her ease, gaiety, and pleasantry, to a degree of pertness, in a few instances, which was very reprehensible, and contrary indeed to that sense of propriety and decorum, of which we cannot but suppose, from the quickness of her understanding, she was in reality possessed. Having said that she stated or showed something to Mr. Adam, the question was put to her, what Mr. Adam thought of it, under the impression no doubt that Mr. Adam would naturally say something about it. Mrs. Clarke answered, "I do not know what Mr. Adam thought." The question being put to her by Mr. Croker, if ever she had written an anonymous letter to his royal highness, the prince of Wales, she answered that she had, and that colonel MacMahon had called on her in consequence. Did you sign, said Mr. Croker, any name to this anonymous letter? Mrs. Clarke, looking to the chairman, burst into a fit of loud laughter, in which, indeed, she was joined by the house. The question being put, What situations did you endeavour to procure through Mr. Maltby, and for whom? she answered, I forget. Being closely interrogated and pressed on this point; she named a Mr. Lawson, but said she did not recollect any other. Do you shake the veracity of your testimony on that last answer, that you recollect but one of those persons? "I think that I ought to appeal to the chairman now, whe-

ther I am obliged to answer that question." The chairman directed the witness to state the objection she had, observing, that the committee would decide upon it. "He is a very respectable man, and he has been already very ill used; and I am afraid of committing him and his family." The chairman directed the witness to name the man to whom she had alluded as a respectable person. "That," said Mrs. Clarke, "would be giving his name at once. Really I cannot pronounce his name rightly, though I know how to spell it; and I must be excused." The chairman observed to her, that her present conduct was very disrespectful to the committee. "I mean (she replied) to behave very respectfully to the committee. I am very sorry if I do not. But I do not know but the gentleman may lose the money he has already lodged, if I mention his name." This objection was over-ruled; and Mrs. Clarke said, that the respectable person to whom she had alluded was Mr. Lodowick, or Ludowick.—It is amusing to reflect on the change of manners in the course of a few generations. How differently would the gaiety and levity, and in some instances the trifling conduct, of Mrs. Clarke towards the house of commons, have been treated by the long parliament! She could not possibly have escaped a severe rebuke for even the elegance of her apparel; or being told, that it would have better become her to appear in *sackcloth and ashes*.

After the examination of witnesses was over, the manly and disinterested conduct of colonel Wardle, and that of those too who had been his principal supporters, was publicly acknowledged in the warmest terms of gratitude, esteem, and admiration, by the cities of Glasgow and Canterbury; and, after the inquiry was brought to an issue by the decision of the house of commons and the resignation of the commander-in-chief, by the cities of London and Westminster, the county of Middlesex, and a great proportion of the other counties, cities, and boroughs, throughout the kingdom.

The inquiry into the conduct of the duke of York by the house of commons, gave rise to many other inquiries. On the 27th of March, the Chancellor of the Exchequer, pursuant to notice, rose to move for leave to bring in a bill to prevent the sale and brokerage of offices. The practices, he observed, lately disclosed, consisted not in the sale of offices by those who had the power to give them away, but in the arts of those who pretended to have influence over such persons, and issued public advertisements, giving occasion to the notion that these abuses prevailed to a much greater extent than they actually did. Some persons in a certain office, Kylock and Co. who had carried on this trade, were under prosecution. As there were several persons in that concern, they were prosecuted for a conspiracy. But, if there had been only one individual, he did not see how the law, as it at present stood, could have reached him, though perhaps he might have been indicted for obtaining money under false pretences. The material point then would be, to make it highly penal to solicit money for procuring offices, or to circulate any advertisement with that view.—After a few words from the Attorney General, leave was given, the bill was brought in, and passed through the usual stages into a law.

In the course of the investigation of the conduct of the duke of York, it was ascertained beyond all doubt, that there was a regular, systematic, and almost an avowed, traffic in East-India appointments, as well as in subordinate places under government; wherefore a select committee was appointed by the house of commons, to "inquire into the existence of any corrupt practices, in regard to the appointment and nomination of writers or cadets in the service of the East-India Company; or any agreement, negotiation, or bargain, direct or indirect, for the sale thereof; and to report the same as it should appear to them, to the house, together with their observations thereon; and who were empowered to report the minutes of evidence taken before them, and their proceedings from time to time to the house." From the report of the committee

mittee it appeared, that a very great number of cadetships and writerhips had been disposed of in an illegal manner; and, though nothing had come out that could form any reasonable ground for suspicion that such bargains had been made or carried into execution with the consent or knowledge of the proprietors, yet not only particular facts, but the general tenor of the whole investigation, clearly proved, that, if all the directors had exercised, in the disposal of their patronage, the same vigilance and caution as are usually applied in the management of individual concerns, such a regular and continued traffic could not have been carried on for such a length of time.

The committee, having stated a great number of cases in which a traffic in the patronage of the East-India Company had been most glaring, proposed a check against those who were inclined to purchase appointments in the service of the company; and gave it as their opinion, that the immediate consequence of the information contained in this report must be, that a certain number of persons in the service of the company will be instantly deprived of their employments, and recalled from India. The committee concluded their report with the following paragraph: "The practices which are developed in the present report, and other transactions which this house has recently had under its cognizance, sufficiently demonstrate that the patronage of various descriptions has, in several instances, become an article of traffic; that an opinion of the generality of such practices has been prevalent to a still greater extent, and that fraudulent agents have availed themselves of this belief to the injury of the credulous and unwary, and the discredit of those in whose hands the disposition of offices is lodged. It will depend on the steps which may be taken in consequence of these inquiries, whether such abuses shall receive a permanent check, or a virtual encouragement."

The whole of the writerhips in the disposal of which abuses were detected, were found to have been given by one man, Mr. Thelluson. And so strong and general was the persuasion that he was culpable, at least in not inquiring how the person, at whose disposal he placed the nomination of the offices to which he was entitled to nominate, had bestowed them, on what account, and for what purpose of personal interest he was so anxious to procure them; that, on offering himself to be re-chosen a director, he was rejected by a great majority. It was determined by the court of directors, after long debates, that those young men who had been named by the committee of the house of commons as having obtained their appointments by means of corrupt practices, should be recalled. The hardship of this measure towards the young men who were the objects of it, was felt and acknowledged: but it seemed indispensably necessary; unless the court of directors had been willing, by their own act, to render a solemn law of the East-India Company a dead letter.

In the course of the examination of witnesses by the committee appointed to inquire into the abuse of India patronage, it was discovered, that lord Castlereagh had endeavoured to procure a seat in parliament for his friend lord Clancarty, in exchange for a writerhip, which had been given to him, when president of the board of controul, by some of the directors. Of the board of controul lord Clancarty also was a member. This negotiation, doubly illegal, as it had for its object both the disposal of East-India patronage and the purchase of a seat in the house of commons, was brought under the cognizance of that house on the 25th of April, by lord Archibald Hamilton. His lordship, after reminding the house, that he had ever been in the habit of standing as forward as any other member in pursuing practices of corruption, observed, that not long since they had sent two individuals to prison. If they wished this judgment to have the influence of example, they must take care of their individual and collective respectability. And what, he asked, could be more conducive to this end, than the enforcement of those

laws and regulations which they had so repeatedly enacted for guarding against any improper interference in the election of their members? Against the noble lord, to whom his motion referred, he did not mean to assert one word beyond what the evidence before the committee contained, or to make any charge against him that he had not made against himself. It was in evidence that, in 1805, lord Castlereagh received a letter from a Mr. Reding, (*an advertising place-broker*,) who was a perfect stranger to him, stating, that he thought he had the means of assisting him in coming into parliament; in consequence of which, he had a meeting with him; at which meeting the proposition respecting a seat in parliament was renewed. Lord Castlereagh, as appeared from his evidence on the table of the house, told Mr. Reding, that he did not want a seat himself, but that a friend of his did; and that he sent Mr. Reding's letter to lord Clancarty, the friend he had alluded to. And he admitted that he had been induced to place a writerhip at lord Clancarty's disposal, in order that his coming into parliament might thereby be facilitated. It appears that different meetings took place between lord Castlereagh and Mr. Reding. At one of these, lord Castlereagh asked Mr. Reding the name of the gentleman who proposed to vacate. But this he declined till the terms should be settled; and the negotiation was broken off. But, said lord A. Hamilton, the noble lord has stated in his evidence, "that the writerhip was to be disposed of subject to certain qualifications; that the case before them had no reference to any pecuniary transaction; and, finally, that the nomination to the writerhip did not take place." This plea, said lord A. Hamilton, cannot avail him upon this occasion; for his *intention is obvious*, and of that intention we are to judge.

Lord A. Hamilton having reviewed the whole case, moved, that the minutes of the evidence he had referred to be read. Upon this, lord Castlereagh rose to defend himself, which he did in a modest and somewhat humble manner. The appointment of a writerhip, he said, was not within his official province as president of the board of controul. He had no doubt a degree of influence, but not of an official nature. Having tried, as he said in conclusion, to strip the charge against him of all the aggravations, he left it for the house to consider whether, without any motive, he could be wilfully corrupt, or so senseless as to commit a crime, which, from the very circumstances that attended it, he knew must be public. He had now only to regret, that the motives of private friendship or of public zeal (alluding to the benefit he had said the introduction of lord Clancarty into the house of commons would be to the public) could have induced him to do any thing requiring the cognizance of that house. He certainly had not erred intentionally, and would submit with patience to any censure which he might be thought to have incurred.—Making an obeisance to the Speaker, he then withdrew.

The evidence of the minutes being entered as read, lord A. Hamilton proposed the following resolutions. 1st. That it appears to this house, from the evidence on the table, that lord viscount Castlereagh, in the year 1805, he having just quitted the office of president of the board of controul, and being then a privy counsellor and secretary of state, did place at the disposal of lord Clancarty a writerhip in the East-India Company's service, to facilitate his obtaining a seat in this honourable house. 2d. That lord viscount Castlereagh has been, by the said conduct, guilty of a violation of his duty, of an abuse of his influence and authority as president of the board of controul, and also of an attack upon the purity and constitution of this house.

The debate that ensued was long, but not very keen or animated. There was a wonderful air of candour and moderation. Lord Binning said, that, though it was impossible to defend lord Castlereagh upon principle, the resolution proposed by the noble lord involved a greater punishment than the offence deserved. There were degrees

of offences. A man was not to be punished for a bare *intention* with the same severity as for an actual commission. What was necessary to constitute an offence was here wanting: there was no *malus animus*; no corrupt design appeared in the whole transaction. The noble lord acted not in his official capacity, but as an individual wishing to oblige his friend. Officially he had committed no offence, and the degree of punishment ought to be proportioned to the degree of guilt. On these grounds lord Binning moved, that the other orders of the day be now read. On much the same grounds as those stated by lord Binning, lord Castlereagh was defended by the Chancellor of the Exchequer, Mr. Manners Sutton, and Mr. Canning. Mr. Wynn, Mr. Grattan, Mr. Ponsonby, Mr. Whitbread, and Mr. Windham, supported the motion of censure.

Mr. Canning said, he perceived, that every gentleman who had spoken entertained a due sense of the manner in which his noble friend had conducted his defence, and did not wish to press any severe sentence upon him. To this consideration was to be added another, namely, that the intention of the noble lord was never carried into execution. The voting for passing to the other orders of the day was, according to parliamentary usage, a way of showing that the house had taken a case into consideration, the result of which had been, that they did not think it necessary to come to any criminating resolution. In order, however, to express this opinion more clearly in the present case, he would rather wish that, instead of a vote for passing to the other orders of the day, a resolution should be substituted, declaring that the house saw no reason for a criminating resolution. When therefore the question before them should be disposed of, he would submit to the house the following resolution: "That it is the duty of this house to maintain a jealous guard over the purity and independence of parliament; but that this house, duly weighing the evidence before it, and all the circumstances of the case, and considering that the intention referred to in that evidence was never carried into effect, does not think it necessary to come to a criminating resolution on the same." On a division of the house there appeared, for the original motion, 167; against it, 116. After this, Mr. Canning's resolution was carried.

The preceding inquiries into the abuse of patronage are sufficient to show, that a community of so immense a population as the English metropolis cannot but be much interested in every object which relates to the national army.—A discussion took place in this session, in the house of commons, relative to the measures adopted or advisable for the augmentation of the regular army, the necessity of which was intimated in his majesty's speech at the opening of the session. So early, therefore, as the 2d of February, lord Castlereagh rose in the house of commons to move the second reading of the militia-inlistment-bill.—Mr. Elliot wished to know the rate of bounties proposed by his noble friend. Lord Castlereagh answered, from six to eleven guineas. Mr. Elliot said, that this bill afforded a striking lesson to the house and the country, of the evil consequences of adopting a bad precedent. Heretofore, previously to the introduction of a similar bill, there was much of detail and preparatory communication with colonels of regiments; but, the former measure of his noble friend having been adopted, he relied that, in this too, he should be successful. But he did most decidedly condemn the principle of a bill, the operation of which would inevitably tend to the dissolution of all discipline, both in the regular army and militia, as well as to the injury of morality throughout the country; for such would be the effect of high bounties given to the recruits from the militia to the line, and to the substitutes who were to fill their places in the militia, as had been fully evinced by experience. By the present bill, the militia-officers were required to recruit at a bounty of ten guineas, for which, it was obvious, that, under the present system of bounties, men could not be had; but then there was the expedient of a little ballot, in case the bounty

should fail, to be inflicted on the county where the quota of men could not be induced to list within a given period. And then, as a remedy, to the balloted men who could not find a substitute at half-price, ten guineas were to be given in aid. But this ballot, coming on the heels of that for the local militia, could not fail to create general discontent, inasmuch as it was not a regular tax, but must weigh oppressively on individuals. Mr. Elliot compared the effects of lord Castlereagh's plan with that of Mr. Windham, which proposed to recruit men for *limited service*, instead of service for life; a plan, the principle of which was founded on the feelings of human nature. He was ready to admit, that, for the first four or five months it was in operation, the preference for unlimited service preponderated. But it was a fact, that, out of 27,000 men, raised in 1807 for general service, about 19,000 were for limited time; a clear proof that, had that principle been adhered to, the country would not only have avoided all the evils experienced under the balloting-system, but that the force of the line would have been increased to any extent necessary, with a saving of nearly one half the expense of bounties.

Mr. Calcraft also defended and praised the military system of Mr. Windham, which had produced, while in force, a supply of nearly 24,000 men annually; a supply as great as the circumstances of the population of this country would admit of. Mr. W's system had not had a fair trial. This was the fourth instance in which the militia had been drafted to supply the army; a practice which had driven qualified officers out of the militia. He did not think it possible to recruit the militia by the bounty proposed by lord Castlereagh.

Colonel Frankland said, that lord Castlereagh's plan of recruiting had a tendency to create disorganization and disgust in the home-service, and to keep up all this when created. He praised the admirable, deeply-founded, and permanent, system of Mr. Windham; and observed, that it was impossible to discuss such measures as that proposed without taking a view of that system. All circumstances that bore upon the question were to be considered; and upon the whole he thought that lord C's system of expedients was the most inefficient and burthensome that could be resorted to.

Lord Castlereagh said, that ministers, in the measures which they proposed for augmenting the army, had always two objects in view. First, to increase the disposable force; secondly, to take care that the defensive force should be so strong, as that the country should not be exposed to peril from the exertions which his majesty's government might think it their duty to recommend for the assistance of other nations. There were in the army, organized as it is at present, 126 battalions of infantry whose numbers exceeded six hundred, and there were 56 that fell short of that number. It was well known, that battalions not amounting to six hundred were considered as inefficient, and not fit for service. If the measure proposed obtained twenty-seven thousand, it would complete all the battalions of our infantry up to nine hundred men.—Lord Castlereagh then entered into a comparative view of his own plan for recruiting our military force, and that of Mr. Windham: a topic become trite, though still worthy of serious consideration, by the prolonged and protracted debates on that subject in the two preceding sessions of parliament. Lord C. thought that men generally preferred the unlimited to limited service. He did not, however, by any means wish to exclude men from limited service. The fact was, that, whatever was the system of recruiting, the country regularly produced about 1200 men in a month. How the number came to be so exact, he could not say. But, even in the halcyon days of high bounty and no ballot, it was not found that the number of recruits exceeded the regular number by a hundred, nor under any other system of recruiting did they fall short to that amount.

Earl Temple said, that, when lord Castlereagh laid his

cold fingers on Mr. Windham's plan, it was producing at the rate of 24,000 men a-year, instead of the 13,000 since produced by lord Castlereagh's.—The bill was then read a second time, and afterwards finally passed.

On the 1st of May, Mr. Ord rose, in the house of commons, to call the attention of the house to the fourth report of the committee of public expenditure; and stated, that commissioners had been appointed in 1795 to manage and dispose of the cargoes of Dutch ships detained or brought in, in order to prevent those cargoes from being greatly injured, or totally destroyed. They had general instructions as to the conduct of their transactions from the lords of the privy-council, requiring them to make minutes of all their proceedings, and to keep their accounts in such form as the lords of the treasury should direct and approve; and, in case of points of any difficulty occurring, they were to refer to the committee of the privy-council for instructions. These commissioners were five in number—James Crawford, John Breckwood, Allen Chatfield, Alexander Baxter, and JOHN BOWLES! a member of the society for the suppression of vice, or rather, as appeared from the report, of pilfering from the public. Their sales ceased, and their transactions were brought nearly to a close, in 1799. As no fixed remuneration had been assigned to the commissioners, these gentlemen resolved to remunerate themselves, and charged a commission of 5 per cent. on the gross proceeds of their sales; which commission, in the four first years, amounted in all to 80,000l. No regular accounts were furnished to government; and, criminal as this was in the commissioners, Mr. Ord could not help saying, that the government was far more criminal in not calling for them. Only one account was rendered to the privy-council, and in this it was remarkable that no mention was made of commission, which omission, the committee observed, might lead the privy-council to imagine that no commission was charged, although, at that time, 25,000l. had actually been divided. This was a most extraordinary thing, Mr. Ord observed, considering the noise which Mr. John Bowles had made about false returns to the property-tax. It would be curious to know what returns John himself had made to the property-tax at the time he was receiving this large profit from his labour. The act authorizing the appointment of these commissioners required, that the proceeds of the sales should be paid into the bank of England: but, instead of this, the commissioners had opened accounts with private bankers; and, instead of applying the balances in their hands, during the years that preceded the completion of the sales, in a way that might render them productive to the public, had employed them in discounting private bills for their own emolument. If these balances had been vested in exchequer-bills, between 40 and 50,000l. would have been saved to the public. The next point in the misconduct of the commissioners to which Mr. Ord adverted was, that, by the commission at 5 per cent. on the gross proceeds, by brokerage and interest on the balances, it appeared, the commissioners had taken for their labours the enormous sum of 133,198l. being at the rate of 26,000l. for each commissioner. Mr. Ord farther pointed out a circumstance which seemed to have escaped the attention of the committee; namely, that the commissioners appeared to have charged the 5 per cent. commission on the property which had been managed and sold by the East-India company, in the management of which they had been at no trouble whatever; so that, in point of fact, a commission of 10 per cent. had been paid on much the largest proportion of this property, inasmuch as the East-India company had also a commission of 5 per cent. on their sales. Some of the commissioners were themselves merchants; and must have known that the highest commission among merchants, on the gross proceeds, is 2½ per cent. What are the real services of these commissioners? Their sales had been finished in four years and a half from the time of their appointment, and the important part of their labours had of course then closed. Though they

were retained *nominally*, as a law-suit had commenced in their names, in point of fact, during the ten years the commission lasted after the completion of the business, the gentlemen found time enough to do a great deal of other business. John Bowles had been active in several elections which had since taken place, and had time besides to write about thirty pamphlets about religion, morality, loyalty, and the duty of contributing faithfully and accurately to the property-tax. The employment of such men was a bounty on roguery, and an encouragement of abuses. Negligence in the selection of proper agents, and a profligate profusion in the public expenditure, had ever been the peculiar characteristic of the administration under which these commissioners had been appointed.

Mr. Ord concluded with moving the following resolutions: 1. That it appears to this house, that to commit pecuniary trusts to any persons whatever, without providing any check upon their proceedings, without calling for any regular or periodical accounts, and without settling, during a long course of years, the mode or amount of their remuneration, is a neglect which must inevitably lead to the most prejudicial consequences, and a violation of the most essential duty of government. 2. That such neglect and deviation have been proved to exist. 3. That the commissioners upon Dutch property have been guilty of gross misconduct in violating the act under which they were appointed, and appropriating to their own use, without authority, sums for which they ought to have accounted to the public. 4. That the accounts of the commissioners be referred to the auditors of public accounts, to be examined. 5. That all consideration of the remuneration to be allowed to the commissioners ought to be deferred till their accounts are finally settled.

This gave occasion to several speeches in which Mr. Bowles was often held up to ridicule, contempt, and detestation.—Mr. Huskisson endeavoured to defend the treasury; but neither Mr. Huskisson nor any one else attempted to defend the conduct of the Dutch commissioners.—Mr. Henry Thornton, in order to obviate some objections to the resolutions moved by Mr. Ord, proposed to consolidate them into one, and in such terms as should meet with general approbation. The resolution which he intended to substitute for the whole five was as follows: "That the commissioners appointed in the year 1795 for the disposal of captured Dutch property, taking advantage of the neglect of the government to enquire into their proceedings, have, without authority, appropriated to their own use large and unreasonable profits; that they have privately taken interest on large balances of money, which ought to have been lodged in the bank of England; that they have refrained from giving correct and explicit information respecting the interest so taken to the committee appointed for inquiring into the public expenditure; and that they had been guilty of a great violation of public duty."—This resolution was adopted, after substituting the word *omission* for neglect.

Many other abuses and frauds of a most extraordinary and shameful kind were detailed during this session, arising from the reports of the commissioners of naval revision and of military inquiry. But, as these arose chiefly, like those we have noticed already, from the neglect or omission of the ministry in examining accounts, (some of which appear to have been unaudited for seven-and-twenty years,) the motions for inquiry were either negatived, or got rid of by the previous question.

On the 12th of May, the house having resolved itself into a committee of ways and means, the subject of the lottery, as one item of those ways and means, was brought up, and amply discussed.—Mr. Whitbread thought it one of the worst modes that could be resorted to. How many were the evils which lotteries occasioned! what wretchedness, desperation, and suicide! He was astonished that the Chancellor of the Exchequer, a devout man, and of correct manners, should patronise such a measure.

The Chancellor of the Exchequer said, it would be for

the house to determine on some future occasion, after that night, if the lottery should ever again form part of the ways and means of the year. It should not, however, be taken for granted, because the guards against improper practices in the lottery had once failed, that they must always fail. He was satisfied, that it was not to the lotteries, but to the *insurance*, that the objection lay. He did not say, that for a revenue of 300,000*l.* a-year, the house ought to give their sanction to any thing immoral, or productive of evil; but, at the same time, he was not for abandoning a financial resource of this kind, without trying whether some measure might not be devised for remedying the evils resulting from it.

Mr. Wilberforce said, that *insurance* was not the only evil of lotteries. By dividing tickets into *small shares*, a spirit of gambling was disseminated, which was attended with the most serious evils to the lower classes. As to the productiveness of the lottery, it had dwindled from 600,000*l.* to 300,000*l.* and he thought that the sum which appeared to be sacrificed to morality would be far more than repaid otherwise. By suppressing lotteries, many would remain to enrich the country with their labours, whom the lottery would reduce into habits of idleness and extravagance.

Sir Samuel Romilly was extremely sorry to hear the Chancellor of the Exchequer treating the case of the lottery as a matter falling of course to form part of the service of the year. He (sir S. R.) had formerly attempted an improvement on the criminal law of the country. If the house could pass a law to do away temptations to commit crimes, that would be the most effectual mode of improving the criminal code. But what were they now about to do? To pass a law to allow and encourage crimes, by encouraging the temptation to commit them. The most active agents were employed to seduce persons to the commission of the crimes to which lotteries gave birth; and the most ingenious paragraphs in newspapers were invented for the furtherance of this purpose. He could point out paragraphs holding out lures to apprentice-boys to embark in this trade, and to begin with their Christmas-boxes, under the assurance, that by perseverance they would soon ride in their coaches. These practices were now spread from the capital to every village in the kingdom.

The resolutions were agreed to, and ordered to be reported. Of course, the question was again agitated, when Mr. Wharton brought up the report, on the 18th of May. It would be superfluous, even did our limits admit, to enter much farther into the arguments against lotteries, which are reducible to two; namely, that they tended to encourage vice, with its pernicious consequences both to the individual and the state; and that the profits arising from them to the public had dwindled to the small sum of 300,000*l.* We cannot refrain, however, from extracting a short paragraph from Mr. Whitbread's speech against lotteries, as it contains a very curious fact: "There is a society existing for the Suppression of Vice; one of the rules of which is, that no man shall be admitted *unless a member of the established church*. This regulation will certainly be highly relished by the no-popery gentlemen. But, if they set their faces against minor offences, and yet countenance the lottery, it will be like casting out seven devils from a man, when a legion of other devils were immediately to enter." He believed that there was not a sin pointed at in the decalogue, which was not encouraged by the lottery.

In defence of the lottery, it was observed by sir Thomas Turton, that the sum accruing to government from the annual lottery, was not, as had been stated, 300,000*l.* only, but, together with stamps, 700,000*l.*—The Chancellor of the Exchequer said, that it had been argued by Mr. Whitbread, that, if this species of gambling were put an end to, it would stop all kinds of vice. This was straining the argument too far. The circumstances of misery that had been alluded to, arose not out of lotteries, but

from *insurances*; and could never be the effect even of insurance, if the lottery was *drawn in one day*—a period to which he proposed to confine it in future.

On a division of the house, there appeared—for lotteries go, against them 36. After this, the resolution of the house in favour of a lottery was passed through the remaining stages into a law.—The limiting the drawing of each lottery to one or two days, which has been the practice since this time, has certainly lessened the evil of them; but still it will be urged, that the love of money, the hope of rising into a better situation by the benefit of chance, and the lures held out by those whose interest it is to sell the tickets, are incentives too powerful not to be dangerous in a large community. Gambling is a vice to which so many of all classes are blindly prone, that the entire extermination of that hydra would have been a day of triumph for many who mourn the folly of their relations and friends labouring under the disease, and even for those, who, although they are affected by the mania, yet, in their lucid moments, detest the very passion which drives them on to *try their fortune*, and deprecate the pangs of disappointment they feel after the irretrievable loss of their too-easily ventured property.

The principal subject of attention and debate that occupied the house of commons for the remainder of this session, was the great question of parliamentary reform. It is a curious fact, that, whenever a moment of rest seems to approach, after long and laborious discussions, *reform* is taken up as an everlasting order of the day; and appears as if brought on purpose to fill up a chasm in the records of the house, and to keep the ministers constantly on the alert.

A plan was first proposed by Mr. Madocks; but, although amended and re-amended, fell to the ground with its appendages, chiefly because it included a charge of parliamentary corruption against lord Castlereagh and Mr. Perceval.—Then a plan and a motion from Mr. Curwen, long debated upon, modified so as substantially to reverse its original tendency and object, in one word, neutralized, and passed at last.

The indefatigable champion, sir Francis Burdett, brought forward his plan for parliamentary reform; but even his modest and condescending motion, "that his plan should be taken into future consideration," was negatived. This plan, which coincided very nearly with that proposed thirty years ago in the house of lords by the late duke of Richmond, was briefly as follows: 1. That freeholders *and others*, subject to direct taxation in support of the poor, the church, and the state, be required to elect members to serve in parliament. 2. That each county be subdivided according to its taxed male population, and each subdivision required to elect one representative. 3. That the votes be taken in each parish by the parish-officers; *and that all the elections should be finished in one and the same day*. 4. That the parish-officers make the return to the sheriff's court, to be held for that purpose at stated periods. 5. That parliaments be brought back to a constitutional duration.

These few and simple regulations appear to us to form a very good ground-work for reform: its effect would be to unite property with political right, and abolish rotten boroughs.—Sir James Hall, however, thought that the plan amounted to *complete and radical revolution*. "It would be the ruin of a ship if you take away her ballast: the ballast of the British state-veffel might be sometimes too heavy; but on the whole she proceeded very well in her course; and even the *rotten boroughs might ultimately do a great deal of good*." The ministers and the holders of rotten boroughs of course agreed in this profound observation; and, on the division of the house, the numbers were, for sir Francis Burdett's motion 15, against it 74.

On the 8th of June, Mr. Whitbread, after a suitable preface, moved a resolution to the following effect: "That this house will, early in the next session of parliament, take into its most serious consideration, how far it may be expedient to provide some farther limitation to the num-

ber of persons holding seats in this house, together with pensions, sinecures, and places of emolument under the crown." This was negated by 113 against 54.

On the 19th of June, Mr. Wardle called the attention of the house to public economy, a most important subject, and from an orator who had lately so well proved the usefulness of it. All his motions, which were certainly intentionally good and conducive to good, were agreed to.

Some relief to the poor clergy was, upon the motion of the Chancellor of the Exchequer, unanimously adopted. And this last act of justice, as well as of benevolence, closed the session on the 21st of June.

On Thursday, the 1st of August, a court of common-council was held at Guildhall, at which the following resolutions were passed.

"That this court did, on the 6th of April last, express its thanks and gratitude to Gwyllym Lloyd Wardle, esq. for his conduct in bringing forward and substantiating serious charges against the late commander-in-chief, which, notwithstanding the majority in his favour in the house of commons, compelled his resignation. That no circumstance has since transpired, which can, in any manner, lessen the importance of that investigation, impeach his motives, or affect the merits of the case. On the contrary, his unwearied exertions, perseverance, and fortitude, under unexampled threats and difficulties, have developed a scene of scandalous abuse and corruption, not only in the army, but in various departments of the state.

"That it has been discovered by the said investigation, that these abuses have extended, not only to the disposal of church and East-India patronage, but also to the disposal of seats in the legislature; and charges have been brought forward, and proofs offered, implicating in such corrupt and illegal traffic, lord viscount Castlereagh, the honourable Spencer Perceval, and the honourable Henry Wellesley, all members of the house, and then and now holding ostensible situations in his majesty's government; a traffic, which, in the language of the Speaker of the house of commons, 'would bring a greater scandal upon the parliament and the nation than this country has ever known since parliament has had an existence.'

"That the said investigation has also led to the discovery, that the said lord Castlereagh, one of his majesty's secretaries of state, and late president of the board of control, did, in flagrant breach of his duty as a minister, abuse of his patronage, and gross violation of the constitution, place a writership in the hands of lord Clancarty, a member of the same board, for the purpose of obtaining for him a seat in parliament; which fact, the said lord Castlereagh has himself admitted; and, notwithstanding there appeared a smaller majority in his favour than appeared in favour of the duke of York, in manifest injustice to his royal highness, and gross insult to the nation, the said lord Castlereagh still retains his official situation.

"That these attacks upon the vital principles of the constitution have been made without punishment or censure; and motions for inquiry into such practices have been rejected, upon the alleged frequency and notoriety of them; and parliament has thereby, as well as by passing a bill to prevent the sale of seats in that house, recognized and acknowledged the corrupt influence under which it has been called together, and exercised its functions.

"That it was stated by Mr. Wardle, that there was an office publicly kept open for the sale of places under government; and, although such statement, when made, only excited the derision of ministers and the house, it has since appeared that the above statement was correct; and his majesty's ministers have indicted and convicted several persons concerned therein; and such practices were declared in the said indictment, to have a tendency to degrade, vilify, traduce, and bring into contempt, the administration of the country.

"That, by various statements which Mr. Wardle has lately submitted to parliament, it appears, that, by a correction of the frauds, abuses, corruption, and speculation, which have been found to exist in every branch of the

public expenditure to which inquiry has extended, and a wise and honest application of our resources, the people might be relieved from heavy and oppressive burthens, if not wholly from that inquisitorial and most grievous of imposts, the tax upon income. That his conduct on this occasion seems to have drawn upon him, in a high degree, the malice and rancour of those who are interested in the continuance of these abuses.

"That, in the opinion of this court, individuals who devote their exertions towards exposing and correcting public abuses, are at all times entitled to the support and protection of the country, particularly at the present moment, when there appears an unabating effort on the part of those notoriously under the influence of government, or who participate in the existing frauds, corruptions, and speculations, to cry down, vilify, and traduce, every man who has courage and integrity to expose such practices, in order to mislead the public, and divert their attention from these great evils."

On the 22d of September, the two secretaries of state, lord Castlereagh and Mr. Canning, met each other, pistol in hand, to settle a dispute; for a full and particular account of which we must refer our readers to the newspapers of the day. Mr. Canning supposed himself, and was supposed by many others, to possess greater talents than lord Castlereagh: lord C. again possessed very considerable influence by the number of votes he could command in the house of commons, as well as great dexterity in managing members, and an extraordinary share of activity in whatever business was committed to his charge. Mr. Canning intrigued for the removal of lord C. on the ground of his incapacity, from office, while at the same time his deportment towards his lordship, on all occasions, was such as if he had not harboured in the least any such lurking intention. This (though it does not seem to fall within the circle of points of honour), lord C. considered as a personal insult. On the second fire, Mr. Canning received his lordship's bullet in his left thigh, and the combat was terminated. They had both of them, previously to the duel, resigned their places. The duke of Portland died a few days afterwards. The remaining ministers now offered a coalition with the lords Grey and Grenville, which was rejected. The marquis of Wellesley was then called from Spain, to fill the place of secretary for foreign affairs, that had been held by Mr. Canning.

In the midst of these transactions his majesty entered on the fiftieth year of his reign. A reign of fifty years had happened but twice before in this kingdom; and it has been noticed, as worthy of remark, that the only three kings who have attained this jubilee were each of them the third of the name—Henry III. Edward III. and George III. It was therefore thought to be a proper time for paying a signal mark of respect to the king. The proposal for celebrating the day as a jubilee, was received with pleasure throughout the united kingdom; and the 25th of October, 1809, was accordingly distinguished by a singular display of loyalty. Yet, although affection and gratitude towards our aged monarch was so general, this joyful event was celebrated by the corporation of London with a magnificence and splendour highly becoming its wealth and distinguished rank among the nations of Europe. The day was ushered in by the ringing of bells in the different churches, among which we noticed particularly the fine peal of St. Michael's, Cornhill. At half past ten o'clock the lord-mayor proceeded from the mansion-house to Guildhall, in the state-coach drawn by his set of six beautiful grey horses, splendidly adorned with ribbands, and attended by the usual officers, preceded by the trumpets sounding, and the band of the West-London militia playing God save the king. At Guildhall his lordship was joined by the members of the corporation; and at half-past eleven o'clock the procession moved from thence. In the large space between the iron-gates and great west door of St. Paul's cathedral, the West-London militia received his lordship, and the rest of the procession with presented arms. On entering the great

great west door of the cathedral, his lordship was received by the dean and chapter. The centre aisle to the choir was lined on each side by the river-fencibles, in full uniform. A most excellent and appropriate sermon was preached by his lordship's chaplain, from 2 Kings viii. 66. *And they blessed the king, and went into their tents joyful and glad of heart, for all the goodness the Lord had done for David his servant, and for Israel his people.* The coronation-anthem was performed previous to the sermon, by the full choir, with great effect. The procession returned about three o'clock in the same order.

At five o'clock the corporation were introduced up the grand staircase, in front of the Mansion-house; the trumpets sounding during their entrance in the vestibule. The building had been previously decorated with a splendid illumination, consisting of elegant devices of the rose, thistle, and shamrock, in coloured lamps—in the centre, a radiant display of G. R. and the crown, with "Long may he reign." The pillars were tastefully ornamented with wreaths of lamps; and the whole was much admired for its general grandeur and effect. On entering the grand saloon, which was lined by the band of the West-London militia, playing God save the king, Rule Britannia, &c. the company were individually received by the lord-mayor in his robes of state, with all the affability, politeness, and attention, that distinguish this worthy chief magistrate. The saloon was brilliantly lighted with large Grecian lamps beautifully painted, and displaying a scene at once novel and elegant. At half past five o'clock, the doors of the magnificent Egyptian Hall were thrown open, illuminated by the blaze of innumerable lamps, tastefully arranged round the pillars and the elegant lustres and chandeliers suspended from the roof. The tables were laid out with the greatest taste, and covered with an elegant and hospitable dinner, the whole of which was served with plate. The band continued during the whole of dinner to play several delightful military and other airs. —After the cloth was removed, *Non nobis Domine* was sung. The lord-mayor then gave, "The King, God bless him, and long may he reign over a free and united people;" which was drunk with three times three, and with exulting enthusiasm, amid thunders of applause that continued unabated for a considerable length of time. After this effusion of loyal feeling had subsided, the grand national anthem of God save the king was performed by the professional gentlemen present, with appropriate additional verses for the occasion, the whole company standing and joining in the chorus with the most heartfelt zeal, accompanied by the animating sound of the military band. Many other loyal toasts were given; and the company retired, highly pleased with their own feelings and with the hospitality and urbanity of their chief magistrate.

The illuminations of the public buildings and offices were unusually tasteful and splendid.

On this happy occasion too, a proclamation was issued for pardoning all deserters from the fleet; and another, pardoning all deserters from the land-forces, provided they surrendered in two months. The lords of the admiralty ordered an extra allowance of 4lbs. of beef, 3lbs. of flour, and a pound of raisins, to every eight men in his majesty's ships in port, with a pint of wine, or half a pint of rum, each man. Eleven crown-debtors were this day discharged from prison, in addition to above 100 liberated by the Society for the Relief of Persons imprisoned for Small Debts. The donations to this society for the above charitable purpose were most liberal. The city of London set the example by subscribing 1000l.

The provincial newspapers of the following week were filled with accounts of the manner in which the jubilee was celebrated in every country town and almost every village; in some by illuminations and feasting, in others by setting unfortunate debtors at liberty. The Annual Register contains an account of a charming fête contrived for this day at Flogmore, near Windsor, by her majesty and the princess Elizabeth. Nor was this display confined

to the united kingdom. It was seen in the most distant parts of the empire; and it was in one of our foreign dependencies (Bombay) that the jubilee was celebrated with the greatest judgment, taste, splendour, and effect. See Ann. Reg. 1809. p. 395, 703.

We have now a few incidents to relate which more particularly concern the metropolis.

On the 22d of January, about half past two in the morning, a fire was discovered in St. James's Palace, near the king's back stairs. An alarm was instantly given, but it was several hours before water could be procured for the engines kept in the palace and those belonging to the various insurance-offices which had hastened to the spot. The flames during this interval had made considerable progress, and they were not subdued till they had consumed the whole of the private apartments of the queen, those of the duke of Cambridge, the king's court, and the apartments of several persons belonging to the royal household. The Dutch chapel nearly under the the armoury-room sustained considerable injury; but the most valuable part of the property, in such of the royal apartments as were destroyed, was preserved.

On Friday night the 24th of February, Drury-lane theatre was burnt to the ground. About five minutes past eleven o'clock, the flames burst out at the lobby-windows of the front in Brydges-street, while volumes of smoke were seen issuing from every part of the theatre. In less than a quarter of an hour it spread into one unbroken flame over the whole of the immense pile, extending from Brydges-street to Drury-lane; so that the pillar of fire was not less than 450 feet in breadth. It is impossible for the mind to conceive any thing more magnificent than the spectacle, if the idea of the horror and ruin which it brought on the sufferers could have been separated from the sublimity of the object. In about thirty minutes after its commencement, the Apollo on the top fell into the pit, and soon after the whole of the roof fell. The reservoir of water on the top, which formed with the iron curtain the topic of reliance for security in the prologue with which the theatre was opened, was like a mere bucket-full to the volume of fire on which it fell, and had no visible effect in damping it. Any attempt to go near the flames was totally impracticable; and all that was saved from ruin was done by the presence of mind and activity of Mr. Kent, a literary gentleman, who was the first to discover the flames. He hurried to the door, and gave the alarm. Mr. Powell the prompter, and Mr. Johnston the mechanist, with the two watchmen and Mr. Kent, were the only persons present; for, being a Friday in Lent, there had been no play nor rehearsal. They ascertained that the fire broke out in the hall, under the lobby at the Brydges-street entry, which had been shut up this season, and where some plumbers had been at work. It was, when Mr. Kent broke in, confined to that spot; and they made an effectual attempt to get out the theatre-engine, and play on it from their reservoir; but in ten or twelve minutes the fire ran up the front boxes, and spread like kindled wax. This may be accounted for from the body of air which so large a hollow afforded, and also to the circumstance of the whole being a wooden case: for our readers should be informed, that this immense pile was constructed of timber, and that the frame stood for many months, exhibiting a very fine carcase of carpenter's work, before the ribs were filled in with bricks. Timber was then under 3l. per load; and the architect thought that this wooden frame would contribute to the propagation of sound. It did not, perhaps, perfectly succeed in this respect; but it certainly contributed to the conflagration. Finding it impossible to prevent the destruction of the building, the gentlemen saved the books from the room called the Treasury; and they were carried safely to Mr. Kent's house, in Tavistock-street. The only other article saved was a bureau, in Mrs. Jordan's room: Mr. Kent broke the panels of the door, and brought out the bureau. All farther endeavours were rendered impossible, by the excess of heat.

About a quarter before twelve, a body of horse and foot guards and volunteers came to the place; and engines reached the spot from every quarter, but they could do nothing. Part of the wall next to Vinegar-yard fell down, and the house of Mrs. Mac Beath, the fruiterer, caught fire. The night was uncommonly fine; and the body of flame spread such a mass of light over the metropolis; that every surrounding object glittered with the brightness of gold. Mr. Sheridan was in the house of commons assisting in the discussion of Mr. Ponsonby's motion on the affairs of Spain. The house was illuminated by the blaze of light; and the interest universally taken in this circumstance interrupted the debate. A motion was made to adjourn; but Mr. Sheridan said, with great calmness, "that, whatever might be the extent of the private calamity, he hoped it would not interfere with the public business of the country." He then left the house, and the discussion proceeded. Many of his friends accompanied him to the scene, but it was too late for any effort to be made; and all that the engines could effect was to save the houses in Vinegar-yard and Russell-street, the roofs of which had caught fire, from being burnt down. About half past twelve, parts of the outward walls, both in Russell-street and Vinegar-yard, fell down, and completely blocked up the passage; but fortunately no lives were lost.

The proprietors held a meeting on the Monday following at the house of Mr. Graham, in order to hear the testimony of such persons as could give any information respecting the situation in which the fire broke out, and what was the probable cause of it. Several persons were examined; and, from their depositions, it was tolerably conclusive, that the flames originated in the coffee-room on the first tier, immediately over the grand coffee-room, and under the two-shilling gallery; but the cause of it has never been ascertained. It was reported, that an anonymous letter had been received by an illustrious personage, immediately after the fire in St. James's palace, intimating, "that his royal highness would shortly hear of the destruction of other public buildings in the same manner." Such a letter, it afterwards appeared, was *actually* received by the high personage to whom it was so strangely addressed. It did not at first engage any particular attention; but, on learning the calamitous event of that night, his royal highness sent for Mr. Sheridan, and, after expressing the kindest sympathy in his great and unexpected loss, communicated to that gentleman the contents of this letter, which had been received some weeks before. With respect to this mysterious letter, whether it was meant as an effusion of malice, gratified in some degree, but not yet satiated; or whether it was intended as a menace, calculated for the attainment of some object as yet unspecified, has never been discovered: and we should not have laid so much stress on an *anonymous scroll*, if it were not coupled with another singular and authenticated occurrence, which our readers will peruse with sensations of horror and indignation. It is positively stated that, about five weeks before, a train of gunpowder was discovered at the King's Theatre, disposed evidently for a mischievous purpose. This circumstance had been hitherto concealed through motives of prudence. We now give it publicity from motives equally justifiable.

A fierce and destructive fire broke out about ten o'clock on Sunday night, May the 14th, in a vessel adjoining Billingsgate Dock, at a very short distance from the water's edge. The flames extended almost instantaneously to the other shipping, and to the line of warehouses running from the dock along Dyce Key, &c. The range of warehouses, filled with sugar, tar, oil, hemp, turpentine, tallow, &c. were all successively consumed; and the volumes of fire were rendered more furious and horrible every ten or fifteen minutes by some new combustible matter which they caught. The fire communicated in a gradual but rapid manner to the vessels next the shore. The sight from London and Blackfriars bridges was awfully grand; and it was at one period apprehended that it would be

impossible to preserve any of the shipping in that part of the river from absolute ruin. Fortunately, the tide favouring about eleven o'clock, by the efforts which were made for the preservation of the vessels in the dock, several were towed out, although with extreme difficulty. Four were completely burnt, and about the same number damaged. A floating engine, which was worked with great skill, was of considerable service in preventing the extension of the flames along the river. The extensive warehouses of Ralph's Key, Smart's Key, Young's Key, and Dyce's Key, with their valuable contents, were entirely destroyed; Wiggons's Key was partly so. The fire is said to have been caused by a lamplighter imprudently striking his link, when burning, against a cask of spirits of turpentine, which immediately took fire. A watchman came to the lamplighter's assistance, and the cask was pushed forward with the view of rolling it into the Thames: it took a different direction, however, and fell into a ship lying alongside the wharf.

Between ten and eleven o'clock on the night of Friday the 26th of May, a fire was discovered on the premises of Mr. Seabourne, a block-maker, in Narrow-street, Lincolnhouse. From the combustible nature of the stock in this and the adjoining work-house, warehouses, &c. together with the narrowness of the street, the flames extended with the utmost rapidity on both sides of the way; and, notwithstanding the most prompt and vigorous exertions of the firemen, both by land and water, in about two hours time the following houses, together with an immense quantity of masts, yards, blocks, sail-cloth, pitch, tar, &c. were totally consumed. 1. Mr. Seabourne's dwelling-house, work-shop, &c. 2. The shop-loft and store-house of Mr. Wisborg, sail-maker and ship-chandler, adjoining the former on the western side. 3. The dwelling-house and work-place of Mr. Bell, boat-builder, in the same direction, up to the open landing-place of Ratcliff-cross. 4. The dwelling-house of captain Eitaby, of the ballast-office, on the eastern side of the first-mentioned house. 5. The Ship in Distress, a public-house, on the opposite side of the way. 6. A private house adjoining the latter, occupied by Mr. Jewley. The ballast-office, next door to Capt. Eitaby's, a lodging-house on the opposite side of the way belonging to a person of the name of Scale, and some others, were very much damaged.

On the following morning about two a fire broke out on the premises of Mr. Smeeton, printer, St. Martin's lane, which was subdued before four o'clock, though with the complete destruction of the house and every particle of property. Mr. and Mrs. Smeeton perished in the flames! One of the apprentices was alarmed, and, having awakened his two fellow-apprentices, went down stairs to give their master the alarm; but they were unable to force their way to his apartment, or to rouse him from his slumber; while the increasing smoke and flames compelled them to attend to their own safety. Having alarmed the maid-servant, they, with difficulty effected their escape over the leads of the roof of the adjoining public-house.

On Saturday night, the 6th of July, a dreadful fire broke out in the house of Miss Slarke, milliner and dress maker, N<sup>o</sup> 62, Conduit-street, Bond-street. The whole family had retired to rest; but, before Miss Slarke fell asleep, she smelt fire, and instantly rose to ascertain the fact, when, to her astonishment, she discovered that the flames had reached the staircase. She had presence of mind instantly to fly to the top of the house, where the young ladies her apprentices slept, and happily succeeded in getting them all down stairs and out of the house, where they remained a considerable time, during a heavy rain, without any other clothes on than their night-dresses. The fire by this time had got to such a height, that the whole house was in flames. Had the discovery been ten minutes later, every soul in it must have perished. It next communicated to the house of the Hon. Mr. North, who had lately sailed for Malta, the whole of which was entirely consumed. Great part of Mr. North's library, which was one of the best in London, and had been very lately re-

moved

moved to Conduit-street, was either burnt or damaged. The fire, on the other side of Miss Clarke's house, communicated to the house and shop of Mr. Hurley, a grocer, which, with the contents, were consumed. Miss Clarke lost every particle of her furniture and stock. She was just on the point of setting out for Brighton for the summer, with suitable articles, all of which were in the house. This fire is memorable as having been the remote cause of the death of the celebrated Mr. Windham. With all the zeal of the friend and the scholar, Mr. Windham exerted his utmost to save the valuable library and manuscripts of his absent friend Mr. North: in the course of his exertions he received a blow upon his thigh, for which an operation was subsequently deemed necessary, and which was soon followed by his death.

On the 10th of April, in the Court of King's Bench, came on a trial at bar, before Lord Ellenborough, Sir Nash Grose, Sir Simon Le Blanc, and Sir John Bailey, to ascertain the right of gauging wines, oils, and other gaugeable matters, in the London Docks. The city of London claimed that right exclusively to themselves, by virtue of a charter granted to them in the 10th year of the reign of Edward IV. which charter the London Dock Company insisted was confined to the city of London, and not co-extensive with the site on which the London Docks are built. The emoluments derived from the exercise of the right contended for now amount to 70,000*l.* annually: at the time of the grant, they did not exceed 7000*l.*

The Attorney-general, who conducted the suit for the city of London (assisted by Mr. Garrow, the Recorder, Common Serjeant, and Messrs. Dampier and Watson), addressed the jury at considerable length. He admitted the words of the charter were *intra civitatus*, and thereby granted the right of gauging all gaugeable matters "within the city;" but he would contend, that by those words the city and its liberties were comprehended, and that the right was not confined within the walls of the city. As a proof of that fact, the lord-mayor, who was the city gauger, was obliged to render an account upon oath into the exchequer of the moiety of all forfeitures accruing in the gauging of wine, oil, and all gaugeable matters, "within the city of London and the liberties thereof." The next question would be, whether the London Docks were situated within the liberties of the city of London; and that they were, he said, he should prove by innumerable witnesses. Indeed, the conservancy of the river Thames, the right of metage, and the boundaries of the port of London, were all liberties of the city, and extended over and much beyond the place in question. But he should also show that the right contended for had been uniformly exercised for upwards of 300 years on both sides the river, from Blackwall upwards, and that the law and the practice were in his favour. The documentary evidence was then read; and a host of witnesses called to prove that the city gauger had uniformly exercised his office on both sides the river Thames, as low as Blackwall, and near and about the spot in question, from time immemorial.

The defence was conducted by Mr. Serjeant Best, assisted by Messrs. Park, Holroyd, and Bosanquet. The learned serjeant, in his speech to the jury, said, the attorney-general had left him very little to contend against, as it was a mere question as to the construction of the charter. The words of that charter were, to exercise the right of gauging all wine, oil, &c. "within the city;" now if that was considered, even as applying and extending to the liberties of the city, it must mean to those defined liberties without the bars, and not be considered as wandering from one extremity of the river Thames to the other. The fact was, that that right was originally exercised only on the quays and wharfs within the city; but, the trade and commerce of the country increasing, and the population growing more numerous, other quays and wharfs were erected, and for convenience-sake the city gauger was employed by the merchant; and hence he wandered on

both sides the river Thames in all directions; but he did not do that of his own right, or by virtue of the charter in question. The learned serjeant concluded by observing, that the London Docks were not within the defined liberties of the city of London, and consequently that the company had a right to employ their own gauger.

Lord Ellenborough agreed with the learned serjeant, that it was a question of construction as to the words in the charter; and he was of opinion they did not bear the meaning put upon them by the attorney-general, or that the right was co-extensive with the London Docks. The jury found a verdict for the defendant; and the city of London lost the right contended for.

The following trial is also of much importance for a large and respectable class of gentlemen generally inhabiting the metropolis; we mean the riders or travellers belonging to, and acting for, the different mercantile houses in London and other places. It was a case which established the fact, of landlords and innkeepers being answerable for the property of their customers, while under their roof; being an action tried at the Hereford assizes, before Mr. Baron Wood, the facts of which were as follow:—The plaintiff had a rider in his employ, named Evan Jones, who left London in December, and in five days after arrived at an inn at Wrexham, in Denbighshire, kept by the defendant. The inn being full, the rider was obliged to sleep in a three-bedded room, two of which were occupied by the defendant's own family. The rider swore at the trial, that on the morning of his arrival at Wrexham he had a pocket-book containing 400*l.* in bank-notes; that, meeting with several of his Welsh friends, he drank freely, but was not intoxicated. On going to bed at night, he recollected placing his waistcoat in a chair by his bedside, and the pocket-book was safe. When he awoke the next morning, his clothes were there, but his pocket-book was gone; upon which he roused the whole family, declared his loss, and all joined in searching the bed-chamber; but the pocket-book could no-where be found.—The defendant and his wife appeared extremely anxious that the pocket-book should be found, and actually sent for a constable to assist in the search.

In answer to this, the defendant brought all his servants and children to prove, that they never saw the pocket-book; and the judge summed up in favour of the defendant, observing, that it was a very hard law against innkeepers, who were made liable for the security of the goods of their guests; and, unless the jury were satisfied of the evidence of the rider, they would find for the defendant.—The jury, however, consulted together for some time, and found a verdict for the plaintiff. Damages, 400*l.*

Mr. Jervis obtained a rule to show cause why the verdict should not be set aside, and a new trial had. Since the court granted the rule, the following extraordinary fact had come to light. The defendant had fallen into distress, his goods were seized in execution, and a public sale advertised on the 29th of March; on which day the auctioneer, in presence of the persons assembled, put up for sale a bed and mattresses, remarking, that it was the same in which the young man had slept who lost the 400*l.* The lot was purchased by a person, who joined in making an affidavit of the fact; and, to his astonishment and surprise, between the two old mattresses which were under the feather-bed, the lost pocket-book was discovered, and the 400*l.* in notes within it.—Upon the knowledge of that fact, Mr. Jervis suggested, if a new trial was not granted, that a *set processus* should be awarded, and the defendant spared from payment of the costs. Mr. Jervis added, that the defendant was most interested for his character, which had suffered by the verdict; and he contended, that the rider, having gone to bed intoxicated, might, by the cunning some men possessed in their intoxication, have hid the book between the mattresses, and the next morning lost all recollection of the fact.

The chief baron admitted that it was a sort of action which required as much strictness in proof as a trial for felony;

felony; and that the imprudent conduct of the rider laid him open to a severe cross-examination; but the jury, believing his testimony, had come to a right conclusion. The subsequent finding of the pocket-book was a decisive confirmation of his story; and, though he did not mean to attach suspicion to the defendant or his wife, yet he might have dishonest people about him; and he could not believe the pocket-book was between the mattresses on the morning of the search. He rather believed, from the noise the circumstance had occasioned in the country, that the party who took the pocket-book was apprehensive it could not be got rid of without detection, and had therefore placed it between the mattresses previous to the sale. Upon the whole, he saw no grounds for disturbing the verdict, or for granting a *set processus*. The other judges concurred in opinion; and the rule for a new trial was discharged.

On the 18th of September, the new theatre of Covent-Garden was opened, having been re-built in less than nine months. The managers, in consequence of their large expenses, thought fit to raise the price of admission—to the boxes, from 6s. to 7s.—to the pit, from 3s. 6d. to 4s.—This was resisted by the public as unnecessary and unreasonable, and as arising from an intention to take advantage of the town, which, Drury-Lane being in ruins, had no other place of theatrical amusement. Another and still more popular ground of resistance was, the erection of twenty-eight private boxes in the theatre, by which the audience at large was exceedingly cramped, and which were generally supposed to have been designed as resorts of impurity, and to furnish facilities, which in a British theatre ought not to be suspected. The demons of riot took the place of Comus and the Muses! The performances of the actors were drowned and reduced to mere pantomime, by laughing, groaning, hissing, mewing in imitation of cats, barking like dogs, grunting like swine, growling like tigers—in short, it seemed as if all the animal creation had been assembled in Covent Garden, as in a capacious lyceum, for the purpose of proclaiming their existence by their instinctive sounds. To all manner of natural sounds, emitted or excited by all manner of natural organs, was added the aid of instrumental noise; such as coachmen's horns and trumpets, dustmen's bells, and watchmen's rattles. In the pit they presented their backs to the players, except when they thought proper to grin and make faces at them. Many came with the symbolical characters of O. P. (Old Prices) in their hats, or upon their clothes, forming rings and making mock fights; or the whole joined in the notable O. P. dance, as it was called, which consisted in an alternate stamping of the feet, accompanied with the regular cry of O. P. in monotonous cadence. The managers, of whom some were also players, continued their pantomimical representations for week after week with wonderful patience. At length they lost their tempers: bands of boxers, Jews, chairmen, and butchers, were introduced into the theatre, as well as multitudes of Bow-street runners and constables. Bruises were inflicted and received, and some blood flowed. At last, after a campaign of three-months, the servants of the public made overtures for peace, and they were accepted. The terms were, that the boxes should be raised to 7s. the pit to remain as before. Thus the Pittites gained the day, and the Boxites were lured.—But hostilities were renewed on the 10th of September following, (1810.) when the house opened for that season, because the nuisance of private boxes had not been fully abated according to the contract, as understood by the public. The performances during the first week were rendered inaudible, and the clamour continued to increase: a dance called the Contract was substituted for the O. P. dance. The proprietors having conceded the point in dispute, by opening four more boxes on each side, peace was restored; and the managers continued to enjoy the undivided favour of the public while Drury-Lane theatre lay in its ashes, from which it did not emerge till the year 1812.

1810.—In proportion with his advance in the career which he has found opened to his exertions, the Londinographer finds the annals of those parts of the world, connected commercially or politically with the metropolis, more and more interesting; and yet his speed is still retarded by the influx of matter which presents itself to him, and partly obstructs his way.—This year, though not pregnant with momentous events, with decisive battles, with the fall of empires, or the bestowing of new crowns, yields however enough of interesting matter to fill many pages in our work, were we not bound, by its very nature, to epitomise, and bring within an attainable focus, the transactions which have taken place in our times, and are still fresh in the memory of our cotemporaries. The object of our lucubrations is not confined to the present time; and we must consider, with our readers, that the historian notes-down, for posterity, whatever the fleeting moment of time displays, and marks it (as if in a succession of painted sceneries) to their eager and steady sight; and that, when the hand that now writes has long, long, been withered in the tomb, when the eyes of the present reader have long been deprived of sublunary light, posterity will still peruse these columns, and canvass, perhaps with severity, but at all events with curiosity, the motives of his labours, the impartiality of his intentions, and the accuracy of his statements of facts.

With these considerations before us, we shall resume our annals by noticing some changes which took place in the British ministry; changes which can never fail to affect more or less, according to circumstances, the interests and welfare of the metropolis. On the resignation of the two secretaries, whose differences could not be settled by fair argument, and had called a stern verdict from the mouth of the blind and homicidiary pistol; on the secession of Mr. Canning and lord Castlereagh, (see p. 112.) Mr. Perceval, who had become first lord of the treasury and prime minister, on the retirement of the duke of Portland, set himself to thin and weaken the ranks of opposition, and to consolidate his own administration, by an amalgamation with earl Grey and lord Grenville, men of great wealth as well as eloquence, and no common share of abilities, both natural and acquired. They were considered by their adherents, among whom were many persons of large property, and not a few also of great talents, since the death of Mr. Fox, as the chief leaders of what was still called the whig-party. The project of Mr. Perceval being rejected by these lords, the marquis of Wellesley, just returned from Spain, was appointed secretary of state for foreign affairs; the earl of Liverpool secretary for the department of war and the colonies; and Mr. Ryder for the home department.

The imperial parliament of Great Britain and Ireland assembled on the 23d of January. The session was opened by commission. The king's speech was read by the lord chancellor; it turned, as usual, on the relations in which we stood to foreign states, the principal events that had arisen out of these since the last prorogation of parliament, and the views that had dictated, or continued to dictate, the conduct of government—the expedition to the Scheldt, and reduction of the island of Walcheren—the situation of Sweden—the expulsion of the French from Portugal—the victory of Talavera—the resolution of the Spanish government, in the name and by the authority of Ferdinand VII. to assemble the Cortes—and some grounds for hoping for a speedy restoration of a friendly intercourse between this country and the United States of America.

In the house of lords the address was moved by the earl of Glasgow; who, having taken a brief review of the conduct of ministers, with regard to their foreign policy and various expeditions, maintained, that whatever might have been the result, they were not only undeserving of censure, but entitled to the thanks of the country.

The address was opposed by the earl of St. Vincent, who recapitulated the events which we have taken notice of in the foregoing pages: namely, the convention at Cintra, the

the expedition, retreat, and death, of Sir John Moore, and other topics already fitted by the ingenuity of the opposition.—Lord Grenville proposed an amendment, wishing that, without delay, rigorous and effectual inquiries and proceedings should be instituted respectively to the campaigns in Spain and Portugal, and other parts of Europe.

In the debates on the subject, Lord Harrowby, the lords Moira, Sidmouth, Mulgrave, Grey, and several noble speakers, took an able and manly part.—Lord Liverpool answered with clearness, moderation, and strength; and, respecting the expedition to the Scheldt, said most pointedly; “Some noble lords have urged, that the destruction of Flushing was an achievement of no importance, and as such considered by the ruler of France. I would ask those noble lords, whether, if the case could be reversed, and a French fleet were to attack and destroy Sheerness, and afterwards make good their retreat, it would be considered by Bonaparte as a small triumph, or by us as a trifling defeat?”—The house divided on Lord Grenville’s amendment: for the amendment, 92; for the address, 144.

In the house of commons, the debates upon the address were nearly a fac simile of what had passed in the upper house, and met the same fate.—These eloquent and learned discussions are, we doubt not, productive of much eventual good, in bringing before the public eye certain particulars, which, were it not for them, would remain forever concealed under the ministerial veil.

Grateful for the military achievements, for the prudence, skill, and courage, of Lord Wellington, the house of lords re-founded with the praise of this able commander; and, notwithstanding some previous observations from Lord Grey, the Earl of Liverpool, on the 26th of January, moved the thanks of the house to this brave defender of our Spanish and Portuguese allies. After oppositions and supports, explanations and retorting arguments, the motion of thanks was carried without a division.—In this as in the last instance, the debates in the house of commons were a mere repetition of what had been urged in the other house; and consequently the noble lord who commanded the army at Talavera, and his co-operators, the officers, non-commissioned officers, and privates, all those who had shared the dangers, shared also the unanimous thanks of their country in the British senate.

On the 29th of January, Lord Cochrane rose in the house of commons, and moved, “that there be laid before the house a copy of the minutes of the trial of Admiral Gambier, on the 23d of July, 1809; also the original minutes taken day by day, by the deputy judge-advocate.”—This motion originated from a conviction that the ministry intended to bring in a vote of thanks to Lord Gambier, in both houses of parliament, for the victory in the Basque Roads. After most animated debates, Lord Cochrane’s motion was negatived; and the thanks of the house were voted, on a division to Lord Gambier, and unanimously to the officers, as well as acknowledgments to the seamen and marines, who had given convincing proofs of their undaunted courage on the occasion.

We have next a retrospective view of the affair of the Scheldt; an unfortunate expedition, the failure of which was diversely attributed to different causes, as the members who spoke on the subject were respectively affected.—Lord Porchester made the motion for an inquiry, which, after oppositions and debates, was carried by a small majority. As it would be useless and uninteresting to our readers to go over again all that has been said and printed on this business, we must confine ourselves to the mere statement, that, on the motion of Lord Porchester, a secret committee was appointed to inspect the papers and communications relative to the expedition.—In the course of this inspection, a narrative of the expedition to the Scheldt, signed by Lord Chatham, and presented to his majesty without the intervention of any responsible minister, was found among the papers. This irregular proceeding aroused the indignation of many; and motions upon motions were made to address his majesty on the subject.

This paper was produced on the 19th of February, upon motion of general Loft: it was entitled, “Copy of the Earl of Chatham’s Statement of his Proceedings, dated 15th of October, 1809;—presented to the king 14th of February, 1810.” The date of its presentation to the king was much noticed. It bore date only on the 14th inst. although it had been two or three months ago announced, in the newspapers known or supposed to have some understanding with the ministry, that Lord Chatham had presented a narrative of this description to his majesty. The objections which Lord Folkestone had to this paper, on account of the manner in which it had been presented to his majesty, were considerably aggravated by a knowledge of its contents. It appeared to be a special address from the commander of *one part* of the expedition, appealing to the judgment of his majesty, and actually reflecting upon the conduct of his colleague in the command. He really did not know how the house should proceed, in order to get rid of such a paper; but it seemed highly desirable that it should do so. To entertain such a document, would not only be inconsistent with the constitution, but, in his opinion, with common justice. He would be glad to hear from the chair, in what manner it could be disposed of.

After several members had spoken, the Speaker, having been appealed to, rose, and said, that he trusted the house would not be surprised at his delay in giving his opinion. On his first opening the narrative before them, and finding the name of CHATHAM; he was doubtful whether it ought to be received and acknowledged by that house, on account of its not bearing the signature of any of his majesty’s secretaries of state. But, considering by whom it was presented, he waved his doubts until he sent for some papers. On perusing these, he found that Lord North had presented several similar papers, and that he was considered to be *prima facie* accountable; a circumstance which, in his opinion, left the house at full liberty to discuss the merits of the narrative. The Chancellor of the Exchequer then moved, that it should be referred to the committee of the whole house on the expedition to the Scheldt; which was agreed to. The order of the day being then read, for the house going into a committee on the expedition to the Scheldt; they proceeded in the course of inquiry, on which they had entered the 2d of February, and which was continued through various adjournments, to the 15th of March. The sittings of the committee, employed in the examination of witnesses, were in number eighteen. The principal subjects, to which the inquiry was directed, were, the policy or design and views of the expedition; the manner in which it was conducted; and the evacuation of Walcheren.

Among the witnesses examined was, of course, Lord Chatham himself; and he was repeatedly asked, whether he had, on any former occasion, presented to his majesty *any other narrative*, paper, memorandum, or memorial, respecting the expedition to the Scheldt; but he declined to give any answer. This circumstance excited a strong suspicion, that the noble lord had actually presented to his majesty some such document. Mr. Whitbread, therefore, on the 23d of February, moved, “that an humble address be presented to his majesty, praying that he would be graciously pleased to order, that there be laid before the house, copies of all reports, memoranda, narratives, or papers, submitted at any time to his majesty, by the Earl of Chatham, relative to the late expedition.”

Mr. Secretary Ryder was persuaded, that the present motion was wholly without example. For, even supposing that such a paper as that described did actually exist, as it had never been communicated to his majesty’s ministers, he did not know in what office to search for it, nor could he understand what reply they could possibly advise his majesty to make to an address from the house of commons under such circumstances.

Mr. Ponsonby, adverting to the declaration of Mr. Ryder, that he did not know where to look for such a paper, laid,

said, he would ask the right honourable gentleman where he looked for the list? And, as to his not understanding what answer ministers could advise his majesty to return to such an address,—did he suppose that his majesty would hesitate to deliver any papers he might have in his possession, of the nature required, for the purpose of submitting them to the house of commons?

Sir S. Romilly observed, that, if a witness were asked, in a court of justice, whether he wrote a certain paper, and declined to answer, the judge would direct the jury to consider that paper as in existence. But, if there should be no such paper in existence, that was a still stronger reason for agreeing to the motion; for then all doubts would be satisfactorily cleared up, and the characters of the distinguished officers, supposed to be aspersed, stand as high as ever.—Sir J. Anstruther contended, that any paper relative to an expedition, which led to the waste of millions, and the death of thousands, could not be considered in any other light than as an official paper.—Mr. Bathurst likewise said, that it was not the place where a paper was found, but the nature of the paper, that made it official. It had been said, that those who supported the motion were begging the question. That he denied. They were justifiable in assuming the existence of any papers called for; justifiable in calling for them, in order to ascertain whether they did, or did not, exist. But, he would ask, was there a man in the house who doubted the existence of the paper? Did the Chancellor of the Exchequer contend that there was no such paper? The same question was put by almost every one who spoke on the same side.

Mr. Canning said, that, as soon as lord Chatham accepted the command of the late expedition, he became as responsible for his conduct as any other officer in the army, or as any man in the ranks. He had no right to cut out for himself a royal road to an audience of his majesty. He was, no doubt, responsible to the king, but only through the regular and ordinary channel. As one of the cabinet, he was responsible, equally with the rest of his colleagues in office, for the wisdom or policy of the expedition, to the country and to parliament; but, as commander of the expedition, he was responsible to the king, through his secretary of state. If the other paper, which had been read, had taken the course of going through the medium of the secretary of state into the king's hand, he should most certainly have thought that the papers now moved for did not exist. But when he considered, that the narrative on the table had first got into the king's hand, and was then made official; and that the same adviser had, perhaps, thought it proper not to make the other papers, if they did exist, official; his conviction was pretty strong, that they were not such as ought to have been made official. He did not, however, think that those papers could properly be withheld on the ground of their not being official.

Upon a division of the house, the numbers were—for the motion, 178; against it, 171.—On the 26th of February, the Chancellor of the Exchequer reported to the house, that his majesty had been waited upon with their address of Friday last, to which he had been graciously pleased to direct the following answer to be given: "The earl of Chatham having requested his majesty to permit him to present his report to his majesty, and having also requested that his majesty would not communicate it for the present, his majesty received it on the 15th of January last, and kept it till the 10th of this month, when, in consequence of a wish expressed by the earl of Chatham, on the 7th of this month, to make some alterations in it, his majesty returned it to the earl of Chatham. The report, as altered, was again tendered to his majesty by the earl of Chatham, on the 14th of this month, when his majesty directed it to be delivered to his secretary of state; and his majesty has not kept any copy or minute of this report, as delivered at either of these times; nor has he had, at any time, any other report, memorandum, narrative, or paper, submitted

to him by the earl of Chatham, relating to the late expedition to the Scheldt."

Upon this reply of his majesty, Mr. Whitbread, on the 2d of March, grounded a motion of censure on the earl of Chatham to the following effect: 1. That it appears to this house, that John earl of Chatham, having requested his majesty to permit him to present his report to his majesty, and having also requested that his majesty would not communicate it for the present, did, on the 15th of January last, privately transmit to his majesty a paper, bearing date the 15th of October preceding, and purporting to be a narrative of his proceedings as commander-in-chief of his majesty's land-forces in the late expedition to the Scheldt; and that he withheld all knowledge thereof, both from his majesty's ministers, and the admiral commanding in the said expedition, whose conduct is materially implicated in the said narrative; that the same was, on the 10th of February last, returned to him by his majesty's command, in consequence of his own request; and that, on the 14th of February, he again tendered the said narrative to his majesty, *the same having been altered, by the suppression of a paragraph, containing matter of opinion, the substance of which this house, by the examination of the said earl of Chatham, has not been able to ascertain.* 2. That the earl of Chatham, by private communication to his majesty, accompanied by a desire of secrecy, did unconstitutionally abuse the privilege of access to his sovereign, and thereby afford an example most pernicious in its tendency to his majesty's service, and to the general service of the state." The friends of lord Chatham thought fit to try their strength by moving the previous question upon these resolutions; but it was negatived by 221 votes against 188. The consequence was, that his lordship resigned his office of master-general of the ordnance.

Although these debates may have been interesting at a moment when the metropolis and the nation were conceiving hopes of opening a branch of commerce with the continent through the Scheldt, yet, as the whole came to nothing, we need only to state, that, at length, the ministers obtained a majority of votes, approving of the policy of the expedition, and of the retention of the island of Walcheren.

Arising from, and connected with, the preceding enquiry, we have to notice another subject, and one indeed of peculiar moment, as it refers to the privileges of the house of commons as exercised against the liberty of the subject, whether members of that house or not.—After the house of commons had determined to proceed in an inquiry into the expedition to the Scheldt, Mr. Yorke (February the 1st) gave notice, that, when the inquiry should be gone into, he would proceed to enforce the standing order of the house for the exclusion of strangers. The house having resolved itself into a committee on the expedition to the Scheldt next day, Mr. Yorke, according to his notice, moved the standing order for the exclusion of strangers, which was of course enforced; and the gallery continued shut during the whole of the inquiry.

Mr. Sheridan (Feb. 6.) begged leave to ask what was the sanction of this supposed standing order? In the first place, he contended, that it was no standing order at all. It was passed at the opening of the session *upon question*. It might have been rejected when proposed; and of course was liable to revision and repeal on any subsequent occasion. It was a mistaken idea to suppose that that order empowered any member to call upon strangers to withdraw. The order, which Mr. Sheridan read, said, "That any stranger appearing in the house shall be taken into custody by the serjeant." The power and authority then rested with the serjeant at arms. And how was he to enforce it? If, in proceeding to obey the order, the serjeant should find two or three hundred persons collected in the gallery, it would be impossible for him to take them all into custody; and therefore he must shut them up in the gallery whilst he went to collect his *posse comitatus*. In

the mean time the debate goes on. The strangers are in possession of all that has passed; and thus, by its very operation, the object of that standing order was defeated. There was also, he observed, another order, which held it to be the privilege of members to pass strangers through the house into the gallery, except while the house was sitting.—Here then were two orders wholly irreconcilable, unless it was intended that members should introduce their friends for the purpose of being committed to the custody of the serjeant at arms. Was it not, then, a duty to reconcile such orders to themselves, and to common sense? It was not his intention to move for the repeal of the order, or to maintain that there never could arise an occasion when strangers ought to be excluded; but he did wish the order to be so modified, that it should not depend on the caprice or pleasure of any individual member, but be fairly submitted to the decision of the house. When the character of the king's son was to be investigated, not a syllable had been heard of the exclusion of strangers; but, when the conduct and character of ministers were to be inquired into, then it appeared to be a subject too tender and delicate for public inspection in that house. Mr. Sheridan thought that there never was a period in our history in which it was more necessary for parliament to conciliate the public; therefore he moved, "That a committee of privileges be appointed to meet to-morrow, in the speaker's chamber, to consider the order of the 25th of January last."

Mr. Windham wished to know in what manner the daily publishing the debates was advantageous to the country. He asked what was the value to their constituents of knowing what was passing in that house? Supposing they should never know, it was only the difference between a representative government and a democracy. Till the last thirty years, or a few years farther back, it was not even permitted to publish the debates of that house. So lately as the times of Dr. Johnson, the debates were never published but under fictitious names. He had heard that proprietors of papers had talked of the injustice of closed doors. This was to consider the admission of strangers into the gallery as a privilege. But, though he might perhaps think it useful to let this practice continue, after having so long prevailed, he did not allow it to be a privilege. The house ought to maintain those regulations and orders which had so long prevailed. He would assert that the rights of the house were now in danger of being lost from misuse.

Lord Folkestone said, that, as the public had been allowed regularly to receive a report of the proceedings in parliament, he was desirous that no casual interruption of that permission should occur.

Mr. Yorke haughtily protested against the supposition that it was necessary for a member, who should move to enforce a standing order, to state the reasons which induced him to do so. He had moved the order on the present occasion, from a consideration of the many misstatements which went forth to the public last year, on a very important inquiry before that house. They were now performing their great function as the grand inquest of the nation. The grand jury of a county never admitted strangers during the time of their examining evidence. A right honourable gentleman had asked why they had not proceeded in the same manner in the course of a memorable inquiry last year? He regretted most sincerely that they did not; and he took shame to himself that he had not then enforced the standing order. The standing order in question was a most ancient order; the principle on which it was founded was, perhaps, interwoven in the original constitution of the house.

Mr. Sheridan stated, that the object he had in view, in the motion which he had submitted to the house, was not to prevent any individual member from clearing the gallery; but merely to require, that, after he had done so, he should condescend to give some reason for the step. If, after the exclusion of the strangers, the house should

acquiesce in the propriety of the motives for that exclusion, the public would then be satisfied. To what was it owing that Great Britain was able to maintain a struggle, and he hoped it would be a successful struggle, with the victorious arms that had trampled on the independence of the prostrate nations of Europe for the liberties of the world? To the liberty of the press alone, and most particularly and emphatically to the unrestrained publication of the debates and proceedings of parliament. It had been asked how such publication could produce any public benefit, or conduce to the well-being or happiness of the nation? By showing to the people, the grounds on which public measures were referred to, and particularly by convincing them of their necessity; thus inducing the public to submit with patience to the heaviest burdens that had ever been imposed upon a nation. If the liberty of the press had existed in France before or since the revolution—if it had existed in Austria—if in Prussia—if in Spain—Bonaparte would not now find himself in a situation to dictate to Europe, and filling the throne of nearly an universal monarch. As to the analogy between the house of commons in its inquisitorial capacity and a grand jury, grand juries did not publish the evidence on which they were bound to form a decision, because it could be only an *ex-parte* statement, which, however, might influence the opinion or verdict of a petty jury.—Mr. Sheridan, in conclusion of his reply, begged of gentlemen not to mistake his motion, which was not by any means to rescind the order to which it referred, but to have it ascertained by a committee of privileges, whether any, or what, modification of it was necessary.

The Chancellor of the Exchequer thought it necessary, for the dignity of the house, to maintain the privilege that any member has to call for the clearing of the gallery without argument.—On a division of the house, there appeared: for Mr. Sheridan's motion, 80; against it, 166.

Mr. Yorke was soon after appointed First Lord of the Admiralty and one of the Tellers of the Exchequer.

There is in human nature a very strong and active principle of imitation. It appears in earliest childhood, and has the happy effect of exciting and strengthening the powers of both body and mind. In sea-port towns children amuse themselves with the construction of ships with paper or pasteboard; in military stations with drums and wooden arms, and wheeling like soldiers. At every period of life mankind have a strong propensity to imitate their superiors. In the metropolis, the seat of the government, the middling and lower classes ape the proceedings and debates in parliament, from much the same principle that boys play the parts of soldiers and sailors. In every ale-house club, they dispute on all political, and sometimes other, subjects, and are engaged in *forming resolutions, making motions, seconding motions, and supporting or opposing motions*. Debating societies are instituted, meeting once or twice a-week, where any one, of either sex, is admitted, and may have an opportunity of displaying his oratorical powers, or admiring those of others, at the small expense of one shilling. This became a kind of trade or business. The president, or manager, paid for the room and candles; what remained of the admission-money, after defraying this expense, went into his own pocket. Among these assemblies, was one which assumed the title of the *British Forum*. The president was called *John Gale Jones*. The vote for enforcing the standing order for the exclusion of strangers, and what passed on that occasion in the house of commons, was made the subject of discussion in the *British Forum*. The following placard was every-where stuck upon the walls of the metropolis: "WINDHAM and YORKE. *British Forum*, 33, Bedford-street, Covent garden; Monday, February 19, 1810. Question; 'Which was a greater outrage on the public feeling, Mr. Yorke's enforcement of the standing order to exclude strangers from the house of commons, or Mr. Windham's recent attack on the liberty of the press?' Last Monday, after an interesting discussion,

discussion, it was unanimously decided, that the enforcement of the standing order for shutting out strangers from the gallery of the house of commons, ought to be censured as an insidious and ill-timed attack on the liberties of the press, as tending to aggravate the discontents of the people, and to render their representatives objects of jealous suspicion. The present question was brought forward as a comparative inquiry, and may be justly expected to furnish a contested and interesting debate. Printed by J. Dean, 57, Wardour-street."

Mr. Yorke having stated this in the house of commons, February the 19th, John Dean was ordered to attend at the bar of that house the next day. He attended accordingly; and, being asked what he had to say for himself respecting the offence he had committed, declared that he had been employed to print the paper by John Gale Jones. It was moved by Mr. Yorke, and voted *nem. con.* "that the said John Dean, in having printed the said paper, had been guilty of a high breach of the privileges of that house." Dean was committed to the custody of the serjeant at arms, and Jones ordered to attend next day, February the 21st. John Gale Jones being brought to the bar, the Speaker stated to him what had been declared by the printer, and asked him what he had to say in his own behalf? Mr. Jones answered, "I acknowledge, sir, that I was the author of that paper; and I am extremely sorry that the printer of it has suffered inconvenience on my account." Jones, at the desire of the Speaker, repeated what he had said; and, the question being put to him, if he had any thing more to say in his own behalf, declared, that "in what he had done he was not actuated by any disrespect to the privileges of the house, or the persons of any of its members individually. He had always considered it to be the privilege of every Englishman to animadvert on public measures, and the conduct of public men. But, in looking over the paper in question again, he found that he had erred. He begged to express his sincere contrition, and threw himself on the mercy of that honourable house—that house which, as an important branch of the constitution, had always had his unfeigned respect." The Speaker then put the question, "That the said John Gale Jones had been guilty of a gross breach of the privileges of that house;" which was carried *nem. con.* Mr. Yorke then moved, "that John Gale Jones, for his offence, be committed to his majesty's gaol of Newgate." The question, being put, was carried *nem. con.*—As to John Dean, he was, at the intercession of Mr. Yorke, on presenting a petition humbly praying for forgiveness, and being reprimanded by the Speaker, discharged out of custody, without paying any fees.—It was ordered *nem. con.* that what had been said by Mr. Speaker, in reprimanding the said John Dean, should be entered in the journals.

The attention of the house of commons was again called to Jones, March the 12th, by sir Francis Burdett, who lamented exceedingly that, in consequence of indisposition, he had not been present when John Gale Jones was committed to Newgate for a breach of the privileges of that house. He knew it was at all times much easier to prevent the adoption of a measure, than to induce the house to retract a resolution. He could not, however, discharge his duty if he did not still endeavour to induce the house to retract a step which they were not authorized to take.—The *house*, he contended, and *parliament*, were different: there must, consequently, be a difference in the extent of the privileges which they might, separately, or in conjunction with the other house of parliament, be supposed to possess. On this ground, he maintained that the imprisonment of John Gale Jones was an infringement of the law of the land, and a subversion of the principles of the constitution.—The question was, If the house of commons had a right to imprison a person, not a member of that house, for an offence punishable by the ordinary course of law; and, by a vote for that purpose, deprive the people of their imprescriptible rights? In this question there was involved the consideration of two distinct

qualities: privilege and power. Privilege the house possessed for its own protection: power was a right to be exercised over others. Privilege they were to exercise to prevent the crown from molesting them in their proceedings; as a shield to themselves, not as a scourge to the rest of the commons. A court of record only had a power of commitment: that house was not a court of record; therefore that house did not possess the right of commitment. The warrant of commitment, too, he contended, was illegal in all its parts, but eminently so in its conclusion. A warrant must conclude with the words, "till the party be delivered by the due course of the law." The warrant for committing Jones ended with the words "during the pleasure of the house." Lord Coke laid it down explicitly, that no man could be sent to prison without trial and judgment. The privilege talked of would make the house as great as king, lords, and commons. He might be told this was a privilege of parliament. He answered, No: it was a privilege assumed only by one branch of the legislature. If the members were of opinion that a resolution of that house was equal to that of all the branches of the constitution, they would agree in rejecting his proposition; but if, with him, they thought that they could not overturn the law of the land, and the acts of parliament solemnly passed, by any assumed power exercised by that house alone, they would agree with him, "that John Gale Jones must be discharged;" with a motion for which purpose sir Francis concluded.

The Solicitor General said, that the question before the house was, Whether Jones, convicted on his own confession and by the unanimous vote of the house of a gross breach of privilege, (which contained in itself a gross and scandalous *contempt*;) and punished for his offence in the way that appeared most fitting to the house, was guilty or not? As far as the present practice could be traced, it was found to be legal and constitutional. It was open to Jones to apply by petition; and, for his own part, he might agree to his discharge in this way, the next moment after disposing of the question as it now stood; but he would not, and he trusted the house would not, relax now, after hearing the kind of arguments adduced by the honourable baronet. If they did, it would be said that they yielded because they doubted their own right.

Sir Francis Burdett replied, that the legal meaning of *contempt* was that which throws obstruction, in the way of the proceedings of any court; but how were the proceedings of that house obstructed by a libel? When sir Francis had ended his reply, the house divided: for the motion, 14; against it, 153.

On the 24th of March, there appeared in Cobbet's Weekly Political Register, a Letter inscribed, "Sir Francis Burdett to his Constituents, denying the Power of the House of Commons to imprison the People of England:" accompanied with the argument by which he had endeavoured to convince the gentlemen of the house of commons, that their acts, in the case of Mr. Jones, were illegal.—This publication was brought under the notice of the house of commons, on the 26th, by Mr. Lethbridge, at whose desire the question was put by the Speaker to sir Francis Burdett, whether he acknowledged himself to be the author? Sir Francis having answered in the affirmative, Mr. Lethbridge gave notice of a motion on the subject.—Next day, in consequence of this notice, Mr. Lethbridge rose, with a degree of pain and embarrassment, which, he declared, he had never felt before, to make a complaint against one of the united commons of Great Britain and Ireland, who, in his opinion, had violated the privileges of the house. He did not mean to enter upon the subject itself, but only to lay on the table the document which the honourable baronet, who was the object of the motion he had to make, had admitted to have been published by his authority. For the purpose of saving the time of the house, he had marked certain passages in that document, which, in his opinion, more particularly justified him in the charge which he had preferred.

ferred against the honourable baronet. Mr. Lethbridge then gave in at the table, Cobbet's Weekly Register of Saturday, 24th of March, 1810; and sir Francis Burdett's papers were read by the clerk.

Sir Francis Burdett made a short but able defence. He said, that in writing the Address to his Constituents, and the arguments that accompanied it, he had no idea that he was infringing any privilege of that house. Was it to be supposed that the simple act of arguing on the powers of the commons was a crime? would not the house endure even an abstract doubt of their powers? He was willing to abide by the fact and argument of what he had written: he would stand the issue. But, if it was the pleasure of the house that he should now withdraw, he was ready to withdraw. The Speaker stated that this was, in similar cases, the uniform usage. Sir Francis Burdett accordingly withdrew; after which Mr. Lethbridge proposed the two following resolutions, for the adoption of the house. 1. That the letter signed Francis Burdett, and the further argument which was published in the paper called Cobbet's Weekly Register, on the 24th of this instant, is a libellous and scandalous paper, reflecting upon the just rights and privileges of this house. 2. That sir Francis Burdett, who suffered the above articles to be printed with his name, and by his authority, has been guilty of a violation of the privileges of this house.

The discussion was adjourned till next day, March the 28th; and then to the 5th of April, when the resumed debate was continued till half after seven in the morning; in the course of which, speeches were made by not less than thirty members. The question turned upon, Whether the house had a right to imprison a person not a member thereof; and whether sir Francis's letter, inserted in Cobbet's Register, was or was not a libel. The conclusion was, that the resolutions, moved by Mr. Lethbridge, were agreed to without a division.—A motion was then made by sir Robert Salisbury for the commitment of sir Francis Burdett to the Tower. An amendment was proposed, that sir Francis be reprimanded in his place: upon which the house divided: ayes, 152; noes, 190.

In consequence of this vote for the commitment of sir Francis, the Speaker, on the same morning, (Friday,) at half-past eight o'clock, signed the warrants for commitment, and immediately delivered them to the serjeant at arms, to be carried into effect, if possible, by ten o'clock that morning. From the politeness of the serjeant, in announcing the commission with which he was charged, it was not till about five o'clock in the afternoon that he went to sir Francis at his house, who told him that he would be ready to receive him at eleven o'clock next morning, (Saturday;) on which the serjeant retired, conceiving that it was sir Francis's intention to go with him peaceably to the Tower at the time stated. About eight o'clock, the serjeant, Mr. Colman, came again to sir Francis Burdett's. He was now accompanied by one of the messengers; and told sir Francis, that he had received a severe reprimand from the Speaker for not having executed the warrant, which he read. Sir Francis then said, that he disputed the legality of the warrant, and that he was determined not to go, if not constrained by actual force, which he was determined to resist as far as in his power. He stated also that he had written to the Speaker of the house of commons on this subject.

Meanwhile a mob had been assembled before sir Francis Burdett's house, and was every moment increasing. Mr. Colman, who had called several times without being admitted, went again to sir Francis's house, on Sunday morning, at seven o'clock, attended by a messenger, and some police-officers, and knocked at the door several times, but it was not opened. The serjeant and messenger, by turns, waited in the neighbourhood of sir Francis's house, for the rest of the day and the night, thinking that he might come out again, as he had once done on Saturday, and that they might have an opportunity of apprehending him. It had become evident, from the number of

the populace assembled in Piccadilly, that the warrant could not be executed without force. And the Speaker, having great doubts as to the power he was possessed of by his warrant, sent a copy of it to the attorney-general for his opinion, and on that opinion he acted. Late on Sunday evening, the serjeant went to the secretary of state's office to request civil and military assistance for carrying his purpose into effect. And on Monday, April the 9th, at ten o'clock in the forenoon, he went to sir Francis's house, attended by twenty or thirty police-officers, and a detachment of cavalry and infantry, to escort the carriage which he had in waiting to convey sir Francis to the Tower. The serjeant, attended by some police-officers, forced an entrance into sir Francis Burdett's house down by the area, and through the kitchen-door. Having left a party of the foot-guards in the hall, he went up, with the police-officers, into a room, where sir Francis was with his family, and Mr. Roger O'Connor, brother to the noted Arthur O'Connor. Sir Francis was employed, at that moment, in making his son read and translate Magna Charta.

Mr. Colman told sir Francis, that, however painful it was to him to proceed in such a way, he had such a force, that it would be quite in vain to make resistance; that he was his prisoner, and must immediately come into the carriage that was prepared for him. Sir Francis repeated the objections he had before made against the warrant, and declared that he would not yield to any thing less than actual force. As the constables were advancing, by order of the serjeant, to seize him, his brother and Mr. O'Connor laid hold each of them on one of his arms, and conducted him to the carriage, into which they followed him; but Mr. O'Connor was obliged, by a number of people who had quickly assembled, to come out again. A messenger was left with sir Francis in the carriage, and the serjeant attended on horseback. The escort proceeded rapidly to the Tower, by the northern skirts of the town, without encountering any opposition.

The mob, that had assembled near sir Francis's house, in Piccadilly, and in the adjoining streets, on Friday evening, obliged every one that passed to take off his hat and cry, "Burdett for ever!" They broke the windows of a number of houses; among which were those of lord Chatham, the duke of Montrose, Mr. Yorke, lord Westmoreland, Mr. Wellesley Pole, lord Dartmouth, sir John Anstruther, and Mr. Perceval. On Saturday, between twelve and one o'clock, the populace assembled in such great numbers, and grew so tumultuous, that a company of the foot and another of the horse guards were sent to disperse them; and the riot-act was read by Mr. Read, a police-magistrate. Some companies of volunteers also presented themselves, in readiness to support the civil authority. Towards the close of the day, the mob, which had dispersed, began to rally. The detachment of troops was reinforced; and the cavalry had orders not to permit more than two persons to converse together. There was some firing, without ball, for clearing Piccadilly. Some pistols, charged with ball, were fired on both sides, by which divers persons, both of the soldiery and populace, were wounded, though only slightly. But, on the return of the escort from the Tower, the contest was more sanguinary.

At the time when the serjeant at arms carried off sir Francis Burdett from his house, the number of people assembled in Piccadilly was but small. But the report of his seizure spread rapidly. The streets, through which it was supposed he would pass, were crowded with people, who, being informed that he had passed by a different route, proceeded, their numbers still increasing as they advanced to Tower-hill. The moment sir Francis entered the Tower, some pieces of cannon were fired, according to the custom in similar cases. A report was spread that the cannon of the Tower had fired on the people, which was credited by numbers of the credulous multitude. Scarcely had the military, on their return from the

Tower, entered Little Eastcheap, when they were attacked with showers of stones, brick-bats, and other missiles. The troops, for some time, bore the assault with patience; but, finding that the mob grew more and more outrageous and daring, they fired several shots among them, by which two or three lives were lost, and not a few wounded. This kind of warfare was continued till the guards crossed the Thames, by London-bridge, to return through St. George's Fields, and by Westminster-bridge, to their quarters.

The letter which sir Francis Burdett had written, agreeably to what he had said to the serjeant, on Friday evening, to the Speaker, was communicated by him to the house, on Monday, the 9th of April. In this piece, after stating what he conceived to be his duty, both to his constituents and to the king, sir Francis Burdett proceeds as follows: "Your warrant, sir, I believe, you know to be illegal. I know it to be so. To superior force I must submit. But I will not incur the danger of continuing voluntarily to make one of any set of men who shall assume illegally the whole power of the realm; and who have no more right to take myself, or any one of my constituents, by force, than I or they possess, to take any one of those who are now guilty of this usurpation. And I would condescend to accept the meanest office, being more desirous of getting out of my present association, than others may be desirous of getting profitably into it.— Since you have begun this correspondence with me, I must beg you to read this, my answer, to those under whose orders you have commenced it. I remain, sir, &c. &c."

The Speaker, having read the letter, stated, that the next thing the house had to dispose of was, whether it should be ordered to lie on the table? The debate, on that question, on the suggestion of C. W. Wynne, was adjourned until the next day, April the 10th; on which day Mr. Curwen, thinking that the course most becoming the dignity of the house would be to take no farther notice of that letter, moved, "that the further consideration of it be adjourned to that day six months." The Chancellor of the Exchequer said, that the punishment he had before proposed was for a defiance of the authority of that house. The present letter was but a continuation of the same defiance, and a proof of the same offence. It was, however, a great aggravation to repeat it. He therefore proposed the following resolution: "That the letter which sir Francis Burdett had written to the Speaker was a high aggravation of his offence; but it appearing, from the report of the serjeant, that the warrant for his commitment to the Tower had been executed, this house did not think it necessary to proceed any farther on the said letter."

A long conversation ensued, in which the impropriety of sir Francis Burdett's letter to the Speaker was urged by most of the members, though his conduct was animadverted on with much less severity by some than by others. Sir Samuel Romilly contended that there was no original offence; and that, therefore, the letter could not, properly speaking, be called an *aggravation*.

Capt. Parker, in a tone of great indignation, could not help expressing his wish that the house would at once expel sir Francis Burdett. The objection seemed to be, that sir Francis would be returned again; but he was satisfied, that, when once the electors of Westminster knew all the particulars of his late conduct, they would never return him to represent them again.

Mr. Whitbread could not consent to the word *aggravation* in the original motion; and proposed *flagrant*, as a parliamentary word, and, at the same time, sufficiently strong. The Chancellor of the Exchequer, being extremely desirous of unanimity on the present occasion, wished to adopt this suggestion. In order, however, that it might not appear on the journals that the original words, relative to aggravation, had been left out; he requested he might be allowed to propose the words suggested by the honourable gentleman as a part of the original motion. Mr. Whitbread consented. It appearing

to be the general sentiment of the house, that neither the letter, nor the amendments moved, should appear on the journals, the Speaker said he would give directions accordingly. And the question was put as an original motion; "That it is the opinion of this house, that the said letter is a high and flagrant breach of the privileges of the house: but it appearing, from the report of the serjeant at arms, attending this house, that the warrant of the Speaker, for the commitment of sir Francis Burdett to the Tower, has been executed, this house will not, at this time, proceed further on the said letter." Agreed *nem. con.*

Sir Francis, it may be presumed, was abundantly consoled under his imprisonment in the Tower, by the addresses he received, from different parts of the kingdom, and the petitions that were sent to the house of commons for his liberation. The first place that petitioned, as might be expected, was Westminster. On the 17th of April, lord Cochrane presented a petition from a meeting at Westminster, held that day in Palace-yard. It was entitled a *Petition and Remonstrance*. The house was not petitioned, but called upon, to restore to the inhabitants of Westminster their beloved representative, and to take into their consideration a reform in parliament. It contrasted the refusal of the house to inquire into the conduct of lord Castlereagh and Mr. Perceval, when distinctly charged with the sale of a seat in that house, with the committal of sir Francis Burdett to prison, enforced by military power. The petition being read, lord Cochrane moved, that it should lie on the table. This motion was opposed by several members, on account of the great indecency of the language. The Chancellor of the Exchequer entered fully into the feelings of these gentlemen; yet, in a case of petition, he would rather err on the side of indulgence than of severity, if the question could at all admit of a doubt. If the house should think, that the petition was intended merely as a vehicle of abuse, it ought, undoubtedly, to reject it. If not, then the petition ought, in his opinion, to lie on the table; which, after some further consideration, was ordered.

A petition from Middlesex was presented on the 2d of May by Mr. Byng, who moved that it do lie on the table. The Chancellor of the Exchequer appealed to the house whether there was any member who heard that petition read, that did not conceive it to be rather an experiment to try how far the forbearance of the house would go, in the sufferance of language such as it contained; or whether it could have any other object than to insult? A debate ensued; which was continued, by adjournment, on the next day. On a division of the house, there appeared, for receiving the petition 58; against it 139.—A petition from the livery of London for the release, not only of sir Francis Burdett, but of Mr. Jones, after a debate, continued by adjournment from the 8th to the 9th of May, was rejected by 128 against 36.—A second petition from the same party, in which they declared that in their former one they meant nothing disrespectful to the house, was received.—A petition from the borough of Reading, more respectful to the house of commons, for the discharge of John Gale Jones and sir Francis Burdett, was ordered to lie on the table; so also were petitions from Berkshire, Nottingham, Kingston-upon-Hull, Rochester, and the Borough of Southwark. A petition from Sheffield was rejected.

For some days before the prorogation of parliament, when prisoners committed by either house are always liberated, a number of sir Francis Burdett's most zealous partisans, having formed themselves into what they called a committee of his friends, announced, in the newspapers, the ceremonial to be observed on his going out of prison, as if it had not been a matter of course, but a triumph. There was to have been a procession, for numbers and pageantry beyond any thing of the kind recorded in English history, to accompany the champion of liberty from Tower-hill to his house in Piccadilly. The quarters, in which different parties were to assemble, were pointed out; and the order

in which they were to march described with great exactness. Banners were prepared; and soon after break of day the populace was in motion, and the sound of music was heard in every street. At nine in the morning, a multitude, consisting chiefly of the parish of St. Anne's, Soho, which they considered as being, in fact, the headquarters of the Burdettites, proceeded to the Tower, as a guard of honour; and, by ten o'clock, all the places of rendezvous pointed out by the committee were filled with the partisans of sir Francis. Towards the afternoon the whole line of streets from the Tower to Stratton-street, Piccadilly, was thickly planted with people. Every window and elevated station was occupied. In Piccadilly, scaffolds were erected: the sides of all the streets were also nearly lined with waggons, teams, and carts, filled with men, women, and children; and every eye was eagerly turned to the quarter from whence the spectacle, so much desired, was expected to come.

In the mean time, measures of prevention had been taken by the civil magistrates, by a proper disposition of military assembled in and about the metropolis.

The different bodies of men, that were to form the procession, wore blue cockades. This badge was also every-where to be seen among the multitude that lined the streets. Most of the ladies wore the garter-blue ribbon. From many houses were suspended rods with ribbons of the same colour. Numerous bodies of the Westminster electors began to repair to the Tower, about one o'clock, preceded by bands of music, and with blue silk colours flying, on which were inscribed various devices; such as "The Constitution," "Trial by Jury," "Magna Charta," "Burdett for ever." The north and west sides of Tower-hill were immensely crowded with people of every description, which prevented the procession from being arranged in the regular order that was intended; for never had greater pains been taken to order disorder and confusion. About three hundred men on horseback arrived at Tower-hill about two o'clock; among whom was major Cartwright, and colonel Hanger, mounted on a white horse, with a large oak stick in his hand. They all wore blue cockades.

After a long and anxious expectation of the appearance of sir Francis Burdett, a soldier in the Tower called out several times to the populace, through a speaking-trumpet, "He is gone by water." But no one seemed to credit what he said. A little afterwards one of the constables, posted on Tower-hill, assured the people that sir Francis Burdett had really gone by water. It is extremely difficult to banish ardent hope and expectation. The constable was not credited for his assertion, any more than the soldier who had spoken from the Tower. At half past four o'clock, however, three placards were suspended over the gates of the Tower, with the following inscription: "Sir Francis Burdett left the Tower by water at half past three o'clock." This he was enabled to do, though it was within a few minutes only after the prorogation of parliament was pronounced, by means of a sort of telegraphic communication, established between the Parliament-house and the Tower.

The news of sir Francis having gone from the Tower by water, excited not only surprise, but indignation in many. For some time considerable confusion prevailed, and discontent appeared in every countenance. After a short consultation, the Westminster committee resolved to conduct the procession to sir Francis Burdett's house, in Piccadilly; but it was near half an hour before they could communicate their intention to the whole of those who were to form it. The order of procession being fixed, colonel Hanger, followed by major Cartwright, led the van. Immediately at their heels were several gentlemen from the country, on horseback, four abreast; and, after these, a long column of the electors of Westminster on foot, six abreast, and an immense number of carriages, in some of which were several members of the common-council, and many liverymen of London. Next came sir F. Burdett's

phaeton, the horses of which were led by several attendants on each side. A great part of those who had originally intended to take part in the procession, left Tower-hill, St. John's street, and the Minories, when it was ascertained that sir Francis had gone by water; but many others joined it in its progress. The procession was preceded by horsemen with trumpets, and a long line of people on foot, with blue sashes and ribbons, decorated with appropriate mottoes and emblems.

As it was apprehended by the government, that Jones, alleging a right to a trial, would not quit his quarters in Newgate peaceably, it was determined to effect his ejection by a stratagem. As soon as notice was given to Mr. Newman, keeper of Newgate, of the prorogation of parliament, one of the turnkeys informed him that a gentleman wished to speak with him at the door. Mr. Jones immediately descended from his apartment; but, seeing nobody in the lobby, the turnkey said, "He is on the outside of the door, where you may speak to him if you please." Mr. Jones had no sooner got through, than the wicket was barred against him; and all his entreaties for re-admission were in vain. He therefore harangued the mob out of a hackney-coach window, on the grievance of being (like St. Paul, Acts xvi. 37.) illegally imprisoned, and then *thrust out privily*. Not being much listened to, he hastened to join the procession, where, as soon as he was recognised, his coach was drawn by the populace, preceded and followed by an immense line of hats with blue ribbons, as deep as the passage through the streets would permit, and surmounted by a number of persons wearing the same livery. When he arrived at Piccadilly, he mounted the roof of his hackney-coach, and harangued the populace again; but, such was the confusion and noise, that not a word was heard of what he said.

The grand procession, as it was called, reached Piccadilly about eight o'clock in the evening. By the efforts of the sheriffs and constables, that street was nearly cleared by ten. But parties going off, in various directions, exclaimed, "Lights up!" The summons was instantly obeyed; and the town in a short time displayed a general illumination.

In consequence of sir Francis Burdett's conduct that day, two members of the Westminster committee waited on him at Wimbledon. Sir Francis said, that his conduct had been the result of the deepest reflection. Their enemies, he said, had been base enough to charge him with the blood that had been shed on the day of his commitment; and had he, by gratifying his personal vanity, been the cause of a single accident, he should have reflected on it with pain for the remainder of his life.

Sir Francis, previous to his liberation, had entered an action at law against the Speaker of the house of commons, for issuing the warrant for his arrest and imprisonment; one against the serjeant at arms, generally for executing the warrant, and particularly for breaking open the doors of his house in the execution of it; and another against earl Moira, as the person who kept him in custody in the Tower. The house of commons ordered the attorney-general to defend them. The plea of defence was, that the warrant, being issued by the authority of that house, was a legal warrant, and therefore rendered the arrest and imprisonment legal. This plea was admitted: the privileges of parliament were allowed by the judges of the king's bench not to be cognizable in a court of law, but to be a part of the law of the land.

The peninsula presented during this year a very doubtful aspect with regard to its emancipation from French servitude.—The great battle of Ocana, fought on the 19th of November of the preceding year, and in which the Spaniards had nearly lost an army of 50,000 men, had given new hopes to Napoleon; and he hastened to plant his eagles on the ramparts of Cadiz and the towers of Lisbon. The city and province of Grenada were obliged to yield; and Seville surrendered without the least resistance. Not so Cadiz. Marshal Soult sent, February the 10th, a sum-

mons to the duke of Albuquerque to surrender that place, at the same time inviting him to a conference for settling the terms. The duke replied, that the Spaniards, faithful to Ferdinand, assisted by the English, would not lay down their arms till they should have recovered their just rights; and that they were not to be intimidated by the irruption of the French, who were masters only of the ground they had overrun and now occupied. In return for the interest which marshal Soult took in the fortune of the Spaniards inhabiting the Isle of Leon and the fortrefs of Cadiz, the duke of Albuquerque counselled him to renounce the idea of sacrificing his troops to no purpose; and knowing, as he did, the advantages possessed by his own troops not only in respect of localities, but also in that fraternal concord with which they performed all kinds of service together with the English, their intimate allies. The defenders of Cadiz were Spaniards; but they would be supported by English and Portuguese, and by all those who, penetrated with the justice of their cause, would do themselves honour in contributing to the defence of that fortrefs. The duke concluded by declining the conference to which the marshal had invited him, until by the restoration of Ferdinand VII. to Spain, and the removal of all foreign troops, he should be in a situation to accept what he would do with pleasure, his obliging offer.

On the 16th of February, the junta of Cadiz received a written message from king Joseph, by a flag of truce, in which he graciously expressed his readiness to forgive and forget all their offences; represented the ruinous consequences of war, which must annihilate commerce, and destroy the mass of the inhabitants; and requested that persons might be deputed from Cadiz to treat for the security of the Spanish fleet. This note was addressed to three of the leading members of the junta. The answer of the junta was in the following terms: "The city of Cadiz, faithful to its principles, renounces any other king than Ferdinand VII."

The duke of Albuquerque was some time after removed from the command of the army, and general Blake appointed in his stead; but, until general Blake, who was employed in collecting the wrecks of the army of Arisaga, should arrive in Cadiz, the command of the army was entrusted provisionally to general Castanos.

The cause and manner of the duke's removal, which may well appear a matter of surprize, were as follow:—The duke's little army, on its arrival, after a long and rapid march, in the Isle of Leon, (a place separated from Cadiz by a very narrow isthmus,) was in want of necessaries of all kinds. The only authority at that crisis was a junta of merchants. To this body the duke applied for clothes, arms, ammunition, accoutrements, and pay; and, in a word, for every thing that his troops stood in need of. The junta alleged that it was not in their power to furnish the necessaries demanded. The duke maintained that it was; and declared publicly, that he could not remain at the head of an army in want of every thing with which an army should be provided. The regency, willing to temporize with the junta, appointed the duke of Albuquerque ambassador to the court of London; which was only an honourable exile. It was easy to perceive, that treatment so base and injurious made a deep and painful impression on the feeling mind of that high and heroic spirit. But, animated by the same love of his country which had restrained him from dissolving the municipal junta, which he could have done with a word of his mouth, he smothered his resentment for the space of eight months; when, being no longer under any anxiety for the safety of Cadiz, he conceived it to be due both to his own honour and interest, as well as those of his country, to vindicate his honour and reputation. He set himself to write and publish a manifesto, that might serve as an answer to his enemies. It was dated at London, December 12, 1810. In this the duke declared, that he had attended in person the sittings of the junta of Cadiz as often as possible, to represent the urgent necessity of the troops under his com-

mand. This intercourse was continued till he was convinced by his own observation, as well as what fell in conversation with individual members of that body, that they had not the general interest in contemplation so much as they pretended. From the very commencement of their authority, they strove by all means to acquire the exclusive management of the public revenue. They employed the national funds in commerce, the profits of which were to be appropriated to their own private use; and the most pitiful speculations he had been made acquainted with from the mouths of several of the members. "Who," said the duke, "would believe that the junta of Cadiz could detain in its hands a hundred pieces of cloth, in the hope that, by the management of the public revenue, they should gain, and put in their own pockets, three reals per yard?" This was a fact that the duke knew to be certain.

The junta of Cadiz, on seeing this manifesto, wrote a letter to the duke of Albuquerque, dated the 12th of January, 1811, in which they treated the duke as an impudent calumniator, and an enemy to the public welfare and to his country. Yet the Cortes pronounced sentence in favour of the duke, and transmitted their resolution on the subject, dated Leon, Jan. 14, 1811, to the secretary of the war department, to be communicated to the council of regency. They declared, that the duke of Albuquerque, and the army under his command, had deserved well of their country by their services, and particularly by covering the accessible points of the Isla and of Cadiz. It was therefore the will of the Cortes, that the duke of Albuquerque, who was desirous of continuing his military career, should be called on by the regency to return to Spain to be employed in the army. The council of regency did not delay a moment to send their orders to Albuquerque, to repair immediately to Galicia, to take the chief command of all the north of Spain, in place of general Mahe, who was appointed to a command in Murcia. Had these two dispatches reached the duke of Albuquerque at the same time, it is probable that, from a satisfaction at the conduct of the Cortes, he would have despised the insults offered by the mercantile junta of Cadiz. But this was not the case. He received the letter from the junta first; and that by the twopenny-post, with the seal broken. This made an impression on his mind, which his nomination to the chief command in Galicia, and all the north of Spain, was not sufficient to efface. The insults of the junta rankled, and painfully agitated his soul. Contrary to the advice of his friends, who represented how much he should despise them, he spent three days and three nights in drawing up a reply, almost without taking any nourishment. On the fourth, which was the 15th of February, 1811, he was seized with a phrenzy, which on the 18th terminated in his dissolution. Thus perished, in the 37th year of his age, the great pride and hope, at that crisis, of Spain; the victim of high and just indignation, and of sensibility too lively and exquisite. The remains of this young warrior and patriot were deposited in Henry VII's chapel, Westminster-abbey, until they should be removed to his native country. All the ministers of state, foreign ambassadors, French princes deputed by Louis XVIII. and an immense concourse of persons of the higher ranks, attended his funeral, which was solemnized with a noble and affecting magnificence, and such as we never witnessed before or since that of lord Nelson. His eulogy was worthily pronounced in the house of peers by marquis Wellesley. The assembly of the Cortes poured forth their regrets, together with the praises due to the man who had been the first to quit the Spanish army in Denmark, and fly to the succour of his country; who had always fought the French with glory; who, in the character of a commander in chief, had defeated them in a variety of actions; and, lastly, who had preserved the ground on which they now stood.

The war extended nearly from one side of the peninsula to the other, whilst the siege of Cadiz was going on with

all the exertions the French were capable of. But the operations of the Spaniards and their English allies were not confined to the defence of Cadiz. They acted on the offensive, in rousing, encouraging, and aiding, the natives in a resistance of the invaders. A detachment of 5000 men, under the command of the Spanish general Don Louis Lacey, disembarked at Algeiras, and marched by St. Roche, on the town of Ronda. At this place there was stationed a French force of 6000 men. Being informed of the unexpected arrival of the Spaniards, whose numbers report had greatly exaggerated, and that they were to be attacked by surprise in the night, they suddenly evacuated Ronda, and fled in great disorder, leaving behind them their arms, provisions, and ammunition; the whole of which fell into the hands of the Spaniards. Though the number of the Spanish regulars was exaggerated, the whole of Lacey's troops, regulars and volunteers, in a few days after his landing at Algeiras, is said to have amounted to 12,000. All the arms found at Ronda were distributed among the inhabitants of the mountains. Parties of French were again marched against the insurgents, as the French called them, by general Sebastiani. A murderous warfare was carried on on both sides. The Spaniards were obliged to retreat. The mountaineers were defeated in various actions, but not pacified. All the British officers and men who have had occasion to see any of the Spanish mountaineers, agree in their descriptions of the ferocious and savage appearance and air of the Alpajarese, and other Spanish mountaineers. They every day were bringing prisoners to Gibraltar, with spoils taken from the Frenchmen they had killed, such as horses, helmets, uniforms, &c. The rustics, who were wont to be clothed like the Russian boors, in sheep-skins, were many of them completely accoutred in French uniforms.

On the 22d of August, a combined expedition set sail from the port of Cadiz against Moguer, a town in the province of Seville, on the river Huelva, below its junction with the Tinto, where a French division was posted under the command of the duke of AreMBERG. The land-force consisted chiefly of Spaniards, to the number, it would appear, of from 12 to 1500; but there was also an English division, under the orders of captain George Cockburn. The land-force was commanded by the Spanish general Lacey. Captain Cockburn had charge of the naval part of the expedition. In the evening of the 23d, when the squadron was about four leagues from the entrance of the Huelva, the general intimated to captain Cockburn his desire to disembark on the coast along which they were sailing, by which means the troops could reach Moguer a good deal sooner than by water. About ten o'clock the troops began to disembark; and the whole, with the horses, ammunition, &c. being safely landed between one and two o'clock, the general began his march along the coast. Eleven English flat-bottomed boats advanced for the purpose of transporting the army over a large branch of the Huelva, which intersects the road to Moguer, and comes a great way to the south and west of Moguer, into the country. By the passage of the Huelva, in the boats, the march was not retarded a moment. It arrived at Moguer, twenty-two miles from the point of disembarkation, towards eleven in the forenoon, August 24. The Spaniards, forgetting their fatigues, proceeded immediately to attack the French; who, not expecting such a visit, were driven from the town almost without resistance. They soon rallied, however, and made several attacks on the advanced Spanish line, in order to recover what they had lost. But the Spaniards stood firm, and repelled their onsets with the utmost bravery. Captain Cockburn, in his dispatch to admiral Keates, commanding the naval force at Cadiz, speaks in the highest terms of the alacrity and ardour with which the Spaniards sustained the fatigue of a march of twenty-two miles, after three successive nights passed without repose, and of the firmness and valour they displayed in their engagements with the French. These, he says, had raised his admiration to the highest pitch, and added to his hopes

that such a people must ultimately prevail and triumph in such a cause. Of general Lacey he says, that he showed himself worthy to command such men. The coolness of the general, his ability, and active bravery, qualified him in a singular manner for the kind of service on which he was then employed. The Spaniards were not less liberal in their praises of the English. In the Regency Gazette Extraordinary of Cadiz, Aug. 30, it is said, "The Spanish and English marines contributed in the most distinguished manner to the fortunate success of the enterprise; and our allies, and particularly captain Cockburn, acquired new claims to the gratitude of the Spanish nation."

Some artillery, ammunition, and other articles, being landed from the vessels on the night of the 24th, measures were taken for pursuing the enemy. The next day a division advanced, and took possession of the town of Niebla, about ten miles north-east from Moguer, to the great joy of the inhabitants, and all the country round. But general Lacey, apprised that the French were on their march in great haste towards Seville, having destroyed the magazines and batteries, and spiked the guns of Moguer, re-embarked his troops, and sent them back to Cadiz, where they arrived safely on the 30th of August.

The English flotilla of gun-boats also destroyed the batteries and redoubts of St. Mary's, and some other points, on the Bay of Cadiz.

A secret expedition that set sail from Gibraltar, on the 11th of October, under the command of lord Blaney, against Malaga, produced very different effects from the preceding. The object of the expedition was to take Fort Fangarola, in order to draw the enemy out of Malaga; then to re-embark, set sail for that city, and with the assistance of a reinforcement to be sent without delay from Gibraltar, to destroy the enemy's works at Malaga, and drive away the hords of privateers that took shelter in its harbour. It was calculated that Fort Fangarola would surrender without resistance. The expedition consisted of about 4 or 500 English of the 89th regiment, 500 German deserters enrolled and armed at Gibraltar, a number of artillery-men, and a Spanish regiment sent over from Ceuta. This armament, on the 14th of October, disembarked three leagues west from Fangarola, situate about four from Malaga. The garrison, 160 men, when a division of the troops under lord Blaney were within cannon-shot, fired upon them with a 24-pounder, and some other pieces of smaller calibre. Lord Blaney had trusted that a herald of truce would do the business: he had not at hand either scaling-ladders or battering-cannon: he brought up some pieces from the ships in the night, and planted them on ground from whence they could play with advantage. The fire of the garrison ceased about eleven o'clock A. M. but they sallied out, and stormed the battery. The officers of the English division which remained on the flanks of the height on which the battery was raised, while the rest of the troops were moving to the positions assigned by the general, attacked the assailants, and the battery was cleared. In a very short time a more numerous party of the French appeared in the midst of the cannon; the battery was taken, and the English troops took to flight. The arrival of 1200 men from Malaga, encouraged the French, and struck a panic into the English and Spanish troops. The French from Malaga were disguised in Spanish uniforms; of which stratagem, on their near approach to Fort Fangarola, lord Blaney was apprised by some French deserters; but his lordship firmly believed them still to be Spaniards, and threatened to cut off with his own hand the head of any traitor that should fire on the troops that were come to join them. He persevered in the error of mistaking them for friends till the moment they told him he was their prisoner; which happened nearly at the same instant when the battery was taken a second time. It fortunately happened, that the 32d regiment, which followed the expedition a few days after its departure from Gibraltar, had landed two companies at the moment when the encounter

took place. These two companies took possession of a height commanding that part of the water-side, and supported by the fire of the line-of-battle ship in which they had come, covered the re-embarkation of all such of the 89th regiment as had not taken the route of Marabella, with the fugitive Spaniards. This affair of Fangarola was very disgraceful to the expedition; for the French did not exceed half their number.

The French, to the number of 12,000 men, having early in February made a fruitless attempt on Valencia, from whence they were driven back with considerable loss, proceeded to lay siege to the castle of Hostalrich in Catalonia, the reduction of which was necessary to an attack on the important city of Tarragona. The town of Hostalrich was reduced in the month of January. The castle, situated on a steep and rugged mountain, was not to be taken but by blockade. On the night between the 2d and 3d of May, a bold attempt to throw both provisions and a reinforcement of troops into the castle was frustrated by the vigilance and military skill and valour of the besiegers. On the night of the 12th, the garrison, under the advantage of an exceedingly thick mist, went out of the fort, in profound silence, and the advanced guard fell of course on the French sentinels. One of these was killed, but the other gave the alarm. The French troops were instantly under arms, and pursued the Spaniards with so much celerity, that the whole were either killed or taken. In the fortrefs of Hostalrich were found 42 large pieces of brass ordnance, and a very considerable quantity of ammunition for war, but an extremely-small stock of provisions.

The reduction of Hostalrich facilitated the carriage by land of provisions to Barcelona, and covered the communication between that place and Gerona.—On the 14th of May, general Suchet became master, after fifteen days of open trenches, and three days firing, of Lerida. There he found 100 pieces of cannon of various calibre, 1,500,000 cartridges, 200,000,000lbs. of powder, and 10,000 firelocks. The garrison, eight thousand men, were made prisoners of war.—On the 8th of June, the fortrefs of Mequinenza in Catalonia, situate near the confluence of the Segre and Ebro, in the midst of a desert, and justly called the Key of the Ebro, was taken by the same general. The French found at Mequinenza forty-five pieces of ordnance, four hundred thousand English cartridges, fifty thousand pounds of powder, a great quantity of cast-iron, and provisions for two thousand men for three months.

Agreeably to the orders received from Paris, the corps of Suchet, after the reduction of Lerida and Mequinenza, began to move towards Tortosa. From Mequinenza and Caspe, (a town of Arragon, situate at the conflux of the Ebro and Guadaloupe,) all the way to Tortosa, a road for carriages was cut, waving to the length of thirty leagues, through mountains scarcely passable for mules or travellers on foot. The park of artillery was moved down partly by water-carriage, and partly by land, as far as Xerta, which was within two leagues of Tortosa. While the French were employed in their preparations, or what, in the language of the French general who commanded, is called "all the preliminary labours of the siege," the garrison of Tortosa did not fail, in the months of July and August, to make repeatedly the boldest and most vigorous sallies. On the 3d of August they made a general sally: it advanced on all points at the same time, even under the enemy's entrenchments. The French advanced posts were not able to sustain their shock; but, the choice troops being brought into action, the Spaniards were driven back into the fortrefs with the loss of some hundreds of their men killed, and about as many prisoners. In this bold enterprise, count d'Abras, the governor of Tortosa, was dangerously wounded.—On the 22d, general Frère's division of the army of Catalonia arrived to join the besieging army: he was stationed on the Ebro, at the distance of one league below Tortosa, to have an eye on the route towards Tarragona and the sea-coast.—On the

29th, by break of day, 45 pieces of cannon, from ten batteries raised on both sides of the river Ebro, commenced a fire, which in the space of two hours silenced all that was opposed to them; on the same day the bridge was cut, and the day afterwards entirely broken down. In the night between the 29th and 30th, the Spaniards evacuated the tête de pont, which was taken possession of by the French. On the 30th there was no firing but from the castle, and on the 31st none at all. The parapets were destroyed; the embrasures were unfit for receiving cannon; two breaches had begun to be made in the wall; parties had descended and passed the ditch; and the miners commenced their subterraneous operations. In these circumstances, in the morning of the 1st of January, 1811, a flag of truce was seen on the summit of the castle. Two officers came to the French general with a letter from the governor, authorizing them to propose terms of peace. They offered to quit Tortosa immediately, on the condition of being sent to Tarragona; or to surrender on conditions within fifteen days, if the place should not be relieved. These proposals were rejected in the most peremptory manner. A fire of shells from mortars and obuses was re-opened on both the town and castle. The miners resumed their labours. On the morning of the 2d, a new battery, constructed with extraordinary quickness in the covert-way on the counterscarp of the ditch, played at the distance of fifteen fathoms from the wall, and effected a breach, which was enlarged every hour. Three white flags waved on the ramparts at the same time; but the firing was every-where continued; and in two hours every thing was ready for the assault. Heralds of peace presented themselves anew; and at length the garrison, reduced from 9 to 8000 men, laid down their standards and arms, deified as prisoners of war, and under a suitable escort were led as prisoners of war to Saragossa. Among the standards was one presented by the king of Great Britain, whom Suchet calls "le roi Georges," to the city of Tortosa. The French were put into possession of 177 pieces of ordnance, 9000 firelocks, and a great quantity of bullets, shells, and gunpowder.

A small body of French, three or four thousand, towards the end of December, 1809, entered the capital of Leon, from whence, on their approach, the Spaniards retreated. A corps, which was the 8th, under general Junot, laid siege to Astorga, and held other places in subjection, by a proper distribution of garrisons. A strong division under general Bonnet took possession of Oviedo the capital, extended itself over the whole province of Asturias, and threatened again to penetrate into Galicia. Astorga was taken, after a short siege, on the 12th of April. Three thousand five hundred Spaniards, with English firelocks, and wearing English clothes, laid down their arms, and were conducted to Barneza, whence they were sent to France. But the whole of the prisoners taken during the siege of Astorga, according to the dispatch of Junot to Berthier, amounted to about 5000. The number of the Spaniards killed at the siege was 1500, and 500 wounded were left in the hospitals. The French found at Astorga twenty pieces of cannon and two mortars. The loss of the French, as stated by Junot, in all the different encounters with the enemy, both in Astorga and the territory around it, was only about 160 killed and 400 wounded. The Spaniards stated, probably with equal exaggeration, that the loss of the French in killed and wounded was not less than 4000. After the fall of Astorga, the 8th corps joined that of marshal Ney, duke of Echlingen, before Ciudad Rodrigo. In the mean time, field-marshal Massena, prince of Essling, was on his way from Paris to take the command of the army appointed for the conquest of Portugal, to consist of the 2d, 6th, and 8th, corps, forming all together a force of about 80,000 men.

The siege of Ciudad Rodrigo was obstructed and retarded by heavy rains, bad roads, the difficult conveyance of stores and provisions, and lastly the near vicinity of the allied army of English and Portuguese, un-

der the command of lord Wellington. The trenches were at length opened on the night between the 15th and 16th of June, by which time Mailena had arrived in the French camp to take the command of the army. The town was completely invested by a body of troops under the orders of Ney on the right bank of the Agueda, and by another under Junot on the left. In the morning of the 25th of June, a fire was opened on Ciudad Rodrigo from 46 pieces of battering cannon, which soon obtained an advantage over that of the garrison. But the Spaniards, who had a very numerous artillery, brought different pieces into play, and poured a shower of shells and bullets on the assailants; who, in order to cover their advances, found it necessary to attack two convents, which were taken and retaken several times, and not kept by the French at last until they were partly burnt. Possession was then obtained of the suburb St. Francis, after an obstinate resistance, and several forties. On the 28th, great damage having been done to the walls, the governor, Don Andrew Herrasty, was summoned to surrender; but he refused to capitulate: both the garrison and inhabitants, roused by the monks to a high pitch of religious enthusiasm, appeared determined to stand out to the last extremity. The firing was then re-commenced with increased fury: batteries were erected nearer the walls, in both of which a practicable breach, from fifteen to eighteen fathoms in width, was made on the 9th of July; in the night of which the explosion of a mine threw the counterscarp into the ditch. This breach being discovered about four o'clock P. M. of the 10th, it was instantly mounted, amidst the cries of *Vive l'Empereur*, by three gallant soldiers, who poured the contents of their firelocks among the garrison; whose fire, which had become feeble for some hours, now entirely ceased. The besiegers were marching in columns to the assault, when the white flag appeared. The garrison surrendered at discretion. The French were struck with the appearance of subversion and ruin wherever they turned their eyes. Scarcely was a house to be seen entire, or without some trace of the furious siege it had undergone. Of the troops and inhabitants, 2000 were killed. The garrison, to the number of 7000, deposited their arms in the arsenal. There was found at Ciudad Rodrigo 125 pieces of ordnance, mostly bronze; 200,000 weight of powder; and more than a million of cartouches for infantry.

The next operation in the progress of the French army of Portugal was the siege of Almeida. But a considerable time was spent in repairing and strengthening the defences of Ciudad Rodrigo, in waiting for the return of the troops that escorted the Spanish prisoners to Bayonne, and the arrival of some other reinforcements. The fortrefs of Almeida, deemed by general Dumourier the strongest in Portugal, stands on the top of a high mountain, or rather a lofty mountainous plain; 113 miles north-east from Lisbon. This elevated plain is divided by a very deep valley, or rather an immense glen, containing in its sinuosities, the rapid river Coa, which, rushing down amidst rifted rocks of granite, after being joined by three small rivers, falls into the Ebro. The Coa runs at the distance of a mile from the town of Almeida. It had six royal bastions of stone, and as many ravelins, with a good ditch and covered way. Nearly in the centre of the town, on a lofty mound, stood the castle and magazines, which were bomb-proof. Within its walls were wells, and at a small distance a fine spring of water. The population of Almeida did not exceed 2500. The fortrefs was garrisoned by 5000 men, partly English, partly Portuguese; but the whole commanded by British officers. The governor was brigadier-general Cox. On the 26th, eleven batteries, mounted with 65 pieces of cannon, opened a fire on the fortrefs, which was returned by the garrison with great vigour. Towards eight o'clock, a bomb fell within the walls of the castle on a caisson which they were filling with gunpowder at the door of the principal magazine; the flame was communicated to a hundred and fifty thou-

sand weight of powder: the explosion was like the eruption of a volcano. It was supposed by the besiegers that the whole of the place had been blown up. A great quantity of the wrecks fell into the French trenches. By this accident 900 persons were killed, and 400 wounded; of about 400 artillery-men, not one escaped. The conflagration spread, and was continued for the whole night. Next day, marshal Massena went himself to the trenches, and viewed the ravages of the terrible explosion. The castle, the cathedral, and all the neighbouring houses, had disappeared. Even before this explosion, the fire of the fortrefs had been silenced. The marshal sent a flag of truce, offering capitulation; and also a note to the governor, in which he observed to him, that Almeida was in flames, that the whole of his heavy artillery was now mounted on batteries, and that it was impossible that the English army should come to his relief. After several hours employed in negociation, the governor, whose object had been, as Massena thought, to gain time, refused to accede to the terms. The French therefore re-commenced their fire at eight o'clock in the evening; three hours after, governor Cox signed the capitulation proposed by Massena. The garrison were to have the honours of war, that is, to march out with their arms, and lay them down on the glacis; the militia to return to their homes, and not to serve during the present war, either against France or her allies. Ninety-eight pieces of heavy artillery and seven field-pieces fell into the hands of the French, with 300,000 rations of biscuit, 100,000 rations of salt fish, and a great quantity of other provisions. Of the Portuguese militia, 1200, instead of returning home, entered voluntarily into the service of France.

It is now time to return to lord Wellington, commander-in-chief of the British army, whom (p. 192.) we left at Badajoz, after his retreat from Talavera. The events of the war in Old Castile rendered it necessary for him to retreat from Badajoz, in December 1809, to the north of the Tagus. In February 1810, the English army, augmented by Portuguese troops disciplined by general Beresford, were quartered on an extended line, comprehending Oporto, Lamego, Vizeu, Coimbra, Abrantes, and Santarem. It is unnecessary to follow the Anglo-Portuguese army in all their changes of position during the retreat towards Lisbon. Lord Wellington had formed a plan of defensive operations as profound as any we read of in history. While he was employed in making demonstrations on the frontier of Spain, immense fortifications were rising in a line from the sea to the Tagus, at a short distance from Lisbon. To these, which were almost impregnable, it was his plan to retreat, where he would be near his resources, and receive reinforcements. After the surrender of Almeida, he began to retreat slowly and in good order, and to concentrate the different corps of his army, which had been separated for the purpose of watching and guarding various points that were menaced by the French army of Portugal. The troops with which he made head against Massena, at the commencement of the campaign, did not exceed the number of 25,000.

These movements were preceded by a proclamation issued by lord Wellington on the 4th of August. Having briefly stated the sufferings of such villages on the frontier of Portugal as, confiding in the promises of the French, had remained at their homes, and submitted to their authority; sufferings greater than any calamities that could have been inflicted by a cruel enemy; he told them, that there was no safety for them, but in a fixed and determined resolution to impede as much as possible the advance of the enemy into the interior of the country, by removing all that could be of use to the enemy or facilitate his progress. The army under his command would protect as great a portion of the country as possible; but the people alone could preserve their property by placing it beyond the grasp of the enemy. The duty he owed to the prince regent of Portugal and the Portuguese nation, constrained him to make use of the power and authority

with which he was vested, for the purpose of compelling such persons as might appear to be careless and remiss, to make the necessary exertions for saving themselves from danger, and their country from ruin. For this reason, all magistrates and persons holding offices under government, that should remain in towns and villages after receiving orders from any military officer to depart; and all persons, of whatever class, who should hold any communication, or in any manner assist the enemy; were to be considered as traitors to their country, and judged and punished as such an enormous crime deserved.

While the British army was on its retreat by Ponte Murcella, the whole of the French forces were drawn together in the neighbourhood of Pen-hell, to the number of about 80,000, in pursuit of it. Lord Wellington had advanced in his retreat two leagues beyond Coimbra; and was accompanied by the whole population of the country, who destroyed as much as they could of the property they could not carry with them.

After the fall of Almeida, the plan of Massena began to be unfolded. It was to turn lord Wellington's left. Lord Wellington, to avoid this danger, retreated through the valley of the Mondego, and called the generals Hill and Leith to join him at the strong position of Ponte Murcella, on the Alva, where he was determined to make a stand, and dispute the passage of the bridge. But Massena, having perceived this, suddenly altered his plan, repassed the Mondego, and threw himself on the road which leads from Vizeu to Coimbra, to get possession of the resources presented by that city and the territory adjacent, and to proceed from thence in his march to Lisbon. Lord Wellington, penetrating the design of this new movement of Massena, immediately determined to cover Coimbra, not with the intention of maintaining this open town as a permanent station, but that the inhabitants might have time to retire with their effects. Lord Wellington therefore, with equal judgment and rapidity, repassed the Mondego, and threw himself between Massena and Coimbra.

Marshal Massena, on the 18th of September, arrived at Vizeu. "Through ways," says the marshal, "bristling with rocks, we traversed deserts. Not a soul to be seen: every thing removed, destroyed, or abandoned. The English had the barbarity to order all who should remain at their homes to be shot. Old men, women, and children—every one fleeing before us." At Vizeu, all the forces of Massena were concentrated on the 21st. Here they were obliged to halt for three days, in order to give time for bringing up the baggage and park of artillery. It was this halt that gave time to lord Wellington to execute the judicious and brilliant manœuvre of passing from the left to the right of the Mondego. He posted the central division and the left wing of his army on the Sierra de Buzaco, which was perpendicular to the course of the Mondego, and covered Coimbra, leaving at Ponte Murcella only the corps under general Hill. Massena left that place on the 24th; and on the 26th arrived in front of the position of Buzaco, occupied, with the exception just mentioned, by the allied English and Portuguese armies.

The Sierra de Buzaco is a high ridge, extending from the Mondego in a northerly direction. At the highest point of the ridge, about two miles from its termination, is the convent and garden of Buzaco. The Sierra de Buzaco is connected by a mountainous tract of country with the Sierra de Caramula; and nearly in a line with the Sierra de Buzaco is another ridge of the same description, called the Sierra de Murcella. All the roads to Coimbra from the eastward lead over one or other of these sierras. They are very difficult for the passage of an army, the approach to the top of each of the ridges, on both sides, being mountainous.

Marshal Massena, who was ignorant perhaps of the strength of the allies, and probably did not expect to find them here, made a bold attempt to carry their position. Of the battle of Buzaco, fought on the 27th of September, we have two accounts; one by Massena, and one by lord

Wellington, but both agreeing in the main points, that the French made simultaneous attempts to drive the allies from the mountains, in two different quarters; that in these attempts the French displayed both daring and persevering courage, but that they were repulsed by the allies with great slaughter. During the attack on the Sierra de Buzaco, although nearly the whole of the French army, consisting of the corps of Ney, Junot, and Regnier, amounting to the number of 70 or 80,000, were under arms, from 20 to 25,000 only were engaged in the action; and of the allied army, from 50 to 60,000 strong, as small a proportion. The line of the allied army was eight miles in extent. The fourth battalion of Portuguese caçadores attacked a superior body of French with the bayonet, without firing a single shot. A high compliment was paid to the gallantry of the Portuguese by the enemy, who affirmed in his public statements, that lord Wellington had practised the device of dressing British soldiers in Portuguese uniforms. The loss of the French in killed and wounded is stated by Massena to have been 3000, including a very great number of officers, many of them severely, and some, among whom was general Simon, dangerously. General Grandorge died of his wounds.

While the French, having turned the English position at Buzaco, were on their march by a roundabout way to Coimbra, lord Wellington, by a more direct road, got there before them; which he did on the 30th of September. But, as Coimbra was not a position in which the superior force of the enemy could be opposed with advantage, he sent his advanced guard to the left bank of the Mondego on that day, and continued his retreat in the best order the next day by Pombal, Leyria, and Alcobaca, to his strongly-fortified positions near Torres Vedras, where he arrived on the 9th of October. The stay of the allies at Coimbra was short; but there was time for destroying the magazines there. Those, however, at Figueras, at the mouth of the Mondego, which were of greater value, fell into the hands of the enemy. When lord Wellington moved rapidly to the left of the Mondego, he left some corps of cavalry on the right bank, to give more leisure for evacuating Coimbra. The inhabitants of Coimbra, and of all the other places through which the allied army passed, accompanied them in their retreat, carrying along with them their most precious effects. The inhabitants of Coimbra, after removing every thing they could carry off, requested our soldiers to take whatever they could carry, and immediately after threw the provisions that remained into the Mondego. The same thing was done at Figueras. The picture drawn by Massena of this miserable desolation, is not overcharged: "The enemy burns and destroys every thing as he evacuates the country. He forces the inhabitants to abandon their homes on pain of death. Coimbra, a town of 20,000 inhabitants, is deserted. We find no provisions. The army is subsisted on India corn, and vegetables which we find remaining on the ground." Every soul in Coimbra fled, leaving it literally a desert; for the order of the regency was positive for all to leave their houses, carry off all their goods, or destroy them, and leave nothing for the enemy. The road to Lisbon was blocked up with waggons, carts, mules, horses, and bullocks; mothers, their eyes streaming with tears, carrying their screaming infants; young women of genteel condition, also in tears, on foot, and separated in the crowd from their families; men with heavy hearts, but in silent sorrow, and every thing wearing an air of trouble and confusion. All the roads from St. Thomar and the other neighbouring towns, to Lisbon, were in like manner full of men, women, and children, with what effects they could bring along with them.

Neither the government of Portugal nor the private families of Lisbon remained untouched at the sight of such distress; distress incurred in the common cause of the Portuguese nation. The inhabitants of Lisbon, particularly those of the higher ranks, received the emigrants

from

from the provinces with open arms, and contributed in every possible way to their relief. People of all ranks and characters were united in a common sympathy. Persons but little suspected of possessing tender or generous feelings showed both compassion and bounty on the present melancholy occasion. A very powerful sympathy with the suffering Portuguese, was also expressed by the British legislature and nation. The house of commons (April 8, 1811.) voted for their relief 100,000*l.* and a sum, at least equal to this, was raised by voluntary subscription. This money was very judiciously employed in the purchase of such things in this country as the Portuguese were in most immediate want of.

The French army entered Coimbra on the 1st of October, 1810, the day on which the main body of the allies left it. A show of resistance was made by the British cavalry, that had been left for aiding the retreat of the inhabitants. Massena, on the 2d, sent forward his advanced guard to Condeixa, from which the allies retreated. He did not find the supplies he expected at Coimbra. Provisions of every kind had been carried away or destroyed. His sick and wounded he left in two entrenched convents at Coimbra, with a guard of only 3500 men. He could not spare a greater number. "The best guard," he said, "was to beat the English, and drive them to their ships." Not doubting, indeed, but the English were in full flight to their ships at Lisbon already; though he had no magazines, and though 20,000 Portuguese militia were in his rear; he set out from Coimbra with the whole of his forces, and followed as hard as possible on the heels of the allies, between whose rear-guard and the French cavalry there was daily skirmishing. It was not till the 14th of October, when he reconnoitred the English fortifications in person, that he discovered his mistake, and the dangerous predicament into which he had been led by the military genius of lord Wellington.

The grand position of the allied army was a line of strongly-fortified heights, extending from Alhandra, on the Tagus, to Torres Vedras, about thirty miles from Lisbon, and from thence to the mouth of the Sissandro. And behind these, two other lines of trenches and redoubts, extending from Ericeyra and Mafra, on the sea, to the Tagus. One of these, which was next to the fortified line of Torres Vedras, might be defended by 20,000 men; the other, which was nearer Lisbon, by half that number. On these was planted an immense power of heavy artillery. But, besides this triple line, redoubts were raised at Penniche, Obidos, and other places. Many of the hills were fortified. On the left of the position, the whole of the coast, from Vimeira to the mouth of the Tagus, was studded with redoubts, mounted with heavy artillery. On the right, the banks of the Tagus were flanked by our armed boats. Mines also, ready to spring, were formed in various places. In short, the whole country, from Lisbon almost to the Mondego, appeared like one fortification in the form of a crescent. Within the lines of Torres Vedras, Ericeyra, and Mafra, defended by from 70 to 80,000 fighting men, the allies had collected all the produce of the country through which they had retreated. With Lisbon in their rear, they were abundantly supplied with every thing they wanted.

Massena, having reconnoitred the positions of the allies, confined his operations to the fortification of his own, the taking of Montejunto, and the collection of cattle, grain, and raisins, for the subsistence of his army. None of his movements, or changes of positions or detachments, had any other than this last object. This work alone was sufficiently arduous. His quarters, which were limited on one side by the Tagus, were straitened more and more on the north-west by the Portuguese militia. Colonel Trant, throwing himself into the rear of Massena, entered Coimbra on the 7th of October, and made 5000 prisoners, chiefly sick, and the wounded in the battle of Buzaco. On the day following, brigadier-general Wilson arrived there with his detachment: they had taken about 350 waggon-drivers

that had been left behind the French army at Coimbra for collecting provisions. General Wilson, with a detachment of infantry and cavalry, proceeded southward by Condeixa, and occupied the road between Coimbra and Leyria. The Portuguese garrisons of Penniche and Obidos, and the British cavalry, carried on an incessant and destructive warfare on the rear and the right of the French. The detachments sent out to hunt about for provisions, were so closely watched by the Portuguese militia and the British cavalry on the side of Obidos and Ramalhal, that Massena could not be said to be in possession of any other territory in the whole country than that on which his army was posted. Not less than 6000 men were constantly employed in conducting, not waggons, but small carts, carrying ammunition, provisions, and officers' baggage, to the French. At first they found wheat and millet; the wheat they separated from the husk and boiled; the millet they roasted. But this supply of grain was soon exhausted, or, at least, became so scarce, that none of the common soldiers had any of it; they lived on horned cattle, dried grapes, and other fruit. Flesh, for want of any thing farinaceous, they ate immoderately; and, what was a very distressing privation, they had no salt. Few cattle remained at the end of October; inasmuch that the soldiers began in November to eat the flesh of horses and mules. They were not only in extreme distress for want of provisions; they were in great want of shoes; many of them were barefooted. The following placard was stuck up in a conspicuous place by a French soldier: "A French soldier should have the heart of a lion, the stomach of a mouse, and the humanity of a brute."

The longer the French general lay inactive in the front of the British lines, the more his difficulties increased. The heavy rains falling at that season of the year, rendered it impossible for him to bring up his heavy artillery. From the same cause the Mondego had overflowed its banks. He was hemmed in on every side. To attack the allies, posted as they were, would have been madness; to retreat northwards, extremely hazardous, if not altogether impossible. The hardships and sufferings of the army, for want of provisions, have already been described. In these circumstances he had only a choice of difficulties. To endeavour, by enlarging his quarters, to maintain himself on the right bank of the Tagus, until he should receive a reinforcement of men, together with a supply of stores and provisions, or to make a desperate attempt to cross the Tagus, and support himself in the Alentejo; which, however, he could not have done for any great length of time, as that province is but a poor country. He made a show, however, for occupying the attention of the allies by the construction of boats, pontoons, and flying bridges, of intending this; while, at the same time, he moved farther up the river, exchanged Alentquer for Santarem, which he strengthened by adding art to the advantages which it enjoyed by nature, and even by laying its environs under water. The French position formed a triangle, of which Santarem and the Tagus were the base; the Zezere one of the legs, and a chain of mountains the other. Bridges were thrown across the Zezere, and a body of troops was stationed at Pnnhete, which was fortified. In November and December, the cavalry, 9 or 10,000, were dispersed in cantonments along the right of the Tagus, so far as the borders of Upper Beira. Redoubts were constructed at different points on the same side of the river. Thus the circle Massena had to depend on for subsistence was somewhat widened, and he looked forward to the reinforcements and supplies which he expected from Drouet and Gordanne on the one hand, and from Mortier on the other. Drouet's corps, 12,000 strong, with a large convoy, arrived early in December; and, some weeks after, that under Gordanne, nearly equal in number. Towards the end of that month, detachments from the army of Mortier, and that of Soult, to the number of 12 or 14,000, having quitted Andalusia, were on their march on the left of the Tagus, through Estremadura.

There was now some appearance that seemed to menace a turn of fortune in favour of the French. But lord Wellington was firm in adhering to his plan, nor ever for a moment doubted of ultimate success. He considered that, if the reinforcements sent, or yet to be sent, should be unable to protect his convoys against the attacks of those numerous bodies of troops that harassed him in flank and rear, and to cover the formation of magazines, they would aggravate the distress arising from the want of necessaries, instead of alleviating it. The ardour and activity of lord Wellington were suitable to the importance of the crisis: he was very sparing in his diet, and slept in his clothes; he was up every morning at four o'clock, and at five he rode out and visited his advanced posts. The enthusiasm with which he was actuated was infused by sympathy. The whole country was under arms. Every thing at Lisbon was military. The city was garrisoned by marines from the English fleet. The garrison of Lisbon was sent to reinforce the army, which was also augmented by the arrival of 10 or 12,000 men, under the marquis of Romana. The greater part of the British troops had arrived from Cadiz, and other regiments were arriving from time to time from the Mediterranean, Lisbon, and Gibraltar. The seamen and marines were also landed from the fleet, to assist in working the guns in the batteries. The banks of the Tagus on the right were flanked by our armed boats, and seven sloops were sent up the river. Great fortifications were raised on the south of the Tagus, to cover the river and protect the shipping. The peninsula, formed by a creek or small bay at Moita, near Aldea Gallega, on the Tagus, and the bay of St. Ubes, at Settuval, was cut off from the French by a double line of fortifications, mounted with heavy artillery, and manned, partly, by a body of 3000 seamen; so that the enemy could not advance to Almeida opposite to Lisbon; which it was apprehended might be his intention. The corps of general Hill and general Beresford were posted on the south bank of the river; while, in front of the grand line of Torres Vedras, lord Wellington lay with the main body of the British army at Cartaxo. The British fleet lay between; and, on whichever side an attack might be made, was ready to bring over reinforcements from the other. The number of troops that could be brought into action, within not many hours, has been variously stated. They seem, as we have been able to judge, in point of numbers, to have been pretty nearly equal; that is, on each side from 80 to 90,000. What advantage of numbers there was, probably lay on the side of the allies. Such nearly were the relative positions and force of the French and the allied army of Portugal at the close of 1810.

After the sad reverses of fortune suffered by the Spaniards towards the close of 1809, when they were convinced, by multiplied experience, that their armies were altogether unfit to contend with the French in pitched battles, they had again recourse to that desultory warfare which had been so wisely recommended by the junta of Seville at the beginning of the revolution, and which had been carried on for some time with so much success. The junta of Badajoz issued a spirited and energetic address to the Spanish nation, rousing them to a defiance of the invaders, even in the midst of their triumphs; and gave orders for raising the greatest possible number of detached corps. The order of the junta specified also the weapons to be used: these were only two; the musket, and the *cuchillo*, or side-knife: the musket for attacking the enemy's convoys and detachments by ambush and surprise; and the *cuchillo* for attacks by night and in the streets. Among the most renowned chiefs or leaders of the *Guerillas*, (to the parties of armed Spaniards were called,) were Longa, in Galicia and Asturias; Mina, in the north of Castille; Santocildes, in Leon; Don Juan Sanchez, near Salamanca; baron Deroles, in Arragon; and l'Empecinado, (the appellation assumed by a gentleman of the name of Martin,) in the vicinity of Madrid.

The French troops, after the retreat of lord Wellington, and the total defeat of the main Spanish army under Ariefaga, were dispersed in different and distant stations, for procuring subsistence, and keeping the territories they had overrun in subjection. The allied army presented a formidable force on the frontier of Spain. The French, in the prosecution of their grand design, the reduction of Cadiz and Lisbon, were obliged to concentrate their forces. This operated as a diversion in favour of the *Guerillas*. Many places occupied before by the French, fell into the hands of the *Guerillas*: among these were Oviedo and Gijon, in Asturias. When the French divisions were drawn together for opposing the united armies of lord Wellington and general Cuesta, the *Guerillas*, taking advantage of their absence, scoured the country in different directions. When the French returned, after the retreat from Talavera, to their old quarters, the *Guerillas* were dispersed, but not subdued; for, on the departure of the French troops from a variety of posts, to join Massena, the *Guerillas* appeared again in force with increased boldness; and of this alternation of concentrating the French forces for fighting great battles, and dispersing the different divisions for subsistence in a poor and exhausted country resolute to maintain its independence, there seemed to be no end. In proportion as the *Guerillas* increased in numbers and daring resolution, it became necessary for the French to send stronger and stronger efforts for protecting their couriers and convoys against those parties who incessantly attacked the enemy in the rear, impeded his communications, cut off his supplies, and, by the booty that fell into their hands, made up in no inconsiderable degree for the ravages committed in the provinces by the invaders. Indeed the misery to which the country had been reduced was so great as to drive many young men to the *Guerillas* as their only means of a livelihood. We find the French generals, in their private dispatches to the government, (intercepted,) continually deploring the necessity they were under of detaching or separating their divisions, for the purpose of maintaining the public tranquillity in the conquered provinces. The French, harassed on every side by an armed population, were ignorant of the number of enemies they had to contend with. The *Guerillas*, dispersed by superior forces in one place, appeared re-organized in another: new bodies of armed men seemed to spring up from the earth after they were supposed to be destroyed.

A convoy destined for the pay of the French army, was intercepted in the night of the 10th of October, by the celebrated partisan, the patriot hero, Mina, between Bayonne and Madrid. The governor of Gomara sent 300 men to reinforce the escort, which was also 300. The whole was dispersed or taken by 500 under Mina, who became master of twelve carts loaded with silver, sixty prisoners, thirty horses, arms, and ammunition.—A convoy was taken by the *Guerillas*, of 6000 muskets, and 6000 uniforms, on its way from Bayonne to the troops in Asturias.—In the environs of Madrid, a body of 8000 men, under l'Empecinado, made king Joseph himself tremble on his usurped throne.—It was stated in a Spanish journal, that, about the beginning of September, "the uncle and worthy successor of the immortal Mina, in the command of his party, had routed near Pampeluna 800 *ganachies* [apes]." So the Spaniards nick-named the French; as the Americans, in the war with England, called our soldiers *lobsters*. It is added in the same paragraph, that this excellent warrior laid Pampeluna itself under contribution, by threatening to starve it. The common escort for a courier to the smallest distance was 200 dragoons; to France 1400. But towards the end of 1810, when the *Guerillas* had increased prodigiously, both in boldness and numbers, at the same time that the Portuguese militia and ordenanza hung in great force on the rear of Massena, this force was deemed very inadequate indeed to the service. In November, a body of French infantry and cavalry, 3000 strong, passing the Zézere, and, crossing the

Lower Beira took the road by the side of Castel Branco to the Spanish border, merely for the purpose of escorting a courier and obtaining information; as appeared from the short time in which they returned to the positions at the bridges of the Zezere and the fort of Punhete. There was a whole division of French troops under the orders of general Clarapede, appointed for escorting couriers between Ciudad Rodrigo and Santarem. When general Foix was sent, in November, by Massena to Paris, he was escorted by 2000 men. On his return to the French position at Salamanca, with dispatches for Massena, January 13, 1811, he was escorted by near 3000 men. The success of patriotic skirmishing in Arragon, forced Bonaparte to send 4000 gens-d'armes into that province from France.

These are a few of the examples of the activity and enterprise of the Guerillas. But, after all, the Guerillas were liable to be cut off in detail, or dispersed; while the French, by seizing the fortresses, ports, cities, and towns, and the roads from one city or town to another, proceeded by sure steps to the conquest of the whole country; of a large portion of which, at the end of 1810, they had uncontrolled, though very unquiet, possession.

The convulsions which had rent the bosom of the mother-country, were felt across the Atlantic in the new world. —The Spanish provinces of America, by their geographical position and immense extent, seem destined by the hand of nature to form five great independent states: Mexico, Terra Firma, Paraguay, Peru, and Chili. The Spanish Americans were an oppressed and insulted people. Their grievances were many and various. But the principal of them may be reduced to two heads: restrictions on commerce, and even on the free cultivation of the soil; and an exclusion from all places of profit, trust, and power, in the administration of the provinces. The monopolization of commerce was as detrimental to the inhabitants of Old Spain in general as to the colonists, and benefited only the merchants of Cadiz, the emporium in which that trade centered. The colonies that suffered most from the monopolization of commerce were those of Caraccas, Buenos Ayres, and the great island of Cuba.

The central junta, willing to unite all hands and hearts in support of the tottering and falling monarchy, had declared the ultra-marine possessions to be integral parts of the Spanish empire, and their rights to representation in the general congress. But all the provisory governments that succeeded each other, though they recognized their rights in theory, continued to trample on them in practice. At no former period was there greater speculation in the American colonies of Spain, or greater despotism or insolence in all the political departments, from the highest to the lowest—none in which men were in less danger of being called to account for acts of rapacity and oppression. Crowds of needy adventurers were sent to America, to repair their fortunes, ruined by the convulsions of the mother-country. They filled all the public places, which the natives considered as their natural heritage; nor had the injustice and outrages which they had suffered themselves, taught them moderation and equity in their own conduct towards others.

Such was the actual government, and such the condition of the people, when intelligence was received of the irruption of the French into Andalusia, and the dispersion of the central junta, loaded with execrations and the contempt of the people. On the declaration of war by France against the mother-country, the colonists manifested the greatest ardour in the common cause of the Spaniards, by their ready obedience to the provisory governments in Old Spain, and by the liberality of their contributions. But, when every ship that arrived from Europe was fraught with news of fresh defeats and disasters, and accusations of treason, they became more sparing of their contributions, and less and less disposed to place their confidence in the temporary authorities. They recollected that in the greater part of the Spanish provinces in America, and in those of Europe, without exception,

it was not the nobility and prime gentry that first took the alarm, and set themselves to oppose and confound the designs of France, but the *people*. A general persuasion prevailed, that the persons in possession of the various departments of government, almost all of them natives of Spain, were more anxious to keep up their connections with the mother-country, into whatsoever hands the supreme authority might pass, than to repel foreign aggression and usurpation. There seemed, however, to be at first a tacit agreement or understanding among all the Spanish provinces of America, that, for the sake of avoiding the horrors of anarchy, it would be prudent to recognize the authority of the metropolis, so long as there should be any appearance of a fixed government to rule the monarchy in the name of Ferdinand VII.

The authority of the central junta, and the regency appointed at Cadiz, was first disowned in Terra Firma. On the news of the reduction of Seville, and the dispersion of the junta, the minds of all classes were greatly agitated. The general alarm of the detested and dreaded domination of France was aggravated. But they who were distressed by the restrictions imposed by the mother-country on trade, were not displeased at a conjuncture that might enable them to take the redress of their grievances into their own hands. The unpopular magistracy of Caraccas was deserted by the military, who fell in with the general voice of the people; and a provisory junta was formed for carrying on the government of the province in the present unsettled state of affairs, without dissolving the connection, but on the principle of fraternization, friendship, and unity, with the mother-country. Similar revolutions took place immediately afterwards, and almost simultaneously, in other provinces, and in the same spirit. Caraccas, Cumana, Barinas, Margarita, Barcelona, Merida, and Truxillo, were united as federative governments, in what was called the "American Confederation of Venezuela," April 19, 1810.

The principal promoters and leaders in this revolution looked forward with ardent expectation to ultimate independence, though they concealed themselves at first under the wings of the general partisans of Ferdinand VII. They made warm professions of attachment to the mother-country, and, in common with the rest of their countrymen, swore allegiance to Ferdinand, as their legitimate sovereign; though the new juntas did not acknowledge, or pay any deference or regard to, the regency at Cadiz. This moderation of conduct, though prudent in itself, would not perhaps have been observed in preference to the solicitations of present interests and passions, if it had not been prescribed by an indispensable regard to the general sentiments and inclinations of the provinces. But this stream was soon unfortunately turned into a different, and somewhat opposite, direction.

The council of regency, awakened to a sense of their public duty, by the well-founded and firm remonstrances of the island of Cuba, passed a decree, May 17, permitting the colonies to trade with foreign nations in all the articles of their own product, for which there was not a vent in Old Spain. This decree, morally just, and politically wise and necessary, did not suit the interests, and was offensive in the highest degree to the merchants of Cadiz, on whom the regency were in a great measure dependant for the means of continuing their new, feeble, and slippery, government. This decree was therefore revoked on the 17th of June. And the regency had even the ridiculous folly to pretend, that it was not authentic, but an imposition on the public; as if they would have suffered a forgery to be in circulation, and have the force of a law, for the space of six weeks, in the very place where the regency resided, without contradicting and protesting against it! It was impossible that the Spanish Americans should respect a provisory government so pitifully mean, cunning, and fraudulent.

While the impression made on the minds of the Americans, by the revocation or disavowal of the decree in

favour of colonial trade, was yet fresh and lively, intelligence was received at Caracas, that all who had been concerned in the late revolutionary movements were proclaimed to be traitors, and the ports of the province declared to be in a state of blockade, until the inhabitants should recognize the regency of Cadiz as the true and legitimate representatives of Ferdinand VII. An amnesty, however, was held out for what had passed, provided that submission and obedience to government should be paid in future. Nothing could possibly exceed the weakness of this passionate ebullition of impotent pride and arrogance! Even if the denounced blockade could have been enforced by a numerous fleet and army, the policy of it might well have been questioned.

The French government in Spain was of course desirous to gain over the colonies. King Joseph addressed the inhabitants of Spanish America in a proclamation issued at Madrid, March 22, 1810. He called them his *dear subjects*, and invited them to submit, and partake in the blessings of his just and paternal government. But, if they should not have a mind to do this, he counselled them to have nothing to do with the rebellious and perfidious junta, who, as well as the English, had nothing in view but to deceive and plunder them; and declare themselves free, and independent of all nations in the world. Joseph also sent emissaries for the promotion of his interests, by intrigue, into the Spanish provinces through North America. The regency, aware of these machinations, sent orders to the public authorities in Spanish America, not to admit any one from the North-American frontier, without the most satisfactory passport. A gentleman, arrived from the Havannah at Liverpool, August 1, writes to his friend in London as follows: "In coming toward the Moro, we saw ten thousand people surrounding a gallows, on which was suspended one of Joseph Bonaparte's emissaries to Mexico, Don M. R. Aleman y Pena, a young man of twenty years of age, belonging to one of the first families in Mexico, who was returning from college in Spain. He had accepted of four or five hundred blank commissions from Joseph, for governors, generals, admirals, and other office-bearers, to be filled up at pleasure."

In most of the provinces, juntas were formed by the leaders of the people for carrying on the government, according to the views taken by the respective districts of their relation to the mother-country. In all, the authority of Ferdinand VII. was recognised; but not that of the regency of Cadiz; or, in other words, Ferdinand represented by that council. The governments that submitted to the regency, considered those who did not as rebels. Commissioners were sent from Porto Rico, Mexico, New Mexico, Cuba, Spanish Guiana, Monte Video, and the juntas or governments of some other districts, to the regency of Cadiz, with assurances of their attachment and zealous co-operation in support of the monarchy in all its members or branches. But by far the greatest portion of the Spanish part of South America adopted the principles, and followed the example, of the Caracas. The inhabitants of those fine countries were divided into two parties—the Loyalists, and the Independents; and their dissensions fermented into flames of civil war.

The junta of Caracas had very naturally represented their situation and desires to the British governor of the island of Curaçao, so near the entrance into the gulf of Venezuela, soliciting his countenance and protection. The governor did not hesitate to enter into a friendly correspondence with Caracas; but, in circumstances so new and important, required instructions from home for the direction of his conduct. It was necessary for the British government, at this crisis, to make a public declaration of the system on which it was to act with regard to the Spanish colonies; and the earl of Liverpool, secretary of state for war and the colonies, wrote a letter, June 29, 1810, to the governor of Curaçao, brigadier-general Liddiard, in which he stated, that "it was the first object of his majesty, on being acquainted with the revolution in

Spain, to second the efforts of so brave and loyal a people for maintaining the independence of the Spanish monarchy in all parts of the world. In conformity to these sentiments, and the obligations of justice and good faith, his majesty must discourage every step tending to separate the Spanish provinces in America from the mother-country in Europe. If, however, contrary to his majesty's wishes and expectation, the Spanish state in Europe should be condemned to submit to the yoke of the common enemy, whether by real compulsion, or a convention that should leave only the shadow of independence; on the same principles his majesty would think it his duty to afford every kind of assistance to the provinces of America that should render them independent of *French Spain*, open an asylum to such of the Spaniards as should disdain to submit to their oppressors, regard America as their natural refuge, and preserve the remains of the monarchy to their lawful sovereign, if ever he should recover his liberty. It was a satisfaction to his majesty to learn, by papers he had received, that what had passed in Caracas was in a great measure owing to the erroneous impressions they had received of the desperate state of Spain. These being removed, the inhabitants of Caracas would be disposed to renew their connections with Spain, as integral parts of the empire, on their being admitted to take their place in the Cortes of the kingdom." Nothing could be more prudent than this conduct of the British government in a situation so new, delicate, and difficult. A copy of lord Liverpool's letter was communicated to the council of regency at Cadiz, and published in all the Spanish newspapers.—We will just observe, that the noble secretary should not have used the word *Caracas*, but *Venezuela*, of which the city of Caracas is the capital. The province of Caracas was only one member of the confederation of Venezuela, as above noticed; (p. 231.) In our common books of geography, and particularly in the last edition of Pinkerton's Geography, the names of provinces are generally confounded with those of the department, or political division, to which they belong, and *vice versa*: which cannot fail to occasion much embarrassment to English readers of newspapers and other periodical publications. The grand political divisions of Spanish America are, four viceroyalties, and five general *capitanias*, or principalities, independent of the viceroys. The four viceroyalties are, Mexico or New Spain, New Grenada, Peru, and Buenos Ayres; the five states, independent of these, are Cuba, Porto Rico, Guatimala, Venezuela, and Chili.

The empire of France furnished, during this year, some political events of a very interesting kind. The divorce of Josephine from Napoleon, which was conducted with great dignity and decorum, (see p. 198.) was a prelude, as might well be imagined, to a second marriage. Bonaparte, on the 27th of February, announced, by a message to the senate, that he had dispatched his cousin, the prince of Neufchatel, to Vienna, to demand for him the hand of the archduchess Louisa-Maria, daughter of the emperor Francis II. according to a contract that had been made, and of which the conditions were to be laid before them. The ceremony of marriage, in which the archduke Charles received the hand of his niece, as the representative of Bonaparte, was performed on the 11th of March. This was a grand source of amusement in a great variety of ways, both to the volatile French and the stiff and formal German nations: the feasts, the balls, the shows, the poetry, and the addresses and other pieces in prose, to which it gave birth, were endless. From Vienna to Compiègne, the road by which the princess passed seemed to be strewn with flowers. Paris leaped for joy. It was at first generally imagined, that Louisa was an unwilling victim to preserve her family from farther humiliation, if not total ruin. She appeared however gay, lively, and almost playful, and delighted with her conquest over a man who had conquered the world. But, while the face of France and its dependencies seemed to be brightened with joy, the well-wishers to established monarchies and the old order of things de-  
piored

piored the humiliation of Austria, and the fervility of the archduke Charles.

The intimation given by Bonaparte in December 1809, of an intended change in Holland, by which it would become a part of the French empire, (p. 198.) was not long before it was acted upon. French troops had begun to glide imperceptibly into Holland, till at last it was occupied by a French army of 40,000 men. The Exchange of Rotterdam was converted into a stable for French cavalry. This was a virtual or real annexation of that country to the French empire. Yet Bonaparte appears at first to have been willing that it should possess a nominal independence, and his brother wear a nominal crown. A treaty was made (April 1.) with Louis, whereby Holland on the left bank of the Waal only was to be annexed to France. An army of 18,000 men, including 3000 cavalry, partly French and partly Dutch, was to be distributed at all the mouths of the rivers, along with officers of the French customs, for the prohibition of all trade between Holland and England; the whole to be paid, provisioned, and clothed, by the Dutch government. About the middle of June, 20,000 French troops were assembled in the environs of Utrecht. On the 29th of that month, Louis king of Holland received official information, that the emperor insisted on the occupation of Amsterdam, and the establishment of the French head-quarters in that capital.

Under these circumstances, Louis, on the 1st of July, resigned his rank and royal dignity in favour of his sons, Napoleon-Louis and Charles-Louis-Napoleon. On the same day he wrote a farewell address to the legislative body, stating the circumstances under which he was compelled to sign a treaty dictated by France. "I have the cruelly-grievous satisfaction, yet now the only one I can have, that I have fulfilled my obligations to the end. That I have (if I am permitted to speak) sacrificed to the existence and welfare of the country all that was possible; but, after the resignation and submission of the 1st of April, I should be much to blame if I consented to retain the title of king, being no longer any other than an instrument—no longer commanding in my own capital, and, perhaps, soon not even in my palace. My brother, so violently irritated against me, is not so against my children. Perhaps I am the only obstacle to the reconciliation of this country with France; and, should that be so, I might find some consolation in dragging out the remainder of a wandering and languishing life at a distance from the first objects of my whole affection, this good people, and my sons. These are my principal motives. There are others equally powerful, with respect to which I must be silent, but they will easily be divined. The emperor, my brother, though strongly prejudiced against me, must feel that I could not act otherwise. He is great; and he *ought to be just*. As to you, gentlemen, I should be much more unhappy even than I am, if possible, could I imagine that you would not do justice to my intentions. May the end of my career prove to the nation and to you, that I have never deceived you; that I have had but one aim, the true interest of the country; that the faults I may have committed are to be ascribed solely to my zeal, which induced me to employ, not always the best, but the most practicable, means of overcoming the difficulty of circumstances. I cannot, gentlemen, conclude, without recommending to you, in the name of the interest and the existence of so many families, whose property and lives would be infallibly compromised, to receive the French with the attention, cordiality, and kindness, due to the brave people of the first nation in the universe. In whatever place I may terminate my days, the name of Holland, and the most lively prayers for its happiness, will be my last words and my last thoughts."

In this address, and indeed in the whole tenour of Louis's conduct towards Holland, as was acknowledged by the Dutch themselves, we recognise moral sentiments, the very reverse of those of his brother; a sympathy with the human race, and a lively regard to their sympathy

and approbation. Louis showed an excellent understanding too. He appeared in the light of both a good and a sensible man, struggling hard to do the best he could under untoward and adverse circumstances. Yet he cannot on any account be considered as a great man. He had become the instrument of a tyrant in subverting the constitution of the country, and establishing a form of government inconsistent with the habits, and repugnant to the opinions, of the inhabitants. How much more noble, lofty, and truly great, was the conduct of Lucien; who, after repeatedly refusing to accept proffered crowns, withdrew from the tyranny of a despot, though his brother, to breathe the air of liberty in this happy island! Lucien Bonaparte, with his lady, seven children, and the whole of his suite, which was very numerous, including a number of artists and men of letters, arrived at Plymouth from Malta, on the 13th of December, in an English frigate. He has continued ever since to reside near Worcester, under the protection of this government, having a range of parole four miles from his house, which includes the city of Worcester. His establishment consists of about fifty persons; and he is greatly respected in the neighbourhood.

The ex-king Louis, after many conferences with Napoleon at Paris, during a residence there for six weeks, reported to his ministers, by orders from the emperor, that there could no longer be any independence or national existence for Holland, if there should be a continuation of a maritime war with Great Britain. But the annexation of Holland, which would be so great an extension of sea-coast to France, must naturally be an object of alarm to the British government: it was therefore possible, that the cabinet of London, rather than suffer so fatal a stroke, might be induced to make peace with France, or to change the measures it had adopted respecting commerce and the navigation of neutral states. He therefore directed them to send some discreet person, acquainted with the nature of commerce, to England, to represent to the ministry how advantageous the independence of Holland must be to Great Britain. On this mission mynbeer Peter Cœsar Labouchere was sent, on the 2d of February. Having arrived in London on the 16th, he had several conferences with marquis Wellesley. The whole communication was merely verbal. The marquis expressed his sorrow at the aggressions to which Holland was a prey; "but," said the marquis, "we must not sacrifice our own national interests and honour. The commercial war was provoked by the French emperor himself. The orders in council were not the cause, but the consequence, of the decrees of Berlin and Milan. The decrees of France were still in force. It could not be expected that we should relax in our efforts of self-defence." In another conference with Labouchere, lord Wellesley observed, that it would not be convenient for England to admit in principle that the British measures of reprisals should be discontinued as soon as the cause that provoked them should be removed. "In fact," said Labouchere, "this minister thinks very highly of the orders in council, as tending to weaken the means and force of France. No hopes of a change or relaxation in this system, but in a change of ministry. Attempts on the part of hostile nations to bring back the English government to other ideas, would probably have the contrary effect. It is not improbable that Bonaparte, on this last point, was of the same opinion. But it formed a part of his policy to affect an earnest desire of peace. In his message to the conservative senate, dated Tuilleries, December 10, 1810, in which he states his reasons for annexing Holland and other countries beyond it to France, he mentions this fruitless mission of the Dutchman to London. As to the abdication of Louis in favour of his children, it was considered as of no validity, not having been previously concerted with the emperor. The kingdom of Holland, therefore, was annexed to France on the north; and the Valais, on the south, became one of its departments. Thus aggrandizing his empire, and stretching the arms of

his gigantic power from the Alps to the Pyrenees, from Amsterdam to the Mediterranean Sea, Bonaparte thought of securing his situation on the throne.

Count Semonville, who brought up the report of the *Senatus Consultum* for the annexation of Holland, the Hanse Towns, and the Valais, to France, said, "At length, after a struggle, glorious for France, of ten years, the most extraordinary genius that ever nature in her munificence produced, has re-united, and held in his triumphant hands, the scattered wrecks of the empire of Charlemagne." It was also mentioned, that "the new departments had *acquired rights* to contribute to the military conscription; and that consequently the contingent to be furnished by each department would be considerably less than it had been for some years." Amsterdam was to rank as the third city in the French empire. Paris was the first; the second Rome. In the annual statement presented to the emperor for the year 1811, the whole population of the French empire, before the annexation of Rome, Holland, the Valais, and the Hanse Towns, amounted to 38,080,443 persons, without reckoning the military actually bearing arms. It was, after that annexation, computed at about 43,000,000.

The electorate of Hanover was annexed to the kingdom of Westphalia: it was divided into three departments, and the name of Hanover abolished. The French conscription-laws were also introduced into the kingdom of Naples, and into part of Denmark. A corps of French marched to Lubec: the peninsula of Jutland was completely isolated, and wholly at the mercy of France. By a royal decree, the Jews were to be included in all military levies in Denmark. A census was taken throughout the grand duchy of Warfaw; a prelude to the establishment of the conscription-law in that country.

An imperial decree was issued in December for restraining the liberty of the press. In its provisions it was extremely minute, consisting of not fewer than fifty-one articles; among the most essential of which were the following:—Article 1. There shall be a director-general, under the orders of the minister of the interior, charged with the superintendance of every thing relating to the printing and publication of books. 2. From the first of January, 1811, the number of printers in each department shall be fixed, and that of the printers in Paris reduced to sixty. 10. It is prohibited to print, or cause to be printed, any thing contrary to the duty which the subjects owe to the sovereign, or to the interests of the state. 12. The printer shall transmit to the director-general of the printing and book-selling business, a copy of the manuscripts in his hands, and also one to the prefect of the department to which he belongs. 15. When the director-general inhibits the printing of any work, he shall send a copy of it to a censor, chosen from a number of persons to be named for that office by the emperor. 16. On the report of the censor, the director-general may point out to the author such alterations or erasures as may be thought proper. If he should refuse to agree to these, the sale of the work to be inhibited, the forms to be broken, and possession taken of the sheets or copies printed. 30. Warrants to be delivered to booksellers on or after the first of January, 1811, on their taking the prescribed oath, by the director-general of the press, submitted to the approbation of the minister of the interior. 33. Warrants not to be granted to any other persons wishing to set up the business of a bookseller, than such as should have recommended themselves by good lives and good morals, and also by an attachment to their country and to their sovereign. 38. When books are allowed to be published, a copy of each, or the first volume, shall be marked with a stamp at the provisory depot, and the books shall be returned from thence to the proprietor.—Never, perhaps, was the importance of the printing press so emphatically illustrated as by this decree of the tyrant of France.

Next to the desire of maintaining internal tranquillity, and preventing all attempts against either his government

or life, that of ruining the English commerce appears to have been in the mind of Bonaparte the strongest. Not only were military governors appointed at the ports of the maritime coasts of Germany annexed to France; but at Dantzic, Colberg, and some other places, we believe, in Prussia, for preventing the introduction of English goods and colonial produce. A very great number of French troops, at the head of which was general Raupe, was stationed in Dantzic: this was the head-quarters of the army at war with commerce. The English goods seized in the Hanse Towns and the ports of Prussia, brought eight or nine millions sterling into the French exchequer. In Westphalia, a line of French custom-houses extended from Rees to Bremen. The hatred of English merchandise became at length stronger than the desire of improving the French finances. All English merchandise, whether taken at sea or land, was ordered to be burnt. The decrees, first for seizing, and lastly for burning, English merchandise, were carried into execution with great rigour, in the Hanse Towns, in France, Italy, Germany, Prussia, Swiflerland, and Denmark. The zeal of his Danish majesty, in this business, was signalized by a severity that seemed to outrun even that of Bonaparte: to hold any intercourse with England was made felony in the captain of a ship, who was accordingly liable to be punished with death, and the owner of the ship was to be branded. By an imperial decree, punishments of different kinds and degrees were denounced against all who should be concerned in English merchandise, from captains of ships to common porters. We have a picture of the rigour with which the anti-commercial decrees of Bonaparte were enforced, in a letter, dated at Frankfort, November 1, and received in London November 16. "The gates of the town have been shut, and domiciliary visits made to most of the mercantile houses in the city, in order to seize every kind of English and colonial goods." The emperor, as some relief to his own subjects, granted licences to certain individuals, both for exportation and importation of certain articles, on certain conditions. But such licences were not to be signed by any of his ministers; they must be signed by himself. His autograph consisted in the three first letters of his name, [*Nap.*] fantastically written. He repealed, nominally, the decrees of Berlin and Milan, as far as related to America; but he imposed such a duty on the importation of colonial produce as amounted nearly to a prohibition; while, at the same time, he continued to seize occasionally, and sequester, American vessels as usual.

The affairs of SWEDEN will naturally be looked for under that article; yet, as the events which took place in that kingdom are intimately connected with the general situation of the continent at the moment of which we are taking notice, we must give a slight sketch of them to prevent a chasm in our annals. They, besides, affected the trade of this country, and consequently the metropolis was interested in their issue.—The advanced age of the duke of Sudermania, who had ascended the throne under the title of Charles XIII. and who had not any children, admonished this prince, as well as the states of Sweden, of the necessity there was of electing a successor. The choice of the states fell on the person proposed by the new king, Charles-Augustus prince of Augustenburg, a subject of the king of Denmark. This prince, on the 24th of January, 1810, repaired to Stockholm, where he took the oaths of fidelity, and received the homage of the states. But he did not live long to enjoy his new dignity. On the 29th of May, while he was reviewing some regiments of cavalry, he was suddenly seized with a fit of sickness, and, having fallen from his horse, soon expired. On the 20th of June, great crowds were assembled in the streets of Stockholm, to see the funeral procession. Count Fersen, who, in virtue of his office of high marshal, led the procession, in a coach drawn by six horses, was assailed with hissing and hooting; and a volley of stones was thrown at the carriage, one of which struck him in the face

face as he looked out at the window. The count immediately ordered the postillions to stop, and took refuge, with difficulty, in the nearest house. At that moment, baron Silverparre, the adjutant-general, arrived, and demanded to know the cause of the riot. The cry was, "Count Ferfen has murdered the crown-prince." The baron then said, that the king had ordered him to declare that the count should be arrested and tried. The mob then huzzaed, and, apparently satisfied, began to disperse. But in a very little time a large party returned; rushed into the house and the chamber where he was; and, with most horrid imprecations and abusive language, stripped him of his sword, the insignia of the orders he wore, his watch, his money, the medal suspended from his neck, and his coat, which they tore in pieces. These spoils they threw to the rabble out at the window. In the mean time, baron Silverparre continued to harangue the mob, whom he at length prevailed on to agree to what he prayed for; which was, that the count should be suffered to go to prison without being insulted, to be tried, and condemned if he should be found guilty. The leaders of the mob promised to let him go quietly to the town-house, on condition that the life-guards, which by this time had come up, should be sent back. Silverparre had the stupidity to trust to their word. The count, in his waistcoat, left the house, and proceeded to the place of confinement through a crowd of people, agitated by passion, over which there was not any curb; yet they divided for the unhappy count to pass through them, as he advanced to the town-house; and he at length made his way into the guard-room. The mob, for about ten minutes, paused; but at length, perceiving that they had not any resistance to encounter, they burst into the guard-room, seized the count by the legs, threw him on the ground, took the rings out of his ears, and cut off his hair; they then dragged him out, and, in the presence of the regiment of guards, drawn up in parade, but with their arms laid on the ground, murdered him, by the mere dint of repeated strokes with sticks and umbrellas. His body was stripped naked, and left all day to the outrages of the populace. It was not till the evening, when the insurgents were dispersed by the fire of the troops, that any one durst remove the body; when it was secretly conveyed to one of his estates, about five miles from Steding, where it was interred in the garden.

The regularity and relentless perseverance with which the attack on count Ferfen was conducted, could not but give rise to a suspicion, that it was the result of a previous plan, rather than an ebullition of popular indignation. That the Swedish guards, commanded by officers of the first families in the kingdom, should remain inactive spectators of the murder of the count; that a body of regular troops should not have the courage to save a high officer of the crown from the sanguinary rage of a mob, was a circumstance, of all the kingdoms on the continent of Europe, the least to be expected in Sweden. But another event soon occurred, which placed the degeneracy of the Swedish nation in a light still more striking.

On the 15th of August, the states assembled at Orebo, for the election of a successor to the king on the throne. There were four candidates. The first was the eldest son of Gustavus IV. When this unfortunate prince, during his exile in Swisserland, was informed of the proclamation for convoking the diet at Orebo, he quitted the place of his residence *incognito*, and took the route of Germany, with the intention of soliciting the support of the courts of Peterburg and Berlin in favour of his eldest son; but he was arrested on his journey by order of the king of Prussia, and sent to Wittenburg. The second competitor was the prince of Holstein, the elder brother of the prince of Augustenburg. The king of Denmark also appeared in the list of candidates: to overcome the aversion of the Swedes, and conciliate their favour, he promised to quit Copenhagen and reside at Stockholm. The fourth competitor was Bernadotte, prince of Ponte Corvo. Though

this was the candidate, as was well enough understood, and as could scarcely be misunderstood, favoured by the emperor of the French; yet he secretly encouraged the king of Denmark to solicit the succession, because he knew that he could never succeed, and that the very idea of being governed by a Danish king was odious to the Swedes, which must operate in some measure in favour of Bernadotte; at the same time that the offer of the Dane to reside at Copenhagen would tend to render him an object of suspicion, and to weaken the loyalty and attachment of his own subjects. The new old king of Sweden, on the day above mentioned, with the advice of his council, proposed to the states, as a successor to the crown, John Bernadotte. A letter from Bonaparte had been received by the king and the states, in which he professed the strongest attachment to the interests of Sweden, and a resolution to defend and promote them. He hoped that, in choosing a successor to the reigning sovereign, the states would select one of similar sentiments; but said he should not interfere in the election. On the 21st of August, Bernadotte was chosen crown-prince of Sweden by the general voice of all the orders composing the states; and an ambassador was sent to Paris, to announce their decision to the emperor and the prince elect. The world began now to combine this event with the murder of count Ferfen, some even with the death of the prince of Augustenburg.

Be the case as it may, the French emperor certainly never thought that his old friend and companion Bernadotte would one day invade the "sacred territory" of his dominion; but events have proved, that lust of power and blind ambition will easily turn the best friends into bitter enemies. Strong suspicions have been entertained, that the death of the prince of Augustenburg, and the murder of count Ferfen, were both the work of the chief ruler of events at that time; and that the poisoned cup and the weapons of the Swedish mob had been successively tempered at St. Cloud. We shall not enter into the minutiae of the arguments for and against these not-ungrounded suspicions, and will only remark that, in the hands of Providence, the tools used by wicked men are often turned against the original purpose for which they were taken up.—But we cannot avoid quoting a kind of prophetic remark of the author of the Annual Register for 1810. After noticing, that the deliberate election of Bernadotte, by the states of Sweden, in preference both to the brother of the late crown-prince, and the eldest son of Gustavus IV. appears to be the most deplorable instance of national degeneracy and degradation to be met with in history; the author concludes, "Yet it may eventually, if the prince of Ponte Corvo has sufficient wisdom, courage, and magnanimity, prove the salvation of Sweden; and even the whole north of Europe. A fair field for surpassing the glory of Bonaparte lies before him."

After his arrival in Sweden, Bernadotte endeavoured in every possible way to ingratiate himself with the nation, and to acquire their confidence. He professed to change his religion, and to adopt the Lutheran tenets of the Swedish church. He appropriated part of his immense private fortune to the purchase of the estates in Pomerania that had been distributed among French officers, which he did on easy terms, and restored them to their true owners; and he accommodated the Swedish government with the loan of more than 300,000l. sterling, at four per cent. interest. These acts of beneficence he had promised before his election; and he kept his word. His installation took place on the first of November, in the presence of the assembled diet; and about the middle of the same month the Swedish government, at the requisition of Bonaparte, declared its adherence to the continental system. War was declared against Great Britain and Ireland; all intercourse with the British dominions was prohibited; and the importation of colonial produce interdicted.

On the 13th of November, the late king of Sweden, the unfortunate Gustavus IV. in the course of a languish-

ing and wandering life, arrived in England, under the title of Count Gottorp. The particular object of this visit has not transpired, though it may easily be divined. He was received with due sympathy, honour, and regard, by the court, the government, and the nation. He avoided all state, declined to accept the offer of pecuniary aid, and lived, for the short time he remained in this country, as a private gentleman. He left London, March 26, 1811, for Yarmouth, and proceeded from thence to Heligoland on-board a British frigate. We understand that he is now living privately in some obscure part of Germany, where he forgets perhaps the loss of a crown in the enjoyment of free and tranquil retirement.—Gustavus Adolphus was an heroic prince in a corrupt age; possessed of all the virtues except prudence; for, without discretion, heroism itself is but a splendid madness; though it seems strange to affirm, that what would be virtue in an heroic, that is a virtuous, age, ceases to be virtue in an age not heroic and not virtuous. We have before observed, that, if all the sovereign princes of Europe had acted like the king of Sweden, the ancient thrones would have been preserved, and public law, the law of nature and nations, still respected. Yet it must be admitted that his dethronement was an act of necessity. Like his renowned predecessor Charles XII. and his father Gustavus III. he was more concerned for personal glory than for the good of his subjects. But the deliberate choice, by all the orders of the state, of Bernadotte, to the exclusion of all the royal family from the succession to the crown, was (though it is at this moment unfashionable to say so) an indelible stain on the Swedish nation; and, above all, on the duke of Sudermania.

So much for the Swedes.—The Danes were in the mean time employed with great activity in fitting out frigates and gun-boats for annoying our trade in the Baltic; and which annoyance they pursued with great courage as well as assiduity, and no small success.—In the beginning of July, Murat, the Neapolitan king of Naples, threatened an invasion of Sicily; but the issue was, that, on the 3d of October, he proclaimed to his soldiers, “that the expedition to Sicily was adjourned.”—Meanwhile the Turks and Russians were carrying on war with an infatuation which would scarcely appear credible to posterity, if there were not similar instances of folly in history, both ancient and modern. Their whole faculties seemed to be absorbed in mutual hostility and rage. They seem never so much as once to have bestowed a serious thought on the tremendous power that hovered over them, ready to pounce on one or both, when they should be sufficiently debilitated by their mad conflicts.

Some farther efforts were made this year to procure peace with America. Instead of Mr. Erskine, who was recalled on account of his being said to have acted contrary to his instructions, Mr. Jackson was sent: but Mr. Jackson was personally disliked by the American people; and his behaviour was not at all conciliating. His unaccommodating firmness was contrasted with the amiable pliancy of Mr. Erskine; and it served the political views of the American ministers to nourish the popular prejudice against him. It was not to be expected that, in such circumstances, he should succeed in his negotiation: from subsequent information it is now known to have been absolutely impossible, upon the terms of his instructions. It could not, however, be foreseen that his mission would terminate, as it did, in the suspension of all official communication between him and the government to which he was deputed.

The British government considered the transaction between the United States and Mr. Erskine as terminated by the formal and public disavowal of the envoy's authority to do what he had done; and Mr. Jackson was directed to take the business up where the disavowal had left it, and to proceed on the terms which were anew prescribed to him. But the president thought proper to call repeatedly on Mr. Jackson for an explanation of the disavowal. This gentleman declared, that the disavowal was occasioned by

Mr. Erskine's deviations from his instructions. He took occasion, at the same time, to contradict a rumour that Mr. Erskine had other instructions besides those that were laid before parliament, and had been communicated. Unfortunately for Mr. Jackson, he discovered that Mr. Erskine had so far adhered to his instructions, as to propose to the acceptance of the American minister the conditions contained in them; and that it was owing only to his subsequent relinquishment of them that all the embarrassments arose. The Americans therefore had no right to express so much surprise at the agreement not being approved in England. But Mr. Jackson, who did not scruple to say so, was told that he had insulted the government, and that no farther communication would be received from him. It was asserted that he had reproached the American government with knowing, at the time of their making the agreement with Mr. Erskine, that he was exceeding his powers. The British minister was exposed to repeated insults; and nothing but the utmost prudence on his part could have averted the most serious personal danger. The official account of these transactions was brought to England by the secretary of the British legation. And Mr. Pinkney, the American resident at London, in consequence of the orders he had received, demanded the recall of Mr. Jackson; which was, without hesitation, acceded to. Marquis Wellesley, the British secretary of state, told the American minister, “that his majesty was always disposed to pay the utmost attention to the wishes and sentiments of states in amity with him, and had therefore been pleased to direct the return of Mr. Jackson to England; but his majesty had not marked with any expression of his displeasure the conduct of Mr. Jackson, whose integrity, zeal, and ability, had long been distinguished in his majesty's service;” and who did not appear, on the present occasion, to have committed any intentional offence against the government of the United States.

Thus ended the third attempt that was made, by the British government, to accommodate those differences with the United States which had arisen out of the peculiar maritime situations of the two countries, and the unfortunate rencontre which, in the year 1807, occurred between two of their ships of war. And it is to be apprehended that, without a departure of one of the two parties from their respective tenets, no permanent adjustment of their views, at least if the war continues, can be expected. The surrender of the right of taking our seamen by force out of American ships is, among other things, expressly refused by the British government; and it has been as peremptorily declared by the Americans, that, without that surrender, no treaty can ever be agreed to. Let us, however, hope better things from the present conferences at Gottenburgh. Let us hope that we may be able to close this article by a declaration of peace, not with America only, but with Europe also.

In such a conflict, however, as that which exists at present between Great Britain and the United States, the party with the smallest capital, and the fewest channels of industry and enterprise, must, for a time at least, be the greatest sufferer: and, if the unseemly policy of restrictions, embargoes, and commercial hostility, be persevered in, a commercial intercourse with America is not so essentially necessary to Great Britain as to render it advisable to purchase it by the sacrifice of any other branch of our national policy. It is certain that, before the general maritime commerce of the United States became circumscribed by the measures adopted by them in 1807, their markets were of very great importance to the British trade, both for the sale of a large proportion of British manufactures, and for the purchase of many necessary articles of supply for our own consumption, which could not then be procured elsewhere. The embargo and the acts which grew out of it rendered it necessary to obtain from other sources the articles in question, and to send through other channels those furnished by our manufactures. Canada has, in consequence, risen to a degree of importance and prosperity

prosperity altogether unexampled. In 1810, upwards of 600 sail of ships arrived at Quebec for timber; and saw-mills every-where sprang up, worked by steam-engines. Our navy is supplied with her timber; our West-India islands with her lumber; large and every-year-increasing quantities of corn, the growth both of the Upper Province and of the states bordering upon the Lakes and the river St. Lawrence, supply the deficiency of what had before been obtained from New York, Philadelphia, and the towns situated within the Virginian Cape. On the other hand, we are now the carriers of our own manufactures to places where they had before been sent under the protection of the American flag, and through the lucrative agency of American commissioners. A very general belief had been sedulously propagated, by those persons who are interested in the trade with the United States, that the failure of their market would inflict a deadly blow on our manufacturing interests. The assertion was specious, and not without some apparent foundation; but, besides that it has been disproved by the event, the contradiction of it is satisfactorily explained by this circumstance, that, of the whole amount of British manufactures at any time sent to the United States, only a small portion was consumed in that country: by far the largest part was re-exported, with the accumulated profits of duties, commission, and freight, accruing to the American treasury, merchant, and ship-owner. These profits have been willingly, but we must think unwisely, relinquished by America, although it is not for us to quarrel with her policy, since they are thrown by it into British hands. We have the best official authority, the returns of our own custom-house and those of the American treasury, for asserting, that the British manufactures, exported to the island of Jamaica alone, exceed, by one million sterling, the greatest amount of annual exportation that was ever sent to the United States. The loss then of our trade to those states, even if it were not counterbalanced by the acquisition of markets in other quarters, would be reduced to the amount of our manufactures actually consumed in them, deducting from that amount always the quantity that must, of necessity, be conveyed there in spite of all restrictions and prohibitions whatsoever. If, then, this loss would not greatly affect the general balance of our trade, still less can it be put in competition with the advantage of maintaining unimpaired those principles of general policy which the dignity and the interests of the empire have suggested.

This year, the star of Great Britain shone on our naval and colonial affairs with even more than its usual benignity. In the Mediterranean, the fortress and isle of St. Maura, the ancient Leucadia, not far from Cephalonia, in the direction of Corfu, and nearly in the mouth of the Gulf of Lepanto, was taken, after a slight resistance, on the 16th of April, by an armament from Zante, under the command of brigadier-general Oswald. In the West Indies, the island of Guadaloupe, the last that remained to the French in that part of the world, surrendered on terms, February the 6th, to the combined military and naval British force, commanded by lieutenant-general sir George Beckwith: the naval part of the expedition was conducted by vice-admiral Alexander Cochrane. This year also the French were deprived, by the English, of the last establishments that remained to them beyond the Cape of Good Hope; viz. the Isle of Bourbon, and the Isle of France, or the Mauritius.

The reduction of the Mauritius, either by blockade or force, had been considered as impracticable. It was accomplished, however, with little resistance, by an army of 8 or 10,000 men commanded by major-general John Abercrombie, second son to the late general sir Ralph Abercrombie; the naval part of the expedition was under admiral Bertie. The whole fleet, transports and ships of war, amounted to 70 sail. All the arrangements for an attack on the isle having been made, the troops effected a landing, under cover of the fire-ships, on the 29th of November. Some skirmishes took place till the 2d of December; but, on the 3d, the enemy

proposed to capitulate. Terms were immediately agreed on; and, on the same day, a capitulation was signed, by which an immense quantity of stores and valuable merchandise, five large frigates, some smaller ships of war, and 28 merchantmen, with two British East Indiamen that had been captured, were surrendered. Our whole loss did not exceed 150 men, in killed and wounded. The French troops were sent to France, not as prisoners of war, but free, and at their own disposal. The inhabitants were to preserve their religion and laws, and all private property was to be respected. General Abercrombie observes, that what had hitherto been considered as the grand obstacle to an attack on the Isle of France, was the difficulty of finding a proper place for the debarkation of a considerable number of troops, the whole coast being surrounded with breakers; and the supposed impossibility of finding anchorage for a fleet of transports. But these difficulties were, at length, surmounted: by the indefatigable labours of commodore Rowley, seconded by other naval officers, engineers, and pilots, a fit place for anchorage was discovered, and an opening in the surf sufficient to admit the passage of three ships abreast. The Isle of France, which was by far the most important, was the last of the possessions that remained to France, in or between the Cape of Good Hope and India. A British garrison was placed in the *Mauritius* (for it had now recovered its ancient name) of 5000 men. The two restored East Indiamen, the *Ceylon* and *Windham*, were sent to England: the first with a cargo from the Isle of Bourbon; the second with one from the Mauritius. They arrived safely in an English port, about the middle of April, 1811; together with the five French frigates, the *Astrea*, the *Bellona*, the *Venus*, the *Minerva*, and the *Victor*.

After the reduction of the Mauritius, three frigates were dispatched on an expedition against Tametava, on the coast of Madagascar, and to go from thence to root out the French from the Isle of Almerante, and some other little nestling-places of theirs. But the great object of the expedition was, to destroy the batteries of Tametava, under cover of which the French vessels were wont to be victualled and repaired when they could not reach the Mauritius, and to trade with these isles, where they procured salt-fish, cocoa-nuts, and tortoise-shells. On the 10th of January, 1811, there did not remain to France any territory in either of the Indies, or ship in the Indian ocean.

The Dutch settlement of Amboyna, with its dependant isles, was surrendered on the 17th of February, to a detachment of an European regiment, with artillery, from Madras, together with 300 seamen from British ships of war. On the night of the 8th of August, a handful of British seamen, not more than 180, led by captain Cole, of the *Caroline* frigate, took Banda, the principal of the Dutch spice-islands. The guns of fort Belgia, at Banda Neira, near which the scaling ladders were placed, fortunately burnt priming, owing to the heavy rains. The Dutch garrison were panic-struck, and fled in all directions, leaving the colonel-commandant and ten men killed. A flag of truce was dispatched to the governor, offering protection of private property, on the surrender of the island; which was refused. However, one shot from fort Belgia, and a threat to storm the town and fort Nassau, both of which lay immediately under its guns, produced an immediate and unconditional surrender; and 700 regular troops and 300 militia grounded their arms. Banda Neira, and its dependencies, exported 900,000l.-worth of spices annually to Batavia. The conquerors found about 400,000l.-worth of spices at the time of the capture.

But the highest degree of bravery and enterprise could not protect the whole of our numerous ships of war from accident and disaster. A part of the squadron, stationed at the Cape of Good Hope, fell, August the 23d, into the hands of the enemy. Four English frigates, the *Sirius*, the *Magicienne*, the *Nereide*, and the *Iphigenia*, determined to attack the harbour of Sud-Est, opposite to the

Isle of Passé, into which three French frigates had taken two of our Indiamen, and in which the French ships of war were stationed. Unfortunately the *Sirius* and *Magicienne* ran aground on shoals with which the pilots were unacquainted; and the crews, after burning them, returned in the *Iphigenia*, which they took in tow to the Isle of Passé. The *Nereide*, having proceeded nearer to the inner harbour, was also stranded, and shattered almost to pieces; yet the captain, Willoughby, though exposed not only to the fire of the three frigates, but also to that of the batteries on-shore, did not surrender before every man on-board was either killed or wounded. The *Iphigenia*, closely blockaded in the Isle of Passé, was afterwards taken, together with the isle itself, by the French frigates. General Decaen, governor of the Mauritius, gave a pompous account of these conquests; and also of the previous actions, not only with the *Nereide*, but, as the governor says, with the *Sirius* and *Magicienne*, with whom there was no action, the whole fire of the three French frigates being directed against the *Nereide*. The circumstance of our ships being stranded on unknown shoals was altogether concealed in the French journals; in which the capture of the frigates, and the Isle of Passé, was blazoned as a great and glorious achievement. It is almost unnecessary to observe, that neither was any notice taken in the French papers of the retreat of a French squadron, on the 20th of July, from the presence of a small British force, under the orders of captain Blackwood, cruising off Toulon. Though we cannot, in this summary narrative, relate all the distinguished acts of skill and bravery performed by our navy, which would require a volume, we cannot refrain from noticing that of captain Blackwood. His squadron consisted of three 74-gun ships, with a frigate and corvette. These two last vessels being in danger of being cut off by a French squadron of six ships of the line, of which one was a three-decker, and four frigates, captain Blackwood, with his three ships drawn up in a line, bore down on the French fleet, and poured a broadside into the foremost ship. The French, intimidated by this bold attack, which they supposed to be a certain proof of the near vicinity of the fleet under admiral Cotton, sheered off for the harbour of Toulon. The courage of British seamen, and the excellence of the tactics of British naval officers, though both have been so often tried, were never more gloriously illustrated.—It may be mentioned among the naval and colonial affairs of Britain, that the English in the course of this year fortified and established a commercial depôt at the small Danish island of Anholt, situated in the Categat, in the same manner as had been done in 1809 at Heligoland, near the mouth of the Elbe, very convenient for the smuggling of goods into the Danish territory, and also into Germany, by the Elbe and the Weser.

The burning-decrees of Bonaparte, and an exclusion from the American market, occasioned much stagnation of trade in many of the manufacturing and some trading towns in England; but new avenues were opened, and our commerce still flourished, all things considered, wonderfully. It is lamentable to see refined nations, instead of co-operating for their own, together with the convenience and comfort of society, using all possible means for oppressing each other's industry:—duties, prohibitions, confiscations, and even punishments, usually inflicted only on criminals. There is something in this procedure, which, after all the calculations of a crafty narrow policy, appears to be odious, immoral, and inhuman. The ruler of France was so sensible of this, that his demi-official newspaper, the *Moniteur*, was employed to weaken the impression naturally made by such barbarous attacks on human industry and genius, by showing that they were common on the part of England. And certainly the *Moniteur* made it out clearly, that, in matters of finance and revenue in France, there was no regulation so severe as to be without multiplied examples in the revenue-laws of England. Divers English laws for

the burning of French manufactures, and smuggled tobacco and tea, are cited; and one, passed in the nineteenth year of the reign of George the Second, making the importation of any article prohibited felony, whether the importation should be clandestine or open.

If we turn from foreign countries to domestic scenes, we shall find some matters which, though beneath the dignity of history, cannot be passed over in a topographical article.

Erostratus set fire to the famous temple of Diana at Ephesus, in order, as it is said, to obtain celebrity. What could have been the reason which induced Mr. Lyon Levy, an eminent Jewish diamond-merchant, to take the trouble to ascend the staircase of the Monument, and to throw himself from the gallery into the street, cannot be exactly ascertained. This singular kind of suicide, however, took place on the 18th of January; and the hapless Israelite was killed on the spot.

We may venture to conclude, however, that a failure in some money-speculation was the cause of this rash act; and we have to record another of the same kind, and by a person of the same religion, which was perpetrated on the 28th of September following.—When the depraved gambler, reduced to desperation by an adverse throw of the dice, visits on himself the injuries which he has inflicted on society; when the seducer or adulterer lifts against his own breast the pistol with which he was wont to defend and augment his crimes; when the fashionable idiot, tired with a life of folly, and shuddering at reflection, seeks in vain for endless rest in the grave;—we are grieved, but not surprised, at the blind audacity of our fellow-creatures. But, when the benevolent of heart, in whose hands wealth has proved a source of comfort to the poor, assistance to the helpless, and support to the deserving, close an honourable and useful career by an act as cowardly as it is criminal, we not only feel grief but astonishment at the weakness and perversity of man. We interrogate the past to discover some traces of iniquity, unmarked by the eye of the world, which might have led more watchful observers to the expectation of such a deed; but when, as in the present case, none appears, we can only attribute the rash action to the absence of that Christian light which reveals in present calamities future blessings, and those Christian principles that sweeten the most bitter cup with the dew of resignation. It is remarkable, that, whilst the wicked amongst Christians, or those who, although born under the dispensation of the gospel, both by their conduct and professions deny its doctrine and contemn its faith, are found to commit suicide, the best characters in other religions have recourse to that dreadful expedient as a means of security for their fame and rest for their souls.—Mr. Abraham Goldsmid, whose self-inflicted death gave birth to the preceding observations, was the second son of a respectable Dutch merchant of the Jewish persuasion, and came over to this country with his father and elder brother. He was born in the year 1757; and, as soon as his mind had acquired sufficient powers, was initiated into the principles of merchandise. Tenderly attached to his brother, he became his partner when both were grown up, and when the death of their father left them in possession of a capital that enabled them to venture into bold speculations. Their indefatigable industry and natural acuteness soon improved their fortune, which was greatly increased by the marriage of the elder Goldsmid with the daughter of Mr. Solomons, of Clapton, who brought him no less a sum than one hundred thousand pounds. From that time their commercial undertakings became more considerable, and in a few years they were ranked among the first men in the moneyed world. Their increasing riches introduced them to the notice of an administration celebrated for the expense which it incurred, and the debt which it entailed on the nation. Whenever a loan was wanted, the Goldsmids mostly supplied a large portion of it; and, as the terms on which it was obtained were always advantageous, their fortune

kept pace with the facilities which they granted to government. In the purchase and sale of bullion, stock, navy-bills, and exchequer-bills, and in negotiating foreign bills of exchange, they also annually disposed of millions; till at last the extent of their speculations, the greatness of their credit, and the liberality of their dispositions, caused them to be placed, without one dissenting voice, at the head of the Stock Exchange. Thus eminently raised in the public opinion, they incessantly laboured, not to obtain the applause of men, which they already possessed, but that of their own hearts. Charity and benevolence marked all their actions, and their munificence was not confined to the deserving objects of their own nation and belief, but to men of every denomination. They supported every public-spirited institution with their subscriptions, and never closed their hearts or their purse to those who wanted assistance, whatever might be their religious principles. The unfortunate end of Mr. Benjamin Goldsmid, his brother, (April 18, 1808,) greatly affected him, and perhaps first awakened the thought of committing suicide in his mind. Mr. Goldsmid was joint contractor with the house of sir Francis Baring for the loan; and, taking the largest probable range, that he had dealt amongst his friends one half of the sum allotted to him, the loss sustained by the remainder, at the rate of 65l. per thousand, was more than any individual fortune could be expected to sustain. Ever since the decline of omnium from par, Mr. Goldsmid's spirits were progressively drooping; but, when it reached five and six per cent. discount, without the probability of recovering, the unfortunate gentleman appeared evidently restless in his disposition and disordered in his mind; and, not finding that cheerful assistance amongst his moneyed friends which he had experienced in happier times, he was unable to bear up against the pressure of his misfortunes. Another circumstance that is said to have pressed heavy upon his mind within the last week was, that he had borrowed of the East-India Company half a million; he had given security for this sum; but the period of redemption had arrived; it was to have been paid off on the 28th; and Mr. Goldsmid, it is reported, felt considerable difficulty in raising the money. It is said that he had at one time determined, if possible, to put an end to all his dealings in the Stock Exchange, and to retire to private life. But this determination could not be executed immediately; and in the mean time heavy demands would come against him. His temper, hitherto so equal, became in consequence irritable. He lost all his fortitude. Despondency took possession of him, and drove him to the commission of that fatal act which terminated his life. Yet he so far mastered his feelings in company, that his friends and family had not the least apprehension of his committing suicide. He came to town on Thursday, September 27, in his carriage, from Morden, accompanied by his brothers, Edward and Isaac, and his son Moses; and several friends who met him did not observe any thing particular in his manner or appearance. He returned to Morden to dinner, and had company. In the evening he joined in a party at cards, after walking a good deal in his grounds, and giving notice to several of the workmen employed in his large premises that he should soon discharge them. On Friday morning he rose at his usual early hour; and about half past seven o'clock was observed to pass over the bridge to the wilderness or rookery, in his grounds; and there he perpetrated the fatal deed. His coachman having, as was usual, enquired what horses were to go to town, he was referred to Mr. G. being told at the time which way he had walked. The coachman went in search of him, and was the first that found him, weltering in his blood, with the pistol grasped in his right hand. Life was not quite extinct; but, before the medical assistance which was sent for arrived, he had expired in the arms of his afflicted family, but wholly unconscious of being with them. He left a widow and several children. He was in his 53d year. An inquisition was held, on Saturday, on the body, at his house at Morden.

The proceedings lasted but a few minutes, when the following verdict was returned: "Died by his own hand, but not in his senses at the time." His remains were interred in the Jews' burial-ground, at Mile-end. The hearse, which conveyed the body, passed over London-bridge, followed by the carriage of the deceased, and thirteen mourning-coaches, in which were the high priest, the elders of the synagogue, and a great part of the family, except his brothers, who were too much affected to attend. On their arrival at the ground, a number of poor persons had collected to witness the interment of a man, who had proved not only their particular benefactor, but had studied to render himself useful through life to all classes of mankind. The mourners were scarcely able to support themselves. Mr. Alison, the brother-in-law of the deceased, fainted over the body twice, and sunk on the grass, lamenting the dismal event. The high priest and elders paid every distinction in their power to the remains of their departed friend; but, in conformity to the Mosaic laws, they withheld from him the customary funeral rites.

It is always with pleasure that we return to the transactions of our Guildhall; but, in the present instance, we are sorry to find that the old question, about presenting the addresses of the livery to the king upon the throne, was again unsuccessfully revived.—A common hall was held on the 9th of January, for the purpose of receiving the report of the lord-mayor and sheriffs on the address voted by the livery to his majesty. The clerk read the report, which stated, that the remembrancer had called at the secretary of state's office with the address, and an intimation that it was intended to present it on the levee-day. Next day he was told, that it must be left at the secretary of state's office, to be presented (as was usual with all addresses, except those from the two universities, and the corporation of London) by him to his majesty. On the levee-day the lord-mayor told the secretary of state, that he then had the address in his pocket, and wished to present it. The secretary said it was best to give it to him, and he would save the lord-mayor all further trouble; to which his lordship replied, that he would not consent to present it to any one except to the king in person; and that it was both the wish of himself and sheriffs to do it in any way which would save his majesty most trouble. The secretary said, the king's pleasure had been already taken and expressed as to the mode of presenting it. Mr. Sheriff Wood then demanded an audience of his majesty; which the secretary replied could not be granted, except upon some especial and expressed reason; for that no audience could be granted on a subject upon which his majesty had already expressed his pleasure. Such was the report, to receive which the hall had been called. In consequence of which, the following resolutions, among others, were then passed:

"Resolved unanimously, That it is the undoubted right of the lord-mayor, aldermen, and livery, of the city of London, to present their petitions to the king sitting upon the throne.

"Resolved unanimously, That it appears, that the secretary of state informed the sheriffs, that the petition of the livery could be received only through his office; that they have been denied, not only the usual access to his majesty by a personal audience, but even the undoubted right of presenting the same when they had actual access to his majesty at the levee, where they attended to present, and did present, a petition from the court of common-council.

"Resolved unanimously, That such denial is not only subversive of the rights of the livery, but a flagrant violation of the right of petitioning, claimed, demanded, and insisted upon, and confirmed to them by the bill of rights.

"Resolved, That whoever advised his majesty not to receive the petition of the livery in the accustomed and established mode, have committed a scandalous breach of their

their duty, violated one of the first principles of the constitution, and abused the confidence of their sovereign.

“Resolved unanimously, That the sheriffs, attended by Mr. Remembrancer, do forthwith wait upon his majesty, and deliver into his majesty's hand, in the name of the lord-mayor, aldermen, and livery, of London, a fair copy of the foregoing resolutions.”

On the 23d of February, Mr. Waithman, at a court of common council, brought forward a motion for a petition to parliament, against granting a pension to lord Wellington for his services; which, after two divisions, was carried by a majority of seven; and a petition to the house of commons agreed to accordingly.—This will appear, at the present moment, to have been a very ungracious proceeding; but it must be observed, that his lordship's talents were not then so fully appreciated by the public in general, nor had his services been of so decided and unambiguous a nature. Another reason was, that, while lord Wellington's pension-bill was passing through the house, the sinecure office of a teller-ship of the exchequer became vacant; and might have been given to lord Wellington, instead of Mr. Yorke, who had certainly never performed any services for which a direct pension to that amount could with decency have been granted. The whole amount of the pension, therefore, might have been saved to the public. This circumstance was also urged in the house of commons by Mr. Banks.

In the early part of this month, a court-martial was held at Portsmouth, on the Hon. Capt. W. Lake, of his majesty's ship *Ulysses*, for having, when commander of his majesty's ship *Recruit*, on the 13th of December, 1807, at six o'clock in the evening, caused a seaman of the name of Robert Jeffery, to be put on-shore on the desert island of Sombbrero, in the West Indies. It appeared, that in the month of November, 1807, Jeffery went into the gunner's cabin, and took out a bottle with some rum in it; that on the day he was sent on-shore he broached a cask of spruce-beer, which had been brewed for the ship's company; and that his general character was that of a skulker. The *Recruit* being off the isle of Sombbrero, captain Lake asked the master what island it was, and if there were not some thieves on-board? To which the master answered, “Yes, there are two.” Captain Lake then desired him to send Jeffery up to him: the man soon came up, and captain Lake said he would not keep such a man in the ship. He then ordered lieutenant Mould to land the man, and return immediately to the ship. As soon as admiral Cochrane heard of the circumstance, he reprimanded captain Lake, and sent him to take the man off the island. Some of the officers of the *Recruit* landed, and explored the island, but they found only a barren spot, covered in the middle with a kind of rough grass-weed. There was no house nor inhabitant on it. It appeared, however, by the American newspapers afterwards received, that the man had been taken off the island by an American ship, and landed in America. Captain Lake, in his defence, admitted that he put the man on-shore, but denied that he intended to put his life in jeopardy, as he thought the island was inhabited; that in landing him he thought he would be more sensible of his want of conduct, and would reform in future. The court agreed that the charge had been proved, and sentenced captain Lake to be—Dismissed from his majesty's service.

In October following, Jeffery arrived in London from America; when the lords of the admiralty gave him his free discharge from the service; and the friends of captain Lake made him a liberal compensation for the hardships he had sustained. In the account of his sufferings and preservation, he says, that at first he did not believe that it was intended to leave him on the island. He saw the ship the morning after he was put on-shore, and expected every moment that a boat would be put off to take him on-board. He suffered at first very much from thirst; and to allay it he drank a quantity of salt water, which only increased it. Fortunately for him, some rain fell on

the third day after he was put on-shore, and the quantities that remained in the cavities of the rocks supplied him while he remained there: he was under the necessity of sucking it out with a quill. He saw great numbers of birds of the gull kind, rather larger than a goose, but he could not catch any of them: he found only one egg, but it was in such a putrid state that he could not eat it. The only food (if it may be called food) that he had was some bark, which he found on the shore. He saw five ships pass by while he was on the island, but at too great a distance for him to be visible to the people on-board; and the American vessel by which he was at last taken off would probably have passed on in the same manner, if the captain had not heaved to from motives of curiosity, to examine the birds which were flying in great numbers about the island.

Early in the morning of the 31st of May, an attempt was made to assassinate his royal highness the duke of Cumberland. The duke had dined at Greenwich, returned to town in the evening, and went to the concert for the benefit of the royal society of musicians. He came home about half past twelve, and went to bed about one. About half past two he received two violent blows and cuts on the head: The first impression upon his mind was, that a bat had got into the room, and was beating about his head; he was soon convinced to the contrary, by receiving a third blow: he jumped out of bed, when he received a number of other blows: from the glimmering light, and the motion of the instrument that inflicted the wounds, reflected from a dull lamp in the fire-place; they appeared like flashes of lightning before his eyes. He made for a door near the head of his bed, leading to a small room, to which the assassin followed him, and cut him across the thighs. His royal highness, not being able to find his alarm-bell, which there is no doubt the villain had concealed, called with a loud voice several times for Neale, his valet in waiting, who came to his assistance, and, together with his royal highness, alarmed the house. The duke desired Neale not to leave him, as he feared there were others in the room. His royal highness, however, shortly afterwards proceeded to the porter's room; and Neale went to awaken Sellis (a Piedmontese), another of the duke's valets. The door of Sellis's room was locked, and Neale called out to him saying, “The duke is murdered.” No answer being given, the door was broke open, and Sellis was found dead on his bed, with his throat cut from ear to ear. It is supposed that Sellis, conscious of his own guilt, (for it is said that he was the assassin,) imagined, when the alarm was given at his door, that they were about to take him into custody, and immediately cut his throat. His blue coat was found folded up on a chair in one corner of the room, the inside of which was stained with blood; and, as he had cut his throat in another part of the room, the blood must have been that of his master. A pair of his slippers was also found in the closet adjoining the duke's chamber, where he had concealed himself until his royal highness was asleep. The assassin seems to have stood rather back towards the head of the bed, which was placed in a small recess, in order to avoid discovery, and was therefore obliged to strike down at the duke's head in a slanting direction; in consequence of which, the curtains which hung from the top impeded the action of the sword; and to this alone can his royal highness's preservation be attributed—several of the tassels of the curtain were cut off. The weapon was a large military sabre of the duke's, and had been lately sharpened. The whole edge appeared hacked and blunted with the force of the blows. His royal highness's shirt was cut through in several places, and a great splinter was shivered from the door through which he made his escape. Adjoining the room itself, and communicating with it, is the little closet where the murderer is thought to have secreted himself. There is in this closet a small press, in which the bolsters were usually put, and in which he hid himself, as the scabbard of the sabre was found there. Sellis had five different rooms to pass

pafs through from the duke's bed-room to his own, and his traces were diftinctly marked by the blood left by his left arm upon the fides of the narrow door; and, when his coat was examined, the left fleeve was found to be covered with blood. His royal highnefs, we understand, received fix diftinct wounds: one upon the forehead, towards the top of the head; another down the cheek, one upon the arm, another by which his little finger was nearly fevered from the hand, one on the front of the body, and another on the thigh, befides feveral punctures in different parts with the point of the fabre. Mr. Home, the furgeon, was immediately fent for, who pronounced that none of them were mortal. Sir H. Halford was alfo called in. The prince of Wales went to the palace early in the morning to vifit his royal brother; and about eight o'clock fet off for Windfor, to communicate to the royal family the intelligence of the attack made upon the duke. A coroner's inqueft was held on the body of Sellis; who, after fitting four hours, to hear evidence, &c. deliberated about an hour, and then returned a verdict of *Felo de fe*.—As Sellis was quite dead when difcovered, and as dead men tell no tales, the plot of this tragedy has never been fully cleared up. Mr. White, jun. the editor of the Independent Whig, a weekly newspaper, was afterwards convicted of a libel on the duke of Cumberland, for what he thought fit to write on the fubject, and is now under fentence of imprifonment in Newgate, befides which he is to pay a fine of 200l. Mr. White certainly foretold a particular circumftance which has fince come to pafs; and almoft every week he continues boldly to afert that Sellis was not his own murderer.

On the 15th of June came on, in the court of King's Bench, the trial of Mr. Cobbett, author of the Weekly Political Register, for a libel.

The Attorney-general opened the cafe on behalf of the crown. In 1808, lord Caftlereagh brought in his bill by which the local militia might be called out for twenty-eight days, though they had only been called out twenty days. When the Cambridgefhire militia was called out, fome difaffected perfons in the Ifle of Ely caufed them to mutiny; and it was found neceffary to call in the military in the neighbourhood. Five of the ringleaders were fentenced to receive 500 lathes, part only of which they received. The *German legion*, who were thus called in, is compofed of a body of men, who, when Hanover was overrun, quitted their country, and, entering into his majesty's fervice, have conducted themfelves with bravery; and it was no difparagement to the British army to fay, that the German legion fhared the glory with them. At the battle of Talavera, the German legion took three ftandards. No troops had ever conducted themfelves in a more quiet, orderly, and fober, manner, and he could not find that any complaint had been made againft them. Mr. Wardle, in a motion in the houfe of commons, had propofed to difband the German legion; againft which Mr. Hufkiffon offered fufficient reafons.—A paragraph foon after appeared in the Courier, which he would read. "The mutiny amongft the local militia, which broke out at Ely, was fortunately fuppreffed on Wednesday, by the arrival of four fquadrons of the German legion cavalry. Five of the ringleaders were tried by a court-martial, and fentenced to receive 500 lathes each, part of which punishment they received on Wednesday, and a part was remitted. A *ftoppage for their knapsacks* was the ground of complaint that excited this *mutinous* fpirit, which occafioned the men to furround their officers, and demand what *they deemed* their arrears." With this paragraph, as a text to a fermon, had Mr. Cobbett headed his paper.—The Attorney-general then read the alleged libel.

"LOCAL MILITIA AND GERMAN LEGION.

"See the motto, Englifh reader! See the motto, and then do pray recollect all that has been faid about the way in which Bonaparte raifes foldiers.—Well done, lord Caftlereagh! This is juft what it was thought your plan would produce. Well faid, Mr. Hufkiffon! It really was

not without reafon that you dwelt with fo much earneftnefs upon the great utility of the foreign troops, whom Mr. Wardle appeared to think of no utility at all. Poor gentleman! he little imagined how a great genius might find ufeful employment for fuch troops. He little imagined, that they might be made the means of compelling Englifhmen to fubmit to that fort of *discipline*, which is fo conducive to the producing in them a difpofition to defend the country, at the risk of their lives. Let Mr. Wardle look at my motto, and then fay, whether the German foldiers are of no ufe.—Five hundred lathes each!—Aye, that is right! Flog them; flog them; flog them! They deferve it, and a great deal more. What! fhall the rafcals dare to *mutiny*, and that too when the *German legion* is fo near at hand! Lafh them, lafh them, lafh them! They deferve it. O yes; they merit a double-tailed cat. Bafe dogs! What, mutiny for the fake of *the price of a knapsack*! Lafh them! flog them! Bafe rafcals! Mutiny for the price of a goat's skin!—And then, upon the appearance of the *German foldiers*, they take a flogging as quietly as fo many trunks of trees!—I do not know what fort of a place Ely is; but I really fhould like to know how the inhabitants looked one another in the face, while this fcene was exhibiting in their town. I fhould like to have been able to fee their faces, and to hear their obfervations to each other at the time. This occurrence at home will, one would hope, teach *the loyal* a little caution in fpeaking of the means which Napoleon employs (or rather, which they fay he employs) in order to get together and to difcipline his confcripts. There is fcarcely any one of thefe loyal perfons, who has not, at various times, cited the *hand-cuffings*, and other means of *force*, faid to be ufed in drawing out the young men of France; there is fcarcely one of the loyal, who has not cited thefe means as a proof, a complete proof, that the people of France *hate Napoleon and his government*, affift with *reluctance* in his wars, and would *fain fee another revolution*. I hope, I fay, that the loyal will, hereafter, be more cautious in drawing fuch conclufions, now that they fee that our *galant defenders* not only require phyfical reftraints in certain cafes, but even a little blood drawn from their backs, and that, too, with the aid and affiftance of *German troops*. Yes; I hope the loyal will be a little more upon their guard in drawing conclufions againft Napoleon's popularity. At any rate, every time they do, in future, burft out in execrations againft the French for fuffering themfelves to be 'chained together and forced, at the point of the bayonet, to do military duty,' I fhall juft re-publish the paffage which I have taken for the motto to the prefent fheet. I have *heard* of fome other pretty little things of the fame fort; but I rather choofe to take my inftance (and a very complete one it is) from a public print notoriously under the fway of the miniftry."

Mr. Cobbett defended himfelf; and the jury returned a verdict of *guilty*.—On the 9th of July following, the Attorney-general prayed judgment againft Mr. Cobbett, which was as follows: "That you, William Cobbett, do pay a fine to the king of 1000l. that you be imprifoned in his majesty's gaol of Newgate for the fpace of two years; that, at the expiration of that time, you enter into a recognizance to keep the peace for feven years, yourfelf in the fum of 3000l. and two fureties in the fum of 1000l. each. And, further, that you be imprifoned till that recognizance be entered into, and that fine paid."

Upon this fevere fentence we fhall juft obferve, that the difcuffions which took place about this time, in the parliament and elfewhere, upon the fubject of flogging in the army, have at length caufed that punifhment to be much lefs frequent; and it feems to be now underftood that a man cannot legally be brought out a fecond time under the fame fentence, to have his wounds torn open afrefh.

About this time, in purfuance of a petition to the houfe of commons from the trustees of the British Mufeum, Mr. Greville's minerals were valued by Drs. Babington

and Wollaston, C. Hatchett, esq. and four other gentlemen, who reported, that the whole collection consisted of about 20,000 specimens; that the series of crystallized rubies, sapphires, emeralds, topazes, rubelites, diamonds, and precious stones in general, as well as the series of the various ores, far surpassed any that were known to them in the different European collections; and that the value of the whole was 13,727*l.* including that of the cabinets, which cost 1600*l.*

On the 23d of July, the earl of Northesk and sir Richard Strachan received, at the Mansion-house, the swords voted to them by the city of London. They were accompanied by earl St. Vincent. Appropriate speeches were made by the chamberlain, and answered by the admirals. After this ceremony, they staid and dined with the lord-mayor.

On the 14th and 15th of August, the metropolis and its neighbourhood were visited by a tremendous thunder-storm. At two o'clock in the afternoon it appeared as if a cloud burst over the metropolis, and discharged in the course of a minute a profusion of water: this was succeeded by a shower of very large hailstones, which broke several windows, and much glass in the gardens south-west of the town. The flashes of lightning succeeded in the most rapid succession; and, from the clouds being so low, the air was so strongly impregnated with sulphur as to become quite offensive. About a mile beyond Kilburn Wells, a brilliant ball of fire passed rapidly along, which had a sublime and awful effect: the Watford coach was coming to town at the time, and the coachman and a female passenger were struck down by the lightning; the hand of the woman was very much hurt, and the ring on her finger was melted; a team which was near the coach had one of the horses killed, and a woman in the cart struck down by the lightning. An aged man, working in the garden of Mr. Sneathe, in the Edgeware-road, was struck blind by the lightning. Three men were struck by the lightning on Bexley Heath, one of whom was killed, and his watch-case melted. At Ditton, a barn filled with corn was burnt by the lightning. At Hampstead and Highgate the claps of thunder resembled the firing of heavy artillery. The tempest extended to most parts of Kent; and two gentlemen were killed near Canterbury while taking shelter under a tree. But the greatest damage was produced by the rain: in many parts, the streets were impassable; and the property of the inhabitants in their kitchens and cellars received much injury. Westminster-hall presented an unusual appearance: the water overflowed the sewer at the back of the Exchequer coffee-house, and soon covered the lower part of the hall. Boys were stationed with brooms to sweep away the inundation; but the stench produced by the overflow made the place uncommonly disagreeable to those who attended on business. The convulsions, which prevailed at intervals, frequently occasioned a momentary suspension of the proceedings in the courts, as the lightning had a peculiar effect on the eye-sight.

On the 4th of September, at six in the morning, a fatal duel was fought on Wimbledon Common. Mr. George Payne, who was killed, was the younger son of the late René Payne, esq. who left him his fortune, to the amount of 14,000*l.* a year. The cause of the fatal duel is truly melancholy. The orphan daughter of the late Dr. Clark, of Newcastle, was the friend of Mrs. Payne, and a visitor in the family. An unfortunate attachment took place between Mr. Payne and Miss Clark, which the irritated feelings of her brother forced him to resent. Every means were tried by Mr. John Payne, the elder brother of the deceased, to avert the catastrophe, but in vain. Mr. George Payne was most exemplary in all his conduct through life, except in this fatal attachment. He was a most liberal and most amiable man. He had whispered to his second, Mr. Abbott, that he should not return Mr. Clark's fire; but the first shot was mortal. Mr. Clark effected his escape.

On the 3d of October, the coffer-dam at the Limehouse

entrance of the West-India docks, erected for the purpose of keeping out the water, while the building of the wing-wall of the lock was going on, gave way. At nearly high water in the afternoon, the workmen employed in excavating the earth for the foundation, having observed the water to burst underneath the piles, were ordered to remove immediately from the dam. The confidence however reposed in its security, from the immense strength of the braces, &c. was such, that hopes were entertained that it would not entirely give way. But in a few minutes the piles (which were upwards of thirty feet long) were forced perpendicularly into the air; the water of course filled the dam, and the effects were immediately felt in the basin, though not to the extent that might have been expected. Fortunately no lives were lost. The situation of the dam was so much exposed, that not less than from thirty to forty vessels passed every tide. Many of these, in passing, (notwithstanding every exertion on the part of the dock-master,) came with a severe craft against the dam; and from this circumstance, and the pressure of about fifteen hundred thousand tons of water, the blowing up of the whole was not to be wondered at.

To our antiquarian readers the following anecdote will not be unacceptable. The workmen employed, in the beginning of November, to repair the church of St. Mary, Aldermanbury, discovered the remains of the notorious chancellor Jefferies. A large flat stone was removed near the communion-table; and in a vault underneath the men found a leaden coffin containing the body. The coffin did not appear to have suffered much decay. It was closed, and a plate remained on it, inscribed with the name of Chancellor Jefferies. His son and daughter are also buried in the same vault. The coffin was not opened; and, after public curiosity had been gratified, it was replaced in the vault, and the stone fastened over it.

We have had, in the course of this article, several occasions to notice the hoaxes played on the credulity of the public. The following instance is most egregious, and ought to be recorded to give future readers an idea of the humour of the present times, and put our cotemporaries under their guard.—On the 26th of November, by nine in the morning, the house of Mrs. T. a lady of fortune, at No 54, Berners-street, was beset by dozens of tradespeople at one time, with their various commodities; and such crowds had collected as to render the street impassable. Waggoners laden with coals from the Paddington-wharfs, upholsterers' goods in cart-loads, organs, pianofortes, linen, jewellery, and every other description of furniture, were lodged as near as possible to the door, by anxious tradespeople attended by a laughing mob. About eleven the lord-mayor arrived in his carriage; but his lordship's stay was short, and he was driven to Marlborough-street police-office. At the office his lordship informed the sitting magistrate, that he had received a note, purporting to have come from Mrs. T. which stated that she had been summoned to appear before him, but that she was confined to her room by sickness, and requested his lordship would do her the favour to call on her. Berners-street at this time was in the greatest confusion, by the multiplicity of tradesfolks, who were returning with their goods, and spectators laughing at them. The officers belonging to Marlborough-street office were immediately ordered out to keep order; but it was impossible for a short time. The first thing witnessed by the officers was six stout men bearing an organ, surrounded by wine-porters with permits, barbers with wigs, mantua-makers with band-boxes, opticians with their various articles of trade; and such was the pressure of tradespeople who had been duped, that at four o'clock all was still in confusion. Every officer that could be mustered was enlisted to disperse the people; and they were placed at the corners of Berners-street, to prevent more persons from advancing towards the house with goods. The street was not cleared till a late hour; as servants of every denomination, wanting places, began to assemble at five o'clock. It turned out that letters had been

been written to the different tradespeople, which stated recommendations from persons of quality. This hoax exceeded by far that in Bedford-street, a few months before; for, besides a coffin, which was brought to Mrs. T.'s house, made to measure, agreeable to letter, five feet six by sixteen inches, there were accoucheurs, tooth-drawers, miniature-painters, and artists of every description.

On the 10th of December, a very melancholy accident happened in Swan-yard, near Drury-lane. At the head of Swan-yard several houses had been pulled down; but the corner-house was left standing, and was occupied by families from the top to the bottom. A large stack of chimneys belonging to this house, having lost its former support and protection, gave way about six o'clock at night, and, falling in upon the roof, brought the whole down through all the floors successively. A man named Anderson, and his wife, in the third floor, were carried down with the ruins, and almost literally crushed to pieces: about half an hour afterwards they were dug out of the ruins, but without any signs of life: their son, a boy about twelve years of age, was carried also down by the ruins, but escaped nearly unhurt. The father and mother were found locked in each other's arms, and in a state completely mangled; the father was an old soldier, who, in the field of battle, had had many a hair-breadth escape. Another man lost his life, whose body was not found till some days after.

The following mysterious and sacrilegious robbery reminds us of Horace's expression: *Omne sacrum rapiente dextra*; "Nothing's too sacred for their plund'ring hands." On Saturday night the 22d, or early on Sunday morning, St. Paul's cathedral was robbed of the whole of the church-service of plate, of considerable value. The ingenuity required to get at the property, proves the depredators to have been complete masters of their profession. The plate carried off consisted of the following articles, all silver gilt: One large embossed chased waiter, with the emblems of the Lord's Supper, weight 128 ounces; the covers of a large folio bible, richly chased, 110 oz. ditto of a prayer-book, 100 oz. a large plain salver, with an angel's head engraved in the centre, 108 oz. a smaller salver, engraved with a glory, 67 oz. two rich chased waiters, with very fine alto-relievo figures, occasionally to use in the centre, 153 oz. two very large chased altar-candlesticks, 330 oz. two smaller candlesticks, 200 oz. two very large rich chased flagons, 260 oz. two smaller flagons, 130 oz. two chased chalices, with hexagon feet, and two salvers for the covers, 112 oz. two small salvers richly chased, 31 oz. and one pierced spoon. Several of these articles had been used on the 21st, at a private ordination, and, when done with, were locked up in the plate-room, immediately over the vestry, in iron chests, which had on them padlocks as well as other locks. There are two doors to the room, an inner and outer one; the former was entirely iron, the other plated, and of uncommon strength. To these principal doors there are several passages leading, all of which have doors always locked, through which persons must pass before they reach the plate-room; and it is only known to a few persons to what apartment they lead. All these doors remained locked; and it was not until Sunday morning, when the plate was wanted for the church-service, that the robbery was discovered. The person who had the plate under his care opened the passage-doors with the keys belonging to them; but the lock of the main-door he could not open until he had procured the master-key. He then found that the chests containing the plate had been broken with an iron crow, or some such instrument, after the padlock had been opened in the usual way. Notice was immediately given at Bow-street; and Mr. Read the magistrate, and Mr. Stafford the clerk, went and inspected the apartments, &c. The police-officers were of opinion, that the robbery was what is called, in the slang language, a *put-up robbery*; or that the quantity and value of the plate, the place where it was kept, and the way to get at it, were all previously

well known, and the crime committed by persons perfectly acquainted with the place. The plate had lately been newly double gilt, which gave it the appearance of gold. The robbers must have passed nine doors or gates before they could get at the property. The master-key was kept in a closet where one of the vergers usually placed his silver staff; but that was not stolen, although it is supposed the key was used to effect the robbery. It appeared, upon further inquiry, that there was a master-key to all the doors leading to the room wherein the plate was deposited; and that it was not unusual for that key to be publicly shown to any person who might express a wish to see or examine it. The officers of police have no doubt but that by means of taking an impression of the key in wax, the robbers gained access thereto.

On the 25th of October, a court of common-council was held, to receive the report of the committee appointed to consider of the propriety of extending the time allowed for the election of aldermen (three days) to eight days, and for increasing the sum necessary for qualifying a person to take that office upon him, from 10,000l. to 30,000l.

On the 31st of the same month, a very full court of common-council met for the purpose of taking into consideration the following motion, of which Mr. Jacks had given notice: "That a bust of our most excellent sovereign George III. be placed in the council-chamber of this city, as a grateful testimony, to descend to the latest posterity, of the high sense this court entertains of the manifold blessings enjoyed under his paternal reign; in which, during the long period of fifty years, continued in the most eventful times, and under the most arduous circumstances ever recorded in history, Britons have the proud satisfaction to feel, that, amid the wreck of surrounding nations, their beloved country has preserved its laws, its religion, its liberties, and its independence, unimpaired." This resolution was, in the issue, changed to an order for a whole-length statue.

Alas! at this moment his majesty was unconscious of the respect that was paid him, and of the veneration in which he was held.—On the 1st of November, the lord-mayor received a communication from Mr. Ryder, secretary of state for the home-department, informing his lordship, that, in consequence of the continuing indisposition of his majesty, no new chief magistrate of the city could be submitted for the royal approbation, and that in consequence his lordship would be expected to continue in the discharge of the duties of that high office until his majesty's pleasure could be taken on the appointment of his successor.

The cause of this notice was, the melancholy recurrence of that dreadful calamity which has repeatedly visited our worthy and revered monarch, and is now considered to be incurable. The present and permanent attack originated in an excess of filial tenderness and parental affection.—The parliament had been prorogued to the 1st of November; on which day a proclamation was issued, as by the king in council, stating it to be his majesty's pleasure that it should be further prorogued. This proclamation, which was not of itself sufficient for the prorogation of parliament, was to be followed, of course, by the usual commission, signed by the king, and read in the house of lords by commissioners appointed for that purpose. But the royal sign-manual was not to be obtained. The parental and tender heart of the king was wrung with inexpressible grief and anguish, at the protracted sufferings which terminated, November the 2d, in the death of his youngest and favourite daughter, the princess Amelia. His whole soul was absorbed in the sufferings and fate of one who had always returned his parental affection with exquisite sensibility and duty. He could not think or speak of any thing else. The powers of his understanding were impaired; and the mental malady, under which he had laboured in 1788, returned. Committees were appointed by both houses of parliament for the examination of physicians, who were examined accordingly, on the state of his majesty's health. In this, and in other necessary points, they

they were guided in their proceedings by the precedent of the year 1788.

After various adjournments, in the vain hope of some favourable turn in the king's malady, at length, on the 20th of December, Mr. Perceval thought fit to move, in the house of commons, three resolutions: the first declarative of the incapacity of the sovereign; the second, on the competency of the two houses of parliament to supply that incapacity; and the third, that the proper mode of doing it would be by bill. Of these, the 1st passed unanimously; the 2d with the single negative of sir Francis Burdett; but on the 3d Mr. Ponsonby moved an amendment, "That an address should be presented to the prince of Wales, praying him to take upon himself the office of regent." On this motion a division took place, in which the amendment was rejected; the votes for it being 157, against it 269; majority for the minister, 112. In the house of lords the same resolutions were proposed, and carried, after a similar amendment had been moved on the third, and rejected; the division being, contents 74, non-contents 100; majority, 26. The assent of the lords to the resolutions having been announced to the commons on the 31st, Mr. Perceval moved five separate propositions as the basis of an intended bill for regulating the office of regent. Of these, the first appointed his royal highness the prince of Wales, regent, under certain restrictions and limitations; by the second he was restrained from conferring the rank of peerage for a time to be determined; by the third, from granting offices in reversion, or places or pensions for a longer term than during the royal pleasure; the fourth made regulations respecting the king's private property; and the fifth related to his household, vesting the management of it in the queen.

The first stand made by the opposition was against the leading proposition, "That the regent should be laid under certain restrictions;" the hon. Mr. Lambie moving an amendment upon it, "That the entire royal power should be conferred upon him, without any restrictions." In this debate the same ground was gone over again as on the occurrence in Mr. Pitt's ministry, with the same result, the amendment being negatived by 224 against 200; but the smallness of the majority indicated that the ministers began to totter in their seats. The views of the two parties at this period are easily understood. The opposition contemplated the establishment of the regency as the conclusion of the present administration, the members of which were avowedly destitute of the prince's confidence; they therefore naturally wished to put into his hands as much power as possible, and resisted every restriction which would operate as a limitation of that influence and authority to which they expected to succeed. The ministry, on the other hand, borne up by the prospect of the king's speedy recovery, an event which his physicians represented as little less than certain, were chiefly intent upon the means for facilitating his resumption of the regal office, and in the mean time retaining a portion of the influence attached to the possession of court-favour. It was therefore their policy on one hand to restrict the regent in the distribution of his graces, and on the other to establish a counterpoise to the authority necessarily conferred upon him, in the household-appointments left at the disposal of the queen.

1811. The early days of January were consumed in long debates as to the mode to be pursued for the issue of money from the exchequer for the use of the army and navy. It was obliged to be decided according to the exigency of the case; but was not effected without a protest of twenty-one lords in the upper house.

The relation of the proceedings in the two houses during the debates on the several clauses of the regency-bill is involved in singular perplexity, resulting from the fluctuations of party and the vacillations of opinion, whence proceeded a variety of amendments and re-amendments, admitted in one house, and rejected in the other, according to the prevalent feelings of the day. In several of the contested points

the ministers were defeated; and at one time it seemed probable that the proposed restrictions would be in great part annulled; but at the actual passing of the bill it appeared that they had recovered their ground, a circumstance that may reasonably be attributed to the flattering reports of the king's progress in amendment, which excited sanguine expectations that a very short period would intervene before he would be in a capacity for resuming the royal authority. It was doubtless recollected, that in 1789 a recovery had taken place while parliament was still occupied with discussions concerning a regency-bill; and a majority looked forward rather to the revival of the present administration than to the temporary transfer of power to a new one. After, therefore, the draught of the proposed bill had undergone some inconsiderable alterations, it was presented to the queen and the prince of Wales for their acceptance, which was signified by those personages by their separate answers addressed to both houses jointly. In that of the prince, a regret was delicately expressed that he had not been allowed the opportunity of manifesting, by his conduct, what were his reverential feelings towards his father and sovereign; and he accepted the office of regent, restricted as it was, "still retaining every opinion expressed by him on a former occasion."

According to the plan adopted by the ministers in conformity to the precedent of 1789, the great seal was affixed to a commission for the opening of parliament, which ceremony took place on January 15th; and on the 17th the regency-bill was committed. Its clauses underwent fresh discussion in its passage through the two houses; and various amendments were proposed by the opposition, but were negatived by the ministerial majorities. The last stand was made upon the duration of the restrictions, which lord Grenville attempted to reduce from twelve months to six, but without success.

Both houses being finally agreed on the clauses of the regency-bill, the great seal was affixed to it by commission; and on February the 5th it received the *royal assent*, if so it may be called. Strong protests were however made to the last by the opposition-members against the fiction employed of signifying the king's assent by the great seal to an act founded on that very incapacity which disabled him from performing any legislative function; and the expedient was condemned in unqualified terms as fraudulent and unconstitutional. On the other side it was not denied that there existed an irregularity in the case; but it was contended that the peculiar circumstance occasioning the suspension of the royal authority, for which no legal provision had been made, rendered some irregularity unavoidable, and that the application of the great seal was the least that could be devised. The speech which on this question appeared to make the greatest impression was that of Mr. Abbott, speaker of the house of commons, who had hitherto taken no part in the debates, and whose station and character gave the stamp of importance and impartiality to his opinion.

Of the clauses in the regency-bill, the most important of those relating to the regent himself are the following:—He is to exercise, in the name of his majesty, the royal authority belonging to the crown. He is to be deemed a person holding an office in trust, and is to conform to the statutes relating to persons under that circumstance: he is restrained from granting peerages or summoning heirs-apparent, or appointing to titles in abeyance; likewise from granting offices in reversion, or for a longer period than during pleasure, except those which by law are granted for life, or during good behaviour, and except pensions to the chancellor, judges, &c. These restrictions to continue till after the 1st of February, 1812, and then to determine, provided parliament shall be then assembled, and have been sitting six weeks previously.

With respect to the queen, the act vests in her the care of his majesty's person during his indisposition, with the sole direction of such portion of his household as shall be deemed requisite for due attendance on his person, and

the maintenance of his royal dignity, and the full power of nominating to all vacancies of officers of his household, with the exception of the lord-chamberlain, the gentlemen and grooms of the bed-chamber, the equerries, the captain of the yeomen of the guards, and the captain of the band of gentlemen pensioners. Her majesty to be assisted by a council, the members of which are named in the bill; and, in case of their death or resignation, she has authority to nominate others from among the members of the privy-council.

Some provisions were made, at the same time, for the eventual case of his majesty's being restored to mental health and power; but this was placed entirely in the hands of the queen and her council, no public body being invested with a power of enquiring into the fact of his recovery. As an examination by both houses of parliament preceded the declaration of the king's incapacity, it may seem incongruous that the very momentous circumstance of restoring him to his high functions should be decided upon by a kind of secret junta; and, although the characters of its members in the present instance precluded all suspicion of collusion, yet it may perhaps be wished that such a precedent had not been established for future times.

The feelings of the regent on his accession to power were soon made known in a way the nation had not been prepared to expect. It was announced that the present ministers were to be continued in office. As the restrictions imposed upon him, though some diminution of his influence, by no means prevented him from effectually supporting an administration of his own choice, it was obvious that some other cause had produced this unexpected determination. And it cannot be doubted that the expected short term of the regency operated as well to disincline the prince to the delicate and somewhat-invidious task of marking out the members of a new ministry, as to render the persons themselves who possessed his confidence unwilling to come forward and take upon them, at such a critical period, the burthen and responsibility of offices which they were likely to hold for so short a time. In a letter which has been made public, as that by which his royal highness apprised Mr. Perceval of his intention not to remove from their stations those whom he found in them as his majesty's official servants, he explicitly declares, "that the irresistible impulse of filial duty and affection to his beloved and afflicted father leads him to dread that any act of the regent might, in the smallest degree, have the effect of interfering with the progress of his sovereign's recovery; and that this consideration alone dictates the decision now communicated to Mr. Perceval."

That his royal highness really regarded his situation as that of the ceremonial rather than the efficient head of the state, was apparently indicated by his declining to open the parliament in person; and delivering by commission, on Feb. 12, a speech in no respect different (except in as far as it touched upon the circumstance of the regency) from that which the ministry would have dictated had the king still been sitting on the throne. The customary addresses, in echo to the speech, were moved in both houses, objected to, commented upon, defended, and then passed *nem. diff.*

An address, however, of a very different complexion, from the lord-mayor, aldermen, and commons, of the city of London, was presented to the regent on the 24th of February. It was, in fact, a strong remonstrance, respecting the insult lately received by the corporation of London, through the ministers of the crown; the grievances and distresses undergone by the country in general; the criminal deception practised by ministers in carrying on the government by the royal authority during his majesty's incapacity; the restrictions laid upon his royal highness by the regency-bill; and the defects of the representation in parliament. The regent's answer was guarded and general: the feelings suggested by his situation were however expressed, where he assured the addressers, that

"the happiest moment of his life would be when by the blessing of Providence he should be called upon to resign the powers now delegated to him, into the hands of his beloved and revered father and sovereign."

Another proof of the manner in which the regent viewed the temporary authority with which he was invested, was afforded in a communication made to the house of commons, Feb. 21, by the Chancellor of the Exchequer, stating, that his royal highness, on being informed that a motion was intended to be made for some provision for the regent's household, declared that he would not, for his own personal magnificence, add another burthen to those already imposed on the nation. The fact was further explained by Mr. Adam, who said, that the regent put into his hands the letter from Mr. Perceval, mentioning the intended provision, accompanying it with written instructions, that, should any proposition for an establishment, or a grant from the privy purse, be made to the house, he should inform that assembly, that his R. H. declined it; and that, during a *temporary regency*, he would not accept that which ought to belong to the crown.

The commercial distresses of the nation began to be so sensibly felt, that the attention of government was necessarily drawn to them; and, on the 1st of March, the Chancellor of the Exchequer moved for a committee to consider the present state of commercial credit. He said that various applications had for some time been made to him on the subject, which at first did not seem to demand serious attention; but that of late they had become so numerous, and were supported by such authorities, that he thought it expedient to bring the matter before the house. He accordingly proposed the appointment of a committee of twenty-one members, which was then nominated, and comprised the individuals most distinguished for commercial knowledge, taken indifferently from both sides of the house. On the 7th of March, the first report of the committee was brought up. It began with stating three points to which they had thought proper to direct their attention:—1st, the extent of the difficulties and embarrassments at present experienced by the trading part of the community; 2dly, the causes to which the same might be ascribed; 3dly, the expediency, with a view to the present and future interests of the merchants and manufacturers, of affording any assistance by parliament. The committee then refer to memorials presented to the treasury-board from the cotton-manufacturers of Glasgow and Paisley, and to the representation of a meeting held in London on the 12th of February; the statements of which they had found, upon the examination of evidence, to be founded on fact; and whence they drew the conclusion, that the principal part of the distress complained of had arisen out of great and extensive speculations, which commenced upon the opening of the South-American markets in the Brasils and elsewhere. (See p. 164, 170.) The committee also found that great distress occurred in a quarter much connected with this trade, viz. among the importers of produce from the foreign West-India islands, and from South America; a great proportion of the returns for the manufactures exported to those parts of the world coming home in sugars and coffee, which not being entitled to sale in the home-market, there were no immediate means of realizing their value. Another cause which might be considered as connected with and aggravating the existing distress, was the extent to which the system of warehousing the goods of foreigners, as well as of native merchants, for exportation, had been carried. Upon the whole, the committee stated, "that the embarrassments at present experienced are of an extensive nature; and that, though many circumstances create a great difference between the present period and that of 1793, yet that the distress is of such a nature as to render parliamentary relief highly expedient and necessary, and likely to be productive of extensive and important benefit; and, having considered the happy effect of the relief afforded in 1793, they recommend similar provisions to be adopted

in the present case; and that the amount of exchequer-bills to be issued should not be less than, nor exceed, 6,000,000*l.* to be repaid by equal payments from three months to three months, the first not commencing till the middle of January next."—After several speakers had given their opinions on the subject, in which some expressed a doubt whether any good at all would result from the proposed measure, and none regarded it as more than a remedy for some temporary distress, the resolution was agreed to without a division; and a bill founded upon it was finally passed. But its effect appears to have been inconsiderable in relieving the distresses for which it was meant as a remedy. The sums applied for were even to a less amount than the provision made; for not many of those in embarrassed circumstances were able to furnish the required security; and the radical cause of the evil was of a nature which such relief was not at all calculated to remove. In fact, the commercial distresses went on increasing during the whole year, displaying themselves by frightful lists of bankrupts in every Gazette, amounting to an aggregate to which no former year exhibits a parallel.

Ever alive and most eager to purify and correct our code of criminal laws, sir Samuel Romilly rose on the 21st of February to renew his exertions relative to the subject, (see p. 174.) and moved for leave to bring in a bill to repeal so much of the act of the 10th and 11th of William III. as takes away the benefit of clergy from persons privately stealing from ships, warehouses, coach-houses, and stables. This motion was agreed to, and also a similar one for a bill to repeal the capital part of the punishment for stealing privately on navigable rivers and canals. These and other bills brought in by sir Samuel Romilly, were all passed in the commons. Three of the bills sent up to the house of lords were thrown out; but the two relating to stealing from bleaching-grounds in Ireland and England, passed without opposition. See the article LARCENY, vol. xii. p. 241, 2.

The severity and disgracefulness of the punishment by flogging in the British army had frequently been a subject of animadversion as well in parliament as from the press; and, though government had shown itself very sore on the subject,—though Cobbett, Hunt, and Drakard, had been prosecuted for the manner in which they had exposed this practice in their addresses to the public,—yet an impression had been made which it was apparently thought unsafe to disregard. When, therefore, the mutiny-bill was passing through the house of commons, on the 11th of March, Mr. Manners Sutton proposed an amendment to give a power to courts-martial to inflict the punishment of imprisonment in the place of corporal punishment, when they should judge proper. The clause was adopted with general concurrence; and this acquisition to the interests of humanity may fairly be numbered among the benefits resulting from public discussion by means of the press, however reluctant persons in power may be to listen to such a monitor.

The closing of the foreign markets against us having caused a vast quantity of sugar to remain on hand, the Chancellor of the Exchequer declared his purpose of making the distillery productive of some relief to the colonial planters; and on May the 9th he obtained leave to bring in a bill for exonerating the distillers of spirits from sugar from the excess of duties to which they were liable, in consequence of the expiration of the act of the 48th of Geo. III. above the duties imposed by the said act. This bill was brought in, and read for the first time, and ordered to be read again on the following day. The minister then gave notice, that on the morrow he should move for a bill to lay a duty on the distillation on grain, in the same manner as if this bill had passed. It was also his intention, in correspondence with these duties, to propose a remission of duty on spirits made at home, in order to put them on a level with foreign spirits; and also, an alteration in the spirit-intercourse between this country

and Ireland, and a countervailing duty on the spirits of the latter country. These proposals he introduced on the 10th, the house being in a committee of ways and means; and, after some conversation on the subject, his resolutions were agreed to. Bills were at length passed by both houses relative to these objects.

A message from the prince-regent on the subject of granting additional relief to Portugal having been sent to parliament, the Chancellor of the Exchequer, on March 18th, the house of commons being in a committee of supply, rose to introduce it to the attention of the members. He said, that, although the proposition which he had brought forward last year on the same subject had incurred some opposition, and though the grant he now meant to submit to the committee amounted to a considerable increase beyond the sum then voted, he conceived, that under the present circumstances it was not likely that his motion should be objected to. He then proceeded to advert to the happy effects which had ensued from the employment of Portuguese troops in British pay, and under British officers and discipline, and to show that it had not relaxed the exertions of the Portuguese government. He dwelt at large on the advantages which had accrued from carrying on the campaign in Portugal; on the frustration of the enemy's confident expectations of expelling the British army from that country; and on the hopes for the future that might be entertained from a vigorous persistence in the same plan; and concluded with moving, "That a sum not exceeding two millions be granted to the prince-regent, to enable him to take a certain number of Portuguese troops into British pay, and to afford such further assistance to the Portuguese nation as the circumstances of the campaign may render necessary."—Mr. Ponsonby opposed the motion; but, after a short debate, it was carried without a division. The same success awaited the motion in the house of lords.

Among the various measures by which, during the progress of the French revolution, the dissemination of principles considered as dangerous to the British constitution had been repressed, one was an act of parliament obliging all printers to put their name and place of abode at the beginning, and, if more than one leaf, at the end, of every paper or book, of whatever kind, that they should print. On failure, they were subjected to a penalty of twenty pounds for every single copy of such paper or book. That this bill was passed in the haste and precipitation of alarm, was manifest from the enormity of the penalty imposed upon defaulters, which might arise to a sum absolutely ruinous even to a considerable property, and that when the crime might be nothing more than mere negligence. The body of printers had submitted in silence to this hardship, thinking themselves secure in the intention of not offending; till some instances had occurred of prosecutions instituted by informers on the most trifling deviations from the provisions of the act, and where traps had been purposely laid for producing those negligencies. A petition was therefore at length agreed upon from the printers, book-sellers, and publishers, of the united kingdom, which was presented by Mr. Henry Martin to the house of commons, on the 4th of March. It stated, in strong but respectful terms, the grievances to which the important business of printing and publishing was exposed by the injunctions of the bill, and prayed for such relief as the house might think expedient. The penalties which might be possibly incurred by a printer, through the carelessness or malice of a servant, were calculated at 100,000*l.* and the remarkable circumstance was mentioned, that, "in every instance of prosecution that had hitherto occurred, the publication was of an innocent, or even useful, nature." The petition was ordered to be laid upon the table; and Mr. Martin gave notice of his intention to move for leave to bring in a bill to explain and amend the act of the 39th of the king relative to this subject.

On the 19th of March, Mr. Martin made his promised motion. In his introductory speech he enumerated all the provisions

provisions of the act, and dwelt upon the evils which might result, and had actually resulted, from it. Some of the cases stated were curious exemplifications of the detestable artifices practised in that trade of informing, which is too much encouraged by the imposition of heavy penalties, of which a moiety goes to the informer. In one instance, persons had gone about to different printers to procure an impression of title-pages to an Elzevir edition of Cicero's Works; many copies of which were defective in that particular; and, as the printer could not consistently put his own name instead of Elzevir's, penalties were incurred to a vast amount. In another, a printer who was employed to print proposals for a military work had, in specifying his place of abode, inadvertently omitted the word London, after that of Paternoster-row; and he was summoned to Guildhall to show cause why he should not be fined 20,000*l.* for this omission. In these and other cases, the magistrates had indeed ventured to dispense with the injunctions of the act; but it would be obviously better to give them a discretionary power by law, or grant to the parties aggrieved a right to appeal to the quarter-sessions. He concluded with moving to bring in the announced bill, in which he was seconded by Lord Folkestone; and, after a few farther observations on the subject, leave was granted.

The committal of the bill was moved for on April 5th, when the attorney-general objected to a clause in it, by which the magistrate was confined to the levying of one penalty only for every publication, however numerous the copies; asserting that, if this were to pass, the end of the law would be entirely defeated, since no man wishing to circulate a mischievous paper would be deterred by such a consideration.—Mr. Martin, in reply, observed, that all the penalties to which printers had been liable before the passing of the act in question would be still in force after this proposed amendment. He recalled to the recollection of the house the circumstance under which the act had been originally framed, which was that of the existence of seditious societies who circulated a vast number of papers, of which it was scarcely possible to discover the printers. Such societies no longer existed; the exigence therefore being at an end, it was reasonable that the bill should be repealed, or at least modified. The attorney-general himself, he believed, had found it necessary to bring in a bill to indemnify some who had violated it; and was it fitting that such a bill should be left standing on the statute-books *in terrorem*? His wish was not to innovate, but to restore the law to what it was before, with the exception of the single penalty of 20*l.* for a whole impression, if without the printer's name.—After some further discussion, the attorney-general, "in order to show how willing he was to go along with his honourable and learned friend as far as he could," proposed that the magistrate should in no case have the power of imposing more than twenty-five penalties of 20*l.* or 50*l.* It was next agreed that the magistrate should be allowed to mitigate the fine to 5*l.* that an appeal to the quarter-sessions might be entered within twenty days from the time of conviction; and that six days notice should be given to the prosecutor.—The bill thus modified was reported, and afterwards passed into a law.

On the 21st of March, lord A. Hamilton introduced a motion in the house of commons, relative to the state of the press in India. He began with saying, that his object was not to find fault with the regulations to which his motion referred, but merely that an opportunity might be afforded of knowing what were the laws in existence upon this subject, and also upon what authority they had been established. It might be urged, that, though there might be no positive law, yet long practice might be sufficient to establish an usage, and give it the efficacy of law. He could not, however, admit that any such usage could justify such regulations of the press as appeared now to exist in India, and had never received the sanction of that house. By those, as he understood, no newspaper could

be published in India which had not previously received the sanction of government, on the penalty of immediate embarkation for Europe. They also contained rules for the guidance of the secretary of the government in revising newspapers. He was to prevent all observations respecting the public revenues and finances of the country—all observations respecting the embarkations on-board ships, of stores or expeditions, and their destination, whether they belonged to the company or to Europe—all statements of the probability of war or peace between the company and the native powers—all observations calculated to convey information to the enemy; and the republication of paragraphs from the European papers which might be likely to excite dissatisfaction or discontent in the company's territories. If the press was to be prevented from publishing any thing on all these heads, he was at a loss to know what subject was left open to it. With respect to the administration of justice at Madras, it was considered as pure; yet the courts appeared to be ashamed of their proceedings, since they would not suffer them to be published. And he then stated, that two grand jurors, and three petty jurymen, had been sent away from Madras for their conduct in these courts. He concluded by moving "for copies of all orders, regulations, rules, and directions, promulgated in India since the year 1797, regarding the restraint of the press at the three presidencies of Bengal, Madras, and Bombay, whether acted upon by the government there, or sent out by the court of directors, or the board of controul."

Mr. Dundas rose to state his reasons for opposing the motion of the noble lord, not only in its present form, but in any possible shape in which it could be framed. He must say that a wilder scheme never entered into the imagination of man than that of regulating the Indian press similarly to the English. There could be but two descriptions of persons in India; those who went to that country with the license of the company, and those who lived in its actual service; and there could be no doubt whatever that the company had a right to lay any regulation it pleased on those who chose to live under its power.

Sir J. Newport could not concur in the opinions advanced, that the servants of the company were bound to abide by all the regulations of the company, or else return to England. The company might make regulations highly unjust and oppressive; and it was the duty of that house to take care that they did not.

Lord Folkestone did not call in question the right of the East-India company to make rules for their own territory; but that was no reason why the house should be kept in ignorance what these rules were. It was not only proper, but highly expedient, that we should know to what our fellow-subjects in India were subjected.

Sir Thomas Turton spoke in a strain of severe sarcasm on the principles of our government in India. He fully agreed that so delightful a plant as the liberty of the press could never flourish in the sterile soil of despotism. "Why (said he) should you give Indians the advantage of knowledge? You would only thereby be giving them the means of detecting your own injustice. You have ransacked their country, you have despoiled its people, you have murdered their princes; and of course, for your own protection, you must keep them deluded, deceived, and ignorant. You might as well talk of the liberty of the press in Morocco and Algiers, as under your government in India. According to the right honourable gentleman, the people of India are considered as nothing. If such is your principle, to keep them ignorant is as much your policy, as to keep them enslaved has been your crime."

Mr. Wallace opposed the motion, saying, that the liberty of the press was for the preservation of freedom, and that there was no freedom in India to preserve.

Mr. C. Grant observed, that we did not carry despotism to India, but found it there; and he thought the subject under discussion highly dangerous.

The Chancellor of the Exchequer objected to the production

duction of the papers, because granting them would convey an idea that there was *something wrong* in the conduct of the persons concerned, and in his opinion no case had been adduced to warrant such a supposition.
