UNITED STATES DEPARTMENT OF AGRICULTURE

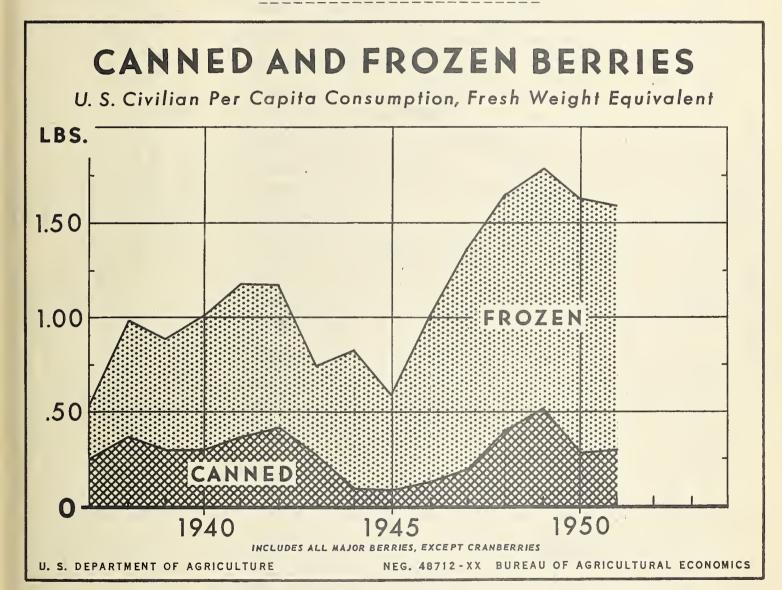

TFS-103

BAE

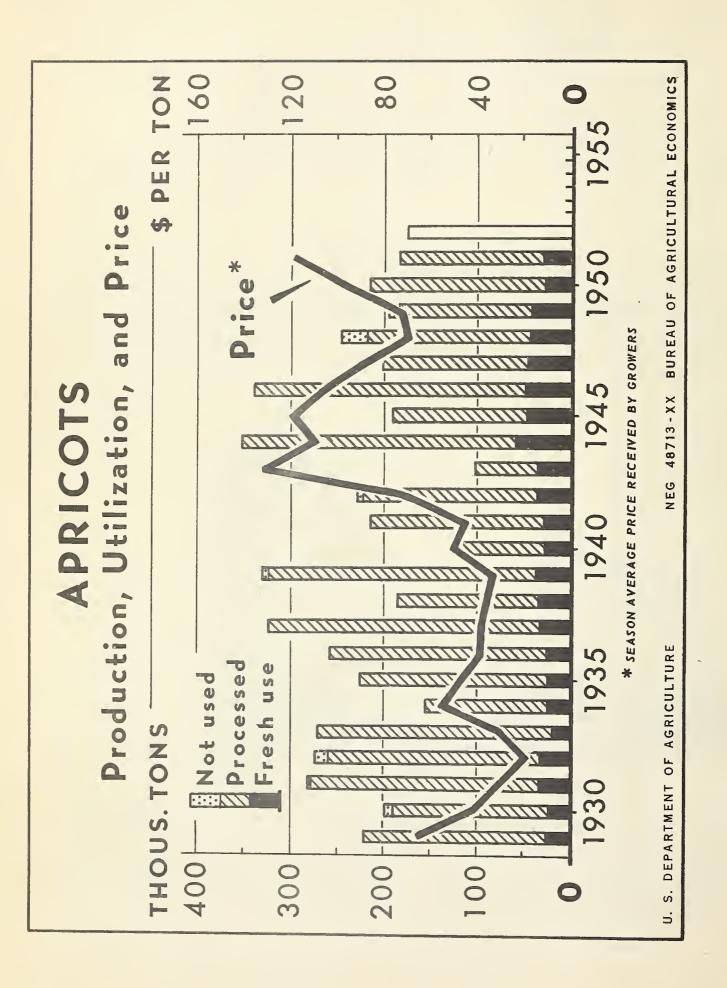

JUNE 1952

In this issue:

Production and Consumption of Berries

Per capita consumption of canned and frozen berries combined, fresh weight equivalent, tripled from 1937 to 1951. During these years, consumption of canned berries increased only slightly, but that of frozen berries increased more than four-fold. Although consumption of frozen berries was about equal to that of canned berries in 1937, it was 4 times as large in 1951.

Production of apricots in recent years has been about as large as two decades earlier. The greater part of production each year has been processed, mostly by canning, drying, and freezing. Fresh use of apricots has increased and in most

s postwar years has been about double that of 1929. Per capita on consumption has increased less markedly. Prices in most d years since 1941 have been considerably higher than in prest vious years.

and reflect toopy of the end lift or see the few areas, and

A slightly smaller total deciduous fruit crop is in prospect for 1952 than last year but stocks of canned finit are larger, military requirements for canned fruits are smaller, and demand from canners probably will be weaker Prices growers receive for deciduous fruits this season are expected to average somewhat lower than in 1951. Prospects for citrus fruit this summer are for smaller supplies of fresh oranges than last summer, about the same quantity of grapefruit, smaller supplies of canned juices and much larger supplies of frozen juices. Prices for oranges this summer probably will average about the same as in the summer of 1951. Prices for grapefruit are expected to advance seasonally.

u di Sai de Maranda da Armada do Estado (Millonga), de la la la como de la como de la como de la como de la co The 1951 crops of most of the major deciduous fruits will be smaller than last year, with sweet cherries, peaches, and pears the chief exceptions. The sweet cherry crop is expected to be much larger than in 1951, the peach crop moderately darger and the pear crop about the same

at endough and deserve this same an early for the entry of a displaced that Mostrof the peaches marketed in July will come from California and some of the Southern States where the crops are smaller than last year. Prices in July to growers for peaches from such Southern States may be higher than a year earlier. Peaches marketed in August and September will come from States where production is expected to be larger than in 1951, and prices for these peaches are expected to average under 1951 prices.

JOAC AL AL TOTAL WE NEED TO BE A SECOND Among other major fruits, lower prices than in 1951 also seem probable for sweet cherries, and pears. An important factor in the outlook is the prospect for some reduction in demand by processors. In contrast, higher prices seem likely for the small 1952 plum crop. Not at the foreign amplitude to become the first providence and the same in the

The first second with I for the first for the first of the first of the first second s

La destruction of the control of the control of the product of the first of the control of the c

With increased carry-over of high-cost canned fruits and smaller Government set-asides from the 1952 pack, demand of processors for fruit for canning is not expected to be as strong as in 1951. This not only will contribute to lower prices for some fruits for canning but also probably will result in a small reduction in total canned pack.

Although the 1952 pack of canned citrus juices in Florida is about one-fifth smaller than the 1951 pack, this reduction is considerably more than offset by a record pack of frozen citrus concentrate.

PEACHES

Increased Production in 1952

* 1 * 4 * 1 * 1 * 1 * 1

The 1952 crop of peaches in the United States is estimated as of June 1 at 69.4 million bushels, about 9 percent larger than the 1951 crop and slightly above the 1941-50 average. Prospective production in 1952 is up considerably in Washington, Colorado, Arkansas, Illinois, Michigan, Virginia, and in several of the smaller producing States. Substantial reductions are in prospect in California (clingstone crop), New Jersey, South Carolina, and Georgia. The crop in the 10 Southern early States is expected to be about 3 percent smaller than the 1951 crop and 13 percent smaller than average. Peaches from these 10 States and California provide most of the fresh market supplies during June and July. In California, the clingstone crop is down about 10 percent from the record 1951 crop but nearly 14 percent above average. But supplies are expected to be adequate for the usual requirements for canning. Light shipments of early peaches from California and Georgia began early in June.

Grower Prices for Larger 1952 Crop Expected to Average Under 1951 Prices

Demand for fresh peaches probably will be about as strong in 1952 as in 1951. But demand for clingstone peaches for canning is not expected to be as strong as in 1951. Because of smaller production, peaches marketed fresh from Georgia, South Carolina, and perhaps a few other States in July may bring higher average prices than in 1951. Much of the increased production in 1952 is in States that will market the peaches in August and September, when nearly all canning and drying is done. Prices for most peaches marketed in these two months are expected to average lower than in this time of 1951. In California, where most of the clingstone peaches are grown, grower prices for the 1952 crop probably will average much lower than in 1951, and prices for freestone peaches also may average lower. Grower prices for the entire peach crop of the United States are expected to average lower in 1952 than in 1951.

Smaller Pack of Canned Peaches Seems Probable in 1952

Prospects are for a smaller pack of canned clingstone peaches in 1952 than in 1951 because of the heavy stocks of canned peaches and also fruit cocktail of which clingstone peaches are an important ingredient. On April 1, 1952, combined packer and wholesaler stocks of canned peaches were 48 percent larger than on that date in 1951; stocks of fruit cocktail and salad were

38 percent larger. The pack of canned freestones may be about the same as in 1951. Freestone peaches are canned in many other States besides California and some of the increased production of these States probably will be canned. The total pack of canned peaches in 1952, including both clingstones and freestones; is expected to be somewhat smaller than the 1951 pack of 22.8 million cases (24-22's), which was a new record. About 84 percent of this pack was California clingstone. APRICOTS APRICOTS APRICOTS APRICOTS APRICOTS

The transport of the second transports.

Production Slightly Under Relatively Small 1951 Crop

The 1952 crop of apricots in California, Washington, and Utah is estimated as of June 1 at 175,500 tons, 4 percent smaller than the 1951 crop and 23 percent below the 1941-50 average. The 1952 crop is the smallest since 1943. A large reduction in California plus a small one in Utah more than offset a substantial increase in Washington.

14. 15. 15.

No Higher Than 1951 Prices Prices for 1952 Crop May Average

The carlot rail movement of new-crop apricots from California started the last week of May and increased rapidly in early June. Prices for California apricots on the New York City auction averaged considerably higher during the first 2 weeks in June 1952, than in the same weeks of 1951. But grower prices for the entire 1952 crop may average no higher than prices for the 1951 crop. Demand for apricots for canning may not be as strong as in 1951, mainly because of the large stocks on hand. On April 1, 1952, combined packer and wholesaler stocks of canned apricots were about 53 percent larger than the relatively small stocks on that date in 1951. The 1952 pack probably will be somewhat smaller than the 1951 pack of about 4,6 million cases (24-21's), the largest in the last decade except for 1948, 1946 and 1944. In contrast to the prospects for a smaller packlof canned apricots, the 1952 pack of dried apricots probably will be larger than the small 1951 pack. (See also the chart inside of front cover.

CHERRIES

Larger Than in 1951 The 1952 crop of sweet, cherries is estimated as of June 1 at 106,030 tons, 48 percent larger than the 1951 crop and 15 percent larger than the 1941-50 average, Production is up sharply in 1952 in the important cherry producing States of California, Oregon, Washington, Idaho, and Michigan. But it is down considerably in New York.

Carlot rail movement of the California crop got under way early in May. By early June, shipments to fresh markets were nearly double the rate of a year earlier. On the Chicago auction market, prices for the first shipments

were seasonally high, in some weeks averaging above comparable prices in 1951. With the sharp increase in shipments in early June, prices dropped somewhat under 1951 levels. Market supplies are expected to be very large during late June as shipments from the Pacific Northwest reach heavy volume, resulting in seasonally low prices. Grower prices for the large 1952 crop probably will average considerably under 1951 prices.

Stocks of canned sweet cherries held by packers and wholesale distributors on April 1, 1952 were about the same as a year earlier. With the crop larger and prices lower than in 1952, more cherries probably will be processed than last year. In 1951, about 900 thousand cases (24-22's) were canned, 21 percent larger than the 1950 pack, but 46 percent under the large 1949 pack.

Sour Cherry Production Slightly Under 1951 Tonnage

Production of sour cherries in 1952 is estimated at 148,070 tons, 6 percent smaller than the record tonnage in 1951 but 50 percent larger than average. Prospective production is up slightly in Wisconsin. But it is down slightly in Michigan, the leading State, and down also in other important States. The above estimate for 1952 is based on the June 15 condition of the crop in Michigan, New York, Wisconsin, Pennsylvania, and Ohio and on the June 1 condition in other States.

The 1951 packs of canned and frozen sour cherries were nearly as large as the record 1950 packs. On April 1, 1952, combined packer and wholesaler stocks of canned sour cherries were about as large as on that date in 1951. Stocks of cherries in cold storage May 31 were 5 percent larger than a year earlier. Demand for sour cherries for canning and freezing, the two major outlets, is not expected to be as strong as in 1951. Hence, grower prices for the 1952 crop probably will average about the same as for the 1951 crop. At these prices, about as many cherries are likely to be canned as in 1951, but fewer will be frozen.

PEARS

Prospective Crop About Same Size as 1951 Crop

On June 1, the outlook was for a crop of about 30.2 million bushels of pears in 1952, about the same as the near-average crop in 1951. In the Pacific Coast States, the prospective Bartlett crop of 18.8 million bushels is slightly smaller than the 1951 crop. But the crop of 6.5 million bushels of other varieties, mostly winter pears, is slightly larger. In most other States, production is not expected to differ greatly from 1951.

Prices for 1952 Crop May Average Under Relatively High Prices for 1951 Crop

Grower prices for pears in July probably will average above the unusually low prices of July 1951. But later in the summer as the movement of pears to fresh markets and processors becomes heavy, prices exe likely to be under

corresponding prices in 1951. Although demand for pears for fresh use is expected to be about as strong as in the summer of 1952, demand for pears for processing may not be as good. Total stocks of canned mears held by packers and wholesale distributors on April 1, 1952, were considerably larger than a year earlien. Military procurement of cannot pears from the 1952-pack is expected to be somewhat under that from the 1951 pack. I be taken a sure on a plantid to the second of the second of the second of the second

Stocks of 1951 crop pears in cold storage May 31, 1932, were down to about 17,000 bushels, indicating that the end of the season was near. Movement of the 1951 crop of winter pears was facilitated by a Covernment export-payment program which was in operation from July 23 to November 30, 1951; Under that program about 463,000 bushels were exported of Total exports of pears during July 1951 through April 1952 amounted to approximately 680,000 bushels, or about 2 percent of the group. In the same part of the 1950-51 season, 791,000 bushels were exported. na kanada ka Kanada kanad

About Average-Sized Crop of the Average and Average an Apples in Prospect in. 1952

The 1952 commercial apple crop is expected to be about average in size based on June 1 condition. The first official forecast of the crop The state of the s will be issued on July 10. Sept and the section will be and the committee of th

Prices for Apples Generally Higher This Winter and Spring

Stocks of apples in cold storage at the end of each month of farin 1952 have been smaller than usual for that date. On May 31, 1952, cold storage holdings were down to about 1 million bushels, 64 percent smaller than on that date in 1951 and 42 percent smaller than the 1947-51 average for May 31. Targely because of the smaller subplies this winter and spring, grower prices each month since January have averaged considerably higher than the price in the corresponding month of 1951. the grading the control of the second of

Increased Exports in 1951-52

Under the export payment program for 1951-crop apples that was concluded March 31, 1952, nearly 3 million bushels were exported. exports from July 1951 through April 1952 were about 3.3 million bushels, or 3 percent of the crop. In the same months of the 1950-51 season, about 2.6 million bushels were exported. Imports of apples during the same months of 1951-52 were about 0.9 million bushels, 44 percent smaller than in the comparable period of 1950-51. In addition to the apples moved under the export program, the Government purchased 1.5 million bushels of the 1951 crop for distribution to school lunch programs and other eligible outlets.

to the second of the second of

A TO SECTION OF A SECTION OF A

PLUMS AND PRUNES

Smaller Crops in California

Production of fresh plums in California is estimated as of June 1 at 56,000 tons, 42 percent under the large 1951 crop and 29 percent below the 1941-50 average. Condition of plums in Michigan on June 1 pointed to a crop larger than in 1951 and average. The 1951 crop in Michigan was 4.800 tons.

Production of dried prunes in California in 1952 is estimated at 137,000 tons (dry basis), 23 percent smaller than in 1951, 25 percent under average, and the smallest since 1929. Even so, supplies are expected to be adequate for domestic consumption. In the Pacific Northwest, June 1 prospects were favorable for prunes in Idaho but condition of the Washington and Oregon crops was variable and the outlook still uncertain.

Higher Season Average Prices in Prospect for 1952 Plum Crop

The carlot rail movement of fresh plums from California started in late May and increased rapidly in early June. Shipments to fresh markets are expected to continue heavy, and output of canned plums probably will be down somewhat from 1951. California Beauty plums started the season on the New York City auction market at prices averaging considerably above comparable 1951 prices. Grower prices for the entire 1952 crop probably will average substantially higher than prices for the 1951 crop.

STRAWBERRIES

1952 Crop Slightly Larger Than 1951 Crop

Production of commercial strawberries in 1952 is estimated as of June 1 at 32.1 million crates of 24 quarts each. The new crop is about 3 percent larger than the 1951 crop and 38 percent larger than the 1941-50 average. Increased production in the late spring States more than offset reductions in other States. Among important producing States, larger crops than in 1951 are estimated for California, Michigan, Oregon, and Washington.

In May and June, movement of strawberries was seasonally large to both fresh markets and freezing plants. In May 1952, there was a net movement of 29 million pounds of frozen strawberries into cold storage. The total in cold storage at the end of May was over 70 million pounds, about 6.6 million less than a year earlier. In 1951, nearly 158 million pounds were frozen, almost a third of the commercial crop.

Prices for Fresh Strawberries In Early June Above 1951 Levels

Prices received by growers for strawberries averaged \$7.45 per 24-quart crate during the first half of May, 85 cents higher than in the same time of 1951. In mid-June 1952, prices for fresh strawberries on the New York City

TFS-103 and Chicago wholesale markets were somewhat below comparable 1951 prices. Prices for late-spring strawberries sold to freezers may not average quite as high as in 1951. Prices received by growers for the entire 1951 crop averaged \$6.58 per crate.

Smaller Supplies of Oranges In Prospect This Summer Than Last

Supplies of 1951-52 crop oranges are expected to be somewhat smaller in the summer of 1952 than a year earlier. On June 1, 1952, approximately 25 million boxes of oranges remained to be marketed. In California, there still were 20 million boxes of Valencias compared with 27 million on June 1. 1951. In Florida, there were about 5 million this June 1 and 8 million a year earlier. Moreover, movement of the Florida crop is expected to be about completed by July 1 this year, but in 1951 movement continued into mid-summer.

The 1951-52 crop of oranges and tangerines is estimated as of June 1 at 122.4 million boxes, less than 1 percent larger than the 1950-51 crop and 19 percent above the 1940-49 average. About 60.4 million boxes of the 1951-52 crop are Valencias. The California Valencia crop, which will provide most of the fresh oranges marketed during summer, is estimated at 25.4 million boxes, 17 percent under the 1950-51 crop.

Prices for Oranges About the Same
This Summer as Last

Each month since October 1951, prices received by growers for oranges have averaged considerably under corresponding prices in the 1950-51 season. Except in October and late December 1951, weekly auction market prices for Florida oranges also have averaged considerably under comparable 1950-51 prices. But auction prices for California oranges have frequently averaged above 1950-51 prices. The decline in prices for Florida oranges was influenced strongly by the sharp increase in size of crop. Furthermore, processors faced with heavy carry-overs of frozen orange concentrate offered much lower prices than in 1950-51. In fact, prices paid growers for oranges delivered to concentrating plants during February through mid-May have averaged less than half the prices paid in the same time in 1951. In California, the smaller crop of oranges was an important factor in the relatively high price levels. Although the marketing of Florida oranges will be completed earlier this summer than last, and production of California Valencias is smaller, there are much larger supplies of frozen orange concentrate than in the summer of 1951. Under these conditions, prices for oranges this summer may average about the same as in the summer of 1951.

By Packers of Frozen Concentrate Sharp Increase in Use of Cranges

Movement of Florida oranges, both to fresh markets and to processors, has been much heavier in the 1951-52 season than in 1950-51. Total utilization by processors through June 14 was about 19 percent heavier than in the same

part of 1950-51. Through June 14, 1952, packers of frozen concentrate had utilized about 67 percent of the oranges processed, compared with 53 percent a year earlier. This means that about 51 percent more oranges had been made into frozen concentrate than at the same time in 1951. In contrast packers of canned juice and sections utilized about 16 percent less. As a result, output of frozen orange concentrate set a new record in 1951-52.

Increased Exports in 1951-52

Exports of fresh oranges from November 1951 through April 1952 were over 3.2 million boxes, 27 percent larger than in the same months of 1950-51. In addition, about 3.2 million gallons of orange juice of all types, mostly single-strength, were exported, about 9 percent less than a year earlier. Under the export-payment program for 1951-52 crop oranges, about 2.3 million boxes of fresh oranges, 247,000 cases (24-2's) of single-strength orange juice, and 53,000 gallons of concentrated orange juice had been exported or declared for export by June 21, 1952.

GRAPEFRUIT

Supplies of Grapefruit Expected to Be About the Same This Summer As Last

Supplies of grapefruit will be seasonally small in July and August. Nearly all of the summer grapefruit will come from California, where the crop of 1.5 million boxes is about the same as the crop last summer but 12 percent under the 1940-49 average. Some Florida grapefruit also may still be available in July. Although supplies in this State on June 1 were much larger than a year earlier, most of the remaining grapefruit was disposed of in June.

The 1951-52 crop of grapefruit was about 40.4 million boxes, 13 percent smaller than the 1950-51 crop and 21 percent under the 1940-49 average.

Prices for Grapefruit Expected

To Increase Seasonally This Summer Prices received by growers and at terminal auctions for grapefruit averaged moderately lower during January-May 1952 than in these months of 1951. Although supplies from the smaller 1951-52 crop remaining to be marketed after January 1, 1952 were about as large as supplies a year earlier, demand for grapefruit for processing was not as strong. This was the result partly of increased stocks of canned grapefruit and grapefruit juice carried into the 1951-52 season and partly of increased supplies of frozen orange concentrate at low prices. Prices for canned orange juice also were relatively low.

As usual, most of the relatively small supplies of grapefruit marketed in summer will be for fresh use. Hence, prices for grapefruit can be expected to rise about seasonally this summer. But they may not average quite as high as in the summer of 1951.

More Florida Grapefruit Used Fresh,

Although total utilization of Florida grapefruit through June 14 of the 1951-52 season has been nearly as large as in the same period of 1950-51,

considerably more graperruit has been used fresh and considerably less has been processed. About 12.7 million boxes, 25 percent less than in 1950-51, had been processed by June 14, 1952. This is in contrast to the increased processing of oranges this season.

Exports Assisted by Government Payment Frogram

To encourage exports of fresh and processed grapefruit during the 1951-52 season, the United States Department of Agriculture on March 5, 1952 inaugurated an export payment program for grapefruit similar to the one for oranges. It provides for payments up to 40 percent of the export sales price, basis free alongside ship, United States ports. Under this program, approximately 122,000 boxes of grapefruit, 136,000 cases (24-2's) of single-strength camed grapefruit juice, and smaller quantities of other processed grapefinit were experted or declared for export by June 21, 1952. Total exports of fresh grapefruit during November 1951 through April 1952 were about 1 million boxes, 7 percent larger than in the same months of 1950-51. Total exports of fresh grapefruit in 1950-51 were about 1.6 million boxes.

and the right for all tempts and bines is an about the at and was a second of the second of the second of

About as Large Supplies of Lewons In Prospect This Summer As Last

Approximately 6 million boxes of Lemons were available for use afterJune 1, 1952, about the same as on that date in 1951 and 1950. Production of lemons in California in 1951-52 is estimated at 12.8 million boxes, 5 percent under the 1950-51 crop but near the 1940-49 average. Amateria de Colonia de

Exports of Lemons and Times (mostly lemons) during November 1951. April 1952 were about 237,000 boxes, 28 percent larger than in the same months of the 1950-51 season. Total exports in 1950-51 were 482,000 boxes. The above figures for 1951-52 include exports under the Government exportpayment program that became effective January 28, 1952. Under this program about 60,000 boxes had been exported or declared for export by April 30 and 154,000 boxes by June 21. Most of such exports went to Belgium and The Netherlands. Imports of lemons so far this season and all of last season have been negligible. The state of the s

Prices received by growers and terminal auction prices for lemons during November 1951-May 1952 have Tollowed, about the same course as prices in that part of the 1950-51 season. The principal exception was in February 1952 when prices were considerably lower. In mid-June 1952, auction prices averaged moderately above those of a year earlier. Lemon prices through the year are characterized by large fluctuations, mainly in response to changes in market supplies and temperature f

Limes in 1952-53 was a series of the will be a series The 1952-53 lime crop in Floridadis estimated at 300,000 boxes, 15 percent larger than the 1951-52 crop and 63 percent above average. Movement of new crop limes usually starts in April; runs heavy during June-September, and then diminishes to the rest of the season. Distribution is heaviest in the Eastern States. Domestic supplies of limes usually are supplemented by relatively small imports which arrive in largest quantities during late spring and summer. Prices received by growers for limes averaged lower during April and May, 1952 than in these months of 1951.

TREE NUTS

Production of walnuts in California in 1952 is estimated as of June 1 at 71,000 tons, 6 percent larger than the 1951 crop and 13 percent larger than the 1941-50 average. Prospects on June 1 also were favorable for the walnut crop in Oregon. In 1951, 67,000 tons were produced in California and 8,800 tons in Oregon.

Condition of almonds in California on June 1 was not as good as on that date in 1951 and also below average for June 1. The 1951 crop was 42,700 tens. The June 1 condition of filberts in Oregon and Washington was better than that of a year earlier. Production in these two States totaled 7,390 tens in 1951.

DRIED FRUITS

The cutlock on June 1 for dried prunes in California was for the production of 137,000 tons, (dry basis). This is 23 percent less than in 1951-52.

The total pack of dried fruits in 1951-52 was about 475,000 tons (processed weight), approximately one-fourth larger than the 1950-51 pack. Most of this increase was the result of considerably larger packs of raisins and prunes. In order to help move excess supplies of these two fruits, the United States Department of Agriculture has had an export-payment program in operation since August 15, 1951. Under this program, approximately 64,000 tons of raisins and 43,500 tons of prunes had been exported or approved for export by June 20, 1952. Earlier in the season under a purchase program, the Department bought over 5,000 tons of dried prunes for school lunch use.

CANNED FRUITS AND FRUIT JUICES

Smaller Pack of Canned Fruits Seems Probable in 1952-53

Packers' stocks of 10 major items of canned fruits combined (apricots, fruit cocktail, peaches, pears, sweet cherries, sour cherries, plums and prunes, apples, applesauce, and citrus segments) were about 72 percent larger on June 1, 1952 than on June 1, 1951. Among items held by packers in largest quantities on June 1, 1952 were peaches and fruit cocktail. Stocks of several important items were larger than a year earlier as follows: peaches, 524 percent; fruit cocktail, 372 percent; apricots, 440 percent; and pears, 174 percent. Figures are not available on stocks held by wholesale distributors on June 1, 1952. But on April 1, 1952, such stocks of the above 10 items excluding apples were 19 percent smaller than on that date in 1951. Total packer and wholesaler stocks of the same 9 items, however, were 24 percent larger than on April 1, 1951.

With large stocks of canned fruits held by packers at the start of the 1952 canning season, some reduction in several important deciduous crops, and smaller Government set-asides from the 1952 pack, prospects are for a

smaller canned pack than the near record pack of 1951. Among important fruits, reductions seem most probable in the packs of apricots, peaches, pears, and fruit cocktail. But a larger pack of sweet cherries is expected.

The 1951-52 pack of commercially-canned fruits in the continental United States was approximately 3.1 billion pounds, the equivalent of about 70 million cases of 24 No. $2\frac{1}{2}$ cans. This was nearly a tenth larger than the 1950-51 pack and second only to the record 1946-47 pack. Through June 14, 1952 of the 1951-52 season, slightly less than 2.8 million cases (basis $24-2\frac{1}{2}$'s) of grapefruit sections, orange sections, and citrus salad had been canned in Florida. This was 28 percent smaller than output in the same part of the 1950-51 season. Total stocks of citrus sections and salad held by Florida packers on June 14, 1952, were about 15 percent larger than on that date in 1951. In Hawaii output of canned pineapple through March 31, 1952 of the 1951-52 season was about 10.0 million cases $(24-2\frac{1}{2}$'s), $\frac{1}{2}$ percent smaller than the pack in the same part of the 1950-51 season.

Requirements of 1952-Pack Canned Fruits For Defense Use Much Smaller Than Those of 1951

Requirements of 1952-pack canned fruits for defense use total slightly under 5 million cases (equivalent 24 No. 2½ cans), or about 7 percent of the prospective 1952 pack. This is substantially smaller than the requirements from the 1951 pack. Fruits covered are apples, applesauce, apricots, blackberries, blueberries, red sour pitted cherries, sweet cherries, Kadota figs, fruit cocktail, peaches, Bartlett pears, purple plums, and pineapple. A setaside order covering the 1952 pack was established effective April 3, 1952 by the United States Department of Agriculture (Revision 1 to Sub-Order of DFO-2).

Reduced Pack of Canned Citrus Juices in Florida in 1951-52

The 1951-52 pack of canned fruit juices probably will be about 2 billion pounds, the equivalent of 66 million cases of 24 No. 2 cans. This prospective total is about 20 percent smaller than the 1950-51 pack of about 2.4 billion pounds. The major part of each pack consists of citrus juices, canned in Florida. Through June 14, 1952 of the Florida canning season, which was nearing the end, about 33.2 million cases (24-2's) of citrus juices had been canned. This was 19 percent less than in the same part of the 1950-51 season. Output of each of the major juices was down as follows: Orange, 4 percent: blanded orange and grapefruit, 26 percent; grapefruit, 35 percent; and tangerine, 59 percent. These reductions were more than offset by substantial increases in output of frozen citrus concentrate in Florida in 1951-52. (See Appendix table for further detail). Total stocks of these four items held by packers were 23 percent smaller than on June 14, 1951. Output of canned pineapple juice in Hawaii was about 10.2 million cases through March 31, 1952 of the 1951-52 season. This was 21 percent smaller than the comparable pack in 1950-51.

FROZEN FRUITS AND FRUIT JUICES

Record Pack of Frozen Orange Concentrate in 1952

Total commercial production of frozen fruits and fruit juices in the United States in 1952 is expected to be at least 900 million pounds. In 1951,

total output was slightly over 800 million pounds. Prospects are for a small increase in pack of strawberries and a slight decrease in pack of sour cherries in 1952. However, the total pack of frozen fruits and berries, excluding citrus juices, probably will be about as large as in 1951, when it was about 420 million pounds. But output of frozen citrus juices will be much larger than in 1951. In Florida, over 426 million pounds (over 43 million gallons) of frozen orange concentrate had been made by June 14, 1952. This was 57 percent larger than comparable output in 1951. In addition, about 16 million pounds (1.6 million gallons) of frozen grapefruit concentrate and blended orange and grapefruit concentrate had been made. Although the packing season for Florida is about over, that for California will extend through the summer and fall. In 1951, about 79 percent of the total pack of frozen citrus juices was made in Florida.

Per Capita Consumption Continues Upward Trend

Cold-storage holdings of frozen deciduous fruits and berries on May 31, 1952 were about 200 million pounds, 7 percent smaller than on that date in 1951. Strawberries were the only item for which storage stocks increased during May. But the 70 million pounds in storage on May 31 were 8 percent smaller than the record stocks a year earlier. Stocks of all other fruits and berries decreased during May.

Stocks of frozen orange juice increased about 38 million pounds during May 1952. The total of 270 million pounds (27.2 million gallons) in cold storage May 31, 1952 was about 64 percent larger than stocks a year earlier. But movement of frozen orange concentrate into consumption this year also is much heavier than a year ago. Purchases by householders during April 1952 are reported to have been 77 percent larger than in April 1951. Per capita consumption of all frozen fruits, berries, and fruit juices in 1952 is tentatively estimated at 5.3 pounds, compared with 4.7 in 1951.

PRODUCTION AND CONSUMPTION OF BERRIES

Although relatively small in volume, berries comprise an important constituent of the total supply of fruit. For many years, berries, especially strawberries, were available only as fresh fruit in season. Later, canning extended the use of berries from one season to another. More recently, freezing has popularized and facilitated the widespread use of berries, resulting in a sharp upward trend in consumption of the frozen product.

control to the first of the second of the control of the second of the s

In addition to direct consumption in the fresh, canned, and frozen forms berries are also used extensively in a number of other ways. Substantial quantities of berries are manufactured each year into jams and jellies, to be used as spreads for bread, waffles, pancakes, and the like. Large quantities are used in making berry pies and other desserts. Berries also are used widely to give body and flavor to ice cream, confections, and other food and beverage items.

Principal kinds of berries are strawberries, raspberries, blackberries, boysenberries, loganberries, youngberries, blueberries, gooseberries, currents, and cranberries. The United States Department of Agriculture each year gathers statistics on the production and other aspects of strawberries and cranberries, summaries of which are presented in the Fruit Situation and other reports. On the production of other berries (also strawberries), some figures become available every 5 or 10 years through the Census of Agriculture. Such other

Original data converted from pounds to quarts on the basis of 1 quart equals pounds.

Compiled from preliminary State reports of the 1950 Census of Agriculture.

berries as reported by the 1950 Census, plus strawberries as reported by the Department of Agriculture, are herein treated together. They form a group of small fruits having a high degree of similarity in use.

Raspberries and Strawberries are Grown in Many States

The 1950 Census of Agriculture gathered statistics on number of farms reporting, acreage, and production of (1) raspberries; (2) blackberries and dewberries, (3) boysenberries, loganberries, and youngberries, (4) wild blueberries, (5) tame (cultivated) blueberries, and (6) strawberries. Figures on the quantities of each group of berries harvested in 1949, except strawberries, are shown by States in table 1. Raspberries comprised about half of the reported production (excluding strawberries); having been harvested in 25 States and the District of Columbia. Washington, Oregon, Michigan, and New York, in that order, led in production. Blackberries (cultivated) and dewberries, grown mostly in Oregon, Washington, Texas, and Michigan, constituted over one-fifth of the total of all berries reported. Boysenberries, loganberries, and youngberries were reported only for Oregon, Arkansas, and Washington, amounting to about one-sixth of the total. Production of blueberries was centered in New England, with Maine the leading State. Production was about one eighth of the total. More than half of the production of these five groups of berries was in Oregon and Washington.

States leading in the production of strawberries in 1949, as reported by the Department of Agriculture, were Oregon, California, Washington, Michigan, Louisiana, and Arkansas.

Berries Comprised About 2 Percent
Of Reported Deciduous Production in 1949

Statistics on berry production in the United States are summarized in table 2. The indicated quantities harvested understate the actual production in 1949. The figures for strawberries cover only commercial production in about 30 States. Hence production for home and local consumption in these States and all production in other States is excluded. But such production is only a small percentage of the total. Concerning census figures on berries, it seems that some farm production was unreported. Production on non-farm establishments was generally excluded. Although some production of wild blueberries was reported, that of other wild berries, especially blackberries, was excluded. Figures on packs of canned and frozen berries indicate that production of berries other than strawberries probably was considerably larger than that reported by the Census.

Despite these limitations, the figures in table 2, do give some notion of the magnitude and relative importance of the several berries. In 1949, the reported production of berries (excluding cranberries) amounted to approximately 432 million pounds, or nearly 3 pounds per capita. 1/ This was slightly more than 2 percent of total deciduous production. Strawberries comprised about 73 percent of this total.

Considerably More Berries Frozen Than Canned in 1949

Statistics on the utilization of berries, similar to those on the quantities of the major deciduous fruits used fresh and processed, are not available. But some indication of the quantities of berries that were canned and frozen in 1/2 Total production of cranberries in 1949 was about 84 million pounds, or 0.56 pound per cenite.

JUNE 1952

1949 may be derived from data on packs. The 1949 packs were converted to a fresh-weight basis, and the results are shown in table 3. More blueberries were canned than any other berry, while strawberries and raspberries were first and second for freezing. More than twice, as many berries were frozen as were canned in 1949 mainly because of the large production of frozen strawberries. The total quantity of strawberries frozen and canned in 1949 was about 29 percent of the reported production. But the quantities of blackberries, boysenberries, loganberries, youngberries, and blueberries that were processed considerably exceeded the production reported by the Census. An estimated 71 percent of the 1949 commercial strawberry crop was used fresh. Data are not available on the quantities of other berries used fresh in 1949.

Consumption of Frozen Berries in 1951 Was About 4 Times That of Canned Berries

Civilian per capita consumption of canned and frozen berries, fresh weight equivalent, 1937-51, is shown in table 4. These figures include relatively small imports of berries, mostly frozen blueberries: In 1937, the first year for which comparable data are available for both canned and frozen berries, per capita consumption of each class was about one-fourth of a pound. Consumption of both canned and frozen berries increased during the late thirties and early forties, with that of the frozen increasing the more rapidly. Consumption of both declined during wartime, mainly as a result of reduced production of the raw fruit and heavy military procurement. In the late forties and early fifties, consumption of canned berries again increased, and in 1951 it was only slightly above the 1937 level. But consumption of frozen berries increased sharply to a level of about 1.3 pounds. In 1951, per capita consumption of frozen berries was about 4 times that of canned berries. Per capita consumption of canned and frozen berries combined tripled from 1937 to 1951. (See also chart on front cover.)
