NARRATIVE

A. Habitat Management

The amount of time used in the BLM Wildlife Planning System increased greatly from 1970. Four URA's, two MFP's, and three wildlife habitat plans were written.

An interagency browse evaluation study involving the BLM, USFS, and the New Mexico Game and Fish was completed on portions of Deer Management Units 9 and 10. The data collected was used in the preparation of the Rosa and Middle Mesa Wildlife Plans.

The major wildlife habitat accomplishments were the continuation of the prescribed burning program and the establishment of the Alcalde Prairie Dog Refuge.

The New Mexico Game and Fish Commission established a prairie dog refuge on public land to protect a small prairie dog population and to provide the public with an opportunity to view a prairie dog town under natural conditions. The BLM constructed ½ mile of road from US 284 and a small parking lot. Also BLM interpretive signs were installed.

We continued the prescribed burning program by burning and seeding 1,300 acres of chained P-J in the San Juan Resource Area. We are highly satisfied with the results of the burning, and we plan to continue with this type of habitat development work.

The San Juan River program package was prepared following up the special widdife habitat plan that was completed in 1970. The BLM will not take over the administration of the upper three miles of river as hoped, but the Bureau of Reclamation plans to develop this area so the benefits to the public will occur as planned.

B. Animal Damage

No prairie dog control work was needed or conducted in 1971, but we may need some control next summer (1972) if numbers continue to increase. The District Predator Control Program is a major problem. The general public does not want any control while other users, sportsmen and ranchers feel that control is needed. Each year more time is used in preparing the District's Predator Control Program and less time is available for BLM planning and general wildlife work.

C. Wildlife Statistics

Four rare and/or endangered wildlife species may be inhabiting the district.

Mexican Duck - E American Peregrine Falcon - E Prairie Falcon - R Greater Sandhill Crane - R

D. Other Problems

The BLM should plan to employ a fisheries biologist to establish a fishery habitat management program. Form 6500-1 (July 1970) semerly 6960-1),

WILDLIFE ANNUAL REPORT

NARRATIVE SUPPLEMENT

A. HABITAT MANAGEMENT

A COOPERATIVE AGREEMENT HAS BEEN SIGNED THAT GIVES BLM THE AUTHORITY TO MANAGE WILDLIFF HABITAT ON 680 ACRES OF MARSH LANDS ALONG THE RIG GRANDE UNDER WITHDRAWAL BY THE BUREAU OF RECLAMATION. THIS AGREEMENT WILL ALLOW DEVELOPMENT OF NESTING HABITAT FOR THE ENDANGERED MEXICAN DUCK (ANNAS DIAZI).

NEGOTIATIONS ARE UNDERWAY TO DEVELOP A PRAIRIE DOG TOWN INTERPRETIVE SITE ALONG A MAJOR HIGHWAY IN THE SOCORRO DISTRICT.

B. ANIMAL DAMAGE

No predator control was requested in the Socorro district in FY 1971. $_{\rm a,t}\epsilon^{\delta}$

UNAUTHORIZED CONTROL OF PRAIRIE DOGS ON SEVERAL HUNDRED ACRES OF PUBLIC DOMAIN LAND. ACTION WAS TAKEN TO SEE THAT SHE SITUATION DOES NOT RECUR.

C. WILDLIFE STATISTICS

REFER TO WILDLIFE ANNUAL REPORT PARTS

- 4B. POTENTIAL HABITAT IN THE SOCORRO DISTRICT FOR THE PERGRINE FALCON WAS DETERMINED TO BE LESS THAN PREVIOUSLY REPORTED.
- GA. PELLET TRANSECTS READ IN CONJUNCTION WITH UTILIZATION TRANSECTS HAVE NOT BEEN PREVIOUSLY REPORTED NOR HAS 5 QUALL TREND ROUTES.

D. OTHER PROBLEMS

ANNUAL WILDLIFE MANAGEMENT RECOMMENDATIONS TO THE STATE GAME DEPARTMENT CONTINUE TO RECEIVE LITTLE RECCONITION, ESPECIALLY WHEN CLOSURE OF AN AREA OR SEASON IS RECOMMENDED. Form 6500-1 1970) merly 6960-1)

Wildlife Annual Report Narrative

A. Habitat Management

Three intensive inventories and analysis were completed for:

- 1. San Simon Cienega Mexican Duck
- 2. Guadelupe Canyon Peripheral Birds
- 3. Gila Box Endangered & Peripheral Wildlife

One additional intensive inventory and analysis was completed for:

Big Hatchet Mountains - Desert Bighorns

Major management emphasis has been placed on rare and endangered species through inventory and planning.

Development work is progressing in the San Simon Cienega Habitat Area - the endangered Wexican duck program. Work completed during fiscal year 1971 included:

- Maintenance of existing developments and still in progress-no units reportable.
- Drilling of 1 well completed but not equiped. Not reportable.
- Revegatation of disturbed areas. Completed but not reportable. This is considered maintenance.

Administration of the Cienega is now under the Las Cruces District with Lordsburg Area Manager as the program coordinator.

B. Animal Damage

No problems encountered during fiscal 1971.

C. Wildlife Statistics

THE .

No significant change in numbers is presented from last $year's_{\bullet}$

- 1. Mule deer numbers are down due to the drought.
- Antelope populations remain the same. No hunt held due to low population.

- 3. Javelina numbers are increasing. No hunt held due to low populations.
- L. Elk, white tailed deer, mountain lions and bighorn sheep population remain the same.

Habitat expenditures has not been included as this information is not available at the district level. Access blocked by private lands has been derived by using, area currently blocked not having legal access across private lands, though these lands are for the most part being used, by the public with access by permission of owners.

D. Other problems.

Environmental analysis work by district biologist is requiring a major expenditure of time. Environmental analysis have been completed for the San Simon Cienega and the predator control program.

No other problems are apparent at this time.

WILDLIFE ANNUAL REPORT FOR FY 1971

NARRATIVE REPORT

A. Habitat Management

An antelope pass fence was constructed to facilitate antelope movements between woven wire fenced pastures. This is a modification of 'Paul's Pass' antelope pass.

Censusing of the Lesser Prairie Chicken booming grounds were initiated and will be continued with a complete inventory of the habitat area. Two game watering boxes were installed along the Camino Well pipeline to provide water for the Lesser Prairie Chicken. These waterings were fenced in 5-acre enclosures to maintain protective vegetative cover.

A cooperative agreement is being drafted with the Bureau of Reclamation on phreatophyte control on federal lands along the Pecos River. Provisions are being made to leave a buffer strip parallel to the river for wildlife habitat and stream-side shading for fisheries.

B. Animal Damage

Predatory animal control program was carried out by the Bureau of Sport Fisheries and Wildlife on a request basis. The District was segmented into areas of no control, limited control in specific cases, and control without limitations.

C. Wildlife Statistics

Correction under 1. HABITAT CONDITION, Part b. Aquatic (1) Lakes -Reported in FY 1970 as 480,000 acres - should be 480 acres. Otherwise no major changes from FY 1970.

D. Other Problems

- - Restricted antelope movements in areas of potentially suitable antelope habitat areas due to woven wire fences.
- 3. Action is needed to assure the preservation of the Lesser Prairie Chicken. Current status is rare according to the Rare and Endangered Species List. A program package has been submitted to reverse the downward trend in population numbers and acres of usable habitat.

Portland, Oregon 97208

Memorandum:

SEP 1 5 1971

To:

Director (360)

From:

State Director, Oregon

Subject: Wildlife Annual Report

Enclosed is subject summary for Oregon including form 6500-1 and an accompanying narrative. Individual district copies are also included.

A. Habitat Improvement

Emphasis has been placed on completion of MFP's rather than HMP's. Wildlife habitat development projects are principally cooperative efforts with the Oregon and Washington State Game Commissions. Rehabilitation of deer winter ranges and water development projects received the most emphasis.

Six fishery biologists, financed primarily by 5220 funds, continue to devote the majority of their efforts toward coordinating stream protection procedures with other BLM activities in western Oregon. Practices to protect the fishery resource and enhance water quality were incorporated in timber sales and construction of logging roads. The comprehensive physical inventory of streams was continued in each district. The initial draft of an aquatic habitat management plan for Smith River was completed.

Habitat improvement projects were completed on streams within the Oxbow Burn, on tributaries of Canton Creek, and on streams in the Nestucca and Suislaw River systems. Structures were installed to create additional spawning and rearing areas in selected streams. Stream clearance was accomplished to increase productive areas for anadromous fish and to insure migratory fish continued access to available spawning grounds. Assistance was given the Oregon Game Commission during chemical rehabilitation of Cow Creek (Umpqua River) and its tributaries to increase the production of salmon and trout by reducing large populations of rough fish.

B. Animal Damage

Animal damage control, chiefly for predators, continues to be one of the most controversial activities on BLM lands. Conflicting instruction memos, differences of opinion among Game Commission, BSFSW, and BLM personnel result in occasional problems. Increased emphasis by preservationists and the non-hunting public make decisions for all concerned much more difficult.

A cooperative agreement between the Oregon State Office and Douglas County has been signed pertaining to predator control by that county. This is the first time in Oregon that a county has decided to withdraw funds from BSFSW and hire their own control agents. Our agreement pertains to the placement of traps only. No Poisons will be allowed. More sheep are raised in Douglas County than any other county in the State.

C. Wildlife Statistics

Hunting and fishing recreation days show a slight decline over 1970 figures due to an adjustment in percent of BLM contribution, reflecting truer figures. Data for Washington State are included in the total (see Spokane District's submission). The substantial increase in the commercial harvest of fish over the preceeding year resulted from above average catches of Chinook salmon and record landings of coho salmon.

Acreages of reservoirs shown is below last year due to a district reporting error. Rare and endangered species are based on listings in the "Red Book" and from Oregon State University.

D. Wildlife Personnel - F.Y. 1971

Current status by district is as follows:

	Fisheries	Wildlife
State Office	1	1
Lakeview	0	1
Burns	0	1
Vale	0	1
Prineville	0	1
Baker	0	0
Salem	1	0
Eugene	1	0
Roseburg	1	0
Medford	1	1
Coos Bay	1	1
*Spokane	<u>o</u> .	<u>o</u>
Totals	6	7 = 13

*The Spokane District has a forester with a wildlife background who has been acting as district coordinator. As of this year (F.Y. 1972) he has been appointed as district biologist. Baker has the only district office with a biologist position unfilled. District biologists attended the Bureau-wide wildlife training conference held at Salishan last March.

SUMMARY

NARRATIVE REPORT WILDLIFE ANNUAL STATISTICAL REPORT FY-71 VALE DISTRICT. OREGON

Habitat Management

The past winter of 1970-71 imposed stress on mule deer herds in the northern portion of the District. Little mortality was observed, however spring fawn production was below normal.

Pronghorn antelope have continued to increase in the northern and central portions of the District. The Oregon State Game Commission liberalized the season for 1971 which will be reflected in next year's data.

A cold and persistently wet spring hindered upland game bird reproduction. Populations are lower than those of last year.

Townsend ground squirrels continue at high populations for the fourth consecutive year.

Insects and resultant vegetative damage are prevalent during this summer of 1971. Grasshoppers, crickets, webvorms, and army worms are at high populations in localized areas.

Bighorn sheep, re-introduced into the Cwyhee Breaks in 1966, are expanding their populations and range repidly. An aerial census of August 1971 showed 11 rams, 25 ewes, and 17 lambs (53 total) from the initial stocking of 17 animals.

Animal Damage

The enormous populations of ground squirrels in the seedings of the northern portion of the District have reduced the forage available for livestock. Little permanent damage seems to have resulted to the crested wheatgrass as yet.

Coyote numbers are abnormally high throughout much of the District. When rodent populations eventually fall, we may anticipate increased predation on wildlife and domestic livestock. Restrictions on control of coyotes by professional hunters will likely compound this problem.

Wildlife Statistics

Wildlife habitat and fisheries habitat statistics presented on Form 6500-1 are rough estimates. There have been no formal studies on this subject in this area.

One habitat management plan is implemented in the District. A second is complete and ready for review.

Closure of private lands to public access is extremely localized and a minor problem. These lands are generally scattered tracts of public domain located in the northern extremity of the District. Most have been classified for exchange or disposal.

Wildlife Personnel

There is one full-time Wildlife Biologist in the Vale District.

Other Problems

The concept of Habitat Management Plans remains confused. Our efforts continue to be directed toward specific areas important to waterfowl or fisheries.

Emphasis on Allotment Management Plans for livestock dictate that the District Biologist devote much attention and planning to this function. The nitty-gritty of habitat management and manipulation in this range District is in livestock management.

Close scrutiny of future land treatment projects and maintenance activities is mandatory. Wildlife habitat consideration of each proposal demands considerable time. Form 6500-1 (July 1970) : (formerly-6960-1)

State Director - 930

FROM :

District Manager, Spokane

SUBJECT:

Annual Wildlife Report - TT No. ORE 71-278

Narrative Report

The fiscal year '71 wildlife program was again hampered by funds. The three man-months allotted were used to update the extensive inventory, do some intensive inventory, install 4 cisterns, and support the Bureau Planning System.

Several statistical entries have changed from our last report. The updating of inventories and the Bureau Planning System supplied needed information on habitat and population numbers necessitating these changes. There were two more Bighorn sheep plants on BLM lands this year. A total of 5 rams and 10 ewes were released with preliminary surveys showing a 70% use of Bureau lands. Another plant is planned for F.Y. '72.

A start was made in improving upland bird habitat through the installation of 4 cisterns. The material was contributed by the Washington State Game Department and labor furnished by the Richland Rod and Gun Club. Recent surveys have shown immediate use by upland game. Future installations are planned for F.Y. '72 using the same procedure.

The Spokane District is still relying heavily on the Washington State Game Department for cooperation in our Wildlife program. Relief in funding is seen for F.Y. '72 however, with the addition of five man-months to our previous base program of three man-months.

Narrative FY-1971 Wildlife Annual Report Medford District

A. Wildlife Habitat Management

The District wildlife specialist expended 7.33 man-months on wildlife activities this fiscal year. Of this time, 2.5 man-months were used in support of the Bureau's Planning System.

<u>Cooperation and coordination</u> with other District activities and the Oregon State Game Commission account for a large part of the wildlife program. Working relations with local Game Commission biologists are excellent - with contact being almost daily.

Cooperative wildlife habitat improvement projects completed by the Game Commission on BLM lands this fiscal year are listed below:

1. Wildlife and Erosion Control Seedings

Objective: Seeding of legumes and grasses on newly disturbed roadsides, skid roads, landings, heliponds and jeep roads.

Seeding rate: 15 lbs/acre

Acres seeded: 80 (74 acres along 30 miles of roads (6 acres at 6 heliponds

Special Conditions: The Game Commission provided the seed on the condition that the BLM would apply it.

Results to date: Very successful.

2. Rum Creek Big Game Habitat Improvement

Objective: To establish grass and legumes in areas being used by the Rum Creek elk herd.

Seeding rate and species: 161bs/acre

Subterranean Clover Dutch White Clover Perennial Rye grass Orchard grass Intermediate wheat grass

Acres seeded: 5 acres

Results to date: Fair to good. Seeding in loose soil and open areas.

3. Agate Flat Project

Objective: This project is a continuation of the attempt to replace decadent brush fields on the Agate Flat deer winter range.

Twenty-two acres of brush fields were scarified in three seperate areas with each receiving different treatments.

Site 1 - 10 acres. This area was seeded to grass with a range land drill. Fertilizer was applied at the rate of 3001bs/acre.

Site 2 - 10 acres. This Scarified and seeded to Wedgeleaf ceanothus and bitterbrush.

Site 3 - 2 acres. Scarify service berry and seed grass. Fertilizer was applied at 500lbs/acre.

Seeded grasses: Pubescent wheatgrass Intermediate wheatgrass

Mountain brome.

Results to date: Results of past "wildlife" scarification are beginning to look promising. Many wedgeleaf ceanothus seedlings are sprouting back with as many as 36 seedings per

square yard recorded. Habitat manipulations on this deer critical winter range is done annually in small segments, so that the usable habitat is not reduced drastically in any one year.

Inventory of Rare and Endangered Bird Habitat

A great deal of time was expended locating and mapping nesting sites of eagles and ospreys. The bald eagle is classified as being endangered in Oregon. Five possible nesting sites were located with only one active this year.

Ospreys arc classified as being rare in Oregon. A total of 30 nests were located.

Two active golden eagle nests were found on BLM lands.

Bitterbrush "Bullet" Trial Seeding

Bitterbrush seedlings were grown at the Sprague Seed Orchard in bullets for field trials. Some 950 seedlings were out planted on three deer winter ranges. Ten percent of the seedlings were caged as a control to measure animal damage. Results to date from caged plants indicate 75% seedling survival.

Goose Nest Platforms

In FY-1970 the Game Commission and BLM cooperatively installed 12 artificial goose nest platforms. This year 5 of the 8 remaining platforms. Four

platforms were damaged by ice and snow and were unusable. Goose acceptance of these artificial structures is good. Plans are to install 12 additional nest platforms in FY-1972.

Other Activities and Accomplishments

- 1. Assisted the Game Commission in conducting wildlife inventories and supervised habitat improvement projects on BLM lands.
- 2. Completion of a joint wildlife plan and intensive inventory for the Rogue River Wild and Scenic River.
- 3. Review of the District timber sale plan.
- 4. Monitored forest rehabilitation spray projects and animal control programs.
- 5. Investigated winter range problems involving the Agate Flat interstate black tail deer herd.

B. Animal Damage

Status of the Pokegama Coyote Control Study.

This coyote control program was terminated in March, 1970. During this fiscal year a request was received from the Game Commission for the continuation of the control program for another year. This request was eventually retracted by mutual agreement of all parties involved. A justified need for continuing the control program was lacking because of a substantial reduction in the coyote population. Results of the previous two year control program indicated an 82% reduction in coyote activity from the 1968 land.

Gopher Control

Gophers are the leading cause of damage in established tree plantations. Control of gophers on this District began in FY-1970. Costs of control were Meduccid this year by \$3.37 per acre.

A cooperative research study between Oregon State University and the BLM is scheduled to begin in FY-1972. Manipulation of vegetation will be used in an attempt to force gophers to leave our plantations.

Porcupine Control

Control of porcupines through the use of strychnine salt blocks continues on this District but on a reduced scale with emphasis on bait station placement in known areas of sixmificant porcupine population.

Fisheries Habitat Management

Review of resource activity and its effect on aquatic life is the highest priority work. Road design and placement, stream crossings, timber harvest, grazing allotments, mineral exploration and other resource uses are reviewed with other District personnel.

Information and Education

Keeping other District personnel informed of the importance of aquatic life and water quality to fishery health plus methods of protecting and enhancing these resources is an important and daily aspect of the fishery biologist position.

Fish habitat protection needs were explained during a guest appearance at the White City Kiwanis Club and at the BIM Wildlife Workshop.

Bureau Planning System

Considerable knowledge was gained while working on the Bureau Planning System. During FY-1971 the initial fishery URA input was completed for two of the District planning units and updated for the third. Initial MFF's were completed for all three planning units.

Assistance was given the State Game Commission during completion of a joint Fish and Wildlife HMF for the Rogue Corridor within that portion of the Wild and Scenic River administered by the BLM.

Stream Survey and Habitat Improvement Projects

In FY 1971, District personnel completed surveys on 42 streams involving 104.6 stream miles. Survey efforts were primarily confined to the lower Rogue River and tributaries.

Fish habitat improvement work consisted of log jam removal and chemical rehabilitation of the Cow Creek drainage.

Through an equipment rental contract, anadromous fish habitat was enhanced by removal of three major log jams from Panther Creek, a tributary of the Cow Creek drainage.

During July and August of 1970, District personnel expended 23 man days assisting the State Game Commission with rehabilitation of the Cow Creek drainage. Liquid rotenone was applied to 74 stream miles of main stem Cow Creek and 45 miles of its tributaries for control of a large rough fish population. Target species removed included dace, redsided shiners, suckers and squawfish. The State Game Commission has subsequently restocked Cow Creek and tributaries with coho salmon, steelhead, cutthroat trout and rainbow trout.

Cooperation and Coodination with Other Agencies

Fishery habitat considerations are reviewed with the state and other federal agencies before management decisions are formulated.

Locally, stream survey efforts are coordinated with the State Game Commission and U.S. Forest Service with good exchange of information gathered. Standard survey procedures now used by the State Game Commission, State Fish Commission, U.S. Forest Service and BLM have improved the quality of surveys.

Cooperative effort by the State Game Commission, Forest Service and BLM resulted in survey of 34.5 miles of lower Rogue River from Grave Creek to Foster Creek.

^{*}Zacreage shown consisted of hand cutting juniper trees to GPP 855-492 release native vegetation.

Narrative Report Supplement - Wildlife Annual Report

A. Habitat Management

- 1) Five 500 gallon capacity wildlife watering devices (guzzlers) were installed in the Prineville District. This was a cooperative project, with the Oregon State Game Commission supplying the materials and the BLM furnishing labor for installation. Mineral satt clocks provided within the guzzlers' protective fenced area have received notable use. One of the new guzzlers is now being used actively by antelope. The Prineville District has now installed 12 active guzzlers.
- 2) Two projects covering 128 acres public land were completed by the OSCC and consisted of hand cutting juniper trees to release a desirable increase in percent litter, a release of bitterbrush Current Annual Growth, and an increased vigor of native grass plants on both project areas. Mule deer browsed heavily on the downed junipers. Such project work should be completed in late fall so that this downed juniper can provide supplemental deer winter range forage.
- 3) Both sanfoin and four-wing saltbush plants are increasing in size and vigor on areas where previously planted. Sanfoin continues to survive well even under intensive livestock use. Four-wing saltbush plants appear to have a definite prolonged emergence period as judged by young seedlings appearing in stands as old as three years.
- 4) Protective fencing combined with grass and legume seeding and planting is continuing to show success for channel stabilization and providing upland game cover on Camp Creek. Project areas subject to a January 1971 flash flood were still able to show survival of both shrubs and seeded species and quite evidently demonstrated soil protection of stream banks during flood conditions.
- 5) A 70 mile segment of the Lower John Day River from Kimberly to Cherry Creck was treated for rough fish control last August. CSGC personnel directed operations with the BLM Wildlife Biologist assisting. There has been no planting of Channel catfish and small mouth bass in the river so far and it is hoped that the river can become a worthwhile warm water fishery.

B. Animal damage

There were no significant animal damage problems within the District. Porcupine bait stations placed in the field in 1939 to control damage to pine and fir trees were removed in the Spring of 1971 and the program was discontinued.

C. Wildlife Statistics .

Changes in antelope and mule deer population numbers reflect updating of extensive inventory. Changes in animal months from 1970 show actual animal months for 1971 instead of Animal Unit Months which were reported in 1970.

D. Other Problems

There still exists within the Prineville District a high demand for fisheries habitat inventory and analysis. However, an insufficient allocation of man months, personnel, and funds has delayed completion of this inventory. Increased allocations are definitely needed.

LAKEVIEW DISTRICT ANNUAL WILDLIFE REPORT WILDLIFE ACCOMPLISHMENTS FY 1971

A. Developments:

1. Seeding - Approximately 2500 acres of wildlife seedings were completed the spring of 1971. All areas were previously sprayed for control of undesirable brush during the spring of 1970. The purpose of these projects is to provide green feed for deer during late Fall and early Spring. They are all located on or adjacent to important deer winter ranges. The projects were financed by the Oregon State Game Commission, with BLM providing supervision and administration of the development work. Approximately \$32,215.00 was contributed by the O.S.G.C. for these projects. Listed below is a list of the treatment areas.

Name	Acres	Planning Unit	Species Seeded
Paulina Seeding	800	Silver Lake	Siberian Wheatgrass
Sink Seeding	1,300	Christmas Valley	Small Burnet, Sainfoin, Crested Wheatgrass, and 4-Wing Saltbrush
Priday Res. Seeding	g 400	North Warner	Crested and Intermediate Wheatgrass, Alfalfa, and Sweetclover.

 Juniper Chaining - A 200 acre chaining project was completed on critical deer winter range in Klamath County. A mixture of grass, forbs, and browse was seeded in an attempt to restore this depleted range. This project was funded by the OSGC, at an expenditure of about \$4,000.00.

3. Water Developments -

a. Projects designed specifically for wildlife:

Туре	No.	Source of Funds
Spring Developments	5	BLM
Spring Developments	5	OSGC
Water Catchment	1	BLM & OSGC
Reservoirs	2	OSGC

Cost: O.S.G.C. - \$8,633.00, BLM \$5,000.00

b. Additional BLM developments providing some benefit to wildlife:

Type	No.
Reservoirs	4
Waterholes	14

4. Fisheries -

a. Spaulding Reservoir in Beatys Butte was reconstructed in the spring of 1971. The project was funded 50% each by the BLM and OSGC. When full, the impoundment will provide 20 surfaces of water. The reservoir was planted with 5000 (advanced fry) Eagle Lake Cutthroat trout this June. It should develop into a good fishery.

B. Management:

- 1. The wildlife portions of all Unit Resource Analysis have been completed.
- A Habitat Management Plan for the Bonanza Resource Area was completed. Identifies problems and possible solutions for the wildlife habitat in Klamath County.

C. Wildlife Statistics

The only significant change is in the antelope population figure. This was lowered to 2,500 as we believe it reflects a more accurate figure than the former 5,100.

NARRATIVE REPORT

Habitat Management

Up to about 240 whistling swans, as well as ducks and geese, used the South Jetty area where grain was planted. Approximately 30 chinook, coho, and steelhead redds were observed near gabions at spawning areas provided on the Siuslaw River and tributaries.

Animal Damage

There have been no known animal damages of significance.

Wildlife Statistics

Esmond Lake is approximately 15 acres rather than 60 acres as shown last year. American ospreys and great gray owls are the two wildlife species considered rare in Oregon, and bald eagles are endangered in the state. Approximately 30% of the District is provided with legal access, although an estimate of about 3% was used for habitat blocked to public access by closure of private lands. Public access is permitted to some of the streams only during the deer season.

Other Problems

In addition to the need for continued stream protection, fishery problems include excessive water temperatures at various locations and poor fish passage above falls and log jams. Also, funding is needed for adequate studies concerning rare and endangered species and other wildlife.

NARRATIVE WILDLIFE ANNUAL REPORT - FY 1971

Under Question #1

a. (3) Waterfowl - 762 Acres. This figure consists of 269 acres at Loon Lake and 493 acres located along the ocean at New River, T. 30 S., R. 15 W.

Under Ouestion #2

Terrestrial and Aquatic Habitat Blocked to Public Access

a. Closure of private lands - 10,000 acres. This is an estimate and these lands are generally found in Curry County. Most lands are scattered and surrounded by private land. A case in point is the \$1.00 per car that is charged by Mr. Jack Storm to use his access road to fish and hunt on public lands along New River, T. 30 S., R. 15 W.

Under Question #5

Wildlife Personnel

a ξ b. The district has one Wildlife Biologist and one Fisheries Biologist. Their supervisor is listed as a Coordinator.

Under Question #6

Wildlife Surveys

- a. Use, Condition and Trend 14 intensive inventory areas were established to monitor the wildlife habitat condition and trends for the district.
- b. Stream & Lake 45 streams were surveyed during FY 1971.

Under Ouestion #7

Habitat Management Plans - No H.M.P's were completed during FY 1971.

Under Ouestion #9

- a. Management The \$20,000 is the sum of the Fisheries & Wildlife Biologists salaries for FY 1971.
- b. The \$7,100 includes \$2,300 on terrestrial habitat improvement done by the Oregon State Game Commission in cooperation with the district. The other \$4,800 was spent directly for stream clearance work by the district.

NARRATIVE WILDLIFE ANNUAL REPORT - FY 1971 (Continued)

Streams are also cleared during timber sale contracts and wildlife habitat is improved by our extensive hydromulching program on the district.

Under Question #10

a. (1) Hunting

10,000 visitor days 500 visitor days

(2) Small Game (3) Waterfowl 500 visitor days

Total Hunting

11,500 visitor days

b. Fishing

22,000 visitor days

NARRATIVE

A. Habitat Management

 $869~{\rm acres}$ were mechanically treated and seeded to improve the Murderer's Creek deer winter range.

B. Animal Damage

No significant animal damage problems occurred.

C. Statistics

There is a big change from the previous years report under lb. acres of aquatic lakes. Iast years report listed 41,168 acres. I estimated the acres of lake and reservoir habitat at 8,000.

United States Department of the Interior

BUREAU OF LAND MANAGEMENT Utah State Office Post Office Box No. 11505 Salt Lake City, Utah, 84111

September 1, 1931

Memorandum

To: Director

io: Director (360)

From: State Director Utah

Subject: Wildlife Annual Report for 1971

Rare and/or endangered wildlife species found to be either permanent transient residents of Utah include the Western burrowing owl (10) at sandhill crane (R), peregrine falcon (R), Colorado River squawfish humpback chub (E), prairie falcon (status undet.). Abert's squired undet.), and ferruginous rough-legged hawk (status undet.). There are confirmed sighting of a black-footed ferret in the Vernal District & the year, and we suspect their presence in the Price and Monticelle 1. tricts. The Utah prairie dog was recently removed from the list mammals, but it should be placed on the status undetermined list studies presently underway are completed. So far, no determination been made concerning means to improve living conditions for the entity species found in the Green and Colorado Rivers or for the migrature We have protected prairie dog colonies in southeastern Utah from more where the presence of black-footed ferrets is suspected. However at the year some of the colonies have died out, apparently from plane of the colonies where a roadside interpretive area was being plantage died out for an unknown reason.

Our working relationship with the Division of Wildlife Services in I predator and rodent control is very good. However, we need a well-spolicy established by the Secretary regarding BIMs future role in macontrol and management. Recent Instruction Memoranda from the Wastloffices of both the BSFKW and BIM have confused the issue as to whn primary responsibility for justifying the program. We have advised permittees that they must provide BIM with requests for continued montrol work, with statements of justifications, or programs may he If BIM is to accept full responsibility to determine justifications control work, then we will need either (1) additional funds and macro verify losses, collect data, and relate to livestockmen, or (2) to decrease emphasis on existing programs of inventory, analysis, in

ning, etc. in order to spend more time on the predator contro.
Washington Office should provide a firm Bureau policy in this:

It would also be well if the Washington Office would provide additional instructions on coordinating the statistics prepared for the Public Land Statistics and for the Wildlife Annual Report, especially with reference to hunter and fisherman visitor days. The Wildlife Annual Report is not prepared by the districts until about one month after the Public Land Statistics, and frequently the figures are not compatible.

Most of the statistics in the current report are reasonably close to the figures submitted in the 1970 report. Data will continue to be adjusted as new surveys and increased information become available.

Utah has many thousands of acres of public land that are blocked to public access either by private lands or by lack of physical access. Efforts are continuing to consolidate lands by exchanges where this is in the best public interest, or to otherwise negotiate access where possible.

Utah had three antelope transplants on BLM lands during the past year. These were accomplished after cooperative agreements were prepared and took place in the Monticello, Vernal, and Kanab Districts. Animals were obtained from Wyoming and contained 84,71, and 22 antelope, respectively. A desert bighorn sheep transplant is being contemplated in Zion National Park on lands adjacent to a proposed BLM primitive area, Canaan Mountain. A cooperative agreement will be prepared for the management of these animals in the event they move onto BLM lands. Three mountainous areas were studied during the past year for possible elk introductions. BLM lands would have provided some of the winter range. Final recommendations are now being prepared.

A stream improvement project was completed in the Salt Lake District during FY 1971 wherein 15 gabion structures were installed to improve the pool-riffle ratio and increase bank stabilization. About one mile of the stream was fenced to prevent livestock grazing of the stream bank. Vegetation along the stream has increased substantially since the project, providing trout cover. Fishing along the stream is expected to improve as better cover develops.

Gravel has been removed in large quantities from a BLM site near Glen Canyon City during the past year for use in construction of the Navajo Steam Generating Plant near Page, Arizona. It was discovered there was a high water table at the gravel removal site in the stream and that a well dug to obtain water for gravel cleaning operations produced a high volume of good water. The Utah Division of Wildlife Resources became interested in the site as a possible striped bass rearing site. Plans are being prepared and tentative agreement has been reached to rehabilitate the gravel removal site for this purpose at the conclusion of the gravel removal operation. The Division hopes to rear striped bass here and plant them directly into Lake Powell, just down stream from the site.

Although BLM has little control over exploratory mining operations and mineral extraction, we have made good progress in soliciting cooperation from the mining industry in protection of bighorn sheep habitat. Certain roads may be closed to the general public to prevent undue harrassment of desert bighorn sheep in the Monticello District.

There are three bald eagle winter roosts in the Salt Lake District where up to 50 eagles use each site during the winter months. We are cooperating with Dr. Joseph Murphy, Head, Biology Department, Brigham Young University, in determining how best to protect these sites from molestation or vandalism. Several eagles are shot by rabbit hunters in this area each year, and we have not yet decided whether or not we could adequately protect the sites if they were provided special designation and public notification of their existence.

NARRATIVE FOR 1971 FY WILDLIFE ANNUAL REPORT

There are significant changes from previous annual reports. Based on more accurate information after completion of extensive inventories on the entire district and unit resource analysis on three planning units, the total miles of streams was found to be 100 miles rather than the 50 miles previously reported. The acreage to which public access is restricted is also much greater. The new figure is based on a more thorough analysis of the access problem district-wide. It is quite obvious that a very serious access problem exists on the district mainly because many of the tracts of public land are completely surrounded by private lands.

Considerable progress was made in the wildlife program during the past year. Delineation of terrestrial wildlife habitat areas was completed on the entire district. Intensive inventories have now been completed on nine habitat areas involving 1,373,460 acres, or more than half of the public lands in the district.

Interim reports were prepared for the Diamond Ring antelope-fencing study and antelope pass studies. As the result of the study findings, a comprehensive report concerning guidelines for fencing on antelope range was prepared which has been adopted as district policy. In cooperation with the state office wildlife biologist, a technical bulletin was written on the use of pass structures to facilitate antelope movement through fences.

INVENTORIES AND PLANNING DATA

	: COMPLETED	REMAINING	OVERLAP
Extensive Inventories	:	: :	
Acres No. of Habitat Areas	2,398,153 32 areas	None None	
Intensive Inventories	;		
Acres No. of Habitat Areas	1,373,460 9 areas	1,024,693 23 areas	
Management Plans	:	:	
Number Acres No. of Habitat Areas	None None None	37 (1): 2,398,153: 32 areas (1):	

⁽¹⁾ In addition to the 32 terrestrial wildlife habitat areas there are 5 special project areas that require habitat management plans.

C. There was a considerable overall increase in elk harvested in this region last year and the harvest figures for public land reflect this general heavier harvest. The moose harvest and population figures for public lands are down some due to the population reduction effected by the large permit quota set in the fall of 1969. The object of the high quota was to reduce the off-forest moose populations due to damage complaints received. Their strategy was successful.

Narrative for Annual Wildlife Report FY 71

A. Habitat Management

Major emphasis was devoted to gathering inventory data to complete URA's and MFP's in all districts. As a result better information is now available and is constantly being updated. In many areas basic inventory information is not available from the state wildlife agency, and estimates are being cooperatively developed and field investigations made to verify data.

Cooperative efforts with the state wildlife agency have continued to improve, and the results are developing into closer working relationships and more confidence in each others data.

Very little effort was done in wildlife development; funds and man months were insufficient. There was some cooperative work done with the state wildlife agency in the development of water sources (wells, and guzzlers) for wildlife. In many parts of the state the state wildlife agency appears willing to cooperate with funds and manpower in the development of wildlife waters in key areas. The state wildlife agency has an active program for purchasing and developing winter game ranges, and much work has been done in developing cooperative management plans for these areas when public lands are involved.

Work has continued on the antelope sheep-tight fencing controversy to provide for antelope movements. Some antelope passes, special gates, and special fencing stipulations have been developed to provide for antelope movement. One publication on the development of the antelope pass was made in the Journal of Range Management by the Casper district wildlife biologist and the state office wildlife specialist. They also have in draft form a technical bulletin for use of the antelope pass which is under review by the Denver Service Center.

In the Pinedale district the cooperative deer trapping and marking project was continued and has provided some data on deer movements.

The Colorado Cutthroat trout has been identified in several small streams in western Wyoming, and a package has been developed to enhance and protect the habitat. The trout are located in the Pinedale and Rock Springs districts.

B. Animal Damage

Animal damage control has had national attention in Wyoming with the loss of eagles from coyote poisoning efforts by private groups, shooting, and electrocution from power distribution lines. The whole program is now under review and there appears to be considerable controversy. Livestock operators,

particularly sheepmen, maintain more predator control for coyotes and bobcats is needed; while preservationist groups would limit or reduce all control. Private control organizations in Wyoming are well funded and organized, and carry out aggressive control programs reportedly on private and state lands under their control. The federal land management agencies and BSF&W animal control division has only limited or no knowledge of their activities. Sport hunting for predators is only of limited effectiveness around major population centers. Aerial hunting is effective in some areas. As guidelines are developed from the Washington office, they are implemented at the local level; however, it does appear that latitude is needed to provide for problem case areas.

Animal damage from big game continues to be reported by ranchers in wildlife wintering areas, and the state wildlife agency does make payments for damage when it can be shown and proven. There was an unsuccessful effort made to provide for animal damage control payments in the state legislature by providing for an AUM use payment by wildlife use on private lands. The antelope coupon does provide the rancher with some return for antelope harvested from his range, but there have been abuses to this program.

C. Wildlife Statistics

With URA's and MFF's being developed in all districts, statistics are being updated and refined. The major source of the data is from the state wildlife agency. Harvest figures are just barely being developed in time to meet the deadlines of the annual wildlife report.

D. Other Problems

Access problems continue to arise and are becoming more acute in scattered areas. Some of the local organizations which have created access problems are Elk Mountain Safari in southentral Wyoming, Recreation Unlimited in central Wyoming, and the checkerboard lands in the eastern part of the state. The American Sportsman organization is also looking toward leasing and blocking out lands in Wyoming. We are continuing with the S-60 sign program and cooperative efforts, but funds and manpower are limited.

The antelope fencing controversy continues to demand work and attention, and the animal damage control problem needs more attention. We have been working on the eagle loss through electrocution from power distribution lines.

Increasing work demands from other programs on district wildlife personnel limit their effectiveness in the wildlife program. Also, transfers of key personnel have slowed down work in some districts.

Increasing work demands from other programs on district wildlife personnel limit their effectiveness in the wildlife program. Also, transfers of key personnel have slowed down work in some districts.

WILDLIFE ANNUAL REPORT

Narrative

A. We had no habitat improvement or development work during this year. Maximum effort was expended toward completing URAs and MFPs on the District's planning units.

The cooperative deer trapping and marking project, conducted in cooperation with the Wyoming Game and Fish Department is continuing. We captured and marked 12 more deer in the Soap Holes area last winter and are getting valuable return information.

The cutthroat trout populations reported last year have been identified as the Colorado River Cutthroat trout. This trout will reportedly be designated as rare in the next revision of the "rare and endangered species" list. In cooperation with the Wyoming Game and Fish Department fisheries personnel, we are continuing investigation of this trout's habitat and populations on public land streams. A major package for habitat protection and enhancement was submitted in FY 70 and will again be submitted in FY 74.

The Wyoming Game and Fish Department contributed \$15,000 to the District for water development and maintenance of water developments in the Desert and Sandy Planning Units. The District is conducting all development and operations. The object is to provide more water for antelope and sage grouse in these arid areas. The Wyoming Game and Fish Department has initiated a study to evaluate the effects of the new water developments in this area.

B. Predator control programs in this District still are a subject of controversy. This District is still operating under a policy of "no lethal stations" on public lands. We are limiting predator control to aerial or ground hunting on a "problem area" basis. The Sublette County Predatory Animal Control Board bountied 200 coyotes in this District at \$10.00 per coyote last winter. One bald eagle was found dead on the Fall Creek elk feed ground last winter. It was reportedly shotguned. The Wyoming Game and Fish Department complained of aerial (helicopter) hunting of coyotes on and around the Scab Creek, Fall Creek and Muddy feed grounds last winter. The BSFKW denies involvement in these operations. It is reported that the Buffalo Flying Service was contracted to do this hunting by the Sublette County Predatory Animal Control Board. Evidently there is little we can do about the complaints of the Wyoming Game and Fish Department.

WILDLIFE ANNUAL NARRATIVE REPORT

A. Habitat Management

Accomplishments in habitat management and improvement work was accelerated with the filling of the GS-11 Wildlife Biologist position. After seven months the position was vacated and the district is in the process of filling the vacancy. However the ground work was laid for the necessary studies for development of management plans which previously hindered needed accomplishments in wildlife management.

Funds were not available this past year for any habitat development projects. Future projects with impact upon wildlife habitat continue to be coordinated with the Wyoming Game and Fish Commission. Utilization studies are undertaken jointly with the Wyoming Game and Fish Commission.

B. Animal Damage

Animal damage within the district is not serious, however, some damage to haystacks in the Cokeville area is experienced as the result of large elk and deer populations combined with limited winter habitat. Potential habitat areas which we anticipate may become critical are the Prospect Mountain wintering area for elk and deer and the Pine Mountain-Little Mountain wintering area for elk and deer. Desirable browse space in these areas are showing extreme use.

Predator problems in the district are primarily coyote predation upon sheep. Complaints continue to be received from user groups for increased protection from predation by coyotes on sheep ranges, Control measures are under the supervision of the Bureau of Sport Fisheries & Wildlife and any requests for predator control programs on public lands are handled under the existing Bureau policy.

C. Wildlife Statistics

Population estimates are being continually updated as more and better information becomes available.

D. Wildlife Personnel

We had on board a GS-ll Wildlife Biologist who recently vacated the position after seven months within the district. We are presently in the process of recruitment.

E. Other Problems

Due to the loss of trout experienced in 14-Mile Reservoir in FY 70, a cooperative determination was made with the Wyoming Game and Fish Biologist not to plant this year. As suspected there was a high imbalance in the magnesium-calcium ratio. Cooperative studies will be maintained with the Wyoming Game and Fish personnel with the hope that future transplants may continue.

F. Non-consumptive Uses of Wildlife

No data available.

G. Access

There are presently no problems with access to hunting and fishing areas in important wildlife habitat areas that district personnel are aware of.

H. Waterfowl Use

Data available concerning waterfowl use is limited and of low reliability.

A. Habitat Management:

Antelope movement through sheep-tight fences continues to be a problem of primary concern within the district. Eight pass structures were installed during the year in an effort to facilitate their movement. Two light weight 8' x 6' cattleguards were placed in fence corners in the Overland P.U. south of Rawlins. Six other pass structures were placed in the Red Desert P.U. These six were of the special gate type in which existing gates were fitted with three strand barbed wire gates in addition to the existing sheep-tight gate. Also, in two sections along the fence, two rods of net wire at two different points were removed and three strands of barbed wire stretched across the opening with a spacing of 16", 14", and 10" from the ground up. The net wire removed was made into a gate and set to one side when sheep were not in the allotment. The net gate may also be used as a wing to direct antelope movement by placing it in the center of the opening on one side or the other of the fence, depending on the direction of antelope movement. When sheep are in the allotment all the sheep-tight gates are closed. When they are not in the allotment, the sheep-tight gates and two sections of net are removed to permit antelope movement. These structures are apparently working quite well since considerable sign of use exists at several of the gates.

The majority of time and effort has been spent in the completion of district URA's and MFP's. It is anticipated that all URA's and several MFP's will be completed by the end of FY 73. The commencement of an HMP is expected in FY 73 and others in FY 74.

Considerable time has also been spent in program coordination both with other agencies and with functions within the office. The major coordination efforts have been concerned with additional sheep-tight fencing proposals and sagebrush eradication proposals. Also coordination with the State Game and Fish Agency.concerning recommended seasons and harvests.

B. Animal Damage:

Coordination of animal damage control with BSF & W and the Carbon County Predatory Control Board continues to be carried on. Since BSF & W has discontinued the maintenance of local field representatives, and since all requests by ranchers must now go through the BLM office, a few problems have arisen. The Carbon County Predatory Control Board now desires to implement control measures themselves by using traps. It also appears as though ranchers are going together and hiring control work done. The apparent result of which has been the easele controversy.

C. Wildlife Statistics:

Several changes have occurred in this year's report over last year's. Some of the changes are due to a misinterpretation of the questions on previous reports.

ITEM 1s - Acres of unsatisfactory habitat have been indicated. Various areas of big game habitat are unsatisfactory because such factors as limited water and fences have left some habitat unusable while others are receiving increased use. Also much of the waterfowl habitat is poor since most, if not all, of their habitat is also used by livestock resulting in the removal of all the surrounding vegetation, which supplies food and cover.

ITEM 1b - Additional aquatic lakes have been indicated as the result of new transplants of fish.

ITEM 2a - The 400,000 acres of public domain lands indicated, for the most part, lie within the railroad checkerboard. In effect access is permitted after a fee for crossing private lands has been paid. Of the 400,000 acres indicated, 106,177 acres are within an area of railroad checkerboard which has just been reported, but not confirmed, as also blocking access.

ITEM 3a and b - An increase in bird-days is shown. The figure shown in last year's report represents the number of days use can be made by waterfowl during the year. The figures shown in this year's report are the estimated bird-days of use within the district.

ITEM 10 & 12 - It is felt that visitor use data and harvest data should be completed by the state office for the consolidated state wide report from available statistics. The reason for this is that many of the Game and Fish Management areas overlap or include two or more BIM districts. The data given could be construed differently by each district resulting in an unrealistic picture. The statistics presented are estimated to be representative of the district.

D. Other Problems:

Access to public lands within the railroad checkerboard continues to mount. Private recreation groups such as Elk Mountain Safari and Recreation unlimited continue to create access problems to public lands. Form 6500-1 ly 1970) ormerly 6960-1)

NARRATIVE - Annual Wildlife Report - FY 1971

1971 figures remain quite similar to previous year submissions. Again this year, items numbers 10 and 13 have not been considered at the district level. All figures and estimates are the result of consultation with involved agencies and/or individuals. Statistics have been "broken down and rounded off" to relate to BIM administered lands and, where applicable, FY 1971 only.

Much of FY 1971 was directed toward planning activities. Habitat improvement was limited to the installation of four bird watering devices stratified through areas having known upland bird potential.

As in the past, Worland District relations with other agencies and user groups were good. Especially important was a good working relationship with the Wyoming Game and Fish Commission.

Animal damage control, as a program, was a reasonably low-impact undertaking during FY 1971. Program levels were much the same as in the past.

Item 1-b, requesting acreages, is reflected literally rather than in terms of 1000's of acres. Item 4 listing four rare or endangered species results from observations logged by other than BIM personnel with the exception of the osprey. The American osprey, although presently enjoying an undetermined status, has been included as a wildlife species worthy of special recognition. Habitat acreages are undetermined.

Item number 12, Wildlife Populations, etc., is based primarily on winter population information.

Public access to BLM administered lands (or the lack of it) remains a management problem near previous levels.
