Method of obtaining representative samples..	1	Directions for using the tables.....	3

**METHOD OF OBTAINING REPRESENTATIVE SAMPLES.**

The rules and regulations for the enforcement of the United States Grain Standards Act prescribe a definite procedure for securing a representative sample upon which the grade of any particular lot or parcel of shelled corn or wheat is to be based.

The rules provide that the original sample must be not less than 2 quarts in quantity, of which approximately 1½ pints must be placed in an air-tight container and the remainder inclosed in a cloth sack. The portion in the container is intended for the determination of the percentage of moisture, and this portion should be used for that test only. The remainder of the sample, contained in a cloth bag, will approximate 2½ pints, and this portion is to be used for the remaining determinations, which for wheat include color, wheat of other classes, damaged kernels, inseparable material, and dockage, and for corn include color, damaged corn (not including heat damage), heat-damaged corn, and foreign material and cracked corn. The grades specify maximum and minimum percentages for the factors mentioned, and these percentages are to be determined by weight.

<sup>1</sup> The work covered by this bulletin was begun under the direction of Dr. J. W. T. Duvel, of the Office of Grain Standardization of the Bureau of Plant Industry. Since Aug. 18, 1916, the grain-standardization work of the Department of Agriculture has been administered jointly by the Bureau of Markets and the Bureau of Plant Industry in connection with the administration of the United States Grain Standards Act.

Because of the time involved, it is impracticable to make the mechanical separations on the entire  $2\frac{1}{2}$  or more pints, and it therefore becomes necessary, in most cases at least, to divide the sample in order to obtain a smaller representative portion for the determination of the factors mentioned.

Experiments have shown that the sample upon which the determinations for the factors mentioned are based should be approxi-

FIG. 1.—A vertical cross section of the sampling device, showing the paths taken by the material in passing from the hopper to the containers.

mately 40 grams in weight for wheat and approximately 250 grams in weight for corn. After the mechanical separations and weighings have been made, mathematical calculations are involved in order to convert these weights into terms of percentage, and the accompanying tables enable the analyst to accomplish these results without any calculations.

## DIRECTIONS FOR USING THE TABLES.

Table I shows the percentage equivalents for separations weighing from 0.1 to 20 grams taken from samples weighing from 25 to 65 grams, inclusive, which covers the entire range of maximum and minimum limits of color, wheat of other classes, damaged kernels, and inseparable impurities specified in the numerical grades of the United States standards for wheat.

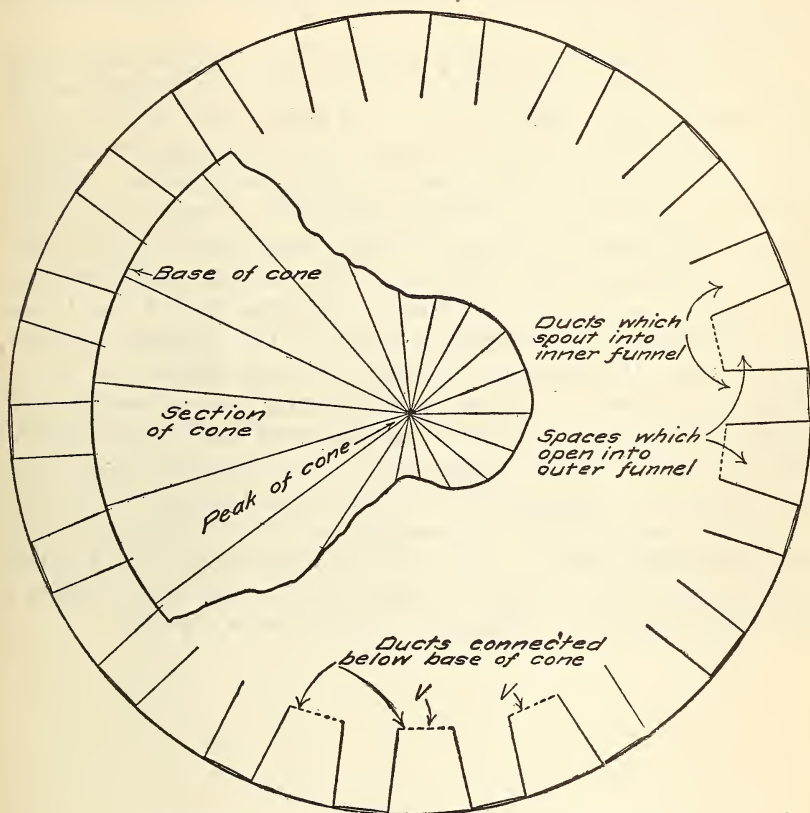

FIG. 2.—Cross section of the sampling device at the base of the cone.

Table II shows percentage equivalents for separations weighing from 0.1 to 40 grams taken from samples weighing from 240 to 260 grams, inclusive, which covers the entire range of maximum limits of corn of other colors, damage, heat damage, and foreign material and cracked corn specified in the numerical grades of the United States standards for shelled corn.

The solution of the following problem will illustrate the use of the table:

*Problem.*—A sample weighing 240 grams contains 8 grams of damaged corn. What is the percentage of damaged corn contained in the sample?

Referring to Table II (p. 14), follow down the first column to the figure 8.0 (the weight of the separation of damaged corn in grams). The figure opposite (in the second column, with heading 240) is found to be 3.3, which is the correct percentage expressed in the nearest tenth of 1 per cent.

The use of the table will save time in converting the separations into terms of percentages of the whole sample analyzed, and its careful use will prevent errors which often occur in the mathematical calculations involved.

In this connection it is highly essential that extreme care should be taken to preserve accurately the character of the original sample when reducing the original  $2\frac{1}{2}$  or more pints taken from the bulk grain to the smaller sample of approximately 40 grams for wheat or approximately 250 grams for corn for analytical purposes. Experiments have shown that it is almost impossible to divide a large sample into smaller portions and at the same time retain the correct proportion of damage, dirt, color, etc., in the smaller sample unless a device similar to the one described in Bulletin 287 of the United States Department of Agriculture is used. This apparatus was devised to meet the demands of grain and seed dealers, as well as laboratory workers, for securing a reliable grain or seed sample from a larger portion of the material to be examined, analyzed, or graded. Figure 1 shows a vertical cross section of the sampling device, while figure 2 shows a cross section of this device at the base of the cone. A detailed description of this sampling device is contained in the before-mentioned bulletin. This device has been covered by a public-service patent (No. 1,160,036), and anyone in the United States is free to make and use it without the payment of a royalty.

TABLE I.—Equivalent percentage of a sample of wheat, etc., when the weights of the sample analyzed and of the mechanical separation are given.

Weight of separation.	Weight of sample analyzed (grams).
