Nicæa, in Bithynia, 155 A. D. He rose to high position and was twice consul. Of his great *History of Rome*, in eighty books, from the landing of Æneas to the accession of Alexander Severus and Dio's consulship of 229, books 36–60 from 68 B. C. to 47 A. D. are extant, mutilated in parts, the rest only in fragments and in excerpts. Dio Cassius is our most important source for the period of which he treats, and he is a vivid and interesting writer, showing the soldier and the man of affairs at every turn. But he repels by his groveling superstition, and his groveling self-abasement before the imperial power. His model of style is Thucydides, whom he imitates so closely that his text is often appealed to by the commentators of his great original. Ed. by Bekker (1849), and Dindorf (1863–65). D. about 235.

B. L. GILDERSLEEVE.

Diocese [O. Fr. *diocise* (> Mod. Fr. *diocèse*): Ital. *diocesi* < Lat. *diœce'sis*, district, province = Gr. διοίκησις, management, province, deriv. of διοικεῖν, manage, administer; διά, through + οἰκεῖν, inhabit, hold, manage, deriv. of οἶκος, house]: the district under the ecclesiastical jurisdiction of a BISHOP (*q. v.*); belonged originally to the civil hierarchy. Under Constantine the Great the Roman empire was divided into thirteen civil territories called dioceses, which were again subdivided into 120 provinces. These dioceses were governed either by prefects, proconsuls, or vicars, and the provinces by rectors. The word gradually acquired an ecclesiastical use; but its meaning varied. In the Western Church by the end of the fourth century it meant what is now meant by it. In the East it meant a patriarchate equivalent to what is now known as a province with suffragan sees. Revised by J. J. KEANE.

Dioele'tian (Lat. *Diocletianus*), or, more fully, **Cains Valerius Aurelius Diocletianus**: a Roman emperor; b. in Dalmatia, in 245 A. D., of humble parentage. He served with distinction in the army under Aurelian and Probus. On the death of Numerianus, in 284, he was proclaimed emperor by the army at Chalcedon, and after a brief war in Moesia, in which his rival Carinus was killed, he was installed at Nicomedia. In the year 286 he adopted Maximian as his colleague in the empire, which was disturbed by incursions of barbarians and menaced by the Persians. They suppressed revolts in Gaul, and, in order to divide the labor of ruling so vast an empire, chose Galerius and Constantius Chlorus as their assistants in 292 A. D., and gave them the title of cæsar. This was the beginning of the division of the empire into Eastern and Western. Diocletian reserved to himself Asia and Egypt; Maximian received power over Italy and Africa; Thrace and Illyricum were assigned to Galerius; and Gaul and Spain to Constantius Chlorus. The supremacy of Diocletian (whose court was at Nicomedia) was acknowledged by the other three. After this distribution of power the Roman armies gained successes in Egypt, Persia, and Britain. Diocletian protected or omitted to persecute the Christians until 303 A. D., when a persecution was commenced at the instigation of Galerius. Diocletian abdicated the throne in 305 A. D., in favor of Galerius, and retired to Salona, in Dalmatia, where he devoted his time to horticulture. The immense palace which he built at Salona marks a great change in architecture from the pure classic Græco-Roman style to the earliest Romanesque. This palace is the subject of an excellent book by R. Adam, published in 1764, and one of the earliest attempts at a true archæological treatment. The modern town of Spalato is almost wholly contained within the walls of this palace. D. in 313 A. D. See Gibbon, *Decline and Fall of the Roman Empire*; Tillemont, *Histoire des Empereurs*; Vogel, *Der Kaiser Diocletian* (1857).

Dioeletian Era (called also the **Era of Martyrs**, on account of the persecution in Diocletian's reign): the period in the early Christian chronology dating from the year 284 A. D., the year of the proclamation of Diocletian as emperor. The term was employed till the method of reckoning time from the birth of Christ was introduced by DIONYSIUS EXIGUUS (*q. v.*) early in the sixth century, and is still used by the Abyssinians and Copts.

Dioda'ti, GIOVANNI: Calvinistic theologian; b. of an Italian family at Geneva, Switzerland, June 6, 1576; appointed Professor of Hebrew at his native place in 1597; became Professor of Theology there in 1609, resigning in 1645. In 1618 he represented the Church of Geneva in the Synod of Dort, where his reputation was so high that he was one of the persons appointed to write the articles of faith. He produced the still most widely circulated Italian (Geneva, 1607) and French (1644) translations of the Bible, and wrote several treatises against the doctrines of the Roman Catholic Church. D. in Geneva, Oct. 3, 1649. See his *Life* in French by E. de Budé (Geneva, 1869).

Di'odon [from Gr. δι-, two, double + ὀδούς, ὀδών, tooth]: a genus of marine fishes of the order *Plectognathi*, without distinct teeth, but having the jaws covered with an ivory-like substance, which is formed by the blending of the teeth into one. Some of them have the power of filling their stomachs with air and assuming a globular form, whence they are called globefish; others are designated porcupine-fish from their numerous spines, which stand out like those of a hedge-hog. Most of the diodons of the Atlantic waters of the U. S. are called balloon-fish. They are of several species.

Diodo'rus Sic'ulus: Greek historian; b. at Agyrium, in Sicily; flourished about 50–20 B. C. He traveled in Europe and Asia in order to collect materials for a universal history, and afterward became a resident of Rome. He expended many years in the composition of his history, which is entitled *Historical Library* (Βιβλιοθήκη ἱστορική), in forty books. It is a history of the world from the earliest times to 60 B. C. The name describes it fitly. It is a collection of books in abridged editions, the facts of the greatest interest and importance, the authorities often a matter of dispute. The librarian lacks knowledge of the world, critical faculty, vision, and sense of proportion. The annalistic arrangement is unhappy and the style, though clear and simple except where it rises by a spasmodic rhetorical effort, has little movement and is wearisome by its repetition of set phrases. Fifteen entire books of his work, and some fragments of the others, are extant. Among the best editions are those by Bekker (4 vols., 1853–54) and by L. Dindorf (5 vols., 1867–68). Revised by B. L. GILDERSLEEVE.

Diog'enes (in Gr. Διογένης): a famous Cynic philosopher; b. at Sinope, in Asia Minor, about 412 B. C. He was a pupil of Antisthenes, who declared that it was god-like not to need anything. Accepting this principle, Diogenes inured himself to extreme privations; his house was a tub, his wealth a cloak, a wallet, a staff, and a wooden cup, and this he threw away on seeing a lad drink from the hollow of his hand. He was a severe and caustic censor of the follies and vices of the Athenians, who allowed him a great latitude of comment and reproof. He was renowned for his witty and sarcastic sayings. He once received a visit from Alexander the Great, who inquired, "What can I do for you?" Diogenes replied, "Cease to stand between me and the sun." Having been captured by pirates, who offered him for sale in a slave-market of Crete, he cried, "Who wants a master? The man who buys me must obey me as masters obey their physicians." He was purchased by Xeniades, a citizen of Corinth, who was a kind master, and soon liberated him and employed him as a tutor of his children. D. about 323 B. C. See Ritter, *History of Philosophy*; Grimaldi, *Vita di Diogene Cynico* (1777).

Diogenes Laertius (in Gr. Διογένης ὁ Λαέρτιος): the name attached to a kind of scrap-book labeled *Lives and Doctrines of Famous Philosophers*. Of Diogenes himself we know absolutely nothing. The work contains important information, interesting anecdotes, and priceless extracts from lost works, all put together in the most mechanical way. See Usener's *Epicurea*, introduction. The standard edition is still that of Hübner (4 vols., 1828–33). B. L. G.

Diogenes of Apollonia: an ancient Greek philosopher; b. in Crete; lived about 470 B. C.; a disciple of Anaximenes, and taught philosophy at Athens. He regarded air as the first principle of all things, and wrote a work on nature or cosmology, which is not extant.

Diogenia'nus: Greek grammarian of Heraclea; flourished about the middle of the second century A. D. From him was derived the mass of what is found in the lexicon of Hesychius. His name appears also as one of the collectors of Greek proverbs on *Paroemiographi Græci*, ed. by von Leutsch and Schneidewin, i., pp. 177–320. B. L. G.

Diomedea: See ALBATROSS.

Di'omede Islands: a group of three small islands in the middle of Bering's Strait, midway between Asia and America.

Diome'des, often anglicized **Di'omede** or **Di'omed** (in Gr. Διομήδης): a Greek warrior and King of Argos, celebrated in the ancient legends as a son of Tydeus (hence he was

called Tydides), and a favorite of Minerva. He fought with distinction at the siege of Troy, and, according to Homer, ventured to attack Mars, who defended the Trojans. Diomedes and Ulysses are said to have carried away the Palladium of Troy. Some writers relate that after the capture of Troy he settled in Italy.

Diomedes: a king of the Bistones in Thrace; fabled to have fed his horses on human flesh. He was slain by Hercules.

Diomedes: Latin grammarian of the fourth century. His treatise on grammar in three books has considerable value, having incorporated much from earlier writers of authority now lost. It is printed in the first volume of Keil's edition of the *Grammatici Latini*. M. W.

Di'on (in Gr. Δίων): statesman of Syracuse; b. about 410 B. C.; inherited an ample fortune from his father. He acquired great influence at the court of Dionysius the Elder, who had married Aristomache, a sister of Dion. He was a pupil and intimate friend of Plato, who taught at Syracuse. After the accession of Dionysius the Younger (*q. v.*), Dion persuaded him to invite Plato to return to Syracuse. The virtue and austere morals of Dion rendered him obnoxious to the dissolute tyrant and his courtiers. He was banished, and took refuge at Athens, leaving at Syracuse his wife Arete, who was compelled to marry another man. In order to revenge himself and liberate his country, he raised a small body of troops in 357 B. C., and attacked Syracuse, which he occupied without much resistance. He expelled Dionysius, but was soon deprived of power by the intrigues of Heraclides. Dion was recalled by the people, but was assassinated by Calippus about 354 B. C. See *Life of Dion*, by Plutarch, who compares him to Marcus Brutus; Cornelius Nepos, *Dion.*

Dion: See Dio.

Dionæ'a [a name of Venus]: a genus of insectivorous plants of the family *Droseraceæ*. But one species is known, the *D. muscipula*, or Venus's flytrap, which grows upon the moist sandy land near Wilmington, N. C. It is a low perennial herb, having a rosette of peculiarly shaped leaves which lie flat upon the ground. Each leaf has a broad wedge-shaped petiole and a nearly round blade. The margins of the blade are fringed with bristly hairs, while the surface bears three sensitive hairs upon each side of the midrib. When the sensitive hairs are touched by a fly the two halves of the blade spring up suddenly and inclose it, the marginal hairs overlapping so as to imprison still more securely the unfortunate insect. Very soon an acid exudation from the leaf surface incloses the insect and dissolves its soft parts. Still later the solution is absorbed, leaving nothing but the empty shell and hard parts of the insect's body, when the leaf opens and is now ready for the capture of another insect. The plant has been grown in conservatories, and has been much studied by many botanists. For a further discussion, see the article Insectivorous Plants and the writings of Gray and Darwin, who gave the plant much attention. C. E. B.

Dionæa: Venus's flytrap.

Dion Cassius: See Dio Cassius.

Dionne, Narcisse E.: See the Appendix.

Dionys'ia (in Gr. Διονύσια): great annual festivals in honor of Dionysus (Bacchus); said to have been introduced into Greece from Egypt in 1415 B. C. They were of four kinds—the rural or lesser, the Lenæan, the Anthesterian, and the great Dionysia. They were chiefly celebrated at Athens. See Bacchanalia.

Dionys'ius, Saint: called The Great; the most distinguished convert and disciple of Origen; b. in Alexandria; became Origen's assistant in the catechetical school in 233; bishop of Alexandria in 248 A. D.; was driven out of that city by severe persecution in 250. In 257 A. D. the persecution was renewed, and Dionysius was banished to Libya, but he was restored in the year 260. He occupied a moderate position amid the controversies of his time, opposing the Sabellians, and gently urging the Novatians to be gentle with the lapsed. He denied the Apostolic origin of the Revelation, attributing it to the Presbyter John. He wrote many letters and religious treatises, which are not extant, except in fragments, which are found in Migne, *Pat. Gr. X.*, and in English translation by S. D. F. Salmond, in the New York edition of the *Ante-Nicene Fathers*, vol. vi., 77–120. See the monograph on him by Franz Dittrich (Freiburg im Br., 1867), and by Paul Morize (Paris, 1881). D. in 265 A. D. His day in the Greek Church is Oct. 3; in the Latin Church Nov. 17.

Dionysius Exig'uus: a learned monk; b. in Scythia; was a friend of Cassiodorus. He lived at Rome, and brought out an enlarged and revised Latin translation of a collection of apostolical canons and decisions of councils, which laid the foundation of canon law. He was the first who dated the Christian era from the birth of Christ, and unfortunately made it four years too late, so that the common chronology which was derived from him is wrong. His name Exiguus, "the little," refers either to his small stature or to his lowliness of mind. D. about 556. See his works in Migne, *Pat. Lat. LXVII.*

Dionysius of Halicarnassus (in Gr. Διονύσιος ὁ Ἁλικαρνασεύς): Greek rhetorician and historian; b. at Halicarnassus in Caria; went to Rome under Augustus, and passed more than twenty years in the study of Latin and in the composition of a Greek history of Rome, his *Roman Antiquities* (Ῥωμαϊκὴ ἀρχαιολογία) in twenty books, of which we have eleven and fragments. The theme was selected for its rhetorical opportunities. "History," he says, "is philosophy teaching by example," and the speeches are introduced to point the lessons of events and to display the resources of the writer's art. Of the period which he undertook to represent he had no vision. The sturdy Romans of the early republic became loquacious Greeklings of the early empire. Niebuhr was the first to assail the authority of Dionysius, which he demolished, but Dionysius used good sources, and can not be neglected. As a literary critic, Dionysius is more satisfactory than as a historian, and although he is narrow in his judgment of larger matters, in all that pertains to oratorical style he is an invaluable guide. Under Roman influence he became a passionate partisan of the Attic against the Asiatic school of rhetoric, and Demosthenes was his canon of excellence. His own style is fluent, and abounds in happy turns. D. after 8 A. D. Ed. of all the works by Reiske (1774); of the *Antiquities* by Kiessling in the Teubner series (1860–70), and by Jacoby (1885). Valuable edition of the *De Compositione*, by Schaefer (1808), of the treatises on Thucydides by Krüger (1823); specimen of a critical edition by Usener, *De Imitatione* (1889). See Blass, *De Dionysii Halicarnassensis scriptis rhetoricis* (1863).

B. L. Gildersleeve.

Dionysius Periege'tes: Greek geographer; author of a *Description of the Earth* in 1,187 hexameters. He flourished under Hadrian, and his poem became the great school geography. It was often translated into Latin, e. g. by Avienus and Priscian, and copiously commented. Ed. by Bernhardy with commentary, 1820; also in Müller, *Geographi Græci Minores*, vol. ii., 103–452. B. L. G.

Dionysius the Areop'agite: mentioned in the Acts of the Apostles (chap. xvii. 34) as one of the persons converted at Athens by the Apostle Paul. He is supposed to have been a member of the court of the Areopagus when Paul appeared before that tribunal. According to an early tradition, he was the first Bishop of Athens, and, according to a later tradition, suffered martyrdom there. In France he has been confounded with the Dionysius who went as missionary bishop to Paris about the middle of the third century, and who is commonly called St. Denys. The spurious mystical writings which bear his name, and which had permanent influence in developing Roman Catholic mystical theology, attempt to unite Neoplatonic ideas with those distinctively Christian. They appear to have had their origin in Alexandria during the fifth century. In the ninth century they were brought into Western Europe, and translated into Latin by Scotus Erigena. They are found in Migne, *Pat. Græc. III., IV.*; Scotus's version in *Pat. Lat. CXXII.* There is a French translation by J. Dulac (Paris, 1865). Cf. the treatise by C. M. Schneider (Regensburg, 1884.)

Dionysius (Gr. Διονύσιος) **the Elder**: tyrant of Syracuse; b. about 430 B. C. He was in his youth an obscure private citizen, and became a general in the service of the republic of Syracuse when Sicily was invaded by the Carthaginians. In the year 405 he usurped the supreme power in Syracuse, which then ceased to be a republic. He suppressed several insurrections of his subjects, and in 397 B. C. began or renewed hostilities against the Carthaginians, who then held some towns in Sicily. His fleet was defeated by the Carthaginians, who besieged Syracuse, but their success was hindered by a pestilence, and Dionysius gained a decisive victory over them after they had lost great numbers by disease. He also captured several towns in Sicily, and made conquests on the Italian peninsula. He was an able ruler, displayed superior political talents, and was one of the most powerful princes of his time. At the request of Dion he invited Plato to his court, but the lectures of that philosopher offended the tyrant, who ordered the captain of a ship to take Plato away and sell him as a slave. He was ambitious of literary fame, and wrote poems and tragedies, some of which he sent to the Olympic games, but he failed to obtain a prize. It is stated that in the latter part of his life he was very suspicious, and took many precautions against the traitors and conspirators who (he imagined) intended to kill him, and there are many stories told of his craft and cruelty as a tyrant, as, for example, that of the so-called Ear of Dionysius, a cave hewn in the rock, and communicating with his room, from which he could hear all that was said by his victims in the adjoining prison; but these traditions are doubtless exaggerated. D. in 367 B. C., and was succeeded by his son Dionysius. See Grote, *History of Greece*, part ii., chaps. lxxxi.–lxxxiii.; Holm, *Geschichte Siciliens*, ii., 92 foll.

Dionysius the Younger: tyrant of Syracuse; son of Dionysius the elder, whom he succeeded in 367 B. C. He was indolent, dissolute, and inferior to his father in political talents. He was persuaded by Dion (*q. v.*) to invite Plato to his court, but the eloquence and wisdom of that philosopher were unavailing to reform him. Dionysius banished Dion, who in 357 B. C. returned with a small army and expelled the tyrant. The latter fled to Locri, and became the despotic ruler of that city. He recovered power in Syracuse about the year 346, soon after which the oppressed Syracusans applied for aid to the Corinthians, who sent Timoleon with an army in 344 B. C. Dionysius was then deposed, and went as an exile to Corinth, where he is said to have taught school.

Dionysius Thrax, or **the Thracian**: disciple of Aristarchus; composed about 100 B. C. the first Greek grammar (τέχνη γραμματική), a famous compendium, which was made the basis of grammatical study, and has come down, according to the judgment of well-qualified scholars, substantially in its original form. Ed. by Bekker in his *Anecdota Græca*.

Dionysus: See Bacchus.

Diophan'tine Analysis [so called from Diophantus (*q. v.*)]: a branch of algebra not reducible to systematic rule, which treats of indeterminate problems, principally such as involve square or cube numbers, or the relations of the parts of right-angled triangles; and in which integral or commensurable values are found for the indeterminates by means of artifices suggested by the nature or conditions of the problems themselves. The subject is now generally included in the theory of numbers.

Diophan'tus (in Gr. Διόφαντος): Greek mathematician; lived at Alexandria, probably between 200 and 400 A. D. He is the author of the most ancient extant treatise on algebra, and is the reputed inventor of algebra, according to Lagrange and others. He wrote an important work called *Arithmetica*, in thirteen books, of which only six are extant.

Diop'sis [from Gr. δι-, two + ὄψις, view]: a genus of dipterous insects belonging to the family of flies (*Muscidæ*) remarkable for having the eyes and antennæ at the end of long, horny stalks growing from the sides of the head. In some instances the distance of the eyes from the head is almost as great as the length of the wings.

Dioptrics [from Gr. τὰ διοπτρικά, science of dioptrics; deriv. of διόπτρα or δίοπτρον, names of optical instruments; διά, through + root ὀπ-, see; cf. ὄψις, view]: that branch of geometrical optics which treats of the refraction of light, or of the changes which take place in the direction of rays transmitted from one medium to another (as from air to water, etc.), or through media of varying density. It is applied chiefly in the construction of telescopes, microscopes, and other instruments requiring the use of refracting lenses. See Optics and Lens; also Littrow, *Dioptrik* (1830); Prechtl, *Practische Dioptrik* (1828); Steinheil, *Angewandte Optik* (Leipzig, 1890); and Mascart, *Traité d'Optique*.

Dioptric System: an arrangement of lenses for condensing light in lighthouses; devised by Fresnel about 1819, and based on the discoveries of Buffon, Condorcet, Brewster, and others. See Lighthouse Illumination.

Diora'ma [from Gr. διά, through + ὅρᾱμα, vision, spectacle; deriv. of ὁρᾶν, see]: a mode of scenic display invented by Daguerre and Bouton, and first exhibited in Paris in 1822. The painting is viewed through a large aperture or proscenium, beyond which it is placed at such a distance that the light is thrown upon it at a proper angle from the roof, which is glazed with ground glass, and can not be seen by the spectator, who is in comparative darkness, receiving no other light than what is reflected from the painting itself. By means of shutters or curtains the light may be diminished or increased at pleasure; and some parts of the picture being transparent, light may be admitted through it—an artifice which secures the advantages of painting in transparency without its defects.

Di'orite: a name given near the beginning of the nineteenth century by the French mineralogist Haüy to a rock belonging to an important group of granular and massive greenstones, which in appearance and structure resemble granite, but which in composition differ materially from this rock type. Diorite is composed essentially of the two minerals hornblende and triclinic feldspar (oligoclase, andesine or labradorite). It is to the sharp contrast between these constituents that the rock owes its name (Gr. διορίζειν, to distinguish). Other minerals may, however, also be present in varying amounts, giving rise to varieties of the main type. Thus the most acid contain free quartz, and are known as *quartz-diorite*; the hornblende may be partially replaced by mica or augite, producing *mica-diorite*, *augite-diorite*, etc. The most frequent non-essential constituents are magnetite, apatite, and sphene. In general appearance and mode of occurrence diorite is so like granite that it is, as a rule, popularly known by this name. It is available for all the uses to which granite is applied.

In its origin diorite also resembles granite. It is usually an igneous rock, which owes its coarse and granular structure to the fact that it solidified slowly while deeply buried in the earth's crust. In chemical composition diorite is about equivalent to the volcanic or surface igneous rocks called Andesite (*q. v.*), and it occupies an intermediate position between granite and gabbro, just as andesite does between rhyolite and basalt. In many cases diorite has been shown to have originated from an augitic rock (gabbro) by the gradual alteration of its augite into hornblende. See Granite, Gabbro, and Rocks. George H. Williams.

Dioscor'ides Peda'nius (in Gr. Διοσκουρίδης Πεδάνιος): Greek botanist; b. at Anazarba in Cilicia; lived between 50 and 200 A. D. He traveled in Asia Minor, Greece, and Italy to procure information about plants, and wrote in Greek a celebrated work on materia medica, in which he describes or names more than 500 plants. This work was regarded as the highest authority for fifteen centuries or more, and was universally used by medical and botanical students. Best edition by Sprengel (2 vols., Leipzig, 1829–30).

Dioscu'ri (in Gr. Διόσκουροι) (i. e. sons of Zeus): a name given to Castor and Pollux (*q. v.*).

Dios'ma [from Gr. δίοσμος, transmitting odor, full of odor; διά, through + ὀσμή odor]: a genus of plants of the family *Rutaceæ*. The buchu leaves are obtained from the *Diosma crenata* and other species.

Diospolis: See Egypt, Ancient; also Thebes.

Dios'pyros [Gr. Διόσπυρος, name of a plant, liter., the wheat of Zeus; Διός, genit. of Ζεύς, Zeus + πυρός, wheat]: a large genus of trees of the ebony family, comprising about 100 species, mostly natives of the tropical parts of the Old World. They generally have hard wood, and many of them yield edible fruits. The persimmon tree of the Atlantic U. S. and Mississippi valley (*Diospyros virginiana*) is well known for its fruit, which becomes edible late in autumn, and for its wood, which is used by makers of lasts for shoes. It is represented in Texas and Northern Mexico by the *Diospyros texana* (persimmon, ebony, or japote). The pishamin or date-plum (*Diospyros lotus*) grows in Europe as far N. as London, and its fruit is made into preserves or eaten

without cooking. Other species are prized in China, Africa, and Japan for their fruit. The CALAMANDER-WOOD (*q. v.*) and several other diospyri of Asia are greatly valued for their timber. Among these is the true ebony (*Diospyros ebenum*), which grows principally in Ceylon. (See EBONY.) Remains of many fossil species are found in the Eocene of the U. S.

Dip: in geology, the angle of inclination of a stratum to the horizon. Where the country is level an inclined stratum cuts the surface in a line, and the direction of this line is called the *strike* of the stratum. The direction of the dip is at right angles to the strike. The belt through which a stratum is exposed at the surface is called its *outcrop*. In a level country the outcrop has the same direction as the strike; in a hilly or mountainous country it may have a very different direction. When strata are moderately regular, the line of strike is a very useful fact to determine, as it enables the geologist to follow the same bed, and when concealed suggests the place where he should seek for it. Beds dipping at a high angle are soon lost sight of, being covered up with other deposits of newer date. In the direction opposite to that of the dip beds of older date come up from below, or "crop out." Revised by G. K. G.

Diph'ilus of Sinope: a master of the new Attic comedy and contemporary of Menander; flourished in the second half of the third century B. C. He was especially famous for the comic effectiveness of his plots. The *Casina*, *Rudens*, and *Vidularie* of Plautus were modeled on plays of Diphilus, and Terence has borrowed from him in the *Adelphi*. In some of his pieces he wrote subjects that belonged rather to the middle comedy, such as Sappho. Fragments in the collections of Meineke, vol. iv., p. 375, foll., and Kock, vol. ii., p. 541, foll. B. L. GILDERSLEEVE.

Diphtheria [from Gr. διφθέρα, a skin, piece of leather, in allusion to the false membrane described below]: an acute infectious disease (also called *malignant sore throat*, *membranous angina*, etc.) characterized by inflammation of the mucous membrane of the pharynx, attended by an exudation of lymph, generally assuming the character of a false membrane, which may extend into the larynx and air-passages, into the œsophagus, and into the mouth, occasionally also appearing upon raw or mucous surfaces of other parts of the body; it is also attended by prostration and albuminuria, which may or may not be persistent. The infectious nature of this disease was long suspected, but finally and definitely proved by the discovery of the specific cause, a form of bacillus, generally known by the names of the discoverers—Klebs-Löffler. Its duration and symptoms are variable, and the distinctive exudation is by no means of uniform appearance. In general, the mucous membrane is congested, and the exudation growing from one or more centers, if torn away, leaves a bleeding and sensitive surface. The symptoms of the disease are those of a profound general depression, with fever and nervous disturbances, caused by the absorption of poisonous substances produced at the point of local infection by the action of the bacillus. Besides these symptoms there are those called forth by the local disease, such as intense sore throat with involvement of neighboring lymphatic glands, difficulty in breathing when the larynx is occluded by membrane, and the like. Laryngeal diphtheria is practically synonymous with croup, though there are cases of membranous croup which can not yet be called diphtheria with entire propriety. (See CROUP.) The prognosis is always grave, no case being free from danger. The mildest attack may be followed by paralysis or by fatal prostration. No routine treatment can be laid down for this disease. In mild cases it is permissible to use detergent washes for the mouth, and the general treatment may be mainly expectant, provided the pulse is firm. The medicinal preparations of mercury seem to have a decided influence in this disease, and are borne in very unusual doses, a proof that they supply some need of the system. Sulphate of quinia has the happiest effects upon many cases. The inhalation of vaporized water is an excellent measure. The treatment of the various sequelæ of diphtheria requires the careful use of tonics, such as strychnia and iron, with the best hygienic conditions. See ANTI-TOXINE. W. P.

Diphthong [from Gr. δίφθογγος; δι-, two + φθόγγος, sound, connected with φθέγγεσθαι, emit sound]: the union of two vowels pronounced together in one syllable, i. e. with one push or impulse of voice; thus *ou* in *loud*, *oi* in *soil*. An improper diphthong is one which is such only in orthography, as *ea* in *beat*. A genuine diphthong may, on the other hand, be represented by a single vowel sign, as *i* in *five* (pron. *faiv*). B. I. W.

Diph'yodont: See TEETH.

Diplograptus [from Gr. διπλόος, double + γραπτός, marked, engraved; γράφειν, write]: a genus of fossil Cœlenterates of the extinct sub-order *Graptolithidæ*; occurring in abundance in some of the black shales of the Silurian, distinguished from the monograptus by the occurrence of the cells in a double row along the slender stem or axis. H. S. W.

Diploma [Gr. δίπλωμα, a folded letter; letter of introduction, deriv. of διπλόος, double]: formerly any royal charter or letter-patent; so called because under the Roman emperors charters were inscribed on two tablets of copper, joined together so as to fold in the form of a book. The charter by which a physician or surgeon is declared qualified to practice his profession is called a diploma. The term is also applied to the certificate of graduation given to every one who has taken a degree in a college or university.

Diplomacy [deriv. of DIPLOMA (*q. v.*)]: the art of conducting the official intercourse between foreign states; it is generally managed by ambassadors instructed in the policy to be pursued, or by the ministers of foreign affairs. The negotiation of treaties forms an important part of the duties of these envoys, but frequently they exercise a delicate and yet profound influence over the nation with which they are sent to deal. In receiving his instructions, much must sometimes be left to the discretion of the diplomatist. Very early in history heralds and ambassadors are found bearing messages from one power to another. Generally these messages were special. It is only in modern times that diplomatists are established permanently in foreign courts to watch the interests of their own governments. From the very necessities of the case ambassadors have been held personally sacred, since, were it not so, it would be impossible for them to venture into unfriendly states. Even among barbarians their privileges were respected. When resident ambassadors first came to be employed they were looked on as spies, but as the usage became general its advantages were made manifest. It tends to bring nations nearer together, and to make them respect one another; when there are representatives of foreign states in each country, the community of nations is more vividly felt. Ambassadors become acquainted with the laws, institutions, and history of the land where they reside; they protect their countrymen who are there as travelers or residents; they foresee difficulties and are able to prevent them; they put their countries on their guard against the preparations for war of other states; and when they withdraw on account of war their absence causes the separation of the two countries to make more impression. Even the exchange of compliments, the opportunity of representing their country in expressions of friendship at public and festive gatherings, as well as by condolence and forms of sympathy—these minor uses of resident ministers will not be despised by those who rightly estimate the effect of such things on national feeling.
Revised by T. S. WOOLSEY.

Diplomatic Agents: ambassadors, ministers, and other representatives accredited by a sovereign or government to other sovereigns or governments. Every party to international law is a treaty-making power, and every such power must act by some representative. No inferior community, no body of lower grade than a state, no organization trying to become a state but not yet recognized as such, is entitled to send representatives abroad who have international rights. Bulgaria and Egypt, for instance, do not enjoy the right of embassy, being under the suzerainty of the Porte. How far the members of a confederation possess this right will depend upon the terms of their union. Thus in the Germanic confederation the right remained to the individual states composing it, while in the U. S. and in Switzerland it reposes in the general government only. In a personal union, like that binding Norway to Sweden, one set of diplomatic agents represents the two countries and their one sovereign. A province, or colony, or city may have agents in foreign lands, but such persons have none of the rights of *ambassadors*. This term, *ambassador*, may be used generically to include various grades or kinds of diplomatic ministers, and it is often used also to denote *one*, and generally the *highest*, class of such ministers. Other words are *legates* and *nuncios*, usually denoting representatives of the pope; *chargés d'affaires*, a term for a lower grade of ambassadors; *envoys*

and *plenipotentiaries*, which latter term generally means less than its derivation implies. There are again ambassadors sent for a particular object, and others whose functions relate to all the political transactions of one nation with another; there are temporary and resident ambassadors; there are also persons who discharge the office without taking the name. Thus kings or commanders of armies sometimes negotiate treaties. All ambassadors, of whatever rank they may be, have the privileges which belong to this class of persons by the law of nations.

As for the relative rank of diplomatic agents, the rules laid down by the plenipotentiaries of the eight leading powers concerned in the Congress at Vienna are generally followed, together with the supplementary rule adopted at Aix-la-Chapelle in 1818. The ranks are—(1) ambassadors, legates, or nuncios; (2) envoys, ministers, or others accredited to sovereigns; (3) resident ministers; (4) *chargés d'affaires* accredited to ministers of foreign affairs or secretaries of state.

The distinctions between these classes are not very clear. Ambassadors represent the person of their sovereign, and are received with almost equal dignity. Agents of the second class represent their sovereign in his affairs rather than in his person. Resident ministers deal usually with the state department, though representing in some degree the person and dignity of their sovereign. They are treated with less ceremony than ambassadors or envoys. *Chargés d'affaires* represent their foreign ministers only. In the diplomatic service of the U. S. ambassadors are now employed in some cases, but minister resident is the rank customary, and previous to 1893 no diplomatic agent of higher rank than that of envoy extraordinary and minister plenipotentiary ever represented the U. S. in foreign countries.

In each class or rank the diplomatic employees take precedence among themselves according to the date of the official notification of their arrival. When the ministers of several powers sign acts or treaties in common the order of signature is determined by lot. These rules cut off some of the quarrels between ambassadors of different nations in regard to rank and national honor, which were not infrequent in earlier times. It may be noticed here that one minister may be accredited to two different powers; on the other hand, two of the smaller states may be represented by a single agent at one court.

Ambassadors have had from very early times a sacred character, which has been sometimes accounted for by their being originally persons of a religious order; but it is better to say that the office was protected by religious sanctions on account of its great importance and because without personal inviolability it could not be usefully administered. The ancient herald became a sacred person because he could not otherwise safely mediate between armed men. The ambassador needs for his protection the same sanctions, and, as he represents the highest interests of a state, it is a great crime to treat him with indignity or injury. There is a difference between the ambassadors of ancient and those of modern times, consisting especially in *this*—that the former were sent for a temporary purpose, and returned after completing their work; but the latter, since the time of Louis XI. of France and Ferdinand the Catholic of Spain, have generally resided in the foreign country for a considerable time. The resident minister is now expected to make himself acquainted with the politics of the country where he lives, to calculate the chances of war and peace, to use a constant influence in behalf of his own country; and thus, since this custom began, nations have felt themselves more secure than before. As intercourse is suspended by war, ambassadors, on the outbreak of a war or in expectation of it, are either dismissed or summoned home. When peace returns, the renewal of intercourse is marked by the parties receiving each other's diplomatic representatives.

An ambassador represents the sovereign or the sovereignty of his country. In a republic the power of appointing such officers is determined by the constitution or the laws, but instructions are given by the executive authority. In the U. S. diplomatic agents are appointed by the President with the confirmation of the Senate. In most monarchies the king or emperor appoints those who represent him in foreign courts, but this he does as the head of the government. Hence, when a sovereign is deposed and is no longer the actual head of the administration, other countries are not bound to recognize his ambassadors, nor, on the other hand, are they bound to receive those of a new sovereign *de facto*. The rule here, apart from dynastic and political preferences, is the same which holds good when new states are recognized. When the *de facto* government is acquiesced in by a country, and is in orderly operation, other countries will enter into new diplomatic relations with it. If agents of the old and displaced authority are received also, they will have no rank, and to do this at all after an established state of things exists in the revolutionized country is an unfriendly proceeding, implying a hope that there may be a counter-revolution.

There is no positive obligation on the part of one state to enter into diplomatic relations with another. But if such relations have been customary, to break them off is proof of an unfriendly disposition. As a rule, a government will accept the agent accredited to it without question. His social position, religion, profession, training, and fortune are matters which concern only his own state. But there are certain reasons which will warrant a country in declining to receive him. If he be a notoriously bad character, it will ill accord with the dignity of a state to do so. If he be a subject of the country to which he is sent, he may be objected to, since his diplomatic immunities will conflict with the rights which that country has over him. Mr. Burlingame, for instance, the negotiator of a number of treaties with foreign powers in behalf of China, was treated with in the U. S. as a special agent and not as an envoy, since he was still a U. S. citizen. If a proposed minister has expressed views hostile to the government to which he is accredited, or merely if he is personally disagreeable or unacceptable to it, a *persona non grata*, his coming may be declined, though not without explanation, for one of his chief duties is to foster friendly relations between the two countries, and if his character, sentiments, or antecedents render this work clearly impossible, he may be fairly objected to. Thus, in 1892, China declined to receive Senator Henry W. Blair, because he had spoken in Congress in favor of the exclusion of Chinese from the U. S. and had denounced the Mongolian race. But if an ambassador is received he is entitled to all the privileges of his office, whatever may have been his history, as when, in 1888, Mr. Carl Schurz was sent by the U. S. to Prussia and fulfilled his mission, though a political exile from that country.

The privileges of ambassadors may be comprised under the terms inviolability and exterritoriality. As the privileges themselves are, in great part at least, due to comity, and as the feelings of men will change from age to age with changes of civilization and greater closeness of intercourse, these terms, especially the second, may vary somewhat in their extent of meaning. It will not be safe to give to exterritoriality the broadest meaning it can bear, and then from that meaning deduce the privileges accorded. We must inquire what is the general understanding of the present age in regard to the position which an ambassador may take in a foreign land, and then perhaps it may happen that his own country will somewhat contract his latitude of privilege. The privileges in question are (*a*) inviolability of person; that is, exemption from all violence, whether proceeding from the public authority or from private persons. The exceptions to this rule are that the public authority, when he has committed a gross crime, may send him beyond the borders, using so much force as is necessary for this end; and that private persons do not lose their rights of self-defense if he is an aggressor. (*b*) He has various privileges, summed up in the word exterritoriality, which amount to exemption from the operation of foreign law. There is no departure from the theory of his office if when he returns home he is called to account for transactions pronounced to be illegal by his country's laws which take place while he resides abroad, and if he commits a crime such trial is a matter of course. His first privilege—which may be referred to his inviolable character, as well as to his exterritorial—is his *exemption from the criminal jurisdiction* of the country where he is resident. If there he commits crimes, acknowledged to be such by the moral sense of mankind, he can not be tried or punished, but can be required to leave the land, and only in an extreme case, if he refuses to do this, can force be applied. He can not be forced to testify in a criminal case where he has been witness to the act, though his government may instruct him to do so. He can not commit treason, but he can abet treason and be a party to revolutionary measures, yet his punishment must be left to his own sovereign and country. Some of the older British lawyers, as Sir Matthew Hale, thought that any capital offense except treason—as rape, murder, or theft—might subject an ambassador to indictment and trial

like other aliens; and still later it was held that for crimes committed by them against those moral laws which keep all societies together they might be brought to justice like other offenders. But this opinion would hardly find favor at present. Both the law and the feeling of England have increased in the respect they attach to these foreign representatives. The need of a rule is obvious, for if subject to arrest and trial an ambassador might not be able to discharge his functions. (*c*) The diplomatic agent is exempt from the *civil* jurisdiction of the land where he is resident. This exemption is conceded to him everywhere, although it is not strictly necessary for the discharge of his duties. If he contracts debts, the only remedy is by appeal to his sovereign or by suit in his country's courts after his return home. The laws of the U. S. include distress for rent among other legal remedies which are denied to the creditors of a foreign minister. Moreover, it is not enough that he be free from the consequences of conviction; no suit against him should be brought. In the case of M. Drouet, a Belgian secretary of legation in 1854, the British courts denied this, but if this principle held there would be no real immunity. (*d*) The hotel also and the goods of an ambassador have the same immunity from local jurisdiction. As far as he himself and his retinue are concerned, his house is a sanctuary, but the immunity will not allow him to defy the law of the land by sheltering transgressors. It is admitted, on all hands, at the present day that criminals belonging to the country of his residence, if not his servants at the time of the crime, may be searched for and seized in his hotel, and that all the force necessary for effecting an entrance for this purpose may be applied. (*e*) By national comity the personal effects of the foreign minister and the articles from abroad which he needs for himself and his family are exempt from duties. He is also free from the payment of local taxes, except upon real property not used by him for legation purposes. Even on the legation property, owned by himself or his government, taxes are levied in some states, and certainly all police, sewerage, street, or other local dues should be paid, though they are not collectible by process of law. In the U. S. the rule of reciprocity is observed, water, paving, and sewerage dues and taxes on legation property being collected if similar property owned by the U. S. in the country of the foreign minister in question be taxed. He is liable to the payment of tolls and postage, but can not be compelled to have troops quartered upon him. Formerly, ambassadors abused their privilege of having goods passed free of duty through the custom-house, and, as Bynkershoek, near the beginning of the eighteenth century, charges upon them, they imported merchandise which they afterward sold. The same abuse continued for some time afterward, and was, when discovered, complained of in more than one country. A minister of the U. S. in Spain has been charged with making importations for himself on account of certain merchants. It is plain that exemptions from duties were never intended to cover any articles besides those intended for the use of the embassy, and it would be no breach of comity to have even this privilege taken away. (*f*) Liberty of worship. This is allowed in all Christian lands, and even beyond their borders, to ambassadors, their families, and, by a stretch of comity, to other persons belonging to the same nation, but co-religionists with the ambassador, if subjects of the state in whose bounds he resides, are permitted only by sufferance to be present. This exemption, of course, has no significance where, as in the U. S., all religions are free; and it has, at least in one instance, been claimed that, where there was already a church of the religion which the foreign minister professes, the permission to set up another for himself might be denied him. The jealousies of Catholic and Protestant Christians in times past have led to the rule that the ambassador's worship must be *private*, and even *house*-worship, without bell, organ, or other sign making it known to the public, and that the chaplain must not appear in his canonicals. The reasons for this freedom of worship are obvious. No state could with any regard for its own dignity consent to send a minister to another court where he was forbidden to exercise his own or his country's religion, and no honest or honorable man would be willing to represent his government where such prohibition existed. (*g*) That the foreign minister may freely discharge his functions he must have some assurance of having his retinue at command. Accordingly, his family, the secretary of legation, and the other officials who compose his train have the same exemptions which are conceded to him. In this privilege his servants are usually included, as well as the bearers of his dispatches. The dispatches themselves, as well as the embassy records, are of course inviolable. But it should not be forgotten that these immunities are granted a foreign diplomatic agent solely in order to enable him to transact his business unfettered and smoothly, and they should be construed strictly and in accord with this principle. No minister wishes to make his residence a place of refuge for criminals. If such escape to him, they should be surrendered; even his own servants in most cases should be handed over to the local authorities for trial. (*h*) If the state itself has no direct control over an ambassador's suite, it is evident that he ought to have, but how much power he may use over them is a matter, in part, for his own country to decide. In former times the jurisdiction of foreign ministers was almost as great as that of consuls from Christian states in Mohammedan countries. When Sully, then Marquis of Rosny, represented the French court in England in 1603, one of his train having killed an Englishman in a quarrel, a jury of Frenchmen was called together, found the man guilty, and delivered him over to the English authorities for execution. It is evident that such exercise of high justice would not now be allowed in any Christian state, and no notice would be taken of such a procedure. The ambassador now will collect evidence in criminal cases and send a member of his suite home for trial, unless indeed he prefers, as already suggested, to turn him over to the local law. Nor has he properly any *civil* jurisdiction except that of a voluntary kind, such as receiving and legalizing testaments and affixing his seal. "The right of contentious jurisdiction is nowhere," according to Heffter (§ 216), "conceded to ambassadors in Christian countries, even over the people of his suite." In Oriental countries, however, a certain degree of jurisdiction, both civil and criminal, is often conferred upon resident ministers and consuls by treaty. See EXTERRITORIALITY and CONSULS. (*i*) Has the ambassador such a kind of inviolability that third parties—for instance, enemies of his country—are bound to respect his official immunities? The answer given by history is that one enemy has had no scruple at capturing negotiators of the other, and at treating them like every other foe in war. Further, although a friendly power would be regarded as committing a hostile act if it seized or imprisoned such a person, yet it might refuse him transit through its territory, and in the act of transit, if he were found passing into a hostile country, he might be prevented from pursuing his journey, for his diplomatic *rights* hold good only in the country to which he is sent. Cases have occurred also where foreign ministers were arrested in a third country on account of pecuniary obligations contracted there. But there is no right to seize even an enemy's ambassador on a neutral ship, much less on neutral soil. Where one country is invaded by another, neutral ambassadors there resident have the right of personal inviolability, and should be permitted free intercourse with their own government and with that to which they are accredited. Yet during the siege of Paris in 1871 the U. S. minister was allowed to send his dispatches through the German lines only unsealed, which was stretching belligerent rights unduly. (*j*) The ambassador's rights begin when he lands in the country to which he is sent, and continue until he leaves its soil; and this whether he is received or not, and whether or not peaceful relations continue between his country and that to which he is sent. On his arrival at the court to which he is commissioned he is expected to produce his letter of credence—which is sometimes accompanied by one of recommendation—and his *full power*, which indicates the subjects on which he is authorized to treat and the amount of power with which he is invested. According to their rank, some envoys are accredited directly to the sovereign of the country, and some to the minister or secretary for foreign affairs; in either case diplomatic business will usually be transacted with the latter. After an audience with the sovereign or chief executive, at which the original letter of credence is presented, the official character and capacity of the new diplomat are established. He will then pay visits of etiquette to the members of the diplomatic corps, and in other respects conform to the usages and ceremonial of his place of residence, remembering that his usefulness must largely depend upon his tact, breeding, temper, sense, and ability to transact business smoothly as well as skillfully. (*k*) The ceremonial of departure is as formal as that of reception. The mission of a diplomatic agent may end from several causes. He may have accomplished the purpose for which he was sent if this was a specific one.

He may be recalled for promotion elsewhere; because he is distrusted; to indicate relations which are inconsistent with friendly intercourse. Thus in 1891 the Italian agent, Baron de Fava, was withdrawn from Washington because of the lynching of Italian subjects at New Orleans, on Mar. 14 of that year. His recall may be requested by the state to which he is accredited on account of his intrigues or misconduct. The death of the sovereign sending or receiving him, or a change in the form of government in either state, will also terminate his mission, though it may be readily revived by fresh credentials from or to the new sovereign, or from the new government if it has secured recognition.

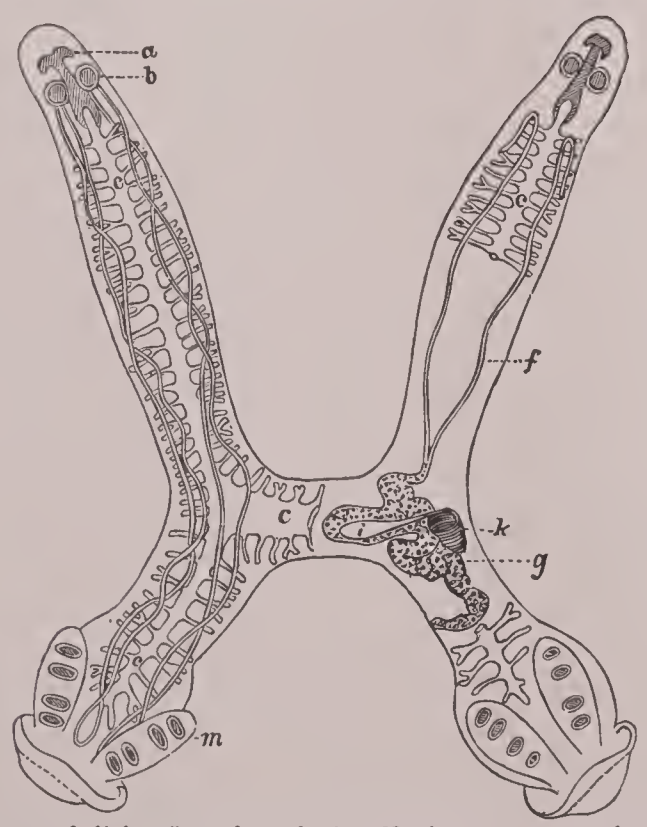
By Article III., §§ 1, 2, of the Constitution of the U. S. the Supreme Court was given original jurisdiction in all cases affecting diplomatic agents and consuls.

By the statute of Apr. 30, 1790, all writs or processes aimed at their persons or property and including their suites and households are declared null and void under penalty. Laws to enforce these diplomatic privileges have been widely enacted in other countries. T. S. Woolsey.

Diplomatics [deriv. of Diploma (*q. v.*)]: the science of diplomas, i. e. of ancient legal documents. It classifies their parts, tests their genuineness, studies the circumstances of their creation, and thus determines their worth as historical evidence. Their dates and seals draw into its province historical chronology and sigillography. Until the nineteenth century palæography, the art of deciphering ancient handwriting, was counted a part of diplomatics; but the two are now distinct sciences. Diplomatics was, in 1681, brought into existence as a science, and given a name, by the *De Re Diplomatica* of the Benedictine Mabillon. Its principles were more fully developed in the *Nouveau Traité de Diplomatique* (1750–65) of Toustain and Tassin. The most elaborate modern treatise is Bresslau's *Urkundenlehre für Deutschland und Italien*; but the one comprehensive handbook is Giry's admirable *Manuel de Diplomatique* (Paris, 1894). Leist's *Katechismus der Urkundenlehre* is a convenient primer. See Palæography. George L. Burr.

Diplopoda: See Myriapoda.

Diplozo'ön [from Gr. διπλόος, double + ζῷον, animal]: a parasitic trematode worm which, in the adult condition, is a veritable double animal. The young animals, formerly known as diporpa, have each a dorsal and a ventral sucking



Anatomy of diplozoön, enlarged after Nordmann: *a*, mouth; *b m*, suckers; *c*, digestion tract; *f*, excretory tubes; *g k*, reproductive organs.

disk. Two of these come together, adhere to each other, and finally grow into one—the Diplozoön—shaped like the letter X. The genus has not been found in America, but is not uncommon in Europe upon the gills of the breams.

J. S. K.

Dipnoi, dip'nō-ī [from Gr. δι-, double + πνεῖν, to breathe]: an almost extinct group of fish-like forms which show affinities toward the Ganoids and the Batrachia. The skeleton is partly cartilaginous, partly converted into bone. The skull consists of but few bones, while the strong jaws have but few very large teeth. On either side of the throat are four, or fewer, gill-slits, while respiration is mostly accomplished by means of one or two lung-like organs homologous with the swim-bladder of the true fishes. The heart has a muscular conus arteriosus with internal valves, and there is a spiral valve in the intestine as in the Ganoids. The body is covered with scales (large in the Australian, small in the other forms), and the two pairs of fins are weak, in the Protopterus having an axial skeleton with rays on one side, in Ceratodus with rays on both sides. The species popularly known as lungfishes are divided into two groups—(1) *Monopneumonia*, with large scales, four large teeth in the upper and two in the lower jaw; a single symmetrical lung; (2) *Dipneumonia*, with small scales, small teeth, and two lungs. To the first belongs the genus *Ceratodus*, with two species from Australia; to the second the genera *Protopterus*, with one African species, and *Lepidosiren*, with a single species from Brazil. This distribution indicates great antiquity, a view which receives support in the fact that *Ceratodus* occurs in rocks of Permian age. The African lungfish lives in the streams of equatorial Africa, and at the dry season it burrows into the mud, where it forms "cocoons," which have an opening for breathing and which are frequently shipped as curiosities to Europe. Specimens of all four species are comparatively rare in collections, only two individuals of the South American species being known. J. S. Kingsley.

Dip of the Horizon: in navigation, the apparent depression of the sea horizon, or line between ocean and sky, below a horizontal line going out from the eye of the observer. It arises from the rotundity of the earth. It varies with the state of the air, but its amount, in minutes of arc, is nearly equal to the square root of the number of feet the eye of the observer is above the ocean. The following table shows the dip at different heights in feet:

Height.	Dip.	Height.	Dip.	Height.	Dip.	Height.	Dip.	Height.	Dip.
1	0′ 59″	10	3′ 3″	19	4′ 13″	28	5′ 2″	65	7′ 48″
2	1 22	11	3 12	20	4 20	29	5 13	70	8 06
3	1 40	12	3 21	21	4 26	30	5 18	75	8 23
4	1 56	13	3 29	22	4 32	35	5 43	80	8 39
5	2 10	14	3 37	23	4 39	40	6 07	85	8 55
6	2 21	15	3 45	24	4 45	45	6 29	90	9 11
7	2 33	16	3 52	25	4 51	50	6 51	95	9 26
8	2 43	17	3 59	26	4 56	55	7 11	100	9 41
9	2 54	18	4 06	27	5 02	60	7 30	110	10 09

Dippers: popular name of birds of the genus *Cinclus* and family *Cinclidæ* which contains the ouzels, found in Europe, Asia, and America. They feed chiefly on mollusks and on aquatic insects and their larvæ, which they seek in clear lakes and streams, frequently diving with great facility, and moving about under water by means of their wings. They resemble the wren in their manner of dipping the head, accompanied with an upward jerking of the tail. The dippers build very curious nests of interwoven moss, having the entrance in one side.

The term is frequently applied on the New England coast to small ducks and diving fowl, especially to the bufflehead (*Charitonetta albeola*) and the ruddy duck (*Erismatura rubida*). Revised by F. A. Lucas.

Dipping Needle: an instrument showing the magnetic dip. When a magnetic needle is hung within a stirrup so as to move freely in a vertical direction, and the whole system is suspended by a thread, it will adjust itself in the magnetic meridian, and its pole will dip toward the north pole of the earth. Such a needle is called a *dipping needle*, and its deviation from the horizontal line is its *inclination*. When the needle is carried nearer the magnetic pole the inclination increases. Sir James Ross in 1832 saw the dipping needle stand within one minute of a degree of the vertical position near Baffin's Bay. Approaching the equator, it becomes less and less inclined, until a point is reached at which it is horizontal. This point will be in the *magnetic equator*, or line of no dip, which is near, but not coincident with, the equator of the earth. When tracing the lines of equal dip on a Mercator's map, we find that they coincide in a remarkable manner with the isothermals or lines of equal mean temperature, indicating a close connection of the distribution of heat with that of magnetism, and seemingly a common cause for both.

The inclination, like the declination, is subject to periodic and secular variations. Since 1671 it has steadily diminished at the rate of three to five minutes a year.

Dipsaceæ: See TEASEL FAMILY.

Dip'sas [Gr. διψάς, -άδος, name of a venomous serpent, whose bite caused intense thirst, deriv. of σίψα, thirst]: a genus of non-venomous serpents belonging to the *Colubridæ*; natives of the warmer parts of America and Asia. They are tree-snakes, greatly elongated in form, and having a broad, thick head; some are of large size. Etymologically the name is inappropriate.

Dip-sector: an instrument constructed on the principle of the SEXTANT (*q. v.*) for ascertaining the dip of the horizon.

Dipsomania [from Gr. δίψα, thirst + μανία, madness]: in pathology, a morbid craving for alcoholic drinks, sometimes called methomania. The disease has been successfully treated in "inebriate asylums" in various countries. The term is also sometimes applied to DELIRIUM TREMENS (*q. v.*).

Dip'tera [from Gr. δίπτερος, having two wings; δι-, two + πτερόν, wing]: the order of true insects which includes the flies. They are the most differentiated (highest) of all insects, and are characterized by having the various mouth parts so modified into a piercing and sucking organ that the different elements can only with difficulty be traced. The eyes are very large; the anterior wings alone are of use in flight, the second pair are reduced to short clubbed "halteres" or "balancers," the latter name given in allusion to the fact that without them the fly can no longer direct its flight. In their development the flies undergo what is known as a "complete metamorphosis." The larvæ, commonly known as maggots, are usually footless, and some have lost the sense organs and biting mouth parts. In some (Coarctata) the pupa is inclosed in a hardened pupa case; in others (Obtecta, e. g. the mosquito) the pupa is free and capable of motion. The Diptera are divided into two sub-orders: (1) *Brachycera* (Gr. βραχύς, short + κέρας, horn) with short antennæ. Here belong the common house-flies, blow flies, bat flies, and the like, as well as certain forms which, like the sheep louse, have so degenerated by parasitism that they have lost the wings. (2) *Nemacera* (Gr. νῆμα, thread + κέρας, horn) with long, often feathered, antennæ, containing the midges, the mosquitoes, gall flies, Hessian flies, and the like. The fleas (APHANIPTERA, *q. v.*) are sometimes placed here. See ENTOMOLOGY.

J. S. KINGSLEY.

Dipterocar'pus [from Gr. δίπτερος, two-winged + καρπός, fruit]: a genus of resinous trees of the family *Dipterocarpeæ*, including about fifty species, all natives of tropical Asia. They are large trees with opposite simple, entire or dentate leaves, clusters of large white flowers, each with a tubular, five-cleft calyx, which in fruit has two greatly enlarged lobes, petals five, stamens many, ovary superior, three-celled, each cell with two ovules. *D. turbinatus* of India attains the height of 200 feet, and is valuable not only for its durable timber, but also for an oil which is used in medicine and the arts. Other species yield resins. C. E. B.

Dip'terus [from Gr. δίπτερος, two-winged; δι-, two + πτερόν, wing]: a genus of ganoid fishes whose fossil remains comprising two species are found in the Old Red sandstone. They have a large and flattened head, and double anal and dorsal fins, opposite to each other.

Diptych, dip'tik [from Gr. δίπτυχος, of double fold; δι-, two + πτυχή, πτύξ, fold, connected with πτύσσειν, to fold]: in the later times of the Roman empire, a pair of tablets of ivory or wood, covered on one side with wax. This form had been in use from early times, but the name is generally given to the presentation tablets given as presents by consuls and questors, under the empire. A number of these of the fifth and sixth centuries remain; they are elaborately carved, contain the name and titles of the consul, and were distributed by him among his friends on entering his office. On one side of the sacred diptych were inscribed the names of living, and on the other those of deceased, ecclesiastics and benefactors of the clergy, which were read during service by the deacon. They were often decorated with scenes from biblical history. Diptychs are still used in the Eastern churches. See TRIPTYCH.

Diræ: See EUMENIDES.

Direct Inheritance Tax: See INHERITANCE TAX in the Appendix.

Director [Lat. deriv. of *diri'gere*, *direc'tus*, direct, control; *dī* (*dis-*), apart + *re'gere*, direct]: one who directs or manages; usually one of a number of individuals whose duty it is to conduct the affairs of certain enterprises, such as banks, railways, insurance companies, etc. Directors are usually elected by the stockholders from their own number; they have the right of supplying casual vacancies, and may delegate their powers to committees of such number as they may judge expedient. The title is also usually given to the chief officer or superintendent of an astronomical or physical observatory.

Directory (in Fr. *directoire*): in French history, the executive body of the French republic established by the constitution of 1795 which represented moderate republicanism and marked the downfall of the Jacobins. This constitution vested the legislative authority in the Council of Five Hundred with the exclusive right of initiating the laws and in the council of the ancients consisting of 250 members who considered the laws proposed by the former body. The Directory consisted of five persons called directors (*directeurs*), who were selected by the Council of Elders from a list of candidates presented by the Council of Five Hundred. Their names were Barras, Carnot, Larevellière de Lépeaux, Letourneur, and Rewbell. One of them retired every year, and was succeeded by another chosen in the same way. Each director presided for three months in turn. They came into power at a time when France was involved in war with nearly all Europe, and was distracted by domestic factions. The French armies gained many victories under this *régime*, but the home policy of the Directory was unpopular. The Directory was divided into two parties, and the majority, consisting of Barras, Larevellière de Lépeaux, and Rewbell, removed their adversaries by the *coup d'état* of the 18th Fructidor (Sept. 4, 1797). In 1797 the directors were Barras, Ducos, Gohier, Moulins, and Sieyès. The growing popularity of Napoleon, the dissension in the government, and above all the disastrous results of its military policy in 1799, prepared the way for its overthrow by the *coup d'état* of the 18th Brumaire (Nov. 9, 1799), in which Napoleon, his brother Lucien, and Sieyès were the chief actors. See Barante, *Histoire du Directoire* (1855). See FRANCE.

Directory: a book containing the names of the inhabitants of a city arranged in alphabetical order, together with the place of business or residence or both. The first London directory, *A Collection of the Names of Merchants, etc.*, was published in 1677. In the U. S., as in Great Britain, every town of importance has its own directory. In several States there are also published *State directories*. In New York city the earliest published was in 1786—a small volume of eighty-two pages with about 900 names.

Directrix, plu. **Directrices** [femin. of *director*, formed on analogy of Lat. *ja'nitrix*: *ja'nitor*, *ge'netrix*: *ge'nitor*]: in geometry, a line which serves for the description of a curve or surface. The directrix of a conic is a right line perpendicular to the axis, whose distance from any point on the curve bears a constant ratio to the distance of the same point from the focus. Quadric surfaces have also directrices possessing analogous properties. When a surface is conceived to be generated by the motion of a line, right or curved, which always rests on other fixed lines, the latter are sometimes called directrices, but more frequently directing lines or directors, the former being distinguished as the generator.

Dirge [M. Eng. *dirige* = Lat. *dirige*, direct, 2d sing. impv. of *diri'gere*; the initial word of the funeral hymn beginning: "Dirige Domine, Deus meus, in conspectu tuo viam meam" (Direct, O Lord, my God, my way in thy sight), Ps. v. 8.]: a hymn of a mournful character sung at funerals, much used in the services of the Roman Catholic Church.

Dirk: See DAGGER.

Dirschau, deer'show: a town of Prussia, province of West Prussia, on the river Vistula, and on the railway from Berlin to Dantzic, 20 miles S. S. E. of Dantzic (see map of German Empire, ref. 2–J). It has a railway bridge 2,843 feet in length, machine-works, tanneries, sugar-refineries, etc., and a transit trade by the river. Pop. (1890) 11,897.

Dis [Lat. from weak form (*div.*-) of same stem as in *Jupiter* (*dieu*-), or, as some hold, a contraction of *divcs*, rich, cf. πλούτων]: a name of Pluto, sometimes applied to the infernal regions. See PLUTO.

Disability: in law, the quality or state of being incapable of enjoying certain legal benefits or of doing a legal

act; also, the fact or circumstance which makes a person so incapable. The disability is either absolute, as in the case of outlawry or attainder, or it is partial, as in the case of infancy and coverture. It may arise from the act of God, of the law, of the person himself, or of his ancestor. See CAPACITY. Revised by F. STURGES ALLEN.

Disappointment, Cape: See CAPE DISAPPOINTMENT.

Disciples of Christ: a religious body often, in the Southern and Western U. S., called the "Christian Church," or "Church of Christ"; sometimes "Campbellites," a name which is repudiated, however, as they are opposed to all party or sectarian names.

Origin.—In Sept., 1809, Thomas Campbell, a minister in the Seceders' branch of the Presbyterian Church, who had migrated from North Ireland in 1807 to Western Pennsylvania, being grieved by the bitterness of party spirit among Christians of different denominations, issued a "declaration and address" deploring the divided state of the Church and the evils resulting therefrom, and urging, as the only remedy for this state of things, a complete restoration of primitive apostolic Christianity—its faith, its doctrine, its ordinances, and its life, and the consequent rejection of all creeds or confessions of faith which stood in the way of such return to the ancient order of things. An association was formed, called the Christian Association of Washington, Pa., for the purpose of promoting the principles set forth in this new declaration of independence. About this time Alexander Campbell, son of Thomas Campbell, arrived on the scene, fresh from his studies at Glasgow University, Scotland, being then in his twenty-first year, and having but recently dedicated his life to the ministry. He threw himself heartily into the new movement, and by his ability, learning, and force of character soon became its recognized leader. It was not the intention of the Campbells at first to form a distinct religious body, but so to leaven the churches with the principles they advocated as gradually to effect the needed reforms. Failing, however, to find hospitality or even tolerance for their plea within the fellowship of any of the denominations, they found themselves compelled, by the necessities of the case, to assume an independent position. Accordingly, the Brush Run church was organized on May 4, 1811, being the first congregation formed by the new movement.

Basis of Union.—In assuming an independent position, the reformers, as they were then called, did not cease their plea for Christian union, which they believed it their special mission to promote. Hence in forming the first church they were careful not to include anything in the terms of fellowship which the Scriptures did not expressly warrant. A favorite motto at this time was, "Where the Scriptures speak, we speak; where the Scriptures are silent, we are silent." Under this rule, first enunciated in the "declaration and address" of Thomas Campbell, they felt compelled to surrender some tenets and practices which they had hitherto held as binding, and to adopt others which they had heretofore disregarded. Having, however, repudiated the authority of human creeds, they felt free to make such changes as would bring them into strictest harmony with the Word of God, and enable them the more effectively to plead for union on a divine basis. In yielding the practice of infant baptism because they could find no scriptural authority for it, and in adopting immersion as the proper form of baptism because the New Testament seemed to teach clearly that such was the original practice, they found themselves so nearly in accord with the Baptists as to be received into one of their associations, and for a time cooperated with them. But it soon developed that the principles of restoration held by the Campbells and their coadjutors were too sweeping for a majority of the Baptists, and the relation was discontinued, though many Baptists embraced the principles of the Disciples, and went with them. Henceforth new congregations were formed on the simple New Testament basis. All who gave credible evidence of faith in Jesus Christ were, upon confessing him, baptized and received into the fellowship of the Church, being asked only to take Christ as their leader and the New Testament as their guide.

Cardinal Principles.—Aside from the great fundamental truths which the Disciples of Christ hold in common with all evangelical Christians, the following are some of their characteristic principles: 1. The Church of Christ is intentionally and constitutionally one; and all divisions which mar this unity are contrary to the will of God, and should be terminated. 2. As these divisions resulted from a *departure* from New Testament Christianity, the remedy for them is the *restoration* of the Gospel in its purity. 3. This restoration involves the surrender of all human formulations of doctrine as authoritative bases of Church fellowship, and the acceptance of the Bible alone as the rule of faith and practice; and the confession of Jesus as the Christ, the son of the living God, by Simon Peter (Matt. xvi. 16) as the creed of the Church; the exchange of all party names for scriptural names, and the restoration of the ordinances to their original meaning and place, baptism being the burial in water of a penitent believer who has died to sin, and the Lord's Supper being a memorial feast to be observed each first day of the week as the central act of worship. 4. The faith which justifies and saves has Christ, not dogma, for its object, and is a vitalizing force which issues in practical righteousness, and leads to a life of obedience, and not an orthodox set of notions about God. The polity of the Disciples is congregational, the local officers consisting of elders and deacons, besides a minister or pastor, who may be one of the elders. They combine in district, State, and national organizations for missionary work, but have no general ecclesiastical body for legislative purposes.

Numerical Strength.—The growth of the Disciples has been remarkable. Beginning in 1811 with a single congregation of about thirty members, they numbered at the death of Mr. Campbell, in 1866, over 300,000. Statistics for the U. S. taken in 1899–1900 show 10,528 churches, 6,339 ministers, 1,149,982 members, and 732,642 Sunday-school scholars and teachers. They have also a few churches in Great Britain and on the Continent. The General Christian Missionary Society (home), organized in 1849, raised and expended during 1899 $100,550. The Foreign Christian Missionary Society, organized in 1875, has missions in India, China, Japan, Turkey, England, and Scandinavia. Its principal stations are 24; out-stations, 35; missionaries, 64; native helpers, 46; in all, 110. In 1899 it raised and expended $180,016. The Christian Woman's Board of Missions (home and foreign), organized in 1874, raised and expended $106,723 in 1899.

Institutions of Learning.—Among their principal schools are Bethany College, Bethany, West Va.; Kentucky University, Lexington, Ky.; Butler University, Irvington, Ind.; Drake University, Des Moines, Ia.; Hiram College, Hiram, O.; Eureka College, Eureka, Ill.; Christian University, Canton, Mo. There are, besides these, many small colleges. All these make the Bible a text-book. Their principal publishing-houses are the Christian Publishing Company, St. Louis, Mo., and the Standard Publishing Company, Cincinnati, O. The Disciples publish twelve religious weeklies and one quarterly magazine. See CHRISTIANS and CHRISTIAN CONNECTION. J. H. GARRISON.

Discipline, Ecclesiastical: the means employed by churches to maintain correctness of life among their members, orderly government in church affairs, and to prevent the spread of heresy in their ranks. In the Middle Ages discipline was either penitential (that is, inflicted on those who confessed their sin; see PENANCE) or punitive, which was, in theory at least, frequently administered by the civil power.

Discipline, First and Second Books of: important documents in the ecclesiastical history of Scotland.

The *First Book* was drawn up in 1560 by John Knox and four others. It lays down rules for the election and support of ministers and other officers; for the conduct of public worship and the administration of the sacraments; for the maintenance of schools and colleges; and for ecclesiastical discipline. Though subscribed to by many of the nobles, it was never acknowledged by an act of Parliament.

The *Second Book of Discipline* was drawn up by a committee, and submitted to the General Assembly in 1578. Andrew Melville took a leading part in preparing it. It was adopted, but Parliament would not ratify it. It was designed to correct and augment the *First Book*, which was a hasty performance, and on the basis of it the present constitution of the Church of Scotland rests. Both books are standards in that church.

The *Discipline* of the Methodist Episcopal Church is a volume containing all the doctrines, administrations, and ritual forms of that denomination, and is revised every four years, so as to include the changes made by the quadrennial or general conference.

Discipline, Military: the training and educating the soldier or sailor in all the duties of his profession, and the implanting of that respect for authority which causes him to obey without question the legal orders of his superiors under all circumstances, even to the unhesitating sacrifice of his life. It can not be obtained without good organization and thorough and continued instruction. It is the essential factor in preserving the zeal, spirit, and confidence of troops under the depressing influence of defeat, as well as in restraining the excesses and preventing the demoralization which result from victory. The term is frequently, but improperly, so restricted in its meaning as to include only instruction in drill, and the punitive or "disciplinary measures" used in armies and navies. JAMES MERCUR.

Disclaimer: in law, (*a*) in equity pleading, a plea containing an express denial or renunciation of some claim alleged to have been made by the party pleading. (*b*) The act of one who renounces or refuses to accept a gift or devise made to him of land or other property, and generally to the waiver of any claim. (*c*) In the law of landlord and tenant, a denial by the tenant of the landlord's title, in such a way as to cause a forfeiture of the tenant's estate. (*d*) In patent law, the renunciation of all claim to what is, or appears to be, claimed as a part of his invention by the patentee in his application for a patent.

Revised by F. STURGES ALLEN.

Disco: large island in Davis's Strait off the western coast of Greenland; lat. 69° 11′ N., lon. 53° 20′ W. It belongs to Denmark, is mountainous in character, and has valuable coal mines. On the southern coast is the harbor of Godhavn, the seat of government in Danish Greenland.

Discob'oli [from Gr. δισκοβόλος, quoit-thrower; δίσκος, quoit + βαλεῖν, throw; so called in allusion to the habit of the fish of placing its disk on some firm body]: a group of fishes, containing two or three families, having the ventral fins united to form a sucking disk on the under surface of the body, by which the animal is enabled to attach itself firmly to a rock or other fixed body in order to obtain food. To this group belongs the lumpsucker (*Cyclopterus lumpus*) and the sea-snails (*Liparis*).

Discobolus [for etymology, see DISCOBOLI]: a quoit-thrower; an ancient statue representing a man either holding a circular quoit, but at rest, like one in the Vatican, or in the very act of hurling the quoit, like Myron's statue, of which a copy exists in the Vatican, one in the British Museum, and one of peculiar importance in the Palace Lancellotti at Rome.

Discocepha'li [from Gr. δίσκος, quoit + κεφαλή, head]: a sub-order of fishes in which the anterior dorsal is modified into a sucking disk. This disk is placed on the head, and is composed of laminæ so arranged that by exhaustion of the water the fish is enabled to adhere to larger fishes or to ships, and is thus carried to great distances without effort on its own part. The group contains one family, the ECHENEIDIDÆ (*q. v.*). DAVID S. JORDAN.

Discontinuous Function: in mathematics, a function which does not continuously increase or diminish when the independent variable increases uniformly. The function *tan. x* is discontinuous; for though the arc x increases uniformly from 0° to 360°, *tan. x* changes abruptly from $+\infty$ to $-\infty$ at $x = 90°$ and $x = 270°$.

Discord [from Lat. *discor'dia*, deriv. of *discors*, inharmonious; *dis-*, apart + *cor*, *cordis*, heart]: want of concord; dissension, strife; a combination of sounds which have no harmonical relation. In music, a combination of notes more or less disagreeable to the ear. Discords are largely employed in musical compositions, being introduced by way of transition between successive concords, of which they serve, by contrast, to heighten the pleasing effect. They are therefore indispensable to the highest order of musical expression. The concord preceding a purposely introduced discord is called the *preparation*, and that which follows, the *resolution*.

Discount [O. Fr. *disconter*, reckon off < Lat. *dis-*, from + *computa're*, reckon]: an allowance or deduction made for cash or advanced payments. Thus if a seller allows a discount of 15 per cent. for the prompt or advanced payment of a bill amounting to $250, the purchaser may pay it with $212.50 ($250 less 15 per cent.). Discount is also the amount deducted from the face value of a promissory note, bill of exchange, or the like, in purchasing the privilege of collecting it at maturity. *Bank discount*, the form recognized in business and law, is simple interest paid in advance, and reckoned on the amount of the paper instead of on the amount advanced. *True discount* is such a deduction as to be the interest on the amount advanced. At bank discount a note or bill for $100 due in twelve months, if discounted at 6 per cent., would bring $94. At true discount the same paper would bring $94.34 (computed by dividing $100, the face value, by $1.06, or $1 + the rate).

Discovery: in equity jurisprudence (see EQUITY), the act of disclosure by a defendant of facts to which he is required to answer by reason of a "bill of discovery" which has been filed against him. The court entertains such a bill to secure the due administration of justice. There must be an interest on the part of the plaintiff in the subject to which the discovery refers, and the information sought must appear to be material either to the prosecution of the suit or of some other suit or action then pending or which may be begun. The defendant will not be compelled to make the discovery when disclosure would subject him to criminal proceedings or to a forfeiture. (The works on equity jurisprudence should be consulted for fuller information; those by Story, Adams, Spence, etc.) In a number of the United States, following the lead of the New York code of procedure, the bill for discovery is abolished. Either party to an action under that system may obtain an order from a judge to examine a party to an action before trial. The mode of examination is regulated by rule of court. This proceeding is a substitute for the former bill of discovery.

T. W. DWIGHT.

Discovery of America: See HWEI-SHIN, FUSANG, SAINT BRENDAN, LEIF ERICSSON, VINLAND, NORUMBEGA, MADOC, and COLUMBUS, CHRISTOPHER.

Discovery of Territory: the claim to territory on the ground of discovery, though always somewhat vague in its character, has been a positive source of state aggrandizement since the fifteenth century, and even to-day is not obsolete. In the early days of adventure and discovery mariners sailed along a coast, perhaps up its principal rivers, landed, planted their sovereign's flag, arms, or a cross, and claimed as his territory in consequence the coasts visited and all the country drained by the rivers thus discovered. The rights of the aboriginal inhabitants were of small importance. The whole of the American continent, North and South, the East and West Indies, and large portions of Asia and Africa, were portioned off on the basis of such claims. Original discovery, however, was not enough to found a permanent title to territory, but must have been followed by occupation and "beneficial use." By this latter phrase was meant any wealth-producing employment of the soil or adjacent waters, whether for agriculture, fisheries, or the capture of and trade in furs. The indefiniteness of claims to territory based on such grounds as these, both as to character and extent, naturally brought nations into conflict.

The Oregon controversy is an example. The U. S. laid claim to the Oregon region on the score (1) of Gray's discovery of the Columbia river, Gray being a merchant captain, not a commissioned officer of the navy; (2) of the occupation and beneficial use of territory by Astor's fur-trading posts at Astoria and elsewhere; (3) of Lewis's and Clark's exploration from the head-waters of the Columbia to its mouth; (4) of contiguity to, perhaps inclusion in, the Louisiana purchase; (5) of subsequent extensive immigration into and settlement of that region by citizens of the U. S. It was owing to the last-mentioned fact that the ownership of the Oregon territory was really secured by the U. S.

As a recent example of the acquisition of jurisdiction over unoccupied territory on the ground of discovery may be mentioned the practice of both Great Britain and the U. S. to cover with their protection and law, on certain conditions, those guano islands which may have been discovered and are being worked by their subjects. And at present on the African continent discovery is constantly enlarging the territory claimed by states with colonizing tendencies.

THEODORE S. WOOLSEY.

Disease [O. Fr. *desaise* : Ital. *disagio*, discomfort, inconvenience < Lat. *dis-*, apart + a word meaning comfort, ease, Ital. *agio* : Fr. *aise* : Eng. *ease*; of uncertain origin]: a deviation from a state of health, consisting in most cases (if not in all) in some change, palpable or impalpable, of some one or more of the tissues, rendering such tissue (or the organ containing it) incapable of performing its proper part in the economy of the organism to which it belongs. In a less general sense, a particular form of ill-health

is called a disease. Diseases are either *diathetic* (arising from the diathesis or predisposition of the patient) or *enthetic* (arising from without the patient). It is at present a favorite theory with many that enthetic diseases arise from minute organisms or disease-germs. For the effects of climate upon disease, see CLIMATE IN RELATION TO MEDICINE.

Diseases, Distribution of: See GEOGRAPHICAL DISTRIBUTION OF DISEASES.

Disfran'chisement: the act of depriving a person of any privilege, liberty, franchise, or immunity, such as depriving a member of a corporation of his corporate rights. It is distinguished in this case from "amotion," which refers to the removal of an officer of the corporation from office, without affecting his membership. Another instance is the act of depriving a person of the rights and privileges of citizenship. This term is often applied to the act of depriving a person of the right to vote, and in Great Britain to the act which deprives a constituency of the right to return a member to Parliament. Revised by F. STURGES ALLEN.

Dishonor [from Lat. *dis-*, un- + *honor*, honor]: in mercantile law, the refusal or neglect to pay (or to accept) a draft or a bill of exchange at maturity, or when duly presented for payment. The act of drawing or indorsing such a bill or draft involves the drawer and indorser in an obligation to pay it in case the drawee dishonors the same. In order that the person in whose favor it is drawn may have recourse against the drawer and indorser, it is necessary that notice of the dishonor shall be given to these parties without unreasonable delay. Revised by F. STURGES ALLEN.

Disinfection [from Lat. *dis-*, apart, un- + *inficere*, *infectus*, affect, infect, taint, stain]: strictly, the destruction of the causes of infectious and contagious diseases, disinfectants being the agents employed in the process of destruction. It is now believed that the causes of all infectious and contagious diseases in man and the lower animals are minute organisms, and for a certain number of them—including anthrax, tuberculosis, glanders, malignant œdema, erysipelas, various forms of suppuration, diphtheria, typhoid fever, tetanus, etc.—these organisms have been isolated, identified, and shown to belong to the family of bacteria. For others, including some of those against which disinfection is commonly practiced, such as smallpox, scarlet fever, measles, yellow fever, and typhus fever, the nature of the organism is unknown; but from manifold experience it is inferred that it is destroyed by the same agents that have been shown to be effective against the specific pathogenic bacteria. As employed popularly the word disinfection is quite as often used to denote efforts at the destruction of infection supposed to be present as it is to denote the actual destruction of infective matters in the strict sense of the word; but as there is no other single word which can properly be applied to the use of disinfectants, when, as in the great majority of cases, we do not positively know that the causes of infection are present, but only believe them to be there, this loose employment of the word is likely to continue, and we therefore speak of disinfecting privy vaults, sewage, or the hold of a ship, although in many cases we do not know whether any really infectious matter is thereby destroyed.

Disinfection is accomplished by both thermal and chemical means. Thermal disinfection includes destruction of infection by both hot air and steam, while chemical disinfection implies the destruction of infective particles by the use of substances of a chemical nature. In either case the vitality of the infective agents is destroyed through alterations in the protoplasm composing them by the agent employed. In some cases this involves the decomposition and disintegration of the infective particles, in others they may be simply killed and not otherwise altered.

Sterilization is the killing of all living things, including spores and vegetative forms of micro-organisms, that may be present in a substance or inclosed space, or on a given surface. Sterilization may be said to involve disinfection, for, although a sterilized fluid might contain enough of the specific products of the diphtheria bacillus to produce the pathological results of the disease if injected into the living body, there would be no increase of the virus, and hence the person thus diseased would not convey infection to another. On the other hand disinfection does not always require sterilization, for in a mixture of bacteria containing pathogenic forms many of the latter may be destroyed by means which would have little effect on the spores of some of the non-pathogenic bacteria present.

An antiseptic is a substance which hinders or prevents the growth of micro-organisms, and in its employment is directed especially against those forms of bacteria which cause fermentation or putrefaction, or which give rise to suppuration in the living body.

In certain cases the action of a disinfectant may be limited to the time of its application—as is the case with steam—it kills the living organisms present, but leaves the place or the substance capable of supporting a growth of other living forms that may subsequently gain access to them: while the action of an antiseptic is more permanent, hindering the development of not only the bacteria present but of those added afterward, although it may not kill them. Agents which destroy or mask foul and unpleasant odors are sometimes called disinfectants, but this is an error. It is true that some deodorizers are disinfectants, and *vice versa*, but there is no definite relation between odors and infection, and the absence of the one does not imply the absence of the other. The specific organisms of contagious and infectious diseases differ in their vital properties and powers, so that what will destroy one may not seriously injure another, but in general it may be said that sunlight and the drying action of the air are unfavorable to their development and are nature's chief disinfectants. The action of the oxygen of the air as a disinfectant appears to be often indirect, by favoring the growth of the common ærobic bacteria of nitrification and decay, which either destroy the organic matter required by the pathogenic organisms as food, or develop products which are directly poisonous to such organisms. Cold is the natural disinfectant for yellow fever—the first frost puts an end to an epidemic of this disease, and if cases occur afterward they can be traced to inclosed rooms in which the temperature did not fall to the freezing-point. Even zero temperatures do not destroy the infection of anthrax, of typhoid, of tuberculosis, of smallpox, or of some of the pathogenic micrococci. Disinfection is to be applied to substances and surfaces which are supposed to have become infected, either directly or indirectly, by the presence of specific pathogenic micro-organisms. The process of removing or destroying all micro-organisms on the instruments or hands of the surgeon or obstetrician, or on the skin of a patient to be operated on, is sometimes called disinfection, but it is more properly named sterilization.

In selecting a disinfectant the following points should be considered: (1) its powers as a germicide under different conditions of concentration and length of time required; (2) its liability to produce injury to persons or property; (3) the ease and certainty of its application by unskilled persons; (4) its cost.

The most certain and valuable disinfectant is heat, which may be applied by fire to effect complete destruction by burning, by baking in dry hot air, by steam under slight pressure, and by boiling water. For all articles of clothing and bedding, towels, or other things which can be washed and boiled without injury, this is the cheapest, easiest, and most satisfactory method of disinfection.

The experience of the large laundry connected with the Hospital for Infectious Diseases in Glasgow, extending over fifteen years, has practically proven, what might have been anticipated from laboratory experiments, that the clothing and bedding of smallpox, typhus, scarlet fever, and other similar cases may be freely mingled and passed through the tubs and kettles without risk to subsequent wearers. Simple boiling for fifteen minutes will destroy all known infection except possibly that due to spores, which may require an hour. Even an hour's boiling will not certainly destroy the spores of the hay bacillus, but this is not a disease-producing organism.

Dry heat or baking at temperatures of from 230° to 260° F. or upward is useful for sterilizing articles of metal, glass, crockery, etc., which will not be injured by a little excess of heat, but it is not a good method of disinfecting blankets, mattresses, pillows, etc., although it is still used in many places for that purpose. Dry heat penetrates very slowly into articles having many air spaces and otherwise being good non-conductors, and the degree and duration of heat which is required to destroy spores (245° F. for five hours) is perilously near the temperature which will injure the texture of woven stuffs, and make them either brittle or change their color. Such a degree of heat fixes stains from blood, excreta, etc., so that they can not be washed out, and it is practically impossible to regulate the temperature of a large hot-air chamber so that all parts shall be of a sufficient temperature and yet no part in excess.

For this reason disinfecting ovens are now being replaced by cylinders or chambers into which steam under slight pressure is admitted. It is desirable that the steam should have a temperature of from 220° to 230° F., with a pressure only just sufficient to prevent any deposition of moisture in the chamber, and that it shall be so admitted as to drive out all air from the interstices of the infected articles as well as from the chamber at large, and thus insure its penetration into the interior of mattresses, pillows, etc. The operator should know when this penetration has been effected by the action of a thermometer placed in the interior of the mattress, and by electric connection, sounding a bell when the desired temperature is reached.

It is of advantage in this form of steam sterilizer to have the chamber so arranged that for a period before the steam is introduced hot air can be allowed to enter the chamber, and penetrate the materials to be disinfected. This warms all objects, and prevents condensation of the steam and wetting of the materials in the chamber.

These disinfecting chambers are usually made of boiler iron, and may be fixed or movable. Most large cities in Europe now have one or more disinfecting stations under the direction of the health authorities, and here a steam disinfecting cylinder is so set that its opposite ends open into different rooms in order that the articles which have been disinfected may not be exposed to the dust of a room which has recently contained infected things.

Dust is a most important factor in practical disinfection. Bacteria and spores rarely exist as free particles in the air, but rather as adhering to fragments of carbon, finely pulverized straw, shreds of cotton, etc. They are not given off from the surface of liquids nor from thoroughly moist surfaces, unless with particles of the liquid thrown into the air as a spray. Hence it is of the utmost importance in handling infected articles to keep them moist until they are disinfected. Sheets, underclothing, etc., should be thoroughly moistened, or placed in vessels of water before they are taken from the infected room to the laundry, and mattresses and other articles to be taken to the disinfecting station should be carried in rubber bags.

There are many infected things and surfaces to which heat can not be applied, and for these gaseous or liquid disinfectants are used. Of the gaseous disinfectants sulphurous acid and chlorine are those most used. The air of a sick-room can not be disinfected while the patient is in it. The use of chloride of lime in saucers, or of strips of cloth soaked in carbolic acid, or the burning of pastilles is useless so far as disinfection is concerned.

The removal of infection from walls, floors, and the surfaces of furniture is best effected by thorough rubbing with rags or sponges moistened with solutions of corrosive sublimate 1–1,000, or of carbolic acid 3 per cent., in such a way as to remove all dust, and then boiling or burning the rags. Rubbing walls and ceilings with moist bread crumbs is a good way of removing infectious dust. Especial care is to be taken to remove the dust from all cornices and projecting ledges over doors, and from the tops of wardrobes, etc.

It will usually be found, however, that the walls and wood-work contain cracks, and that to complete the process it will be advisable to employ sulphurous acid, produced by burning sulphur in an iron pot placed on sand. All openings into the room should be tightly closed, and the fumes should be left to fill the room for at least twelve hours. At least 4 lb. of roll brimstone per 1,000 cubic feet will be required, and if the room is not more than usually airtight 6 lb. will be needed. The gas diffuses with great rapidity, penetrating upholstery and clothing, and has little injurious effect upon furniture or woven stuffs. Its efficiency is greatly increased by saturating the air of the room with water-vapor at the time the sulphur is being burned. This is most conveniently accomplished by having several open vessels of boiling water standing at different parts in the room.

It will not destroy spores, and is chiefly useful against the infection of scarlet fever, measles, and smallpox. It should not be relied upon in anthrax, diphtheria, or tuberculosis.

The liquids most useful for disinfecting purposes are common whitewash made with freshly slacked lime, 4-per-cent. solutions of fresh chloride of lime, 5-per-cent. solutions of carbolic acid, and solutions of corrosive sublimate 1–1,000.

The solution used in the Paris disinfection service is composed as follows:

Corrosive sublimate.....	grammes.	4
Tartaric acid.....		48
Distilled water.....		200

A few drops of a 5-per-cent. solution of carminate of indigo are added to give it a distinctive color, and the whole added to 2 liters of water.

Half an ounce of corrosive sublimate to 3 gal. of water and a few grains of anilin blue makes a solution of general utility for disinfecting surfaces of all kinds.

For the disinfection of fæces and of sputa a 5-per-cent. solution of fresh chloride of lime or a 5-per-cent. solution of carbolic acid is recommended. They should be allowed to remain in contact with the excreta for from six to twelve hours. For disinfecting privy vaults and cesspools strong milk of lime is the best. Corrosive sublimate should not be used for the disinfection of excreta or sputa, as it forms an insoluble compound with albuminous matters.

Sulphate of iron is not a disinfectant.

Other chemical disinfectants which are more rarely used are permanganate of potash, chloride of zinc, and various coal-tar products. These, with such substances as iodoform, peroxide of hydrogen, etc., are used for special purposes in medical and surgical practice, but are more costly, more liable to inflict injury, or in other ways are less desirable for general use in disinfection than heat, lime, corrosive sublimate, carbolic acid, chlorine, and sulphurous acid.

For the sterilization of instruments used in surgical operations it is becoming customary to boil them in water containing 2 per cent. of common soda. This method has been shown by experiment to possess much value as a means of disinfection. J. S. Billings and A. C. Abbott.

Disintegration [from Lat. *dis-*, un- + *integra're*, make whole (*in'teger*), renew]: the separation of the integrant particles of a body; the destruction of cohesion; in geology, the gradual wearing away of a rock by ordinary atmospheric action, etc.; the process by which a solid rock is reduced and comminuted to sand, gravel, or soil. Soil or arable land is formed and prepared by the disintegration of rocks. The action of the weather is helped by frequent alternations of temperature above and below the point at which water attains its greatest density—i. e. 39° F.

Disk, or **Disc** [from Lat. *dis'cus*, quoit, plate = Gr. δίσκος, quoit]: in astronomy, the face of the sun, moon, or a planet, such as it appears to us projected on the sky. The forms of the celestial bodies being nearly spherical, their projections are circular planes. The fixed stars, when viewed through a telescope, present *spurious disks*, in consequence of the diffraction of light.

Disk, or Disc, in botany, is a fleshy expansion of the receptacle of the flower; a part of the receptacle, or a growth from it enlarged under and around the pistil; also the central part of a head of flowers of the *Compositæ*, as the *Coreopsis*.

Disk Worship: See Egypt, Ancient.

Dislocation, or **Luxation** [*dislocation* is from Lat. *dis-*, un- + *loca're*, place, deriv. of *locus*, place; *luxation* is from Lat. *luxa're*, to loosen]: in surgery, the displacement of a bone from its proper relation to another bone with which it is articulated. A complicated dislocation is the displacement of a bone, accompanied by a severe local lesion of the soft parts, or fracture of a bone. Congenital dislocations are those which occur before birth. The restitution of a dislocated bone is called its reduction. Reduction of recent luxations is usually a comparatively easy task to those who have the requisite knowledge and experience, but in old and long-neglected cases it is frequently a most formidable operation, and is liable to be followed by bad consequences to the patient.

Dismal Swamp: a great morass in Virginia and North Carolina, occupying the eastern part of the peninsula between Chesapeake Bay and Albemarle Sound. It was originally about 35 miles long and 25 miles wide, but has been diminished by the drainage of its margin and of portions of the interior. A large portion of it is covered with dense forests of juniper, cypress, white cedar, and black gum trees, the lumber of which is exported, while other parts are covered with a dense growth of reeds. West of the middle of the swamp is Lake Drummond, which has an area of about 6 sq. miles, and abounds with fish. A canal through the swamp opens steam communication between Chesapeake Bay and Albemarle Sound, and the Norfolk and Southern Railway runs through the eastern portion. The swamp does not occupy a basin, but is higher in the middle than at its northern, eastern, and southern margins; its highest part is 21 feet above tide-water.

Dispensary [deriv. of verb *dispense* < O. Fr. *despenser* < Lat. *dispensa're*, weigh out, distribute; *dis-*, apart + *pen'dere*, *pensum*, weigh]: a charitable institution in which medical and surgical aid is gratuitously furnished to the poor. During the Middle Ages dispensaries were set up in the houses of the wealthy and in monasteries, and toward the end of the eighteenth century were established in their present form. They are now established in most large cities. The oldest in Great Britain, the Royal General Dispensary, Bartholomew Close, London, was opened in 1770. The oldest in the U. S. was founded in New York in 1795.

Dispensation [from Lat. *dispensa'tio*, distribution, assignment, management; deriv. of *dispensa're*, weigh out; *dis-*, apart + *pendere*, weigh]: in the Roman Catholic Church, an exemption from some canon or other law. Bishops and priests grant dispensations in some cases, but the pope alone has the power of giving them in the more important ones. Papal dispensations were first granted in 1200 by Innocent III. After the English Reformation the dispensing power was assumed by the kings, but it was abolished by the Bill of Rights in 1689. See PARDON.

Dispen'satory [for etymology, see DISPENSARY]: a book containing an account of the physical qualities and medicinal powers of different drugs, with their natural and commercial history, and their preparation and combinations. One of the most complete works of the kind is the *United States Dispensatory*, by Wood and Bache (1833; 13th ed. 1870).

Dispersion [from Lat. *disper'sio*, scattering; *dis-*, apart + *spar'gere*, *spar'sum*, scatter]: in optics, the angular separation of the constituent rays of light when decomposed by the prism. Owing to the unequal refrangibility of the rays of different colors, a beam of light admitted through a small aperture in the shutter of a darkened room, and refracted by passing through a prism, forms an elongated image or spectrum; the red rays, which are the least refracted, occupying one end of the spectrum, and the violet rays, which have the greatest refraction, the other end. The rays after refraction are no longer parallel, so that the index of refraction (the ratio of the sine of the angle of incidence to the sine of the angle of refraction) is different for each ray; and the difference of the indices for the extreme rays is called the dispersion of the light. The amount of dispersion varies with the angle of the prism and the material of which it is composed. On the latter, too, depends the relative breadth of two parts of the spectrum, or irrationality of dispersion. It had been supposed by Sir Isaac Newton that the dispersion was proportioned to the refraction, but it was soon found that although the colors in spectra formed by prisms of different substances are always arranged in the same order, they do not occupy the same relative amount of space; a prism of flint-glass giving, in proportion, less red and more violet than a prism of crown-glass, and that substances for which the index of refraction of the middle ray of the spectrum is nearly the same, produce spectra of different lengths.

Disposition [Lat. *dispositio*, from *disponere*, dispose, put in order, arrange]: in architecture, one of the six essentials of the art. It is the arrangement of the whole design by means of the ichnography (plan), orthography (section and elevation), and scenography (perspective view), and differs from *distribution*, which signifies the particular arrangement of the internal parts of a building.

Disraeli, diz-ray'li, BENJAMIN, Earl of Beaconsfield: statesman and novelist; b. in London, Dec. 21, 1804; of Jewish extraction; educated by his father and private teachers. He entered a solicitor's office, but had no taste for legal business, and finally took to literature. His principal novels are *Vivian Gray* (1826); *The Young Duke* (1830); *Contarini Fleming* (1832); *Henrietta Temple* (1836); *Coningsby* (1844); *Lothair* (1870); and *Endymion* (1880), some of which were successful—not so much on account of any great literary merit as on account of their close reference to actual circumstances. He began his political career as a Radical, and offered himself as a candidate for Parliament in 1831, but was defeated. Having become a Tory, he was again rejected by the electors of Taunton in 1835, but was elected a member of Parliament for Maidstone in 1837. His maiden speech was so pretentious, and uttered with gestures so extravagant, that he excited the laughter of the House, and closed abruptly, saying, "I shall sit down now, but the time will come when you will hear me." He married in 1839 the widow of Wyndham Lewis. Having gradually acquired skill as a debater, he became, about 1842, the leader of the "Young England Party" and an opponent of Sir Robert Peel, whom he denounced with unsparing invective because Peel advocated the repeal of the corn-laws. In 1846 he was returned to Parliament for Buckinghamshire, which he represented for many years. He succeeded Lord G. Bentinck, who died in 1848, as leader of the Protectionist party in the House of Commons. He was Chancellor of the Exchequer in the Conservative ministry of Lord Derby for nearly nine months in 1852. About the end of that year he resumed the post of leader of the opposition in the House of Commons. Early in 1858 he was again appointed Chancellor of the Exchequer in the new Conservative Derby-Disraeli ministry. In 1859 he introduced a bill for parliamentary reform, which was rejected by a majority of the House of Commons. He therefore resigned with his colleagues in June of that year. He opposed the electoral Reform bill of Russell and Gladstone, which was defeated in June, 1866. The Liberal ministers then resigned and the Conservatives formed a new cabinet, in which Disraeli was Chancellor of the Exchequer. He also became the leader of the House of Commons, and the most prominent minister except the Premier, Lord Derby. He was the principal author and manager of the Reform bill which became a law in Aug., 1867, and extended the right of suffrage to every householder in a borough. This bill enfranchised nearly a million of men, mostly workingmen, and was considered a dangerous innovation by the Conservatives. Disraeli succeeded Lord Derby, who resigned the place of Prime Minister in Feb., 1868. He opposed the resolutions or bill which Mr. Gladstone introduced to disestablish the Irish (Episcopal) Church. After a long debate, Mr. Gladstone's resolutions were adopted by the House of Commons on May 1, 1868, by a majority of sixty-four. Disraeli, though defeated on this important question, resolved not to resign office, but to wait for the result of the general election, which occurred in the next November. The Liberal party having secured a large majority in the new Parliament, he and his colleagues resigned Dec. 2, 1868, and Mr. Gladstone then became Prime Minister. He was chosen lord rector of the University of Glasgow 1873, and was Prime Minister again 1874–1880. During this his last term of power he was principally occupied with the foreign policy of the country. Among the characteristic measures of his ministry were the creation of the title Empress of India, the establishment of the "scientific frontier" between Afghanistan and the Russian possessions in Central Asia, the acquisition of Cyprus, and the subjugation of the Zulus. D. in London, Apr. 19, 1881. See his *Selected Speeches* (2 vols., 1882); *Life*, by Hitchman (3d ed. 1884); Brandes (1879); O'Connor (hostile, 1879); Kebbel (1888); Froude (1890).

Disraeli, ISAAC: English author; father of Benjamin Disraeli; b. at Enfield in May, 1766. He studied in Amsterdam and Leyden, and spent some years in France. Inheriting a fortune from his father, a Hebrew merchant originally from Venice, and belonging to one of the Jewish families who escaped to Venice from the Inquisition in Spain in the fifteenth century, he devoted himself to the study of literary history. His principal works are *Curiosities of Literature* (1790); *Calamities of Authors* (1812); *Quarrels of Authors* (1814); and *Amenities of Literature* (1841). D. at Brandenham House, Buckinghamshire, Jan. 19, 1848.

Disruption [from Lat. *dis-*, asunder + *rum'pere*, *rup'tum*, break; cf. *dīrup'tio*, *dīrum'pere*]: the schism in the Church of Scotland in 1843. See FREE CHURCH OF SCOTLAND.

Dissection: See ANATOMY.

Dissection Wounds: See WOUNDS.

Disseizin, or **Disseisin** [O. Fr. *disseisin*, deriv. of *desseisir* > Mod. Fr. *dessaisir*, disseize; *dis-*, *des-*, away + *saisir*, take, seize]: in law, an unlawful ejection of one who is seized of a freehold in lands, so as to deprive him of the SEISIN (*q. v.*) and place it in another. The modern equivalent for this word is "adverse possession." There is also "disseizin by election," where a person chooses to consider himself disseized, though he is not so in fact, in order to avail himself of legal remedies applicable to a true disseizin.

Dis'sen, GEORG LUDOLPH: classical scholar; b. Dec. 17, 1784, near Göttingen; a pupil of the philologist Heyne and the philosopher Herbart; professor in Göttingen from 1813 till his death. Having occupied himself in his earlier years with grammatical and philosophical investigations

(especially of Plato), he afterward devoted himself exclusively to æsthetical exegesis of the classics, laying special emphasis upon the development of rigid stylistic laws, which he contended governed all poetical and oratorical composition among the ancients. This new doctrine, though at bottom a sound one, was carried by its inventor to an unwarranted extreme in his successive commentaries on *Pindar* (1830); *Tibullus* (1835); and Demosthenes's *De corona* (1837). See Dissen, *Kleinen Schriften* (Göttingen, 1839), and Bursian, *Gesch. der class. Philologie in Deutschland*, p. 751 ff.
D. Sept. 21, 1837. ALFRED GUDEMAN.

Dissenters [deriv. of *dissent*, from Lat. *dissenti're*, differ in opinion; *dis-*, apart + *senti're*, think]: English Protestants who differ in their views from the Church of England. This party originally represented the desire for a more radical reform than that introduced by the Anglican Church, and was divided into the Puritans and the Separatists, the former of whom expected to reform the Church from within, while the latter resolved to leave its communion. The Acts of Uniformity in the reigns of Edward VI. and Elizabeth had the effect of alienating both these groups, and, in spite of severe penalties, the Puritans followed the Separatists in withdrawing from the Church. The tyrannical institutions of the Ecclesiastical Commission (1583) lessened the hope of reconciliation, and the repressive enactments of the Stuarts served to embitter the nonconforming Protestants without suppressing the practice of their faith, till the tables were turned in the civil war and left Puritanism in the possession of the government. Another Act of Uniformity, passed after the Restoration (1662), caused the secession of about 2,000 clergymen, who in a restricted sense of the term have been called the Dissenters. All who refused to take the oaths of allegiance and supremacy, and the Eucharist according to the rites of the Established Church, were excluded by the Test Act (1673) from Government employment. By the Toleration Act (1689), Dissenters obtained legal security in celebrating their worship, and the Corporation and Test Repeal Act (1828) enabled them to accept public employment without taking the Eucharist. In 1836 they were first authorized to solemnize marriages in their own places of worship or at a registrar's office. The General Body of Protestant Dissenting Ministers of the Three Denominations is the official name of the union of the three boards of the Presbyterian, Independent, and Baptist ministers resident in and about the cities of London and Westminster. This union was organized July 11, 1727, and has always taken a leading part in the struggle for the disestablishment of the Church of England. In some European countries Dissenters are called Dissidents. See also NONCONFORMISTS and SEPARATISTS.

Dissepiments [from Lat. *dissæpimen'tum*, partition, deriv. of *dissæpi're*; *dis-*, apart + *sæpi're*, hedge in, fence]: in botany, the partitions formed in the ovary by the united sides of the cohering carpels. Sometimes dissepiments meet in the center, and divide the ovary or the fruit into cells; in other cases they are partial, and leave the ovary one-celled.

Dissidents: See DISSENTERS.

Dissociation, or **Disassociation** [*dissociation* is from Lat. *dissocia're*, disrupt the companionship of; *dis-*, apart + *so'cius*, companion]: in chemistry, the resolution of more complex molecules into simpler ones by the action of heat; also called thermolysis.

The word was first introduced into chemical nomenclature by Henry St. Claire Deville, who presented a paper to the French Institute Nov. 23, 1857, *On the Dissociation or Spontaneous Decomposition of Bodies under the Influence of Heat.* Deville says in this paper: "When heat acts upon any body it produces an expansion which we attribute to a force called the repulsive force of heat. By selecting a proper compound and heating it sufficiently, the distance between the molecules can be increased to such an extent that they will separate into their elementary condition. This is a spontaneous decomposition not determined by any chemical action. I propose to call it the *dissociation* of compound bodies."

A very full discussion of the subject of dissociation by Mène may be found in the *Revue Hebdomadaire de Chimie*, vol. iii., 1871. See also the researches of Graham, Debray, Grove, Regnault, Lamy, Isambert, Frankland, and Clausius.

Dissolving Views: enlarged images of transparent pictures thrown upon a screen by means of two magic lanterns placed side by side, with their lens tubes a little convergent, so that the projected images may be superposed. By means of mechanical contrivances, which differ in different forms of the apparatus, one of the images is gradually extinguished while the other is similarly developed. At the middle point the two are confusedly intermingled, and afterward one seems to swallow up the other. See MAGIC LANTERN.

Dis'sonance [from Lat. *dissonan'tia*; *dis-*, apart + *sona're*, to sound, deriv. of *so'nus*, sound]: the opposite of *consonance*; those intervals in music whose relative proportions are unsatisfactory to the ear. In a special sense, the term is applied to a dissonant interval purposely introduced by the addition of a dissonant note to a concord, or by the substitution of a dissonant for a concordant note.

Distaff [O. Eng. *distæf* = *disestæf*; for former element cf. Low Germ. *diesse*, bunch of flax on the distaff, of which noun *dizen*, to deck out, represents a derivative; the latter element is Eng. *staff*]: one of the earliest and most simple implements used in spinning, consisting of a stick with a cleft or pronged end, around which the fiber to be spun was wound. The distaff was usually held under the left arm, a spindle was attached to the end of the thread and set rotating, and the thread as it was drawn out rapidly by the right hand wound itself around the spindle. When the small wheel used for spinning flax was invented the distaff was attached to it. The Fates are represented as spinning the thread of life from the distaff. The distaff is at present not much used except in rude and barbarous countries; but no spinning-wheel, much less any machinery driven by water or steam, has ever produced work which can compare in delicacy with the finest products of the distaff.

Distance: in music, the interval between two notes; in astronomy, real distance is an interval between two heavenly bodies expressed in terrestrial measures, as miles, meters, etc.; mean distance is a mean between the perihelion and the aphelion; curtate distance of a planet is the distance from the sun or earth to that point where a perpendicular let fall from the planet meets with the ecliptic. Line of distance in perspective is a straight line from the eye to the principal point of the plane. The point of distance is that point in the horizontal line which is at the same distance from the principal point as the eye is from the same. Distance in navigation is the number of miles from point to point in a ship's course. The arc of a rhumb line between two places is the nautical distance. Distance in horse-racing is the last 250 yards of the course. Any horse not reaching the distance-post before the winning horse has reached the end of the course is said to be distanced.

Distemper (in Fr. *détrempe*; Ital. *tempera*): a method of painting in which the pigments are ground up with size and water, white of egg with gum-water, or similar vehicles. It is employed in scene-painting and in the preparation of wall-paper. Distemper was the ordinary method of painting in the higher departments of art before the invention of painting in oil. The rapidity with which the vehicle dries renders it difficult to blend the tints in distemper.

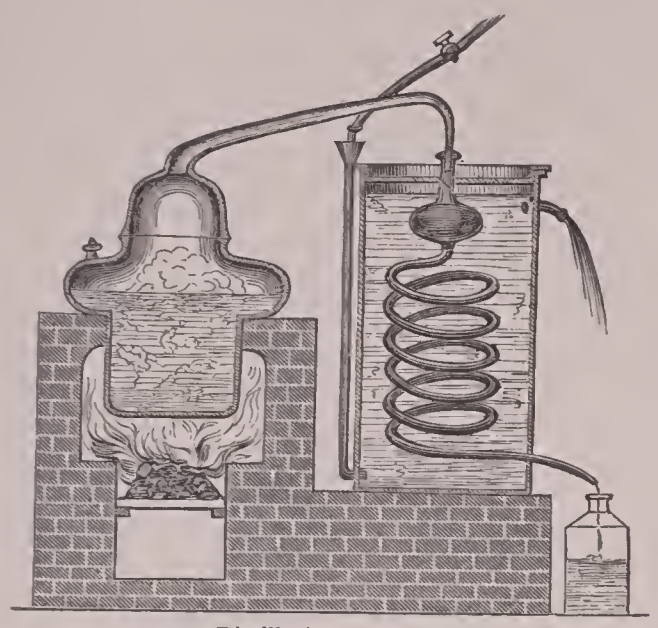
Distemper: the name of certain diseases of animals. See DOG DISTEMPER, and HORSE DISTEMPER.

Disthene: See CYANITE.

Dis'tich, dis'tik [Gr. δίστιχον; δι-, double + στίχος, row, verse]: a couplet of verses. In the Greek and Latin languages the distich consists of a hexameter followed by a pentameter verse. It was much used by the Greeks and Romans in the expression of single thoughts and sentiments, and in the composition of epigrams.

Distillation [from Lat. *destilla'tio*, a dripping or oozing down; deriv. of *destilla're*; *de*, off + *stilla're*, to drop, cf. *stilla*, a drop]: in chemistry and the arts, a process by which substances which are vaporized at different temperatures are separated from each other, or substances which can be vaporized are separated from those which can not. When the vaporized substance assumes a solid form after distillation, the process is called "sublimation." Distillation is usually performed by means of a boiler for raising the vapor, and a condenser for reducing the vapor to a liquid or solid form. The condenser is often a spiral tube or "worm," which is kept cool by water while in use. Various instruments for distilling are used in the laboratory of the chemist. "Dry" or "destructive" distillation is the production of new compounds by submitting substances of organic origin to a high but carefully regulated heat. These products are often complex, but sometimes perfectly definite. "Fractional" distillation is the separation of one volatile

substance from another, by collecting the parts that pass over at different temperatures in different vessels, and afterward distilling each of the fractions a number of times.



Distillation process.

To produce spirits two distinct operations are required: one to convert vegetable principles into alcohol; the other the separating of the alcohol from the several substances with which it is united while being produced. Sugar is the principle which is necessary to the formation of alcohol, and is used *directly* when molasses and similar saccharine products are submitted to quick fermentation; and *indirectly* when sugar is produced from the starch which certain grains contain, and afterward converted into alcohol. The latter method is commonly employed in distilleries, and grains of various kinds, generally with some malt, are *mashed*. To accomplish this result, a mixture is made of the ground grain and crushed malt, and infusion made in hot water, constantly shaken in the mash-tub, which is best made of circular cast-iron plates, after which the wort is run off and water added until the soluble matter of the grain is extracted. While in process of mashing, sugar is formed from the starch, and changes into alcohol while fermenting; the mash gradually becomes thinner in consequence, and as soon as the proper state is reached, which the hydrometer determines, in order to prevent acetic fermentation it should be distilled. See WHISKY for full account of its distillation.

Much skill and care in mashing, fermentation, and distilling is necessary to the successful production of the greatest possible amount of alcohol from a given quantity of grain, fruit, or other raw material. According to Hermstadt, about 51 lb. of alcohol and 49 of carbonic acid may be obtained from 100 lb. of sugar; 100 lb. of starch yield 35 lb. of alcohol, and the same quantity of the following grains yields a spirit containing 45 per cent. of alcohol—namely, wheat, 40 to 45 lb.; rye, 36 to 42; barley, 40; oats, 36; buckwheat, 40; maize, 40. Revised by IRA REMSEN.

Distilled Water (in Lat. *aqua destillata*): the condensed product obtained by the distillation of water, which separates from it all saline matter and impurities, and also most of the air which it had previously contained. On this account it is flat and vapid to the taste. It is much used in chemical and pharmaceutical operations. In some points on the Gulf Coast of the U. S., as at Brazos Santiago, Tex., where streams are unknown and springs scarcely exist, water is procured for drinking and other economical purposes by distillation from the sea. On some sea-going steamers the product of the condensers of the low-pressure engines is utilized for cooking, washing, etc.

Distillery: an establishment fitted up with apparatus for the distillation of spirits. See DISTILLATION.

Distress, or **Distrain**: in English law, the taking of a personal chattel without process of law out of the possession of a wrong-doer, by way of pledge for redress of an injury or for the performance of a duty, as for non-payment of rent or taxes, etc.

Distribution of Species: See ZOÖLOGICAL GEOGRAPHY.

Distributive Co-operation: See CO-OPERATION.

District [Fr. *district* (doublet of *détroit*), territorial division, from Lat. *destrictus*, past partic. of *destrin'gere*, draw away from]: a territorial division: a defined portion of a state or city, which is divided into districts for judicial, fiscal, or elective purposes. The U. S. are divided by the Federal Government into judicial districts, for each of which there is created a district court (see COURTS). Each State having a sufficient population is divided into congressional districts, which are nearly equal in population, and elect each one member of Congress. By the census of 1890, the population of a "district" is to be 173,901; the number of districts is 356. The ratio is raised after each census, in order that the number of members in Congress may not become inconveniently large. Each State is, by the Constitution, entitled to at least one representative, though its population may not equal the prescribed number for a district. Nevada, with less than 50,000 inhabitants, has one representative, and Delaware, with less than 170,000, also has one. But each of these States has two Senators. Every State is also divided into senatorial districts, each of which sends a member to the Senate of that State. There are also tax districts, land districts, etc. Townships in many parts of the U. S. are divided into school districts, each of which maintains and manages one or more public schools.

District Attorneys of the United States: the officers appointed to act as attorneys for the U. S. in the several judicial districts. Formerly, in Great Britain, a district of country embracing several counties was assigned to a judge, in which he held criminal courts called over and terminer—to "hear and determine"—as is still done in some of the U. S. An attorney to represent the crown or state was necessary to enter upon trials. As he was selected to proceed through the whole district, he received the appellation of "district attorney." In the Federal courts, and in many of the States, the duties of this officer have become local, confined to a particular county or place of holding a single court, and the officer is called district attorney, as being the attorney appointed for that district only. It is the duty of the district attorney of the U. S. to prosecute in his district all delinquents for crimes and offenses cognizable under the authority of the U. S., and all civil actions in which the U. S. are concerned, and, unless otherwise directed by the Secretary of the Treasury, to appear in behalf of revenue officers against whom proceedings are pending to recover money exacted by them and paid into the treasury. The office is much sought, both for the honor attached to it and for the profit arising from it. The district attorneys, with two exceptions, receive a nominal salary of $200, and the residue of their compensation is mainly derived from fees prescribed by act of Congress. The amount of the fees and emoluments which may be retained by a district attorney is limited by law to $6,000 over and above the necessary expenses of his office. When they defend officers and others at the instance of the Government, their remuneration is not regulated by law, but depends upon agreement. The district attorneys are under the direction of the Attorney-General, and must render to him an account of their official proceedings, and the state and condition of their offices, at such time and in such manner as he may direct. Revised by F. STURGES ALLEN.

District Courts of the United States: See COURTS.

District of Columbia: since 1800 the seat of government of the U. S.; bounded N., N. W., E., and S. E. by Maryland, and W. and S. W. by the Potomac river and Virginia. Area, 70 sq. miles. Originally its area was 100 sq. miles, consisting of a tract lying on both sides of the Potomac, 10 miles square, ceded to the U. S. by Maryland and Virginia 1788–89. The Virginia portion, with the city of Alexandria, was retroceded to Virginia by Congress July 9, 1846.

The soil of the District is a light sandy loam, well watered in most parts. It belongs geologically to the Cretaceous formation, with deposits of marl underlaid by gneiss, the surface exhibiting sandstone, limestone, pebbles, clay, gravel, sand, and loam.

The fauna and flora are generally identical with those of Eastern VIRGINIA and MARYLAND (*qq. v.*). The Potomac river abounds in shad, herring, black bass, perch, rockfish, sturgeon, etc.

Climate.—The temperature has a wide range, suddenly rising or falling many degrees, but the climate is as equable as is common in the Atlantic States, and generally healthy, though miasma prevails near the Potomac flats. The mean temperature of summer is 76°, of winter 36°, and of the whole year 56°. Average rainfall, 90 inches a year.

The snows of winter rarely lie long on the ground. Storms seldom last twenty-four hours.

Manufactures are limited. According to the census of the U. S. for 1900, they comprised 2,754 establishments, with a capital of $41,981,145, giving employment to 24,693 persons, at an annual wage of $14,643,714. The cost of materials was $19,369,571; the value of products, $47,667,622. Building trades showed the largest aggregate product, $11,521,077; next, printing and publishing, $1,846,535.

Finances.—The assessed value of real estate and personal property in the District in 1899 was $190,958,987. By law one-half the total expenditure for the District of Columbia is borne by the general Government, the other half being taxed on private property. The net public debt of the District was $15,891,620.18, mainly created by the vast street improvements carried out by the short-lived territorial government and board of public works in 1871–74.

Railways.—All the street railways are operated by underground electric power. The Balt. and Ohio and Balt. and Potomac (branch of the Pennsylvania), the Southern, Chesapeake and Ohio, Sea Board Air Line, Atlantic Coast Line, Norfolk and Western, and Chesapeake Beach afford ready transit to the North, South, and West.

The commerce of the District is trifling, though Georgetown is a port of entry, and the Potomac is navigable for large vessels to the navy-yard on the east branch, and to the head of tidewater at Georgetown.

Banks, etc.—In 1901 there were 12 national banks, capital, $3,027,000; circulation, $1,330,525; and deposits, $18,760,598.95; 4 loan and trust companies, capital, $4,450,000; deposits, $11,363,117.52. There are 12 fire-insurance companies, capital, $1,625,000; assets, $3,218,452.

Education.—The public schools of the District have an enrollment of 45,560 pupils, with average attendance of 34,032. Amount expended for free schools, 1899, $1,148,850.36, of which $801,016.26 was for teachers' salaries. Private schools for both sexes are numerous and well attended. There are 7 universities or colleges, with 432 instructors and 2,875 students. Georgetown College, founded in 1789 (Roman Catholic), Columbian University (1814), and Howard University (colored) have each law, medical, and collegiate departments. The Smithsonian Institution (*q. v.*) and the National Museum, erected in 1880, are free public institutions with extensive exhibits in natural history, ethnology, etc. There are 55 Government, society, and school libraries, and a public library, numbering 1,695,525 volumes.

Government.—A territorial government was created by Congress for the District of Columbia in 1871, repealing the charters of the cities of Washington and Georgetown, and merging them into the same government. This was abolished in 1874, and the affairs of the District, including those of Washington, are now managed by three commissioners under the direct legislation of Congress for the levying and disbursement of taxes and for all public improvements. The citizens have no vote, either in District or national affairs. Justice is administered by a Supreme Court of the District of Columbia, having six judges, a Court of Appeals composed of three judges, and by a police court, presided over by two judges.

Pop. (1880) 177,624; (1890) 230,392; (1900) 278,718. For fuller information, see Washington, city of.

Distri'to Federál (that is, the federal district): a reservation about the national capital in federal governments in Latin America. The example was set in the District of Columbia. It was later adopted in Mexico, where the distrito federál embraces the city of Mexico, and has an area of 463 sq. miles and a population of 798,480. The distrito federál of Venezuela embraces Caracas, has an area of 45 sq. miles and a population of about 72,000; this includes Caracas. The municipio neutro of Brazil, embracing Rio de Janeiro (*q. v.*), is a modification of the same idea. The present constitution of Brazil provides for a national reservation in the geographical center of the country, which shall at some future time serve for the seat of the capital.

M. W. Harrington.

Disulphide: See Carbon Bisulphide.

Ditch, or **Fosse** (in Lat. *fossa*): in fortification, a deep trench or excavation around a fort, serving as an obstacle to the enemy and supplying earth for the parapet or rampart. It is generally dry, but is sometimes filled with water. In permanent works, such as the regular fortifications of a town, the rampart and ditch are the most important; the former being beside the latter, and formed of earth excavated from it. The ditch is often 100 feet wide, and 12 feet deep below the natural level of the ground.

Dith'yramb [Gr. διθύραμβος, a form of Greek lyric poetry; etymol. obscure]: a kind of lyric poem sung in honor of Bacchus. It was invented by Arion, in Corinth, about 620 B. C., according to Herodotus. It was of a lofty but often inflated style; hence the term *dithyramb* is frequently applied to any lyric of a boisterous character, such as might be supposed to be composed in a state of intoxication.

Ditmarschen, or, as its Scandinavian name reads, **Ditmarsken**: a district of Western Holstein stretching along the North Sea from the mouth of the Elbe to the mouth of the Eider, and comprising an area of about 500 sq. miles, with a population of (1887) 77,347; its original name was *Thiatmaresguho*—that is, "Dietmar's Gau." At present it forms no independent community; it is merely a portion of the Prussian province of Holstein. It was inhabited by Frisians in the two coast-marks, Norderstrand and Süderstrand, and by Saxons in the two inland marks, Norderhamme and Süderhamme: but a strongly marked community in all the principal conditions of life seems very early to have obliterated the tribal differences. Charlemagne claimed authority over the country and conferred the authority upon the Archbishops of Bremen, but some form of self-government had already developed in that corner of the world, and the pretensions of the archbishop remained mere vain-glory. The Danes defeated the Ditmarschers toward the close of the twelfth century, and the country became a part of Holstein under Danish rule (1559), but continued to preserve much of its local independence. It was annexed to Prussia, with the rest of Holstein, as a consequence of the war of 1866.

Dittany [O. Fr. *ditain, dictame*: Ital. *dittamo* < Lat. *dictamnum* = Gr. δίκταμνον, a plant said to be so named because it grew on Mt. Dictè, in Crete]: a plant of the genus *Dictamnus* and family *Rutaceæ*, with the calyx five-partite, five petals, unequal, ten stamens, and five one to three seeded follicular capsules. The *Dictamnus fraxinella* (*ruber* or *albus*) is a perennial indigenous in Southern Europe, and is often cultivated in gardens. It has red or white flowers, of a powerful spicy fragrance. In the U. S. the dictamnus is often called gas-plant, and the name dittany is given to the *Cunila mariana*, of the order *Labiatæ*. It is probable that the dictamnus of the ancients was the *Origanum dictamnus*, a labiate plant to which the old authors ascribe the most marvelous powers.

Dittéah: same as Datíya (*q. v.*).

Dit'ton, Humphrey: mathematician; b. at Salisbury, England, May 29, 1675; was minister of a Dissenting church at Tunbridge. He was befriended by Sir Isaac Newton, who procured his appointment as mathematical master of Christ's Hospital. He wrote able works entitled *Laws of Nature and Motion* (1705); a *Treatise on Fluxions* (1706); and *Synopsis Algebraica* (1709). D. Oct. 15, 1715.

Diu: an island of India, in the Arabian Sea, near the coast of Guzerat; has a fortified seaport, Diu, with a tolerably safe harbor and the remains of a famous Hindu temple (see map of North India, ref. 8–B). It has been possessed by the Portuguese since 1515. Area, 62 sq. miles; pop. 12,700.

Diuretics: medicines which promote the secretion or discharge of the urine. They are used in certain stages of kidney diseases, in affections of the urinary passages, and in rheumatism, gout, and dropsy. Their action, though useful, is lacking in certainty, and depends upon various conditions, such as the state of the kidneys themselves, the condition of other organs, and the surroundings of the patient.

Divan' [from Arab. *dīwān*, council, court of justice or of revenue, sofa, perhaps viâ Fr. *divan*; viâ Romance the word appears in Ital. *dogana* : Fr. *douane* : Span. *aduana*, custom-house]: a word common to several Oriental languages. It is employed by the Persians to denote a collection of poems by one author, as the divân of Saadi and the divân of Hafiz. The term is also applied to a muster-roll or military day-book. The Turkish divan is the great council of the empire or supreme judicial tribunal. The word *divân* is also among the Turks a common appellation for a saloon or hall which serves for the reception of company, and along the sides of which are arranged low cushioned seats or sofas.

Diver: any bird of the genus *Colymbus* and family *Colymbidæ*. The bill is straight, strong, and pointed, tail and

wings short, and the toes webbed. They dive with great facility, and pursue the fish on which they live under the water. The principal species are the Loon (*q. v.*) or great northern diver (*Colymbus glacialis*), the black-throated diver (*Colymbus arcticus*), and the red-throated diver (*Colymbus septentrionalis*). The name is also popularly applied to numerous aquatic birds, such as the grebes and auks.

Revised by F. A. Lucas.

Divers: persons who make a business of diving, as in fishing for pearls, sponges, etc., in blasting and other engineering operations under water, and in the recovery of sunken property. (See Pearl-fisheries.) In the fisheries, divers still work largely without mechanical aid, although the Diving-dress (*q. v.*) is employed to some extent. Another important device employed by divers is the Diving-bell (*q. v.*).

Divertimen'to, or **Divertissement**, dĕĕ'vār'tēēs'maṅ' [*divertimento* is the Italian and *divertissement* the French word for diversion]: a kind of musical composition arranged for one or more instruments. It has generally no fixed character, and may be classed between the *étude* and the *capriccioso*. The term is also applied to a ballet, or songs introduced between the acts of an opera.

Divide: See Basin and Valleys.

Dividend [from Lat. *dividen'dus*, to be divided, fut. pass. partic. of *divi'dere*, divide]: in arithmetic, the number or quantity given to be divided; also the sum apportioned to creditors from the realized assets of a bankrupt's estate, the annual or half-yearly interest on the public funds or national debt, and the distributed profits of joint-stock companies, which are paid annually or half-yearly to each stockholder.

Dividers: instruments for "dividing" or marking off distances, or for drawing circles, ellipses, and other curves. They sometimes consist of two or even three bars or legs, joined at one end by a hinge. Sometimes two movable points are arranged to slide along a "beam" or straight bar. "Proportional dividers" are made of bars crossing each other and pointed at both ends. By means of a sliding joint at the point of union, dimensions included between one of the pairs of the points may be made greater or less than those included between the other at the same time in any proportion.

Dividing-engine: a machine for marking the divisions of scales of measurement in scientific, mathematical, and astronomical instruments. Scales for mechanics' work were formerly divided by hand, but it is impossible to attain accurate results by such methods, while by a carefully made engine a most surprising degree of precision is reached. The dividing-engine depends primarily for its accuracy upon the degree of precision attainable in the cutting of a steel screw. The most remarkable screws as yet constructed are probably those in two dividing-engines designed by Prof. Rowland. They are used in the ruling of diffraction gratings for optical work. Test-plates for the microscope have been ruled by Mr. F. Nobert, of Barth, Pomerania, with divisions only $\frac{1}{240000}$ of a French inch apart. See Ruling-machines.

Divi-divi, dee'vĕe-dee'vee (*Cæsalpinia coriaria*): a leguminous shrub of tropical America; valued for its pods, which contain tannin and gallic acid. It grows 20 feet high, and the pod is 3 inches long. It is used principally for tanning leather and dyeing cloth, and large quantities are exported from Savanilla, Rio Hache, and Maracaibo.

Divina Commedia, or **Divine Comedy**: See Dante.

Divination [from Lat. *divina'tio*, deriv. of *divina're*, prophesy, have divine (*divi'nus*) foresight]: the art of foretelling events by superstitious experiments, etc., by observing the flight of birds, the planets, clouds, and also by the alleged influence of spirits. Among the ancient Romans divination was practiced in various forms, and is supposed to have originated among the Etruscans. The Israelites were forbidden by the law of Moses from performing divination of any kind. Among the ancient Greeks divination was extensively practiced, but it flourished especially in Chaldæa and Egypt. It was not confined to ancient races, however, nor to the East, for throughout the Middle Ages various arts of divination were commonly practiced in Europe. See Astrology, Horoscope, and Augur.

Divine Right of Kings: the doctrine, probably of very ancient origin, that a monarch was the immediate representative of Deity, by whom alone he could be held responsible for his actions. It would appear that the idea was gradually developed out of the principle of authority that prevailed in the Roman Catholic Church, the power of whose rulers was derived from above, and we find the divine authority of the civil magistrate asserted throughout the Middle Ages. In the great papal-imperial struggle the divine nature of the emperor's authority was maintained by Ghibelline writers, and Dante's *De Monarchia* reveals the dream of a new world emperor ruling by the grace of God, but the idea was not systematically advocated till the time of the Stuarts in England. The most complete exposition of the theory is to be found in Sir Robert Filmer's *Patriarcha*. Hobbes and other prominent writers supported it. Among its opponents were Milton and Algernon Sidney.

Revised by F. M. Colby.

Diving-bell: a hollow, bell-shaped chamber, open at the bottom, used by divers to descend into deep water for the purpose of conducting various subaqueous works or explorations. A kind of kettle is said to have been used by divers in the time of Aristotle. John Taisnier (b. 1509) makes in his works the earliest mention of the practical use of the diving-bell in Europe. In 1665 it was used to raise portions of the Spanish Armada. Though of clumsy dimensions and imperfect in the manner of supplying air, it was similar in construction to those of the present day. Dr. Halley's plan for supplying fresh air was introduced about 1715. His diving-bell consisted of a wooden chamber open at the bottom, where it was loaded with lead to keep it perpendicular in its descent. Light was admitted through glass set in the upper part. Air was supplied by means of a hose attached to casks filled with air and weighted with lead, which were let down lower than the bell. In the year 1779 Smeaton first applied the diving-bell to engineering purposes, and in 1788 he contrived to supply it with air by the use of the force-pump. He constructed a diving-bell of cast iron, shaped like a square chest, its greatest thickness being at the lower part, that it might not overturn. It sinks by its own weight, and affords room for two men, being 4½ feet long, the same in height, and 3 feet wide. This construction of the diving-bell gives those within it no power to raise or sink it. The blows of a hammer on the inside of the bell can be heard by those above the water, and in this manner the divers communicate with the assistants by a series of concerted signals. On account of the cumbrousness of this apparatus, it is little used except for heavy works of subaqueous engineering. For most operations carried on beneath the water a submarine armor or diving-dress is employed.

Diving-dress: a waterproof dress worn by divers, enabling them to walk and work under water. An aquatic armor, consisting of a leather dress and a helmet, is described in Schott's *Technica Curiosa*, published in 1664. An india-rubber cloth diving-dress was invented subsequently, with a metal helmet having in front pieces of plate-glass. Attached to the helmet are two tubes—one to admit fresh air in the same manner as for the diving-bell, the other to carry off the waste air. Leaden weights are attached to the diver, enabling him to descend and walk about. Communication can be carried on with those above by means of a cord running between the diver and the attendants. The diving-dresses in use at present make the diver independent of any connection with persons above the water. They are elastic and hermetically closed. The diver carries upon his back a reservoir containing air compressed to thirty or forty atmospheres, which is supplied to him for breathing by a self-regulating apparatus at a pressure corresponding to his depth. When he wishes to ascend, he simply inflates his dress from this reservoir. For full information see F. A. P. Barnard's *Report on the Paris Exposition of 1867*.

Divining Rod (in Lat. *virgula divina*): a Y-shaped or forked branch of wood, usually cut from a tree; sometimes artificially made, or a metallic rod similarly shaped; by which, according to the belief of the vulgar, water or minerals hidden under ground may be discovered. The operator grasps a prong in each hand, holding the rod before him as he walks, and when the exact spot is reached the rod twists suddenly, pointing to it. The superstition is one of very great antiquity. In Europe the rod used for finding water is usually a branch of the rowan tree; in the U. S. it is generally cut from the witch-hazel, or from a fruit-tree.

Divinity: See Theology.

Divisibility: the capacity of being separated into parts. The question whether matter can be infinitely divided or not has often been discussed by philosophers. The subdivision of matter in nature is beyond calculation, nor can it be appreciated by the senses. A tube of glass has been drawn out by the blowpipe to the fineness of a silk fiber, still preserving the form of a tube. In the gilding of buttons five grains of gold, applied as an amalgam with mercury, are allowed to each gross, so that the coating left must amount to the 110,000th part of an inch in thickness. A single grain of blue vitriol will tinge 5 gal. of water. The divisibility of matter is best illustrated in the case of odors. The particles which impress the sense of smell must fill the whole atmosphere for hundreds of cubic feet, and yet a grain of musk may perfume a large apartment for years with scarcely a sensible loss of weight. See CHEMISTRY.

Division: one of the four fundamental operations of arithmetic, its object being to find out how many times one number is contained in another. The dividend is the number to be divided; the divisor, the number of parts into which it is to be divided, the value of one of these parts being the quotient; or the divisor may be one of these parts, and the quotient the number of them in the dividend. Division is an inverse process, whose effect is annulled by the direct operation of multiplication. It is necessary in dividing a number to have recourse to tentative processes, suggested by previous knowledge, and the accuracy of the procedure may be tested by multiplication.

DIVISION in logic is the enumeration of the species which make up a given genus; thus tree is divided into oak, elm, etc.

DIVISION in military language signifies—1, two or more brigades under a general officer; 2, two guns of a battery of artillery, with their equipment, etc.; 3, two companies of a battalion arranged in column of two companies.

DIVISION in music is the separation of the interval of an octave into a number of lesser intervals.

Division of Labor: in political economy, the plan by which a mechanic or laborer, instead of finishing the whole of any piece of work, is kept employed upon one special department of that work. Many persons are in some trades employed in turning out a piece of work which would formerly have been finished by one man. The first result of the division of labor is the great increase of production, for ten men, each employed upon a special branch of work, will turn out more and much better work than the same ten men would do if each began and finished an entire piece of mechanism. It is objected, on the other hand, that the division of labor tends to diminish the versatility and excellence of individual workmen, and the force of this objection is felt in times of industrial depression, when highly specialized labor can not readily flow into other channels. Division of labor is extending with the advance of civilization. Even the learned professions are influenced by it. Lawyers more and more devote themselves to particular departments of their professional work. Medicine is becoming divided into specialties. No one man is equally expert in every branch of a great science like chemistry, some giving their attention, for example, to organic chemistry, some to toxicology, others to analysis, etc. The general result will undoubtedly be beneficial to society.

Divorce [O. Fr. *divorce*: Ital. *divorzio* < Lat. *divor'tium*, separation, divorce, deriv. of *diver'tere*, separate, turn aside]: the dissolution of a marriage by a court of law, or, in some cases, by a legislative or parliamentary act. In heathen nations divorces have generally taken place at the will of the parties concerned, and even the ancient Romans, during the later period of the republic and under the emperors, allowed the greatest license in this respect. Divorce existed to some extent among the Greeks, more especially at Athens. Easy divorce, which had prevailed among the Hebrews, was restrained and discouraged, though not done away with, by the laws of Moses. Among Christian nations marriage is for the most part looked upon as possessing at once a religious and a civil importance. The Roman Catholic Church denies the possibility of divorce, although there are cases in which, according to the canon law, the union is declared to have been illegal from the first, and in reality never to have existed at all. In English law the word divorce has been applied to two distinct classes of cases—one where the marriage is by competent authority declared to be void from the beginning; the other, where it is conceded to have been valid in its origin, but for some cause subsequently arising it is dissolved or suspended. The first instance is sometimes termed a case of nullity—the second, a case of dissolution or of judicial separation. Sentences of nullity and of judicial separation, not amounting to dissolution, might take place in the ecclesiastical courts. A marriage could only be dissolved by act of Parliament. In the year 1857 an act was passed establishing the Court for Divorce and Matrimonial Causes, in which was vested the power previously exercised by the ecclesiastical courts as well as by Parliament. In the U. S., as there are no ecclesiastical courts in the English sense, matrimonial jurisdiction is established by statutes in the different States, enumerating the causes of divorce, which are by no means uniform. These, as a rule, are more numerous in the Western States than in the Eastern. The power to grant divorces is in general exercised by courts having equity jurisdiction, though it exists in the legislature, unless taken away by the State constitution. This is the case in a number of the States, and among them New York.

Revised by T. W. DWIGHT.

Dix, DOROTHEA LYNDE: philanthropist; b. at Worcester, Mass., about 1794; was a school-teacher in her youth, but about 1830 inherited from a relative a modest competence. She devoted much time to the work of ameliorating the condition and treatment of prisoners, lunatics, and paupers, for which purpose she visited nearly every State of the Union, efficiently promoting the establishment of asylums for lunatics in New York, Pennsylvania, North Carolina, Illinois, Indiana, and other States. By petitions to Congress she induced that body in 1854 to appropriate 10,000,000 acres of public land for the endowment of hospitals for the insane, but President Pierce vetoed the bill, chiefly on the ground that the general Government has no constitutional power to make such appropriations. During the civil war she rendered service in the hospitals near Washington. Besides children's books, tracts, etc., she published anonymously *The Garland of Flora* (1829) and *Prisons and Prison Discipline* (Boston, 1845). D. in Trenton, N. J., July 19, 1887.

Dix, JOHN ADAMS, LL. D.: statesman and general; b. at Boscawen, N. H., July 24, 1798. He entered the army in 1812, and became a captain in 1825, but soon resigned and studied law. He removed to Cooperstown, N. Y., joined the Democratic party, and was elected Secretary of State in 1833. After he had passed several years in private life, he was elected to the Senate of the U. S. in 1845, to fill a vacancy. He advocated in the Senate the principles of the Free-soil Democrats, whose candidate for Governor he was in 1848. He was chairman of the Senate committee on commerce. His term expired in Mar., 1849, and he was then succeeded by Mr. Seward. Having visited various countries of Europe, he published a *Summer in Spain and Florence* (1855). He was Secretary of the Treasury of the U. S. from Jan. to Mar., 1861, and as such issued the famous order: "If any one attempts to haul down the American flag, shoot him on the spot!" referring especially to the captain of a revenue cutter of New Orleans who had refused to obey orders. In May, 1861, he became a major-general of volunteers, and in July, 1862, took command of Fortress Monroe. He was appointed commander of an army-corps in Sept., 1862, and ascending York river in June, 1863, cut Gen. Lee's communications. He was minister to France in 1867–68, and chosen president of the Union Pacific R. R. In 1872 he was elected Governor of New York by the Republicans. D. in New York city Apr. 21, 1879.

Dix, MORGAN, S. T. D., D. C. L.: an Episcopalian divine, son of Gen. J. A. Dix; b. in New York city Nov. 1, 1827; graduated at Columbia College 1848, and at the General Theological Seminary 1852; became assistant minister in Philadelphia (St. Mark's) 1853; of Trinity church, New York city, 1855; assistant rector of Trinity 1859; rector 1862. He is also president of the standing committee of the diocese of New York, vice-president of the New York Protestant Episcopal public school, and holds various other offices. Among his works are *Commentaries on Romans* (New York, 1864) and on *Galatians and Colossians* (1866); *Lectures on Pantheism* (1865); *Lectures on the Two Estates, that of the Wedded in the Lord, and that of the Single for the Kingdom of Heaven's Sake* (1872); *The First Prayer-book of King Edward VI.* (1881; 4th ed. 1885); *The Calling of a Christian Woman and Her Training to Fulfill it* (1883; 6th ed. 1885); *Memoir of John A. Dix*, his father (2 vols., 1883); *Gospel and Philosophy* (1886); *The Sacramental System* (1893).

Dixon: town; on railway: Solano co., Cal. (for location of county, see map of California, ref. 7–C); 21 miles W. by S. of Sacramento. Pop. (1890) 1,082; (1900) 783.

Dixon: city and railway center: capital of Lee co., Ill. (for location of county, see map of Illinois, ref. 2–E); situated on Rock river; 98 miles W. of Chicago, and 40 miles E. of Clinton, Ia. Dixon has a normal school, business college, flouring-mills, milk-condensing factory, plow-factory, and three shoe-factories. Pop. (1880) 3,658; (1890) 5,161; (1900) 7,917. EDITOR OF "TELEGRAPH."

Dixon, JAMES, D. D.: Methodist minister; b. at King's Mills, Leicestershire, England, Oct. 28, 1788; became a preacher in 1812, and occupied important pulpits in his denomination; was the president of its conference in 1841, and its delegate to the American Methodist General Conference in 1848. He wrote, besides other works, *Methodism, its Origin, Economy, and Present Position* (London, 1843) and *Methodism in America* (1849). D. in Bradford, Yorkshire, Dec. 28, 1871. See his *Life* by his son R. W. Dixon (London, 1874).

Dixon, JAMES MAIN, M. A., F. R. S. E.: teacher; b. at Paisley, Scotland, Apr. 20, 1856; educated at Ayr Academy and at Edinburgh and St. Andrews Universities. He was Tyndall Bruce Scholar and Tutor in Philosophy, St. Andrews, 1879; Professor of English Literature in and secretary of the Imperial College of Engineering, Tokio, Japan, 1886–92, and became Professor of English Literature, Washington University, St. Louis, Mo., 1892. He has published a *Dictionary of Idiomatic English Phrases* (London, Edinburgh, and New York, 1890) and various papers in the *Transactions of the Asiatic Society of Japan*.

Dixon, WILLIAM HEPWORTH: author and critic; b. in Manchester, England, June 30, 1821, of Dissenting parents; settled in London in 1846, and contributed to the *Daily News*. His articles on *London Prisons*, in book form, in 1850, were the precursors of Mayhew's inquiries into the condition of the London poor. In 1849 he published a *Life of John Howard*, which passed through three editions in one year. In *William Penn, an Historical Biography* (1851), he replied to the animadversions of Macaulay on the character of the philanthropical Quaker. He was the chief editor of the *Athenæum* from 1853 till 1869. Among his other works are a *Personal History of Lord Bacon* (1861); *The Holy Land* (1865); *New America* (1867); *Spiritual Wives* (1868); *Her Majesty's Tower* (4 vols., 1869–71); *Free Russia* (2 vols., 1870); *British Cyprus* (1879); *Royal Windsor* (1878–80). D. in London, Dec. 27, 1879.

Dixon's Entrance: a strait on the west coast of North America, 100 miles long. It separates Queen Charlotte island from the Prince of Wales archipelago.

Djemil Pasha, jem-eel'pa-shaa', or **Jemeel Pasha**: Turkish statesman; b. at Constantinople in 1827; the eldest son of Resheed Pasha. He was educated at Paris and London, and was for many years a public officer, especially in diplomatic affairs. In 1866 he was appointed ambassador to Paris. D. Sept. 22, 1872.

Djezzar, or **Jezzar** (the butcher): surname of ACHMED PASHA; Turkish soldier and governor; b. in Bosnia, 1735; left his country to escape punishment for a crime, and after many hardships was sold as a slave at Cairo to Ali Bey, in whose service his success as an assassin of his master's enemies won for him the title of butcher. But his reluctance in one instance to commit murder cost him Ali's favor, and he soon had to flee the country. He then sought service in Syria, where his boldness and duplicity exalted him above his rivals and brought him to the favorable notice of the Sultan, who made him Pasha of Acre with the mission of crushing out the independence of the Druses, a work that he executed with savage effectiveness. His violence to the French consul and residents at Acre was one of the ostensible grounds for Napoleon's invasion of Syria in 1799. Though alarmed by the victories of the French, Djezzar was induced by Sir Sidney Smith to attempt the defense of Acre. The result was a serious check to the French arms. A three months' siege, in the course of which several assaults were made, proved unavailing; a pestilence broke out among the besiegers, and the threatened attack of the English on Egypt caused their recall. D. at Acre, 1804.

F. M. COLBY.

Djinn: See JINN.

Dmitrof, d'mĕĕ-trŏf': town of Russia; government of Moscow; 40 miles N. of Moscow (see map of Russia, ref. 7–E). It has seven churches, a college, and manufactures of cotton and silk goods. Pop. 9,206.

Dnieper, nee'per [the *Borysthenes* of the Greeks, the *Danapris* of the Romans, the *Uzi* of the Turks, the *Elice* of Visconti's map (1381), the *Lerene* of Contarini (1437)]: a river of Russia, and, next to the Volga and the Danube, the greatest and most important river of Europe; rises in the government of Smolensk, at the foot of the Valdai Hills, near the sources of the Volga and the Dwina, in lat. 55° 52′ N. It flows nearly southward to Kief, below which its direction is southeastward to Ekaterinoslaf. It afterward runs southwestward, and enters the Black Sea on the north side. Its length, including windings, is about 1,330 miles. The greater part of it is navigable, but some rocky rapids occur below Ekaterinoslaf, where the river has to make its way through the granitic offshoots of the Carpathian Mountains. At Kief the river is free of ice 267 days in the year; at Ekaterinoslaf, 274; and at Kherson, 280. The fisheries are insignificant in the upper part of the river, but very important in the estuary. From the mouth of the Berezina the Dnieper will be the southern part of the ship-canal route building (1899) from Riga on the Baltic to the Black Sea. (See SHIP-CANALS.) Its principal tributaries are the Berezina, the Pripet, the Merea, the Sozh, the Borona, and the Desna, all of which are navigable.

Dniester, nees'ter (anc. *Tyras*, afterward *Danaster*): a river of Europe; rises in the Carpathian Mountains in Galicia, and flows southeastward into Russia. It forms the boundary between Bessarabia on the right and Podolia and Kherson on the left, and enters the Black Sea near Akerman, about 30 miles S. of Odessa. Its total length is about 760 miles. Its navigation is difficult; besides frequent shallows, the Yampols rapids, caused by a granitic spur of the Carpathian Mountains, obstruct the course. For ordinary river-craft the passage of these rapids has been made possible, though not free from danger, by an artificial channel.

Doab, or **Duab**, doo-aab' (i. e. two waters): in Hindustan, a tract between two rivers, especially that between the Ganges and the Jumna. This doab extends from Allahabad to the base of the Himalayas, a distance of 500 miles or more.

Doane, GEORGE WASHINGTON, D. D., LL. D.: bishop and poet; b. at Trenton, N. J., May 27, 1799; graduated at Union College in 1818; ordained as an Episcopalian clergyman in 1821; preached in New York city, and chosen Bishop of New Jersey in 1832. He published a volume of poems (1824) and several works on theology. D. in Burlington, N. J., Apr. 27, 1859. See his *Life and Writings* (4 vols., New York, 1860).—One of his sons, WILLIAM CROSWELL DOANE, D. D., LL. D. (b. in Boston, Mass., Mar. 2, 1832), also an Episcopalian clergyman, was on Feb. 2, 1869, consecrated Bishop of Albany.—A second son, GEORGE HOBART DOANE (b. in Boston, Mass., Sept. 5, 1830), became a Roman Catholic priest; was in 1873 appointed vicar-general of the diocese of Newark, and in 1886 received the title of monsignor.

Doane, THOMAS: See the Appendix.

Dobbin, JAMES COCHRANE: politician; b. at Fayetteville, N. C., in 1814; graduated at the University of North Carolina 1832; admitted to the bar 1835; became a member of Congress in 1845, and was appointed Secretary of the Navy by President Pierce in 1853. D. Aug. 4, 1857.

Dobbs Ferry: village; Westchester co., N. Y. (for location of county, see map of New York, ref. 8–J); on railway and on Hudson river; 20 miles N. of New York city. It has manufactories of gas-burners and piano-stools, and is a place of summer residence. Here are remains of military works erected during the Revolutionary war. Pop. (1890) 2,083; (1900) 2,888.

Dobell', SYDNEY: poet; b. at Cranbrook, Kent, England, Apr. 25, 1824; a wine-merchant's son. He began his literary career by *The Roman*, a poem (1850). Among his other works are *Balder* (1854); *England in Time of War* (1856); and *England's Day* (1871). His poems exhibit a mixture of the philosophical and poetical spirit. D. Aug. 22, 1874. See his *Life and Letters* (2 vols., 1878).

Döbereiner, JOHANN WOLFGANG: chemist; b. near Hof, Bavaria, Dec. 15, 1780; studied at Jena, where he became in 1810 Professor of Pharmacy and Chemistry, a position which he held until his death. He was an intimate friend of Goethe, by whom he was aided in his investigations. He is best known as the discoverer of the combustibility of platinum and of the so-called Döbereiner's lamp, which is

ignited by directing a jet of hydrogen upon a piece of platinum sponge. D. at Jena, Mar. 24, 1849. Among his writings are *Zur Gärungschemie* (1822); *Beiträge zur physikalischen Chemie* (1824–36); and *Zur Chemie des Platins* (1836).

Dobrizhoffer, Martin: Jesuit missionary; b. at Gratz, Styria, Sept. 7, 1717. He entered the Jesuit Society in 1736, and in 1749 was sent as a missionary to Paraguay, where he remained until the expulsion of the Jesuits from South America in 1767. At first he taught in the long-established Guarany missions; later he was sent to the western side of the Paraguay, where for seven years he labored among the savage Abipones Indians. Returning to Europe in 1767 he lived in Vienna, Austria; the Empress Maria Theresa often sent for him that she might hear him recount his adventures. In 1784 he published in Latin an account of Paraguay, and especially of the Abipones, with the title, *Historia de Abiponibus, Equestri, Bellicosaque, Paraquariæ Natione*, etc. This was republished the same year in German, and there is an English translation, by Sara Coleridge, entitled *An Account of the Abipones* (3 vols. 8vo, London, 1822). This is one of the most interesting books of travel ever published, and gives by far the best account of a tribe which is now extinct. D. in Vienna, July 17, 1791.

Herbert H. Smith.

Dobrowski, dō-brov'skeĕ, Joseph: philologist; b. near Raab, Hungary, Aug. 17, 1753. He was liberally educated, joined the Jesuits, and distinguished himself by his researches into the language and literature of the Slavonic nations. His most important works are a *Grammar of the Bohemian Language*; a *History of the Bohemian Language and Literature* (1792); and a *German and Bohemian Dictionary* (2 vols., 1802–21). He also published a number of minor essays. D. at Brunn, Jan. 6, 1829.

Dobrudscha, or **Dobrujda**, dō-broo'jăă: the southeastern portion of Roumania; separated from Moldavia and Wallachia by the Danube, and bounded E. by the Black Sea. It belonged to the Turks until 1878. Pop. about 175,000, consists of Bulgarians, Cossacks, Tartars, Armenians, Turcomans, Greeks, and Jews.

Dobson, Henry Austin: poet; b. in Plymouth, England, Jan. 18, 1840. He was educated as a civil engineer, but since 1856 has held a clerkship in the Board of Trade. He has successfully domesticated old French stanza forms in English verse, and is unexcelled as a writer of *vers de société*. Author of *Vignettes in Rhyme* (1873); *Proverbs in Porcelain* (1877); *At the Sign of the Lyre* (1885). Mr. Dobson has also done much to revive a taste for the English art and literature of the eighteenth century by studies of *Hogarth* (1879); *Thomas Bewick* (1884); *Sir Richard Steele* (1886); *Oliver Goldsmith* (1887), etc. H. A. Beers.

Doce, dō'sā: a river of Southeastern Brazil; rising in the Serra da Mantiqueira of Minas Geraes, and flowing with a general easterly course, through Espirito Santo, to the Atlantic; length from the junction of the rivulets Piranga and Gualacho, which are regarded as the sources, 462 miles. It is navigable for small steamers to Sousa, 138 miles. The basin of the Doce embraces over 20,000 sq. miles, largely of forest land, much of which is very fertile, but has not yet been utilized. The Doce valley has long been a principal source of the rosewood supply of Brazil. The upper river flows through a wild mountain region. See Hartt, *Geology and Physical Geography of Brazil*, 1870, p. 86, *et seq.*

Herbert H. Smith.

Doce'tæ [Gr. Δοκηταί, deriv. of δοκεῖν, hold opinion]: a sect which arose in the first century, practically denying the incarnation of God in Christ. Some of the Docetæ affirmed the body of Christ to be a mere deceptive appearance, others only denied its fleshly character, but the object of both was to render the conceptions of Christ's life on earth less gross and material than the orthodox view seemed to them to present. Docetism was one of the earlier forms of Gnosticism (*q. v.*).

Dock: a perennial herbaceous plant of the family *Polygonaceæ* and genus *Rumex*, found chiefly in temperate climates; has large ovate or lanceolate leaves, and greenish flowers in panicles. It increases rapidly from the seed, and having long tap-roots is a very troublesome weed. The roots of several species are valued in medicine for their astringent properties; they are also used in dyeing. The yellow dock (*Rumex crispus*) is esteemed in the U. S. as an alterative.

Docket [apparently deriv. of verb *dock*, cut short, as an abridgment, summary]: a summary or abridged entry of a proceeding on a piece of paper or parchment. Exemplifications of decrees in chancery, fiats in bankruptcy, and other instruments are thus *docketed* for purposes of reference. The word docket is frequently employed to designate an abridged entry in a book, as in the case of judgments of courts, in order to make them a lien upon land, and also a book of records. Docket also denotes a list or calendar of causes ready for hearing or trial, prepared for the use of courts.

Revised by F. Sturges Allen.

Docks: artificial basins for the reception of ships. *A wet dock* is a large basin in which the water is kept at a certain level by means of walls, so as to be unaffected by tidal changes, in order to facilitate the loading and unloading of cargoes. *A dry dock* is intended for the repairing and examination of ships, the water, after the entrance of the vessel, being removed by pumps or other means.

In ports where vessels would be naturally much exposed during rough weather, or where the changes in the tide are very great, the necessity of secure and well-sheltered docks or artificial basins, in which ships may be safely moored and kept at one level, is especially manifest. In the northern parts of Europe the rise and fall of the tides are so great that every port which has any pretensions to a first-class mercantile harbor is necessarily supplied with one or more wet docks; at most of the ports of Great Britain, and especially at those of Liverpool and London, docks have been constructed on a truly magnificent scale.

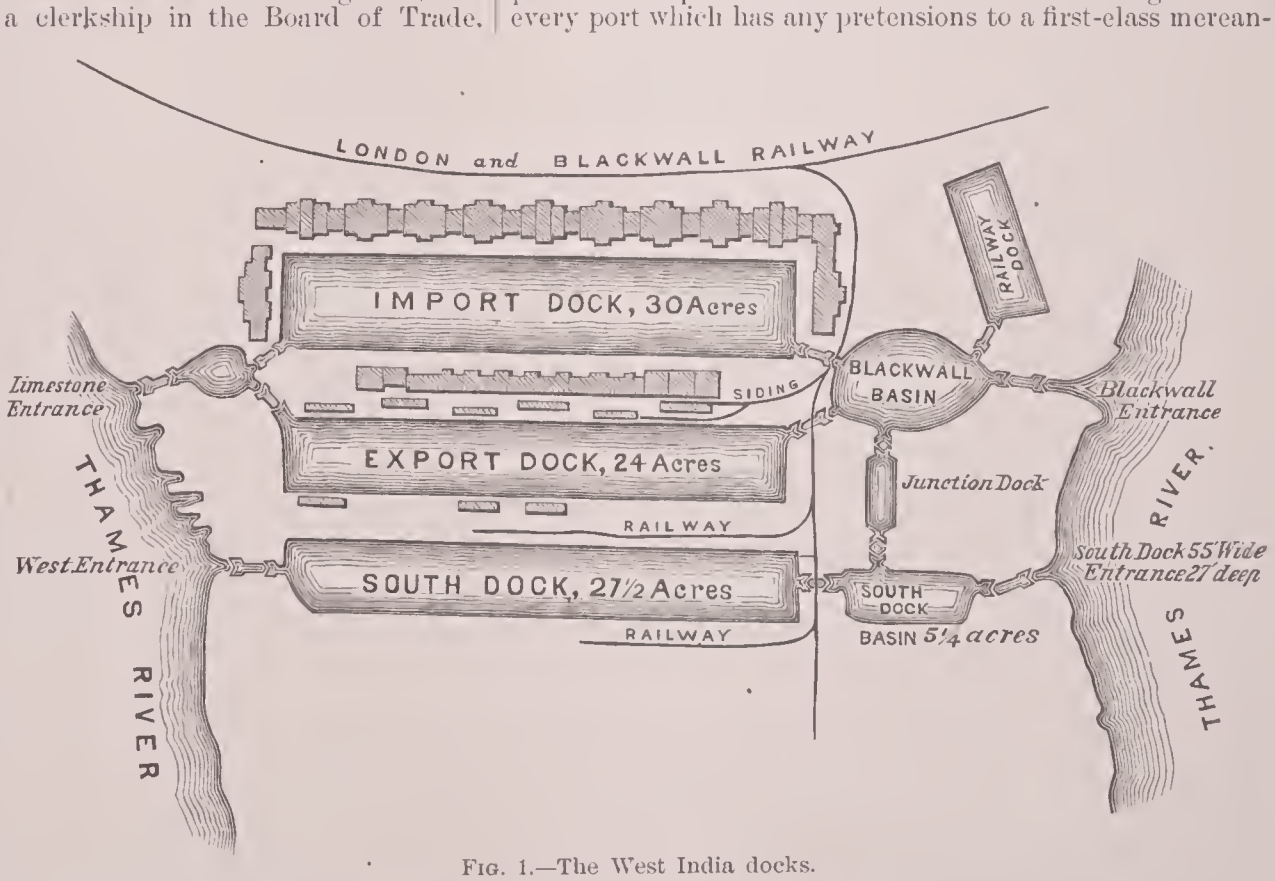


Fig. 1.—The West India docks.

Notwithstanding the obvious importance of wet docks to the vast trade of London, it was not until a few years previous to the beginning of the nineteenth century that plans for docks on anything like an adequate scale were, at the request of a parliamentary committee, submitted by Messrs. Telford and Douglas, among other plans for the improve-

ment of the port of London. The act authorizing the construction of the West India Docks was passed in 1799; work was begun in Feb., 1800, and in 1802 they were so far completed that a homeward-bound vessel entered them.

These, the first docks of London, with their entrances and basins, extend across the isthmus (at low water) of the island formed by the Thames on the Middlesex side of the river, and called the Isle of Dogs. They originally consisted of an Import Dock containing an area of 30 acres, and an Export Dock with an area of 24 acres, connecting at both ends by basins and locks with the Thames. They were constructed of brickwork and timber. There was a canal on the south side of the docks, which was subsequently converted into a dock called the South Dock, the retaining walls of which are 34 ft. 10½ in. in height from the bottom of the dock to the top of the coping, where the width is 11½ feet, spreading downward with a batter of 1 in 24: the face and back of the wall are of brick, the former 3 ft. 4½ in., the latter 18 inches thick, connected by vertical transverse walls 2 ft. 3 in. in thickness, and placed 10 feet apart, the pockets thus formed being filled with concrete, upon a foundation of which, 3¼ feet in thickness, the wall stands. The bottom of the dock is covered throughout with a layer of puddle 18 inches in thickness. On the north side are sixteen jetties, projecting into the dock, of timber, 130 feet in length, furnishing accommodations for thirty-two vessels, and opposite each jetty is a buoy for mooring vessels. The area of the South Dock is 27½ acres.

The cost of the South Dock, with the machinery, railway extension, dock-basins, warehouses, etc., was $2,850,000. It will be seen from the plan that an incoming vessel can pass directly into the Import Dock, unload her cargo, and then, without being locked out into the Thames, when the tide permits may pass into the Export Dock to receive her outward-bound cargo.

The East India Docks, which are a short distance to the eastward of the West India, were at first intended exclusively for ships in the East India trade, but are now open to vessels from all parts. Their area is 27 acres, exclusive of entrance-basins, and their depth of water is never less than 23 feet. They belong now to the same company as the West India Docks, and have magnificent warehouses for tea, indigo, drugs, spices, etc., attached to them.

The London, the St. Katherine, and the Victoria London Docks, also on the north side of the Thames, are under the control of one company. The London Docks have a water-area of 34 acres, the St. Katherine Docks a water-area of 11 acres, and the Victoria London Docks, situated immediately below the East India Docks, have an area of 74 acres in the inner dock alone, exclusive of 16 acres in the tidal basin. The depth of water in the inner dock varies from 24½ feet to 26½ feet. The entrance to this dock from the Thames is by means of a lock 320 feet in length, 80 feet in width, and with a depth of water on the sill of 28 feet. The jetties, with the sides of the dock and of the basin, provide a length available for quay-room of nearly 3 miles.

On the Isle of Dogs, S. of the West India Docks, are the Millwall Docks, comprising two basins, one having a water-area of 25 acres, the other of 10½ acres. The Surrey Commercial Docks, intended for ships with bulky commodities, are upon the south side of the Thames, and have a water-area of 176 acres.

These various docks have undergone extensions and improvements, to keep pace with the requirements of commerce, the latest addition being the Albert extension of the Victoria Dock, opened in 1880, and affording an additional water-area of 70 acres. It is one of the most complete docks in the world. The Tilbury Docks opened in 1885 provide 76 acres. The total water-area of the north side docks exceeds 465 acres, and the Surrey and Commercial docks, on the south side, cover 330 acres, giving an aggregate of over 795 acres. Including the land contiguous to the quays there are over 2,000 acres devoted to terminals.

The docks are also provided with cranes and other appliances, worked by steam or hydraulic power, for the rapid transfer of cargoes.

The dock establishments of Liverpool are not excelled in extent and arrangement by those of any port throughout the world. Though the number of vessels belonging to this port is less than that of London, yet the fact that they can not lie with safety or ease in the Mersey on account of its rapid current and exposed situation, and the great rise and fall of the tides (21 feet at neap and 31 feet at spring tides), require the dock accommodations to be of sufficient extent for the entire trade of the port: while at London the Thames affords a secure and convenient berth for a great number of vessels.

The Liverpool docks have, on the side next the river, a sea-wall of 6¼ miles in extent, which, when considered in connection with the obstacles to be overcome, is one of the greatest works of modern times. In most cases docks are formed by excavations made on the bank of the river, but at Liverpool they have been formed in the river itself by inclosing within the wall referred to a portion of the beach of the Mersey, and afterward excavating the part thus reclaimed to a proper depth. The wall is 11 feet in thickness and 40 feet in height from the foundation, the more modern parts being faced with granite. There are between thirty and forty docks, having a water-area of 363½ acres, exclusive of 19 acres of entrance-basins. The quay-space is over 24 miles. Most of the docks have a separate entrance from the Mersey, and communicate with each other, so that ships may pass from one to another without the necessity of being locked out into the river and back again into the docks. They are also connected with the different railways entering the town, and by a series of locks with the Leeds and Liverpool Canal.

The new North Docks are estimated to cost $20,500,000. They will include the Langton Dock, of 18 acres; the Alexandra Dock, of 44 acres; and the Hornby Dock, of 17 acres.

Large steamers of an aggregate tonnage of 34,197 have been docked and cleared in one tide of 2⅔ hours.

The whole of this immense dock estate is vested in the Mersey Docks and Harbor Board, who enforce strict rules for the maintenance of good order and prevention of fire and depredation. Every precaution is taken to prevent the injury of the docks from the accumulation of mud by the use of steam-dredging machines. The income of the Mersey Docks and Harbor Board for 1889 was $4,950,000 on 9,292,000 tons. The revenue of this board, after paying expenses and interest on money borrowed, is applied to the reduction of the dock rates.

The landing-stage is 2,063 feet long and from 80 to 110 wide, covering 4 acres. It is supported on 158 boiler-plate pontoons, 80 by 10 by 7 feet, and cost $2,350,000. Seven hinged bridges and one floating roadway lead to it. The traffic amounts to about 2,500,000 passengers per year.

There are 25 graving-docks, with a total floor length of 12,490 square feet, costing $4,700,000.

The warehouses are very extensive, covering 93 acres, with sheds sheltering 94 acres more, while their cost has been $16,660,000.

Birkenhead, on the Mersey, directly opposite to Liverpool, has a water-area of 165 acres of docks and subsidiary basins; among them are two large docks, one of 52, the other of 59 acres. The quay-space is betweeen 10 and 11 miles in length. At Southampton there are docks surrounded by quays and bonded warehouses, and provided with powerful shears for shifting boilers, heavy machinery, masts, etc. Among other ports of the British islands which possess large docks may be named Bristol, Hull, Grimsby, Barrow-in-Furness, Sunderland, Glasgow, Leith, Newcastle-on-Tyne, Tyne, Cardiff, and Belfast.

At Havre, where the rise of the tides is from 20 to 27 feet, there are capacious docks. At Antwerp, where in 1803 Napoleon I., who intended to make it a great naval establishment, undertook the construction of docks on a grand scale, new and convenient ones with warehouses have been opened. At Bremen and Amsterdam docks have been constructed and improved.

The port of Cardiff is celebrated for its large docks. It is located on the river Taff, a short distance from the Bristol Channel, where the spring tides rise 37½ feet and the neap 29; consequently the flats, which are bare at low water, may be readily traversed at high tides. The town is of recent origin. In 1839 the West Bute Dock was built, covering 20 acres, at a cost of about $100,000 an acre. The opening of the Taff Vale Railway in 1841 so stimulated commerce that in 1851 the East Dock was commenced and opened in 1855, although not finished until 1859. It covers 46 acres, but was soon found to be too small, and the Roath Basin was opened in 1874, covering 12 acres. Another large dock connecting with this basin will extend the total area to about 113 acres. The West Dock is only 200 feet wide, while the East Dock is from 300 to 500 feet in width, the Roath Basin 550, and the New Basin 600 feet.

These basins are supplied with fresh water from the Taff. The quays are fully supplied with coal tips or staiths, 13

balance tips at the West Dock, 12 balance and 8 hydraulic tips at the East, 8 at the Roath Basin, and one at the entrance-channel. One movable hydraulic 25-ton crane is also used, and over 12,000,000 tons of coal can be shipped here each year. The gates, bridges, and machinery are all operated by hydraulic power. There are also 8 graving-docks, varying in length from 220 to 600 feet. The tonnage has increased so rapidly as to give rise to rival docks at Penarth and Barry, which are also growing rapidly, being thoroughly equipped with the best modern appliances.

In many ports throughout the world—such, for example, as that of New York, where the harbor is naturally protected, and as also in the Mediterranean, where the rise and fall of the tides is so small as not to obstruct the loading and unloading of ships—wet docks are not an absolute necessity to commerce.

But, though in many cases they may be dispensed with, all first-class ports need dry docks for the examination and repair of those parts of a ship which are usually immersed in water. Dry docks may be separated into two classes—the *stationary dry dock*, to which the name *graving-dock* is generally applied, and *the floating dock*.

In ancient times, where there was no rise and fall of the tides, vessels were hauled up on the beach and "careened"; where the tides permitted they were grounded at high water, so as to be exposed at low. Sometimes the heaving-down plan was adopted; this was to attach ropes to the heads of the masts of the vessel and to the mooring rings of a quay, or to the deck of another vessel, so as to haul the ship over into a nearly horizontal position on the water, the ballast or weights being removed or shifted. It was while undergoing this very dangerous operation that the Royal George foundered at Spithead in 1782, with 600 persons on board.

This method was supplanted by the *graving-dock*, generally constructed of stone, though sometimes of timber, and usually of such dimensions as to contain only one vessel at a time. The sides are formed in steps or altars, so that the form of the dock is somewhat similar to that of the vessel which it is to contain, but sufficient space is left around it to enable the workmen to get at every part of the bottom of the vessel and to afford sufficient light for their work. The entrance is closed by gates, which open sideways, like a lock, or fall upon the bed of the entrance, or by caissons; the latter, since the introduction of iron for ship-building purposes admits of their being made of that material, are almost universally adopted for large docks, and have the advantage of affording the means of retaining the water inside the dock as well as of keeping it out, which is of importance where the tide is ebbing rapidly, in allowing time to adjust the vessel before it settles down on the keel-blocks. The vessel is floated into the dock at high water, the gates closed, the sluices opened, and the water allowed to run out with the ebb of the tide, or, where the fall of the tide will not permit, is pumped out, leaving the dock perfectly dry, the vessel being supported on timber struts and shores resting upon the steps already mentioned as forming the sides of the dock.

The U. S. naval graving-dock at Brooklyn, N. Y., was, in its day, one of the finest in the world. At the time of its construction it possessed many features and improvements that were unequaled by any other graving-dock. Owing to the nature of the soil selected for its site, the excavation for the foundation was attended with many obstacles, and afforded opportunity for the display of great engineering skill. This lower soil was an almost impalpable quicksand, becoming semi-fluid when saturated with water; and before the required level for the foundation had been reached springs coming from a great depth burst up through it, rendering necessary measures to overcome it. This was finally done by driving piles into the cavities formed by the springs, on which a flooring of plank was laid; upon this bricks were laid in hydraulic cement, and upon the brick floor concrete masonry, the whole being done with the greatest dispatch; vent-holes for the water were left until the permanent foundations were completed. In this manner the flow of sand was checked.

The gates, of iron, are supported on friction rollers, and, with the machinery for turning them, weigh nearly 200 tons. The caisson is an iron vessel, with keel and stems made to fit the grooves in the masonry at the entrance of the dock. It is 50 feet in length at the keel, and 68 ft. 8 in. in length at the rail; its breadth at the center of the top is 16 feet, at the keel 7 feet. The grooves in the masonry, in which the stems and keel of the caisson fit, are 26 inches in width and 12 inches in depth from the top to the bottom of the side walls and in the floor. By admitting water into the chambers of the caisson it settles into these grooves and closes the entrance; it is removed by pumping out sufficient water to float it clear of the grooves. Its weight is nearly 218 tons, exclusive of ballast. It is used when greater length of dock may be required, when the turning-gates need repair, or to partially relieve the strain upon them. The engine and pumps are of very large capacity, and will

FIG. 2.—Plan of dry dock at Brooklyn navy-yard.

relieve the dock of water in about two hours. In order that the bottom may be dry and free from water, there is a slight inclination in the bottom of the dock, and a gutter is carried across at the lower end, leading into a culvert which passes entirely around the dock, from which the water is constantly pumped. Several flights of steps are provided in the different parts of the dock for the use of the workmen, by which they are enabled to reach any part of the vessel with great facility. The main chamber of the dock is 286 feet in length and 30 feet in breadth at the bottom,

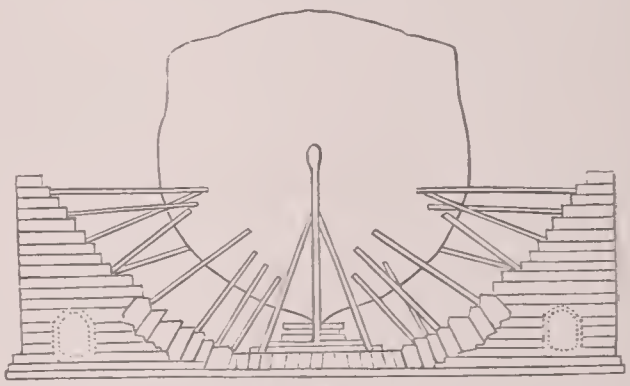

FIG. 3.—Section of dry dock at Brooklyn navy-yard.

307 feet in length and 98 feet in breadth at the top; by using the caisson an additional length of 52 feet may be obtained, giving a total length of 359 feet. The height of the walls is 36 feet, and the sills are 26 feet below high water. The total cost, including all machinery and appurtenances, was about $2,000,000; the work was completed in 1851.

The naval graving-dock at Boston, Mass., built of granite and completed in 1833, is 253 feet in length and 86 feet in width inside the chamber; the turning-gates and the caisson are of timber and composition fastened with copper bolts, the caisson being 60 feet in length, 30 feet in height, and 16 feet in width amidships. The total cost of this dock was about $700,000. The naval graving-dock at Norfolk, Va., is almost precisely similar in style and dimensions to that at Boston, and cost about $950,000.

The masonry dock at Mare island, Cal., has now (1893) been under construction about twelve years, and has cost nearly $3,000,000.

The cost of the construction of graving-docks depends greatly upon the situation selected. At Birkenhead five graving-docks, having an aggregate length of 1,690 feet, were hewn out of the rock at a cost of $430,000. Many of the most successful docks on the Thames have been built of timber and brick at a cost which is trifling by comparison. A heavy item of expense in those places where the fall of the tide is not sufficient to empty the dock is the cost of the large engines and pumps needed to remove the water.

In addition to her magnificent wet docks, Liverpool possesses a large number of graving-docks, there being on the side of the Mersey on which that city is situated no less than sixteen, having an aggregate length of over 1½ miles.

Among the largest graving-docks are the double dock at Brest, 721 feet in length, 92 feet in width, with a depth of 25 feet of water over the sill; and the double dock at Portsmouth, England, 644 feet in length by 80 feet in breadth. Portsmouth has besides nine single graving-docks, the

largest of which is 406 feet in length at the bottom. Devonport has five. Cherbourg eight, Sheerness five, Toulon six, Brest four. There are several on the Thames, and many other ports have one or more. Southampton has three, one of which, the Eastern Dock, is 425 feet in length, with a width of entrance of 80 feet, made, in 1853, of brickwork with Portland copings, and is stated to have cost $260,000.

The largest dry dock on the Great Lakes of North America is located at Detroit, Mich. It was built by the Detroit Dry Dock Company in 1891. The caisson gate is of steel, 79 ft. 5 in. long and 12 feet beam. It contains five 30-inch valves for flooding the dock, which it is estimated will require twenty minutes. The time required to empty the dock is an hour and a half. There are two centrifugal pumps having 30-inch discharge-pipes, operated by two 150 H.-P. Westinghouse engines. The fuel for the three boilers is oil. The dock is founded upon 2,000 piles driven into a fine blue clay and surrounded by a wall of puddle 5 feet thick. The cost was $200,000.

The Simpson dry dock is built of timber. Its inventors claim for it greater economy, freedom from water, facility of access for workmen, and better light and air, due to the great breadth at the coping. The altars have about the size and pitch of an ordinary staircase. The increased area of base due to the splay of the sides is compensated for by the use of timber in construction, and its durability and economy have proven to be so satisfactory that not less than fourteen of them have been constructed on the Atlantic coast. The one at St. Johns, Newfoundland, was built between May 28, 1883, and Dec. 10, 1884. The cost of the two docks at Brooklyn with one set of pumps was $1,283,356, and that for the one at the League island navy-yard, built in 1889–90, was $548,700. This structure is 500 feet in length; 130 in width at top; 50 at bottom; 80 at entrance; 25½ feet depth on the sill, and 32 feet to floor. The dock at Newport News is 600 by 130 feet at top, the dimensions and draught being almost exactly the same as those at St. Johns. It can be emptied in an hour and a half.

A prominent feature of these docks is the gate, which is made of iron or steel plates fastened to a trapezoidal frame, which rests in a groove in the abutment. On the outer edge of the groove there is a heavy semi-cylindrical strip or bead of rubber, which serves to make a watertight joint against the outside. In consequence of the great spread of the abutments, it is only necessary to raise the gate a few inches before it may be floated aside. Its weight at League island, Philadelphia, is about 120 tons. It is 88 feet long on top, 54 on the bottom, 32½ feet high, and has a beam width of 20 feet.

The new dry dock for the U. S. naval station on Puget Sound is to be a modification of the Simpson wooden dock, whereby greater attention is given to the drainage under the floor, which is to be constructed in part of concrete filling between piles, with drain pipes leading to open conduits. It will be larger than any hitherto built in the U. S. The soil is sand, gravel, and clay, with some hard-pan.

The last Brooklyn dock was opened in May, 1890. Its general dimensions are 530 feet long; inside of caisson, 500 feet; 130 ft. 4 in. wide at center on top, and 50 feet at bottom. The entrance is 85 feet wide at top, and 53 at floor. The sill is 30½ feet below coping, and 25½ below mean high water. Depth of floor, 32⅔ feet. The total cost was $595,892, while the adjoining masonry docks, only 359 feet long, cost $2,241,000.

The largest dry dock now building on the Southern coast is at Port Royal, S. C. It will be 500 feet long and about 120 feet wide. In its general features it will resemble that at Brooklyn, N. Y.

Of the floating dock there are several distinct varieties:

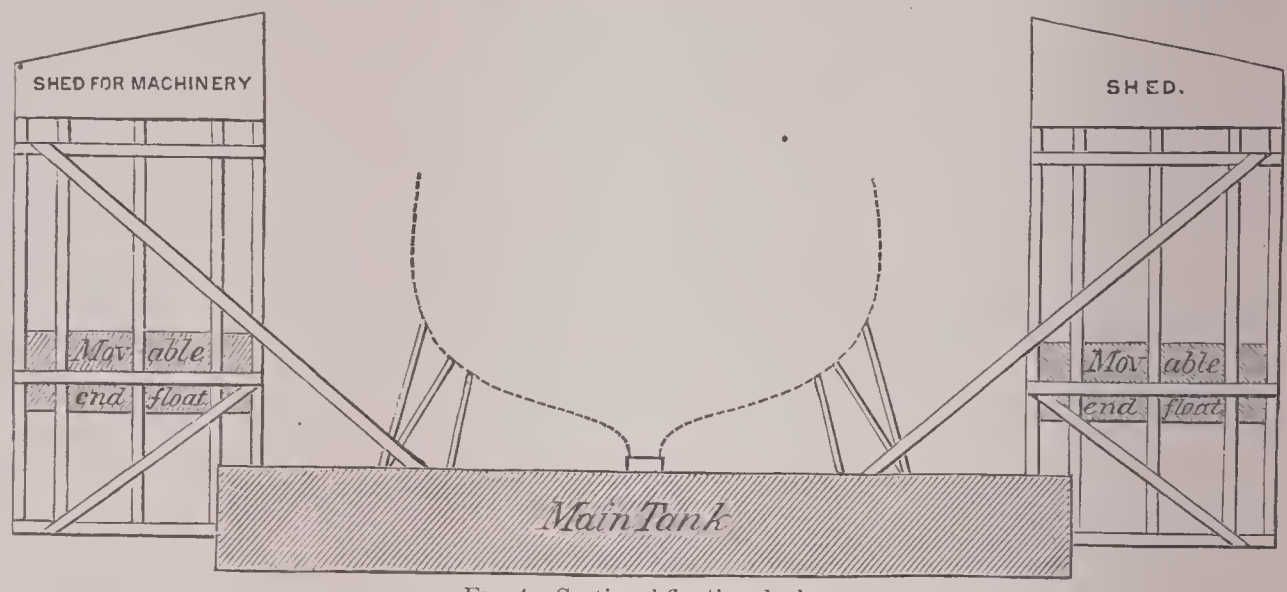

FIG. 4.—Sectional floating dock.

the sectional dock, such as is in use in the Philadelphia and San Francisco navy-yards; *the Gilbert balance dock*, in use in the Portsmouth, Va., and Pensacola, Fla., navy-yards; *the iron floating dock* of the Bermuda dock patern; *G. B. Rennie's patent iron floating dock*, of which the Cartagena dock is an example; and *Edwin Clark's hydraulic lift dock*, in use in the Victoria Docks, London.

The sectional floating dock in the Philadelphia navy-yard is made in nine separate and independent sections, differing only in their widths. Each section consists of a pontoon or tank, watertight, 105 feet in length, 30 or 32 feet in width, and 11 feet in depth; two end-frames, and two end-floats. Together, the sections form a floor of over 300 feet in length and 10[illegible] feet in width. At each end of each section is an open frame in which is a float, connected with the four posts of the framework, which is raised and lowered by machinery—raised to assist in sinking the main tank to the depth required, or lowered into the water to give it greater buoyancy.

When the dock is to be used a sufficient number of these sections are joined together to give the length required, and firmly connected by beams so arranged that they may be placed from 6 inches to 6 feet apart, though they are not generally farther apart than 3 feet. They are then connected by means of shafting with the engines, of which there are four. At each end of each section are three pumps. When the vessel is ready to be docked the main tanks or pontoons are filled with water, the end-floats raised by machinery upon the end-frames until the dock is sunk to the proper depth. The ship is then hauled over the dock, and the end-floats depressed into the water until its keel has a bearing upon the keel-blocks; the shores or supports for the vessel are then adjusted, and the water is

pumped from the tanks, the end-floats being used, if necessary, to preserve the proper equilibrium.

This dock, as well as Gilbert's balance dock, is used in connection with a basin and railways. The basin in the Philadelphia navy-yard is 350 feet in length by 226 feet in width. The floor, of granite 10 inches in thickness, is laid upon a pile and concrete foundation, and is perfectly level; on three sides of this floor are granite walls 14½ feet in height. The "bed-ways" are two, and each consists of three "ways"—one to support the keel, and two to support the bilges; each is 350 feet in length and 26 feet in width. The basin and "ways" are used thus: the dock, with the ship upon it, drawing from 8 to 10 feet of water, is hauled into the basin by means of capstans; the line of the ship's keel is brought into the line of the "bed-ways," water is admitted to the tanks, and the dock settled firmly upon the stone platform of the basin. The vessel, by means of hydraulic power and a cradle, is slid upon the bed-ways, and the dock may be immediately used for another vessel. The dock without the basin may be used for repairing a vessel. This dock was completed in 1851 at a total cost of about $814,000. Its lifting power is nearly 6,000 tons.

The California sectional dock is composed of ten sections, 100 feet in length, 32 feet in breadth, and 11 ft. 9 in. in depth.

The balance floating dock was invented by Mr. John S. Gilbert, of New York city. Like the sectional dock, it is constructed of timber, and consists of a pontoon bottom with two side walls, possessing sufficient displacement to carry the whole weight of the dock and the vessel to be raised. The side walls are hollow and of considerable width, serving, like the floats in the sectional dock, to preserve its stability in rising and sinking. The outside of these walls is vertical, while the inside is sloping, so as to conform to a certain extent to the shape of the ship. Port-holes are made in the walls for ventilation. The walls also afford the means of shoring up the ship, as in a stone dock; on the top are the engine-house, pumps, and working platform. There are sometimes gates at the ends for inclosing the dock, which are used only when vessels of great weight are to be lifted. Of this description is the Portsmouth, Va., navy-yard dock, which is 350 feet in length, 38 feet in depth, and 90 feet in inside width. This dock, with the basin and railways, cost $733,000. The Pensacola dock, which is similar, cost $923,000. There are also balance docks at New York, Charleston, Savannah, Mobile, and New Orleans.

The iron floating dock at Ireland island, Bermudas, was built in England and towed out in 1869. It is 381 feet in length, by 124 feet in breadth, weighs without the caissons about 8,200 tons, and has a lifting power of 16,700 tons.

Iron floating docks at Cartagena and Ferrol, Spain, constructed by the Messrs. Rennie, of England, are remarkable works. That at Cartagena is 320 feet in length; 105 feet in breadth outside; breadth inside, 79 feet; height outside, 48 feet; height inside, 36½ feet; weight 4,400 tons. This dock, possessing many points of resemblance to Gilbert's balance dock, may be described as an oblong rectangular box or trough, without top or ends; walls and bottom hollow, and

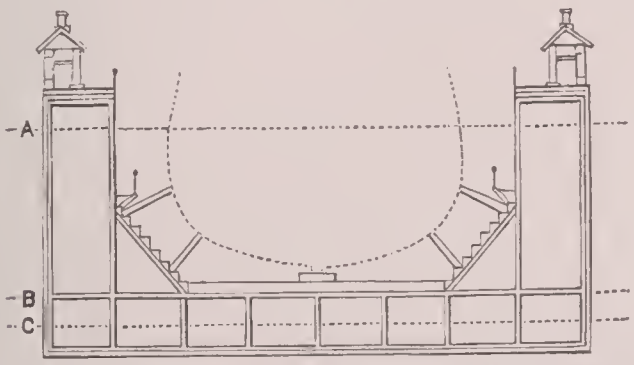

FIG. 5.—End elevation of Rennie's dock. A, level of water when ready to receive a ship; B, level of water with ship docked; C, level of water when light.

divided into several independent chambers; the side walls act as floats to prevent the dock from sinking too rapidly, and eventually from being entirely submerged. The operation of docking is performed thus: Water is admitted to the base compartments by sluices and pipes; the dock gradually sinks to a depth sufficient to admit the vessel, which is then hauled in and shored in the usual manner; the engines and pumps then discharge the water from the base compartments until the floor of the dock is out of water.

Among the largest vessels which this dock has lifted is the Spanish iron-clad Numancia, of 21¼ feet draught and weighing 5,600 tons. This vessel remained supported eighty days without damaging or straining the dock. The draught of water of the dock, with the Numancia in, and with 800 tons of water in the chambers, was 11¼ feet; without a load the draught of the dock is 4 ft. 7 in.

For a description of the hydraulic lift and carriage for transporting vessels across the isthmus of Tehuantepec as proposed by James B. Eads, see the article on SHIP-RAILWAYS.

Clark's hydraulic lift dock, first constructed by Mr. Edwin Clark, at the Victoria Docks, London, consists of a shallow pontoon filled with water and sunk between two rows of cast-iron columns. The pontoon, when the vessel is placed over it, is raised by hydraulic pumps acting on the pontoon by chains. In about thirty minutes a vessel drawing 20 feet of water is left afloat on a shallow pontoon drawing only 4 or 6 feet, and may be taken into the shallow dock prepared for its reception.

A plan has been proposed by a Mr. Janicki before the French Society of Engineers for a floating dock composed of a number of pontoons from which the water is driven by compressed air, stability being given to the pontoons by lateral moving floats.

Revised by LEWIS M. HAUPT.

Doctor [Lat., teacher, deriv. of *doce're*, *doctum*, teach]: a title of honor which was applied in early times to teachers of doctrine in the churches, and in more recent times conferred by universities; at first as the equivalent of "master" (*magister*), and afterward as a still higher degree. Four of the Greek Fathers (Athanasius, Basil, Nazianzen, and Chrysostom) and three Latin Fathers (Jerome, Augustine, and Gregory the Great) were distinguished as "doctors of the Church." Thomas Aquinas, Bernard of Clairvaux, Bonaventura, and others bore the same title in later days. The distinction is usually conferred after death. The title "doctor" was given later in the Western Church to prominent teachers of scholastic theology. Many of these titles were conferred by their followers, and had an additional epithet, designed to be expressive of some special excellence. Thus William Hales was called "Doctor Irrefragabilis"—the irrefutable doctor. William Ockham was called by his admirers "Doctor Singularis"—the pre-eminent doctor—a title given to several others. Doctor of laws, LL. D. or J. U. D. (*doctor utriusque juris*, teacher of both laws, i. e. the civil and the canon law), was the first title of the kind conferred by the universities. Bologna appears to have been the place where this title was first conferred, but the University of Paris soon followed, first giving this degree in 1145. Doctors of laws (except when bearing a merely honorary title) long had a certain jurisdiction in the courts, which is even now scarcely extinct in England. (See Shakspeare's *Merchant of Venice*, act iv., scene i.) In the English universities the doctorate in law is given in course at Oxford under the form D. C. L., and at Cambridge and London under the form LL. D. The degree of S. T. D. (*Sacrosanctæ Theologiæ Doctor*, i. e. Teacher of Sacred Theology) or D. D. (Doctor of Divinity), otherwise written T. D. (Doctor of Theology), is still given at all the European universities after examination in the regular university course. The popes and archbishops of Canterbury have long claimed and exercised the right of conferring the doctorate both in law and divinity. The degree of doctor in medicine has been traced back to 1384, and that of doctor of music is nearly or quite as old. The regents of the University of the State of New York confer the honorary degree of Doctor of Letters (L. H. D.) as their highest distinction. See DEGREES, COLLEGE, UNIVERSITY, BERLIN, UNIVERSITY OF, and descriptions of the various other universities.

The word "doctor" as used in the New Testament is taken in its primitive Latin meaning, "teacher," and corresponds to the Hebrew word *mori* (teacher) or to the title *rabbi* (master), which was conferred during the centuries immediately preceding and following the birth of Christ by the "nasi," the chief of the Sanhedrim, accompanied by the ceremony of the laying on of hands.

Revised by C. H. THURBER.

Doctor of Music: the superior of two musical degrees conferred by the English universities, the inferior being that of *Bachelor of Music*. At Cambridge and Oxford five years must elapse before a Bachelor of Music can receive the degree of Doctor of Music. The *honorary* degree has sometimes been conferred on distinguished musicians who had not graduated as bachelors. The following are the published conditions for Oxford: "Candidate must compose and send to professor a vocal composition, secular or sacred, in eight-part harmony and good eight-part fugal counterpoint with accompaniment for full orchestra. Length of performance, forty to sixty minutes." If this "exercise" be approved, a *written* examination follows, in "harmony, eight-part counterpoint, fugue, form, instrumentation, musical history, acoustics, so far as related to theory of harmony, and knowledge of the scores of great masters." If the candidate passes this examination satisfactorily, *then* he "must have his exercise publicly performed in Oxford, with complete band and chorus *at his own expense*. He must furthermore deposit the manuscript full-score in the library of the music school. Fees for this degree, £20." Conditions, fees, etc., at Cambridge and Dublin are about the same as at Oxford. The Archbishop of Canterbury still possesses by law the right to confer the title of Doctor of Music by diploma without special examination. The only condition appears to be the payment of £63 in fees. Germany and France confer no such degrees.

In the U. S. many colleges confer this degree oftentimes without technical examination, so that the title no longer implies any specially learned or scientific standing in the profession. DUDLEY BUCK.

Doctors' Commons, or **College of Doctors' Commons**: in London, England, the popular name for the courts, offices, etc., formerly occupied by the body which was incorporated June 22, 1768, under the title of "The College of Doctors of Law exercent in the Ecclesiastical and Admiralty Courts," and which had previously existed for more than two centuries as a voluntary organization. These buildings were on the east side of St. Paul's Churchyard, and were so called in allusion to the "community of board," or dining together, of the members of the college. The college consisted of a president (the dean of the arches for the time being) and of those doctors of law who, having regularly taken that degree in either the Universities of Oxford or Cambridge, and having been admitted advocates in pursuance of the rescript of the Archbishop of Canterbury, had been elected fellows of the college in the manner prescribed in the charter. The functions of this body of lawyers were much diminished by laws passed to reform the system of courts, and the property of the college was sold, the charter surrendered, and the corporation dissolved under powers conferred by statute in 1857 (20 and 21 Vict. c. 77, ss. 116, 117). Revised by F. STURGES ALLEN.

Doctors of the Church: in the Roman Catholic Church, certain saints who, after death, have received this title on account of their superior wisdom and excellence. They are at present nineteen in number, viz.: Sts. Hilary of Poitiers (d. 368 A. D.), Athanasius (373), Basil (379), Gregory Nazianzen (389), Ambrose (397), John Chrysostom (407), Jerome (420), Augustine (430), Peter Chrysologus (450), Leo (460), Gregory (604), Isidore (636), Peter Damian (1072), Anselm (1109), Bernard of Citeaux (1153), Thomas Aquinas (1274), Bonaventura (1274), Francis de Sales (1622), and Alphonsus of Liguori (1787). Outside the Roman Catholic Church the seven Christian Fathers mentioned in the article DOCTOR (*q. v.*) are more especially designated by the title "Doctors of the Church."

Doctrinaires, dok-tri-nãrz': the politicians who, in France, just after the restoration of 1815 occupied in the Chamber of Deputies a place between the Center and the Extreme Left. The chief men of this party were systematic writers and speakers on government, who wished to establish a form of constitution somewhat resembling that of England, and supported scientific doctrines of constitutional liberty against the arbitrary will of the king. The word *doctrinaire* was used by their opponents to stigmatize them as pedantic and unpractical theorists. The leaders of the Doctrinaires were Royer-Collard, Guizot, the Due de Broglie, and the Duc de Decazes. They ceased to exert any influence as a party after the revolution of 1848. The term is now frequently used to designate the partisans of abstract theories, the direct opposites of "practical politicians."

Document [from Lat. *documen'tum*, proof, example, i. e. something from which one learns; deriv. of *doce're*, teach]: an original or official paper or writing relied on as the basis or proof of something; in law, a written instrument adduced for the purpose of evidence.

Dodd, CHARLES: the assumed name of Hugh Tootel, a Roman Catholic priest of England; b. at Durton-in-Broughton, near Preston, Lancashire, 1672; educated at Douay; returned to England 1698, and had two charges, the last at Harvington, where he died Feb. 27, 1742–43. He was the author of *Church History of England* from 1500 to 1688 (3 vols. folio, Brussels, 1737–42), and several other works, chiefly polemical. His history was a reply to that of Burnet, and has been in part republished down to 1625 (5 vols., London, 1839–43). Its value is regarded as considerable, but it is characterized by severity and unfairness.

Dodder-laurels (*Cassythaceæ*): a family of parasitic plants having the habit and appearance of dodders, but in other respects resembling the laurels, to which they are generally referred. They replace the dodders in hot regions, where alone they grow. The U. S. have but one known species, the *Cassytha filiformis* of Florida.

Dodders [O. Eng. *dodder*: Germ. *Dotter*, connected with O. Eng. *dott*, point, spot, Eng. *dot*, point]: leafless parasitic plants, generally placed by botanists in the genus *Cuscuta* and family *Convolvulaceæ*, but sometimes made a distinct family called *Cuscutaceæ*. They have twining thread-like stems of orange yellow, and flowers in thick clusters. They are found native in the temperate zone, in both the Old and New Worlds, and are sometimes injurious to the flax, clover, hop, and bean crops by smothering the plants. The dodders are remarkable for having their embryos without cotyledons. On germinating the slender stem grows up from the ground, and having attached itself as a climbing parasite to herbs and shrubs the proper root dies, leaving the vine to subsist upon the juices of the plant which supports it. This it does by means of papilla-like roots, which penetrate the bark of the plant on which it lives. Huge dodders in Afghanistan grow upon the trees, and even prey upon themselves. About twenty species are known in North America, growing upon many herbaceous plants and even a few shrubs. *C. arvensis* sometimes attacks clover in the U. S., while *C. epithymum*, a foreign species, is very destructive to clover in Europe, and is sparingly introduced into the U. S. *C. epilinum*, another foreign species, is occasionally found in flax-fields in the U. S. Revised by CHARLES E. BESSEY.

Doddridge, JOHN: jurist; b. at Barnstaple, England, 1555. He entered Exeter College, Oxford, in 1572, and began the study of law at the Middle Temple in 1576; was justice of the king's bench 1613–28. Author of *The Lawyer's Light* (London, 1629); *A Complete Parson, or a Description of Advowsons and Church Livings* (1602); *The History of the Ancient and Modern Estate of the Principality of Wales* (1630); *The English Lawyer* (1631); *Opinions Touching the Antiquity, Power, Order, State, Manner, Persons, and Proceedings of the High Courts of Parliament in England* (1656). D. in London, Sept. 13, 1628.

Doddridge, PHILIP, D. D.: preacher and author; b. in London, England, June 26, 1702. He became pastor of a Dissenting congregation at Kibworth in 1723, but left in 1725, went to Market Harborough, and removed in 1729 to Northampton, where he was principal of a theological seminary and at the same time pastor of a large congregation. In 1730 he married Mercy Maris. From principle he avoided controversy, but that course drew upon him the charge of being a trimmer and double-dealer. He was an earnest and devout preacher, and acquired a high reputation as a writer. His most important works are *The Rise and Progress of Religion in the Soul* (1745); *The Family Expositor* (6 vols. 4to, 1739–56); *Life of Colonel Gardiner* (1747); *A Course of Lectures on Pneumatology, Ethics, and Divinity* (1763); and *A Commentary on the New Testament*. He also was the author of improvements upon Jeremiah Rich's *Brief and Easy System of Shorthand* (1799). He wrote 374 hymns, some of which are admirable. D. at Lisbon (whither he had gone for his health), Oct. 26, 1751. See Job Orton, *Life of Doddridge* (London, 1766); Thomas Stedman, *Letters to and from Dr. Doddridge* (1790); *Correspondence and Diary*, edited by John Doddridge Humphreys (5 vols., 1829); especially the *Life* by Charles Stanford (London and New York, 1881).

Revised by S. M. JACKSON.

Dodec'agon [from Gr. δώδεκα, twelve + γωνία, angle]: a regular polygon of twelve equal sides and twelve equal angles.

Dodecahe'dron [from Gr. δώδεκα, twelve + ἕδρα, seat, base]: one of the five Platonic bodies or regular solids, bounded by twelve equal and regular pentagons; has thirty equal edges and twenty equal solid angles, each formed by the meeting of three equal plane angles. Its volume is nearly 7·66312 times that of the cube of one of its sides.

Dodeca'theon [Lat. *dodecatheon*, plant of the twelve gods; from Gr. δώδεκα, twelve + θεός, god, probably in allusion to its curious nodding flowers, about twelve in number]: a genus of plants of the family *Primulaceæ*. The *Dodecatheon meadia* of the U. S. is an elegant plant called American cowslip, or shooting star.

Döderlein, Ludwig: pedagogue and classical scholar; b. in Jena, Dec. 19, 1791; son of Johann Christoph, a Protestant divine; studied philology in Munich, Heidelberg, Erlangen, and Berlin. In 1815 he became professor in Bern, where he published, together with Bremi, a large number of exegetical editions of the Greek and Roman classics. In 1819 he went to Erlangen in the double capacity of director of a gymnasium and professor at the university. D. Nov. 9, 1863. Apart from his elegant translations and eloquent orations, his reputation rests on his lexicographical labors, in particular on his *Lateinische Synonyme u. Etymologien* (6 vols., 1838). See R. Rauchenstein, *N. Schweizer Museum* (iv., pp. 155–280); Bursian, *Allgemeine deutsche Biographie* (v., p. 281 f.).

Dodge, Charles Richards: See the Appendix.

Dodge, Ebenezer, D. D., LL. D.: a Baptist divine and scholar; b. at Salem, Mass., Apr. 22, 1819; graduated at Brown University in 1840, and at Newton Theological Institution in 1845; instructor in Hebrew at Covington Theological Institution (1846–47); pastor in New Hampton, N. H. (1847–48); New London, N. H. (1849–53); professor in the theological department of Madison University, Hamilton, N. Y. (1853–68); and president of the university from 1868 till his death, Jan. 5, 1890. He published *Evidences of Christianity* (Boston, 1869); *Christian Theology* (Hamilton, N. Y., 1883); several able reviews, etc.

Dodge, Grenville Mellen, LL. D.: general; b. at Danvers, Mass., Apr. 12, 1831; graduated at a military academy in Norwich, Vt., in 1850; became a civil engineer and made one of the earliest surveys along the Platte for a Pacific railway; commanded a brigade at Pea Ridge in Mar., 1862, and became a major-general of Union volunteers in June, 1864. He directed a corps of Gen. Sherman's army in the campaign against Atlanta (May to Sept., 1864), and succeeded Rosecrans as commander of the department of Missouri in December of that year; resigned May, 1866, to become chief engineer of the Union Pacific Railway. He represented a district of Iowa as a member of Congress in 1867–69, and was a delegate to the Chicago Republican convention of 1868, and to the Cincinnati convention of 1876.

Dodge, Henry: general; b. at Vincennes, Ind., Oct. 12, 1782. He served with distinction in the War of 1812 and in various Indian wars; was Governor of Wisconsin Territory 1836–41 and 1845–48; a delegate to Congress (1841–45); and U. S. Senator from Wisconsin (1849–57). D. at Burlington, Ia., June 19, 1867.

Dodge, Mary Abigail (*Gail Hamilton*): author; b. in Hamilton, Mass., about 1830; was a school-teacher in her youth; in 1865–67 was one of the editors of *Our Young Folks*; in 1876 became a resident of Washington, D. C. Among her works are *Gala Days* (1863); *Woman's Wrongs, a Counter-Irritant* (1868); *Skirmishes and Sketches*, *The Battle of the Books* (1870); *Our Common-School System* (1880); and *The Insuppressible Book* (1885). She was a frequent contributor to current literature. D. Aug. 17, 1896.

Dodge, Mary Mapes: author; b. in New York city in 1838, daughter of Prof. James J. Mapes, an eminent chemist, and married to William Dodge. She has been since 1873 editor of *St. Nicholas*, a children's magazine. *Hans Brinker, or the Silver Skates* (1865), is the best known of her writings, which include also *Irvington Stories* (1864); *Along the Way*, poems (1879); *Donald and Dorothy* (1883), etc. H. A. Beers.

Dodge, Richard Elwood: See the Appendix.

Dodge, Theodore Ayrault: See the Appendix.

Dodge, William Earle: philanthropist; b. in Hartford, Conn., Sept. 4, 1805; removed to New York in his thirteenth year. At the age of twenty-one he went into business on his own account, and became an extensive importer and manufacturer. He was an active member of many benevolent and religious societies, a member of the peace convention of 1861, and a Republican member of Congress 1866–67. He was the principal founder of the Syrian Protestant College at Beirut. D. in New York city, Feb. 9, 1883. A statue of Mr. Dodge was erected in New York in 1885. See his *Life* by D. Stuart Dodge (New York, 1887) and by Carlos Martyn (New York, 1890).

Dodge City: city and railway center; capital of Ford co., Kan. (for location, see map of Kansas, ref. 7–D); on the Arkansas river. It has a Presbyterian college, graded schools, electric lights, water-works, etc. Pop. (1880) 996; (1890) 1,763; (1900) 1,942. Editor of "Times."

Dodgeville: city; capital of Iowa co., Wis. (for location of county, see map of Wisconsin, ref. 7–D); on Ch. and N. W. and Ill. Cent. Railways; 48 miles W. S. W. of Madison; has seven churches, public school with a high school department, and manufactures of wagons, buggies, plows, flour, and creamery butter; lead and zinc are mined in the vicinity. Pop. (1880) 1,547; (1890) 1,722; (1900) 1,865.
Editor of "Chronicle."

Dodgson, Charles Lutwidge, M. A.: author; b. in England about 1833; graduated at Christ Church College, Oxford, in 1854, with a first class in mathematics; took holy orders in 1861; was mathematical lecturer at Christ Church College 1855–81; published *Euclid and his Modern Rivals* (1879); *The Game of Logic* (1886); *Mathematica Curiosa* (1888); also, under the pseudonym of Lewis Carroll, *Alice's Adventures in Wonderland* (1865) and *Through the Looking Glass* (1872); besides other volumes of poems, parodies, and children's stories, including *Doublets* (1879); *Rhyme? and Reason?* (1883); and *Sylvie and Bruno* (1889). D. at Guildford, England, Jan. 14, 1898.

Dodo (*Didus ineptus*): a remarkable extinct member of the order *Columbæ* (pigeons) and family *Dididæ*; found only in the island of Mauritius. A closely related bird, the solitaire (*Pezophaps solitaria*), was found in Rodriguez, and what was probably a third member of the family in the island of Bourbon. The dodo is described as larger than a swan, of a clumsy form, with a large head and enormous bill, the upper mandible being the longer and hooked at the point, short thick legs covered with scales, and such extremely short, weak wings that the bird could not fly. With the exception of the wing feathers the plumage was soft and downy. The general color was gray, the breast brown, and the wings and tail yellowish. The flesh, though tough, was eatable, and dodos were taken in considerable numbers by the Dutch voyagers to provision their ships. Being incapable of flight, a poor runner, and withal stupid, the dodo was easily captured, and its extermination was rapid. By 1693, a little less than a century after the discovery of Mauritius, the dodo seems to have been exterminated, the last record of its occurrence being July, 1681. Up to 1866 the only known remains of the dodo consisted of a skull in Copenhagen, an imperfect skull in Prague, a foot in the British Museum, and a head and foot in Oxford. In 1866, however, a considerable number of bones were ob-

Dodo.

tained from a small marsh, termed the Mare aux Longes, and others have been procured still more recently. Our knowledge of the external appearance of the bird—aside from the descriptions of voyagers—is based on the paintings of Roelandt and John Savary, who drew the dodo from examples brought alive to Holland. F. A. Lucas.

Dodo'na (in Gr. Δωδώνη): an ancient city of Epirus; seat of a celebrated oracle and temple of Jupiter, for a time the most famous oracle of Greece except that of Delphi. Its origin was attributed to Deucalion. This oracle was consulted by the Athenians, Spartans, and other nations, and its responses were delivered from an oak-tree; or, according to another legend, by the agitation of a row of kettles suspended in the air, the noise of which was interpreted by priests as the answers of the oracle. The temple of Dodona was destroyed by the Ætolians in 219 B. C.

Dods, Marcus, D. D.: Scottish divine of liberal tendencies; a minister of the Free Church of Scotland; b. at Belford, Northumberland, England, Apr. 11, 1834; educated at Edinburgh University (M. A. 1854) and at New College, Edinburgh (1854–58). He became pastor of the Renfield Free Church, Glasgow, 1864; Professor of New Testament Exegesis in New College, Edinburgh, 1889. Among his published works are the following, some of which have passed through several editions: *The Prayer that Teaches to Pray* (Edinburgh, 1863); *The Epistles to the Seven Churches* (1865); *Israel's Iron Age* (London, 1874); *Mohammed, Bûddha, and Christ* (1877); *Handbook on Haggai, Zechariah, and Malachi* (Edinburgh, 1879); *Isaac, Jacob, and Joseph* (London, 1880); *Handbook on Genesis* (Edinburgh, 1882); *Commentary on Thessalonians* (1882); *The Parables of Our Lord* (1st series, 1883; 2d series, 1885); *Introduction to the New Testament* (London, 1888); *The Book of Genesis* (1888); *The First Epistle to the Corinthians* (1889); *Erasmus and other Essays* (1891); *The Gospel of St. John* (2 vols., 1891–92). Willis J. Beecher.

Dodsley, Robert: bookseller and author; b. near Mansfield, England, in 1703. He opened a book-store in London, and became a friend of Pope and other literary men of his time. He produced in 1737 a farce called *The King and the Miller of Mansfield*, which was successful. His tragedy of *Cleone* (1758) was performed with great applause. He purchased Dr. Johnson's *London* for ten guineas, and his *Vanity of Human Wishes* for fifteen guineas. He published a *Select Collection of Old Plays* (12 vols., 8vo, 1780) and other works. D. Sept. 25, 1764.

Dodwell, Henry: chronologist; b. in Dublin, in Oct., 1641; educated at Trinity College, Dublin: elected Camden Professor of History at Oxford in 1688, but deposed from his chair in 1691 because he refused to take the oath of allegiance to William III. Among his noteworthy contributions to Greek and Roman chronology are his *Annales Velleï, Quintil., Statian.* (1698); *Annales Thucyd. et Xenophont.* (1702). D. in Schottesbrook, June 7, 1711. See Dodwell's *Works*, abridged, with an account of his life, by Fr. Brokesby (2 vols., London, 1723). Alfred Gudeman.

Doe, Charles: See the Appendix.

Doe, John: a name in legal documents for a person whose name is unknown; specifically, the fictitious plaintiff in Ejectment (*q. v.*).

Doebereiner: See Döbereiner.

Dogbane: a plant of the genus *Apocynum* and family *Apocynaceæ*, having bell-shaped flowers, no style, and the fruit a pair of follicles. Some of the species are herbaceous, others shrubby, and some are found in colder climates than is usual for plants of this order. The dogbane of North America (*Apocynum androsæmifolium*) is a perennial herbaceous plant about 2 feet high, with smooth stem, milky juice, smooth ovate leaves, and light-pink flowers. It grows in open, barren places from Canada to Georgia, and is valued for the medicinal properties of the bark of the root, which is emetic, diaphoretic, and in small doses tonic. This and the Indian hemp (*A. cannabinum*), which contains similar medicinal properties, yields a copious fine flax-like fiber, used by the Indians; but otherwise the plant is employed only for medicinal purposes.

Dog Days, or **Canicular Days**: the forty days between July 3 and Aug. 11. Canicular is derived from *Canicula*, the Latin name of Sirius, the dog-star, which rose heliacally near July 1. The ancients ascribed the great heat of summer to the influence of this star, but it was by accident only that its rising coincided with the warmest season. The time of its rising depends on the latitude of the country, and, owing to precession, is later every year.

Dog Distemper: a disorder common among young dogs, considered to be of a catarrhal character. A general running from the nose and eyes is a leading symptom, together with a short dry cough, succeeded by loss of strength and wasting of the body. The flow from the nose, at first watery, in a little time becomes mucous and purulent, filling the eyes and choking up the nostrils, and is attended by coughing and vomiting, with an increased wasting of flesh and loss of appetite. A convulsive twitching, paralysis of the extremities, attended by fits, with symptoms of an affection of the brain, appear when the disease becomes malignant. At such a time the sight of another dog often brings on a fit, which may be somewhat checked by fondling. The fits usually prove fatal if they continue to increase in violence and frequency. A frequent consequence of the distemper is inflammation of the lungs and a dysenteric discharge, indicating ulceration of the intestines.

The leading remedies, which must be applied in the early stage of the disease, are laxatives, emetics, occasional bleeding, etc. Astringents should be used to check the diarrhœa, and the violence of the fits may be quelled by warm baths and anodynes.

Doge, dōj [Ital. < Lat. *dux, ducis*, leader]: the title of the chief magistrate in the republics of Venice, Amalfi, and Genoa. The origin of the office in Venice dates as far back as 697. Previously Venice had been governed by seven tribunes, but the intrigues consequent on their election, and the rising power of the republic, made it expedient to concentrate the power of the government. The first doge was Paoluccio Anapeste. The doges were elected by the people, but the choice usually fell on a member of one of the powerful families. They were invested with almost absolute power till about the year 1172, when the legislative power was placed in the hands of a great council of 470 members. This council elected twenty-four of their members, who in turn elected twelve of their own number, upon whom the choice of the doge devolved. The first doge elected in this manner was Sebastiano Ziani, who, on the occasion of his installation in office, scattered money among the people to win their favor—a custom which was followed by his successors. This doge also introduced the custom of wedding the Adriatic Sea. This was a marriage ceremony which took place on Ascension Day, and which typified the absolute dominion which the Venetians claimed over that sea. On these occasions a ring was thrown into the sea from the ship Bucentaur. The principle of indirect election has probably never been carried to such absurd lengths as by the electoral machinery established in 1268. Ten or twelve bodies of voters were successively chosen before the actual electors were reached. From this time the council gradually narrowed the powers of the doge, till in 1628 the offices of commander-in-chief of the army and high-admiral of the navy ceased to belong to the dogate (or dogado, as the dignity was called) unless by a special decree of the council of forty, a high court of justice composed of forty members. In the fourteenth century the council of ten was established, and vested with the highest power in the state, which entitled it to pass judgment even upon the doge himself. About this time the powers of the doge became so restricted as to be little more than nominal, and the constant espionage to which he was subjected made the office no longer an object of ambition. In 1339 it was found necessary to pass a law prohibiting a doge who had been elected from resigning his place. The office disappeared with the fall of the Venetian republic in 1797. Lodovico Manin, elected in 1788, was the seventy-third and last doge of Venice.

The first doge of Genoa was Simon Boccanera, elected by the people in 1339. Like that of the Doge of Venice, his office was originally for life. His powers were shared, though not restricted, by twelve aldermen. In 1528 the Genoese framed a new constitution, by which the doge was to be re-elected every two years, and the powers of the office were restricted by two councils, of which one comprised 300 and the other 100 members. In 1797, when the French occupied Genoa, the office of doge ceased to exist. In 1802 it was restored with the restoration of the republic, but it finally disappeared in 1804. The republic of Amalfi in 897 A. D. exchanged its government by annually chosen consuls for the dogate, which was held for life; but its republican government ceased in 1350. Revised by F. M. Colby.

Dogfishes: popular name of several small species of shark, so named probably from their pursuing their prey like dogs hunting. The common dogfish, *Squalus acanthias*, is found in great quantities on the coasts of the Hebrides and Orkneys. The same species is abundant along the New England coasts and on the Pacific coast northward. It is everywhere caught for its oil. Most of the small spotted sharks are known as dogshark or dogfish. The dogfish of the Western States is the Amia (*q. v.*).

Dog-fox: a small animal found in Asia and Africa, belonging to the family *Canidæ*, of the genus *Cynalopex*. It has erect pointed ears, a sharp muzzle, somewhat resembling that of a greyhound, and a bushy tail.

Dog'ger [Dutch *dogger*, codfish]: a two-masted fishing-boat of the ketch build, with bluff bows. It is used by the Dutch for the Doggerbank fishery.

Doggerbank: an extensive sandbank in the middle of the German Ocean, between England and Denmark. Length about 170 miles; average width, 40 miles. In some parts it is covered with only 8 fathoms of water. Here are important cod-fisheries. An indecisive battle was fought here between the Dutch and English fleets in Aug., 1781. See Mather, *Nor'ard of the Dogger* (1888).

Doggett, David Seth, D. D: bishop of the Methodist Episcopal Church South; b. in Lancaster co., Va., June 26, 1810; educated at the University of Virginia; entered the itinerant ministry in the Virginia Conference of the Methodist Episcopal Church in 1829. He was professor in Randolph-Macon College, Virginia, 1841–46, and was consecrated bishop in 1867, from which time his residence was in Richmond, Va. He wrote *The War and its Close* (Richmond, 1864). D. in Richmond, Va., Oct. 27, 1880.

Dog Island Light: a revolving light, 45 feet above the water, on the southern coast of Florida; lat. 29° 46′ 51″ N., lon. 84° 38′ 37″ W. The island is 30 miles E. of Appalachicola, and the light is a mile E. of its western end.

Dogma [Gr. δόγμα, an opinion, that which seems good, a decree, deriv. of δοκεῖ, it seems good, δέδοκται, it has been determined]: originally an opinion, afterward an article of belief derived from authority. The term is sometimes applied to what are regarded as the essential doctrines of Christianity, as contained in the Scriptures or the writings of the Fathers of the Church. The study or science of dogmas (*Dogmatik*) has a separate professorship in the Protestant universities of Germany. The term doctrine is a preferable one, as dogma is coming more and more to be used in an unfavorable sense.

Dogs: the *Canidæ* in general, but usually only the domesticated races which are considered as different varieties of one species—*Canis familiaris*. The domestication of the dog took place at an early date; he is mentioned by Homer, pictured on Egyptian monuments 5,000 years old, his bones occur in the neolithic shell-heaps of Europe and America, and, like his master's, his origin and early history are largely conjectural. As the various races of man are supposed to have had a common origin, so modern dogs are, by some, believed to be the descendants of one ancient and wild species. It seems, however, more probable that various species of wild dogs have been tamed in different parts of the world, and that the wolf, coyote, and jackal have been the chief sources whence come the many breeds of dogs, although others have been domesticated. These three species when young are easily tamed, and are playful, cross with domesticated dogs and produce fertile hybrids, and, although comparatively silent in their wild state, learn in captivity to bark, while dogs that run wild lose the habit. Foxes can scarcely have been among the progenitors of the dogs, since, according to Bartlett, there is no well-authenticated case of a cross between the dog and fox. The length of time that dogs have been domesticated, the various purposes for which they are used, and the demands of fashion have given rise to the numerous breeds of dogs, which can not be far from 200. The variation among them is immense—in size, from the toy terrier of 2 lb. or less to the St. Bernard of over 150 lb.; in shape, from the bow-legged bulldog and crook-limbed dachshund to the slender greyhound; in disposition, from the gentle Chinese sleeve-dog to the savage Tibet mastiff. This great variation prevents any exact classification, since between any two extremes intermediate forms can be found. Cuvier divided dogs into three groups, mainly according to the shape of the head, proportions of parietal bones, size of frontal sinus, and size and shape of brain cavity; but more recent writers have arranged them in races according to external characters, dividing them into Wolf-dogs, Greyhounds, Spaniels, Hounds, Mastiffs, and Terriers (*qq. v.*).

The Eskimo, collie, and Newfoundland are examples of *wolf-dogs*, the first named with its pointed muzzle, erect ears, and savage disposition, being indeed little removed from a wolf. The Newfoundland is regarded as either the result of a cross between the Indian dogs and those introduced by the English settlers or as descendants of dogs brought over by early Norwegian visitors. The breed is at a low ebb in Newfoundland and at its best in England. The Leonberg is a cross between the Newfoundland and St. Bernard, this last being also included in the wolf-dogs. The original St. Bernards were exterminated by a distemper in 1820 and replaced by the present breed, whose long-haired variety has been brought to an enormous size by English breeders. The *greyhounds* are an old race, a breed with curled tails being portrayed on Egyptian monuments 3,000 years old. In feudal England the greyhound could be kept only by princes and nobles, and to kill one was punishable with death. The coarse-haired deerhound is a lineal descendant of an Irish dog used in hunting wolves and red deer, and approaches the staghound very closely, although this last is placed with the hounds. Greyhounds hunt almost entirely by sight, speed and wind having been cultivated at the expense of other qualities.

The *spaniel* group includes the various spaniels and setters, the latter being a comparatively recent breed derived by selection from the former. Few setters now "set," although this name was given them from their indicating the presence of game by crouching instead of pointing, like the pointer. In both the habit has been brought about by man's taking advantage of the stealthy creep or brief pause of the wild dog before making a sudden rush and bringing it to a full, long-continued stop.

To the *hounds* belong the bloodhound, pointer, and related breeds, the group including those dogs which have the keenest scent, and rely on their noses rather than on their eyes. Many of them are noteworthy for speed and "staying" qualities, foxhounds having been known to make 4 miles in seven minutes, and to keep on the run for ten consecutive hours. The pointer bears evidence of his Spanish origin in names like Don and Carlo, which still cling to him.

The *mastiffs*, characterized by shortness and breadth of muzzle and generally robust form, comprise such well-known forms as the now popular English mastiff, bulldog, and pug. The race of mastiffs is an old one, figured on Assyrian monuments of 640 B. C., and represented in statuettes of clay bearing such names as "biting his enemies," "capturing enemies," and "causing evil to come forth," names which refer to the use of these dogs in war. The present tendency is to breed mastiffs of a more slender, "leggier" build than formerly. The bulldog is no longer used for bull-baiting, and is to a great extent bred for show purposes.

Lastly, the *terriers* comprise a number of small, active, and greatly varied breeds. The name comes from the Old French, in allusion to their digging habits, and they were formerly used in conjunction with foxhounds to dig out foxes when run to earth.

The uses of dogs are manifold. They serve as beasts of burden, and in the icy North furnish the sole means of winter travel. They participate actively in the sports of civilized man, and aid their savage masters in the chase, while among some tribes they not only help to obtain food, but are themselves cooked and eaten, as in the days of the Incas and Aztecs, when a special breed was regularly kept for this purpose, and fed exclusively on vegetable diet.

Wild dogs, descended from the domesticated breeds, occur in various parts of the world; a well-established race is found in Cuba, and others in Africa and South America, while even the pariah or street dog of the East has so far become a distinct breed as to have certain cranial characters of his own.

F. A. Lucas.

Dog's-tail Grass: (1) a grass of the genus *Eleusine*, and (2) a grass of the genus *Cynosurus*. Species of both genera are found native in Europe and Asia. The crested dog's-tail grass (*Cynosurus cristatus*) is much prized in England for lawns and sheep-pastures. The *Eleusine indica* is extensively naturalized in the U. S.

Dog Star: a popular name of Sirius (*q. v.*), a star of the first magnitude in the constellation Canis Major, and the brightest fixed star in the firmament.

Dogtooth Spar: certain pointed crystals of calcareous spar, somewhat resembling the teeth of a dog.

Dog-watch: on shipboard, a short watch of two hours. There are two dog-watches—the first from 4 to 6 o'clock P. M., and the second from 6 to 8 P. M.

Dogwoods: small trees of the genus *Cornus* and family *Cornaceæ*, which includes the cornel trees or dogwoods of Europe, the *Cornus florida* of the U. S., and others. The larger species are characterized by their hard wood, which is useful in turnery, and by their bitter tonic bark. The *Cornus florida* is well known for its white, showy involucral blossoms, appearing in May and June. In the West Indies, etc., other trees are known as "dogwoods." One of these, the *Piscidia erythrina*, or Jamaica dogwood, a small leguminous tree, found also in Florida, has a valuable and very hard timber. Its bark is a powerful narcotic and anodyne poison, which has been introduced into medicine and used quite largely to take the place of opium for the relief of pain. It is not a very successful substitute.

The "poisonous dogwood" or "poison sumach" (*Rhus venenata*) is probably much the most poisonous to the touch of the native plants of the U. S. It closely resembles the *Rhus vernix* or varnish-tree of Japan, and may be distinguished from the harmless sumachs by its panicles, which are loose (not thyrsoid or closely clustered in a spike, like the harmless ones), and which are axillary, while those of the harmless species are terminal. (See Rhus.) The common dogwood of Europe, *Cornus sanguinea*, which is found also in Northern Africa, is a shrub of 14 to 15 feet in height, with greenish-white flowers of an unpleasant odor.

Dohrn, Anton: zoölogist; b. at Stettin, Prussia, Dec. 29, 1840; studied natural sciences in several universities, finishing his course at Jena. He then applied himself to the study of the crustaceans of the English coast and the shores of the Mediterranean, and in 1870 founded a zoölogical laboratory at Naples which, within the next ten years, became one of the most noted establishments of its sort in the world. Among his writings are *Der Ursprung der Wirbelthiere* (Leipzig, 1875) and *Studien zur Ungeschichte des Wirbelthierkörpers* (1882). F. M. Colby.

Dojsi, Giovanni: Italian painter. See Dossi, Giovanni.

Dolabel'la, Publius Cornelius: a profligate Roman patrician; b. about 70 B. C.; married Cicero's daughter Tullia. He fought for Cæsar at Pharsalia in 48 B. C., and became consul about the year 44. He was afterward a partisan of Antony, was defeated by Cassius in Syria, and killed himself in 43 B. C.

Dolby, Charlotte Helen: See Sainton-Dolby.

Dolce, dōl'chā, Carlo: painter of sacred subjects; b. in Florence in 1616. His powers were feeble and his feeling limited, but his work is popular with the masses on account of its smoothness and elaborate finish, and its religious sentiment, which at best is weak. His pictures are chiefly small ones of madonnas and saints. D. Jan. 17, 1686.

Dol'cinites, or **Dul'cinists**: a sect of the Apostolici (*q. v.*), founded by Segarelli during the latter half of the thirteenth century, but deriving its name from his abler and more distinguished successor, Dolcino, an Italian born at Novara in the thirteenth century. They opposed the popes, and, according to Milman, held kindred tenets with the Fraticelli or Spiritual Franciscans, with some leaven of the old doctrines of the Patarines (Puritans) of Lombardy. Dolcino and some of his followers were burned alive in 1307.

Dole, Sanford Ballard: jurist; b. in Honolulu, Hawaii, in 1844. He was the son of an American missionary who went from Maine to Honolulu in 1840; received his early education in Punahan College; came to the U. S. in 1866, and studied in Williams College a year; studied law, and was admitted to the bar in Boston; practiced in Honolulu from 1870 till 1887; and then became a judge of the Supreme Court of Hawaii. On the abrogation of the Hawaiian monarchy in Jan., 1893, he was chosen president of the provisional government, and on the proclamation of the republic of Hawaii on July 4, 1894, he became its chief executive. When the islands were annexed to the U. S. on Aug. 12, 1898, President Dole and his administrative and judicial officers were continued as the government of the Territory.

Dolerite: See Basalt.

Dolet, dō'lā', Étienne: author; b. at Orleans, France, in 1509, probably on Aug. 3. He lived at Lyons, where he established a printing-press and published able works on theology and other subjects. His writings were burned by order of Parliament as heretical in 1543. He translated some works of Plato and Cicero, and wrote a great work, *Commentariorum Linguæ Latinæ* (1536), which has an important place in the history of Latin lexicography. He was first hanged and then burned in Paris, in the Place Maubert, on a false charge of heresy, Aug. 3, 1546. On the scene of his martyrdom a bronze statue of him was erected in 1890. See his *Life*, by Joseph Boulmier (Paris, 1857), and by R. C. Christie (London, 1880); cf. also A. Firmin-Didot, *Essai sur la Typographie*. Revised by A. R. Marsh.

Dolgelly, dol-geth'li: market-town of Wales; capital of the county of Merioneth; on the Wnion, here crossed by a bridge, 46 miles W. of Shrewsbury (see map of England, ref. 9–E). It is in a rich valley at the foot of Cader Idris, and is surrounded by beautiful scenery. It has manufactures of coarse woolens and flannels. Here in 1404 Owen Glendower signed a treaty of alliance with Charles VI. of France. Pop. 4,000.

Dolgoruki: name of one of the oldest princely families of Russia, connected with the present ruling dynasty by the marriage of Maria Dolgoruki to the Czar Michael in 1624, and having at different times exerted great influence in the imperial court. In the reign of Peter the Great the most prominent member of the family was Yakov Federovitch, who served as chief of the first formal embassy sent to France and Spain (1687), fought against the Turks (1696–97), winning honor at the siege of Azov, was captured at the battle of Narva (1700), and held a prisoner for ten years. Upon his release he was made a senator, and held other important dignities till his death in 1720.—Vasili Vladimirovitch, also a soldier and a diplomatist, rose to the rank of major-general, was banished in 1718 for suspected disloyalty, but recalled by Catherine in 1726, and placed in command of the army in the Persian war. Peter II. gave him the rank of field-marshal, but in 1739 he was imprisoned on a frivolous charge. He was released in 1741, and reinstated in his former dignities. D. 1746.—His nephew Vasili conquered the Crimea in a remarkably brief campaign, and received the title of krimskoi from the empress.—Peter Vladimirovitch, author, was born 1807, wrote a number of political works, of which *La vérité sur la Russie* (Paris, 1860) caused his banishment and the confiscation of his estates. He also wrote *La France sous le régime Bonapartiste* (Paris and London, 1864); *De la question du servage en Russie* (Paris, 1861); and *La question russo-polonaise et le budget russe* (Leipzig, 1861). D. at Geneva, 1868. Two volumes of his *Mémoires* were published after his death (Geneva, 1869–71).

F. M. Colby.

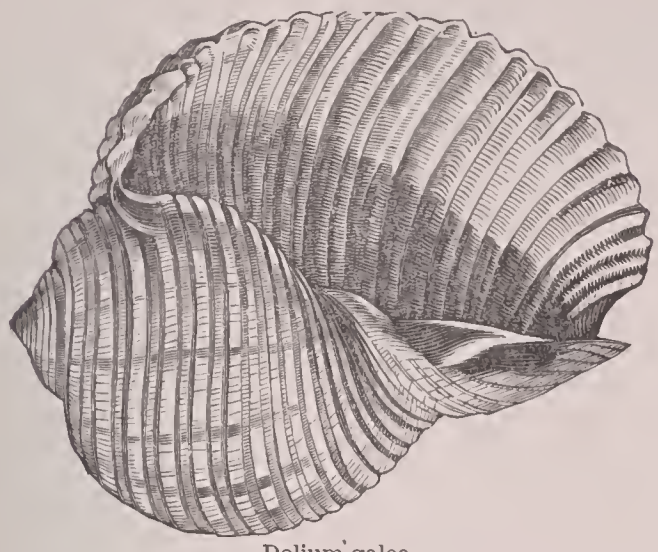
Dolgoruky, Katharina, Princess: favorite of the Czar Alexander II., whose determination to contract a morganatic marriage with her caused much unhappiness in his family. The marriage nevertheless soon followed the death of his first wife, Marie. After the czar's assassination the princess lived at Geneva, and published, in 1882, under the pseudonym of Victor Laferté, *Alexander II., Détails inédits sur sa vie intime et sa mort*.

Dolichocephal'ic [from Gr. δολιχός, long + κεφαλή, head]: long-headed; applied to human skulls which have the occipito-frontal diameter (that from the back to the front) much in excess of the transverse diameter. The native Australians and West African races afford extreme examples of this form of skull. Those skulls which have a relatively short occipito-frontal diameter are called *brachycephalic*—i. e. short-headed. Examples of both forms here noted are found among the remains of the prehistoric races of Europe. Which of the two types belongs to the earlier period is an unsettled question. Among the historic peoples of Europe the dolichocephalic form prevails among the Indo-European varieties, and the brachycephalic among the Finnic. See Wilson, *Prehistoric Annals of Scotland*, and Lubbock, *Prehistoric Races*, pp. 90–116.

Dol'ichos [Gr. δολιχός, long—in allusion to the length of the pods]: a genus of leguminous plants, allied to *Phaseolus*. They are natives of the East and West Indies, where the pods and seeds are used as food. The Chinese sauce called soy is made from the *Dolichos soya*, or soy bean, and the tuberous roots of some species are eaten in China. Other species are cultivated for the beauty of their flowers.

Do'lium [Lat., a large cask or jar]: a genus of gasteropod mollusks of the family *Doliidæ*, having spirally

furrowed shells, which suggest the hoops of a barrel. Some fourteen living species are found in the warm seas of the



Dolium galea.

eastern hemisphere, and several fossil ones, mostly from the Tertiary.

Doll [clip-form for *Dorothy*, cf. *Dolly*]: a toy made in the image of a child. Dolls have been in use from the earliest times, and those of the Greek and Roman children were buried with them when they died. Much ingenuity is often displayed in their construction, and some of the modern dolls can creep, walk, talk, and swim. Large quantities are manufactured in Germany, France, Switzerland, England, and the U. S.

Dollar [from the Low Germ. form of *Thaler*, a clip-form of *Joachimsthaler*, adjec. applied to name of coin, and denoting the place, i. e. Joachim's *dale* (in Bohemia) whence silver was obtained (fifteenth century)]: a gold or silver coin of different values current in the U. S., Canada, parts of Spanish America, and several countries of Europe. In the monetary system of the U. S. it is the unit of account. It was coined exclusively in silver until 1849, when the coinage of gold dollars was authorized. Its value was originally the same as that of the Spanish piaster of eight reals, but is now somewhat less. The law of 1837 fixes the weight of the silver dollar at 412½ troy grains, of which 371¼ are pure silver. The so-called trade-dollar, created by the act of 1873, weighed 420 grains, but it has not been coined since 1883. The further coinage of the standard silver dollar was prohibited by the act of 1873, but was resumed in 1878 under the Bland-Allison bill of that year, and was continued by the act of July 14, 1890, providing that the Secretary of the Treasury shall "purchase from time to time silver bullion to the aggregate amount of 4,500,000 ounces, or so much thereof as may be offered in each month." In accordance with the terms of this act, 4,898,369.18 fine ounces, costing $4,584,826.60, were coined into 6,333,245 silver dollars. The bullion value of the silver dollar at the average price of silver was $1·004 in 1873, but steadily depreciated till it stood at .724 in 1889. In 1890 it rose to .809, but fell to .674 in 1892, and has since declined. The market value of bar silver on June 16, 1893, was 83⅞ cents an ounce. The gold dollar weighs 25·8 grains = 1·672 grammes, and in exchange with Great Britain is usually estimated at 4*s*. 2*d*. The standard fineness for both silver and gold for coinage is nine-tenths, one-tenth being alloy. The British standard of fineness is eleven-twelfths for gold, and thirty-seven-fortieths for silver. Half-dollars, quarter-dollars, and dimes are coined in silver, and a silver half-dime was coined before 1873. This subsidiary silver currency is legal tender for amounts not exceeding five dollars. The gold coins of the U. S. are legal tender for all sums. They are double-eagles, eagles, half-eagles, and quarter-eagles, valued respectively at twenty, ten, five, and two and a half dollars; and there are also one-dollar pieces. In Canada the unit of account is also the dollar, though no dollars are coined. The German thaler has different values. The most current, that of Prussia, is worth seventy-five cents. For the relative value of the world's coins, see Coinage. See also Rixdollar, Silver Coinage, and Money.

Revised by F. M. Colby.

Dollar-bird: a bird (the *Eurystomus pacificus*) belonging to the family *Coraciidæ* popularly known as rollers. It is found in Australia, and is called dollar-bird by the colonists on account of a conspicuous, rounded, white mark on the open wing. Like all the rollers the dollar-bird is brightly colored, being marked with blue, brown, and green. F. A. Lucas.

Dol'lart, The: a gulf of the German Ocean; at the mouth of the river Ems, between Hanover and Holland. It is 8 miles long and 7 miles wide, and was formed by inundations (1277–1362).

Döl'linger, Johann Joseph Ignaz: German divine and leader of the Old Catholic movement; b. at Bamberg, in Bavaria, Feb. 28, 1799. He received priestly orders in 1822, and almost immediately after became chaplain in the dioeese of Bamberg. *The Doctrine of the Eucharist during the First Three Centuries* was published by him in 1826, and in that year he became Professor of Church History in the University of Munich. The substance of his lectures there appeared in 1828 in his *Manual of the History of the Church*, and again, more extended, in his *Treatise on the History of the Church* (1838). He turned his attention to politics in 1845, and represented the University of Munich in the Bavarian Parliament. In 1849, when a delegate to the Diet of Frankfort, he voted for the absolute separation of the Church from the state. In 1861 he delivered lectures advocating the abandonment of the temporal power by the holy see. He published *Origins of Christianity* (1833–35); *The Religion of Mohammed* (1838); *The Reformation, its Interior Development and its Effects* (3 vols., 1846–48); *A Sketch of Luther* (1851); *Hippolytus and Callistus, or the Roman Church in the First Half of the Third Century* (1854; Eng. trans., Edinburgh, 1876); *The Gentile and the Jew in the Courts of the Temple of Christ* (1857; Eng. trans., 2 vols., 1862); *The First Age of Christianity* (1860; 2d ed., 1868; Eng. trans., 2 vols. 1866); *The Church and the Churches, or the Papacy and the Temporal Power* (1861; Eng. trans. 1862); *Papal Legends of the Middle Ages* (1863; n. e. by J. Friedrich, Stuttgart, 1890); *Essay on the Prophetic Spirit and the Prophecies of the Christian Era* (Eng. trans., New York, 1872). Dr. Döllinger in particular obtained wide fame by his opposition to the decrees of the Vatican Council, and particularly to that one declaring the infallibility of the pope when addressing the Church *ex cathedrâ* on questions of faith and morals. He published on this subject the pamphlets *A Few Words on the Infallibility Address* and *The New By-laws of the Council* (1870), and he was, with Profs. Huber and Friedrich, author of *The Pope and the Council* by Janus (1869; Eng. trans., London and New York, 1869), one of the most important works published against papal infallibility, and with Huber *Letters from Rome on the Council* by Quirinus (Eng. trans. 1870). As he emphatically declined to submit to the decrees of the Vatican Council, he was, on Apr. 17, 1871, formally excommunicated by the Archbishop of Munich. On July 29, 1871, he was elected rector of the University of Munich, receiving 54 out of 63 votes cast. He took a leading part in the Old Catholic congresses of Munich (1871) and Cologne (1872). In the former he showed himself opposed to the measures adopted by the majority for effecting a permanent ecclesiastical organization of the Old Catholics; in the latter he was elected chairman of a special committee on the reunion of the Christian churches, a subject to which he devoted a special attention. He was for years a member of the first chamber of the Bavarian Diet. D. in Munich, Jan. 10, 1890. In 1872, in the interest of a union of Greek, Anglican, and Old Catholic Churches, he published *Lectures on the Reunion of the Churches* (1872), and participated in the Bonn conferences of 1874 and 1875. His last publications included *Collection of Documents for the History of the Council of Trent* (1876); *The Autobiography of Cardinal Bellarmin* (1887); *History of the Ethical Controversies in the Roman Catholic Church since the Sixteenth Century, with Contributions to the History and Characteristics of the Jesuits* (1889); *Contributions to the History of the Sects of the Middle Age* (1890, 2 vols.). See Louise von Kobell's *Conversations of Dr. Döllinger* (London, 1892), and his *Life* by E. Michael (Innsbruck, 1892).

Revised by Samuel Macauley Jackson.

Dol'lond, John, F. R. S.: optician; b. in London, England, June 10, 1706; was a silk-weaver in his youth, and employed his leisure hours in the study of sciences and languages. In 1752 he became a partner of his son Peter (b. 1730; d. July 2, 1820) in the business of optician. They made telescopes of superior quality. John Dollond invented the achromatic telescope, for which he received the

Copley medal of the Royal Society in 1758. D. in London, Sept. 30, 1761.

Dolly Varden: common name of a trout, the large charr (*Salvelinus malma*); found in all the clear, cold rivers of the Pacific-coast region from about Mt. Shasta northward to Kamtchatka. The species is similar to the brook trout of the Eastern U. S. (*Salvelinus fontinalis*), from which it is best distinguished by the fact that the red spots which are characteristic of all the group of charrs are found on the back of the fish as well as the sides, while the olive-colored marblings which are found on the Eastern fish are wanting. It is a gamy fish, and sometimes reaches a weight of 12 lb. Besides Dolly Varden, which Prof. Baird, U. S. fish commissioner, chose to retain as the permanent popular name when the fish was sent him for examination, this trout is called in Oregon bull trout, and by the Russians farther north malma or golet. DAVID S. JORDAN.

Dol'men [a word of Keltic origin, meaning table-rock; cf. Breton. *dol*, table, and Welsh *maen*, rock]: in archæology, the framework of a chambered cairn, consisting of two or more unhewn stones placed erect in the ground supporting a large stone which serves as a roof. Formerly in England such a structure was called a CROMLECH (*q. v.*). Kits Coity House, near Aylesford, in Kent, England, is a dolmen composed of four large blocks. In France, where dolmens are very numerous, the term is applied to the whole construction of the cairn, including the covering of earth and stones. See CAIRN.

Dolomieu, dō'lō'mi-ö', DÉODAT GUI SYLVAIN TANCRÈDE GRATET, de: mineralogist; b. at Dolomieu, in Dauphiny, France, June 24, 1750. He joined the order of the Knights of Malta in his youth, and having returned to France in 1791 made a study of the geology of that country, and wrote several treatises, which were inserted in the *Journal de Physique*. He was one of the savants who accompanied Bonaparte to Egypt in 1798; was thrown into a prison by the Neapolitans in 1799, and released the following year; became Professor of Mineralogy in the Museum of Natural History. D. Nov. 26, 1801. See Lacépède, *Notice historique sur la Vie de Dolomieu* (1802).

Dolomite (named in honor of the savant Dolomieu): a mineral, called also *magnesian limestone*, consisting of carbonate of lime and carbonate of magnesia in variable proportions, which are sometimes nearly equal. Its crystals are usually rhomboidal. Dolomite is extensively used as a building-stone, and is converted into good lime by burning. It is abundant in all parts of the world. A cleavable variety is called bitter spar. See LIMESTONE.

Dolo'res Hidal'go, formerly **Dolores**: a city of Mexico; in the northern part of the state of Guanajuato, near the Rio de la Laja (see map of Mexico, ref. 6–G). It is in the *tierra fria*, or cold lands; the hills of the vicinity contain numerous silver mines, now mostly abandoned, and other minerals occur. Dolores was founded as a mission village late in the sixteenth century. It is noted as the birthplace of Mexican independence. On Sept. 16, 1810, the curate, Miguel Hidalgo y Costilla, and others gave the signal of revolt against the Spaniards, called the *Grito de Dolores*. Pop. (1889) 7,220. HERBERT H. SMITH.

Dolph, J. H.: animal and genre painter; b. at Fort Ann, N. Y., Apr. 18, 1835; pupil of Louis van Kuyck, Antwerp, and studied in Paris 1880–82: associate National Academy, N. Y. His pictures of cats and kittens are popular and well known to collectors. Studio in New York. W. A. C.

Dolph, JOSEPH NORTON: politician; b. at Dolphsburg, N. Y., Oct. 19, 1835; educated in the common schools and in Genesee Wesleyan Seminary, Lima, N. Y.; studied law at Havana, N. Y.; admitted to the bar 1861; orderly sergeant in Crawford's Company, raised for protecting emigrants to the Pacific coast against hostile Indians, 1862; settled in Portland, Ore., Oct., 1862; member of Oregon State Senate in 1866, 1868, 1872, and 1874; of U. S. Senate (Republican) 1883–95. D. in Portland, Ore., Mar. 10, 1897. C. H. T.

Dolphin [O. Fr. *dolphin* (> Mod. Fr. *dauphin*) < Lat. *delphi'nus*, from Gr. δελφίς, -ῖνος, dolphin]: a cetaceous mammal of the Atlantic Ocean (*Delphinus delphis*); the dolphin of the classic poets. It is 6 or 8 feet in length, and very active in its habits. There are many similar species known as dolphins in various parts of the ocean. The dolphin or *Dorado* of modern sailors, the beauty of whose colors when dying is so celebrated, is a true fish, the *Coryphæna hippurus*, abounding in the warmer parts of the Atlantic, where it wages incessant warfare against the flying fish and other inhabitants of the sea. It is often eaten, although the flesh is rather dry and said to be sometimes poisonous. The change of color in the dying dolphin consists merely in the fading of the beautiful golden green of life to the dull leaden hue of death, a change which takes place very quickly, the paling being occasionally interrupted by a flush or momentary increase of color. This phenomenon is seen in most brightly colored fishes, and in the case of the dolphin it has become considerably exaggerated by the repetition of the story. It is due to the withdrawal of blood from the pigment cells, or chromatophores, the temporary access of color being produced by a temporary increase of circulation caused by muscular effort. See DELPHINIDÆ.

Dom, or **Don** [Span. < Lat. *domine*, vocat. of *dominus* > Span. *dueño*: Ital. *donno*; O. Fr. *dans*, whence Mid. Eng. *Dan*, as used e. g. by Chaucer]: a title originally assumed in the Middle Ages by the popes. It was afterward borne by bishops, and sometimes given to monks, as Dom Calmet and Dom Mabillon. In Portugal the title *dom* is confined to the king and his family. The Spanish *don* was formerly a title confined to noblemen, but is given by courtesy as indiscriminately as the English *Mr.* In the U. S., Roman Catholic dignitaries of German origin have the title *dom*.

Domain [Fr. *domaine*: Ital., Span. *dominio* > Lat. *domi'nium*, sovereignty, dominion]: empire, authority; the territory over which authority is exercised; landed estate; an estate which a person has in his own right; that portion of the territorial possessions of a lord which he retains in his own occupation, sometimes called DEMESNE (*q. v.*). The term *domaine* is applied in France to public property in general. The public land belonging to the Government or people of the U. S. is often called the public or national domain.

Domain, Eminent: See EMINENT DOMAIN.

Domas y Valle, dō'maäs-ĕĕ-vaal'yā, JOSÉ: Spanish naval officer; b. at Cartagena about 1717. He entered the navy in 1737, and in 1743 had attained the rank of chief of squadron, taking part in many actions on the coasts of Spain Italy, and at Oran. Subsequently he commanded fleets in the West Indies during the war with England 1778–1780, distinguishing himself by safely convoying the treasure ships from Vera Cruz to Havana, despite the English fleet of Rodney which lay in the way. He took part in the capture of Pensacola in 1781, and the siege of Gibraltar in 1784. From 1786 to 1794 he was governor of Panama, and from 1794 to July, 1801, captain-general of Guatemala. D. at Guatemala city, Oct. 9, 1803. HERBERT H. SMITH.

Domat, dō'maa', JEAN: jurist; b. at Clermont, in Auvergne, France, Nov. 30, 1625. He was a friend of Pascal and other recluses of Port Royal. He officiated for many years as king's advocate at Clermont, and published an important systematic work entitled *The Civil Laws in their Natural Order* (1689), for which he received from Louis XIV. a pension of 2,000 livres. It is one of the most important of French legal writings. His selection from Justinian's laws was posthumously published under the title *Legum Delectus*, and subsequently appended to his former work. D. in Paris, Mar. 14, 1696. See E. Cauchy, *Études sur Domat* (1852).

Dombrowski, dom-brovs'kĕĕ, JOHN HENRY: soldier; b. in the palatinate of Cracow, Aug. 29, 1755. He fought against Russia in 1792, under Poniatowski, and again in 1794 when Kosciusko raised the standard of national independence. In 1796 he entered the French service, and having been authorized to organize and command a Polish legion in Italy, he passed into the service of the Cisalpine republic, 1797. In 1806 he raised an army of 30,000 Poles to fight for Napoleon, and distinguished himself at the siege of Dantzic and at the battle of Friedland, in which he was wounded. He gained a victory at Dirschau in 1809, and took part in the Russian campaign of 1812. D. June 6, 1818.

Dombrowsky, JAROSLAV: soldier; b. at Cracow in 1826; served first in the Russian army, and was in 1862 compelled to flee in consequence of having participated in the Polish insurrection. He is also accused of having been a counterfeiter and a traitor to the Poles. He formed a Polish legion in the beginning of the Franco-German war, was on Apr. 8, 1871, appointed to the command of the insurgent troops at Asnières, and on May 9 succeeded Rossel as commander-in-chief of all the forces of the Paris Commune. D. May 23, 1871, having been mortally wounded the day before.

Dome [O. Fr. *dome*, town-house, cupola > Mod. Fr. *dôme*, cupola : Ital. *duomo*, cathedral < Lat. *domus*, house, in sense "house" displaced in Romance languages by *casa* and *man'sio*]: a hemispherical or nearly hemispherical vault or roof rising above the rest of a building, as in many Italian churches. It may be either circular or polygonal in plan, and its section may be semicircular, semi-elliptical, or like a pointed arch. The Romans were the first to erect large domes, and that of the Pantheon at Rome, 140 feet in diameter (probably dating from the time of Trajan), has never been surpassed. Domes were also used on some of their circular temples, and over the circular halls of their thermæ. The Byzantines first applied the dome to ecclesiastical structures, and made it a distinctive feature of their architecture. The dome of Santa Sofia at Constantinople (538 A. D.) is the earliest known example of a dome supported on four arches by means of *pendentives*. (See PENDENTIVES.) Rarely used in the Middle Ages, except in the Byzantine empire, the dome became a favorite feature of Renaissance church architecture (Duomo at Florence; St. Peter's at Rome; St. Paul's, London). Other modern domes are those of the Invalides and Panthéon at Paris, and of the Capitol at Washington, the most important in America. In many cases the dome seen outwardly is a mere shell, supported by the inner dome, or by the walls; thus in that of St. Paul's, in London, a cone of brick built around the inner dome and a complicated timber construction support the outer shell with its lantern. Domes are frequent in the Mohammedan architecture of Turkey and India. See CUPOLA.

Revised by A. D. F. HAMLIN.

Dome-book, Doom-book, or **Dom-boc** (in Lat. *Liber Judicialis*): a code of laws compiled by King Alfred, and ratified by the witan (wise men), gathered from the Kentish collection of Ethelbert, the Mercian laws of Offa, and the laws made by his own ancestor, Ina. The original text is said to have been extant in the reign of Edward IV., but is now lost. Alfred made few original laws, but collected what seemed to him to be good of those already existing. The code begins with an introduction reciting the Mosaic laws (including the Ten Commandments) and passages from the New Testament. It is marked by an evident zeal for justice, and shows a growth of the country in civilization; most were offenses punishable by fines. The laws of England, up to the time of the Norman conquest, were administered in the vernacular speech of the people.

Revised by F. STURGES ALLEN.

Domenichino, dō-men-ĕē-chee'nō (*Domenico Zampieri*): painter; b. at Bologna, Italy, Oct. 21, 1581; a pupil of the Caracci and of Denis Calvaert; painted sacred subjects, of which the *Communion of St. Jerome*, at the Vatican, is considered his masterpiece. His work is powerful in handling, but purely academic and devoid of any form of inspiration or refinement. His reputation and that of his masterpiece belong to a time when the standard of taste was purely artificial and rested on the most superficial qualities of art. D. in Naples, Apr. 15, 1641. W. J. STILLMAN.

Domesday Book, or **Doomsday Book**, or frequently simply **Domesday** [so called because it is a final authority in certain matters]: an ancient record of England containing a survey and statistical account of the state of that country, made by direction of William the Conqueror, and finished in the year 1086. Several of the northern counties were not included in this account. This work is very comprehensive and minute, and forms the basis of all historical accounts of those times. The principal matters of which it treats are the classes of persons in the realm, the different descriptions of land (arable, wood, meadow, etc.), the denominations of money, the territorial jurisdictions and franchises, varieties of tenures, ecclesiastical matters, historical and other particular events, and a few illustrations of ancient manners. By means of it the king acquired an exact knowledge of the possessions of the crown, and ascertained the number of the landholders, the military strength of the country, and the best sources of an increase of revenue. To the people the *Domesday Book* furnished a record by which might be tried questions as to whether land was held by ancient demesne or not. The original *Domesday Book* is preserved among the records in the exchequer at Westminster, and consists of two volumes, one a large folio (called the "great" *Domesday*), and the other a quarto (called the "little" *Domesday*). It was the first great English record to be published at the cost of the nation, and appeared in two folios, printed with type cast for the purpose. It was ten years passing through the press, being completed in 1783; and later supplementary records have since been published, including *A General Introduction to Domesday Book*, by Sir Henry Ellis (1833). Several other English records are known as *Domesdays*, such as the registers of the visitations and inquisitions made by the dean and chapter of St. Paul's, London (1181–1222), which were published in 1857 by the Camden Society.

Revised by F. STURGES ALLEN.

Domestic Animals: such animals as are reared by man for his own use, and at the same time tamed and familiarized to some extent with man's presence; but the mere taming of an individual member of a species is not enough to insure true domestication, which implies a course of breeding for many generations. The more important domestic animals are the ox, buffalo, yak, sheep, goat, reindeer, camel, llama, alpaca (ruminants), the horse, ass, elephant, swine (pachyderms), rabbit, guinea-pig (rodents), dog, cat, ferret (carnivora), and of birds, the hen, turkey, peacock, guinea-fowl, pheasant (gallinaceous birds), goose, duck, etc. (natatores), besides the pigeons and various songbirds. The breeding of fishes for food is not true domestication. The wonderful changes of form, habit, and temper observed in various breeds of the dog, and the still more remarkable variations in the form of pigeons, are adduced by many naturalists to prove the mutability of species. For a discussion of the question in this aspect, see Darwin, *The Variation of Plants and Animals under Domestication* (1867); also DARWINISM and EVOLUTION.

Domett, ALFRED: poet; b. in Surrey, England, May 20, 1811; educated at St. John's College, Cambridge; traveled in America for two years, and on his return, about 1836–37, contributed a number of poems to *Blackwood's Magazine*. After two more years of travel on the Continent he was called to the bar (1841), but in the following year emigrated to New Zealand, where he was among the first settlers. He held important offices in the colonial government, and for his services was created C. M. G. Retiring from public life in 1871 he returned to England and devoted himself to literature. He is thought to be the original of Browning's poem of *Waring*. The best known of his poetical writings are *Ranolf and Amohia, a South-Sea Day Dream* (1872); *Flotsam and Jetsam, Rhymes Old and New* (1877); *Venice* (1839). In prose he wrote a *Narrative of the Wairau Massacre* (1843) and some works on the laws and politics of New Zealand. D. Nov. 2, 1887.

Domeyko, IGNATIUS: scientist; b. at Niedzviadka, government of Minsk, Lithuania, July 31, 1802. He studied at the University of Wilna. Involved in the Polish revolt of 1830, he was compelled to leave the country, finally taking refuge in Paris, where he continued his scientific studies in the School of Mines. Subsequently he was engaged in mining work in Alsatia until 1838, when he accepted employment with the Government of Chili. His services to that country can hardly be overestimated; besides being the acknowledged leader of scientific research, his influence in introducing advanced methods of mining and in developing the riches of Chili was very great. He founded a school of chemistry and mineralogy at Coquimbo; was Professor of Mineralogy and Geology in the University of Santiago from 1839, held various other offices in that institution, and became rector in 1867. Among his published works are *La Araucania y Sus Habitantes* (Santago, 1845), the result of a journey which he made to the country of the Araucanian Indians; a volume of travels in Chili, in the Polish language; and a great number of papers and pamphlets on geology, mineralogy, meteorology, etc. D. in Santiago, Jan. 23, 1889. HERBERT H. SMITH.

Domicile [from Lat. *domicilium*, abode, deriv. of *domus*, house]: a mansion; a place of permanent residence; in law, the place where a person has his home or his legal place of abode.

A distinction must be taken between residence and domicile. A person may have two or more residences, but can have only one domicile. A domicile may be said to be the place where a person has his true fixed and permanent home and principal establishment, and to which, whenever he is absent, he has the intention of returning. A domicile may be acquired in three ways—by birth, by choice, or by operation of law. Domicile acquired in the first mode is frequently called "domicile of origin." When of choice, it must consist both of an act and an intent. A mere intent to acquire a domicile will have no effect. Nor will a

prolonged residence in a particular place constitute a domicile, unless accompanied by an intent to acquire it. Domicile is acquired by operation of law when it is a consequence of certain legal relations, as in the instance of a wife. The rules affecting domicile have much importance in international law, whether public or private, and for this purpose it may be distinguished into domestic and national. Questions concerning the validity of marriages and divorces, the execution and construction of wills, and succession to estates, frequently depend on the law of domicile.

The leading rules governing domicile are these: 1. The domicile of origin continues until a new one is acquired. The same rule of continuance applies to successive domiciles. 2. A person having legal capacity may, in general, change his domicile at will. Persons under legal disability, such as minors and lunatics, have no such power. The domicile of a minor is in general that of his parents or guardian. 3. The law in some cases fixes the domicile of a person at the place where the person is under a duty to reside. Under this rule the holder of an office may be domiciled at a place where official duty requires him to reside. On the same principle the wife's domicile follows that of the husband, though this rule is modified in matters of divorce. 4. To change one's domicile there must be both an intent and an act. The intent may be inferred from a variety of circumstances, and in some instances the inquiry ranges over a period of many years. Under this rule an enforced sojourn in a place will not in general constitute a domicile. See INTERNATIONAL LAW, PRIVATE.

T. W. DWIGHT.

Dominant [from pres. partic. *dominans* of Lat. *domina're*, rule]: in music, the fifth tone of the scale. The dominant is the ruling tone of the key, and next in importance to the first tone of the scale. See CADENCE.

Dominant Tenement: in the law of easements or servitudes, the tenement in favor of which the easement is created. See EASEMENTS.

Domingo, Santo: See SANTO DOMINGO.

Dom'inic (Sp. *Domingo de Guzman*), SAINT: founder of the order of Dominicans; b. at Calahorra, in the diocese of Osma, Old Castile, in 1170; d. in the monastery of St. Nicholas, at Bologna, Aug. 6, 1221. He studied theology in the University of Palencia, and was in 1195 made a canon of the chapter of Osma. In that position he distinguished himself by his zeal for the reform of canonical life and by his success as a missionary among the Mohammedans in the neighborhood. In 1204 he was chosen to accompany the Bishop of Osma on a diplomatic errand, and on that occasion he came into contact with the Albigenses of Southern France. The ecclesiastical situation in those regions was rather critical at that moment. The Cistercians, who had been sent to convert the Albigenses, gave up the task in despair and retired. Dominic, supported by a small brotherhood of followers, took it up and began preaching. He was not more successful than the Cistercians, but he was more persistent. Innocent III. proclaimed a crusade against the Albigenses after his legate, Peter of Castelnau, had been murdered, 1208, by a partisan of the Count of Toulouse, who was favorable to them. In 1233 the disciples of Dominic were given charge of the Inquisition instituted to put down the heresy. (See DOMINICANS and INQUISITION.) After the successful close of the crusade, Dominic determined to transform the brotherhood into a monastic order, silence, poverty, fasts, complete abstinence from flesh, linen clothes, and perpetual preaching against heretics being the vows. Innocent III., because the councils of that period discouraged the establishment of new orders, barely allowed it to be founded. His successor, however, Honorius III., was more favorable. He confirmed the order (1216) and gave it great privileges. Monasteries were founded at Metz and Venice, and Dominic himself, having preached during a visit to Rome to the papal household and made a great impression, was appointed *magister sacri palatii*, or court-preacher, to the pope—an office which is still held by a Dominican. Nevertheless, the new order would not grow, and it was not until 1219 that Dominic, being present at a chapter-general held at Assisi by the Franciscans, discovered the highway to success. At the chapter-general held by the Dominicans at Bologna in 1220 they declared for complete or absolute poverty, renouncing the possession of property in any form or shape, and adopting daily begging for the means indispensable to the sustenance of life. That proved the key to the popular sympathy, and when the next chapter-general was held (Bologna, 1221), sixty monasteries were represented, and members were sent to distant places to make preparations for new foundations. Thus Dominic lived to see his undertaking in a fair way to success. Thirteen years after his death he was canonized by Gregory IX. (1234). His *Life* was written by Jordanus, his successor as general of the order (Lacordaire, Paris, 1840, and Caro, Paris, 1853).

Revised by JOHN J. KEANE.

Dominica: a British West Indian island, about midway between Guadeloupe and Martinique; crossed by lat. 15° 15′ N.; 30 miles long by 11 in greatest width; area of about 290 sq. miles (see map of West Indies, ref. 7–M). It is mountainous throughout, and the peaks are the highest in the Lesser Antilles—the Morne Diablotin (5,340 feet) is the culminating point, the Tres Pitones measures 4,660 feet, and there are many lesser mountains. There are no volcanoes which have been active within historical times, but evidences of volcanic action are very apparent. Several hot springs are known, some of them impregnated with sulphurous acid; the largest, called the boiling lake, occupies a hollow which is supposed to be an extinct crater. The coasts, in great part, are sheer precipices, the harbors are mere roadsteads, and the island is one of the poorest and most thinly peopled of the Antilles. The valleys have been utilized for sugar-planting, the chief industry of the island. Latterly cocoa-planting has risen in importance. Dominica is one of the "Leeward Islands" colony, the central government being at Antigua. The local government consists of an administrator, an executive council, and a legislative council of seven nominated and seven elected members. The island was named by Columbus in allusion to his discovery of it on Sunday (Domingo), Nov. 3, 1493. It was then, and for a long time after, inhabited only by Carib Indians. It was first settled by the French early in the seventeenth century, taken by the English 1759, retaken by the French 1778, and restored to the English by the peace of 1783. A few descendants of the ancient Caribs still live on the island, occupying a small reservation. Pop. (1892) 29,500. Capital, principal town, and port, Roseau, or Charlottetown. See Ober, *Camps in the Caribbees* (1886); Coke, *History of the West Indies* (vol. ii., 1810).

HERBERT H. SMITH.

Domin'ical Letter [*dominical* is from Lat. *domi'nica*, Sunday (for *dominica dies*, Lord's day) > Ital. *domenica*: Fr. *dimanche*; Span. *domingo* < *dominicus* (*dies*)]: in calendars, the letter used to denote Sunday. The Romans used the first eight letters of the alphabet (A to H) to mark the consecutive days of their recurring nundinal period. The early Christians adopted the same plan for marking the days of the week, dropping the last one (H) as unnecessary. In the Church calendar A has always stood for the first day of January, B for the second, and so on. G therefore marks the seventh day, and the cycle begins again with A on the eighth. A returns in like manner on the 15th, the 22d, and so on. Each day in the year has thus its calendar letter, and the letter which falls on Sunday is called the *dominical letter* of the year. Feb. 28 has always the letter C, and Mar. 1 has always the letter D. Feb. 29 in leap-year has therefore no letter provided for it, and this makes a change in the Sunday letter after February, so that in leap-year there are two dominical letters. As the common year contains fifty-two weeks and one day, the dominical letter changes from year to year, going backward one place for every common year and two places every leap-year. This mode of representing the days of the week has been uninterruptedly employed in the calendar of the Church throughout the world from the earliest ages of Christianity.

Dominican Republic (Sp. *República Dominicana*): a country occupying the eastern and larger part of the island of Santo Domingo, in the West Indies. Area calculated at 18,045 sq. miles. The boundary with Haiti is uncertain and liable to change. For physical features and early history, see SANTO DOMINGO.

Population.—Officially estimated in 1888 at 610,000, which is probably too high. The events which led to the establishment of a French colony in the western part of the island did not greatly affect the eastern portion. It long remained under the rule of Spain, and the Spanish language and customs were preserved. Comparatively few African slaves were introduced. Hence the richer and more influential class in the Dominican Republic is largely composed of descendants of Spaniards, more or less mixed with Indian, and, to some extent, with Negro blood. The mass of the

population is a mixed race, with white, Indian, and African blood in about equal proportions, and there are comparatively few pure blacks. Slavery was abolished in 1795. Spanish is the common language everywhere, though French and English are also used in the coast towns. The chief cities are Santo Domingo, the capital, with 14,150 inhabitants; Puerto Plata, the principal port, with 15,000; Santiago, 8,000; La Vega, 10,000; and Samaná, 2,000.

Government.—Theoretically a constitutional republic. The president and vice-president are now chosen for four years by universal suffrage, and are eligible for immediate reelection. The president is assisted by a cabinet of five ministers. Congress consists of a single house of twenty-two members—two from each province and maritime district. They are elected by popular vote, the suffrage in this case being restricted. The six provinces and five maritime districts are administered by governors appointed by the president. The highest judicial power lies in a supreme court. The state religion is the Roman Catholic, but other cults are permitted, with certain restrictions. The mass of the population is still very ignorant, though considerable improvements have been made in public instruction. Primary education is now free and obligatory, at least in theory. There are over 300 municipal schools for primary instruction, with about 10,000 pupils, superior, technical, and normal schools, and a professional school having the features of a university. The republic supports about forty newspapers, mostly very small sheets, and a number of small libraries, museums, etc.

Finances.—The total foreign and internal debt, including unpaid interest, was, on Jan. 1, 1899, about £8,000,000. The revenue and expenditure in 1899 was about £680,000. The revenue is derived chiefly from customs duties levied on both imports and exports, and in many cases are so heavy as to be practically prohibitory. On July 1, 1897, the U. S. gold dollar was adopted as the standard of value, but only a debased silver coinage and depreciated paper money are in circulation. By an arrangement made early in 1893, the American Santo Domingo Improvement Company assumed control of the custom-house on Mar. 1 of that year, agreeing to pay from the receipts the interest on $6,500,000 of the foreign debt, to provide $90,000 per month for the budget, and to finish, in conjunction with the government, the railroad from Puerto Plata to Santiago. The company claims that by careful management the customs receipts may be largely increased.

Industries and Commerce.—Agriculture, grazing, and forestry are almost the only industries. It is stated that five-sixths of the land is fit for cultivation, but only a small portion is utilized, and that in a very primitive and slovenly manner. The chief agricultural products are tobacco, coffee, cacao, sugar, a little cotton, and maize, beans, and manioc for home consumption. Large herds are kept on the open lands, running almost wild. They are used only for their hides and meat. Logwood, lignum-vitæ, satinwood, mahogany, and fustic are obtained in the forests. The exports in 1898 were valued at $5,789,997, the principal items being tobacco, coffee, sugar, hides, and cabinet woods. The imports for the same year were officially stated at $1,696,280. More than half the trade is with the U. S. The circulating medium consists mainly of silver coins from Spain, Mexico, the U. S., France, and England. The French metrical system of measurements is legal, and is coming into general use. A railroad has been completed from Samaná to La Vega, 72 miles, and is being carried on to Santiago; another, from Puerto Plata to Santiago, 45 miles, was opened in Aug., 1897. There are 430 miles of telegraph, and the island is connected with Europe by the cable of the French Submarine Telegraph Company.

History.—The revolt of the Negroes and mulattoes in the French part of the island, 1791–97, did not extend to the eastern districts, which remained faithful to Spain. But in 1795 Spain, by treaty, transferred the whole island to France, and French troops occupied Santo Domingo city. They were driven out by Toussaint Louverture Jan. 2, 1801, and for a time the whole island was an independent country under his rule. In 1802 it was again occupied by the French, and, though they were soon driven from the western part, they remained masters of the east until 1809, when Santo Domingo and Samaná were taken by the English and turned over to Spain. The Spanish rulers, by their tyranny and weakness, provoked a revolt. Boyer, president of Haiti, aided by the rebels, occupied Santo Domingo in 1822, and the whole island was again united in the republic of Haiti. The deposition of Boyer in 1843 was followed by a revolution in the east, and on Feb. 27, 1844, the entire eastern or Spanish-speaking portion of the island formally separated from Haiti, taking the name Dominican Republic. In the war for independence which followed Gen. Pedro Santana was the principal leader of the Dominicans, and the Haitians being defeated he was elected first president. He resigned in 1848. His successor, Zimenes, was a weak man, and is said to have invited an invasion of the Haitian leader, Soulouque; but the country flew to arms under the old leader, Santana, and Soulouque was defeated at Ocoa, Apr. 21, 1849. Zimenes was then deposed and Buenaventura Baez was elected president. He was succeeded in 1853 by Santana, who exiled Baez, and in 1856 again defeated the Haitians under Soulouque; but he became unpopular and was obliged to retire, and in 1857 Baez was recalled from exile and again made president. A revolution in 1858 drove Baez out and again made Santana president. Unable to maintain peace, Santana betrayed the country by ceding it to Spain under certain conditions (May, 1861). The Spaniards, once in possession, ignored the conditions, and though at first the people made no resistance to them, the tyrannical acts of some of their officers eventually provoked revolts. Headed by José Maria Cabral the Dominicans drove the Spanish troops out in 1865 and reaffirmed the constitution of 1844 with certain changes. Baez was again called back and made president. He was deposed by Cabral in 1866, but recalled in Mar., 1868; and on Nov. 29, 1869, he signed with President Grant two treaties, one for the annexation of Santo Domingo to the U. S., and the other for the cession of the bay of Samaná, both subject to the approval of the people. The annexation scheme was ostensibly, at least, approved by the people of Santo Domingo; but the Senate of the U. S. refused to ratify it, and though a U. S. commission which visited the island reported favorably on it, nothing further was accomplished. The failure of this scheme led to another revolution and the banishment of Baez. For several years the republic was in a disordered state. In 1886 Gen. Ulisses Heureux, a young man of mixed race, was elected president, and by a change in the constitution he was allowed to be his own successor. Heureux in 1893 entered on his second term, and the country under his rule has been prosperous and orderly, though affected by business depression.

Herbert H. Smith.

Domin'icans (also called *Preaching Friars*): an order of mendicant friars founded by St. Dominic at Toulouse; confirmed by Pope Honorius III. in 1216. They were called Black Friars in England and Jacobins in France, from the Rue St. Jacques (Jacobus), where they first established themselves. In 1216 Honorius III. constituted the order under the rules of St. Augustine, which enjoined almost continual fasts, perpetual silence, and other mortifications. In 1221 the order was introduced into England, and their first establishment made at Oxford. In 1276 the corporation of London granted the order two lanes near the Thames, where a monastery was erected, the neighborhood of which is still called Blackfriars.

The secrets of the immense success of the mendicant and predicant orders were simply their cultivation of poverty and asceticism, which made them accepted by the mass of the people as brethren, and their popular, impressive preaching, which made them the spiritual guides of the masses. Their poverty, however, soon gave way to the necessities of other works than preaching. In 1425 Martin V. recalled the prohibition, so far as the Dominicans were concerned, to possess real estate or other property, and donations and bequests immediately began to pour down upon the order; it has erected some of the most magnificent ecclesiastical buildings in Christendom. To its preaching the order afterward added lectures. In 1228 it obtained a chair of theology in the University of Paris, and in 1230 another. At the beginning of the Reformation the Dominicans were the foremost expounders of theological science, and the strenuous upholders of that form of it, the scholastic, of which Thomas Aquinas had been the master builder.

Among the men of genius and eminent scholars belonging to this order were Thomas Aquinas, Albertus Magnus,

Meister Eckart, Johann Tauler, Heinrich Suso, Savonarola, Las Casas, Vincent Ferrier, and Vincent of Beauvais. It has given to the Church more than 800 bishops, 150 archbishops, 60 cardinals, and 4 popes. The reputation of the Dominicans in history, however, is famous for their connection with the Inquisition. It was in 1233, twelve years after the death of their founder, Dominic, that they were appointed inquisitors. Their principal rivals were the Franciscans, and the two orders for a long time divided between them the intellectual control of the Church. The history of theology, philosophy, and science was for a couple of centuries wholly taken up by the rivalry of the Dominicans and the Franciscans. All mental exertions were absorbed by the controversy between the Thomists and the Scotists. The Jesuits in the sixteenth century gradually took possession of the intellectual supremacy formerly exercised by the Dominicans. Dominican monks and nuns are, however, still found in most countries.

After the discovery of America the order took a prominent part in the evangelizing of Mexico, Peru, New Granada, the islands of the Mexican gulf, Florida, and New Mexico. Las Casas, the champion of the Indians against the cruelty of the Spanish colonists, was a Dominican. They were introduced into California under the Spanish domination. Their first foundation in the U. S. was made in Springfield, Ky., in 1807. Revised by JOHN J. KEANE.

Dominion of Canada: See CANADA, DOMINION OF.

Dom'inis, MARCO ANTONIO, de: an Italian theologian; b. in the isle of Arba, near Dalmatia, in 1566. He became a Jesuit at Padua 1579, and professor of philosophy, and wrote a curious treatise on light, entitled *De Radiis Visus et Lucis in Vitris Perspectivis et Iride* (1611), in which the phenomena of the rainbow were explained for the first time. In 1596 he left the Jesuits, became Bishop of Segni, and in 1598 Archbishop of Spalatro and Primate of Dalmatia. He got out of sympathy with the Roman Church, in consequence fell under the suspicion of the Holy Inquisition, and to escape trial fled to England, professed Protestantism 1616, and was made Dean of Windsor 1617. He wrote *De Republicâ Ecclesiasticâ* (On the Ecclesiastical Republic, 1617) and other treatises against Rome; but he did not feel at home in his new surroundings. His old friends pleaded with him to return, especially Cardinal Ludovici, who had become Pope Gregory XV., and so in 1622 he returned to Italy and the Roman Catholic Church. He gave his reasons, *M. A. de D. sui Reditus ex Anglia consilium exponit* (Rome, 1623; Eng. trans., *My Motives for Renouncing the Protestant Religion*, n. e. London, 1827). Shortly after Pope Gregory died (1623). He then was accused of heresy before the Inquisition, thrown into prison, and ere his trial was finished he died, Sept., 1624. On Dec. 21, 1624, sentence was pronounced; his body was dragged through the streets of Rome, burned by the hangman, and its ashes thrown into the Tiber. SAMUEL MACAULEY JACKSON.

Domin'ium [Lat. sovereignty, deriv. of *do'minus*, master]: in Roman law, full legal right in and to an object, but which could not be conferred by actual possession alone unless such possession had endured for the period of legal prescription.

Domi'tian, or, more fully, **Ti'tus Fla'vius Domitia'nus**: a Roman emperor; b. Oct. 24, 52 A. D.; the second son of Vespasian. He succeeded his brother Titus in the year 81, and began his reign with moderation and apparent respect for justice. In the year 87 he was unsuccessful against the Marcomanni, and soon afterward was defeated by the Dacians, who compelled him to pay tribute; but in spite of his reverses he celebrated a triumph, and assumed the victorious titles of Germanicus and Dacicus. After 93 A. D. he became extremely cruel and suspicious, persecuted the Christians, and caused many innocent persons to be put to death. He banished a number of eminent men and philosophers, including Epictetus. Through the emperor's jealousy the great general Agricola was recalled from Britain. Domitian was assassinated by conspirators in his palace in 96 A. D., and was succeeded by Nerva. See Suetonius, *Domitianus*.

Don: a title. See DOM.

Don (anc. *Tanais*): a river of Russia; rises in the government of Tula, and flows in a general southeasterly direction to Kachalinsk. Below the town it runs nearly southwestward, and enters the northeastern part of the Sea of Azof, near the town of Azof. Its total length is about 1,125 miles. Its navigation is difficult during low water, but when the water is high (i. e. in April and May) vessels can ascend about 600 miles from its mouth. The Don in its upper course is connected by canal and railway with the Volga. In its lower course it is subject to two floods, called respectively the cold water and the warm water, of which the former is caused by the melting of the snow in the country of the Don Cossacks, and the latter by the melting of the snow in the regions of its upper course. When flooded it presents a very lively aspect, a great number of steamboats traversing its waters from its mouth to Kachalinsk, on the Wolga railway. But when the flood subsides, in June or July, navigation almost ceases. The river is generally closed by ice from November or December to March or April, and in rare cases the freezing has taken place in October. At Aksai it remains open 250 days in the year, but at the influx of the Medvieditza only 239.

Don, COUNTRY OF THE: a province of Southeastern Russia; on the lower Don river, N. E. of the Sea of Azof. Area, 61,886 sq. miles. Pop. (1897) 2,575,818. It is a low, level plain, a part of the southern steppe of Russia, alkaline and monotonous in the E., but somewhat diversified in the W., abounding in marshes and lakes, some of them saline. Forests occupy only 2 per cent. of the surface, and the soil is such that it is generally incapable of forestation. The country is devoted to the rearing of cattle, but the vine thrives along the right bank of the Don, though the wine is poor. Fish form an important resource of the province, and considerable salt is produced. The country is well provided with railways. The people are mostly Cossacks. Capital, Taganrog. M. W. H.

Don: a river of Scotland, in Aberdeenshire; rises in Ben Aven, and enters the North Sea a mile from Old Aberdeen. Its general direction is eastward, and its length, including windings, 78 miles. Nearly a mile from its mouth it is crossed by the "Brig o' Balgownie."

Donaldson, EDWARD: rear-admiral U. S. navy; b. in Baltimore, Md., Nov. 17, 1816; entered the navy as a midshipman July 21, 1835. He commanded the steam-gunboat Scioto at the passage of Forts Jackson and St. Philip and capture of New Orleans April 24, 1862, and at the passage of the Vicksburg batteries June 28, 1862; and the steamer Seminole at the battle of Mobile Bay. D. May 15, 1889.

Donaldson, JAMES: educator and author; b. at Aberdeen, Scotland, Apr. 26, 1831; appointed Greek tutor in Edinburgh University 1852; rector of the High School of Stirling 1854; classical master (1856) and rector (1866) of the High School of Edinburgh, and Professor of Humanity 1881. In 1890 he became principal of the University of St. Andrews. Besides many contributions to British periodicals, he has written critical and grammatical works of great value, among which are a *Modern Greek Grammar for the use of Classical Students* (1853); *Lyra Græca: Specimens of the Greek Lyric Poets from Callinus to Soutsos* (1854); *Critical History of Christian Literature and Doctrine from the Death of the Apostles to the Nicene Council* (3 vols., 1864–66). In conjunction with the Rev. Alexander Roberts he edited *The Ante-Nicene Christian Library* (24 vols., 1867–72).

Donaldson, JAMES LOWRY: U. S. military officer; b. Mar. 17, 1814, in Baltimore, Md.; graduated at West Point, 1836; and July 28, 1866, assistant quartermaster-general U. S. army (rank of colonel); served in Florida war 1836–38; in the war with Mexico 1846–48, and in the civil war. He was made brevet colonel and brigadier-general Sept. 17, 1864, for distinguished services in the Atlanta campaign, and major-general U. S. army Mar. 13, 1865, and major-general U. S. volunteers June 20, 1865, for faithful and meritorious services; retired Mar. 15, 1869; resigned Jan. 1, 1874. He was author of *Sergeant Atkins*, a tale of adventures in the Florida war (1871). D. in Baltimore, Nov. 4, 1885.

Donaldson, JOHN WILLIAM, D. D.: philologist and biblical critic; b. in London, England, June 7, 1811; was educated at Trinity College, Cambridge, of which he became a fellow in 1834; wrote the *New Cratylus* (1839); was head master of King Edward's School at Bury St. Edmunds from 1841 till 1855, and thenceforward resided as a tutor at Cambridge. In 1854 he published *Jashar; or, Fragments of Original Hebrew Songs inserted in the Masoretic Text of the Old Testament*. The book was written in Latin; it excited a great clamor and was defended in his *Christian Orthodoxy Reconciled with the Conclusion of Modern Biblical Learning*, 1857. He also published *The Theatre of the Greeks* (1827; 8th ed. 1875), once a standard work, now quite an-

tiquated; *The History of the Literature of Ancient Greece* (1858, 3 vols., the first two being a translation from the German of O. Müller), etc., and grammars of Hebrew, Greek, and Latin. D. in London, Feb. 10, 1861.

Revised by A. Gudeman.

Donaldsonville: town (incorporated in 1813); capital of Ascension parish, La. (for location of parish, see map of Louisiana, ref. 10-E); situated on railway and on Mississippi river, at the origin of Bayou Lafourche, 64 miles above New Orleans; has 6 churches, 2 public schools, 3 parochial schools, ice-factory, 2 saw-mills, 2 brickyards, 2 lumber-yards, electric lights, etc. Pop. (1880), 2,600; (1890) 3,121; (1900) 4,105. Editor of "Chief."

Donatello, dō-naă-tel'lō, Donato di Nicolo di Betti Bardi: sculptor; b. in Florence, Italy, 1386. He carried the true principles of Greek art to the highest perfection that Italian art has ever seen, in some of its finest qualities even beyond Michaelangelo, though with less imagination and less technical power. His ideal of character in the statues of historical, as well as of mythical, personages unknown to art, stands unequaled in art-history; and although he is influenced by the life around him, in the types and forms of his ideal portraiture, in the spirit of the work and the complete ideality of its development he is entitled to rank amongst the first sculptors of all time. His art is purely sculpturesque, like Michaelangelo's, but with more individuality and distinctiveness in its idealization of character. His great work is the colossal equestrian statue of Gattamelata at Padua. Other important works are a bronze statue of David with Goliath's head in the National Museum at Florence; a marble statue of St. John the Baptist in the same museum; a large sculpture in relief of the Annunciation in the Church of Santa Croce; and the statues of St. Peter, St. Mark, and St. George, at the Church of Orsanmichele, all in Florence; the front of the high altar of St. Anthony at Padua, and the bas-reliefs of the out-of-door pulpit of the Cathedral at Prato. Italy is full of his precious works. D. in Florence, Dec. 13, 1466. W. J. Stillman.

Donation: in law, the giving or transferring of property by the owner to another without consideration; a gift. The word is often used in its Latin form in the phrases *donatio inter vivos*, a gift between the living, and when the donor is not in apprehension of death; and *donatio causa mortis*, or gifts in prospect of death. In either case a delivery into the possession of the donee is essential to the completion of the donation. In the case of a *donatio inter vivos* the property vests beyond retraction in the donee upon delivery, unless the donor was under some legal disability, as infancy or lunacy, or unless the donation would work a fraud upon the rights of the creditors of the donor. In the case of a *donatio causa mortis* the property vests in the same way, upon delivery and the contemplated death of the donor. F. Sturges Allen.

Donation of Constantine: a fictitious document by which Constantine is said to have bestowed on Pope Sylvester (*q. v.*) the temporal sovereignty over Italy, in return for a miraculous cure from leprosy through the agency of that pontiff. The transaction, though purely mythical, was believed in for some time and gravely urged by some writers in support of the papal claims to Italian territory.

F. M. Colby.

Donati's (dō-naa'tēēz) **Comet**: a comet discovered in June, 1858, by the Italian astronomer Giambattista Donati (b. in Pisa, Dec. 16, 1826; d. in Florence, Sept. 20, 1873). It continued visible for many months. It was nearest to the earth in October, at which time its tail was over 40° in length and remarkably brilliant. It was carefully observed by Prof. Bond of Cambridge, who published an elaborate and elegantly illustrated memoir on the subject. Mr. G. W. Hill combined all the observations that were made on its position, and as a result assigned to it a period of about 1950 years. Newcomb says that the uncertainty arising from imperfect observations may amount to fifty years.

Don'atists: in ecclesiastical history, a party in the North African Church which effected a schism that lasted from 311 A. D. till the sixth century. They took their name from Donatus the Great, who was their bishop after Majorinus, from 315 to 348. The early history of this deeply interesting movement is obscure and complicated. A powerful exciting cause of the schism was the question as to the mild or severe discipline of Christians who left the faith in times of persecution, the Donatists advocating rigorous measures; but there were numerous other questions involved in the controversy, the most important being that of the union of the whole people within the Church (as maintained by the Catholic party), while Donatus demanded the separation of the Church from the world. Early in his reign Constantine the Great excluded the Donatists from the privileges conferred upon the Church, and in 316 A. D. he issued penal edicts against them. A fierce persecution ensued, lasting till 321, when the emperor granted them liberty of conscience. After his death the penal laws against them were revived, but they defended themselves with much spirit until, in 361 A. D., Julian (the so-called Apostate) restored to them their full freedom. Prosperity followed, and they boasted at one time of having 400 bishops in Africa; but controversies sprang up among them as well as with the Catholic party, until the Emperor Honorius ordered a conference between seven representatives on each side to take place at Carthage in June, 411, under the presidency of Marcellinus, a soldier and under secretary of state. As it came out very plainly from the luminous speech of Augustine that the Catholic representatives had reason and scripture upon their side, the emperor classed the Donatists as heretics (412), and all their clergy were banished (414). Donatism, as well as the African Church in general, was overwhelmed by the Vandal conquest (428 A. D.), yet it survived in a feeble condition for many years.

The Donatists are held by many historians to have erred by excessive fanaticism and a schismatical spirit, while it is generally conceded that the treatment they received from the state Church was severe and injudicious. In doctrine they were essentially orthodox, and the charges of immorality brought against them appear to have been the inventions of their enemies. There were doubtless errors on both sides, but the general position of the Donatist party appears to have been in accord with that now taken by those Protestant churches which demand a personal experience of regeneration, as separating their membership from the world at large. See Augustine's *Writings Connected with the Donatist Controversy*, tr. by J. R. King, in vol. iv. *Nicene and Post-Nicene Fathers*, 1st series, pp. 369–651; F. Ribbeck, *Donatus und Augustinus* (2 vols., Elberfeld, 1857–58); Deutsch, M., *Drei Aktenstücke zur Geschichte des Donatismus* (Berlin, 1875); D. Voelter, *Der Ursprung des Donatismus* (Freiburg, Baden, 1883). Revised by S. M. Jackson.

Donative, or in full **Donative Advowson**: in Great Britain a species of advowson in which the benefice is in the gift or disposal of the patron of the church or chapel, and in which the right of visitation is in the founder, and not in the bishop or ordinary. The donee is vested with the benefice without presentation, institution, or induction, but he must be a priest in holy orders by episcopal ordination.

F. Sturges Allen.

Donato: sculptor. See Donatello.

Dona'tus: Bishop of Casæ Nigræ in Numidia, an early leader in the Donatistic schism; not to be confounded with Donatus the Great, an abler man, who was the second schismatic bishop (Majorinus being the first), as noticed in the article Donatists (*q. v.*).

Donatus, Ælius: Latin grammarian; flourished about 353 A. D.; taught rhetoric at Rome. He was the teacher of St. Jerome, who expressed a high opinion of his talents. He wrote a work on grammar, which was commonly used in the schools of the Middle Ages. This exists in a longer and shorter form. (See Keil's ed. of the *Grammatici Latini*, vol. iv.) The word Donat became synonymous with *grammar* or any kind of elementary lesson. Donatus wrote also a valuable commentary to Vergil's *Æneid* and *Georgics* and to the plays of Terence. An interpolated copy of the latter to all the plays except the *Heautontimorumenos* is preserved. See Klotz ed. of Terence in 2 vols., Leipzig, 1838–40.

Revised by M. Warren.

Donatus, Tiberius Claudius: Latin grammarian of the latter part of the fourth century; much inferior in ability to Ælius Donatus, with whom he is frequently confused. His commentary on the *Æneid* of Vergil is preserved, but has little value. M. W.

Donauwörth, dō'now-vert: a town of Bavaria; on the Danube, at the mouth of the Wernitz, 25 miles N. N. W. of Augsburg (see map of German Empire, ref. 7–E). It was formerly a free town of the empire, but has declined in importance. It has several churches and hospitals. Here Marlborough defeated the Bavarians July 2, 1704, and here

the French general Soult gained a victory over the Austrian general Mack Oct. 6, 1805. Pop. (1890) 3,733.

Do'nax [Gr. δόναξ, reed, name of a fish]: a genus of bivalve mollusks of triangular form, belonging to the *Donacidæ*. There are forty-five living European and tropical species, and thirty fossil ones from the Eocene of Europe and the U. S. *Donax* is also the specific name of a reed or grass (*Arundo donax*) found in the South of Europe, used for fishing-rods and other purposes.

Don Benito, dōn'bā-nee'tō: a town of Spain; province of Badajoz; near the river Guadiana; 69 miles by rail E. of Badajoz (see map of Spain, ref. 17–D). It has manufactures of woolen goods, wine, and oil. Pop. (1887) 16,287.

Don'caster (anc. *Danum*): market-town in the West Riding of Yorkshire, England; on the river Don, 35 miles S. of York (see map of England, ref. 7–I). It is pleasantly situated and well built; has two stone bridges across the Don, a fine parish church, a public library, and a theater, and has manufactures of iron, brass, sacking-linen, locomotives, railway cars, and agricultural machines. There is a large corn market here. The town was burned by lightning in 759 A. D. It is famous for its annual horse-races, for which Col. St. Leger founded the stakes in 1776. Pop. (1891) 25,936.

Donegal': a county in the extreme northwestern part of Ireland, province of Ulster, bounded N. and W. by the Atlantic Ocean. Area, 1,870 sq. miles. The coast-line is 395 miles long, and is deeply indented by many bays and loughs. The surface is mountainous and boggy; about one-third is arable. Granite, Devonian rocks, and carboniferous limestone are found here. This county has some manufactures of linen and worsted hose, and good fisheries of cod, sole, plaice, herring, and mackerel, but it was at one time also the chief seat of illicit distilleries in Ireland. Capital, Lifford. Pop. (1881), 206,035; (1891) 185,211.

Donegal: a seaport of Donegal county, Ireland; on Donegal Bay, at the mouth of the Eske, 11 miles N. N. E. of Ballyshannon (see map of Ireland, ref. 4–F). It has a harbor for vessels which draw 12 feet of water. Corn and butter are exported. Lat. 54° 39′ N., lon. 8° 6′ W. Pop. 1,400.

Donegal, Marquesses of (1791): Earls of Donegal (1647), Earls of Belfast (1791), Viscounts Chichester and Barons Belfast (Ireland, 1625), Barons Fisherwick (Great Britain, 1798), Barons Ennishowen and Carrickfergus (United Kingdom, 1841).—George Hamilton Chichester (b. Feb. 10, 1798), third marquess, K. P., G. C. H., F. R. S., aide-de-camp to the Queen, succeeded his father Oct. 5, 1844. D. in Oct., 1883. He was succeeded by his brother Edward (b. June 11, 1799), who died Jan. 20, 1889, and was succeeded by his son, George Augustus Hamilton Chichester, fifth marquess, b. June 27, 1822.

Don'elson, Andrew Jackson, LL. D.: U. S. military officer and diplomatist; b. Aug. 25, 1800, near Nashville, Tenn.; graduated at West Point in 1820. He served (1821–22) as lieutenant of engineers and as aide-de-camp to his uncle, Maj.-Gen. Jackson, when governor of Florida, just acquired from Spain. He resigned from the army Feb. 1, 1822, studied law and became a cotton-planter near Nashville, Tenn. He was private secretary to President Jackson 1829–30; *chargé d'affaires* to Texas 1844–5, negotiating its annexation to the U. S.; U. S. minister plenipotentiary to Prussia 1846–49; and to the federal government of Germany 1848–49. Soon after his return from Europe he became enlisted in efforts to secure the settlement of the slavery agitation growing out of the acquisition of territory from Mexico. With strong national views he became editor of the Washington *Union* 1851–52, and in 1856 was the candidate of the American party for Vice-President of the U. S. After his defeat he retired altogether from public life, and devoted his time to planting interests in Mississippi. D. at Memphis, Tenn., June 26, 1871.

Donelson, Fort: See Fort Henry and Fort Donelson.

Do'nets: a river of Southern Russia; the chief affluent of the Don; rises in the government of Koorsk. It flows nearly southeastward, and enters the Don 40 miles N. E. of Novo-Tcherkask. Length, about 400 miles.

Dongola, dong'gō-la: town of Nubia, in East Sudan; on the left bank of the Nile (see map of Africa, ref. 3–F). It is generally called **Dongola Makarah**, or New Dongola, in contradistinction to Dongola Angusa, or Old Dongola, a village, half in ruins, situated about 75 miles farther up the river and once a flourishing place, but destroyed by the Mamelukes in 1820. New Dongola grew up around the new military and administrative buildings which were established on the spot in 1820 by the Egyptian government, and it is now a thriving place, with well-furnished bazaars, an indigo-factory belonging to the government, public baths, and a considerable trade. Pop. 10,000.

Donizet'ti, Gaetano: composer; b. at Bergamo, Nov. 29, 1797; received his musical education in his native city and in Bologna; produced his first opera, *Enrico*, at Vienna in 1818; composed about thirty other operas, now forgotten, in the style of Rossini; entered a new stage of development by his *Anna Bolena* (Milan, 1830), partly under the influence of Bellini, partly in rivalry with him; acquired a European fame by his *Lucia di Lammermoor* (Naples, 1835); produced at Paris in 1840 *La Fille du Régiment*, *Polinto*, and *La Favorita*; at Vienna, in 1842, *Linda di Chamouni*; at Paris, in 1843, *Don Pasquale*; was in 1844 stricken with paralysis, and spent his last years for the most part in a lunatic asylum. D. at Bergamo, Apr. 1, 1848.

Donjon, or **Dungeon** [O. Fr. *dongeon*, Mod. Fr. *donjon* < Med. Lat. *dominio*, domain, castle]: the central building, tower, or keep of an ancient castle or fortress of the Middle Ages. It was often erected on a natural or artificial elevation. The lower story of the donjon was used as a prison. See Castle.

Don Juan: a legendary personage; according to Spanish tradition, a profligate nobleman who killed in a duel the father of a lady he had attempted to seduce. The story is localized at Seville, and the hero's name is given in full as Don Juan de Tenorio. In later versions, however, he is confused with one Don Juan de Marana, who sold himself to the devil that he might indulge his unbridled sensuality. The original Don Juan having invited to a feast the statue erected to his victim, he challenged the spirit, whose existence he denies, to manifest itself to him. The spirit thereupon proves its power and condemns him to perdition. This story was dramatized by Tirso de Molina; it also forms the subject of one of Molière's comedies, of Mozart's celebrated opera, *Don Giovanni*, and of Byron's famous poem.

Revised by A. R. Marsh.

Donkey: See Ass.

Donne, John, D. D.: poet; b. in London, England, in 1573; educated at Hart Hall, Oxford; entered Lincoln's Inn, London, 1592. He married Anne More, a niece of Sir George More, of Loxly, lord-lieutenant of the Tower, who was visiting in the house of Sir Thomas Egerton, afterward Lord Chancellor Ellesmere, where he had a position as private secretary. Though Donne had already acquired a reputation as a poet, Sir George absolutely refused to give his consent to the marriage, and when they were, nevertheless, married clandestinely (1600), he disinherited the daughter. Donne afterward became a priest of the Anglican Church (1615), although of Roman Catholic parentage, and not without scruples on that account. But James I. had conceived high ideas of his theological capacity, and would give him no other preferment than in the Church. Having gained distinction as the only eloquent preacher of his time, he was appointed dean of St. Paul's, London, in 1621. He wrote elegies, satires, and other poems, and belonged to the school called "Metaphysical Poets," whose works abound in forced conceits. Some of his early poems are very licentious, but many have great poetic merits. His sermons are justly admired. They are given by H. Alford (6 vols., London, 1839). The first complete edition of his poems was issued in 2 vols. (London, 1872). D. in London, Mar. 31, 1631. See Izaak Walton, *Life of J. Donne* (1640); H. Alford, *Life of Donne* (1839).

Donnelly, Ignatius: politician and writer; b. in Philadelphia, Nov. 3, 1831. After 1856 he resided in Minnesota, which State he several times represented in Congress. As an author he was known chiefly by the eccentric geological theories propounded in *Atlantis* (1882) and *Ragnarok* (1883), and by his claim to have discovered a cryptogram or word-cipher in Shakspeare's plays which transfers their authorship to Francis Bacon. D. Jan. 1, 1901.

Don'ner, Johann Jacob Christian: translator; b. in Crefeld, Germany, Oct. 10, 1799; professor in Stuttgart. He translated Homer, Pindar, Æschylus, Sophocles, Euripedes, Aristophanes, Plautus, Terence, Juvenal, and Persius, in the meters of the originals. D. in Stuttgart, Mar. 28, 1875.

A. G.

Don'ner Lake: a small lake in Nevada co., Cal., near the Central Pacific Railroad; 154 miles from Sacramento; is a place of summer resort. It takes its name from the tragical fate of a party of overland emigrants, led by a man named Donner, who in the winter of 1846 were snow-bound at this point, and nearly all starved to death, those who escaped having survived by eating the flesh of their dead comrades.

Don'nybrook: village of Ireland; county of Dublin; partially incorporated in Dublin (see map of Ireland, ref. 9–I). It has a magdalen asylum, a dispensary, a hospital for incurables, and an asylum for lunatics called the Bloomfield Retreat, established by the Society of Friends. It formerly had a famous annual fair. Pop. 1,800.

Donoho, Gaines Ruger: landscape-painter; b. at Church Hill, Miss., Dec. 21, 1857. Pupil of R. Swain Gifford, New York, and Boulanger and Lefebvre, Paris; diploma of honor, New Orleans Exposition, 1885; second-class medal, Paris Exposition, 1889; member Society of American Artists 1882; Webb prize for landscape, S. A. A., 1892. His work is virile in execution, true to nature, and strong in color. Studio in New York. W. A. C.

Dono'so Cortés, Juan Francisco Maria, Marques de Valdegamas: writer and diplomatist; b. in El Valle, Estremadura, Spain, May 6, 1809. He opposed Don Carlos, and became secretary to Queen Isabella in 1844. In 1848 he was sent as ambassador to Berlin. He was conservative in politics, and defended the Roman Catholic religion in his *Essai sur le Catholicisme, le Libéralisme, et le Socialisme* (Essay on Catholicism, Liberalism, and Socialism, 1851). D. in Paris, May 3, 1853.

Donoso, Justo: Chilian prelate; b. in Santiago, 1800. He was rector of the Seminario Conciliar at Santiago; lecturer on theology in the university; judge of the ecclesiastical court, and one of the founders of the *Revista Católica*, an organ of the Church party. In 1844 he was named Bishop of Aneud, and in 1855 he was translated to the see of La Serena. Bishop Donoso is well known for his works on canonical law, which are authorities throughout South America. D. at La Serena, Feb. 22, 1868. All his property was bequeathed for charitable purposes. H. H. S.

Donoughmore, Earls of, and Viscounts Suirdale (1800), Barons Donoughmore (Ireland, 1783), Viscounts Hutchinson (United Kingdom, 1821).—John Luke George Hely Hutchinson, fifth earl; b. Mar. 2, 1848; succeeded his father Feb. 22, 1866.

Don Quixote de la Mancha, Sp. pron. dōn'kĕe-*kh*ō'tā-de-lăă-maan'chăă: the hero of the celebrated romance in which its author, Miguel Cervantes de Saavedra, satirized the dangerous prejudices of race and blood and the contempt of useful work which prevailed among the larger part of Spanish society at his time, and held up to his countrymen a higher moral ideal. The first part of the famous work of Cervantes was published at Madrid in 1605, the second in 1615; the first complete edition dates from 1637. The best annotated editions are still those of the Spanish Academy (1780 and numerous reprints), of Pellicer (5 vols., Madrid, 1797–99), of Ideler (6 vols., Berlin, 1804), and of Clemencin (6 vols., Madrid, 1833–39). Of translations may be mentioned as especially faithful the German one by Braunfels (4 vols., Stuttgart, 1884), the English one by Ormsby (4 vols., London, 1885), and the French by L. Biart (4 vols., Paris, 1878). Henry R. Lang.

Doo, George Thomas, F. R. S.: engraver; b. in Surrey, England, Jan. 6, 1800. He became historical engraver to Queen Victoria in 1842, and was elected a Royal Academician in 1856. Among his works are *Ecce Homo*, after Correggio; *Knox Preaching*, after Wilkie; and *Pilgrims Coming in Sight of Rome*, after Eastlake. He exhibited at the great Exposition of Paris in 1867 his engraving of *Saint Augustine and Saint Monica*, after Scheffer, and in 1878 three portraits. D. Nov. 13, 1886.

D'Ooge, Martin Luther: Professor of Greek; b. July 17, 1839, at Zonnemaire, province of Zealand, Netherlands; Ph. D., Leipzig, 1872; LL. D., University of Michigan, 1889; has been principal of Ann Arbor High School; Professor of Greek in the University of Michigan; president of American Philological Association; director American School of Classical Studies at Athens; editor of Demosthenes's *On the Crown* (1875); and the *Antigone* of Sophocles (1884).

Doolittle, Edwin Stafford: See the Appendix.

Doolittle, James Rood: See the Appendix.

Doolittle, Theodore Sandford, D. D., LL. D.: minister and educator in the Reformed (Dutch) Church; b. in Ovid, N. Y., Nov. 30, 1834. He graduated at Rutgers College 1859, and at the Theological Seminary at New Brunswick 1862; became pastor at Flatlands, N. Y., 1862; Professor of Rhetoric, Logic, and Metaphysics in Rutgers College 1864; and vice-president 1890, acting as president for five months in 1891–92. He published *History of Rutgers College* (1879) and *Syllabus of Architecture* (1892). He was editor of the *Christian at Work* from 1873, and a prolific contributor to newspapers and magazines. He was also known as a lecturer on art and other subjects. D. in New Brunswick, N. J., Apr. 18, 1893. Willis J. Beecher.

Doom [O. Eng. *dōm*, judgment, sentence : Goth. *dōms*, judgment; Eng. *deem* : Goth. *dōmjan* is from same root]: the old name given in England to the Last Judgment, and to representations of it in churches by painting or otherwise. Most of these were obliterated in the time of Edward VI., but a fine one still exists in the Church of the Holy Trinity at Coventry.

Doom-book: See Dome-book.

Doom- or **Dum- Palm** (*Hyphæne thebaica*): a tree of Upper Egypt and Central Africa, where it sometimes forms forests, growing even in the deserts. The lower part of the stem is single, and invariably divides at a certain height into two branches, each of these again being bifurcated, always in two sets. The wood is tougher than that of most other palm-trees. It has fan-shaped leaves, globular fruit about the size of an orange, with the outer skin red, inclosing a thin spongy substance which resembles gingerbread. From this substance, which forms an article of food, it has been called the gingerbread-tree. Ornaments are made from the hard, semi-transparent kernel of the fruit. This tree produces the gum resin called Egyptian bdellium, and its fiber is made into ropes which are dyed black.

Doomsday Book: See Domesday Book.

Doon: a river of Scotland; rises in Ayrshire; flows nearly northwestward, and enters the Frith of Clyde 2 miles S. of Ayr. It is 30 miles long, and passes through picturesque scenery. The Doon has been immortalized by the poet Burns. Loch Doon, an expansion of this river, is 5 miles long, and is inclosed by mountains.

Door [O. Eng. *dor* : Germ. *Thor* : Goth. *dŏr*; cf. Gr. θύρα, Lat. *fores*, Skr. *dvâr*]: the panel of wood or other material by which the entrance of a house, etc., is opened or closed. Doors are of different kinds, the most common being made to move on hinges. Others, called sliding doors, are moved on rollers. A trap-door opens vertically over a hole in a roof or floor, while a jib-door is made even with the wall and concealed as nearly as possible.

In architecture great attention has been paid to the ornamentation of doors, and sometimes they have been made of metal, with very ornate decoration, such as the bronze doors or gates of the baptistery of Florence, those of the Capitol at Washington, D. C., and those of Trinity church, New York city.

Doora: See Durra.

Doorak: same as Durak (*q. v.*).

Doornboom, dōrn'bōm (thorn-tree, *Acacia horrida*): a tree growing abundantly in South Africa, so named by the Dutch on account of its sharp and numerous spines. Its usual height is about 30 feet, and the wood is valued for building.

Doostee: same as Desht (*q. v.*).

Do'ra d'Is'tria [from *Istria*, the Roumanian name of the Danube]: the literary pseudonym of Helena Ghika, Princess Koltzoff Massalsky, a Roumanian writer; b. at Bucharest, Jan. 22, 1829; a daughter of Prince Michael Ghika and niece of Prince Alexander Ghika, ex-hospodar of Wallachia. Thoroughly conversant with classical literatures and languages from her home education, she mastered the principal European languages and literature by extensive travels. After an unfortunate marriage to Prince Koltzoff Massalsky in 1849 she lived partly in Russia, partly in Italy and Switzerland. Her principal works are *Monastic Life in the Oriental Church* (1855); *The Heroes of Roumania*; *The Roumanians and the Papacy*; *Women in the Orient* (2 vols., 1858); *On Women, by a Woman* (1864); *The Poetry of the Ottomans* (1873). She was elected member of several scientific societies. D. at Florence, Nov. 22, 1888.

Dora Baltea, dō′răă-băăl-tā′ăă (anc. *Duria Major*): a river of Italy; in Piedmont; rises at the foot of the Little St. Bernard, and enters the Po near Crescentino. Length about 90 miles.

Dorado, El: See El Dorado.

Dorama, dō-raa′măă: a town of Arabia; in Nedjed; 30 miles N. E. of Derayeh (see map of Persia and Arabia, ref. 6–F). The caravans moving between Persia and Mecca halt here to obtain supplies. It was taken in 1818 by Ibrahim Pasha, who killed nearly all the inhabitants. Pop. about 8,000.

Dorasques: See Indians of Central America.

D'Orbigny, Alcide: See Orbigny.

Dor-bug: a name applied in England to the Cockchafer (*q. v.*), and in the U. S. to the numerous species of May or June bugs, *Lachnosterna*.

Dor'cas Society: a benevolent association of ladies, usually of the same congregation, for the purpose of providing the poor with clothing. It is so called from Acts ix. 39: "And all the widows stood by him weeping, and showing the coats and garments which Dorcas made while she was with them."

Dor'chester (anc. *Durnovaria* and *Durinum*): town; capital of Dorsetshire, England; on the river Frome and on the South Downs; 115 miles W. S. W. of London, and 7 miles from the English Channel (see map of England, ref. 14–G). The Southwestern Railway connects it with London and Weymouth. It has a county museum, a free grammar school, a large agricultural market, held weekly, and a trade in ale and beer. Here are the remains of the most perfect Roman amphitheater in England, 218 feet long and 163 feet wide. The seats for the spectators were formed of masses of chalk, rising 30 feet above the arena. It is probable that the Poundbury camp, to the N. W. of the town, is of Roman origin. Durnovaria was one of the principal stations of the Romans in England, and was surrounded with a wall, parts of which are still standing, and a fosse. Cromwell captured and held the town in 1645, and George Jeffries (*q. v.*) held his Bloody Assize here in 1685. Pop. (1891) 7,946.

Dorchester: formerly a separate town of Norfolk co., Mass.; on Dorchester Bay, an arm of Boston harbor; 4 miles S. of Boston, to which city it was annexed in 1869, constituting the Sixteenth Ward. It was settled in 1630 by a party of Puritans, and was named after Dorchester, England, from which many of the colonists came. In Mar., 1776, Dorchester Heights, which commanded the town and harbor of Boston, were fortified by Gen. Washington, and the British soon after evacuated the latter place.

Dorchester: a river-port and capital of Westmoreland co., New Brunswick; on the Memracook river, near its mouth, and on the Intercolonial Railway; 115 miles E. N. E. of St. John (see map of Quebec, etc., ref. 5–I). Large ships can ascend from the Bay of Fundy to this place, which has an active trade. Gas-coal and building-stone are largely exported. Pop., including Dorchester township, about 7,000.

Dorchester, Daniel, D. D.: minister of the Methodist Episcopal Church; b. at Duxbury, Mass., Mar. 11, 1827; educated at Norwich Academy and Wesleyan University; has been active as pastor and presiding elder, and has served in the Connecticut Senate, Massachusetts House of Representatives, as commissioner of idiocy in Connecticut, superintendent of Indian schools for the U. S.; author of *Concessions of Liberalists to Orthodoxy* (Boston, 1878); *Problem of Religious Progress* (New York, 1881); *Latest Drink Sophistries versus Total Abstinence* (1883); *Liquor Problem in All Ages* (1884); *The Why of Methodism* (1887); *Christianity in the United States* (1888); *Romanism versus the Public School System* (1888).

Dordogne, dōr′doñ′: a river rising in the south central part of France; flows nearly westward through the departments of Corrèze, Lot, and Dordogne, and enters the Garonne 13 miles N. of Bordeaux. It is about 350 miles long, and is navigable for 185 miles.

Dordogne: department of Southwestern France; area, 3,545 sq. miles; bounded N. by Haute-Vienne, W. by Charente and Charente-Inférieure, S. W. by Gironde, S. by Lot-et-Garonne, and E. by Lot and Corrèze. It is drained by the river Dordogne. The surface is diversified by hills, marshes, and fertile valleys. The soil is generally sandy. Chestnuts and wine are among the staple productions. It has mines of coal, copper, and iron, quarries of marble and alabaster and manufactures of paper, brandy, hosiery, and iron. Capital, Périgueux, which is also the seat of a bishopric. Pop. (1881) 495,037; (1891) 478,471; (1896) 464,822.

Dordrecht: See Dort.

Doré, dō′rā′, Gustave Paul: figure-painter, illustrator, and sculptor; b. in Strassburg, Jan. 6, 1833; went to Paris at the age of fifteen and began his career by making sketches for illustrated papers; exhibited his first picture in oil, *Battle of Alma*, in 1855; officer Legion of Honor 1879. Doré worked rapidly and produced a large number of pictures. His illustrations are almost countless, including designs for *Rabelais* (1854), Balzac's *Contes Drôlatiques*, *Don Quixote* (1862), Dante's *Inferno* (1861), *Bible* (1865–66), La Fontaine's *Fables* (1867), *Idyls of the King* (1867–68), *The Ancient Mariner* (1876), and Poe's *Raven* (1883). As an illustrator he was marvelously fertile in invention, but a poor technician. He exhibited frequently at the Paris Salon, being exempt from the examination of the jury through his first decoration as chevalier of the Legion of Honor given him by the emperor in 1861. D. in Paris, Jan. 27, 1883.

William A. Coffin.

Doree: same as Dory (*q. v.*).

Dore, Mont, mōñ′dōr′: a group of high mountains in Auvergne, France; department of Puy-de-Dôme. They are of volcanic formation. The highest summit is the Pic de Sancy, which has an altitude of 6,190 feet.

Dore'mus, Robert Ogden, M. D., LL. D.: chemist; son of Sarah Platt Doremus (*q. v.*); b. in New York, Jan. 11, 1829; studied at Columbia College; graduated at the University of New York 1842; studied chemistry; assistant to Prof. Draper in the medical department; went to Europe in 1847 to continue his chemical researches, and graduated at the medical department of the New York University (1850). He was one of the founders of the New York Medical College. In 1861 he was appointed Professor of Chemistry and Toxicology in the Bellevue Hospital Medical College, and soon afterward he was appointed to a similar position in the College of the City of New York. Dr. Doremus has devoted much time to applied chemistry and has patented several processes.

Doremus, Sarah Platt Haines: philanthropist; b. in New York, Aug. 3, 1802; married Sept. 11, 1821, to Thomas C. Doremus; in 1828, with eight other ladies, organized the Greek Relief Society, whose almoner was Rev. Dr. Jonas King; in 1836 aided Madame Henriette Feller in her Grande Ligne Mission to the French peasantry of Canada; with Miss Catherine Sedgwick established in 1842 the Home for Women from Prison, now called the Isaac T. Hopper Home; one of the founders of the House and School of Industry, and a manager of the City Bible Society and of the City Mission and Tract Society from their beginning; in 1849 labored efficiently for the relief of the famine-stricken people of Ireland; in 1854 became vice-president of the Nursery and Child's Hospital; in 1855 aided in organizing the Woman's Hospital Association; in 1863 assisted in organizing the Presbyterian Home for Aged Women. For fifty years she labored in behalf of foreign missions with untiring zeal. Her memorial in this direction is the Woman's Union Missionary Society, organized in New York in 1860, and the prototype of similar organizations all over the U. S. Her labors in behalf of the sick and wounded soldiers from North and South during the civil war were not excelled by those of any other woman in the U. S. D. in New York city, Jan. 29, 1877.

Do'ria: one of the four most noble and powerful families of Genoa. It was attached to the Ghibelline party. In 1339 the families of Doria, Spinola, Grimaldi, and Fieschi, which had by their rivalry long troubled the republic, were exiled.—Paganino Doria, a famous Genoese admiral, gained a naval victory over the Venetian admiral Pisani in 1352.

Doria, Andrea: admiral and patriot, called the restorer of Genoese liberty; b. at Oneglia, Italy, in 1466. He entered the pope's guards and afterward served with honor under the Duke of Urbino and Alfonso of Naples. Returning to Genoa he was rewarded for his military exploits, and rose to the rank of admiral in 1513. For several years he applied himself to the task of suppressing the Turkish corsairs in the Mediterranean. A sincere patriot, he dreaded the loss to Genoa of her independence through the ambition of France or Spain. In 1522 the imperial interest became paramount in Naples, and Doria gave in his allegi-

anee to Franeis I., whose fleet he eommanded with success in the war with Charles V. In 1524 he defeated the imperial fleet near Marseilles. He also captured Genoa, from whieh he expelled the Adorni. In 1528 he abandoned the serviee of Franeis I., and beeame an ally and adherent of Charles V., on the condition that Genoa should be a free and independent state. He entered Genoa in 1529, was welcomed by the citizens, and gave them a free constitution, whieh remained in vigor until the republie ceased to exist. He afterward acted as admiral in the service of the emperor, and gained a victory over the Turks near Patras in 1532. In 1535 he contributed greatly to the conquest of Tunis, but the rest of his career was marred by reverses. He was defeated by the Turks off Prevesa, and his expedition to Algiers with Charles V. in 1541 ended in disaster. Charles V. gave him the title of Prince of Melfi. D. without issue at Genoa in Nov., 1560. See Carlo Sigonio, *De Vita et Gestis A. Doriæ* (1586); Richer, *Vie d'André Doria* (1789).

Do'rians (in Gr. Δωριεῖς): one of the four principal braneches or tribes of the ancient Hellenic people; elaimed that they were descended from Dorus, a son of Hellen. They are supposed to have originally lived in Doris, from which they migrated to the Peloponnesus, where they founded Sparta, Argos, and Messenia. The migration of the Dorians to the Peloponnesus, whieh is called the return of the Heraclidæ, and forms a eelebrated epoeh in ancient chronology, is said to have oeeurred soon after the siege of Troy, in 1104 B. C. Dorian colonies were planted in Crete, Sicily, and Asia Minor. The Dorians were the most powerful and warlike of the Hellenic tribes. They surpassed the Ionians in solidity and earnestness of character, but were less refined and ingenious. Their language was the Doric Dialect (*q. v.*). See K. O. Müller, *Die Dorier* (2 vols., 1824; 3d ed. 3 vols., 1844); Curtius, *History of Greece.*

Dor'ic Dialect: a strongly marked division of the Greek language; distinguishing itself from at least three other important groups of dialects, the Ionic (Attic-Ionie), the Æolic (Lesbie-Thessalian), and the Areado-Cyprian. Its center of distribution seems to have been the mountain districts of extreme Northwestern Greece. The great Dorian migration (about 1000 B. C.) spread it over the Eastern Peloponnesus and the Isthmus, where it displaeed or absorbed the native Achæan; later migrations earried it over the southern islands of the Ægean and to the southwestern coast of Asia Minor; and colonists carried it later still to the shores of Afriea, Sicily, Italy, and elsewhere. The most prominent braneches of the dialeet which have left a reeord in inseriptions or in literature are the following: (1) The Laeonian, probably surviving in the modern Zakonian; (2) the language of the Spartan colonies Tarentum and Heraelea in Italy; (3) the language of Argolis and the island Ægina; (4) the language of Megara and its eolony Byzantium; (5) of Corinth and its eolony Coreyra (Corfù); (6) of the Peloponnesian eolonies in Sicily, especially Syracuse; (7) of Messenia; (8) of the islands Thera and Melos; (9) of Rhodes and its Sicilian eolonies Agrigentum and Gela; (10) of Crete. As compared with its chief competitor, the Attic, it is particularly distinguished by its retention of the inherited broad ā, whieh in Attie had been largely changed to open ē. This characteristie it shares, however, with most other dialects except the Ionie-Attie. Its really peculiar features are the use of the ending -μες (Attie -μεν) in first plural active of verbs, the retention of -τι (Attic -σι) in third personal ending of verbs, the formation of futures in -ξω from verbs in -ζω, the use of active personal endings in the future passive, and certain peculiarities of aeeentuation.

Authorities.—Ahrens, *De Græcæ linguæ dialectis* (1839–43); Meister, *De dialecto Heracliensium Italicorum* in Curtius's *Studien*, iv., 355 ff.; Baunack, *Die Inschrift von Gortyn* (1885); Herforth, *De dialecto Cretica* (1887); Schneider, *De dialecto Megarica* (1882); Müllensiefen, *De titulorum Laconicorum dialecto* (Strassb. Dissert. vi., 131 ff.).

Benj. Ide Wheeler.

Doric Order: a form of column and entablature named from the Dorians, its reputed inventors. From the middle of the seventh century, and perhaps earlier, to the elose of the sixth century B. C. it appears to have been the only order used by the Greeks, except perhaps in Asia Minor, where some authorities ascribe an equal antiquity to the Ionic. The Greeks, whether they originally derived it from wooden prototypes or from primitive structures in stone, developed this order to a wonderful perfection, realized in the Parthenon at Athens (438 B. C.). The column, measuring in height from 4 to 6 or even 7 diameters, and decorated with from sixteen to twenty shallow flutings with sharp *arrises* or edges, rises directly and without a base from a stepped *stylobate* or platform. It tapers slightly toward the capital, which is composed of a spreading eireular echinus and a plain square abacus or cap. The column supports a plain architrave, with a frieze above it having square *metopes* separated by *triglyphs*, the whole crowned by a cornice decorated with *mutules* and *guttae*. The Romans employed a modification of the Greek Doric entablature with a column derived presumably from Etrusean models, more slender than the Greek column, and adorned with a molded base. They rarely used it as a free-standing column, but applied it to the lower stages of arcaded structures like the Coliseum.

A. D. F. Hamlin.

Dorion, dō'ri-ōṅ', Sir Antoine Aime: Canadian jurist; b. at Ste. Anne de la Perade, P. Q., Jan. 17, 1818; educated at Nieolet College; called to the bar in 1842; appointed queen's counsel in 1863; and chief justiee of the Provinee of Quebec in 1874. He represented Montreal in Canada Assembly 1854–61; Hoehelaga in that body 1862–67; and the same county in the Dominion Parliament from that date till 1872, when elected for Napierville, which he represented until his elevation to the beneh. During his political career he held at various periods the portfolios of Commissioner of Crown Lands, Provincial Secretary, Attorney-General, and Minister of Justiee. He was leader of the *Rouges* or Freneh-Canadian Liberal party of the Provinee of Quebec from his entranee into politics until his retirement, and was knighted in 1877. D. May 31, 1891.

Neil Macdonald.

Do'ris [from the Gr. Δωρίς, the name of a daughter of Oceanus and Tethys, and the wife of her brother Nereus]: a genus of marine gasteropodous mollusks belonging to the seetion *Nudibranchiata*. They are found mostly in southern seas, but several speeies are native on northern eoasts. They have an oval body; the mouth is a proboscis with two tentaeula, and the vent is encircled by branched gills. They are sometimes called sea-lemons.

Do'ris (in Gr. Δωρίς): a small mountainous distriet of ancient Greece; bounded by Thessaly, Loeris, Phocis, and Ætolia. It was the original home of the Dorians (*q. v.*), and forms part of the nomarchy of Phocis in the modern kingdom.—The name Doris is also given by some ancient writers to that part of Caria whieh was oeeupied by Dorian colonists and their descendants.

Dormant Animals: See Hibernation.

Dormant Partner: in law, properly a partner who does not actively participate in the eonduet of the partnership business; in an inaccurate but eommon use of the term, a partner whose name does not appear as such; a silent or secret partner.

F. S. A.

Dormer [orig. meaning, a sleeping-room, from O. Fr. *dormeor*, from a deriv. of Lat. *dormi're*, sleep, cf. *dormito'rium*], or **Dormer Window**, also written **Dorment** or **Dormar**: a window inserted on the inclined plane of the roof of a house, the frame being plaeed nearly vertically with the rafters. It is often used for the purpose of lighting the attie or garret of modern dwelling-houses. In some styles of arehitecture, large and showy dormers rising from steep roofs are an important part of the design, especially in the later Freneh Gothie and in the Freneh and German Renaissanee.

Revised by Russell Sturgis.

Dormouse [*dorm*, sleep + *mouse*, because dormant in winter]: a common name for the various members of the family *Myoxidæ*, a group of small rodents related to the miee, but arboreal in their habits. Called dormiee from their habit of lying torpid, or dormant, throughout the greater portion of the winter, waking only on warm days to eat a little of the food which they store up in the fall. They have large eyes and ears, long hairy tails, and soft fine fur. They are found in Europe, Asia, and Afriea. The common dormouse (*Muscardinus avellanarius*) is reddish brown above, yellowish white below, and the tail is bushy. It is about as large as the house mouse, and is noeturnal in its habits. The fat dormouse (*Myoxus glis*) is larger, and was regarded as a dainty morsel by the old Roman epieures. The garden dormouse (*Eliomys nitela*), as its name indieates, frequents eultivated grounds and often does considerable damage to choice fruit, of which it is

very fond. Each jaw contains four molar teeth on each side; there are no cheek-pouches; each of the fore paws has four toes and a rudimentary thumb, and they have five toes on the hind feet. F. A. Lucas.

Dorn, Johann Albrecht Bernhard: Orientalist; b. at Scheuerfeld, Saxe-Coburg, Mar. 11, 1805. He became in 1843 the chief librarian of the imperial library at St. Petersburg, and devoted himself chiefly to the history and languages of Afghanistan, Persia, and Caucasia. D. in St. Petersburg, May 31, 1881. Revised by C. H. Toy.

Dorner, Isaac August, D. D.: Protestant theologian; b. at Neuhausen-ob-Eck, in Würtemberg, June 20, 1809; educated at Tübingen; became Professor of Theology there 1837; at Kiel 1839; at Königsberg 1843; at Bonn 1847; at Göttingen 1853; and at Berlin 1862. He wrote, besides other works, a *History of the Development of the Doctrine of the Person of Christ* (1839; 2d ed. 1845–56; Eng trans., Edinburgh, 1861–63) and an able work entitled *History of Protestant Theology, particularly in Germany* (1867; Eng. trans. 1871, 2 vols); also *History of Pietism, especially in Würtemberg* (Hamburg, 1840); *The Principle of our Church* (Kiel, 1841); *A System of Christian Doctrine* (1879–80; Eng. trans. 4 vols., 1880–82); *System of Christian Ethics* (1885; Eng trans. 1887); his correspondence with Martensen was published in 1888. He visited the U. S. in 1873 as a delegate to the meeting of the Evangelical Alliance. He was the leading German conservative theologian. D. at Wiesbaden, July 8, 1884.

Dor'noch: a royal burgh (established in 1628); capital of Sutherland county, Scotland; on an inlet of the sea called Dornoch Frith; 14 miles N. of Cromarty (see map of Scotland, ref. 5–G). It has an old cathedral, which was restored by the Duchess of Sutherland in 1837. Pop. (1891) 514.

Do'rogobush: a town of Russia; government of Smolensk; on the river Dnieper; about 55 miles E. N. E. of Smolensk (see map of Russia, ref. 7–D). An engagement took place here in Oct., 1812, between the Russians and the rear-guard of the retreating French. The latter partially burned the town. Pop. 9,000.

Dorp: a town of Prussia; in the Rhine province; on the Wupper (see map of German Empire, ref. 5–C); has iron, steel, and paper factories. It was before 1849 an insignificant place, but since that time, like many other towns in the Wupper valley, it has greatly increased, and has become the center of a considerable manufacturing industry, owing principally to the presence of extensive coal-deposits. Pop. 13,500.

Dor'pat, or **Derpt** (Russ. *Yoorief*): a town of Russia; government of Livonia; on the river Embach; 138 miles N. E. of Riga (see map of Russia, ref. 6–C). It is well built, and has a stone bridge across the river. The old ramparts have been converted into gardens and public promenades. Here Gustavus Adolphus founded in 1632 a university which became a large and celebrated institution. Nearly all the lectures at the university are given in the German language, but the Russian Government has since May, 1877, turned it into a thoroughly Russian institution. Struve and Mädler have successively directed the astronomical observatory of Dorpat, which their labors have made famous. There are five faculties in the university and about 2,000 students. Dorpat was founded in 1030, and became an important town, but sank into decay. It was captured in 1625 by the Swedes, and in 1704 by the Russians, under whom it revived. Pop. (1897) 42,421.

Dörpfeld, Wilhelm: See the Appendix.

Dorr, Julia C. (*Ripley*): See the Appendix.

Dorr, Thomas Wilson: politician; b. in Providence, R. I., Nov. 5, 1805; graduated at Harvard in 1823: was a Democrat and a leader of the suffrage party. Under the old charter the right to vote was limited to men who possessed a certain amount of real estate, and to their eldest sons. In 1841 the suffrage party formed a new constitution, and chose Mr. Dorr Governor of the State. His official action was resisted in May, 1842, by the government chosen according to the old charter. Dorr was arrested, convicted of treason, and sentenced to imprisonment for life, but was pardoned in 1847. D. in Providence, Dec. 27, 1854. See Dorr Rebellion.

Dorrego, dōr-rā'gō, Manuel: Argentine statesman; b. at Buenos Ayres, 1787. He studied law, and in 1810 went to Santiago, Chili, to complete his legal education there. The Chilian revolution breaking out that year, he joined the patriots and served through the earlier campaigns. Returning to Buenos Ayres he joined the army engaged against the Spaniards in Upper Peru (Bolivia), attaining the rank of colonel. In 1816 Pueyrredon banished him for alleged acts of insubordination, and he went to the U. S. Returning after some years he became the leader of the federalist party, and in Aug., 1827, he was elected governor of Buenos Ayres. He at once undertook to organize a new confederation of the provinces, and at first was successful. In 1828 the war with Brazil was brought to an end, both countries agreeing to recognize the independence of Uruguay, which had been the territory in dispute. A revolt of the army under Lavalle compelled Dorrego to fly from Buenos Ayres, Dec. 1, 1828; joined by the forces of Rosas he attempted to regain the city, but was defeated and captured by Lavalle, and shot without trial Dec. 13, 1828. Dorrego was a man of estimable character; his lawless execution gave rise to disorders which culminated in the tyranny of Rosas a few years later. Herbert H. Smith.

Dorr Rebellion: a popular uprising in Rhode Island (1841–42) under Thomas Wilson Dorr (*q. v.*), for the purpose of securing an extension of the suffrage. Up to that time the people of Rhode Island had lived under the charter adopted as early as 1663, according to which none but freeholders of an estate valued at not less than $134, or renting for $7.00 a year, were entitled to vote. Representation in the Legislature was also very unequal, in consequence of the growth of certain towns and the decline of others. The Legislature, made up under the provisions of the charter, was stubbornly opposed to any important change. New constitutions were proposed in 1824 and in 1834, but were defeated. The popular zeal, however, could not be suppressed or ignored. A suffrage association was formed, and a convention, summoned without regard to legal voters, was brought together in 1840, and having framed a new constitution providing for universal suffrage and equal representation, submitted it to popular vote. Another convention, called by the Legislature, proposed a constitution providing for a more limited suffrage. The so-called people's constitution was adopted by a vote of 14,000 against 8,000. There were charges of fraud in the election, but it was evident that the supporters of the people's constitution now stood face to face against the regularly organized government under the charter. The Legislature undertook to suppress agitation by declaring that any persons who should preside over illegal meetings or allow their names to be used on illegal tickets should be subject to fine and imprisonment; but the agitation, so far from being discontinued, increased to such an extent that the Governor called for aid upon the President of the U. S. President Tyler replied that he would render assistance in case any violence should be committed. But the populists were in no way intimidated. They proceeded with their election and chose as Governor the most conspicuous of the popular leaders, Thomas W. Dorr. Civil war on a small scale immediately followed. Dorr organized his government at Providence, while Governor King at Newport was helpless. The Governor renewed his call upon the President, and U. S. troops arrived at Newport in May, 1842. Dorr made an attempt to get possession of the Providence arsenal, but was unsuccessful. This defeat discouraged many of his followers, and Dorr himself fled from the State. But he soon returned. Throwing up intrenchments a few miles from Providence, he assumed an attitude of defiance. It became evident, however, that even the insurgents had little faith in his courage or ability; for when within a week several thousand men had volunteered to march against them, they found that the works had been abandoned. Though it is customary to refer to the movement of which Dorr was the leader with ridicule, it can hardly be denied that it was indirectly the means of securing the desired end. The insurgents disbanded in June; in the following September a State convention adopted a constitution which embodied nearly every provision that had been advocated by Dorr and his followers.

Authorities.—King, *The Life and Times of Thomas Wilson Dorr* (Boston, 1859); *Might and Right* [*A History of the Dorr Rebellion*], *by a Rhode Islander* (Providence, 1844); Jacob Frieze, *A Concise History of the Efforts to obtain an Extension of Suffrage in Rhode Island* (Providence, 1842).
C. K. Adams.

Dorset, Charles Sackville, K. G., Sixth Earl of: an English courtier and wit; b. Jan. 24, 1637; a son of Richard,

the fifth Earl of Dorset. He was brave, witty, and generous, and had superior talents, but was indolent and unambitious. His popular qualities rendered him a general favorite. He was distinguished as a patron of literary men, and bestowed his bounty with equal judgment and liberality. Dryden was one of the authors who enjoyed his bounty. Lord Dorset was appointed lord chamberlain by William III. in 1689. He wrote several admired satires and songs. D. at Bath, Jan. 16, 1706, and was succeeded by his son Lioncl Cranfield, seventh earl, who was created Duke of Dorset in 1720. Charles Sackville Germain, fifth duke, died unmarried July 29, 1843.

Dorset, Thomas Sackville, K. G., First Earl of: statesman and poet; b. at Buckhurst, Sussex, England, in 1536. He wrote a tragedy entitled *Gorboduc, or Ferrex and Porrex* (1561), which was praised by Sir Philip Sidney, and also the *Induction to the Mirror for Magistrates* (1563). He received the title of Lord Buckhurst in 1566, and was sent as minister to France in 1570. In 1599 he succeeded Lord Burleigh as lord treasurer of England. He was afterward created Earl of Dorset by James I. D. at Whitehall, Apr. 19, 1608, and was succeeded by his son Robert.

Dorsetshire, or **Dorset**: a county in the southern part of England; bounded N. by Somerset and Wiltshire, E. by Hampshire, S. by the English Channel, and W. by Devonshire. Area, 980 sq. miles. The surface is partly hilly and occupied by chalk-downs. The chief rivers are the Frome and the Stour. Among the mineral resources are chalk, china clay, and the celebrated Portland building-stone. The chalk-downs or hills produce fine pasture, on which vast numbers of South Down sheep feed. Dorset is mainly a pastoral county, and exports cattle, sheep, butter, and cheese. From the middle of March to midsummer great quantities of mackerel are caught along its shores. The chief towns are Dorchester (the capital), Poole, Bridport, Weymouth, and Shaftesbury. The Saxons called the country *Dornsota* or *Dorsola*, from the root *dwr*, water. In the Roman period it belonged to *Britannia prima*, and in the British, previous to the landing of Cæsar, it was, according to Ptolemy, inhabited by a tribe of the name *Durotriges*. Pop. (1891) 193,542; (1901) 202,093.

Dorsey, James Owen: anthropologist; b. in Baltimore, Md., Oct. 31, 1848. He attended the high school of that city and the Theological Seminary of Virginia; ordained a deacon of the Protestant Episcopal Church (1871), and became missionary among the Ponka Indians in Dakota Territory. From 1878 until his death in Washington, D. C. (Feb. 4, 1895), he was engaged in linguistic and sociologic work for the Bureau of Ethnology. Among his published works are the following: *Omaha Sociology* (Third An. Rept. of the Bur. of Ethnology); *Osage Traditions* (Sixth An. Rept. of the Bur. of Ethnology); *Contributions to North American Ethnology*, vol. vi.; *The Dhegiha Language, Myths, Stories, and Letters* (published by the Bureau of Ethnology); *Omaha and Ponka Letters* (Bureau of Ethnology). He contributed numerous articles to the *American Antiquarian*, *American Naturalist*, *American Anthropologist*, and *Journal of American Folk-lore*.

Dort, also called **Dor'drecht** (Lat. *Dordracum*): a fortified town of the Netherlands; in South Holland; on an island in the Meuse; 10 miles S. E. of Rotterdam (see map of Holland and Belgium, ref. 7–E). It is traversed by canals, is accessible to large ships, and has an active trade in grain, flax, timber, and salt fish. Here are ship-building docks, sugar-refineries, sawmills, and manufactures of tobacco, white lead, etc. In 1421 a terrible inundation destroyed seventy villages, and converted the ground where Dort stands into an island. The Synod of Dort met here in 1618, and condemned the doctrines of Arminius. Pop. (1896) 36,687.

Dortmund, dōrt'moont: town of Prussia; in Westphalia; on the Embscher and on the Cologne and Minden Railway; 47 miles N. N. E. of Cologne (see map of German Empire, ref. 4–C). It has several fine churches, three hospitals, a Protestant gymnasium, and a Realgymnasium; also manufactures of cotton, linen, and woolen fabrics, cutlery, and nails. It was a city of the Hanseatic League, and was the chief seat of the Fehmic Court. Its trade was nearly ruined by the Thirty Years' war. Dortmund was ceded to Prussia by the Congress of Vienna in 1815. Pop. (1900) 142,418.

Dort, Synod of (in Lat. *Synodus Dordracena*): a great synod of the national Church of Holland; convened at Dort from Nov. 13, 1618, to May 19, 1619, consisting of 39 ministers, 18 ruling elders, and 5 professors, deputies from the several states of the Netherlands, besides 24 foreign deputies representing the Anglican and most of the Calvinistic churches. The synod was convoked by the States-General on account of the controversies between the Gomarists (Calvinists) and Remonstrants (Arminians). The latter derived their name from the remonstrance which they addressed to the States-General defining their religious doctrines in the five articles henceforth known as the five points of Arminianism. The synod was convened in the Calvinistic interest, and there has been much difference of opinion as to the fairness of its proceedings, because of its refusal to permit the Arminian deputies to aid their brethren who were cited before the synod to defend their views. The principal work of the synod was the preparation of canons setting forth the Calvinistic doctrines, and the publication of an ecclesiastical censure against the Remonstrants, calling upon the civil power to enforce the decrees of the synod by banishment, imprisonment, or fines imposed upon the refractory. The canons are ably drawn up, and were officially received by the Reformed churches of the Low Countries, France, Switzerland, and the Palatinate, but were some years later rejected by the Church of England. See the official *Acta Synodi* (4to, 1620). Revised by F. M. Colby.

Dory, or **John Dory** [*Dory* is a corruption of Fr. *dorée*, gilded, in allusion to its golden tinge. John may be merely the proper name, or, as some give it, a corruption of Fr. *jaune*, yellow]: a marine fish (*Zeus faber*) having the membrane of the back fin extending, like streamers, far beyond the spines. The head is large, and there is a conspicuous black spot on each side. It is found on the coasts of Europe, and attains a length of 18 inches. It is among the various fishes pointed out by tradition as the one from whose mouth St. Peter took the penny, the spots on the sides being the impression of his thumb and finger.

F. A. Lucas.

Dosith'eans: an unimportant Samaritan sect founded in the first century after Christ by Dositheus, who is said to have represented himself to be the Messiah. In the fourth century there still remained a few who believed implicitly in the claims of Dositheus.

Dossert, Frank G.: organist and composer; b. in Buffalo, N. Y., 1861; at the age of eighteen succeeded his father as organist of the cathedral. He has held several important organ positions, and since 1886 has been organist of St. Stephen's Roman Catholic church, New York city. His compositions include songs, motets, several masses, and other sacred works, a mass in E minor, and some pieces for orchestra. One of his masses, dedicated to Pope Leo XIII., was produced at Rome in 1893. D. E. Hervey.

Dossi, dos'sĕ, Giovanni: painter; b. at Dosso, near Ferrara, either in 1474 or 1479. He studied under Lorenzo Costa. In connection with his brother Battista he worked much at Ferrara and at Modena. Perhaps his most important work still existing is the *Madonna and Saints* in the Ferrara Museum. He died at Ferrara in 1542. He is often called Dosso Dossi.

Dost Mohammed: See Afghanistan.

Dostoïev'ski, Fédor Mikhaïlovitch: Russian novelist; b. in Moscow in 1822. His literary career began in 1846 with the book *Poor People*, in which he described vividly and pathetically the life of the small tradesman and laborer in Russia. In 1849 came an event of the most terrible consequence in his own life. An eager liberal, he had associated himself with a club whose aim was the reform of governmental abuses. Suspicion soon fell upon the club; its members were arrested and at once condemned to death. Only on the scaffold itself was their sentence commuted to banishment to Siberia. Dostoïevski was given ten years of hard labor in place of death. The full penalty was, however, not inflicted; by 1854 he was relieved of the requirement of hard labor. Yet it was 1860 before he was able to go to St. Petersburg. There he found his wife hopelessly broken in health, his own fortune ruined, and want staring him in the face. The rest of his life was given to the hard struggle of earning his bread with the pen. In 1861 he published *The Downtrodden and Oppressed*, a novel full of the same sympathy for the poor and weak and lowly that he had shown before his exile. Still he would not ally himself with the nihilists; and in 1867 his novel *Evil Hearts* seemed to contain his renunciation of their

principles. Later in the same year the greatest of his works, *Crime and Punishment*, made this still more clear. In fact this terrible book, with its psychological analysis of apparently the utmost realism, did, taken as a whole, seem to show in human life a thread, a tendency, a purpose of a distinctly spiritual and even religious character. The extreme party was not slow to see this, and denounced the author as a reactionary and mystic. In 1869 appeared *The Idiot*; in 1875, *Podrostok*, *The Brothers Karamrasov*, *Krotkaia*, and *The Underground Spirit*. In 1876 Dostoïevski undertook to produce by himself alone a periodical entitled *An Author's Journal*, in which he printed from time to time his reflections upon the fundamental questions interesting Russia, always from the point of view of an ardent Slavophil. Although denounced by the nihilists, he remained exceedingly popular among the educated young men and women, even of liberal leanings, in Russia. His death was the cause of almost national mourning. D. in St. Petersburg, Jan. 28 (Feb. 9 of the English calendar), 1881.

A. R. Marsh.

Dotis: same as Totis (*q. v.*).

Dotterel: the popular name for a species of plover (*Eudromias morinellus*), common in Europe and Asia. The plumage above is varied with black and rusty red, the belly is black, the breast yellow, and there is a band of white and black on the neck. The bird is about 9 inches in length. The young, which run about as soon as hatched, are good examples of protective coloration, so blending with the sandy pebbly places which they frequent as to escape detection by crouching flat on the ground. F. A. Lucas.

Douai, doo'ā' (in Lat. *Duacum*): fortified town of France; department of the Nord; on the river Scarpe and on the Chemin de Fer du Nord; 21 miles S. of Lille (see map of France, ref. 2–F). It is well built, has several fine churches and hospitals, a theater, an arsenal, a botanic garden, and a national college representing the Douai University founded by Philip II. in 1562, with which was affiliated the famous college for the education of English Roman Catholic priests, founded by Cardinal Allen in 1562. For more than two hundred years Douai was the center of English Roman Catholicism and the refuge for the persecuted members of that Church. Missionaries from the college returned to England and worked for the restoration of the old faith. Of its alumni it is stated that thirty became bishops, while 160 sacrificed their lives on the scaffold for the papal cause. The college was suppressed and its property confiscated by the French Government, Oct. 12, 1793. After their expulsion the members of the college, among whom was the historian Lingard, founded a similar college at Crook Hall, afterward transferred to Ushaw, near Durham, England. At Douai are manufactures of cotton stuffs, lace, gauze, paper, glass, pottery, and soap. Douai existed in the time of Cæsar. It has often been besieged and taken by the French and Flemings. Pop. (1896) 31,397.

Revised by F. M. Colby.

Douai, or **Douay**, **Bible**, **The**: a translation of the Bible by English Roman Catholic divines connected first with the college at Rheims, and afterward with the college at Douai. The translators were Gregory Martin, William Allen, Richard Bristow, William Reynolds, and others. The New Testament was published at Rheims in 1582. The Old Testament, then already translated, was published at Douai in 1609–10. Both Testaments were translated from the Vulgate. The annotations were quite copious, and intensely Roman Catholic. Numerous editions have appeared, which greatly vary both in the text and in the notes. An exact reprint of the original Rheims New Testament was published in New York in 1833. Of the original Douai Old Testament there has been no exact modern reprint. See Henry Cotton, *Rhemes and Doway* (Oxford, 1855).

Doub, Peter, D. D.: minister of the Methodist Episcopal Church South; b. in Stokes co., N. C., Mar. 12, 1796. He joined the Virginia Conference in 1818. Many thousands in Virginia and North Carolina were brought into the church by his ministry. He was a polemical preacher of great power. He was for three years before his death Professor of Biblical Literature in Trinity College, N. C. D. in Greensboro, N. C., Aug. 24, 1869.

Double Consciousness, sometimes called **Double Personality**: a form of mental disease involving confusion in the idea of personal identity. Persons with this disorder are variously affected; some conceive that parts of their frame belong to another person; others that they are inhabited by another entity in addition to their own, and which opposes itself to their will and interests; others appear to be possessed at one time of one personality, at another of another, according to the mental or physical conditions under which they are placed. In the last-named form of the phenomenon the person affected can not remember in one state the events which happened during the other. The phenomena of double consciousness have never received a satisfactory explanation. For some striking examples of the last-named variety, see Wayland, *Intellectual Philosophy*. See also Psychology (*Physiological*).

Doubleday, Abner: general; b. in Ballston Spa, N. Y., June 26, 1819; graduated at West Point in 1842. He became a captain in 1855, and was one of the garrison of Fort Sumter in 1861; brigadier-general of volunteers Feb., 1862; major-general Nov., 1862, and engaged in battles of Manassas, South Mountain, Antietam, Chancellorsville, and at Gettysburg commanded the First Corps in the first day's fight after the death of Gen. Reynolds; brevet brigadier and major-general U. S. army; became a colonel of infantry in 1867. Retired in 1873. He published *Reminiscences of Forts Sumter and Moultrie in 1860–61* (New York, 1876) and *Chancellorsville and Gettysburg* (1882). D. Jan. 26, 1893.

Double Refraction: a phenomenon exhibited by Iceland spar and several other crystals. A ray of common light passing through them is divided into two polarized rays, which take different directions and are refracted according to different laws. See Refraction and Polarization.

Double Stars, or **Binary Stars** (see Binary System): sidereal systems composed of two stars, one revolving around the other, or both about a common center. These were noticed by Sir William Herschel in 1803. Subsequent observations have confirmed this discovery, and in some instances the periods of revolution have been determined. Some of these binary systems have periods of great length, and some of them afford curious instances of contrasted colors, the color of the smaller star being complementary to that of the larger. In such instances the larger star is usually red or orange, and the smaller star blue or green.

Doublets: in historical grammar a pair of words in a given language, which have been differentiated out of what was originally one and the same word; thus *hotel* and *hospital*, which are historical descendants of Lat. (vulg.) *hospita'le*. The differentiation of form is almost always found to be utilized for the expression of some variety of signification. It is this indeed which, by giving the doublets a *raison d'être*, insures their existence. Their linguistic importance lies in the fact that their divergence of form exhibits an accurate measure of the historical forces that make for change in the different linguistic routes which the words have followed. The differentiation of form may be either phonetical or analogical (minor variations of suffix being disregarded in our classification).

A. Phonetical differentiation may make itself apparent—(1) When a given language borrows a word cognate to one of its own from a related language; thus *name* is the native English word of Teutonic stock, whereas *noun* comes viâ French from the cognate Lat. *nomen*; so *brother* : *friar* (O. Fr. *frere*); so the verb *ward* (= Germ. *warten*) : *guard*, which has come to us from Germ. viâ Old French; so *wain* (= Germ. *wagen*) : *wagon* (Dutch). (2) When a word is borrowed from the earlier sources of a language. This is called "learned" borrowing. Thus Fr. *meuble* and *mobile* both represent Lat. *mŏbilis*, cf. *chose* : *cause*, *droit* : *direct*, *mûr* : *mâture*, *chétif* : *captif*. (3) When different dialects of the same language contribute cognate forms to its literary language; thus *church* : *kirk* (No. Engl. Scandin. influence); so *road* : *raid* (cf. *inroad*), *whole* : *hale*, Germ. *sanft* : *sacht* (Low Germ.); Lat. *popina* : *coquina*; *palumba* : *columba*. (4) When a language borrows from two different dialects of another language, or at two different periods of its history; thus *suit* (from O. Fr.) : *suite* (from Mod. Fr.) = Lat. *secta*; *hostel* : *hôtel*; *reason* : *ration* = Lat. *ratio-nem*; *beast* : *bête* = Lat. *bestiam*; *corpse* : *corse* : *corps*; *rout* : *route* = Lat. *ruptam*; *cadence* : *chance*; *fashion* : *façon* = Lat. *factionem*. (5) When a language borrows cognates from two languages: thus *guitar* (Fr.) : *zither* (Germ.) = Gr κιθάρα; *gopher* (Heb.) : *cypress* (Gr.); *czar* (Russ.) : *kaiser* (Germ.) = Lat. *Cæsar*: *castle* (Lat.) : *château* (Fr.); *blame* (O. Fr.) : *blaspheme* (Lat.); *preach* (O. Fr.) : *predict* (Lat.): *place* (O. Fr.) : *piazza* (Ital.). (6) When a language gives per-

manent recognition in its literary form to variants of a single word originally due to different positions in the phonetic sentence: thus *of* : *off*; *one* : *an*; Lat. *prehendere* : *prendere*: *providens* : *prudens*; Germ. *jungfrau* : *jungfer*.

B. Analogical differentiation appears when a neologism is given a permanent place beside the old form by its appropriation of a special signification or function; thus *mister* (*Mr.*) formed from *master* by the analogy of *mistress* is made permanent by its special use as a title; so *clothes* : *cloths*; *brethren* : *brothers*: *pence* : *pennies*; Fr. *plier* : *ployer*: *sachant* : *savant*; Germ. *bescheiden* : *beschieden*; *verdorben* : *verderbt*; Lat. *partim* (old accus. used as adv.) : *partem*.

Some doublets are merely orthographical; thus *to* : *too*; *bass* (music. term) : *base* (adj.).

(1868). Benj. I. Wheeler.

Doubloon' [from Fr. *doublon*, from Span. *doblon*: Ital. *doppione*, from deriv. of Lat. *duplus*, double]: a Spanish gold coin nearly equivalent to sixteen dollars. It is the double of a pistole.

Doubs, doobz (anc. *Dubis*): a river of France; rises in the Jura Mountains, flows nearly southwestward through the departments of Doubs and Jura, and enters the Saône at Verdun-sur-Saône. Total length about 250 miles. The chief towns on its banks are Besançon and Dôle. It is navigable to Dôle.

Doubs: a department in the eastern part of France; bordering on Switzerland. Area, 2,018 sq. miles. It is intersected by the river Doubs. The surface is traversed by several ridges of the Jura Mountains, which are covered with forests of pine, walnut, and other trees. The soil of the valleys is fertile, and produces good pasture. Here are mines of coal and iron and quarries of marble. Among the exports are cattle, horses, iron, and butter. Capital, Besançon. Pop. (1881) 310,827; (1891) 303,081; (1896) 302,046.

Doubting Insanity (in Fr. *folie du doute*): a form of melancholia in which the patient pauses in doubt as to which of two trivial things must be done. This very peculiar condition is not to be regarded as a form of insanity itself, but is a symptom in certain cases, and has occurred in a number of illustrious men not regarded insane. It is well known that Samuel Johnson would not pass along the streets of London without touching each post, and if he neglected to touch one he returned to it. Flaubert said the "mania of doubt exhausts me. I doubt about everything; even about my doubts." Certain persons can not decide which stocking or shoe to put on first, and would pause for hours should no help be given. While thus the insanity of doubt not rarely occurs in those of generally sound mind, it is apt to be met in its more pronounced types only in the otherwise insane. William Pepper.

Doucet, doo'sā', Lucien: figure and portrait painter: b. in Paris, Aug. 23, 1856. Pupil of Lefebvre and Boulanger; Grand Prix de Rome 1880; second-class medals, Salon, 1887, and Paris Exposition, 1889; first-class medal, Paris Exposition, 1889, for pastels; Legion of Honor 1891. His work is individual and extremely brilliant technically; his portraits of women are graceful and refined. *Portrait of Mme. Galli-Marie*, a remarkable work, is in the Marseilles Museum. Studio in Paris. W. A. C.

Dough: See Cookery.

Dougherty, dokh'er-ti, Daniel: lawyer; b. of Irish parentage, in Philadelphia, Oct. 15, 1826; at eighteen began the study of law and was admitted to the bar in 1849; soon became one of the foremost advocates in Philadelphia; was a prominent speaker on the Democratic side, but being an uncompromising Unionist left the Democratic party in 1861; returned to the Democratic party on nomination of Samuel Tilden in 1876; in 1880 nominated Gen. Hancock as a candidate for the presidency, in a speech which won for him the title "silver-tongued orator." Another remarkable oration was made at the opening of the Roman Catholic lay congress in Baltimore, Nov. 11, 1889. He nominated Grover Cleveland as a candidate for the presidency in 1888. Mr. Dougherty was an orator of great finish and power, and was as well known on the lecture platform as for political addresses. Although prominent in politics, he never held office. In the later years of his life he removed from Philadelphia to New York, and devoted himself mainly to the law. D. Sept. 5, 1891.

Doughty, dow'ti, Thomas: landscape-painter: b. in Philadelphia, Pa., July 19, 1793. One of the earliest of the landscape-painters of the U. S., having begun to paint about 1820. He was self-taught. Five of his pictures are in the permanent collection of the Pennsylvania Academy, Philadelphia, and possess an historical interest merely. D. in New York, July 24, 1856. W. A. C.

Douglas, dŭg'las: a seaport and the chief town of the Isle of Man: on the east coast: 80 miles N. W. of Liverpool (see map of England, ref. 5–D). It stands on a picturesque bay, and has a harbor which will admit vessels drawing 10 to 12 feet of water. It contains a custom-house, handsome villas, good hotels, and baths. The excellence of its sea-bathing renders this an important watering-place. Pop. about 18,000.

Douglas: the name of an ancient noble family of Scotland which has produced many eminent men. The first member of the family who appears on record was William of Douglas, 1175–1200. By far the most famous member of the family before it entered into the earldom was the Good Sir James, known as the Black Douglas, the hero of many battles in the Scotch war of independence, the bravest and most faithful supporter of Robert Bruce. He was slain in 1330 while bearing the heart of his royal master to the Holy Land. Sir William, who had been made the first Earl of Douglas in 1357, was a competitor for the crown in 1371, but agreed to recognize his rival, Robert II., on the condition that his son James should marry a daughter of that king. The Earl of Douglas died in 1384, and was succeeded by his son James, who was killed at the battle of Otterburn in 1388. As he left no lawful issue, Archibald the Grim, a natural son of Sir James the Good, became the third Earl of Douglas. He died in 1401, leaving a son, Archibald, the fourth earl. This was Douglas the Tineman, or loser, so called from his misfortunes. He was severely wounded at the battle of Homildon Hill in 1402 and taken prisoner by Hotspur. In the battle of Shrewsbury in 1403, though he displayed great bravery, he was again wounded and captured. He went to France where he became Duke of Touraine, and was killed at Verneuil in 1424. He was succeeded by his son Archibald, the fifth earl, who died in 1439. His son and heir William, the sixth earl (b. about 1422), became an object of fear and suspicion to the court on account of his power and foreign possessions. He was beheaded after a hasty trial, Nov. 24, 1440, and left no issue. The earldom was then given to his granduncle James, who died in 1443 and was succeeded by his son William, the eighth earl, a powerful and turbulent person. He was appointed lieutenant-general of the kingdom by James II., but soon lost the royal favor. He was killed by that king Feb. 22, 1452, and was succeeded by his brother James, ninth Earl of Douglas, who waged open war against King James II. in 1454. He was defeated and taken prisoner in 1484, and died in 1488, when that branch of the Douglas family became extinct. The Earls of Angus and the Earls of Morton, besides other noble lines, belonged to the family of Douglas, which is now represented in the peerage by the Earls of Selkirk.

Revised by F. M. Colby.

Douglas, Archibald: fifth Earl of Angus, surnamed Bell the Cat, was a son of George, the fourth earl, who had been rewarded for his loyalty to the king against the older branch of the family by a grant of a portion of the latter's estates. Archibald was a powerful and ambitious subject, and held the highest offices in the state. He was the father of Gawin Douglas, the poet, and of other sons. He derived his popular name from his boldness in heading the disaffected nobles who in 1488 seized and imprisoned King James III. D. in 1514. His grandson Archibald became the sixth Earl of Angus, and married in 1514 Margaret, who was a sister of Henry VIII. of England and widow of James IV., of Scotland. He had a daughter, who became the wife of the Earl of Lennox and the mother of Lord Darnley. The sixth earl died about 1660, and his title was inherited by his nephew George, who was a brother of Regent Morton. The eleventh Earl of Angus was created Marquis of Douglas in 1633. See David Hume, *History of the Houses of Douglas and Angus* (1644).

Douglas, David: botanist: b. at Scone, in Perthshire, Scotland, in 1798. As an agent of the London Horticultural Society he visited the U. S. in 1823 to collect botanical specimens. He returned to England in 1827, and afterward went on a scientific excursion to the Sandwich islands, where he was killed by a wild bull July 12, 1834.

Douglas, Gawin: Scottish poet; b. in 1474; the third son of Archibald, fifth Earl of Angus. He was educated for the Church, and became Bishop of Dunkeld in 1515. His most remarkable production is a translation of Vergil's *Æneid* into Scottish verse (1513), which is highly commended. His chief original poem is *The Palace of Honor*. D. in 1522.

Douglas, George Cuninghame Monteath, D. D.: scholar and minister of the Free Church of Scotland; b. in Kilbarchan, Renfrewshire, Scotland, Mar. 2, 1826; educated in the University of Glasgow and New College, Edinburgh; pastor at Bridge of Weir, Renfrewshire, 1852–57. Then he became Professor of Hebrew and Old Testament Exegesis in the Free Church College, Glasgow, and, later, principal of the college. Among his published works are articles in Fairbairn's *Imperial Bible Dictionary* (1866); annotated translation of Keil's *Introduction to the Old Testament* (2 vols., 1869–70); *Why I still believe that Moses wrote Deuteronomy* (Edinburgh, 1878); *The Book of Judges* (1881); *The Book of Joshua* (1882); *The Six Intermediate Minor Prophets* (1890), the last three being in the Dods and Whyte *Handbooks for Bible Classes*; *A Short Analysis of the Old Testament* (1889). He was a member of the British company of the revisers of the Old Testament.

Willis J. Beecher.

Douglas, Stephen Arnold: statesman; b. at Brandon, Rutland co., Vt., Apr. 23, 1813. He entered upon an academical course, first at Brandon, Vt., and then at Canandaigua, N. Y. At the latter place he remained until 1833, and took up the study of the law at the office of the Messrs. Hubbel, and prosecuted this in connection with his academic course. After some wanderings in the Western States in quest of a new home where his fortunes were to be tried, he took up his abode at Jacksonville, Ill., where, after teaching school for three months, he was admitted to the bar, and opened an office in 1834. He rapidly rose in his profession. Within a year from the time that he received his license to practice he was elected attorney-general of the State. Having been reared in the Jeffersonian school of politics, Mr. Douglas zealously espoused the Democratic side on all public questions then agitated, and soon became one of the most popular orators of his party in Illinois. He was at an early day in his political life styled "The Little Giant," in allusion to his diminutive stature in contrast with the extent and comprehensiveness of his intellectual powers. In 1835 he resigned his position as attorney-general upon his being elected a member of the State Legislature. In 1841 he was chosen one of the judges of the Supreme Court of the State. This position he resigned in 1843 to take a seat in the House of Representatives of the Congress of the U. S.

When Mr. David Wilmot, of Pennsylvania, in Aug., 1846, moved his celebrated proviso for slavery restriction to any new territory that might be acquired from Mexico in a treaty of peace, Mr. Douglas was one of five only in the House, from the entire North, who took decided position against that measure. The internal polity and domestic institutions of the several States composing the Union were subjects, in his judgment, over which the Federal legislative authority did not extend under the limitations of the Constitution.

In 1847 he was elected to the Senate for a full term of six years. In that body he was no less distinguished than he had been in the House. No man in the Senate, not excepting Mr. Clay or Mr. Webster, acted a more conspicuous part than he did in what is known as the Compromise or adjustment of the sectional questions of 1850. In 1852 he was again elected to the Senate for another full term. Under his lead the Kansas-Nebraska bill was triumphantly carried in the Senate, on the grounds that the principle of a division of the public domain between the sections by the Missouri or any other line had been totally abandoned by the adjustment of 1850, and the principle of non-intervention by Congress anywhere in the Territories substituted in its stead. On the like ground it was triumphantly carried in the House, and constitutes what is known as the "Territorial legislation of 1854." (See *Harper's Magazine*, Sept., 1859.) In 1858 Mr. Douglas was again re-elected to the Senate for another full term, after one of the fiercest and bitterest contests ever before waged in the U. S. for a similar position.

As early as 1852 the name of Mr. Douglas had been brought prominently before the Democratic nominating convention at Baltimore as a candidate for the presidency, but, at his own instance, was not pressed by his friends. In 1856 it was again in like manner presented to the Cincinnati convention, but as soon as he discovered that Mr. Buchanan had a majority in that body he gave positive instructions to his friends in that convention by telegram from Washington to withdraw his name and not to allow it to be used in any contest for the nomination under the two-thirds rule. The platform of political principles which had been adopted there before the subject of nominating candidates had been taken up was just such as had governed the whole of his public life, and he gave Mr. Buchanan a cordial support upon his indorsement of them. In 1860, after his triumphant return to the Senate at his last election, he was the most prominent candidate of the Democracy of the U. S. for the presidential nomination at the convention held that year in Charleston, S. C., and very probably would have received it by a two-thirds vote but for the withdrawal of the delegates of the States of Alabama, Arkansas, Florida, Louisiana, Mississippi, South Carolina, and a majority of those from Georgia. The presidential canvass that year was perhaps the most exciting that had ever occurred since that between Mr. Jefferson and the elder Adams in 1800. Four tickets for President and Vice-President were in the field—Lincoln and Hamlin, supported by the Republicans; Bell and Everett, supported by those styling themselves the American party; Douglas and Johnson, supported by one wing of the Democracy, and Breckenridge and Lane, supported by the other. The chief objection to Mr. Douglas on the part of his former Democratic associates, who refused to support him, was what was called his squatter-sovereignty doctrine. The result of the election, by the popular vote, was for Lincoln and Hamlin, 1,857,610; for Douglas and Johnson, 1,365,976; for Breckenridge and Lane, 847,953; and for Bell and Everett, 590,631. The result by the college of electors, however, was very different. By this Messrs. Lincoln and Hamlin received 180 votes; Messrs. Breckenridge and Lane, 72; Messrs. Bell and Everett, 39; Messrs. Douglas and Johnson received 12 only.

The great events of 1861 followed in rapid succession. Mr. Douglas was spared their full development. He died, after a short illness, at his residence in Chicago, June 3, 1861.

Douglas Island: an island of Southeastern Alaska, celebrated for its gold mines. It is N. of Admiralty island and opposite Juneau, in lat. 58° 20′ N., lon. 134° 30′ E.; is about 20 miles long by 10 broad, separated from the mainland by a very narrow strait, and is nearly opposite the mouth of Taku inlet. The Treadwell gold mine on this island is the best-known mine in Alaska. It works a pyritic ore which is very easily reached, and though yielding only $4 per ton gives a good profit.

Douglass, David Bates: civil and military engineer; b. at Pompton, N. J., Mar. 21, 1790; graduated at Yale College Sept. 18, 1813, and Oct. 1, 1813, was appointed a second lieutenant in the corps of engineers U. S. army, and was promoted to first lieutenant in the following year for his services in the operations around Niagara and Fort Erie. He resigned his position in the army Mar. 1, 1831, to become the chief engineer of the Morris Canal Company; was one of the engineers of the Croton aqueduct 1833–35; and chief engineer of Greenwood Cemetery 1837–40. He was president of Kenyon College, Ohio, from 1840 till 1844, when he returned to New York, and was engaged till 1848 in important engineering work. In 1848 he became Professor of Mathematics at Hobart College, Geneva, and retained the position for the rest of his life. D. at Geneva, N. Y., Oct. 9, 1849.

Douglass, Frederick: orator; b. at Tuckahoe, near Easton, Md., in Feb., 1817; son of a white man and a negro woman who was a slave; at ten years of age sent to Baltimore to live with a relative of his master, Col. Lloyd; found employment in a ship-yard, and learned to read and write; escaped to New Bedford, Mass., in 1838; changed his name from Lloyd to Douglass; became agent of the Massachusetts Anti-Slavery Society, and lectured in New England and Great Britain; edited at Rochester, N. Y., a weekly journal, *The North Star*; lectured frequently before lyceums; in 1870 became editor of the *New National Era*; in 1871 as-

sistant secretary to the commission to Santo Domingo; in 1872 first in the list of presidential electors chosen by the Republican party of the State of New York; U. S. marshal District of Columbia, 1877–81; recorder of deeds in same District 1881–86; U. S. minister resident and consul-general at Haiti 1889–91. D. in Washington, Feb. 20, 1895. He published *Narrative of My Experience in Slavery* (Boston, 1844); *My Bondage and My Freedom* (Rochester, 1855); *Life and Times of Frederick Douglass* (Hartford, 1881).

Douglass, John Hancock, M. D.: b. in Waterford, N. Y., in 1827; graduated at Williams College 1843; in the medical department University of Pennsylvania 1847; studied two years in Europe; editor of the *American Medical Monthly* (1856–62); *New York Medical Journal* (1865–66); served with U. S. Sanitary Commission during the war and became its secretary. He was the leading physician in attendance on Gen. Grant in his last illness. D. Oct. 2, 1892.

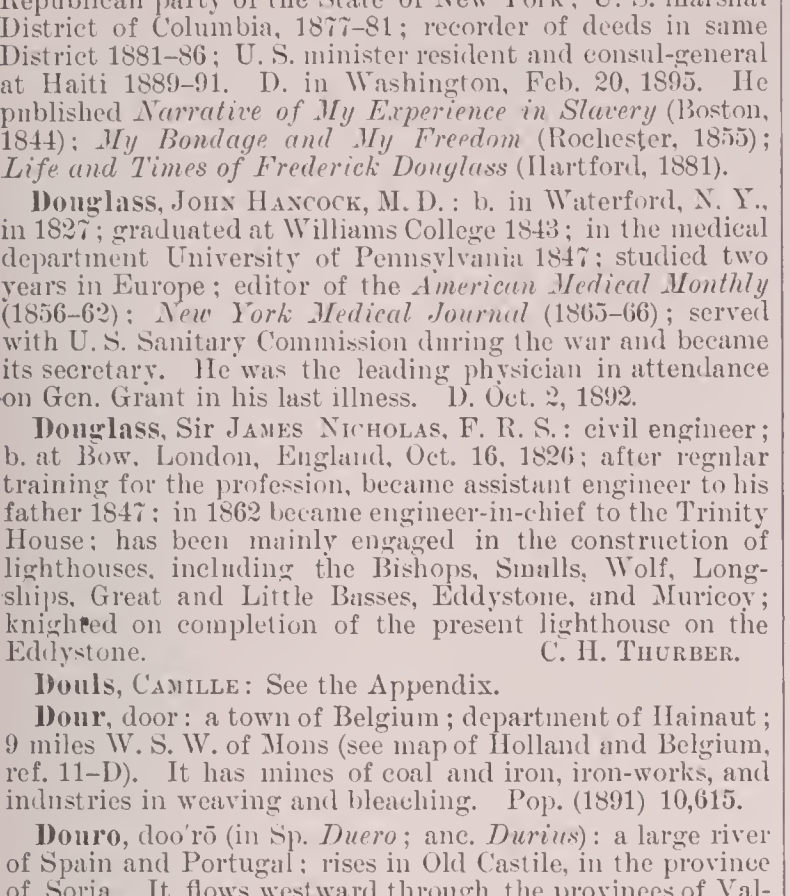
Douglass, Sir James Nicholas, F. R. S.: civil engineer; b. at Bow, London, England, Oct. 16, 1826; after regular training for the profession, became assistant engineer to his father 1847; in 1862 became engineer-in-chief to the Trinity House; has been mainly engaged in the construction of lighthouses, including the Bishops, Smalls, Wolf, Longships, Great and Little Basses, Eddystone, and Muricoy; knighted on completion of the present lighthouse on the Eddystone. C. H. Thurber.

Douls, Camille: See the Appendix.

Dour, door: a town of Belgium; department of Hainaut; 9 miles W. S. W. of Mons (see map of Holland and Belgium, ref. 11–D). It has mines of coal and iron, iron-works, and industries in weaving and bleaching. Pop. (1891) 10,615.

Douro, doo'rō (in Sp. *Duero*; anc. *Durius*): a large river of Spain and Portugal; rises in Old Castile, in the province of Soria. It flows westward through the provinces of Valladolid and Zamora until it touches the northeast extremity of Portugal. It then runs southwestward, and forms part of the boundary between Spain and Portugal. Resuming a westward direction, it traverses the northern part of Portugal, and enters the Atlantic 3 miles below Oporto. Its total length is nearly 500 miles. Rocks, sandbanks, and the rapid current render its navigation difficult. In Spain it is a narrow but deep river, pressed in between precipitous banks. But, in spite of its unequal fall, it could easily be made navigable on account of the great mass of water it carries. In Portugal it is a stately stream, forming a large lake-like basin just before disemboguing. Its mouth is narrow, however, and somewhat embarrassed by sand. Of its many affluents the Pisuerga is the most important.

Douroucouli, door-roo-koo'lē: the common name of several species of small, nocturnal monkeys, found from



The douroucouli, or the night monkey.

Central America to Southern Brazil. The most common species (*Nyctipithecus trivirgatus*), from Guiana and Brazil, has a short muzzle, large round eyes, and long, soft fur. It is a little over 2 feet in total length, of a silvery-gray color, light chestnut below and on the inner side of the limbs, with three black marks on the face. The douroucouli is dull and sluggish by day, but active at night, when it emerges from the hollow tree that forms its home, to pilfer birds' eggs, gather fruit, and catch insects, these last forming the bulk of its diet. F. A. Lucas.

Douven, dow'ven, or doo'ven, Jan Francis: portrait-painter; b. at Roermond, Holland, Mar. 2, 1656; studied under Gabriel Lambertin at Liège, and in 1684 settled at Düsseldorf, at the court of the Duke of Neuburg. He visited Vienna, Madrid, and other cities for the purpose of painting the portraits of sovereigns and other noble personages, and executed so many works of this kind that he is well styled the court-painter of Europe of that time. D. in Prague in 1710.

Douville, doo'veel', Jean Baptiste: traveler; b. at Hambye, department of Manche, France, Feb. 15, 1794; inherited a fortune which enabled him to travel extensively in Asia and America; in 1832 published at Paris a work in three volumes describing his explorations and discoveries in the interior of Africa. The Société de Géographie awarded him a gold medal, the Royal Geographical Society of London made him an honorary member, and the French maps and text-books were altered in accordance with his publication. He was soon exposed as an impostor, who at the time of his supposed explorations was teaching languages in England. He again visited South America, and was murdered there in 1835.

Dove [O. Eng. *dūfe*: Germ. *Taube*; origin doubtful]: in Christian art, a symbol of purity and an emblem of the Holy Spirit. Issuing from the lips of dying saints and martyrs, it represents the soul purified by suffering. Holding in its mouth an olive branch, it is the emblem of peace. In Catholic churches the pyx or ciborium containing the host is sometimes in the form of a dove. It is mentioned more than fifty times in the Bible. It was the only bird which could be offered as a sacrifice among the Jews, and, as it was cheap, it was often selected for that purpose by poor people. In order to supply the demand, the raising of doves was from early times a pursuit among the Jews, and the dealers had their stalls on the premises of the temple.

Dove, in ornithology: See Pigeon.

Do've, Heinrich Wilhelm: physicist; b. at Liegnitz, Silesia, Oct. 6, 1803; graduated at the University of Berlin in 1826. He became Professor of Physics there in 1829, and made researches into the laws of climate and atmospheric phenomena. He published, besides other works on meteorology, electricity, etc., *Meteorologische Untersuchungen* (Meteorological Researches, 1837); *Verbreitung der Wärme auf der Oberfläche der Erde* (The Diffusion of Heat on the Earth's Surface, 1852; published in 1853 by the British Association); *Gesetz der Stürme* (The Law of Storms, 4th ed. 1874). D. Apr. 4, 1879.

Dove, Richard Wilhelm: jurist; son of Heinrich Wilhelm Dove; b. in Berlin, Prussia, Feb. 27, 1833; studied in Berlin and in Heidelberg; became in 1859 privat docent at the University of Berlin; in 1862 professor at the University of Tübingen; in 1865 at Kiel; and in 1868 at Göttingen. In 1871 he was elected to the German Reichsrath, where he voted with the National Liberal party. He began in 1860 the publication of the *Zeitschrift für Kirchenrecht*, the leading periodical in Europe on all questions relating to church law.

Dovekie, or **Sea Dove**: the popular name for one of the small auks (*Alle alle*), a bird about 8 inches long. The head, neck, and upper parts are black, the under parts white. In winter the white extends to the bill and upon the sides of the neck. The dovekie is found in northern latitudes on both sides of the Atlantic, and during summer occurs in myriads at its breeding-places on the shores of Greenland and the adjacent islands. In winter it frequents the open ocean, and during storms is frequently blown inshore, occasionally inland. See Auk. F. A. Lucas.

Do'ver (anc. *Dubris*): city and seaport of Kent, England; situated on Dover Strait, 66 miles E. S. E. of London and 26 miles from Calais, France (see map of England, ref. 13–L). It is the point in England nearest to the Continent, and is the terminus of the Southeastern Railway. It stands at the entrance of a deep depression in an amphitheater of chalk-hills and cliffs. This city is defended by Dover

Castle, which is built on chalk-cliffs 320 feet high, and is a fortress of great strength and extent. This castle is said to have been founded by the ancient Romans. Dover contains a custom-house, a town-hall, a theater, and a military hospital. The harbor is protected by a stone pier built of solid masonry, 60 feet wide, and extending about 1,800 feet into the sea. Dover is the chief port of communication between England and France, and is only 21 miles distant from the nearest part of the Continent. Steamers ply daily between this port and Boulogne and Calais. Dover returns a member to Parliament, and is one of the Cinque Ports. A submarine cable was laid from Dover to Calais in 1850. With respect to its physical condition, the place is one of the healthiest in England, and the agreeable variation of open downs and steep cliffs in the surroundings makes it a favorite summer resort. Pop. (1891) 33,418.

Dover: capital of Delaware and of Kent County (for location of county, see map of Delaware, ref. 4–N); on St. Jones river and on railway; 48 miles S. of Wilmington and about 5 miles W. of Delaware Bay. It stands on high ground, the streets are wide, well shaded, straight, and cross each other at right angles, and most of the buildings are built of brick. The principal buildings face an open square planted with fine elms. It has 10 churches, an excellent public school, 3 select schools, the Conference Academy, a State-house, with a State library containing 50,000 volumes, a fine U. S. post-office building, a job-printing office, 2 fruit-

State capitol, Dover, Del.

packing houses, 4 fruit-evaporating houses, flouring-mill, sash and fruit-crate factory, foundry, machine-shop, carriage-manufactory, stocking-factory, gas-works, and the Holly system of water-works. It is the center of a great fruit-growing section. The town was settled in 1687, and was incorporated about 1720. Its first church (Protestant Episcopal) was completed in 1708. Dover became the capital of the State at the time of the outbreak of the Revolutionary war. A handsome monument commemorates the patriotic services of John Haslett, M. D., colonel of one of the Delaware regiments during the Revolution, who fell at the battle of Princeton. Pop. (1880) 2,811; (1890) 3,061; (1900) 3,329.

EDITOR OF "DELAWAREAN."

Dover: city and railway center; capital of Strafford co., N. H. (for location of county, see map of New Hampshire, ref. 8–G); situated on Cocheco river: 68 miles N. of Boston and 10 miles N. W. of Portsmouth. It is at the head of sloop navigation and at the lower falls of the river, 32 feet high, affording abundant water-power; the city has twelve churches, high school, private academy, a State library of 16,000 volumes, several large cotton-mills, extensive print-works, a large number of brick-yards, belt-factory, and manufactures of woolen cloths and flannels, shoes, machinery, etc., electric railway 4 miles in length, and a costly system of water-works. The Dover Navigation Company has a fleet of fifteen schooners, and the amount shipped from this port is very large. Dover was founded in 1623, and is the oldest town in the State. Pop. (1880) 11,687: (1890) 12,790; (1900) 13,207.

EDITOR OF "REPUBLICAN."

Dover: town; on railway; Morris co., N. J. (for location of county, see map of New Jersey, ref. 2–D); on the Morris Canal, and on Rockaway river. It has several iron-forges, iron-foundries, steel-works, spike-factories, and rolling-mills. Pop. (1880) 2,958; (1900) 5,938.

Dover: town; capital of Stewart co., Tenn. (for location of county, see map of Tennessee, ref. 5–D); on the Cumberland river; 75 miles W. by N. from Nashville and a mile E. of Fort Donelson. A national cemetery is situated a quarter of a mile W. of Dover. Pop. (1880) 317; (1890) not given in census; (1900) 400.

Dover's Powder [named from its inventor, Dr. Dover, an English physician]: a sudorific composed of ipecacuanha and opium, 1 part each, with sugar 8 parts, rubbed together to a very fine powder. Where the brain is unaffected and the tongue and skin moist it is of great service. Its composition now differs considerably from that given in Dover's formula.

Dover, Strait of (in Fr. *Pas-de-Calais*; Lat. *Fretum Gallicum*): the strait which separates England from France, and connects the English Channel with the North Sea. It is about 20 miles wide at the narrowest part. The depth varies from 6 to 29 fathoms. The English side of the strait is bordered by chalk-cliffs, some of which are about 600 feet high. Chalk-cliffs also occur on the French shore. It has been proposed to unite England with the Continent by way of the Straits of Dover or the channel by a bridge, a tubular railway, or a tunnel, but all these schemes have met with Government opposition.

Dov'refield: a mountainous plateau in Norway, forming the northern end of the central mass of the Scandinavian system. It extends along the north side of the Rauma valley, which separates it from Langfjeld plateau, to the sources of the Lougen, and thence N. E. to those of the Glommen. Its highest peak is the Sneehaettan, 7,613 English feet, formerly considered the highest in Scandinavia.

Dow, dow, or **Douw**, GERARD: painter; b. at Leyden, Holland, Apr. 17, 1613; a pupil of Rembrandt. He excelled in chiaroscuro and in technical skill, and finished his works with excessive delicacy. Among his works, which are small in dimensions, are *The Charlatan*; *The Dropsical Woman*; *The Dentist*; and *The Village Grocer*. D. in Feb., 1675.

Dow, LORENZO: clergyman; b. in Coventry, Conn., Oct. 16, 1777; received a meager education; admitted to the Connecticut (Methodist) Conference 1798. He soon dropped his official relations with that body, and went to Ireland to preach against Romanism. Immense crowds listened to him, attracted by his eloquence, his eccentricity, and his evident sincerity. Returning to the U. S. he directed his efforts against the Jesuits, preaching mostly in the South. Here, too, he attracted great congregations, despite the prejudices excited by his increasing eccentricity. He published *Polemical Works*; *The Stranger in Charleston, or the Trial and Confession of Lorenzo Dow*; *History of a Cosmopolite, or the Writings of the Rev. Lorenzo Dow, containing his Experiences and Travels in Europe and America up to near his Fiftieth Year*, etc. D. in Georgetown, D. C., Feb. 2, 1834.

Dow, NEAL: temperance reformer; b. in Portland, Me., Mar. 20, 1804; educated in Portland and New Bedford; was very early interested in the temperance cause; while mayor of Portland, 1851, drafted a bill to prohibit the manufacture and sale of intoxicating liquors; took the bill to the Legislature then in session at Augusta; had a public hearing before a special committee which voted to report the bill exactly as presented. It was printed that night, and the following day, May 30, was passed by both houses. That act became widely known as the "Maine Law." During the civil war he was colonel of the Thirteenth Maine Volunteers, and afterward brigadier-general. He was the Prohibitionist candidate for President in 1880. D. at Portland, Oct. 2, 1897. C. H. T.

Dowager: a widow endowed—that is, who either enjoys a dower from her deceased husband, or has property of her own brought by her to her husband on marriage, and settled on herself after his decease. In Great Britain the term is used in a less technical sense to distinguish the widow from the wife of her husband's heir of the same name and title, thus the dowager duchess, dowager countess, etc. No man can marry a queen-dowager without special license

from the sovereign on pain of forfeiting his land or goods. A queen-dowager does not lose her regal title when she marries a subject. Revised by F. Sturges Allen.

Dowagiac: city; Cass co., Mich. (for location of county, see map of Michigan, ref. 8–H); situated on the Michigan Central Railroad and on the Dowagiac river; 103 miles E. of Chicago; has 8 churches, 2 schools, and manufactures of stoves, agricultural implements, flour, and feed. Pop. (1880) 2,100; (1890) 2,086; (1900) 4,151. Editor of "Republican."

Dowden, Edward, LL. D.: Anglo-Irish scholar and author; b. in Cork in 1843. Since 1867 he has been Professor of English Literature in the University of Dublin. Author of several volumes of Shaksperean studies, of lives of *Southey* (1880) and *Shelley* (1886); *Studies in Literature* (1878); *Transcripts and Studies* (1888), etc.; in 1888 succeeded Prof. Müller as president of the English Goethe Society. He is secretary to the Liberal Union of Ireland. Commissioner of National Education, Ireland, 1896. Lectured in the U. S. in 1896.

Dower [O. Fr. *doaire* (> Mod. Fr. *douaire*) < Lat. **dotarium*, deriv. of *dos*, *dotis*, dower]: in the common law of England, an estate for life which a widow has in one-third part of all the lands and tenements of which her husband was seized beneficially, or of an estate of inheritance at any time during the marriage.

1. *The Nature of the Estate.*—Dower passes through three stages. While the husband lives it is but an inchoate right and incapable of enforcement. Should the husband sell to a stranger and leave her destitute, she would have no claim to the land while the husband lived. On her husband's death, and before dower is assigned, she has a right of action. After dower is assigned she has an estate in the land. The rights of dower depend upon a rule of law which is founded on public policy. The law of the place where the land is situated governs it.

2. *The Requisites of Dower.*—These are threefold—marriage, seizin of the husband, and his death. The leading questions on this subject concern seizin. By this is meant beneficial ownership of a present estate of freehold, which may descend to the husband's heirs. There can be no dower in an estate for years, however long it may last. Nor can there be in a reversionary estate which is preceded by a prior estate of freehold or for life owned by another person, though there may be where the prior estate is for years. The widow of a trustee can not be endowed, as he is not a beneficial owner. This proposition would be applied to the widow of a deceased partner, who could only be endowed subject to the adjustment of the affairs of the partnership. Formerly the trust estate itself was not the subject of dower. This rule does not prevail in the U. S., and dower may sometimes be had in money, which by the doctrine of equitable conversion is treated as land. Whenever the husband's estate is defeated by a superior title, dower falls with it.

3. *Assignment of Dower.*—As dower is one-third part of the husband's estate, it must be assigned either by the parties or by act of the law. Certain legal rules must regularly be followed, when dower is said to be assigned of common right. These may be relaxed by agreement under seal, when the assignment is said to be against common right.

4. *Barring of Dower.*—The right can not be destroyed by the mere act of the husband. Creditors also take subject to this claim. It can in general be barred only by the wife's own act, as by joining in a conveyance with the husband, or by a jointure settled before marriage. The husband often in his will, either expressly or by implication, gives his wife property in lieu of dower. In this case she may, after his death, elect to take such property or her dower, but can not take both.

This right occasioned much inconvenience in England by impeding the conveyance of property. For this reason, by the Dower Act of Aug. 29, 1833, the right of dower was virtually placed entirely in the hands of the husband in the case of all marriages contracted after Jan. 1, 1834. The husband may now dispose of his lands by will or otherwise, free from any claim of dower on the part of his wife. If, however, he dies intestate, his widow, under the statute of distribution, receives not merely for life, but absolutely, one-third of his personal estate. In the U. S. the general rules of the English common law still prevail. As a general rule, also at least one-third of the husband's personal estate is given to the wife, as by the English statute of distribution.

T. W. Dwight.

Dowlais: an outlying district of Merthyr Tydvil, Wales, noted for its large iron and steel works.

Dow'latabad: a fortified and decayed town of Hindustan; in the Nizam's Dominions; 10 miles W. of Aurungabad (see map of South India, ref. 2–D). It is defended by a rock-fortress which occupies the summit of an isolated rock about 500 feet high. The lowest third of this rock is perpendicular, so that the summit is accessible only by a passage excavated in the interior. Near this town are the cave-temples of Elora.

Dowling, John, D. D.: clergyman and author; b. in Pevensey, Sussex, England, May 12, 1807; became a resident of the U. S. in 1832, and an eminently successful writer and Baptist preacher of New York city. He published a *Defense of the Protestant Scriptures* (New York, 1843); *History of Romanism* (1845); and other works. D. in Middletown, N. Y., July 4, 1878.

Down: a county in the northeastern part of Ireland, in Ulster; bounded N. by Antrim and Belfast Lough, E. and S. E. by the Irish Sea, and W. by Armagh. Area, 957 sq. miles. The chief rivers are the Bann and the Lagan. The surface is mostly hilly or undulating, and the southern part is occupied by the Mourne Mountains, the highest peak of which is 2,796 feet high. The soil of many parts is fertile. The chief articles of export are linen fabrics, hosiery, grain, butter, pork, and hides. The fisheries of this county are important, though they are very far from being fully developed. Capital, Downpatrick. Pop. (1881) 272,207; (1891) 266,893.

Downcast: in mines, the shaft through which air for ventilation descends, the impure air ascending through another shaft, the "upcast," at the bottom of which a fire is kept up. In other mines various forms of fans are used to secure ventilation.

Downie, David, M. A., D. D.: missionary; b. in Glasgow, Scotland, July 29, 1838; emigrated to the U. S. in 1852; graduated at Phillips Andover Academy 1865, at Brown University 1869, and at Rochester Theological Seminary 1872; appointed missionary of the American Baptist Missionary Union in 1873, and went to Nellore, India. During his ministry the number of missionary stations has increased to fourteen, and the number of communicants from 1,500 to 80,000. He has published *The History of the Telugu Mission* (Philadelphia, 1893).

Downieville Butte: a mountain-peak in Sierra co., Cal.; about 12 miles E. N. E. of Downieville. Altitude about 8,800 feet above the sea.

Downing Street: a short street in Westminster, London, England, where the colonial and foreign offices and the official residence of the Premier are located. As the place of the cabinet's meetings it has become closely identified with the policy of the ministry, and the name is sometimes used to signify the Government. The street was named from Sir George Downing, Secretary to the Treasury in 1667.

Downingtown: borough and railway junction; Chester co., Pa. (for location of county, see map of Pennsylvania, ref. 6–I); in Chester valley; 32 miles W. of Philadelphia. It has a young ladies' academy, the Chester Valley Academy for young men and boys, a limestone quarry, manufactures of carriages, shoes, paper, woolen goods, stoves, and machinery, water-works, etc. Pop. (1890) 1,920; (1900) 2,133.

Downpat'rick: a seaport of Ireland; capital of the county of Down; near the mouth of the Quoyle (which enters Lough Strangford); 21 miles S. S. E. of Belfast (see map of Ireland, ref. 6–J). It has a cathedral, a hospital, and manufactures of sewed muslin, linen, soap, and leather. It is said to be the oldest city in Ireland, and was burned by Edward Bruce in 1315. The see of Down was united with that of Connor in 1442, and with that of Dromore in 1842. Pop. 3,400.

Downs, The: two broad ridges of undulating chalk-hills S. of the Thames river in England. They extend from the middle of Hampshire eastward; the North Downs through Surrey and Kent to Dover, and the South Downs through the southeastern part of Hampshire to Beachy Head. Between the two ridges, the former of which is nearly 120 miles long, lies the valley of the Weald, from which the chalk strata have been removed by denudation. Toward the Weald the ridge sides are somewhat steep, constituting the "chalk escarpment," and the outward slopes are relatively gentle.

The ridges are characterized by the absence of streams, even in time of rain, the porous chalk absorbing the water as it falls. For the same reason they are not adapted to tillage, and contain no villages, but they produce fine aromatic grass, and are the home of the famous Southdown sheep.

Revised by G. K. G.

Downs, The: a portion of the North Sea off the southeast coast of Kent, England, between the North and South Forelands; important as a shelter for shipping, which is protected by the Goodwin Sands, a natural breakwater. This large natural harbor of refuge is 8 miles long and 6 miles wide, having an anchorage which varies from 4 to 12 fathoms in depth. It is safe except during a south wind. In time of war it is a place of rendezvous for the royal navy.

Downshire, Marquesses of (1789): Earls of Hillsborough (1751), Viscounts Hillsborough (1717), Viscounts Kilwarlin (1751), Barons Hill (Ireland, 1717), Earls of Hillsborough and Viscounts Fairford (1772), and Barons Harwich (Great Britain, 1756).—Arthur Wills John Wellington Blundell Trumbull Sandys Roden Hill, sixth marquess, b. July 2, 1871; succeeded his father Mar. 31, 1874.

Dowry [for *dowery*, an extended form of Dower (*q. v.*)]: in law, the marriage portion brought by a wife to her husband. This term is often confounded with *dower*, but has a different signification.

Doxology [from Gr. δοξολογία; δόξα, praise + λέγειν, speak]: a form of praise said or sung in divine service, commonly at the close of a prayer. The Great Doxology, as it is called, is an expansion of the angelic hymn, and is sung in the Roman Catholic Church at the celebration of the Eucharist. It begins with the words "Gloria in excelsis Deo." The Lesser Doxology is the "Gloria Patri," the substance of which appears in the metrical doxologies in use among Protestants generally.

Doyen, Gabriel François: artist; b. in Paris, 1726; studied under Carl Vanloo, and gained the great prize in 1746. After seven years' study in Italy, he returned to Paris in 1753. His pictures attracted very little attention; they were even condemned. But he was too proud to yield to the bad taste reigning. He concentrated all his powers on the magnificent picture *La Mort de Virginie*, and it took the public by storm. His masterpiece, however, is *Le Miracle des Ardents* in the Church of St. Roch, in Paris (1773). In 1791 he removed to St. Petersburg, as director of its academy of art. D. in St. Petersburg, June 5, 1806.

Doyle, Richard: illustrator and caricaturist; b. in London in 1826. He was one of the staff of *Punch*, founded in 1841, and designed the cover of that paper, which has never been changed; but he left *Punch* in 1851, because of the attacks of that paper on the new Roman Catholic hierarchy in England. He illustrated many books, such as Thackeray's *Newcomes*; and published some collections of his work in *Punch*, such as *Manners and Customs of ye Englishe*; other humorous stories, chiefly told in pictures, such as *The Foreign Tour of Messrs. Brown, Jones, and Robinson*; and some charming books of fairy-land illustrations. D. in London, Dec. 11, 1883.

Russell Sturgis.

Doylestown: borough (incorporated in 1835); capital of Bucks co., Pa. (for location of county, see map of Pennsylvania, ref. 5–J); terminus of Doylestown Branch of Phil. and Reading R. R.; 32 miles by rail N. of Philadelphia; has a public library founded in 1856, graded public school and private seminary, spoke-factory, agricultural-machine works, water-works, gas-works, and electric lights. It is much frequented by summer visitors from Philadelphia. Pop. (1880) 2,070; (1890) 2,519; (1900) 3,034.

Editor of "Democrat."

Dózy, Reinhart: Semitist; b. at Leyden, Holland, Feb. 21, 1820; graduated at the University of Leyden in 1844. In 1850 he became Professor of History at Leyden. Most of his works are contributions to the history of the Moslems in Spain and North Africa. Especially important are *Recherches sur l'Histoire et la Littérature de l'Espagne pendant le Moyen Âge* (3d ed. 2 vols., Paris, 1881); *Histoire des Musulmans d'Espagne*, a book of extraordinary charm (Paris, 1861 and 1881); *Glossaire des mots espagnols et portugais dérivés de l'arabe* (2d ed. Leyden, 1869). C. H. Toy.

Draa Wadi: the longest river of Morocco, though some others contain a greater volume of water. Rising in the Atlas Mountains of Central Morocco, it flows S. to the boundary, which it then follows through the Western Sahara till it reaches the Atlantic at Cape Nun. It is the only river of the Western Sahara that has a constant flow of water, and it forms a natural boundary between the nomads of the desert and the settled tribes of South Morocco. Its banks and bed are of light alluvium, capable of great fertility if cultivated. The river is not navigable. C. C. Adams.

Dracæ'na dra'co, or **Dragon-tree**: a tree belonging to the family *Liliaceæ*, some examples of which grow to prodigious size in the Canaries and India. The height is not proportioned to the thickness of the stem, and the head is crowned with short branches having tufts of sword-shaped leaves. It produces a part of the resin called Dragon's Blood (*q. v.*). A specimen in the island of Teneriffe was described by Humboldt as having a stem about 45 feet in circumference in 1799. It had the same measurement in 1402. It was worshiped by the Guanches, and its hollow trunk was converted by their conquerors into a chapel. This extremely old tree was overthrown in 1868.

Drachenfels, draa'chen-fels (i. e. dragon's rock): a mountain-peak in Rhenish Prussia, on the Rhine; about 8 miles S. E. of Bonn; 1,056 feet high. It rises abruptly from the river, and is renowned in Byron's verses commencing—

> The castled crag of Drachenfels
> Frowns o'er the wide and winding Rhine.

Its summit, crowned by a ruined castle, commands a beautiful prospect.

Drachm, or **Dram** [from Gr. δραχμή; in Fr. *drachme*; Lat. *drachma*]: a measure of weight. The avoirdupois drachm is one-sixteenth part of an avoirdupois ounce; the apothecaries' drachm is the eighth part of a troy ounce. The orthography *dram* is commonly employed in avoirdupois weight, and *drachm* in apothecaries' weight. In apothecaries' measure a fluid drachm is one-eighth of a fluid ounce.

Drachma: a silver coin, the unit of the monetary system of ancient Greece. The Athenian drachma was equivalent to six oboli, or nearly twenty cents, and weighed from sixty-three to sixty-six grains. Other Greek states had drachmas of different values.

Drachmann, draak'man, Holger Henrik Herholdt: Danish poet; b. in Copenhagen, Oct. 9, 1846. In his youth he studied art and won some reputation as a marine painter. In 1872 he published a volume of poems (*Digte*), and another of sketches (*Med Kul og Kridt*), and since that time he has made literature his profession, producing with astonishing fecundity lyrics, narrative poems, dramas, novels, tales, etc. His best work is his lyric verse, which takes rank with the best in Danish literature, and his sketches of the life of fishermen and sailors (cf. Blicher). Drachmann is the most eminent of the Danish writers that have been influenced by Georg Brandes (*q. v.*) and follow what is called the new direction. (See Danish Literature, *Latest Period.*) At the beginning of his career he was intensely radical, but his sentiments have undergone some modifications. He has traveled much and made himself intimately acquainted with the life of many conditions of men. The restlessness of the last part of the nineteenth century is in him combined with a remarkable poetic genius, which, though manifesting itself in very different degrees in his various works, has already given them the position of classics. Of his numerous publications the following may be mentioned: *I Storm og Stille* (1874); *En Overkomplet* (1876); *Ungt Blod* (1877); *Sange ved Havet* (1877); *Tannhäuser* (1877); *Paa Sømands Tro og Love* (1878); *Derovre fra Grænsen* (1877); *Prinsessen og det halve Kongerige* (1878); *Ranker og Roser* (1879); *Ungdom i Digt og Sang* (1879); *Østen for Sol og Vesten for Maane* (1880); *Vandenes Datter* (1881); *Strandby Folk* (1883); *Der var en Gang* (2d ed. 1887); *Alkibiades* (1886); *To dramatiske Digte* (1888); *Troldtøj* (1889 ff.); *Tusind og en Nat* (1889); *Forskrevet* (1890); *Tarvis* (1891).

G. L. Kittredge.

Draco, or **The Dragon**: a constellation near and around the north celestial pole. It was from observations upon the star γ Draconis that Bradley was led to his brilliant discovery of the aberration of light.

Draco (in Gr. Δράκων): a Greek grammarian of Stratonicea, in Caria, of whose life few traces are found, but who flourished probably about 125 A. D. Suidas and Eudocia assign to Draco a great number of works on grammar, on meter, and on the poems of Pindar and Alcæus, all of which have perished, with one exception, a treatise on Greek meters

(περὶ μέτρων ποιητικῶν), which Hermann considers an epitome of Draco's work, with numerous interpolations from other quarters by a later hand. This was edited by Hermann (Leipzig, 1812).

Dra'co, or **Dra'con** (in Gr. Δράκων): an Athenian legislator who was archon in 621 B. C., and was the author or compiler of the first written laws among the Athenians. Judged by the standard of a more humane age, this code was extremely harsh, the death penalty, according to Plutarch, being inflicted for every offense, but of the code itself not a line has come down to us, and tradition has undoubtedly exaggerated its cruelty, while, if it be taken in connection with the rude state of society at the time, it will appear a distinct advance in the judicial system. It remained in force until the time of Solon, who substituted milder penalties. The term *draconic* is sometimes applied to laws which are excessively severe.

Dracon'tium [from Gr. δρακόντιον, literally a little dragon, from some supposed fanciful likeness to a dragon]: a genus of plants of the natural family *Araceæ*. The *Dracontium polyphyllum*, a native of Guiana, India, and Japan, has a powerful action on the nervous system, and is used as a remedy for asthma. The flower emits an intolerable stench when it first opens. The *Dracontium* of the U. S. Pharmacopœia is the skunk-cabbage (*Symplocarpus fœtidus*), which has similar medical properties. It is kindred to the true *Dracontium*, and like it has a strong offensive odor.

Dracon'tius, Blossius Æmilius: advocate in Carthage; flourished in the latter half of the fifth century; was a writer of poetry of considerable merit. Besides several epyllia on mythical subjects, two epithalamia, and an elegiac poem called *Satisfactio*, addressed to Gunthamund, King of the Vandals (484–496), by whom he had been imprisoned, he wrote a didactic poem in three books entitled *Laudes dei*, a part of which (the Hexæmeron), containing an account of the six days of creation, was edited separately, and is praised by Isidorus. In the seventh century Eugenius, Bishop of Toledo, added to it an account of the seventh day. Dracontius shows a surprising familiarity with classical writers, and his manner is very rhetorical. On account of the resemblances in diction and meter, the poem known as *Orestis tragœdia* is now generally ascribed to Dracontius. See edition of the *Carmina minora* by F. de Duhn (Leipzig, 1873). M. Warren.

Draft: a bill of exchange; an order for the payment of money drawn by one person upon another; also a tentative copy of a legal document or other formal writing made for the purpose of adjusting the matter which is to be admitted into the fair copy. See Bill of Exchange.

Draft Riots: certain outbreaks that occurred in the streets of New York city, July 13–17, 1863, occasioned by the first draft under the Enrollment Act of Apr. 16, 1862, which provided for the enrollment by provost marshals and enrolling officers of all able-bodied males between the ages of eighteen and forty-five to be chosen by lot. The draft was held by many to be not only unconstitutional in itself but most unfair in its working on account of the excessive quota required of the urban districts. Moreover, the clause permitting the purchase of exemption from service for the sum of $300 caused much dissatisfaction. Inflamed by the intemperate words of some of the newspapers and by the harangues of agitators, the mob, consisting chiefly of the poorer classes and those of foreign birth, burst into a house in the upper part of the city where the drawing was going on, drove out the clerks, destroyed the papers, and set fire to the building. Then followed a series of brutal outrages, which the police though efficient were powerless to prevent. Stores were plundered, buildings burned, and unoffending citizens murdered. The fury against the colored race showed itself in the murder of several Negroes and the burning of the Colored Orphan Asylum. The crowd, now swollen to thousands, encountered no serious opposition till the troops from the posts in the harbor gathered in the streets. From that time collisions were frequent, with the heavier losses on the side of the rioters, but for four days the tumult continued. The return of the militia from Pennsylvania and of some regiments of veterans from the Army of the Potomac restored order. The loss of property was severe, but the owners were in part indemnified by the payment of $1,500,000 by the city government. Gov. Seymour, sympathizing with the opposition to the draft, petitioned the President for its suspension until its constitutionality should be decided upon, and complained especially of the unfair apportionment, but President Lincoln, though willing to consider the question of a more equitable distribution, thought the matter too urgent to admit of delay. In the following month the draft was resumed in New York and completed without resistance. See Greeley, *American Conflict*.

F. M. Colby.

Drag'oman [deriv. of Gr. δραγούμανος < Ar. *tarjumān* > E. *tagum*]: in the Levant, an interpreter or guide for foreigners. The dragoman of the Sublime Porte is an important Turkish officer, who forms the medium of communication between his own Government and foreign ambassadors. The term is also applied to the interpreters attached to European embassies and consulates in the Levant. They are usually natives of Italian extraction. They and their families are not subject to the Turkish laws, but are under the protection of the embassies which they serve.

Dragon [deriv. of Gr. δράκων, a serpent, a dragon]: a small inoffensive East Indian lizard of the genus *Draco*, called winged dragon, or flying dragon (*Draco fimbriatus* and *volans*), remarkable for an expansion of the skin on each side, supported by the greatly elongated last six ribs, forming a kind of wing, which sustains the animal like a parachute; when not in use the ribs and fold of skin are folded along the body. Other species, the dragon lizards (*Ada*), belonging to the *Tejidæ*, are natives of South America only. They have the tongue forked like a serpent, back and tail crested, and are sometimes 6 feet long. They have no parachute; they are bold and resolute in self-defense.

Flying dragon: *Draco volans*.

Revised by F. A. L.

Drag'onet: any fish of the genus *Callionymus* and family *Gobiidæ* (goby family); found in the temperate seas of the Old World. There is no air-bladder; the ventral fins are larger than the pectorals and placed under the throat, and the gill-openings are reduced to a small hole on each side of the nape. One of the finest species is the gemmeous dragonet (*Callionymus lyra*), of a golden color, variegated with sapphire blue.

Dragon-fly (in Fr. *démoiselle*; Germ. *Stechfliege*): the popular name of the members of the families *Libellulidæ*, *Æschnidæ*, and *Agrionidæ*, which include an immense number of species of neuropterous insects. They have large globular heads, strong mandibles, eyes lateral, large, and projecting, antennæ short, four narrow, gauze-like wings,

Dragon-fly: *Agrion*.

strongly reticulated, and the abdomen often remarkably slender. They are found in northern countries, but they are most common in the warmer climates, and frequent marshes, lakes, and rivers. Their food is insects, which they devour with great voracity. They are sometimes known as "devil's darning-needles," and are often regarded by the ignorant with groundless dread.

Dragonnade, drăg-on-nād′: a persecution carried on with the aid of troops; specifically, one of a series of persecutions which the French Protestants suffered in the reign of Louis XIV.; so called because dragoons (in Fr. *dragons*) were employed as instruments of the persecution.

Louvois, the king's minister, is thought to have originated these measures, which were executed with great severity in 1684 and the years immediately succeeding the Revocation of the Edict of Nantes (1685). A body of dragoons led by a bishop and intendant marched through the provinces, requiring the Protestants to abjure their religion, and persecuting those who refused. Troops were quartered in Protestant households and allowed to subject the inmates to every kind of insult and injury, from which the only escape was conversion to the Roman Catholic faith. Such conversions accordingly took place in great numbers, but with questionable sincerity. See Perkins, *France under the Regency*; see also the article HUGUENOTS.

Dragon's Blood, or **Gum Dragon** (in Lat. *Sanguis draconis*): a resin obtained from various trees growing in warm climates. Among these are the DRACÆNA DRACO (*q. v.*), the red sandal-wood (*Pterocarpus santalinus*) of the East Indies, the *Pterocarpus draco*, a leguminous tree of South America, and the *Calamus draco*, an East Indian rattan palm. The dragon's blood of commerce is of a dark reddish-brown color, smooth, and brittle, and dissolves in oil, alcohol, and ether. The solution is used for staining leather, wood, and even marble. The resin is also an ingredient of some varnishes and lacquers. It comes from the Moluccas, Socotra, Brazil, and Teneriffe.

Dragoon: See CAVALRY.

Drainage: the removal of the excess of water from the soil, either by means of canals and open ditches or by underground sewers, pipes, and hollow tiles. No part of farm-husbandry pays a larger profit upon capital invested than the judicious drainage of land. In the U. S. there is very little ground that is not too wet in rainy weather and too dry in the frequent and long-continued droughts. Thorough drainage not only relieves the first-mentioned evil, but, strange as it at first appears, it greatly mitigates the bad effects of dry weather. When soil is drenched with water and dried by evaporation, it becomes hard, especially if it be argillaceous; land that is dried by drainage is porous and permeable to the dews and showers; while the soil deepened by drainage permits growing crops to put forth longer roots, and thus become secured against drought. Experiments in draining bogs have shown that when the water is given free passage through a cold soil by thorough drainage its temperature at the depth of 7 inches may be raised 10° above that of the adjoining undrained soil.

It appears also that good drainage diminishes the relative number of fevers, especially those of a malarial origin, while it is almost certain that excessive moisture in the soil is a fruitful cause of consumption. So important is this subject considered in Great Britain that Parliament in 1846 offered in the Drainage Act to advance money on easy terms to landholders for the purpose of improving the drainage of land. The act has proved a great blessing.

Underground drainage is the best for land that is not decidedly marshy; and of all underground drains those made with tiles (hollow cylinders of porous burned clay) are the most effective. The tiles should be laid near enough to the surface to effect a thorough drying after rains, and deep enough to escape the plow and frosts, and to afford "draught" from the soil above. From 3½ to 4 feet deep is considered the proper depth. The ideal drainage system places these tile drains at a distance apart of about 4 rods throughout the field. It is very important to avoid curves and angles in the vertical plane of drains, because any earth which may enter the tiles will be sure to lodge at depressed points.

Draining lakes and marshes is a matter requiring great capital and much engineering skill, but it is sure to become a very important question in the South and West of the U. S. In Holland, steam-pumps, wind-mills, and tide-gates are used extensively. The great Haarlemer-meer was drained and is kept drained by steam-power. See HAARLEM LAKE. For the drainage of cities, see SEWERAGE, and for house-drainage, see PLUMBING.

Revised by MANSFIELD MERRIMAN.

Drainage, in physical geography: See RIVERS and VALLEYS.

Drake, BENJAMIN M., D. D.: minister of the Methodist Episcopal Church South; b. in Robeson co., N. C., Sept. 11, 1800. He joined the Tennessee Conference in 1820, but the next year was transferred to the Mississippi Conference. He built the first Methodist church in New Orleans, was president of Elizabeth Female Academy, the first Methodist school established in Mississippi, 1828–32, and was president of Centenary College, Jackson, La., from 1854 till his death in Mississippi in 1860.

Drake, CHARLES DANIEL: jurist; a son of Dr. Daniel Drake, an eminent physician and writer on medical subjects; b. at Cincinnati, O., Apr. 11, 1811. He served as midshipman in the navy 1827–30, and was admitted to the Ohio bar in 1833. In 1834 he removed to St. Louis, where he became eminent as a lawyer and politician; was in 1864 vice-president of the convention which revised the constitution of Missouri; was U. S. Senator 1867–71, and was appointed chief justice of the U. S. court of claims in 1871, retiring in 1885. He was prominent in the councils of the Presbyterian Church; published *Law of Attachments* (1854) and *Life of Dr. Daniel Drake* (1871). D. Apr. 1, 1892.

Drake, Sir FRANCIS: English naval hero: b. probably at Tavistock, Devonshire, about 1540. Nothing is positively known of his early life. In 1567 he commanded a little vessel, the Judith, in the squadron of his kinsman, John Hawkins, which was seized and destroyed by the Spaniards, only the Judith and one other vessel escaping. He made voyages to the West Indies and the Spanish main (1570 and 1571), and in 1572 he left England with two vessels and seventy-three men, the object being to attack Nombre de Dios. As England was then nominally at peace with Spain, the enterprise was practically a freebooting expedition. Nombre de Dios was taken, and an immense amount of treasure was found; but Drake was wounded, his men became disheartened, and the town and treasure were abandoned (July 29, 1572). Later, Cartagena and Porto Bello were successfully attacked, many Spanish ships were taken, and a vast amount of silver was captured on the Isthmus of Panama, most of it being abandoned because the men were unable to carry it. Drake crossed the isthmus to Panama, and was the first Englishman to see the Pacific. In Dec., 1577, he started on another cruise with five vessels, as before without a royal commission. The object was to attack Spanish vessels off the Pacific coast of America. The squadron passed the Straits of Magellan safely, but shortly after one ship was lost and another turned back. With the rest Drake plundered Valparaiso and Callao (Jan. and Feb., 1579), captured a treasure ship with over $800,000, crossed the Pacific, and, after cruising among the Malay islands, returned to England by way of the Cape of Good Hope, Sept., 1580. Queen Elizabeth visited Drake on his ship and knighted him there, and thereafter he held important commands in the royal navy. In 1584–85 he was a member of Parliament. In 1585 he commanded an expedition to the West Indies and Virginia. Spain was preparing the great armada for the invasion of England. Early in 1587 Drake was sent with a strong fleet against the Spanish coast to "singe the King of Spain's beard," an operation which he conducted with his usual daring and success. Nearly 100 unfinished ships, intended for the armada, were sunk or burned at Cadiz and elsewhere, and a homeward-bound Portuguese East Indiaman was captured with a rich booty. In July, 1588, Drake commanded a division of the English fleet under Howard in the great fight with the Spanish armada. In 1595 he commanded another expedition to the West Indies, but died Jan. 28, 1596, as the fleet was approaching Porto Bello.

HERBERT H. SMITH.

Drake, FRANCIS SAMUEL: author; b. at Northwood, N. H., Feb. 22, 1828; son of the antiquary and historian, Samuel Gardner Drake. He published a valuable *Dictionary of American Biography* (1872); a volume of memorials for the Massachusetts Society of the Cincinnati; *Life of General Henry Knox* (1873); and *Indian History for Young Folks* (1885). D. in Washington, D. C., Feb. 22, 1885.

Drake, draa′ke, FRIEDRICH: sculptor; b. at Pyrmont, Germany, June 23, 1805; was a pupil of Rauch. He gained a high reputation by statues and busts of many eminent

Germans of his time, including the Humboldts and Oken, and two colossal statues of King Frederick William III. Among his other works is an allegorical group of the *Eight Provinces of Prussia* (1844), in the castle of Berlin; a remarkable colossal statue of his teacher, Rauch, for the new museum at Berlin; and an equestrian statue of King William I. of Prussia for the bridge over the Rhine at Cologne. D. Apr. 6, 1882.

Drake, Joseph Rodman: poet; b. in New York city, Aug. 7, 1795; studied medicine and took his degree in 1816; became an intimate friend of Fitz-Greene Halleck and James Fenimore Cooper. A volume of his poetical works, published in 1836, includes his longest imaginative poem, *The Culprit Fay*, written probably in 1819, and some spirited verses entitled *The American Flag*. D. in New York city, Sept. 21, 1820. H. A. B.

Drake, Samuel Gardner: antiquarian; b. at Pittsfield, N. H., Oct. 11, 1798. For many years a school-teacher in a country district, he removed in 1828 to Boston, where he opened an antiquarian bookstore, the first of its kind in the U. S. He was one of the founders of the New England Historical and Genealogical Society, and published, besides other works, *Indian Biography* (1832); *The Book of the Indians* (1833); *History and Antiquities of Boston* (1856); and *Annals of Witchcraft in the United States* (1869). D. in Boston, Mass., June 14, 1875.

Drakenberg, draa'ken-bĕrg (that is, *Dragon Mountain*), **Range**: the highest and longest portion of the series of mountain buttresses in South Africa running nearly parallel with the coast of the Indian Ocean and forming the divide between the river systems tributary to the Atlantic and those of the Indian Oceans. This sandstone range extends, under the name of the Drakenberg, from about 31° S. lat. to the southern boundary of the Transvaal at a mean distance from the sea of about 120 miles. Its southeast slopes, exposed to abundant rain, are greatly worn by denudation, and show many valleys and jagged peaks, some of which are imposing summits—e. g. Giant Castle, 9,657 feet; Champagne Castle, 10,357 feet; and Monts aux Sources, 10,000 feet. Presenting from the coast regions every appearance of a mountain-range, it largely loses this aspect when viewed from the plateau on the other side of the mountains, where the higher peaks alone rise impressively above the general level. C. C. Adams.

Drakenborch, draa'ken-bōrkh, Arnold, von: philologist; b. in Utrecht, Holland, Jan. 1, 1664; Professor of Classical Languages there; edited, with notes, an edition of *Livy* (17 vols., Stuttgart, 1828), which is still of great value. D. at Utrecht Jan. 16, 1748. A. G.

Dram: See Drachm.

Drama, draa'ma [Gr. δρᾶμα, action, deriv. of δρᾶν, do]: originally the exhibition of human actions (especially those which reveal the feelings and passions) upon the stage. The ancient Greek drama, comedy as well as tragedy, had its origin in the worship of Bacchus (Dionysus). The Dionysian dithyrambs sung at the festivals of Bacchus sometimes expressed wild and boisterous gayety, at other times passionate sorrow. From the former was at length developed the old Greek comedy, which may be said to have attained its highest perfection in the plays of Aristophanes (*q. v.*); from the latter arose the Greek tragedy, which found its most perfect expression in the immortal works of Æschylus, Sophocles, and Euripides.

The Roman drama was derived from the Greek, to which, in the opinion of all the most distinguished critics, it was much inferior. The most celebrated Roman dramatic poets, Plautus and Terence, appear to have taken Menander and Philemon (of the New Greek comedy) as their models, and their productions have exercised considerable influence on the modern comedy. In tragedy ancient Rome produced one truly great poet, Seneca.

The Hindu drama, quite independent of the drama of Europe in its origin, has produced some works of great merit, the most celebrated of which is the *Sakoontalâ, or the Lost Ring*, of Kâlidâsa (who is supposed to have lived about 50 B. C.)—a work which has received the highest commendation from some of the most eminent critics of modern Europe, and has been pronounced worthy of the genius of Shakspeare. This remarkable production, instead of being divided into five acts, like the classic and modern drama, consists of seven acts.

The Chinese also have a drama, but greatly differing in some respects from that of the Western nations; a single piece being often extended through no inconsiderable portions of several successive days.

In modern times the drama has been cultivated with success, it may be said, by all the principal European nations, but more especially by the Italians, the Spaniards, the French, the English, and the Germans. For a long period the French were generally supposed to surpass all other nations in the genius and skill of their dramatic writers, as well as in the admirable performance of their actors. The French critics usually insisted on the strictest adherence to the rules of the classic drama, and particularly to what are commonly termed "the three unities." Until the time of Lessing the German theater was scarcely more than a reflection of that of Paris, but that great author and critic taught his countrymen to throw off the trammels and affectations of a foreign school, and to give entire freedom to the cultivation of the national genius. Since that time the German authors, taking the English for their model rather than the French, but without servilely following any, have produced the finest dramatic works that have appeared in Europe since the time of Shakspeare. Among the German dramatic writers, Goethe and Schiller, by universal consent, occupy the foremost rank. Denmark has also produced some eminent dramatic writers, among whom Öhlenschläger (*q. v.*) is the most celebrated. Italy can scarcely be said to have produced any dramatic poets of the highest order; among her best are perhaps Goldoni in comedy, and Alfieri, Manzoni, and Silvio Pellico in tragedy. The Spanish drama has given to the world many productions displaying rare genius, but none that are worthy to be placed by the side of the greatest dramatic works of Greece, England, Germany, or France. The most celebrated names in Spanish dramatic literature are those of Lope de Vega and Calderon, the former surpassing all that is recorded in the history of the human mind in the marvelous fertility of his genius; the latter pre-eminent for the brilliancy of his imagination, as well as for the fertility of his invention, but neither of them producing any work of the highest order.

The French drama justly holds a high place in European literature. It is not too much to say that in comedy the writers of no other nation, either in ancient or modern times, have equaled the French. The best plays of Molière may be said to be not only unrivaled, but unapproached, by those of any other author, Shakspeare, Goethe, and Schiller excepted. In tragedy, Corneille, Racine, and Voltaire all exhibit genius of the highest order, but Racine, in the natural, graceful simplicity, as well as in the exquisite finish, of his productions is generally admitted to have approached most nearly to the best specimens of the ancient Greek tragedy.

Though the dramatic literature of England presents us with fewer writers of the highest order than that of France, the former can boast of one whose dramatic genius surpasses everything to be found in ancient or in modern times. While in his best comedies Shakspeare is perhaps not inferior to Molière, in his tragedies, not merely in the exhibition of the conflict of the mightiest human passions, but also in his representation of the workings of the most intricate and subtlest of human motives, he has no equal.

In the opinion of many critics the highest exhibition of poetic genius is to be found in the tragic drama, which naturally combines the fire and passion of lyric inspiration with that representation of outward circumstances, conduct, and events which belongs to epic poetry. It thus unites every advantage for the exhibition of human character. It not only shows us the external conduct, but in the various soliloquies and discourses of the *dramatis personæ* it reveals to us the hidden thoughts and passions of the soul. In this last respect it has a great superiority over epic poetry, in which, though the expression of feeling occasionally occurs, it is always made subordinate to the events of the story. See Theater.

Dram'men: seaport-town of Norway; in Aggershuus; on both sides of the river Drammen, near its entrance into the Christiania Fiord; about 24 miles S. W. of Christiania (see map of Norway and Sweden, ref. 10–C). It has a college, extensive sawmills, and manufactures of chicory, sailcloth, ropes, etc. Large quantities of timber are exported from this port. Pop. (1891) 20,684.

Draper, Andrew Sloan, LL. D.: lawyer and educator; b. at Westford, N. Y., June 21, 1848; educated in the public schools, Albany Academy, and the law department of Union University; practiced law in Albany 1871–84; mem-

ber of school board in Albany 1878–81; member New York Legislature 1881; one of the judges of the U. S. court of Alabama claims 1884–86; superintendent of public instruction, New York, 1886–92: LL. D., Colgate University, 1890; elected superintendent of schools in Cleveland 1892; president of the University of Illinois 1894; has published *What Ought the Common Schools to do? How Can it be Done?* (1886); *How to Improve the Country Schools* (1887); *The Powers and Obligations of Teachers* (1887); *School Administration in Large Cities* (1888); *The Indian Problem of the State of New York* (1888); *The Origin and Development of the New York Common School System* (1889); *A Teaching Profession* (1890); *The Authority of the State in the Education of her Children* (1890); *The Legal Status of the Public Schools* (1890); *The Normal and Training School System of New York* (1891); *The Responsibility and Authority of Trustees* (1891); *American Schools for American Citizenship* (1891); *Public School Pioneering in New York and Massachusetts* (1892). C. H. THURBER.

Draper, DANIEL, M. E., Ph. D.: meteorologist; b. in New York city, Apr. 2, 1841; son of Prof. John W. Draper, and brother of Dr. Henry Draper; educated in New York city, and obtained his doctorate from the New York University. From 1857 for several years he assisted his brother Henry in his observatory at Hastings on the Hudson. From 1860 he served an apprenticeship of five years at the Novelty Iron Works, passing through the foundry, mechanical shops, and drawing-room. In 1865–66 he was assistant port-engineer of the Star line of steamships to New Orleans. In 1867–68 he was amanuensis to his father in the preparation of the *Intellectual Development of Europe* and the *Civil War in America*. In 1869 he was appointed director of the New York Meteorological Observatory, in which position he has since remained and distinguished himself by the care with which he has conducted the work of the observatory, and by his success in the invention and construction of self-registering meteorological instruments. He has also issued annually an excellent report of the work of his institution, in which are given many discussions of meteorological topics. In particular his paper on the *Cause of Pneumonia* has attracted much attention, and been translated into several languages. M. W. H.

Draper, HENRY, M. D., LL. D.: scientist; b. in Prince Edward co., Va., Mar. 7, 1837; son of John William Draper; graduated at the medical department of the University of the City of New York in 1858; became Professor of Physiology there in 1860, and also Professor of Physiology and Analytical Chemistry in the scientific department. He published *On the Construction of a Silvered-glass Telescope* and *Text-book of Chemistry* (1864). He devoted much attention to photographic and spectroscopic examinations of the moon and other heavenly bodies. D. in New York city, Nov. 20, 1882.

Draper, JOHN CHRISTOPHER, M. D., LL. D.: physiologist and chemist; b. in Prince Edward co., Va., Mar. 31, 1835; a son of John William Draper; graduated in 1857 from the medical department of the University of the City of New York; Professor of Physiology there 1858–60; subsequently Professor of Chemistry in the Cooper Union, Professor of Chemistry in University Medical College, and of Physiology and Natural History in College of City of New York; published *On Respiration* and *Text-book on Anatomy, Physiology, and Hygiene* (New York, 1866). D. in New York city, Dec. 20, 1885.

Draper, JOHN WILLIAM, M. D., LL. D.: chemist and writer; b. near Liverpool, England, May 5, 1811; educated at the University of London, and emigrated to the U. S. in 1833. He graduated as M. D. in the University of Pennsylvania in 1836; was Professor of Chemistry and Physiology at Hampden-Sidney College 1836–39, and became Professor of Chemistry in the University of New York in 1839. In 1841 he was appointed Professor of Chemistry in the newly founded medical department of that university. In 1839 he took the first photographic portrait ever taken from the life. He discovered many of the fundamental facts of spectrum analysis, and published them 1841–50. He published *Human Physiology, Statistical and Dynamical, of the Conditions and Course of Life in Man* (1856); *History of the Intellectual Development of Europe* (1863); and *History of the American Civil War* (3 vols., 1867–68), and numerous monographs on mathematics, chemistry, and optics. D. at Hastings on the Hudson, N. Y., Jan. 4, 1882.

Draper, LYMAN COPELAND: antiquarian; b. near Buffalo, N. Y., Sept. 4, 1815; as secretary he edited the *Collections* of the Wisconsin Historical Society; State superintendent of public instruction, Wisconsin, 1858–59; largely instrumental in the collection of the State Historical Library at Madison of about 120,000 volumes. Author of *Madison, the Capital of Wisconsin* (1857); *King's Mountain, its Heroes* (1881); *Essay on the Autograph Collection of the Signers of the Declaration of Independence and of the Constitution* (1889). D. Aug. 26, 1891. C. H. T.

Draper, WILLIAM HENRY: Canadian jurist; b. near London, England, Mar. 11, 1801, and removed to Canada in 1820. He was admitted to the bar in 1828; became member of the Legislative Council in 1837; solicitor-general of Upper Canada in 1838, and afterward attorney-general. He was appointed puisne judge, court of queen's bench, in 1847; chief justice court of common pleas in 1856; chief justice of Upper Canada in 1863; and president court of errors and appeals in 1869. He was a brilliant and eloquent speaker. D. in Toronto, Nov. 3, 1877. NEIL MACDONALD.

Drapery [O. Fr. *draperie*, deriv. of *drap*, cloth: Ital. *drappo* < Lat. *drappus*, possibly of Germ. origin]: cloth or woolen stuffs, clothing, or apparel. The dealers in such commodities are called *drapers* in England. Drapery in painting and sculpture is the clothing applied to the human figure, the various costumes and modes of dress used by different nations and classes of people. The ancient Greeks, although they often executed nude statues of heroes and gods, surpassed all other artists in the representation of drapery and costume. The art of disposing the folds of drapery forms a considerable part of the painter's and sculptor's study, and requires good taste and judgment. See COSTUME.

Draught (of a chimney): See CHIMNEY.

Draughts: See CHECKERS.

Drave (anc. *Dravus*; in Germ. *Drau*; Slavonic *Drava*): a river of Europe; rises in the Tyrol, and flows nearly eastward, through Carinthia and Styria, to the western frontier of Hungary. It afterward runs southeastward, and forms the boundary between Hungary on the left and Croatia and Slavonia on the right, until it enters the Danube 14 miles E. of Essek. Its total length is nearly 400 miles. It is navigable for over 200 miles.

Dravid'ian Languages: a family of languages formerly called Tamulic, from Tamil, the chief member of the group. The objection to this name was that it was not sufficiently comprehensive. Dravidian is not altogether free from the same objection, for the name which the Aryans first gave to this family was "Andhra-Drivida-Basha," which means "The Telugu-Tamil Language." Nevertheless, Dravidian has become the generally accepted term for this group.

Scholars have been divided as to the relation which the Dravidians sustain to the Aryans. Carey, Colebrooke, Pope, and others have claimed that they were of Aryan origin, and that their language was an offshoot of Sanskrit. On the other hand, Rask, Norris, Max Müller, Caldwell, and others claim to have demonstrated that the Dravidian languages are independent of Sanskrit, except that they have borrowed largely from the Sanskrit vocabulary. What Trench says of the contribution of Anglo-Saxon and Latin to English may be said with equal truth respecting the relation and proportion which the Dravidian and Sanskrit elements bear to Tamil, Telugu, etc. "All its joints, its whole articulation, its sinews, and its ligaments, the great body of articles, pronouns, conjunctions, prepositions, numerals, auxiliary verbs, all smaller words which serve to knit together and bind the larger into sentences, these, not to speak of the grammatical structure," are exclusively Dravidian. The Sanskrit "has contributed its tale of bricks, yea its polished hewn stones, but the mortar, with all that holds and binds these together, and constitutes them into a house," is Dravidian.

A few of the distinctive characteristics of the Dravidian languages are as follows: The verb occupies the last place in the sentence. *He struck me* is rendered *he me struck*. Prepositions become postpositions. *To men* becomes *men to*. Nouns are inflected by means of postpositions. The first person plural has two pronouns, one of which includes and the other excludes the person addressed. Relative participles are used instead of relative pronouns. *The person who came* is rendered *the who came person*. There is no passive voice.

The territory covered by the Dravidian languages is, in general, the whole of the Indian peninsula, from the Vindhya Mountains, in the north, to Cape Comorin, in the south, and also the northern half of the island of Ceylon.

The number of Dravidian languages is twelve—Tamil, Telugu, Malayalam, Canarese, Tulu, Tuda, Kudagu, Kota, Gond, Khond, Oraon, and Rajmahal. Of these only the first four are cultivated languages, though Cust and others include also Tulu and Kudagu. As Tamil is undoubtedly the representative member of the Dravidian group, a fuller account of it may be desirable. Telugu, though second only to Tamil, need not be so fully discussed, and the remaining members need but the briefest mention.

Tamil.—Tamil was spoken in India before the Aryan invasions took place, or probably a thousand years before Christ. But when the Aryans entered India the Tamils were driven south, and now occupy the country lying between Cape Comorin, in the extreme south, and Lake Pulicat, about 25 miles N. of Madras, and inland from the Bay of Bengal about half-way across the peninsula, where it joins the Canarese country. It is also the language spoken in the northern half of the island of Ceylon. The number of people speaking Tamil is about 16,000,000.

There are two kinds of Tamil—the classical and the colloquial—and they are almost as different as Latin and Italian. It is the most copious as well as the most highly cultivated of the Dravidian languages. On this point Dr. Caldwell says: "The extraordinary copiousness of the Tamil vocabulary is shown by the fact that a school lexicon of the Tamil language, published by the American missionaries at Jafna, contains no less than 58,500 words; notwithstanding which it would be necessary to add several thousands of technical terms, besides provincialisms, and thousands upon thousands of authorized compounds, in order to render the list complete." It also has an enormous number of synonyms. There is reason to believe that ancient Tamil and Malayalam were identical; and there are the clearest evidences that the cultivation of the other Dravidian languages was long subsequent to Tamil. This is proved by the early Tamil inscriptions which exist. These are always in the Tamil character, and no Sanskrit inscriptions are to be met with in the Tamil country earlier than the fourteenth century. This is not the case with the inscriptions of the other Dravidian languages. Dr. Caldwell also finds numerous names of places which he says are petrified into Greek and Latin names. This shows both the antiquity of Tamil and the early date at which India began to be known to Europeans.

Telugu.—Telugu ranks at least second among the Dravidian languages. Tamil is probably older, as it certainly is more copious and more independent of foreign words. In euphony and melodious sweetness, however, Telugu deservedly holds the first place. From this latter quality it has been likened to Italian, and has, in fact, been called the "Italian of the East." As might be expected from the dominating influence of the Aryans, the Telugu, in common with the Tamil and other Dravidian languages, has incorporated a large number of Sanskrit terms. Of the higher or literary Telugu fully one-third of the vocabulary is Sanskrit. The proportion is less, however, in the language of the common people. It is chiefly because of this large Sanskrit element in the Dravidian languages that some have claimed for them an Aryan origin.

The Telugu country was originally divided into two kingdoms—the Andhras and the Kalingas. The former occupied the interior and northern portion of the country. The latter occupied the seaboard, and although less known to the Aryans, who gave the name Andhras to both nations, yet it is to the Kalingas that the name Telugu is to be traced. From Kalinga came Talinga and Tenugu—the name which is even now frequently applied to the language by some pundits. But the favorite derivation of Telugu pundits for Telugu is Trilinga, or country of the three lingas. These three celebrated lingas, or stone emblems of the divine creative power, are said to be at Kalahastry in the south, Sreesalem in the west, and Dracharamu in the north. A better known boundary is Pulicat in the south, Chicachole in the north, and Udgiri in the west. The country thus described contains about 73,728 sq. miles.

Canarese.—Canarese claims the third place among the Dravidian group. Its territory is W. of the Telugu country, S. of the Mahratta, and includes the Mysore plateau and portions of the Nizam's territory. The people speaking Canarese number about 10,000,000. In common with Tamil and Telugu, Canarese has a classical and colloquial dialect. The dialect of the Budagas, a numerous tribe inhabiting the Neilgherry hills, is a very ancient one. The Canarese character has a very close resemblance to the Telugu.

Malayalam.—Malayalam is spoken along the Malabar coast, and includes the native states of Travancore and Cochin. Caldwell places Malayalam second in the list of Dravidian languages, because of its close resemblance to Tamil. Cust, on the other hand, regards it as simply an offshoot of Tamil, though greatly altered, and for that very reason puts it fourth in the list. Malayalam is the language of the 300,000 Syrian Christians who dwell there. There is also a colony of white Jews who have lived there from a very early period. The population of the Malayalam country is about 4,000,000. Malayalam has a larger proportion of Sanskrit words than any other of the Dravidian languages.

Tulu.—Although Tulu has neither a character of its own, the Canarese character being used, nor a literature, yet Caldwell and others claim that it belongs to the cultivated languages. The number of people speaking Tulu is so small and they are so mixed with other tribes that the language will probably soon disappear.

Kudagu.—This also is regarded by Caldwell and Cust as being a cultivated language, but like the Tulu, it has neither character nor literature, and hence the claim is a doubtful one. The name Kudagu is seldom heard in India, Curg being the modern name of the country. Like the Tudas, the people practice polyandry and worship demons. The probabilities are that both people and language will soon be extinct.

Tuda.—Tuda or Toda is the language of a rude tribe who claim to be the original owners of the Neilgherry hills. Their claim, however, is denied, and the probability is that they were early emigrants to the hills from the Canarese country, and their language is probably a corruption of Canarese. They number only about 700; they practice polyandry, and are fast dying out.

Kota.—The Kotas are a small tribe of people of a very low type. They are, however, an industrious, peaceful people, dwelling among the Todas on the Neilgherries. They pay a small tribute to the Todas, who claim to be the lords of the hills. Like the Toda, the language is allied to the Canarese. It has no independent character of its own, nor any literature.

Gond.—The Gonds are a wild jungle people, numbering about 1,500,000, and occupy the hill country now included in the Central Provinces. They are divided into a number of tribes, four of which are called Koitors, and this is the name which the Gonds, as a whole, prefer to call themselves. To the missionaries who have settled among them we are indebted for nearly all that is known of the Gonds.

Khond.—The Khonds are a wild people inhabiting the hilly parts of Orissa. Up to a very recent date they practiced human sacrifices. The name Khond is traced by some to the Telugu word *konda*, meaning a hill. But the Telugus do not call the people Khonds, but Gonds, and as they call themselves Kus, the derivation from *konda* is at least doubtful. The number of Khonds is about 150,000.

Oraon.—The Oraons number about 275,000, and occupy the district of Chutia Nagpur in the province of Bengal. The language, though clearly Dravidian, is surrounded by the Aryan to such an extent that it has not only incorporated a large number of Aryan words, but even the pronunciation and orthography have been modified. Although it retains the chief characteristics of the Dravidian languages, yet, since it has neither a character of its own nor a literature, it will scarcely survive the struggle for life.

Rajmahal.—This is the name of a mountaineer tribe occupying the hills of the same name in the Province of Bengal. The language is Dravidian, though the Santals, who occupy portions of the same hills, are not Dravidians, but Kolarians. Another name for Rajmahal is Maler, but the common name is Rajmahal. Very little is known about the language. A few vocabularies have been compiled, but it is not at all likely that the language can survive.

The number of people speaking the Dravidian languages as above enumerated may be estimated as follows:

Tamil	16,000,000	Kota	1,112
Telugu	17,000,000	Gond	1,500,000
Canarese	10,000,000	Khond	150,000
Malayalam	4,000,000	Oraon	275,000
Tulu	300,000	Rajmahal	41,000
Kudagu	150,000		
Tuda	700	Total	49,417,812

According to this estimate the Dravidian races may be put down at not far from fifty millions.

Bibliography.—R. Caldwell, *The Comparative Grammar of the Dravidian Languages*; Dr. Bowen, *Tamil Language and Literature* (*Calcutta Review*, vol. xxv.–); Dr. Hunter's *Comparative Dictionary of the Non-Aryan Languages of India*; R. N. Cust, *The Modern Languages of the East Indies*; Introduction to Brown's *Telugu Dictionary*; Dr. Winslow's *Tamil Dictionary*. D. Downie.

Dravidian Literature: Tamil literature is of considerable extent. The more ancient portion of it was composed in verse. Works on grammar, medicine, theology, science, or art were, by the universal law of custom, written in verse. It is only of late years that Tamil prose has been cultivated to any considerable extent. Concerning the precise date of the rise of Tamil literature nothing is known with certainty. The ripest Tamil scholars can do no more than guess when any question of date comes up respecting the ancient works or their authors. One of the oldest, as well as one of the greatest, of Tamil poems is entitled the *Kural*. It was composed by Tiruvalluvar, a pariah, and probably was written before the tenth century A. D.

The following is one of the stanzas of the *Kural*:

> The flute is sweet; the lute is sweet say they
> Who have never heard the prattle of their own children.

Another celebrated poem is the *Ramâyana*, in Tamil. The version is by Kamban, one of the most fluent and ornate of the Tamil classical writers. The Tamil *Ramâyana* is not a slavish translation of Valmiki's Sanskrit epic, but it is rather an adaptation of it in Tamil. Two other famous Tamil poets of Kamban's time are Pugalendi and Ottakkuttan. Apparently there did not arise any great Tamil authors until two centuries after the death of Kamban, when there was a literary revival. A new poet, Athivîrarama Pândya, now flourished, and this elegant writer produced the *Neidadam*, the *Kâsikandam*, and *Vettri Verkei*—the latter a small poem which has attained enormous popularity. About this time, too, Villiputturâr translated the Sanskrit *Mahabhârata* into Tamil verse. At this period also was probably composed the most noteworthy of the Vedantic poems in Tamil, the *Gnâna Vâsishtham*. Not much later than this time were written those poems, full of similes and metaphors and pleasant moral aphorisms, which are taught in every Tamil vernacular school in the Madras presidency.

Since the beginning of the eighteenth century several writers of the highest eminence have flourished in the Tamil country. Among these Tayumânavar, of Trichinopoly, and Beschi, of Madura, have left an imprint of their genius on the literature of Tamil which will not be erased as long as that literature exists. *Tayumânavar* is perhaps the purest and most chaste of Tamil writers; his style is a model of elegant simplicity. His poems have a high philosophic and religious tone, and in some of them distinct traces of Christian ideas are to be met with. Beschi composed a large number of controversial treatises, as well as a Tamil satirical novelette, the first in the language. It is greatly owing to him that Tamil now possesses a prose literature. But it was especially as a poet that he left his mark upon Tamil. His great poem the *Tembavani* is recognized by the most learned Hindus as a Tamil classic of the highest merit. Brahman pundits named him Vira Mamuni, "the heroic devotee." Since Beschi's time the literature of Southern India has been enlarging itself at a prodigious rate, but, though a large number of works has been produced, their quality has sadly fallen off. The Tamil Bible, translated and published under the auspices of the Madras Bible Society, is acknowledged to be a work of rare scholarship and a most faithful rendering of the sacred Word. The Madras Religious Tract and Book Society has also published a large number of Tamil and Telugu works, prepared chiefly by missionaries and native Christian scholars, and a school lexicon in the Tamil language is published by the American missionaries at Jafna. Like Tamil, Telugu has a considerable literature, including all the great epic poems of the Hindus. In the library of Brown University, Providence, R. I., there is a copy of the Mahâbharata in eight volumes, written in Sanskrit in the Telugu character on palm leaf. William Carey, the Baptist missionary, was the first to translate the New Testament into Telugu. The missionaries of the London Missionary Society were the first to translate the whole Bible.

Canarese literature is not extensive, but it has a number of linguistic books, and the Bible has been translated into the language. There is a grammar of the Tulu language. Certain portions of the Bible have been translated into Ghond, and a brief grammar and vocabulary of that language has been published by Rev. J. Dawson, of Allahabad. A few Khond books have been written in the Uriya character, and a few vocabularies of the Rajmahal language have been compiled. D. Downie.

Drawback: in commerce, a paying back or remitting of money paid as duty, freight, or other charge. The term is especially applied (*a*) to the refunding or remitting by a common carrier of a part of the regular freight charges paid by the shipper, so that he really pays less for the services rendered than another person or persons is charged for similar services; (*b*) to an allowance made by the government to merchants on the re-exportation of certain imported goods liable to duties; also a repayment or remission of a duty laid on any article produced in a country and suitable for the foreign market, when such article is entered for exportation. In some cases this allowance or remission consists of the whole of the customs or excise duties; in others, of a part only. In the U. S. drawback has been regulated by various acts of Congress. Such duties are, of course, an enhancement of the natural price of the commodity on which they are imposed. The object of the allowance or remission is to establish or stimulate a trade with foreign countries in the commodity. Adam Smith, in his *Wealth of Nations*, thus speaks of the remission or repayment of the latter form of duty: "To allow," he says, "the merchant to draw back, upon exportation, either the whole or a part of whatever excise or inland duty is imposed upon domestic industry, can never occasion the exportation of a greater quantity of goods than what would have been exported had no duty been imposed. Such encouragements do not tend to turn toward any particular employment a greater share of the capital of the country than what would go to that employment of its own accord, but only to hinder the duty from driving away any part of that share to other employments. They tend not to overturn that balance which naturally establishes itself among all the various employments of the society, but to hinder it being overturned by the duty; they tend not to destroy, but to preserve what it is in most cases advantageous to preserve, the natural division and distribution of labor in the society." These remarks are subject to this qualification: provided the drawback is equally applicable to all domestic productions that are sought to be exported. It might, perhaps, be shown also, by experience, that the practice of giving drawbacks is liable to abuse: for, supposing a great fall in the value of some excisable article, it may be exported with a view, partly or entirely, to get the drawback. An important species of commerce would thus be fostered. Of course the government must guard against deceptions by exercising an oversight of the packing, weighing, tying and sealing of such goods, of their ownership, of the time when such goods were charged with the duties, and of the exportation; and in some particulars it requires a verification by oath.

Revised by T. D. Woolsey.

Drawbridge: a bridge which can be drawn back, lifted up, or swung around so as to prevent travel over it (as at

Tower bridge, London, England.

the portals of fortifications) or to allow vessels to pass. The swing or pivot drawbridges are in most common use, and these will be found described in the article Bridges. A rolling drawbridge is placed on friction rollers, and the

shore end is counterweighted so that it can easily be drawn back; these have been used but to a limited extent and only for very short spans. Lifting drawbridges consist of one or two leaves, or spans, which turn in a vertical plane; these have also been little used, but there are two which deserve notice.

The Tower bridge across the Thames in London has two movable leaves, each of which is 50 feet wide, 100 feet long, and 950 tons in weight. When closed these form a roadway 29 feet above the water and 200 feet in span. When they are opened to allow the passage of vessels, foot passengers can cross over by ascending in elevators, situated in the towers, to a permanent foot bridge placed 135 feet above the water. This structure has also two side spans of 270 feet each. Its total cost is stated at about $3,000,000.

A lifting railroad drawbridge was completed in 1892 at the crossing of the New York Central and Hudson River R. R. over the Harlem river at 134th Street, New York. It is a double-tracked structure 93 feet long. The tower which carries the lifting machinery is 120 feet high. The bridge has two counterbalance weights of 45 tons each, and it can be raised or lowered in twenty seconds. See BRIDGES.

MANSFIELD MERRIMAN.

Drawee' and **Draw'er**: See BILL OF EXCHANGE.

Drawing: originally delineation, or representation, description, etc., by means of lines. By extension, the representation of solid objects on a plane surface, by means of lines and tints, and by contrast and gradation of dark and light. In this sense drawing is the applying of lines and tints to a flat surface in such a way that a picture shall appear there. But the original sense is also in use, and the drawing of an engineering draughtsman does not produce a picture of a machine or a canal-lock, but a conventional diagram by means of which the machine, etc., may be correctly made or put together. In like manner architectural drawing, as of a plan or section, will not produce a picture of a house or of any part of one. These kinds of drawing, by means of straight ruled lines, curves drawn mechanically, etc., are generally spoken of as *mechanical drawing*. Perspective and isometrical perspective are varieties of mechanical drawing, because they are produced by rule and with the general use of instruments of accuracy, but their purpose is the representation of objects nearly as they look to the eye, so that these methods approach artistic or free-hand drawing in their results. This last is the kind of drawing usually meant when the word is used alone.

Such free-hand drawing may be done with the lead-pencil, with what are called *crayons* (see CRAYON), with powdered crayon or *sauce* and the stump or *estompe*, which spreads the black powder over the paper, and may produce very delicate gradations, with a hard point on tinted paper (see SILVER-POINT), with pen and ink, with the brush and india-ink or sepia, or bister or other one-colored material, and, finally, with precisely similar materials, but of several or many colors. There are also some curious and unusual methods of drawing, as with a hot metal point which burns and chars a smooth surface of wood. Moreover, it is really drawing that an etcher does on the surface of his varnish, or a dry-point engraver on the copper, though it may be doubtful whether the term should be employed for engraving with the burin. See ENGRAVING.

The concrete term *a drawing* is applied to any piece of the mechanical work of architectural, engineering, or machinist draughtsmen, also to the slightest scrawls or feeble attempts of children and savages, and in writing and talking about the fine arts, to all pictures on a flat surface, not incised nor in relief, except oil-paintings, frescoes, the larger and more elaborate paintings on walls of any kind, and the more elaborate tempera pictures of old times. Thus in the exhibitions and studios it is customary to use *picture* for an oil-painting and *drawing* for a water-color.

RUSSELL STURGIS.

Drayton, MICHAEL: poet; b. at Hartshill, Warwickshire, England, in 1563. His chief work is *Poly-Olbion* (1613), a poetical description of the mountains, rivers, valleys, and forests of Great Britain, with the traditions connected with them. He was appointed poet-laureate in 1626. Among his numerous works are *The Barons' Wars* (1596), an historical poem somewhat tedious in character but containing many fine passages; *Poems, Lyric and Heroic* (1606); *Nymphidia*, a fairy poem (1627); and *The Muses' Elysium* (1630). D. in 1631.

Drayton, WILLIAM HENRY: statesman: b. in South Carolina, Sept., 1742. He wrote political works, was chosen chief justice of South Carolina in 1776, and president of that State in 1777. In 1778 he became a member of the Continental Congress. D. in Philadelphia, Sept. 3, 1779, leaving in MS. a *History of the Revolution*, which was published by his son (2 vols., 1821).

Dream: a series of thoughts, feelings, and acts of the imagination occurring in sleep. In some cases the reasoning powers are abnormally active in dreams, but in general the mental action is incongruous. Dreams usually are evidence of imperfect sleep. They take their character from some preceding state of the mind, and are often modified by the conditions of the health. The Bible speaks of dreams as being sometimes prophetic or suggestive of future events. This belief has prevailed in all ages and countries, and there are numerous modern examples, apparently well authenticated, which would appear to favor this hypothesis. The interpretation of dreams was a part of the business of the soothsayers at the royal courts of Egypt, Babylon, and other ancient nations. See SLEEP.

Dredges and **Dredging**: the machines and operations employed in removing submerged obstructions by mechanical means rather than by utilizing the natural forces of currents and tides, as in scouring.

The material may be lifted entirely from its site by various classes of dredges known as the *bag and spoon*, *dipper*, *clam-shell*, *ladder*, *grapple*, and others, which hoist a definite quantity of rock or earth at each movement; or it may be raised by *vacuum*, *sand*, or *centrifugal* pumps, and be ejected into barges or directly upon the neighboring shores through conduits; or it may be merely dragged off the reefs or bars by *scrapers* or *scoops* into deeper water adjacent to the locality.

The earlier forms of these machines as used by the Italians and Dutch were crude, limited, and expensive. The *bag and spoon* dredge, the simplest and earliest form, was much used on the shallow canals and ditches of Holland. It consisted merely of a leather sack laced to an iron ring of about 2 feet in diameter, having a cutting edge. It was operated by a pole, which served as a guide, while a rope fastened to the ring served to drag it along the side of the scow, at the bow of which a winch was fastened. A similar device was used on the Fossdyke Canal in England for removing 135,000 tons of soft material. It is slow and very limited in application.

The scraper consists merely of a scoop of iron or steel attached to the lower end of a beam, which is pivoted at its upper end to a scow. It is operated by towing or dragging the scow over the bar, from which the material is scraped off mechanically. It is a very inefficient device in this form, and the results are not permanent where there is a current. The earlier form of scraper dredges consisted of two barges moored on opposite banks of the channel to be improved, and connected by ropes running over pulleys. A bucket was suspended by chains so as to traverse the interval between the boats, across the bottom of which it was drawn by a windlass and crab operated by six men for the full

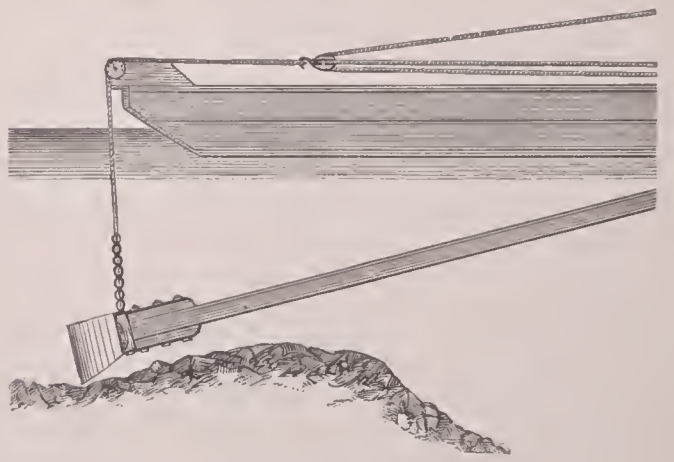


FIG. 1.

bucket and two for the empty. This process was in use on the river Tay in Scotland until 1833, but was primitive and prevented navigation during its operation.

The application of steam to dredging is said to have been first made on the Wear at Sunderland, England, in 1796, when a machine was made for Mr. Grimshaw by Boulton and Watt.

Ladder or *bucket dredges* consist of a series of scoops or

buckets attached to an endless belt or chain passing over the side of the vessel or through an opening amidships, and working over pulleys or wheels so arranged that the chain can be lowered or raised to suit various depths of water. The buckets descend empty, fill themselves at the bottom, and when they rise over the upper wheel discharge into troughs leading to scows alongside.

Fig. 2 shows a longitudinal section, and Fig. 2a an enlarged view of buckets and lower wheel, of a powerful steam-dredger used on the river Clyde, Scotland. The hull is of boiler plates and angle iron, being 161 feet long, 29 feet breadth of beam, and 10 feet greatest depth of hold. An endless band, carrying 40 dredge-buckets of nearly 14 cubic feet capacity each, works through a well amidships, passing over two wheels, one at either end of an iron bucket-girder 90 feet long, and weighing 125 tons when working, inclusive of the contents of the ascending buckets and hoisting chains. The axis of the upper wheel is stationary at the height of about 30 feet above the water, and the girder revolves about this axis sufficiently, by raising and lowering the submerged end, to allow the dredging to be carried on at any depth from 6 feet to 30 feet. One man, by means of a lever on deck, has complete control of raising and lowering the bucket-girder.

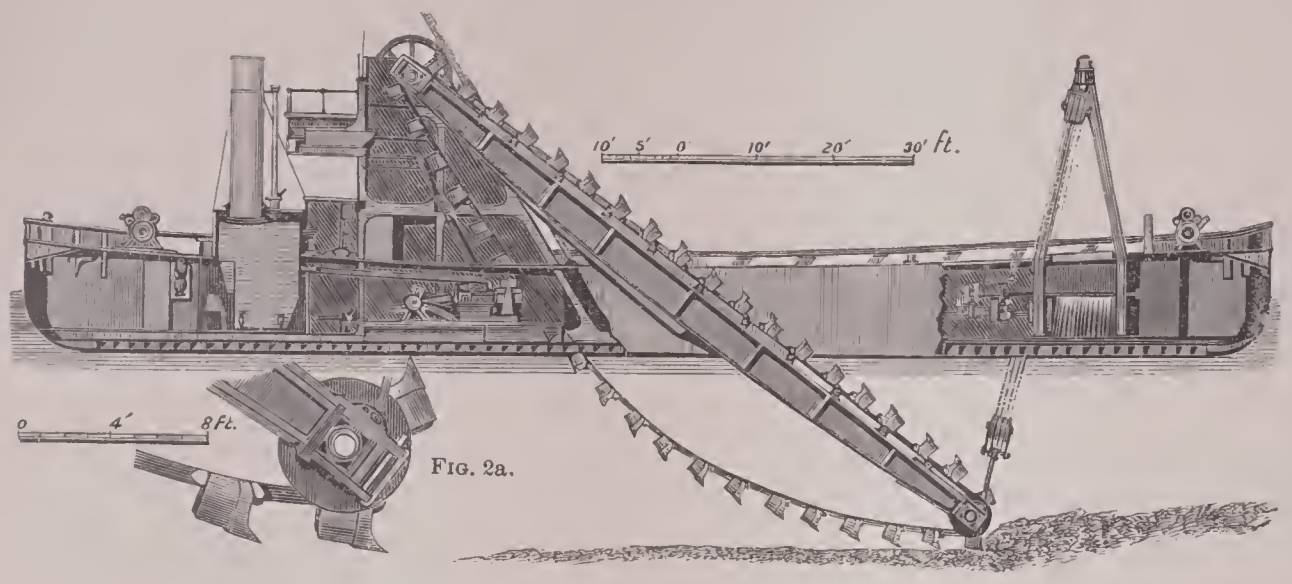

Fig. 2a.

Fig. 2.

By suitable appliances provision is made for moving the vessel ahead, astern, and athwartship. Surging heads are also fitted to crabs to haul the hopper barges alongside, also hand gear to work the surging heads independent of steam. Friction gearing is provided and adapted to work these moorings at three different speeds. The main gearing and girder hoisting gear are also fitted with adjustable friction-wheels, to prevent accidents in case of undue strain coming on the buckets or girder. This dredger, working at full speed in 10 or 15 feet of water, can raise about 500 tons, or 380 cubic yards, of ordinary soil per hour.

The European commission employed on the Sulina branch of the Danube the open-ended single-ladder machines with mud-pumps, such as were used also on the Amsterdam ship-canal as well as at St. Petersburg.* The material was conveyed through floating tubes over dikes 8 feet high. The dredges were 115 feet long, 25 beam, and 10¾ draught. Each machine was operated by a 40-horse-power engine, and had a capacity of only 1,300 cubic yards per day of twelve hours in favorable ground. The average cost of this dredging was 6·2 cents per cubic yard, and for towing 4,000 feet 2 cents, exclusive of depreciation and interest on plant. When the mud-pumps and distributing-pipes were used the cost was increased to 7·5 cents per yard. The season was but 200 days long, and coal was dear on the lower Danube. In the inner port at Boulogne, France, the plant consisted of two powerful bucket-ladder dredges, which discharged into hopper barges having a 2-mile haul. The contract price was 24½ cents per yard in the barge. The material was mud and sand mixed with stones; underlying this was a hard stratum of clay and schist, for which the price was 64¾ cents. The buckets were too light, and repairs were frequently necessary.

The first bucket-ladder dredge was driven by steam at Sunderland harbor, Oct., 1811, of which it was said: "A steam-engine of great power was erected upon a floating barge, which continually drove round a number of iron buckets fastened to a chain, which filled themselves with sand and gravel at the bottom of the harbor, and successively emptied themselves at the top of a shaft into a spout to receive them. The machine could lift 55 tons in thirty-five minutes." This type gives a very low efficiency, as most of the power is required to run the machinery.

On the Suez Canal the plant consisted of a ladder dredge with a shoot and supporting girder, about 73 feet in length, a portion of which is not shown in the illustration. Where the banks of the canal were too high to use the long-shoot dredger, an elevating apparatus was employed, consisting of a portable tramway supported by two parallel lattice girders, the lower end, about 10 feet above the water, resting upon a barge in the canal, and the shore end, 45 feet above the water, upon a truck running upon a railway laid along the bank of the canal. In operating this apparatus the dredgings are first delivered from the dredge into boxes arranged side by side upon a raft or float; the raft is then floated under the lower end of the tramway, and the boxes are hooked on, one after another, to the lower side of the tramway truck, and conveyed to the upper end of the tramway and tipped by steam-power. This arrangement is shown in Fig. 4, a portion of the shore end not being shown in the illustration. The tipping is effected by two wheels attached to the lower rear edge of the box which run up a steep incline at the upper end of the tramway.

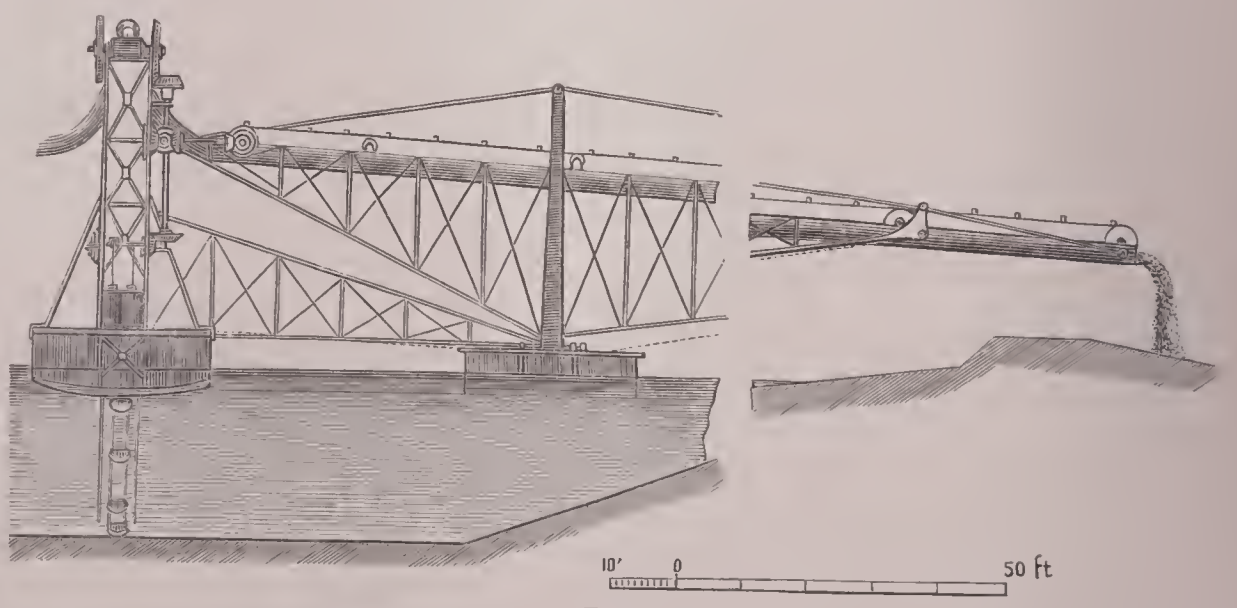

Fig. 3.

Wheel Dredgers.—Instead of an endless chain to carry the buckets, these are sometimes placed upon the perimeter of a wheel 25 to 30 feet in diameter, or larger according

* See *Engineering*, Nov. 8, 1872.

to the depth to be dredged. This wheel is set in a well in the boat, its axle or shaft working in boxes that can be lowered or raised by suitable machinery as the depth requires. As the wheel revolves the buckets scoop themselves full at the bottom, and in ascending lift in succession the upper end of a shoot adjusted against the perimeter of the wheel, which, falling back to its place, causes the bottom of the bucket to unlatch, and the contents to be discharged into the shoot, and thence into a scow alongside. The dredge-boat is drawn along by a cable leading to the engine at the precise rate which the progress of the excavation requires. Under favorable circumstances a 24-foot wheel carrying four buckets has been known to excavate 1,200 cubic yards in ten working hours. See Fig. 5.

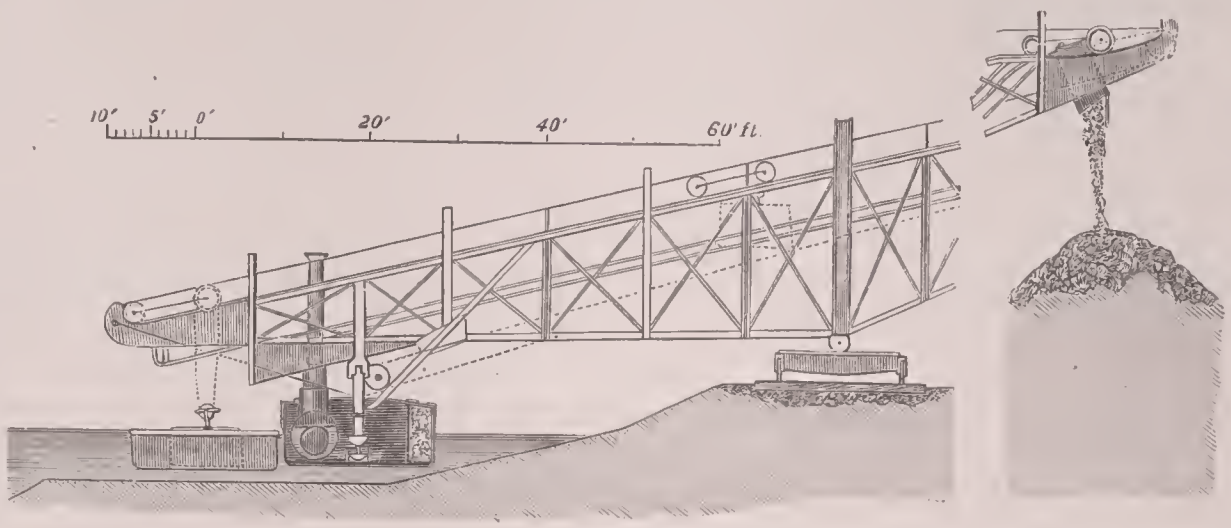

Fig. 4.

Clam-shell Dredgers.—Each dredge-boat operates but one bucket, which is in two parts hinged together horizontally, something like a clam-shell, with arrangements by which it is opened and closed by the same power which lowers and raises it through the water. The bucket, being open and suspended from the end of a crane-jib, descends vertically through the water until it rests on the bottom. It is then filled by closing together the two parts, when it takes the form of a short horizontal trough or hollow semi-cylinder closed at the ends. It is then raised out of the water, swung round over a scow, opened, and emptied.

When working in hard material like compact clay, hard sand, or gravel, the cutting edges of the bucket are provided with sharp teeth.

The bucket is guided in its descent by a pair of wooden poles attached to the guides of the crossbar, and working up and down through eyes near the end of the crane-jib. For raising stones, logs, fragments of wreck after blasting, etc., a strong grapple with steel-pointed prongs is used in place of the bucket.

A mammoth grapple-dredge was used in removing obstructions in the East river at New York. The barge was

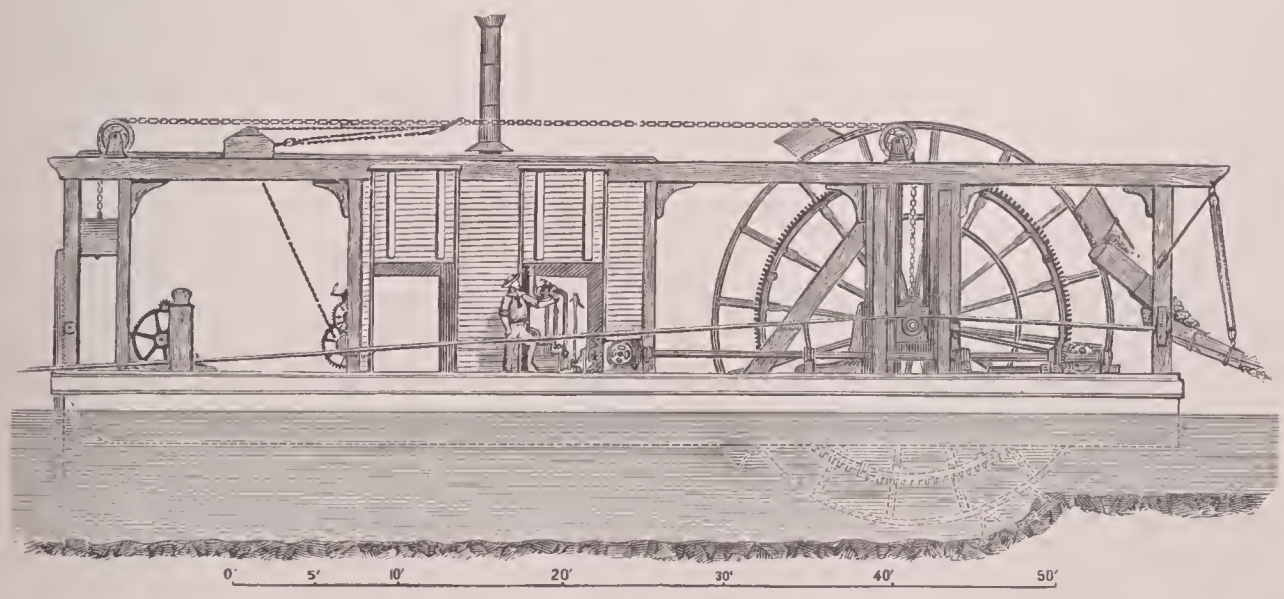

Fig. 5.

120 by 44 by 15 feet deep. The beam was 65 feet long, and sustained grapples having a clear opening of 15 feet and weighing 14 tons. The grapple was operated by 1¾-inch steel-wire ropes connected with a friction drum on the scow. This machine was designed to hoist boulders weighing 70 tons, the average load being 20 to 30. These machines were used on Hell Gate and Flood Rock reefs, in a strong tideway, and were built by the Atlantic Dredging Company.

Fig. 6 gives a view of the longitudinal section of a *clam-shell dredger* manufactured in New York (perhaps the best of the kind), and Figs. 6a and 6b the bucket and grapple of such a dredger. For these dredges two sizes of buckets are usually made: the smallest weighs 3,500 to 4,000 lb., with 1½ cubic yards actual capacity, or 2 yards when heaped up, and the largest weighs 6,500 or 7,000 lb., with 3 cubic yards actual capacity, or 4½ to 5 yards when heaped up. The teeth are made from 6 to 9 inches long. The grapples also are of various sizes, the largest being 5 feet along the hinge, and 8 feet wide between the points of the prongs when open. In 25 feet of water three lifts can be made in two minutes with the 3-yard bucket. The largest dredge-boats are 80 feet long and 30 feet wide, and the smallest 60 feet long and 25 to 30 feet wide. The power for the heavy grapple is supplied by two 20-inch cylinders with 20 inches stroke, 45 lb. steam-pressure, and making from 40 to 60 revolutions per minute; for the large buckets, two 12½-inch cylinders with 30 inches stroke, 75 lb. steam-pressure, and making from 60 to 70 revolutions per minute; and for the small buckets, two 10-inch cylinders with 24 inches stroke, 75 lb. steam-pressure, and making from 60 to 70 revolutions per minute.

In Baltimore harbor a machine with a 3-yard bucket, operating partly in soft mud and partly in oyster shells, in 26 working days, of which 7 were lost by breakages and bad weather, leaving only 19 days work of 10 hours each, raised 26,334 cubic yards, or a daily average of 1,386 cubic yards. The best day's work was 1,980 cubic yards. The average depth of water-way was 21 feet, with occasional lumps with 16 feet soundings. The depth to be attained was 24 feet. Another machine with bucket of the same size, in 26 days, of which two were lost, raised 48,000 cubic yards. In the same harbor, operating in soft mud in a 16-feet channel, to make it 24 feet deep, a machine with a 1½-yard bucket, working 26 days, of which 7½ were lost, raised 23,310 cubic yards. The best day's work of 10 hours was 1,665 cubic yards. Another machine of the same size, working 21 days, of which two were lost, raised 19,109 cubic yards. The aggregate quantity raised by the four dredgers during the respective periods above specified agreed to within about 150 cubic yards with the return made by the engineer inspector, upon which payment for the work was made. In Boston harbor a 3-yard bucket of the kind shown in Fig. 6a, working 26 days in stiff whitish-gray clay, raised only 3,335 cubic yards, or 128¼ yards per day of 10 hours. In this case the teeth did not penetrate more than 8 or 9 inches, tearing up the clay in large lumps, but not so as to fill the bucket.

In making shallow cuts much time is lost in moving the dredger forward.

Single-scoop or Dipper Dredgers (Fig. 7).—By these machines dredging is performed with a single bucket, shaped, as the name implies, like a scoop or dipper, having a swinging door closing with a catch at its back, by which it is emptied. This bucket is fixed to a beam or handle of a length suitable for any depth of water in which the dredger is intended to work. The bucket with its handle is worked from a crane, which has its post set on a movable platform placed in the center of the bow of the dredge-boat. The crane-post, jib, and stay are each built of two parallel timbers, secured to one another at the foot of the stay, neck of the post, and end of the jib. The bucket handle works in the space left between these parallel timbers. This beam or handle is slotted for the greater portion of its length, and on the back, on either side of the slot, has two racks working on pinions whose shaft is fixed upon the crane-jib about one-third its length from the post. These racks are kept in contact with their pinions by a friction-roller pressing on the front of the handle, and made fast by a link passing through the slot to the shaft of the pinions.

An improvement on the ordinary crane, which had a radius of about 19 feet, has been applied to the scoop used in the Osgood dredge, namely, an extension of the end of the crane-jib, by which a longer cut ahead can be made by the bucket and a greater width of bottom covered by the swing of the crane, thus saving time which would otherwise be lost in moving the machine. The extension of the jib is carried out nearly horizontally, the bucket being suspended as before described, with the exception that the outer shive at the end of the jib becomes a traveling one, with a tendency to keep a position directly over the bucket. In machines with the larger-sized buckets the cranes have a counterpoise attached. In very hard ground the bucket is taken off and a pick or plow attached, with which the ground is broken up, to be afterward picked up with the bucket.

These machines are made of various sizes, those most commonly built having buckets of 3, 1¾, and 1½ cubic yards capacity. The dimensions of boat for the larger machines are about 65 feet length, 26 feet beam, and 6½ feet depth of hold, and having a hoisting chain of 1¼ inches. Their power is derived from a pair of 15-inch cylinders with 12 inches stroke.

The larger machines of this pattern, with 3 yards capacity of bucket, when working in soft mud under the most favorable circumstances—that is to say, from a fixed position—will average in 20 feet of water about 2,000 cubic yards per day of 10 hours. Under ordinary circumstances it may be expected, in a series of working days of 10 hours each, to average about 1,300 cubic yards of soft mud or 800 cubic yards of gravel and sand.

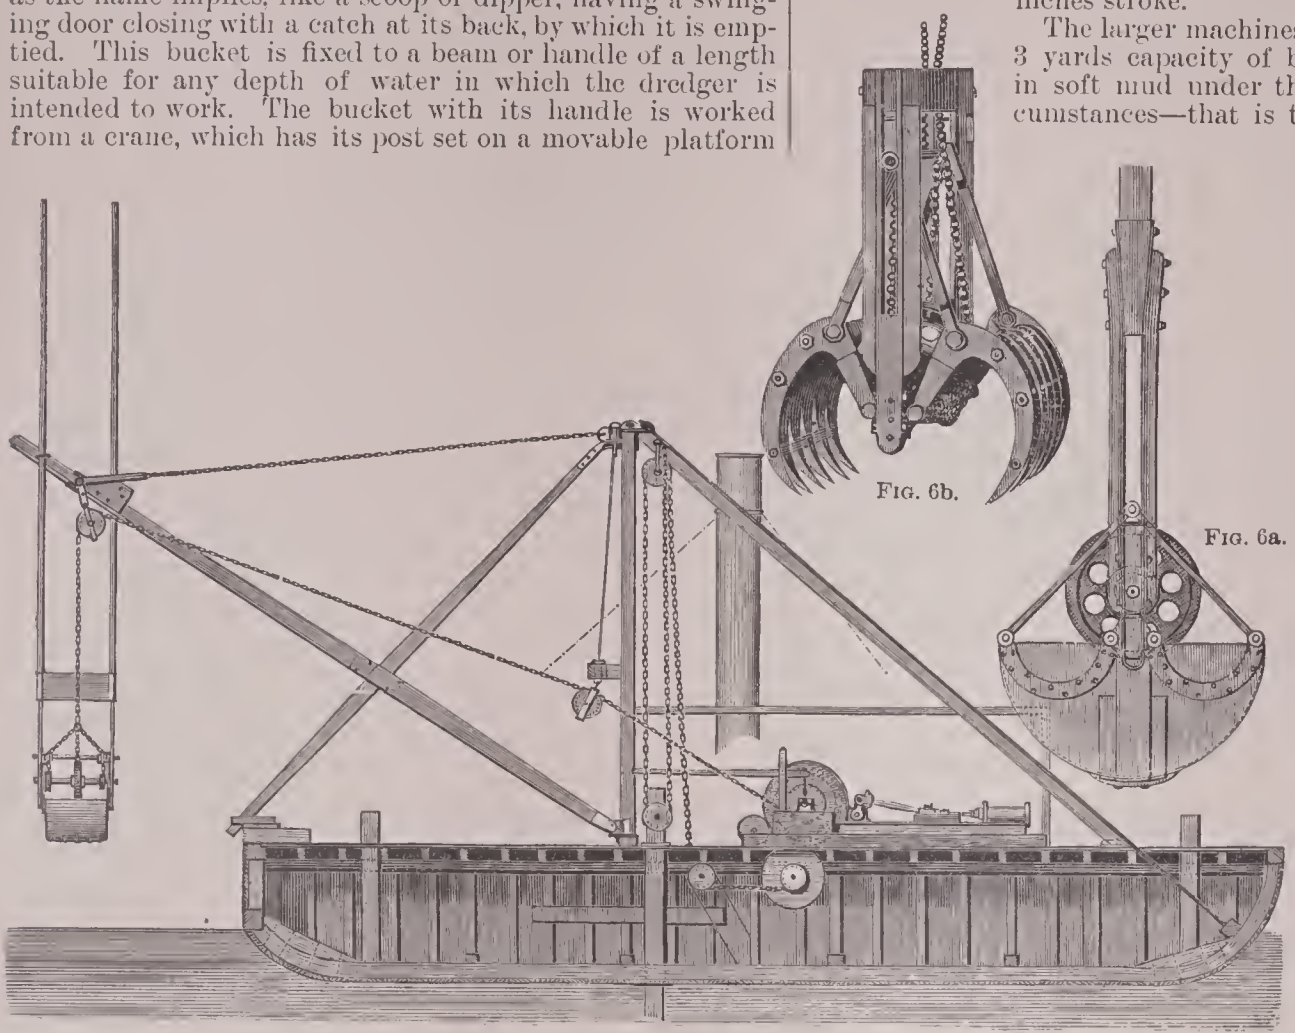

Fig. 6b.

Fig. 6a.

Fig. 6.

In the slips of New York a machine with a bucket of 1½ cubic yards capacity, 7-inch cylinders with 12 inches stroke, a steam-pressure of 60 lb., and with 200 revolutions, working in soft mud, in 12 days of 10 hours lifted 10,302 cubic yards, or 859 yards per day. The best day's work was 968 yards. The same machine working in soft mud at Wallabout, Brooklyn, with a cut of from 2 feet above to 10 feet below low water, in 131 working days of 10 hours lifted 72,621 cubic yards, or nearly 555 yards per day of 10 hours. At the same place the same machine, working in gravel and sand, with a cut of from 15 to 22 feet below low water, in 14 days lifted 5,591 cubic yards, or nearly 399 yards per day of 10 hours.

Another machine with a 1¾-yard bucket, and with cylinders of 10 inches diameter and 15 inches stroke, cutting to a depth of 10 feet through a meadow at the junction of the Delaware and Schuylkill rivers, the material seemingly consolidated mud, in 26 working days of 10 hours lifted 12,532 cubic yards, an average of 482 yards per day. The same machine, near Philadelphia, working from a fixed position, picking up soft mud which had been dumped under it from scows, and loading into cars, lifted 1,000 cubic yards in 10 hours; its average, however, was about 800 yards per day. These working days include the time lost in repairing chains and other slight damages incidental to the best running machines.

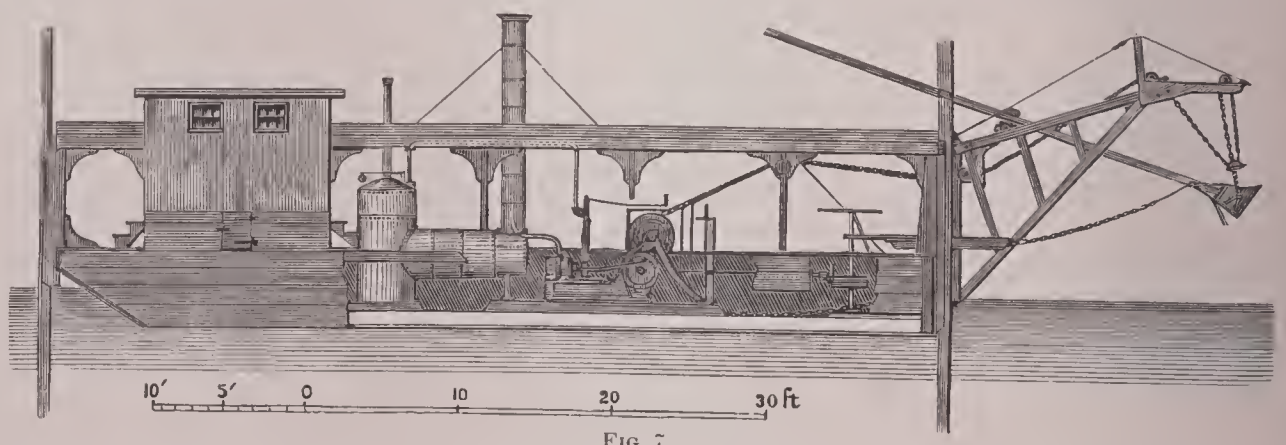

Fig. 7.

A tug of 100 horse-power can, with 4 scows of about 150 yards capacity each, keep one of the smaller machines busy when the tow does not exceed 3 miles. The smaller

dredger consumes about 1¼ tons, and the tug about 1½ tons, of coal per day.

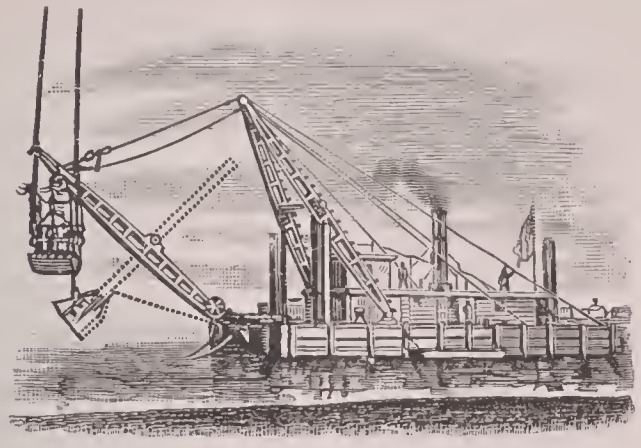

FIG. 8.—Osgood dredge.

CURRENT DREDGES constitute a class of machines which are cheap, simple, and effective. The principle embodied in them is that of a vertical deflection of the currents and a partial reduction in the area of the cross section, whereby the head as well as the velocity due to it are increased. Thus in the formula for the discharge of a stream, $Q = A\,V$, the velocity V varies directly as Q, the quantity, and inversely as A, the area of cross section. As the bottom velocities are very low, while those near the surface are high, to utilize these higher velocities for scour many simple devices have been tried.

Kingston dredger was one of the earlier forms. It was used on the river Stour, in England, and consisted of a boat with a broad rake fitted to the bow, and capable of adjustment to different depths. At the side of the boat were hinged two wings of the same depth. The rake being dropped

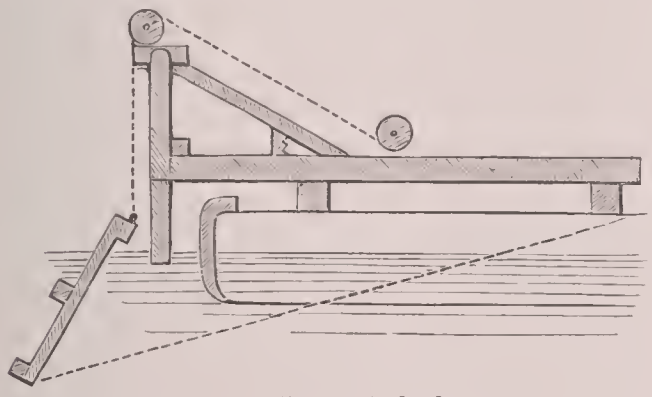

FIG. 9.—Kingston's dredge.

to the required depth and the wings extended, they formed a temporary dam, causing a "head," varying from 6 to 12 inches, which drove the boat forward and carried the mud with it. The rate of motion was 3 miles per hour, and the results were very satisfactory in cleansing the river.

For removing the silt from the tail bays of the Indian canals at Calcutta and on the Orissa coast, Mr. John Kingston proposed a simple wooden shield to be lowered over the down-stream end of the barge and hauled taut at an angle, so that its lower edge rested near the bottom, thus forcing the current under it and cutting away the bar. The barge was let down stream by hawsers or by a tug at a slower rate than the currents. See Fig. 9.

This idea has also been applied on the Garonne, in France, where a very similar device was employed for removing bars at the rate of about 60 yards of clay and sand per day, at an expense of 4½ cents per cubic yard. The boat was but a small affair.

Mr. J. Henry Apjohn has enlarged and improved upon Mr. Kingston's elementary device, until he has produced an iron caisson carrying a deflector operated by a walking-beam, whereby the bars are cut down at the rate of from 6 inches to 2 feet for a length of 300 feet in about two hours.

In 1885 the writer, believing himself to be a pioneer in the matter of utilizing surface currents for scour, patented the simple device shown in Fig. 10, and soon after tested its efficiency by erecting a temporary plant supported on piles driven into a bar on the Delaware. In two tides, or after about 22 hours, it had increased the depth from 9 to 18 feet, and for a distance up and down stream of about 300 feet, at the 9-foot curve, leaving no doubt as to its practicability where the material is not required to be taken out of the bed of the stream.

The general principle, however, had been anticipated in the device of Gen. P. G. T. Beauregard, of New Orleans, La., who, on Oct. 25, 1853, obtained a patent for a rectangular box open at both ends, but having an inclined diaphragm of timber placed inside, thus making the passage wedge-shaped. It was expected that the ebb tide passing through this contracted opening at the outer end would remove the sand of the bars from the mouth of the Mississippi. The apparatus was to be anchored with heavy stone. No means of locomotion were provided, and it was useless.

In 1876 Capt. J. Grant used a series of planks attached to vertical rods near the bottom, and so arranged as to be raised or lowered to fit the bed of the stream. They were held in place by a framework placed on a barge, which was held broadside to the current with which it drifted down, and by these means the bars on the lower Mississippi were shorn off

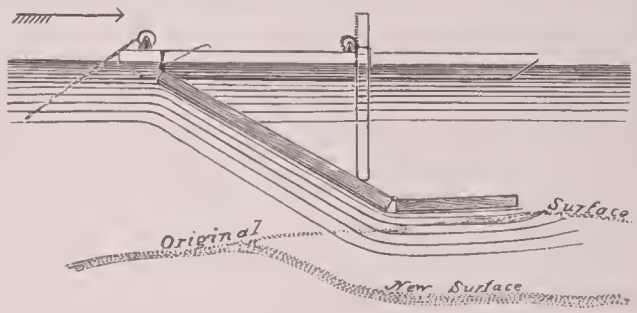

FIG. 10.

several feet, but as there were no permanent structures to change the regimen of the stream permanently, the bars soon formed again.

These are but a few of the many devices, some of which are quite complicated and local in their action, for removing bars by the application of surface currents. The same principle has long been in use in the *vannes* used in cleansing the *cunettes* of the Paris sewers.

Steam-pump and Hydraulic Dredgers.—At Boulogne the entrance to the port was for some years maintained by a steam hopper dredge with a sand pump, which ran to and fro across the bar when the swell did not exceed 3 feet for head waves and 1½ for cross waves. The haul to dump was 2 miles and the price 14½ cents per cubic yard, while the estimated cost of dredging by this plant was only the half of this sum. A similar plant was used by M. Plocq at Dunkirk in 1875, and was so successful that the French Government authorized its use at Calais also in 1881. During the year ending May 1, 1882, this dredge removed about 490,500 cubic yards from before the Dunkirk jetties, and obtained a least depth over the outer bar of 5¾ feet below zero.

On Oct. 19, 1870, a contract was entered into by the U. S. for enlarging the channel over the bar at St. Johns river entrance, Florida, by raking or otherwise, to a width of 80 and depth of 10 feet. The contractor never having secured more than 2 feet increased depth, his contract was annulled May 22, 1871, and Gen. Q. A. Gillmore assumed the work. He recommended a sand-pumping dredge, consisting of a 9-inch centrifugal drainage pump connected with two 6-inch suction-pipes with flexible hose—all mounted on a steam-barge 132 feet long, 24½-beam, drawing 5½ feet. The material was discharged in bins on deck through a 9-inch pipe, which was bifurcated into two 6-inch pipes. The engine was a low-pressure one of 120 horse power, containing two 10-inch cylinders of 10-inch stroke, running at 25 lb. pressure with a speed of 180 revolutions per minute. The pump was run by a belt at 315 revolutions.

The lower ends of the suction-pipes were loaded with an iron frame and drag, each weighing about 200 lb. To the under edge of this frame, below the mouth of the pipe, a number of teeth were attached to loosen the sand. Each pipe was supported by a chain reaching up to the deck of the steamer, and tackles were used for regulating the depths. The total cost for equipping this steamer was $6,300, while the rent of the boat was $2,500 per month. The total expense per month, including interest, was $3,000.

At high speed, from 50 to 55 per cent. of sand was pumped, but in consequence of the swell over the bar 45 per cent. was seldom reached, the average under favorable conditions being 35. The least cost during any one month was in May, 1872, when it was 26 cents per cubic yard. The greatest cost was in Dec., 1871, when it reached $1.22 per yard. The

best day's work was on May 14, 1872, when 770 yards were removed in $10\frac{1}{2}$ hours, at a cost of only 13 cents per yard. The average cost for the entire seven months was $52\frac{2}{3}$ cents. Much time was lost, due to low water and bad weather. The total quantity of sand removed during the fiscal year 1872 was 40,762 yards, giving a channel 150 feet wide at bottom, 9·7 feet deep, and 2,400 feet long at low water. The tide is 5·4 feet. The total expenditure during the year was $29,803.

This early and experimental dredge was improved upon from time to time until it has been developed into a machine capable of handling 3,000 yards per diem. The completion of the contract for dredging the main ship and Gedney's channels leading into New York harbor gives for the total cube of excavation under the several contracts 4,299,858 yards, costing $1,285,862.94, or $24\frac{48}{100}$ cents per yard, which, it is said, is only 23·37 per cent. of the original estimate. The dredges employed in this exposed locality were the Advance, with two 15-inch centrifugal pumps, and capable of carrying 500 yards; the Mt. Waldo, 275 yards capacity; and the Reliance, with two 18-inch centrifugals and a capacity of 650 yards. The material was raised from a depth of 24 to 35 feet under water to the bins on the dredges, a total height of from 36 to 46 feet. In addition to the three dredges there were provided four large scows of 500 yards each, four tugs, one steam supply-boat, one steam tender, docks, repair-shops, etc. The working capacity of the Mt. Waldo was eight scow-loads of 500 yards per diem.

The suction-pipes are 15 and 18 inches in diameter and about 60 feet long, terminating opposite the stern in suitable mouth-pieces, termed drags, to fit the bed of the channel and facilitate the ingress of material. The pipes contain a flexible rubber section to provide for rolling, and are suspended by chains, as in Gen. Gillmore's design. The Advance was sunk and destroyed by a collision during the work.

The following data are from the record of the Reliance: Average time pumping a load in Sept. and Oct., 1891, 48·6 minutes; cubic yards, 584·87; time per day in pumping, 4 hours 58·4 min.; time from bar to dump, 34 min.; dumping, $12\frac{1}{10}$ min.; back to bar, 25·7 min. Under steam per day, 16 hours 4·2 min. Number of loads per day, 6·73; cubic yards per day, 3,936·65; rate per minute, 12·03 yards. Time lost in repairs, 2 hours 24 min.; by bad weather, 32 hours 50 min. The total time lost out of $28\frac{1}{2}$ working days was 458 hours. Portions of the work were done at the rate of 946 cubic yards per hour. The round trip to the dump averaged 26 to 28 miles for part of the work, and from 12 to 14 miles for the balance. These pumps have raised up from the ocean bed bars of pig iron and cannon balls, passing them through the pumps to the hoppers 46 feet high. It is an efficient method of removing bars in a seaway, but there is in general no assurance of permanency in the results.

Another form of hydraulic dredge which has been brought to a high stage of perfection and remarkable efficiency is the machine patented by A. B. Bowers, of California. This consists substantially of a large barge carrying engines, boilers, pumps, cutters, and gearing, with a flexible distributing-pipe supported upon floats, whereby the spoil is conveyed ashore, and used for back filling and reclamation of low or marsh lands. The boat is so arranged as to cut a swath of about 130 feet in length, and to a depth of over 30 feet. The earth mixed with water is fed to a delivery-pipe extending to the cutter, and drawn into the delivery-pipe by a centrifugal pump. The invention dates back to 1868, when hydraulic dredges were very crude, but so rapidly has improvement been added to improvement that dredge No. 3, working at Tacoma on Puget Sound, put in place 165,000 cubic yards in July, 1891, and during the year, with a loss of three months, it handled 821,700 cubic yards.

The stimulus given by Mr. Bowers to this class of dredges has effected great economy in the removal of obstructions to navigation. In 1887 Sir John Coode described a small centrifugal dredge in use at the mouth of the Maas which lifted 400 tons of sand in 22 minutes. Had the hopper been large enough it could have pumped 1,000 tons in one hour. Ten or more smaller machines of this type had been working at that silt for seven or eight years, in an undulation of from 2 to 3 feet. The proportion of sand was about 20 per cent. The general principle of these machines, as covered by Mr. Bowers's patents, is a revolving cutter with interior delivery, connected with a non-rotating suction-pipe, whereby the spoil is removed from the cutter after suitable dilution with water, and pumped ashore or to hoppers or barges alongside. The proportion of earth to water removed by these dredges has reached over 70 per cent. Where the material must be removed from the stream they are the most efficient machines known.

Among the other devices belonging to this class of hydraulic machines may be mentioned the various pulsometers and the three-throw plunger pump patented by Mr. C. H. Booth and the sucker dredge of Mr. J. M. Robbins.

Dredging Operations.—Where the activity of the bar-building agencies is greater than the capacity of the dredging plant, successful competition is out of the question. Such instances are frequently found along the seaboard, where, between wave-action and littoral currents, the littoral drift is supplied faster than it can be removed. In rivers and embayed sounds or estuaries, the conditions are much more favorable. In Great Britain the best examples of successful works are to be found in the Clyde and Tyne. In the former the depth at Glasgow has been increased from 5 ft. 8 in. to 26 feet. Here the operations extend over 150 years, and although many millions of yards have been removed the improvement is not permanent, and a fleet of heavy dredgers is required to remove annually the million yards necessary to maintain the channel. The Tyne improvements date from 1861, and there is now a depth of 27 feet. The flood line has been lowered, and the scour greatly increased by the removal of the obstructing bars at the mouth of the river.

In the U. S. numerous attempts to dredge ocean bars or to cut through spits of sand have resulted in failure. It is only when such work is supplemented by permanent structures which modify the physical conditions that satisfactory results can be expected.

For more detailed and specific information, the reader is referred to *Minutes of Proceedings of the Institution of Civil Engineers*, especially vol. lxxxix.

Revised by Lewis M. Haupt.

Dred Scott Case: the case of Scott *vs.* Sandford in the Supreme Court of the U. S. in 1856, reported in 19 Howard R., 393. A slave named Dred Scott was carried by his master (Sandford) from Missouri into Illinois and Wisconsin, and thence back to Missouri. Scott was descended from Africans who were slaves. He brought an action in the circuit court of the U. S. to assert his title to freedom. The judgment of that tribunal was carried by writ of error to the Supreme Court. It was there decided by a majority of the court that if Scott were assumed to be free he was not a "citizen of a State," so as to bring the action; and further that he was still a slave. Accordingly, the case was dismissed for want of jurisdiction on the part of the circuit court. In reaching the conclusion that he was still a slave, the court held that the act of Congress which prohibited a citizen from holding slaves in the Territories of the U. S. N. of 36° 30′ N. lat. was unconstitutional and void. The action of the court has been severely criticised in respect to this last point, as being unwarranted after the decision was made that Scott, considered as a freeman, was not a citizen. It is maintained, on the other hand, that both questions under the pleadings were properly decided. Some information as to the circumstances under which the decision was rendered will be found in letters of Justices Campbell and Nelson in Tyler's *Life of Chief Justice Taney*, pp. 382–385. The chief justice, when delivering the opinion of the court, made an historical survey of the public opinion of the civilized world concerning the African race at the time of the formation of the American Constitution. Among other things he said: "They (the Africans) had for more than a century before been regarded as beings of an inferior order, and altogether unfit to associate with the white race, either in social or political relations, and so far inferior that they had no rights which the white man was bound to respect." Much injustice has been done him by an erroneous statement, still occasionally repeated, that the chief justice had himself affirmed that the Negro had "no rights which the white man was bound to respect." T. W. Dwight.

Dreibund: See Triple Alliance.

Dreisse'na [named in honor of Dr. Dreyssen, a Belgian naturalist]: the typical genus of the family *Dreissenidæ*, a group of fresh-water lamellibranchiate mollusks related to the mussels (*Mytilus*), differing, however, from the true mussel in having the mantle closed except at the branchial and anal slits. *Dreissena polymorpha*, a Russian species, in some manner introduced into English waters, has invaded even the water-pipes of London. Ten fossil species are found in Europe. Revised by F. A. Lucas.

Drelincourt, dre-lăn'koor', CHARLES: a French Protestant minister; b. at Sedan, July 10, 1595. He preached at Charenton, near Paris, from 1620 on, and gained great popularity. He was also distinguished as a writer of polemical theology. Among his very numerous works was *The Christian's Defense against the Fear of Death* (Charenton, 1651), which was translated into English and passed through many editions. Its sale in England has been accounted for by the fact that Defoe, in his famous story of *The Apparition of Mrs. Veal* (1706), makes that lady, "a maiden gentlewoman of about thirty years of age," assert on her return from the dead that Drelincourt, in his book on death, had presented "the clearest notions of death and of the future state of any who had handled that subject"; (Defoe's *Novels and Miscellaneous Works*, Tegg's ed., Oxford, 1840, vol. v., 344, 348). But the fact is that the book was very popular before the appearance of Defoe's pamphlet. D. in Paris, Nov. 3, 1669. —His son, CHARLES DRELINCOURT (1633–97), physician to William III. and Queen Mary, was the author of numerous medical works.

Drenthe, drān'te: a province of the Netherlands bordering on Prussia; area, 1,032 sq. miles. The surface is level and partly occupied by marshes. A large portion of the soil is poor. The rearing of cattle is the principal branch of industry. Capital, Assen. Pop. (1896) 143,028.

Drepa'nius, LATINUS PACATUS: a Gallic rhetorician; b. in Aquitania in the south of Gaul; classed among the Latin Panegyrists. He attained the rank of proconsul A. D. 390, and under this title was addressed by Ausonius in one of his poems, in which he pays a high tribute to the poetical abilities of Drepanius. Of his poetry nothing remains, but the panegyric which he delivered in the presence of the Emperor Theodosius in 389 A. D., when he was sent to congratulate the conqueror on the overthrow of Maximus, is extant, and is contained in the collection entitled *Panegyrici Veteres*, edited by Jaeger (Nuremberg, 2 vols. 8vo, 1799), and by Baehrens (Leipzig, 1874).

Dresden: capital of the kingdom of Saxony; called the "Florence of the Elbe"; situated in a beautiful valley on both sides of the river Elbe; 116 miles S. of Berlin, 72 miles S. E. of Leipzig; lat. 51° 3′ 16″ N., lon. 13° 44′ E. (see map of German Empire, ref. 5–G). On the left bank of the Elbe are the Altstadt, in which are most of the interesting buildings and collections, with three suburbs, and Friedrichstadt, separated from the Altstadt by the Weisseritz; on the right bank the Neustadt and the Antonstadt. The Elbe is crossed by three bridges, of which the oldest and most celebrated is the Augustus bridge. Dresden is the center of the Saxon railway system. Numerous steamers ply on the Elbe; the manufacturing interests are considerable; the chief exports to the U. S. are artificial flowers; the chief object of interest is the Zwinger, built in the Rococo style (1711–22) by Augustus the Strong, originally intended as the vestibule to an enormous palace, now containing the celebrated Royal Picture Gallery, a collection of engravings, zoölogical museum, mineralogical and geological museums and hall for mathematics and physics. The picture gallery is rivaled only by those of Florence and the Louvre. It contains over 2,500 pictures, being especially rich in specimens of the Italian, Dutch, and Flemish schools. Raphael's *Madonna de San Sisto*, the chief ornament of the collection, is exhibited in a separate room. The castle and residence of the King of Saxony contains the Green Vault, a remarkable collection of objects in gold, silver, amber, and ivory, precious stones, pearls, crown jewels, etc. The Museum Johanneum, on whose outer walls, facing the Auguststrasse, are the noted frescoes by Walther representing all the Saxon princes, contains an historical museum, a gallery of armory, and collection of porcelain. The Museum Albertinum contains plaster casts and a collection of casts of the works of the famous sculptor Rietschel. The Japanese palace in the Neustadt contains the Royal Public Library, numbering between 300,000 and 400,000 volumes, with 3,000 MSS. and 20,000 maps. The Brühl Terrace, rightly considered one of the greatest ornaments of Dresden, is a fine elevated promenade along the bank of the Elbe, running E. from the Augustus bridge and commanding a charming view of the Elbe and the surrounding country. The main park is the Grosser Garten, containing a palace built in 1660 and the zoölogical garden. The principal churches are the Frauenkirche, Sophienkirche, the Hofkirche, and the Kreuzkirche. The city contains an academy of arts, a technical school, four gymnasia, and numerous other institutions of learning, academies of science, etc. The principal street is Pragerstrasse in the Altstadt, a part of the continuous thoroughfare from the Elbe S. to the suburbs of the city, which bears successively the names Schloss-strasse, Seestrasse, Pragerstrasse, and Reichstrasse. The new König Johann Strasse, running E. from the Altmarkt, first opened in 1890, is a short but remarkably broad and handsome street, lined with fine shops. There are two theaters, the one in the Altstadt, a handsome building in the Renaissance style, erected (1871–78) on the site of the old opera-house which was destroyed in the revolution of 1849, devoted mainly to opera, with occasional representations of classic dramas; and one in the Neustadt, erected 1871–73, devoted to the production of comedies and light dramas. There are also one or two other theaters of less note. The two royal theaters are supported by the Government, and are no less remarkable for their admirable organization than for the celebrated actors and musicians permanently engaged. In the Altmarkt stands the monument of *Victory* by Henze. Other notable monuments of the city are the equestrian statue of King John, in the Theaterplatz, by Prof. Schilling, the statue of Weber by Rietschel, and that of Theodor Körner and the Rietschel monument on the Brühl Terrace by Schilling. Dresden has always been a favorite spot with tourists, and is especially attractive to English-speaking people living abroad. The picture gallery, the opera and theater, the educational opportunities, and the social attractions of the city unite to draw together a considerable colony of U. S. and British residents. A section of the Altstadt is known as the English quarter, and it is here that the English church is located. A part of the Neustadt S. of the railroad is known as the American quarter, and contains what is called the American church. A little beyond the church is the village of Raecknitz, where stands the monument to Moreau erected upon the spot where he fell in 1813. The surroundings of Dresden are extremely picturesque. The steamers on the Elbe offer enjoyable excursions, and an hour's ride by rail brings one to the famous region of the Saxon Switzerland. Dresden is of Slavonic origin, and was known as early as 1206, the present Neustadt having been first settled. In 1270 it became the capital of Henry the Illustrious, Margrave of Meissen. In 1485 it fell to the Albertine line, which has since held it. From 1405 to 1510 it suffered severely in the Seven Years' war; also in 1813, when it was the headquarters of Napoleon's army, and during the revolution of 1849; was occupied by the Prussians in 1866; since 1871 has been greatly improved and has increased rapidly in population. Pop. (1900) 395,349.

C. H. THURBER.

Dresden: town; Kent co., Ontario, Canada (for location, see map of Ontario, ref. 6–B); situated on railway and at the head of navigation on the Sydenham river. The town has a large trade in staves, timber, and lumber, and also has a ship-building industry and a large canning industry. Pop. (1881) 1,979; (1891) 2,058; (1893) estimated, 2,200.

EDITOR OF "TIMES."

Dresden, Battle of: a battle between the French and the allied armies of Russia, Austria, and Prussia, Aug. 27, 1813. Dresden was occupied by a French army of 30,000 men, when, on Aug. 23, 1813, the army of the allies appeared before it. Napoleon, with the main army, came to relieve it, and entered the city on the 26th of the same month. Schwarzenberg, the commander of the allied army, immediately assaulted and bombarded the city. Having been repulsed by a sally of the French guard on the 26th, he renewed the attack on the 27th, when a great pitched battle was fought, Napoleon gaining the victory. The French were forced to surrender the city on Nov. 11.

Dress [subst. of vb. *dress* < M. Eng. *dressen*, set right, make straight, clothe < O. Fr. *dresser*, arrange, dress: Span. *derezar*: Catal. *dressar*: Ital. *dirizzare* < Vulg. Lat. **directia're*, make straight, deriv. of *directus*, straight > Ital. *diretto*: Fr. *droit* > Span. *derecho*]: From the time of the first crude covering of the body with leaves, tradition and history furnish interesting accounts of the importance which savage and civilized people alike have attached to the clothing and ornamentation of their persons.

With all civilized or semi-civilized races some form of covering has been considered necessary to modesty and decency, but the ideas of what constitutes modesty have differed widely with different peoples and ages.

The history of dress is full of interesting inconsistencies and incongruities, and careful analysis of the successive forms of covering worn by successive races establishes the

fact that neither nature nor art has been recognized in any modern form of dress as fully as among the ancients.

The earliest Semitic races of which we have any authentic account—the Assyrians, Babylonians, Hebrews, Egyptians, Scythians—wore but few garments. The Old Testament often mentions raiment for the body, and the vestments of the early priesthood are enumerated in several important passages—Exod. xxviii. 42 (1491 B. C.): "And thou shalt make them linen breeches to cover their nakedness; from the loins even unto the thighs they shall reach." Other passages occur in Exodus, Leviticus, and Maccabees concerning sacerdotal vestments, and in other books of the Bible important mention is made of the raiment of needlework and jewels worn by kings and the daughters of kings (Gen. xxiv. 53; Ezek. xvi. 10–13, etc.). There is frequent mention also of purple and fine linen, and the sackcloth of sorrow and repentance.

Among the Hebrews mantles were made four-cornered and were, according to the law of Moses, bordered with fringes and ribbons of blue. Herodotus refers to Egyptian dresses of fine linen having a bordering of fringe about the legs. With the Israelites fringes and fine needlework seem to have been in universal use. Their garments were few in number. The sadin was worn next the skin, and the outer tunics were known as coats. Gold and silver were undoubtedly regarded as important adjuncts to the costumes of the Israelites, and there was a wide distinction in the richness of the garments and ornaments worn by people of different degrees of rank.

The monuments of the early Theban dynasties show little difference between the garments worn by men and those worn by women, the long flowing robe and girdle being common to both. Slaves and others who were obliged to labor were girt about the loins with a single garment. The early Egyptian dress was very simple, but after the new empire (1600 B. C.) it became exceedingly elaborate in ornamentation among the higher classes, and gold and precious stones were used for every form of personal adornment.

The Assyrians, who were advanced in the arts of dyeing, weaving, and embroidery, were celebrated for the beauty and richness of their attire. The invention of the Assyrian dress of rank has been attributed to Semiramis. This dress is said to have consisted of an undergarment embroidered and fringed, and confined with a girdle having cords and tassels. Over this a second garment, also richly embroidered, was worn nearly the length of the first. Sandals were worn by both the Assyrians and Egyptians. The fabrics employed for dress were very largely made from cotton and flax. Among the Egyptians woolens were forbidden to be worn next the skin, and priests were not allowed to enter the temples when this material formed any part of their attire; such parts were laid aside for the time.

The Greeks accepted and retained a fashion of clothing which gave the figure perfect freedom, serving at the same time as a graceful and attractive covering. There can be no doubt but that a kind of noble simplicity marked this period in dress. The *chiton* was the chief garment worn by women. This was a single piece of material sewed together and worn in the form of a long garment which was confined under the bust by a zoster or girdle. See COSTUME.

The Ionians wore a long linen *chiton* with sleeves, and the outside garment, known as *himation*, was of wool. The sleeves of the *chiton* were formed by drawing the folds of the garment down from the shoulders, and fastening them around the arm with buttons and loops.

Some modern writers have contended in support of the corset of the present day that the women of Greece and Rome wore a garment which served the same purpose, but there is nowhere any account of a similar garment. Both Greek and Roman women seem to have worn a kind of breast support, but it was a single band of cloth which served its purpose without having the objectionable tendency to compression and deformity which distinguishes the stays of latter centuries. For extra warmth a half-length garment, known as the *diploidion*, was worn outside the *chiton*.

Much attention was undoubtedly given to embroidery and dignified ornamentation by both the Greeks and Romans. While the character of their dress was simple, its perfect adaptation to the needs of their lives, to climate, and other conditions is not to be questioned. Among men there was a distinction in the garments worn. Workmen wore a garment which left the arms and legs free, while officials, priests, and those of rank wrapped themselves in the ample classic folds of the *himation*. Among the early Romans the loose and flowing tunica and toga found favor, and much attention was given to covering for the feet. The artistic value of dress during this period of the world's history, especially in the dignity of its flowing lines, has been established beyond a peradventure of doubt.

With the decadence of Rome's civil power, changes occurred which afforded practical advantages for war and work, and the trousers or *bracae* of the more active barbarian races came into use. There is no doubt that trousers originated in the highlands of Central Asia, which is now recognized as the birthplace of the Aryan race. The first trousers were worn by the Aryan people, who, under Cyrus, descended from their mountains into the fertile plains of Mesopotamia and overthrew the Semitic empires, which had ruled the Euphrates from the beginning of history. From this time the history of dress in Europe is changeable and nondescript, but the tendency for many centuries has been toward the degradation of the human form, and away from the recognition of that symmetry and simplicity which was the result of the idealization of bodily proportion as immortalized by the sculpture of the Greeks.

Through the centuries of the Christian era there have been certain arbitrary distinctions in dress, like the ecclesiastical, monastic, judicial, etc., which have been comparatively permanent, but the dress of the masses has been subject to frequent change, without reason, for a long period.

Among Eastern and Oriental nations generally no such changes have taken place, and very nearly the same simplicity of general design prevails century after century, all changes in dress being ornamental in character. The Orientals delight in flowing robes, gorgeous coloring, and rich ornamentation, but not in change of form. Western nations, on the contrary, revel in the most extreme and novel changes in the shape and cut of their garments, and pay comparatively little attention to true art in decoration.

This love of change in the form of dress has necessarily led to some most extravagant departures from symmetry and proportion in effects, and consequently to deteriorated physical conditions, since the internal organization has been compelled to conform to outward changes which were in direct violation of physiological law.

During the early centuries of the Christian era the robe of the primitive Christian minister was simple, loose, and dignified, and the magnificence of ecclesiastical costume obtained between the tenth and twelfth centuries, when the plain white of the early priestly robes gave place to materials of different colors, rich with various decorations of gold and silver work and gems, and wrought with elaborate embroideries. The principal vestments of the Christian ministry since the seventh century have been the alb, stole, dalmatic, chasuble, amice, tunic, cope, pall, surplice, and miter. The hood or cowl, gown or cassock, and cloak form the principal garments of the monastic order.

All nations have paid more or less attention to military dress, even savages having an instinctive appreciation of the effect produced upon their enemies by a brilliant display of paint and feathers; while more civilized nations have replaced the feathers with bullion and gold lace and other equally gorgeous paraphernalia for making their officers of rank impressive.

For many centuries a kind of dignity attached to men of profound learning, to judges, and other officers of state, which found expression in ceremonial dress of ample dimensions; but the age of reverence for everything human having passed, the leveling tendency of modern life has been toward doing away with all costume and insignia of learning and office, and what still obtains among the royalty and nobility of older countries is tolerated as an attractive spectacle where it was formerly regarded with respectful awe as the essential expression of superiority.

Planché writes of dress during the first centuries of the Christian era: "We must resort to those mosaics of Italy which have been preserved for us for a view of those dresses and ornaments which, worn at the court of Constantinople, became the fashion among the various races that had overrun the west of Europe during the first five centuries of the Christian era—the Greeks, the Goths, the Franks, and Lombards. In the *Revue Archéologique*, 1830, are copied mosaics from the originals of St. Vitale, Ravenna, one representing the Emperor Justinian, his court, and the clergy of Ravenna; and the other his wife, the Empress Theodora, and her attendants, said to have been the work of artists about the year 540. A singular mixture of Greek, Roman,

and Asiatic decoration gives a peculiar character to the costume of all classes at this period, and it will be remarked that while an Oriental taste was gradually increasing, to the obliteration of all features of ancient Roman classical dress among the people in and adjacent to Constantinople, the Franks and other Scythic or Teutonic nations occupying the old provinces of Rome were assuming more and more the dress and habits of the former empire of the West."

Mediæval dress is interesting as far as any historical facts are ascertainable. Men of the higher classes, nobles and knights, were so constantly in an attitude of aggression or defense that the principal feature of their attire was necessarily the protecting armor and garments to be worn under or over it, conforming to requirement. The three centuries following the settlement of the Franks in Gaul and the Saxons in England were marked by simplicity of attire and little variation. With the Norman conquest, however, many absurdities were introduced into dress. During the twelfth century sleeves became utterly preposterous in size and style, reaching nearly or quite to the feet of the wearer, while all manner of excess and luxury in personal adornment was indulged in. See COSTUME.

It would be impossible, in a limited article, to do justice to any of the important features of dress since the twelfth century, but a few of the more extravagant and eccentric fancies that have appeared in the clothing of men and women will serve to illustrate the utter degeneracy of dress at intervals during several centuries of our advancing civilization.

From the thirteenth century to the sixteenth head-gear was eccentric and exaggerated to such a degree as to defy accurate description. Addison, in the *Spectator*, chronicled the success of the monk Thomas Connecte, who traveled from town to town preaching down that wonderful head-covering known in his day as a *hennin*, with such vigor that women threw them aside in the middle of his sermon and made a bonfire of them in sight of the pulpit. Among the most celebrated of these monstrous head-dresses were the horned head-dress, the miter, and the butterfly. These strange devices were built to such height as to render passing through an ordinary doorway without stooping an impossibility, and the drapery depended from them sometimes reached to the floor. Anything more utterly at variance with all laws of beauty and art as a head-covering the human mind can not conceive, while ingenuity must have been exhausted in their construction. But head-dresses came in for part only of the exaggerated display of this period. From the time of Rufus to that of Henry VII. shoes were so grotesque in shape as to excite ridicule from poets and historians, as well as censure from the clergy. At one time shoes were worn so long and pointed that their wearers were compelled to fasten the toes to the knees by small chains. Waists were contracted to wasp-like dimensions with both men and women. In the time of George III. tailors advertised "Codrington corsets and Petersham stiffness for the benefit of gentlemen of fashion"; fifteenth-century gallants deserve sympathy in retrospect for the misery they must have endured in their clothing. The tunic was worn close and short, and their hose so tight that they were compelled to have assistance in dressing and undressing; their waists were laced, and their shoes so pointed and long as to embarrass movements.

Catherine de Medici is said to have invented a corset which was opened longitudinally by hinges secured by a hasp and pin like an ordinary box fastening. Among other absurdities in dress the enormous ruffs of Queen Elizabeth's time must be mentioned. Concerning these Stubbs wrote in 1583 as follows: "There is a certain liquid matter which they call starch wherein the devil hath learned them to wash and dye their ruffs, which being dry will then stand stiff and inflexible about their necks." The farthingale for women, a wheel-like contrivance which carried the skirts out from the hips, and the trunk-hose for men came into use at about the same time. Of the farthingale Sir Roger de Coverley said that it made his great-great-grandmother look as if she were standing in a drum. The portrait of Queen Elizabeth was painted in this unsightly garb, which continued in favor during the entire reign of James I. Early in the eighteenth century the dress of women was so fantastic that the *Spectator* declared the wife of a dignitary of state to be looped, ribboned and wrinkled and furbelowed until she resembled a Friesland hen. It is worth noting that during all of these successive centuries of exaggerations in the shape of dress, extravagance and splendor of fabric and ornamentation kept pace with the general spirit of excess. The sleeves to the *hauppeland* of Charles, Duke of Orleans, had embroidered upon them the words and music of a song. The lines of the music were worked in gold thread, and each note was finished with four pearls.

The nineteenth century has witnessed some remarkable changes in the shape and style of the garments worn by women, such contradictions indeed of the human form in its purity that it is difficult to believe that modern women could be found to disfigure themselves so. The enormous hoops worn in the sixties, in which women looked like animated pyramids, were no less artistic, and certainly not so vulgar as the bustle which after some years succeeded them.

In the early efforts of the few at "dress reform" there was no concerted movement in favor of all-round improvement, and there was a very widespread belief that freedom of body and artistic grace were incompatible, a theory which gained force with the masses by the example of the early dress-reformers, who offended good taste and æsthetic sensibility with their utterly graceless habiliments. The work of modern dress improvement is found to rest upon the sound principles of æsthetic grace no less than upon anatomical and physiological laws. The failure of early "dress reform" was due to the failure on the part of its advocates to recognize all of the principles involved in any general change not authorized by that arbitrary and inexplicable force known as fashion. The dress-reformers said, "The dress worn by women is wrong," but they did not demonstrate how to make it right upon any basis that appealed to critical judgment as embodying all that was needed in a change from existing forms and fashions. Dress reform, however well meant, did not rest upon the essential basis of symmetrical bodily development as a first principle, and the graceful and artistic clothing of the perfected structure in accordance with the laws of proportion, utility, and harmony. Without recognition of the philosophy underlying bodily expression, improved dress is impossible. Fashion does not recognize the body; it subjugates it, and becomes itself the central and arbitrary point of attraction. Fashion does not demand the co-operation of the body in expression, but rather seeks in every possible manner to deprive the body of independent expression in order that it may serve as an inconsequential model for the external decoration. Fashion does not seek to ornament the woman, but rather to use the woman as a lay figure for the display of its own novel features of attractiveness.

When, however, integrity of bodily function is the end sought, all of the conditions are reversed and the woman becomes a medium for giving expression to clothing. Decoration is then studied with the object of bringing out her best, drapery is designed to meet her requirements for utility and poetry of motion, and suggested instead of revealed form becomes the supreme ideal. Between these two extremes the work of early dress-reformers came in as a nondescript movement, conforming to neither the laws of fashion nor the laws of expression. Dress reform demanded of bodies that had been cramped into stays to the point of actual deformity, of sunken chests, rounded shoulders, curved spines, and protruding abdomens, that they should not only get along without the artificial supports to which they were accustomed, but that they should in such a state of physical degeneracy prove attractive points of display for clothing, which was in its main features devoid of all artistic consideration, being loose and comfortable only. Such a proposition, when arrayed against popular prejudice, was necessarily doomed to failure. But much good has come from the discussion that followed the aggressive earnestness of the dress-reformers; the dress-reformers made the dress-improvers possible because they awakened thought, and thought has led to study of the actual principles involved in a system of healthful and at the same time attractive dress.

Correct dress should not violate either health or the plastic beauty of the figure by cramping any part. The natural points of support, like the shoulders and hips, should be recognized as those from which all drapery should radiate in fine flowing lines free to follow and accentuate the movements of the body until the outward covering expresses the wearer's personality and suggests something special to each individual. The highest type of dress must recognize not only freedom, expression, radiation, and color, but such subdivisions as utility in freedom, grace in expression, harmony in radiation, and subtlety in color, qualities that should remain supreme through all the variations affecting the minor changes of dress. See COSTUME.

Bibliography.—Of the few books which give a critical account of dress there may be named: Planché's *Cyclopædia of Costumes or Dictionary of Dress*; Viollet-le-Duc's *Dictionnaire Raisonné du Mobilier Français* (vols. iii. and iv.); Paul Lacroix, *Mœurs, Usages, et Costumes au Moyen Âge et à l'époque de la Renaissance; XVII^me Siècle: les Institutions, Usages, et Costumes de la France 1590–1700*; and *XVIII^me Siècle: Institutions, Usages, et Costumes de la France 1700–1789*; Hefner-Alteneck, *Trachten des Christlichen Mittelalters*; also a later and larger work; Lane's *Manners and Customs of the Modern Egyptians*; Smith's *Dictionary of Greek and Roman Antiquities* (new ed. 2 vols., 1892); Ary Renan, *Le Costume en France*; Fairholt's *Costume in England, a History of Dress to the End of the Eighteenth Century*; Hughes's *Dictionary of Islam*; M. A. Racinet, *Le Costume Historique*; Quicherat's *Histoire du Costume en France*; Bouring's *Chinese Costumes*; Luard's *History of the Dress of the British Soldier from the Earliest Period*; Strutt's *Dresses and Habits of the English*; McIan and Logan, *Clans of the Scottish Highlands*; Wilkinson's *Manners and Customs of the Ancient Egyptians.*

There exist also many elaborate books of plates more or less accurately representing ancient costumes, but without any examination into their significance. Such are: Bonnard and Mercuri, *Costumes Historiques des XII^me, XIII^me, XIV^me, et XV^me Siècles*; Bruce's *Bayeux Tapestry*; *Hogarth's Works* engraved by himself, with descriptions by J. Nichols; Holbein's *Portraits of the Court of Henry VIII.*; Lodge's *Portraits and Memoirs of Illustrious Personages of Great Britain*; Du Sommerard, *Les Arts au Moyen Âge*; Jaquemin's *Iconographie méthodique du Costume du V^me au XIX^me Siècle.*

Many books exist devoted to ecclesiastical vestments and costumes, for which see the article Vestments, Ecclesiastical. Also for modern military costumes, see Thoumas, *Les Anciennes Armées Françaises* (very full, for the eighteenth and early nineteenth centuries); Scott, *The British Army*; and a number of books similarly devoted to different national armies. Annie Jenness Miller.

Dresser, Henry Erles, F. Z. S., F. L. S.: ornithologist; b. at Thirsk, Yorkshire, England, May 9, 1838; educated in England, Germany, and at Upsala, Sweden; a business man who has devoted his leisure time to ornithology, especially to that of Europe. A monograph of the bee-eaters is one of his most important works, but that by which he is probably best known is *A History of the Birds of Europe*, a monographic work in eight quarto volumes, with colored plates (London, 1871–81). Mr. Dresser has been a member of the council of the Zoölogical Society of London, president of the Yorkshire Naturalists' Union, and secretary of the British Ornithologists' Union. F. A. Lucas.

Dreux, drö (anc. *Durocasses*): a town of France; department of Eure-et-Loir; on the river Blaise; about 50 miles W. S. W. of Paris and 22 miles N. of Chartres (see map of France, ref. 3–E). It has a fine Gothic church, a town-hall, a theater, and manufactures of serge, woolen hosiery, hats, etc. Within the precincts of the old half-ruined castle of the twelfth century, which crowns the hill overlooking the town, a chapel of great magnificence was begun in 1816 by the Dowager-Duchess of Orleans, and completed by Louis Philippe. Here the Roman Catholic army, led by Constable Montmorenci, defeated the Prince of Condé and the Huguenots Dec. 19, 1562. Pop. (1896) 9,718.

Drew, Daniel: capitalist; b. in Carmel, Putnam co., N. Y., July 29, 1797; began active life as a cattle-drover; became conspicuous as a steamboat-builder, still later in connection with railways, especially in the fortunes and misfortunes of the Erie road, and at last was recognized as a leader in the stock speculations of Wall Street. He was also distinguished for liberality to certain educational interests of the Methodist Episcopal Church, having founded the Drew Ladies' Seminary at Carmel, N. Y., and the Drew Theological Seminary (*q. v.*). D. in New York city, Sept. 18, 1879.

Drew, John: actor; b. Sept. 3, 1825. He first appeared at the Bowery theater, New York, in 1845, as Dr. O'Toole in *The Irish Tutor*. After acting for some time in Albany, N. Y., he went to Philadelphia, where he became a favorite and was manager of the Arch Street theater in that city in 1853, in conjunction with William Wheatley. He acted in the principal cities of the U. S., and afterward visited England and Australia. He returned to the U. S. in 1862, and retired from the stage May 9 of that year. As an Irish comedian Drew had few equals. D. in Philadelphia, May 21, 1862. B. B. V.

Drew, John: actor; b. in Philadelphia, Nov. 13, 1853; son of John and Louisa Drew; educated at the Episcopal Academy in that city; made his first appearance at the Arch Street theater, Philadelphia, Mar. 22, 1872, in the character of Plumper in *Cool as a Cucumber*. He played many and varied parts for two years, and on Feb. 17, 1875, appeared at the Fifth Avenue theater as Bob Ruggles in *The Big Bonanza*. Then followed the long run of *Pique*, and a short season of Shakspeare at the same theater with Edwin Booth, playing such parts as Rosencrans in *Hamlet*, France in *King Lear*, and other minor *rôles* in the tragedian's repertory. During the temporary retirement of Augustin Daly from the theater in America during the season of 1878–79, Drew traveled through the country playing Henry Beauclerc in *Diplomacy*. The opening of the new Daly's theater in New York in 1880 found Drew again a member of the company, where he remained until 1892, visiting Europe with Daly's company, creating many parts in original plays, and playing in Shaksperean, Sheridanian, and other classic *rôles*. In the autumn of 1892 he began his career as a star in a comedy translated from the French of Bisson, called in English *The Masked Ball*. B. B. Vallentine.

Drew, Samuel: Wesleyan theologian and metaphysician; b. at St. Austell, Cornwall, England, Mar. 6, 1765; was a shoemaker; settled in London in 1819. He was an intimate friend of the famous Dr. Adam Clarke, and of Dr. Thomas Coke, the first American Methodist bishop, whose *Life* he wrote. Among his other works, the principal are *Essay on the Immateriality and Immortality of the Soul* (1802); *Essay on the Identity and General Resurrection of the Human Body* (1809); and *History of Cornwall* (1820–24). D. at Helston, Mar. 29, 1833. See his *Life* by his son, J. H. Drew (London, 1834; 2d ed. 1835; abridged ed. 1861).

Drew Theological Seminary, an institution founded in 1866 by the liberality of Daniel Drew, of New York. Its object is to train young men for the ministry of the Methodist Episcopal Church. The seat of the seminary is Madison, N. J., 25 miles from New York. The seminary park contains 95 acres of land, a portion of which is ornamented with walks and drives, trees and shrubbery. On the northern side of the seminary park are the buildings, four in number. Over $275,000 were spent by Daniel Drew in the purchase of these grounds, the erection of the necessary additional buildings, and in securing the valuable collections of books that now compose the library. The Cornell Library Building, entirely fire-proof, cost $80,000. The library itself is large and is rapidly growing. The institution was formally opened for students Nov. 6, 1867. The course of study occupies three years, and is adapted to the needs and attainments of college graduates. The general conference of the Methodist Episcopal Church in the U. S. has the direction and supervision of the faculty, seminary, and the theological instruction and education therein, constituting the bishops of the Methodist Episcopal Church as its board of supervision, and thus virtually controlling the management of the seminary. The Rev. Dr. John McClintock was the first president of the seminary and the organizer of its course of study, and was succeeded by Rev. R. S. Foster, D. D. Dr. Foster was elected bishop in 1872, and was succeeded by Rev. J. F. Hurst, D. D., as president. Dr. Hurst was elected bishop in 1880. His successor in the presidency was Rev. Henry A. Buttz, D. D. For the encouragement of advanced scholarship two fellowships are endowed. Those who hold them have the privilege of studying either at the seminary or in foreign lands. John F. Hurst.

Dreyse, drī'ze, Johann Nikolaus, von: inventor of the needle-gun; b. at Sömmerda, in Prussia, Nov. 20, 1787; the son of a locksmith; worked in a Paris gun-factory 1809–14; after his return to Germany established an iron-ware factory in Sömmerda, and devoted his attention chiefly to the improvement of firearms. He perfected the famous Needle-gun (*q. v.*) in 1836, and in 1841 he established an extensive gun and ammunition factory. D. Dec. 9, 1867.

Drift, or **Glacial Drift**: certain detrital deposits of distant origin, for a long period unexplained, but now known to have been produced during the Pleistocene period through the agency of glaciers. The most characteristic deposit is *till* or *bowlder clay*, an indiscriminate mixture of fine and coarse material, usually without lamination or bedding. The fine stuff, constituting a sort of matrix, is usually clay, but sometimes sand. The coarse stuff, imbedded in the fine,

ranges from grains, pebbles, and cobbles to bowlders of great size—occasionally many yards in diameter—and is characterized by worn surfaces, with groups of parallel scratches, and often with facets flattened by grinding. Usually the fragments differ in character from the rock on which the deposit rests, and it is often demonstrable that the parent beds from which they were torn lie many miles away. From this fact the bowlders are called *erratics*. Associated with the till are usually gravels and sands, likewise of distant origin, but more or less stratified and assorted as by the action of running water. In some regions broad tracts are covered by laminated clays including scratched pebbles and bowlders like those in till, and these deposits are ascribed to bodies of water in which icebergs floated.

The superficial forms of drift are no less characteristic than its material. As *ground moraine* the till mantles the land unequally, and presents a gently undulating surface. As *marginal moraine* it is heaped in irregularly disposed hills and hillocks which inclose undrained hollows, and these hills are grouped in belts one or more miles broad and of great length, tracing on the face of the country curved and more or less escalloped figures, and outlining the boundaries of the ice at various times. It also forms *drumlins*, isolated oval or lens shaped hills of symmetric form, trending in the direction of ice-motion. The assorted drift, gravel, and sand constitutes *kames*, or irregular grouped hills similar to moraine hills; *kame plains*, or plains diversified by abrupt kettle-shaped depressions and margined by kames; *frontal aprons*, or sloping alluvial plains on the outer flanks of marginal moraines; and *osar*, or long narrow ridges trending in the direction of ice-motion; besides other rarer features. The laminated clay with stones has the smooth surface characteristic of lacustrine and marine deposits. See GLACIERS, PLEISTOCENE, and GEOLOGY. G. K. GILBERT.

Drill: See BLASTING.

Drill: an old English word for ape; supposed by Huxley to be the source of the name *mandrill* (i. e. a man-like ape), but the latter word appears to be the original one. (See MANDRILL.) The term drill is applied especially to the *Cynocephalus leucophæus*, a baboon of Africa.

Drill, Military: the instruction of soldiers and the exercises through which they are required to pass. See TACTICS, MILITARY.

Drip: in architecture, the same as CORONA (*q. v.*).

Dris'ler, HENRY, LL. D.: scholar; b. Dec. 27, 1818; graduated at Columbia College in 1839; classical instructor in its grammar school for several years; appointed tutor of the Greek and Latin languages in the college, 1843; adjunct professor in the same department, 1845; Professor of Latin, 1857; transferred to the chair of Greek on the death of Dr. Anthon, 1867; in the same year was acting president of the college during President Barnard's absence as a commissioner to the Exposition Universelle in Paris. He again became acting president in 1888, and was dean of the School of Arts 1889–94. D. in New York, Nov. 30, 1897. Prof. Drisler was for several years engaged with Dr. Anthon on his classical text-books, etc. His contributions to classical learning are an enlarged edition of Liddell and Scott's Passow's *Greek Lexicon* (1846), co-operation in the seventh Oxford edition (1883), and revision of Yonge's *English-Greek Lexicon* (1870); general editor of Harper's Classical Series.

Driver, SAMUEL R.: See the Appendix.

Drogheda, dro*kh*'*e*-da: a seaport-town of Leinster, Ireland; on the boundary between the counties of Louth and Meath, and on the river Boyne, 4 miles from its entrance into the sea, and 25 miles N. of Dublin; lat. 53° 44′ N., lon. 6° 12′ W. (see map of Ireland, ref. 8–I). The Dublin and Belfast Railway here crosses the Boyne by a viaduct 95 feet high. The town has a Roman Catholic cathedral, several convents, and a custom-house, and manufactures of cotton and linen fabrics, steam-engines, etc. Vessels of 400 tons can ascend the river to this port, from which grain, cattle, linen, hides, butter, and ale are exported, mostly to Liverpool. Drogheda was formerly a town of great importance, the meeting-place of several parliaments, among them that at which Poyning's laws were enacted in 1495, and the chief military station of Leinster from the fourteenth century to the seventeenth, but it is, above all, noted as the place of a massacre by Cromwell in 1649. After a brief but courageous resistance he captured it, and put to the sword all the inhabitants, except thirty, who escaped, but were afterward captured and transported to Barbados. Pop. (1891) 11,812.

Drohobicz, drō'hō-bitch: a town of Austria, in Galicia; on a tributary of the Dniester; 18 miles S. E. of Sambor (see map of Austria-Hungary, ref. 3–K). It has a castle, two handsome churches, a monastery, and extensive salt-works. Pop. (1890) 17,784.

Droit d'Aubaine, drwăă'dō'bān': the right of a sovereign to inherit the property of a foreigner dying intestate without native-born heirs. This practice was abolished in 1790, but was restored by Napoleon I. See INTERNATIONAL LAW.

Droit'wich (anc. *Salinæ*): a town of Worcestershire, England; on the Bristol and Birmingham Railway; 7 miles N. N. E. of Worcester (see map of England, ref. 10–G). It derives its prosperity chiefly from its trade in salt, for which it has been famous from remote times. Here are brine-springs rising from a depth of 200 feet through new red sandstone, and yielding annually about 100,000 tons of salt, said to be the best in Europe; also saline baths which are visited by thousands annually. Pop. (1891) 4,021.

Drölling, drö'ling, MICHEL MARTIN: historical painter; b. in Paris, Mar. 7, 1786; pupil of his father, Martin Drölling, a genre-painter; studied also with David, and took the Grand Prix de Rome; member of the Institute 1833; Legion of Honor 1837. He was the master of several of the great French painters of the present day. His works are classical in style. There is a ceiling by him in the Louvre. D. in Paris, Jan. 9, 1851. W. A. C.

Drôme, drōm: a department in the southeastern part of France; area, 2,519 sq. miles. It is bounded W. by the river Rhône, and drained by the Drôme. The surface is partly hilly and mountainous. Coal, copper, iron, lead, and marble are found here. The highlands are covered with forests of oak, pine, beech, and chestnut. Among the staple productions are grapes, olives, chestnuts, silk, and wine of excellent quality. The wine called L'Hermitage is celebrated. Drôme is intersected by the Lyons and Avignon Railway. Capital, Valence. Pop. (1891) 306,419; (1896) 303,491.

Dromedary [from Late Lat. *dromeda'rius*, deriv. of *dromas* = Gr. δρομάς, -άδος, running (i. e. running camel); cf. δραμεῖν, to run]: the Arabian and African camel (*Camelus dromedarius*), a species differing from the Bactrian camel in having only one hump on the back. It has also more slenderness

Dromedary, or Arabian camel.

and symmetry of form. Its usual pace is a trot, which it often maintains for many hours together at the rate of 9 miles an hour. The dromedary surpasses other camels in speed, and can travel several days without drink. It is extensively used as a beast of burden in Africa and Arabia. See CAMEL.

Drongo-shrike: any bird of the family *Dicruridæ*, a group of fly-catching birds related to the crows, inhabiting Africa, Southern Asia, and some of the adjoining islands. The drongos are about the size of an American robin, of a blue or metallic blue-black color, with long forked tails, the outer feathers of which are in some species curved outward and have a racket-shaped termination. F. A. LUCAS.

Drontheim: See TRONDHJEM.

Dropping Tube: in chemistry, a slender tapering tube open at both ends, but terminating at the lower in a narrow orifice, used to supply liquids in delicate experiments, drop by drop. A bulb to hold the liquid is blown near the upper

extremity. The flow is regulated by placing the finger on the open upper end, so as partially or entirely to close it.

Dropsy [for Early Eng. *ydropsie* < O. Fr. *hydropisie* < Lat. *hydropisis*, from a deriv. of Gr. ὕδρωψ, dropsy (cf. ὑδρωπίασις), deriv. of ὕδωρ, water]: a condition characterized by excess of the natural fluid in any of the serous cavities of the body or in the areolar tissue. Dropsy was formerly thought to be a disease, but it is now recognized as a symptom of many diseases, caused for the most part by disturbances of the circulation of the blood or other vascular derangements. If the cerebro-spinal fluid be increased, it constitutes *hydrocephalus*, or "water on the brain." If the excessive secretion (exudation) takes place from the pleura, it is called *hydrothorax*, or "dropsy of the chest." If the fluid collect in the abdominal cavity, the disease is called Ascites (*q. v.*), a disease which may arise without assignable cause, but which most frequently comes from cirrhosis of the liver, a contracted, hardened condition of that organ, mechanically obstructing the portal circulation, and thus leading to transudation of serum from the blood-vessels. Habitual intemperance is its most frequent cause. General dropsy of the serous and areolar tissues is called *anasarca* (from Gr. ἀνά, throughout + σάρξ (gen. σαρκός), flesh). Obstructive organic disease of the heart and degenerative diseases of the kidneys are the most frequent causes of general dropsy, which is therefore a very important symptom. *Hydropericardium*, or "water on the heart," *hydrarthrus*, or effusion into a joint, *hydrorachis*, which is seated in the spinal canal, and *hydrocele*, in the scrotum, are forms of dropsy. Ovarian dropsy is a fluid collection occurring in ovarian cysts, which may be unilocular (of one sac) or multilocular (composed of many aggregated cysts), the whole frequently forming a mass of enormous size. Thus far its only successful treatment consists in the removal of the cysts by excision, one of the boldest, and, on the whole, one of the best, of the more recent surgical operations. Revised by William Pepper.

Droschky, or **Droshky** [a Slavic word, Polish *drozhka*, Russ. *drozhki*, dimin. of *drogi*, carriage, which has passed into most European languages; cf. Germ. *Droschke*, Swed. *droska*]: originally a low four-wheeled Russian carriage in which the passenger sat astride a seat placed lengthwise, with his feet resting on steps, to which were fastened fenders which curved over the wheels. When other forms of public conveyances were introduced into St. Petersburg, the name was transferred to them, and it is now applied in both Russia and Germany to a fiacre or other comfortable public carriage resembling a victoria.

Dros'era [from Gr. δροσερός, dewy]: a genus of perennial herbaceous plants of the family *Droseraceæ*, popularly called sundew, several species of which are natives of the U. S. and of the United Kingdom. From the glands of the leaves exude drops of a clear fluid glittering like dewdrops; hence the name. When flies or other small insects light upon a leaf they are held by the sticky fluid of the glands; the leaves then roll down from the apex and eventually surround the insect. It is pretty certain that the insect is digested and absorbed by the leaf. Revised by Charles E. Bessey.

Drosom'eter [from Gr. δρόσος, dew + μέτρον, measure]: an instrument for measuring the quantity of dew which falls upon the surface of an exposed body. It is in the form of a balance; the body under observation is supported by one arm, while the weights are placed in a scale-pan attached to the other, and protected from the dew.

Droste-Hülshoff, dros'te-hül'shōf, Annette Elisabeth, von: German poet; b. near Münster, Jan. 12, 1797. Her works (*Gedichte*, 1838; *Letzte Gaben*, 1859) show deep sentiment, powerful diction, and rich imagination. No woman of modern times in Germany has excelled her in poetry. D. May 24, 1848, at Meersburg. See Levin Schücking, *Annette von Droste* (2d ed. 1871). Julius Goebel.

Droste zu Vischering, dros'te-tsu-fish'e-ring, Clemens August, von, Freiherr: ecclesiastic; b. at Vorhelm, near Münster, Prussia, Jan. 21, 1773; became vicar-general in 1807; assistant bishop of the diocese of Münster in 1827, and Archbishop of Cologne in 1835. In consequence of difficulties with the Prussian Government in regard to mixed marriages, which the archbishop forbade the priests to solemnize unless they received the promise that all the children should be brought up in the Catholic religion, he was imprisoned in the fortress Minden in 1837 but was released in 1841. His imprisonment called forth an extraordinary excitement in Germany, and greatly strengthened the Roman Catholic Church. D. in Münster, Oct. 19, 1845. See his *Life* by F. A. Muth (Würzburg, 1874).

Drouet, droo'ā', Jean Baptiste, Comte d'Erlon: general; b. in Rheims, France, July 29, 1765; fought in the campaigns of 1793–96; general of brigade in 1799; won praise by his skill at Ulm and Hohenlinden, but especially by his brilliant manœuver which is said to have decided the victory at Jena (1806); was conspicuous in the siege of Dantzic; severely wounded at Friedland (1807), but afterward served with distinction in the Peninsular war. He was trusted and honored by the Bourbons, but soon disgraced on account of suspected treachery. On Napoleon's return from Elba he succeeded in capturing and holding the fortress of Lille for the emperor, who made him a peer of France. In the campaign ending at Waterloo Drouet commanded the First Army-corps. On the day of Ligny and Quatre Bras he wasted the time in which he might have been of inestimable service to Ney in a fruitless march between the two battle-fields through a misapprehension of Napoleon's orders. This unfortunate mistake brought upon him the keenest reproach. When Paris fell he fled to Bavaria, but returned to France in 1830, and was placed in command of the army of Vendée in 1832. He was governor-general of Algeria 1834–35, and in 1843 was raised to the rank of marshal. D. Jan. 25, 1844. F. M. Colby.

Drouyn de Lhuys, droo'ăn'de-lü-ee', Édouard: diplomatist; b. in Paris, France, Nov. 19, 1805. He was appointed director of the commercial bureau in the ministry of foreign affairs in 1840. Having voted in the Chamber of Deputies against the ministry, he was removed from office in 1845. He was Minister of Foreign Affairs in the first cabinet of Louis Napoleon in 1848, and was sent as minister to London in 1849. He was again appointed Minister of Foreign Affairs in July, 1852, resigned in 1855, and was restored to that position in Oct., 1862. He again resigned in 1866. D. in Paris, Mar. 1, 1881.

Drown, Thomas Messinger, M. D.: chemist; b. in Philadelphia, Mar. 19, 1842; graduated in 1859 at the Philadelphia High School; studied at the University of Pennsylvania, where he graduated as M. D. in 1862; at the Sheffield Scientific School, New Haven, 1862–63; at the Lawrence Scientific School 1863–65; and at Freiberg and Heidelberg 1865–68. He was Professor of Analytical Chemistry in Lafayette College for seven years, and held a similar position in the Massachusetts Institute of Technology from 1885 to 1895, when he became president of Lehigh University.

Drowning: death by submersion in water or the like. The following rules for the recovery of persons after apparent death from drowning are derived from the experience of the best physicians: (1) It is necessary in all cases to keep the body cool until respiration be re-established, since the application of warmth (both in frozen and nearly drowned persons) seems to arouse those dormant energies that absolutely require the aëration of the blood, which failing, death ensues. (2) Respiration must be artificially established, either by direct inflation of the lungs by the breath or the bellows, or, much better, by the "Marshall Hall method" or some of its modifications. The patient being in a horizontal position to facilitate the exit of water from the lungs, and the head being slightly raised, the lungs are alternately inflated and compressed by gently rolling the body from a prone to a half-prone position (upon one side), and reversing the process. The lungs may also be inflated by retracting the arms with some force, and by pressure upon the thorax. (3) Expose the face and chest to the air, unless the weather be very cold. (4) Rub the limbs upward, and as soon as dry clothing can be procured put it upon the patient. (5) Avoid the use of the galvanic battery, which is always dangerous, even in experienced hands. (6) Continue these operations until, if possible, natural respiration be re-established. Cases are reported where artificial respiration had to be kept up for hours before signs of life appeared. Similar treatment should be employed in all cases of so-called "asphyxia" from whatever cause. See Resuscitation.

Drowning, as a capital punishment, was formerly practiced in various parts of the Old World. In the Anglo-Saxon codes women convicted of theft were condemned to be drowned. The ancient Burgundians condemned a faithless wife to be smothered in mud. This form of punishment was common in the Middle Ages, and seems to have been principally inflicted upon women. It was not abolished in Scotland till 1685, and in Austria it lasted till 1776.

Droyls'den: a village of Lancashire, England; on the Lancashire and Yorkshire Railway; 4 miles E. of Manchester (see map of England, ref. 7-G). It has extensive manufactures of cotton and several dye-works. Pop. (1891) 9,482.

Droysen, droi'zen, Johann Gustav: historian and philologist; b. in Treptow, near Berlin, Prussia, July 6, 1808. He received his academic training in Berlin, where he became privat docent in 1833 and professor extraordinary in 1835. Five years later he went to Kiel, and thence to Jena, the outbreak of the revolution in 1848, in which he took a prominent part, making his stay in Kiel undesirable. In 1859 he returned to Berlin as Professor of History, where he remained till his death, June 19, 1884. Droysen commanded an extraordinarily wide field of study. His most important publications are *Geschichte Alexanders des Grossen* (1833; 3d ed. 1880); *Geschichte des Hellenismus* (2 vols., 1836); *Leben des Feldmarschalls Grafen York* (1851); *Geschichte der Diadochen*; *Geschichte der preussischen Politik*; celebrated metrical translations of *Æschylus* and *Aristophanes*. See M. Dunker, *Biogr. Jahrb.*, vii. (1884), pp. 110–118. Alfred Gudeman.

Druids [of Celtic origin; cf. O. Fr. *drui*, aeeus. *druid*, magician, sorcerer; possibly connected with word for oak; cf. Welsh *derw*, O. Fr. *daur*, Gr. δρῦς]: the priests of the ancient Celtic religion. In Cæsar's time they formed an exclusive class, which shared with the nobility and the knights the rule over the people, and were free from taxes and from military service. They presided at the sacrifices, instructed the youth, and guarded the secret doctrines of religion. They acted as judges in the difficulties between different tribes, and exercised the art of prophecy and of sacred minstrelsy. They were also skilled in medicine, in astrology, the division of time, and other branches of knowledge, which were kept secret from the masses of the people. They recognized a ruling destiny and the immortality of the soul, and reverenced the oak and mistletoe as sacred. Their political importance ceased on the subjection of Gaul and Britain to the Romans, and their religious service was abolished by a decree of the Emperor Claudius because of its feature of human sacrifices. There were also druidesses of several ranks. Of the druidical doctrines little is known. See d'Arbois de Jubainville, *Introduction à l'étude de la littérature celtique* (Paris, 1883); Rhys, *Celtic Heathendom* (London, 1888).

Druids, Order of: a secret benevolent and beneficial association, founded in London in 1781 and originally intended for the mere mutual entertainment of its members. A system of ceremonies was adopted similar to that of the Freemasons, but professedly based on traditions handed down from the ancient Druids. As the society extended, many changes were introduced, and the original organization in course of time was divided into a great number of independent Orders of Druids. The oldest branch of the society holds its sessions in London. Another branch, calling itself the Order of Druids in England, is very numerous in that country, having more than 1,000 lodges. The whole number of members belonging to the different orders in Great Britain, Australia, and the U. S. is estimated at above 100,000. The first lodge in the U. S. was founded in New York in 1839. There are in the U. S. 15 grand groves, 300 groves, and over 15,000 members. Since 1849 over $5,000,000 has been paid in benefits. In North America, besides the degree conferred at the first entrance, there are five others. Degrees have also been instituted in Great Britain, but they differ from those used in the U. S. Though of purely English origin, the German element in the Order of Druids has obtained a decided preponderance in the U. S., so that nearly if not quite two-thirds of the "groves" conduct their proceedings in the German language.

Drum: a martial musical instrument, consisting of a hollow cylinder of wood or metal having skin or parchment stretched across one or both ends, on which the drummer beats with a wooden stick called a *drum-stick*. The military drum is used to give various signals, as well as for music. There are three kinds of drums—the *side* drum, the big or *bass* drum, and the *kettle* drum. The first of these is suspended at the side of the drummer, who beats on one end of it only. Strings of catgut, called *snares*, are stretched across the other end; hence it is often called a *snare* drum. The bass drum is beaten on both ends. The kettle drum is of hemispherical form, and has but one head or parchment. It was formerly used in martial music, but is now confined to the orchestra. In its orchestral use at least two kettle drums are used (rarely three), tuned at intervals of fourths or fifths apart, sometimes in octaves, as in Beethoven's scherzo in the Ninth Symphony.

Drum, in architecture, the upright part of a cupola below the carving or rounded part. The solid part or vase of a Corinthian or composite capital beneath the acanthus leaves is also called a drum, though more often a *bell*. The term drum is applied in machinery to a hollow cylinder fixed upon a shaft for the purpose of driving another cylinder by a band.

Drum, the name given in the eighteenth century to a crowded fashionable assembly, so styled, says Smollett, "from the noise and emptiness of the entertainment." A large assembly of the kind was called a "drum-major." The name "kettle-drum" applied to an informal afternoon reception appears to have originated in the nineteenth century.

Drumfish: a marine fish (*Pogonias chromis*) belonging to the family *Sciænidæ*; found on the Atlantic coast of America from Cape Cod to Brazil. A similar species (*Aplodinotus grunniens*) occurs in the Great Lakes and the Mississippi river. The drumfish derives its name from the emission of a peculiar sound, somewhat resembling the beat of a drum, and thought to be caused by the movement of the air in its complicated air-bladder. A similar power is possessed by most other members of the *Sciænidæ*.

Drumgoole, John C.: See the Appendix.

Drumlin: in geology, a smooth oval hill composed of till. The name, first applied in Ireland, was afterward introduced in America, where it supplanted "lenticular hill" and "mammillary hill." The contours and profiles of drumlins are smooth curves, attributed to the modeling power of glacial ice. Their tops are rounded; their sides are frequently steep, but merge gradually with surrounding surfaces. Their contours are oval, sometimes long and narrow, sometimes nearly circular. The longer diameter always lies in the direction of the ice movement. Where the hills are grouped together, the groups frequently constitute belts running parallel to neighboring terminal moraines. The till of which they are chiefly constituted is thoroughly compacted, and is supposed to have been deposited by the Pleistocene ice-sheets from their under surfaces. In the U. S. they are especially abundant in New England, Western Central New York, and Eastern Wisconsin. See Drift and Pleistocene. G. K. G.

Drummond, Henry, F. R. S. E., F. G. S., LL. D.: scientist and theologian; b. in Stirling, Scotland, in 1851. He studied at Edinburgh and at Tübingen, Germany, giving his attention first to theology and afterward to the natural sciences. In 1877 he became professor extraordinary and in 1884 Professor of Natural Science in the Free Church College, Glasgow. In 1883–84 he was engaged in exploration in Central Africa. He lectured on religious, scientific, and sociological subjects in Great Britain, the U. S., Canada, and other English-speaking countries. He published *Natural Law in the Spiritual World* (London and New York, 1883); *Tropical Africa* (London, 1888); *The Ascent of Man* (1894), and several widely influential minor religious works, mostly collected in *The Greatest Thing in the World, and other Addresses* (1893). Most of these works have been translated into German and other languages. D. at Tunbridge Wells, England, Mar. 11, 1897. Willis J. Beecher.

Drummond, Josiah Hayden: b. at Winslow, Me., Aug. 30, 1827; A. B., Waterville College (now Colby University), 1846; LL. D. 1871; served three terms in the House of Representatives, twice as Speaker; State Senator; and four terms attorney-general of Maine. Mr. Drummond has been for many years prominent in Masonic circles, and is author of *Maine Masonic Text-book for Use of Lodges*. C. H. T.

Drummond, Thomas: engineer; b. in Edinburgh, Scotland, in Oct., 1797. He was well versed in mathematics and skillful in mechanics. He was one of the royal military engineers employed in the trigonometrical survey of Scotland. In 1825, while engaged in this operation, he made successful experiments with incandescent lime to render distant objects visible. (See Drummond Light.) He was appointed undersecretary for Ireland in 1835. D. in Dublin, Apr. 15, 1840.

Drummond, William (of *Hawthornden*): poet; b. at Hawthornden, near Edinburgh, Scotland, Dec. 13, 1585; was educated at Edinburgh University and studied law in France. He resided on his beautiful paternal estate of Hawthornden, where he passed his life in retirement and

in literary pursuits. In 1619 Ben Jonson traveled several hundred miles in order to visit Drummond, who wrote *Notes of Ben Jonson's Conversation* on this occasion. These notes are among his most interesting productions. He was author of *Tears on the Death of Mœliades* (1613); *Poems* (1616); *Forth Feasting* (1617); *Flowers of Zion* (1623); besides a *History of the Five Jameses*, and some political tracts. D. Dec. 4, 1649.

Drummond Island: an island in Lake Huron; the most western of the Manitoulin islands; belongs to Michigan. It is 20 miles long and 10 miles wide.

Drummond Light [named from Thomas Drummond, its inventor], also called **Lime Light, Calcium Light**, etc.: an intense light produced by throwing the oxyhydrogen blowpipe flame upon a pencil of lime, which is thereby raised to vivid incandescence. If magnesia or metallic magnesium be used instead of lime, the light is rich in actinic rays, and hence is useful in photography. Zirconia is often employed instead of lime, on account of its non-volatility.

Drunkenness: See DIPSOMANIA and INTEMPERANCE; also CIVIL DAMAGE ACTS.

Drupe [Fr. *drupe* < Lat. *druppa*, ripe olive, apparently an abbreviated form of Gr. δρυπεπής, ripened on tree, or δρυπετής, ready to fall]: in botany, a one-celled, superior indehiscent fruit, having a single seed or kernel, usually inclosed in a hard and bony *endocarp* called a stone, as a peach or a plum. The outer part of the fruit, which is succulent or fleshy, is called the *sarcocarp* or *mesocarp*. The term *putamen* is applied to the hard, stony substance which incloses the kernel.

Dru'ses: a people of mixed race (largely Persian and Arab), almost limited to the Lebanon and the Hauran; speaking the Arabic language. They number nearly 90,000. They are industrious, hospitable, brave, temperate (all are required to abstain from tobacco and wine), cleanly, and very proud of their birth and pedigree, but revengeful and cruel. Their chief business is the production and manufacture of silk. For about 800 years they have maintained a distinct religion and an independent nationality. Their creed is an offshoot of Mohammedanism, probably developed by the Shiites, or more especially by the so-called Batiniya, or Batenians, the most radical branch of the Shiites. In some of its fundamental tenets, however, it is directly opposed to the very spirit of Mohammedanism, and seems to approach Christianity. It emphasizes the unity of God as strongly as Mohammedanism. "There is no god but God," the Druses say, and he is unknowable to man. But, though he can not be grasped by the senses, he becomes known to man through revelation, they add; and then follows a doctrine of incarnation not altogether unlike the Christian doctrine, but an abomination to all Mohammedans. The highest, and also the last, of these incarnations was, according to the Druses, that of Hakim Biamrillahi, the sixth of the Fatimites, caliph from 1019 to 1044. Hakim was a half-insane tyrant; and when his favorite, Ismail Darasi, a Persian by birth, one day in 1040 began to expound to the audience assembled in the great mosque of Cairo that Allah had revealed himself in Hakim, that Hakim was an incarnation of Allah, a riot immediately ensued, and it could not be suppressed until Darasi was expelled from the country. He went to the regions of the Lebanon, and his doctrine was accepted by the people living there; hence their name Druses. But though the new sect thus formed even developed a literature, its later history is very obscure. Externally, the Druses saw fit to profess Mohammedanism, and nothing was known about their peculiar creed and their sacred books until the latter part of the eighteenth century. A bloody war between them and the Maronites led, in 1860, to European intervention on behalf of the Christians. See MARONITES. See also the Earl of Carnarvon's *Druses of the Lebanon* (London, 1860); Rev. John Wortabet, *Researches into the Religions of Syria* (1860); H. Guyo, *La théogonie des Druses* (Paris, 1863); and *La nation Druse* (Paris, 1864); and particularly C. H. Churchill, *Ten Years' Residence in Mt. Lebanon* (3 vols., 1853); *The Druzes and the Maronites under the Turkish Rule from 1840 to 1860* (1862); Laurence Oliphant, *Land of Gilead* (1880) and *Haifa* (1887).

Revised by SAMUEL MACAULEY JACKSON.

Dru'sus, CLAUDIUS NERO: a Roman general; b. in 38 B. C.; son of Tiberius Nero and Livia (who subsequently became the third wife of the Emperor Augustus), and a younger brother of the Emperor Tiberius. He married Antonia, a daughter of Mark Antony. In 13 B. C. he defeated the Germans near the Rhine. Having conquered the Sicambri and Frisii, he extended the Roman empire to the German Ocean and to the river Elbe. For these victories he received the surname of GERMANICUS. He died early in 9 B. C., leaving two sons, Germanicus and Claudius, the latter of whom became emperor.

Drusus, MARCUS LIVIUS: a Roman orator and politician: became tribune of the people in 122 B. C. as a colleague of Caius Gracchus. He supported the cause of the senate and optimates, opposed the policy of Gracchus, and gained popularity by planting colonies. He was elected consul for 112 B. C.

Drusus, MARCUS LIVIUS: a son of Marcus Livius Drusus and an uncle of Cato Uticensis. He is said to have been ambitious, proud, and arrogant, and a champion of the senatorial or aristocratic party. Having been chosen tribune of the people for 91 B. C., he courted the popular favor by passing an agrarian law. Unable to win the support of the senate, he attempted to gain the support of the colonies by promising them the right of citizenship. He was assassinated by a political opponent in 91 B. C.

Dry Bank Light: a lighthouse on the Florida Reef; situated on Sombrero Shoal, near Dry Bank, Coffin's Patches, and Sombrero Key; in lat. 24° 37′ 36″ N., lon. 81° 6′ 43″ W. It is an open framework of iron 149 feet high, with a fixed white dioptric light of the first class.

Dryden: village; on railway; Tompkins co., N. Y. (for location of county, see map of New York, ref. 5–F); 32 miles N. of Owego. It has a large woolen-factory, a tannery, and sulphur springs. Here is the Dryden Spring Place, a resort for invalids. Pop. (1890) 663; (1900) 699.

Dryden, JOHN: poet; b. at Aldwinckle, Northamptonshire, England, Aug. 9, 1631: a grandson of Sir Erasmus Driden, created a baronet in 1619. He was a pupil of Dr. Busby, and entered Trinity College, Cambridge, in 1650. Having graduated as master of arts in 1657, he became a resident of London. He wrote *Heroic Stanzas on the Death of Cromwell* (1658), and celebrated the restoration of Charles II. in 1660 by a poem entitled *Astræa Redux*. His first drama was *The Wild Gallant* (1662). He married Lady Howard, a daughter of the Earl of Berkshire, in 1663, and wrote in 1667 a poem called *Annus Mirabilis, or Year of Wonders*. In 1668 he was appointed poet-laureate, with a salary of £200 annually. He afterward wrote numerous comedies and tragedies, among which are *Marriage à la Mode*, *All for Love* (1678) and *Aurungzebe*. His brilliant political and poetical satire of *Absalom and Achitophel* (1681) is directed against the party of which Lord Shaftesbury and the Dukes of Buckingham and Monmouth were the leaders. He announced his conversion to the Roman Catholic religion by his allegorical poem called *The Hind and the Panther* (1678). He produced in 1696 a metrical translation of Vergil, which Pope commended as "the most noble and spirited translation I know in any language." It is, however, deficient in fidelity. Among his other works are an excellent prose *Essay on Dramatic Poesy* (1660) and an *Ode for Saint Cecilia's Day*. His later works exhibit a purer taste than his dramas. D. May 1, 1700, and was buried in Westminster Abbey. See ENGLISH LITERATURE.

Dry Dock: See DOCKS.

Drying-machine: a device for extracting the moisture from fabrics. A machine most commonly used by dyers and large laundry establishments, called an "extractor," consists of two cylinders, one within the other. The inner one is the receptacle for the goods, and is made to revolve with great rapidity, expelling the water through perforations made in the sides. The outer cylinder receives the water, and from thence it is carried off by means of a pipe. By this process the drying is not quite complete, but what remains is expelled by drying in a hot chamber or in the open air.

Drying Oil: in painting, oil which has the property of drying quickly; especially linseed oil and other seed oils. The process of drying is hastened by heating the oil with oxide of lead. See OILS and PAINTS.

Dryobalanops: See CAMPHOR.

Dry'ophis [from Gr. δρῦς, oak + ὄφις, serpent]: a genus of snakes belonging to the *Colubridæ*, natives of tropical America and the East Indies. Like the *Dendrophidæ*, to which they are allied, they have extremely slender, elongated forms,

and live on trees. They are sometimes placed with other related genera in a separate family. F. A. L.

Dry Pile: a kind of voltaic pile or battery, constructed without liquids, and furnishing a feeble electric current. The dry piles of Zamboni and De Lue consist of disks of copper and zinc papers placed in pairs back to back and piled up or packed in glass tubes, with the copper surfaces all in the same direction.

Dry Point: in engraving, engraving done directly on the copper, by the etching-needle, and without acid. Prints taken from plates so engraved are much prized. See ENGRAVING.

Dry Process: See PHOTOGRAPHY.

Dry-rot: a popular term used to designate the slow decay of wood after it has been dried or seasoned. The term is used technically to distinguish the work of certain fungi, particularly of *Merulius lacrymans*. It is a common opinion that this disease proceeds most rapidly in perfectly dry timber, but this is an error. The mycelium of the fungus is quickly destroyed when the wood is made perfectly dry. Under all ordinary conditions, however, there is sufficient moisture in timber exposed to the air to supply the needs of the fungus. The spores germinate on the surface of damp timber, and the filaments pass through the walls of the wood-cells and feed upon them. Wood which is thoroughly well seasoned and is protected from dampness by paint or other means is secure from the injuries of the dry-rot fungi. Among horticulturists dry-rot is the slow decay of the heart-wood of fruit-trees, due to the mycelium of various toadstool and punk fungi, which gain an entrance through some wound or break in the surface of the trunk. L. H. B.

Dry-stove: a glazed structure designed for the protection of the plants of dry, arid climates; a hothouse in which the air is kept less moist than in the bark-stove. It is particularly adapted to succulent plants. The temperature should be higher than that of a greenhouse.

Dry Tortu'gas [from Sp. *tortuga*, a tortoise]: a group of ten small, low, barren islands, belonging to Monroe co., Fla., situated over 40 miles W. of the most western of the Florida keys proper. On the southwesternmost island, called Loggerhead Key, stands a brick lighthouse 150 feet high, with a fixed white dioptric light of the first order; lat. 24° 38′ 5″ N., lon. 82° 52′ 53″ W. There is also a smaller light for Dry Tortugas harbor (lat. 24° 37′ 47″ N., lon. 82° 52′ 53″ W.). This lighthouse stands inside Fort Jefferson, an important fortification on Garden Key. The Dry Tortugas served as a place of imprisonment for persons under sentence by courts martial during the civil war 1861–65. Several criminals concerned in the conspiracy in which President Lincoln was murdered were confined here.

Du'alin [deriv. of *dual*, from Lat. *dua'lis*, containing two; *duo*, two; so called because it is a mixture of two different substances]: an explosive compound introduced in 1868 by Dittmar; composed of NITRO-GLYCERINE (*q. v.*) mixed with sawdust, or wood-pulp such as is used in paper-mills; the latter being first treated with nitric and sulphuric acids. The object of the mixture is to diminish the danger connected with the storage and transportation of nitro-glycerine. See EXPLOSIVES.

Dualism [from Lat. *dua'lis*, containing two; *duo*, two]: in metaphysics, the doctrine that the universe exists by the concurrence of two principles, the spiritual and the material, each necessarily independent and eternal. The "dualism" of Zoroaster belongs rather to religion than to philosophy. It assumed two independent principles—one good, the other evil—through the collision of which was explained the disorder, moral and physical, of the world. The Gnostics in the second century adopted these views in a greater or less degree. The Greek philosophers are called dualists, inasmuch as the most of them held to the belief that matter and spirit were each self-existent and independent in origin. Their statements of the doctrine differ from each other, and are vague and indistinct. But the Stoical doctrine of a soul of the world, contradistinguished from matter without qualities (Gr. ἄποιος ὕλη), represents the general drift of the Greek thought. The prevailing mode of thought among Christian theists recognizes the real being of mind and matter in the constitution of man and the order of the universe, while it attributes self-existence and creative power solely to the Supreme Mind. In connection with theories of perception the term dualism has been used to denote the soul and the modes of matter in relation and opposition while the mind is in the act of acquiring knowledge of the external world. See Hamilton's edition of Reid's works, p. 817.

Dual Number: in grammar, that form of the noun, adjective, or verb denoting in some languages the number two. For example, in the ancient Greek there were three numbers in grammar, the singular, the dual, and the plural; but the dual was not very often used, and is never found in Æolic or in Hellenistic Greek. It occurred most frequently in the Attic dialect.

Duane, dyu-ān′, JAMES: lawyer; b. in New York, Feb. 6, 1733. He was a member of Congress 1774–77 and 1780–82; the first mayor of New York in 1784, and U. S. district judge 1789–94. D. at Duanesburg, N. Y., Feb. 1, 1797.

Duane, JAMES CHATHAM: U. S. military officer; b. at Schenectady, N. Y., June 30, 1824; graduated at West Point in 1848, and Jan. 10, 1883, became a colonel of engineers. He served throughout the civil war, taking part in many important engagements and receiving the brevet rank of colonel for his services in the Richmond campaign and of brigadier-general for the gallantry and skill displayed in the siege of Petersburg and subsequent operations. He served in the construction of the defenses of the eastern entrance to New York harbor 1865–68; member of engineer boards 1867–73; became lighthouse engineer of the Northeast Atlantic coast and superintendent of the fortifications at Maine and New Hampshire. In 1886 he became chief of engineers, with rank of brigadier-general. Retired June 30, 1888. He was commissioner Croton aqueduct, New York, from Aug. 1, 1888, till his death, in New York, Nov. 8, 1897. Author of *A Manual for Engineer Troops* (1862).

Duane, WILLIAM JOHN: lawyer and statesman; b. at Clonmel, Ireland, in 1780; son of William Duane, an American journalist; practiced law in Philadelphia, and published, besides other works, *The Law of Nations Investigated in a Popular Manner* (Philadelphia, 1809). He was appointed Secretary of the Treasury of the U. S. early in 1833, but was dismissed from office in September of that year by President Jackson, because he refused to remove the deposits of public money from the Bank of the U. S. D. in Philadelphia, Sept. 27, 1865.

Duarte Coelho: See COELHO.

Duban, dü'bäañ′, JACQUES FÉLIX: architect; b. in Paris, France, Oct. 14, 1797. He was the pupil of Debret and of the École des Beaux-Arts. He was made inspector of that school in 1832, and soon afterward began the reconstruction of its buildings upon a larger plan. He continued in charge until his death. In connection with Lassus he restored the Sainte Chapelle in Paris. The restoration of the Château of Blois is one of his most important works. D. at Bordeaux, Oct. 12, 1870.

Du Barry, MARIE JEANNE GOMARD DE VAUBERNIER, Comtesse: favorite of Louis XV.; b. of humble parents at Vaucouleurs, France, Aug. 19, 1746: went to Paris as a dressmaker, but her beauty and cleverness attracted the notice of the dissolute Jean, Comte Du Barry, who made her his mistress. Noting the admiration she excited among the guests of his house he brought about her presentation to the king, then sixty years old but still the slave of his vices. In spite of the protests of relatives and advisers Louis at once gave himself up to her influence, and caused her introduction at court by her marriage to Guillaume, Comte Du Barry (1769), the brother of her former patron. From this time her ascendency over the king was absolute; she had the whole court at her feet, caused the dismissal of the Duc de Choiseul, who attempted to resist her power, and with her confidant, the Duc d'Aiguillon, she controlled the entire policy of the government. On the death of the king (1774) she was banished from the court, but allowed to remain in her palace at Luciennes. In 1792 she went to London to sell her jewels, and on her return to France in the following year she was tried on the charge of having squandered the public treasures, conspired against the Government, and while in London worn mourning for the late king. She was condemned Dec. 6, 1793, and guillotined on the same day. The amount of the public money that went to gratify the vanity of the Comtesse Du Barry and advance the interests of her family is estimated at 35,000,000 francs, but some credit is due to her for her liberality toward artists and men of letters. F. M. COLBY.

Du Bartas, dü'bäär'taa′, GUILLAUME SALLUSTE: poet; b. at Montfort, in the department of Gers, 1544; undertook various diplomatic missions to foreign courts for the Hugue-

not cause; fought in the Huguenot army, and died from a severe wound in the battle of Ivry, Mar. 14, 1590. His fame rests upon two epic poems, the second unfinished, entitled *La Sepmaine* (The Week) and *La seconde Sepmaine*. The first, which is far the better of the two, describes the creation of the world; the second, the period from the creation to the incarnation of Christ. These poems were very popular in France and much read in England. In 1598 Joshua Sylvester translated the poems into English. They were also partially done into English by Th. Hudson, William Lisle, and Th. Winter. See Georges Pellissier, *La Vie et les Œuvres de Du Bartas* (1883).

Revised by A. R. Marsh.

Dubbs, Joseph Henry, D. D.: historical and ethnographical writer and worker; b. at North Whitehall, Pa., Oct. 5, 1838; graduated at Franklin and Marshall College 1856, and at the Mercersburg Theological Seminary 1859. After several pastorates in the Reformed Church in the U. S., he became, in 1875, Professor of History and Archæology in Franklin and Marshall College, Lancaster, Pa. He is a member of various ethnographic and historical societies in Great Britain, France, and America, and has published *Historic Manual of the Reformed Church* (Lancaster, Pa., 1885); *Home Ballads and Metrical Versions* (Philadelphia, 1888); *Why am I Reformed?* (Philadelphia, 1889); and a large number of historical monographs, addresses, and contributions to encyclopædias. He edited *The Guardian*, a monthly magazine, 1882–86. Willis J. Beecher.

Du Bellay: See Bellay.

Dublin: a county of Leinster, Ireland; area, 354 sq. miles; bounded on the E. by the Irish Sea, and intersected by the river Liffey, which flows into Dublin Bay. The surface is nearly level; the soil is productive and well cultivated. Granite, copper, lead, and carboniferous limestone occur here. Chief town, Dublin. Pop. (1891) 429,111.

Dublin: city; capital of Ireland and of Dublin county; on the Liffey, at its entrance into Dublin Bay; 66 miles W. of Holyhead and 135 miles W. of Liverpool; lat. 53° 20′ 38″ N., lon. 6° 17′ 30″ W. (see map of Ireland, ref. 9–J). Mean annual temperature, 49° F. The river, which runs eastward, divides the city into two nearly equal parts, which are connected by nine bridges—seven of stone and two of iron. In the northeastern and southeastern parts are many beautiful squares, streets, and terraces, occupied by the aristocratic class. The mercantile business is mostly transacted in the central and northwestern portions, where are many residences of the middle class. The city is surrounded by the Circular Road, nearly 9 miles long, which is a favorite drive and promenade of the citizens. The most imposing street of Dublin is Sackville Street, 120 feet wide and 700 yards long. Among the numerous squares is Stephen's Green, having an area of nearly 20 acres. The most remarkable public buildings are the Bank of Ireland (formerly the Parliament House), Trinity College, the custom-house, the Four Courts, Dublin Castle, occupied by the Lord-Lieutenant, and St. George's church with a steeple 200 feet high. The cathedral of St. Patrick is one of the most interesting buildings of the city. It was founded in 1190 by John Comyn, Archbishop of Dublin. In the next century it was burnt down, but was immediately rebuilt in still greater splendor. At the time of the Reformation it was closed, and Edward VI. thought of using the building for a university, but the plan was defeated. Near the north end of Sackville Street is a monument to Lord Nelson, 134 feet high. Among the literary and scientific institutions are the University (see Dublin, University of), the Royal College of Science, the Roman Catholic University, the College of Surgeons, the Royal Dublin Society, the Royal Irish Academy, the Hibernian Academy for Paintings, and the National Gallery. Dublin is the seat of a Protestant Episcopal and a Roman Catholic archbishop. In the environs of Dublin, which are remarkably beautiful, is Glasnevin, once the favorite residence of Addison, Steele, Swift, and Sheridan; and Phœnix Park, which contains nearly 2,000 acres. The fine scenery of this noble park, the massive public buildings, the spacious squares, the clean granite quays which line the river, and the beauty of the bay which expands before the city, render Dublin one of the most beautiful and agreeable capitals of Europe. Railways extending in several directions connect this place with the chief towns of Ireland. It is the eastern terminus of the Grand and Royal Canals, and has a good harbor, which has been improved by the construction of two breakwaters. This city has glass-works, foundries, and distilleries; also manufactures of poplin, which is much celebrated. Dublin returns four members to Parliament, besides two who represent the university. It is a very old town, and its ancient history is mainly legendary. It was taken in the ninth century by the Danes, and, though they were several times expelled, and completely defeated in the battle of Clontarf, they managed to hold the city until 1170. In 1172 Henry II. landed in Ireland at the head of an Anglo-Norman armament. He went to Dublin, held his court there with great magnificence, and made an alliance with the Irish chiefs. In 1689 James II. took up his residence in Dublin and held a parliament there; after the battle of the Boyne he speedily departed. On Jan. 1, 1800, the imperial standard of the United Kingdom was hoisted on Dublin Castle. Pop. (1891) 254,709 in the city proper, but 361,891 within the metropolitan police district.

Dublin, University of (otherwise called **Trinity College, Dublin**): an institution of learning, said to have been founded in 1320; re-established in 1593 by Queen Elizabeth. It was endowed by the corporation of Dublin and by private gifts, and still further by grants of James I., who in 1613 gave it representation in Parliament, which it still possesses, sending since 1832 two members to the House of Commons. Its government is modeled upon that of the English universities, but its fellows (since 1840) are at liberty to marry. It has a full corps of professors in all departments of knowledge, who, like the fellows, are liberally supported from the income of the college. The students are of four classes: (1) Noblemen, baronets, and the sons of noblemen, who have peculiar privileges, and, with the exception of baronets, obtain the degree of B. A. without examination. They pay about $500 a year in fees. (2) Fellow-commoners, who dine with the fellows, and have one less examination than the third class, at about one-half the cost in fees of the preceding. (3) Pensioners, to which class most of the students belong. Their fees are little more than half as great as those of the second class. (4) Sizars, thirty in number, who pay a nominal fee. Each of the ranks wears a distinctive dress. The examination on entrance is thorough. It is possible to obtain degrees without great exertion, but the honors can be obtained only by severe study. No restriction is made with regard to the admission of those who are not members of the Anglican Church. The fees for graduation are much higher than in American colleges. Dublin University occupies a high rank among European institutions of learning. It has special departments for the study of medicine, divinity, and engineering. Among the eminent graduates were Berkeley, Ussher, Swift, Burke, Goldsmith, Sheridan, and Sir W. Hamilton. An unsuccessful attempt made Mar. 11, 1873, in the British Parliament to unite the Catholic University, Magee College, Belfast, and the Queen's Colleges of Cork and Belfast to the University of Dublin, and to abolish the Queen's College at Galway, led to the temporary disruption of the Gladstone ministry.

Dübner, düp'ner, Friedrich: classical philologist; b. in Hörselgau, Germany, Dec. 20, 1802; professor at the Gymnasium of Gotha 1826–31. After 1831 lived in Paris, where he superintended Didot's new edition of the Greek *Thesaurus* of Stephanus. Subsequently he became the chief editor of Didot's *Bibliotheca Græca*, for which great undertaking he himself contributed the scholia to Aristophanes, Theocritus, the *Anthologia Palatina*, Theophrastus, Plutarch's *Moralia* and the *Fragmenta et spuria*. At the direction of Napoleon III. he prepared a critical edition of *Cæsar* (Paris, 1867). For the *Collection Elzévirienne* of the same firm he wrote the commentaries to Horace and Vergil. He is also the author of numerous school editions, a Greek grammar, and a Greek-French lexicon. He died in Montreuil-sous-Bois, near Paris, Oct. 13, 1867. See Eckstein, *Allgemeine deutsche Biographie*, v., 440 ff.

Alfred Gudeman.

Dubnitza: same as Dupnitza (*q. v.*).

Dubois, doo-bois': borough and railway junction; Clearfield co., Pa. (for location of county, see map of Pennsylvania, ref. 4–D); 127 miles N. W. of Pittsburg. The chief industries are coal-mining and lumbering. Pop. (1880) 2,718; (1890) 6,149; (1900) 9,375.

Du Bois, Augustus Jay, C. E., Ph. D.: Professor of Engineering; b. at Newton Falls, O., Apr. 25, 1849; graduated at the Sheffield Scientific School of Yale College in 1869; received the degree of C. E. in 1870 and that of Ph. D. in

1873. Subsequently he studied mining at Freiberg, in Saxony. From 1875 to 1877 he was Professor of Civil and Mechanical Engineering in Lehigh University; from 1877 to 1884 Professor of Dynamical Engineering in the Sheffield Scientific School of Yale College: and since 1884 Professor of Civil Engineering in the same institution. He is the author of *Elements of Graphical Statics* (1875); *The New Method of Graphical Statics* (1875); and *Strains in Framed Structures* (1883; 8th ed. 1892); and valuable papers in engineering journals. He translated Weisbach's *Hydraulics and Hydraulic Motors* (1877); Weyrauch's *Iron and Steel Structures* (1877); Weisbach's *Theory of the Steam-engine* (1878); and Roentgen's *Thermodynamics* (1880). He has delivered and published several lectures on the relations of science to faith, to the supernatural, and to immortality.

Dubois, dü'bwăă', Clément François Théodore: organist; b. at Rosny, France, Aug. 24, 1837; studied in the Paris Conservatory, and gained many prizes, among them the Prix de Rome in 1861; was appointed *maître de chapelle* of Ste. Clotilde in 1867, where he produced his oratorio *Les Sept Paroles du Christ*. He has composed several operas and operettas, but his fame rests on his organ-playing and his numerous and important organ compositions. Since 1877 he has been organist of the Madeleine, Paris, having succeeded Saint-Saëns there. In 1883 he was decorated with the order of the Legion of Honor. D. E. Hervey.

Dubois, Guillaume: ecclesiastic and politician: b. at Brives-la-Gaillarde, Limousin, France, Sept. 6, 1656. He was preceptor to the Duc de Chartres, who became Duke of Orleans and Regent of France in 1715. Having gained the favor of this prince by pandering to his vices, he was appointed a councilor of state. He exhibited much political cunning and talent for intrigue. Among his important diplomatic acts was the treaty between France, England, and Holland called the Triple Alliance (Jan., 1717). He became about 1718 Minister of Foreign Affairs, and, though his morals were depraved, Archbishop of Cambray in 1720, and cardinal in 1721. He was appointed Prime Minister in 1722, and retained power until his death, Aug. 10, 1723. See C. L. Sevelinges, *Mémoires secrets et correspondance inédite du Cardinal Dubois* (Paris, 2 vols., 1815); Seilhac, *L'Abbé Dubois* (2 vols., 1862); Fontaine de Rambouillet, *La Régence et le Cardinal Dubois, relations anecdotiques* (1886).

Dubois, Paul: sculptor and portrait-painter; b. at Nogent-sur-Seine, France, July 18, 1829; one of the greatest artists of the French school; pupil of Toussaint; has received the highest honors at exhibitions in Paris and elsewhere for sculpture and painting; member of the Institute 1876; commander Legion of Honor 1886. One of his best works in painting is *My Children* (1876). His sculptured busts are admirable. Among his finest works in sculpture are *The Child St. John* (1863; the four figures for the tomb of Gen. de la Moricière at Nantes (1875); *Narcissus* (1873); and *Jeanne d'Arc* (1889). Several works are in the Luxembourg Gallery. Studio in Paris.

Du Bois-Reymond, dü'bwăă'rā'mōn', Emil: physiologist; b. in Berlin, Prussia, Nov. 7, 1818; in 1858 succeeded his teacher, Johannes Müller, as professor at the university there, and became a member of the Academy of Sciences, of which he became secretary in 1867: published the *Archiv für Anatomie* (in connection with Reichert) 1857–77; and since then the *Archiv für Physiologie*. He is widely known for his researches in animal electricity. Author of *Untersuchungen über tierische Elektrizität* (2 vols., 1848–84); *Ueber die Grenzen des Naturerkennens* (6th ed. 1884); *Gesammelte Abhandlungen zur allgemeinen Muskel- und Nervenphysik* (2 vols., 1875–77); *Reden* (2 vols., 1886–87). D. Dec. 26, 1897. Revised by S. A. Torrance.

Dubovka, doo-bov'kăă: a town of European Russia; government of Saratof; on the river Volga; 180 miles S. S. W. of Saratof (see map of Russia, ref. 9–F). It has manufactures of leather, tallow, soap, and tobacco; an active trade by the river, and an annual fair lasting a month. Pop. 13,500.

Dubs, Jakob: Swiss statesman and publicist; b. at Affoltern, canton of Zürich, July 26, 1822; studied law at Berne, Heidelberg, and Zürich. After holding several important offices in his native canton, he became a member of the federal court in 1855, and in 1857 its president. In 1864 he was president of the confederation, and again in 1870. His policy was liberal and progressive. D. at Lausanne, Jan. 13, 1879. Among his works are *Die Schweizer Demokratie in ihrer Fortentwickelung* (1866) and *Das öffentliche Recht der Schweizerischen Eidgenossenschaft* (1877–78).

F. M. Colby.

Dubuc, Joseph: Canadian jurist; b. at St. Martine, P. Q., Dec. 26, 1840; graduated at McGill University in 1869. He removed to Manitoba in 1870; has been a member of the executive council, attorney-general, and Speaker of that province; and in 1878 was elected to the Parliament of Canada. In 1879 he was appointed judge of the court of queen's bench. He was a commissioner to investigate rights claimed by settlers on the Red and Assiniboine rivers, and a member of the council of Manitoba University.

Neil Macdonald.

Dubufe, dü'büf', Claude Marie: genre and portrait painter; b. in Paris, France, 1790. Pupil of David; first-class medal, Salon, 1831; Legion of Honor 1837. Style classical and work mediocre. *The Surprise* is in the National Gallery, London; *Portrait of General Montesquiou-Fezensac* (Versailles Museum). D. in Paris, Apr. 24, 1864.

W. A. C.

Dubufe, Édouard: figure and portrait painter; b. in Paris, Mar. 30, 1820. Pupil of his father, C. M. Dubufe, and of Paul Delaroche. First-class medal, Salon, 1844; second-class, Paris Expositions, 1855 and 1878; officer Legion of Honor 1869. His portraits are showy but well drawn; his decorative work is of considerable importance. *Congress of Paris* is in the Versailles Museum; *Portrait of Émile Augier* (an excellent work) is in the Luxembourg Gallery, Paris. D. at Versailles, Aug. 11, 1883.

W. A. C.

Dubufe, Édouard Marie Guillaume: figure and portrait painter; b. in Paris, May 16, 1853. Pupil of his father, Édouard Dubufe, and of Mazerolles; second-class medal, Salon, 1878; first-class medal, Paris Exposition, 1889; Legion of Honor 1889. Among his important works are *St. Cecilia* (1878) and *Sacred Music and Profane Music* (1882). He painted the ceiling in the public foyer of the Théâtre Français, Paris. His work is notable for good technical qualities. Studio in Paris. W. A. C.

Dubuque, doo-byuk': city; capital of Dubuque co., Ia. (for location of county, see map of Iowa, ref. 4–K); situated opposite the point where the line between Wisconsin and Illinois reaches the Mississippi river, and occupying 13 sq. miles of plateau and bluffs on the west bank of the Mississippi river; 337 miles N. of St. Louis, 247 miles S. of St. Paul, and 147 miles W. of Chicago. In 1900 it was the second city in size in Iowa. Four railways center here—the Ill. Cent., Ch., Mil. and St. Paul, Ch. Gt. West., and the Ch., Bur. and No. (C., B. and Q.). Dubuque is the headquarters for the only packet line on the Mississippi river, and also has the boatways and harbor set apart by the Government for the wintering of boats. The city is connected with the opposite shore of the Mississippi by three bridges.

Institutions, Churches, and Schools.—The city has a public library, a court-house, a custom-house, a Roman Catholic orphan asylum, asylum for the insane, Roman Catholic and Protestant hospitals, is the seat of the federal court for the northern district of Iowa, of a Roman Catholic archbishoprie, and contains 24 Protestant churches, 7 Catholic churches, 13 Roman Catholic colleges, academies, and parochial schools, a Lutheran seminary, and the German Presbyterian Theological School of the Northwest, 10 public schools, including a high school, and several private schools. There are two parks, many beautiful private residences on the terraced bluffs, and 27 miles of electric railways. The manufacturing interests are represented by about 300 establishments, with a capital of $10,000,000, and giving employment to more than 5,000 persons. The products include sashes, doors, and blinds, wagons, steel-hulled steamboats, carriages, steam-engines, boilers, mortising-machines, water-wheels, water-works appliances, hardware novelties, and other special machinery, boots and shoes, leather, pumps and plumbing goods, furniture, tobacco, paint, paper, linseed oil, and brick; there are situated here three pork-packing houses, iron and brass works, and the Ch., Mil. and St. P. repair-shops. The lead-mining industry, which before 1857 was the principal one, has been revived, and zinc-works have been established. The assessed valuation of property in 1900 was $24,000,000.

The city was named after Julien Dubuque, a French trader, who, with others, settled here in 1788 to work the

mines of lead: this settlement, which was the first in what is now the State of Iowa, was abandoned after Dubuque's death in 1810, and the site was not again occupied until 1833, when the first permanent settlement in Iowa was made here by miners. Pop. (1860) 13,000; (1880) 22,254; (1890) 30,311; (1900) 36,297.

City Editor of "Telegraph."

Duc, dük, Joseph Louis: architect; b. in Paris, France, Oct. 15, 1802. He was the pupil of Percier, and studied at the École des Beaux-Arts. In 1840 he was made architect of the Palais de Justice on the island, in Paris, and the great works connected with this continued almost until his death. D. in Paris, Jan. 22, 1879.

Du Cange, dü'kaañzh', Charles du Fresne: historical writer and lexicographer; b. at Amiens, France, Dec. 18, 1610. He was liberally educated, and studied law. Among his most important works are *Histoire de l'empire de Constantinople sous les empereurs français* (Paris, 1657), the first part of which contains the text of Villehardouin's *Conquête de Constantinople* and extracts from Philippe Mousket's *Chronique rimée*; a *Glossarium ad Scriptores Mediæ et Infimæ Græcitatis* (2 vols. folio, 1688; n. e. Breslau, 1890–91); and a *Glossarium ad Scriptores Mediæ et Infimæ Latinitatis* (3 vols. folio, 1678, enlarged to 6 vols. folio in 1733–36, and reissued with additions, in 7 vols. quarto, in 1840–50, and again in 10 vols., Niort, 1883–87). He lived in Paris after 1668. D. there Oct. 23, 1688. In 1849 a statue was erected to him at Amiens, where he had lived up to 1668. See the essay upon him by H. Hardouin (Amiens, 1849); L. Feugère, *Étude sur la vie et les ouvrages de Du Cange* (Paris, 1852). Revised by E. S. Sheldon.

Du'cas, Michael (in Gr. Μιχαὴλ ὁ Δοῦκας): a Byzantine historian who flourished about 1450; related to the imperial family of Constantinople. He wrote a *History of the Fall of the Byzantine Empire*, covering the period from the death of John Palæologus VI. (1355) to the capture of Lesbos by the Turks (1462). This work is written in a barbarous style, but appears to be trustworthy (edited by Bekker for the Bonn series of Byzantine historians, 1834). D. after 1463.

Revised by A. R. Marsh.

Ducasse, Jean Baptiste: French naval commander and administrator; b. at Berne about 1640. He became a partner in the Senegal Company, and from 1678 to 1690 seems to have been principally engaged in shipping slaves from Africa to the West Indies; during this time he was twice captured by Dutch privateers and forced to pay high ransoms. In 1691 he was appointed governor of the French colony in Santo Domingo. He managed to repress the disorderly spirit of the buccaneers, who formed a large part of the colony, and in 1694 he employed them in an attack on the English at Jamaica, reducing that island almost to ruin. The English retaliated by ravaging the northern part of French Santo Domingo in 1695. In 1697 Ducasse commanded the land forces under De Pointis in a descent on Cartagena, one of the richest towns in South America. The place was forced to capitulate May 2, and, though a heavy ransom had been paid, the houses were sacked and a rich booty obtained. During the peace with Spain Ducasse went to that country, 1700, and returned in command of a Spanish fleet, having in convoy the Viceroy of Mexico and troops for Cartagena. He was attacked by the English squadron of Benbow Aug., 1701, and sustained a running fight of four days, but escaped with little damage. Returning to France 1703, Ducasse did brilliant service in Spain during the war of succession, attaining the rank of lieutenant-general; in 1714 he commanded the naval forces in the attack on Barcelona. On account of ill health he resigned, and died in France, July, 1715. Herbert H. Smith.

Duc'at [O. Fr. *ducat*, loan from Ital. *ducato* (: Fr. *duché*), dukedom, ducat < Lat. *duca'tus*, command (Late Lat.), dukedom, or a Low Lat. deriv. of Ital. *duca* < Byz. Gr. δοῦκα, from Lat. *dux* (gen. *ducis*), a leader. The meaning ducat was probably due to a motto on a coin struck by Roger II. of Sicily as Duke of Apulia (twelfth century): "Sit tibi, Christe, datus, quem tu regis, iste *ducatus*" (To thee, O Christ, be given this duchy which thou rulest)]: a gold coin which originated in Italy and was afterward coined in several countries of Europe. In 1559 the ducat was adopted as a legal coin of the German empire. There was much difference in the value of the ducats which circulated in various countries. Those of Austria, Holland, and Hamburg contain about 52·8 grains of pure gold, and are nearly equivalent to two U. S. gold dollars. The Spanish silver ducat (*ducado*) is worth about one dollar. The ducat is said to have been first struck in the sixth century by Longinus, Duke or *duca* of Ravenna, but Gibbon attributes its origin to the Dukes of Milan.

Ducato, Cape: See Cape Ducato.

Duccio, doot'chō, **di Boninsegna**: a Siennese painter of whom little is known personally except that he was the head of the Siennese school in the latter part of the thirteenth and early part of the fourteenth centuries, contemporary with but older than Giotto. The little work by him that remains, so far as can be stated positively, is at Sienna and in the National Gallery at London, where there are three small pictures. At Sienna there is a Madonna and a series of stories from the life of Christ, in which is shown the purest feeling for the sacred dramatic art and a sentiment of harmony in composition which has been the inspiration of many later painters. His art had nothing to do with that of Cimabue, save as it is like that descended from the Byzantine. W. J. Stillman.

Duces tecum: in law, a phrase sometimes used as an abbreviation of *subpœna duces tecum*. See Subpœna.

Du Chaillu, dü'shaă'yü', Paul Belloni: a traveler; b. in Paris, France, July 31, 1835; son of a French merchant in Equatorial Africa; naturalized as a citizen of the U. S. He explored the Gaboon region, etc., and published, besides other works, *Explorations and Adventures in Equatorial Africa* (1861); *A Journey to Ashango Land* (1867); *My Apingi Kingdom* (1871); *Wild Life under the Equator*; *Lost in the Jungle*; *The Country of the Dwarfs*; *Land of the Midnight Sun* (1881); *Age of the Vikings* (1889). He was the first white man to hunt the gorilla (1856), though specimens living and dead had been secured earlier (1851) by Dr. Henry A. Ford, of the Gaboon mission. Du Chaillu's fame is chiefly founded on his introduction of the gorilla to the knowledge of the general civilized public.

Duchâtel, dü'shaă'tel', Pierre (Lat. *Castellanus*): ecclesiastic; b. in Burgundy, France, about 1500. He became a thorough Greek scholar; assisted Erasmus; was a proofreader at Basel; studied at Rome; traveled in the East; was made Bishop of Tulle by Francis I. 1539; Bishop of Mâcon 1544; Bishop of Orleans 1551; grand almoner of France 1547. He was a virtuous and tolerant prelate, and a zealous advocate of the interests of the Gallican Church. D. at Orleans, Feb. 2, 1552.

Duchesne, dü'shen', André: historian; b. in Touraine, France, May, 1584; became geographer and historiographer to the king. He wrote many valuable works, among which are *Historiæ Normanorum Scriptores Antiqui* (Ancient Historians of the Normans, 1619) and *Historiæ Francorum Scriptores cætani* (Contemporary Writers of the History of the Franks, 5 vols., 1636–41). D. near Paris, May 30, 1640.

Duchobor'zi (i. e. champions of the Spirit): a sect among the peasantry of Russia. They seceded from the Molokan sect in the eighteenth century, and are not very numerous. The sect was founded by one Ilarion Pobirochin, who taught the Trinity and the transmigration of souls, and considered himself, it is said, an incarnation of God. Their doctrinal system, however, is not well known, but their ethical teachings show a striking resemblance to those of Quakers, especially in their dependence upon an "inward light." They refuse to take oaths, to serve in the army, to partake of the sacraments, and they reject a sacerdotal class, a liturgical service, etc. They were banished in consequence to the regions near the Sea of Azof. In 1841 they were exiled to the Trans-Caucasus, where they are now chiefly found.

Du'cie, Earls of (United Kingdom, 1837): Barons Ducie (England, 1763), Barons Moreton (United Kingdom, 1837). —Henry John Reynolds Moreton, third earl, P. C., F. R. S., b. June 26, 1827; was M. P. for Stroud 1852–53, and succeeded his father June 2, 1853.

Ducis, dü'sēs', Jean François: poet; b. at Versailles, France, Aug. 22, 1733; devoted himself entirely to poetry; declined the seat in the senate which Napoleon offered, and lived in deep retirement in his native city. Of his original works, the tragedy *Abufar* (1795) became very celebrated, but he is best known from his having translated and arranged for the French stage *Hamlet* (1769), *Romeo and Juliet* (1772), *Lear* (1783), *Macbeth* (1784), *King John* (1791), and *Othello* (1792). D. at Versailles, Mar. 31, 1816.

Duck [connected with verb *to duck*: Germ. *tauchen*]: the popular name for many waterfowl of the family *Anatidæ*, typified by the common duck *Anas boscas*. In a general way ducks are distinguished from geese on the one hand and the mergansers on the other by a broad, flattened bill, short legs, and scaled tarsi. There are about 150 species, grouped in two sub-families, the river ducks (*Anatinæ*) and sea ducks (*Fuligulinæ*), the former without, the latter with a flap or lobe on the hind toe. The members of these groups are by no means so restricted in their habitats as the popular names might seem to indicate, the fresh-water species going to the sea and *vice versa*. The ruddy duck and its allies are sometimes placed in a group apart (*Erismaturinæ*) on account of the long, narrow tail feathers, and the tree ducks (*Dendrocygna*), which have leanings toward the geese, are occasionally classified with those birds. There are ducks in nearly all parts of the globe, the species being most numerous in warm regions, the individuals in cold climates. The species inhabiting the temperate zones usually migrate north or south (according to the hemisphere they reside in) in spring to their breeding-places, while in winter they assemble in vast flocks. Male ducks are generally larger and handsomer than the females, and have a peculiar bony enlargement of the windpipe just above the bronchi. The majority of species nest on the ground, some in holes, while a few build in hollow trees or even among the branches. The eggs are from six to sixteen in number, the period of incubation three to four weeks; the young are clothed with down and run about as soon as hatched. Most ducks fly well, and some are estimated to make from 60 to 90 miles an hour, the old squaw (*Clangula hyemalis*) of the Atlantic coast of North America being one of the swiftest. On the other hand, at least one species, the steamer-duck (*Tachyeres cinereus*) of South America, is flightless in its adult form, although it flies when young, the growth of the wings not keeping pace with that of the body. In the cold regions of the north ducks and their eggs form important articles of food, while their skins and the down used for lining their nests are made into garments.

The different breeds of domesticated ducks, with the probable exception of certain varieties in China and the neighboring countries, are all descended from the mallard. In domestication ducks become polygamous, although they always live in pairs when wild. The male also ceases to care for his offspring, and even the females are sometimes not good mothers, so that it is always better to hatch ducks' eggs under a hen. The eggs, owing to their somewhat rank taste, are less prized than those of the hen, but the flesh of some breeds, such as the Aylesbury duck, is considered a great delicacy.

Ducks seem to have been domesticated at a comparatively recent date, for they were unknown to the Egyptians, and Roman writers of the first century speak of the necessity of keeping them covered with netting to prevent their escape. The mandarin-duck of China, the *Aix galericulata*, a near relative of the summer duck of the U. S., is regarded in China as an emblem of conjugal affection. F. A. Lucas.

Duckbill, or **Water-mole**: a monotrematous mammal (*Ornithorhynchus anatinus*) of Van Diemen's Land and Australia. It deviates less from the birds than any other mammals except the Tachyglossidæ (*q. v.*). The duckbill is the only animal of its genus. It is about 15 inches long, with a brown fur. It has a sort of horny tooth near the base of each jaw or mandible, and the males have spurs on the hind legs. The female has no nipple, but the young (which are hatched from eggs and are at first very slightly developed) draw their milk through a slit-like opening.

Duckbill: *Ornithorhynchus*.

This animal inhabits ponds and quiet streams, where it swims about on the surface of the water with its head somewhat elevated, often diving for its food, which consists of insects and other small aquatic animals. It climbs trees with facility, and is sometimes seen in small groups on the limbs of trees near the water. It digs a burrow, often 30 feet long, in the river-bank, with one opening above and another below water. This burrow is projected in a serpentine course into the bank and ascends toward its termination, and at the end is built the nest, which is composed of dried grasses, leaves, weeds, etc., strewn over the floor. See Ornithorhynchidæ.

Ducking-stool: a contrivance formerly used in Great Britain and in some parts of the U. S. for the punishment of scolds. The most common form seems to have been that of a strong wooden chair attached to one end of a beam, which pivoted midway on a post planted in the ground at the edge of a pond or stream. The woman having been secured in the chair, the beam was worked up and down by a chain at the other end, and she was thus plunged into the water, or "ducked." The practice of ducking originated toward the close of the fifteenth century, and very generally prevailed in Great Britain until the early part of the eighteenth, and in some places even to the beginning of the nineteenth century.

Duck River: a river of Tennessee; rises in Coffee County; flows nearly westward through Middle Tennessee, and enters the Tennessee River in Humphries County. Length about 250 miles.

Duckweed: a small and usually floating plant, with unisexual flowers, without calyx or corolla, and with loose hanging roots. The duckweeds belong to the family *Lemnaceæ*, and are related to the arums. They are widely distributed over the world, and several species are found in the U. S., covering the surface of stagnant waters with their flat green fronds.

Duclerc, Charles Théodore Eugène: statesman; b. at Bagnères-de-Bigorre, France, Nov. 9, 1812; entered the office of *Le Bon Sens* in Paris, 1836, as a proof-reader, but soon rose to the position of editor; was on the staff of the *National* 1840–46, contributing a series of important financial articles. In the Revolution of 1848 he took an active part, displaying energy and bravery in the critical days of May and June. As representative to the National Assembly (1871) from the departments of the Landes and the Basses-Pyrénées, he led the Republican Left and figured prominently in debate. He was elected vice-president of the National Assembly in 1875, and senator for life Dec. 10 of that year. On Aug. 7, 1882, Duclerc became Premier, but his ministry was lacking in strength, and fell in Jan., 1883, on account of its persistent demand for the expulsion from French territory of princes who might be dangerous to the republic, and its refusal to consent to a compromise bill. D. July 21, 1888. F. M. Colby.

Duclos, dü'klō', Charles Pineau: author; b. at Dinan, France, Feb. 12, 1704; wrote several successful romances; admitted into the French Academy in 1747; appointed historiographer of France in 1753. Among his works are moral essays entitled *Considérations sur les Mœurs de ce Siècle* (Reflections on the Manners of this Century, 1750) and *Mémoires secrets sur les règnes de Louis XIV. et XV.* (Secret Memoirs of the Reigns of Louis XIV. and XV., Paris, 1791). D. in Paris, Mar. 26, 1772.

Ducrot, dü'krō', Auguste Alexandre: soldier; b. at Nevers, Feb. 24, 1817; educated at Saint-Cyr; appointed lieutenant in the army Dec. 27, 1840, and general of division June 7, 1865. After the battle of Sedan he declined those favors which the French officers could obtain on their word of honor, and was incarcerated at Pont-à-Mousson. He escaped and reached Paris. He commanded at Rueil, La Jonchère, and Buzenval, and partook in the various sorties. After the conclusion of peace he wished to retire to private life, but was appointed commander-in-chief of the Eighth Army-corps, stationed at Bourges. In poli-

tics he opposed every scheme for the re-establishment of the empire. He wrote *La Journée de Sedan*; *La Verité sur l'Algérie* (1871); *Observations sur le système de la défense de la France*; *Défense de Paris* (4 vols., Paris, 1875–78). D. in Paris, Aug. 17, 1882.

Ductility [Lat. *ducti'litas*, deriv. of Lat. *duc'tilis*, capable of being drawn, capable of extension; *du'cere*, draw]: capability of being drawn out into a long and slender form. The metals having the greatest ductility are gold, silver, platinum, aluminium, and iron. A grain of gold may be drawn into 500 feet of wire, and a wire of platinum not exceeding a 30,000th of an inch in diameter has been obtained by placing a fine wire of platinum in the axis of a larger silver wire, then drawing the compound wire in the usual mode, and finally dissolving the silver by nitric acid. The ductility of glass (when melted or heated to a red heat) is almost unlimited. The ductility of many bodies is modified by temperature.

Du Deffand, Marquise: See Deffand.

Dudevant, dü'de-vaăn', Madame: See Sand, George.

Dudley: municipal and parliamentary borough of England; in a detached part of Worcestershire and South Staffordshire; 9 miles W. N. W. of Birmingham (see map of England, ref. 10–G). It is well built, and is one of the chief seats of the iron-trade. Here are manufactures of glass, grates, fire-irons, nails, vices, chain-cables, etc. Near Dudley are the ruins of Dudley Castle, founded in 760 A. D. by Dudo, a Saxon prince. Mines of coal and iron and quarries of Silurian limestone are worked in the vicinity. Dudley returns one member to Parliament. Pop. (1891) 45,724; (1901) 48,809.

Dudley, Benjamin Winslow, LL. D.: surgeon; b. in Spottsylvania co., Va., in 1785; he began the study of medicine in Lexington, Ky., and took his degree in the University of Pennsylvania in 1806. He went to Europe in 1810, and during his four years of absence studied with Sir Astley Cooper, Abernethy, Cline, Larrey, Dubois, Boyer, Marjolin, and others. In 1817, in conjunction with Blythe, Caldwell, Brown, Richardson, Drake, etc., he organized the medical department of the University of Transylvania, which was long the leading school of medicine in the West. He became known as one of the most successful surgeons of his day, and is said to have performed lithotomy 225 times with but six deaths. D. at Lexington, Ky., Jan. 20, 1870.

Dudley, Charles Edward: U. S. Senator; b. in Staffordshire, England, May 23, 1780; emigrated to the U. S. in 1794. He was elected mayor of Albany in 1821, and a Senator of the U. S. for an unexpired term of four years in 1829. D. in Albany, Jan. 23, 1841. The Dudley Observatory at Albany, N. Y., was founded by his widow, who gave it $70,000.

Dudley, Edmund: minister of Henry VII. of England; b. about 1462; notorious for his extortions from the people in connection with his associate Empson, in order to gratify the king's avarice; became privy councilor, but was sent to the block by Henry VIII. Aug. 18, 1510. He was the father of John Dudley, who was created Earl of Northumberland in 1551. See Northumberland, John Dudley, Duke of.

Dudley, Henry Bate: journalist and dramatist; b. at Fenny-Compton, England, 1745. He was educated at Cambridge and destined for the Church, but devoted his time and energy chiefly to literature. In 1775 he founded the *Morning Post* and in 1780 the *Morning Herald*, both of which achieved a great and rapid success. Of his plays the most important are *Flitch of Bacon* (1779); *The Woodman* (1791); *The Blackamoor Washed White* (1776); and *The Travelers in Switzerland* (1793). He was an intimate friend of Garrick. D. in London, Feb. 1, 1824.

Dudley, Joseph: Colonial Governor; son of Thomas Dudley, deputy Governor of Massachusetts; b. in Roxbury, Mass., July 23, 1647. He was appointed chief justice of Massachusetts in 1686, chief justice of New York in 1690, and was Governor of his native province from 1702 to 1715. D. in Roxbury, Apr. 2, 1720.

Dudley, Paul, F. R. S.: lawyer; son of Joseph Dudley; b. Sept. 3, 1675; graduated at Harvard 1690, and studied law at the Temple in London. He was distinguished for eloquence and talents; became attorney-general of Massachusetts in 1702, and chief justice in 1745; founded the Dudleian Lectureship at Harvard College. D. in Roxbury, Jan. 25, 1751.

Dudley, Thomas: Colonial Governor; b. at Northampton, England, in 1576; served in Holland in Queen Elizabeth's army, and in 1630 went to Boston as deputy Governor of Massachusetts Bay under his son-in-law, Governor Bradstreet. He held the office twelve years. He was Governor of the colony in 1634, 1640, 1645, and 1650, and became major-general in 1644. D. July 31, 1653, at Roxbury, where he left an estate long held by his descendants.

Dudley, Thomas Underwood: bishop; b. in Richmond, Va., Sept. 26, 1837; graduated at the University of Virginia; served in the Southern army during the civil war; studied theology after the close of the war, and was ordained deacon in the Protestant Episcopal Church in 1867. He became rector of Christ church, in Baltimore, in 1869; was chosen assistant Bishop of Kentucky in 1874, and in 1884 became bishop of the diocese.

Duel [Fr. *duel*: Ital. *duello*, based upon *duellum*, the Old Lat. form of *bellum*, which was adopted into Romance on the pedantic but mistaken presumption that the word implied a contest between *two* (*duo*); the word may be connected with Gr. δαΓΙς, battle, δήΓιος, hostile, or with Sanskr. *dvis-*, hate]: originally a trial by battle resorted to by two individuals, either for the purpose of determining the guilt or innocence of a person charged with a crime, or of deciding a disputed right; in more recent times a hostile meeting between two persons in consequence of an affront given by one to the other, and for the purpose of affording satisfaction to the injured party.

The practice of fighting duels as a means of deciding private differences seems to have originated, at a comparatively recent date, with the feudal system. The appeal to arms as an alternative to the trial by ordeal was placed under definite regulations by a code promulgated by Philippe le Bel, of France, in 1306. This same monarch, however, discouraged private duels.

In England, dueling does not appear to have prevailed until the latter part of the reign of Queen Elizabeth. At this period appeared the famous *Treatise of Honor*, by Vincentio Saviolo, a fierce and punctilious Italian. He was a fencing-master by profession. His work, published in 1594—now little known—appears to have been adopted as a standard book of reference in cases of supposed insult. Saviolo resolves all quarrels into the *lie*—that is, he supposes the original insult to be followed by a regular series of replies and retorts, until one of the parties is reduced to give the lie direct; which, like the phrase "stupid youth" in some German universities, was immediately followed by the appeal to arms.

Henry II. of France issued an edict in 1574 prohibiting the public or judicial combat. This decree was caused by the death of his favorite La Chataigneraye from wounds received in the lists. The public duel survived longer in Italy. Its abolition in France was not followed by the good effects which the statesmen of those days probably anticipated from it. Private duels, conducted with a sanguinary spirit before unheard of, became very prevalent. Brantôme gives instances of duelists who prided themselves on advantages which they had taken of their opponents, and were not less esteemed in society for having done so; there were said to be regiments in the same service, the officers of which were bound to fight one another whenever they met. Lord Herbert of Cherbury mentions the honor in which the French ladies held the brave Balagny, a man with neither wit, figure, nor fortune, but whose merit consisted in the fact that he had killed eight or nine of his friends in single combat.

In the reign of Henry III. the custom of the seconds taking part in the quarrels of their principals seems first to have been established—a custom which did not cease till the beginning of the eighteenth century. When such practices were rife in all parts of France we can scarcely doubt the extraordinary assertions of writers of those times—that 120 gentlemen were killed in duels in a single province in six months; that in the reign of Henry IV. 4,000 fell in two years; and that this mania cost France more gentle blood than thirty years of civil war. Henry IV. issued edicts against dueling: Louis XIII. proceeded against it with such severity that it is said wounded duelists were dragged from the field to the gibbet; but this extreme severity, as usual in such cases, appears to have had no good effect. In the minority of Louis XIV. the Duke de Nemours, a prince of the blood, fell, with two of his seconds, in a quarrel with another grandee. Soon after this many noblemen and gen-

tlemen of undoubted courage made a voluntary compact to abstain from dueling. This resolution was seconded by Louis XIV. when of age, in several edicts. It should be remembered to the honor of that monarch that he labored during his whole life to correct this abuse, and with considerable success. One of his expedients was the establishment of a court of chivalry, the Maréchaussée or Connétablie, the members of which were the marshals of France, which was to decide on all questions in which a gentleman might conceive his honor to be involved. French duels are generally supposed to have become rather farcical. Harmless enough, surely, were those of Gambetta and Fourton, who in 1878 fought on a foggy morning at a distance of forty paces, and of Gen. Boulanger and M. Fouquet, in 1888, in which the general "spitted" himself on the rapier of the retired attorney. Killing in duels in France is now punishable as homicide, and a civil action lies on behalf of the friends of the man who has been slain.

The first attempt made in Great Britain to introduce legislative enactments for the suppression of duels is said to have taken place in 1713, when, after the duel of the Duke of Hamilton with Lord Mohun, a bill for that purpose was brought into the Commons, but lost on the third reading. A challenge to fight is now a high misdemeanor. In Scotland as late, it would appear, as the middle of the sixteenth century, licenses for dueling were granted by the crown, and formed a source of revenue: killing in a duel without license was murder. In Germany duels are punishable with imprisonment in a fortress, yet in 1887 an officer was expelled from the army for refusing to challenge one who had insulted him! In no country were duels more prevalent formerly than in Ireland. In France the period of the restored monarchy (1815–48) was one of those in which duels were most rife, not only among the military, but among civilians; but since 1848 they have greatly diminished. In Great Britain a heavy blow was aimed at dueling in the army by a new article (the 98th) inserted in the articles of war of 1844, rendering it an offense punishable by cashiering. Duels are comparatively rare in Belgium, although the soil of that country is frequently chosen for the encounters between gentlemen from adjacent states.

The first duel in North America is said to have occurred at Plymouth, Mass., in 1621. The most famous duel in the U. S. was that between Aaron Burr and Alexander Hamilton, in 1804, in which the latter lost his life. Other notable duels were those between Henry Clay and John Randolph, Apr., 1826; between Andrew Jackson and Charles Dickinson, in which the latter was killed; and between Thomas H. Benton and Lucas, the latter being killed. In the U. S. by common law the survivor and the seconds are guilty of murder when one of the parties is killed. It is, moreover, not only made illegal by statute, but is forbidden in the army and navy by the articles of war. Notwithstanding all the efforts made to suppress dueling, it is noteworthy that the custom is still prevalent in some form, more or less serious, in all but the English-speaking countries.

The weapons usually employed in duels are the pistol and the sword, or rapier. In Scandinavian countries what was known as the "girdle duel" was formerly practiced, in which the two combatants were stripped, tied together by a girdle, and a knife given to each. They then fought until one or both succumbed. This duel is the subject of the famous statue on the quay at Stockholm. In Tibet it is reported that the two adversaries throw a white piece of metal and a black piece of metal into a caldron of boiling water, plunge their hands simultaneously at a given signal into the water, and the one who succeeds in securing the white piece vindicates his honor. In Germany, in what is curiously enough called the "American duel," the two parties draw lots, and the unlucky one is bound to die by his own hand in a specified time. The most interesting German dueling custom is the student *Mensuren*. Nearly every student belongs to a *Corps*, as a member of which he is bound to fight. If after a reasonable length of time he has had no quarrel thrust upon him, the leader of the corps informs him that he must have a duel within a certain period. He is then obliged to secure a quarrel with some one—perhaps he may select his best friend. The duels are fought with *Schläger*—long, thin, double-edged weapons which are sharpened only at the extremities. The parts of the body liable to be hit and also the sword arm are protected by padding. The throat is protected by a stiff collar and the eyes by heavy goggles, so that the only exposed parts are the face and brow. Wounds are seldom serious, but often leave ugly scars, of which the bearers are very proud. The custom is senseless enough, but seems to be firmly fixed in student tradition, and has been sanctioned by German leaders, notably by Prince Bismarck. Since 1883 these duels have been punishable with imprisonment, but the law is not enforced with much rigor. Revised by C. H. THURBER.

Duen'na (in Sp. *dueña*): the chief lady-in-waiting on the Queen of Spain; in a more general sense a woman holding a middle station between a governess and a companion, and appointed to take charge of young ladies.

Duer, JOHN, LL. D.: jurist; b. in Albany, N. Y., Oct. 7, 1782; son of Col. Duer. He practiced law in New York city, whither he removed in 1820, and was elected a judge of the superior court of that city in 1849. Among his works is *The Law and Practice of Marine Insurance* (2 vols., 1845–46). He succeeded Oakley as chief justice of the superior court in 1857. D. on Staten Island, Aug. 8, 1858.

Duer, WILLIAM ALEXANDER: jurist; b. in Dutchess co., N. Y., Sept. 8, 1780; a brother of John Duer. His mother was a daughter of Gen. William Alexander, claimant of the earldom of Stirling. He was admitted to the bar in 1802, and became a partner of Edward Livingston in New Orleans, but returned to the city of New York about 1812. He was a judge of the Supreme Court of New York from 1822 to 1829. In the latter year he was chosen president of Columbia College. He was the author of a *Treatise on the Constitutional Jurisprudence of the United States* (1856). D. in New York, May 30, 1858.

Duez, dü'ā', ERNEST ANGE: figure-painter; b. in Paris, France, Mar. 8, 1843. Pupil of Carolus-Duran; first-class medal, Salon, 1879; officer Legion of Honor 1889. His pictures of modern Parisian life are charming. He sometimes painted historical and religious subjects. His triptyeh *St. Cuthbert* is a work of fine quality, and is in the Luxembourg Gallery, Paris. D. in Paris, Apr. 5, 1896. W. A. C.

Dufaure, dü'fōr', JULES ARMAND STANISLAS: orator and statesman; b. at Saujon, in Charente-Inférieure, France, Dec. 4, 1798; practiced law at Bordeaux; was elected to the Chamber of Deputies in 1834, and became an influential leader of the liberal party. After the formation of the republic in 1848 he was a moderate republican member of the Assembly, and was Minister of the Interior for about two months ending in December of that year. He filled the same office from June to Oct., 1849, and was driven from the public service by the *coup d'état* of Dec., 1851, after which he gained great eminence at the bar. He was appointed Minister of Justice by Thiers in Feb., 1871. D. at Rueil, June 27, 1881.

Dufay, dü'fā', CHARLES FRANÇOIS DE CISTERNAY: savant; b. in Paris, France, Sept. 14, 1698. He was the author of the theory of two kinds of electricity, vitreous and resinous, and wrote treatises on chemistry and other sciences. D. July 16, 1739.

Duff, ALEXANDER, D. D., LL. D.: Presbyterian missionary; b. on a farm near Pitlochry, Perthshire, Scotland, Apr. 26, 1806; educated at St. Andrews. In 1829 he was ordained the first missionary of the Kirk to India, and labored there with great zeal and success for many years. He departed from the traditional methods of missionary work, and laid emphasis upon the value of education in secular matters alongside of the religious. In 1839 he published a work *On India and the Missions*. After the disruption of the Scottish Church in 1843 he was the chief agent of the mission which the Free Church maintains at Calcutta. He visited the U. S. in 1854, returned to India in 1855, and remained there until 1863. After his return to Scotland he became Professor of Evangelistic Theology in the theological schools of the Free Church. D. in Edinburgh, Feb. 12, 1878. See his *Life* by George Smith (2 vols., London, 1879; 2d ed. 1881).

Dufferin and Ava, FREDERICK TEMPLE HAMILTON BLACKWOOD, Marquis of: British diplomatist; b. in Florence, Italy, June 24, 1826, and educated at Eton and at Christ Church, Oxford. He succeeded to his father's title July 21, 1841; for a few years subsequent was lord-in-waiting to the Queen; in 1855 was attached to the mission of Lord John Russell to Vienna; in 1860 sent as British commissioner to Syria to investigate the massacre of Christians there; was Under Secretary of State for India 1864–66, and in the latter year for a short time Under Secretary for War. In 1868 he was appointed Chancellor of the Duchy of Lancaster; created a British earl in 1871, and in 1872 appointed Gov-

ernor-General of Canada, an office which he held for six years. He secured a great degree of popularity during his term of office in Canada owing to his courtesy, and to his ability and tact in his eloquent addresses. In Feb., 1879, he was appointed British ambassador at St. Petersburg; transferred to Constantinople in May, 1881; in Oct., 1882, proceeded to Cairo to settle a difficulty between the British Government and Egypt: in 1884 was appointed Viceroy of India; in 1888 British ambassador at Rome; the same year was created Marquis of Dufferin and Ava; and was British ambassador at Paris, 1891–96, when he retired from the diplomatic service. In 1878 he was elected president of the Royal Geographical Society; received the degree of LL. D. from Harvard same year, and that of D. C. L. from Oxford in 1879. Among his published works are *Letters from High Latitudes* (London, 1860); *Contributions to an Inquiry into the State of Ireland* (1866); *Speeches in India* (1890).—His wife, Georgina Rowan Hamilton, to whom he was married in 1862, is author of *Our Viceregal Life in India* (1889) and *My Canadian Journal* (1891). *Lispings from Low Latitudes* (1863), erroneously attributed to his wife, was the production of his mother. Neil Macdonald.

Duffield, George, D. D.: clergyman; b. in Lancaster co., Pa., Oct. 7, 1732; son of George Duffield, who emigrated from Ireland to Pennsylvania about 1732, and became an extensive landholder. The son graduated at Princeton College in 1752, and was tutor for two years in that institution; ordained to the Presbyterian ministry in 1761; after ministering to churches at Carlisle, Big Springs, and Monaghan, labored as a missionary in Maryland and Virginia as well as in his native State; opposed the Old Light party in the Presbyterian Church (see Old Lights); in 1771 was settled over the Third Presbyterian church of Philadelphia; noted for patriotism; became chaplain in the Revolutionary army, and was associate chaplain of the first Continental Congress (1774); was active in reorganizing the Presbyterian Church after the war; author of *An Account of a Missionary Tour through Western Pennsylvania in 1766*, and *A Thanksgiving Sermon on Peace*, delivered in 1783. D. in Philadelphia, Feb. 2, 1790.

Duffield, George, D. D.: clergyman; grandson of George Duffield (1732–90); b. at Strasburg, Lancaster co., Pa., July 4, 1794; educated at the University of Pennsylvania. He was for many years a pastor of Presbyterian churches in Philadelphia, New York, and Detroit, and was an active leader of the "New School" movement. D. in Detroit, Mich., June 26, 1869.

Duffield, George, D. D.: clergyman; son of George Duffield (1794–1869); b. at Carlisle, Pa., Sept. 12, 1818; graduated at Yale College 1837, and at Union Theological Seminary, New York city, 1840; held various Presbyterian pastorates. Author of the familiar hymns *Blest Saviour, Thee I love* (1851) and *Stand up, stand up, for Jesus* (1858). D. at Bloomfield, N. J., July 6, 1888.

Duffield, John Thomas, D. D., LL. D.: mathematician; b. in McConnellsburg, Pa., Feb. 19, 1823; graduated at Princeton College 1841, and at the Theological Seminary there 1844. In the college he became successively tutor in Greek 1845, Adjunct Professor of Mathematics 1847, Professor of Mathematics 1856, Professor of Mathematics and Mechanics 1862, and Professor of Mathematics again 1871. He published *The Princeton Pulpit* (1850) and various important articles and pamphlets, among them *The Discovery of the Law of Gravitation*; *That Blessed Hope* (1866); *The Philosophy of Mathematics* (1867); *Is the Origin of Man by Evolution consistent with Biblical Anthropology?* (1878); *Discourse at the Funeral of President McLean* (1886). D. in Princeton, Apr. 10, 1901. Willis J. Beecher.

Duffield, Samuel Augustus Willoughby: Presbyterian clergyman and religious poet; son of George Duffield (1818–88); b. in Brooklyn, N. Y., Sept. 24, 1843; graduated at Yale 1863; from 1882 preached at Bloomfield, N. J. Among his publications are *Warp and Woof* (New York, 1870); *English Hymns, their Authors and History* (1886); and *Latin Hymn-writers and their Hymns* (posthumous, completed and edited by Robert Ellis Thompson, 1889). D. at Bloomfield, N. J., May 12, 1887. H. A. Beers.

Duffy, Sir Charles Gavan: statesman and author; b. in Monaghan, Ireland, 1816; edited a journal in Dublin and then in Belfast; was one of the founders of the *Nation*, which became the organ of the Young Ireland party, and at first zealously supported O'Connell; was tried and convicted of sedition along with O'Connell, but the House of Lords quashed the conviction on appeal. He was again tried with the leaders of the Young Ireland party in 1848 for treason-felony, but was acquitted. He was elected to Parliament from New Ross 1852, but resigned 1856 and emigrated to Australia, where he filled important offices in Victoria, becoming Prime Minister of the colony 1871. He is author of *The Ballad Poetry of Ireland*; *Young Ireland: a Fragment of Irish History, 1840–50* (1880); and *Four Years of Irish History, 1845–49* (1883). F. M. Colby.

Dufile: See the Appendix.

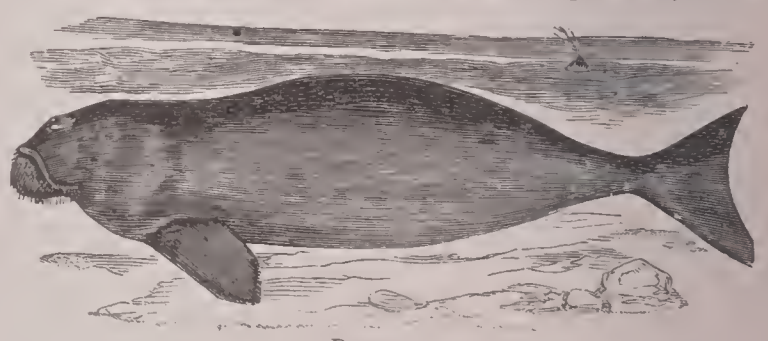
Dufour, dü'foor', Guillaume Henri: general; b. at Constance, Baden, Sept. 15, 1787; entered the French army in 1809, and rose to the rank of captain in the Hundred Days, but retired from the French service after the battle of Waterloo and resumed his Swiss citizenship. In 1847 he was chosen commander-in-chief of the federal army raised to defend the integrity of the republic against the Roman Catholic Sonderbund. He quickly quelled the rebellion. In 1864 he was president of the Geneva convention. Among his works are *De la fortification permanente* (On Permanent Fortification, Geneva and Paris, 1824) and *Cours de Tactique* (Manual of Tactics, 1840). D. in Geneva, July 14, 1875.

Duganne, dü'găn', Augustine Joseph Hickey: poet and novelist; b. in Boston, Mass., in 1823; published *The Ring of Destiny*, several volumes of poems, and a *Class-book of Governments and Civil Society* (1859). Among his poems are *The Iron Harp* (1847). He commanded a regiment in the civil war. D. in New York, Oct. 20, 1884.

Dugdale, Sir William: antiquary; b. near Coleshill, Warwickshire, England, Sept. 12, 1605; appointed blanch-lion pursuivant-extraordinary in 1638; rouge-croix pursuivant-in-ordinary in 1640; became Chester herald in 1644; was a royalist in the civil war; became Norroy king of arms in 1660, after the restoration of Charles II., and Garter king of arms in 1677. Dugdale and Dodsworth published an important work on English monasteries entitled *Monasticon Anglicanum* (3 vols., 1655–73). Among his other works are *Antiquities of Warwickshire* (1656), which is highly esteemed, and *Origines Juridiciales* (1666). D. Feb. 10, 1686. See *Life and Diary of Sir W. Dugdale* (edited by Hamper, 1827).

Dughet, dü'gā', Gaspard (known in France by the name of Gaspard Poussin): landscape-painter; b. in Rome, 1613. He studied with his brother-in-law, Nicholas Poussin, up to the age of eighteen. He then worked under Claude Lorrain. After this, his reputation being made, he worked for the Princes Borghese and Panfili, and the Constable Colonna and even Bernini employed him to decorate rooms. He was a popular landscape-painter; his works are to be found in almost every gallery in Italy. Many of his pictures have been engraved in England. D. in Rome, 1675. W. J. S.

Du'gong [a word of Malay origin]: a marine animal of the genus *Halicore*, belonging to the *Sirenia*. The dugong of the Australian seas (*Halicore australis*) is generally about



Dugong.

8 feet long. The upper lip is thick and fleshy, and forms a kind of snout; the upper jaw bends downward almost at a right angle; the eyes are very small, with a nictitating membrane; the skin thick and smooth. In its internal structure it has considerable resemblance to the pachyderms, and it feeds chiefly on algæ. It is also remarkable for the ventricles of the heart being entirely detached from each other. Its flesh is said to resemble beef, and is prized as food. The oil is recommended as a substitute for cod-liver oil, and there is a regular fishery for the dugong in Moreton Bay. The species inhabiting the Indian Ocean is *Halicore dugong*, that found in the Red Sea has been called *Halicore tabernaculi*, from a belief that the skin of the animal was used by the Jews to cover the tabernacle.

Revised by F. A. Lucas.

Duguay-Trouin, dü′gü-ā′troo′ăn′, René: French naval officer and soldier; b. at St.-Malo, June 10, 1673. From 1690–97 he commanded a privateer, and in the latter year he entered the royal navy as captain, serving with distinction in the war of the Spanish succession. In 1707 he captured three English warships with a convoy of about sixty merchant-vessels and transports. When it was known in France that Charles Duclerc had failed in his attack on Rio de Janeiro, and that he had been imprisoned and assassinated, Duguay-Trouin resolved to repair this disgrace to the French arms. Encouraged by the Government, he got together at St.-Malo 16 vessels and 4,500 men, and with this squadron he appeared at Rio de Janeiro Sept. 12, 1711. The governor, Francisco de Castro Moraes, though he had superior forces, made no resistance, and finally fled from the city. The French took possession Sept. 22, sacked the public and private buildings, and, after exacting a ransom from the cowardly governor, sailed away in triumph. Duguay-Trouin subsequently served with the French army, attaining the rank of lieutenant-general. D. Sept. 27, 1736.

Herbert H. Smith.

Du Guesclin, dü′gā′klăn′, Bertrand: general; b. near Rennes, France, about 1314; fought against the English, who occupied many places in France, and defeated the Duke of Lancaster at Rennes in 1356. In 1366 he commanded an army which fought for Henri de Trastamare against Peter the Cruel of Castile. He gained a victory over Peter, but he was defeated and taken prisoner by the English Black Prince in 1367. He paid a large ransom, and was soon released. Having been appointed Constable of France in 1369, he defended the country against the English invaders, whom he expelled from nearly every province of France before 1375. D. July 13, 1380. See Froissart, *Chronicles*; Jamison, *Life of Duguesclin* (1864).

Duhamel, dü′ăă′mel′, Joseph Thomas: Roman Catholic archbishop; b. at Contrecœur, Province of Quebec, Canada, Nov. 6, 1841, and educated at the College of Ottawa. He was ordained priest in 1863, went to Rome in 1869, and in 1874 was consecrated Bishop of Ottawa. He founded several Christian Brothers' schools there; revisited Rome in 1878, 1882, and in 1886 was appointed first Archbishop of Ottawa. In 1882 he was made a Count of the Holy Roman Empire.

Neil Macdonald.

Duhamel du Monceau, -dü-mōn′sō′, Henri Louis: botanist; b. in Paris, France, in 1700. Among his numerous useful works are a treatise on the culture of land (1751); a treatise on the structure and physiology of plants, entitled *De la Physique des Arbres* (1758); and a work on the elements of agriculture (1762). He was a member of the Academy of Sciences. D. Aug. 23, 1782.

Duhring, Louis A., M. D.: dermatologist; b. in Philadelphia, Pa., Dec. 23, 1845; educated at the University of Pennsylvania, where he afterward became Professor of Dermatology; ex-president American Dermatological Association; member of the British, French, and New York Dermatological Societies. Author of *Treatise on Skin Diseases* (1st ed. 1887, subsequently 2d and 3d eds., translated into French, Italian, and Russian); *Atlas of Skin Diseases* (1876–80); *Epitome of Skin Diseases* (1882).

Duillian Column: the *Columna Rostrata* which was erected in the forum at Rome (as Quintilian states) to commemorate the victory of the consul Caius Duillius in the battle of Mylæ, off the northern coast of Sicily, 260 B. C.—the first naval victory of the Romans over the Carthaginians. Columns of this kind were called *rostratæ*, from having the beaks of ships (*rostra*) projecting on each side. The restoration of the Duillian column by Michaelangelo is now preserved in the Palazzo de' Conservatori on the Capitoline Hill, retaining on the pedestal a portion of the original inscription in archaic Latin. The inscription has been copied and printed, and may be found at the end of the fourth book of Duker's *Florus*.

Henry Drisler.

Duisburg, doo′is-boorkh: a town of Rhenish Prussia; on the Ruhr and near the Rhine; 16 miles N. of Düsseldorf (see map of German Empire, ref. 4–C). It is an old town, and has a church founded in 1187. Here is a gymnasium, with a Realschule and a high school for girls; also manufactures of cotton and woolen fabrics, hosiery, porcelain, soap, etc. In the thirteenth century it was a city of the Hanseatic League. The railway which connects Cologne with Minden passes through this place, which has been declared a free port. Pop. (1895) 70,272.

Dujardin, dü′zhăăr′dăn′, or **De Jardyn**, Karel: painter; b. in Amsterdam, Holland, about 1640; was a pupil of Berghem. He studied in Rome and painted pastoral landscapes. He made also a series of fifty etchings of rural subjects, which are much sought. During a second visit to Italy he died at Venice, Nov. 20, 1678.

Duke [O. Fr. *duc* = Ital. *duca*, from Byz. Gr. δούκα, loan from accus. form of Lat. *dux*, leader; the regular successor of *dux* may be found in Ven. *doge*]: a title originally given in the Byzantine empire to military governors of provinces, and previous to the time of Theodosius regarded as inferior to that of count. Dukes in Germany became in course of time the chief princes of the empire. In France and Italy dukes form the second rank in the nobility, being next below princes; in England they are first. The title was introduced in the reign of Edward III., whose eldest son, the Black Prince, was made Duke of Cornwall. In 1351 Henry Plantagenet, Earl of Lancaster, became Duke of Lancaster. The dignity thus created in these instances was not a dukedom by tenure; it has always remained a personal title only, hereditary according to the limitations of the patent. The Austrian archdukes and the Russian grand dukes are princes of the blood. The princes of the royal house of Saxony also have the title of duke. In Bavaria and Würtemberg the side branches of the reigning family are called "dukes in Bavaria" and "Dukes of Würtemberg." In Prussia the title was conferred in 1840 upon the Prince Hohenlohe Waldenburg Schillingsfürst (Duke of Ratibor), and in 1861 upon Prince Hohenlohe Ochringen (Duke of Ujest). Several reigning sovereigns of German states have the title of duke (Anhalt, Brunswick, Saxe-Coburg, Saxe-Meiningen, Saxe-Altenburg) or of grand duke (Baden, Hesse, Oldenburg, Saxe-Weimar, Mecklenburg-Schwerin, and Mecklenburg-Strelitz). Royal dukes in Great Britain are princes of the blood. British dukes have no territorial jurisdiction. The English dukes are, next to the peers of the royal blood and the Archbishops of Canterbury and York, the first peers of the realm.

Dulce y Garay, dool′thā-ee-gaă-raa′ĕe, Domingo: Marquis of Castell-Florit; Spanish general; b. at Sotés, Logroño, May 7, 1808. He entered the College of Cadets, 1823; took part in the Carlist war; was captain-general of Catalonia in 1854, and in July of that year aided in the triumph of the revolution. From Dec. 10, 1862, to May 30, 1866, he was captain-general of Cuba, distinguishing himself by the strong measures which he took for the suppression of the slave-trade; in two years he recovered 3,565 Africans who had been illegally imported. On his return to Spain he proposed a plan for the gradual abolition of slavery in Cuba. He conspired with Prim, Torre, and others for the dethronement of Isabel II., but took no active part in the revolution. In June, 1869, he again became captain-general of Cuba, but the success of the insurgents forced him to resign. Owing to sickness he retired to Amélie-les-Bains in France, where he died in Dec., 1869.

Herbert H. Smith.

Dulcigno, dool-cheen′yō (anc. *Olcinium*; Turk. *Olgoon*): town and seaport, formerly of European Turkey; lat. 41° 54′ N., lon. 19° 12′ E.; on the Adriatic Sea; 14 miles W. S. W. of Scutari (see map of Turkey, ref. 3–B). It is the seat of a Catholic bishop, and has a trade in timber and oil. It was ceded to Montenegro in 1880. Pop. 5,000.

Dulles, Charles Winslow: surgeon and author; b. at Madras, India, Nov. 29, 1850; educated at Lawrenceville, N. J., and University of Pennsylvania (M. D. 1875). He has been surgeon in several hospitals, is fellow of the College of Physicians and of the Academy of Surgery of Philadelphia, and is a frequent contributor to medical literature. He has published *What to do First in Accidents or Poisoning* (Philadelphia, 1880); *What to do First in Accidents and Emergencies* (2d ed. 1883); *Accidents and Emergencies* (3d ed. 1888).

Dulong, dü′lōn′, Pierre Louis: chemist; b. at Rouen, France, Feb. 12, 1785; studied and practiced medicine, but the brilliant discoveries of French chemists soon drew him to the study of chemistry. He studied with Berthollet, and discovered the chloride of nitrogen in 1812. With the Swedish chemist Berzelius he made a new analysis of water, revealing the inexactness of the former analysis, and investigated the formation of carbonic acid gas; but his chief distinction lies in his share in the discovery of the law that the capacity for heat of elementary atoms is identical, known in chemistry as Dulong and Petit's law. He was chosen a

member of the Academy of Sciences in 1823. D. in Paris, July 19, 1838.

Dulong and Petit's Law: See CHEMISTRY.

Dulse: the name popularly given to many of the red seaweeds. The *Rhodymenia palmata*, belonging to the *Rhodymeniaceæ*, grows on rocks on the coasts of the British islands, the U. S., and other regions. It has a sessile leaf-like body (the so-called frond) of a dark-red or purple color, irregularly notched, and of a leathery texture. It is an important article of food in Iceland, where it is dried and stored in casks. It is abundant on all the coasts of Great Britain, and is sometimes used as food, either raw or cooked. The *Schyzimenia edulis*, of the family *Cryptonemiaceæ*, is also called dulse, and is used as food. This also occurs in the U. S. "Pepper dulse," of the genus *Laurentia*, is eaten in Scotland. It grows on the Pacific coast of North America. Revised by CHARLES E. BESSEY.

Duluth': city and railway center; capital of St. Louis co., Minn. (for location of county, see map of Minnesota, ref. 4–F): situated at the west extremity of Lake Superior; 155 miles N. N. E. of St. Paul. It is one of the eastern termini of the Northern Pacific R. R., the northern terminus of the St. Paul and Duluth R. R., and the terminus of seven other railways. It has a custom-house, a weather-signal office, and some of the largest private docks in the U. S. Among the noteworthy public buildings are the opera-house, the board of trade building, the State normal school, the public library, masonic hall, and the central high school, one of the finest public-school buildings in the U. S., costing over $500,000. The harbor, entered by a ship-canal 250 feet wide, is landlocked, being formed by Minnesota and Rice's Points; the former is a scythe-shaped natural breakwater, running out 7 miles into the lake. The harbor has been improved by the construction of several docks and piers, independent of the railway company's works. Large quantities of wheat, flour, sheep, wool, hides, iron, copper and silver ore and bullion are shipped from here, and the capacity of the elevators of the city aggregates 35,000,000 bushels. Duluth has a blast furnace, machine and car-building works, lumber-mills, and other manufactories. There are quarries of granite, sandstone, slate, and trap in the vicinity. The fisheries of Duluth are very important. A superior water supply for the city, from the fresh clear waters of Lake Superior, has been installed at an expense of over $2,000,000. In May, 1869, the site of the city was a forest—the old Duluth was on Minnesota Point. It was named after Grecylon Du Luth, an early French explorer of this region. The village of West Duluth was annexed Jan. 1, 1894. Pop. of Duluth (1880) 838; (1890) 33,115; (1900) 52,969. SECRETARY IMPROVEMENT ASSOCIATION.

Dul'wich: a suburb of London, England; in Surrey, 5 miles S. of London (see map of England, ref. 12–J). It is pleasantly situated near Sydenham, and has numerous handsome villas and mansions. Here is Dulwich College, founded in 1619 by Edward Alleyne, a tragic actor.

Dumas, dü'maa', ALEXANDRE: poet, novelist, and dramatist; member of the French Academy; b. in Paris, July 28, 1824; son of Alexandre Davy Dumas. Began his literary career, while a boy of seventeen, with a book of trivial poems, *Péchés de Jeunesse* (1847); traveled through Spain and Northern Africa with his father, and on his return published *Aventures de quatre femmes et d'un perroquet* (1847). This was followed by *La Dame aux camélias* (1848); *Le Roman d'une femme* (1848); *Diane de Lys* (1851); *La Dame aux perles* (1854); *La Vie à Vingt ans* (1856), and others in rapid succession. Their style was simple, natural, and dramatic, and their popularity immediate and permanent. *La Dame aux camélias* put into dramatic form (1852) brought increased fame and fortune, and was followed by *Diane de Lys* (1853), *La Dame aux perles* (1855), and *Demi-Monde* (1855). In 1868 he published a complete edition of his plays, and in the prefaces advanced bold and radical social theories which were widely discussed. His most famous plays are *Le Demi-Monde* (1855); *Le Fils naturel* (1856); *Les Idées de Mme. Aubray* (1867); *Une Visite de Noces* (1871); *Monsieur Alphonse* (1877); *l'Étrangère* (1876); *Denise* (1885). He was joint author with Émile de Girardin of *Supplice d'une femme* (1865) and *Heloïse Paranquet* (1866). D. in his palace at Marly-le-Roi, Nov. 27, 1895.

Dumas, ALEXANDRE DAVY: novelist and dramatist; b. at Villers-Cotterets, Aisne, France, July 24, 1803. He was not liberally educated. He went to Paris in 1823 to seek his fortune. In 1828 he produced *Henri III.*, a drama which was very successful. He was a writer of the romantic school, and was remarkable for literary fecundity. Even those novels which seem loosest and least substantial are distinguished by an abundance of fancy and a luxuriance of imagination which make a certain impression. He displayed much skill in the construction of plots. He understood the art of creating excitement in the minds of his readers, but this quality, to which his success is chiefly due, is also the principal argument against his books. Among his novels are *Les trois mousquetaires*, with continuations (30 vols., 1844–45), and *Le Comte de Monte Cristo* (12 vols., 1845). It appears that a large part of the works published in his name were written by other men. A scandalous lawsuit divulged that he bought other people's manuscript and ably retouched it. His dramas have, indeed, a much greater literary value than his novels. *Le Mariage sous Louis XV.* is still played with effect on all European stages. D. at Puys, near Dieppe, Dec. 5, 1870.

Dumas, JEAN BAPTISTE: chemist; b. in Alais, France, July 14, 1800. He began the study of pharmacy in Geneva, and afterward, following the advice of Alexander von Humboldt, went to Paris. He became Professor of Chemistry in the École centrale des Arts et Manufactures, and at the Sorbonne. His lectures were extremely attractive. From 1849 to 1852 he was Minister of Agriculture and Commerce. He exerted a powerful influence on the development of chemistry. He studied the substituting action of chlorine on organic compounds and developed his theory of substitution (1834). He further devoted much attention to the study of the relations between the specific gravity of gases and atomic weights. From 1840 he was one of the editors of the *Annales de Chimie et de Physique*. D. at Cannes, Apr. 11, 1884. IRA REMSEN.

Dumas, MATHIEU, Count: general; b. at Montpellier, France, Nov. 23, 1753. He fought for the U. S. in 1780–82 as aide-de-camp to the Comte du Rochambeau, and was a moderate member of the Legislative Assembly in 1791, and in the following year was elected president of that body. In the Reign of Terror he was condemned to death, but escaped and went into exile. He became a general of division in 1805, served at Ulm and Austerlitz, and after the campaign was called to Naples by the new king, Joseph Bonaparte, who made him his Minister of War. In 1812 he was intendant-general of the grand army in Russia. He wrote a narrative of the French campaigns from 1798 to 1807, entitled *Précis des Événements Militaires* (19 vols., 1816–26), and *Souvenirs*, an account of his career. D. in Paris, Oct. 16, 1837.

Du Maurier, GEORGE LOUIS PALMELLA BUSSON: a British artist, humorist, and novelist of French descent; b. in Paris, Mar. 6, 1834; lived in France until he was seventeen; studied art in Gleyre's studio, Paris, and had intended to be a painter until he had a severe affection of the eyes. After his recovery he devoted himself mainly to black-and-white work, and especially to book illustration. In 1862 he was working for *Once a Week*, but had been a contributor to *Punch* as early as June, 1860, his connection with which continued until his death, Oct. 8, 1896. He also illustrated Thackeray's *Henry Esmond*, though not in its original form; Douglas Jerrold's *Story of a Feather*, and other books. His fame, however, now rests on his novels, *Peter Ibbetson* (1891), *Trilby* (1894), and *The Martian* (which appeared as a serial in *Harper's Magazine* shortly after his death), but specially on *Trilby*.

Dumb: See DEAF-MUTES.

Dumb Ague: See INTERMITTENT FEVER.

Dumbar'ton: a county of Scotland; area, 264 sq. miles. It consists of two detached parts, one bounded E. by Loch Lomond, S. by the estuary of the Clyde, and W. by Loch Long; the other, much smaller, lying on both sides of the Forth and Clyde Canal. The surface is mountainous, and presents much picturesque scenery. Here are mines of coal and iron, and quarries of limestone and slate. Capital, Dumbarton. Pop. (1891) 94,511; (1901) 113,660.

Dumbarton, or **Dunbarton**: a seaport of Scotland; capital of the county of same name; on the river Leven near its entrance into the Clyde; 13 miles N. W. of Glasgow (see map of Scotland, ref. 11–F). Steamboats ply regularly between this port and Glasgow, with which it is also connected by rail. It has manufactures of glass, machinery, and ropes, and ship-building is extensively car-

ried on. Here, on a steep, rugged, basaltic rock, rising to the height of 560 feet, stands the famous Dumbarton Castle, which has been a stronghold for many centuries. Pop. (1881) 10,294; (1891) 14,172.

Dumb-cane: a West Indian shrub (*Dieffenbachia seguine*), so named from its acrid juice causing the tongue to swell. It belongs to the family *Araceæ*. The root and the juice have medicinal properties, and are used in sugar-refining.

Dumbness: in medicine, the loss of the power of speech, from whatever cause arising. When associated with deafness, it is usually the result of that deafness; the child being unable to hear, of course is unable to learn to talk; but there are at least two important varieties of dumbness which are the direct results of disease, namely APHASIA (*q. v.*), due to brain disease, and APHONIA (*q. v.*), due to external disease, as of the larynx or vocal cords. See also DEAF-MUTES.

Dum'dum: a town of British India, in Bengal; 8 miles N. E. of Calcutta (see map of S. India, ref. 1–I). Here are a cantonment and a cannon-foundry. It was here that in 1757 the ruler of Bengal made treaties with the British which have permitted the progress of the latter in Eastern India; and in 1857 it was the scene of the first open resistance of the Sepoys to the use of greased cartridges. Pop. 4,500.

Dumfries, or **Dumfriesshire**: a county in the south of Scotland; bounded S. by Solway Firth, E. by Cumberland, N. by Roxburgh, Selkirk, Peebles, and Lanark, and W. by Ayr and Kirkcudbright. Area, 1,071 sq. miles. It is drained by the Annan, the Esk, and the Nith rivers. The surface is mountainous in the N. and undulating in the S. The valleys of the Annan, Esk, and Nith are fertile. The climate is, generally speaking, mild, with a mean temperature of 50° and a sufficient average rainfall. The soils are gravel, sandy loam, clay, or along the rivers and their estuaries, rich alluvial deposits. The county is consequently essentially an agricultural one, and as such it takes a high rank. Large crops of oats, wheat, turnips, etc., are raised; the cattle, and especially the sheep, have a high reputation. Among the minerals of this county are coal, lead, silver, limestone, and new red sandstone. It is traversed by two railways extending to Edinburgh and Glasgow. The chief towns are Dumfries, Annan, Moffat, and Sanquhar. Pop. (1881) 76,140; (1891) 74,308; (1901) 72,562.

Dumfries: a seaport of Scotland; capital of the county of same name; on the river Nith; 9 miles from its entrance into Solway Firth, and 64 miles S. by W. from Edinburgh (see map of Scotland, ref. 14–H). It is well built of red freestone, and is regarded as the capital of the south of Scotland. Two bridges across the river connect it with Maxwelltown. The high tides of Solway Firth bring vessels of 60 tons to the town, and larger vessels to the river quays near Dumfries. Here are manufactures of woolen cloths (tweeds), hosiery, hats, etc. An infirmary and an asylum for lunatics are among the public institutions. Among the notable objects of the place are the tomb of Burns, who here officiated as exciseman, and a statue of the poet. Pop. (1891) 17,804.

Dümichen, dü'mich-*en*, JOHANNES: Egyptologist; b. at Weizholz, near Grossglogau, Silesia, Oct. 15, 1833; studied in Berlin, and passed many years in archæological research in the valley of the Nile. He has written several treatises on Egyptian inscriptions.

Dumont, dü'mōn', PIERRE ÉTIENNE LOUIS: author; b. in Geneva, Switzerland, July 18, 1759. He was a Protestant minister, and emigrated in 1782 to St. Petersburg, where he preached for eighteen months. In 1785 he removed to England, and became tutor to the sons of Lord Shelburne. He was intimate with Sir Samuel Romilly and Jeremy Bentham. He passed the years 1790 and 1791 mostly in Paris, where he associated with Mirabeau, whom he aided in composing his speeches and reports. Having returned to England in 1792, he edited and popularized Bentham's works on legislation—namely, *Traités de Législation* (1802) and *Théories des Peines et Récompenses* (1810). D. at Milan, Sept. 29, 1829, leaving *Souvenirs sur Mirabeau* (1832). See A. P. de Candolle, *Notice sur la Vie et les Écrits de M. Dumont* (1829).

Dumont d'Urville, -dür'vēl', JULES SÉBASTIEN CÉSAR: navigator; b. at Condé-sur-Noireau, France, May 23, 1790. He commanded an expedition sent in 1826 to obtain tidings of La Pérouse and to survey the coasts of New Zealand, New Guinea, etc. In 1837 he conducted an exploring expedition to the Antarctic regions. He discovered land, which he called Terre Adélie, in lat. 66° 30′ S.; returned in 1840, and became a rear-admiral. He wrote *Enumeratio plantarum in insulis archipelagi et litoribus Ponti Euxini* (Paris, 1822); *Voyage de l'Astrolabe* (1830–34); *Voyage Pittoresque autour du Monde* (1834; new ed. 1859); and *Voyage au pôle sud et dans l'Océanie* (1841–54). D. at Versailles, May 8, 1842.

Dumoulin, dü'moo'lăn' (in Lat. *Molinæus*), CHARLES: jurist; b. in Paris in 1500. Though a Protestant and often persecuted for his religion, he was not prevented from freely expressing his views. He wrote several legal works which are esteemed among the greatest treatises on French law ever published. The most famous of these are his *Commentaires sur le titre des Fiefs de la Coutume de Paris* and *De Dividuo et Individuo*. In 1564 he published a vigorous work on the Council of Trent, examining its decrees in detail, and protesting against accepting them as the laws of the state. His books were placed on the Index Expurgatorius, but the Italians published them under the fictitious name of Gasper Caballinus, to evade the restriction against citing him in Italy. D. in 1566.

Dumouriez, dü'moo'ri-ā', CHARLES FRANÇOIS: general; b. at Cambrai, France, Jan. 25, 1739. He served as an officer in the Seven Years' war, was quartermaster-general in Corsica in 1768, and was employed in a secret mission to Poland by the Duke of Choiseul in 1770. Between 1776 and 1787 he was commandant at Cherbourg, where he planned and directed great naval works. In the Revolution he acted with the Girondists. He was appointed Minister of Foreign Affairs in Mar., 1792, and acquired the confidence of the king. War having broken out between France and Austria, he resigned office in June, 1792, in order to take command of the army; the allies, who were advancing in great force, were held in check by him in Maine, and the Prussians were routed in the battle of Valmy, the first battle in which the republican arms were successful. He invaded Flanders in Oct., 1792, and defeated the Austrians at Jemappes in November, and conquered Belgium. According to Lamartine, he was at this period the virtual dictator of all parties. After his defeat by the Austrians at Neerwinde, he was suspected of plotting a counter-revolution and negotiating secretly with the Austrians. The Convention sent four commissioners in Apr., 1793, to summon him to Paris. Dumouriez refused to obey the Convention, and when the commissioners ordered the soldiers to arrest him he sent them as prisoners to the Austrian camp. His army refused to support him in this defection, and he became a fugitive and exile. D. near London, Mar. 14, 1823. See *Mémoires de Dumouriez*, by himself (2 vols., 1794).

Dumpy Level: a leveling instrument with a short telescope of large aperture and a non-reversable bubble. It is used principally in Great Britain, while in the U. S. engineers prefer the wye level. See LEVELING.

Dun [Celtic, cf. Ir. *dūn*, Gael. *dūn*, hill, castle, appearing as *-dūnum* in Lat. names of Celtic towns, as *Lugdu'num*; cogn. with O. Eng. *tūn* > Eng. *town*: Germ. *Zaun*]: a word used as a prefix or suffix in many place-names in Great Britain. It assumes the various forms of *Dun-*, *Dum-*, *Don-*, *-don*, as Dunkirk, Dumbarton, Donegal, etc.

Dü'naburg: a strongly fortified town of Russia; government of Vitebsk; on the river Düna, where it is crossed by the railway from Warsaw to St. Petersburg; about 120 miles S. E. of Riga (see map of Russia, ref. 6–C), with which it is connected by another railway. It is an important military position, and has an active trade. Pop. (1897) 72,231.

Duna Földvar, doo'nă-föld-vaar': town of Hungary; county of Tolna; on the Danube; 28 miles N. of Tolna (see map of Austria-Hungary, ref. 7–G). Here are a Franciscan cloister, important sturgeon-fisheries, and two match-factories. Pop. (1890) 12,250.

Dunbar': a royal burgh and seaport of Haddingtonshire, Scotland; at the mouth of the Firth of Forth; 27 miles E. N. E. of Edinburgh; lat. 56° N., lon. 2° 29′ W. (see map of Scotland, ref. 11–J). It has valuable herring-fisheries, and a harbor which will admit vessels of 300 tons. Dunbar is a fine old town, containing the remains of Dunbar Castle. Cromwell gained near this town a decisive victory over the royalists on Sept. 3, 1650. Pop. (1891) 3,545.

Dunbar, PAUL LAURENCE: See APPENDIX.

Dunbar, WILLIAM: poet; b. at Salton, in Lothian, Scotland, about 1460. He was a Franciscan friar and itinerant

preacher in his youth. He was employed by James IV. as clerk of embassy. Among his works are *The Thistle and the Rose* (1503), an allegory in honor of the marriage of James VI., and *The Merle and Nightingale*, poems showing a rich fancy. He also wrote several poems of a religious character, and some powerful satires, among them *The Dance of the Seven Deadly Sins*. By many he is considered to be the greatest of the Scottish poets. An edition of his works, by Dr. John Small, was published in 1884. D. about 1520.

Dunbarton, Scotland: See DUMBARTON.

Duncan, ADAM, Viscount Duncan of Camperdown: admiral; b. in Dundee, Scotland, July 1, 1731; entered the navy in 1746, and became a post-captain in 1761. In 1789 he obtained the rank of rear-admiral of the blue. With the rank of vice-admiral he was appointed commander of a fleet in the North Sea in 1795, and waged war against the Dutch. He defeated the Dutch and captured eleven of their vessels near Camperdown in Oct., 1797, and was raised to the peerage for that service. D. in Dundee, Aug. 4, 1804.

Duncan, JOHN: Hebraist; b. at Gilcomston, near Aberdeen, Scotland, 1796. He graduated from Marischal College, Aberdeen, in 1814, studied theology in Edinburgh, and was licensed to preach in 1825. Having been converted in 1826 under the influence of Cæsar Malan, he settled in 1831 at Glasgow, but went in 1841 to Pesth as missionary among the Jews, and was in 1843 appointed Professor of Hebrew and Oriental Languages in Edinburgh. His conversation was extraordinary, his spiritual influence great, but his capacity to impart didactic instruction very small. See David Brown, *Life of John Duncan* (Edinburgh, 1872) and *John Duncan in the Pulpit and at the Communion Table* (1874); also William Knight, *Colloquia Peripatetica* (1870; 5th ed. 1879). D. in Edinburgh, Feb. 26, 1870.

Duncan, JOHNSON KELLY: general; b. in York, Pa., Mar. 19, 1827; graduated at West Point in 1849. He entered the service of the Confederate States in 1861, and took command of Forts Jackson and St. Philip, on the Mississippi below New Orleans. After the fleet of Farragut had passed these forts Duncan surrendered them, Apr. 29, 1862. D. in Knoxville, Ky., Dec. 18, 1862.

Duncan, SARA JEANETTE: author; b. in Brantford, Ontario, Canada, in 1863, and educated there. She contributed extensively to Toronto and Montreal newspapers and periodicals, and, in her capacity as newspaper correspondent, made a tour of the world. In 1890 she was married to Mr. Everard Cotes, of Calcutta, India, where she now resides. She wrote *A Social Departure* (New York and London, 1890); *An American Girl in London* (New York, 1891); *The Simple Adventures of a Memsahib* (New York, 1893).

NEIL MACDONALD.

Duncan, WILLIAM WALLACE, D. D.: bishop of the M. E. Church South; b. at Boydton, Va., Dec. 20, 1839; graduated at Randolph College, Va., 1858; held pastorates in the M. E. Church: elected, June, 1875, Professor of Metaphysics and Political Economy in Wofford College, S. C.; member of œcumenical conference in London 1881; elected bishop May, 1886. C. H. T.

Duncker, doon'ker, MAXIMILIAN WOLFGANG: historian; b. in Berlin, Germany, Oct. 5, 1811; educated there and at Bonn, but in the latter place, becoming implicated in the democratic movements, he was arrested and condemned to six years' imprisonment, but was very soon pardoned. He became Professor of History at Halle in 1842, a member of the German National Assembly in 1848, professor at Tübingen in 1857, and received an appointment as keeper of the Prussian archives in 1861. Among his works are *Origines Germanicæ* (1840); a *History of Antiquity* (1852), his principal work, translated into English (6 vols., 1877–82); *Die Krisis der Reformation* (Leipzig, 1846); *Zur Geschichte der deutschen Reichsversamlung* (1849); *H. von Gagern* (1850); *Vier Monate auswärtiger Politik* (1850); *Feudalität und Aristokratie* (1858). On Jan. 1, 1875, he retired to private life, having accomplished the incorporation of the archives of Hesse, Nassau, and Hanover with those of Prussia. D. at Anspach, July 22, 1886.

Duncombe, dŭn'kŭm, THOMAS SLINGSBY: English radical; b. in 1797; elected to Parliament in 1826. He represented Finsbury from 1834 to 1861, advocated the vote by ballot, extension of suffrage, and other reforms. He was a witty, fluent, and popular speaker. He made in 1858 a motion which resulted in the relief of the Jews from political disabilities. D. Nov. 13, 1861.

Dundalk': seaport-town; capital of the county of Louth, Ireland; at the mouth of Castleton river and on Dundalk Bay; 50 miles N. of Dublin, with which it is connected by railway (see map of Ireland, ref. 7–I). It has a safe harbor, which admits vessels drawing 16 feet of water. The chief articles of export are linen, timber, iron, dairy products, and live stock. Here are manufactures of salt, soap, pins, leather, starch, etc. Edward Bruce took Dundalk in 1315, and held his court here until he was killed in 1318. Pop. (1891) 13,207.

Dundas': town (settled in 1801, incorporated in 1848); Wentworth co., Ontario, Canada (for location, see map of Ontario, ref. 5–D); situated on Grand Trunk Ry., and also on Desjardins Canal; 50 miles from Hamilton and 43 miles from Toronto; has five churches, high school, water-works, mills, and manufactories. Dundas is a manufacturing town, surrounded by a fine agricultural region. Pop. (1881) 3,709; (1891) 3,546. PROPRIETOR OF "BANNER."

Dundas, HENRY, Viscount Melville: British statesman; b. in Edinburgh, Apr. 28, 1742; admitted to the bar 1763; was returned to Parliament for Midlothian 1774, and made lord advocate for Scotland 1775. His political record is more creditable to his ability than to his consistency. Though his constituents opposed the ministry, he supported Lord North's administration, and favored the war with the American colonists in opposition to Pitt. He continued in office under the Rockingham ministry, and when Pitt came in power became one of his ablest and most faithful allies against his former associates. He was foremost in carrying Pitt's India bill through Parliament (1784), and was made president of the board of control established by this measure. To his searching investigation of Indian affairs is partly due that movement for reform which culminated in the trial of Hastings (1786). He was appointed principal Secretary of State for the Home Department in 1791, and held several other important offices, but resigned with Pitt in 1801. Accused of malversation in office he was acquitted on his trial and completely vindicated, despite the energy and talents of his political enemies (1806), but after this he lived in retirement. D. in Edinburgh, May 28, 1811.

F. M. COLBY.

Dundas's Strait: a strait of Northern Australia: separates Melville island from Coburg peninsula, and is 18 miles wide.

Dundee' (Lat. *Taodunum*): a city and seaport of the county of Forfar, Scotland; finely situated on the north side of the wide estuary of the Tay; 10 miles from the sea and 50 miles by water N. N. E. of Edinburgh; lat. 56° 27′ 36″ N., lon. 2° 57′ 45″ W. (see map of Scotland, ref. 10–I). The principal public edifices are the royal exchange, opened in 1856, the corn exchange, St. Paul's church, with a tower and spire 217 feet high, the infirmary and town hall, and Kinnaird hall. Here is a remarkable tower 156 feet high, built in the twelfth century, to which three parochial churches under one roof have been annexed. Dundee has a university college, opened in 1883, a theater, a public library, and an asylum for the insane. There are several large parks. It is the chief seat in Britain of the manufacture of linen fabrics—from the finest damasks down to osnaburgs, sheetings, ducks, dowlas, drills, and canvas. It has also manufactures of machinery, jute, confectionery, and marmalades. The annual value of the flax, hemp, and jute manufactures of Dundee is about £5,500,000. Dundee has a number of ship-building yards, and an excellent harbor with extensive docks which cost upward of £700,000. It is the center of the whale and seal fishing trade of Great Britain, and the number of vessels of all kinds entering the port is very large. It has direct railway communication with the south by the Tay bridge, 3,593 yards long. Dundee is a place of great antiquity, and was one of the places of residence of the Scottish kings. It became a stronghold of Protestantism during the Reformation. It was burned by the Duke of Lancaster in 1385, and sacked and burned by Gen. Monk in 1651. Pop. (1891) 155,640; (1901) 160,871.

Dundee: village and railway junction; Monroe co., Mich. (for location, see map of Michigan, ref. 8–K): has four churches, union school, flouring-mills, furniture-factory, creamery, cheese-factory, stone-quarry, etc. It is situated in a rich farming, fruit-growing, and stock-raising region. Pop. (1880) 932; (1890) 1,166; (1900) 1,118. EDITOR OF "REPORTER."

Dundee: village; on railway; Yates co., N. Y. (for location of county, see map of New York, ref. 5–E); about 12 miles from Penn Yan, and 32 miles N. by W. from Elmira. It has an academy, furnace, mills, etc. Pop. (1880) 1,025; (1890) 1,200; (1900) 1,291. EDITOR OF "OBSERVER."

Dundon'ald, EARLS OF (1669): Barons Cochrane (Scotland, 1647).—THOMAS COCHRANE (*q. v.*), tenth Earl of Dundonald; b. Dec. 14, 1775; succeeded his father July 1, 1831; d. Oct. 31, 1860, and was succeeded in turn by his son, THOMAS BARNES, eleventh earl (b. Apr. 18, 1814; d. Jan. 15, 1885), and his grandson. DOUGLAS MACKINNON BAILLIE HAMILTON COCHRANE, twelfth earl, son of Thomas Barnes; b. Oct. 29, 1852.

Dune [viâ Fr. *dune*, from Celt. *dūn*, (O. Fr.) hill, tower, and a doublet of Eng. *down*, hill < O. E. *dūn* = O. Ir. *dūn*]: a hill of sand, heaped up by the wind. Dunes are found in various situations: (1) Along coast lines, especially where the prevailing winds blow on shore; the sands delivered by the waves are then carried out of their reach by the winds, forming hills often a hundred or more feet in height: a great accumulation of such dunes is found along the shore of Southwest France, where they have forced villages to retreat before their inland advance; their movement is much reduced by planting pine trees, which shelter the sand from the wind. Similar dunes occur on the sand-bars or "beaches" that fringe the Atlantic coast of the U. S., and also on the southeast shore of Lake Michigan. (2) In desert regions, where aridity excludes vegetation and allows the wind to carry about the fine products of rock disintegration. The coarser stones are left in place; the finer dust is blown far away; the sand is drifted into dunes, sometimes several hundred feet in height. Extensive areas in the Sahara and in the deserts of Arabia, Persia, Central Asia, Western North America, etc., are covered by hills of drifting sand; their form is sometimes crescentic, convex to the wind. (3) In relatively dry regions, as the western plains of the U. S., dunes are frequently formed on the leeward banks of rivers where the sand is blown from the river channel at times of low water. W. M. DAVIS.

Dunedin, dŭn-ee'din: city (founded in 1848); capital of Otago, and the most important commercial center of New Zealand; situated at the head of Otago harbor, on the southeast coast of the Middle isle; lat. 45° 50′ S., lon. 170° 36′ E. The site is somewhat hilly, but the streets are well paved; the city has street railways and water-works, and is lighted by gas. It contains many handsome churches and public buildings, beautiful botanical gardens, and manufactures of woolen goods. Here also is the University of Otago, now affiliated with that of New Zealand. It is the seat of Anglican and Roman Catholic bishoprics. The chief export is wool. Pop., with suburbs (1896) 47,280.

Dunferm'line: a handsome royal burgh of Fifeshire, Scotland; on a long ridge 3 miles from the Firth of Forth and 15 miles N. W. of Edinburgh (see map of Scotland, ref. 11–H). Among noteworthy structures are the new abbey church, corporation buildings, the high school, St. Margaret's hall, the Carnegie public library, and the Carnegie baths. It derives its prosperity chiefly from manufactures of linen, cotton, worsted, iron, etc., and is said to be unrivaled by any British town in the manufacture of damask linen. Here are also several iron-foundries, collieries, dye-works, and bleaching-works. Dunfermline was a town as early as 1100 A. D. Malcolm Canmore founded here about 1080 a Benedictine abbey, of which some ruins are still visible. Here was also a regal palace of the Stuarts, now ruined. Robert Bruce was buried at Dunfermline. Pop. (1891) 22,365; (1901) 25,250.

Dunfish: in the U. S., codfish cured in such a manner as to give them a "dun" color. Fish for "dunning" are caught in February or in early spring. They are taken in deep water, are split and incompletely salted, then laid in a pile for two or three months in a dark place, covered with salt hay, eel-grass, etc., and pressed by some weight. They are then uncovered and closely packed for several months, when they are ready for use. They acquire a peculiar flavor, which is greatly liked by many.

Dungar'van: a seaport and bathing-place of the county of Waterford, Ireland; on Dungarvan Bay; 40 miles E. N. E. of Cork (see map of Ireland, ref. 13–G). Its harbor admits only small vessels. It has three convents, and an old castle now used as barracks. It has important fisheries, and exports fish, grain, butter, and cattle. Pop. 7,000.

Dung-beetle: a name given to many coleopterous insects of the family *Scarabæidæ* and of the genera *Copris*, *Phaneus*, *Aphodius*, *Geotrupes*, *Bolbocerus*, *Trox*, and others. Some of these insects inclose their eggs in pellets or globes of manure. There are many species in America, Europe, Asia, and Africa. The sacred scarabæus of the Egyptians was a true dung beetle, the *Ateuchus sacer* of the Old World.

Dunglison, ROBLEY, M. D., LL. D.: physician; b. at Keswiek, England, Jan. 4, 1798; received his medical education at London and Erlangen; Professor of Medicine in the University of Virginia 1824–33; of Therapeutics in the University of Maryland 1833–36; and of the Institutes of Medicine in the Jefferson Medical College, Philadelphia, 1836–68. He published about twenty volumes, among which are *Human Physiology* (1832); a *Dictionary of Medical Science and Literature* (Boston, 1833; later ed. 1874); and *Therapeutics and Materia Medica* (1836; 6th ed. 1857). D. in Philadelphia, Apr. 1, 1869.

Dunkeld': a small town of Perthshire, Scotland; situated on the Tay (see map of Scotland, ref. 9–H), in a vale inclosed by mountains; 15 miles N. N. W. of Perth. The cathedral, built on the site of an ancient Culdee monastery, was completed in 1501, several centuries after the foundation of Dunkeld, which had become the seat of a bishopric in 1127. Here is the mansion of the Duke of Athole, with the largest and finest park in Scotland, including 20 sq. miles of lareh woods. Pop. about 800.

Dunkers, dŭng'kerz, **Dunkards**, -ardz, or **Tunkers**, tŭng'kerz [*Dunker* is a dialectic form of Germ. *Tunker*, dipper, deriv. of verb *tunken*, dip < O. H. Germ. *dunchōn*, *tunchōn*, cf. Lat. *tingere*, Gr. τέγγειν, moisten, wet]: a sect of German-American Baptists, called by themselves **Brethren**, said to have been founded at Schwarzenau in Westphalia by one Alexander Mack in 1708, and named from their manner of baptism by trine immersion of believers. Having been driven from Germany by persecution between 1719 and 1729, they settled in Pennsylvania, and subsequently in Ohio, Indiana, Maryland, Virginia, and several other States. Their doctrines are similar to those of the Mennonites, and in the simplicity of their dress and speech they somewhat resemble the Society of Friends. From the Dunkers as a sect must be distinguished the Seventh-day Dunkers, commonly called *German Seventh-day Baptists*.

Dun'kirk (Fr. *Dunkerque*): a fortified seaport-town in the extreme northern part of France; in the department of Nord, and on the Strait of Dover; about 40 miles N. W. of Lille and 46 miles E. of Dover; lat. 51° 3′ N., lon. 2° 22′ E. (see map of France, ref. 1–F). It is the northern terminus of the Chemin de Fer du Nord. It is well built, with wide and well-paved streets, and is defended by a citadel and ramparts. The harbor is shallow, but the roadstead is large and safe. Dunkirk has several fine churches, a college, a theater, a public library, and a town-hall; metal-foundries, salt-refineries, and ship-building yards; also manufactures of linen, cotton, beet-root sugar, soap, starch, cordage, and leather. It became a free port in 1826, since which it has had an active trade in wines, liqueurs, etc. Its fisheries are very important. A church is said to have been built here in the seventh century among the sandhills or dunes, and hence its name, which signifies "church of the dunes." Dunkirk was burned by the English in 1388 and was taken by them in 1658, but was sold to the French king by Charles II. in 1662. Pop. (1881) 37,528; (1891) 39,498.

Dunkirk: city, port of entry, and railway center; Chautauqua co., N. Y. (for location of county, see map of New York, ref. 6–B); situated on Lake Erie, 40 miles S. W. of Buffalo. It is the western terminus of the Erie R. R., which connects it with New York city, 459 miles distant, and has a good harbor and an advantageous position for trade. It has an orphan asylum, free library, extensive locomotive-works, a foundry, large planing-mills, a coal elevator, a grain elevator, various mills and factories, gas and electric lights, the Holly system of water-works, and electric street railways. Pop. (1880) 7,248; (1890) 9,416; (1900) 11,616.

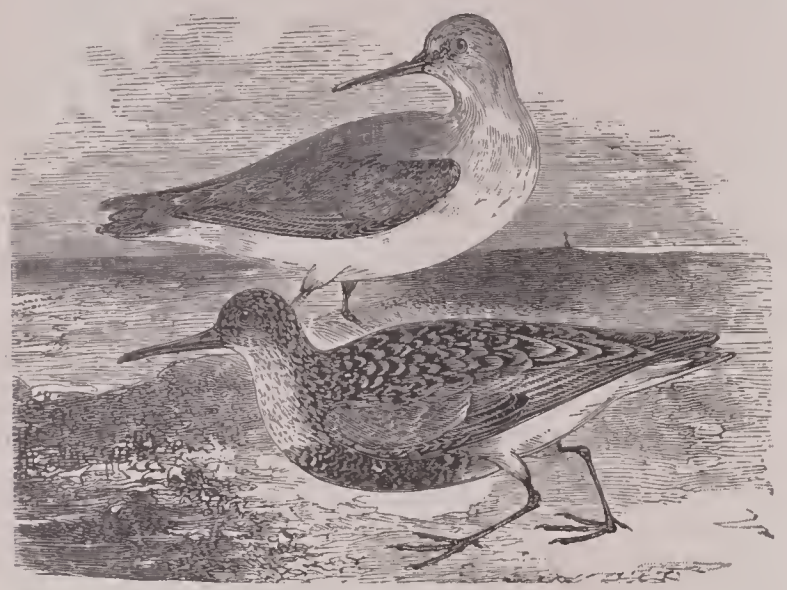
EDITOR OF "OBSERVER-JOURNAL."

Dunlap: town; Harrison co., Ia. (for location of county, see map of Iowa, ref. 5–C); situated on Ch. and No. West. Railway, 47 miles N. E. of Omaha; has 6 churches and 2 schools. Its principal industry is agriculture. Pop. (1880) 1,246; (1890) 1,088; (1900) 1,355.

EDITOR OF "REPORTER."

Dunlap, William: painter and writer; b. at Perth Amboy, N. J., Feb. 19, 1766. Among his paintings are *Christ Rejected* (1821) and *Calvary* (1828). He was one of the earliest dramatic writers in the U. S., and from 1798 to 1805 was manager of the Park Street theater in New York. Among his plays are *The Father*, a comedy, acted in 1789, and *Leicester* (1794), the first American tragedy regularly produced. Among his other works are *Life of Charles Brockden Brown* (1827); *History of the Rise and Progress of the Arts of Design in the United States* (1834); and a *History of the American Theater* (1832). D. in New York, Sept. 28, 1839. Revised by H. A. Beers.

Dunlin, called also **Sea Snipe** and **Oxbird**: a sandpiper (*Tringa alpina*) found in most parts of Europe, and occurring as a straggler in Greenland. It is about 8 inches long, and is of a black, rufous, and gray color on the back, and black and white beneath. A distinct geographical race, or



The dunlin.

sub-species (*Tringa alpina pacifica*), inhabits North America, breeding in the northern portions and migrating southward in winter. Dunlins are nimble-limbed birds, always on the move, keeping close to the water's edge, running along the sands, pecking eagerly at mollusks and worms.
Revised by F. A. Lucas.

Dunmore: borough; Lackawanna co., Pa. (for location of county, see map of Pennsylvania, ref. 3–L); situated on the Erie and Wyoming Valley Railroad, 2 miles N. E. of Scranton. It derives its prosperity chiefly from coal-mining. Pop. (1880) 5,151; (1890) 8,315; (1900) 12,583.

Dun'net Head: a rocky peninsula of Caithness, Scotland, 100 to 600 feet high; the most northern point of Great Britain. Here is a lighthouse 340 feet above the sea.

Dunnville: a town and port of entry of Monck co., Ontario, Canada; on the Grand river; 43 miles by rail W. of Buffalo and 40 miles S. of Hamilton (see map of Ontario, ref. 5–E). It has several mills, a foundry, and a considerable lumber and grain trade. Pop. 1,808.

Dunois, dü'nwăă', Jean, known as the "Bastard of Orleans": soldier of the Hundred Years' War (*q. v.*); b. in Paris, Nov. 23, 1402; the natural son of the Duke of Orleans, brother of Charles VI. As the deliverer of France from the English he stands forth as the most prominent French warrior of the fifteenth century. His first important achievement was the defeat of the English at Montargis in 1427. In the following year he occupied Orleans, which he held against the English till Joan of Arc came to his relief, and to Dunois as well as to the Maid belongs the honor of the victory at that place in 1429. He was again victorious with her at Patay, and though checked for a time by her capture and death, he renewed the war with all his former vigor and success, capturing Chartres, forcing Bedford to raise the siege of Lagny, and driving the English out of all French territory except Normandy and Guienne. These provinces were attacked 1449–51; two months sufficed for him to sweep the English from the former, and by 1455 Calais was the sole reminder of foreign domination. As a reward for his services Dunois was legitimated by Charles VII., who gave him the title of defender of his country and the office of grand chamberlain. His revolt under Louis XI. caused the loss of his dignities, but they were restored to him under the treaty of Conflans (1465), and he was named president of the council for the reform of the state. D. Nov. 24, 1468.
F. M. Colby.

Dunraven, Wyndham Thomas Wyndham Quin, Fourth Earl of: b. at Adare Abbey, Feb. 12, 1841; educated at Christ Church, Oxford; entered the First Life Guards 1865; was war correspondent for the *Daily Telegraph* in Abyssinia 1867, and again in the Franco-German war; succeeded to the title 1871; Under Secretary for the Colonies in Lord Salisbury's two administrations, but resigned Feb., 1887.

Duns, John, D. D., F. R. S. E.: minister of the Free Church of Scotland; b. in Duns, Berwickshire, in 1820; educated at the University of Edinburgh. After some work in the pastorate he was, in 1864, appointed to the chair of Natural Science in New College, Edinburgh. He has published *Biblical Natural Science*; *Science and Christian Thought*; *Life of Sir James Simpson*; *Life of Professor Fleming*; *Life of the Rev. Samuel Martin*; *Creation according to Genesis and the Confession of Faith*; and a very large number of papers read before the Royal Society of Edinburgh, the Royal Physical Society, the Society of Antiquaries of Scotland, and the Victoria Institute. He is a contributor to the *North British Review*, of which he was for four years the editor; was Rhind lecturer in Archæology 1890; and is a member of several American scientific societies. Willis J. Beecher.

Duns Sco'tus, Joannes: surnamed The Subtle Doctor; theologian and scholastic philosopher, about whose life nothing is really known. The following statements are traditional. He was born about 1265; is claimed as their countryman by the Scots, the English, and the Irish. He was of gentle blood, studied at Oxford, became a Franciscan friar, and in 1301 Professor of Theology at that place. In 1304 he removed to Paris, where he taught theology with great distinction. He wrote many works on theology and metaphysics, and was a realist in philosophy. He affirmed, against Thomas Aquinas, that the existence and nature of God can not be proved by reason, but is known only through revelation; that the will is absolutely free; and that the faculties of the soul are not subjectively distinct from each other, but are constant modes of action of a unit of existence. In theology he favored the doctrine of the immaculate conception of the Virgin Mary. He was the founder of a school called Scotists, who maintained for several centuries a controversy with the Thomists (i. e. the disciples of Aquinas). D. at Cologne, Nov. 8, 1308. His works, with a *Life*, were edited by Luke Wadding (12 vols. fol., Lyons, 1639). See Scholasticism.

Dunstan, Saint: an English prelate; b. at Glastonbury in 925 A. D. He was a man of extraordinary abilities, and gained renown by his ascetic piety. Of gentle birth and dauntless courage, he acquired the favor of Edred, who began to reign in 946 A. D., and he took a prominent part in the government during his reign. He was banished by Edwy in 955, but obtained the chief power under Edgar, who became king in 959 and appointed Dunstan Archbishop of Canterbury. Dunstan enriched and exalted the monks, in learning, religion, and morals, and deprived the married clergy of their class privileges. On the accession of Ethelred in 978 his political power was lost, but he kept the archbishopric. D. in Canterbury, May 19, 988. See *Memorials of St. Dunstan*, ed. W. Stubbs (in the Rolls series).
Revised by Samuel Macauley Jackson.

Dunster, Henry: the first president of Harvard College; b. in Lancashire, England; educated at Magdalen College, Cambridge (B. A. 1630). To escape persecution he emigrated to New England in 1640, and entered upon his presidency Aug. 27 of that year. In 1654 he was compelled to resign, in consequence of having borne public testimony against the baptism of infants, for which offense he was afterward tried by a jury and placed under bonds. Still later, he was again presented by the grand jury for neglect to have one of his children baptized. He removed to Scituate, Mass., and preached there until his death. He was esteemed for learning and piety. He assisted in the preparation of the *New England Psalm-book* (1640). He secured the charter of 1650, and, it is supposed, obtained that of 1642. D. at Scituate, Feb. 27, 1659. See his *Life* by J. Chaplin (Boston, 1872).

Dunton, John: eccentric English writer and Dissenter; b. at Graffham, May 4, 1659. He opened a bookstore in London about 1685, but failed in business. He published *The*

Athenian Mercury (1690–96); and wrote, beside other works, the *Dublin Scuffle* (1699) and *The Life and Errors of John Dunton, with the Lives and Characters of a Thousand Persons*, containing an account of a visit to Boston and Salem, and sketches of ministers and prominent citizens of New England in 1685 (1705; new ed. 1818). D. in 1733.

Dunwoody, Major Henry Harrison Chase: meteorologist; b. in Highland co., O., Oct. 23, 1842; removed to Iowa in 1849; graduated at the U. S. Military Academy in 1866, when he was appointed second lieutenant of the Fourth Artillery. He served with his regiment from 1866 to 1871, and was made first lieutenant in 1867. In 1872 he was detailed for duty in the Signal Corps, and to the Weather Bureau on its formation in 1891. He has been chiefly employed in work pertaining to meteorology, and especially in the official forecast of the weather—a work for which he has been especially commended in numerous official reports. He originated the system of cold-wave warnings, and in 1887 recommended the organization of State weather services. In 1889 he obtained the rank of major, on the score of the importance and usefulness of his work in the Signal Corps. He is a graduate of the Columbia Law School (1876). He is the author of many papers published by the Signal Service. Among them may be mentioned *Decrease of Temperature with Elevation and Reduction of Barometer to Sea-level*; *Tables of Rainfall and Temperature compared with Crop Production*; *Weather Proverbs*; *Geographical Distribution of Rainfall in the United States*; *Absolute Humidity and Mean Cloudiness in the United States*; *Rainfall in the United States for each month, from January, 1870, to December, 1873, Based on Reports from Voluntary Observers.*

Mark W. Harrington.

Duodecimals, called also **Cross-multiplication** [*Duodecimals* is from Lat. *duode'cimus*, twelfth; *duo'decim*, twelve]: the name given to a method by which the area of a rectangular surface is calculated when the length and breadth are stated in feet, inches, and lines. It is principally used by artificers in finding the contents of their work. The operation is performed by substituting the duodecimal scale of notation for the decimal.

The Duodecimal Scale is the scale of notation obtained by the division of magnitudes into twelve equal parts. Computation in this manner has some advantages, as 12 admits of so many divisors—viz., 2, 3, 4, and 6; but the decimal scale, which coincides with our arithmetical system is now preferred, though still not adopted universally.

Duode'num [Mod. Lat., from Lat. *duode'ni*, twelve each, so named because in man it is about 12 finger-breadths long]: that part of the small intestine which is nearest the stomach. In man it is 8 or 10 inches in length. It is the widest, shortest, and most fixed part of the small intestine, having no mesentery. It is somewhat horseshoe-like in form, the convexity to the right. It receives the secretions of the liver and the pancreas. Its muscular fibers are more numerous than in the rest of the small intestine.

Dupanloup, dü'păn'loo', Félix Antoine Philibert: bishop; b. at St.-Félix, near Annecy, in Savoy, Jan. 3, 1802. He studied in Paris, and was ordained a priest in 1825. In 1827 he became confessor to the Count of Chambord, in 1828 catechist to the Orleans princes, and in 1830 almoner to Madame la Dauphine, but retired from all those positions after the Revolution, and was appointed superior of the diocesan seminary of Paris. He became Bishop of Orleans in 1849, and was admitted into the French Academy in 1854. He belonged to the Gallican party, vigorously opposed the infallibility dogma, but accepted it, submitting to the decisions of the Council of the Vatican. He fought ardently for free education, and wrote, besides other works, a popular treatise on education, *De l'éducation* (3 vols., Paris, 1855–57; 10th ed. 1882). Among his other writings, which are very numerous, the most noticeable are *Le Mariage chrétien* (1868; 7th ed. 1885); *Histoire de notre Seigneur Jesus-Christ* (1869), etc. In 1871 he was elected a member of the National Assembly. He was nominated Archbishop of Paris in 1871, but declined that office. D. at Lacombe, near Lancey, Isère, Oct. 11, 1878. See his *Life* by F. Lagrange (3 vols., Paris, 1883–84; 5th ed. 1886; Eng. trans., 2 vols., London, 1885).

Duparquet, Jacques Diel: See Diel du Parquet.

Duperré, dü'păr'rā', Victor Guy, Baron: admiral; b. at La Rochelle, France, Feb. 20, 1775. He gained the rank of viee-admiral in 1826, and commanded the fleet which aided the army to conquer Algiers in 1830, and was made admiral. D. Nov. 2, 1846.

Duperrey, dü'păr'rā', Louis Isidore: navigator and hydrographer; b. in Paris in 1786; conducted an exploring expedition in 1822 to the islands of the Pacific; surveyed the coasts of New Zealand and parts of Australia; returned in 1825, and published *Voyage autour du Monde sur la corvette La Coquille* (1826–30).

Duperron, -rōń', Jacques Davy: cardinal; b. at St.-Lô, France, in 1556; educated in Switzerland by his father, a Protestant fugitive from perseeution; went to Paris, where his talents attracted the notice of the Count of Matignon and the poet Desportes. Having abjured Protestantism, he was appointed reader to the king. Though a layman he was chosen to preach before the court, and was induced by the success of his sermons to take orders. He was selected to deliver the funeral oration on Mary Queen of Scots, and though his strictures upon Queen Elizabeth were formally disavowed by the king, Duperron lost nothing by his vehemence. After the death of Henry III. he attached himself to the Cardinal de Bourbon, whose secrets he is accused of having sold to Henry IV. On the latter's accession he was appointed Bishop of Evreux, and as one of those chosen to instruct the king in the Roman Catholic faith is said to have been the chief instrument in his conversion. With Cardinal d'Ossat at Rome he procured the withdrawal of the interdict that had been placed on the kingdom, and the cardinal's hat was bestowed upon him in the same year (1604). D. in Paris, 1618. Besides controversial works he wrote ballads, poetical satires, and a poem entitled *l'Ombre de l'amiral de Joyeuse.*

F. M. Colby.

Dupetit-Thouars, dü'pe-tee'too'aar', or **Petit-Thouars**, Abel Aubert: admiral; b. in France, Aug. 13, 1793; son of Aristide Aubert Dupetit-Thouars, captain of the ship Le Tonnant, destroyed in the battle of the Nile (1798). He was appointed commander of the French naval forces in the Pacific Ocean, and seized the island of Tahiti in 1842, but this act was disavowed by his Government. He published *Voyage autour du Monde* (10 vols., 1841–49).

Dupin, dü'păń', Amantine Lucile Aurore: See Sand, George.

Dupin, André Marie Jean Jacques: lawyer and statesman; b. at Varzy, Nièvre, France, Feb. 1, 1783. He gained distinetion as the advocate of Marshal Ney, Béranger, and other persons tried for political offenses. In 1826 he was elected a member of the Chamber of Deputies, in which he acted with the liberals. He promoted the revolution of 1830 and the accession of Louis Philippe. He was chosen president of the Chamber of Deputies eight times between 1832 and 1848, and was admitted into the French Academy in 1832. In Feb., 1848, he supported the Count of Paris as the successor to Louis Philippe, but he recognized the republic which was then formed. He was a prominent member of the Constituent Assembly, and was president of the Legislative Assembly in 1849. In 1857 he was appointed procureur-général of France. He published *Mémoires et Plaidoyers* (20 vols., 1806–30). D. Nov. 10, 1865.

Dupin, François Pierre Charles, Baron: geometer; a brother of A. M. J. J. Dupin; b. at Varzy, France, Oct. 6, 1784; visited England in 1816; published *Voyages dans la Grande Bretagne* (Travels in Great Britain, 6 vols., 1820–24), and became Professor of Mechanics at the Conservatoire des Arts et Métiers in 1810. He wrote on geometry and mechanics, and did much to advance the useful arts and improve the condition of the laboring people. In the legislature his labors were extensive. He was an Orleanist. D. Jan. 18, 1873.

Dupin, Louis Ellies: Jansenist theologian; b. in Paris, June 17, 1657; educated there; embraced Jansenism 1703, and thereby lost his chair of Philosophy in the College of France. His great work is *A New History of Ecclesiastical Writers* (47 vols., Paris, 1686–1714; 2d ed. 19 vols., 1690–1715; Eng. trans., 17 vols., London, 1693–1707; 3d ed. 3 vols., Dublin, 1722–24). D. in Paris, June 6, 1719.

Dupleix, dü'plā', Joseph, Marquis: French colonial governor; b. about 1695. He amassed a fortune by commercial operations in India, and in 1742 was appointed governor of Pondicherry and all the French possessions in India. He formed the project of founding a European empire in that country, and soon made himself master of the Carnatic, partly by fighting and partly by political intrigues. He was opposed by the British general Clive, who defeated the

French in several battles. Dupleix was removed from the command in 1754, and returned to France, where he died in 1763.

Du Plessis-Mornay, dü′plās′see′mōr′nā′, Philippe: a leader of the French Protestants; b. at Buhy, Normandy, Nov. 5, 1549; was an intimate friend of Henry IV., for whose cause he fought with sword and pen. After the conversion of Henry IV. to Romanism, however, the friendship cooled. Several of his treatises have been translated into English: *Discourse of Life and Death* (London, 1576) and *Treatise of the Church* (1579); *The Trueness of the Christian Religion* (London, 1587). One of his most favorite treatises is *The Mystery of Iniquity* (1612), a violent attack on the papacy, written in the latter part of his life. D. at La Forêt-sur-Sèvre, Nov. 11, 1623.

Duplicate Whist: See Whist.

Duponceau, dü′pōṅ′sō′, Pierre Étienne, LL. D.: lawyer and scholar; b. at St.-Martin, island of Rhé, France, June 3, 1760; emigrated to the U. S. in 1777, and served in the army as aide-de-camp to Baron Steuben; practiced law in Philadelphia with distinction, and was president of the American Philosophical Society. He wrote on philosophy and other subjects. In 1838 he published a work on Indian languages. D. in Philadelphia, Apr. 1, 1844.

Du Pont, Henry: second son of Eleuthère Du Pont de Nemours; b. near Wilmington, Del., Aug. 8, 1812; graduated at the U. S. Military Academy, and entered the army as brevet second lieutenant of artillery in 1833, from which he resigned in 1834, and became proprietor of the celebrated powder-mills bearing his name near Wilmington, Del., which under his direction grew to immense size, and became an important factor in the civil war. For many years he was adjutant-general of the State of Delaware, and during the civil war served as major-general of militia in command of the militia of the State, by his prompt and decisive action contributing very largely to securing the State's allegiance to the Union. He was presidential elector in the years 1868, 1876, 1880, 1884, and 1888. D. Aug. 8, 1889.

James Mercur.

Dupont, dü′pōṅ′, Pierre: song-writer; b. in Lyons, France, Apr. 23, 1821. He composed the words and airs to his poems at the same time. Among his works are *Les deux anges* (The Two Angels, a poem, 1842) and *Le chant des ouvriers* (Song of the Workers). D. in Lyons, July 25, 1870.

Du Pont, Samuel Francis: rear-admiral U. S. navy; of French descent; b. at Bergen Point, N. J., Sept. 27, 1803; entered the navy as a midshipman Dec. 19, 1815; was in command of the Cyane on the west coast of Mexico during the Mexican war; became captain in 1855, and two years later went on special service to China in command of the Minnesota. In Sept., 1861, he was appointed flag officer, led the expedition that sailed from Norfolk the following month, and successfully attacked the fortifications defending Port Royal harbor on Apr. 7, 1863. He made a brilliant but unsuccessful attempt to take Charleston. In July, 1863, being relieved from the command of the South Atlantic fleet, he returned to his home, where he died on June 23, 1865.

Dupont de l'Étang, -de-lā′taṅ′, Pierre: French general; b. at Chabannais, July 14, 1765; aided in the victory of Marengo; defeated a superior Austrian force at Pozzolo on the Mincio; served with distinction at Jena (1806) and Friedland (1807). Having obtained the command of an army in Spain, he was defeated at Baylen in June, 1808, by De Castaños, who took from him 18,000 prisoners. For this ill-success he was disgraced and imprisoned, but his condemnation was annulled on the return of Louis XVIII., who appointed him Minister of War. He was dismissed from this office, but after the second restoration was appointed member of the privy council, and afterward elected several times to the Chamber of Deputies from his department. D. in Paris, Feb. 16, 1838.

Dupont de l'Eure, -de-lör′, Jacques Charles: statesman and lawyer; b. at Neubourg, France, Feb. 27, 1767; was a friend of the Revolution, and remarkable for his consistent advocacy of liberal principles throughout his political career. He was a member of the Council of the Five Hundred in 1798, and of the Corps Législatif in 1813. As vice-president of the Chamber of Deputies during the Hundred Days, he showed admirable firmness in opposing the reactionary projects of the allies. From 1817 to 1848 he was continuously a member of the Chamber of Deputies. In 1848 he was made president of the provisional government, but failing of a re-election to the chamber in the following year retired to private life. D. in Paris, Mar. 3, 1855.

F. M. Colby.

Dupont de Nemours, dü′pōṅ′de-ne-moor′, Pierre Samuel: economist; b in Paris, Dec. 14, 1739; was of the school of economists represented by Quesnay and Turgot, and associated in office with the latter, 1774, sharing in his schemes of reform; became a member of the National Assembly in 1790, where he sided with the constitutional monarchists. The effect of his steadfast opposition to the excesses of the mob was to mark him out for vengeance after Aug. 10, 1792, but he escaped the guillotine, was released from prison after the death of Robespierre, and afterward elected to the Council of Five Hundred. He emigrated to the U. S. in 1799, returned to France in 1802, and the esteem in which he was held in both countries is shown by his election to arrange the Louisiana purchase in 1803. He refused to take office under Napoleon, and emigrated to Delaware in 1815. He wrote several treatises on political economy and natural history, the *Philosophie de l'Univers* (1796), and contributed a number of papers to the Institute, of which he was a member. D. near Wilmington, Del., Aug. 6, 1817.

Dupré, dü′prā′, Jules: landscape and marine painter; b. at Nantes in 1812; studied design as a boy in his father's porcelain-manufactory, and taking up painting by himself exhibited five landscapes at the Salon of 1831. He received second-class medals, Salons, 1833 and 1849, and Paris Exposition, 1867; medal of honor, Paris Exposition, 1889; officer Legion of Honor 1870; one of the great landscape-painters of the Romantic school. His work is very individual in method, and is notable for fine qualities of color and unity of effect. His marines are often hard and stony in the painting of the water, but are handsome as color harmonies. *Morning* and *Evening* are in the Luxembourg Gallery, Paris. D. in Paris, 1889. William A. Coffin.

Dupré, Julien: landscape and figure painter; b. in Paris, Mar. 17, 1851; pupil of Pils, Lehmann, and Langée; second-class medals, Salon, 1881, and Paris Exposition, 1889; Legion of Honor 1892; medal, Centennial Exposition, Philadelphia, 1876. His pictures depict peasant-life, and are painted with frank, simple methods; strong draughtsman and careful observer of nature. *Mowing Clover* (1880) and *The Refractory Cow* (1885) are in Luxembourg Gallery, Paris; *The Pasture* in the museum at St. Louis, Mo. Studio in Paris.

W. A. C.

Dupuis, dü′pü-ē′, Charles François: philosopher: b. at Trie-le-Château, Oise, France, Oct. 16, 1742. He became Professor of Rhetoric in the College of Lisieux in 1766, and was a friend and pupil of Lalande, the astronomer. His *Origine de tous les Cultes, ou la Religion Universelle*, contains bold speculations on religion. D. Sept. 29, 1809.

Dupuis, Nathan Fellowes: See the Appendix.

Dupuytren, dü′pü-ē′traṅ′, Guillaume, Baron: surgeon and anatomist; b. at Pierre-Buffière, France, Oct. 6, 1777; became Professor of Surgery in Paris in 1811. He was reputed the most skillful French surgeon of his time, made important discoveries in morbid anatomy, and invented several useful instruments. D. Feb. 8, 1835. See Cruveilhier, *Vie de Dupuytren* (1841).

Duquesne, dü′ken′, Abraham, Marquis: French naval commander; b. at Dieppe in 1610. He served with distinction against the Spaniards at Tarragona in 1641. In 1643 he defeated the Danes near Gothenburg, and compelled them to make peace. He defeated the Spanish and Dutch fleet under De Ruyter in the Mediterranean, near Catania, in April, 1676. D. in Paris, Feb. 2, 1688. See André Richer, *Vie du Marquis Duquesne* (1783).

Duquoin, dyu-kwoin′: city and railway junction: Perry co., Ill. (for location of county, see map of Illinois, ref. 10–E); 76 miles N. of Cairo. It has a graded school, a park, a public library, a foundry, machine-shops, salt-works, a flouring-mill, fourteen coal mines, and gas-works. Pop. (1880) 2,807; (1890) 4,052; (1900) 4,353.

Editor of "Tribune."

Du'ra Ma'ter [Lat. *dura*, femin. of *durus*, hard; *mater*, mother—so named because it is more unyielding than the pia mater]: the outermost of the three meninges or membranes enveloping the brain and spinal cord in vertebrate animals. Within the skull the dura mater is closely attached to the bones, forming their endosteum. Its inner

surface is covered with pavement epithelium, and perhaps by the parietal layer of the arachnoid membrane, but this is denied by Kölliker. It is usually studded, except in infancy, by numerous small whitish masses called the Pacchionian bodies, whose use is not understood. The tentorium and the falces (*falx cerebri* and *falx cerebelli*) are induplications of the dura mater sent into the cavity of the skull. Within the spinal canal the dura mater becomes a fibrous tube, separated from the vertebræ (which have an endosteum) by a loose areolar fatty tissue and a plexus of veins. It is much larger than the spinal cord, the space between being filled by the other meninges and by the cerebro-spinal fluid.

Revised by WILLIAM PEPPER.

Dura'men [Lat., hardness, ligneous vine-branch, deriv. of *durus*, hard]: the heart-wood of ligneous plants. It is the inner and older wood, and is distinguished from the alburnum or sap-wood by its greater density and hardness, and usually by a darker color. The line of demarcation between the duramen and alburnum is usually not clearly marked. The proportion of alburnum to the entire trunk runs from 0·1 per cent. in chestnut to 0·4 in the Scotch fir. Of the remainder, the greater part is heart-wood. L. H. B.

Duran, doo-raan', AGUSTIN: scholar; b. in Madrid, Spain, Oct. 14, 1789; devoted himself first to legal studies, then turned to literature. In 1836 he became chief librarian of the Royal Library; in 1854 director of the same. He is chiefly known for his researches in the ballad-poetry of Spain. His *Romancero General*, or collection of all the Spanish ballads accessible in his time, long remained the best work of the kind in Europe (2 vols. in the Biblioteca de Autores Españoles, 1849–50). D. in Madrid, Dec. 1, 1862.

A. R. MARSH.

Durance (in Lat. *Druentia*): a river in the southeastern part of France; rises among the Cottian Alps in the department of Hautes-Alpes. Its general direction is nearly southwestward. It flows through the department of Basses-Alpes, forms the southwestern boundary of Vaucluse, and enters the Rhône 3 miles below Avignon. Its total length is nearly 200 miles. Marseilles is supplied with water from this river by an aqueduct 51 miles long.

Durand': city; capital of Pepin co., Wis. (for location of county, see map of Wisconsin, ref. 5–B); situated on railway and on Chippewa river; about 20 miles N. of Wabasha, Minn.; has churches of three denominations, high school, creamery, machine-shops, saw-mills, lumber-yard, etc. It is situated in an agricultural district, and has a very large trade in hogs. Pop. (1880) 642; (1890) 1,154; (1900) 1,458.

EDITOR OF "COURIER."

Durand, ALICE MARY CÉLESTE: See GREVILLE, HENRY.

Durand, ASHER BROWN: landscape-painter; b. at Jefferson, N. J., Aug. 21, 1796. He was an engraver until 1835, when he took up painting and went to Europe to study in 1840. One of the founders of the National Academy of Design in 1826, and its president from 1845 to 1861. D. at South Orange, N. J., Sept. 17, 1886. W. A. C.

Durand-Claye, dü'raăn'klā', ALFRED AUGUSTINE: civil engineer; chief engineer of Ponts et Chaussées; officer of the Academy; b. in Paris, July 18, 1841. After studies at St.-Barbe he entered the Polytechnic School, taking the highest rank on his examinations. He graduated also at the head of his class in 1862, and entered the École des Ponts et Chaussées. Appointed engineer in 1866 and attached to the service of the city of Paris, he was assigned by Belgrand to study the questions of the utilization of sewage and the purification of the Seine, a subject to which he devoted his whole life. He established the irrigation works in the Forest of St.-Germain and the plain of Gennevilliers, the first and most successful works on a large scale for the purification of sewage. An indefatigable worker, Durand-Claye was upon all the great commissions on public works. He was also professor at the École des Beaux-Arts and at the École des Ponts et Chaussées. His principal writings are upon sewage disposal, sewage irrigation, and the purification of the Seine. In 1867 he published in *Annales des Ponts et Chaussées* a remarkable theory of the stability of arches. D. Apr. 28, 1888. W. R. H.

Durand de Saint-Pourçain, dü'raăn'de-săn'poor'săn', GUILLAUME, known as the MOST RESOLUTE DOCTOR: a scholastic divine; b. at St.-Pourçain, Auvergne, about 1280. He was a Dominican friar in his youth. In 1318 he became Bishop of Le Puy-en-Velay (or Annecy), and in 1326 Bishop of Meaux. He was a decided nominalist, and by his independent thinking is believed to have contributed to the rise of the Reformation. His best-known writings are commentaries on Peter Lombard and a work on the canon law (*De Origine Jurisdictionum*). In his treatise *On the State of the Pious Dead* he attacked the opinions of Pope John XXII. D. at Meaux, Sept. 10, 1334.

Durando, doo-raan'dō, GIACOMO: general; b. at Mondovi, Italy, in 1807. He printed in 1847 a brochure in favor of Italian unity under a constitutional government, which had an extensive influence. He was Minister of War at Turin 1854–55; became a senator in 1860; was Minister of Foreign Affairs in the cabinet of Ratazzi 1862–63; and president of the senate 1884–87. D. in Rome, Aug. 26, 1894.

Durau'go: a state in the western part of Mexico; bounded N. by Chihuahua, E. by Coahuila and Zacatecas, S. by Jalisco, and W. by Sinaloa. Area, 42,530 sq. miles. The greater part of the state lies on the Mexican plateau. The Sierra Madre Mountains separate it from Sinaloa and occupy a considerable area in the W. In the S. E. there is a region of volcanic hills and lava-beds, occupying nearly 1,000 sq. miles and known as La Breña. The plateau is generally fertile, but is scantily watered, and portions in the N. and E. are deserts. Maize is the principal agricultural product, being extensively grown where the land is not too dry. A little wheat is raised, and sugar-cane and cotton are planted in some of the warmer valleys. The grazing industry is decreasing in importance; recent statistics for the state give 97,000 horned cattle, 31,000 horses, and 105,000 sheep. The mountains are well wooded and are rich in minerals, especially silver. There are rich iron-beds, as yet very little used. Durango corresponds nearly to the old intendency of Nueva Biscaya. Pop. (1895) 294,366. Capital, Durango.

HERBERT H. SMITH.

Durango, or **Victoria**: a city; capital of the state of Durango; in the southwestern part; about 30 miles E. of the Sierra Madre (see map of Mexico, ref. 5–F). It is situated in the extensive plain of San Antonio, on the little Rio del Tunel, at an elevation, according to Humboldt, of 6,847 feet. The celebrated Cerro del Mercado, near the city, is a hill about a mile long and 600 feet high, composed of iron ores (magnetic and hematite). Durango was founded by Alonso de Pacheco in 1563, and long marked the limits of civilization in Northern Mexico. At present it is reached by diligence from Zacatecas, on the Mexican Central Railway, a three-days journey. The city is an episcopal seat; has a large cathedral and many churches. The trade with the surrounding districts is considerable. The Durango mint was established in 1811, and up to 1888 had coined 63,000,000 pesos in gold and silver. There is a cotton-factory of some importance. The city is furnished with warm water from a large spring at the upper end. Pop. (1895) 42,165. HERBERT H. SMITH.

Durango: town; capital of La Plata co., Col. (for location of county, see map of Colorado, ref. 6–B); situated on Las Animas river and on the Denver and Rio Grande R. R.; 450 miles S. W. of Denver. It is in an agricultural, stock-raising, and mining region, and is an outfitting-point for miners. Pop. (1890) 2,726; (1900) 3,317.

Durant, HENRY FOWLE: philanthropist; b. at Hanover, N. H., Feb. 20, 1822; named originally Henry Welles Smith; graduated at Harvard in 1841; studied law with Benjamin F. Butler; changed his name; practiced in Boston with success and made profitable business investments; in 1863, on the death of his only son, determined to devote himself to the promotion of religion, and gave up his lucrative practice to become a lay preacher; founded WELLESLEY COLLEGE (*q. v.*). D. at Wellesley, Mass., Oct. 3, 1881.

Durante, doo-raan'tā, FRANCESCO: composer; b. in Naples, Italy, Mar. 15, 1684; studied music at Naples under Gaetano Greco and under Scarlatti, and in 1742 became director of the conservatory of Sta. Maria di Loreto at Naples. His compositions consist solely of church music, and are marked by loftiness and purity of style. D. in Naples, Aug. 13, 1755.

Durao, JOSÉ DA SANTA RITTA: See SANTA RITTA DURÃO.

Durazno: a central department of Uruguay; between the Rio Negro and its southern affluent, the Yi; bounded N. by the departments of Rio Negro and Tacuarembó, E. by Cerrolargo and Treinta y Tres, S. by Treinta y Tres, San José, and Florida, and W. by Rio Negro. Area, 5,526 sq. miles. The high hills called the Cuchilla Grande del Durazno cross the middle from E. to W., giving out many spurs on each

side. The country is well watered and fertile, generally prairie land, though there are some woods near the rivers Negro and Yi. Stock-raising is almost the only industry. Some of the largest and finest stock-farms of Urnguay are situated here, and in connection with them are extensive meat-drying establishments and some tanneries and soap-factories. Capital, Durazno, on the river Yi, connected with Montevideo by railway, and having about 2,000 inhabitants. Pop. of department, 26,000. HERBERT H. SMITH.

Durazzo, doo-raat'sō (Turkish *Drasch*; anc. *Epidamnus*, afterward *Dyrrhachium*): a fortified maritime town of European Turkey; in Albania; on the Adriatic; lat. 41° 18′ N., lon. 19° 28′ E. (see map of Turkey, ref. 3–B). It is the seat of a Roman Catholic archbishopric. It has a safe harbor and an active trade in grain, tobacco, and olive oil. The ancient *Epidamnus* was a populous city. The expulsion of its aristocrocy in 436 B. C. was the origin of the Peloponnesian war. It was captured by the Norman chief Robert Guiscard in 1082, and by the Venetians in 1205. Pop. 5,000.

Durban, dŭr-băn': the largest and chief commercial town and only port of the British colony of Natal, South Africa; on the north side of the bay of Port Natal; in lat. 29° 52′ S., lon. 31° 2′ E. (see map of Africa, ref. 9–G); founded in 1834 by the British Captain Gardner, who named it in honor of Sir Benjamin D'Urban, governor of the Cape; connected with the Boer republic by rail; has a number of fine buildings, 7 hotels, 3 banks, and 2 newspapers. Pop. (1866) 4,991; (1895) 39,000.

Dur'bin, JOHN PRICE, D. D.: Methodist preacher; b. in Bourbon co., Ky., in 1800; educated at Miami University and Cincinnati College; entered the ministry in 1819. He was president of Dickinson College, Carlisle, Pa., from 1834 till 1845. Having visited Europe and the Levant, he published *Observations in Europe, principally in France and Great Britain* (2 vols., New York, 1844), and *Observations in Egypt, Palestine, etc.* (2 vols., 1845). For many years he was missionary-secretary of the Methodist Episcopal Church (1850–72), displayed great administrative ability in its affairs, and gained a high reputation for eloquence. He contributed largely to periodicals, etc. D. in New York city, Oct. 17, 1876. See his *Life* by J. A. Roche (New York, 1879).

Dü'ren, or **Mark Düren** (anc. *Marcodurum*): a town of Rhenish Prussia; on the river Roer and on the Cologne and Aix-la-Chapelle Railway; 18 miles E. of Aix-la-Chapelle (see map of German Empire, ref. 5–C). It has a Roman Catholic gymnasium, a high school, a female high school, an asylum for the blind, several fine churches, and manufactures of woolen cloth, carpets, cotton goods, etc. It was besieged and taken by Charles V. in 1543. Charlemagne held diets here in 775 and 779 A. D. Pop. (1890) 21,702.

Dü'rer, ALBRECHT: painter and engraver; b. at Nuremberg, Germany, in 1471; son of a goldsmith. The day of his birth is uncertain, owing to the way in which it is inserted in his father's diary, but it was probably May 21. He was a pupil of Michael Wohlgemuth, with whom he studied and worked three years (1486–89). He afterward passed four years in travel, visiting various parts of Germany, and returned to Nuremberg in 1494. He visited Venice in 1505, and while there painted a picture for the Tedeschi, or guild of German merchants, which was probably *The Feast of the Rose Garlands*, now in the monastery of Strahow at Prague. This was his first picture of importance. In 1520 he went to the Netherlands, accompanied by his wife, and during his journey, the object of which is not known, he kept a minute diary, which was first published in Von Murr's *Journal zur Kunstgeschichte* (1775–88). This curious and interesting record of early travel has been several times translated into English. Dürer returned home in 1521, and continued to live in his native town until his death, Apr. 6, 1528. Dürer's works consist of paintings in oil and engravings on wood and copper. He has also left a number of etchings; and over 500 of his drawings in pen and ink, water-color, chalk, charcoal, india-ink, and with the silver point, exist in public and private collections. These drawings and sketches are remarkable for their precision, delicacy, and firmness of touch, and for the power of observation and patient study they reveal in the master. The finest collections are in the British Museum, the Albertina Gallery at Vienna, and the Uffizi at Florence. His most celebrated paintings are *The Four Apostles*, originally presented by him to the city of Nuremberg, but now in Munich; his own portrait in the Pinakothek at Munich, painted in 1500, and another—an earlier one—in the Uffizi Gallery at Florence, and an *Adoration of the Magi*, a most beautiful picture, well worthy of the place it occupies in the tribune. His best wood-cuts are the four series, *The Apocalypse*, *The Great Passion*, *The Little Passion*, and *The Life of the Virgin*, but there are many fine single cuts. Dürer is not believed to have engraved all the wood-cuts that bear his monogram, but only to have made the designs. Perhaps the works by which Dürer is most widely known are his engravings on copper. Of these the most famous are the *Adam and Eve*, the *Melencholia*, the *Knight, Death, and the Devil*, the *Saint Eustache*, *Saint Jerome in his Study*, and *The Great Fortune*. These are all large, but many among the smaller engravings are equal miracles of execution. Dürer was much beloved by the Emperor Maximilian I. and by many of the most distinguished men of his time—by Luther, by Melanchthon, by Erasmus, as well as Camerarius and Pirkheimer. When in Venice he received much kindness from Bellini, and Raphael and he exchanged specimens of their work. Dürer has left us valuable portraits of Melanchthon, Erasmus, Pirkheimer, and many other notables of his time. He was the author of several treatises—*Instruction in the Art of Mensuration with the Rule and Compass* (1525); *The Art of Fortification* (1527); with one on *The Proportions of the Human Body* (1528). A work on the *Proportions of the Horse* is lost, as is also one on *The Art of Fencing*, with perhaps some others whose names are not known. The most important works on Dürer are J. Heller, *Das Leben und die Werke A. Dürers* (1827–31)—only the second volume of this valuable work ever appeared; his *Life* by Thausing (Leipzig, 1876; Eng. trans. 1882), and by Mrs. Charles Heaton (London, 1869), with the *Albert Dürer, ses Dessins*, by Charles Ephrussi (Paris, 1882). An English translation of his writings is published by the Clarendon Press. His engravings on metal have been reproduced by Amand-Durand, of Paris, and his wood-cuts of his *Apocalypse* and *Life of the Virgin* by Van de Weiger, of Utrecht. A photo-lithographic reproduction of *The Little Passion* was issued by J. W. Bouton in 1868, and copies of his copper-plates by J. R. Osgood, of Boston, in 1872.

CLARENCE COOK.

Du'ress [O. Fr. *durece* : Ital. *durezza* : Span. *dureza* < Lat. *duri'tia*, hardness, deriv. of *durus*, hard]: in law, restraint of the person or of goods. 1. *Of the Person.*—This is exercised in two modes, either by threats or by imprisonment. Duress by threats (*per minas*), according to the older authorities, occurred where a person entered into a contract or performed some other act through fear of loss of life or limbs, or grievous bodily harm. It was even an excuse for some crimes, but not for those of the graver class, such as the killing of an innocent person. The modern cases do not take quite so technical a view of the subject, and the tendency is to make the presence of duress turn on positive inquiry whether the threat was of a kind calculated to overcome the will of a person of ordinary firmness and prudence. In equity jurisprudence the word is used in a broader sense than in the courts of common law, and includes cases where a party is in extreme necessity and distress; and duress may be exercised not only toward the person who makes a contract, but in certain cases toward one standing in confidential relations with him. Thus a threat to prosecute criminally a son, whereby a father is induced to execute a deed in order to save him from arrest, is sufficient duress in equity to furnish a basis to set the conveyance aside. A contract executed under duress is not void, but only voidable at the election of the injured party. Duress of imprisonment can be affirmed only of the case of unlawful restraint.

2. *Duress of Goods.*—This phrase refers to a case where a person having goods illegally detained pays money to obtain their release. If such payment is made under protest, the money may be recovered as being paid under compulsion. An instance is an exaction of unauthorized duties upon goods by the collector of a port. The mode of making the protest in this special case is regulated in the U. S. by act of Congress.

The question has been raised whether the doctrine of duress can be applied in international law to relieve a nation from the obligations of a treaty of peace. The answer must in general be in the negative, as the terms of peace, however humiliating, are the chances of war to which the parties have appealed.

T. W. DWIGHT.

Duret, dü'rā', Francisque Joseph: sculptor; b. in Paris, Oct. 19, 1804; studied with his father, with Bosio, and at Rome. His works, among them *Fisher-boy Dancing* (1833), *Vintager* (1839), and statues of Molière and Chateaubriand, are dignified compositions of great power and correctness, but somewhat lacking in originality and in vigor of conception. Perhaps his most famous work is a *Neapolitan Dancer*, exhibited five years after the *Fisher-boy*. Equally fine are two bronze statues at the tomb of Napoleon I. at the Church of the Invalides. D. in Paris, May 25, 1865.

D'Urfey, dŭr'fĕe, Thomas: dramatist of Huguenot ancestry; b. at Exeter, England, 1653; gained the favor of Charles II. He wrote successful comedies, among which were *The Fond Husband, or the Plotting Sisters* (1676), and *Sir Burnaby Whig, or No Wit like a Woman's* (1681); popular songs, published collectively in 1719-20 as *Wit and Mirth, or Pills to Purge Melancholy*; and odes. D. in London, Feb. 26, 1723.

Durgâ, or **Dourga**: a Sanskrit word signifying "difficult of access"; one of the many names of Pârvatî (*q. v.*).

Durham, dŭr'am: a county in the northern part of England; bounded N. by the river Tyne, E. by the German Ocean, and S. by the river Tees. Area, 1,012 sq. miles. The surface is hilly, but the greater part of the land is arable. The rocks which underlie it are new red sandstone, carboniferous limestone, and magnesian limestone. Among its mineral resources are coal, iron, lead, and marble. The collieries of Durham are the most extensive and valuable in England. The county produces a celebrated breed of shorthorned cattle. The chief towns are Durham, Sunderland, Darlington, South Shields, and Gateshead. Pop. (1901) 833,310.

Durham: an episcopal city of England; capital of the county of the same name: on the river Wear, 14 miles S. of Newcastle (see map of England, ref. 4–H). It is built around a steep rocky hill, the top of which is occupied by a castle and cathedral. It is connected by railways with Newcastle and other towns. It sends a member to Parliament. Here is a castle founded by William the Conqueror about 1072. The magnificent cathedral of Durham was founded in 1093, and is a Norman structure 507 feet long by 200 wide, with a central tower 214 feet high. The grand Norman church which Bishop Carileph built, and which is distinguished by its strength, the exquisite proportions in all its divisions, and the elaborate execution, still forms the main part of the whole construction. Many additions, however, have been made in the course of time; as, for instance, the Galilee or western chapel, from the Transition period, built by Bishop Pudsey between 1153 and 1195, the eastern transept, or the so-called Nine Altars, containing the remains of St. Cuthbert, etc. The city itself originated, indeed, from the cathedral. Though there was a small Roman camp at Maiden Castle Hill, close by, Durham itself dates only from the end of the tenth century. The cathedral contains the tombs of Saints Cuthbert and Bede. A college was instituted here by Cromwell, but was suppressed at the Restoration. The present university was opened in 1833. The colleges of medicine and of physical science at Newcastle-on-Tyne are affiliated with it. Durham also has seven parish churches, diocesan training-colleges, a grammar school, a school of art, a miners' hall, a town-hall, and a prison. At Ushaw, 4 miles to the W. of Durham, is a noted Roman Catholic college called St. Cuthbert's College. Pop. (1891) 14,863.

Durham: city and railway center; capital of Durham co., N. C. (for location of county, see map of North Carolina, ref. 2–G); 25 miles N. W. of Raleigh. It has many large factories producing smoking tobacco, cigarettes and snuff, tobacco-boxes, fertilizers using tobacco dust as a basis, and tobacco-bags. There are 11 churches, a seminary for young ladies, graded schools, 2 newspapers, and waterworks. The surrender of Gen. J. E. Johnston, of the Confederate army, took place near Durham, Apr. 25, 1865. The prosperity of the city dates from the close of the civil war. Pop. (1880) 2,041; (1890) 5,485; (1900) 6,679.

Editor of "Recorder."

Durham, John George Lambton, Earl of: statesman; b. in the county of Durham, England, Apr. 12, 1792. He was elected to Parliament by the Whigs in 1813, and was an advanced Liberal. He was created Baron Durham in 1828; became Lord Privy Seal in the cabinet of Earl Grey in Nov., 1830, and was one of the four persons who prepared the Reform bill of 1831, which he supported in the House of Lords. In 1833 he resigned the office of Lord Privy Seal and received the title of earl. He was sent as ambassador to Russia in 1835, and in 1838 was appointed Governor-General of Canada, then in rebellion, but returned suddenly in Dec., 1839, on account of the Government's disapproval of his measures. He submitted an important report on Canadian affairs, advocating liberal changes in the colonial government. D. in Cowes, Isle of Wight, July 28, 1840.

Durham Breed of Cattle: See Shorthorns.

Du'rian, or **Durion**: a tree (*Durio zibethinus*) of the family *Sterculiaceæ*, a native of the Malay peninsula, cultivated by the Malays for its delicious fruit, which forms a great part of their food. It is a lofty tree, with simple leaves and large clusters of pale-yellow flowers. The fruit is globular or oval, about 10 inches in diameter, and has a hard, thick, prickly rind inclosing a creamy pulp. Its ten to twenty seeds are eaten roasted. It combines the most delicious flavor with a very offensive odor.

Duris of Samos: Greek historian of the fourth century; disciple of Theophrastus; uncritical collector of historical and annalistic material; one of the sources of Diodorus and Plutarch. See Müller, *Fragmenta Historicorum Græcorum* (vol. ii., 466–88).

Durkheim, doork'hīm: town of Bavaria; on the Isenach; 20 miles N. of Landau (see map of German Empire, ref. 6–D). It has a castle, a hospital, manufactures of paper and glass, and an active trade in wine. It is surrounded by beautiful scenery, and is a resort of invalids. The neighboring salt-springs of Philippshall not only supply the bathing-establishment, but annually produce about 8,000 cwt. of salt. The city originated as a dependency of the Benedictine abbey of Limburg, came afterward into the possession of the Counts of Leiningen, and had its share of the military vicissitudes of the Palatinate. Pop. (1890) 6,081.

Durlach, door'laḵh: town of Baden; on railway and on the river Pfinz; 3 miles E. of Carlsruhe (see map of German Empire, ref. 6–D). It is at the base of the Thurmberg, a hill the top of which is occupied by a ruined castle. It manufactures linen, iron, sewing-machines, tobacco, beer, vinegar, and chicory. Before the foundation of Carlsruhe, in 1715, it was the residence of the Margraves of Baden and a prosperous place, though it was several times devastated by the French. Pop. (1890) 8,240.

Duroc, dü'rok', Gérard Christophe Michel: Duke of Friuli; general and diplomatist; b. at Pont-à-Mousson, France, Oct. 25, 1772. Destined for a military career, he early entered the military school of his native city, from which he was graduated in 1792 as sub-lieutenant of artillery. He became in 1796 aide-de-camp to Bonaparte, whom he accompanied to Egypt in 1798. During the consulate and the empire, he was sent on diplomatic missions to Berlin, Vienna, and other courts. He was a favorite officer of Napoleon, who made him general of division, governor of the Tuileries, and Duke of Friuli, and who received the news of his death with the greatest emotion. He was killed in the battle of Wurtzen, May 23, 1813.

Durra, **Dhurra**, or **Doora**, called also **Indian Millet**: a kind of grain (*Sorghum vulgare*) much cultivated in Asia, Africa, and Southern Europe. The genus differs from *Andropogon* in having hermaphrodite spikelets and glumes, with three small teeth at the end. The species are mostly tall, broad-leaved annual grasses, with large panicles, and strong culms containing a sweet and juicy pith. The durra (sometimes called jowaree in India) has grain somewhat larger than mustard-seed. It yields abundant crops, and the stalks and leaves are food for cattle and horses. The sugar-cane is also a variety of the same species. The Caffer corn (*Sorghum caffrorum*) is chiefly valued as food for horses. The durra grows well in the U. S., but has not been found profitable for culture.

Duruy, dü'rü-ee', Jean Victor: historian; b. in Paris, Sept. 11, 1811. He published many popular and excellent historical and geographical works, some of which were designed for schools. He was minister of public instruction from June, 1863, to July, 1869, and made important changes in the educational system of France. Author of *Histoire des Romains* (History of the Romans, 2 vols., 1843–44; 7 vols., 1870–79); *Histoire de France* (2 vols., 1852); and *Histoire de la Grèce ancienne* (History of Ancient Greece, 2 vols.,

1862), and a number of important works on historical geography. D. in Paris, Nov. 25, 1894.

Dur'yea, Joseph Tutnill, D. D.: clergyman; b. at Jamaica, Long Island, N. Y., Dec. 9, 1832; graduated in 1856 at the College of New Jersey, where he afterward taught Greek and rhetoric 1857–59; graduated at the Princeton Theological Seminary 1859; was pastor of the Second Presbyterian church, Troy, N. Y., 1859–62; associate pastor of the Collegiate Reformed Dutch church, New York, 1862–67; became pastor of the Classon Avenue Presbyterian church, Brooklyn, N. Y., in 1867, of Central Congregational church, Boston, Mass., in 1879, of the First Congregational church, Omaha, Neb., in 1889, and of the First Reformed church, Brooklyn, N. Y., in 1895. D. in Boston, Mass., May 17, 1898.

Düs'seldorf (i. e. Düssel-Town): town of Rhenish Prussia; the former capital of the duchy of Berg; finely situated on the right bank of the Rhine, at the mouth of the river Düssel; 17 miles N. N. W. of Cologne; lat. 51° 13′ N., lon. 6° 45′ E. (see map of German Empire, ref. 4–C). It is connected by railways with Cologne, Elberfeld, and other towns. The Rhine is here crossed by a bridge of boats. Düsseldorf is mostly built of brick, and has wide and regular streets. It has several fine churches, a fine public garden called the Hofgarten, a celebrated academy of art (see below), an old electoral palace, a gymnasium, a Realschule, a townhall, a public library, a theater, an observatory, and manufactures of woolen and cotton fabrics, jewelry, hats, leather, carpets, etc. Its prosperity is derived partly from trade and the navigation of the Rhine; it became a free port in 1829. Pop. (1900) 213,767.

The Düsseldorf Academy, founded in 1767 by Prince Charles Theodore, led a languishing life until, under the patronage of Frederick William III., Cornelius was appointed director, which position he continued to fill until his removal to Munich in 1826. A man of such ability and force naturally quickened the growth of art, and the academy soon became the center of a new life. On the departure of Cornelius, William von Schadow was made director, and his great skill as a teacher, added to his proficiency in his art, increased the reputation of the academy as a school, and drew to it more and more of the rising, undeveloped talent of Young Germany. The names that make this period in the history of German art, in the eyes of Germans at least, a modern Renaissance—Koch, Overbeck, Veit, Schnorr, Von Schwind—are most widely known by the frescoes with which they adorned so many palaces, villas, churches, and public buildings in Rome, Munich, and Berlin; but the artists of the Düsseldorf school have spread the name of their alma mater far and wide by means of their easel pictures. Their chief influence outside of Germany has been in the U. S., where many of their best works have been exhibited and sold. Several artists who were trained in Düsseldorf and returned to the U. S. to live aided in spreading the doctrines of the school through their own productions. In 1853 an exhibition of Düsseldorf pictures, belonging to Mr. Boker, was opened in the city of New York, and long continued one of the principal attractions of the town.

The school at Düsseldorf was early divided into two parties—the Roman Catholic and the Protestant, the former seeking to restore the ancient exclusive devotion of art, as in the Old Cologne school, to religious, chiefly Roman Catholic, subjects; the other, of which Lessing was the acknowledged head, refusing to be shut up in such narrow limits, and painting all subjects—landscape, genre, historical, and religious—having, however, a strong leaning to the Protestant side. The harm the Düsseldorf school has done is not perhaps greater than has been done by the schools of Berlin and Munich. It inculcates the fatal doctrines that art can be taught sufficiently by an academic process, and that its ministry is that of a preacher of doctrines or a narrator of anecdotes, religious, historical, domestic. It confounds art with science, and dissects where it ought to create. But in their own narrow, pedantic field here were men of sense, talent, learning, industry—everything but genius; the men of genius in Germany, as everywhere, have grown up and worked outside of all schools—and they have had the reward that always awaits the commonplace and the practical. They have been extremely popular, they have stimulated a great number of kindred minds, and they have more than supplied the demand for works of art that everybody can understand.

Dussieux, dü'si-ö', Louis Étienne: historian and geographer; b. in Lyons, France, Apr. 5, 1815; obtained the prizes of the Academy in 1839 and 1840, and became Professor of History and Geography in the School of St. Cyr 1842. D. 1894. Author of *L'art considéré comme symbole de l'état social* (1838); *Essai historique sur l'invasion des Hongrois en Europe et spécialement en France* (1839); *Recherches sur l'histoire de la peinture sur émail* (1840); *Géographie historique de la France, ou Histoire de la formation du territoire français* (1843, in thirty-three charts); *Cours de géographie physique et politique* (1846–48, with maps and notes); *Les Artistes français à l'étranger* (1852; 3d ed. 1875); *Force et faiblesse de la Russie au point de vue militaire* (1854); *Histoire de France racontée par les contemporains* (4 vols., 1860–62); *Cours classiques de géographie* (6 vols., 1859–65); *Les Lettres intimes de Henri IV.* (1876).

Dust: particles of matter so fine that they may be raised and wafted by the wind. The recent discoveries of science have shown that dust plays an important part in the spreading of infectious diseases, and in the occurrence of many cosmic, meteorological, physical, and geological phenomena. In meteorology it is important for the fine colored effects it produces in the sky. These were well illustrated in the brilliant twilights, green sun, bishop's ring, and other phenomena which followed the Krakatoa eruption in Aug., 1883. These phenomena are due to the diffractive effects of minute bodies. A study of the phenomena showed that the minutest particles, which were thrown the highest, traveled on a high west-bound current of air whose existence had hardly been suspected before. They also showed that these extremely minute particles fell through the air with such slowness that they were months, possibly years, in descending.

The relation of dust to the condensation of moisture in the air has been especially studied by a Scotch physicist named Aitken. He believes that he has shown that the moisture in the air condenses to form the particles of fog, rain, and snow, only where there are particles of dust present to form a nucleus. His theory is that moisture condenses with difficulty unless there is a free surface or particle of matter for it to condense upon as a nucleus, and that the particles of dew, fog, rain, snow, and hail are formed by condensation upon the dust on the surface of the earth or particles of solid matter suspended in the atmosphere, as the case may be. This theory is not yet universally accepted, though all competent judges admit that condensation is easier on free surfaces.

The dusts at the earth's surface consist of comminuted earth and rock, particles of fibers and fragments of vegetable tissue, smoke, and to a greater or less degree of living organisms and spores. The last play an important part in disease, the nature and extent of which we are just beginning to understand.

Many of the showers noted as extraordinary, such as showers of sulphur, blood, etc., are due to dusts of various sorts which mingle with the rain.

The electric reactions of dust are also remarkable. A piece of rosin rubbed will attract or repel dust, and it is said that the fumes produced in some forms of manufacturing can be expelled by electric action. See Afterglows and Loess.

Cosmic Dust consists of the ashes of meteorites. The smaller meteors usually undergo complete combustion in the air because of the heat generated by their rapid motion. It is possible that some of the results or remains of combustion reach the earth's surface. Nordenskiold in 1870 found on the inland ice of Greenland tear-shaped grains of magnetic iron with cobalt, which he attributes to a cosmic origin. There is a high degree of probability in this hypothesis, as volcanic dusts are not of this character, and dusts of other origin are improbable on this ancient ice-sheet. He has since found dust of similar character on Spitzbergen (1872), in Finland (1872), and in heavy snows at Stockholm. See Nordenskiold, *Voyage of the Vega* (1886).

Mark W. Harrington.

Dust-brand: See Smuts.

Dus'tin, Hannah: wife of Thomas Dustin, of Haverhill, Mass.; was married Dec. 3, 1677, and became the mother of thirteen children. She was taken prisoner by the Indians in the attack on Haverhill, Mar. 15, 1698, her nurse and infant one week old being also taken, but the child was soon after killed. She was placed in an Indian family of eleven persons on an island (now called Dustin's island) in the Merrimack river, near the mouth of the Contoocook, in New Hampshire, but with the aid of the nurse and a white captive boy she killed all the Indians in their sleep,

except a squaw and a boy who escaped. She returned to Haverhill with their scalps.

Dutch East India Company: See East India Company.

Dutch Gap Canal: a cut through the narrow isthmus of a peninsula known as Farrar's island, in the James river, about 5 miles below Richmond, Va.; made during the civil war; designed to afford the national vessels a nearer approach to the Confederate works, to avoid the great obstructions which had been placed in the curve of the river, and to outflank the heavy Howlett House batteries. It was executed under Maj. P. S. Michie, by order of Gen. B. F. Butler. The work was undertaken Aug. 15, 1864, and finished Jan. 1, 1865; but a large part of the bulkhead of clay which was blown out by powder on that occasion fell back, so as to obstruct navigation for the time. It was of no service to either side during the war, but has since shortened the navigation of the river to Richmond some 7 miles.

Dutch Gold: an alloy of copper and zinc, closely resembling common brass, but having rather less zinc in its composition than brass generally has. It is used for beating into thin plates, resembling gold-leaf in appearance when new, and is used for ornamentation instead of gold-leaf. It tarnishes readily, and may be tested by the application of strong nitric acid, which will not injure gold-leaf, but readily dissolves the imitation.

Dutch Guiana: See Guiana.

Dutch Language: that spoken by the inhabitants of the Netherlands. In its earlier as well as in its present form Dutch or Hollandish is, with some slight differences, identical with the Flemish (*q. v.*), the language of the Low German inhabitants of Belgium. Dutch is furthermore spoken in the East and West Indian colonies of the Netherlands, in the South African Republic, in the Orange Free State, and to some extent in the English Cape Colony.

The Term Dutch.—In the Middle Ages this language was called *Dietsch*, i. e. the popular, vernacular language, especially in distinction from Latin and from the Romance languages. In the well-known poem *Van den vos Reinaerde* (vs. 1461, *seq.*), when Reinaert begins to make his confession in Latin, Grimbert answers to him: *Ôm, walschedi? Of ghi iet wilt, sprîct jeghen mi in Dietsche, dat ict mach verstaen* (i. e. Do you speak in a foreign tongue, uncle? Talk Dutch to me, if you please, so that I may understand it). In a similar way *Walsch* and *Dietsch* are often contrasted. Besides *Dietsch*, the spelling *Duutsch*, or later on *Duitsch*, is found. As concerns its etymology, this term is of course identical with *Deutsch*, the name given by the Germans to their language. Its origin may be traced back to an early date in the history of the Teutonic languages. In the Gothic translation of the Bible by Vulfila, dating from the fourth century, we find (Gal. ii. 14) the adverb *þiudiskō* translating the Greek *ἐθνικῶς*. The meaning is heathen; but the word is derived from *þiuda*, people, in the same way as Greek *ἐθνικός* from *ἔθνος*, or Latin *gentilis*, heathen, from *gens* (genit. *genti-s*), and the more literal and more original meaning of the adjective *þiudisks* is popular, found with the people. The same adjective occurs in Anglo-Saxon in the form *þéodisc*. It is used as a noun, meaning language, nation. In Old High German the original form *þiudisc* has changed, according to Grimm's law, to *diutisc*. While *diot* in O. H. G. is simply people, *diutisc* is only applied to the popular or vernacular (i. e. German) idiom, as distinguished from the learned language and the language of the Church (i. e. Latin). The term was then adopted by the Frankish authors of the ninth century in their writings in Latin, and in its Latinized form *Theodiscus* (or sometimes *Diutiscus*) is found even more frequently than in O. H. G. texts. *Lingua Theodisca* is used parallel with expressions like *sermo vulgaris*, *barbarus*, *rusticus*, *patrius*, and *Theodisce*, instead of *vulgo*, *rustice*. In Mediæval Latin *Theodiscus* yielded in the tenth and the following centuries to the more learned form *Teutonicus*. The revival of classical Latin by the "humanists" has led, since the sixteenth century, to the replacing of *Teutonicus* by the more correct forms *Germanicus* and *Germanus*. Meanwhile the adjective *thiudisc*, or *diutisc*, retained its place outside of Latin in the language of Germany and the Netherlands, and is still the regular designation of the vernacular language, only having undergone the regular phonetic changes to which the divergence of Modern German and Modern Dutch from the older stages of the language is mainly due. Old High German *diutisc* became Middle High German *diutsch* (pronounced *dŭtsch*) and Modern German *deutsch*. In Middle Low German we find *dudesch*. This form would seem to contain in its first syllable a long *u*. But as in Modern Low German the adjective is *dŭtsch*, which presupposes Middle Low German *dŭdesch* and can not be derived from *dūdesch*, it is more probable that *dudesch* was pronounced *dŭdesch*, the modified vowel, as in other cases, not having been marked in writing. In the Modern Low German dialect of Westphalia and Waldeck *ŭ* is pronounced *°ŭ* or *ᵘŭ* (by others spelled *uĭ*), and with this or a similar pronunciation is to be identified the Middle Dutch spelling *duutsch* and its modern successor *duitsch*. The old variation *dietsch* is either simply a different spelling of the form just mentioned, or it belongs to a different dialect, in which the original *iu* was (like original *io*) changed to *ie*.

Dutch Dialects.—The history of the Dutch language—like that of most written languages—can not be thoroughly understood without regard to its connection with the Dutch dialects. There are three quite distinct sets of dialects found among the Germanic inhabitants of the Netherlands and Belgium, which extend as far back as our sources go—Frisian, Saxon, and Frankish.

(1) *Frisian* was originally in geographical area the chief dialect, but has gradually retrograded before the two other dialects. In the earliest times Frisian tribes occupied the whole north and west of the Netherlands, from the mouth of the Ems down beyond the mouth of the Schelde, viz., the provinces Groningen, Friesland, Drenthe, Over Ijssel, North Holland, South Holland, Zealand, and (W. of the Leije and Schelde) East and West Flanders. But as early as in the ninth century we find part of this territory occupied by Frankish and Saxon dialects. In the twelfth century pure Frisian was confined to Friesland, the northern part of North Holland, and the northern part of West Flanders (along the seacoast and in the "Vrije van Brugge"). A mixture of Frisian and Saxon was then spoken in Groningen, Western Drenthe and Western Over Ijssel, and in the southeast corner of North Holland. A mixture of Frisian and Frankish was found in the southern part of North Holland (the Naardingeland of Gooiland), in South Holland, Zealand, and in the greater part of East and West Flanders. At present Frisian is heard only in the province of Friesland (with the exception of the towns and a small area of the country, where Dutch has replaced it) and on the islands Schiermonnikoog and Ter Schelling. Traces of Frisian are preserved in the Frankish dialect of the eastern part of North Holland and in the Saxon dialects of Groningen (especially the "Westerkwartier," where the dialect is half Frisian).

(2) *Saxon* formerly occupied a much smaller area than Frisian, but has spread over former Frisian territory. It was at first confined to the southeast part of Groningen and the eastern parts of Drenthe, Over Ijssel, and Gelderland. At present the Saxon dialect is found in almost the whole of the provinces Groningen, Drenthe, and Over Ijssel, and in the county of Zutphen belonging to the province of Gelderland; but a difference is still noticeable in the dialect of the original Saxon territory and that of those localities which have adopted the Saxon instead of their former Frisian language.

(3) *Frankish* held and still holds the remainder of the Netherlands and of Belgium. It had its original seat in Limburg, Antwerp, South and North Brabant, East and West Flanders (excepting the parts of these provinces which have been mentioned under Frisian), Utrecht, and Gelderland (excepting the county of Zutphen). Like Saxon, it has expanded at the expense of Frisian, displacing the dialects along the western coast of the Netherlands and Belgium, where originally Frisian and later on a mixture of Frisian and Frankish was spoken, viz., the provinces North and South Holland, Zealand, and the northwestern parts of East and West Flanders. The Frankish dialects of the Netherlands and Belgium may at present be subdivided into (1) North Hollandish, (2) the dialect of South Holland, Utrecht, and West Gelderland, (3) Brabantish, (4) East Flemish, (5) West Flemish, (6) Zealandish, (7) Limburgish. All of these belong to the Low German division of Frankish, while the Frankish dialects of Germany (save a small area near the Dutch territory) constitute Middle Frankish and the High Frankish. The difference between the three divisions may briefly be indicated by stating that High Frankish has gone through the second shifting of consonants, whereas Low Frankish (like Low Saxon) has not been affected by the second shifting, and Middle Frankish takes an intermediate position between High and Low Frankish.

The Literary Language.—While in the development of the popular dialects both Frankish and Saxon have gained at the expense of Frisian, the written language manifests a distinct and early preponderance of the Frankish over the Saxon as well as the Frisian dialects. The latter can scarcely be said to have ever been literary languages. Official documents, laws, treaties, contracts, deeds were drawn up during the Middle Ages in Frisian and Saxon. But even in this limited use of an official language they were at first superseded by the Saxon of Northern Germany, and in the seventeenth century by the written language of the Low Frankish tribes. Traces of the Frisian and Saxon dialects are still found in the vocabulary of Modern Dutch about to the same extent as traces of Low German are found in Modern German. On the whole, these dialects have probably exerted less influence on Modern Dutch than the written language of France and Germany. The appearance of the written language has in course of time considerably changed. Its development may be divided into three periods (corresponding to the division of Low German into Old Low German, Middle Low German, and Modern Low German).

(1) *Old Dutch* (from the earliest times until about the end of the eleventh century).—It goes back to a time when the difference in spelling, pronunciation and inflexion between Dutch and German was not quite so distinct as it became later on. The most noteworthy monument of Old Dutch or Old Low Frankish is an interlinear version of the Psalter, dating probably from the tenth century, but only preserved (in a very fragmentary condition) in copies of the sixteenth and seventeenth centuries. The language of the Psalter represents, on the whole, an older form of Middle Dutch, although its dialect does not entirely coincide with what we may suppose to have been the original form of the latter.

(2) *Middle Dutch* (from the twelfth century until about about 1550).—The difference between Middle Dutch and Old Dutch is especially noticeable in the inflexional endings, where the various full vowels of the older language have given way to a monotonous *e*. Other changes have taken place in the stem-vowels, consonants, and inflexions. It is noteworthy that these changes sometimes agree with the changes which Low German and High German underwent at about the same time (e. g. the *e* of final syllables or *d* instead of older *th*), while in other cases they are peculiar to Dutch, or only shared by special German dialects (e. g. *cht* instead of older *ft*, or *ud* for older *ld*). The earliest author in Middle Dutch that we know of is Heinrik van Veldeke, who, in the latter half of the twelfth century, wrote his poems in the Limburgish dialect of Maastricht. As Limburg is near the German frontier and its dialect inclines toward Middle Frankish, it is natural that Veldeke's language differs to some extent from the general type of Middle Dutch. It is not before the thirteenth century that this type took a definite and lasting form, which is especially represented by the works of the well-known Flemish author Jacob van Maerlant (1235–1300). The language found in the works of Maerlant and his followers is the one which is called "Dietsch." It is a literary language of a distinct South Low Frankish character. It was based upon the dialect of Flanders, but admitted from the beginning words from the closely related dialects of Brabant, Limburg, Zealand. Later on it was subjected to the influence of German, French, and the Northern Low Frankish dialects. Still its character remained about the same until 1450, when a period of transition to Modern Dutch ensued.

(3) *Modern Dutch* (from about 1550 to the present time).—Modern Dutch differs less from Middle Dutch than e. g. Modern German from Middle High German. Its relation to Middle Dutch finds rather a more exact parallel in that of Modern German to Luther's language. At least in spelling, phonetics, and inflexion the difference is not greater than that between Modern German and Early Modern German. More considerable are the changes which the vocabulary has undergone. The reason for this is that while there is a break between the literary tradition in Middle High German and Modern German, in that the literary language in Modern German started with a dialect different from that upon which the literary language in Middle High German was based, Middle Dutch and Modern Dutch may be said to represent one and the same dialect. The literary language which originated in the southern provinces was gradually adopted by the writers of the northern provinces after these had been drawn into the literary movement and had become interested in literary culture. It is from the middle of the sixteenth century that in the literary language the supremacy of the southern provinces declines, the influence of the northern provinces gradually becoming predominant. This change coincides with the opposition of many authors (southern as well as northern) to the great number of foreign, chiefly French, words which had been introduced into the Middle Dutch language especially during the period of transition (with the government of the Dukes of Burgundy), and with a general attempt at purifying the language and revising its spelling, vocabulary, and syntax. The shifting of the center of literature from the south to the north was also aided by the separation of the southern from the northern provinces after the conquest of Antwerp by Parma in 1585. While during the sixteenth century Frisian and Saxon were still used—besides Low Frankish—in official documents, in the course of the seventeenth century the latter obtained the supremacy over the whole of Northern Holland. Another noteworthy fact in the history of the Dutch language of the seventeenth century is the publication, under the authorization of the States-General, of the so-called *Statenbijbel*, i. e. the translation of the Bible begun in 1619 and finished in 1637. This translation has contributed much to settling the spelling and inflexion of the literary language, and to strengthening its position. On the whole, the history of Modern Dutch is remarkably similar to that of Modern German. In the sixteenth century the literary language predominant, but still struggling with dialects which attempt to gain literary influence; at the end of the sixteenth century, and especially during the seventeenth, the formation of learned societies whose members are interested on the one hand in poetry and literary production, on the other hand in grammar, spelling reform, and in purifying the literary language; in the eighteenth, systematic and often arbitrary and hair-splitting rules, dictated by grammatical authorities for so-called logical and practical reasons, but without any knowledge of historical grammar; in recent times (from about the middle of this century), a steady emancipation of the language from the fetters which are due to the narrowness of former grammarians and the application of the results of modern historical grammar. The comparison may be carried up to the most recent times, when in the Netherlands as well as in Germany a new spelling has been introduced. In the Netherlands the spelling reform is especially connected with the names of L. A. te Winkel (d. 1868) and M. de Vries, the two chief editors of the great *Woordenboek der Nederlandsche Taal*, who proposed the present orthography in 1863 (or in its final form in 1865). Their proposals met with general approval on the part of the public, and were adopted by the Belgian Government as early as 1864, and finally by the Dutch Government in 1883.

Literary References.—(*a*) *General.*—For the etymology and history of the terms *Dutch*, *Deutsch*, etc., comp. J. Grimm, *Deutsche Gramm.*, i., 3d ed. (1840), pp. 10–20; *Excurs über Germanisch und Deutsch*; and E. Verwijs in *Taalk. Bijdr.*, i. (1877), pp. 217–232. For a general introduction to the Dutch language, see J. B. Vinckers and J. H. Gallée, art. *Holland.—Language* in the 9th ed. of the *Encyclopædia Britannica*; Jan te Winkel, *Geschichte der Niederländ. Sprache* in Paul's *Grundriss der german. Philologie*, i. (1891), pp. 634–722. Important essays on various matters connected with the Dutch language and its history are contained in several Dutch periodicals, especially *De Taalgids* (Utrecht, 1859–67); *De Taal en Letterbode* (Haarlem, 1870–76); *Taalkundige Bijdragen* (Haarlem, 1877–79); *Noord en Zuid* (Kulenborg, since 1876); and *Tijdschrift voor Nederl. Taal en Letterkunde* (Leyden, since 1881).

(*b*) *Dialects.*—On the modern dialects of the Netherlands, see especially J. Winkler, *Algemeen Nederduitsch en Friesch Dialecticon* (The Hague, 1874), and H. Jellinghaus, *Die Niederländ. Mundarten* (Norden and Leipzig, 1892). Comp. also the references in Paul's *Grundriss*, vol. i., p. 971, *sqq.* A special periodical on Dutch dialects is *Onze Volkstaal*, ed. by T. H. de Beer (1882, *sqq.*). Specimens of the different dialects are found in Winkler's work, in the third volume of Firmenich's *Germaniens Völkerstimmen* (Berlin, 1856), and in Leopold's *Van de Schelde tot de Weichsel* (Groningen, 1882). For a study of the Frankish dialect in general, comp. Braune in Paul and Braune's *Beiträge*, vol. i., page 1 ff., and Heinzel's *Geschichte der Niederfränk Geschäftssprache* (Paderborn, 1874).

(*c*) *Old Dutch.*—The remnants of the Old Low Frankish Psalms are easily accessible in Heyne's *Kleinere Altniederdeutsche Denkmäler* (2d ed. Paderborn, 1877). On the dia-

lect, see P. J. Cosijn, *De oudnederlandsche Psalmen* (Haarlem, 1873).

(*d*) *Middle Dutch.*—There are two recent grammars of Middle Dutch—J. Franck, *Mittelniederländische Grammatik* (Leipzig, 1883), and W. L. van Helten, *Middelnederlandsche Spraakkunst* (Groningen, 1886). A *Middelnederlandsch Woordenboek* is being published by J. Verdam and Verwijs (The Hague, 1882, *sqq.*). Volumes i. and ii., containing the letters A–G, have appeared; for the rest of the alphabet the glossaries of Middle Dutch texts have to be consulted. Comp. L. D. Petit, *Bibliographie der Middelnederl. Taal en Letterkunde* (Leyden, 1888).

(*e*) *Modern Dutch.*—Grammars of the current speech by Dutchmen are, e. g. H. Kern, *Handleiding tot het Onderwijs der Nederl. Taal* (6th ed. Amsterdam, 1883); P. J. Cosijn, *Nederl. Spraakkunst* (7th ed. Haarlem, 1886); W. L. van Helten, *Kleine Nederl. Spraakkunst* (5th ed. Groningen, 1885). The present spelling is based upon L. A. te Winkel, *De Grondbeginselen der Nederl. Spelling* (4th ed. Leyden, 1879), and M. de Vries and L. A. te Winkel, *Woordenlijst voor de Spelling der Nederl. Taal* (3d ed. Leyden, 1881). The representative Dutch dictionary is the *Woordenboek der Nederlandsche Taal*, begun in 1864 by M. de Vries and L. A. te Winkel and modeled after Grimm's *Deutsches Wörterbuch*. After Te Winkel's death in 1868 the work has been continued by De Vries in co-operation with several Dutch scholars (Verwijs, Cosijn, Kluyver, and others). An *Etymologisch Woordenboek der Nederl. Taal*, by Joh. Franck, begun in 1884, was finished in 1892. A phonetic analysis of the Dutch sounds (according to M. Bell's system) is given in H. Sweet's *Handbook of Phonetics* (Oxford, 1877). There are elementary Dutch grammars for English-speaking people, e. g. those of F. Ahn (new ed. London, 1887); J. M. Hoogvliet (new ed. The Hague, 1889); A. L. Snell (London, 1885); also dictionaries of Dutch and English, e. g. those of D. Bomhoff (new ed. Arnhem, 1877); and F. M. and N. S. Calish (new ed. Leyden, 1890).

HERMANN COLLITZ.

Dutch Literature: literature in the language of the people of the Netherlands. It may be said to have had its beginning about the middle of the thirteenth century, though a few fragments dating from the eighth century and written in Old Dutch are still extant, and translations of the *Chanson de Roland* and other French romances had been made as early as the end of the twelfth century. About 1250, however, appeared a Dutch version, probably by Willem the Minstrel, of the epic *Reynard the Fox*, written originally in Latin by Flemish priests, and regarded as one of the finest and most spirited productions of the Dutch literary genius. It became very widely known and popular, especially by means of a Low German version, *Reineke der Vos*, which was published in Lübeek in 1498. Willem the Minstrel's work was followed (about 1260) by translations of several of the Arthurian legends, of which those dealing with Merlin and the Holy Grail were rendered into Dutch by the famous Jakob van Maerlant (1235–1300), the so-called father of Dutch poetry. Van Maerlant, indeed, was the founder of a new school of writers, who protested against the works of the legendary poets and romance writers of the day, and devoted themselves to ethics, religion, history, and natural science. He left the domains of Arthurian legend and romances of chivalry (*ridderromans*) for lyric and didactic poetry, and it is in these fields that his best work was done. Among his didactic works may be mentioned *Der Naturen Bloeme* (Flowers of Nature), a treatise on natural history in thirteen books, containing many moral reflections and satirical observations on the society of his time, and his masterpiece, *Spiegel Historiael* (Mirror of History). Of his lyric poems *Wapene Martijn*, *Der Kerken Clage*, and *Van den Lande van Oversee* are specimens.

Among the immediate successors, imitators, and disciples of Van Maerlant may be mentioned Melis Stoke, who wrote the history of the state of Holland (*Rijmkronik*) down to the year 1305, a work which for its accuracy and fullness of detail has been of great service to subsequent writers; Jan Boendale, the author of a rhymed chronicle, the *Brabantsche Yeesten* in 1315; and Jan de Weert, a satirical and ethical writer.

A new chapter in the history of Dutch literature begins with the institution of literary guilds called *chambers of rhetoric*. These guilds had their origin in theatrical companies, *Gesellen van den Spele*, formed to represent the various *mystery* and *miracle plays* or religious dramas of that time. The earliest of these literary guilds dates from the end of the fourteenth century, and they continued to flourish during the fifteenth and sixteenth centuries. They were wholly mediæval in character, fashioned on the model of the craft guilds, and consequently opposed to aristocratic tendencies. Hardly a town of importance in the Low Countries was without one of these guilds, whose wealth and power became considerable, and whose splendid tournaments (*landjuweelen*), at which prizes for literary skill were awarded, were occasions of great social importance. But the influence of the guilds was not favorable to genuine literary taste or to poetic feeling and expression.

To the later period of the history of these chambers belong the names of two prominent writers, Hendrik Laurenszoon Spieghel and Roemer Visscher, who were connected with the Amsterdam guild called *De Eglentier* (The Eglantine), the chief of the chambers in Holland. Another eminent author of that time, but not connected with the chambers, is Dirck Volkertsz Coornhert (1522–90), the first to expound the principles of humanism in the Dutch language. He translated the *De Officiis* of Cicero and the *De Beneficiis* of Seneca, wrote plays, poems, and controversial works, and finally produced as his masterpiece the *Zedekunst* (Art of Ethics), a philosophical treatise in which he strove to set an example of pure and graceful style. The period that followed was the most brilliant in the history of Dutch letters. Among the noted writers were Jacob Cats (1577–1660), Pieter Cornelissen Hooft (1581–1647), Constantijn Huygens (1596–1687), and, greatest of all, Joost van Vondel (1587–1679).

JACOB CATS (*q. v.*), or *Vader Cats* (Father Cats) as he is affectionately called, was the writer of several long poems, whose simple, homely style, excellent moral tone, and shrewd common sense have made them wonderfully popular with the middle classes.

Hooft excelled in the writing of tragedy and of history. In the latter department he took Tacitus as his model. Motley speaks of him as one of the greatest historians of Europe. He was a severe purist in style, striving to rid the language of foreign and bastard words; but, on the other hand, he introduced many Latinisms of style and construction.

Of Huygens it is said that "while he had but little of the sweetness of Hooft or of the sublimity of Vondel, yet his genius was eminently bright and vivacious, and he was a consummate artist in metrical form. The Dutch language has never proved so light and supple in any hands as in his, and he attempted no class of writing, whether in prose or verse, that he did not adorn by his delicate taste and sound judgment."

Van Vondel is the greatest name in the history of Dutch literature. He excelled in the loftiest species of poetry, lyric, satire, and tragedy. His masterpieces are *Gijsbreght van Aemstel* and *Lucifer*, which, like his other tragedies, are lyric and plastic rather than dramatic. *Lucifer* was published in 1654, many years before Milton wrote the work treating a somewhat similar theme, the immortal *Paradise Lost*, and it is thought by some to be not improbable that Milton derived his material from the work of Vondel. This brilliant period in the history of Dutch literature came to an end about 1680, when a long interval of literary decline began, lasting until the closing years of the eighteenth century.

Among the more noted names of this period are Huibert Cornelissen Poot (1689–1733), a pastoral poet, who sang in emotional and melodious verse the praises of country as opposed to city life; Justus Van Effen, who was strongly influenced by the writings of Addison, Swift, and Defoe, and published the *Hollandsche Spectator* (1731–35); and Jacobus Bellamy (1757–1786), the author of *Roosje*, one of the most tender and touching ballads in Dutch or in any other language, and of many odes much admired in their day.

With Willem Bilderdijk (1756–1831) appeared the revival of letters which characterized the end of the eighteenth century. Bilderdijk's greatest works, however, were produced late in life, and have given him the foremost place in the Dutch literature of the nineteenth century. Of wonderful productive activity, he was distinguished in almost every department of letters. One of his best-known works is *De Ziekte der geleerden* (1806) (The Disease of the Learned), a didactic poem. His most ambitious work was an unfinished epic, *De ondergang der eerste waereld* (1820) (The Destruction of the First World).

Other modern poets of note are Hendrik Tollens (1780–

1856), author of the national hymn, *Wien Neerlandsch bloed*, and of many lyrical romances and popular ballads; Isaac Da Costa (1798–1860), the friend and disciple of Bilderdijk, and regarded as the most eminent poet in Holland after the latter's death in 1831; J. J. L. Ten Kate (b. 1819), author of *Bladeren en Bloemen* (1839) and the popular poem *The Creation* (1866); and P. A. De Genestet (1829–61), a poet of unusual promise.

Among prominent writers of serious prose may be mentioned Jan Hendrik Van der Palm (1763–1840), the famous Orientalist; Joannes Clarisse (1770–1846), J. J. Van Oosterzee (1817–1882), theologians; J. R. Thorbecke (1798–1872) and G. Groen Van Prinsterer (1801–1876), historians.

Among the best prose-writers in lighter vein and fiction are Jacob Van Lennep (1802–68), whose masterpiece, *Ferdinand Huyck*, is a most charming novel; Anna Louisa Geertruida Toussaint (1812–86), whose masterpiece is *Het Huis Lauernesse*; Nicholas Beets (1814), whose *Camera Obscura* is unsurpassed by anything in English for character-drawing, humor, and pathos; Van Koetsveld (b. 1807), who wrote *Schetsen uit de Pastorie te Mastland*; and J. P. Hasebroek, author of an excellent series of essays called *Truth and Dreams*.

In conclusion, attention may be called to the fact that Dutch literature has suffered perhaps most of all from the fact that Holland's greatest scholars and foremost literary men did not write in Dutch, but in Latin. Witness only the names of Erasmus, Hugo Grotius, and Spinoza.

Dutch Liquid, or **Ethylene Chloride** [called Dutch liquid because it was discovered by Dutch chemists in 1785]: a combination of ethylene (olefiant gas, C_2H_4) with chlorine; formula, $C_2H_4Cl_2$. It is a thin, inflammable, colorless liquid, of an agreeable fragrance and pleasant taste, somewhat resembling chloroform. Like chloroform, it has great anæsthetic powers when its vapor is inhaled, but the medical profession are not satisfied of its safety.

Dutch South and East and **Dutch West Borneo**: See Borneo.

Dutch West India Company: an association formed in the Netherlands in 1621 for the purpose of trading with America and Africa, establishing colonies, and fitting out privateers against the Spanish and Portuguese. The capital was eventually 18,000,000 florins. It was composed of a union of five chambers, representing respectively the cities of Amsterdam, Zeeland, Rotterdam, Groningen, and the district of the north; these nominated nineteen directors who formed the central body of administration. The company received from the state 200,000 florins yearly for five years, a monopoly of trade with Africa and America, the right of constructing forts, raising fleets and armies, and making treaties; troops were to be furnished by the state but paid by the company; and in case of war the state agreed to lend a fleet. One of the first acts was to send a large fleet to Brazil, where Bahia was taken (1624) but soon abandoned; later, Pernambuco was seized, and became the center of extensive Dutch colonies in that part of Brazil. New Amsterdam (New York), already founded, was strengthened; powerful colonies were established in the West Indies and Guiana, and for half a century the fleets of the company ravaged the shores of Spanish and Portuguese America, taking cities, destroying ships, and gathering an immense amount of booty. The continual wars with Spain, Portugal, and England eventually proved the ruin of the company. Brazil was given up in 1654, and New York in 1667. In 1674 the company was forced to dissolve. A new one was formed in 1675, and held together until 1791, but it was never very prosperous. Of all the conquests of the West India Company the Netherlands now retain only Dutch Guiana, Curaçao, Saba, St. Martin, a few smaller islands in the West Indies, and the fort of St. George at Elmina on the Gold Coast of Africa. Herbert H. Smith.

Dutch White: See Baryta.

Dutens, Louis, F. R. S.: author; b. at Tours, France, Jan. 15, 1730; removed to England, where he obtained from the Duke of Northumberland the lucrative living of Elsdon; acted at three different times as English *chargé d'affaires* at Turin. Among his works are *Recherches sur l'origine des découvertes attribuées aux modernes* (1760); numismatical treatises, and *Mémoires d'un Voyageur qui se repose* (Paris, 1806). D. in London, May 23, 1812.—His nephew, Joseph Michel Dutens (b. at Tours, Oct. 15, 1765; d. Aug. 6, 1848), political economist, published *Philosophie de l'économie politique* (2 vols., Paris, 1835).

Dutertre, Jean Baptiste: French Dominican missionary and historian; b. at Calais, 1610. He served in the Dutch fleet, then entered the army, and was present at the taking of Maestricht 1633. In 1635 he joined the Dominicans and was sent to the Antilles in 1640. During the next seventeen years he resided in or visited most of the French West Indian islands, and was an eye-witness of many events of the Carib wars. He several times made short trips to France, and while there in 1656 was employed by M. de Cérillac to go to Grenada and examine that island with a view to the establishment of a permanent French colony. On his voyage out he was captured by an English privateer, but was ransomed, finished his commission satisfactorily, and finally returned to France in 1657. In 1654 he published his *Histoire générale des îles Saint-Christopher, de la Guadeloupe*, etc., enlarged and republished as *Histoire générale des Antilles habitées par les Français* (4 vols., Paris, 1667–71). This work is a standard authority for the region and period of which it treats, but should be consulted in connection with the later book of Labat. D. in Paris, 1687.

Herbert H. Smith.

Duties [M. Eng. *duetee*, deriv. of *due*]: in law, (*a*) those things which one is legally bound to do or refrain from doing; a legal obligation. The term is correlative to Rights (*q. v.*), and when a right is violated a duty is neglected. Civil duties, like civil rights, are those which arise out of the relationship of the individual to the state of which he is a member. Duties of imperfect obligation (so called in the civil law) are those not compellable by action. (*b*) In a general sense, a term synonymous with taxes, embracing all impositions or charges levied on persons or things; but in its usual and more restricted sense the term is used to designate indirect taxes upon the importation or exportation of goods, or the manufacture, sale, or consumption of goods within the country. In the U. S. Constitution the term is used for "stamp duties," as is shown by contemporary history. See *Elliot's Debates*.

Revised by F. Sturges Allen.

Dutt, Toru: Hindu poet; b. in Calcutta in 1856; daughter of Chunder Dutt, a learned East Indian; composed verses in English, French, and Hindustani, and

translated the *Vishnupurana* from Sanskrit into English blank verse. Some of her literary remains have been collected in *A Sheaf Gleaned in French Fields* (1881) and in *Ancient Ballads and Legends of Hindustan, with an Introductory Memoir by E. W. Gosse* (1882). D. in Calcutta, Aug. 30, 1877. H. A. BEERS.

Dutton, CLARENCE EDWARD: soldier and geologist; b. in Wallingford, Conn., May 15, 1841; graduated in arts at Yale 1860; first lieutenant and afterward captain Twenty-first Connecticut Volunteers 1862; second lieutenant of ordnance, U. S. army, 1863; first lieutenant 1867; captain 1873; major 1890. As an officer of volunteers he was engaged at Fredericksburg, Norfolk, Cold Harbor, Bermuda Hundred, and Drury's Bluff. In 1884 he was elected a member of the National Academy of Sciences. As an ordnance officer he has contributed to the literature of gunnery, and also written on the metallurgy of steel and on economics, but his more important publications are in the field of geology. In 1875 he was detailed to assist the U. S. survey of the Rocky Mountain region, under Maj. J. W. Powell; in 1879–80 he was secretary of a commission charged with the investigation of problems connected with the U. S. land system; from 1880 to 1891 he was a member of the U. S. Geological Survey. Among his geologic writings are *Geology of the High Plateaus of Utah* (Washington, 1880); *Tertiary History of the Grand Cañon District* (1882); *Hawaiian Volcanoes* (1884); *Mount Taylor and the Zuñi Plateau* (1886); and *The Charleston Earthquake of August 31, 1886* (1889). G. K. G.

Dutton, HENRY, LL. D.: jurist; b. at Plymouth, Conn., Feb. 12, 1796; graduated at Yale in 1818; was Professor of Law in Yale 1847–55; became Governor of Connecticut in 1854; and was a judge of the superior court and court of errors 1861–66. He prepared several digests, compilations of State statutes, etc., which were valuable additions to juridical literature. D. in New Haven, Apr. 12, 1869.

Duum'viri, or **Duo'viri** [Lat., a commission composed of two men; *duo*, two + *vir*, man]: the title of various magistrates of ancient Rome and her colonies. Two men jointly held the office, whence the name. The duumviri, "*juri dicundo*" (for pronouncing judgment), were chief magistrates in municipal towns. Naval duumviri were occasionally appointed to equip fleets. Duumviri "*perduellionis*" were appointed to try cases of treason (*perduellio*) and parricide. Quinquennial duumviri were the censors of municipal towns, and were chosen every five years, hence called *quinquennales* (from *quinque*, *annus*), but the duties of the office occupied only one year. The position was one of great dignity. Sacred duumviri were sometimes appointed to erect temples. There were also duumviri for performing other minor duties.

Duvergier de Hauranne, dü'vãr'zhi-ā'de-ō'raăn', JEAN: theologian; b. at Bayonne, France, 1581; was a fellow-student at Louvain with Jansen, and became a zealous reformer. His inflexible character and the asceticism of his life won him many followers, but his position in the Jansenist controversy made the Jesuists his bitter enemies, and finally the Government began to suspect his views. Richelieu threw him into prison in 1638, but after the death of the cardinal he was released. D. in 1643.

Duvergier de Hauranne, PROSPER: publicist; b. in Rouen, Aug. 3, 1798. He visited England, and became in 1824 contributor to the *Globe*, together with Guizot and Rémusat. Elected a deputy from Saucerre, he supported with all his might the policy of resistance which Casimir-Perier represented, and the cabinet of Molé he attacked in the chamber and in the press. The policy of Thiers he adopted with great sympathy, and finally broke altogether with Guizot. Elected a member of the Constitutional Assembly of 1848, he took his seat among the royalist minority. After the *coup d'état* he was imprisoned for a short time, and then banished, but was soon after allowed to return to France. During the second empire he devoted himself to literature. At the general senatorial election of 1876 he entered the senate, having declared himself in favor of a conservative republic; but his influence seemed to have decreased. He contributed to the *Revue des Deux Mondes*, and published *Des principes du gouvernement représentatif* (1838) and *Histoire du gouvernement parlementaire en France* (10 vols., 1857–73). In 1870 he became a member of the Academy. D. in Paris, May 22, 1881.

Duvernoy, dü'vãr'nwaă', GEORGES LOUIS, M. D.: zoölogist and anatomist; born at Montbéliard, France, Aug. 6, 1777. He edited Cuvier's *Lectures on Comparative Anatomy* (1805) at his request. He succeeded Cuvier in 1837 as professor in the College of France, and became in 1850 Professor of Comparative Anatomy. Among his important works is *Lectures on Organic Bodies* (1842). D. in Paris, Mar. 1, 1855.

Duveyrier, dü'vā'ri-ā', HENRI: traveler; b. in Paris, France, Feb. 28, 1840; the son of Charles Duveyrier, a political and dramatic writer, and nephew of Aimé Joseph Duveyrier, who, under the pseudonym of Mélesville, wrote a great number of theatrical pieces in collaboration with Scribe and others. After finishing his studies, Henri Duveyrier went to England to procure the support necessary to a tour of exploration through Africa. He first visited Algeria, and made some explorations of the northern parts of Sahara; and, having acquired the friendship of the chief of the Tuariks, he finally succeeded in penetrating to the center of the Sudan. After his return, in 1867, the Société de Géographie of Paris gave him its great gold medal and made him one of its perpetual secretaries. He published *Exploration du Sahara*; *Les Touaregs du Nord* (1864, with thirty-one maps); *Livingstone et ses explorations dans la région des lacs de l'Afrique orientale* (1873); and *La Tunisie* (1881); edited the *Année géographique* 1876–78. Committed suicide near Sèvres, April 26, 1892.

Duyckinck, dī'kingk, EVERT AUGUSTUS: editor and essayist: b. in the city of New York, Nov. 23, 1816; graduated at Columbia College in 1835. He was the founder and editor of the *Literary World*. With the aid of his brother George he published an important *Cyclopædia of American Literature* (2 vols., 1856). Among his works is a *History of the War for the Union* (3 vols., 1861–65). D. in New York, Aug. 13, 1878.

Duyckinck, GEORGE LONG: brother of Evert Augustus Duyckinck; b. in New York city, Oct. 17, 1823; graduated at the University of New York in 1843. He was joint author of the *Cyclopædia of American Literature* (1856), and published several biographies, among which was a *Life of George Herbert* (1858). D. in New York, Mar. 30, 1863.

Dvořák, dvōr'zhaăk, ANTONIN: musician; b. Sept. 8, 1841, at Mühlhausen, near Kralup, in Bohemia; the son of a butcher, and destined for the same trade. He learned to play the violin from the village schoolmaster, and in 1853 was sent to school at Zlonitz, where he studied under the local organist. Two years later he went to school at Kamenitz, where he learned the German language. In 1857 he entered the organ school at Prague and learned rapidly. He wrote much, but burned mostly what he composed. His first published composition was a patriotic hymn, *The Heirs of the White Mountain* (1873), he being then thirty-two years old. Soon afterward his opera *The King and the Collier* was accepted by the National theater and, having been withdrawn and altogether rewritten before performance, was successfully produced. His *Stabat Mater* was composed in 1876, published in 1881, and performed by the London Musical Society, Mar. 10, 1883. It made his fame in England, and soon was produced in the U. S., where it was sung by several societies. He then composed *The Spectre's Bride* for the Birmingham festival of 1885, *Saint Ludmilla* for the Leeds festival of 1886, *Requiem Mass* 1891. In Sept., 1892, he removed to New York to become the musical director of the National Conservatory of Music, and on Oct. 21 he made his first public appearance in a concert at which he produced a new *Te Deum* for solos, chorus, and orchestra. He has since published a mass, and a triple overture entitled *Nature, Life, Love*.
D. E. HERVEY.

Dwarfed Trees: trees stunted in their growth. They may be produced in three different ways—by grafting on dwarf slow-growing stocks, as, for example, the pear on the quince; by planting in small pots filled with poor soil, by which the plant is starved and stunted; and by causing a portion of the extremity of a branch to produce roots, and then cutting it off and planting it in a pot with poor soil. The last is the Chinese method, and is thus performed: The extremity of a branch 2 or 3 feet long in a fruit or flower bearing state is selected, and a ring of bark is taken off at the point where it is desired that roots should be produced. The part thus denuded of bark is covered with a ball of clay, kept moist with the frequent application of water. After the roots have grown out the branch is cut off, planted in a pot of poor soil, and sparingly supplied with water. The

dwarf tree will remain nearly of the same size for years. The pear-tree especially is often dwarfed, because in this condition it will produce fruit while young, and the trees can be kept in small compass. The apple is dwarfed by grafting it upon the paradise apple. With the exception of pears, dwarf fruit-trees are not common in the U. S.

Revised by L. H. Bailey.

Dwarfs [O. Eng. *dweorh*: O. H. Germ. *twërg* > Mod. Germ. *Zwerg*]: any animal or plant greatly below the usual size of its kind, particularly a human being of small dimensions. In ancient times dwarfs were kept by persons of rank for their amusement, and the Roman ladies employed them as domestics. In Europe the passion for dwarfs reached its height under the reigns of Francis I. and Henry II. of France. Among the most celebrated dwarfs were the following: Philetus of Cos, a philosopher and poet, who lived about 330–285 B. C.; Geoffrey Hudson, b. in 1619, who was 3 ft. 9 in. high; Joseph Borowlawski, b. in 1739, who attained the height of 39 inches, and was remarkable for acute intellect; and Nicolas Ferry, or Bébé (33 inches high), who was a favorite of Stanislas, King of Poland. Tom Thumb (Charles S. Stratton, b. at Bridgeport, Conn., in 1837; d. 1884) also was celebrated, and his performances as an actor were received with applause both in Europe and America. For dwarf races, see Pygmy Tribes.

In Scandinavian mythology, according to the Younger Edda, dwarfs were produced as maggots in the flesh of the great giant Ymer. The gods gave them the form and understanding of men. They shun the light and live in the earth and rocks, and are very skillful artisans. They made many excellent treasures for the gods. Four dwarfs, named North, East, South, and West, support the four corners of the heavens. See Scandinavian Mythology.

Dwelshauvers-Dery, Victor: mathematical physicist and engineer; b. at Dinant, Belgium, Apr. 25, 1836; educated at Dinant, the colleges of Dinant and Antwerp, the University of Brussels, and at Liège. He was *repétiteur* at the University of Liège 1861–69, when he was made Professor of Engineering. He is a civil and mechanical engineer, and is a doctor of science in mathematics and physics. Dr. Dwelshauvers-Dery represented his Government at the International Exhibition at London in 1862, and wrote an extended report on the mechanical division; also at the exhibitions at Paris in 1867, Vienna in 1873, Paris in 1878, Milan in 1882, Amsterdam in 1883, Antwerp in 1885, and Paris in 1889. His numerous writings are published mainly in the technical journals. He wrote much on regulation of machinery and the mathematical theory of regulators and governors up to about 1875; since then he has given more attention to the theory of heat-engines, and especially to the introduction of the Hirn calorimetric method of analysis of the distribution of useful and wasteful energies in the steam-engine, and has reduced to algebraic form and established the fundamental equations for the modern applied theory of these engines.

His *Exposé succinct de la Théorie pratique des Moteurs à Vapeur* (1880–82) will be found in *La Revue Universelle des Mines*. Several of his productions are separately printed, one of the most notable being his *Étude expérimentale thermique de la machine à vapeur*, in the series known as the encyclopedia of Léauté (Paris, 1892). He is a member of several learned and technical societies, and an honorary member of the American Society of Mechanical Engineers. He retains his position at Liège, and has done some important work in experimental research (especially in the elaboration of the methods inaugurated by Hirn) and in the organization of an engineering laboratory for such purposes.

R. H. Thurston.

Dwight: village and railway junction; Livingston co., Ill. (for location of county, see map of Illinois, ref. 4–F); 72 miles S. W. of Chicago. Agriculture and stock-raising are the chief pursuits. Pop. (1890) 1,354: (1900) 2,015.

Dwight, Benjamin Woodbridge, Ph. D.: author; b. in New Haven, Conn., Apr. 5, 1816; graduated at Hamilton College, New York, in 1835; was principal and proprietor of a high school for boys in Brooklyn and New York city for many years; author of *The Higher Christian Education* (New York, 1859); *Modern Philology, First and Second Series* (2 vols., New York, 1859–64); *The History of the Strong Family* (2 vols., Albany, 1871); *The History of the Dwight Family in America* (2 vols., New York, 1874); *Woman's Higher Culture*; and *The True Doctrine of Divine Providence*. D. in 1889.

Dwight, Harrison Gray Otis, D. D.: missionary; b. at Conway, Mass., Nov. 22, 1803; graduated at Hamilton College, New York, in 1825, and at Andover Theological Seminary 1828; became a missionary of the A. B. C. F. M. in 1830 to the Armenians, making Constantinople the center of his field of operations. He published several volumes at different times, as *Memoir of Mrs. Elizabeth Barker Dwight*, his first wife (New York, 1840); *Christianity Revived in the East* (1850; 2d revised ed., under caption *Christianity in Turkey*, London, 1854); *A Catalogue of Armenian Literature in the Middle Ages* (in *Journal of the American Oriental Society*), etc. He composed also several books and tracts in the native languages of the East. He was killed in a railway accident near Shaftesbury, Vt., when on a brief visit to the U. S., Jan. 25, 1862.

Dwight, John S.: music critic and writer; b. in Boston, Mass., May 13, 1813, and from his early youth connected with musical enterprises in Boston. On Apr. 10, 1852, appeared the first number of *Dwight's Journal of Music*, which continued until 1880. He was also the music editor of the *Harbinger*, a periodical published at Brook Farm, the author of a *History of Music in Boston*, and a frequent contributor to the daily press on musical topics. He was one of the leading members of the Harvard Musical Association. D. in Boston, Sept. 5, 1893.

D. E. Hervey.

Dwight, Joseph: soldier and judge; b. at Hatfield, Mass., Oct. 16, 1703; graduated at Harvard College in 1722; was judge of the court of common pleas of Hampshire co., Mass., and afterward of Berkshire County, and judge of probate. He was eminent both as a judge and a soldier. He commanded the Massachusetts Artillery at the reduction of Louisburg in 1745 with distinction, and led a brigade at Lake Champlain in the second French war in 1756. He was also for eleven years member of the general council of Massachusetts. D. in Great Barrington, Mass., June 19, 1765.

Dwight, Nathaniel, M. D.: physician and author; brother of Timothy Dwight (1752–1817); b. at Northampton, Mass., Jan. 31, 1770; prepared and published the first school geography ever issued in the U. S. He was also the author of *The Great Question Answered* and of *A Compendious History of the Signers of the Declaration of Independence*. D. June 11, 1831.

Dwight, Sereno Edwards, D. D.: Congregational divine; b. at Greenfield Hill, Conn., May 18, 1786; a son of Timothy Dwight (1752–1817). He graduated at Yale in 1803, and practiced law in New Haven with success 1810–16. He was afterward pastor of Park Street church, Boston 1817–26, and was president of Hamilton College 1833–35. Besides other works, he published the writings of Jonathan Edwards, with a biography (10 vols., New York, 1830). See his *Select Discourses*, with memoir by his brother, Rev. William T. Dwight, D. D. (Boston, 1851). D. in Philadelphia, Pa., Nov. 30, 1850.

Dwight, Theodore: journalist; a brother of Timothy Dwight (1752–1817); b. at Northampton, Mass., Dec. 15, 1764. He was a member of Congress (1806–07). He practiced law with distinction, and was a leader of the Federalist party. He was secretary of the Hartford Convention in 1814. His mother was a daughter of Jonathan Edwards. In 1817 he founded the *New York Daily Advertiser*, which he edited until 1835. He published *The Life and Character of Thomas Jefferson* (Boston, 1839) and *The History of the Hartford Convention* (New York, 1833), and was a contributor to *The Echo* (1791–96) and *The Political Greenhouse* (1799), political satires in verse, published by the Hartford Wits. See his *Life and Writings* (New York, 1846). D. in New York city, July 12, 1846.

Dwight, Theodore: author; son of Theodore Dwight, the journalist; b. at Hartford, Conn., Mar. 3, 1796, and graduated at Yale in 1814. He wrote, besides other works, a *Tour of Italy* (1824); a *History of Connecticut* (1841); a *Life of Garibaldi* (1859); *A School Dictionary of Roots and Derivatives*; *The Northern Traveler* (1841); *The Tour of New England*; *The Father's Book*; *First Lessons in Modern Greek*; *The Roman Republic of 1849* (1851); and *The Kansas War* (1859). D. in Brooklyn, N. Y., Oct. 16, 1866.

Dwight, Theodore William, LL. D.: jurist, professor, and editor; b. at Catskill, N. Y., July 18, 1822; graduated at Hamilton College, New York, in 1840, and at Yale Law School in 1842. In 1846 he was elected Maynard Professor

of Law in Hamilton College, and there established a law school. In 1858 he was chosen Professor of Municipal Law in Columbia College, New York, and was soon made warden of the law school, a department of the college organized under his direction. He received the degree of doctor of laws from Rutgers College, New Jersey (1859), and from Columbia College (1860). He published an *Argument in the Rose Will and Charity Cases* (1863), and other arguments in leading law cases. In association with Dr. E. C. Wines he published *Prisons and Reformatories in the United States.* He edited *Maine's Ancient Law* (1864). As associate editor of the *American Law Register* he wrote articles which were separately published, as *Trial by Impeachment*, etc. He was elected non-resident Professor of Constitutional Law in Cornell University, New York (1868), and lecturer in Amherst College, Massachusetts, on the same subject (1869). He was a member of the New York constitutional convention of 1867, and early in 1873 was vice-president of the New York board of State commissioners of public charities, president of the New York prison association, and an active member of the well-known "committee of seventy" of the city of New York. In Jan., 1874, he was appointed by Governor Dix, of New York, a judge of the commission of appeals, a court sharing the duties of the court of appeals. D. in Clinton, N. Y., June 28, 1892.

Dwight, Timothy, D. D., LL. D.: divine and scholar; b. at Northampton, Mass., May 14, 1752. He graduated at Yale College in 1769, after which he was a tutor in that institution for six years. Between 1778 and 1782 he was a chaplain in the army or lived with his mother at Northampton; in 1783 he became minister of a church at Greenfield, Conn., where also he was principal of a flourishing academy. In 1795 he was elected president of Yale College, in which he also became Professor of Divinity at the same time. As such it was his function to preach in the college chapel. He was an able preacher, and was eminently qualified as an instructor of young men. He continued to be president of Yale College until his death. His chief works are *The Conquest of Canaan*, an epic poem (Hartford, Conn., 1785); *Theology Explained and Defended in a Series of 173 Sermons* (5 vols., New York, 1818), often reprinted: and *Travels in New England and New York* (4 vols., New Haven, 1821). D. at New Haven, Jan. 11, 1817. His influence through the republication of his *Theology*, etc., in Great Britain was great. See W. B. Sprague, *Life of T. Dwight*, in Sparks's *American Biography*, vol. iv., second series; also Sprague's *Annals of the American Pulpit*, vol. ii., pp. 152–165. Revised by George P. Fisher.

Dwight, Timothy, D. D., LL. D.: grandson of Timothy Dwight (1752–1817); b. at Norwich, Conn., Nov. 16, 1828; graduated at Yale College 1849; was a graduate student two years and a tutor in the college 1851–55; May 22, 1855, was licensed to preach; studied at the universities of Bonn and Berlin 1856–58; became Professor of Sacred Literature in Yale Divinity School in 1858; was ordained a minister Sept. 15, 1861; has frequently contributed to the *New Englander Magazine*, of which he became associate editor in 1886. He has edited the volumes on Romans, Philippians-Philemon, Timothy-Hebrews, James-Jude, in the American edition of the English translation of Meyer's *Commentary*; also similarly the American edition of the English translation of Godet's *Commentary* on John's Gospel. He was president of Yale College 1886–98.

Dwight, William Buck: scientist; son of Harrison Gray Otis Dwight; b. in Constantinople, Turkey, May 22, 1833; went to the U. S. in 1849; graduated at Yale College 1854; Union Theological Seminary, New York city, 1857; Yale scientific school 1859; 1859–65 principal and proprietor of Englewood Female Institute, Englewood, N. J.; 1865–67 occupied in mining and geological examinations in Virginia and Missouri; 1867–70 principal of the Officers' Family School at the U. S. Military Academy, West Point, N. Y.; 1870–78 associate principal and instructor in natural sciences in the State Normal School at New Britain, Conn.; 1878 appointed Professor of Zoölogy in the Martha's Vineyard summer institute, Massachusetts; in 1882 appointed Professor of Natural History and curator of the museum in Vassar College, Poughkeepsie, N. Y.; in 1885 invented a machine for making thin sections of rocks and fossils. He has investigated the Wappinger valley limestones of Dutchess co., N. Y., and the Taconic limestones of Canaan, N. Y., and published the results of his studies in scientific periodicals.

Dwight, William Theodore. D. D.: clergyman; son of Timothy Dwight (1752–1817); b. at Greenfield Hill, Conn., June 15, 1795; graduated at Yale in 1813; practiced law in Philadelphia for ten years (1821–31), when he entered the ministry, and was settled as a Congregational clergyman at Portland, Me., where he remained for thirty-two years (1832–64). His ministry was one of great success, and his influence was very great, not only throughout Maine, but also throughout the Congregational denomination at large. D. in Andover, Mass., Oct. 22, 1865.

Dwina, or **Northern Dwina**, dwee'nă: a large river of Russia; formed by the confluence of the Suchona and Jug, in the government of Vologda. It flows nearly N. W., and enters the Gulf of Archangel by three principal mouths. Near Archangel its width exceeds 4 miles. It is free from ice from May to October. The Vytchegda is its principal tributary. Its length is estimated at 450 miles; with the Suchona, 760 miles.

Dwina, or **Western Dwina** (Germ. *Düna*): a river of Russia; rises in the government of Tver near the source of the Volga; forms the boundary between Livonia and Courland and enters the Gulf of Riga, 7 miles below the town of Riga, where it has an average depth of 26 feet. Its length is about 580 miles. From Riga to Dünaburg the ship-canal now building (1899) across Russia from the Baltic to the Black Sea follows the Dwina.

Dyaks: the aborigines of Borneo; occupy mostly the interior of the island. See Borneo.

Dybeck, dü'bek, Richard: Swedish antiquarian; b. on Sept. 1, 1811. His archæological works throw much light on the antiquities of Sweden. He also made large collections of Swedish ballads. His *Sverikes Runurkunder* (1860–76) is a standard work. D. July 28, 1877. R. B. A.

Dyck, Anthony Van: See Vandyke.

Dyea: See the Appendix.

Dyeing: the art of coloring yarn or cloth; has been practiced from the most remote antiquity. The fibers and fabrics usually dyed are either cotton, linen, silk, or wool. (See Textile Fabrics.) The coloring-matters employed are either the natural products of animals or plants, or are the results of chemical processes. (See Dyestuffs.) Thorough cleansing of the fibers is an indispensable preliminary to dyeing. Resinous and oily matters must be removed to give the dye liquors free access to the fibers, and natural coloring-matters must be destroyed in order to secure the brightest and clearest tints of the dyes. Cotton is successively boiled with lime, soda-ash, and rosin soap; it is then soured with dilute sulphuric acid, and finally treated with hypochlorite of lime (bleaching-powder). Linen is subjected to repeated treatment with water, alkalies, acids, and hypochlorite of lime, alternating sometimes with exposure on the grass to air and sunlight. Silk is boiled in a solution of fine soap to remove the gelatinous, resinous, and fatty matters which make up a large proportion of its weight. Wool is thoroughly cleansed by washing in weak soap or carbonate of soda solution, putrid urine, or weak ammonia. For the details of these operations, see Bleaching.

The dyeing is effected upon loose or unspun fibers, yarn, and woven cloth, and the operations performed differ according to the nature of the fiber, its condition, and the dyestuff used. Loose materials are dyed in tubs or vats, yarn is hung over sticks which rest upon the top of the vat and is turned from time to time; or warp yarns are dyed in long chains, while pieces are dyed in a continuous dyeing machine, divided into a series of compartments which contain the necessary mordants and dyestuffs, or upon the jigger, a machine consisting of two rollers placed above a tank which contains the dyeing liquor; the pieces are wound back and forth through the dye-bath upon the rollers.

Some colors combine with the fibers very readily as soon as they are immersed in their solutions; such colors have been called *substantive*. Silk and wool take colors much more readily than cotton and linen; many dyes are therefore substantive for these animal fibers. Many of the aniline colors belong to this class. With such colors the operations of dyeing are very simple. They consist in the mere immersion of the yarn or cloth in cold or hot solutions of the dye, with sufficient handling to secure the even distribution of the color. Agents are often added to fix or set the color, or to obtain a more even shade [*assistants*], such as acids, alkalies, tin salt, alum, etc.

For adjective dyes, those which will not unite directly

with the fibers, the aid of *mordants* is necessary. Mordants are bodies which possess an affinity for the colors, and which can be fixed in an insoluble condition on or within the fibers. Some are metallic oxides or salts, as alumina, oxide of iron, oxide of chromium, oxide of tin, tannate of tin, etc.; others, as tannin, are of a different character. The mode of applying the mordant depends on the fabric, as well as on the character of the mordant itself. Silk and wool, when immersed in a solution of alum, take up a considerable quantity of the salt without decomposing it. The acetates of alumina, iron, and chromium are easily decomposed, with the liberation of a portion of the acetic acid and the formation of an insoluble basic acetate. By boiling cotton in their solutions the fibers become thoroughly impregnated with the insoluble compounds, and when the yarn is transferred to the solution of the dyestuff the color unites with the mordant, forming insoluble colored bodies in or upon the fibers, which are called LAKES (*q. v.*). The goods thus become permanently dyed. The same decomposition of the aluminous or ferrous salt occurs if the goods are simply immersed and then hung up in the air. Chloride of tin is decomposed by boiling its dilute solution, with the liberation of hydrochloric acid and the formation of insoluble oxide of tin. Sometimes the insoluble oxide or salt is produced by first immersing the goods in a soluble salt, and then passing them through a second solution of another agent. Exposing fabrics to an iron salt, and then to an alkaline lye, fixes oxide of iron. A lead salt and an alkaline lye fix oxide of lead. Stannate of soda, followed by a solution of nutgalls, sumach, etc., fixes tannate of tin in the fibers.

Mordants often affect the natural tints of the dyes, thus enabling the dyer to produce a variety of shades with the same dye. Oxide of iron is most remarkable in this respect; it changes the red color of madder, logwood, Brazilwood, etc., to shades of purple, lilac, chocolate, and even black, according to the proportions in which it is employed. The oxide of tin tends to brighten the shades, while alumina fixes them in their natural tints. This is a very important circumstance in calico-printing, as it enables the dyer to produce several colors on the same cloth by one operation of dyeing. (See CALICO-PRINTING, *Madder Style.*) Metallic pigments are often produced in the yarn or cloth by the successive application of the agents necessary for their production. Thus when cloth mordanted with oxide of iron is passed into an acidulated solution of ferrocyanide of potassium, an insoluble Prussian blue is at once produced. Goods impregnated with oxide of lead by immersion in acetate of lead become bright yellow in a solution of bichromate of potash, owing to the formation in the fibers of insoluble chromate of lead. By subsequently boiling with lime-water the yellow is changed to orange basic chromate. Indigo blue is produced in cotton by immersing in a solution of colorless reduced indigo (see CALICO-PRINTING, *Indigo Styles*) and exposure to the air, when the indigo blue is regenerated by oxidation in an insoluble form.

The following methods of dyeing are in use:

(1) Direct dyeing in water, usually with an assistant; as example, see receipt 3.

(2) Direct dyeing with the mordant in the dye-bath; as example, see receipt 5.

(3) Mordanting followed by dyeing; as example, see receipt 15.

(4) Dyeing (called here *stuffing*) followed by mordanting (called *saddening*); as in receipt 55.

(5) Mordanting, dyeing, and saddening.

(6) Production of the coloring-matter upon the fiber, as in the case of some azo-reds.

The following are a few typical ways of dyeing; more detailed statements are given in the articles on the various dyestuffs:

REDS.

On Cotton.—(1) The most beautiful red on cotton, Turkey red, is produced by means of alizarin dyed upon an alumina mordant. This has been largely superseded by the alizarin red, dyed frequently as follows: The bleached cotton is thoroughly impregnated with a water solution of alizarin assistant (made by the action of sulphuric acid upon castor oil), dried, steamed, mordanted in acetate of alumina, dunged with arseniate or phosphate of soda, dyed in an alizarin bath, again treated with alizarin assistant after thorough washing, steamed, and very carefully washed with hot soap. (2) Aniline reds and pinks on cotton mordanted in nut-galls or sumach, followed by a tin or antimony salt. (3) Substantive reds produced by benzopurpurin and Congo red upon unmordanted cotton, and dyed in a bath containing soap or carbonate or phosphate of soda.

On Wool.—(4) Mordant with alum and tartar and dye with alizarin. (5) Cochineal, with cream of tartar, sumach, and fustic. (6) An artificial red (azo-red) in a bath containing sulphuric acid and sulphate of soda. (7) *Pink.* An eosine in a bath containing alum. (8) Aniline shades are fixed on wool without mordants in acid baths.

On Silk.—(9) Peach-wood and fustic, followed by red spirits, with annatto for scarlets, cochineal and safflower for finer tints. (10) *Pink.* Safranine or rhodamine in soap bath, or an eosine in a soap bath acidulated. (11) Benzidine reds in a soap bath, or basic anilines. (12) Acid artificial reds are applied to silk in a warm bath, slightly acidulated with acetic, tartaric, or sulphuric acid.

BLUES.

On Cotton.—(13) Prussian blue produced by an iron mordant, followed by ferrocyanide of potassium. (14) Indigo vat, a solution of reduced indigo. (15) *Aniline blues.* Mordant with sumach or tannin, then a salt of antimony or of tin; dye in warm bath.

On Wool.—(16) Prussian blue, as for cotton. (17) Indigo extract, with argol and alum. (18) Aniline blue, with sulphuric acid and sulphate of soda.

On Silk.—(19) Prussian blue, as for cotton. (20) Indigo extract and alum. (21) Anilines, with soap and sulphuric acid.

YELLOWS AND ORANGES.

On Cotton.—(22) Chromate of lead, produced by bath of acetate of lead, followed by bichromate of potassa. (23) The chrome yellow is deepened to orange by boiling in lime-water. (24) Mordant with tannin and dye with chrysoidine or auramine. (25) Mordant in weak protochloride of tin, dye in quercitron bark, fix with protochloride of tin. (26) Chrysamine in a bath containing soap or phosphate of soda.

On Wool.—(27) Mordant in tartar and alum; dye in mixture of quercitron, sumach or fustic, and red spirits. (28) Weld, with alum and tartar. (29) Picric acid. (30) Acid coal-tar yellows. (31) Flavine, with a tin mordant. *Orange.* (32) Alizarin orange with alumina mordant. (33) Acid artificial orange.

On Silk.—(34) *Yellow to orange.* Annatto, with alum and white soap. (35) Weld, with alum and tartar. (36) Picric acid. (37) Artificial neutral and basic yellows and oranges in soap baths. (38) Acid artificial yellows in acid baths.

GREENS.

On Cotton.—(39) Dye blue, then yellow with fustic quercitron bark or chrome yellow. (40) Aniline green, on cotton mordanted with sumac.

On Wool.—(41) Dye yellow with fustic and alum, then blue with indigo. (42) For olive, use fustic with logwood, madder, and peach-wood, following with copperas. (43) Aniline green. (44) Picric acid and indigo carmine.

On Silk.—(45) Fustic, with sulphate of indigo and alum, using logwood and copperas to darken shades. (46) Basic artificial greens in a soap bath. (47) Acid aniline green, with sulphuric acid or cream of tartar. (48) Picric acid and indigo carmine.

PURPLES, VIOLETS, AND LILACS.

On Cotton.—(49) Mordant with red spirits, and dye with logwood, to which a little red spirits and acetate of alumina have been added. (50) Dye light blue, then redden in logwood with alum. (51) Mordant in sumach, then in red spirits, and dye in logwood. (52) *Safflower lavender.* Dye light blue, then cover with safranine. (53) Dye alizarin on a mordant of alumina and oxide of iron. (54) *Aniline colors.* Mordant with sumach, followed by perchloride of tin or tartar emetic.

On Wool.—(55) Cudbear, logwood, barwood, camwood, or peach-wood, with alum. (56) Basic aniline violets in a neutral or soap bath. (57) Acid violets in acid baths.

On Silk.—(58) Basic and acid violets, as for wool.

BLACKS.

On Cotton.—(59) Sumach, followed by copperas, then by logwood, then by weak copperas; the color is improved by adding fustic and replacing the second copperas bath by acetate of iron. (60) For blue-black preceede 59 by the in-

digo vat. (61) Aniline black. Impregnate with aniline salts and an oxidizing agent. Oxidize by dunging or in an oxidizing machine, and treat with bichromate of potash. See CALICO-PRINTING.

On Wool.—(62) Mordant with copperas and blue vitriol, then logwood, finally copperas. (63) Mordant in bichromate of potassa; hang in the air; dye in logwood, barwood, and fustic; sometimes finish in copperas.

On Silk.—(64) Copperas and logwood repeated; the addition of nitrate of iron and fustic improves. (65) For blue-black, dye in Prussian blue and follow with 64. Artificial blacks in acid or soap baths.

DRABS.

On Cotton.—(66) Sumach, followed by weak copperas, then fustic, Lima-wood, and logwood; raised with alum.

On Wool.—(67) Madder, peach-wood, logwood, fustic, with alum and copperas.

On Silk.—(68) Sumach, fustic, and logwood, with copperas.

BROWNS.

On Cotton.—(69) *Catechu brown.* Boil in catechu, pass through hot bichromate of potassa, wash in hot water containing a little soap. (70) *Chocolate or French brown.* Dye in spirit yellow, 25, then in logwood, and raise with acetate of alumina. Basic aniline browns on tannin mordants.

On Wool.—(71) Pass through a bath of fustic, madder, peach, and logwood; then through dilute copperas. (72) Bath of bichromate of potassa, argol, and alum; then of madder, peach, and logwood. (73, 74) Neutral and acid coal-tar browns.

On Silk.—(75) Neutral and basic coal-tar browns in soap baths. (76) Acid coal-tar browns in acid baths.

For further details, see Sansone's *Dyeing*; Delmart's *Echtfärberei der losen Wolle*; Soxlet's *Färberei der Baumwolle*; Hurst's *Silk Dyeing, Printing, and Finishing*; Hummel's *Dyeing of Textile Fabrics*; and Kertesz's *Die Anilinfarbstoffe.*

C. F. CHANDLER.
Revised by L. M. NORTON.

Dyer, ELIPHALET: jurist; b. at Windham, Conn., Sept. 28, 1721; graduated at Yale College in 1740, and began to practice law in 1745. During the French war (1755) he commanded a Connecticut regiment, and in 1762 he was elected a member of council. In 1763 he went to England as agent for the Susquehanna Company, and he was a delegate to the Stamp Act Congress in 1765. He was a member of Congress during the war of Independence. D. in Windham, May 13, 1807.

Dyer, GEORGE: antiquary and scholar; b. in London, Mar. 15, 1755. He was educated at Cambridge; lived by literary labor in London after 1792. He edited Valpy's Classics, and wrote, besides other works, a *History of the University of Cambridge* (2 vols., London, 1814). D. in London, Mar. 2, 1841.

Dyer, JOHN: English poet; b. in Aberglasney, Carmarthenshire, in 1700. He was originally a painter, and studied art in Italy. He published in 1727 a poem entitled *Grongar Hill*, remarkable for its descriptions of natural scenery. Having taken holy orders in 1740, he obtained the living of Calthorpe, Leicestershire, which he exchanged for livings in Lincolnshire. Among his works are the *Ruins of Rome* (1740) and *The Fleece*, a didactic poem (1754). D. July 24, 1758.

Dyer, WILLIAM TURNER THISTLETON, B. Sc., M. A., Ph. D., C. M. G.: English botanist; b. July 28, 1843; educated at Oxford, King's College, and Halle; Professor of Natural History, Royal Agricultural College, Cirencester (1868); Professor of Botany, Royal College of Science for Ireland (1870); assistant director of the Royal Gardens, Kew (1875–85); became director (1885). He has published *The Flora of Middlesex* (with Dr. Trimen, 1869) and the English translation of *Sachs's Text-book of Botany* (1875).

CHARLES E. BESSEY.

Dyers' Broom, called also **Woadwaxen**, **Dyers' Greenweed**, and **Whin**: a low shrub with yellow flowers and simple leaves. It is the *Genista tinctoria*, a European leguminous plant now thoroughly naturalized in New England. It is said to be the *genêt*, the bush which gave its name to the Plantagenet family. It was introduced into New England for garden cultivation, for its tops were formerly used to make a yellow dye for domestic purposes. It is used in Russia as a preventive to hydrophobia, but it appears to be simply a hydragogue cathartic of no great value.

Dyersburg: city; capital of Dyer co., Tenn. (for location of county, see map of Tennessee, ref. 6–B); situated on railway, and at the head of navigation on Forked Deer river; 76 miles N. of Memphis; has four churches, fine school, cotton compress, sawmills, machine-shop, brick-yard, planing-mills, roller flouring-mills, wooden-bowl factory, cottonseed oil mill, electric lights and water-works. Pop. (1880) 1,010; (1890) 2,009; (1900) 3,647.

EDITOR OF "NEAL'S STATE GAZETTE."

Dyersville: town; Dubuque co., Ia. (for location of county, see map of Iowa, ref. 4–K); situated on Ch. and No. West. and Ill. Cent. railways; 30 miles W. of Dubuque; has four churches, and public and parochial schools. The principal industries are manufacturing and trading, the town being one of the best live-stock markets in the State. Pop. (1880) 975; (1890) 1,272; (1900) 1,323.

EDITOR OF "COMMERCIAL."

Dyers' Weed or **Weld**, also called **Woold** and **Rocket**: the *Reseda luteola*, a European herb of the family *Resedaceæ*, naturalized in the vicinity of New York. It considerably resembles its congener, the mignonette. It is extensively cultivated in Holland and France, and to some extent in England, and is a valuable yellow dyestuff. Its quality is much improved by cultivation. It was formerly used in medicine as a sedative, diaphoretic, and diuretic.

Dyestuffs: bodies used to impart color to textile fibers and fabrics. Many colors exist already formed in plants; others are produced from colorless bodies by oxidation or other processes. Lakes are compounds of coloring-matters with metallic oxides, such as alumina, the oxides of tin, lead, antimony, and barium. They are generally prepared from cochineal, alizarin, weld, Brazil-wood, aniline colors, etc. (See LAKES.) The following are some of the most important dyestuffs of animal and vegetable origin:

I. ANIMAL DYES.—*Cochineal*, the female insect of the species *Coccus cacti*, is by far the most important. Its coloring principle is carminic acid. It produces scarlets and crimsons of great brilliancy on silk and wool. Carmine is nearly pure carminic acid. *Kermes*, *kermes grains*, *alkermes* is the insect *Coccus ilicis*, one of the most ancient dyes for red shades on silk. *Lac* is the *Coccus laccæ*, a similar insect. The *Tyrian purple* was obtained from mollusks, and is no longer used. *Galls* are excrescences produced on the leaves and leaf-stalks of the oak by punctures of the gall-wasp, made for the purpose of depositing her eggs. Their characteristic constituent is tannic acid, which produces drabs and blacks with iron salts. They also serve as a mordant for some aniline colors, and are the basis of most writing-inks. *Sepia* is the fluid of cuttlefish; it is not used as a dye, but as a water-color by artists. *Murexide* is a purple compound produced by the action of nitric acid and ammonia on uric acid from guano; it is no longer used.

II. VEGETABLE DYES.—These are extremely numerous, although only a few are in general use. They are derived from different parts of plants: (1) From roots the most important is *madder* (*Rubia tinctorum*), which contains two principles, alizarin and purpurin. These bodies produce on cotton the most permanent reds, purples, and chocolates, which makes them specially applicable for calico-printing. Madder appears in commerce in the form of ground root; garancin, the ground root boiled with sulphuric acid and washed; and extract, a tolerably pure alizarin. The use of madder as a dyestuff has nearly ceased, and it has been replaced by alizarin manufactured artificially from the anthraeene of coal-tar. *Munjeet* is the Indian madder. *Alkanet* is the *Anchusa tinctoria*, formerly used for lilac, lavender, and purple on silk. Its colors were always fugitive. *Barberry* produces a yellow of little importance. *Turmeric*, the tuber of *Curcuma tinctoria*, or Indian saffron, produces a fugitive yellow. It is now chiefly used for yellow lacquers, as a test for alkalies, for mixing with curry-powder and with mustard, and in dyeing wool. *Soorangee* is a yellow much used in India. (2) Among the more important woods are *logwood*, containing hæmatoxylin, extensively used for reds, purples, violets, blues, and blacks; *Brazil-wood*, comprising several species of *Cæsalpinia*, found in Central and South America and in Japan, known as Lima, Pernambuco, Santa Martha, Peach, Nicaragua, Sapan or Japan, etc. It yields a coloring-matter known as brazilin, which produces rich reds. *Sandal-wood*, from Ceylon, and *camwood* or *barwood*, from Africa, contain santalin, which gives reds, violets,

and scarlets. *Fustic*, or yellow wood, is the *Morus tinctoria* from the West Indies. *Fustet*, young fustic, or Hungarian yellow wood, is the *Rhus cotinus*. (3) The only bark of special importance is the *quercitron* from the *Quercus tinctoria*, which contains quercitron and produces a rich yellow, and greens when combined with blue; a pulverized preparation made from it is known as florine. *Lu-kao*, or *Chinese green*, is a green lake prepared by the Chinese from the bark of a species of *Rhamnus*, or buckthorn. (4) Leaves of the *Rhus cotinus* are known as *sumach*; they produce a yellow, but are generally used, on account of the tannic acid they contain, either as a mordant or to produce blacks, etc., with iron salts. *Chica*, which gives an orange on cotton, consists of the leaves of *Bignonia chica*. (5) *Flowers*. The petals of *Carthamus tinctorius* constitute safflower. They contain a useless yellow coloring-matter, soluble in water, and a beautiful pink (*carthamin*), soluble in alkalies. *Saffron*, a beautiful yellow dye, consists of the stigmas of *Crocus sativus*. (6) *Fruit*. Persian, French, Turkey, etc., berries are derived from several species of *Rhamnus*. They contain a beautiful yellow dye (*chrysorhamnine*) and olive yellow (*xanthorhamnine*). They are used in calico-printing, for paper pulp, and for lakes. *Annatto* or *annotto* is an extract of the seed-pellicles of *Bixa orellana*. It is used for yellows, oranges, and with reds for scarlet. It is also employed for coloring butter and cheese. *Divi-divi* is the pod of the *Cæsalpinia coriaria*. It contains tannic acid. *Catechu*, *terra japonica*, and *gambir* are the extracts prepared from the fruit, wood, twigs, and unripe pods of several plants growing in India. Their active principle, as well as that of *divi-divi*, is a species of tannic acid. They are used as mordants, with iron salts for drabs and blacks, and in tanning skins; catechu and gambir furnish browns. (7) *Entire plants*. *Indigo* from various species of the *Indigofera*, and *woad* from the *Isatis tinctoria*, contain a glucoside (*indican*) which by fermentation yields indigo blue (*indigotine*). This color has long been used as one of the most permanent blue dyes. Several preparations are employed by the dyer: (*a*) solution of colorless or reduced indigo, with which the cloth or yarn is impregnated, and from which the insoluble blue indigotine is precipitated on exposure to the air; (*b*) in solution in sulphuric acid as sulpho-purpuric acid, purple blue, or as sulpho-indigotic acid, deep blue; (*c*) as carmine of indigo, or extract, the soda compounds of the above-mentioned acids, usually the sodium salt of indigo-disulphonic acid. It is used for cotton, silk, and wool, and in calico-printing. *Lichens*. A variety of lichens yield, by a kind of oxidation, a series of products known as *archil* or *orchil*, *cudbear* or *persio*, and *litmus*. The weeds (from the Canaries, the Pyrenees, etc.) are pulverized and moistened with urine, when certain acids they contain are changed to the coloring-matter *orcein*. Archil appears in commerce as a purple paste, cudbear as a red powder, litmus as a blue lake. Before the introduction of the aniline colors the most beautiful purples for silk were obtained from archil. *Weld*, the *Reseda luteola*, contains lutioline, which yields a rich but fugitive yellow. Extracts containing the coloring-matters in concentrated form are prepared from most of the dye-woods, and are found in trade in the liquid or solid form.

III. Artificial or Chemical Colors.—(1) Pigments are insoluble metallic compounds, either produced in the yarn or cloth by successively applying the necessary reagents, or attached mechanically to the surface by albumen or other adhesive substances. *Prussian blue* is a ferrocyanide of iron; *chrome yellow* and *orange* are chromates of lead; *Schweinfurt green* is the aceto-arsenite of copper; *Guignet's green* is a hydrated oxide of chromium; *ultramarine* is a compound of alumina, silica, soda, and sulphur. (2) *Coal-tar colors* which have become equal to if not more important than the natural ones. The consumption of these colors is rapidly increasing in the tinctorial arts. This entirely new class of dyestuffs, the creation of modern chemistry, is derived from the refuse tar produced in gas-works from bituminous coal. The colors belong to four distinct series: (*a*) The aniline series, including the red rosaniline salts, the purple, violet, and blue substitution products derived from them, the greens, yellows, browns, black, and pinks, all of which are described under Aniline Colors (*q. v.*). (*b*) The phenol or carbolic acid series, including picric acid, and other nitro-coloring matters, the eosines, coerulein, etc. (See Phenol Colors.) (*c*) The azo-coloring-matters, chrysoidine, Bismarck brown, the tropæolins, the numerous wool scarlets, and the benzidine or tetrazo-colors. (*d*) Anthracene series, of which artificial alizarin anthrapurpurin, alizarin orange, anthracene blue, etc., are the representatives. See Anthracene, Alizarin, and Madder.

All the important animal and vegetable dyestuffs above mentioned are described more fully under their respective titles. For fuller information, consult the works on dyeing mentioned in the article on Dyeing.

C. F. Chandler.
Revised by L. M. Norton.

Dying, or Deathbed, Declarations: in law, statements made by a person in the prospect of impending death with regard to the cause of his death. In most countries such statements can not be received in civil cases as evidence, and in criminal cases only when the cause of death of the deceased is the subject of the charge. They must be made in the firm belief that death will soon follow, must relate to facts only, must be complete and unqualified, and must be freely made. They are further subject to the ordinary rules of evidence. The theory is that the knowledge of the approach of death creates an obligation at least equal to that of a judicial oath.

Revised by F. Sturges Allen.

Dyke: See Dike.

Dykes, James Oswald, D. D.: minister of the Presbyterian Church of England; b. in Port Glasgow, Scotland, Aug. 14, 1835; educated at Edinburgh University, New College, Edinburgh, and Heidelberg and Erlangen Universities, Germany. After two Free Church pastorates in Scotland, and four years of work as preacher, teacher, and editor in Melbourne, Victoria, he settled in London in 1869, where he was minister of the Regent Square Presbyterian church till 1888, when he became principal and Barbour Professor in the Theological College of the Presbyterian Church of England. Besides editing for some years the *British and Foreign Evangelical Review*, he has published *On the Written Word* (London, 1868); *The Beatitudes of the Kingdom* (1872); *The Laws of the Kingdom* (1873); *The Relations of the Kingdom* (1874)—these three in one volume; *The Manifesto of the King* (1881), *From Jerusalem to Antioch: Sketches of the Primitive Church* (1875; 5th ed. 1890); *Abraham, the Friend of God* (1877; 3d ed. 1878); *Sermons* (1882); *The Law of the Ten Words* (1884); *The Gospel according to St. Paul* (1888); *Plain Words on Great Themes* (1892).

Willis J. Beecher.

Dynam'eter [contraction of dynamometer; from Gr. *δύναμις*, power + *μέτρον*, measure]: an instrument for determining the magnifying power of a telescope. This power is expressed by the ratio of the solar focal distance of the object-glass to the focal distance of the eye-piece, considered as a single lens; and this ratio being the same as the ratio of the effective diameter of the object-glass of the telescope to the diameter of the image of the same formed at the solar focus and seen through the eye-piece, the object of the instrument is to measure the exact diameter of this image, which can be either projected on mother-of-pearl or measured by optical means. Ramsden proposed for this purpose the double-image dynameter, or micrometer, which is formed by dividing the eye-lens of a positive eye-piece into two equal parts, and mounting them so that the divided edges are made to slide along each other by means of a fine screw apparatus. Each semi-lens gives a separate image; and the distance of the two centers, measured by the revolutions of the screw when the borders of the two images are brought into contact, gives the distance of the centers of the images or the diameter of one of them.

Dynam'ics: literally and in modern usage, the science which has for its object the investigation of the laws and principles which govern the action of forces. The science of dynamics may be divided into various branches, each embracing the principles applicable to some special conditions of the action of forces or of the bodies acted on, such as the subject of *statics*, or the equilibrium of forces; the subject of *kinetics*, the action of forces in connection with the motions and changes which they produce; and the special applications of both these subjects to bodies in the *solid* and *fluid* states.

The abstract idea of force is derived from our knowledge and experience in regard to the forces of nature—gravitation, inertia, friction, molecular force, muscular force, etc. These forces are so far similar and identical in their effects as to admit of a common measure, and of being subjected to the same laws and principles. In general they arise from the action of one body on another in such a manner that this action is distributed among all the particles or is exerted through a surface. But it is nearly always possible to

assume a single force acting through a definite point and in a particular direction, which shall be equivalent in its effects to such combined or distributed forces. The force of gravity, for instance, is an attractive influence exerted between two bodies, which can only be supposed to be exerted by the separate particles or molecules of each, and yet a single force equivalent to the sum of the attractions of all the particles of a body, and acting through its center of gravity, is usually assumed to represent the force of gravity. A force may thus be regarded as an influence or action between two bodies or between two molecules of matter which requires two elements for its determination—its *line of action* and its *magnitude*.

This abstract idea is applicable to all forces, and furnishes the starting-point or basis of the system of principles which constitutes the science of force. These principles depend also on certain axioms of physical science derived from a consideration of the nature of forces and their effects; and also upon certain geometrical laws involving the relation between the magnitudes of forces and motions, and their equivalent components. To compare the magnitudes of forces a standard unit or measure must be adopted which is applicable to all forces under all ordinary conditions. As all standards of measure are arbitrary, such a unit of measure may be found in the effects which a given force will produce under conditions which permit of the effect being measured by some other known standard of measure.

To explain the standard or unit of force adopted in dynamical science, it will be necessary to explain just what is understood by the mass of a body. If we suppose (*for the purpose of this explanation only*) that the ultimate particles or molecules of all substances are the same, and that we may designate by the term *density* the degree of proximity of the particles of any body to each other, then the number of particles in a given *volume* may be taken to denote the mass of the body—i. e. this number would represent the *quantity of matter in the body*. This quantity of matter or mass has important properties as regards force. First, the action of the force of gravity upon the body is directly proportional to the mass; and this mass possesses a peculiar power of resistance to any force which acts to change its condition in respect to motion. It is inert as regards any power in itself to change, but a force of resistance is developed with the action of an impressed force. The truth of this principle is so well established that the following relation between an impressed force, the mass of a body free to move without resistance (other than its inertia), and the velocity which is produced in a unit of time, has the force of a scientific axiom. This relation may be stated as follows: *The velocity produced in a body free to move without resistance in a unit of time will be directly proportional to the intensity or amount of the impressed force, and inversely proportional to the mass of the body.* In algebraic symbols, if v be the velocity, F the force, and M the mass, the relation will be expressed by the equation $v = \frac{F}{M}$. From this is determined the value of the force $F = Mv$. If the mass M be that of a given volume of some substance assumed as a standard, the unit of force may be assumed to be that force which will produce a given velocity —the unit of velocity, for instance—in a unit of time. This is an *absolute unit of force*, and serves as a universal measure. Another measure adopted is more specific, but not an invariable standard. It is, however, that in most common use, and is perhaps the most universally understood as the standard of measure for forces. If the force F, instead of being any force, be taken as the force of gravitation, the total attraction of the earth at a given place on the mass M will be what is commonly called the weight of the body; representing this by W, we shall have $W = Mv$. If the same standard mass be chosen as before, the weight of this mass may be taken as the unit of force. Such a unit has been generally adopted for different national standards. For English measures the mass M is that of a piece of platinum carefully preserved, the weight of which is called 1, or 1 lb. This weight will differ for different latitudes, because the force of attraction of the earth varies with the latitude, and hence this measure is not absolute in its character, but it is convenient for use, and is generally employed in ordinary calculations and transactions involving weight measure and the stress of materials in English measures. In electricity and magnetism the absolute unit forms the bases of computations. If any mass be allowed to fall under the influence of gravity, the velocity generated in one second may be determined experimentally, and the equation $W = Mv$ will give the relation between the weight, mass, and velocity under these circumstances. In the latitude of London this velocity is 32·2 feet approximately; so that $\frac{W}{32{\cdot}2} = M$. The mass of a body is thus found by dividing the weight by 32·2. The unit of force, for British measures, may therefore be said to be *one pound avoirdupois*, and the mass of the body may be found by dividing the weight by the number 32·2; these quantities representing British measures referred to the latitude of London. The corresponding French unit of force is 1 kilog., equivalent to about 2·2 British units.

A force being fully represented by its *magnitude*, *direction*, and *point of application*, the first problems in order in the action of impressed force relate to the laws of equilibrium, or the rules for finding the resultant of any number of forces acting on a body. If the lines of direction of the forces all pass through the same point, the resultant may be found by the application of the geometrical theorem called the parallelogram of forces. If two forces act upon one point, and portions of their lines of direction be taken to represent the magnitude of the forces, their resultant, or a single force equivalent to the action of the two, will be represented by the diagonal of the parallelogram constructed on the lines of the other two. By counting the forces which act on a point two and two, and repeating the process, a single resultant for all may be found. Or, to determine graphically the resultant, from the extremity of the line representing one of the forces draw a line parallel to the direction of any other force, of a length representing the magnitude of this force; then from the extremity of this last line draw another, parallel to and equivalent to another force, and so on; the final resultant will be a line drawn from the extremity of the last line to the origin, or point of application; if this line is zero, then the forces are in equilibrium. If the forces do not all act on one point in the body, the conditions of equilibrium require that the action of the forces shall be such that they not only produce no motion of the body in a straight line, but there must be no unbalanced effort to turn the body about any line as an axis.

The *moment of a force* in reference to an axis is the product of the intensity of the force into the perpendicular distance of its line of action from that axis.

Several special cases may be considered as leading to the most general case of the equilibrium of any number of forces acting upon a rigid body in any direction.

1. To find the resultant of two parallel forces acting in the same direction, divide any line across their common direction into parts inversely proportional to the magnitudes of the forces; the point of application of the resultant may thus be found, and its magnitude will be equal to the sum of the magnitudes of the two forces. A third force equal and opposed to this resultant will produce equilibrium.

2. The resultant of any number of parallel forces acting in one plane and in the same direction may be found by first finding the resultant of two, then the resultant of this with a third, and so on.

3. For any number of parallel forces not in one plane, the conditions of equilibrium require that the algebraic sum of the forces shall be equal to zero, and the algebraic sum of the moments of the forces in reference to any two rectangular axes in the plane; that is, the combined action of the forces must produce neither a motion of translation nor of rotation.

4. Two equal parallel and contrary forces not acting on the same point produce a couple which has no single resultant.

5. When a system of forces acts in various directions and on various points of a rigid body, if three axes be assumed at right angles to each other, each of the forces may be replaced by three component forces in the direction of these axes. The components of each force being found by multiplying the magnitude of the force by the cosine of the angle which its line of action makes with the direction of the component (a process which depends on the theorem of the parallelogram of forces), then the conditions of equilibrium of the system are that the algebraic sums of the components in the directions of the three axes shall be zero, and also the algebraic sums of the moments of the forces in reference to these axes must be zero.

The application of these principles to find the centers of

gravity of various lines, surfaces, and solids is made by supposing the body to be divided into small elementary portions, and these portions to be acted on by the parallel forces of gravity acting on each. In a corresponding manner the center of pressure of fluids resting upon surfaces may be found.

The various cases of equilibrium when no other forces act on a body than the force of gravity, and the pressure between the body and fixed supports, constitute a large class of problems which occur in the applications of dynamics to engineering; the stresses and strains which are produced in the pieces of a structure being the principal objects for calculation. In the action of forces where motion is produced, the elements of time, space, and velocity enter into the discussion, as well as the mass of the body acted on.

The three fundamental axioms or truths on which the science of dynamics principally rests are:

1. Every body continues in its state of rest or of uniform motion until compelled by impressed forces to change its state.

2. Change of motion is proportional to the resultant of the impressed forces, and takes place in the direction of the straight line in which that resultant acts.

3. There can be no action of a force without a contrary and equal reaction.

The *work* of a force is the product obtained by multiplying the intensity of the force by the space passed over by its point of application.

According to the above axioms or fundamental principles, the effort of any force must be opposed by an equal and contrary effort from some other force. In cases of bodies free to move under the influence of any force, a portion of the resistance to the external force is always supplied by the inertia of the body. If no other force acts upon the body than the force which produces the motion, the whole of the resistance will be supplied by inertia, and the expression which has been employed, $F=Mv$, gives the relation between the force and the resistance in terms of the mass and velocity. The quantity Mv, called by some writers quantity of motion, and by others momentum, may be interpreted as implying that this is *the measure of a force* which, acting for a unit of time upon the mass (M), generates the velocity v. If the force continue to act on the body so as to accelerate the velocity, the *work* of the impressed force must be equivalent to the work of the resistance during any given time or through any given space. A body moving, for instance, with a velocity v, and having by the action of an impressed force its velocity changed to v', the change of momentum will be $M.(v-v')$. The force necessary to produce this change in the time t will be $F=M.\frac{v-v'}{t}$. If during this time we suppose the body to have passed with a uniformly accelerated velocity over the space s, the *work* of the force F will be Fs. But the space s is equal to the mean velocity multiplied by the time, or equal to $\frac{v+v'}{2}t$, and we have

$$F\times s=M\frac{v-v'}{t}.\times\frac{v+v'}{2}.t=M.\left(\frac{v^2-v'^2}{2}\right).$$

If the body start from rest, the initial velocity will be 0, and we shall have

$$F\times s.=\frac{Mv'^2}{2}.$$

The same may be proved whether the impressed force is constant or variable; and the important principle is thus established that the product of the mass of a body multiplied by half the square of the velocity with which the body is moving, is equivalent to the *work* of the *impressed force* which produces this velocity in the body. And generally a change in the value of $\frac{Mv^2}{2}$ is always equivalent to the *work* of the force which produces the change. The quantity $\frac{Mv^2}{2}$ is called *living force*, and sometimes *actual energy* of the body, because a body moving with the velocity v will always require the expenditure of the work represented by $\frac{Mv^2}{2}$ to bring it to rest.

In cases where external resistances act on the body in opposition to the impressed force, the work of the resistance, added to the work of inertia, will be equivalent to the work of the impressed force. This gives rise to a very simple enumeration of the laws of all machines—viz., the work of the effort or prime mover must always, during any interval of time, be equal to the total work of the resistances added to the actual energy or living force accumulated in the moving pieces. If during a given period the living force of any piece is alternately increased and diminished, the quantities of energy stored and re-stored may just equalize each other; and such a piece may be employed simply for the purpose of storing up and restoring work, as a regulator. The common fly-wheel is such a piece in machinery.

If a body has a rotary motion about any axis, the actual energy or living force due to the rotation is expressed in terms of the angular velocity and the moment of inertia of the body with reference to the axis. If the angular velocity be represented by a, the actual energy due to rotation will be $\frac{a^2}{2g}I$; the moment of inertia I being found by means of what is called the radius of gyration, which is that radius or distance in a rotating body the square of which is the mean of the squares of the distances of the particles of the body from the axes. For the fly-wheel this radius is approximately equal to the mean radius of the rim.

When a body in motion is constrained to move in a curve, the force which causes it to deviate at each instant from the tangent is found by multiplying the mass by the square of the velocity, and dividing by the radius of curvature. The deviating force is equal and opposite to the influence which tends to draw the body away from the axis, the centrifugal force, and hence the *centrifugal* force is always proportional to the square of the velocity, and inversely as the radius of curvature.

In the application of the laws of dynamics to fluids the principle of living force holds true as for solids. Every fluid mass in motion has a living force proportional to the mass, multiplied by the square of the velocity.

The force of heat is derived from the same general dynamical law. It has been demonstrated that the molecules of all bodies have a constant vibratory motion, and these molecules having weight, the energy exerted when a body is cooled is equivalent to the expenditure or change of living force; and when a body is heated, the vibratory motion of the particles being increased in velocity, living force or actual energy is stored.

The property of matter which is called inertia, by virtue of which masses in motion possess a force which is appropriately called *living* force, is of great importance in the economy of machines, and of special importance also to living beings. In nearly all motions of animals this principle acts to aid the muscles in the execution of particular movements, which would otherwise be accomplished by fatiguing exertions, and would often be otherwise impracticable.

The demonstrations and applications of the various principles which have been enunciated, with their secondary consequences, usually occupy entire volumes. Works of this character have generally been entitled works on mechanics, and are often divided into two subjects or parts, *statics* and *dynamics*, but the tendency of modern writers is to exclude the word *mechanics* from definitions connected with *abstract* science, and to employ the term *dynamics* to designate the whole science of force. W. P. Trowbridge.

Dynamic Units: units for measuring forces and their effects. The simple *unit of force* has been defined under Dynamics. A *unit of work* combines two elements—viz., force acting, and space through which it acts; and is the product of a unit of force and a unit of distance. Such is the foot-pound, which is the work done in raising 1 lb. 1 foot; or the kilogrammètre, the work done in raising 1 kilog. 1 meter. A *unit of power*, or of *rate of working*, involves the additional consideration of time. It is a definite amount of work conventionally fixed upon for purposes of comparison as the work of a unit of time. Thus the horse-power, the unit of rate commonly used in the U. S. in estimating the performance of machines, is 550 foot-pounds per second, or 33,000 per minute. The *cheval-vapeur* (French horse-power) is 75 kilogrammètres per second, or 4,500 per minute; equal to 542½ foot-pounds per second, or 32,550 per minute, nearly—a little less than the former.

W. P. Trowbridge.

Dynamite: See Explosives.

Dynamite-gun: a gun for throwing dynamite. An experimental gun for this purpose was made in New York city and tried at Fort Hamilton in Apr., 1884. The gun consisted of a tube 40 feet long and one-eighth of an inch thick,

with a bore 4 inches in diameter, connected with a large steel cylinder supplied with compressed air by a steam-engine. The target was 8 feet by 10, 1¼ miles distant, and the projectile first used was 22 lb. in weight and loaded with sand instead of dynamite; afterward two shots were discharged loaded with fulminate of mercury. Neither of the shells exploded until it struck the earthworks, and both penetrated 4 or 5 feet into the earth. The experiment, which was conducted by Col. John Hamilton and Lieut. E. L. Zalinski, was entirely successful. On Mar. 26, 1887, a projectile of 146 lb., and containing 50 lb. of dynamite and nitro-glycerine, was discharged from a gun of 8-inch bore, thrown about a mile, and exploded under water in New York harbor. For illustration and further information, see ORDNANCE.

Dynamo-electric Machine (usually called simply dynamo): a machine for the transformation of mechanical energy into electrical energy, or *vice versa*. Machines of the latter class are usually called electric motors. Fundamentally, in a dynamo-electric machine an electric current is generated by the rotation of conductors in the presence of a magnetic field, or by the mechanical variation of magnetism embraced by electric conductors. A conductor carrying electric current in a magnetic field is acted on by a force tending to move the conductor across the field at right angles to the direction of magnetization. An electric conductor, when moved across a magnetic field, has an electromotive force produced in it that causes an electric current in the conductor in a direction opposite to the motion. Fig. 1 shows the relations of the direction of magnetic lines of force, motion of a conductor, and induced current. Fig. 2 gives one an idea of a simple dynamo. The quadrangular conductor is rotated in the field of a magnet. The right conductor of the quadrangle is moving down through the field, and has therefore an electromotive force developed in it that tends to cause a current toward the pulley, while the left conductor is moving up through the magnetic field across the lines of force in an opposite direction, and has therefore an electromotive force developed in it that will cause a current away from the pulley as indicated by the arrows. The result of the two electromotive forces is to produce a circulating current in the quadrangle. This continues while the conductors, as the quadrangle rotates, are moving across the field or "cutting lines of force"; but when the quadrangle is at right angles to the lines of force, the conductors no longer cut across the lines of force, but for the time being are moving parallel to them. At this point, therefore, no electromotive force is produced in the conductors, and the current in the quadrangle is zero. As the rotation continues, the conductors have exchanged positions in their relation to the magnetic field. The right-hand conductor in Fig. 2 is now on the left hand, and moving up across the lines of force, whereas it was going down before. This reversal of relations produces a corresponding reversal of the electromotive forces in the conductors, and therefore a reversal of the current in the quadrangle. The current then during one half of the revolution is in one direction, and in the opposite direction during the other half. By a continuous rotation we have thus produced an alternating current in the quadrangle. We may open the quadrangle at any point, and extend the ends thus produced by means of metallic conductors to two insulated metallic rings upon which press stationary insulated metallic brushes, as illustrated in Fig. 3. From these brushes insulated conducting wires may extend to any point, and there be joined through an apparatus for utilizing the electric current. If the conductor leading from the brushes be joined through a galvanometer, its needle will be deflected first in one direction and then in the other as the rotation of the quadrangle continues. By joining the ends of the quadrangle each to semicircular rings, thus forming a "two-part commutator" (see Fig. 4), the current in the circuit external to the quadrangle will always be in the same direction, but fluctuating in amount.

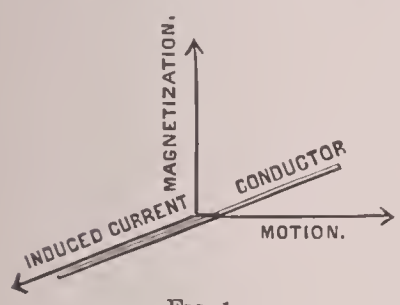

FIG. 1.

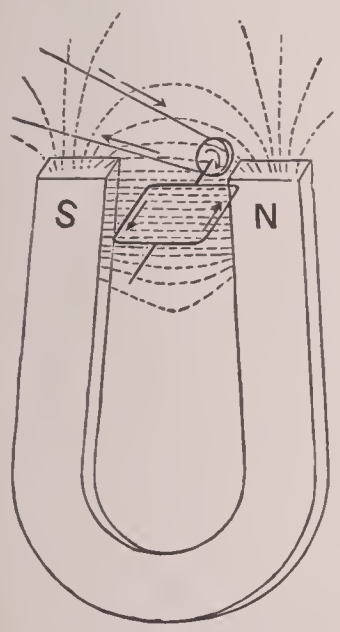

FIG. 2.

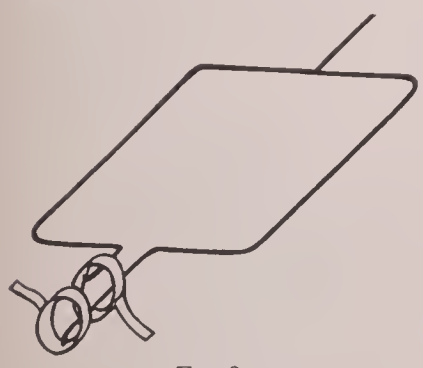

FIG. 3.

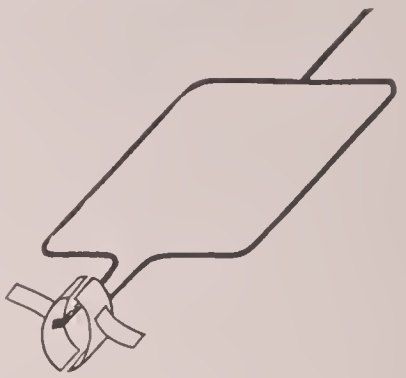

FIG. 4.

Practical dynamo-electric machines are constructed and operated on the principles just described; the field is made greater and more intense, while the two conductors forming a single turn are replaced by many turns. There are two great classes, direct-current and alternating-current generators. The former includes all dynamos for the production of electromotive force and current that are of the same sign or direction at all instants. The latter includes all machines for the production of "alternating" electromotive forces and currents that for one short interval of time exist with one sign or direction and for the next instant exist with the opposite sign or direction. Usually the electromotive forces, and therefore the currents that are induced in the active conductors, are alternating, as in the simple dynamo described above. In direct-current dynamos the two-part commutator of the simple dynamo is replaced by one of many parts; each part is connected to the end of one generating coil, or to the end of one generating coil and the beginning of the next. In alternate-current dynamos the generating coils or conductors are connected in series, and the remaining terminals are connected to rings (as in Fig. 3), when the coils instead of the magnets constitute the moving parts; and when the coils are stationary their terminals are connected to binding posts. The alternating current is taken off by means of insulated conductors from the rings or binding posts, as the case may be. In all but the smallest dynamos the electric current is used for establishing the magnetic fields in which the conductors move. This is done by encircling the magnetic circuit with numerous turns of insulated copper wire, carrying current. The product of the current in ampères into the number of turns thus applied is the number of ampère-turns. The magnetomotive force of each ampère-turn is 1·257 in centimeter-gramme-second units, so that 795·0 ampère-turns set up in air a magnetization of 1,000 lines per sq. centimeter through a distance of 1 centimeter, or 313·2 ampère-turns will set up in air 1,000 lines per sq. inch through a distance of 1 inch. Cast-iron, wrought-iron, and steel castings are used to make up the greater part of the magnetic circuit in dynamo-electric machines. For magnetic densities below 10,000 lines per sq. centimeter in cast iron and 18,000 lines per sq. centimeter in wrought-iron and steel castings the number of ampère-turns required to set up a given magnetic density through a given distance is far less than for air. Relations between the magnetic densities in lines per sq. centimeter and ampère-turns requisite to set up such magnetic densities through a distance of 1 centimeter for cast-iron, wrought-iron, and steel castings are given in the diagrams of Fig. 5.

In all dynamo-electric machinery the collection of parts in which the electrical energy is generated is called the *armature*. The collection of parts utilized in providing the magnetic field is called the *field*. In Fig. 6 the portions of the field from which the magnetism enters the armature are called the *poles*; those about which the current circulates

for setting up the magnetism are called the *field cores*; the portion that joins the field cores together at their extremities opposite the poles is called the *yoke*; the windings on the cores through which the excitation current is set up are called the *field coils*. In general the construction of the magnetic circuits of direct-current dynamos necessitates the use of laminated iron cores in the armature for the purpose of lessening the reluctance of the magnetic circuit. The lamination is accomplished by building up the cores with insulated iron disks about ·015 inch in thickness, and arranged parallel to the lines of magnetic force. Iron wire is occasionally used for building up armature cores. The lamination prevents the loss of energy that otherwise would occur through the parasitic currents that are formed in solid iron when rotated in a magnetic field. The space in

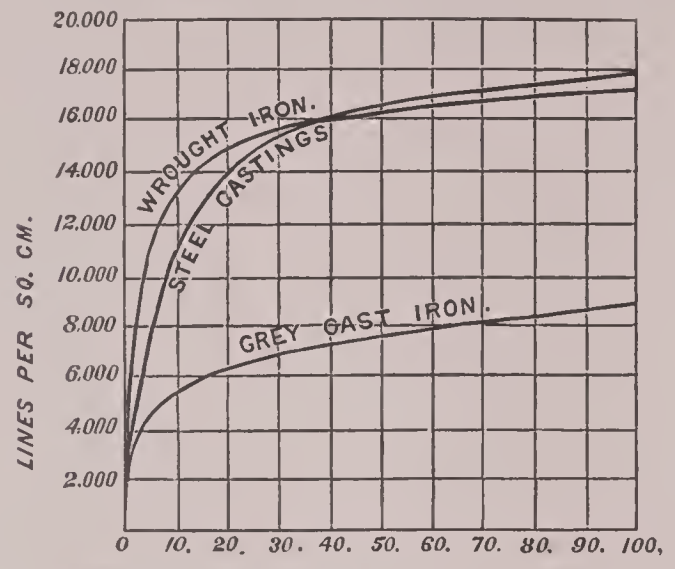

FIG. 5.

the magnetic circuit occupied by air and non-magnetic materials is called the air-gap. The distance between the surface of the armature core and that of the poles is known as one-half the depth of the air-gap. The magnetic density varies in different parts of the circuit and with different materials. Cast-iron field cores are worked at 6,000 or 7,000 lines per sq. centimeter; yokes at 5,000 lines per sq. centimeter; and poles at 3,000 lines per sq. centimeter; field cores, poles, and yokes made of wrought-iron or steel castings are worked at 14,000 to 16,000 lines, 7,000 lines, and 12,000 lines per sq. centimeter respectively. The magnetic density in the air-gap varies in different makes and sizes of machines from 3,000 to 7,000 and sometimes 10,000 lines per sq. centimeter. Two classes of iron cores are used in armatures, depending upon the method of winding the conductors. Those of the one class are solid cylinders, usually

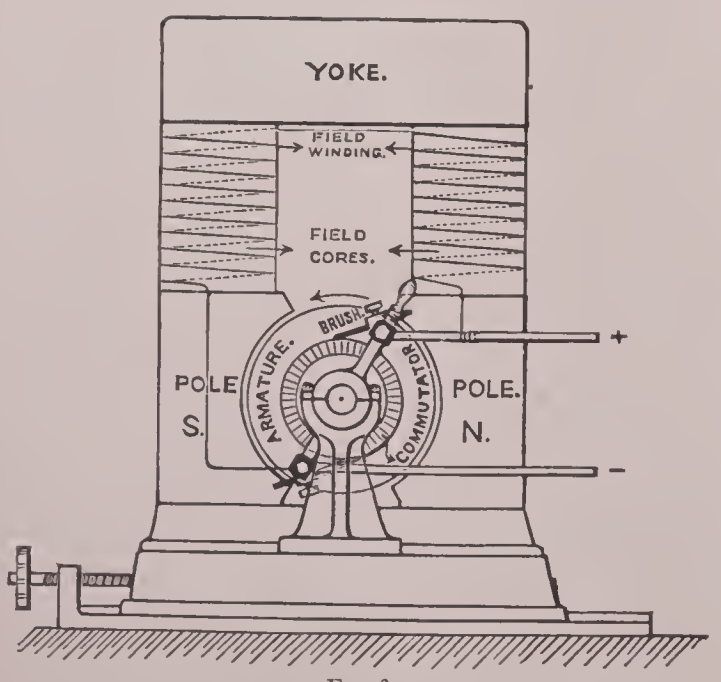

FIG. 6.

longer than their own diameter; those of the other class are hollow cylinders, generally shorter than their own diameter. The first are used in drum-armatures, and the second in Gramme ring-armatures. Disk-armatures are seldom provided with iron cores. Drum-armature cores are operated in practice at magnetic densities varying from 5,000 to 10,000 lines per sq. centimeter, while ring-armature cores at the point of maximum density are generally operated at from 12,000 to 18,000 lines per sq. centimeter. Because of the permeability of the air which everywhere surrounds the field of the dynamo, quite a considerable portion of magnetism that is set up through the yoke and field cores by the exciting coils leaks by the armature. The ratio of the magnetization through the field, M_f, to the magnetization through the armature, M_a or $\frac{M_f}{M_a}$, is the coefficient of magnetic leakage, or γ. This ratio is generally about 1·4, so that in such cases the field cores and yokes must be proportioned so as to accommodate 1·4 times the number of lines of magnetism that are needed through the armature. The following is an expression for determining the number of ampère-turns that is requisite to set up a given amount of magnetism through the armature:

$$T_wC=\frac{H_f \times L_f}{1{\cdot}257}+\frac{H_y \times L_y}{1{\cdot}257}+\frac{H_p \times L_p}{1{\cdot}257}+\frac{H_a \times L_a}{1{\cdot}257}+\frac{B_{ag} \times L_{ag}}{1{\cdot}257},$$

Where

T_wC is the number of ampère-turns,

B_{ag} the magnetic density in the air-gap,

H_f, H_y, H_p, H_a the magnetomotive forces obtained from the above diagrams for setting up through a distance of 1 cm. the corresponding magnetic densities in the field and armature cores, poles, and yoke,

L_f, L_y, L_p, L_a, and L_{ag} the distances in centimeters through which are set up the respective magnetic densities in the field cores, yoke, poles, armature core, and air-gap.

The magnetic density in any part of the magnetic circuit is $\frac{M}{S}$ where M is the total number of lines and S the cross-section in square centimeters at that point.

In the armatures of direct-current machinery, conductors, or groups of conductors, called sections or coils, have their terminals attached to insulated bars arranged cylindrically or annularly, forming the commutator. To obtain a direct current it is necessary for the armature to rotate with reference to the brushes or field, or *vice versa*. The former method is usually adopted, since in practice the brushes must occasionally be adjusted while the dynamo is in operation. With alternators either the field or armature may rotate. In direct-current dynamos there are two classes of armatures, open coil and closed coil. The latter are used much more generally than the former. In open-coil armatures there is one commutator bar for each terminal of a coil that is brought to the commutator; while in closed-coil armatures there are two coil terminals, usually the end of one coil and the beginning of the next, for every commutator bar. Figs. 7 and 8 illustrate the two methods of commutating the current. In open-coil armatures the terminals of one coil, or two or more joined in series, are connected to opposite commutator bars. While the coils are passing through the magnetic field, and are therefore active in producing an electromotive force, their commutator bars are passing under the brushes; at the same time the idle coils are cut out of the circuit altogether. This method of commutating the current has been found to be

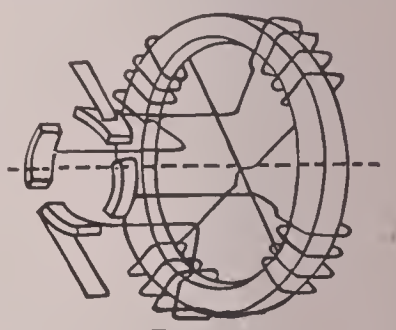

FIG. 7.

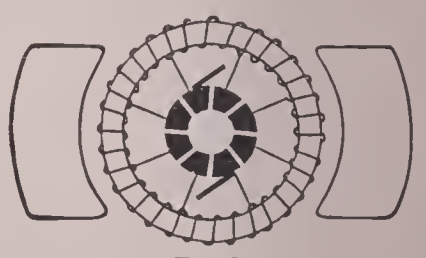

FIG. 8.

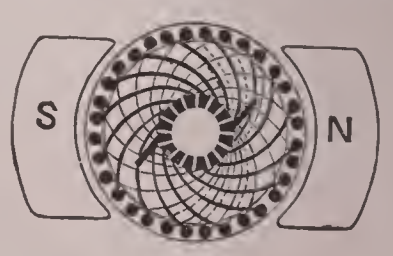

FIG. 9.

especially adapted to the generation of small currents at high voltages, such as are used for arc lighting. In the closed-coil armatures, as seen in Fig. 8, one-half of the coils or sections are constantly in multiple with the other half. Each set produces the same electromotive force as the other, which therefore is the full electromotive force of the generator, and being in multiple arc each furnishes half of the current.

Either open or closed coil armatures are still further distinguished as Gramme ring and drum armatures. In Gramme ring-armatures the core is in the form of a ring or cylinder, and the coils are wound on this core, as shown in Fig. 8. In drum-armatures the core is like a drum or solid cylinder. Fig. 9 gives a diagram of a drum-armature winding for a two-pole dynamo. The following expression is used in designing direct-current closed-coil armatures:

$$E = \frac{B_{ag} \times N_c \times L_c \times v \times \rho}{k \times 10^8},$$

Where

E = the electromotive force generated,
N_c = the number of conductors on the surface of the armature,
L_c = the length in centimeters of the portion of each conductor that is active in cutting lines of force,
v = the linear velocity in centimeters per second of the conductor,
ρ = the percentage of the armature circumference covered by the poles,
k = the number of circuits in parallel.

The maximum allowable current that an armature may furnish is limited only by the maximum heating effects that may be permitted. Heating effects in armatures are produced by hysteresis and Foucault current losses in the revolving iron cores, and by the resistance of the copper conductors. Cotton-covered, varnished wires, as used in armatures, will stand a safe allowable rise of temperature of 70° C. above ordinary temperatures. At this rise of temperature the output of an armature is generally determined. In well-made armatures 30° of this rise is produced by the heat developed in the core, and the remaining 40° by the current in the copper conductors. With this performance the cross-section of the copper conductors is generally about 450 circular mils per ampère. Direct-current dynamos are built in practice to produce either a constant electromotive force and variable current or a constant current and variable electromotive force. The former are known as *constant-potential* and the latter as *constant-current dynamos.* In all direct-current dynamos the field is produced by a current generated in the armature. In constant potential dynamos the field is wound with fine wire and the terminals are connected to the brushes at the commutator, as shown in Fig. 6. A small current is thus obtained from the armature or shunted from the main current. Such a machine is called a *shunt dynamo.* The field exciting current is varied by means of an adjustable resistance. Every variation of field current produces a corresponding variation of the amount of magnetization through the armature, and of the electromotive force generated. At a given speed the relation between the exciting current and the electromotive force generated is called the *internal characteristic* of a dynamo. The relation at a given speed between the electromotive force at the brushes and the current delivered by a dynamo is called the *external characteristic.* The diagrams in Fig. 10 give the external and internal characteristics of a shunt machine, having an output of 100 ampères at 110 volts and a speed of 1,500 revolutions per minute. These characteristics are to a dynamo what an indicator-card is to a steam-engine. They are of great assistance in determining whether the dynamo has been properly constructed, and whether it is properly operated. Frequently heavy turns of wire are wound about the field, and through these the main current produced by the armature passes; by this means more magnetization is produced through the armature as the current output increases, enabling the armature to produce a higher electromotive force to compensate for any natural falling off of the electromotive force due to the resistance of the armature, increased reluctance of the field due to the

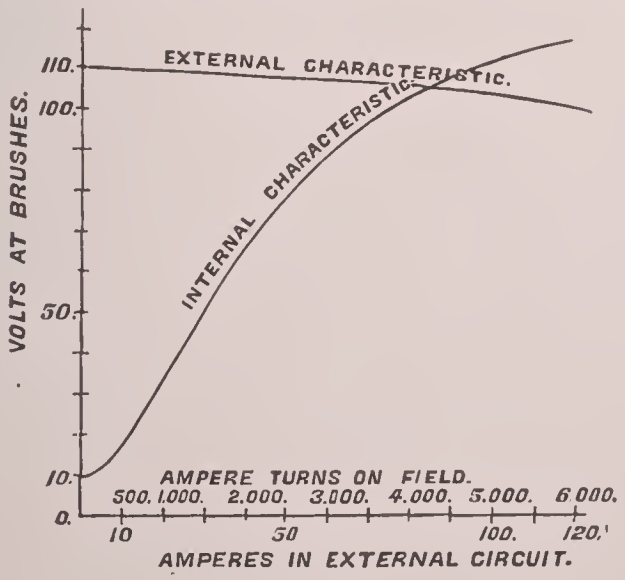

Fig. 10.

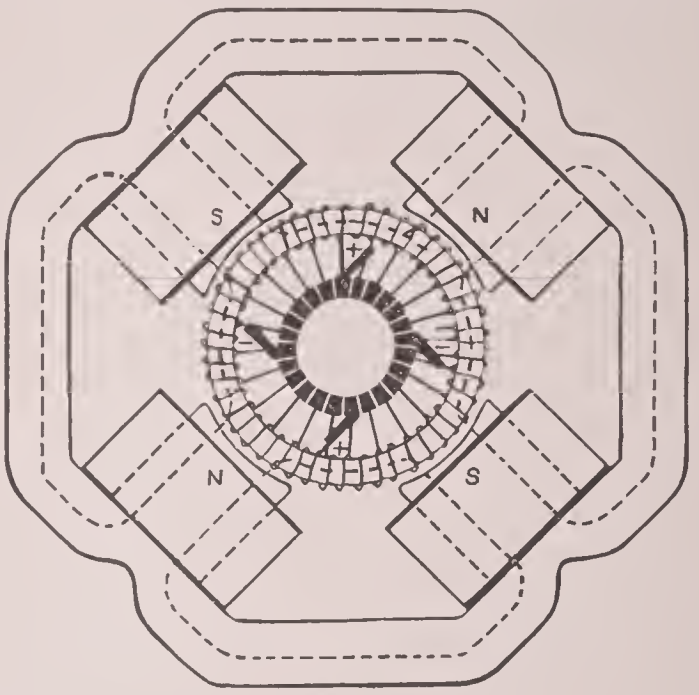

Fig. 11.

magnetic action of the current in the armature, or falling off of the speed of the prime mover. Such machines are called *compound dynamos.* Machines in which the field is produced entirely by means of turns through which the main current of the armature passes are called *series dynamos.* These are generally used for the production of a constant current and variable electromotive force. There are two methods for constant current regulation, giving rise to two classes of constant-current dynamos. In the one class the constant current produced by the armature circulates through the field for all electromotive forces, the magnetization through the armature remains constant, and the electromotive force is varied by automatically shifting the brushes at the commutator. In these machines the fall of magnetic potential between the pole faces is just equal to the magnetomotive force of the ampère-turns on the armature in the diameter occupied by the brushes. There is no magnetization in the armature along the diameter of the brushes, so that in any position the brushes are on a neutral point, and current may be taken off without sparking or disruptive effects. The electromotive force is a maximum when the brushes are at right angles to the field and coincident with the normal diameter of commutation, and it is zero when the brushes are parallel to the field or at right angles to the normal diameter of commutation. In the other class the brushes remain almost in a fixed position; the requisite variation of electromotive force is produced by varying the magnetization through the armature. This is accomplished by varying the current through the field-winding, by automatically changing the resistance of a conductor that is connected in multiple arc with it.

The fields of direct-current dynamos are distinguished by the number of their poles, as two poles, four poles, six poles, etc. Open-coil armatures are used only with two-pole fields. Armatures for the multipolar fields have hollow cylindrical cores that may have either Gramme or drum windings. In the Gramme windings for multipolar fields there are as many sets of coils in multiple with each other as there are poles, while in drum windings there are generally but two. The two styles of winding are illustrated in Figs. 11 and 12. Multipolar dynamos are usually built as shunt or compound

generators for constant potential and variable current. The multipolar forms possess certain great advantages over the bipolar forms for the large sizes of generators. Chief among these are slow speed and great output per pound of material used in construction.

Alternate-current dynamos are used extensively for electric lighting. They are generally made to develop electrical energy in the form of high alternating electromotive forces and correspondingly small currents. In this form large amounts of electrical energy may be transferred to great distances with little loss by the use of comparatively small conductors. At distant points where lights are needed the electrical energy is changed by means of a TRANSFORMER (*q. v.*), a reversed induction coil, from the form of high electromotive force and small current to that of the low electromotive force required to operate incandescent lamps, with a corresponding increase of current. Transformation by means of the induction coil can only be effected with alternate-current energy. Two succeeding alternations of electromotive force or current are known as a complete period or cycle. Alternators are generally built and operated at from 40 to 130 periods per second, and at electromotive forces from 1,000 to 10,000 volts. When higher voltages are required the alternate-current energy is developed at lower electromotive forces, and then raised by means of transformers. Alternators vary greatly in design and construction. There are two great classes—those with and those without iron cores in their armature. Fig. 13 illustrates an alternator with a revolving iron-cored armature. The armature is wound with as many coils as there are poles, and produces as many alternations per revolution as there are poles, or half as many periods. One of these alternators with ten poles making 1,200 revolutions per minute will produce, therefore, 100 periods per second. The iron cores in alternator armatures dissipate considerable energy, even when well laminated and made of the best wrought iron. It is for this reason that many alternators are built without iron armature cores. They are generally disk-like in form, and must be made as thin as possible, in order that too many ampère-turns may not be needed on the field for producing the necessary degree of magnetization through the air gap which the armature occupies. The field of alternators is usually excited by means of current generated in a small auxiliary direct-current dynamo.

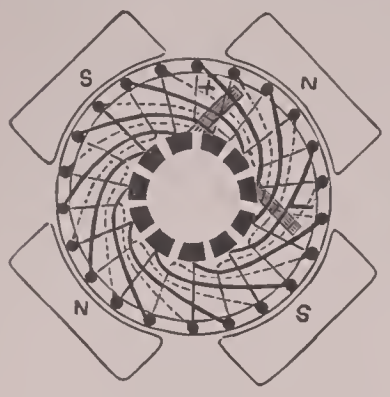

FIG. 12.

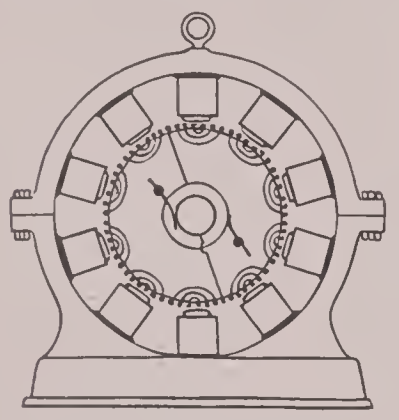

FIG. 13.

The commercial efficiency of a dynamo is the per cent. of energy given up to it in the mechanical form that is received from it in the electrical form. Well-made dynamos have a commercial efficiency of 90 per cent. American dynamos average in weight 100 lb. to the electrical horse-power output.

The following are the most important facts in connection with the history of the dynamo. Faraday in 1831 discovered the electro-dynamic induction of currents. Jacob Brett in 1848 suggested the use of the induced currents for increasing the strength of the magnets used in inducing them. Dr. Werner Siemens in 1855 developed the Siemens shuttle armature, by which greatly augmented effects were obtained. Pacinotti in 1864 gave us the first modern armature with a commutator and connected conductors, that made possible the generation of an unfluctuating current by mechanical means. Gramme in 1871 produced the ring-armature with its commutator, substantially as used to-day. In 1873 Hefner Alteneck gave us the modern drum-armature. From this time on dynamo-electric machinery has enlisted the serious thought and attention of a host of engineers, by whose combined efforts it is rapidly being brought to a high stage of development. HARRIS J. RYAN.

Dynamom'eter [from Gr. *δύναμις*, power + *μέτρον*, measure]: an instrument or apparatus for measuring energy exerted or work performed. Any contrivance may be so called which indicates the intensity of a force used to produce motion. The work done is found by multiplying the *mean* effort thus indicated into the space passed over by the point where the force is applied. A dynamometer may record only the intensities of the force, space being ascertained independently, or it may record both force and distance traversed. A spring attached to a plow-beam may, by suitable mechanism, be made to record the varying force of traction, and thus become a dynamometer. The mean force shown by it, multiplied into the length of the furrow, will give the work of the animals drawing the plow. Prony's friction dynamometer is the form most easily applied to revolving shafts. A flexible band, enveloping either the shaft or a drum turning with it, resists the driving force by its friction. The resistance is measured by a weight required to keep the band from turning with the shaft, and this weight, multiplied by the circular distance through which it would have been carried in a given time if it had revolved with the shaft, gives the work of the prime-mover. Hirn's torsion dynamometer measures the force applied to a shaft by the torsion caused by such force in the shaft itself. This dynamometer was an ingenious device, but has not been applied to any extent in practice. The torsion dynamometer and the spring dynamometer are best suited to measure variable forces, but there are instruments of this class in which force is measured by the resistance of fluids driven through small apertures. For measuring the work of fluid pressure, the steam-engine indicator is the dynamometer in common use. In this the pressure of the fluid upon a small piston is resisted by a spiral spring. A pencil which moves with the piston traces upon a moving slip of paper a curve, of which the ordinates give the pressure, while a straight line perpendicular to these shows the distance passed by the surface pressed. The mean pressure multiplied by this distance gives the work done. Transmission dynamometers are intended to measure work transmitted; as, for example, the work transmitted by belts. W. P. TROWBRIDGE.

Dyne: the absolute unit of force. (See DYNAMICS; also UNITS.) Forces are measured by means of the motion which they are capable of imparting to matter. A dyne is the force which applied to a gramme (mass) for one second of time will impart to it a velocity of 1 cm. per second. In other words, a dyne is the force which acting upon a gramme of matter gives it a unit of acceleration. The poundal, a force unit used to some extent in the British empire and in the U. S., is equal to 13,825 dynes. E. L. NICHOLS.

Dyrrachium: See DURAZZO.

Dyscra'sia [from Gr. *δυσκρασία*; *δύς*, bad + *κρᾶσις*, mixture]: in medicine, a morbid condition of the body in general, anciently thought to be due to disorders of the blood and humors of the body, whence the name. See CACHEXIA.

Dysentery [from Gr. *δυσεντερία*; *δυσ-*, ill, bad + *ἔντερα*, bowels]: a febrile disease, characterized by paroxysms of pain in the bowels, and by scanty though often frequent bloody, mucous stools. The glands and tissue of the large intestine are inflamed, and sometimes, though rarely, the small intestine shares the disorder. It may be acute or chronic, and is a frequent and formidable disease, especially in hot climates. It is sometimes epidemic, and then is peculiarly fatal among children. Many times it attacks and decimates armies. Sporadic cases in civil practice usually recover with little treatment. Pain is relieved by opium or Dover's powder. Gentle purgatives are extremely useful. Enemata of warm water will often relieve tenesmus. Astringents, ipecac, opiated starch injections, etc., are useful adjuvants in some cases.

Niemeyer regards epidemic dysentery as a disease distinct from the common or sporadic disease. He considers it truly infectious. The severer cases of this disease are not much benefited by treatment. Even the mild cases are apt to assume a chronic form, which may prove fatal. This disease is akin to cholera, and perhaps to intermittent fever. It is endemic in Southern Europe. Certain dysentery-like diarrhœas occur in Egypt, and are caused by a trematode worm (*Bilharzia hæmatobium*) in the intestinal walls. The cause of some forms of dysentery is now thought to be a form of

amœba—the *Amœba coli*. This organism presents the general appearances of ordinary water amœbæ.

Revised by WILLIAM PEPPER.

Dysmenorrhœ'a [from Gr. δυσ-, hard, ill + μήν, month + ῥοιά, flow]: painful and difficult menstruation. It may be variously caused, as (1) by flexion or displacement of the uterus, in which case the proper treatment is the restitution of that organ to its normal position; (2) by an excessively or morbidly excitable nervous condition, best relieved by sedatives at the time of attack, and by supporting treatment and correct hygienic regimen; (3) repeatedly by uterine rheumatism, in which case it may require the treatment appropriate to rheumatism; and (4) by a variety of other local troubles which may require special treatment. When associated with endocervicitis or endometritis it is often benefited by local treatment with caustics, etc.

Dyspepsia [from Gr. δύσπεπτος, hard to digest; δυσ-, hard + πεπτός, partic. of πέσσειν, soften, ripen, cook, digest]: a disordered state of the stomach, attended by a great variety of symptoms. Dyspepsia may be a purely functional disease—that is, may be unattended by any structural alteration in this organ—and such is doubtless often the case. On the other hand, the disordered state of the stomach may be the expression of true organic disease, or may be the result of disease elsewhere, affecting the stomach secondarily. The symptoms of dyspepsia are as well known as they are varied, and according as one group or another predominates, different forms of the disease have been described. The feeling of weight after eating, flatulence, heartburn, or pyrosis, coated tongue, constipation, headache, and general malaise are among the common symptoms. In some cases in which there is actually an inflamed condition of the stomach, gastritis, more or less pronounced, the discomfort after eating may be immediate, and may amount to severe pain; there is apt to be vomiting, and the tongue is heavily coated. Cases of acute gastritis are not generally reckoned with dyspepsias, but only the subacute and chronic forms. The term catarrhal dyspepsia is applied to such cases. In other cases flatulence is marked, all food rapidly undergoing fermentative decomposition with production of gases; the stomach is distended, there is great discomfort or pain, constant belching and sometimes vomiting; the pressure on the diaphragm may influence the heart and lead to palpitation or intermittent action. The term *flatulent dyspepsia* is applied to such cases. In a third group of cases the symptoms of the disease partake of a nervous character, such as headaches, depression, colicky or neuralgic pains in the stomach (gastralgia), tremulous, glazed tongue, and general nervous disturbance. The term *nervous dyspepsia* is sometimes used to designate these cases, which not infrequently belong to a class of individuals in whom there is a general disturbance of nutrition and assimilation, bearing a more or less close relation to gout, and called *lithæmia*, a condition in which nervous dyspepsia, vague rheumatoid pains, headaches, depression of spirits, with uric acid or urate deposit in the urine, play a prominent part as symptoms.

Thus it will be seen that the symptoms of dyspepsia are extremely varied, and the question of underlying cause so difficult as to tax the best skill of the physician. In all cases it is of first importance to appreciate the vice of system or of habits leading to the malady, and to eradicate this if possible. In many instances it will be found that faulty habits with reference to food lie at the root of the trouble. Improper or improperly varied food, coarse, indigestible articles, rapid eating, with insufficient mastication, bad teeth, and the like are among the causes, and require radical correction. The food should be plain and wholesome, varied to an extent from day to day, eaten slowly and well chewed. Cold water should be taken only in small amount.

In regard to medicinal treatment, the most important indication is to avoid excessive medication. At times the symptoms require palliative remedies, rarely can much permanent good be done by drugs alone. If there be much tendency to fermentation, carbolic or weak mineral acids act well by preventing the growth of the micro-organisms which cause decomposition. If the stomach be irritable, small doses of bismuth subnitrate are advisable. If constipation is marked, the food should be regulated to obviate this; but *purgative medicines must be avoided as much as possible*. When the action of the stomach seems functionally sluggish, stomachics, such as strychnia, quinine, and similar bitters may do good. Pepsin and other digestants may be needed, but are to be used sparingly.

WILLIAM PEPPER.

Dyspha'gia [from Gr. δυσ-, hard + φαγεῖν, eat]: in medicine, a difficulty in swallowing, caused by paralysis, disease of the muscles of the throat, quinsy, œsophagitis, carcinoma, stricture, or spasm of the œsophagus; or it may be a symptom of hysteria, tetanus, or hydrophobia. Its treatment is various, according to the disease of which it is a symptom.

Dyspho'nia [not from Gr. δυσφωνία, roughness of sound (δύσφωνος, ill-sounding), but, in its present meaning, to be viewed as derived from δυσ-, hard + φωνεῖν, utter sound (φωνή, sound)]: a difficulty in speaking. The most common variety is the *dysphonia clericorum*, or "clergyman's sore throat," a follicular inflammation of the pharynx, accompanied by huskiness of the voice, with more or less coughing, hawking, and expectoration. The follicles of the fauces and the pharynx are larger or more apparent than in health. The follicles occasionally discharge hard or elastic lumps of mucus, greatly to the alarm of the patient. Ulceration may supervene, and the patient may be constantly inclined to swallow. Time, rest, muscular exercise, tonics, traveling by sea or land, are all useful in the treatment.

Dyspnœ'a [Gr. δύσπνοια, difficulty in breathing; δυσ-, hard + πνεῖν, breathe]: a difficulty in breathing, a common symptom in most diseases of the heart or lungs. If the difficulty is increased by lying down, so that the patient can only breathe with any comfort when erect, it is called *orthopnœa*. Dyspnœa is sometimes the result of some functional or organic nervous disease, as hysteria. It is then relieved in most cases by diffusible stimulants. In other cases the character of the dyspnœa is remarkably varied, and the proper treatment is as various; belladonna, stramonium, cannabis, chloral, ipecac, and many other remedies are often useful. Strict temperance in eating and drinking should always be observed.

Dytis'cidæ, or **Dyticidæ** [deriv. of Mod. Lat. *Dytis'cus*, name of one of the genera, appar. for *dy'ticus* = Gr. δυτικός, able to dive; δύτης, diver, δύειν, dive]: a group or family of beetles, embracing nearly a thousand species, with broad, oval, and usually flattened bodies, and with the hinder legs flattened and furnished with hairs for swimming. The colors are usually dark (brown or black), and both larvæ and adults are found in rivers, lakes, and ponds, where they feed upon other insects, as well as on mollusks, and even small fishes. Most of the species are small, but some reach a length of nearly 2 inches. The adults are strong flyers, and frequently leave the water at night, and are attracted by electric lights. The larvæ are frequently known as "water-tigers" on account of their ferocious habits. When ready to transform they go into the pupa stage at the shore, and the adult beetles live through the winter in such situations. The adults are protected against injury by a milk-white, strongly-smelling fluid, secreted from the margins of the prothorax.

J. S. K

Dzig'getai, or **Koulan** (*Asinus onager*): a wild ass abounding in Eastern Turkey, Persia, Afghanistan, and the Punjaub. It is one of the swiftest of quadrupeds, and can not ordinarily be overtaken, even by the Arabian horse, and the greyhound can follow it successfully only on the open plains. These animals live in troops, under a leader who rules them despotically. They are extremely wild, for they are much hunted, not only for their excellent flesh, but for the great difficulty and excitement of the chase. They are pursued by means of falconry, but are more frequently shot with the rifle. They are of a brown color, with a black stripe along the back.

E

(pron. *ee*): the fifth letter and second vowel of the Roman and of most modern alphabets. The Greeks had two vowels represented by the Latin *e*—the one short (ε, *epsilon*), the other long (η, *eta*); ε stood for the number 5, η usually represented 8. The Sanskrit has only one *e*; this is always long (see SANSKRIT), and is usually represented in the Western languages by *e* circumflexed (*ê*). In the Arabic and Persian the vowel *fatha* (see ARABIAN LANGUAGE), being a somewhat obscure sound, is often represented in the European languages by *ĕ* (short), though it properly corresponds to short *ă*; thus we may write *el-Korân* or *al-Korân* for the Koran, *er-rasheed* (rashîd) or *ar-rasheed*, the surname of Harun (Haroun), the celebrated Caliph of Bagdad. In like manner, the Arabian prophet's name may be written either Mohammed or Mohammad. The Arabs have no vowel sound corresponding to long *ĕ* (*ê*), although this frequently occurs in the Persian.

In most of the modern European languages *e* occurs more frequently than any other letter. This remark is especially true of the French and English. One reason of this is that *e* (mute) in these languages usually replaces the terminal letter or letters of Latin or Greek words, as in the following nouns: *fame*, from the Latin *fama*; *muse* (Lat. *musa*; Gr. μοῦσα); *plume* (Lat. *pluma*); *bile* (Lat. *bilis*); *cone* (Lat. *conus*; Gr. κῶνος); *face* (Lat. *facies*); so also in adjectives, as *prone* (Lat. *pronus*); *pure* (Lat. *purus*); *vile* (Lat. *vilis*), etc. All the foregoing derivative words are French as well as English. In a few instances the final *e*, though found in English, is omitted in French; as *pine* (Lat. *pinus*; Fr. *pin*); *wine* (Lat. *vinum*; Fr. *vin*), etc.; but more frequently the reverse occurs, particularly in adjectives; thus we have *arid* (Lat. *aridus*; Fr. *aride*); *avid* (Lat. *avidus*; Fr. *avide*); *livid* (Lat. *lividus*; Fr. *livide*), etc. For the different sounds of *e* in English, see PRONUNCIATION.

E in music is the third note in the diatonic natural scale of C. The scale of E major has four sharps in the signature; that of E minor one sharp; and C sharp and G are their relatives, major and minor. E is the keynote of the "Phrygian" mode in the old Greek system of tonality.

Eachard, eeh'ard, JOHN, D. D.: clergyman: b. in Suffolk, England, in 1636. He became a fellow of Catherine Hall, Cambridge, in 1658, and master in 1675, in succession to Dr. John Lightfoot. He wrote *The Ground and Occasions of the Contempt of the Clergy and Religion Inquired into* (1670) and a *Dialogue on Hobbes's State of Nature* (1672). He was a writer of considerable humor, but of no great ability. D. in Oxford, July 7, 1697.

Eadie, ee'dĕe, JOHN, D. D., LL. D.: a divine of the Scottish United Presbyterian Church; b. at Alva, Stirlingshire, May 9, 1810. He graduated at the University of Glasgow, studied theology in the seminary of the United Presbyterian Church, was appointed pastor of the Cambridge Street church, Glasgow, in 1835, and in 1843 Professor of Biblical Literature in the United Secession Divinity Hall, Edinburgh, continuing to live in Glasgow. In 1863 he formed the new Lansdowne church, in Glasgow, of which he was minister until his death. Besides commentaries on the Epistles to the Ephesians (1854), Colossians (1856), Philippians (1859), Galatians (1869), Thessalonians (1877, published posthumously), two volumes of discourses—*The Divine Love* (1855) and *Paul the Preacher* (1859)—and a history of the English Bible (2 vols., 1876), he prepared a very popular condensation of Cruden's *Concordance to the Scriptures* (1830); *The Bible Cyclopædia* (1848); *The Ecclesiastical Cyclopædia* (1861), etc. D. in Glasgow, June 3, 1870. See his *Life* by James Brown (London, 1878).

Eadmer, ed'mŭr, or **Edmer**: an English historian and monk. He entered in his youth the Benedictine monastery at Canterbury, and became a friend of St. Anselm. He was elected Bishop of St. Andrews in 1120, but the Scottish king would not allow him to be consecrated by the Archbishop of Canterbury, and he soon returned to his monastery. He is one of the most important historians of the time. His works are *Historia Novorum*, in six books, giving the history of the three Archbishops of Canterbury, Lanfranc, Anselm, and Ralph, edited by Selden (London, 1623) and reprinted in Gerberon's edition of Anselm's *Works* (Paris, 1675); *Vita Anselmi*, edited by Surius (Antwerp, 1551); a letter to the monks of Glastonbury about the life of St. Dunstan, and another to the monks of Winchester about episcopal election; the *Lives* of St. Bregwin, St. Oswald, and St. Odo (see list of his works in Wharton's *Anglia Sacra*); a *Life of St. Wilfrid of York*; and some minor treatises wrongly ascribed to Anselm, all of which are found in Migne, *Patrologia*, *CLIX.* The best editions of the *Historia* and *Vita Anselmi*, by Martin Rule, are in the Rolls Series (London, 1884). D. Jan., 1124.

Eads, eedz, JAMES BUCHANAN, LL. D.: civil engineer; b. at Lawrenceburg, Ind., May 23, 1820. From childhood he was eager to learn, and showed great mechanical ingenuity. While a mere lad he built and equipped a miniature steamboat, and a few years later invented a diving-bell boat for recovering wrecks, which brought him an ample fortune. He built the first ironclad steamer used in the U. S. navy, and was instrumental in putting the first fleet of ironclads on the Mississippi (1861–62). He completed the construction of the St. Louis bridge in 1874 (see ST. LOUIS), was engaged for several years in building the jetties at the mouths of the Mississippi (see JETTIES), and in 1879 prepared plans for a ship-railway across the Isthmus of Panama (see SHIP-RAILWAY). The Albert medal was awarded to him in 1884. D. in Nassau, Bahama islands, Mar. 8, 1887.

Eagle [M. Eng. *egle* from O. Fr. *egle* (Mod. Fr. *aigle*) < Lat. *aquila*]: the popular name of several species of large rapacious birds of the order *Raptores* and family *Falconidæ*. They belong to the genera *Aquila*, *Haliaëtus*, etc., and are characterized by hooked beaks and sharp, powerful claws. About seventy species are known. They have great powers of flight and of vision, are diurnal and solitary in their habits, and use their claws in killing their prey. The eagle was regarded by the ancients as a symbol of royalty, and has the proverbial distinction of being the king of birds. Large specimens measure about 3½ feet in length, and 9 feet from tip to tip of the expanded wings. Eagles usually breed in mountainous districts or forests, remote from human habitations. They are all monogamous, and it is said that a pair will live together in perfect harmony until death separates them. They build their nests on a high tree, a ledge of rock, or on some inaccessible cliff. The nest is inartistically constructed of sticks, which are rudely arranged. The eagle is supposed to live to a great age, more than one hundred years.

The golden eagle (*Aquila chrysaëtos*) is a magnificent bird found in Europe, Asia, and North America, deriving its name from the golden-red color of the feathers which cover its head and neck. The plumage of the body is a rich dark brown. This species is the largest of the European eagles. It feeds on hares, lambs, pigs, fish, etc., which it carries to its nest. When in pursuit of its prey it is very audacious, and has been seen to carry off a hare before the noses of a pack of hounds.

It is stated that the golden eagle can be tamed, and has been trained to catch game for its master. The flight of this bird is very graceful, and presents an interesting spectacle. It sweeps through the air in a series of spiral curves, rising with every curve, and making no perceptible effort or motion with its wings. The imperial eagle (*Aquila imperialis*), which inhabits Asia and Southern Europe, is nearly as large as the golden eagle, and is similar in appearance. It may be distinguished from the other species by the white patch on its scapularies. Its head and neck are covered with feathers of a deep fawn color. It generally builds on lofty trees.

Much more common than the golden eagle is the sea-eagle (*Haliaëtus albicilla*), also called the white-tailed and the cinereous eagle, because the adults have a grayish-brown color, with pale head, yellow beak, and white tail—characters of plumage which, however, the young ones do not assume

until the third or fourth year of their age. It lives chiefly along the coasts of the sea or the banks of inland waters, as it principally feeds on fish and the refuse which may be thrown up on the shore; it takes, however, also lambs, hares, and rabbits. It sometimes builds on the ground and sometimes in a high tree, but always in a lonely and inaccessible place, on the ledge of a steep cliff or in an island in a lake. The nest is very rude, consisting merely of a mass of sticks with a hollow, lined with grass, in the center. The species is found all over the northern part of the Old World, from Ireland to Kamtchatka, and in Europe it breeds as far to the southward as the Albanian Mountains.

The national bird of the U. S. is the bald eagle (*Haliaëtus leucocephalus*), which has a white head, neck, and tail. It is said to lay its eggs in the same nest year after year. It is fond of fish, which it generally steals from the osprey. Its habit is to watch near a river or other water until an osprey has caught a fish, which the eagle snatches in the air or catches as it falls from the claws of the osprey. The bald eagle is widely distributed through different regions of North America, and frequents the seacoasts, lakes, and large rivers. It measures from 35 to 40 inches in length. See BALD EAGLE and HARPY EAGLE. Revised by F. A. LUCAS.

Eagle: a gold coin of the U. S., equivalent to $10.00. It bears the figure of an eagle, weighs 258 grains troy, and, being nine-tenths fine, contains $232\frac{2}{10}$ grains pure gold. The only larger gold-piece coined in the U. S. is the double eagle, equivalent to $20.00.

Eagle: in heraldry, a bearing of frequent occurrence, and often assumed by sovereigns as the emblem of empire, from having been borne on the legionary standard of the ancient Romans. The eagle of Russia is *or*, with two heads displayed, sable, each ducally crowned of the field; the whole imperially crowned, beaked, and membered gules. The eagle of Austria is also displayed with two heads. The Prussian eagle has only one head. The U. S. adopted (1785) the bald eagle, its wings displayed, proper, as the national emblem.

The eagle was also one of the most ancient Roman military standards. In 104 B. C. it became the distinctive ensign of the Roman legions. It was made of bronze or silver, and was carried upon a short staff. An eagle of gold was the royal emblem of ancient Persia.

Eagle-hawk: a name given to several species of birds of prey of the genus *Morphnus* and family *Falconidæ*, similar in form to the eagle, but inferior in size. They are natives of South America, the East Indies, and Africa. They have short wings and long legs. Some of them are beautiful. Like the eagles, the eagle-hawks are monogamous, and remain constant to their mates through life. Like the eagle, the eagle-hawk is assisted by his mate in hunting.

Eagle, JAMES P.: politician; b. in Maury co., Tenn., Aug. 10, 1837; removed to Arkansas in 1839, where he was brought up to farm labor. In 1861 he entered the Confederate army as a private; at the surrender of the army of Gen. Johnston he was lieutenant-colonel of Reynolds's brigade, which had been consolidated into a regiment. After the war he became a successful planter. He was ordained as a Baptist minister in 1870; attended school and college in 1870 and 1871. In 1873 he was elected to the Legislature, and three times afterward was a member of that body. In 1885 he was chosen to be Speaker of the House of Representatives; in 1888 he was elected Governor of Arkansas, and was re-elected in 1890. He is one of the vice-presidents of the Southern Baptist Convention. W. H. WHITSITT.

Eagle Pass: city; on railway; capital of Maverick co., Tex. (for location of county, see map of Texas, ref. 6–F); situated on the Rio Grande, 248 miles S. W. of Austin, in a coal-mining and stock-raising district. During the civil war it had a large trade with Mexico. Pop. (1880) 1,627; not separately given in 1890 and 1900.

Eagle-ray: a name applied to the large rays, or skates, of the family *Myliobatidæ*, or in a more restricted sense to one species, *Myliobatis aquila*, a fish of wide distribution. These rays, found in temperate or tropical waters, have the fins expanded into a pointed, wing-like shape, the teeth arranged something like a mosaic pavement to form a flat, crushing surface in each jaw, the tail long, whip-like, and armed with one or more sharp, serrated spines. F. A. LUCAS.

Eagle-wood: the fragrant wood of *Aquilaria ovata*, a tree of the family *Thymelæaceæ*, indigenous in the tropical parts of Asia. It is used for burning as incense.

Eagre [etymology unknown]: a Norse word, used to express the sudden rise of the tide in the mouth or estuary of a river. See ÆGIR and BORE.

Eakins, ee'kinz, THOMAS: genre and portrait painter; b. in Philadelphia, 1844. Student in the Pennsylvania Academy, Philadelphia, and pupil of Gérôme and Bonnat, Paris; for several years Professor of Painting at the Pennsylvania Academy. His portrait of Prof. Barker in the Art Club of Philadelphia is an excellent work; and a genre picture of serious merit, *Professionals at Rehearsal*, is in the collection of T. B. Clarke, New York. He has given great attention to photography and to the study of anatomy. It may be said of his work in general that it is more scientific than artistic. Studio in Philadelphia. W. A. C.

Eames, eemz, CHARLES: lawyer and journalist; b. at New Braintree, Mass., Mar. 20, 1812; graduated at Harvard in 1831, and studied law. In 1845 he took a situation in the navy department at Washington, and soon became an editor of the Washington *Union*. He was sent by President Polk as commissioner to the Sandwich islands, whence he returned in 1850. After several years of journalism he became U. S. minister to Venezuela under President Pierce. After his return, in 1858, he attained high reputation as an admiralty lawyer. D. in Washington, D. C., Mar. 16, 1867.

Eames, EMMA: opera-singer; b. in 1868, in China, where her parents, who were natives of Boston, were temporarily residing. She studied in Boston under local teachers, and in 1883 went to Paris and studied under Mme. Marchesi; made her *début* there at the Opéra early in 1889, in Gounod's opera *Roméo et Juliette*; in 1891 appeared in New York as one of Abbey's company at the Metropolitan Opera House, and made a brilliant success during the season, especially in *Faust*. These operas were taught to her by Gounod himself. In July 1891, she was married to Julian Story, an artist, and son of William W. Story, the sculptor. D. E. HERVEY.

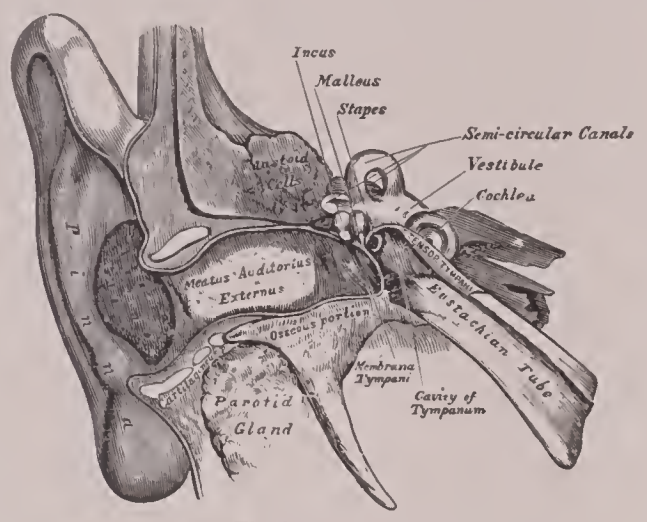
Ear: the organ of hearing. For the perception of sound the essential structure is a nerve capable of receiving and transmitting sonorous vibrations. Some animals (as spiders), possessing no special organ of hearing, nevertheless show a distinct recognition of sounds. The lowest animals, Protozoa, have no specialized organs of sensation. In some of the *Acalephæ* (belonging to the Radiata of Cuvier), as *Medusa*, small sacs arranged around the margin of the disk appear to represent the ear in a rudimentary form. Many of the Mollusca have auditory organs. In Gasteropoda (e. g. snails) these are connected with the pedal ganglia, seeming thus to aid directly in the guidance of locomotion. Cephalopoda, the highest of the Mollusca, have the organs of hearing connected with the head, as they are in Vertebrata. Worms also often have auditory vesicles in the head, connected with the œsophageal nervous ring. Grasshoppers and locusts have similar organs, either at the sides of the first abdominal segment or on the main segments of the anterior legs. In the lobster and other large Crustacea they are placed in the basal joints of the first pair of antennæ. Probably they have a similar situation in some insects, which appear to find each other by hearing sounds made especially by those of the male sex.

All vertebrate animals, except *Amphioxus*, have distinct organs of hearing. They differ much, however, in the different classes. Fishes have no external or middle ear, and no cochlea in the internal ear. Amphibia also are without a cochlea; some have a tympanum, others none. Reptiles, except the crocodile, are quite destitute of external ears. All of them, except serpents, have a tympanum, and several an externally visible membrana tympani. The columella in them is either one small bone or a row of bones in the tympanic cavity. It is homologous with the stapes or stirrup-bone of mammals. Comparative anatomists generally consider the other tympanic bones (incus and malleus) to be homologous with the "quadrate" and "jugal" bones, which support the jaws in birds, reptiles, and fishes; being thus, in all of these animals, outside of the ear. Some anatomists, however, assert the existence within the tympanum of reptiles of a rudimentary incus and a cartilaginous malleus. No *external* ear exists in any fish or reptile. Birds, especially owls, present it in the form of a circular arrangement of feathers. In birds the middle ear (tympanum) contains only a single bone, the columella, with processes of cartilage representing the other bones. The cochlea of the internal ear is, in birds, a conical, slightly twisted double canal; the semicircular canals in them are large.

Mammals always have the internal and middle ear complete, and mostly also an external ear. This is slight, however, in diving quadrupeds, as the otter and beaver, and wanting altogether in the whale, seal, mole, ornithorhynchus, and armadillo. Several aquatic animals have a valve near the entrance of the external meatus or canal of the outer ear, which closes when they are under water, protecting the membrana tympani against excessive pressure. The elephant also is provided with a sort of valve or ear-flap. Bats are endowed with very large and sensitive external ears. Many quadrupeds (e. g. the horse and dog) have considerable muscular power over their ears, by which they can turn them so as to receive sound from different directions. Man has three *rudimentary* muscles of the same kind, but they are commonly powerless and without use.

The Human Ear.—This consists of three distinct though connected parts—the *external ear*, the *middle ear* or tympanum, and the *internal ear* or labyrinth.

Of the *outer ear*, the expanded part is the pinna; its prominent rim or margin is the helix. The ridge next within this is called the anti-helix: it divides above. Its lower and front part encircles a cavity, the concha, below

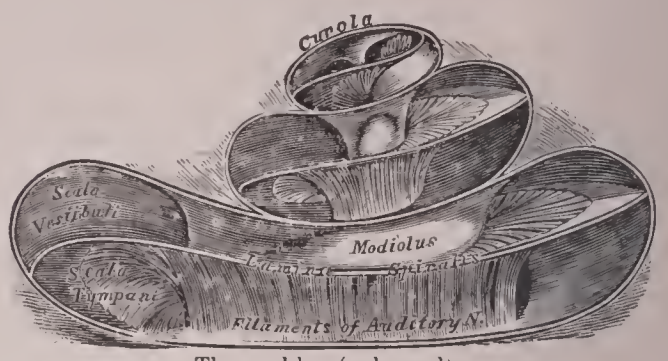


The human ear.

which are two opposite prominences, tragus and anti-tragus. The lower, soft, flexible part is the lobule. The whole external ear, except the lobule (which is formed of fat and connective tissue), is composed of cartilage covered with skin, well supplied, however, with nerves as well as blood-vessels. The entrance to the ear is the meatus auditorius externus. It is about 1¼ inches long, directed forward and inward, slightly curved. Near its orifice are the ceruminous glands, secreting the ear-wax. At the bottom of the meatus is the membrana tympani.

The middle ear or tympanum is a sort of drum or hollow organ, containing air, and through its middle a small chain of bones—the malleus or hammer bone, the incus or anvil, and the stapes or stirrup. The tympanum communicates with the throat (pharynx) by means of the Eustachian tube. The fenestra ovalis, or oval window of the tympanum, is a membranous partition between the internal part of the tympanic cavity and the vestibule of the labyrinth or internal ear. The fenestra rotunda is a round, membranous "window" between the tympanum and the cochlea of the labyrinth. Three muscles are asserted by most anatomists to exist in the tympanum—the tensor, tympani, laxator tympani, and stapedius. The second of these is considered by some to be only a ligament. An important part of the middle ear, in grown children and adults, is the mastoid process. It contains the mastoid cells, which communicate with the tympanum.

The internal ear is composed of the vestibule, cochlea, and three semicircular canals. The vestibule is the middle portion, the cochlea is anterior, and the three canals are above and behind the vestibule. Within the latter are two small bodies, the otoliths, or ear-stones, composed of carbonate and phosphate of lime. The semicircular canals always differ definitely in their direction, two being vertical and one horizontal. The cochlea is shaped somewhat like a snail shell. In its center is a conical bony axis, the modiolus. Around this is a spiral canal, within which is the lamina spiralis, partly composed of bone and partly membranous. This divides the canal into two passages or scalæ —the upper communicating with the vestibule, scala vestibuli, and the lower communicating through the fenestra rotunda with the tympanum, scala tympani. The bony part of the lamina spiralis has a grooved margin, the uppermost edge of which, toward the scala vestibuli, supports a finely toothed membrane, lamina denticulata. From each



The cochlea (enlarged).

of these margins of the lamina spiralis is given off a fine periosteal layer—the upper one of the membrane of Corti, the lower the basilar layer. Between these is a space called by Kolliker the scala media. Within this space are arranged two sets of minute, rod-like bodies, parallel to each other, radiating from the axis of the cochlea, those of the two sets being inclined toward each other above. These are the rods of Corti. Looked at in a certain direction with the aid of a lens, they resemble somewhat the keys of a piano.

The whole inner surface of the bone labyrinth is lined by a fibro-serous periosteal tissue. This secretes a thin fluid, the perilymph. The membranous inner labyrinth, which duplicates, as it were, the osseous wall of the vestibule and semicircular canals, secretes a similar liquid, the endolymph. The auditory nerve (portio mollis of the "seventh pair" of cephalic nerves, according to anatomists) is subdivided into branches, which are distributed to all the parts of the internal ear. Those filaments which enter the cochlea form a sort of ganglionic plexus in the scala tympani: thence proceed some very delicate nervous extremities which in the scala media are brought into relation with the rods of Corti, and probably also with certain large nucleated cells in their vicinity called the cells of Claudius. For physiology of auditory apparatus, see Acoustics. See also *Treatise on the Ear*, by D. B. St. John Roosa (New York, 1866).

D. B. St. John Roosa.

Ear, Diseases of the: Foreign bodies frequently become lodged in the auditory canal, as when children put beads, buttons, or other small objects into the ear, or when it is entered by insects. The canal is also sometimes obstructed by cerumen, or ear-wax, which may accumulate in great quantities, so as to occupy and occlude the passage and exclude sounds. It may press on the membrana tympani (drumhead), the membrane separating the external canal of the ear from the tympanum. It is a most frequent cause of deafness. Cerumen is to be removed by the surgeon by the ear-syringe and warm water. A solution of bicarbonate of soda (1 drachm of soda to 6 oz. of water), used for a few hours before, will greatly assist in the removal. The auditory canal is frequently the seat of little abscesses, or "boils in the ear." They are painful, though not dangerous, but their presence generally indicates a low condition of the general system. For a time they occlude the passage and cause impairment of hearing, which subsides with the pain when the abscesses discharge. The treatment should be warm poultices and fomentations to the region of the ear, leeching in severe cases, and free use of hot water by means of the fountain syringe, until the boils discharge. Incisions are sometimes necessary. The membrana tympani or drumhead of the ear may be injured by the introduction of sharp instruments, or ruptured by sudden impaction of air, compressing it from without, as by a box on the ear, the noise of a loud explosion, as of blasting, cannon, or even firearms. It may also be ruptured by air from the throat, through the Eustachian tube, suddenly and forcibly pressing from within, as in violent blowing of the nose, vomiting, and paroxysms of whooping cough. Such ruptures usually heal. Ulcerative perforations may be minute, or include nearly the whole membrane. Often, if the Eustachian tube be not closed, a person can blow air from the throat through the perforated drum into the external, auditory canal with a perceptible sound. An artificial drumhead or membrana tympani of hard rubber can be worn with benefit in a limited number of cases. A pellet of moistened cotton wool introduced each day in a measure effects the same result.

The chief inflammations of the ear are those that extend from the throat and nose by the Eustachian tube to the tympanum. They may be catarrhal or go on to become purulent. In the latter case the pus usually breaks through the drumhead and causes a discharge of pus to appear in the external canal of the ear (Otorrhœa). The catarrhal form is best treated by the hot douche to the auditory canal, and if this does not suffice the pain may be relieved by leeches. When the pain has subsided, inflation of the tympanum by Politzer's method should be practiced daily until the hearing is restored. The purulent form is to be treated by constant removal of the pus, by syringing with hot water, and also by inflation of the tympanum. The auditory nerve is sometimes the seat of disease as a result of cerebral inflammations, tumors, or the like. Inflammations, tumors and hæmorrhages, syphilis, as well as the excessive use of quinine in large doses, salicylic acid, wintergreen, may also produce disease of the acoustic nerve. Persons in middle and advanced life sometimes suffer from impairment of hearing, which is probably due to shriveling or dryness of the tissues. This form has been called *presbykousis* (Roosa). There may be a neuralgia of the ear with no apparent lesions resulting from decayed teeth or malaria, but it is rare. Most of the painful affections of the ear are inflammatory in character. Diseases of the middle ear may be readily differentiated from those of the nerve or brain by the use of the tuning-fork C. When such a vibrating tuning-fork is placed in front of the external canal of the ear, if there be disease of the nerve it is heard longer and louder than when placed upon the mastoid process behind the ear. In diseases of the nerve, the patients, like persons with normal hearing, hear better in a quiet place. Those who have disease of the tympanum or middle ear hear better in a noise. Sometimes the catarrhal or purulent inflammation of the tympanum extends to the mastoid cells. Should this occur this part of the ear becomes very painful and tender. If not very speedily relieved by the use of leeches or poultices, a surgical operation for opening the mastoid cells will be required. D. B. St. John Roosa.

Earl [M. Eng. *erl* < O. Eng. *eorl*: O. Norse *earl*, *jarl*, chief, nobleman: O. Sax. *erl*, warrior]: a British title of nobility, next in rank to a marquis, and one degree higher than a viscount. It was formerly the highest rank of hereditary nobility of England. Under the Saxon dynasty the earls were those nobles who directed the affairs of the shires. By the time of Edward the Confessor they had acquired so great power as to imperil the royal authority, the whole kingdom being divided among five earls. After the Norman conquest the title of earl was used by the English to express the French *comte*, count (Lat. *comes*). Hence the wife of an earl is still styled a countess. In the reign of Edward III. earldoms were granted by letters-patent to earls and their heirs. Earldoms were gradually converted from territorial into merely titular honors. In Great Britain an earl marshal is an officer who takes charge of important ceremonial matters, is the head of the Heralds' College, and appoints the officers at arms. The office is hereditary in the Howard family and is held by the Duke of Norfolk.

Earl, Robert, LL. D.: jurist; b. at Herkimer, N. Y., Sept. 10, 1824; educated at Herkimer Academy and Union College; county judge and surrogate of Herkimer County 1856–60; judge of the court of appeals in New York State since 1870; the term to expire by limitation of age Jan. 1, 1895. He has twice served as chief justice.

Earle, John: clergyman and author; b. in York, England, in 1601. He was educated at Oxford; became tutor to Prince Charles, and accompanied him in his exile. After the Restoration he was made successively Dean of Westminster (1660), Bishop of Worcester (1662), and Bishop of Salisbury (1663). His best known work is *Microcosmographie* (1628), one of the class of "character" books popular in the seventeenth century; best edition by Bliss (London, 1811; reprint, 1868). D. in Oxford, Nov. 17, 1665.

Earle, John: See the Appendix.

Earle, Parker: horticulturist; b. in Mt. Holly, Vt., Aug. 8, 1831; resided in Illinois, where he was a trustee of the State University, and then removed to Mississippi. He had charge of the horticultural interests at the World's Exposition at New Orleans in 1884, and since 1885 has been president of the American Horticultural Society.

Earle, Pliny: physician; b. at Leicester, Mass., Dec. 31, 1809; a son of Pliny Earle, the inventor; educated at the Friends' School at Providence, R. I., and graduated as M. D. at the University of Pennsylvania in 1837. He was resident physician of the asylum for the insane at Frankfort, near Philadelphia, 1840–42; physician to the Bloomingdale asylum, New York, 1844–49; became Professor of Materia Medica and Psychology in the Berkshire Medical Institution at Pittsfield, Mass., in 1863, and was superintendent of the Massachusetts State Hospital for the Insane 1864–85. In the years 1837–39, 1849, and 1871 he traveled in Europe, visiting the most prominent institutions for the insane. He published many reports, articles in periodicals, etc., and is author of *Marathon, and other Poems* (1841); *Institutions for the Insane in Prussia, Germany, and Austria* (1853); *An Examination of the Practice of Blood-letting in Mental Disorders* (1854). D. in Northampton, Mass., May 18, 1892.

Earlham College: a co-educational institution of learning; situated at Richmond, Ind.; chartered in 1859; has five buildings, with attractive grounds, large and well-equipped chemical and biological laboratories, an extensive museum containing exceptionally valuable collections in geology, mineralogy, palæontology, anatomy, botany, and archæology, and libraries aggregating 35,000 volumes. There are eight courses of study of four years each, and a department of fine arts. The faculty numbers fifteen. The standard of admission and of graduation is high. The college owns 120 acres of land adjoining the city of Richmond.

Earlville; city and railway junction; La Salle co., Ill. (for location of county, see map of Illinois, ref. 3–E); 72 miles W. by S. of Chicago; has a good school, and is the center of an agricultural and stock-raising district. Pop. (1880) 963; (1890) 1,058; (1900) 1,122.

Editor of "Leader."

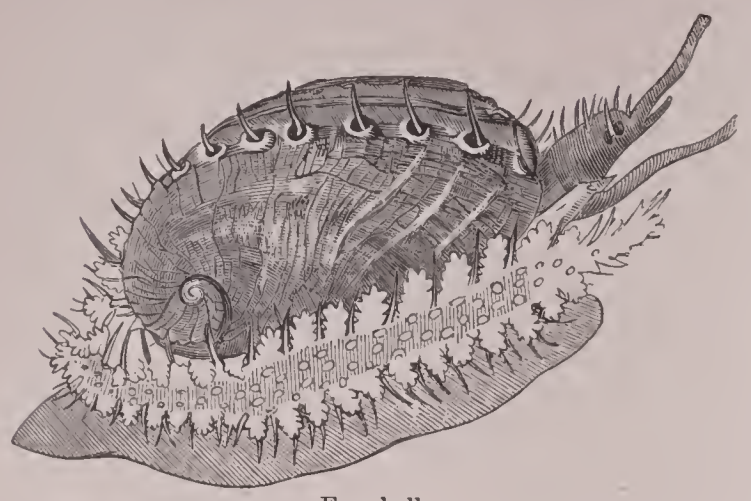
Early, John, D. D.: bishop of the Methodist Episcopal Church South; b. in Bedford co., Va., Jan. 1, 1786; joined the Virginia Methodist conference in 1807; one of the chief founders of Randolph-Macon College, Va., and a laborious and eminently successful preacher of Methodism in his native and adjacent States. He took a prominent part in the proceedings which in 1844 divided his denomination into Northern and Southern sections; was first book-agent of the Southern division, and in 1854 was ordained as one of its bishops. D. in Lynchburg, Va., Nov. 5, 1873.

Early, Jubal Anderson: general and lawyer; b. in Franklin co., Va., Nov. 3, 1816; graduated at West Point in 1837. He afterward studied law, and served in the Mexican war as a major. He joined the Confederate army, was a major-general at Gettysburg in July, 1863, and commanded an army which invaded Maryland in July, 1864. He was defeated by Gen. Sheridan near Winchester, and at Fisher's Hill in Virginia, on Sept. 19 and 20. On Oct. 19, 1864, he attacked the Union army at Cedar Creek, Va., in the absence of Gen. Sheridan, who arrived in time to rally his retreating army and to gain a decisive victory. After the war he returned to the practice of law in Richmond, Va., and later resided alternately at New Orleans and Lynchburg. Author of the pamphlet *A Memoir of the Last Year of the War for Independence in the Confederate States* (Lynchburg, 1867). D. at Lynchburg, Va., Mar. 2, 1894.

Earn: popular name of a genus of eagles. See Erne.

Earnest, or **Arles**, or **Erles** [M. Eng. *ernes*, history obscure, but probably the same word with *arles*, *erles* < O. Fr. *erres*, *arrhes*: Ital. *arra*: Span. *arras*, money paid at purchase, probably of Semitic origin. The Eng. forms *ernes*, *earnest* are probably due to false associations with nouns in *-ness*, and finally with subst. and adjec. *earnest* (= Germ. *ernst*), as if implying that the bargain were in earnest]: the giving of money, or a commodity, or a delivery of a part of any goods sold, to "bind a bargain," i. e. to mark the conclusive assent of both parties to the bargain. In some countries the same object is accomplished by the performance of what are now meaningless ceremonies as a pledge of good faith. The effect of giving earnest is to make the contract binding, and, in the case of the sale of a specific chattel, to vest the property in the vendee. Neither party can rescind the contract without default by the other, but the seller is not obliged to deliver the goods till the whole price is paid; and if the buyer fails to demand and pay for the goods, the seller, after due notice, can sell again and keep his earnest. The giving earnest is now fallen into disuse, and is important chiefly because it is one method by which a contract may be made valid under the Statute of Frauds. Revised by F. Sturges Allen.

Ear-shell: the shell of various marine gasteropods of the family *Haliotidæ*; found principally in warm regions.



Ear-shell.

The flesh, though tough, is edible. The shells are used by savage races for money and ornaments, by civilized man for various kinds of ornamental work, and by the Japanese and Chinese they are largely employed for inlaying lacquer ware. On the Pacific coast of the U. S. the shells of the *Haliotis* are known as *abalones*, and there is an extensive fishery, chiefly carried on by Chinese, for the shells and the flesh, which is salted, dried, and exported. The genera and species, living and fossil, of this family are numerous and widely distributed. F. A. Lucas.

Earth, The: a planet of the solar system, the third in order of position. As the dwelling-place of man it is the subject of his most attentive study, which study constitutes the science of geography. (See Geography.) It may be considered in its relations to other globes, and in itself. Viewing it as an individual, we may give attention to its form and dimensions, its mass, its densities, its temperatures, its composition, its physical constitution, its magnetism, its envelopes. its inhabitants, and the history of its evolution.

1. *The Earth in relation to the Universe and the Solar System.*—As a star the earth belongs to the non-luminous group. It shines only by reflected light, and would be invisible to eyes like our own looking from any star more distant than the planet Jupiter.

As a planet the earth belongs to the inner group of four, its orbit lying without those of Venus and Mercury and within that of Mars. (See Solar System.) Its two principal motions are rotation about an axis and revolution about the sun. Its period of rotation, known as the sidereal day, is 23 hours 56 min. and 4·1 sec. Its period of revolution, known as the sidereal year, is 365 days 6 hours 9 min. and 9·3 sec. (See Day and Year.) The axis of rotation is not vertical to the plane in which the orbit of revolution lies, but is inclined from the vertical at an angle of 23° 27½′. This angle is subject to a small and very slow variation, ranging from 22° 22½′ to 25° 33½′. The direction toward which the axis inclines is likewise continuously changed, sweeping through a complete circle in about 2,600 years. This movement is analogous to that of an inclined top, which, while swiftly spinning, moves its axis slowly about an imaginary line rising vertically from its point of support. (See Precession of the Equinoxes.) Upon this motion is superposed a smaller, known as the nutation of the earth's axis. These axial movements are caused by the attractions of various heavenly bodies acting on the protuberance of matter about the earth's equator. A third small movement differs from the others in that the relation of the axis to the earth is changed, while its relation to the plane of the earth's orbit is unaffected.

The orbit of the earth is an ellipse so nearly circular that its longer and shorter diameters differ only in the ratio of 60 to 59. The sun, being at one of the foci of the ellipse, is at a distance from its center equal to the 119th part of the diameter. The least distance of the earth from the sun, at perihelion, is 91,200,000; its greatest distance, at aphelion, is 94,400,000 miles; its mean distance is 92,800,000 miles. All these elements, except the mean distance, are subject to gradual but great variations, and the position of perihelion slowly revolves about the sun, consuming in a complete cycle more than 100,000 years. The mean velocity of the earth in its journey around the sun is 1,108 miles per minute, or 18½ miles per second. The velocity with which an object on the equator rotates about the axis is 17·3 miles per minute, or 1,520 feet per second. The earth's mass is the 327,000th part of the sun's, and is eighty-one times that of the moon.

The moon revolves about the earth in a slightly elliptic orbit at a distance of 238,850 miles, or about 30 terrestrial diameters. Its period of revolution is 27 days 7¾ hours; its synodical period, or the mean interval between conjunctions with the sun, is 29 days 12¾ hours. See Moon.

The solar system is separated by an immense interspace from all other visible stars, and between its members there subsist numerous orderly relations pointing to community of origin. The planes of the orbits of the eight planets coincide nearly with the medial plane of the solar system (the "invariable" plane), the most aberrant being inclined but 7°. The average inclination of the orbit planes of the 280 determined asteroids is 8°, and that of the most aberrant is 35°. All these bodies revolve about the sun in the same direction, and so do 16 of the 21 discovered satellites. The only bodies constituting exceptions to the general rule are the four satellites of Uranus, whose orbits incline about 90°, and the satellite of Neptune, whose motion is retrograde. The directions of rotation have been determined for the sun, the moon, and four of the planets, and these directions not only agree with one another, but they coincide with the direction of orbital revolution. These elements of order, to which may be added an approximate harmony in the series of intervals between planets, compel the belief that the assemblage of bodies is not fortuitous, and render plausible the hypothesis of Laplace, that all were evolved by the gradual condensation of an immense, rotating, nebulous mass. (See Nebular Hypothesis.) This condensation is supposed to have left each globe highly charged with heat, which is being gradually dissipated by radiation, and accordingly the sun, the greatest body of all, is now intensely hot; traces of heat are believed to have been detected in the light of the greatest planet, Jupiter; no such traces are afforded by the smaller planets; and the earth, which we can examine more thoroughly, is found to have an internal store of heat. Accepting this hypothesis as more probable than any other, we are enabled to reason in regard to the early history of our globe before the beginning of the long series of superficial changes constituting the field of geologic research.

2. *General Form and Dimensions.*—The earth is a globe with a diameter of about 8,000 miles. Its form approximates closely to an exact sphere, but is slightly flattened on two sides, so that its diameter from one of those sides to the other is about 27 miles less than in a direction at right angles to this. In technical terms, and more precisely, its figure is an oblate spheroid of revolution, with a mean diameter of 7,917·5 miles, and a flattening of $\frac{1}{295}$. The shortest diameter coincides in position with the axis of rotation, and the longest diameter passes from any point of the equator to the opposite point. Theoretically, a globe of any mobile material poised motionless in space and held together by the mutual attraction of its particles should assume a spherical form. If endowed with a motion of rotation, the parts remote from the axis of rotation should tend to fly off from the axis, and this tendency, combined with gravitational attraction, should give to the mass the form of an oblate spheroid similar to that of the earth. The dimensions of the terrestrial spheroid, as determined by measurement (see Geodesy), coincide closely with those theoretically deduced from the relation of its velocity of rotation to gravitative force.

Dimensions of the Earth.

	Miles.		Miles.
Mean radius.....	3,958·8	Mean diameter.....	7,917·5
Equatorial radius...	3,963·3	Equatorial diameter.	7,926·5
Polar radius	3.949·9	Polar diameter.....	7,899·7
Difference.....	13·4	Difference.....	26·8

Equatorial circumference.....	24,902	miles.
Meridional circumference.....	24,860	"
Difference.....	42	"
Area of the surface.....	196,940,000	sq. miles.
Volume.....	260,000,000,000	cubic miles.

These quantities are based on the spheroid deduced by A. R. Clarke, and published in 1866, the spheroid adopted by most great surveys.

The preceding statements ignore the details of the earth's surface, such as mountains, continents, ocean beds, and apply to an ideal spheroid whose surface coincides almost precisely with the surface of the ocean, and with the level

extension of that surface beneath the land. A level surface is ordinarily conceived as plane, but it really represents a certain equilibrium of attractive and rotational forces, and is always curved. As the surface of the earth is rugose, and as the bodies of rock immediately beneath the surface vary in density, and therefore in attraction, the level surface has local irregularities, undulating gently in every part. When account is taken of these undulations the level surface is called a geoid, to distinguish it from the ideal terrestrial spheroid to which it approximates.

3. *Circles and Zones.*—Upon any globe representing the earth there is drawn for convenience a system of conventional lines. The two points at which the axis intersects the surface are called respectively the north pole and south pole; a circle midway between them is called the equator. A series of circles parallel to the equator and systematically disposed on either side are called parallels. They are used to indicate distances from the equator. The equator divides the spherical surface into two equal parts; the parallels divide it into unequal parts. Another series of lines called meridians pass from pole to pole, intersecting the equator and each parallel at right angles. These are equally spaced about the equator, and at the equator are parallel with one another, but they gradually converge toward the poles. The portion of a meridian included between the equator and either pole is the fourth part of a circle, and it is divided after the manner of circular arcs into degrees. Distances from the equator northward or southward are reckoned in degrees, minutes, and seconds, and are called latitude. The parallels are drawn to facilitate their estimation. The equator and parallels, all being circles, are likewise divided into degrees, and distances upon them are reckoned eastward and westward from a selected meridian known as the initial meridian. Such distances, given in terms of arc, are known as longitude. The position of any point on the surface of the globe is accurately indicated by recording its latitude and longitude, which are called its geographic coordinates. Upon maps other than globes, as, for example, those which accompany this article, lines are drawn representing meridians and parallels, and these lines constitute a framework to which all other parts of the map are adjusted. They are collectively called the projection of the map. See DEGREES OF LATITUDE AND LONGITUDE and MAP.

In addition to the parallels of the projection, which are drawn at equal intervals, four parallels are drawn on maps to indicate the limits of certain zones. The arctic circle is a parallel at a distance of 23° 27½′ from the north pole, the antarctic circle is at the same distance from the south pole, and these two are known as the polar circles. The tropic of Cancer is a parallel at a distance of 23° 27½′ N. of the equator, and the tropic of Capricorn lies at the same distance S. of the equator. The areas included by the arctic and antarctic circles are called respectively the *north frigid zone* and *south frigid zone.* The area between the arctic circle and the tropic of Cancer is called the *north temperate zone*, and the corresponding area of the southern hemisphere is the *south temperate zone.* The area between the two tropics is the *torrid zone.* The positions of the polar and tropical circles depend on the relation of the earth's axis of rotation to the plane of the earth's orbit, and they are intimately connected with the variations in the length of the day and with the cycle of the seasons. If the earth's axis were perpendicular to the plane in which it travels about the sun, the sun's apparent course as seen by an observer on the equator would be invariable and would pass through the zenith each day. Its apparent course as seen by an observer at either pole would each day follow the horizon about its complete circle. As the axis is inclined from the vertical, each pole in alternation is turned somewhat toward the sun, and each hemisphere in alternation receives a greater amount of light and heat. When the north pole is turned toward the sun to its extreme amount the hypothetic observer at the north pole sees the sun more than 23° above the horizon during the entire day of twenty-four hours, and to every observer within the arctic circle the sun is also visible during the entire day. At the same time the sun is invisible to all observers within the antarctic circle. To an observer on the equator the sun at midday appears 23° N. of the zenith, and to an observer on the tropic of Cancer the sun at midday appears in the zenith. To all observers in the north temperate zone the apparent course of the sun is higher than at other seasons, and it is visible for more than twelve hours; to all observers in the south temperate zone the apparent course of the sun is relatively low, and it is visible less than twelve hours. Six months later, when the opposite pole is inclined toward the sun, all these various relations and conditions are reversed. During the period of greater illumination of the northern hemisphere a correspondingly greater amount of heat is received from the sun, and summer is the result; on the opposite hemisphere winter is experienced at the same time, and the succeeding winter of the northern hemisphere corresponds to summer in the southern.

Each point of the earth's surface receives light and heat from the sun for the same aggregate period during each year, viz., for half of the whole period, but the total amount of heat received nevertheless varies from place to place. This variation depends upon the angle of incidence of the sun's rays. When the sun is in the zenith a bundle of rays having a cross section of a square mile is received by a square mile of the earth's surface. When the sun is low in the sky a bundle of rays of the same size is distributed over several square miles of surface, and the heat received by each unit of surface is correspondingly less. This difference, which makes the middle of each day warmer than the morning or evening, also makes the equatorial region of the earth warmer than the polar regions. There is a gradual increase in solar heat from the poles to the equator, and this increase is reflected in the general distribution of climates over the globe. As a whole, the torrid zone has warmer climates than the temperate zones, and the temperate zones are warmer than the frigid. The local climate of each district is affected also by other conditions, such as its altitude, the proximity of forests, mountains, sandy deserts, areas, large bodies of water, or the character of the country from which the prevailing winds blow. Thus the climate of oceanic islands is tempered by the air from the surrounding water, the changes of temperature in which are gradual and slight comparatively to those of the land. For particulars as to the climate of special localities, see the article CLIMATE.

The area of each polar zone is 8,204,000 sq. miles; of each temperate zone, 51,215,000 sq. miles; and of the torrid zone, 78,102,000 sq. miles.

4. *General Constitution.*—The visible portion of the main body of the earth is solid, consisting of rocks of various kinds. These rocks are arranged more or less regularly in layers and other definite units, and from a study of their mode of arrangement, as exhibited at the surface and in mines and wells, valuable inferences have been drawn with reference to the general composition and structure of the earth for a distance of several miles downward from the surface. To this outer portion, concerning which much is known either directly or through legitimate inference, the term crust is ordinarily applied, and the greater mass lying within the crust is called the nucleus. No definite lower limit is assigned to the crust, and the term is variously made to include thicknesses from 5 or 10 miles to 50 or 100 miles. It can be defined only as the outer portion, in distinction from the nucleus or inner portion. Outside the crust are two envelopes, the one aqueous, gathered in the hollows of the surface, the other gaseous, and surrounding the entire globe with nearly equable distribution.

5. *Composition of the Crust.*—If the earth were once in a molten condition, as indicated by the nebular hypothesis, its original crust was formed by the congelation of the outer molten layer. If any portion of such original crust remains at the surface it has undergone such modification by subsequent action that it can not now be identified. The visible rocks result immediately from other processes. In large part they are formed from the consolidation of sediments gathered in ancient oceans; in other part they are derived from the congelation of lavas extruded through the sediments and spread on the surface; in other part they are formed by the alteration through various physical and chemical processes of sedimentary and igneous rocks. They exhibit great variety in composition and texture as well as in their structural relations, and from their study has been deduced a history of the transformations of the surface, going back through an immense period of time. (See GEOLOGY.) Notwithstanding their variety, it has been found possible, by combining the results of a great number of chemical analyses, to reach a fairly trustworthy estimate of the average composition of the crust. From the combination and study of 880 analyses, F. W. Clarke finds that oxygen constitutes nearly one-half of the crust, silicon, the metallic base of quartz, a little more than one-fourth, and that the metals aluminum, iron, calcium, magnesium, potassium, and sodium are of importance in the order named.

The precise percentages deduced by him are contained in the following table:

ELEMENTARY CONSTITUENTS OF THE EARTH'S CRUST.

	Per cent.		Per cent.
Oxygen	47·29	Hydrogen	0·21
Silicon	27·21	Phosphorus	0·10
Aluminum	7·81	Manganese	0·08
Iron	5·46	Sulphur	0·03+
Calcium	3·77	Barium	0·03
Magnesium	2·68	Chlorine	0·01
Potassium	2·40	Chromium	0·01
Sodium	2·36		
Titanium	0·33	Total	100·00
Carbon	0·22		

6. *Internal Temperatures.*—Each day while the sun shines all parts of the surface acquire heat from the solar rays. At all times, both day and night, heat is radiated from the surface outward. As a result of this unequal heating and more equable cooling the surfaces of rock and soil grow warmer during the day and grow cooler during the night. Similarly the soil is gradually heated during summer and is gradually cooled during winter. These variations of the surface are communicated downward, but with diminishing amount, so that at a short distance beneath the surface they cease to be perceptible. The diurnal changes affect but a few feet of soil or rock; the annual changes a few scores of feet. Beneath the zone of annual change a constant temperature is found, and this constant temperature coincides closely with the mean annual temperature of the air immediately above. It varies therefore with the local climate, and is higher in equatorial regions than in polar. Passing further downward by means of an artificial excavation, such as a mine or artesian well, a gradual change is found, the temperature of the rock increasing more or less uniformly with the depth. The rate of increase varies in different places, ranging from one degree Fahrenheit for each 150 feet of descent to one degree Fahrenheit for each 30 feet. The general or normal rate is perhaps one degree in 75 feet. The water which rises from deep artesian wells retains the temperature of its source, and is invariably warmer than the ordinary spring water of the locality.

Similar evidence as to internal temperature is afforded by springs. If in any district the average temperature of springs issuing from the rock is compared with the mean annual temperature of the air, it is found to be somewhat higher; and wherever the relation of the spring to the rock structure indicates that the water has risen from a considerable depth beneath the surface, its temperature is notably high, so that the spring is classed as thermal. Other evidence of the same tenor is afforded by volcanoes, which bring to the surface from unknown depths not only steam, requiring for its production a temperature of 212° F., but molten rock with temperature of 2,000° and upward.

These facts show not only that the interior of the earth has a higher temperature than the exterior, but they show that there is a movement of heat from the interior to the surface, whence it is dissipated by radiation. It is a law of physics that where two bodies in contact have different temperatures, heat flows from the warmer to the cooler, and this flow continues until they have the same temperature. The progressively higher temperatures found at progressively greater depths from the surface demonstrate that there is an upward flow of heat. Heat is also brought to the surface by the subterranean flow of water. The water of each thermal spring was originally derived from rain, and penetrated the earth at localities remote from its point of issue. As it entered the earth it had the temperature normal to the surface at the locality. In its subterranean course it received heat from the rocks, and its acquired heat was conveyed to the surface. Similarly the heat of lavas, derived from the terrestrial store, is brought to the surface and there dissipated by radiation. All the phenomena of wells, thermal springs, and volcanoes, are phenomena of the terrestrial crust. They tell us nothing directly of the temperature of the nucleus, but they are in full accord with that portion of the Laplacian hypothesis which supposes that the whole body of the earth was originally intensely hot, and that the lost portion of the original store of heat has been gradually dissipated at the surface. It may plausibly be assumed that the temperature continues to increase downward for an indefinite distance, the rate of increase gradually diminishing; but any more definite hypothesis with reference to the distribution of internal heat must be based upon special postulates as to the molecular condition of the nucleus and the molecular changes accompanying gradual refrigeration. We are, moreover, profoundly ignorant as to the laws affecting the rate of movement of heat in bodies subjected to temperatures and pressures far beyond those which can be reproduced in our laboratories. See REFRIGERATION OF THE EARTH.

7. *Density and Mass.*—The density of a body is the ratio of its weight or mass to that of an equal volume of water. The data of astronomy, in conjunction with the laws of gravitation, give the proportion of the mass of the earth to the masses of the sun and the principal planets, and thus the determination of the absolute mass of the earth will determine the absolute masses of the sun and planets, and then their density can be found. The densities of the more important kinds of rock range from 2·3 to 3·1, and the mean density of the visible portion of the crust, as determined from many samples of rock, is approximately 2·7. As all substances are more or less compressible, we must suppose that the lower parts of the crust and all parts of the nucleus, being pressed upon by the weight of overlying portions, are compressed into less space and therefore have greater density than the superficial portions. The conclusion thus indicated by theoretical considerations has been amply sustained by the results of measurement. The subject has been approached in various ways, depending for the most part on the comparison of the earth's attraction with the attraction exerted by some smaller body of known mass. In the earlier experiments the mass used for comparison was that of a mountain or hill whose form was carefully measured, and whose density was determined by weighing numerous samples of rock. By means of astronomic observations the direction assumed by the plumb line was ascertained on each side of the eminence, and their convergence was determined. It was assumed that in the absence of the mountain they would converge so as to meet at the center of the earth, but that they would be drawn together by the mountain's attraction so as to converge toward a point nearer to the surface, and from the observed convergence it was found possible to compute the relative attractive force of the mountain and the earth and thence to deduce the mass of the earth. In 1778 Maskelyne and Hutton, from observations at Mt. Schiehallion, in Scotland, deduced 4·5 as the mean density of the earth. Subsequent determinations of the mass of the mountain and recomputations based on these gave to Playfair and Hutton severally the densities 4·7 and 5·0. Similar observations at a hill near Edinburgh, known as Arthur's Seat, afforded James and Clarke the estimate 5·3; and Peehmann, from observations in the Alps, deduced 5·4.

A second method of determination depended on pendulum observations. One of the factors determining the time in which a pendulum completes its oscillation is the force of gravitation, and when the same pendulum is swung successively at different localities the comparison of its oscillation periods affords a delicate indication of the relative values of the attractive force at the localities. As the force with which bodies are attracted toward the earth varies with reference to their distance from the center of the earth, it was thought that the comparison of the oscillation periods of the pendulum at the top of a mountain and at its base, or at the entrance of a mine and at its bottom, might afford a valuable estimate of the earth's mass and density, provided due account were taken of the masses and distances of mountains and other superficial bodies in the immediate vicinity of the pendulum stations. Observations of this character have been made by Carlini in the Alps, by Bouguer and La Condamine in Peru, by Airy at a colliery in England, by Mendenhall at the peak of Fujisan, in Japan, and by Sterneck in the mines of Bohemia, the results for the density varying from 4·39 (Carlini) to 6·57 (Airy). In 1889 Wilsing made an important variation in the pendulum experiment by substituting for change of position an artificial change in local attraction. He employed for this purpose a large mass of iron, which he placed successively in various positions with reference to a pendulum. The density computed by him was 5·58.

All experiments involving the weights of mountains are to a certain extent unsatisfactory, first, because it is difficult to deduce from superficial observations a close approximation to the weight of a mountain; and, second, because there is reason to suspect that the portions of the earth's crust immediately beneath mountains have less density than the portions beneath deep valleys. As early as 1798 an experiment was devised by Cavendish which obviates this objection. A slender wooden rod, having a small lead ball attached to each end, was suspended in a glazed box by

means of a delicate wire, an apparatus constituting the torsion balance of Coulomb. In a position of rest the rod hangs lower than in any other position, and the tendency of gravitation is to maintain that position; but the extent to which the rod is lifted by a small rotation is so slight that it is possible to induce rotation by means of the attraction of bodies exceedingly small as compared with the earth. Cavendish used two large balls of lead, which he caused to approach the opposite ends of the balance from opposite sides. From the resulting deflection he deduced a terrestrial density of 5·5. Subsequently various students repeated his observations with more refined apparatus, obtaining for the earth's density the values 5·48 (Reich), 5·58 (Reich), 5·67 (Baily), 5·56 (Cornu and Baille). An analogous experiment by Poynting substituted for the torsion balance a delicate beam scale and yielded an estimate of 5·7. An experiment by von Jolly depended, like the pendulum experiments, upon the variation of gravity with distance from the earth. With a beam scale he first compared two balls of mercury in the usual way, and then compared them again with one resting in the scale pan and the other suspended about 70 feet beneath. His result for the density was 5·7.

Considering the variety of methods by which the subject has been approached, and the vast disparity in size between the earth and the various bodies with which it has been compared, the resulting estimates are wonderfully accordant. The results which command the greatest confidence are those obtained by the method of Cavendish with the aid of more refined apparatus, and those obtained by Wilsing. The final determination of Reich, 5·58, that of Cornu and Baille, 5·56, that of Baily as corrected by Cornu and Baille, 5·56, and that of Wilsing, 5·58, give as a mean 5·57, and this may be regarded as a more accurate determination of the earth's mean density than it is possible to make of the mean density of any mountain mass, or of the earth's crust as a whole. The combination of the mean density with the volume, as given above, yields as the total mass of the earth 6,660,000,000,000,000,000,000 tons of 2,000 lb. each.

The mean density of the earth being 5·57 and the superficial density but 2·7, it is manifest that the central density is considerably greater than the mean, but the vertical distribution of densities is not equally clear. We have learned little of the compressibility of rocks, and we are wholly ignorant of their compressibility at high temperatures. It is quite conceivable that the nucleus is constituted of materials like those of the crust, and that their great density is due purely to condensation under pressure. It is equally conceivable that the tendency toward condensation due to pressure is in the main counterbalanced by the tendency toward expansion due to heat, and that the nucleal density of the earth arises from the presence of substances specifically heavy. It has been suggested by some that the oxygen of the earth occurs only or chiefly near the surface, and that the nucleus consists largely of metals in an unoxidized condition. If the nucleus contains a series of different substances arranged in the order of their specific gravities, then the downward succession of densities may be characterized by a series of abrupt steps, concerning which it is vain to speculate. If, on the other hand, the densities are due primarily to compression, then their sequence should conform to some continuous law. Such a law, suggested by the astronomer Laplace, is that the downward increment of density varies as the square root of the increment of pressure. Postulating this law and assuming the superficial density of the earth to be 2·75 and its mean density to be 5·50, Mr. R. S. Woodward has computed the quantities of the table given in the next column.

DENSITY, GRAVITY, AND PRESSURE AT VARIOUS DEPTHS WITHIN THE EARTH, ACCORDING TO THE LAW POSTULATED BY LAPLACE.

Depth in miles.	Density.	Gravity.	Pressure in atmospheres.	Depth in miles.	Density.	Gravity.	Pressure in atmospheres.
0	2·75	1·0000	1	500	4·18	1·0379	256,000
5	2·76	1·0006	2,020	610	4·50	*1·0392	354,000
10	2·78	1·0012	4,200	1,000	5·63	1·0225	672,000
15	2·79	1·0018	6,390	2,000	8·28	0·8312	1,700,000
20	2·81	1·0024	8,600	3,000	10·12	0·4567	2,640,000
50	2·89	1·0060	22,000	3,959	10·74	0·0000	3,000,000
100	3·03	1·0116	45,300				

* This is the maximum value. At the corresponding depth, 610 miles, a given mass would have the greatest weight.

In the great surveys of Europe, India, and the United States, measurements of high precision have been carried by the method of triangulation over broad areas. Through these measurements it has been possible to compare with one another astronomic observations made at many points, and one of the results of these comparisons is the knowledge of the fact, which has been previously mentioned, that the geoid deviates at nearly all points from the form of the theoretic spheroid. In other words, it is found that the plumb line at a majority of localities is not strictly normal to the general spheroid, but inclines toward one side or another. This is found to be the case not only in the vicinity of mountains, where exceptional attractive masses are visible, but also upon plains, where it must be assumed that the deviations of the plumb line are caused by local variations in the density of the crust. From a study of these variations, and from a co-ordinate study of pendulum observations, it has been determined, first, that the crust of the earth is conspicuously heterogeneous as regards density, varying rapidly and irregularly; and, second, that in a general way those portions of the crust beneath continents and plateaus are less dense than the portions beneath oceans. A conclusion of the same character is reached from the study of the general distribution of land and water. As geographers usually divide the earth into two hemispheres, eastern and western, the eastern contains much more land than the western; or if it be divided into northern and southern hemispheres, then the greater amount of land is found in the northern. The inequality may be rendered still more striking by a division into hemispheres such that England shall occupy the center of one and a point near New Zealand the center of the other. As thus divided, 45 per cent. of the former hemisphere consists of land, and only 11 per cent. of the latter. (See figure.) If the highest lands lay in the hemisphere having the smaller land area, and if the deepest oceans lay in the hemisphere having the smaller water area, these facts might compensate for the inequality in areas; but the actual condition is just the reverse. In the hemisphere with the greater area of land the height of the land is nearly one-fifth greater than in the water hemisphere; in the area characterized by the greater extent of water the depth of the water is nearly one-third greater than in the land hemisphere. The mobility of the water enables it to move freely in any direction, and we must assume that its position on the surface of the globe is determined by the

WATER HEMISPHERE

LAND HEMISPHERE

earth's attraction; nevertheless we find that more than half the total volume of water is gathered in one hemisphere, and that the hemisphere containing the greatest continental masses fails to draw to it a due share of the water. There can be little doubt that the excess of attractive force on the oceanic side of the earth is due to exceptionally high density in portions of the crust or nucleus on that side.

8. *Condition of the Nucleus.*—One of the most difficult inquiries affecting the earth's nucleus relates to the question whether it is liquid or solid. Early in the progress of geologic inquiry facts indicating its liquidity were discovered, and their sufficiency was not questioned. Afterward, however, other facts discovered in the progress of physical and astronomical science were found to indicate solidity, and the question is still involved in serious doubt. The considerations favoring the theory of liquidity are as follows: 1. The rate of increase of temperature downward, if continued, gives at a distance of but a few miles a sufficient heat to liquefy all known rocks. 2. The rocks which issue from volcanoes are actually liquid, and have temperatures commensurate with those deduced from the progressive increase found in wells and mines. 3. Rocks brought to the surface by denudation in various regions are crumpled and intricately folded, as though kneaded while in a plastic condition. 4. From time to time in the geologic history of the crust not only broad tracts but narrow belts of the crust have risen, while others adjacent to them have gone down —changes which appear difficult of explanation unless the crust rests on a soft substratum.

The first consideration adduced by the opponents of the theory of liquidity is that most substances, and probably all of the ordinary rocks, expand in passing from the solid to the liquid condition and contract in congelation. For this reason liquefaction is opposed by pressure, and a much higher temperature is necessary to melt a rock subjected to great pressure. The fact that subterranean substances are hot does not, therefore, of itself demonstrate that they are liquid. It must be shown in addition that their heat is sufficient to overcome the restraining tendency of the pressure to which they are subjected. In the second place, it is pointed out that volcanoes not only erupt lava but also cease eruption, and it is argued that, if the lava erupted were part of a molten nucleus, the conditions necessary to the production of an eruption should also suffice for its continuance. It is also pointed out that eruptions at neighboring vents do not exhibit such harmony of action as might be expected if they communicated with the same body of molten material. Eruptions at different points in a volcanic district are neither simultaneous nor alternate, but appear altogether independent.

The precession of the equinoxes, as fully explained in the article under that title, is due to a twisting of the earth by attractions of other bodies acting on that portion in equatorial regions which projects beyond the surface of the sphere to which the earth's figure approximates. The twisting is opposed by the inertia of rotation, or the tendency of every rotating body—such, for example, as a top or a gyroscope—to resist the deflection of its axis of rotation. (See GYROSCOPE.) The observed amount of precession seems to imply all the resistance which can be ascribed to the earth's mass, whereas, if a liquid spherical nucleus were surrounded by a solid crust, resistance would be afforded only by the crust. The earth thus seems to behave as a rigid and therefore solid body. This argument, originally advanced by Hopkins, has been much discussed by physicists, and its force has been somewhat weakened by considerations subsequently adduced by Hennessey and Thompson. An argument in favor of rigidity has also been drawn from the phenomena of tides. These depend on the inequality of attractions exerted by the moon and sun on the parts of the earth nearest and most remote from them, which inequalities tend to produce a small distortion of the globe. Doubtless some distortion is produced in the earth, but a greater distortion is produced in its aqueous envelope, and the difference between the two finds expression in the oceanic tides. If the earth, or all of it excepting a thin crust, were liquid, it would respond freely to the deforming force, and there would be no discrepancy between its tide and that of the aqueous envelope. It has therefore been argued that the earth either is a rigid body or else has a rigid crust of great thickness.

The apparent conflict between the geologic data and the data connected with the attractions of celestial bodies has probably depended in part upon the difficulty which the mind experiences in passing from the consideration of small bodies and small amounts of force to the consideration of large bodies subjected to correspondingly great stresses and strains. In relation to such forces as we apply in the arts, the rocks of the earth are exceedingly rigid, resisting great stresses and fracturing in a brittle manner when their resistance is overcome; but when masses and forces are considered of the magnitude of those with which terrestrial physics deals, all rocks are properly regarded as viscous, behaving in a manner quite analogous to those of such plastic substances as wax and clay. At a depth of 2 or 3 miles beneath the surface it is quite possible that rocks may be molded into new shapes, not only without fracture, but even without losing the strength which they exhibit at the surface. But while this and other considerations may contribute to a conception of possible physical conditions and possible physical processes in the earth's interior, the problem of the actual conditions and processes remains an interesting and important field of investigation.

9. *Magnetism of the Earth.*—It is the property of magnets that, when brought near together, they tend to assume certain definite directions with reference to one another. Whenever a magnet at a distance from others is suspended in such manner that it is free to turn, it is found to assume a definite direction with reference to the earth, and the earth is thus shown to be a magnet. By means of the compass, a slender magnet so suspended as to rotate freely in a horizontal plane, the horizontal direction of the earth's magnetic force has been observed in all regions, to the great advantage of the mariner. By means of the dip needle, a magnet so suspended as to rotate in a vertical plane, observations have been made of the deviation of the magnetic direction from the horizontal. Through these observations it has been ascertained that the north pole of the earth-magnet is not at the pole of rotation, but lies about 17° distant, in the archipelago N. of British America; that the south magnetic pole is equally distant from the south pole of rotation, and that the local directions of magnetic force intersect the meridians of longitude at angles which vary from place to place and from time to time. See MAGNETISM, TERRESTRIAL.

10. *Configuration of the Surface.*—In comparison with the earth as a whole, the irregularities of its surface are small; if proportionately represented on a globe 15 feet in diameter, the highest mountain would project but the eighth part of an inch above the lowest plain. But upon the scale of nature, and when viewed with reference to the activities of man, they are of signal importance. The geographer refers all inequalities to the level of the surface of the ocean, expressing their vertical dimensions as heights above and depths below that surface. Above that surface spring a number of broad, low swells, called continents; below it are sunk still broader areas called ocean beds. The surfaces of the continents are diversified here and there by projecting peaks and mountain ranges, between and about which lie valleys, basins, and plains. The ocean beds are similarly diversified, but their features have a different nomenclature. The lowest hollows are known as deeps, prominences approaching the surface are called shoals, and eminences rising above the surface constitute islands.

To the origin of the greater inequalities of surface, those of continental and oceanic magnitude, science has yet obtained no clew, and no meaning has been discovered in the form and arrangement of the continental protuberances. It is evident that the outlines of the continents themselves depend not only upon the configuration of the surface, but also upon the volume of the water by which that surface is partially covered. If the earth had less water, or if it had more, some other contour of its surface would be followed by the coast line, and the forms of the areas would be very different. Little importance is therefore to be attached to the conclusions of those who seek to discover homologies of earth structure by studying the outlines of land areas and comparing them with triangles and other geometrical figures. On the accompanying map contours are drawn upon land areas and ocean beds at vertical intervals of 6,000 feet, and the areas comprised between each pair of adjacent contours are differently shaded. Each of these contours shows approximately the form which would be given to the coast if the volume of water in the ocean were either increased or diminished so that its surface stood at the corresponding level. Collectively, they show the distribution of the greater prominences and hollows of the

earth's surface. It will be observed that not only the highest mountains but the greatest expanse of upland occur in the Himalaya district of Southern Asia, and that the greatest of the ocean-deeps lies at the southern extremity of the South Atlantic Ocean. Giving consideration to the contour at 3,000 feet above the ocean-level, we see that the principal plateaus and uplands of the land surface are arranged in a long line beginning with the southern extremity of South America, following the western coast of the two Americas to Alaska, crossing Asia from Eastern Siberia to Arabia, with a great expanse in the Tibetan region, and continuing through Eastern Africa to its southern extremity. A branch of minor importance runs from Western Asia along the shores of the Mediterranean to the Atlantic, and a broad outlier occupies the island of Greenland. Giving attention to the line of 3,000 fathoms, or 18,000 feet below sea-level, we see that the areas of great depression do not constitute a linear series, but are distributed irregularly through the North Atlantic and South Atlantic Oceans and the western portion of the Pacific Ocean.

The following tables are based upon computations by John Murray of the areas of the earth's surface lying above and below various contours:

RELATIVE AREAS OF THE EARTH'S SURFACE LYING ABOVE AND BELOW CERTAIN LEVELS.

CONTOURS.	Per cent. of surface above.	Per cent. of surface below.
Contour 24,000 feet above sea-level	0·004	99·996
" 18,000 " " "	0·09	99·91
" 12,000 " " "	0·7	99·3
" 6,000 " " "	2·3	97·7
Sea-level	27·7	72·3
Contour 6,000 feet below sea-level	42·5	57·5
" 12,000 " " "	57·3	42·7
" 18,000 " " "	96·8	3·2
" 24,000 " " "	99·93	0·07

PERCENTAGES OF THE EARTH'S SURFACE LYING BETWEEN CERTAIN LEVELS.

	Per cent.
More than 6,000 feet above sea-level	2·3
Between sea-level and 6,000 feet above	25·5
" " " " below	14·8
" 6,000 and 12,000 feet below sea-level	14·8
" 12,000 and 18,000 " " "	39·4
More than 18,000 feet below sea-level	3·2
Total	100·0

It appears from the first table that the contour which divides the surface into two equal parts falls between 6,000 and 12,000 feet below sea-level, and the figures indicate 9,000 feet as its approximate depth. From the second table and from the map we learn that the earth's surface, if divested of its aqueous envelope, would present as its great features two systems of broad plateaus, differing in height by about 18,000 feet, the upper comprising one-fourth and the lower two-fifths of the entire superficies.

11. *Features of the Land.*—Topographic features considered chiefly with reference to slope and contour are plains, plateaus or table-lands, mountains, ridges, hills, valleys, basins, cañons, etc. Features specially relating to bodies of water are islands, peninsulas, isthmuses, and coasts. These various features are of such importance in their relation to man, and as subjects of physiographic study, that separate articles are assigned to them. Their discussion is therefore omitted at this place, and the reader is referred to the general article on PHYSIOGRAPHY and the special articles entitled BASIN, CAÑON, COAST, CONTINENT, DESERTS, GLACIERS, GORGE, ISLAND, MOUNTAIN, PLAIN, PLATEAU, PRAIRIE, VALLEY, VOLCANO, etc. See also the articles on the various political divisions of the world.

12. *The Aqueous Envelope.*—In mass the water of the earth's surface is $\frac{1}{4300}$ of the globe. If it were evenly distributed it would have a uniform depth of about 9,000 feet. Gathered as it is into the hollows of the surface, it leaves a fourth part bare, and its chief body, the sea, has a mean depth of 12,500 feet. Its minor bodies, the lakes, although exceedingly numerous, contain relatively but a very small portion of the whole mass of water, and constitute but a small fraction of the aqueous surface. The water is characterized by two great systems of circulation which have a profound influence on the configuration and character of the surface of the land and on the distribution of climates. From the surfaces of water bodies moisture is lifted into the air to be subsequently discharged as rain and snow upon the land. A portion of the rain water soaks into the surface, where it occasions a series of processes resulting in the decay of rocks and the formation of soil. The remainder flowing over the surface carries with it particles of the soil, and gathering into rivulets and rivers returns to the sea where its load of detritus is deposited. Through this circulation the land is sculptured and is rendered fertile. The second circulation is oceanic, depending partly on the heat acquired by water in the torrid zone and partly on the friction of winds, and through it there is a constant transportation of heat from equatorial to temperate and polar regions, whereby extremes of climate are mitigated and the habitability of the globe is increased. The ocean is also swayed to and fro, as the earth turns on its axis, by inequalities in lunar and solar attraction.

As a constituent of all organic tissues, water is an essential condition of animal and vegetable life. As the abode of innumerable species its natural bodies constitute for man a vast storehouse of food. As a solvent of almost universal range, it is one of the indispensable materials of the arts of man in all stages of culture. It is at once the most serious obstacle to and the most economic avenue for that commercial interchange which makes the natural wealth of every district contribute to the general prosperity of all nations. Through the power of falling water and of expanding steam it is the medium for the transmutation of solar energy into the leisure and comfort on which human progress depends. In these and countless other ways it is so intimately associated with the activities of man that its full discussion in this place would unduly expand the present article. The reader is referred to the articles FLOODS, GULF STREAM, LAKES, OCEAN, RIVERS, SPRINGS, TIDES, and WATER.

13. *The Gaseous Envelope.*—The atmosphere is inferior in mass to the ocean in the ratio of 1 to 300, but in volume it is far superior. Its upper limit has not been ascertained, but has certainly a height greater than 100 miles. The density of each layer depends on the weight and pressure of all layers above. At sea-level a pound of air occupies about 19 cubic yards; in rising to 18,000 feet altitude half the atmosphere is passed, and at that height a pound of air occupies 38 cubic yards. Through its complex circulation under the influence of solar heat, the atmosphere conveys the moisture which fertilizes the land, and it is a principal factor in the determination of climates. The study of its properties and functions constitutes the science of meteorology. See ATMOSPHERE, BAROMETER, CLIMATE, METEOROLOGY, RAIN, WEATHER, and WINDS.

14. *The History of the Earth.*—The rate at which the earth's internal heat is being dissipated indicates that at a remote epoch its surface was molten. Its history previous to the formation of a solid crust belongs to the astronomer. The present condition of the crust shows that it has undergone many changes; the discovery of the nature and sequence of these changes is the chief task of the geologist. Plants and animals, whose existence was first possible after the consolidation and cooling of the crust, have undergone a long series of changes, and the history of these is the theme of the palæontologist. Finally man appeared, at first recording that intellectual development by which he is distinguished only in the implements of primitive arts, but eventually preparing and preserving a written account of his progress. See ARCHÆOLOGY, ASTRONOMY, GEOLOGY, HISTORY, NEBULAR HYPOTHESIS, PALÆONTOLOGY, and SOLAR SYSTEM. For population of the earth, see POPULATION.

Earth-closet: a form of close-stool, designed to take the place, to some extent, of the water-closet, and frequently made portable for convenience. It is well known that dry soils have wonderful disinfecting powers, owing to their property of absorbing ammonia and other gases. It is upon this absorbing quality that the usefulness of manures, when applied to soil, depends. Advantage is taken of this absorption in the construction of the earth-closet. The fæces are covered by a small quantity of thoroughly dried soil or peat, which completely absorbs all unpleasant and injurious vapors, and after a time the mass becomes perfectly inodorous. It is found that the same earth may, if necessary, be used over and over again, and that finally, when it has become thoroughly charged with excrementitious principles, it is one of the best forms of concentrated fertilizing material known. Owing to the expense of supplying fresh earth and removing that which has become foul, the earth-closet has not been able to compete with the water-closet, except in country houses, where it may often be used with advantage.

Revised by MANSFIELD MERRIMAN.

Earth-currents: See MAGNETISM, TERRESTRIAL.

Earthenware: collectively, vessels or objects made of earth and afterward baked. See POTTERY.

Earth-nut: a popular name given to the tubers or subterranean stems of several plants—viz., the *Bunium flexuosum*, an umbelliferous plant which grows in Europe; the *Cyperus rotundus*, a native of Egypt; and the *Arachis hypogæa*, a leguminous plant often called *peanut* or *goober*. The tubers of the *Bunium*, which resemble chestnuts, and are sometimes called *earth-chestnuts*, are extensively used for food.

Earthquakes: tremors or shakings of the ground, naturally produced. An earthquake may be so gentle as to be imperceptible to the senses, and discovered only by the aid of refined apparatus, or it may be of destructive violence. The motions thus characterized are of small amplitude, but are so rapid and brief that they are called shocks. Usually the ground moves upward and downward, or in a horizontal or an oblique direction through the space of a fraction of an inch, or at most of a small number of inches, and the oscillations are repeated several times. Vibratory motions are communicated to buildings, and in tall buildings the effects are apt to be cumulative, so that shocks imperceptible on the lower floors may be detected on upper floors. When shocks are severe they are usually accompanied by sounds comparable to the detonations from explosions near or distant. Other associated phenomena are fissures, faults, extravasations of water and mud, elevation, subsidence, the drying of springs, the opening of new springs, landslides, sea waves, and alluvial waves. The greatest fissures are formed in unconsolidated deposits, such as alluvium. They may open widely and immediately close, or they may remain open with a width of several feet. Their depth is undetermined, but must in some cases be considerable, as they have received the waters of streams for hours, and even days, before they were filled. Fissures formed in rocks are usually less than an inch in width. The partings known as "joints," which divide rock masses by systems of parallel planes, are thought to be due to the transmission of earthquake waves. Sometimes the fissures become faults through the vertical or horizontal displacement of one wall with reference to the other. Sometimes they serve for the escape of gases, water, and mud. Where large quantities of water and mud are extravasated, the fissures are locally enlarged so as to form tubular conduits, about the mouths of which the solid ejecta are heaped after the manner of a volcanic crater. The mud is supposed to be derived from subterranean layers of alluvium saturated with water. The elevation and subsidence associated with earthquakes may be either general or local. When general it is rarely detected, except where the region affected borders on the sea, whose level serves as a standard of comparison. The local phenomena consist usually in the subsidence of narrow belts of land lying between fissures. In some cases basins are thus created in which water gathers to form lakes. The vibrations not infrequently serve to precipitate partially detached rocks down mountain-slopes, and thus occasion avalanches, and from cliffs of softer material, at the margins of streams or upon coasts, blocks are detached which sink to the base as landslides. Sometimes the descent of an avalanche or landslide will throw a dam across a stream so as to create a new lake. When the shocks originate under the sea, surface waves are generated similar to those produced by throwing a pebble into a pool, and these sometimes acquire great dimensions, so that when they reach a coast they rush far up on the land. Analogous to these are surface waves produced in masses of wet alluvium. In localities where the semi-fluid character of the substrata is shown by the extravasation of mud, the surface of the ground is sometimes thrown into waves several feet in height, whose behavior is closely allied to that of the oscillatory waves of water. Violent earthquakes occurring in densely populated districts inflict great injury upon buildings, and not infrequently throw down their walls. At the seashore these disastrous results may be increased and even multiplied by the inrush of sea waves. Through the falling of walls, and especially through the rush of waves, many lives are lost, the fatalities sometimes amounting, in the case of individual earthquakes, to many thousands.

Earthquake Waves.—The observed tremors of an earthquake are superficial phenomena resulting from some subterranean shock, which is transmitted as an elastic wave through the material of the earth's crust. From the point of initial disturbance, known as the centrum, the waves pass outward in all directions with gradually diminishing energy. In the case of the earthquake at Charleston, S. C., in 1886 the shock was felt more than 900 miles away, and a comparison of time observations showed that its velocity of transmission was about 17,000 feet per second. Theoretically the initial shock gives rise to two waves, having different characters and traveling with different velocities. In one, called the compression wave, the motion of each particle of the transmitting medium is forward and back in a direction radial from the centrum; in the other, known as the distorsion wave, the motion of the particle is to and fro in a direction transverse to the radial direction. The wave of compression has the greater velocity. Whenever, as these waves pass through the earth's crust, a change in rock character is encountered, they are refracted and partially reflected, and as such changes are multifarious near the earth's surface, the waves reaching the surface are of the most complicated character, the original direction and rhythm being partially or wholly obscured. For an account of the principle of wave transmission, see the article WAVES.

Cause of Earthquakes.—While it can not be said that the causes of all earthquakes are known, important progress has been made in this direction. Many earthquakes are associated with volcanic phenomena in such way that the mode of their origin can not be questioned. These are of two classes, due severally to explosion and to the formation of fissures. When the lava of a volcano in eruption contains a large amount of water, the conversion of portions of this water into steam produces explosions which project masses of lava into the air, and the same explosions occasion jarring of the ground which may frequently be perceived at a distance of several miles, and which constitutes true earthquakes. It sometimes happens that the force contained in the heated and imprisoned water, instead of being spent in a series of minor explosions, is stored for a long period, and then produces a great explosion whereby the top of the volcano is blown off. A number of catastrophes of this character have occurred in historic times, and each has been accompanied by an earthquake extending to a distance of many miles. Earth waves of feebler force but identical in character have been produced by artificial explosives. The explosion of a mine for the removal of rocks from Hell Gate, near New York city, produced tremors which were observed at Clinton, N. Y., 175 miles away.

Other earthquakes connected with volcanoes do not accompany explosions, but are the preludes of eruption. After a long period of inactivity the rock of a volcano must be fissured in order that the lava may escape, and these earthquakes are referred to the fissuring of the rock under strains whose culminating effect is the opening of a vent for the lava. Accordant with this idea is the fact that the stumps of extinct volcanoes, whose bodies have been removed by erosion, exhibit systems of radial dikes formed by the injection of lava into fissures.

Earthquakes of a third class are associated with the development of mountain structure of a certain type. In an extensive district in Western North America the prevalent structure of mountain-ranges involves extensive faulting. Each range consists of one or more huge blocks of rock, bounded by faults and lifted above their neighbors. In modern times there have been two instances in which renewed movement has occurred on old fault lines of this region, and each of these movements has been accompanied by a great earthquake. Entirely similar phenomena were observed in New Zealand in 1885.

In numerous other instances earthquakes have originated in districts where there is no other evidence of recent volcanic activity or of recent orogenic disturbance, and in such cases causes can not be assigned with confidence. Still it is not difficult to formulate a possible cause which, while undemonstrated, appears to be competent. In portions of the earth's crust, where deforming forces are not of such nature and distribution as to up-raise mountain-ridges, there are, nevertheless, more or less localized elevations and subsidences, and with these differential movements it is reasonable to suppose that there are associated powerful strains. Wherever and whenever such strains suffice to overcome the elasticity of the rocks involved, either viscous flexure or rupture must result. If the local conditions determine rupture as the mode of dislocation, an earthquake is one of the consequences.

In the descriptive literature of earthquakes there is probably considerable confusion of cause and effect. In connection with an earthquake in 1822 several hundred miles of the coast of Chili were lifted to a height of several feet, and there is reason to believe that portions of the land at a distance from the sea were raised more than those at its border. It was computed that the volume of rock changed from a position below the plane of sea-level to a position above that plane was comparable in magnitude with Mt. Etna, and this stupendous result was supposed to have been caused by the earthquake. As the subject is at present understood, it appears more reasonable to suppose that the continent-making forces of the earth's crust, whatever their origin may be, tended to elevate that portion of South America, and for a long period had accumulated strains which were opposed by the elasticity or rigidity of the crustal material. When finally the resistance was overpowered by the strains, fractures occurred along certain critical lines, the tract of land rose, the strains were in great part relieved, and an earthquake occurred as an incidental result—a result of supreme importance to the unfortunate inhabitants of the country, but relatively insignificant as a phenomenon of physical geography. Of the local elevations and subsidences which occur in alluvial tracts in connection with earthquakes, it is probable that the greater number are consequences of the vibration of the land, and are more or less analogous to landslides, while a smaller number are direct result of faults by which the earthquakes were produced. The surface oscillations of the sea and of alluvial tracts, and the vibrations of air observed as sound, are all believed to result from the modification or transmutation of the elastic waves by which the shock of earth rupture is primarily transmitted.

In the study of earthquakes three classes of instruments have been employed. Seismoscopes are devices for determining automatically the time at which the vibration occurs. Seismometers are devices for determining the comparative violence or energy of earthquake shocks. Seismographs accomplish both these purposes, and also indicate the forms of the earthquake waves as they arrive at the surface of the ground. (See SEISMOGRAPH.) Such refinement has been attained in the construction of instruments of the last class that it is possible to record tremors which escape the senses, and their employment has led to the discovery that earthquakes are far more numerous than had been previously realized. In some regions feeble shocks are of almost daily occurrence, and there is probably no part of the earth in which they could not be detected at short intervals.

Earthquakes in the U. S.—The more important earthquakes are well described by Sir Charles Lyell in the second volume of his *Principles of Geology*, and other references to the literature are given at the close of this article. The most notable earthquakes of the U. S. occurred near the head of the Mississippi delta in 1811–12; in Inyo valley, California, in 1872; and at Charleston, S. C., in 1886. The Mississippi valley earthquake (1811), known as the New Madrid earthquake, was characterized by the great prolongation of its phenomena. Severe shocks occurred at short intervals during a period of several months, and the entire series of shocks covered a period of about two years. As the country was sparsely settled little is known of the distance to which the perceptible vibrations extended, but in the central tract the phenomena were of the most impressive character. It is related that alluvial land was traversed by visible waves which rocked the forest trees to and fro, uprooted some, and permanently entangled the branches of others. Fissures were opened and closed, not merely once, but at each successive shock, and mud of various kinds was thrown into the air with such violence as to lodge in the branches of trees. Some lakes were drained by the escape of their waters into fissures, and other lakes were created by the subsidence of the land. The largest sunken area is said to have been 60 or 80 miles in length, and nearly half as broad. The earthquake of Inyo valley was occasioned by a renewed movement along the great fault plane at the eastern base of the Sierra Nevada. The chief shock lasted but a few minutes, and those which followed at intervals were far inferior in violence. The series continued for two or three months. A principal fissure was formed along the base of the mountain-range for a distance of about 40 miles, and the land west of the fissure rose, or the land east of the fissure fell, through a space of several feet. In some places a second fissure was formed parallel with this, and was associated with a smaller displacement in the opposite direction, so that a tract a quarter of a mile in width was depressed below the adjacent tracts. The greatest displacement of this sort was about 25 feet. There were also horizontal displacements, a line of fence being in one instance dislocated 14 feet. Numerous fractures without vertical displacement were opened in the alluvium of Inyo valley. Owens river was temporarily swallowed, and a number of springs were permanently destroyed. In the village of Inyo all the houses were thrown down and one-tenth of the inhabitants were killed. The Charleston earthquake was preceded by minor tremors, to which little attention was given. The principal shock occupied about one minute, and other shocks followed at intervals with gradually diminishing violence. At the end of four weeks they had ceased to be destructive, but tremors were occasionally observed for several months longer. The foci of disturbance was about 15 miles W. of the city, and the most violent movements there were vertical. Numerous fissures were opened in the surrounding country and the extravasation of water and mud was sufficient to flood the channels of all the streams. The distortion of portions of the alluvial plain was illustrated by the dislocation and buckling of railway tracks. At Charleston the movements were oblique, and although less violent than those outside of the city, they were equally destructive. A large number of houses were thrown down, and nearly all were more or less injured, so that the damage was computed in millions of dollars. Twenty-seven persons were killed outright, and others died afterward from injuries received.

LITERATURE.—*Reports of British Association Committee on Earthquakes* (1850, 1852, 1858); *Transactions of the Seismological Society of Japan* (Yokohama, 1880–1890); R. Mallet, *Dynamics of Earthquakes* (Trans. Roy. Irish Acad., 1846); *The Great Neapolitan Earthquake of 1857* (2 vols., London, 1862); J. A. Ewing, *Earthquake Measurement* (Mem. Science Dept. Univ. of Tokio, No. 9, Tokio, 1883); J. D. Whitney, *The Owens Valley Earthquake* (*Overland Monthly*, vol. ix., San Francisco, 1872); C. E. Dutton, *The Charleston Earthquake of August 31, 1886* (*Ninth Annual Report, U. S. Geol. Survey*, Washington, 1889); J. Milne, *Earthquakes and other Earth Movements*, in International Scientific Series (New York, 1886). G. K. GILBERT.

Earths: in chemistry, compounds consisting each of a metal combined with oxygen. The earths proper are alumina, zirconia, ceria, glucina, thoria, didymia, lanthana, yttria, and erbia. Magnesia, baryta, lime, and strontia are

called alkaline earths, because they are less soluble in water than true alkalies, though they exhibit alkaline reactions. Their carbonates are insoluble in water, and are not alkaline.

Earth-shine (or, as it ought to have been called, **Earth-light**): a reflection of the sun's light from the earth to the moon, and back to the earth again. This phenomenon is often seen when the moon is very old or very new, the outlines of the full moon being rendered visible by the reflection.

Earthwork: in civil engineering, the construction of excavations, embankments in or with the natural earth. Earth is usually excavated and moved under contract at a fixed price per cubic yard, the measurement being made in the excavation. In cuttings for roads and railroads levels and measurements are taken at distances 100 feet apart from which the areas of the sections are computed. Then the number of cubic feet of earth between two stations may be closely found by adding together the two end areas and multiplying their sum by 50. This is called the method of mean areas, and it always gives quantities slightly in excess of the truth, except when the two end areas are equal. A more exact method of measurement is to find the areas of sections 50 feet apart, and then to use the prismoidal formula, which is $C = \frac{1}{6}l(A + 4M + B)$ where A and B are the areas of two end sections, M the area of the section halfway between them, and l the distance between A and B.

Earthwork occupies less space in the embankment than in the original excavation. Sand and gravel shrink about 8 or 9 per cent., clay about 10 or 11 per cent., and loam from 12 to 14 per cent. When the cuts in a railway do not furnish sufficient material for the embankments, the balance is procured from borrow-pits, or excavations in some convenient hillside. These borrow-pits are cut with vertical sides, so as to permit the precise measurement of the quantity removed, levels being first taken over the top surface.

If earth be devoid of cohesion, the sides of the cuts and embankments will ultimately be inclined planes, each kind of earth having its own special angle of inclination, known as the "angle of natural slope." The following table gives the angles of natural slope, the inclination expressed by the ratio of the horizontal to the vertical projection, and the

KIND OF EARTH.	Angle of natural slope.	Inclination.	Weight per cubic foot.
Gravel, round	30°	1·7 to 1	100
" sharp	40	1·2 " 1	110
Sand, dry	35	1·4 " 1	100
" moist	40	1·2 " 1	110
" very wet	30	1·7 " 1	125
Earth, dry	40	1·2 " 1	90
" moist	45	1·0 " 1	95
" very wet	32	1·6 " 1	115

weight per cubic foot of different kinds of earth. If, however, the earth be cohesive, slopes steeper than the natural slope can be built, but it is necessary to protect them from the action of the weather by sodding.

The lateral pressure of earth against a vertical wall is always less than the pressure of water. If w be the weight of a cubic foot of the earth, ϕ its angle of repose, given by the above table, and h the height of the wall, the formula $P = \frac{1}{2}wh^2 \tan^2(45 - \frac{1}{2}\phi)$ may be used to compute the horizontal pressure of the earth upon a lineal foot of the wall. The point where the resultant pressure is applied is, as in the case of water, at a distance above the base of the wall equal to one-third its height. This formula applies only to cases where the surface of the earth behind the wall is level. If the surface be inclined backward from the top of the wall at the angle ϕ, the pressure is given by $P = \frac{1}{2}wh^2 \cos^2\phi$.

MANSFIELD MERRIMAN.

Earthworks: fortifications or constructions, whether for attack or defense, in which earth is the principal material employed. See FORTIFICATIONS.

Earthworms: the popular name of a large number of species of worms belonging to many genera of OLIGOCHÆTÆ (*q. v.*) which are comprised in the great class of Annelida. Formerly they were all regarded as forming the family *Lumbricidæ*, so called from its principal genus, *Lumbricus*, but now they are much divided. In all the body is cylindrical, and is made up of many essentially similar rings placed one after another, all without external organs, except small bristles variously arranged which are used in locomotion. The mouth is provided with upper and under lips, and lacks teeth. The earthworms live on decaying vegetable matter, which they obtain either by swallowing leaves or earth which contains vegetable humus. The indigestible portions are voided on the surface as worm casts. The researches of Darwin have shown that earthworms are of immense value to agricultural interests, for they occur in the earth where there is moisture enough to sustain life, and they are continually working over the soil and passing it through their intestines. The earth thus eaten comes from below, while the worm casts are deposited on the surface. In this way about a fifth of an inch is annually added to the soil, while the same action serves to reduce inequalities and to bury beneath the surface stones and other objects. The earthworms are hermaphroditic, but are incapable of self-fertilization. Their eggs are laid in cocoons, and in some species we have the rare phenomenon of one egg producing two worms. Earthworms are also noticeable from the fact that when cut in two they are capable, to some extent, of reproducing the lost portions. In the temperate zone the largest species of earthworms rarely exceed 8 or 10 inches in length, but in the tropics they are much larger, an African species being an inch in diameter and nearly 6 feet in length. It is hardly necessary to state that earthworms do not rain down; those which are frequently found on the ground after storms have been driven from their burrows by the water. See Darwin, *The Formation of Vegetable Mould Through the Action of Worms* (London, 1881); Rolleston, *Forms of Animal Life* (new ed. 1888). J. S. KINGSLEY.

Ear-trumpet: an instrument for the relief of defective hearing. Ear-trumpets are of a great variety of forms, but they all depend upon the same principle—that of collecting and condensing the sound-waves, and thereby intensifying the impression made upon the ear. It is found in practice that a nice adjustment of parts is not necessary; sound being readily reflected along conical tubes, either straight or coiled, with great facility. Cases of comparatively slight deafness are aided by the wearing of "cornets," or small ear-trumpets attached by a spring to the ear and concealed by the hair of the wearer.

Earwax: See CERUMEN.

Earwigs [O. Eng. *ēorwicga*; cf. Fr. *perce-oreille*, Germ. *Ohrwurm*]: insects of the family *Forficulidæ*; so named from the popular delusion that they have a propensity to creep into the ear. They form a connecting link between the Coleoptera and the true Orthoptera. They have a narrow body, strong and horny mandibles, long antennæ, and a pair of forceps at the extremity of the abdomen. In the U. S. the name is applied to various small centipedes found about houses and beneath boards. See ENTOMOLOGY. Revised by F. A. LUCAS.

Easement: in law, in its most comprehensive sense, the right which the public or an individual has in the lands of another, not inconsistent with a general property in the latter. It is in the nature of a charge or burden upon land. It is called a *dominant right*, while the land burdened is termed the *servient estate*. Easements may be mere personal rights, when they are said to be *in gross*, or they may be connected with the ownership of land. The latter only will be considered. 1. They are incorporeal. 2. They are imposed on corporeal property. 3. They confer no right to the substance of the land. 4. There must be two distinct estates—the dominant, to which the right belongs; and the servient, upon which the obligation rests. They are affirmative or negative. Affirmative, when the owner of the dominant estate may do some act on the servient; and negative, when the owner of the servient estate must refrain from doing some act, otherwise lawful, on his land. The most important instances are the right of way (the right of the owner of one piece of land to pass over the land of another), of water (the right of the owner of the dominant estate to receive water from or discharge it across the servient estate), of support of the soil or of the buildings of the dominant estate by the adjacent soil or building of the servient estate.

Easements exist at common law, and may be created by statute. Common-law easements may arise in various modes. 1. By nature. This is a brief form of expression of a legal rule, that the owners of adjoining parcels of land may have a burden imposed upon them not to disturb the natural state of things. Thus where a natural stream of water flows from the land of one owner through the land of another, the former can not divert or diminish the quantity of water which would otherwise descend to the proprietor below, nor can the latter prevent the stream from discharging its water across his land. Each has an easement "by

nature" in the land of the other. 2. By dedication. This means an appropriation of land by its owner to a public use; e. g. as a street or park or public landing-place. The legal title to the land dedicated is not changed, but the public acquires a right to use it for the special purpose to which it is dedicated. These easements are sustained in law on the doctrine of estoppel, although there is no specific grantee. No particular form or ceremony is necessary to constitute a dedication. It is sufficient if the intention to dedicate appear, either by positive acts of the owner or long-continued acquiescence, and the public act accordingly. 3. By actual grant. In this case the nature and extent of the easement are determined by the words of the instrument creating it, which must be sealed. 4. By implied grant. An easement is created by implied grant when it is necessary for the enjoyment of that which is expressly granted or reserved. Thus if A is the owner of two lots, the first of which can be approached only over the second, and conveys either to B, the owner of the back lot has by implication a right of way across the front lot. 5. By prescription. This is the enjoyment of the right or privilege for so long a time as to raise the presumption of a grant. The length of time necessary to raise this presumption varies in different States, but, after the analogy of the statute barring disputed claims to land, it is usually twenty years. To obtain by prescription an easement in the land of another its enjoyment must have been uninterrupted for the required number of years, adverse to the owner of such land, and exercised under a claim of right. It must be open, so that the owner may be presumed to know of it. In England it is held to be a rule of common law that the right to light may be obtained by prescription. This is called the doctrine of "ancient lights." It would take place where the owner of one lot of land had windows opening on the vacant lot of another for twenty years. He would acquire such a right that buildings could not be constructed on the vacant lot so as to shut out the light from his windows. But in the U. S. this rule has frequently been repudiated by the courts as inapplicable to our rapidly growing and rapidly changing condition; and in a number of States an easement of light can be acquired only by express or implied grant.

Easements may be extinguished by a release given by the owner of the dominant to the owner of the servient estate, or by abandonment. The failure to make use of an easement (technically called non-user) for twenty years is strong evidence of abandonment if the easement was acquired by prescription, although the presumption may be rebutted; but if the easement were acquired by actual grant, no length of mere non-users would operate as an abandonment. In that case there must be acts inconsistent with the existence of the easement. An easement may also be extinguished by a union of the two estates in the same person. This is technically called "merger." T. W. DWIGHT.

East Africa, British: See IBEA.

East Africa, German: See GERMAN EAST AFRICA.

East Anglia: See ANGLIA, EAST.

East Aurora: village; on railway; Erie co., N. Y. (for location of county, see map of New York, ref. 5–C); beautifully situated 17 miles S. E. of Buffalo. It has a Union school and academy, a large flouring-mill and agricultural works, a manufactory of paper-makers' felts, the Jewett stock farm with a covered mile track, and Hamlin's village farm for horse-breeding. The village is the business center of a wealthy farming region, and a place of residence for Buffalo business-men. Pop. (1880) 1,109; (1890) 1,582; (1900) 2,366. EDITOR OF "ADVERTISER."

Eastbourne: a watering-place of Sussex, England; 3 miles N. N. E. of Beachy Head; in a chasm between two cliffs; has a martello tower, a fort, and a chalybeate spring (see map of England, ref. 14–K). Pop. (1891) 34,977.

East Brady: borough; on railway; Clarion co., Pa. (for location of county, see map of Pennsylvania, ref. 3–C); situated on the Allegheny river about 70 miles N. of Pittsburg. The chief industry is coal-mining. Pop. (1880) 1,242; (1890) 1,228; (1900) 1,233.

East Bridgewater: town; Plymouth co., Mass. (for location of county, see map of Massachusetts, ref. 4–J); on the Old Colony Railroad, 25 miles S. E. of Boston. It has valuable water-power, and large manufactures of brick, lumber, cotton-gins, nails, and other goods. Pop. of township (1880) 2,710; (1890) 2,911; (1900) 3,025.
EDITOR OF "STAR."

Easter [O. Eng. *ēastre*; Germ. *ostern* < O. H. G. *ōstara*, plur. *ōstarūn*, a festival named from the Teuton. goddess of spring, **austrō*; cf. Lat. *aurōra*, dawn, Gr. *ἠώς*, *ἕως*, Skr. *usra*]: the Lord's day or Sunday following that fourteenth day of the calendar moon which falls upon or next after Mar. 21 (in Gr. called *πάσχα*, Lat. *pascha*). This is true of both old style and new. Easter is the principal festival of the Christian year, observed in commemoration of the resurrection of our blessed Lord. The returns of this anniversary were originally regulated, and in imitation of this early usage have always continued to be, by the calendar of Judea, in which the months were conterminous with the revolutions of the moon. A mean lunation being, roughly, twenty-nine and a half days long, twelve lunar months, or a lunar year, fall short of a solar year by about eleven days. The beginning of the Jewish year therefore goes backward on the natural year eleven days annually, requiring an intercalary month to be introduced in the third year, and again in the sixth, ninth, eleventh, fourteenth, and so on. Any anniversary regulated by such a calendar as this is consequently *movable* in reference to a calendar regulated by the sun. The Resurrection took place just after the Jewish feast of the Passover, which was held on the fourteenth day of Nisan, the first month of the year—that is to say, the fourteenth day of the moon, or not far from the time of full moon. The Christians of Jerusalem, and after them those of the Asiatic Churches generally, were accustomed to hold the feast of Easter on this same day or simultaneously with the Jewish Passover. This usage was unacceptable to the Gentile Churches in Italy and the West generally, which preferred to celebrate Easter on the Sunday following the fourteenth day of the moon; and the difference of practice in this particular led to grave dissensions between the East and West, which were at length pacified by the agreement reached in the Council of Nicæa (A. D. 325), to make the Western usage universal. In order to find the time of Easter for any given year, it would seem that we should calculate the exact time of the new moon in that year for March, and try whether the fourteenth day of that moon (the day of new moon itself being counted the *first*) would fall not earlier than the 21st, in which case the Sunday following this fourteenth day might be presumed to be Easter. But should this fourteenth day fall earlier than Mar. 21, we should conclude that the new moon of April must be taken. The ecclesiastical calendar, however, is only nominally dependent on the moon in the heavens, the true moon and the calendar moon sometimes differing in their age more than two days. The practical reason for this is that if the astronomical time of new moon is taken, this time will not be the same in the local times of different longitudes; so that a meridian may always be assigned such that the same new moon may fall on different calendar days on different sides of it. And if the calculation is very nicely made, when new moon happens exactly at midnight of Saturday or Sunday in the middle of a large city like London, the east and west halves of the city may have their Easter upon two very different days. The ecclesiastical moon is therefore an ideal or artificial moon; and in determining the beginning and end of each lunation no account is taken of any differences smaller than a day. In order to divest the ecclesiastical calendar as much as possible of complexity, advantage is taken of the fact discovered by Meton, an Athenian astronomer in the fifth century before our area, that in a period of nineteen solar years the sun and the moon return almost exactly to the same relative positions which they occupied at the beginning of this period, the difference amounting to little more than the space the moon would move over in two hours. The calendar therefore assumes that the moons determining Easter will recur in the same order every nineteen years throughout an entire century, and sometimes throughout two or three centuries. The Easters themselves do not therefore necessarily recur on the same days of the month of March or April in each of these successive series of nineteen years, but would do so if the same days of the week always corresponded to the same days of the month. This, however, is not usually the case; and as Easter must be Sunday, it is necessary, in order to fix definitely the date of Easter in any given year, to know both the place of the year in the series of nineteen (or in the Metonic cycle) and also the day of the week on which the year began, or (what is practically the same thing) the dominical letter for the year. Various methods have been given for finding Easter, but all of them begin, expressly or implicitly, with the determination of these two elements. The rules given

by Prof. de Morgan in the *Companion to the British Almanac* for 1845 occupy about a page. See also *The Book of Almanacs, with an Index of Reference, by which the Almanac may be found for every year, whether in Old Style or New, from any epoch, ancient or modern, up to A. D. 2000, with means of finding the day of any new or full moon from B. C. 2000 to A. D. 2000*, compiled by Augustus De Morgan, etc. (London, 1851), and Bishop Samuel Butcher's *The Ecclesiastical Calendar: In Theory and Construction* (Dublin and London, 1877). The formulæ of Delambre, in the first volume of his *History of Modern Astronomy*, and those of Gauss, given in the first volume of the *Theoretical and Practical Astronomy* of the same writer, though concise as mathematical expressions, involve much laborious computation in their practical application. The following rules, however, originally devised by President Barnard, of Columbia College, New York, are very simple and easy. It is to be observed, first, that the fourteenth day of the Easter moon, being approximately the time of full moon, is called the *paschal full moon*. The number of the year in the lunar cycle is also called the Golden Number. (See GOLDEN NUMBER.) Then, supposing that we know the golden number and the dominical letter, we find, for the present century, the paschal full moon as follows:

If the golden number is *odd*: To four times the golden number add *ten*; and

If the golden number is *even*: To four times the golden number add *twenty-five*.

The result, in either case, if greater than twenty and less than fifty, is the date of paschal full moon, *considered as a day of March* (that is to say, if it happens to be, say thirty-three, it is the thirty-third of March = Apr. 2, and so on). If not greater than twenty and less than fifty, add *thirty*, or subtract *thirty*, or *twice thirty*, if necessary to make it so, and the result is once more paschal full moon.

Then, to find Easter: To the constant number *eighteen* add the numerical value of the dominical letter (i. e. A = 1; B = 2; C = 3, etc.), and the sum, if greater than the value of paschal full moon just found, is the date of Easter; but if not, add *seven*, or *twice seven*, or *three times seven*, and so on till a total is obtained which exceeds that value; and this total is the date of Easter considered as a day of March.

To find the golden number and the dominical letter: In either case first separate the hundreds in the number expressing the given year of our Lord from the years less than 100, and treat the parts independently of each other. First, for the dominical letter: If the hundreds be divided by *four*, the remainder from the division will have one or other of the following values—viz., 0, 1, 2, 3. And the dominical letters belonging to the hundreds which give these remainders respectively will be A, C, E, G = 1, 3, 5, 7. These, for convenience, call *centurials*. Then for the *years* take half the largest number divisible by *four*—i. e. half the number of the latest leap-year—increase this by *seven*, and subtract the excess of fours (i. e. the remainder left in the previous division by four). To this result add the centurial, and the excess of sevens in the sum will be the value of the dominical letter; it being observed that if there is no excess the dominical letter has the value of seven itself, or is G. Leap-years have two dominical letters—one for January and February; the other, which is less than the former by a unit, for the remainder of the year. This last, which only is used in finding Easter, is that given by the rule.

To find the dominical letter for *Old Style* the process is the same except as to the centurial. The centurial for old style is found by adding *three* to the number of *hundreds*, and suppressing *sevens*. Thus if the hundreds be *fifteen*, we have 15 + 3 = 18. And 18 with seven dropped as often as possible leaves 4, which is the old style centurial. If there is *no* excess of sevens, the centurial is seven itself.

Secondly, for the golden number: Add a unit to the number expressive of the given year; then divide the *years* by *twenty*, and add the quotient to the remainder. Next divide the centuries by *four*, and add the quotient to *five times* the remainder. Finally, add the two results, and the sum, if nineteen or less, is the golden number. If it exceeds nineteen, drop nineteen, or, if necessary, twice nineteen, and the number left, being not greater than nineteen, will be the golden number.

Take, as an example, the year 1873. For the dominical letter: 18 ÷ 4 gives 2 remainder, and the *centurial* is accordingly 5. The number of the largest leap-year in 73 is 72, and the half of this is 36. Then 36 + 7 = 43, and 43 − 1 = 42. Finally, 42 + 5, with the sevens suppressed, is evidently 5 = E, which is the dominical letter of 1873.

For the golden number: 1873 + 1 = 1874. Then, 74 ÷ 20 = 3, with 14 remainder, and 14 + 3 = 17. Also, 18 ÷ 4 = 4, with 2 remainder, and 2 × 5 + 4 = 14. Then, 17 + 14 = 31, and 31 − 19 = 12, the golden number for 1873.

For Easter in 1873: 12 × 4 + 25 = 73. Then 73 − 30 = 43, or paschal full moon is the forty-third day of March. To 18 add 5, the value of the dominical letter, and the result, 23, is smaller than the date of paschal full moon. But 23 + 7 + 7 + 7 = 44, which is greater than that date (43), and Easter is the forty-fourth day of March, or Apr. 13.

There is one case not provided for in the foregoing. If in finding paschal full moon we obtain a result which is *exactly twenty* or *exactly fifty*, adding or subtracting thirty will not bring it between those limits. In this case paschal full moon must be taken at 49. There is also an irregularity arbitrarily introduced by the mathematicians of Pope Gregory XIII., by whom the calendar was regulated, which is this: Should the rules above laid down give *forty-nine* directly as the date of paschal full moon, *this must be reduced to forty-eight in case the golden number is 12 or upward*; not otherwise.

For centuries earlier or later than the present, the rules are the same, except that the numerical terms *ten* and *twenty-five* used in finding paschal full moon are liable to variation (but do not always vary) in passing from century to century. The second of these terms always exceeds the first by *fifteen*. The first may be found for any century up to the forty-second by the following rule: From the number of the centuries take its fourth part and its third part (disregarding fractions in both cases), and increase the result by *two*. Thus for the twentieth century we have 20 − 5 − 6 + 2 = 11. Hence these numerical terms for the next century will be 11 and 26. In *old style* dates these numerical terms are invariable, and are always *two* for odd golden numbers and *seventeen* for even. See the *Journal of the Proceedings of the General Convention of the Protestant Episcopal Church in the United States* for 1871, Appendix, pp. 538–559.*

The principal festivals and fasts of the Church dependent for the time of their celebration upon Easter are Septuagesima Sunday, nine weeks before Easter; Ash Wednesday, which is the Wednesday of the seventh week before Easter; Good Friday, which is the Friday next before Easter; Ascension Day, which is the Thursday of the sixth week after Easter; Whitsun Day, the seventh Sunday after Easter; and Trinity Sunday, the eighth Sunday after Easter.

Revised by WILLIAM STEVENS PERRY.

Easter, or **Waihu, Island**: a small island of volcanic origin in the Pacific Ocean; lat. 27° 6′ S., lon. 109° 30′ W.; area, 47 sq. miles. It is 11 miles long and 4 miles wide; rises 1,200 feet above the level of the sea, and is scantily supplied with water. It is the easternmost inhabited Polynesian island. The inhabitants have traditions of their ancestors having come from the island of Oparo, 1,900 miles distant. The island has wonderful colossal statues in stone. It has belonged to Chili since 1888. Pop. (1882) 150.

Eastern Archipelago, also called **The Malay Archipelago**: all those islands which lie in the northeastern part of the Indian Ocean. Area about 650,000 sq. miles. They are divided, according to their position, into three groups. The first group comprises the Molucca islands, the Spice islands, Banda, Amboina, Ternate, and the Philippines; the second group consists of Sumatra, Java, and the small Sunda islands east of Java, from Bali to Timorlaut; and the third comprises Borneo and Celebes, together with a large number of smaller islands, as Billiton, Banca, Singapore, etc. In its position this archipelago forms the connection between Asia and Australia. Its soil is very fertile, and resembles in its products that of the neighboring countries of Asia. It has therefore attracted at all ages almost every nation. The original inhabitants consisted of many tribes, but all belonged to one race called the MALAY RACE (*q. v.*). At a later age the Arabs went to these islands, and as a consequence Mohammedanism gained a good many followers. At last the Europeans came and subjugated almost the entire archipelago. The Dutch have become masters of the greatest number of islands; while the Spaniards had only the Philippines; the Portuguese have Dilli and part of Timor;

* This valuable and exhaustive paper is perhaps the most important contribution to the printed literature of this subject extant.
W. S. P.

and the British, Singapore, Labuan, and Northern Borneo. Besides these races, a large number of Chinese are found throughout the islands. The total population is estimated at 23,000,000. See Wallace, *Malay Archipelago* (1890); Keane, *Eastern Geography* (2d ed. 1892).

Eastern Churches: several bodies of Christians in Western Asia, Eastern Europe, and Africa. They are in three divisions: I. The Orthodox Greek Church, composed of ten independent bodies, substantially one in discipline and doctrine, in mutual sympathy, and in deference to Constantinople, numbering about 84,000,000, of whom about 61,000,000 are in Russia. II. The National Churches, consisting of: (1) The Nestorian (since 498 A. D.), numbering about 150,000 in Turkey and Persia, besides 100,000 (Independent St. Thomas Christians) in India. (2) The Armenian (since 491 A. D.), very widely dispersed, numbering about 3,000,000. (3) The Syrian: A. Jacobites (since 451 A. D.), numbering about 350,000; B. Maronites (since 680 A. D.), numbering 250,000, and since 1182 A. D. under the pope. (4) The Coptic, in Egypt (since 451 A. D.), numbering about 500,000. (5) The Abyssinian (since 451 A. D.), numbering about 1,250,000. These all seceded from the Greek Church on Christological issues. III. The United Churches, which have submitted to the pope, accepted the Filioque of the Latin Church and the doctrine of the two natures in Christ, and are allowed vernacular liturgies, clerogamy, and the communion in both kinds. These churches are: (1) United Greek, mostly since the Protestant Reformation, and mostly in Austria, Hungary, and the Turkish empire, numbering nearly 5,500,000. (2) United Nestorian (since 1553), numbering 20,000 in Turkey and Persia, and 150,000 in India. (3) United Armenian (since 1316–34 A. D.), numbering about 100,000, among whom an anti-papal schism occurred in 1869. (4) United Syrian [Jacobite], very few in Syria (since seventeenth century), but 160,000 in India (since 1553). (5) United Coptic (since 1732), numbering about 10,000 or 12,000. (6) United Abyssinian (since 1828), numbering, it is claimed, about 50,000.

Eastern Empire: See Byzantine Empire.

Eastern Question: the problem that confronts nations whose territories border upon or extend into the Balkan Peninsula (*q. v.*), or whose interests would be affected by changes in the governmental systems of that region. It involves the future of the countries in Eastern Europe that have separated from Turkey, as well as the fate of the European possessions of that state itself. Throughout the eighteenth century Russia and Austria made attempts upon the Turkish territory in Europe, but the jealousy of the other powers prevented the plunder of the weaker state. In the nineteenth century the steady tendency has been toward the disintegration of Turkey in Europe, with the result of erecting on the Balkan peninsula a number of independent or semi-dependent states, the fear of whose annexation by one or another of the great powers gives to the Eastern question its formidable character. The question has been complicated by the desire of Russia to establish a protectorate over the Christian subjects of the Sultan, by her ambition to extend her borders to the Bosphorus, and by the apprehension on the part of the British Government that these Russian designs might imperil the Eastern possessions of Great Britain. The term sometimes refers to the conflicting interests of Great Britain and Russia on the frontiers of their Eastern territories, and in this aspect of the question Persia, Turkestan, Afghanistan, and India all fall within its scope. See Crimean War and Russo-Turkish War.

F. M. Colby.

Eastern Rite, or **Oriental Rite**: the ritual of those branches of the Roman Catholic Church which acknowledge the supremacy of the pope, but which do not employ the Latin ritual. The United Christians of St. Thomas have no bishop of their own, but are under the vicar-apostolic of Verapoli, who is of the Latin rite; but the people and clergy use, in part, a modified Syrian rite.

The Eastern rite differs from the Latin, not only in the languages employed in the service (Greek, Slavic, Armenian, Syriac, Ethiopic, Coptic), but generally also in the use of both elements for the laity in the Eucharist, and in the permission of marriage to the lower clergy.

Eastern Rume'lia: a formerly autonomous province, now Southern Bulgaria. It extends from the upper waters of the Maritza eastward to the Black Sea, and S. of the Balkan Mountains. It was collated as a province by the treaty of Berlin in 1878, but, because of a successful revolution, it was placed under the King of Bulgaria in 1886, and is practically a province of that kingdom.

Eastern Shore: a name given to those parts of Maryland and Virginia which are E. of Chesapeake Bay, and sometimes applied to the whole peninsula, including, in addition, the entire State of Delaware. The Eastern Shore has been proverbial for its conservatism, and from the character of its inhabitants claimed the title of "the land of gentlemen"; but it is now traversed by railroads, and the excellence of its soil and climate for peach-culture and market-gardening has caused the development of much industrial enterprise. Its western side is remarkably indented by navigable rivers and creeks, affording great commercial advantages. The waters on both sides abound in oysters, which are a source of great wealth. The fisheries are also extensive. Most of the surface is low and level, but healthful. Malarial fevers are endemic at some places. The climate is singularly mild. Bog-iron ore of fine quality is extensively mined in some parts. Kaolin is found in the extreme N. Oak timber is cut in some parts for market.

East Greenwich: town (incorporated in 1677); capital of Kent co., R. I. (for location of county, see map of Rhode Island, ref. 9–N); situated on railway and on Narragansett Bay; 14 miles from Providence. It has an academy (under the supervision of the Boston University), a free library, two cotton-mills, a woolen-mill, print-works, and a good harbor. Pop. of township (1880) 2,887; (1890) 3,127; (1900) 2,775.

East Hampton: town and railway junction (founded in 1664); Hampshire co., Mass. (for location of county, see map of Massachusetts, ref. 3–E); 5 miles S. W. of Northampton. It is the seat of Williston Seminary for young men, and has a public library and manufactures of suspenders, shoe web, cotton yarns, pumps, vulcanized rubber, buttons, etc. Pop. of township (1880) 4,206; (1890) 4,395; (1900) 5,603.

Editor of "News."

East Humboldt Mountains: a lofty range in Elko co., Nev., some of whose peaks exceed 12,000 feet in height. Secret valley and Fremont Pass cut the range, which is in parts well timbered with pines and firs, affording lumber. Its snows feed the springs by which Lakes Franklin and Ruby are supplied.

East India Company: a famous joint-stock trading company formed in England to carry on commerce with the East Indies. In 1600 a royal charter was granted to a number of London merchants under the title of "The Governor and Company of Merchants of London trading to the East Indies." This charter gave them an exclusive right to trade for fifteen years within certain limits, which were of immense extent. They established factories at Surat, Cambay, and other places in India about 1612. The charter was renewed from time to time. Madras was founded in 1639, and Calcutta in 1645. In 1698 the king granted a charter to a rival company, but the two companies were united in 1702 under a new charter, with the title of "The United Company of Merchants trading to the East Indies." Every person who held £500 of the company's stock became a member of the court of proprietors, who annually chose a court of directors composed of twenty-four members, each of whom must own £2,000 of the stock. The executive power of the company was vested in this court of directors, each of whom retained his office for four years.

In 1708 Parliament granted the company the exclusive privilege of trading to all places eastward of the Cape of Good Hope to the Strait of Magellan. The monopoly of the China trade was abolished in 1833, and the company was then deprived of its original character as a commercial association. Many years before this date the company had become a great territorial power, and had laid the foundation of the British empire in India. By conquest and other means the company obtained sovereign power over vast regions of Hindustan. This region was coveted by the members of the company not only as a source of commercial profit, but as a field in which their relatives might enrich and distinguish themselves by political and military enterprises. By the act 3 and 4 William IV. the functions of the East India Company were rendered merely political. It was to continue to govern India, with the concurrence and under the supervision of the board of control. All the real and personal property belonging to the company on Apr. 22, 1834, was vested in the crown, and to be held or managed by the company in trust for the same; and the

stockholders were to receive an annual dividend of 10½ per cent. on a capital of £6,000,000 out of the revenues of India. The Sepoy mutiny of 1857, which was repressed with a great expenditure of life and treasure, combined with other causes, induced Parliament to transfer the dominion of India to the crown. This change was effected, after strenuous opposition from the company, in 1858. See INDIA.

The Dutch East India Company was formed in 1595–1602. After more than a century of active rivalry with the English company, the two were forced to make common cause against outside adventurers in 1722. Soon after this a more formidable rival appeared. The French company, established in 1664, had under the able management of LA BOURDONNAIS and DUPLEIX (*q. v.*) become more than a match for the English company, and it was only by the genius of Clive that the French were overthrown and English supremacy was established. (For the events connected with the growth of English supremacy in India, see CLIVE and HASTINGS.) Other East India companies (Danish, Swedish, Scottish) were of relatively slight importance. Revised by A. T. HADLEY.

East Indies: a popular but somewhat vague term applied to that part of Southeastern Asia occupied by farther India or Indo-China and the Malay Archipelago, the principal subdivisions being Lower Burma, Siam, Laos, Annam, Sumatra, Java, and the other Sunda islands, Borneo, Celebes, the Banda islands, the Moluccas islands, and the Philippine islands. The area of these, approximately given, is 1,157,200 sq. miles, and the estimated population about 50,383,700. As used by some writers, the term includes Hindustan, and even China and Japan. In the fifteenth century India or the Indies was a name applied by Europeans to an undefined region beyond the Indus, known to them only through the reports of occasional traders. Columbus and the other discoverers of the islands in the western hemisphere believed that the countries found were the western regions of India, and Ferdinand of Spain accordingly assumed the title of King of the Indies. Further explorations by the Spaniards and the discoveries of the Portuguese in the East led geographers to discard "the Indies" as too comprehensive, and to apply the name East Indies to Hindustan and that of West Indies to America. Subsequently "West Indies" was restricted, as at present, to the archipelago comprising the Bahamas, the Greater and Lesser Antilles, and the Virgin islands, while Hindustan and farther India were collectively called India. The Dutch in forming their first company for trade with the East used the term East Indies in its wide sense. After the British occupied Hindustan that country became commonly known as India, but was often called the East Indies, especially in parliamentary papers. See EAST INDIA COMPANY.

Revised by M. W. H.

Eastlake, Sir CHARLES LOCK: historical painter; b. in Plymouth, England, Nov. 17, 1793. Pupil of Royal Academy and Haydon, London; Royal Academician 1830; president R. A. 1850; knighted 1850. Appointed keeper of the National Gallery 1843; published *Materials for a History of Painting* (1847); a prominent figure in British art of the nineteenth century. *Lord Byron's Dream* (1827) is in the National Gallery, London. D. in Pisa, Italy, Dec. 24, 1865. W. A. C.

East Liverpool: city; Columbiana co., O. (for location of county, see map of Ohio, ref. 3–J); on railway and on the Ohio river; 44 miles W. N. W. of Pittsburg and 44 miles E. of Wheeling; has excellent educational advantages; is one of the most important pottery-ware manufacturing centers in the U. S., having thirty potteries, and has an electric railway uniting Wellsville and East End. Pop. (1880) 5,568; (1890) 10,956; (1900) 16,485. EDITOR OF "REVIEW."

East Lothian: See HADDINGTONSHIRE.

Eastman: town; on railway; capital of Dodge co., Ga. (for location of county, see map of Georgia, ref. 5–I); situated 56 miles S. S. E. of Macon, in a section engaged chiefly in farming, lumbering, and sheep-raising; ships large quantities of yellow pine lumber, naval stores, cotton, and wool. Pop. (1890) 1,082; (1900) 1,235.

EDITOR OF "TIMES-JOURNAL."

Eastman, HARVEY GRIDLEY, LL. D.: educator; b. in Marshall, Oneida co., N. Y., Oct. 16, 1832. Having taught school in various places, he founded Eastman National Business College on Nov. 3, 1859, in Poughkeepsie, N. Y. He was thrice elected to the mayoralty of Poughkeepsie; a member of the New York State Assembly 1871 and 1876; for eight years State commissioner of public charities. He received the honorary degree of LL. D. from Ingham University. D. in Denver, Col., July 13, 1878.

Eastman, SETH: army officer; b. in Brunswick, Me., Jan. 24, 1808; graduated at West Point in 1829. He entered the infantry, and was teacher of drawing at West Point 1833–40. He published a *Treatise on Topographical Drawing* (1837) and a *History, etc., of the Indian Tribes* (1850–57). In 1863 retired with the rank of lieutenant-colonel and brevet brigadier-general. D. in Washington, D. C., Aug. 31, 1875.

Easton: town; on railway; capital of Talbot co., Md. (for location of county, see map of Maryland, ref. 3–G); situated on a navigable branch of the Great Choptank river; 55 miles S. E. of Baltimore. It is the seat of a Protestant Episcopal bishop, and has the schools of the diocese of Easton; also an orphan asylum, high school, peach-canning, and fruit-drying establishments, manufactures of lumber, sashes, castings, and farming implements, gas-works, etc. Pop. (1880) 3,005; (1890) 2,939; (1900) 3,074.

Easton: township of Bristol co., Mass. (for location of county, see map of Massachusetts, ref. 5–I); on Old Colony Railroad; has a free library, very extensive shovel-manufactory, and manufactures of boots, shoes, hinges, thread, etc. Pop. (1880) 3,902; (1890) 4,493; (1900) 4,837.

Easton: city and railway center; capital of Northampton co., Pa. (for location of county, see map of Pennsylvania, ref. 4–J); situated at the confluence of the Delaware and Lehigh rivers; 75 miles from New York and 60 miles from Philadelphia. It was settled in 1790, is the seat of LAFAYETTE COLLEGE (*q. v.*), and has a silk-mill, a large shoe-factory, felt-works, several organ-factories, and other industrial establishments, gas and water works, electric street railways, electric lights, and a complete system of sewers. The famous treaty with the Five Nations is recorded as having taken place at the forks of the Delaware. Pop. (1880) 11,924; (1890) 14,481; (1900) 25,238. South Easton borough annexed since 1890.

EDITOR OF "EXPRESS."

Easton, JAMES: a Revolutionary officer; b. in Hartford, Conn.; a builder by trade; became a resident of Pittsfield, Mass., in 1763. He raised a regiment in 1775, served at Ticonderoga, and in Canada under Montgomery, expending his whole fortune in the service. In 1776, after receiving the thanks of Congress, he was obliged by his enemy, Benedict Arnold, to leave the army. D. at Pittsfield, Mass., in poverty.

Easton, MORTON WILLIAM, Ph. D.: philologist; b. in Hartford, Conn., Aug. 18, 1841; studied at Yale, Columbia, and the University of Vienna; Professor of Comparative Philology in the University of Tennessee, and now in the University of Pennsylvania; author of articles in the *Journal of the American Oriental Society*, the *Transactions of the American Philological Association*, the *American Journal of Philology*, and the publications of the Modern Language Association. B. I. W.

East Orange: township; Essex co., N. J. (for location of county, see map of New Jersey, ref. 2–D); situated on the D., L. and W. Railroad and the Wachung Branch of the N. Y. and Greenwood Lake Railway; 12 miles from New York and adjoining Newark on the W. It is a place of suburban residences for New York business men, has a high school, several private schools, a number of churches, and is supplied with water from artesian wells. Pop. (1880) 8,349; (1890) 13,282; (1900) 21,506.

EDITOR OF "GAZETTE."

Eastport: city and port of entry; Washington co., Me. (for location of county, see map of Maine, ref. 7–G); situated on Moose island in Passamaquoddy Bay, at the extreme eastern point of the U. S. It has a good harbor; the tide rises 25 feet. It is the center of an important sardine industry, employing over 3,000 operatives in its eighteen factories. It is also a popular summer resort, and across the harbor, on the island of Campobello, are very large summer hotels. Daily steamers to Boston, Portland, Calais, and St. John, N. B.; weekly steamer to New York. Pop. of township (1880) 4,006; (1890) 4,908; (1900) 5,311.

EDITOR OF "SENTINEL."

East Portland: formerly a city of Multnomah co., Ore.; consolidated with PORTLAND (*q. v.*) in 1891.

East River: a strait connecting Long Island Sound with New York Bay, and separating the city of New York from

Brooklyn. It is nearly 10 miles long, and is navigable by large vessels. See HELL GATE.

East Saginaw: formerly a city of Saginaw co., Mich., consolidated with SAGINAW (*q. v.*), May 3, 1890.

East St. Louis: city and railway center; St. Clair co., Ill. (for location of county, see map of Illinois, ref. 9–D); on the Mississippi river opposite St. Louis. It has a Roman Catholic college, six large public schools, rolling-mills, industries in steel, brass, malleable iron and glass, elevators, stock-yards and packing-houses, electric street railways, etc. Pop. (1880) 9,185; (1890) 15,169; (1900) 29,655.

EDITOR OF "GAZETTE."

East Weymouth: village of Weymouth township, Norfolk co., Mass. (for location of county, see map of Massachusetts, ref. 5–I); situated on the Old Colony Railroad, 14½ miles S. of Boston. It has important manufactures of boots, nails, etc. Pop. of Weymouth township (1880) 10,570; (1890) 10,866; (1900) 11,324.

Eastwick, EDWARD BACKHOUSE: Orientalist; b. at Warfield, Berkshire, England, Mar. 13, 1814; educated at Oxford; entered the service of the East India Company, and filled important positions in Kathiawar and Sind. He was Professor of Hindustani at Haileybury College from 1845 to 1859, when he was appointed assistant political secretary in the India Office. From 1860 to 1863 he was secretary of legation in Persia. D. at Ventnor, Isle of Wight, 1883. He published a number of translations from the Persian: Saadi's *Gulistan* (1852); *Arrival of the Parsees in India* (1845); *Life of Zoroaster* (1843); and *Anvar-i Suhaili* (1854). Besides these, he wrote a *Hindustani Grammar* (1847); *Journal of a Diplomate in Persia* (1864); and *Kaisar-nama-i-Hind, or Lay of the Empress* (1878–82).

Eaton: village; on railway; capital of Preble co., O. (for location of county, see map of Ohio, ref. 6–C); situated on Seven Mile Creek, 53 miles N. of Cincinnati. It has no manufactures, and is surrounded by a fine farming country. Pop. (1890) 2,934; (1900) 3,155. EDITOR OF "REGISTER."

Eaton, AMOS: botanist and geologist; b. in Chatham, N. Y., May 17, 1776; graduated at Williams College in 1799; studied law and was admitted to the bar. In 1828 he became principal and senior professor of Rensselaer Institute at Troy. He published, besides other works, *A Geological and Agricultural Survey of the District adjoining the Erie Canal* (1824) and a *Manual of the Botany of North America* (1833; 7th ed. 1836). D. in Troy, N. Y., May 6, 1842.

Eaton, DANIEL CADY, B. Sc., M. A.: botanist; b. at Fort Gratiot, Mich., Sept. 12, 1834; educated at Yale and Harvard; Professor of Botany at Yale (1864). His principal publications are *Ferns of North America* (1879–80); *Filices Wrightianæ et Fendlerianæ* (1860); the *Compositæ* of Watson's Report of the Botany of King's Survey (1871); and the *Filices* of Chapman's and Gray's *Manuals*. D. in New Haven, Conn., June 29, 1895.—His cousin, DANIEL CADY EATON (b. at Johnstown, N. Y., June 16, 1837), was Professor of the History and Criticism of Art in Yale College 1869–76, and published *Handbook of Greek and Roman Sculpture* (Boston, 3d ed. 1886), besides pamphlets on various subjects.

Eaton, DORMAN BRIDGMAN, LL. D.: lawyer; b. at Hardwick, Caledonia co., Vt., June 27, 1823; graduated at the university of that State in 1848; studied law at the Harvard Law School, and began to practice as a lawyer in New York in 1850 jointly with Judge Kent: edited the seventh edition of *Kent's Commentaries*. He drew up the health laws of New York which created the board of health in New York city. In 1873 he succeeded George William Curtis as a member of the civil service commission, and was its chairman until its dissolution in 1875. In 1877 he published a large volume on the civil service of Great Britain, which has appeared in two editions. He drafted the National Civil Service Act approved Jan. 16, 1883. In Mar., 1883, he was made a member of the new civil service commission; resigned 1885. D. Dec. 24, 1900.

Eaton, EDWARD DWIGHT, D. D., LL. D.: clergyman; b. at Lancaster, Wis., Jan. 12, 1851; graduated at Beloit College, Wisconsin, 1872, and at Yale Theological Seminary 1875; pastor of Congregational church, Newton, Ia., Dec., 1876–Dec., 1879; became pastor of Congregational church at Oak Park, a suburb of Chicago, Ill., Jan. 1, 1880; president of Beloit College, Wisconsin, 1886–1901.

Eaton, GEORGE WASHINGTON, D. D., LL. D.: scholar and Baptist minister; b. at Henderson, Huntingdon co., Pa., July 3, 1804; educated at Ohio University and Union College, Schenectady, N. Y. (B. A. 1829); fellow and tutor at Union College 1829–30; Professor of Ancient Languages in Georgetown College, Kentucky, 1831–33; Professor of Mathematics and Natural Philosophy at the Literary and Theological Institution, Hamilton, Madison co., N. Y., 1833–37; Professor of Ecclesiastical and Civil History 1837–50; Professor of Systematic Theology 1850–61; president of Madison University 1856–68; president of Hamilton Theological Seminary and Professor of Homiletics 1861–71. D. in Hamilton, N. Y., Aug. 3, 1872.

Eaton, JOHN, Jr., Ph. D., LL. D.: educator; b. at Sutton, N. H., Dec. 5, 1829; graduated at Dartmouth in 1854; superintendent of public schools, Toledo, O., 1856–59; studied theology at Andover (Mass.) Theological Seminary 1859–61; ordained by the Maumee (O.) Presbytery 1861; served as chaplain during the war, rising to the rank of brevet general of volunteers; established and edited the *Daily Post* at Memphis, Tenn., 1866–70; State superintendent of public instruction for Tennessee 1867–69; secretary of the board of visitors to the West Point Military Academy 1869; was U. S. commissioner of education 1870–85; president of Marietta College, Ohio, 1885–91; appointed superintendent of public schools in Puerto Rico in Jan., 1899.

Eaton, JOHN HENRY: politician; b. in Tennessee in 1790; elected to the U. S. Senate as a Democrat and served till 1829; was the personal friend of Andrew Jackson, who made him his Secretary of War 1829–31. He was afterward Governor of the Territory of Florida, and in 1836 was appointed minister to Spain. He published a *Life of Andrew Jackson* (Philadelphia, 1824). D. at Washington, Nov. 17, 1856. His name will always be remembered in connection with the "Eaton scandal," in which his wife, MARGARET L. O'NEILL EATON, figured on his appointment to a seat in the cabinet. Unfavorable reports of her reputation caused the ladies of Washington official society to refuse her the recognition which her position as the wife of a cabinet officer demanded. President Jackson espoused her cause with more zeal than discretion; the controversy assumed a political character, and became so bitter as to bring about a disruption of the cabinet in 1831.

Eaton, THOMAS TREADWELL, A. M., D. D., LL. D.: Baptist minister, editor, and author; b. Nov. 16, 1845, at Murfreesboro, Tenn., and educated at Union University, Tennessee, Colgate University, New York, and Washington and Lee University, Virginia. He has been assistant Professor of Mathematics at Washington and Lee University; Professor of Mathematics at Union University; pastor of the Baptist church at Lebanon, Tenn.; pastor of the Baptist church at Chattanooga, Tenn.; pastor of the Baptist church at Petersburg, Va.; and is now pastor of the Walnut Street Baptist church, Louisville, Ky., and editor of the *Western Recorder*. He has published *The Angels* (1876); *Talks to Children* (1888); *Talks on Getting Married* (1891).

W. H. WHITSITT.

Eaton, WYATT: figure and portrait painter; b. at Philipsburg, Canada, May 6, 1849. Pupil of Gérôme. His portraits are excellent in character and arrangement. He exhibited two of the best of them, those of Timothy Cole, the engraver, and of Mrs. R. W. Gilder, at the Paris Exposition 1889. He was one of the founders of the Society of American Artists. D. at Newport, R. I., June 7, 1896. W. A. C.

Eaton Rapids: city; Eaton co., Mich. (for location of county, see map of Michigan, ref. 7–I); on Mich. Cent. and Mich. So. R. Rs., and on Grand river, 24 miles N. N. W. of Jackson. It has 4 churches, 4 brick school-houses, a large apple-evaporator, ax-factory, furniture-factory, and 3 saw-mills. It is the market-center of a rich farming district, and is noted for its mineral magnetic springs, visited annually by hundreds. Pop. (1880) 1,785; (1890) 1,970; (1900) 2,103. EDITOR OF "JOURNAL."

Eatonton: city; on railway; capital of Putnam co., Ga. (for location of county, see map of Georgia, ref. 3–H); situated in a cotton-producing region, 21 miles N. N. W. of Milledgeville. Pop. (1880) 1,371; (1890) 1,682; (1900) 1,823.

Eau Claire, ō′klār′: city and railway center; capital of Eau Claire co., Wis. (for location of county, see map of Wisconsin, ref. 4–C); situated at the confluence of Eau Claire and Chippewa rivers; has a private academy for girls, a high school, numerous sawmills and planing-mills, a flouring-mill, grain elevators, iron and brass foundries, paper-mill, sash, door, and blind factory, furniture-factory,

manufactories of boots and shoes, pearl buttons, electric dynamos and machinery, electric lights, and street railways. The annual lumber output is from 250,000,000 to 300,000,000 feet. It is one of the chief commercial cities of Northwest Wisconsin. Pop. (1880) 10,119; (1890) 17,415; (1900) 17,517.

EDITOR OF "FREE PRESS."

Eau de Cologne, ō′de-kō′lōn′, or **Cologne Water**: a celebrated liquid perfume invented by Farina of Cologne, where large quantities of it are prepared. It is also made in France and almost all other countries. The following recipe affords a good imitation of the original article: Take of alcohol 1 pint; of the oils of bergamot, orange peel, and rosemary, each 1 drachm; of bruised cardamom seeds, 1 drachm; orange-flower water, 1 pint: distill 1 pint from a water-bath.

The secret of the composition of true cologne has been carefully preserved by the Farina family, and the different business-houses of Cologne bearing the name of Farina prepare perfumes which are by no means identical in odor. One of the family is reported to have published in 1863 the following as the formula for genuine eau de cologne: Take of oil of lavender 4 oz.; purified benzoin, oil of rosemary, each 2 oz.; strong alcohol, 9 gal.; dissolve the oil and benzoin in the alcohol, and to the solution add successively oil of neroli, oil of young orange (*huile des petits grains*), oil of lemon, each 10·4 oz.; oil of sweet orange, oil of lime peel, oil of bergamot, each 20·8 oz.; tincture of rose-geranium flowers, a sufficient quantity. Macerate for several weeks, and then bottle the mixture. There are hundreds of recipes, many of which are vouched for as the genuine, but all, no matter how complicated the formula, are simply aromatized alcohol. It is essential that the alcohol be perfectly deodorized and freed from fusel oil before use.

There is a class of cologne-water obtained by macerating aromatic substances in alcohol for some time, and then distilling the whole. But these waters require to be allowed a few months of rest to develop their better qualities. It is probable that the original article was of this class. Good colognes have a rich and permanent odor, not clearly alcoholic. Not one of the essential oils employed should be recognizable by the sense of smell. The best brands have long borne the name of Jean Maria Farina, and there are many claimants to the original proprietorship of the name.

Eau de Javelle, ō′de-zhaă′vel′, or **Javelle's Solution**: a chlorinated solution of potash, analogous to Labarraque's solution of soda. It has bleaching and disinfecting properties, and is employed in removing fruit-stains, etc., from linen. When swallowed in considerable quantity it has poisonous effects.

Eau de Vie, ō′de-vee′: the French for BRANDY (*q. v.*).

Eaux Bonnes, ō′bŭn′ (i. e. good waters): a fashionable resort of France; department of Basses-Pyrénées; 22 miles S. of Pau (see map of France, ref. 9–D). Here are warm sulphur-springs, which are especially efficacious for disorders of the lungs and chest. Pop. (1896) 775.

Eaux Chaudes, ō′shōd′: village of France; department of Basses-Pyrénées; 2 or 3 miles S. W. of Eaux Bonnes; about 25 miles S. by W. of Pau (see map of France, ref. 9–D); has warm medicinal springs. The waters have a wide range of usefulness in the diseases of the lungs, joints, and skin.

Eaves [O. Eng. *efes*: O. H. G. *obasa*, eaves, porch, probably from same root as Germ. *über*, Eng. *over*; cf. Gr. *ὑπέρ*. The word is properly of the singular number]: in architecture, the lowest edges of the inclined sides of a roof, which project beyond the face of the wall, so as to throw off the water from the roof. The eaves are sometimes provided with a gutter and a downpipe or "leader" to carry off the water, which otherwise would be driven against the walls by the wind.

Ebal: See GERIZIM.

Ebel, ā′bel, HERMANN WILHELM: linguist; b. in Berlin, Germany, May 10, 1820; became in 1858 professor at the gymnasium in Schneidemühl; was professor at Berlin from 1872. He published, among other works, a new edition of Zeuss's *Grammatica Celtica* (1871), and many essays in the *Zeitschrift für vergleichende Sprachforschung*, and in Kuhn's and Schleicher's *Beiträge zur vergleichenden Sprachforschung*, some of which have been translated into English under the title *Celtic Studies* (1863). D. at Misdroy, Wollin island, Aug. 19, 1875.

Ebel, JOHANNES WILHELM: divine; b. at Passenheim, Prussia, Mar. 4, 1784; educated at Königsberg, where he became preacher and teacher; was accused of heresy and of founding a sect on grossly immoral principles, and although completely acquitted in two different trials was deprived of his pastorate and died in retirement at Ludwigsburg, Aug. 18, 1861. See his *Life* by J. I. Mombert (New York, 1882).

Ebeling, ā′be-ling, CHRISTOPH DANIEL: scholar and writer; b. in Hildesheim, Germany, Nov. 20, 1741. He devoted himself chiefly to geographical studies, and for his great work, *Geography and History of North America* (Hamburg, 5 vols., 1793–99), he was thanked by the Congress of the U. S. His valuable collection of books and maps relating to this subject was purchased in 1818 by Israel Thorndike, and presented to Harvard College. D. in Hamburg, June 30, 1817.

Eb'ensburg: borough; on railway; capital of Cambria co., Pa. (for location of county, see map of Pennsylvania, ref. 5–D); 26 miles W. of Altoona; has sawmills, woolen-mills, and tanneries. Pop. (1890) 1,202; (1900) 1,574.

Eberhard, CHRISTIAN AUGUST GOTTLAB: poet and savant; b. at Belzig, Prussia, 1769; was at first a student of theology at Leipzig, but afterward devoted himself to literature. In the fields of fiction and poetry he was very successful. D. at Dresden, May 13, 1845. His collected *Works* fill twenty volumes, but he is best known in the literary world as the author of the idyl *Hannchen und die Küchlein* (1822) and of a long poem in hexameters called *Der erste Mensch und die Erde* (1828).

Eberhard, ā′ber-haărt, JOHANN AUGUST, D. D.: philosopher; b. in Halberstadt, Prussia, Aug. 31, 1739; studied theology at Halle; gained distinction as an elegant writer, and became Professor of Philosophy at Halle in 1778. He was a rationalist in theology, and an adversary of Kant in philosophy. Among his best works are an apology for Socrates, *Neue Apologie des Sokrates* (2 vols., Berlin, 1772; 3d ed. 1788); a theory of the fine arts and sciences, *Theorie der schönen Künste und Wissenschaften* (1783; 3d ed. 1790); a general history of philosophy, *Allgemeine Geschichte der Philosophie* (1788); and an excellent dictionary of German synonyms, *Synonymisches Handwörterbuch der deutschen Sprache* (Halle, 1802; 13th ed. by Lyon and Wilbrandt, Leipzig, 1882). D. in Halle, Jan. 6, 1809.

Eberhard, KONRAD: sculptor and painter; b. in Bavaria, Nov. 25, 1768; became Professor of Sculpture in the Academy of Munich in 1816. He is best known as one of the followers of the religious or Catholic revival in art, of which Overbeck was the leader. Among his works are statues of St. George and St. Michael. His best works are in Munich. D. in Munich, Mar. 12, 1859.

Eberhard im Bart: the first Duke of Würtemberg; b. Dec. 11, 1445; became count of a part of Würtemberg when only fourteen years old, and led a dissipated life; but reformed after a voyage to Palestine, and became one of the most popular princes of Germany. He visited Italy, where he met the leading scholars of the age, and on his return fostered the spirit of the new learning in his own state. He founded the University of Tübingen in 1477. Having consolidated his part of Würtemberg with that of his cousin, the emperor created him in 1495, in consequence of his services to the empire, Duke of Würtemberg. As a ruler, he was wise and liberal; his agreement to a limitation of the ducal prerogative was the foundation of the constitution of Würtemberg. D. in Tübingen, Feb. 24, 1496. See Pfister, *Eberhard im Bart, erster Herzog in Würtemberg* (1822).

Ebernburg, ā′bern-boorkh: a small town of the Palatinate, Bavaria; on the river Nahe; 20 miles S. W. of Mentz (see map of German Empire, ref. 6–D). Here is an old ruined castle which belonged to Franz von Sickingen, and was used as a place of refuge by Melanchthon and other reformers.

Ebers, ā′bers, GEORG MORITZ: Orientalist and novelist; b. at Berlin, Mar. 1, 1837; lectured since 1865 in Jena on the language, history, and monuments of ancient Egypt, and became in 1870 Professor of Egyptian Archæology in Leipzig. His chief work is a *Commentary on the Books of Moses* (Die Bücher Mosis; Sachlicher Commentar zu Genesis und Exodus, vol. i., 1868). He also published an essay in Virchow and Von Holtzendorf's collection, *Hieroglyphisches Schriftsystem* (1871); *Durch Gosen zum Sinai*, an account of his travels in Palestine (1872); and *Papyrus E.*,

ein hieratisches Handbuch der ägyptischen Medizin (1874). In 1864 Ebers had turned aside for a time from his scientific pursuits to write a novel, *Eine ägyptische Königstochter* (The Daughter of an Egyptian King). In 1877 a severe lameness induced him to try his hand once more at this less severe kind of writing. He published *Uarda* (1877); *Homo Sum* (1878); *Die Schwestern* (The Sisters, 1880); *Der Kaiser* (The Emperor, 1881); *Serapis* (1885); and other works of fiction, all of which had great success. D. in Aug., 1898. Revised by A. R. Marsh.

Ebert, ā'bert, Adolph: Romance philologist; b. in Cassel, Germany, June 1, 1820; became in 1862 Professor of Romance Languages and Literature at Leipzig. He made many useful contributions to the history of literature in the Romance countries of Europe, especially in the *Jahrbuch für rom. und engl. Literatur*, of which he was one of the founders, in 1859. He will perhaps be longest remembered for his admirable *Geschichte der Literatur des Mittelalters im Abendland*, of which he concluded, however, little more than the review of Latin literature in the Middle Ages (2d ed. 3 vols., 1880–89). D. July 1, 1890. A. R. Marsh.

Ebert, Karl Egon: poet; b. in Prague, Bohemia, June 5, 1801; became librarian to the Prince of Fürstenberg, at Donaueschingen, 1825, holding this and other administrative offices till 1857, when he went into retirement and devoted himself exclusively to literature. He wrote tragedies, dramas, and epics, but his lyric poetry shows his talent to the best advantage. Among his works are *Bretislaw und Jutta*, a drama (Prague, 1835); *Wlasta*, a national heroic poem of Bohemia; the idyl, *Das Kloster*, and his *Gedichten* (1828). D. in Prague, Oct. 24, 1882.

E'bionites [Heb. *ebion*, poor]: a name given at first to all Christians on account of their poverty; then given by Gentile Christians to Jewish Christians; and finally restricted to heretical Jewish Christians. Irenæus (between 182–188 A. D.) is the first to mention the Ebionites by name, though they are thought to be the "hereties" spoken of by Hegesippus some years earlier. The Pharisaic, or the older Ebionites, rejected the writings of Paul and expressed the greatest hatred of him and his opinions, insisted upon the observance of the Mosaic ritual, and were humanitarians and millenarians. They had a recension of the Gospel of Matthew, which they termed "the Gospel according to the Hebrews," and which omitted all allusion to Christ's supernatural birth. To them Christ was a mere man. The Essenic Ebionites, who came up later under Gnostic influences, were more speculative and ascetic, although they practiced marriage. They identified Christianity with primitive Mosaism, and made out of Christ a prophet. They produced the Clementine literature. Ebionism showed life in any force only for a hundred years, never had any considerable influence, yet lingered till about the middle of the fifth century. See R. A. Lipsius, *Die Quellen der ältesten Ketzergeschichte* (Kiel, 1875). Revised by S. M. Jackson.

Eb'onite [so called in allusion to its resemblance to ebony]: a hard black compound obtained by blending caoutchoue with variable proportions of sulphur, generally about half its weight. It is called vulcanite in the U. S.

Ebony [from Lat. *e'benus*, Gr. ἔβενος; prob. a Semitic loan-word]: a name given to a number of tropical or warm-temperate woods. The large part of the ebonies are from the Old World tropics, and they are mostly members of the *Ebenaceæ* or Ebony family. The true ebony belongs to two species of *Diospyros*, *D. embryopteris* and *D. ebenum*. The former grows in India and the latter in Ceylon. *Diospyros melanoxylon* of India and several other species also yield commercial ebony. The "green ebony" of Jamaica is the wood of *Brya ebenus*, a tree of the *Leguminosæ*, which is also known as "cocus-wood." The beautiful Calamander-wood (*q. v.*) is also a species of *Diospyros*. Ebony is a hard and very dense wood, aromatic—particularly when burned—and capable of taking on a high polish. It is ordinarily heavier than water, and of a deep black color. It was known to the Romans. The genus Diospyros (*q. v.*) is widely distributed, and its wood is everywhere characterized by some or all of the qualities which are present in the ebony of commerce. Two species are native in the U. S. L. H. B.

Eboracum: See York.

Ebrard, ā'brärt, Johann Heinrich August: Protestant theologian; b. at Erlangen, Germany, Jan. 18, 1818; studied there and at Berlin; became Professor of Theology at Zurich 1844, at Erlangen 1847, consistorial councilor in Spires 1853, and resigned professorship in 1861; became pastor of the French Reformed Church at Erlangen 1875. He was a prominent representative of the orthodox school. Among his works are *Christliche Dogmatik* (2 vols., 1852; 2d ed. 1863); *Praktische Theologia* (1856); *Peter Lotich der jüngere* (2d ed. 1883). D. at Erlangen, July 23, 1888.

E'bro, Span. pron. ā'brō (anc. *Ibe'rus*; Fr. *Èbre*): a river of Spain; rises in the Cantabrian Mountains near the northern boundary of the province of Burgos. It flows nearly southeastward through the provinces of Navarre and Saragossa, forms the boundary between Huesca and Teruel, and enters the Mediterranean 22 miles E. of Tortosa. The delta at its mouth is crossed by a canal. The chief towns on its banks are Logroño, Tudela, Saragossa, and Tortosa. Its whole length is about 440 miles. Its navigation is rendered difficult by rapids and rocks. A canal extends along the Ebro from Tudela to Sastago, 40 miles below Saragossa.

Ebullioscope, ĕ-bŭl'li-ō-skōp [from Lat. *ebulli're*, boil + *scope*, from Gr. *-σκοπος*, observing]: an instrument for ascertaining the strength of alcohol or other distilled liquids by indicating the boiling-point and the barometrical pressure at the time of the experiment. These instruments are of various kinds; those of Vidal and of Conatty are the best known.

Ebullition, eb-ŭl-li'shŭn [from Lat. *ebulli'tio*, deriv. of *ebulli're*, boil up]: boiling; the violent agitation into which liquids are thrown by the rapid escape of their vapor when sufficiently heated. Before ebullition begins, if sufficient heat is applied, the temperature of the liquid continually rises; but when the liquid reaches the "boiling-point"—the point at which ebullition is seen—the temperature is constant. Ebullition occurs at the temperature at which the vapor tension of the liquid in question is sufficient to overcome the pressure to which the bubbles are subjected. See Boiling-point.

Ecbat'ana, or **Agbatana** (in Fr. *Ecbatane*): a celebrated ancient city; the capital of Media; situated near the base of Mt. Orontes (*Elwend*), about 165 miles S. W. of Teheran. Its foundation is attributed by tradition to Semiramis, but according to Herodotus it was founded by Deïoces 708 B. C. It stood on a conical hill, and was surrounded by seven concentric walls, each of which was higher than the next outer one. It was the favorite summer residence of the kings of Media and Persia, who had here a magnificent palace and a citadel of immense strength. Alexander the Great captured it in 331 B. C., and obtained a very large booty. After this it became a mere provincial town till the time of the Parthians, when it was again the summer residence of kings. Nothing is heard of it in history after its conquest by the Sassanidæ. This city is called *Achmetha* in the book of Ezra. Some recent writers believe it to be the modern Hamadân (*q. v.*). Rawlinson attempts to identify it with the ruined *Takht-i-Soleimán*.

Eccard, Johannes: musical composer; b. in Mühlhausen, Prussia, 1553; studied at Munich under Orlando Lasso; returned in 1574 to Mühlhausen, where he edited with von Burgk a collection of sacred songs. In 1595 he became chapel-master at Königsberg, and in 1608 was called to Berlin as chief conductor of the elector's chapel. Eccard composed exclusively vocal music. His compositions are remarkable for their deep religious feeling as well as for the extraordinary skill which they reveal as works of art. D. in 1611.

Ecce Homo, ek'sā-hō'mō [Lat., behold the man]: the words uttered by Pilate (John xix. 5) when he brought Jesus forth to the people. Monkish tradition points out the spot, now marked by an arch called *Ecce Homo*, only the piers of which appear to be ancient. It spans the *Via Dolorosa* at its highest point, and has "a narrow gallery or chamber on the top." "Ecce Homo" is the name given to pictures of Christ crowned with thorns. Correggio's, in the National Gallery, London, is generally considered the best.

Eccentric [from Gr. ἔκκεντρος, out of the center; ἐκ, out of + κέντρον, center]: in machinery, a device by which circular motion gives rise to "to-and-fro" motion. In one of the forms of the eccentric a disk is made to revolve around a point not in its center. The disk turns in a metallic collar, which is thrown back and forth by the revolutions, and to the collar a rod is attached which receives the required to-and-fro motion. This arrangement is often used to give motion to sliding valves in steam-engines.

Ecchelensis, Abraham: See Echellensis, Abraham.

Ecclesfield: township of the West Riding of Yorkshire, England; 5 miles N. of Sheffield (see map of England, ref. 7–H). It has manufactures of cutlery, linen, and nails. Coal and iron mines are worked in the vicinity. Pop. (1891) 25,890.

Ecclesia [Gr. *ἐκκλησία*, assembly, deriv. of *ἐκκαλεῖν*, call forth]: the great assembly of the Athenians, in which every free citizen might vote. Although possessing supreme authority in the state from a very remote period, it was after a time seldom convened, so that the management of the state fell into the hands of the archons, who were elected from the nobles. Solon afterward appointed it to meet four times every thirty-five days. This was the ordinary ecclesia. The extraordinary assembly, called the cataclesia, was convened on occasions of unusual importance by special messengers to the people. The subjects discussed in the ecclesia were restricted by Solon to such as had passed through the senate of five hundred, but this rule was not strictly observed. The magistrates who managed these assemblies were the prytanes, proedri, and epistates: the first convened the people, the second proposed the subjects on which they were to decide, the third presided over the whole. The name ecclesia was afterward given generally to any public assembly regularly convoked.

Ecclesias'tes [Gr. *ἐκκλησιαστής*, member of an *ἐκκλησία*, assembly; used in Septuagint to translate the Heb. *qōhéleth*, which the English versions translate preacher]: a canonical book of the Old Testament. Its author writes in the person of "Qoheleth," who is described as king in Jerusalem and son of David—i. e. Solomon. Since the time of Grotius (1644) the Solomonic origin of the book has been denied by continental critics generally, even by orthodox writers like Hengstenberg, Keil, and Delitzsch, the dates assigned ranging from 536 to 150 B. C. Its post-Solomonic origin has been argued (1) from its distinctly neo-Hebraic linguistic character; (2) from the sentiments expressed. On the other hand, the ascription of the book to Solomon has been defended by such scholars as Schelling, Van Essen, Hahn, Pusey, Wordsworth, and Tayler Lewis. The old Jewish tradition ascribes it to the men of Hezekiah. The two leading ideas of the Preacher are the vanity of earthly good and the certainty of judgment. The alleged epicureanism of several passages, so much emphasized by some critics, is thought by others to be simply ironical. In any case it presents no teachings that are peculiar to the followers of Epicurus, but only such as are common to them and earlier teachers. For the literature, which is very abundant, see commentary by Ginsburg (London, 1857). See the commentaries by E. H. Plumptre (in *Cambridge Bible*) and S. Cox (1890). Revised by Willis J. Beecher.

Ecclesiastical Commissioners: in England and Wales, the archbishops, bishops, the principal deans, several of the principal judges, the chief baron of the exchequer, the master of the rolls, and twelve lay members, all ehnrchmen, who are appointed for the purpose of examining the state of dioceses and the episcopal revenues, of uniting or dividing parishes (when expedient), and of carrying out other measures for the benefit of the Established Church. The commission was established in 1835.

Ecclesiastical Courts: courts in which ecclesiastical causes are tried. See Courts.

Ecclesiastical History: See Church History.

Ecclesiastical Law: See Canon Law.

Ecclesias'ticus [from Gr. *ἐκκλησιαστικός*, pertaining to the *ἐκκλησία*, assembly, ehurch], or **the Wisdom of Jesus the Son of Sirach**: a book eonsidered apocryphal by Jews and Protestants, but reeeived as canonical by the Roman Catholic and Greek Churches. By the Anglican Articles it is recommended to be read for edification. It appears to have been written in Hebrew at Jerusalem, either about 200 or about 300 B. C. See Pseudepigrapha.

Ecdysis: See Entomology.

Echegaray, José: dramatist and statesman; b. in Madrid, Spain, in 1835; since 1858 Professor of Mathematics and Physics in the Engineering School in Madrid. In this capacity he has published several mathematical and scientific works of value. He has also been prominent in political affairs, being Minister of Commerce in 1868, Minister of Public Instruction in 1873, and Minister of Finanees in 1874. It is as a dramatist, however, that he is chiefly known, even in Spain. His themes are almost invariably tragic ones, and his endeavor is to show the terrible consequences of sin. It must be admitted that he often produees a deep effect; yet oftener, perhaps, the excessive emphasis of his style, his high colors, and his inability to be simply direct, repel the speetator. His first success as a playwright was obtained by *La Esposa del vengador* (1874). Sinee then he has produced many dramas, the most noteworthy being *O locura o santidad* (1878); *El Gran Galeotto* (1881); *Conflicto entre dos deberes* (1885); *Vida alegre y muerte triste* (1887).

A. R. Marsh.

Echellensis, ek-el-len'sis, Abraham: a learned Maronite; b. at Eekel, in Syria. He was Professor of Arabic and Syriac at Rome, and removed abont 1630 to Paris, where he assisted in the editing of Le Jay's polyglot Bible. He was the author of a history of the Council of Nicæa from Oriental sources, and of an *Oriental Chronicle*. D. in Italy in 1664.

Echelon, esh'e-lon [Fr. *échelon*, *échelle*, ladder: Ital. *scala*; Span. *escala* < Lat. *scala*, steps]: in military tactics, an arrangement of troops when several divisions are drawn up in parallel lines, eaeh to the right or the left of the one preceding it, like "steps," so that no two are on the same alignment. Each division by marching direetly forward can form a line with that which is in advanee of it.

Echeneididæ, ek-e-neĕ-id'i-deĕ [deriv. of *echeneis* = Gr. *ἐχενηίς*, ship detaining, name of a fish; *ἔχειν*, hold + *ναῦς*, ship]: a family of fishes of the order *Acanthopteri* and suborder *Discocephali*, particularized by the development of a broad oval sucking-disk on the top of the head. The body is more or less elongated, and the scales very small and imbedded in the skin; the head very depressed; the mouth is moderate, and the lower jaw projects eonsiderably beyond the upper; the dorsal fin exhibits, in part, a perfectly anomalous structure—viz., the anterior portion, instead of being a fin, is developed into the broad oval disk characteristie of the group; by means of this disk the fishes are enabled to adhere to various objects; the posterior portion of the dorsal is normally developed as a true rayed fin. The fishes eomprised in this family are among the most singular of the class, and are familiar to all seafaring people. By sailors and shoremen they are generally designated as suckers; but this name is given to so many different animals that, unfortunately, it is not at all characteristic, although so applicable in other respects to the species. Their peculiar aspect and the depression of their head induce persons unfamiliar with ichthyology to believe that the back is the abdominal surfaee, and, *vice versa*, that the belly is the true back. They are sluggish in their movements, and depend for transportation rather upon others than their own exertions. They are to a large extent commensals, or parasitic upon other fishes, and, to a eonsiderable degree, they seem to restrict their attentions to special animals. Thus, of the common speeies, one (*Remora remora*) chiefly attaches itself to large sharks (*e. g. Eulamia*, *Galeocerdo*, etc.), and another (*Echeneis naucrates*) is partial to the sea-turtles. These are the most common; the others are more limited and much rarer. The more notable are *Remoropsis brachyptera*, which is a parasite of sword-fishes, and *Phtheirichthys lineatus*, which is parasitic upon the barraeuda (a large *Sphyræna*). See also Sucker and Discocephali.

Revised by D. S. Jordan.

Echenique, José Rufino: soldier and statesman; b. at Puno, Peru, 1808. When a mere boy he joined the patriot army, and was taken prisoner by the Spaniards. In 1833, when a colonel, he induced the troops which had revolted under Gamarra and Bermudez to return peacefully to their allegiance, an event whieh is known as the "Embrace of Maquinhuayo." He served on the side of Santa Cruz at the battle of Yungay (Jan., 1839), but subsequently made his peace with the victor, Gamarra. In 1843 he declared against Vivanco at Xauxa, and in 1845 he was a member of Castilla's council of state. On Apr. 20, 1851, he was elected president of Peru. At first his term promised to be peaceful, but in 1853 charges of extravagance and irregularities in the finances were made against him, and Domingo Elias headed a revolt which was ended by the battle of Saraja, Jan. 7, 1854. A second revolt, led by Castilla and Elias, resulted in Eehenique's defeat at the bridge of Iseuchacha, in the valley of Xauxa, Aug. 2, 1854; he retired to Lima, but after several days of hard fighting before the city was again defeated at the battle of La Palma, Jan. 5, 1855, and driven from the country. He was allowed to return as a private citizen in 1862, took part in the Spanish war 1866, and was again a presidential candidate in 1872. D. at Arequipa, Oet. 18, 1879.

Herbert H. Smith.

Echeverría, Estéban: poet; b. in Buenos Ayres, 1809. His first poem, *Elvira*, published in 1832, was followed in 1834 by *Consuelos*, a collection mainly of lyrics, and later by *Rimas*, another collection, and *La Cautiva*, his principal work. He was banished by Rosas to Montevideo, where he died in 1851. Echeverría's works were republished in five volumes in 1874; they are very popular throughout Spanish America. H. H. S.

Echeverría, Francisco Javier: statesman; b. in Jalupa, Mexico, July 25, 1797. He inherited a large commercial business from his father, carrying it on first in Vera Cruz and after 1834 in Mexico. In 1829 he was a deputy to congress, and later was several times minister of the treasury (1834, 1836, and 1837 to 1841). In the latter year he was, for a short time, acting president during the absence of Bustamente. He was again deputy in the congress of 1850–51. D. in Mexico, Sept. 17, 1852. H. H. S.

Échevin, ā'she-văñ' [Fr. *échevin*: Ital. *schiavino*: Span. *esclavin*, a Teuton. loan-word, O. H. Germ. *skeffino* > Mod. Germ. *Schöffe*]: in France from the time of Charlemagne to the Revolution (1789), a royal officer of justice and of finance, whose duties were various in different periods. For the last six hundred years of the duration of the office it was chiefly exercised in the cities. The échevins of Paris were assessors, and had authority as magistrates in some kinds of civil business.

Echidna, ĕe-kid'na [Gr. ἔχιδνα, serpent]: in Greek mythology, a monster, half serpent and half woman; according to Apollodorus, the daughter of Tartarus and the mother of Cerberus, the Chimæra, and other monsters. See Pausanias, 8, 18.

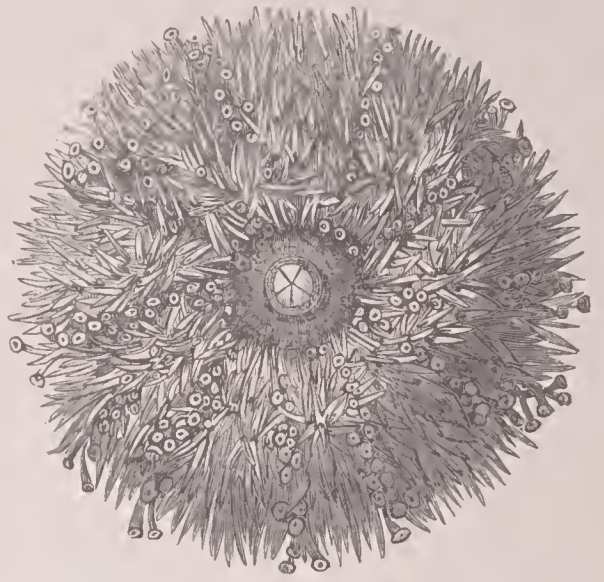
Echidna: a genus of quadrupeds belonging to the order *Monotremata*, having a long slender muzzle, toothless jaws, powerful long-clawed feet, and strong sharp spines thickly set in long thick fur. The animals of this genus are related to the duckbill (*Ornithorhynchus*), and, like it, lay eggs. They burrow in the earth, and feed on ants and other insects, whence they are sometimes called spiny ant-eaters. They are from a foot to a foot and a half long, but a related animal from New Guinea, *Zaglossus* or *Prœchidna bruijnii*, is much larger. *Echidna setosa* is from Van Diemen's Land, *E. aculeata* from Australia, and *E. lawesii* from New Guinea. The name *Echidna* is preoccupied in zoölogy, and the name *Tachyglossus* should be used for these animals.
F. A. Lucas.

Echimys, ĕe-kī'mis [abbrev. for *echinomys*; Gr. ἐχῖνος, hedgehog + μῦς, mouse]: a genus of South American rodent mammals called "spiny rats." They are about the size of large rats, and have numerous flattened spines scattered through their hair. There are six or eight species.

Echinades, ĕe-kin'a-dēez [Gr. Ἐχινάδες, also called Ἔχῖναι, as if named from ἐχῖνος, hedgehog]: the ancient Greek name of a group of islands of the Ionian Sea, off the mouth of the Achelous. Some of the ancient islands have been joined to the mainland by alluvial deposits. The islands are small, rocky, and unimportant. Seventeen have names, but only nine are cultivated. They are now called Kurtzelari islands, and the largest is named Petalá; but Oxiá, Makrí, and Vrómona are the most important. Lat. of the S. end of Oxiá, 38° 17′ N., lon. 21° 6′ E.

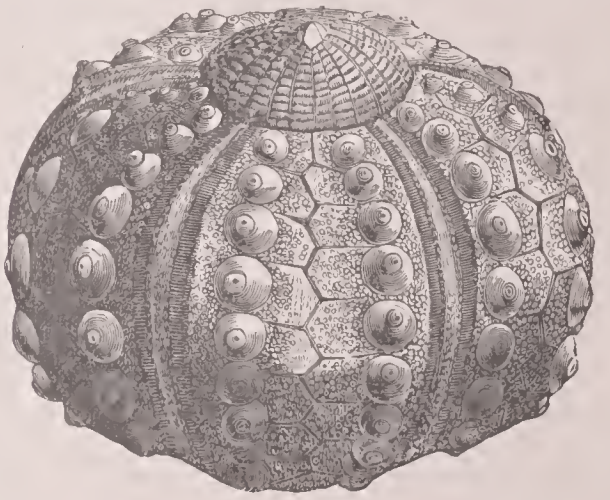
Echinoder'mata [from Gr. ἐχῖνος, hedgehog + δέρμα, -ατος, skin]: the echinoderms, considered as a grand division of the animal kingdom. They were formerly classed with the Cœlenterates as Radiates, from the fact that their parts (in multiples of five) radiate from a central axis. They have an external calcareous skeleton, often covered with spines, an alimentary canal distinct from the body cavity (see Cœlenterata), a radiate nervous system, and a peculiar "water vascular" system, which in some forms is connected with a unique system of locomotor tube feet or ambulacra. They reproduce by eggs (the sexes being separate), and the larvæ in most forms are bilaterally symmetrical, without any trace of the radiate structure so typical of the adults. In some instances these larvæ are characterized by the development of long arms, sometimes stiffened by a slender internal rod of carbonate of lime. At the time of metamorphosis these arms are absorbed, and the new animal forms around the throat of the old, the water vascular system apparently taking the initiative in the metamorphosis. Fossil Echinoderms occur in the Silurian and all later rocks. Some live on animals, others on plants; all are marine. Their relationships to other forms are obscure. The branch Echinodermata is divided into Crinoidea, Asteroidea, Starfish, Ophiuroidea, Echinoidea, and Holothurioidea (*qq. v.*). J. S. Kingsley.

Echinoidea [from Gr. ἐχῖνος, a hedgehog + εἶδος, shape]: a class of Echinodermata popularly known as **Sea-urchins**, or sea-eggs. The typical forms are flattened spheres, with



Sea-urchin showing the spines, tube feet, and the five jaws.

mouth at one pole and vent at the other. The outer wall of this sphere is made up of ten rows of calcareous plates, one series being covered with spherical knobs, on which are



Sea-urchin with the spines removed.

articulated with a ball-and-socket joint the hardened spines which form a part of the animal, the other series being perforated by minute holes, through which pass the peculiar ambulacra or tube feet by which the animal moves. In all, except the heart-urchins, the mouth is armed with five teeth, which meet in the center, and which sharpen themselves like those of the squirrels. A few of the Echinoids are used for food, a European species (*Echinus esculentus*) being largely eaten. Some of the tropical species have poisonous spines, which, when they penetrate the flesh, produce severe wounds. The Echinoids are divided into the regular urchins or *Cidaridea*, the cake-urchins, or *Clypeastridea*, and the heart-urchins, or *Spatangidea*. J. S. Kingsley.

Echi'nus [Gr. ἐχῖνος, hedgehog]: a genus of sea-urchins or Echinoidea (*q. v.*).

Echinus: in architecture, a convex molding or ovolo decorated with "egg-and-dart ornaments," somewhat resembling chestnuts in form. The name is also applied to the circular cushion-like member under the abacus in the Tuscan and Doric orders, whether so decorated or not.

Echiu'ridæ [Gr. ἔχις, an adder + οὐρά, tail]: a family of peculiar degenerate Chætopod annelids in which the segmentation of the body has been lost while the bristles are reduced to a pair of strong spines and (in *Echiurus*) numerous bristles at the hinder end of the body. The body cavity is large, mouth and anus sub-terminal, while the head lobe is developed into a proboscis-like organ, forked at its extremity in *Bonellia*. In the young the annelid affinities are quite marked, the larva resembling that of the regular marine Chætopods and the body showing the rudiments of fif-

teen segments. The *Echiuridæ*, which are represented on the shores of the U. S. by the genera *Echiurus* and *Thalassema*, were formerly grouped with the *Sipunculaceæ* in a division (*Gephyræa*) formerly thought to be related to the Echinoderms. J. S. Kingsley.

Echo (in Gr. 'Ηχώ): in classic mythology, a nymph who aided Jupiter in escaping the watchfulness of Juno by detaining the latter with her amusing talkativeness; but that goddess, discovering the deception, ordained that she should not be able to speak until some person had spoken to her, nor to be silent after any one had addressed her. Cherishing for Narcissus a passion which was not requited, she pined away until nothing remained of her but her voice.

Echo [Gr. ἠχώ, echo, ringing sound, cf. ἠχή, ἦχος, sound, noise, Lat. *vāgor, vāgî tus*, whining, crying]: the reflection of sound from a distant surface. Several conditions must be fulfilled before an echo can be produced. The ear must be situated in the line of the reflection; and in order that the person who emits the sound may himself hear the echo, this line must be perpendicular to the reflecting surface, but if there are several such surfaces the sound may be brought back by a series of successive reflections. The opposing surface must be at a certain distance from the ear, for if the directed and reflected sounds succeed each other with great rapidity, they are confounded. Thus vaulted caves and large rooms have a strong resonance, but produce no echo.

Sound passes through the atmosphere at the rate of about 1,125 feet in a second; hence a person placed at half that distance would hear the echo exactly one second after the sound was emitted by him. The least distance of the reflecting surface from the point whence the sound is emitted must be about 50 feet.

Unless the surface reflecting the sound is of considerable extent, the echo will be too feeble to be heard. Some concavity in the surface by which diverging rays of sound are concentrated at the point where the echo is audible is favorable, if not absolutely essential, to the production of echoes. It is a property of the ellipse that every sound proceeding from one of its foci and impinging against the curve is reflected into the other focus; whence two persons placed in the two foci of an elliptic chamber may converse with each other in a whisper, and not be heard by those who are in the other parts of the room. Thus walls or buildings approaching the elliptic form return sounds with great force and distinctness. The faintest sound is conveyed from one side of the "whispering gallery" of St. Paul's, London, to the other, but is not heard at any intermediate point. Some echoes are remarkable for their frequency of repetition. An echo in the Simonetta palace, near Milan, is said to repeat the report of a pistol sixty times. To the same kind of multiple, or repeating, echo belongs that of Killarney. The phenomenon is caused either by the occurrence of several reflecting surfaces at different distances in the direction of the sound, and with sufficient interval between them, or by two surfaces being inclined to each other in such a way as to give repeated reflections of the sound from the one to the other, like the mirrors of the kaleidoscope. The number of syllables that any particular echo will repeat depends upon the distance the sound has to traverse; an echo in Woodstock Park, England, repeats seventeen syllables.

Echo Cañon: a remarkable ravine or defile in Summit co., Utah; visible to passengers on the Union Pacific Railway; 975 miles from Omaha. It is inclosed between high vertical walls of rock of great grandeur and beauty.

Ecija, ā'thĕe-*khaa* (anc. *As'tigi*): a city of Andalusia, Spain; on the river Genil, about 50 miles E. N. E. of Seville (see map of Spain, ref. 19–D). It is well built, and has numerous churches, convents, and hospitals; also manufactures of linens and coarse woolen fabrics. On the border of the river is an *alameda* (promenade) adorned with statues and fountains. Many Roman remains are found here. The climate is so hot that Ecija is called "the frying-pan of Andalusia." The ancient *Astigi* was one of the chief towns of Hispania Bætica. Pop. (1887) 23,615.

Eck, Johann (properly *Maier*): a learned and vigorous Roman Catholic opponent of Luther: b. at Eck, Swabia, Nov. 13, 1486; was professor at Ingolstadt from 1510 until his death. His most famous encounter with Luther was at Leipzig, 1519. He prepared a German translation of the Bible as a rival of that of Luther (1537). D. at Ingolstadt, Feb. 10, 1543. See his *Life* by Th. Wiedemann, Regensburg, 1865. C. H. Toy.

Eckart, or **Eckhart**, Johannes (called *Meister Eckhart*): See Eckhart, Meister.

Eckermann, Johann Peter: author, noted as the friend of Goethe; b. at Winsen, Hanover, 1792; served in the war of liberation (1813–14), and studied at the Gymnasium of Hanover and the University of Göttingen. In 1823 his *Beiträge zur Poesie, mit besonderer Hinweisung auf Goethe* (Stuttgart) brought him to the favorable notice of Goethe, who employed him at Weimar as an assistant in editing his works. He was for several years tutor to the grand duke's son, and in 1838 was appointed librarian to the grand duchess. Goethe's will intrusted to Eckermann the publication of the poet's posthumous works, which appeared in 1832–33, and in connection with Riemer he afterward brought out a complete edition of Goethe's writings in forty volumes. But his fame rests chiefly on his *Gespräche mit Goethe in den letzten Jahren seines Lebens 1823–32* (2 vols., Leipzig, 1837), which throws much light upon Goethe's character and private life. It has been translated into many European languages. The English translations are Margaret Fuller's (Boston, 1839) and John Oxenford's (London, 1850). Eckermann died at Weimar, Dec. 3, 1854. F. M. Colby.

Eck'ersberg, Johan Frederik: landscape-painter; b. in Drammen, Norway, June 16, 1822. He belongs to the Düsseldorf school. In 1859 he established an art school in Christiania, at which many prominent Norwegian artists have been educated. Among his best pictures are *Sunrise in the High Mountains* and *The Bridal Party in the Hardangerfjord*. D. July 13, 1870. R. B. A.

Eckersberg, Kristoffer Vilhelm: painter; b. in Denmark, Jan. 2, 1783. Besides producing a large number of works, he was a teacher, and many of the most talented Danish painters of the nineteenth century were his pupils. His portrait of Thorwaldsen is famous, and he was very successful in painting naval engagements. D. from cholera, July 22, 1853. See P. H. Weilbach, *Dansk Kunstlerlexikon*. R. B. A.

Eckert, Thomas Thompson: telegrapher; b. in St. Clairsville, O., Apr. 23, 1825; in 1849 placed in charge of the telegraph-office at Wooster, O.; in 1859–61 managed a gold-mining company in North Carolina; in 1861 removed to Cincinnati, where he was placed in charge of the military telegraph-office at the headquarters of Gen. McClellan; in 1862 held a similar position in connection with the Army of the Potomac; in same year established at Washington the headquarters of the military telegraph at the War Department, and was promoted to the rank of major (brevet lieutenant-colonel 1864, brevet brigadier-general 1865); was made Assistant Secretary of War July 27, 1866, and remained in office till Feb. 28, 1867; resigned to become general superintendent of the eastern division of the Western Union Telegraph Company; in 1875 became president of the Atlantic and Pacific Telegraph Company, and in 1880 president of the American Union Telegraph Company. In 1887 he became vice-president and general manager of the Western Union Telegraph Company, and in 1893 was elected its president.

Eck'hart, Meister (Master): the greatest of the German mystics; b. in Thuringia, about 1260; was vicar of the Dominican order in Erfurt, then vicar-general in Bohemia, taught in Paris in 1311–12; became a teacher of the theological school in Strassburg, and in 1327 he became provincial in Cologne. He introduced many reforms into the monasteries, attracted great attention by his sermons, and was supposed to be connected with the Brethren of the Free Spirit. A papal bull issued soon after his death condemned twenty-eight sentences in his sermons. He has been called the "father of modern pantheism," and is regarded as one of the greatest men of the German race, and one of the deepest thinkers of all ages. D. in 1327, near the beginning of the year. A collection of his writings, as far as they have been preserved, has been published by Pfeiffer in the second volume of *Deutsche Mystiker* (1857). See the monographs on his system and character by Martensen, *Mester Eckart* (Copenhagen, 1840); by Lasson, *Meister Eckhart* (1868); also E. Sievers, *Zeitschrift für deutsches Alterthum* (15, 373–439). Revised by Julius Goebel.

Eckhel, Joseph Hilarius: numismatist; b. in Enzesfeld, Lower Austria, Jan. 13, 1737. His catalogue of the famous coin collection in the Vienna Museum has been the model of all subsequent numismatic catalogues, while the *Doctrina nummorum veterum* (8 vols., 1798) remains the

standard authority on the subject. D. May 16, 1798, in Vienna.

ALFRED GUDEMAN.

Eckmühl (in Germ. *Eggmühl*): a village of Bavaria, 13 miles S. S. E. of Ratisbon (see map of German Empire, ref. 7–F). Here on Apr. 22, 1809, Napoleon defeated the Austrian Archduke Charles, who lost 5,000 killed and wounded, besides 7,000 prisoners. The effect of this victory and of the three minor engagements from Apr. 20 to 23, inclusive, was to drive the Austrians into Bohemia and leave the road to Vienna open to Napoleon. DAVOUT (*q. v.*) received the title of Prince of Eckmühl for his conduct in this battle.

Eclampsis [from Gr. ἔκλαμψις, a shining forth], **Puerperal**: See CONVULSIONS.

Eclectic [from Gr. ἐκλεκτικός, selective, deriv. of ἐκλέγειν, to select]: selected or chosen from several others. This term was applied to philosophers who endeavored to select from the systems of various schools the true or most probable doctrines, and to combine these into a harmonious system. An eclectic spirit, it is evident, can exist or prevail only at a period of some maturity in philosophical speculation. In one sense of the word, Plato and Aristotle may be regarded as eclectics, for they both availed themselves largely of the doctrines of preceding philosophers. But in the hands of these great thinkers the *discerpta membra* are endued with a principle of vitality, and reunited as coherent parts of a harmonious system. The term eclectic is especially applied to philosophers of a later age and inferior order. Among these may be classed Epictetus, Potamon, Plutarch, and Plotinus. Among the most eminent modern eclectics, Victor Cousin, the brilliant expounder of the history of philosophy, affords a favorable specimen of the eclectic spirit.

Eclecticism (in medicine): the principles and the practice of that school of medicine which leaves the physician free to select from any and all sources remedies that will cure his patients and to reject all remedies that have been proved to be injurious. *Vires vitales sustinete*, i. e. "sustain the vital forces," has from the very beginning been the recognized principle on which all treatment has been based.

At the beginning of the nineteenth century the prevailing method of treating disease was by blood-letting and the indiscriminate use of large doses of calomel and antimony to produce purging and vomiting. It was against this depleting system of treatment that Dr. Wooster Beach, of New York, and his associates protested, not with the view of organizing a new school, but in the hope of effecting a reform. They were at once denounced by the majority of the profession for attempting an innovation on the recognized methods of practice, and thus the reformed medical school was forced into existence. Through the labors of these pioneers and their disciples the barbarous practice of blood-letting was abolished, antimony was discarded, and mercury but little used, while all schools of medicine now recognize the importance of sustaining the vital forces, and all physicians are anxious to be known as Eclectics.

In 1826 Dr. Wooster Beach established the New York Reformed Medical College, and soon after associated with himself Drs. Thomas V. Morrow and Isaac G. Jones. Recognizing the need of text-books, he published several, which compared favorably with those of the dominant school published at the time.

In 1831 Drs. Morrow and Jones, upon the invitation of Rev. Dr. Chase, then Bishop of Ohio, removed to Ohio, and organized the medical department of the Worthington University, and continued their labors for reformed medical practice till 1842, when they moved to Cincinnati and established the Reformed Medical School. Drs. Balbridge, Carr, L. E. Jones, Jordan, and B. L. Hill were associated with them as teachers, and this school was continued till 1845, when it was incorporated as the Eclectic Medical Institute.

Samuel Thomson, though contemporary with Beach, was not a fellow-laborer. It is a mistake to regard Eclecticism as an offshoot of Thomsonianism, though many Thomsonians in later years became Eclectics.

A Reformed Medical Society was organized in New York in 1827, and a second in Worthington in 1836. The National Eclectic Medical Association was organized in 1848, and held annual meetings till 1857. It was reorganized in 1870, and meets yearly. There are societies in nearly all the States and in Great Britain and Australia, which represent about 16,000 Eclectic physicians; and there are successful colleges in New York, Atlanta, Cincinnati, Indianapolis, Chicago, St. Louis, Crete, Nebraska, and San Francisco.

See *National Eclectic Medical Association Transactions*, vol. v.; *Medical Tribune*, vols. vi. and ix.; and Wilder's *History of Medicine* (New York, 1896).

ROBERT A. GUNN, M. D., EDITOR "MEDICAL TRIBUNE."

Eclipse [via Lat. *eclīp'sis*, from Gr. ἔκλειψις, deriv. of ἐκλείπειν, desert, fail, leave]: in astronomy, the obscuration of one celestial body by another, or by its shadow. Eclipses are divisible into three classes, viz.: 1, the obscuration of the sun by the moon, which is called a *solar eclipse*; 2, the obscuration of the moon by the shadow of the earth, which is a *lunar eclipse*; and 3, the obscuration of a satellite of a planet by the shadow of the primary, which is called the *eclipse of a satellite*, as distinguished from an occultation of the satellite, by which is to be understood the disappearance of the satellite behind the body of the primary.

The way in which eclipses of the sun and moon occur is so obvious to one who studies the motions of these bodies that they have been well understood from ancient times. The moon performs a revolution around the earth in about a month, and at every new moon passes nearly between the earth and the sun. If the plane of the moon's orbit coincided with that of the ecliptic, the moon would pass exactly between the earth and the sun at every new moon, and we should have an eclipse of the sun every month. The moon would also pass through the shadow of the earth at every full moon, and thus we should have a monthly eclipse of the moon. As a matter of fact, however, the moon's orbit is inclined about five degrees to the ecliptic. The result is that the moon generally passes above or below the sun at new moon, and above or below the shadow of the earth at full moon. But the orbit of the moon necessarily intersects the ecliptic at two opposite points, called nodes. If the sun happens to be near the line of the nodes at the time of any new moon, then there will be an eclipse of the sun; and if the approach takes place at full moon, there will be an eclipse of the moon.

The motion of the earth in its orbit, and of the nodes of the moon's orbit, are such that the sun seems to cross one or the other of the moon's nodes at intervals of about 173 days, or a little less than six months. Hence, as a general rule, eclipses can occur only at two opposite seasons of the year. But since the period of recurrence is less than six months, the eclipse season, as we may call it, will occur earlier and earlier in successive years. For example, in 1894 the passage of the sun over one node takes place about Apr. 1 and Sept. 20. Hence during that year an eclipse can occur only near these times. But the period when they may occur is eighteen or nineteen days earlier every year, so that in 1898 the eclipse seasons will be January and July.

It happens that the apparent angular diameters of the sun and moon are very near the same. When the moon is nearest the earth it seems a little larger than the sun; when farthest away it is smaller. Referring to Fig. 1, it will be seen that if an observer is within the dark region, between m and m', the light of the sun will be completely shut off by the body of the moon. This dark region is called the umbra. In Fig. 2 it is represented as ending at the point e. Beyond this point the moon seems smaller than the sun, and the light of the sun can never be completely cut off. Now, by a curious coincidence, it happens that this point of the umbra reaches, on the average, very near to the surface of the earth. Sometimes it will not reach the earth; at other times it will go beyond it, according to the respective distances of the sun and moon from us. If the point reaches beyond the earth's surface, then there will be a small narrow region or strip within which the sun will be totally eclipsed. As the moon moves along her orbit, this shadow sweeps along the surface of the earth through a long, narrow belt. In order to see the sun totally eclipsed, the observer must be somewhere within this belt. Maps of all the eclipses which occur are published two or three years

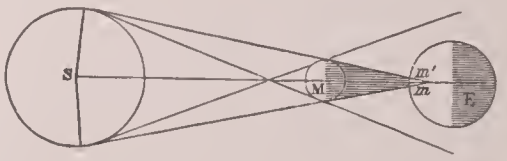


FIG. 1.

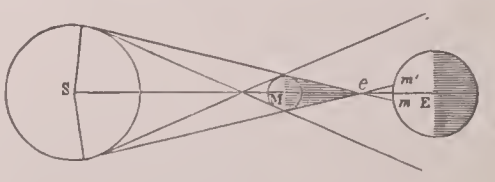

FIG. 2.

in advance in astronomical ephemerides, and by means of them an observer can see exactly at what regions of the earth's surface a total eclipse will be visible. If the shadow comes to a point before reaching the earth, as represented in the second diagram, then there will be a region, *m m'*, within which the moon will be seen projected nearly centrally on the sun, but, the apparent diameter of the sun being the larger, the edge of its disk will be seen as a ring around the dark body of the moon. This remarkable phenomenon is called an annular eclipse of the sun. As in the case of a total eclipse, the annular phase will be seen along only a comparatively narrow belt of the earth's surface.

Owing to the circumstances here described, the duration of a total or annular eclipse is always very small. That of a total eclipse ranges from a few seconds up to four or five, or even, in exceptional cases, seven minutes. The duration of an annular eclipse may be a little greater.

Total eclipses of the sun are looked forward to by astronomers with the greatest interest, because during the few minutes of their occurrence remarkable celestial phenomena can be seen which are not visible at any other time. The observer who is fortunate enough to be within the path of such an eclipse will see nothing remarkable until the sun is nearly obscured. As the moon gradually passes over the solar disk, the latter is at length reduced to a small arc of light, which becomes thinner and thinner, and at length entirely disappears. At once an extraordinary effulgence, or corona, is seen surrounding the dark body of the moon, which looks intensely black in contrast with it. An observer of the total eclipse of Aug. 7, 1869, which was visible in the U. S. from Iowa to North Carolina, thus describes the corona:

"On looking up, one of the grandest spectacles of which it is possible to conceive met the eye. Surrounding the dark body of the moon was a crown of light, with rays shooting out in five great sheaths to a distance equal to the sun's diameter, or nearly a million of miles. We gazed for eight or ten seconds with astonishment at this magnificent spectacle. No painting can represent it, and no pen can describe it."

The brightest part of the corona consists of a comparatively thin ring of white light, immediately around the dark body of the moon, and shading off quite rapidly. The light is, however, very irregular, and the most striking features of the corona are certain beams of soft, white light, which extend out in various directions like the rays from an electric light, sometimes to a distance of several diameters of the sun, or several millions of miles. Photographs of the corona which have been taken from time to time show it to consist very largely of fine lines of light, having a general form somewhat similar to the lines formed by iron filings which are scattered upon paper over a magnet. This appearance suggested to Prof. F. H. Bigelow the idea that the corona is a phenomena of polar forces resembling those of magnetism, and a complete theory of the corona has been constructed on this hypothesis.

Besides the corona, irregular patches of red light are commonly seen here and there around the body of the moon. These have long been known as protuberances, or prominences, and during the total eclipse of 1868, which was visible in India, Mr. Lockyer made the extraordinary discovery that these prominences were due principally to hydrogen gas. It was subsequently found that the whole body of the sun is surrounded by a thin layer of gases at a very high temperature, composed of vapors of several known metals, and perhaps of most of the substances which exist in large quantities on the earth, changed to vapor by the fervent heat which there prevails.

The motions of the sun and moon are such that eclipses recur approximately at an interval of 6.585 days and 8 hours, that is 18 years and 10 or 11 days, according to the number of leap-years which have occurred in the interval. This period is called the Saros. What makes it remarkable is that the time of year of the recurrences will be nearly the same, and the perigee and nodes of the moon's orbit will also return nearly to the same position, so that the eclipse when repeated will be of the same general kind. That is to say, if an eclipse of any sort is seen to-day, then by counting forward a period of one Saros, we shall have another eclipse of very nearly the same kind. Owing, however, to the number of days not being exact, eight hours being left over, the second eclipse will not be visible in the same parts of the earth as the first one was, but generally in regions about 120° farther W. in longitude. It follows that the eclipses remarkable for the duration of totality will recur at the above-named interval. By a study of the motions of the sun and moon through many centuries, it is found that one series of eclipses remarkable for long duration of totality at the present time are those of the years 1832, 1850, 1868, 1886, 1904, 1922, etc. But the duration of the eclipses of this series will continuously diminish, and after a few more periods the eclipse will cease to be total. Another remarkable series will be the eclipses of 1883, 1901, 1919, 1937, etc. This series will attain its maximum in the eclipses of the years 1935 and 1953, and the duration of total phase probably will be the longest that will have been seen for more than a thousand years.

The principal total eclipses of the sun visible in the northern hemisphere from the year 1896 to 1923 inclusive are the following:

Aug. 9, 1896, the moon's shadow passed over the northern part of Norway, Sweden, and Siberia, across Japan into the Pacific Ocean.

Jan. 22, 1898, the shadow passed across Northern Africa and through India, near Bombay and Calcutta.

May 28, 1900, the shadow passed across the northern part of Mexico, through Texas, Louisiana, Mississippi, and North Carolina, passing nearly centrally over Raleigh in that State, and then across the Atlantic to Spain and Northern Africa.

Aug. 30, 1905, the shadow will pass over the northern part of British America in the Hudson's Bay region, across Labrador into the Atlantic Ocean, which it will cross, and thence across Northern Spain, Southern France, the Mediterranean, and Egypt.

Jan. 14, 1907, a total eclipse will be visible in Central Asia, from near the Caspian Sea to China.

Jan. 3, 1908, and Apr. 28, 1911, total eclipses will be visible in the Pacific Ocean.

Oct. 10, 1912, the moon's shadow will cross South America from Peru to Brazil.

Aug. 21, 1914, the shadow will pass across Norway and Sweden, through Russia and Persia, and continue its course nearly to India.

Feb. 3, 1916, the shadow will pass near the Isthmus of Panama into the Atlantic Ocean, and cross it nearly to England.

June 8, 1918, the shadow will cross the Northern Pacific Ocean, strike the coast of America near Vancouver's island, and pass in a southeasterly direction over the whole U. S., reaching to Florida, where it will enter the Atlantic and terminate.

Sept. 10, 1923, the shadow will enter upon the Pacific Ocean, and cross the southern part of California and Texas, where it will enter the Gulf of Mexico.

It will be understood from the foregoing that a total eclipse of the sun at any one place taken at random is an extremely rare phenomenon. A partial eclipse of the sun, however, is visible at any point on the earth's surface every few years. The total number of eclipses of the sun is greater than that of the moon, but an eclipse of the moon is visible over at least an entire hemisphere of the earth, whereas one of the sun can only be seen over a fraction of a hemisphere. Hence in any one place eclipses of the moon may be seen more frequently than those of the sun. Only two, or at most three, eclipses of the moon can occur in any one year, whereas there may be four, or even five, eclipses of the sun.

An eclipse of the moon is for an ordinary observer a remarkable phenomenon, although it is of little astronomical interest. The time of its occurrence, and all the circumstances connected with it, can be predicted with more exactness than they can be observed. The most remarkable circumstance connected with such an eclipse is that although the moon may be completely immersed in the shadow of the earth, it is visible, shining with a lurid copper-colored light. This is owing to the earth's atmosphere, which refracts the sun's light passing over it. An observer of the moon at such a time would see a total eclipse of the sun by the earth. But after the earth had completely passed over and hidden the sun, he would see it surrounded by a bright ring of reddish light caused by sunlight refracted through the atmosphere of the earth. The brilliancy of this light would very largely depend on the amount of cloudiness around that part of the atmosphere through which the sun's rays passed. Hence the brilliancy of the moon in total eclipses varies considerably. It is said to have totally disappeared on some occasions. The light by which it shines is red because the red light passes most freely through the

earth's atmosphere. The cause is the same as that which makes the sun look red at setting.

The only satellites whose eclipses can be frequently observed are those of Jupiter. These are objects of considerable interest to the amateur astronomer, who can always observe them by means of the ephemeris, which gives the predicted times of the eclipses. As a satellite enters the shadow of the planet it fades gradually away, and finally disappears even when viewed in the most powerful telescope so far as is yet known. As the phenomenon is the same at all parts of the earth, such eclipses were once used to determine longitudes. But it is found that the fading away is so gradual that the exact time of disappearance can never be observed with any certainty, so that the longitudes determined from such observations may be 30 or 40 miles in error, or even more. As a practical method of determining longitudes, it has therefore been entirely abandoned.

Eclipses of Saturn's outer satellites, Titan and Japetus, may occur on very rare occasions, but observations are dependent upon such a combination of favorable circumstances that astronomers rarely if ever succeed in making them.

Information respecting the occurrence of eclipses can be most readily gained by consulting the volumes of an astronomical ephemeris. Here may be found maps showing the regions of the earth over which every total eclipse sweeps. These volumes, however, only extend two or three years in advance of the date of publication. For future eclipses, the most valuable source of information is Oppolzer, *Canon der Finsternisse*, published by the Academy of Sciences of Vienna, in 1887, as one of its volumes of memoirs. Here will be found diagrams of all the annular and total eclipses of the sun visible in the equatorial regions, or northern hemisphere of the earth, from B. C. 1200 to A. D. 2161. The only drawbacks to the use of this wonderful work are that the tables are somewhat uncertain in the case of the ancient eclipses, while the method of delineation is such that the shadow paths of modern eclipses may sometimes be several hundred miles in error. It can not therefore be relied upon to determine the exact points where total eclipses will be visible, though the region will be well enough indicated.

For the twentieth century, fairly accurate computations have been made by Mahler, of Vienna, and published in *Memoirs of the Vienna Academy of Sciences*, vol. xlix. Here will be found an exact computation of the shadow path over the earth's surface for all annular and total eclipses from the years 1900 to 1999 inclusive. S. NEWCOMB.

Ecliptic [Gr. *ὁ ἐκλειπτικός* (sc. *κύκλος*, circle), the circle in whose plane eclipses occur; liter., pertaining to an eclipse (*ἔκλειψις*)]: in astronomy, the great circle of the heavens which the sun appears to describe in its annual revolution. It is the circle to which longitudes and latitudes in the heavens are referred. From time immemorial the ecliptic has been divided into twelve equal parts, called signs of the zodiac—Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, and Pisces. These signs, however, do not coincide with the constellations of the same names, but are merely arcs of thirty degrees reckoned from the intersection of the ecliptic and equator, which is not a fixed point, so that they are carried backward by the precession of the equinoxes. The sign Aries is now in the constellation Pisces. The plane of the ecliptic is that passing through the center of the sun and the earth's orbit around the sun. The angle which this plane makes with the plane of the equator is called the obliquity of the ecliptic, which is a variable quantity—about 23° 27′ 30″. The change of seasons is the result of this angle. Revised by S. NEWCOMB.

Eclogue, ek'log [via Lat. *ec'loga*, from Gr. *ἐκλογή*, selection, deriv. of *ἐκλέγειν*, select]: originally the select pieces of an author. The word usually signifies a pastoral poem, the main and proper subjects of which are the loves of shepherds or their adventures. These shepherds, however, are mostly imaginary personages, whose sentiments and circumstances belong rather to an ideal golden age than to the realities of common life. The *Eclogues* of Vergil, often called *bucolics*, have not all the true pastoral character, some of them being occasional poems on events of the day, only slightly enveloped in the pastoral costume. Spenser and Philips are among the eminent English pastoral poets.

École Polytechnique: See SCHOOLS.

Economic Geology: that branch of science which relates to the distribution, modes of occurrence, and exploitation of minerals employed by man. The applications of geology are—1, to agriculture, in the knowledge it conveys of the composition, structure, and origin of soils, the distribution and properties of mineral fertilizers, etc.; 2, to architecture, in materials for construction; 3, to engineering, in drainage, excavations, and construction; 4, to manufactures, in its revelations of the distribution, properties, and uses of ores, fuels, clays, oils, asphalts, gems, and other minerals employed in the arts. It also includes the theory and practice of mining. The relation of general geology to economic geology well illustrates the relation of all science to the industrial arts. Scientific research is conducted for the purpose of increasing our knowledge of nature, and especially for discovering the causal relations by which natural phenomena are connected. It is found that some of the knowledge of relations thus discovered may be applied to industrial ends, and the arts of civilization are the results of such applications. Economic geology is the industrial application of geologic generalizations and principles, the result of researches having for their primary motive only the enlargement of knowledge. See MINING and ORE DEPOSITS. Revised by G. K. GILBERT.

Economy [from Gr. *οἰκονομία*, management of a household, thrift; *οἶκος*, home + *νέμειν*, manage]: the regulation and government of a household or family; a frugal and prudent use of money or commodities; prudent management of affairs; sometimes the regular operations of nature in the reproduction, nutrition, and preservation of animals and plants. Rural economy is nearly synonymous with agriculture and the pursuits of farmers.

ECONOMY, POLITICAL: See POLITICAL ECONOMY.

Economy: borough; Beaver co., Pa. (for location of county, see map of Pennsylvania, ref. 4–A); situated on railway and on the Ohio river, 18 miles N. W. of Pittsburg. It was settled by German socialists called the Harmony Society (see RAPP, GEORGE, and HARMONISTS). Pop. (1890) 413; not returned separately in 1900.

Écorché, *ā'kōr'shā'* [Fr., past ptc. of *écorcher*, flay, skin; Ital. *scorticare* < Lat. **excortica're*, deriv. of *cortex*, bark]: a figure used as a model by artists, representing a man or animal without the skin, so that the muscular system may be more easily studied. The écorché is sometimes represented in action. It is generally made of papier-mache or of plaster of Paris.

Écoutes, *ā'koot'* [Fr., deriv. of *écouter*, listen: Ital. *ascolta're* < Lat. *ausculta're*]: in military engineering, small galleries excavated for the shelter of troops in front of the glacis and toward the enemy's works, whose mining operations may by this means be estimated and provided against.

Écraseur, *ā'kraă'zėr'* [Fr., deriv. of *écraser*, crust]: a surgical instrument for performing amputation, invented by Chassaignac, of Paris. The cutting is done by a small but very strong steel chain, a loop of which is passed around the tumor or other part to be removed. The two ends of the chain run through a steel tube, and in operation are drawn through the tube by an endless screw with a lever handle, which puts the ends of the chain into tension, diminishing the size of the loop and very slowly but irresistibly tearing away the inclosed substance. Its advantages are that the hæmorrhage following its judicious use is usually slight, and that healing takes place rapidly, with comparatively little suppuration. The shock is also comparatively slight, but it can never be used where nice dissection and skillful operation are required; and it is also somewhat unmanageable in its effects. Its use is becoming limited to a small and peculiar class of operations, chiefly upon mucous surfaces; in these its value is great.

Ecstasy [Gr. *ἔκστασις*, bewilderment, insanity, in Late Gr. trance, deriv. of *ἐξιστάναι*, set out of a place or state; *ἐκ*, out of + *ἱστάναι*, set, place]: a morbid mental state which, without amounting to insanity, on account of the temporary character of the affection, diminishes or alters consciousness and destroys the power of self-control. The history of religion furnishes numerous examples of this kind of mental aberration—the dancing epidemics in Germany and Italy in the Middle Ages, the Jansenist convulsionists in Paris in the earlier part of the eighteenth century, etc.

Ectozo'ön (plu. **Ectozo'a**) [from Gr. *ἐκτός*, outside + *ζῷον*, animal]: in contradistinction to ENTOZOA (*q. v.*), parasitic animals which live on the outside of other animals, such as lice and ticks, and the crustaceans found upon fishes and whales. A more common name for these creatures is EPIZOA (*q. v.*).

Ecuador (Sp. *República del Ecuador*, Republic of the Equator, in allusion to its position): a country of Western South America; bounded N. and N. E. by Colombia, S. E. and S. by Peru, and W. by the Pacific; area variously estimated at 120,000 to 276,000 sq. miles. The latter extension was claimed until recently in Ecuadorian official publications; it included an extensive region in the Amazonian basin, the possession of which is disputed by Peru, Colombia, and even Brazil. If the claims of these countries are allowed, Ecuador will be almost restricted to the Andean region and the Pacific coast; and even in these the Mira valley is disputed with Colombia and the Achira valley with Peru.

Topography, etc.—The Andes traverse Ecuador nearly from N. to S., in two great parallel chains which inclose an elevated region or plateau. The eastern chain, facing the Amazonian lowlands, is, as a whole, the highest, and forms an almost continuous wall, pierced only by the narrow river valleys of the Pastaza and Paute; locally this range is called the Andes proper. The western chain, known as the Cordillera, is, on the contrary, irregular and much broken; it contains, however, the highest peak in Ecuador, that of Chimborazo (20,496 feet). The plateau between the two ranges has an average width of perhaps 60 miles and an elevation of 7,500 to 10,000 feet; it is divided by cross ranges or knots into several minor basins or valleys, which, counting from south to north, are distinguished as the basins of Cuenca, Ambato, Quito, and Ibarra. North of the Cuenca basin the western Cordillera disappears almost entirely, and the eastern range is lower than at any other point between Southern Chili and Northern Colombia; there is thus a kind of pass in the Andean chain which must ultimately be of great importance. Around the basins of Ambato and Quito are gathered many of the highest peaks in South America, including about twenty active or extinct volcanoes. "Nowhere on the face of the earth," says Orton, "is there such a grand assemblage of mountains. Twenty-two summits are covered with perpetual snow, and fifty are over 10,000 feet high." Cotopaxi, in the eastern range, is the highest active volcano in the world (19,614 feet), and Cayambe and Antisana are hardly lower.

West of the mountain region the valleys end in low plains which skirt the Pacific coast. North of the Gulf of Guayaquil these are, in parts, 80 miles wide, but they are much broken by spurs of the Cordillera and lower isolated chains. East of the Andes there is an irregular fringing plateau, which abruptly ends in the plains of the Napo and other affluents of the Amazon.

Rivers.—Nearly all the streams of the plateau pass through the western range, and some of them unite to form navigable rivers on the coast plains; the most important of these is the Guayaquil or Guayas, which flows into the Gulf of Guayaquil, and the Esmeraldas, in Northwestern Ecuador. To the east of the mountains the Pastaza and Napo, with their numberless affluents, descend to the great Amazonian plains; the latter is the main and almost the only known route between the inhabited parts of Ecuador and the Amazon, and it can be navigated to a point within a hundred miles of Quito.

Lakes are numerous, and some of them are situated at great elevations. Cuy-cocha, on the side of the peak called Cotocachi, is 10,200 feet above the sea.

Harbors.—The Gulf of Guayaquil is the largest and safest harbor on the Pacific coast of South America, but will not admit very large vessels. The only other sheltered harbors are formed by river mouths, and are of little importance.

Islands.—Puna island, at the entrance of the Gulf of Guayaquil, is nearly 30 miles long, but it is low, marshy, and unhealthy. Numerous other small islands are scattered in the gulf and along the coast. The outlying GALAPAGOS ARCHIPELAGO (*q. v.*) is claimed by Ecuador.

Geology, Volcanoes, and Earthquakes.—Nearly all the higher peaks are of igneous origin, and the plateau is covered in great part with tufa and volcanic conglomerates. Granite, gneiss, and metamorphic schists occupy extensive areas on the eastern slopes of the Andes; the western Cordillera is largely porphyritic. Cretaceous formations skirt the highlands in many places, and the coast plains are of Tertiary or Quaternary age, with large tracts of modern alluvium along the rivers. The highlands of Ecuador are the great center of volcanic activity in South America. Violent eruptions from some of the numerous craters are of almost yearly occurrence, and earthquakes are frequent and sometimes very destructive. The great shock of Aug. 16, 1868, was felt from Colombia to Chili, but was most destructive in Ecuador, where, according to official estimates, 50,000 people perished; many towns were reduced to a mass of ruins. In 1797 the city of Riobamba was partly overwhelmed by earth and rocks loosened from a neighboring mountain by an earthquake.

Climate.—The coast region is hot, damp, and in many places very unhealthful. Yellow fever may be regarded as endemic at Guayaquil, and intermittent fevers are common and very severe. The plateaus have a temperate and pleasant climate, varying little through the year, and generally very healthful. Rains are less abundant than on the coast, but there are almost daily showers. The driest months are July and December. The eastern flanks of the Andes and the adjacent plains are constantly soaked with heavy rains, and the climate is perhaps the most humid in the world.

Vegetation.—Owing to the abundant rains and warm climate, the plains of the coast and the Amazonian basin are covered in great part with matted forests, which extend in many places far up the mountain sides and valleys. These forests are rich in cabinet woods, drugs, dyes, etc., but almost the only products collected are rubber (occurring both on the coast plains and along the Amazonian tributaries), ivory nuts, and small quantities of vanilla, sarsaparilla, cinchona, and tonka beans. There are extensive areas of grass land on the fringing plateau E. of the Andes, and others near the coast. The elevated interior basins are almost devoid of forest growth, and portions of them, owing rather to the soil than to any lack of moisture, are sterile. The fertile parts afford excellent pasturage.

Animals.—Ecuador has the usual rich fauna of the neotropical region (see AMERICA, SOUTH), the valleys of the eastern and western slopes being especially noted for their numerous and beautiful species of birds and insects. The coast forests have their own assemblage, different in great part from those of the Amazonian plains, and many species are confined to single mountains or valleys. Here the humming-birds have their chief habitat. The largest animals are tapirs and jaguars. Llamas are found principally in Southern Ecuador; farther N. mules take their place as beasts of burden. Condors are conspicuous about the mountains, but do not descend to the plains.

Minerals.—Gold and silver are almost the only metals extracted, and these not on an extensive scale. Quicksilver, copper, zinc, and iron are reported, and there are salines of considerable value. Large sulphur deposits occur in various volcanoes. Emeralds, long supposed to exist in Ecuador, have never been found there within historical times.

Inhabitants.—The population is officially estimated (1892) at 1,270,000, of whom about 100,000 are classed as whites, 300,000 as mixed, 670,000 as civilized Indians, and 200,000 as wild Indians; probably the latter are much overestimated. The African element is small. By far the greater portion of the people are gathered on the plateau, in the western valleys, and at a few points along the coast. The region E. of the Andes has very few civilized inhabitants, and is imperfectly known. Quito, the capital, on the plateau, has about 35,000 inhabitants; Guayaquil, the principal port, has 45,000; Cuenca, 25,000; and Riobamba and Latacunga 12,000 each.

The land is nearly all divided among a few rich proprietors, who hold the mass of the population essentially in a condition of serfdom. Agriculture and cattle-raising are almost the only industries, and these are carried on, with a few exceptions, in the most primitive fashion. Except on a few large sugar plantations, improved machinery and even plows are almost unknown. Coffee is cultivated to a considerable extent on the mountain sides; cacao is planted in the warm valleys and on the plains, affording one of the principal articles of export. The large sugar plantations are generally on the alluvial lands near the coast. Lucerne is cultivated largely on the plateau as food for cattle. In manufactures Ecuador is extremely backward. Aside from the sugar-mills, tanneries, and distilleries, and a few small cotton-factories, they are confined to cotton cloths and hats made in the country houses, and workshops of the simplest description. There is a single railway from Duran, on the river Guayaquil, to Chimbo, at the base of the Cordillera, 58 miles. This was acquired by an American company in 1897, who have rebuilt it to standard gauge and are continuing it 292 miles to Quito. The only wagon road is from Quito to Riobamba, 81 miles. There are about 1,250 miles of inland telegraph lines, and Guayaquil is connected by cable with Peru and Panama. The exports in 1897 were valued at 31,025,382 sucres, four-fifths of which was cocoa,

the remainder coffee, straw hats, hides, sugar, ivory nuts, etc. The imports were valued at 18,004,048 sucres, of which 1,631,406 sucres came from the U. S. The value of the sucre is about 45 cents.

Government, etc.—Ecuador is a centralized republic. The executive consists of president and vice-president chosen by universal suffrage for four years, and not eligible for immediate re-election. The election of vice-president alternates with that of president, so that he serves two years with one president, and two with the next. The president is assisted by four ministers (interior and foreign affairs, treasury, war and marine, and religion and public instruction). There is a council of state of five members chosen for six years. Congress consists of senate and assembly. The power of the president is much restricted. The Roman Catholic is the state religion and the only one tolerated. The Archbishop of Quito has practically more power than the president, and there are six bishoprics. Education is compulsory and free. There were, in 1900, 9 superior, 35 intermediate, and 1,088 primary schools, with 1,498 teachers and 68,380 pupils; besides seminaries and commercial and technical schools at Quito and Guayaquil. There are also university bodies in Cuenca and Guayaquil. The university at Quito was established in 1684. It serves principally for the education of priests; wealthy young Ecuadorians usually study in Europe.

Weights and Measures.—By a law of 1856 the French metrical system was made the legal standard, and it is now in general use.

History.—Vague Indian traditions, preserved in Velasco's *Historia de Quito*, go back to a powerful nation which held Quito and the neighboring territory in very ancient times; these were the Quitus, who, about the tenth century, were supplanted by the Caras, a tribe from the coast. Opinions differ as to the credibility of these accounts. It is certain, however, that in the fifteenth century the highlands of Quito were held by a race, presumably of Quichua stock, who, under their chiefs or *Scyris* made a long and brave resistance to the Inca armies from Peru. They were finally subdued by Huayna Capac, about 1590. That Inca left his kingdom divided between his two sons, Atahualpa, who reigned at Quito, and Huascar, who held Peru and the southern provinces. A war between the brothers ended in the overthrow of Huascar, just before the arrival of the Spaniards under Pizarro. Atahualpa, on his way to be crowned at Cuzco, met Pizarro at Cajamarca, Peru, was seized, and eventually killed (Aug., 1533). In 1534 Benalcazar, one of Pizarro's lieutenants, marched against Quito in alliance with the Cañaris Indians; Rumi-ñaui, who had been Atahualpa's general, resisted him, but was disastrously defeated on the plains of Riobamba, and the Spaniards took possession of Quito. The present territory of Ecuador became a presidency (often called the kingdom of Quito), ruled by an audience, which was subordinate to the Viceroy of Peru at Lima. Abortive attempts to throw off the Spanish rule were made in 1809 and 1812; another revolt at Guayaquil, 1820, was powerfully supported by Bolivar, who had by this time secured the freedom of Colombia; and his lieutenant, Gen. Sucre, defeated the Spaniards at the battle of Pichincha, near Quito, May 24, 1822. Shortly after Quito was united to the republic of Colombia, of which Bolivar was president. In 1831 Quito separated from Colombia and took the name of República del Ecuador. The first president was Gen. Juan José Flores, and he ruled either as president or general until 1845. But the people of Ecuador were not capable of sustaining a strong republican government; political squabbles and revolutions followed in quick succession, and since the time of Flores hardly any president has been able to serve out his full term. There was a short war with Peru in 1859, and about the same time Moreno, the president of Ecuador, interfered in the affairs of Colombia, bringing on a struggle that only increased the miseries of the two countries. In 1895–96 a civil war resulted in the success of the Liberal party, Gen. Eloy Alfaro becoming president.

The cartography of Ecuador is quite imperfect.

Herbert H. Smith.

Ecumen'ical [or *œcumenical*, from Gr. *οἰκουμενικός*, pertaining to the *οἰκουμένη* (sc. *γῆ*, earth), the inhabited world, partic. of *οἰκεῖν*, inhabit]: universal; applied to councils of the Christian Church in which all parts of the world are represented. (See Council, Œcumenical.) The latest of the councils called ecumenical (the Roman Catholic Council of the Vatican, 1869–70) proclaimed the infallibility of the pope.

Ec'zema [Gr *ἔκζεμα*, deriv. of *ἐκζεῖν*, boil forth; *ἐκ*, out + *ζεῖν*, boil]: commonly called **Salt Rheum**; a vesicular disease of the skin, characterized by watery blisters smaller than those of herpes and larger than ordinary sudamina, such as are sometimes seen in the difficulty known as "prickly heat." Eczema is often accompanied by intense itching, and is frequently transformed into a pustular or scabbing disease. It is generally chronic. Its treatment is both local and general. The local treatment, when the epidermis is thickened, is by alkaline applications with or without tarry or astringent admixtures. The "benzoated ointment of oxide of zinc" is an excellent application. If the system has received a specific taint, the iodides, with mercury judiciously used, are indispensable, and produce the happiest results. Arsenic in small doses is an extremely useful tonic in many cases. Change of air and visits to thermal and other springs and baths, though not strictly curative, often appear to be wonderfully palliative.

Edam, *ā*-daam' (Lat. *Eda'mum*): a town of Holland; province of North Holland; has a port on the Zuyder Zee, 12 miles N. N. E. of Amsterdam (see map of Holland and Belgium, ref. 5–F). It derives its prosperity from shipbuilding and a trade in cheese. Pop. 5,880.

Edda: a term applied to two entirely different monuments of the Old Norse literature.

I. *The Prose Edda*, also called *The Younger Edda* and *Snorri's Edda*, is a work intended as a manual of mythology and poetry for the use of young skalds. To it alone is the name *Edda*—i. e. *ars poetica*—given with propriety. In its original form (preserved in a MS. at Upsala dating from the end of the thirteenth century) it was in the main the work of the Icelander Snorri Sturluson (1178–1241), the most eminent skald of the decadence. (See Snorri Sturluson and Icelandic Literature.) Snorri's *Edda*, in some respects a rough draft, was worked over about 1250, and this revision, which contains important changes and additions, became a sort of *textus receptus* of the book. According to Snorri's plan, the *Edda* falls into three principal divisions: (1) the *Gylfaginning* (The Deception of Gylfi), in which a great variety of mythological material is thrown into the form of a story about the visit of the fabulous King Gylfi to Ásgarðr (Asgard, the home of the gods); (2) *Skáldskaparmál*, a treatise on the artificial poetic diction of the skalds, with many elaborate explanations of the origin of particular figures; and (3) *Háttatal* (composed between 1221 and 1223), illustrating, in the form of a long poetical encomium, the varieties of skaldic rhythm and meter. The first two of these divisions show Snorri's mastery of Icelandic classical prose and his wide knowledge of Northern myth; the *Háttatal* displays his consummate skill in the technique of the marvelously complicated skaldic style and versification. As an authority on mythology Snorri is to be used with great caution. As was to be expected from his comparatively late date, he often failed to understand the true meaning and connection of the myths of which he treats, and many details in his stories of the gods show the influence of Christian theology and legend.

The standard edition of the *Prose Edda* is the great Arna-Magnæan edition (Copenhagen, 1848–87), which furnishes a Latin translation and an elaborate *apparatus criticus*. There are handy editions by Rask (Stockholm, 1818), Egilsson (Reykjavík, 1848), and Thorleifr Jónsson (Copenhagen, 1875). E. Wilken's *Die prosaische Edda im Auszuge* (Paderborn, 1877–82), though scientifically far from irreproachable, has a convenient glossary. The English reader will find incomplete translations in the English version of Mallet's *Northern Antiquities* (London, 1770; Edinburgh, 1809), vol. ii.; in G. Webbe Dasent's *The Prose or Younger Edda* (Stockholm, 1842); and in R. B. Anderson's *The Prose Edda* (Chicago, 1880 [1879]).

II. *The Poetic or Elder Edda*, also called *Sæmund's Edda*, is a miscellaneous collection of Old Norse poems, mythological, heroic, satirical, and didactic, with some bits of prose, preserved in MS. 2365 of the Royal Library at Copenhagen (the *Codex Regius*). These vary much in style, but most of

them are in strong contrast to the labored artificiality of what is known as the skaldic poetry. Some of them are found elsewhere, and the terms *Edda* and *Eddaic* (or *Eddic*) are often extended to include other Old Norse poems (for example, the stanzas in the *Hervarar Saga*) which resemble some of those in this collection. The *Codex Regius* was discovered in Iceland in 1643 by Bishop Brynjólfr Sveinsson, who gave it the name *Edda Sæmundi Multiscii*, supposing it to be a long-lost work of Sæmund the Wise (1056–1133). This was a double misnomer; for, in the first place, the collection has nothing to do with Sæmund, and, in the second place, the title *Edda* properly belongs to the work of Snorri (see I., above) and to that alone. This error of Brynjólfr's has proved stubborn of correction, and has given rise to many mistakes. The term *Edda* has been absurdly interpreted *Great-grandmother*, and has been thought to indicate that the poems are, so to speak, the tales told by hoar antiquity to her listening descendants. (Compare the curiously similar error with regard to the Welsh Mabinogion, *q. v.*) The character of the collection has also been often misunderstood. The *Elder Edda* is not a single work, in any proper sense, but the result of the attempt of some unknown Icelander to take down in writing such poems, orally current, as pleased his fancy or seemed to him worthy of preservation. It is not compiled in accordance with any plan, and is often confused in arrangement and corrupt in text. Some of the most interesting pieces in it are mere tattered remnants of what they must once have been. The age of the *Edda* has been greatly exaggerated. In anything like their present form the poems can not any of them be older than the tenth century, and the latest of them are perhaps not much older than the *Codex Regius* itself (end of the thirteenth century).

As literature the *Elder Edda* is of the highest value. In the *Völuspá* (The Sibyl's Soothsaying) we have the highest flight of the heathen Scandinavian religious imagination, assisted perhaps by half-understood reports of Christian doctrines. In the *Lokasenna* (The Flyting of Loki) the humor is at times fairly Aristophanic. In the Helgi poems, and in some of those which deal with the Volsungs and the Hniflungs (*Nibelungen*), there is wonderful tragic power.

The standard critical edition of the *Elder Edda* is still Bugge's (*Norræn Fornkvæði*, Christiania, 1867). Other editions of importance are those of Rask (1818), Munch (1847), Lüning (1859, with a valuable commentary), Möbius (1860), Svend Grundtvig (2d ed. 1874), Karl Hildebrand (1876; with an excellent glossary by H. Gering, 1887), Sijmonds (1888, a valuable critical edition of which only one part has appeared), Finnur Jónsson (1888–90). The Arna-Magnæan edition (3 vols., Copenhagen, 1787–1828), though antiquated, is still indispensable. Vigfússon's text (in vol. i. of Vigfússon and Powell's *Corpus Poeticum Boreale*, Oxford, 1883) is quite untrustworthy, but his introductions and notes contain much that is of importance; Powell's translation (in the same work) is practically useless for the general reader, since it, of course, follows Vigfússon's rearrangements. The favorite German translation is Simrock's. There are English versions by Cottle (Bristol, 1797) and Thorpe (London, 1866), and some of the poems have been translated by R. B. Anderson in his *Norse Mythology* (Chicago, 1875). G. L. Kittredge.

Eddy, Clarence: organist; b. in Greenfield, Mass., June 23, 1851; early gave evidence of marked musical ability, and by the time he was sixteen years old was regarded as a fine organist. He then began systematic study under Dudley Buck, and in 1871 went to Germany and took a course under Haupt. Before returning home he gave recitals in several European cities with marked success. Upon his return he settled in Chicago, where, in 1876, he became director of the Hershey School of Musical Art, and gave a series of 100 recitals, with no repetitions. In 1876 he gave officially two concerts daily for a week at the Philadelphia Exhibition, and in 1889 he was invited by the French Government as a representative of American art to give official recitals in the Trocadero. Author of *The Church and Concert Organist* and *The Organ in Church*. D. E. Hervey.

Eddy, Henry Turner, C. E., Ph. D., LL. D.: educator and mathematician; b. in Stoughton, Mass., June 9, 1844; graduated at Yale in 1867 with the degree of A. B. In 1868 he was instructor in surveying in the Sheffield Scientific School; 1869–74 assistant Professor of Mathematics and Civil Engineering in Cornell University; 1874–90 Professor of Mathematics, Astronomy, and Civil Engineering in University of Cincinnati; and, since 1891, president of Rose Polytechnic Institute, Terre Haute, Ind. In 1884 he was vice-president of the mathematical and astronomical section of the American Association for the Advancement of Science. He is the author of *Analytical Geometry* (1874); *New Constructions in Graphical Statics* (1877); *Researches in Graphic Statics* (1878); *Thermodynamics* (1879); and of many papers in technical journals, among which may be mentioned *Maximum Stresses under Concentrated Loads*, published in 1890.

Eddy, Thomas Mears, D. D.: clergyman; b. in Newtown, Hamilton co., O., Sept. 7, 1823; studied in the classical seminary of Greensboro, Ind.; joined the Indiana Methodist conference in 1842; was editor of the *Northwestern Christian Advocate* from 1856 to 1868; served as pastor in Baltimore three years; was appointed to the Metropolitan church, Washington, D. C., in 1872, and elected the same year corresponding secretary of the Methodist Missionary Society. He was eminent as a journalist, and was author of a *History of Illinois during the Civil War* (2 vols. 8vo, Chicago, 1865). D. in New York, Oct. 7, 1874.

Eddy-currents (in electricity): See Foucault Currents.

Eddystone Lighthouse: a lighthouse in the English Channel; 14 miles S. S. W. of Plymouth breakwater, and 9 miles from the coast of Cornwall; lat. 50° 10′ 54″ N., lon. 4° 15′ 53″ E. It stands on the Eddystone rocks, which are daily submerged by the tide, and it rises about 85 feet above the high-water mark in the form of a circular tower, which gradually decreases in diameter from the bottom to the top, with a curved outline resembling the trunk of a tree. It has a fixed light, visible at a distance of 13 miles. It was erected in 1757–59 by Mr. Smeaton. The material employed was Portland limestone. Steps were cut in the rock, to make the foundation as solid as possible. The stones of each course of masonry were ingeniously dovetailed, and each course was doweled to the one below it. The result was an edifice of surpassing strength. The fate of past ventures made the destruction of Smeaton's building seem probable. The first lighthouse had been destroyed by a storm (1703), and the second had been burned (1755). Smeaton's lighthouse was undermined by the waves and a new building, like the old in appearance but with improved appliances, was built upon another of the Eddystone rocks and formally opened in the spring of 1882. See the article Lighthouse.

Edelfelt, Albert Gustav Aristid: genre and portrait painter; b. at Helsingfors, Finland, July 21, 1854; pupil of Gérôme, Paris; second-class medal, Paris Salon, 1882; medal of Honor, Paris Exposition, 1889. His work is notable for excellent drawing. Studio in Paris. W. A. C.

Edelinck, ā′de-link, Gerard: engraver; b. in Antwerp, Belgium, in 1640. He worked for many years in Paris, and was patronized by the French court and Louis XIV. He engraved portraits of many eminent persons, the *Holy Family*, after Raphael, the *Virgin*, after Guido, and several works of Lebrun. His engravings are remarkable for their delicacy and softness, and render costume, armor, etc., with singular perfection. He is ranked among engravers of the first order of those who are not original or, as they are called, painter-engravers. D. in Paris, Apr. 2, 1707.

Edelweiss, ā′del-vīs: a white, woolly, perennial herb (*Leontopodium alpinum*) belonging to the family *Compositæ*, and closely related to the common American plants known popularly as "everlasting," or "ladies' tobacco." It is a native of the Alps, and is annually collected for sale by the Swiss peasants. It is freely cultivated in gardens in America and Europe. Charles E. Bessey.

Eden [Heb., delight]: in the book of Genesis, the region including the garden where at first dwelt Adam and Eve, the first parents of mankind, from which they were expelled in consequence of disobedience. Much discussion has prevailed among critics as to the country where this early paradise was situated. Ceylon, the vale of Kashmir, the lower, middle, and upper regions of the Euphrates, the Caucasus, Turkestan, and other regions have been named. At present the choice appears to lie between Armenia and Babylonia, with a preponderance of argument and authority in favor of the latter. The difficulty consists in identifying the four rivers mentioned in the biblical narrative.

Those who hold the theory that Eden was situated in Armenia take the starting-point from the known sources of the Tigris and the Euphrates and seek two other rivers

rising in the same region. Thus Pison is identified with Phasis, Havilah with Colchis, Gihon with Araxes, and Cush with Κοσσαῖοι. Among the representatives of this theory are Reland, Calmet, Leclerc, Keil, and others. The objections to it are that the Κοσσαῖοι can be found on neither the eastern nor the western shore of the Caspian Sea, and the four rivers can by no show of probability be supposed to be the branches of one parent stream. The hypothesis that the Hebrew word *nahar* does not mean a "stream," but "a river system," is not supported by the usage of the language, and the hypothesis of Luther and others that the Flood so altered the physical features of Asia that the present courses of the streams are different from the original ones is not supported by the biblical account of the Flood.

Those who hold the theory that Eden was situated in Babylonia fall into two groups. The first group, represented by Calvin, Scaliger, Huet, Bochart, and others, places Eden on the Satt-el-Arab, considering the Euphrates and the Tigris as the two branches of the river of Gen. ii. 10, reckoning up the stream, and identifying the Pison and the Gihon with the two main arms through which the Satt-el-Arab empties itself into the Persian Gulf. Classical history, however, the cuneiform inscriptions, the very nature of the soil, and the present rate of physical change in that region, make it certain that at one time the sea extended more than 100 miles farther to the N., thus covering the supposed site of Eden. The second group, represented by Delitzsch and others, places Eden in Northern Babylonia, immediately about the site of Babylon. At that point the Euphrates and the Tigris approached very near to each other, and the country was intersected by a great number of watercourses, whose current, on account of the difference of the level, was always from the Euphrates toward the Tigris. The effect thereby produced was that of an extremely wide river flowing in numberless channels. The objection to this theory is its vagueness, its incapacity for definite physical identification. See the article by Francis Brown in Schaff's *Religious Cyclopædia*.

Edenkoben, ā'den-kō-ben: a town of the Palatinate, Bavaria: on a railway, 7 miles N. of Landau (see map of German Empire, ref. 6–D). It has mineral springs and manufactures of wine and firearms. Pop. (1890) 4,914.

Edenta'ta [Lat. past partic. of *edenta're*, deprive of teeth; *e* (*ex*), forth + *dens*, tooth]: an order of placental mammals having no teeth in the front portion of the jaws, teeth, when present, all of the same general form, without enamel, and, with the exception of *Tatusia*, having no predecessors and growing continuously throughout life. The existing members of the order are the sloths, ant-eaters, armadillos, pangolins or scaly ant-eaters, and aard-varks or African ant-eaters. The extinct forms are the gigantic glyptodons and megatheria. The forms and habits of the various members of the order are extremely diverse. The sloths dwell in trees and feed solely on leaves, the ant-eaters are terrestrial and live on ants and termites, while the armadillos burrow in the ground and eat both animal and vegetable food. The distribution of the group is likewise peculiar. No edentates, living or extinct, are found in Europe, the pangolins are restricted to parts of Africa and tropical Asia, and the two species of aard-varks are confined to Africa. South America is the chief habitat of the group both in species and numbers, and but one species occurs so far north as Southern Texas, although fossils show that representatives of the order were once found in Ohio and Virginia. The name *Edentata*, given by Cuvier, is objected to by some as being, in a literal sense, incorrect, but the Linnæan name *Bruta* is equally inappropriate, since it was used by him for a heterogeneous group containing the elephant, sloths, ant-eaters, armadillos, and manatees. F. A. Lucas.

E'denton: town and port of entry; capital of Chowan co., N. C. (for location of county, see map of North Carolina, ref. 2–J); situated on railway and on Edenton Bay, which opens into Albemarle Sound; 150 miles E. by N. of Raleigh; has extensive fisheries. Pop. (1880) 1,382; (1890) 2,205; (1900) 3,046.

Edersheim, ā'ders-hīm, Alfred, Ph. D., D. D.: divine; b. of Jewish parents in Vienna, Mar. 7, 1825; educated in Vienna; became a Christian and a minister of the Free Church of Scotland 1849; passed over to the Church of England in 1875. He wrote many volumes on biblical topics, especially a superior *Life of Jesus, the Messiah* (2 vols., London, 1883; 3d ed. 1886). D. at Mentone, France, Mar. 16, 1889.

Edessa, ĕe-des'sa, or **Callirrhoe**, kăl-lir'ō-ĕe: an ancient city of Mesopotamia, supposed to be on or near the site of Ur of the Chaldees, mentioned in Genesis xi., though by others identified with Erech, one of the principal cities of the Babylonian empire. The extreme antiquity of its origin is undoubted, but nothing is known with certainty of its history until after the Macedonian conquest of Persia, when a Græco-Macedonian colony was settled there. It was 78 miles S. W. of Diarbekir. It became the capital of an independent kingdom in 137 B. C., and was tributary to Rome in the reign of Trajan. In 216 A. D. it became a Roman military colony. It was an important place in the early history of the Christian Church, and contained numerous monasteries, and was the residence of Ephraem the Syrian (*q. v.*). Christianity was early introduced in the city, though the legend about the correspondence between Christ and King Abgarus appears to have no sufficient historical foundation. In the third century the city became the seat of a Christian bishop. For many years it was the principal center of Oriental learning. Baldwin, a leader of the crusaders, and afterward King of Jerusalem, became Prince or Count of Edessa in 1097 A. D., and made it the capital of a Latin principality. Its capture by the Saracen chief Noor-ed-Deen, who massacred the inhabitants, was the cause of the second crusade (1147), but the Christians failed to regain possession. It was afterward possessed successively by the Byzantine emperors, the Mongols, Persians, and Turks. The site is occupied by the modern town of Orfa (*q. v.*).

Edessa: the ancient capital of Macedonia; situated about 46 miles N. W. of Salonica. It continued to be the burial-place of the Macedonian kings after the court was removed to Pella. Philip, father of Alexander the Great, was killed here. This site is occupied by the modern town of Vodena (*q. v.*).

Edfu, ed'foo, or **Edfou** (anc. *Apollinopolis Magna*; Coptic, *Atbo*): a small town of Upper Egypt, on the west bank of the river Nile, about 60 miles above Thebes. It has two temples, the larger one of which is on a grand scale, and being in excellent preservation gives a good idea of the Egyptian temples in their glory. It was built chiefly by Ptolemy Philometor (181–145 B. C.), the last King of Egypt who is noticed in sacred history. Its entire length (including court and temple) is 451 feet. On each side of the entrance is a pyramidal tower 108 ft. 2½ in. high, adorned with gigantic sculptures. Through this entrance the court is reached, 161 feet long, 140 feet wide, and inclosed by a splendid colonnade, each of whose pillars shows a design of its own. The impression of this magnificent architectural structure is spoiled, however, as the court is filled with rubbish and occupied by wretched dwellings. To the Egyptologist, however, the place is of extreme interest as furnishing the most perfect specimen of an ancient Egyptian temple, and the great fame which it enjoyed among the Greeks and Romans seems to be fully deserved. (See Egypt, Ancient.) Within the temple is the chamber, 33 feet by 17, which contained the image of the deity. The town has manufactures of blue cotton cloth and a kind of earthenware which finds ready sale in all Egypt on account of its striking resemblance to the pottery depicted on the monuments. The city is noted for the importunity and insolence of its beggars. Pop. 3,000.

Edgar: city; Clay co., Neb. (for location of county, see map of Nebraska, ref. 11–F); on two railways; 26 miles S. E. of Hastings; in a district devoted to agriculture and stock-raising. Pop. (1880) 577; (1890) 1,105; (1900) 1,040.

Edgar: King of the English from 959 to 975; called Edgar the Peaceful, from the character of his reign, which, through the wise administration of his minister Dunstan (*q. v.*), was marked by the restoration of law and order and by the promotion of learning. Edgar ruled over Wessex, Northumbria, and Mercia, and forced the Danes of Ireland to acknowledge his overlordship. Eight vassal kings are said to have rowed him in his boat on the Dee. The fusion of the Danes with his English subjects, the vigorous enforcement of the laws, and the improvement of trade made his reign an epoch of greater prosperity than England had hitherto known.

Edgar the Atheling: grandson of Edmund Ironside and heir to the English throne; b. in Hungary about 1057; was chosen king after the death of Harold in 1066, but the submission of the kingdom to William the Conqueror pre-

vented Edgar's succession, and all subsequent attempts to regain the throne proved unavailing. From Scotland, where he had taken refuge with King Malcolm, his brother-in-law, he encouraged the revolts of 1068 and 1071; joined Robert, Duke of Normandy, against William Rufus (1091) and against Henry I., but was taken prisoner by the latter at Tenchebrai (1106). Little is known of the last years of his life, and the date of his death is uncertain.

Edgar, Henry Cornelius: clergyman; b. in Rahway, N. J., Apr. 11, 1811; graduated at Princeton in 1831, read law, but was forced by illness to relinquish study, and traveled extensively. After some years in mercantile life and teaching, he became a Presbyterian minister in 1845, was pastor in Bridgehampton, L. I., and afterward in Easton, Pa. He delivered many lectures on education and temperance, contributed to religious and secular magazines, and published orations and sermons, including *Christianity our Nation's Wisest Policy* (1872) and *The Relation of the Pulpit to Politics* (1884). D. in Easton, Pa., Dec. 23, 1884.

Edgar, James David: member of Canadian Parliament; b. in Eastern Townships, Province of Quebec, Aug. 10, 1841, and educated at Quebec. He was admitted to the bar in 1864, and sent to British Columbia in 1874 by the Canadian Government to arrange terms for the postponement of the construction of the Canadian Pacific Railway. He was for a time legal editor of the Toronto *Globe* and of the Montreal *Trade Review*, and a general writer for the press. He entered Parliament in 1872 and sat for two years; elected again in 1884, 1887, 1891, and 1896, and in the last-named year was made Speaker of the House of Commons. He became a Queen's counsel in 1890, and in 1897 a member of the Queen's Privy Council. He has been a frequent contributor to periodicals, and is author of *The Insolvent Act of 1864* (Toronto, 1865): *The White Stone Canoe* (1887); and *This Canada of Ours, and other Poems* (1893).

Edgartown: port of entry; capital of Dukes co., Mass. (for location of county, see map of Massachusetts, ref. 6–J); situated on the east shore of the island of Martha's Vineyard, 30 miles from New Bedford, on the mainland. Here is a small but safe harbor, and a pier on which is a fixed light 37 feet high, in lat. 41° 23′ 25″ N., lon. 70° 29′ 5″ W. Edgartown is on the Martha's Vineyard Railway, and has communication by steamboat with the mainland. It is a summer resort and a headquarters for whale-fishing. Pop. of township (1880) 1,303; (1890) 1,156; (1900) 1,209.

Edgefield, or **Edgefield Court-house**: town (founded in 1785); capital of Edgefield co., S. C. (for location of county, see map of South Carolina, ref. 6–C); situated on railway, 24 miles N. of Augusta, Ga. It has 6 churches, 2 schools, cottonseed-oil mill, brick-yards, fertilizer-factory, and tannery. Pop. (1880) 808; (1890) 1,168; (1900) 1,775.

Editor of "Advertiser."

Edgehill: a ridge in Warwickshire, England; 7 miles N. W. of Banbury (see map of England, ref. 11–H). It was the scene of the first great battle of the civil war, which occurred Oct. 23, 1642. The royalist army was commanded by Charles I., and that of the Parliament by the Earl of Essex. Prince Rupert, by a charge of cavalry, broke the left wing of the parliamentarians, whom he pursued to Kineton, while the right wing of Essex's army defeated the royalists. Thus the battle proved disastrous to both armies, and the loss was so nearly equal that neither party could claim the victory. Clarendon estimated the total number of killed at 5,000. Among the slain was the Earl of Lindsay, who had led the king's infantry.

Edg'erton: city (founded in 1858); Rock co., Wis. (for location of county, see map of Wisconsin, ref. 7–E); situated on Ch., M. and St. P. Railroad, 25 miles S. E. of Madison. It has 7 churches, a large high school, a pottery, and 34 tobacco-packing houses, and is one of the most important tobacco centers in the State. Pop. (1880) 869; (1890) 1,595; (1900) 2,192.

Editor of "Index."

Edgerton, Alonzo Jay: jurist; b. near Rome, N. Y., June 7, 1827; graduated at Wesleyan University in 1850. He settled in Minnesota, and soon became prominent politically, serving as a member of the Legislature 1858–59. In Aug., 1862, he was commissioned as captain of an infantry company which he had recruited, and served in the Indian campaigns of 1862–63. He was made colonel of the 67th U. S. Infantry (colored) in Feb., 1864, and served with that command in Louisiana. His regiment and the 65th were consolidated under the latter number in 1865, and later he was breveted brigadier-general and placed in command of the district of Baton Rouge, where he remained until he was mustered out in the winter of 1867. He was a presidential elector in 1876, and again a member of the Minnesota Legislature 1877–78. In 1881 he succeeded Mr. Windom as U. S. Senator, and in December of that year was appointed chief justice of the Territory of Dakota. He was president of the convention which, in 1885, formulated the Constitution of the State of South Dakota, also of the convention that revised that Constitution in 1889 in accordance with requirements made by Congress. On the admission of the State into the Union he became district judge for South Dakota, and held that office until his death, in Sioux Falls, Aug. 9, 1896.

Edgewater: village: Richmond co., N. Y. (for location of county, see map of New York, ref. 8–A); now a part of the Borough of Richmond, New York city; situated on the northeast shore of Staten Island; 6 miles S. S. W. from New York city, with which it is connected by ferry. It is on the Staten Island Railroad, has numerous churches, educational institutions, a savings bank, and manufactories, and the residences of many New York business men. Pop. (1880) 8,044; (1890) 14,265.

Edgeworth, Henry Essex: Roman Catholic priest; known as l'Abbé Edgeworth de Firmont; b. in Edgeworthstown, Ireland, 1745; the son of a Protestant clergyman who turned Catholic; was educated at Toulouse and at the Sorbonne, Paris, and after taking orders became confessor to Madame Elizabeth. He was afterward appointed confessor to her brother, Louis XVI., whom he had the courage to attend on the day of his execution, accompanying him to the foot of the scaffold and sustaining him with spiritual consolation. An object of hatred to the mob, he escaped from France amid the greatest peril, and, in 1796, returned to England, where he was received with honor. He afterward became the chaplain of Louis XVIII. at Mittau, Russia, where he died May 22, 1807, from a disease contracted by attending the French prisoners of war at that place. His *Memoirs* were edited in English by C. S. Edgeworth (London, 1815), and in French by Dupont (Paris, 1815). His *Letters* were published in Paris, 1818.

F. M. Colby.

Edgeworth, Maria: author: b. near Reading, England, Jan. 1, 1767; removed with her father, Richard Lovell Edgeworth (*q. v.*), to Edgeworthstown, in Ireland, in 1782. In 1801 she produced *Castle Rackrent*, the first of a series of novels, among the best of which are *Belinda* (1803); *Leonora* (1806); *The Absentee* (1812); *Patronage* (1814); *Ormond* (1817); and *Helen* (1834). She also published *Popular Tales* (1804) and *Tales of Fashionable Life* (1809–12), and wrote a number of works in conjunction with her father, among them her first literary work, *Essays on Practical Education* (1798), *Essay on Irish Bulls* (1802), *The Parent's Assistant*, and *Harry and Lucy*. Her stories for children were as popular in the U. S. as in England. D. in Edgeworthstown, May 21, 1849. See Miss Thackeray, *The Book of Sibyls* (1883), and the *Life* by Helen Zimmern (1883).

Edgeworth, Richard Lovell, F. R. S.: inventor and author; b. in Bath, England, May 31, 1744. He belonged to a family that had long been settled in Ireland, and inherited his father's estate in Edgeworthstown, County Longford. He was educated at Trinity College, Dublin, and at Corpus Christi, Oxford; married in 1763 and settled near Reading, England. His mechanical contrivances brought him considerable fame, and in 1771 he went to France to superintend part of the works undertaken to alter the course of the Rhône. In 1782 he removed to Edgeworthstown, where he devoted himself to questions of education and political economy. He was active in public affairs and sat in the last Irish Parliament (1798–99). Among his inventions was a system of communication by telegraphy. He published several works, mostly in partnership with his daughter Maria, the novelist, among them *Practical Education* (2 vols., 1798) and *On the Art of Conveying Swift and Secret Intelligence*. He was married four times. D. in Edgeworthstown, June 13, 1817. See *Memoirs* (partly autobiographical) *of Richard Lovell Edgeworth* (1820; 3d ed. 1844), by his daughter.

Edgreen, Anna Charlotta: author; b. in Sweden, Oct. 1, 1849; the daughter of J. O. Leffler, a school superintend-

ent in Stockholm. She wrote a number of very popular realistic novels, *Pictures of Life*, *True Women*, etc. In 1872 she married Mr. Edgreen, from whom she was divorced, and in 1890 she married an Italian duke, by name Caianello. Among her later productions is the drama *Hur Man gör godt* (How to Do Good). D. in Naples, Oct. 24, 1892.

R. B. A.

Edgren, August Hjalmar: author and educator; b. in Wermland, Sweden, Oct. 18, 1840; graduated at the University of Upsala and at the Royal Military School of Sweden in 1860; went to the U. S. and served as lieutenant in the civil war, in 1862 and 1863, and served in the regular army of Sweden 1864–70, when he again went to the U. S. He taught modern languages in Riverview Academy 1871–72, was instructor in French, German, and Sanskrit in Yale 1874–80, and lecturer on Sanskrit in the University of Lund, Sweden, 1880–84, and then became Professor of Modern Languages and Sanskrit in Nebraska University. He has written numerous papers on Sanskrit, Romance, and Germanic philology, which have been published in Sweden, England, and the U. S. Among his publications are a Swedish translation of Longfellow's *Evangeline* (1875); a *German and English Dictionary*, with W. D. Whitney (1877); a work in Swedish on *The Literature of America* (1878) and one on *The Public Schools and Colleges of the United States* (1879); *Swedish Literature in America* (1883); and *American Antiquities* (1885).

Edhem Pasha: Turkish statesman; a native of Scio and of Greek family; b. in 1823; purchased as a slave in his boyhood; sent by his master to the École des Mines, Paris; returned to Constantinople 1839; placed on the general staff, and rose to the rank of colonel; aide-de-camp to Abd-ul-Medjid and captain-general of the imperial guard 1849. In 1867 he was Minister of Foreign Affairs, and for the next eight years ambassador at different European courts. In Dec., 1876, he represented Turkey in part at the general conference of the powers. In Feb., 1877, he succeeded Midhat Pasha as grand vizier. He served in 1879 as ambassador at Vienna, and from 1883 to 1885 as Minister of the Interior. On the outbreak of the war between Turkey and Greece in 1897, he was placed in command of the army of precaution concentrated in Monastir, and made arrangements to move 75,000 men over the frontier within a few weeks, including 21 batteries of artillery and 10 squadrons of cavalry. During the fighting that soon followed Edhem Pasha utilized the topographical advantages of his position to the utmost, and his vigorous offensive campaign soon forced the Greek army to withdraw from Thessaly.

Edict [from Lat. *edic'tum*, proclamation; *e*, forth + *di'cere*, speak]: a public decree or proclamation issued by a sovereign or other potentate; an instrument signed and sealed as a law. In ancient Rome the power of making edicts was principally exercised by the *prætor urbanus* and the *prætor peregrinus*, who on entering office published rules for regulating the practice of their courts, etc. The edicts of a prætor were not binding on his successor, but if confirmed by the latter they were called *edicta vetera* (old edicts), as distinguished from the *edicta nova* (new edicts) framed by himself. A digest of the best decisions of the prætors was made under the Emperor Hadrian by Salvius Julianus. It was called *Edictum Perpetuum*, and made the invariable standard of civil jurisprudence.

Edict of Nantes: one of the most famous edicts of history; issued by Henry IV. of France, Apr. 13, 1598, to secure to the Protestants a legal existence within the French monarchy. They obtained permission to celebrate service wherever they already had formed communities, and to establish new churches wherever they chose, with the exception of Paris and the royal residences. They were also permitted to found universities or theological seminaries, and the schools of Montpelier, Montauban, Saumur, and Sedan soon became prominent centers of learning. Nor should their faith be any impediment to their promotion to any civil or military office, etc. The restrictions imposed upon them were few and lenient. Though the act was solemnly confirmed by Mary of Medici, regent after the assassination of Henry IV., by Louis XIII., and even by Louis XIV., it was never fully carried out. The Huguenots were always more or less exposed to vexations, especially after the fall of La Rochelle in 1628, when they lost nearly all political importance. Nevertheless, it was not until the latter part of the seventeenth century, under the reign of Louis XIV., that the vexations assumed the charater of open persecution. The Edict of Nantes was revoked by Louis XIV. Oct. 17, 1685, and its revocation led to a renewal of the bloody scenes which before the issuing of this edict had been enacted among the Huguenots. The depopulation caused by the sword was also increased by emigration. The Huguenots were very generally skilled artisans, and about half a million of her most useful and industrious subjects deserted France, and exported, together with immense sums of money, those arts and manufactures which had largely tended to enrich the kingdom. About 50,000 refugees passed over into England, and many more into Germany and America. The Huguenot refugees became very important elements in the industrial development of Germany, Holland, England, and the U. S.

Revised by C. K. Adams.

Edi'na: town (founded in 1839): capital of Knox co., Mo. (for location of county, see map of Missouri, ref. 1–H): situated on railway, 47 miles N. W. of Quincy, Ill. It has 6 churches, a fine public school, a convent school, 2 carriage and wagon factories, a flouring-mill, a creamery, water-works, and electric lights. Pop. (1880) 1,156; (1890) 1,456; (1900) 1,605.

Editor of "Knox County Democrat."

Edinboro: borough; Erie co., Pa. (for location of county, see map of Pennsylvania, ref. 1–A): 18 miles S. of Erie. It is the seat of the Northwestern State Normal School, and has manufactures of lumber, pumps, sash and blinds. Pop. (1880) 876; (1890) 1,107; (1900) 691.

Edinburg: town; on railway; Johnson co., Ind. (for location of county, see map of Indiana, ref. 7–E); situated on the Blue river, 30 miles S. S. E. of Indianapolis. It has 5 churches, a high school, 2 public schools, good water-power, a cereal-mill, flouring-mills, starch-works, ice-plant, foundry and machine shops, cabinet-factory, carriage and wagon factory, and water-works. Pop. (1880) 1,814; (1890) 2,031; (1900) 1,820.

Editor of "Courier."

Edinburgh, ed'in-bŭr-rŭ [said to be a corruption of Edwin's burgh, the castle having been built by Edwin, King of Northumbria (616–633)]: capital of Scotland and of Edinburghshire or Midlothian; picturesquely situated about a mile S. of the Firth of Forth; 399 miles N. N. W. of London; lat. 55° 57′ N., lon. 3° 12′ W. (see map of Scotland, ref. 11–H). It is divided into the Old and New Town, the former of which occupies the middle and highest of three ridges extending east and west. The Old Town is separated by a narrow hollow or ravine from the New Town, which was built on a broader ridge with more gently sloping sides. Edinburgh is remarkable for the elegance and solidity of its buildings, which are all of stone. The adjacent country is pleasantly diversified with hills and plains. On the southeastern border of the city a hill called Arthur's Seat rises to the height of 822 feet.

The principal street of the Old Town is that which extends along the crest of the ridge, bearing in different parts the names of Canongate, High Street, Lawn Market, and Castle Hill. It is more than a mile long, and rises with a regular but rather steep acclivity from the palace of Holyrood, which is at its eastern end, to the huge rock on which stands Edinburgh Castle, 443 feet above the level of the sea. This street is lined with lofty and antique residences, many of which have seven or more stories. The houses of the New Town are built of a fine white freestone quarried in the vicinity, and are remarkably handsome. Here are three parallel avenues called Queen Street, George Street, and Princes Street, the last of which extends along the south side of the New Town, close to the hollow which separates it from the Old. Princes Street is the most agreeable promenade in the city, and, as it is lined with houses only along its northern side, it commands a fine view of the Old Town with its lordly castle and of the intervening valley adorned with public gardens. At the eastern end of this street is a rocky eminence called Calton Hill, the broad verdant summit of which commands a beautiful view of the Firth of Forth, here about 6 miles wide. Arthur's Hill and another high hill called Salisbury Crags afford prospects of almost unrivaled beauty and magnificence.

The most remarkable public edifices and monuments are the castle, which is a large fortress capable of accommodating 2,000 men, and is one of the oldest structures in the city; the royal palace of Holyrood, or Holyrood House, the oldest part of which was built about 1528: this palace is quadrangular in form, with a central court 94 feet square, and is famous as the residence of Mary Queen of Scots; the

cathedral of St. Giles, a large and ancient edifice of unknown date, in the later Gothic style; Victoria Hall, or Assembly Hall, a magnificent structure, which stands at the head of High Street, has a spire 241 feet high, and is the place where the General Assembly of the Church of Scotland annually meets; the Parliament House, now a hall connected with the courts of law; and the admirable monument erected to Sir Walter Scott, which stands on Princes Street, is 200 feet high, and is unequaled among the monuments of this metropolis for artistic beauty. Among the other objects of interest are the old Tron church, the Free St. George's church, the Free High church, the university buildings, the observatory, the National Gallery of Art, the Royal Institution, a beautiful Grecian edifice containing the apartments of the Royal Society, a chapel belonging to the ruined abbey of Holyrood, founded by David I. about 1128, the theater, and the National Monument (an uncompleted imitation of the Parthenon) on Calton Hill.

Edinburgh contains over one hundred churches and chapels belonging to various denominations—the Free Church, Church of Scotland, United Presbyterian, Presbyterian, Episcopal, Baptist, Congregational, Roman Catholic, Methodist, Evangelical, Unitarian, etc. It is the seat of a bishop of the Episcopal Church and of a Roman Catholic vicar-apostolic. It has numerous large and richly endowed hospitals and charitable institutions, among which is Heriot's Hospital, founded for the education and maintenance of poor boys. This city is important as a center of learning, and is distinguished for the number and excellence of its literary, scientific, and educational institutions. The aristocracy, the literati, and professional men form an unusually large proportion of its population, which is extensively engaged in the business of printing and publishing books. Edinburgh is the headquarters of the book-trade in Scotland, and as a literary mart is second only to London among the British cities. Here is the celebrated UNIVERSITY OF EDINBURGH (*q. v.*). The other chief educational institutions are the High School, which occupies a handsome Doric edifice 270 feet long, the New College, or Theological Seminary of the Free Church, the Royal College of Surgeons, the medical school, the Royal Academy of Fine Arts, and the Royal Society. The Advocates' Library has the largest and most valuable collection of books in Scotland—300,000 volumes; that of the Writers to the Signet nearly 90,000 volumes. There is also a free public library.

Edinburgh is the seat of the supreme courts of Scotland, the principal of which is the court of session, composed of thirteen judges. This court tries all civil causes, and decides not only on the law of the case but also in questions of equity. This city returns four members to Parliament. By virtue of ancient charters and modern acts of Parliament it is a royal burgh, governed by a town council of fifty members elected by popular vote, and by a lord provost, who is elected by this town council. It is the terminus of the North British, the Edinburgh and Glasgow, and the Caledonian railways. This city has two ports on the Firth of Forth—Leith and Granton. Pop. (1891) 261,261; (1901) 316,479.

History.—Edinburgh was recognized as a burgh by David I. in 1128, and a Parliament was held here in 1215. David I., who before his ascension to the throne of Scotland had been Earl of Huntingdon, and was well acquainted with the military and ecclesiastical architecture of the Anglo-Norman kings, built the abbey of Holyrood, which often received the Scottish court as guests. Edinburgh became the capital of Scotland about 1436, when its castle was selected as the only place of safety for the royal household and the Parliament. It was inclosed by walls in the fifteenth century, and for a long period was confined to the central ridge. The hollow between this and the northern ridge was filled with water, called the North Loch. The New Town originated about 1765, when a bridge was erected across that loch to connect the Old Town with the New. Here occurred in May, 1843, the disruption of the Established Church, from the General Assembly of which 203 members seceded and organized the Free Church.

Edinburgh, ALFRED ERNEST ALBERT, Duke of: second son of Victoria, Queen of Great Britain; b. at Windsor Castle, Aug. 6, 1844. He was educated chiefly by private tutors. He entered the British navy in 1858, and served chiefly on foreign stations. In 1862 he was offered the crown of Greece, but declined it. In 1866 he took a seat in the House of Peers by his present title. In 1867 he set sail in command of the frigate Galatea, visiting Australia, Japan, China, India, etc. At a picnic at Clontarf, New South Wales, Mar. 12, 1868, he was slightly wounded by a pistol-shot fired by a Fenian named O'Farrell, who was soon afterward executed. On Jan. 23, 1874, he married the Grand Duchess Marie, only daughter of Alexander II. of Russia. In Nov., 1882, he was promoted to the rank of vice-admiral, and in 1886 was appointed admiral in command of the Mediterranean squadron. The full title of this prince is "his Royal Highness Prince Alfred Ernest Albert, Duke of Edinburgh, Earl of Kent, and Earl of Ulster, K. G., K. P." He is also a Duke of Saxony, and became reigning Duke of Saxe-Coburg-Gotha Aug. 22, 1893.

Edinburgh Review: a celebrated critical magazine founded at Edinburgh in 1802, the oldest of the great British quarterly reviews. Francis Jeffrey, Sydney Smith, Henry Brougham, and Francis Horner were the founders and first contributors of this review, which was a strenuous advocate of Whig principles. Sydney Smith edited the first number, of which 750 copies were printed. Mr. Constable was the original publisher. Lord Jeffrey became its editor in 1803, and conducted it with great ability and success for twenty-six years. The brilliant wit, the critical keenness, the eloquent style, and the extensive knowledge displayed by the contributors produced a great sensation in the literary world. Its circulation had risen to 9,000 in 1808, and 12,000 or more in 1813. Among the eminent men who contributed largely to it were Macaulay, Carlyle, Lord Brougham, Sir J. Mackintosh, and Henry Rogers. Macvey Napier succeeded Lord Jeffrey as editor in 1829. The price paid to contributors was at first ten guineas a sheet, but it was soon raised to sixteen guineas.

Edinburghshire, or **Midlothian**: a county in the southeast part of Scotland; area, 363 sq. miles. It is bounded N. by the Firth of Forth. The surface is diversified by plains and high ridges, among which are the Moorfoot Hills and the Pentland Hills, composed of porphyry. The highest point of the Pentland Hills rises 1,839 feet. The rocks of this county belong mostly to the Carboniferous and Silurian formations. Valuable coal mines are worked in the valley of the Esk. The soil is generally fertile and well cultivated. Near the metropolis, Edinburgh, are many nurseries, dairy pastures, and vegetable gardens. The county is traversed by five great railways. Pop. (1881) 389,164; (1891) 434,276; (1901) 437,553.

Edinburgh, University of: an institution of learning in Edinburgh, Scotland. It was founded in 1582 by a charter granted by James VI., of Scotland, and in 1621 the Scottish Parliament granted to it all the privileges enjoyed by other universities in the kingdom. This grant was confirmed in the treaty of union between England and Scotland, and again in the act of security. The constitution was, however, modified by the act (1858) relating to the Scottish universities, and the University of Edinburgh became a corporation consisting of a chancellor, rector, principal, professors, registered students, alumni, and matriculated students. About 3,000 students matriculate each year. The essential qualification for graduation at this as at other Scottish universities is attendance at certain series of lectures or classes. The course for the arts degree extends over four winter sessions, each lasting from the beginning of November till about the middle of April; and the degree of M. A. is conferred on all who have completed their course and passed the ordinary examinations in Latin and Greek, mathematics and natural philosophy, logic and metaphysics, moral philosophy, rhetoric, and English literature. The university comprises the faculties of arts, laws, medicine, divinity, and science. The buildings were for many years very deficient in the necessary accommodation, but much has been done in the way of improvement. The library contains nearly 200,000 volumes and 7,500 volumes of MSS., and there is also a theological library of 10,000 volumes. The chancellor is (1901) the Rt. Hon. Arthur J. Balfour, the Conservative leader. The universities of Edinburgh and of St. Andrews together have one representative in Parliament. See Sir A. Grant, *The Story of the University of Edinburgh* (2 vols., London, 1883). Revised by C. H. THURBER.

Edison, THOMAS ALVA, Ph. D.: inventor; b. at Milan, O., Feb. 11, 1847; taught to read by his mother, a Scotchwoman of some intellectual attainments; began life as a train-boy on the Grand Trunk Railway running into Detroit. Ambitious, energetic, eager for knowledge, he devoted every spare moment to study. Securing a press, he learned printing, and before long was editing and printing *The Grand Trunk*

Herald in the baggage-car of the train in which he sold his wares. A station-master, whose child he had rescued from peril, taught him telegraphy, and he entered the employ of the Western Union Telegraph Company, where he began the series of inventions which brought him world-wide fame. After brief stays in Cincinnati, Memphis, Louisville, and New Orleans he settled in Boston, where he invented his duplex telegraph in 1870; a year later he removed to New York city. In an immense and perfectly appointed laboratory, first at Menlo Park and later at West Orange, N. J., a corps of skilled investigators, working under his direction, have reduced invention to an art. The carbon transmitter, the phonograph, microphone, megaphone, incandescent lamp, and hundreds of minor inventions introduced to the commercial world with rare discernment, give him a unique position among the great inventors of the nineteenth century. In 1878 he was made a chevalier of the Legion of Honor by the French Government in recognition of his services to science and of a remarkable electrical exhibit at the International Exhibition in that year. In 1889 he was made commander of the Legion, and was also presented with the insignia of a grand officer of the Crown of Italy by King Humbert.

Ed'isto: a river of South Carolina; formed by the North and South Edisto, which unite at Edisto. The North Edisto is the boundary between Barnwell and Orangeburg Counties. The main stream flows southeastward and southward through Colleton County, and enters the Atlantic Ocean by two channels, called the North and South Edisto Inlets.

Edisto Island: an island of South Carolina (for location, see map of South Carolina, ref. 8–F); one of the most important of the Sea island group; situated between the North and South Edisto Inlets. It produces sea-island cotton.

Edkins, Joseph: See the Appendix.

Edmond, John, D. D.: Presbyterian clergyman; b. in Balfron, Stirlingshire, Scotland, Aug. 12, 1816; educated at Glasgow College and the Theological Hall of the United Secession Church. After two pastorates in Scotland, he became in 1860 pastor of the congregation in Islington, London, which two years later removed to the church now known as Park church, Highbury. He has been twice moderator of Synod, and has represented his church in the several general assemblies in the U. S. and Canada. He published *The Children's Charter* (Glasgow, 1855); *The Children's Church at Home* (2 vols., London, 1861–63; 4th ed. 1872); *Scripture Stories in Verse* (Edinburgh, 1871). Willis J. Beecher.

Edmonds, John Worth: jurist; b. at Hudson, N. Y., Mar. 13, 1799; graduated at Union College, Schenectady, N. Y., 1816. In 1819 he was admitted to the bar, and in 1820 commenced the successful practice of law in his native town. In 1831 he entered the New York Legislature as a member of the Assembly, and in 1832 became a State Senator. In 1836 he was appointed a U. S. Indian agent. In 1841 he re-entered upon the practice of law, and opened an office in New York city. In 1843 he was appointed one of the State prison inspectors, and labored with zeal and success in introducing reforms in prison discipline. In 1845 he was appointed a circuit judge, and in 1847 became one of the judges of the Supreme Court, New York. In 1852 he was appointed to the bench of the court of appeals, from which in 1853 he retired to the private practice of law, in which he was after a time a partner with Hon. William H. Field. In 1851 Judge Edmonds became a convert to Spiritualism, and in 1853–55 published, in connection with George T. Dexter, M. D., a work defending its doctrines (new ed. 1865); also *Letters and Tracts on Spiritualism* (London, 1874). D. in New York city, Apr. 5, 1874.

Edmonton: a town of Alberta, Canada; on the North Saskatchewan river; in about lat. 53° 30′ (see map of Canada, ref. 8–F). Daily weather reports are sent out from here by telegraph to the U. S. weather bureau, and severe winter storms in the Northern States often make their first appearance in the vicinity.

Edmund I.: King of the Anglo-Saxons; b. about 922 A. D.; a son of Edward the Elder and a grandson of Alfred the Great. He became king in 941, conquered the Britons of Cumbria, and re-established Watling Street as the boundary between Wessex and the Danes. He was assassinated by the robber Leofa, May 26, 946, and was succeeded by his brother Edred.

Edmund II., surnamed Ironside: King of England; b. in 989 A. D.; was a son of Ethelred II. At the death of the latter, in 1016, the Danes possessed the greater part of England. Edmund, who was renowned for courage, waged war against Canute the Dane, and gained several victories, but was defeated at Assandun. The two rivals then agreed to divide the kingdom, of which Edmund received the southern part. D. Nov. 30, 1016, and Canute then became sole king.

Edmund, Saint: See Rich, Edmund.

Edmunds, George Franklin, LL. D.: lawyer and Senator; b. at Richmond, Vt., Feb. 1, 1828; began the practice of law in 1849, and in 1851 removed to Burlington, Vt.; was a member of Vermont Legislature 1854, 1855, 1857, 1858, 1859, serving three years as Speaker; member of State Senate, and its president *pro tem.* 1861–62. He was appointed to the U. S. Senate as a Republican to fill the vacancy caused by the death of Solomon Foot, and took his seat Apr. 5, 1866; was elected for the rest of the term ending Mar. 4, 1869, and was re-elected for 1869–75, 1875–81, 1881–87, and 1887–93, but resigned in 1891 and retired to private life. He was a member of the Electoral Commission of 1876, and was elected president *pro tem.* of U. S. Senate, Mar. 3, 1883. He was the author of the act of Mar. 22, 1882, for the suppression of polygamy in Utah and the disfranchisement of those practicing it, and of a similar act passed in 1887.

Edmunds, Lewis Humfrey: See the Appendix.

Edom: a name of Esau (*q. v.*).

Edom: a country of Asia. See Idumæa.

Edred: King of the Anglo-Saxons; a son of Edward the Elder. He succeeded his elder brother, Edmund I., in 946 A. D. St. Dunstan acquired an ascendency over Edred, and was his most powerful minister. Edred died Nov. 23, 955, and was succeeded by his nephew Edwy.—Edwy, Eadwig, or Edwin the Fair, reversed the policy of his predecessor, drove Dunstan from the country, and by his misgovernment provoked Mercia and Northumberland to revolt and chose his brother Edgar for their king. On Edwy's death two years later Edgar succeeded to the throne of Wessex (959).

Edriophthal'ma [incorrectly formed from Gr. ἕδρα, seat, or ἑδραῖος, sitting, fixed + ὀφθαλμός, eye]: a group of crustaceans called the sessile-eyed crustacea, because their eyes are placed directly upon the shell, instead of being mounted upon footstalks. They have the organs of respiration connected with the organs of locomotion. None of the *Edriophthalma* attain more than an inch and a half in length. They are generally marine, though some of them of the order *Amphipoda* inhabit fresh water, and a few, belonging to the *Isopoda*, such as the wood-louse, are terrestrial but inhabit damp places. To the *Amphipoda* belong the common sandhoppers which are found along sandy shores.

Edrîsî, ed'rĕe-sēe, or **Edreese**: an Arabian geographer; b. at Ceuta, in Africa, about 1100. He was descended from the royal family of Edrisites. He traveled extensively in Europe and Asia, and passed many years at the court of Roger II., King of Sicily, by whom he was liberally patronized, and for whom he made a silver terrestrial globe. Edrîsî wrote a large book on geography, which was long a standard work. M. Jaubert published a French translation of it in 1836. D. about 1175.

Educabil'ia [Mod. Lat., deriv. of Lat. *educa're*, to educate]: a term invented by Bonaparte and applied to a group, or super-order, of placental mammals distinguished by the relatively large size of the cerebrum, which overlaps the greater part, or all, of the cerebellum and olfactory lobes; the corpus callosum is also large. The group includes the higher mammals, the orders *Primates*, *Carnivora*, *Ungulata*, *Proboscidea*, *Sirenia*, and *Cetacea*, and is opposed to the Ineducabilia (*q. v.*). F. A. Lucas.

Education [from Lat. *educa'tio*, deriv. of *educa're*, rear, nourish; connected with *edu'cere*, lead out; also of children, bring up]: in a general sense, the development and cultivation of the physical, mental, and moral powers of man; in a narrower but more usual sense, the development and training of the mental faculties.

Phases.—Education is one of the oldest of human arts, and has always responded to some human need, or to some conception of what man ought to be. In the main its aim has been practical, but at certain epochs it has aimed rather at some ideal of human perfection. In the course of history almost every conceivable phase of education has been developed and tested, and the art has been perfected by countless

experiments under all conceivable conditions. The earliest phase was doubtless the *practical*, as when a father taught his son how to construct the rude instruments needed for gaining food. Education soon became *prudential*, consisting of maxims or proverbs embodying the net results of human experience concerning good conduct. Another early phase was the *religious*, inculeating man's duties to unseen powers. *Physical* education and education for the *contemplative* life were products of Greek thought. The Jews developed a system of *industrial* education, while the Phœnicians, a trading people, devoted more attention to *commercial* training. Education for the *civil service* has been typical of China for ages. In modern times *manual training* has become one of the forms of industrial education; and *moral* training, which now receives so much emphasis, finds its type in the religious education of the Jews.

Types of Education.—All the phases of education that have been developed through the experience and thought of the race may be reduced to two main types—the *culture* or *humane* type and the *industrial* or *professional* type. Starting from the conception that the man is superior to the instrument, and that the quality of the instrument depends on the quality of the man, thinkers in all ages have devised schemes of education aiming at the perfection of human nature. The religions and ethical systems of education in vogue among ancient peoples were based on the permanent and universal needs of man, and not on his incidental needs as a workman or instrument. The culture type of education took permanent shape in Greece, and Plato's *Republic* is an exposition of a course of training befitting the ideal man, for only out of such a man could the ideal citizen be produced. Indeed, the serenity, harmony, and poise of the Greek ideal presuppose an almost entire exemption from industrial pursuits, and seem adapted to beings leading a purely contemplative life. In order that arithmetic may serve its highest purpose, Plato expressly states that it must not be taught for commercial purposes, as to shopkeepers and merchants. This type of education has persisted through the ages, and has a clearly marked place in the schools of to-day. The classics, the belles-lettres, history, music, and art are humane studies, and the general pursuit of the sciences is best defended on the ground of their culture value—they interpret nature for purposes of contemplation.

Roman education was as distinctively practical or professional as the Greek was humane; it provided for a select few a career in the army or in the forum. All schemes for industrial, commercial, or professional education belong to this type; they regard man chiefly as an instrument, and their direct purpose is the narrow one fitting him to earn a livelihood. This may be called the popular type of education, for among the people at large the notion is thoroughly ingrained that the chief end of school training is to fit the young for "getting on in the world." Alexander Bain speaks of the difficulty of reconciling the whole man with himself, that is, of bringing the instrument into harmony with the man, and this is doubtless the most difficult problem of modern education. The ideal is to make all education, high and low, of the culture or liberal type, and at the same time to guard the child's interests as a wage-earner; but this ideal is hard to realize.

The Patrons of Education.—The earliest education was domestic, and the best type of this home-school existed among the ancient Jews, where the father was the teacher and the law of Moses the text. Later, through that differentiation of function which is common to all peoples advancing toward civilization, the teaching office was relegated by the family to the Church, and for centuries the Church was the patron of the school, as it continues to be in some countries at the present day. But education gradually became secularized, especially in three ways: subjects not essentially religious, as history and science, have been given a place in the education of the young; laymen have been admitted to the teaching office; and the state has gradually displaced the Church in the patronage of the school. In all the progressive nations of modern times education has become to a greater or less degree a function of the state. The secularization of the school is most complete in France, where ecclesiastics are excluded by law from teaching; but in all other countries in which education is administered by the state the Church is not molested in her right to maintain parochial schools. The modern state has become a public educator on the ground of self-preservation, holding that ignorance is a menace to the national life, and therefore claiming the right to diffuse enlightenment among its citizens. The secularization of the school is the logical outcome of the rising democratic spirit which characterizes modern nations. An ignorant and degraded people may be governed, but only an enlightened and virtuous people is capable of self-government. This modern doctrine of education by the state was embodied by Plato in his *Republic*, where it is followed out to the extreme of giving the state complete ownership of children, and even sanctioning the destruction of the sickly.

The Old and the New.—Essential changes in modes of human thought have always been followed by corresponding changes in education; and a new philosophy which profoundly affects the religious nature necessarily gives rise to a new education. As the Reformation wrought a radical change in men's religious philosophy and practice, there is eminent propriety in speaking of the general system of education in vogue before the Reformation as the Old, and of the system that had its rise at that period as the New. There was not an abrupt cessation of the old order of things, for what was essentially good and true necessarily passed into the new order of things. The old education was based essentially on authority; the child was mainly a passive recipient, and his warrant for believing the truth of what he was taught was the authority of the book or of the master. The one great principle of learning was to believe and take for granted, to assume the accuracy of authorized statements without asking questions and without mental unrest. It is not difficult to see how such a conception of teaching and learning resulted from a system of education based on a religion in which dogma played a very large part. Again, the older system of education was addressed almost entirely to the memory, and learning was but little more than memorizing a text or a formula verbatim. In this particular the influence of religious training is also manifest. Not only was the thought or content of a text held sacred, but so also was the form of words in which it was embodied; and the effectual way to lodge the truth in the soul was to lodge the verbal expression of it in the memory.

The later system of education embodies a reaction against the abuses of authority and memory. It appeals to free inquiry, and involves the exercise of the learner's own powers of thought and discovery. A thing is true, not because some one has declared it to be true, but because it has the sanction of one's own reason and experience. The modern teacher therefore addresses the pupil's powers of observation, reflection, and reason, rather than his memory; and learning becomes a process of discovery rather than a servile following of authority. The product of the teacher's art is not to be a disciple, docile and reverent, but an independent thinker, capable of reaching his own conclusions. The older system erred by exaggerating the importance of authority and memory, but the reaction of the modern system threatens to involve education in errors of equal gravity. A distrust of authority is as absurd as a distrust of reason; and education can no more dispense with memory than it can with observation and free inquiry. The ideal system of education is to be found in maintaining the just equilibrium between the old and the new tendencies.

Universality.—Generally speaking, ancient education affected only a select number of minds, while the masses of the people were left uninstructed and unenlightened. Historically, universities preceded common schools. The Reformation made the education of the common people a necessity, but it was left to the genius of Comenius to devise a system of graded instruction which has made possible the downward diffusion of culture. The greatest achievement of modern education is the gradation and correlation of schools, whereby the ladder of learning is let down from the university to secondary schools, and from these to the schools of the people.

The aim of modern education, as administered by the state, is universality, though the organization for effecting it from above downward is partial and incomplete. Even with the conception of Comenius generally embodied in a working organization, as it is in Germany and in some of the U. S., two subsidiary measures are still necessary in order to make education universal: free schools should be provided, and school attendance should be made compulsory; without the first the second will often work hardship. In the U. S. the public schools are free, but in some sections illiteracy exists to an alarming extent. In some of the States there has been a resort to compulsion, but in most cases the laws on this subject are only partially effect-

ive. In Germany, although the public schools are not entirely free, every child is compelled to attend school, and illiteracy does not exist. Compulsory attendance prevails to some degree throughout the greater part of Europe; and wherever it is proposed to make education universal this must ultimately be resorted to.

Education Values.—Plato and Aristotle, Lord Bacon, Sir William Hamilton, Alexander Bain, and Herbert Spencer have discussed the value of subjects as they affect human education. Lord Bacon comes nearest to a classification of values when he says that "studies serve for ornament, for delight, and for ability." Doubtless no one to-day would take the first of these into serious account, and it is evident by Bacon's comment on the term "ability" that he includes under it what are now designated the disciplinary and the practical values of a subject; so that a real science of education values is based on a recognition of these three distinct effects of a study: it may yield contemplative delight, it may train the mental faculties, or it may give power to attain practical ends. The three education values are therefore the *culture*, the *disciplinary*, and the *practical*. Every study has a major or characteristic effect, and may have one or both of two minor effects. Thus geography is in the main a culture subject, though it also has some practical value and a lower disciplinary value. The major value of algebra lies in its disciplinary effect; it has a low practical value, while its culture effect is almost nothing. As a general rule, the practical value and the disciplinary value of a subject are inversely proportional. The development of a science of education values would determine a rational curriculum. See SCHOOLS and UNIVERSITY.

W. H. PAYNE.

Edward (surnamed THE CONFESSOR): an Anglo-Saxon King of England; b. at Islip in 1004. He was a son of Ethelred II. After the death of Ethelred, in 1016, Canute the Dane became master of the kingdom, and married Emma, the mother of Edward. In 1042 Edward came to the throne, succeeding his half-brother Hardicanute. He married Editha, a daughter of Earl Godwin, but did not permit her to share his bed, and for this and other ascetic virtues was surnamed "The Confessor." D. Jan. 5, 1066, and was succeeded by his wife's brother, Harold. Edward the Confessor is honored as a saint in the Roman Catholic Church.

Edward I. (surnamed LONGSHANKS): King of England; eldest son of Henry III. and his wife Eleanor; b. at Westminster in 1239. He fought for his father against the barons in the war which began in 1263. In 1265 he gained a decisive victory at Evesham. He took part in a crusade to Palestine in 1271, and returned to England and took his deceased father's throne in 1274. The conquest of Wales he completed in 1282, after a war of several years. In 1291 several competitors for the crown of Scotland recognized Edward as lord paramount, and chose him as umpire. He decided in favor of John Baliol, who took the oath of fealty to the English king. The Scots took up arms to maintain their independence. In 1296 Edward invaded Scotland, dethroned Baliol, and made himself master of the kingdom. The national cause was bravely defended by Sir William Wallace, who gained a victory at Stirling in 1297, but was himself defeated by Edward at Falkirk in 1298. Edward again invaded Scotland in 1303, and in 1305 captured Wallace, who was then hanged as a traitor. The English king was marching against Robert Bruce, who had renewed the contest, when he died near Carlisle, July 7, 1307. Edward was an ambitious and able ruler, having great political talents, as well as military genius. He greatly promoted the improvement of law and the reformation of civil abuses. Among the important events of his reign was the institution of the House of Commons. He was succeeded by his son Edward II.

Edward II.: King of England; fourth son of Edward I. and Eleanor; b. at Carnarvon, Apr. 25, 1284; became heir-apparent in 1285; was created Prince of Wales in 1301; and succeeded his father in 1307. He was weak and indolent, and utterly incompetent. Immediately after his accession to the throne he recalled Piers Gaveston, made him guardian of the kingdom while he himself went to France, and loaded him with so many honors and presents that the nobles demanded securities before consenting to the coronation of the king. In 1312 the nobles revolted and executed Gaveston, but he was followed by Despenser. Lagging in the prosecution of the Scotch war till Bruce had regained much of what had been lost, Edward at last undertook the invasion. The result was the utter defeat of the English in the great battle of BANNOCKBURN (*q. v.*) in 1314. In 1327 Edward was deposed by Parliament, and shortly after was assassinated.

Edward III.: King of England; eldest son of Edward II.; b. at Windsor, Nov. 13, 1312. He ascended the throne Jan. 29, 1327, but during his minority the royal power was exercised by the queen-mother and Roger de Mortimer. Edward married Philippa of Hainault in 1328. In 1330 Mortimer was arrested, tried, and executed by the order of the young king, who then assumed the royal power. To support Edward Baliol, who claimed the Scottish throne at the death of Robert Bruce, Edward invaded Scotland, and defeated the Scotch at Halidon Hill in 1333. The Scottish people generally refused to recognize Baliol, and although the English army ravaged their country in several campaigns, they again and again rallied and fought resolutely for independence. When his uncle, Charles IV. of France, died without male issue, Edward claimed the throne of France, but Philip of Valois was recognized by the French people. The English king began war in 1339, but hostilities were several times suspended by truce. In 1346 Edward, with his son, the Black Prince, invaded France, marched to the gates of Paris, and gained a complete victory at Crécy (Aug. 26). He took Calais after a siege of several months in 1347, and a long truce was then concluded between the two powers. The war having been renewed in 1356, the Black Prince defeated the French at the great battle of Poitiers Sept. 19 of that year, and took King John prisoner. In 1360 the war was suspended by the treaty of Brétigny, in accordance with which Edward was promised a ransom of 3,000,000 crowns for King John and retained the French provinces which he had conquered. King John's successor, Charles V., renewed the war in 1370, gained a series of victories, and recovered nearly all the French territory which the English had occupied. Edward died June 21, 1377, and was succeeded by his grandson, Richard II. He was popular, and left a high reputation for ability.

Edward IV.: King of England; b. at Rouen in 1442; son of Richard, Duke of York. After the death of his father in 1460 Edward was the head of the house of York, then waging a civil war against the Lancastrians, who fought for Henry VI. Edward gained a victory at Mortimer's Cross, near Hereford, entered London in February, and was proclaimed king Mar. 4, 1461. His courage, handsome person, and other popular qualities rendered him a favorite of the people of London. The cause of the Lancastrians was supported by Margaret of Anjou, the ambitious queen of Henry VI., whose army was defeated at Towton in Mar., 1461. Edward gained another victory at Hexham in 1464, and next year took Henry VI. a prisoner. By his marriage with Elizabeth Woodville (1464) Edward offended the Earl of Warwick, the most powerful of his subjects. Warwick expelled Edward from the country in 1470; but the latter returned in 1471, defeated Warwick at Barnet (Apr. 14), and recovered the throne. On May 4, 1471, he gained a decisive victory at Tewkesbury, which ended the War of the Roses. D. Apr. 9, 1483.

Edward V.: King of England; b. in Westminster, Nov. 4, 1470; eldest son of Edward IV., whom he succeeded Apr. 9, 1483. His uncle, Richard, Duke of Gloucester, obtained possession of the person of Edward V., and became protector of the kingdom. The young king and his brother disappeared in June, 1483, and probably were murdered in the Tower by the order of Richard, who then usurped the throne.

Edward VI.: King of England; son of Henry VIII. and Jane Seymour; b. at Hampton Court, Oct. 12, 1537, and succeeded his father Jan. 28, 1547. His uncle, Edward Seymour, Earl of Hertford (afterward Duke of Somerset), acted as regent, with the title of lord protector. The latter promoted the Protestant cause. During this reign the images were removed from the churches, the articles known as the "Bloody Statute" were repealed, and the Reformation made great progress in England. Somerset invaded Scotland, because the Scottish Government refused to form a

matrimonial alliance between Mary Stuart and Edward VI. He defeated the Scots at Pinkie in 1547. Somerset's enemy, John Dudley, Earl of Warwick, obtained the ascendeney in 1550, and eaused him to be exeeuted. Dudley persuaded the young king to exelude the princesses Mary and Elizabeth from the throne, and to appoint Lady Jane Grey as his successor. Edward died July 6, 1553. See Sharon Turner, *History of the Reigns of Edward VI., Mary, and Elizabeth* (1829); Froude, *History of England*.

Edward VII.: King of England; eldest son of Queen Vietoria and Albert, Prince Consort; b. in Buekingham Palace, London, Nov. 9, 1841. Suceeeded his mother, upon her death, Jan. 22, 1901. He took the oath as king in St. James's Palace, Jan. 23, 1901, and was proclaimed the following day. He was edueated in childhood by private tutors, and after reaching his majority studied at Edinburgh, at Christ College, Oxford, and Trinity College, Cambridge. In 1860 he visited Canada and the U. S. He married, Mar. 10, 1863, Princess Alexandra of Denmark. In 1875–76 he visited India. His first speeeh in the House of Lords, in 1884, was in support of a measure for the better housing of the poor, and led to his appointment as commissioner to study the subject. He is democratie in his tastes, a patron of the stage, and widely known for his interest in all kinds of sports. His eldest ehild, Prinee Albert Victor Christian Edward, Duke of Clarenee, b. at Frogmore, Jan. 8, 1864; d. Jan. 14, 1892. His seeond son, Prince George Frederiek Ernest Albert, Duke of York, b. June 3, 1865, sueeeeded, on his father's accession to the throne, to the title of Duke of Cornwall. The younger children are Princess Louise Victoria Alexandra Dagmar, b. Feb. 20. 1867 (married the Duke of Fife, July 27, 1889); Prineess Victoria Alexandra Olga Mary, b. July 6, 1868; Prineess Maud Charlotte Mary Vietoria, b. Nov. 26, 1869 (married Prinee Charles of Denmark, July 22, 1896); Prinee Alexander, b. April 6, 1871, d. April 7, 1871.

Edward: Prinee of Wales, called the **Black Prince** (from the eolor of his armor); b. June 15, 1330; the eldest son of Edward III. of England and Philippa; was ereated Duke of Cornwall in 1337 and Prinee of Wales in 1343. He eommanded a part of his father's army at the battle of Créey (1346), and then adopted the crest of ostrich feathers and the motto *Ich dien* (I serve), whieh erest and motto had been borne by John, King of Bohemia, who was slain at that battle. Ever sinee, it has been borne by the Prinees of Wales. In 1355 Edward commanded the prineipal of the three armies raised by the English for the invasion of Franee. Landing at Bordeaux he took the city, and in 1356 gained a brilliant vietory over the Freneh at Poitiers, where he took their king, John, a prisoner. In 1361 he married his eousin Joanna, a daughter of the Earl of Kent, and reeeived from his father the title of Prinee of Aquitaine. In his new possessions he lived for a long time a quiet life, until drawn into Spanish polities. He defeated Henri de Transtamare in battle, and in 1367 restored Henri's rival, Peter the Cruel, to the throne of Castile. The heavy taxes eaused by the Spanish campaign brought about rebellion in Aquitaine, and Limoges fell into the hands of the French by treason. Edward retook it and ordered every living being in the city to be killed, elosing his military eareer with this aet of unparalleled cruelty. He shortly after returned to England, utterly broken in health. D. June 8. 1376, leaving a son, who became king as Riehard II. See Creighton, *Edward the Black Prince* (London, 1869).

Edwards, Amelia Blandford, L. H. D., LL. D.: novelist and Egyptologist; b. in London in 1831. Among her novels are *My Brother's Wife* (1855); *Barbara's History* (1864); and *In the Days of My Youth* (1872). In her later years she devoted her attention mainly to Egyptology and Egyptian exploration, and was the chief promoter of the Egyptian Exploration Fund. She published *A Thousand Miles up the Nile* (1877) and *Pharaohs, Fellahs, and Explorers* (1892); translated Maspero's *Egyptian Archæology* (1887); contributed artieles on Egyptology to the *Encyclopædia Britannica*; and was secretary of the Egypt Exploration Fund. D. Apr. 16, 1892. H. A. Beers.

Edwards, Bryan: English West Indian merchant and historian; b. at Westbury, Wiltshire, May 21, 1743. In 1760 he went to live with his unele, a merehant in Jamaiea, who gave him the means of eompleting his education and ultimately took him into partnership. On his nnele's death he fell heir to the business. In 1791 he visited the revolted districts of Santo Domingo, and in 1792 he returned finally to England, where he settled at Southampton and opened a bank. He was elected to Parliament in 1796, and in that position opposed the abolition of the slave-trade. Mr. Edwards is best known for his *History of the British Colonies in the West Indies* (1793–94; new edition, with additions, 5 vols., 1819) and his *Historical Survey of St. Domingo* (1797). He published tracts and a volume of poems. D. at Southampton, July 15, 1800. Herbert H. Smith.

Edwards, Bela Bates, D. D.: theologian; b. in Southampton, Mass., July 4, 1802; graduated at Amherst College in 1824, and at Andover Theological Seminary 1830. In 1833 he founded the *American Quarterly Observer*. He became editor of the *Biblical Repository* in 1835; Professor of Hebrew at Andover in 1837; and editor of the *Bibliotheca Sacra* in 1844. In 1848 he beeame Professor of Biblical Literature at Andover Seminary. He was equally distinguished for the exaetness of his seholarship and for the modesty and beauty of his character. He published a *Life of Elias Cornelius* (1842), a work on the Epistle to the Galatians, and other works. Two volumes of his sermons, addresses, ete., with a memoir were published in Boston in 1853. D. at Athens, Ga., Apr. 20, 1852.

Edwards, Henri Milne: See Milne-Edwards.

Edwards, Jonathan: divine and metaphysician; b. at East Windsor, Conn., Oct. 5, 1703; son of Timothy Edwards, a man of uneommon learning for those times, who was minister at East Windsor. His mother, a woman of superior intellect and attainments, was a daughter of Rev. Solomon Stoddard, of Northampton, Mass. Jonathan is said to have begnn the study of Latin when only six years old. When he was ten years of age he composed an essay in whieh he ridieuled the idea, which some one had recently put forth, of the materiality of the human soul. In 1716 he entered Yale College, and gradnated in 1720. Strong religious impressions appear to have been made on his mind in early childhood, bnt he dated his "eonversion" from about his seventeenth year, after which all nature seemed changed in his view, everything revealing to his purified understanding the wisdom, glory, and love of God. In 1723 he took at Yale the degree of master of arts. He was tutor at Yale 1724–26. In the early part of 1727 he was settled as pastor of the chureh at Northampton, Mass. He was soon after married to Sarah Pierrepont, the daughter of Rev. James Pierrepont, of New Haven, who resembled him in the sweetness and purity of her spirit, in the elevation of her character, and in her entire devotion to duty. After many years of comparative peaee and happiness a difficulty arose in his eongregation whieh put his firmness and eonseientiousness to a severe test. It had become a custom in the church to admit to the communion-table all who professed with the eongregation, without any inquiry as to whether they had been truly eonverted, or whether their spirit and life were eonsistent with their external profession. Jonathan Edwards was opposed to "the half-way eovenant," as it was called. But his attempted reform eaused great dissatisfaction, and he was at length driven forth from his eongregation, June 22, 1750, not knowing whither to go and without any means of support for his family. In 1751 he became missionary at Stoekbridge, among the Housatonic Indians, and pastor of the white chureh there. About this time he wrote out his eelebrated treatise on the *Freedom of the Will*, the plan of which had been matured. it is said. while he was still a student at eollege. In 1757 he was appointed president of Princeton College in New Jersey, where he died Mar. 22, 1758.

Among his various writings are a *Treatise concerning the Religious Affections* (1746), and *An Inquiry into the Qualifications for Full Communion in the Church* (1749); his great work, *An Inquiry into the Modern Prevailing Notions Respecting that Freedom of the Will which is Supposed to be Esseutial to Moral Ageucy* (1754); *The Great Christian Doctrine of Original Sin Defended* (1757); and *The History of Redemptiou*. His works were published at Woreester, Mass.. in 1809, in eight volumes; and again, including much new material, in New York, 1830, in ten volumes. A work of his, entitled *Charity and its Fruits*, was published in 1852 for the first time. See his *Life*, by Sereno Edwards Dwight (New York, 1830), Samuel Hopkins, and in Sparks's *American Biography*, by Samuel Miller, and by A. V. Allen (Boston, 1889).

Edwards, Jonathan, D. D.: theologian; son of Jonathan Edwards, and commonly known as "the younger Ed-

wards"; b. at Northampton, Mass., May 26, 1745; graduated at Princeton in 1765; minister of a Congregational church at New Haven, Conn., from 1769 to 1795; pastor of the Congregational church at Colebrook, Conn., 1796–99. He became president of Union College, Schenectady, in 1799. He prepared for the press a number of his father's writings. His principal works are the treatise on *Liberty and Necessity* (1797); his reply to Chauncey's book on universal salvation (1789); and his *Discourses on the Atonement* (1785). They were published at Andover, 1842, 2 vols., with *Life* by Tryon Edwards. D. in Schenectady, N. Y., Aug. 1, 1801. Revised by GEORGE P. FISHER.

Edwards, JULIAN: See the Appendix.

Edwardsville: city (settled in 1812); capital of Madison co., Ill. (for location of county, see map of Illinois, ref. 8–D); on four railways and on Cahokia creek, 18 miles N. E. of St. Louis, Mo. It has coal mines, brickyards, machine-shops, and a manufactory of carriage poles. In the suburb Leclaire are large shops for the manufacture of sanitary supplies. They are managed on the co-operative plan and the workmen are very prosperous. Pop. of Edwardsville (1890) 3,561; (1900) 4,157.

Edwy, Eadwig, or **Edwin the Fair**: King of England. See EDRED.

Eeckhout, āk'howt, GERBRAND, van den: painter: b. at Amsterdam, Holland, Aug. 19, 1621; a pupil of Rembrandt, whom he imitated with success. He especially excelled in portraits, and was very skillful in the expression of character. Among his best-known pieces is *Christ and the Doctors*, in the Munich Pinakothek, and a remarkable portrait in the Städel Gallery at Frankfort. He was also an etcher, and his prints are valued by collectors. D. July 22, 1674.

Eecloo, ā-klō': a town of Belgium, province of East Flanders; 11 miles N.W. of Ghent (see map of Holland and Belgium, ref. 9–C). It has a convent and several churches; also salt-refineries, oil-mills, and manufactures of cotton and woolen fabrics, hats, soap, tobacco, etc. Here is a large weekly market for grain. Pop. (1891) 11,648.

Eel (O. Eng. *ēl*: O. H. G. *āl*, Mod. Germ. *Aal*): any one of many fishes of elongated and more or less serpentine shape, belonging to the *Anguillidæ*. The best-known species is *Anguilla anguilla*, found in both salt and fresh water on both sides of the Atlantic, although the American eels differ sufficiently from the European to entitle them to be considered at least a subspecies, *Anguilla anguilla chrysypa*. The common eel is found from Maine to Mexico east of the Rocky Mountains, while it is spread over Europe south of 64° 30′, and around the Mediterranean area, but it does not occur in the Danube or in the Black and Caspian Seas; neither is it found in the Pacific. Common as it is, its mode of reproduction has but very recently been discovered, largely through the difficulty of distinguishing the two sexes, the eggs being extremely minute. It is now known that eels spawn on the sand and mud at the mouths of rivers, moving down-stream for this purpose during the dark nights of autumn. In the spring the young eels ascend the rivers in immense numbers, climbing dams and passing over or under all manner of obstructions. The habits of the eel are, in respect to their migrations, exactly opposed to those of the salmon and herring. Eels are voracious, eating almost anything alive or dead, poking their noses into every imaginable hole in search of food, and hunting assiduously among stones for shrimps or crawfish, of which they are very fond. They are caught in quantities in wickerwork traps, and many are speared in winter, for it is their custom to pass the cold weather buried in the mud, often associated in considerable numbers. They are an excellent article of food, although prejudice keeps many people from eating them. See also CONGER EEL, ELECTRIC EEL, and MURÆNA. F. A. LUCAS.

Eel: a river of Indiana; rises in Allen co., flows southwestward, and enters the Wabash at Logansport. It affords abundant water-power. Length about 100 miles. Another Eel river rises in Boone co., Ind., and after a course of nearly 100 miles enters the West Fork of White river, in Greene co.

Eelee: same as ILI (*q. v.*).

Effect [from Lat. *effec'tus*, deriv. of *efficere*, bring about, accomplish: *ex*, out + *fa'cere*, make]: that which is produced by a cause or agent; a result of causation; a consequence; validity; reality. Cause and effect are correlative terms in natural science. In the plural, effects signifies goods, chattels, or personal property. In the fine arts, effect is that quality whose tendency is to give particular efficacy to other qualities, so as to attract the eye of the spectator, or the impression produced by a picture seen at a distance so great as to render the details invisible. See CAUSE.

Effervescence [from deriv. of Lat. *efferves'cere*, begin to boil; *ex*, out + *ferve're*, be hot]: the agitation caused by the sudden escape of gas when certain substances are mixed or combined; the escape of gaseous matter from liquids. An example of effervescence is seen when calcium carbonate is put into dilute acid. All liquids from which bubbles of gas escape rapidly are said to *effervesce*.

Effervescing Powders: medicines of various kinds, usually put up in two papers—one containing an alkaline bicarbonate, and the other citric or tartaric acid. After dissolving and mixing the solutions, carbonic acid escapes with effervescence. These powders are useful refrigerants, and are gently laxative. Rochelle salts are often added to increase the laxative effect, constituting Seidlitz powders.

Effingham: city and railway junction; capital of Effingham co., Ill. (for location of county, see map of Illinois, ref. 8–F); 98 miles E. N. E. of St. Louis, and 199 miles S. by W. from Chicago. It has extensive manufactures. Pop. (1880) 3,065; (1890) 3,260; (1900) 3,774.

Effort: See the Appendix.

Eft, or **Ev'et**: the popular name of many small lizards and of several tailed batrachians. One of the best known is the common red salamander (*Salamandra rubra*), a batrachian of the U. S. There are numerous allied species, which are incorrectly believed by many to be venomous.

Ega, or **Egas**: See TEFFÉ.

Egalité, *ā'găă'lĕĕ'tā'* [Fr., equality < Lat. *aequa'litas*, deriv. of *aequa'lis*, equal, *aequus*, even]: one of the popular watchwords of the first French revolution—*Liberté, égalité, fraternité* (Liberty, equality, fraternity). The Duke of Orleans (1747–93) assumed in 1792 the name of "Citizen Égalité," but he was guillotined nevertheless. See ORLEANS, LOUIS PHILIPPE JOSEPH, DUKE OF.

Egan, MAURICE FRANCIS: scholar and author; b. in Philadelphia, Pa., May 24, 1852. From 1881 to 1888 he was editor of the New York *Freeman's Journal*. He then became Professor of English in the University of Notre Dame, and later in that of Washington. Author of *That Girl of Mine* (1879); *Songs and Sonnets* (1886); and *Lectures on English Literature* (1889).

Egan, PIERCE: author, artist, and journalist; b. in London, of Irish descent, in 1814; son of Pierce Egan (1772–1849), also an author. He published more than twenty novels, among which are *Robin Hood*, *The Flower of the Flock*, and *The Poor Girl*. He furnished many excellent designs on wood for the *Illustrated London News*, and was long an editor in London. He contributed frequently to journals in England and the U. S. D. July 6, 1880.

Egaña, JUAN: Spanish-American jurist, author, and statesman; b. at Lima, Peru, 1767. He graduated in the College of Santo Toribio, and taught philosophy there before he was seventeen years old. Later he went to Santiago, Chili, where he won great distinction as a lawyer. He took a leading part in the revolution of 1810, and was one of the most active and liberal members of the first Chilian congress. On the defeat of the patriots in 1814 he refused to retire from the country, was seized by the Spaniards, and imprisoned at Juan Fernandez until set free by San Martin's victories in 1817. He was almost immediately elected again to the Chilian congress, where he distinguished himself by his wisdom and moderation. In later years he retired from public life. Dr. Egaña's literary works embrace essays on political, legal, educational, and religious subjects, poems, and text-books. D. at Santiago, Apr. 13, 1836.

Egbas: See the Appendix.

Egbert: King of the West Saxons; b. about 775; a descendant of Cerdic. He passed many of his early years at the court of Charlemagne, and began to reign in 800 A. D. At this date England was divided into three separate kingdoms, Mercia, Northumbria, and Wessex. He defeated the Mercians at Ellandun in 823, soon after which he completed the conquest of Mercia and Northumbria, ruled over all the states of the Heptarchy, and styled himself "the King of the English." In 835 he defeated an army of Danes who had invaded England. He died in 836 A. D., and was succeeded by his son Ethelwulf. See Lappenberg's

History of England under the Anglo-Saxon Kings (translated by Thorpe, 1845.)

Egede, eg'*e*-de, Hans: the apostle of Greenland; b. at Harstad, Norway, Jan 31, 1686. He became pastor of the church at Vaagen in 1707. After long endeavors he succeeded in interesting the Danish authorities in his project for the conversion of the Esquimaux, and in 1721, accompanied by his wife, he set out for Greenland, where he labored for some fifteen years, enduring many hardships but meeting with marked success. The death of his wife (1735) and his own failing health compelled his return to Copenhagen in 1736, but he continued to work for the cause, and was appointed superintendent, or missionary bishop, of Greenland in 1740. He wrote an account of his missionary labors, *Relation angaaende den grønlandske Missions Begyndelse og Fortsættelse* (1738), and a description of the island, *Det gamle Grønlands nye Perlustration* (1729; 2d and enlarged ed. 1741). D. Nov. 5, 1758. (See Rudelbach, *Christliche Biographie*, i., 284 ff.)—His son Poul, b. Sept. 9, 1708, went with his parents to Greenland in 1721, where he remained, except for the time necessary for his education (1728–34), till 1740, assisting and finally succeeding his father. In 1779 he was appointed missionary bishop of Greenland. His publications include a valuable Esquimaux dictionary (1750) and grammar (1760), an Esquimaux translation of the New Testament (1766), and an *Account of Greenland* (*Efterretningen om Grønland*, 1788).

G. L. Kittredge.

Eger: town of Bohemia; situated on the river Eger (which enters the Elbe 33 miles N. N. W. of Prague), 92 miles W. of Prague; at the junction of six railway lines (see map of Austria-Hungary, ref. 3–C). It is built on a rock, and was an important fortress. Here are the ruins of a citadel or castle, formerly the residence of kings and emperors. Eger has 7 churches, a fine town-hall, and 2 monasteries; also manufactures of broadcloth, cotton goods, chintz, and soap. Wallenstein was assassinated here Feb. 25, 1634. Near Eger is the watering-place Franzensbad, with five springs. Pop. (1890) 18,658.

Ege'ria: a nymph who, according to the Roman mythology, was one of the Camenæ, and was a prophetic divinity from whom Numa derived religious inspiration and directions respecting the forms of worship. The poets feigned that Numa had interviews with her in a grove, and that when he died she melted away in tears, which became a fountain. An asteroid discovered at Naples by De Gasparis in Nov., 1850, bears the name of Egeria.

Egerton, Francis Henry: See Bridgewater, Earl of.

Egerton, ej'er-tŭn, Francis Leveson Gower, Earl of Ellesmere: author and patron of art; b. in London, Jan. 1, 1800. He was the second son of the first Duke of Sutherland, and his original name was Francis Leveson Gower, but he assumed the name of Egerton in 1833, when he inherited the estate of the last Duke of Bridgewater. He entered the House of Commons in 1820, became chief secretary for Ireland in 1828, and was Secretary at War for several months in 1830. He wrote several books, including a poem called *The Camp of Wallenstein*. He was created Earl of Ellesmere in 1846. D. Feb. 18, 1857.

Egg [loan-word from Norse *egg*: O. Eng. *æg*: Germ. *Ei*; closely connected if not identical with Lat. *ō'vum*, Gr. *φόν*]: the specialized cell in the female of all animals which is set apart for the sexual reproduction of the species. In its typical condition it is such a cell without accessory portions, but usually there are added various envelopes and substances for the protection and nourishment of the germ which is to form later. In the eggs of the birds these secondary envelopes, etc., reach their highest development. Here there is an outer calcareous shell perforated by minute holes for the passage of air, which later is needed for respiration; next within this is a tough (double) shell membrane, which contains the white or albumen. In the white, supported by a twisted membrane (chalazæa) at either end, floats the yolk, and on the upper side of the latter is a circular, lighter spot, the germ. The bulk of the yolk is nourishment, and is not directly, but as food, converted into the chick. In some forms eggs are capable of development without fertilization (see Parthenogenesis). Some eggs, like those of Hydra, are without envelopes. Others, like insects, have but a single outer coat. The largest known egg is that of the extinct Æpyornis of Madagascar, the shell of which has a capacity of about 2 gal., or about six times that of the ostrich-egg. Aside from food, birds' eggs find considerable use in the arts, as a source of albumen which is used for the preparation of photographic paper, etc. Egg albumen differs considerably chemically from that derived from blood. See Food, Embryology, and Evolution; also, for the egg of insects, Entomology.

J. S. Kingsley.

Egg, or **Eigg**: an island of Scotland; 8 miles S. W. of Skye, and 12 miles from the west coast of Inverness-shire. Length, 4½ miles. Here are some remarkable cliffs of trap or basalt, and columns of pitchstone nearly 2 feet in diameter.

Egga: See the Appendix.

Eg'gan: a populous town of Africa; in the British Niger Territory; on the right bank of the Niger; in lat. 8° 42′ N. and lon. 6° 20′ E. (see map of Africa, ref. 4–C). It extends nearly 2 miles along the river. The dwellings are mostly small huts of clay. Narrow cotton cloth is manufactured here in large quantities. Eggan has an active trade in corn, yams, calabashes, dried fish, etc. Pop. 12,000.

Egg-bird, or **Sooty Tern** (*Sterna fuliginosa*): a bird belonging to the gull family, having the back and wings sooty black and the under parts white. The wings and tail are long and pointed, the latter deeply forked. It abounds in the West Indian seas and in Florida, and was formerly so abundant that its eggs, which are laid in a slight depression in the sand, formed an article of commerce.

Eg'ger, Émile, Dr. Lit.: classical scholar; b. of German parents in Paris, July 13, 1813; received his degree in letters in 1833. Held various professorships of ancient languages, and was a member of the French Academy and an officer of the Legion of Honor. A learned and prolific author. Among his best-known works are *Mémoires d'Histoire et de Philologie* (1863); *L'Hellénisme en France* (2 vols., 1869); *Essai sur l'Histoire de la Critique chez les Grecs* (1890); *La Littérature Grecque* (1890). D. at Royat, Aug. 31, 1885.

Alfred Gudeman.

Eggleston, Edward: novelist and historian; b. in Vevay, Ind., Dec. 10, 1837; joined the Methodist ministry in his nineteenth year, and preached during ten years in Minnesota. He began his literary career in 1866 as editor of *The Little Corporal* (Evanston, Ill.); founded in 1867 the *Sunday-school Teacher* (in Chicago); in 1870 went to New York city and became literary editor of *The Independent*; was some time editor of *Hearth and Home*. In 1871 appeared his *Hoosier Schoolmaster*, a novel which has been several times translated; *The Circuit Rider* (1874); *Roxy* (1878); *The Graysons* (1888); *The Faith Doctor* (1891); a popular school *History of the United States* (1888); *The Beginners of a Nation* (1896); and *The Transit of Civilization* (1900).

Eggleston, George Cary: journalist; brother of Edward Eggleston; b. at Vevay, Ind., Nov. 26, 1839. He was in the Confederate service during the civil war. Since 1870 he has been connected with periodicals in New York; was chief editor of *The Commercial Advertiser* 1886–89, and an editorial writer on *The World* since then. Published *A Rebel's Recollections* (1875); *American War Ballads and Lyrics* (1889); *Juggernaut* (1891); and *A Carolina Cavalier* (1901).

Egg-plant (*Sola'num melon'gena*, var. *esculen'tum*): a plant of the nightshade family, of the same genus as the

Egg-plant.

potato. It is cultivated for its large fruits, which are eaten when cooked in a variety of ways. It has been cultivated from the earliest times, and its native country is supposed

TYPES OF BIRDS' EGGS

to be India. It requires a long season for maturity, and is therefore not extensively cultivated in the Northern U. S. It is exceedingly variable, the dozen varieties which are commonly grown in the U. S. representing three or four distinct types. The most popular varieties are the large purple sorts, of which one (the New York Improved) is shown in the engraving. Some of the early dwarf purple sorts are more reliable for cultivation in the Northern U. S. There are a few white-fruited varieties, but, although they are scarcely inferior to the purple sorts, they are not popular. The egg-plant requires a loose, rich soil, and in the Northern States it should be started early under glass, and care should be taken that the plants do not become root-bound or stunted before they are set in the field. In France the egg-plant is known as aubergine, and in the Southern U. S. it is sometimes called Guinea squash. L. H. Bailey.

Eggs: See the Appendix.

Eg'ham: a village of Surrey, England; on the Thames; 18 miles W. of London and 3 miles S. E. of Windsor (see map of England, ref. 12–I). In the vicinity is the field of Runnymede, where King John and the barons held a conference, which resulted in the signing of Magna Charta in 1215. Here also is the Royal Holloway College for Women, founded by Thomas Holloway, and opened in 1886.

Egilsson, ĕ'gil-sŏn, Sveinbjörn, Dr. Theol.: philologist; b. in Southern Iceland, Feb. 24, 1791. After studying at the University of Copenhagen he took up the profession of teaching. He was rector of the school at Reykjavík from 1846 to 1851, when he retired on a pension. D. Aug. 17, 1852. Egilsson's great work, the *Lexicon poeticum antiquae linguae septentrionalis* (Copenhagen, 1860), a monument of learning, industry, and acuteness, is indispensable to the student of Old Norse. He also had a large share in preparing the Arna-Magnæan edition of Snorri's *Edda* (3 vols., Copenhagen, 1848–87), and his minor contributions to Old Norse philology were numerous and important. A collection of his writings was published at Reykjavík in 1855–56 (*Rit Sveinbjarnar Egilssonar*, 3 vols.). G. L. Kittredge.

Egina: See Ægina.

Eg'inhard, Eginard, or **Ein'hard**: historian; b. about 770 in what is now Hesse-Darmstadt; was a pupil of Alcuin. He gained the confidence of Charlemagne, who appointed him his secretary. He accompanied that emperor in his journeys and military expeditions. After the death of Charlemagne he passed into the service of Louis le Débonnaire. His wife was Imma, who in the twelfth century was confounded with Emma, a daughter of Charlemagne. His chief works are a *Life of Charlemagne* (in Latin; English translation by S. E. Turner, New York, 1880), and *Annals of the French Kings*, German translation by O. Abel (Berlin, 1850); best edition of both in Pertz, *Monumenta Germaniæ Historica*, vols. i. and ii.; there is also a complete Latin and French edition of his works by A. Teulet (2 vols., Paris, 1840–43). D. in Seligenstadt, Mar. 14, 840.

Eglantine [Fr. *églantine*, from deriv. of Lat. *acus*, needle; so called on account of its prickles]: a name of the *Rosa rubiginosa*, a species of rose sometimes called sweetbrier. It is a native of Europe, and is naturalized in the U. S. The flower is single and fragrant. The leaves also emit a peculiar fragrant odor from their russet-colored glands. The plant sometimes grows 8 feet high, and is common in fields and roadsides.

Egleston, Thomas, LL. D.: mineralogist; b. in New York city, Dec. 9, 1832; educated at Yale College and at the School of Mines, Paris, graduating in 1860; in 1861 appointed to take charge of the laboratory and the mineralogical and metallurgical collections of the Smithsonian Institution in Washington, D. C.; in 1863 planned a School of Mines for Columbia College, New York, and in 1864 was made Professor of Mineralogy and Metallurgy in that department. In 1866 he made the geological and agricultural survey of the first 100 miles of the Union Pacific R. R. In 1868 he was appointed U. S. commissioner to examine the fortifications of the U. S.; in 1870, 1878, and 1885, was member of the annual pyx of the U. S. mint; in 1873 was juror at the Vienna Exhibition; in 1890 was decorated with the order of the Legion of Honor of France. He was one of the founders of the American Metrological Society, and of the American Institute of Mining Engineers, of which he was vice-president 1872–74, 1877–78, and 1884–85, and president 1886; vice-president of the New York Academy of Sciences 1869–81. He has taken out numerous patents, and has published a number of works, each of which has passed through several editions, including *Tables for the Determination of Minerals* (New York, 1867); *Metallurgical Tables on Fuels, Iron, and Steel* (1869); *Lectures on Mineralogy* (1871); *Catalogue of Minerals and their Synonyms* (1889); and *Metallurgy of Gold and Silver* (1890). D. Jan. 15, 1900.

Eglinton and Winton, Archibald William Montgomerie, Earl of: a British peer; b. at Palermo, Sicily, Sept. 29, 1812; succeeded the twelfth Earl of Eglinton in 1819. In politics he was a Conservative. He was appointed Lord-Lieutenant of Ireland in 1852 and in 1858. D. Oct. 4, 1861.

Eg'mont, or **Egmond**, Lamoral, Count d'; also known as Prince de Gavre: Flemish nobleman and general; b. at the castle of La Hamaide in Hainault, Belgium, in 1522. He was descended from the Dukes of Gelderland; married Sabina, Duchess of Bavaria, about 1545; served in the armies of Charles V., who created him a Knight of the Golden Fleece in 1546. In 1557 he commanded the cavalry of the Spanish army, and defeated the French at St.-Quentin. He gained a decisive victory at Gravelines in 1558, and acquired much popularity. As an associate of William, Prince of Orange, he opposed the intolerant and despotic policy of Philip II., but constantly adhered to the Catholic Church. He was appointed a member of the council of state in 1559. He ceased to act with the popular party after they revolted against the Spanish king, but the latter regarded him with jealousy and hatred, and sent the Duke of Alva to Flanders with viceregal power in 1567. Alva was a bitter enemy of Egmont, and is said to have brought his death-warrant from Philip. Egmont and Count Horn were arrested, tried for treason, and executed June 5, 1568, at Brussels. This cruel act provoked a general revolt against Philip II. The story of Egmont is the subject of a tragedy by Goethe. See Motley, *Rise of the Dutch Republic* (chap. ii., part 3); Brunelle, *Éloge du Comte Egmont* (1820); and Juste, *Le Comte d'Egmont et le Comte de Hornes* (1862).

Egret [Fr. *aigrette*, dimin. to O. Fr. *hairon*; Ital. *aghirone*, from O. H. G. *heigir*]: any one of several species of small herons which have, during the breeding season, a well developed crest and the back adorned with long, loose, flowing plumes. The most beautiful are the white egrets, whose plumage is throughout of a pure white. Two species, *Ardea alba* and *A. nivea*, are found in Europe, and two very similar species, *Ardea egretta* and *A. candidissima*, are found in the warmer parts of America. The plumes of these birds are in great demand, and in many localities where egrets were formerly abundant they have been practically exterminated as a consequence of the demand.

F. A. Lucas.

Egripo, or **Egripos**: a town of Greece. See Chalcis.

Egypt [native *Qem-t*, black, referring to the soil; Coptic, KHME, of the same signification; Heb. *Mizraim*, or *Mazor*; Assyr. *Mi-is-ri-i*, shortened to *Misri*, *Misr*; Arab. *Masr*; Gr. Αἴγυπτος; Lat. *Ægyptus*; Turk. *Gipt*; Ital. *Egitto*; Fr. *Égypte*; Germ. *Ägypten*. *Egypt* comes through the Greek name Αἴγυπτος, which is of uncertain origin]: a country in the northeast part of Africa; bounded on the N. by the Mediterranean Sea, on the E. by the Red Sea, on the S. by Nubia, and on the W. by the Great Desert. It extends from lat. 24° 3′ to 31° 36′ N., its northen and southern limits being respectively the mouth of the Nile and the first cataract at Assuân. In *size* Egypt, exclusive of the desert, is of about the area of Belgium, 11,342 sq. miles. Though 550 miles long, it is exceedingly narrow, only measuring from 4 to 16 miles in width, except in the Delta, which spreads out broad and low. In ancient times the arable area was probably smaller than now; certainly the Delta region was mainly devoted to pasturage. Ancient tomb-sculptures show considerable unavailable tracts where nobles hunted water-fowl. On the other hand the portions farthest from the river are now almost useless on account of the failure of high Nile to reach them even when artificially aided.

Herodotus called Egypt the "gift of the Nile," but it is more. It is the creation of the river, and the river is its preserver. The land occupies the cañon which the water has made, and its annual renewal is due to the fertilizing matter which the inundation brings down. The valley is flanked not by mountains, but by bluffs, which mark the original level. The Delta has been raised above the sea-level in the course of ages by the same means, but it is still so low that the removal of a few inches of soil renders the

land sterile. The only variety offered to the eye is that of ancient city mounds and the low embankments which serve as dams against the Nile floods. Toward the N. E. the level is said to be gradually sinking (see MENZALEH), while at Suez a rising has occurred within historic times. It is almost certain that the Red Sea has receded from its former limits, which must have included the Bitter Lakes and Lake Timsah. See EXODUS.

ANCIENT EGYPT.*

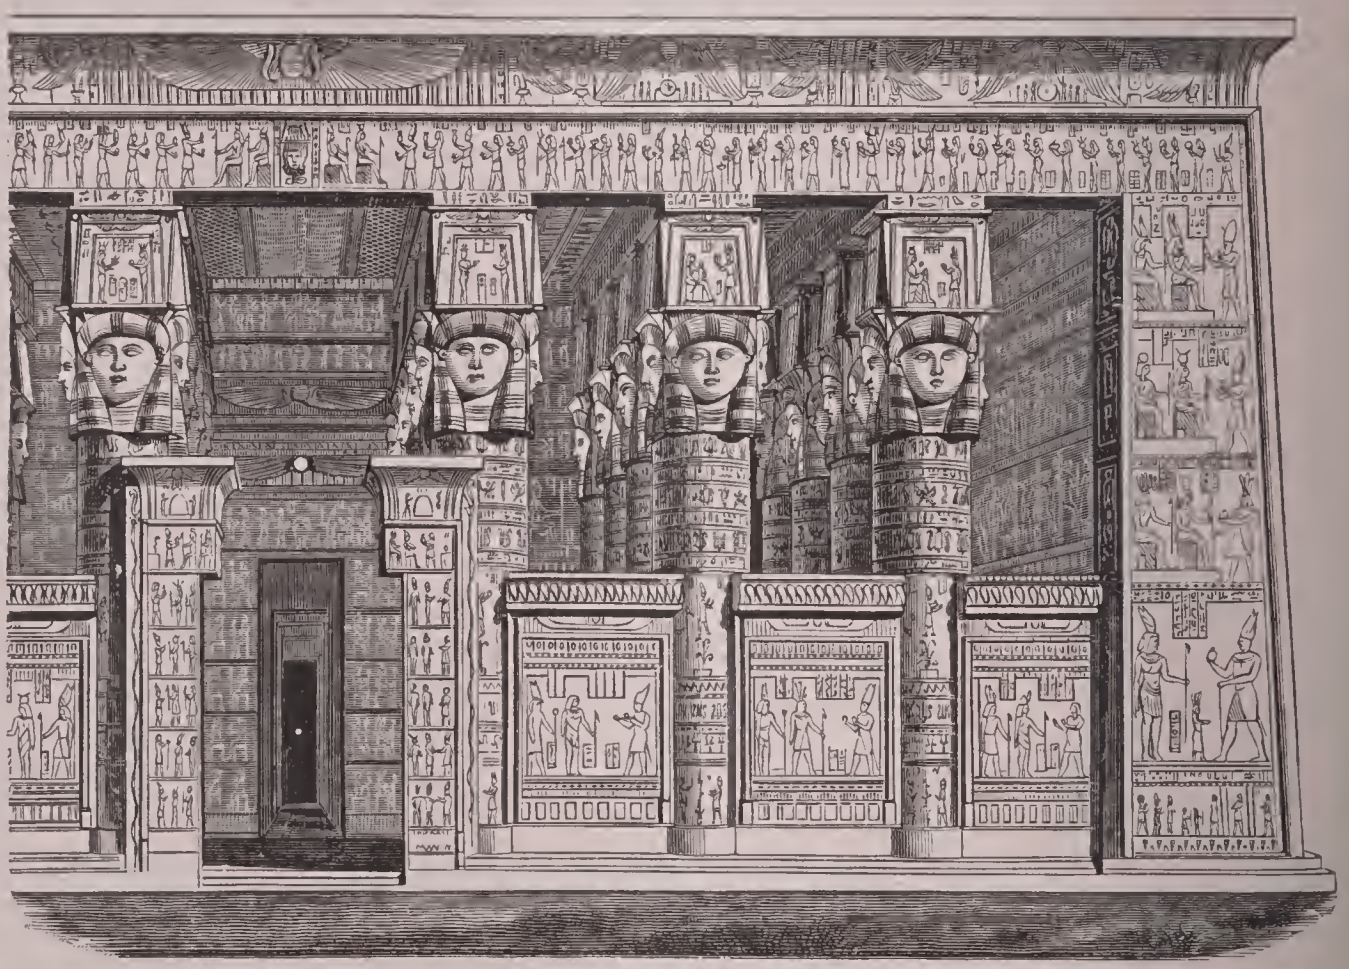
Divisions.—The division of Egypt into Upper and Lower is prehistoric, and the usual royal title "king of the two lands" (dual) points to an original independence, whose termination tradition ascribes to Menes, the first king. Upper Egypt always had precedence and was mentioned first in the royal nomenclature. It was known as *Ta-res*, or with the article *Pa-ta-res*, "the south land," the PATHROS (*q. v.*) of the Hebrews. The Delta was *Ta-meh*, "north land," the Mazor of the Hebrews. For administrative reasons the Ptolemies and Romans made a third district, Middle Egypt.

Nomoi.—In the geographical lists from the times of Thothmes III. (eighteenth dynasty) and his successors, smaller divisions are noted, twenty-two in Upper and twenty in Lower Egypt (the numbers are not always the same). These districts, called nomoi by the Greeks, had each its own particular deity or deities, worship, festivals, and sacred animals.

Although Diodorus (i., 54) ascribes the nomos-division to Sesoosis (SESOSTRIS, *q. v.*; Ramses II., nineteenth dynasty), that of Upper Egypt is supposed to have antedated the establishment of the kingdom, and that of Lower Egypt to have been arranged merely by way of imitation. The particular names of these subdivisions had reference to the deity worshiped, the chief city, local characteristics, or geographical position; Greek designations were based on the first two grounds. Complete lists are to be found in any good history of the land.

Boundaries.—The natural southern boundary was near Assouan at the first cataract, though under Usertasen III. (twelfth dynasty) it was pushed forward to Semneh, just beyond the second cataract (in order to gain control of the mines of Nubia), and later still under Thothmes I. the conquest was continued to the third cataract, and by Thothmes III. to the Sudan. At Syene was a place of barter with the Nubians and the blacks of the south, and from one of the principal articles (ivory) of this trade the island of *Abu*, Elephantiné, got its name. At Semneh a stele was erected by Usertasen III. forbidding the northward passage of foreigners in other than Egyptian boats. At Abu-Simbel (see IPSAMBUL) Ramses II. executed two wonderful rock-hewn temples. Across the isthmus of Suez, marking the northeastern frontier, there extended during a part of Egyptian history a line of fortifications protecting all avenues of approach, to which the name "wall of the prince" was applied. It was by no means a continuous structure. An unpublished papyrus at St. Petersburg ascribes its construction to Snofru of the fourth dynasty (see below), and a papyrus of the twelfth dynasty, at Berlin, recounts the difficulty which a fugitive Egyptian had in passing the sentries set to watch against marauders.

Cities.—The cities of Egypt rank according to a double standard—religious and political. Each nomos had its chief city, its principal deity and cult. The principal places in Upper Egypt were the following: Syene, *Sun*, a strategic point on the southern frontier; Elephantiné, *Abu*, a place of trade; Ombos, *Nubi*, devoted to the peculiar dual worship of Sebek and Horus; Silsilis, *Chenu*, with valuable quarries; Edfu, *Teb*, devoted to Horus and an important place in Egyptian mythology; Esneh, *Sen*, Latopolis, the religious capital of the third nomos; Elkab, *Nechent*, Eileithyia, a place of pilgrimage, devoted to Nechabt, the protecting goddess of the south; Erment, *On*, Hermonthis, the forerunner of Thebes, *Us*, *Nu*, *Nu-Amon*, Heb. No-Amon, the most powerful city of Egypt, though neither the most ancient nor most sacred; Koptos, *Qobti*, devoted to *Min*, the Greek Pan, a place of importance in the Red Sea trade (since the caravan route started thence for Koser), and valuable for its quarries of hard dark stone; *Chemmis*, Panopolis, modern Akhmim, was devoted to the same deity; Denderah in the sixth nomos was an important religious center, devoted to Hathor, and contained a temple whose foundation is ascribed to the earliest times; Abydos (see MEMNONIUM), the most holy place in Egypt on account of its tomb of Osiris; Thinis, *Ten*, the native place of Menes, the first king; Kau el-Kebir, *Du Qau*, Antæopolis, the capital of the twelfth nomos; Siut, *Saut*, Lycopolis, devoted to Anubis, seat of the mighty dynasties of the Middle Kingdom, and possessed of tombs whose portrayal of contemporary life is beyond value; *Chmunu*, modern Aschmunen, Greek Hermopolis, an important religious center; Tell el-Amarna, the city of the heretical King Amenophis IV., the place where many cuneiform tablets were discovered in 1887; Beni Hasan (see HASAN), in the sixteenth nomos, containing tombs from the twelfth dynasty, and the SPEOS ARTEMIDOS (*q. v.*); Ahnes, *Chenensu*, Heracleopolis, of great importance on account of its mythological connections; and the FAYUM (*q. v.*) belonging to the twentieth nomos. The sites of these



Temple of Denderah.

* "Ancient" Egypt here designates the entire period which closed with the Ptolemies in 30 B. C., including the Old Kingdom (Dynasties I.–VI.), the Middle Kingdom (XII.–XIII.), the New Kingdom (XVIII.–XX.), the Tanite, Bubastite, and Saite dynasties (XXI.–XXIV.), the Ethiopian domination (XXV.), the second Saite (XXVI.), the Persian (XXVII.), contemporary in part with the third Saite, the Mendesian and Sebennyte (XXVIII.–XXX.), and finally the Ptolemaic period, 324–30 B. C.

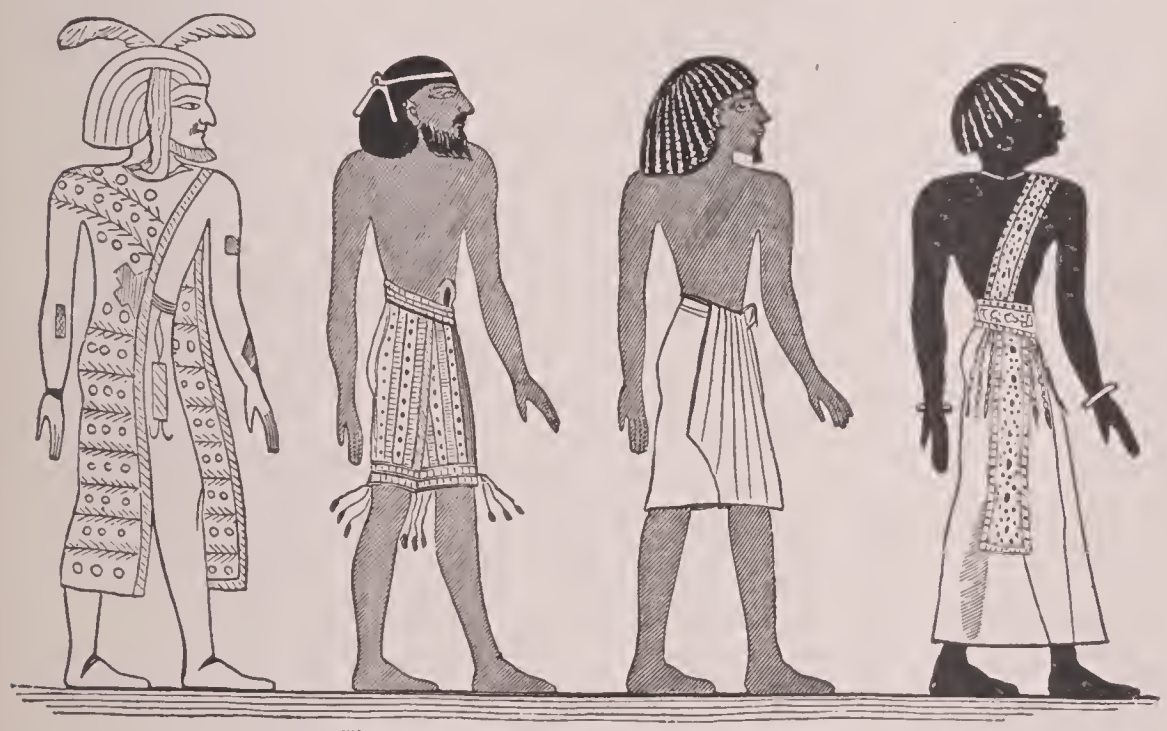
BRADLEY & POATES, ENGRS., N.Y.

places are well identified, but the same is not true of many of the large cities of the Delta. Worthy of mention are Memphis, *Men-nofer*, the capital chosen by Menes in uniting the "two lands"; *On*, Heliopolis, Hebrew Beth-Shemesh, the most learned city of the land, and next to Abydos in sanctity; Sais, *Sau*, the seat of the Libyan rulers, and the resort of Greek scholars; Sebennytus, the seat of the thirtieth dynasty, and the reputed birthplace of the historian Manetho; Mendes, *Ded*, and Busiris, localities important in the Osiris-myth; Bubastis, *Pa-Bast*, Hebrew Pi-Beseth (*q. v.*), a city of great antiquity, and a seat of the Hyksos kings; Tanis, *Tsan*, Heb. Zoan, one of the most important cities in Egyptian history; Avaris, supposed to be Pelusium (*q. v.*), the last Hyksos stronghold; Zar, a border fortress; and Pithom, *Pa-Tum*, Succoth, Heroöpolis, one of the cities built by the Israelites for Ramses II.

Foreign Relations.—During a very long period of history the Egyptians were isolated. Barter with the south was practiced from time immemorial, and a trade in oils and woods was carried on with traveling merchants from the north and east, but both were consummated on Egyptian soil until a comparatively late period. The twelfth dynasty saw extended relations toward the south, and the pursuit of the Hyksos at the beginning of the eighteenth opened new connections with the north. The notable expedition under Queen Hatasu (*q. v.*) to Punt (see Somali Coast) for incense and other desirable objects was a public venture. In the new kingdom trade was carried on privately in the east, but the Government also had its own ships which visited the coast countries. Multitudes of things were imported, and many retained their foreign names, probably a mutual operation. Strange to say, the eastern wars gave this impulse to trade, and their records have revealed much of the geography of the times. Of the lands traversed Palestine included the "Upper" and "Lower" *Retenu*, or "Canaan," and the land of the Amorites; Phœnicia was *Keft*, and its inhabitants *Fenech*; Syria was *Naharan*, and extended to the Euphrates, which is described as that "reversed water, on which one journeys northward upstream." Assyria was probably not trodden to any extent, and Babylonia was a *terra incognita*. Hundreds of Syrian places are mentioned whose sites are unknown. In Palestine there were many tribes, each with its strong place, but Syria alone offered the resistance of powerful national might. To some extent the Egyptians had knowledge of the peoples of Asia Minor, and of the islands, especially Cyprus. (See W. Max Müller, *Asien und Europa*, Leipzig, 1893.) After the eighteenth dynasty there was a heavy Semitic immigration into the Delta, and the mixing of races was much promoted by the multitudes of slaves taken in war. The same effects came from the employment of Libyan and finally of Greek mercenaries in the later periods, only with results more fatal to the integrity of the state.



The four races of the Egyptian monuments.

People.—The origin of the Egyptians is unknown. Ethnologists have endeavored to establish a relationship with the peoples of the south, any differences being accounted for by variations of environment. Philologists have looked to the east for their next of kin as regards descent as well as speech. It has also been thought by some that an eastern origin is indicated by the fact that the Egyptian oriented himself by looking toward the south, but this is rather due to the direction of the Nile. Between the results thus reached there is an evident conflict, with no obvious means of harmonizing them. It has been suggested that the facts can best be reconciled upon the theory, not of a migration of a whole people, but of an incursion of a smaller band who succeeded in establishing their rule over the original people and in gradually forcing their own language, as that of a ruling class, upon those whom they had subjugated, while still the ancient ethnological type persisted. This theory is merely a working hypothesis, and it has reference to a time long anterior to any historical monuments or traditions, for long before the earliest extant inscription Egypt was a united country under the rule of native kings, and possessed of a well and independently developed government and of well-defined classes of society.

Names.—A national name for the people as such never seems to have existed. Among themselves they were *romet*, men, *par excellence*; all others were inferior races, "miserable" Cushites, Libyans, Asiatics, *Shasu*. They themselves were the wards of the great gods, and Pharaoh was descended from Ra, who had himself once ruled in Egypt. Other peoples were descended from the enemies of their deities, and when Ra had overthrown them at Edfu a portion escaped; those southward became Ethiopians, northward Asiatics, westward Libyans, eastward Beduin.

Character.—Personal experience has warped the judgment of observers on this point. Herodotus praises the cleverness of the Egyptians and their excellence of memory; Diodorus declares them to be the most grateful of people; the Emperor Hadrian characterizes them as "thoroughly frivolous, unstable, following every rumor, refractory, idle, and libelous." The modern notion is that they were so occupied with the thoughts of the future as to be oblivious to the present. There is undoubtedly a degree of truth in all of these estimates, but a broader survey shows that they were energetic in their undertakings, as is evidenced by their temples and the pyramids, still the wonder of the world; possessed of sufficient skill to perform by force of numbers labors which would test modern mechanics severely; practical in their methods of utilizing the forces of nature; peaceable as over against other nations, and little given to love of novelty; artistic in their execution and accurate in their observation; a people given to realism; unversed in literary arts; devoted to agricultural pursuits; developed within narrow limits, and little affected by external and foreign influences.

Classes.—The monuments are fuller than the enumerations of Herodotus and Diodorus, who name seven and five classes respectively. Herodotus (ii., 164) gives priests, warriors, cow-herds, swine-herds, tradesmen, interpreters, and boatmen; Diodorus (i., 74), priests, warriors, husbandmen, shepherds, and artisans. All these existed, but the enumeration is defective. True caste was unknown. The population was divided into two great parts—nobles and slaves—while the middle class has left its traces from the Middle Kingdom onward. The upper class included royalty and those in the service of state or religion, a ruling class, far removed from the slave population, foreign and native. They formed the backbone of the state, filled all the higher offices, and were obeyed by all their social inferiors. At the head of the government stood Pharaoh (*q. v.*; Egyptian, *Per-aa*, great house), "King of Upper and Lower Egypt, son of Ra, eternal." Ramses II. is bombastically called

"Horus, the mighty bull, beloved of the goddess of truth, lord of the 'vulture and serpent' diadems, protector of Egypt, subduer of the barbarians, the golden Horus, rich in years, great in victory, King of Upper and Lower Egypt, 'Ra strong in truth, chosen of Ra,' son of Ra, Ramses beloved of Ra." Similarly the queen is called "the consort of the god, mother of the god, the great consort of the king"—god and king being interchangeable terms. She was usually of royal blood, often own sister of the king, his equal in birth and place—"Mistress of the House." Crown prince and princes came next in order. The upper classes consisted of "the nearest friend" of the king, and friends of various grades, generals, high priests, officers, physicians, overseers, district chiefs, presiding judges, keepers of the seal, master builders, treasurers, fan-bearers, scribes, and many others. Officialdom ramified in numberless class gradations, whether the order was priestly, military, literary, architectural, mechanical, or agricultural. Advancement went by royal or other favor. (See Brugsch, *Ägyptologie*, p. 212 ff.) The middle class of the kingdom remained in the background, and is less known because its members could not, like the kings and nobles, erect those enduring tombs from which knowledge of the times is obtained. After the removal of the necropolis from Memphis to Abydos during the period of the Middle Kingdom, and owing to the growth of the practice of erecting memorial stelæ, the monuments of untitled persons begin to appear, giving a conception of their number and position. They possessed households similar to those of officials, and in many ways appear to have been their equals. They were merchants, traders, artisans, free workmen, weavers, potters, carpenters, joiners, smiths, etc. The lowest class was composed of the slaves, native or taken in war, who were hewers of wood and drawers of water, performing all menial offices. They were mere chattels, belonging to temple, necropolis, or landed estate, and were often organized as a part of the military establishment. Closely allied to them were the shepherds, the pariahs of Egyptian society.

Employments.—Each administrative department had its own "troop" of laborers under its own overseer, who kept minute tally of work performed, rations distributed, and of absentees. The troop, not the individual, was the unit. All artisans as well as the slaves were regarded superciliously by the scribes and held in lower repute than the agriculturists, though the products of their skill still command admiration. Weavers, working with papyrus reeds or with linen thread, produced baskets, mats, boats, or the finest linen cloths; joiners, though handicapped by lack of good raw material, nevertheless produced creditable work by the use of instruments most simple in their character. Potters through all periods reproduced patterns tenaciously and with little variation, but atoned for the rudeness of much of their work by the fineness of their products in faïence, the glazing of stone objects being specially noteworthy. Metal workers used gold, silver, bronze, iron, and tin, the source whence tin was derived being problematical. A bronze is mentioned which was an alloy of six metals. Objects in bronze and iron have been found among the remains of the Old Kingdom, though the earliest bronze statue is one of Ramses II. The sources of most metals were the mines of Nubia and Sinai. In value silver exceeded gold, and a mixture of the two is frequently mentioned. The processes of agriculture are well portrayed on the walls of the tombs. The plow was simply a sharpened stick dragged through the ground by oxen; the hoe a broad blade fastened to a handle, a second cord midway of each preventing too great a strain. The seed once scattered was trampled in by animals. Harvesting was done by a short sickle; the grain was carried in sheaves to the threshing-floor, where the hoofs of cattle performed the required labor. Winnowing was done with shovel and wind, and the grain was stored in conical receptacles open at the top, to which the bearers mounted on ladders. Supplementary irrigation was by a well-sweep similar to the modern *shaduf*. These labors were so essential a part of Egyptian life that the future life was portrayed under exactly the same circumstances, happiness consisting essentially in the degree in which personal performance could be avoided. Cattle of all sorts, asses, sheep, pigs, and goats existed in immense herds, and were tended by slaves and peasants whose occupations and lives in marshy districts so far removed them from civilization that they were regarded with detestation (Gen. xlvi. 34). Their disrepute is the more remarkable in view of the evident pride with which landed proprietors enumerated their flocks.

Education.—The school, "book-house" or "house of instruction," presided over by a scribe, was an institution of the Old Kingdom, which received all classes alike, and prepared them for the technical education of the special bureau. In the New Kingdom both branches were combined in departmental schools. Orthography, calligraphy, style, and the formulæ of etiquette comprised the known curriculum; the rest was learned by practice. Many corrected school exercises have survived containing various specimens of literature; tales, religious and magical texts, poems, codes of rules, or "instruction" of ancient sages for the proper regulation of daily life, and *ex-parte* statements of the unlovely condition of soldiers and laborers as contrasted with the beauty of the scribe's life, at once inciting to industry on the part of the pupil, and to profound respect for the teacher. These papyri are of great value in affording knowledge of orthography, language, and literature.

Landed Property.—The tombs of the Old and Middle Kingdoms represent the various operations of large landed estates in all their complexity. Such private ownership of the soil, of large tracts, and even of whole villages, seems to have been a survival from the time when the princes of the nomoi were at the head of the independent districts which collectively constituted Egypt. A decided change is seen in the New Kingdom when the title to all land except that attached to the temples was vested in the king, and when it was worked for the state by slaves or let out at an annual rate per cent. The change came about during the Hyksos period or in the transition to the revived native dynasties. The biblical account of Joseph is of interest in connection with this.

Houses.—The dwellings of the common people probably resembled those of the fellahin of to-day, being mud hovels whose destruction accounts for the formation of the tells which mark city sites. The dwellings of nobles and kings were more pretentious, but no remains have survived. The only models by which to judge are some ancient sarcophagi of house-like form, and some mural representations. Record has survived of a palace which stood 300 cubits square.

Family.—The position occupied by woman was quite extraordinary. In the household there was usually only one *wife*, though there might be several concubines or female slaves. Actual polygamy was infrequent, though the royal harem often contained 200 women. Private persons also maintained harems, the number of inmates depending on the financial ability of the individual. Inheritance and genealogy were reckoned by the mother, not the father, and while a man's possessions might descend to his sons, the line might also pass through the daughter to her sons. Sometimes marriages were contracted upon these considerations. It was a father's ambition to hand down his official position to his sons, and the title of "hereditary prince" is often found. The practice of marriage with a sister is met in early periods, but under the Ptolemies it was quite the rule, and the marriage contracts specified the amounts which the husband engaged to give annually to his wife for family purposes.

Costume.—There is a constant development observable in the dress of the upper classes. Royalty set the fashions, and they were followed at intervals by those standing on the various social levels. There was a distinction between king and noble and between noble and plebeian. The simple apron bound about the loins was always the essential garment. To this the king added a lion's tail and the noble a panther's skin during the period of the Old Kingdom. In that of the Middle Kingdom the apron took a pointed triangular shape in front and became longer. Next comes a double apron, a short one beneath, opaque, and a long and transparent one outside. The priest continued to wear the short apron, however, while the king had advanced to a mode of dress which covered the whole body, and was complex in arrangement and structure. That which before was holiday attire became the garb of every day. The dress of women was more uniform. It consisted at first of a close-fitting garment which extended from the breasts to the ankles, and was fastened by straps over the shoulders. Only in the latest periods were sleeved or sleeveless mantles worn. Transparent cloth was used for female wear, as for the outer apron of males, but without the inner garment. The dress of peasants consisted simply of the apron, which in some cases amounted only to a band with pendant ends. These simple articles were made of papyrus mats, leather or cloth. The hair was worn short, but the shaving of the head does not appear to have been practiced daily. Wigs of various

forms and sizes were used as ceremonial head-coverings. Specimens of them are not infrequent. Natural beards were not worn except by shepherds and similar persons, but an artificial "imperial" beard was one of the marks of royalty and divinity in the tomb representations. Sandals of various sorts completed the costume.

Recreations.—The hunting of wild animals was by coursing with dogs and the use of lasso and spear. The bow and arrow were seldom employed. Fishing was with line or net. Fowling was done in the marshy districts in boats, the weapon used being the boomerang. Traps and nets were also employed. Wrestling-matches and gymnastic exercises, ball-playing and juggling, are often represented in paintings. Singing and music were the accompaniment of work and play, and at feasts music and dancing, performed by members of the harem, enlivened the scene. The instruments used were the flute and a sort of whistle, the guitar, the harp, and lyre, the last two having sometimes nearly twenty strings. Assistants beat time by hand-clapping. Bow practice was engaged in and a game similar to quoits is represented, along with other games which can not be understood in their details. T-shaped boards, divided into squares like checker-boards, have been found, but how they were used is uncertain. The children were not forgotten, for the tombs have yielded specimens of their toys.

Government.—When the king was simply the first among equals, Upper Egypt was divided into thirty administrative departments of different grades, each having its nomarch or governor who stood as the leader in everything—chief judge, district chief, military commander, tax collector, architect, treasurer, etc. As judge he was also the priest of MAT (*q. v.*), the goddess of truth. So long as the king retained supreme power this arrangement continued, but upon the decay of royal prestige each district chief aspired to leadership. This probably explains the periods of confusion in the history indicated by the blanks between the seventh to eleventh and thirteenth to seventeenth dynasties. A new order came in during the period of the New Kingdom. The nomarch surrendered all his functions to the military official appointed by the king to look after his interests and to gather the taxes in kind, peaceably or forcibly as the case might be. Royal stewards and messengers, the "mouths" or "speakers" of the king appear as intermediaries. Some of the more important additional offices were those of chief judge, governor, building-master, treasurer, overseer of granaries, etc. (see above: *Classes*). The chief judge was a man of high standing, a prince or noble, or perhaps a priest. Beneath him were several grades in the office. Several sat as a court, and before them complaint was made, prosecution and defense heard, and judgment pronounced or referred to the king, according to the gravity of the complaint. The prosecutor might be a private person or a public official with whom the complaint was lodged. Confessions were forced with the bastinado. The severest punishments were the loss of ears and nose, or death by impaling, compulsory suicide, or poisoning. Accounts of trials are frequent, but no legal code has survived.

Military.—In the earliest periods there was no standing army, because of the nature of the people and of the peculiar organization of the kingdom. Each nomos had its own militia and each temple its soldiers, who appear rather to have been police. This arrangement continued through the Middle Kingdom. The chief service rendered by the soldiers in these periods was to escort expeditions to the quarries of SYENE and HAMMAMAT (*q. v.*), and to the mines of Sinai and Nubia. They also rendered service as laborers. The most important military expedition undertaken in the Old Kingdom was that of Pepi (sixth dynasty) against the Beduin of the east. The army consisted largely of Ethiopian mercenaries under Una, a judge-general, but it required five expeditions to reduce the "people dwelling on the sand" to subjection. (See *Records of the Past*, ser. 2, vol. ii., p. 1 ff.) This use of mercenaries characterized the whole of Egyptian history. The expeditions of Amenemha III. (twelfth dynasty) to Nubia mark the next stage of foreign warlike operations. A stele of this period in Berlin mentions the wailing which attended the visits of the conscripting officer, the "military scribe" who came "to choose out the likely youth." A new feature of the period is in the body-guard which surrounded the king, a sign of a more developed royalty. The long contest with the Hyksos educated the warlike spirit of Egypt, at least so far as the upper classes were concerned. The armies, however, appear to have been composed of mercenaries in the main, while conscription was little employed. This practice became more and more fixed in later times. A body of troops employed during the nineteenth dynasty contained 1,900 natives and 3,100 foreigners. At first the foreigners were officered by Egyptians. A principal service required of the soldiery was police duty as gendarmes. *Madai* was the special name of the bowmen in the Old Kingdom, and they seem to have been foreigners. In the New Kingdom this name became the ordinary designation of "soldiers." They had their own generals and they played an increasingly important *rôle*. The chariot came into use at or after the Hyksos wars, and was constructed to contain two persons, driver and warrior. Border garrisons were maintained to the east and south. The ancient insignia of the warrior were two feathers on the head, a mark supposed to have been of foreign origin and used to denote foreign troops. The bow was also foreign, and held in lower esteem than the native weapons—the spear and shield, the ax, lance, dagger, and sling. The earliest clothing of the soldier consisted of the simple apron, and was only slowly replaced by the helmet and wadded garments. Naval warfare was little practiced, though it was necessary against the Hyksos on the Nile, and again later against "the inhabitants of the islands," whom Ramses III. drove back from the Nile mouths. Military scenes are reproduced in Rosellini, *Monumenti dell'Egitto: Mon. Storici*; in Lepsius's *Denkmäler aus Ägypten*; in Wilkinson, *Ancient Egyptians*; Meyer, *Geschichte des alten Ägyptens*; and in Erman, *Ägypten*. The details of these scenes are of very great interest historically and as art.

Religion.—No satisfactory treatment of this subject has appeared, though it was one of the first to awaken interest. The names of the deities of the pantheon are well known and their general characteristics are sufficiently defined, but the gradations between them and the conceptions which gave them force are obscured, not only by the most curious inconsistencies, but by the fog of a mythology which is for the most part unknown to us. Religious conceptions existed during all periods, but never a religion in any true sense. It is plain enough that the differences in religious belief and practice corresponded to the primitive condition of the land, each district having its chief object of veneration. It was a condition of HENOTHEISM (*q. v.*) out of which, in consequence of the closer contact produced by the union of the nomoi under a central government, there grew up a system of national polytheism, in which the principal god of the capital gained pre-eminence. The original deities were objects of nature, but their development was various in the different nomoi. Only at a later date did gods appear who represented abstract or cosmogonical ideas. When intimate association occurred there was a resultant confusion of attributes and names. The hegemony of the god of the capital contained in itself the motives of monotheism, but there is no indication that monotheism was the original form of the Egyptian religion or that the people ever advanced to it, in spite of such phrases as "the only god," and the like. When carefully examined these expressions are found to refer to the deity held in special reverence in a particular locality, the "city god" or the leader of the local triad or ennead. Endowed temples and independent priests of separate deities prove that a determined resistance was made to any attempt to introduce monotheism, such as is actually seen in the case of Amenophis IV. See KHUNATEN and RELIGION, COMPARATIVE.

Local Gods.—Ptah was the god of Memphis; Neith, the warlike goddess of Libyan Sais; Khnumu (Chnum) of Elephantiné was the deity of the cataract regions; while Nechebt was the protecting goddess of the south in general. Min (Greek, Pan) was the desert god. Osiris of Abydos supplanted the earlier deity. Amon of Thebes, Anubis of Lycopolis, Tum (Atum) "Lord of Heliopolis," Bast of Bubastis, Sebek of the Fayum, Hathor of Denderah, Horus of Edfu, Thoth of Hermopolis, Mont of Hermonthis—these suffice as examples of deities which enjoyed special local homage.

Animal Forms.—The forms which many of the deities assume are grotesque in the extreme. It may be a human or animal shape, but more frequently it is a mixture of the two, the human trunk being surmounted by an animal head. Thus Ptah appears as the Apis-Bull, Hapi, Amon, and Khnumu (Chnum) as rams, Sebek as a crocodile-headed man, Nechebt as a serpent, Mut as a vulture, Anubis as a jackal-headed man, Bast as a cat-headed woman, Sechmet and Tefnut as lion-headed, Hathor as a cow, Horus as a hawk, or a hawk-headed man, Thoth as an ibis. The Phœ-

nix is possibly derived from *Benu* of Heliopolis, which appears as a heron.

Gods of Nature.—In various periods of the history certain deities appear as deifications of the powers of nature: Ra, the sun, the ruler of the world, having his sanctuary at Heliopolis, was even in prehistoric times conceived as a person; Horus, the bringer of light, is represented in conflict with Set, the god of darkness; Ra-Harmachis was the rising sun, Ra-Tum the sun at evening. Thoth was also worshiped as the moon.

The number of *mythological beings*, such as Nun the original ocean, out of which Ra proceeded, is beyond number. Mat, the goddess of truth, represents a large class which symbolized *abstract* notions. Deities are also portrayed in *pairs*, such as Qeb, god of earth, and Nut, goddess of heaven, Shu and Tefnut, Osiris and Isis, Set-Typhon and Nephthys. In these pairs is seen also the *family relation* which is carried out in numerous ways, not without great confusion. Hathor, Isis, Nephthys, and Nut were daughters of Ra. Horus and Set were sons of Isis. Tum was begotten of Nu, the water-goddess. Imhotep (Greek, Esculapius), the Egyptian god of medicine, was son of Sechmet, who was skilled in the same knowledge. *Combinations* are very frequent in the later periods, though that of Ra-Tum is most ancient. Ra-Harmachis has been mentioned, Hor-Nub was the "golden Horus" representing the rising sun. Amon-Ra, Ptah-Sokar-Osiris are further examples. *Triads*, consisting of father, mother, and son, were numerous: such as Amon, Mut, and Khonsu (or Chonsu), of Thebes; Ptah, Seehmet, and Imhotep, of Memphis; Sebek, Hathor, and Khonsu (or Chonsu), of Ombos. The ennead was theoretically a triple triad, though frequently the number fell short, in which case it was regarded simply as a divine court patterned after that of Pharaoh. As *symbols* of deities two may be mentioned, the obelisk of Ra and Horus, and the scarab of the abstract deity, Kheper. For particulars concerning these deities, see separate articles.

Future Life.—Much of the religion has its explanation only in connection with the future life. (See Metempsychosis.) When the soul or "double" (see Ka) left the body, the latter was preserved with extreme care (see Mummy) and deposited in a secure tomb (see Mastaba), for the personal existence of the disembodied spirit depended upon the absolute preservation of the mummy. The future of the individual was determined by a judgment which is represented as a weighing of the heart by Horus, who counterbalances it with the symbol of the truth. Mat, the god of truth, watches the operation, and Thoth, scribe of the gods, registers the result. The Hall of Justice and the forty-two "assessors" play also an important part, though the whole is too complicated to be rehearsed here. See Ritual of the Dead.

Mythology.—In the earliest periods specific beliefs as to their nature, qualities, and powers, clustered about the individual deities, but these did not become a true mythology till the amalgamation of variant views under the influence of the national union of the nomoi. The confusion which resulted would naturally lead to attempts at harmony, and thence grew up myths whose office was reconciliation. But, as intimated above, little is known of the mass of this mythology. Its extent must have been great if one may judge by the allusions, such as "Isis in the marsh" and "Horus, avenger of his father," which abound in every religious text. A study and compilation of the entire material is an essential to a scientific study of the religion, but as yet no collection has been attempted.

The myths that are best known are the account of the destruction of mankind—Brugsch, *Die neue Weltordnung nach Vernichtung des sündigen Menschengeschlechtes* (Berlin, 1881); Lefébure, *Tombeau de Seti I.*; *Tombeau de Ramses III.*; *Destruction des hommes*; Naville, *Transactions of the Society of Biblical Archæology*, iv., p. 1 ff., viii., 412 ff.; Wiedemann, *Religion*, p. 32 ff. The myth of Ra and Isis—Wiedemann, *Religion*, p. 29 ff.; Erman, *Ägypten*, p. 359 ff. The myth of Horus—Naville, *Mythe d'Horus*; Wiedemann, *Religion*, p. 38 ff. The myth of Isis and Osiris and of the conflict of Horus and Set as preserved by Plutarch, *Morals*, pp. 1–71 (Bohn edition), is of great interest.

Chronology.—It is difficult to construct for Egypt what the Egyptians never made for themselves. No trace of the use of a fixed era has been found. Time was reckoned in the years of the reigning sovereign, and with each the numbering began afresh. But even this method is only partially carried out. Annals in the sense in which they were recorded by the Assyrians were never systematically written, so far as extant documents show. The royal papyrus at Turin might have furnished a valuable guide had it not been shattered beyond repair. The lists of Manetho (*q. v.*) are valuable, but they have been preserved in such fragmentary and contradictory shape by Eusebius, Josephus, Africanus, and others, as to have lost much of their usefulness. They furnish, nevertheless, the only practicable way of locating historical events by dynasties. In terms of our era only the latest dates can be fixed accurately: e. g. Necho, 609–595 B. C.; Shishak about 930 B. C.; Ramses II. in the thirteenth century, and Thothmes III. possibly in the fifteenth century B. C. Amenemha I. is variously put at 2130, 2380 and 2466; Khufu (Cheops, Suphis) at 2830 (Meyer), 3124 (Lepsius), 3766 (Brugsch); while Menes is put at 4400 (Brugseh), 3892 (Lepsius), 5613 (Unger), 5004 (Mariette), 5867 (Champollion), and 5650 (Wiedemann). Each of these estimates is as little capable of proof as the others. The immense differences are due to the various theories touching contemporary dynasties, a problem of exceeding difficulty. It seems probable, however, that Manetho gives in his list only the legitimate rulers, and has passed over in silence those whose claims were ill founded.

General.—Of the development of the Egyptian kingdom and of the conditions which preceded the reign of Menes, the first king, the inscriptions tell nothing. Manetho speaks of gods, demi-gods, and sovereigns from Thinis and Memphis, while the royal papyrus at Turin enumerates beings called "Followers of Horus," as the precursors of Menes. These beings of course were mere myths. It has been claimed that traces of a stone age are found in Egypt, but proof is still lacking, since the remains thus far found can be assigned to historical times. At the opening of their history the Egyptians seem to have stood on about the same level as the present inhabitants of the Somali coast, so far as dress was concerned, but otherwise they were possessed of an ancient culture which presupposes a long period of development. The kingdom of Menes was already organized as fully as that of the later kings, the main difference being only in its extent.

The data of the early history of Egypt are mainly isolated facts, statements of the exploits of various kings and private persons. A connected history of native origin does not exist. The Turin papyrus and Manetho are often in contradiction with the monuments. The lists of kings at Abydos (see Memnonium) give only a selection, though the tablet of Seti I. contains 76 names and that of Ramses II. 18 names. The list of Saqqarah comprises 42 names. It is upon such a basis as this that the framework of Egyptian history and chronology has been formed, supplemented by many inscriptions, which supply an immense amount of bombastic phrase of a laudatory character, combined with a vanishing modicum of historical information. The gaps in the list and the Oriental habit of glossing over defeat and internal dissension have left us with a very fragmentary notion of the chronology of the people who possessed the most ancient known culture of the world.

On page 15 is a list of the Egyptian dynasties, compiled mainly from Wiedemann's history, showing the order of the dynasties, the names by which they are known, the number of kings in each according to various authorities, the length of the dynasties according to Manetho, and the names of some of the principal kings.

Old Kingdom.—No inscriptions have survived from the first three dynasties, though the "step-pyramid" of Saqqarah is ascribed to Uenephes (Egyp., Ata), the fourth king of the first dynasty, and some statues of functionaries of the time have been preserved. Of Menes (*q. v.*), the first king, little is known except that he hailed from This (i. e. Thinis) in Upper Egypt, and founded Memphis. The lists of kings given by Manetho are fairly confirmed by the monuments of following times. With the fourth dynasty contemporary records begin to appear in the tombs (see Mastaba) and pyramids of Gizeh and Saqqarah, built by Snofru (Manetho, Soris, *q. v.*), Khufu (Cheops; Manetho, Suphis (*q. v.*), Chefren (Chafra, Khafra), and Menkara (Mycerinus, *q. v.*) for themselves and their nobles. From the tombs a knowledge of the life of the times is derived, and in the execution of the scenes depicted there is evidence of a developed artistic sense. The long reigns of these kings were employed in building these and other structures in all parts of the land. An unpublished papyrus at St. Petersburg tells of an invasion of the Delta by Asiatics in the time of Snofru, which led to the building of the fortifications on the isthmus at the avenues of approach. See Shur.

LIST OF THE EGYPTIAN DYNASTIES.

Order.	Names.	NUMBER OF KINGS.					LENGTH IN YEARS.	Principal kings, etc.[1]
		Manetho.	Abydos.	Turin.	Saqqarah.	Monuments.	Manetho.	
I.	Thinite	8	8	7	2	4	253	Menes.

[2] 70 kings in 70 days; another version, 5 kings in 75 years.
[3] Or 4 kings in 100 years; Dynasties VII.–XI., a dark period, information uncertain.
[4] Or Bubastite, 153 years, in another version.
[5] Also given as 184 years.
[6] Africanus gives 43 kings in 151 years.
[7] Josephus, 17 kings; Africanus, 263 years.
[8] Africanus gives 209 years; the monuments 107.
[9] ? 178 years; monuments, 142.
[10] Africanus, 89 years.
[11] Monuments, 6; Syncellus, 44 years.
[12] Africanus, 40; monuments, 38+ years.
[13] Figures vary from 124 to 143¼ years.
[14] Monuments show 35+ years.
[15] Syncellus, 16 years.

During this period and the following changes occurred; art lost its primitive simplicity and freshness, taking on a stereotyped form, which was an object of imitation in later times. Under the last king of the fifth dynasty, Unas (Manetho, Obnos, *q. v.*), the practice of inscribing the chambers of the pyramids began, which was continued under the sixth dynasty by Teta (Othoes, of Manetho), Pepi I. (Phios), and Pepi II. (Phiops). Toward the end of the reign of Pepi I., third king of the sixth dynasty, a most notable ruler, whose monuments extend from Tanis to Denderah, a decentralization seems to have begun. Memphis was no longer the necropolis of the whole land, but Abydos, where myth located the grave of Osiris, sprang into prominence never to be displaced. Many other resting-places for the dead were also sought out. Nearly all that is known of this period and that of the following two kings is derived from a long inscription of Una, a contemporary noble already mentioned. Pepi II., the fifth king, waged war with the Beduin (see above) and defended the mines of Sinai, which had been previously worked. Queen Nitocris (*q. v.*) closed the dynasty. Thence till the eleventh dynasty there is a long period of darkness, but the interval seems to have been filled up with the gradual development of the power of the nomarchs, till finally in the eleventh Thebes stood forth in the lead. In this period the ancient religion and writing underwent change, for in the twelfth dynasty many new forms appear. Thebes became the chief city, and maintained its position for ages. It was from Thebes also that the later opposition came which ended in the expulsion of the Hyksos after the next dark period in the history. In each case the country must have gone through troublous times, and while the names of many kings are known, they are incapable of chronological arrangement. The eleventh dynasty, however, was a period of renaissance, though it was rude compared with what preceded. Changes are seen in the stelæ and in the sarcophagi, while the hieroglyphs are clumsy. The princes of the time were obscure, but the power of rulers was growing, and in the following dynasty (twelfth) it was fully exerted under the Usertasens (*q. v.*) and Amenemhas, so that, from being limited to the Thebaid, these kings reached out to Ethiopia and Syria, acquiring the former by conquest, while trade opened friendly relations with the East. The state was reorganized and placed on a firmer footing and in wider relations than ever before. For the first time the nation entered upon foreign conquest, the territory conquered being that south of the first cataract as far as Semneh and Kumneh (see Halfa, Wadi), where Usertasen III. placed fortresses to guard the new frontier. At home temples were erected at various places, and tombs were excavated from the rock at Beni Hasan and Siut (*q. v*). Some colossi at Tanis and Abydos come from the same source. From Amenemha III. proceeded an undertaking which required great engineering skill, the construction of Lake Moeris (*q. v.*), in the Fayum, excavated as a reservoir for surplus water to be used for irrigation in seasons of low Nile. The dynasty lasted 160 years, its kings were regarded as ideal rulers, and its language and orthography were classical models for after ages.

But this period was as an oasis in the desert. In times following, till the close of the seventeenth dynasty, there must have been great commotion and internal unrest. The monuments are few, though the names of rulers who must be assigned to this interval number upward of 150. The state was in a weakened condition, offering itself an easy prey to the invading Hyksos (*q. v.*). Concerning these people little is known; they left few traces of themselves in buildings and monuments to tell their story. The length of their stay is unknown, only that they were worshipers of Sutech (*q. v.*), and that their strongholds were Avaris (see Pelusium), San (see Tanis), and Bubastis (see Pi-Beseth). They threw the country into still greater confusion, but seem to have been content for the most part to remain quietly within their strong places in the Eastern Delta, and to receive tribute from the vassal Egyptian princes. But civilization was not dead even under the weight of this barbarian oppression, and in the seventeenth dynasty it began again to appear. The tombs at Gurnah (*q. v.*) testify that an organized state existed, and it is evident that the native kings were in control at least as far north as Thebes. The cause of the outbreak which ended in the expulsion of the Hyksos hordes was religious. Apepi, the Hyksos, demanded of Ra-sekenen, the "prince of the southern city," Thebes, that he renounce the worship of Amen-Ra and adopt that of Sutech. A refusal led to war, which became aggressive on the part of the Thebans till it developed into a struggle for supremacy lasting for years. It was brought to a successful close by Ahmes I., the first king of the eighteenth dynasty, who in his third campaign not only drove the Hyksos from their last stronghold,

Avaris, but pursued them into Palestine. In so doing he opened a new epoch. Whereas before Egypt had been self-contained, content to remain within its northern borders, and only advancing in conquest toward the south, now the road to Asia became familiar, and the age of conquest began. With surprising rapidity she became a warlike nation, and soon carried her arms to the Euphrates and to the Sudan. Mementos of the northward movement are seen in the introduction of the worship of Baal and Astarte, and in the use of many foreign names.

Following are some of the principal events of the dynasty. Amenophis I., the third king, subdued the Libyans at the west of the Delta. Thothmes I., his successor, marched southward to the third cataract in his first campaign, and Cush became an Egyptian province under a special governor, who was a person of prestige at court. His second expedition took him through Palestine and Syria to the Euphrates, on whose farther bank he erected a monument to record his prowess. He was followed by Thothmes II., Hatasu (*q. v.*), and Thothmes III. (*q. v.*), all his children, but by different wives, the mother of Thothmes III. not being of royal blood. Hatasu is noteworthy for the expedition which she fitted out to bring incense, wood, animals, such as the cynocephalus, or dog-headed ape or baboon, etc., from the land of Punt (*q. v.*). The record is preserved in stone in the temple walls at Der-el-Bahari (see Thebes), with pictured details of great interest. But it was under Thothmes III. that Egypt gained its greatest extension of power. Fifteen expeditions made him master of the lands west of the Euphrates and south of Amanus. In his first he marched unresisted to Megiddo, and there overthrew his allied foes. In his sixth he overcame the Hittites, who first appear during his reign, and captured their chief city, Kadesh. In the Sudan he was also active. By a remarkable chance his mummy has been preserved to us. The two following kings held their own, but Amenophis IV. scattered the seeds of internal discord when he undertook to supplant the current solar religion by a novel and monotheistic phase of the same. He discarded his earlier name, which was tainted with the name of Amon, and chose a new name compounded with *aten*, the title of the sun-disk, Khunaten (*q. v.*). For similar reasons he left the earlier residence of the kings, and established himself at Tell el-Amarna (*q. v.*). His relations with the Semitic races of the East have been revealed by the clay tablets found at Amarna. Not long after his death his city was destroyed, and the anti-reform movement triumphed, through the efforts of the priests.

With the nineteenth dynasty the old status was restored, and after a brief interval the policy of conquest was again adopted. Conditions in Palestine and Syria had changed. The kingdom of the Hittites had become consolidated and powerful. Seti I. (*q. v.*), the first king, claimed to have overcome them, but his victory is doubtful, to say the least. It is true, however, that he overthrew the Libyans and their allies from the "islands" of the sea. Ramses II. (*q. v.*), his successor, made several expeditions: in his first year through Palestine, in his fifth year as far as Kadesh on the Orontes, and finally in his twenty-fifth year he made a treaty of peace with the Hittite king, and took his daughter to wife. This treaty lasted through his long reign, and probably till the fall of the Hittites at the hands of the hordes of the north, the "inhabitants of the islands," whoever they may have been. During the long reign of sixty-six years of Ramses II. Egypt saw many changes. It has been estimated that half of the buildings in Egypt bear his cartouche. This leaves out of account, however, his constant practice of usurping monuments by replacing earlier royal names with his own, usually in so slovenly a manner that it is quite possible to read the original characters. Nevertheless, genuine remains are found, from his colossus at Tanis to the rock-cut tombs of Abu-Simbel (see Ipsambul) in Nubia—indications of his amazing power. Meneptah (*q. v.*), his son, confined his attention to the Libyans on the west, and overthrew them in his fifth year, though they returned under his successors. During his reign probably occurred the Exodus (*q. v.*) of Israel, indicating a weakened condition of the land, which continued under Seti II. and lasted for years.

The twentieth dynasty opened with Ramses III., who reigned thirty-two years. He worked the mines of Sinai and traded with the south. The Libyans who had settled as far south as Memphis were driven out, and in his eighth year he gained a victory over unknown races called "the people of the north, in their islands," who appear to have subdued the Hittite kingdom and to have advanced by land and water against Egypt. It is probable that these were the people who later appear as mercenaries, and who finally grew to be a dangerous power in the land. The remainder of this Ramesside dynasty (Ramses IV.–XIII.) was weak; the sovereigns were the tools of priests and mercenaries by turn, till the priest dynasty (the twenty-first) of Herhor (*q. v.*, Manetho, Smendes) and Pinotem (Manetho, Psusenes usurped the throne. Our main indebtedness to those sovereigns is in the fact that they hid the remains of their great predecessors so thoroughly that they remained in a rocky chamber at Der el-Bahari undiscovered till 1881. During these periods of weakness the Libyan power was developing again, and under Sheshonk I. (Bibl., Shishak, *q. v.*) and Osorkon (*q. v.*) of the twenty-second dynasty, about 930 B. C., it so dominated Egypt that even the governors of cities and the high priests at Memphis and Thebes were Libyans. The adherents of the royal priesthood fled to Ethiopia and there founded an Egyptian kingdom with Napata (*q. v.*) as its capital, and with the priests of Amon in actual power. This kingdom continued through the two following dynasties, twenty-third and twenty-fourth. During the earlier the Ethiopian Pianchi conquered Egypt as far as Memphis; the later, consisting of one king, the Bocchoris of the Greeks, was overthrown to make room for the Ethiopian (twenty-fifth) dynasty under Sabaka (*q. v.*) in 716 B. C. With Sabaka, who is supposed to have been the "So" of the Bible, and with Taharka (Bibl., Tirhakah, *q. v.*), the Hebrews had relations of confederation, as also with Necho (*q. v.*) and Apries (Manetho, Uaphris: Bibl., Hophra, *q. v.*) of the following (twenty-sixth) dynasty (see below). The efforts at foreign conquest put forth by those kings came to nothing in the face of superior power, but at home there was peace for about 138 years. During this time Psemtik I. (Greek, Psammetichus, *q. v.*) built in many parts of the land; efforts were made to establish commerce in new regions, and under Necho a fleet circumnavigated Africa. The establishment of Greek colonies in the Delta at Naucratis and Daphnae was also promoted, but with results which in the long run were detrimental to the ancient order of things. In the earlier contests with Assyria the confederations came to naught, and finally Essarhaddon conquered the land as far as Thebes, making Egypt an Assyrian province from 662–654 B. C. With the aid of Greek mercenaries Psammetichos I. expelled them, and endeavored to restore the land to its former greatness, introducing the titles, language, writing, and art of the old kingdom. It was a period of renaissance, but in the nature of things it could not be permanent. The rising Persian kingdom threatened, and when Cambyses in 525 B. C. met Psammetichos III. at Pelusium, a single battle sufficed to overthrow him. The Persian rule continued till 400 B. C. amid numerous popular uprisings, incited by members of the ancient royal line who maintained an independent existence in the marshy lands of the Delta. The Persian power became weakened, and was finally overthrown. Thence nearly till the arrival of Alexander the Great in 332, the twenty-eighth to the thirtieth dynasties held sway, having with Greek aid broken the Persian yoke. The most famous of the rulers between 400 and 332 B. C. was Nectanebo I. (*q. v.*) of the thirtieth dynasty, who not only successfully held his own against the Persians, but also pursued the arts of peace at home, building and repairing temples throughout the land. With Nectanebo II. in 345 B. C. the native rulers ceased, when after a valiant but ill-advised campaign he fled to Ethiopia with such treasures as he could gather hastily, leaving Egypt to become again a Persian satrapy for a brief space. This triumph was short-lived, and in 332 Alexander the Great was hailed as the deliverer of Egypt.

Under the Ptolemies (I.–XVI.) Egypt's old commanding position was lost, but it began to assume a place of importance as an intellectual center. Old temples were renewed and new ones were built. This period gave us the historical work of Manetho and the Septuagint version of the Scriptures, while about the wonderful library of Alexandria there grew up a class of men distinguished by their love of letters and science.

After the death of Cleopatra, Egypt became a Roman province governed by prefects. The ancient religion, writings, and customs were conserved, and the priests preserved the ancient fiction of Pharaohs, sons of Ra, the sun-god. Even Decius, 250 A. D., appears as a Pharaoh after Egypt had become Christian. But so far as power and national feeling were concerned Egypt was dead. The Roman em-

perors wrote their names in hieroglyphics under a wretched orthography and they built temples, but this was probably as an expedient for holding the people in a more quiet subjugation. While political death had come, intellectual life revived under the influence of Christianity, and for centuries its influence was felt in the world of Christian thought. The edict of Theodosius in 381 A. D. making Christianity the religion of Egypt, marked the annihilation of the ancient *régime*, whose only reminiscence was the Coptic language which became the vehicle of Christian, especially Gnostic, thought and the speech of divine service. See COPTS, COPTIC CHURCH, and COPTIC LANGUAGE AND LITERATURE.

Egypt and the Bible.—The references to Egypt found in the Hebrew Scriptures evince an intimate acquaintance with local conditions. An interesting question arises in connection with this, which has not received investigations, viz., the exact periods to which these correspondences point, since the results of such an inquiry would throw light upon the time when the Hebrew writings were composed. With regard to natural phenomena there is substantial agreement. On the basis of these some of the plagues have been explained. (See PLAGUES OF EGYPT.) References to agriculture and manufactures are true of nearly all periods, as are also those to customs. The biblical name of the kings in the earlier periods is uniformly Pharaoh (see above), giving no hint as to the identity of any individual and rendering identification on any mutual basis impossible. The geographical names mentioned in Scripture are nearly all large and well-known cities, except some connected with the Exodus of the Israelites (see EXODUS), such as Pithom, Goshen, Etham or Shur, Migdol, etc. Ramses, the second store-city built by the Israelites, still awaits identification, unless it is the same as Tanis, which occasionally bears the name of Pi-Ramses. Syene, Hanes, No-Amon, Noph, On, Pi-Beseth, Tahpanhes, Zoan, and probably Sin, are well known. (For further particulars, see separate articles.) The discovery of PITHOM (*q. v.*) by Naville in 1883 was of immense importance in fixing the early stages of the route of the Exodus.

All efforts to find mention of the Hebrews on the Egyptian monuments or other records have failed. But the Hebrew Scriptures contain many historical references to Egypt and her kings. The dates of the entry of Abraham and Joseph are absolutely unknown, and traditions are worthless. The period of the sojourn of the Hebrews is passed over in silence, and it was only by approximation that the conclusion was reached that Ramses II. was the Pharaoh of the Oppression and Meneptah the Pharaoh of the Exodus, conclusions wonderfully confirmed by the discoveries at Pithom. Solomon married the daughter of a Pharaoh, unnamed (1 Kings iii. 1), and Hadad the Edomite fled to another, also unidentified (1 Kings xi. 17, 18). SHISHAK (*q. v.*, see also above) is the first king mentioned by name, and to him Jeroboam fled (1 Kings xi. 40; xii. 2; 2 Chr. x. 2). The same Pharaoh conquered Rehoboam and took Jerusalem, apparently without a struggle (1 Kings xiv. 25). He celebrated his victory on the wall of the temple of Amon at Karnak. The identity of "Zerah the Ethiopian" (2 Chron. xiv. 9–13; xvi. 8) is uncertain, but "So," better Seve (2 Kings xvii. 4), with whom Hoshea had dealings, is believed to have been Sabaka of the twenty-fifth dynasty. In 720 B. C. Sargon overthrew the conspirators. King Hezekiah placed reliance on TIRHAKAH (*q. v.*) the Ethiopian (2 Kings xix. 9) in his contest with Sennacherib, but he proved a "staff of a broken reed" (2 Kings xviii. 21). NECHO (*q. v.*), of the twenty-sixth dynasty, made an expedition to the east, encountered, overcame, and slew King Josiah at Megiddo (2 Kings xxiii. 30), and moved on to the Euphrates. Jehoahaz was meantime made King of Judah, but was deposed and deported by Necho who installed Jehoiakim as a tributary vassal. The face of things was soon changed by Nebuchadnezzar in 606–605 B. C. HOPHRA (*q. v.*), the Greek Apries, made a faint attempt to draw off Nebuchadnezzar from Jerusalem, but was repulsed with heavy loss (586 B. C.). In consequence of troubles arising soon after, the Prophet Jeremiah was carried down to Egypt by Jonahan and settled temporarily at TAHPANHES (*q. v.*). A little later the prophecy of Jeremiah (Jer. xliii. 8–13) was fulfilled, and Nebuchadnezzar penetrated Egypt as far as Syene, though without making it a permanent possession. After the Babylonian exile the Hebrews had no connection with Egypt that is recorded in their books, but it was in consequence of their presence in the land, where they adopted the Hellenistic Greek as the tongue of trade, that we have the Septuagint version of the Pentateuch and of other Hebrew writings.

CHARLES R. GILLETT.

MODERN EGYPT.

The division of Egyptian history into ancient and modern is somewhat arbitrary and irrational, and yet on some accounts it is a matter of convenience and is not wholly without justification. The Roman occupation, extending from 30 B. C. to the Mohammedan conquest in 640 A. D., divided the history of Egypt into two somewhat distinct parts. The Mohammedan period and the period before the Roman conquest present to the student quite as many suggestions of contrast as of similarity.

History.—When the Greek domination established by Alexander the Great was overthrown by Augustus Cæsar, Egypt became a simple province ruled by a Roman prefect. During the 425 years that elapsed before the death of Theodosius in 395 A. D., there was no essential change in the form of administration. The most noteworthy event of this period was the introduction of Christianity. As early as the first century A. D. the new faith succeeded in establishing itself in the valley of the Nile; and only a few years later the neighboring deserts saw the rise of that peculiar phase of Christianity which found expression in the cenobites and anchorites. The growth of these sects compelled the Church to introduce certain important modifications into its early organization and methods. The firmness of the hold which Christianity early acquired in Egypt is illustrated by the fact that inscriptions are found showing that as early as the middle of the third century the new faith had acquired a dominant place in the hearts of the people. The old cult received its complete overthrow at the end of the fourth century, when Theodosius, in 389 A. D., proclaimed the establishment of Christianity, and ordered the temple of Serapis at Alexandria to be thrown down. With this edict the science and literature as well as the religion of ancient Egypt came to an end; for during the fourteen hundred years that followed no one was able to read the inscriptions or interpret the ruins. At the death of Theodosius in 395 the country became a part of the Eastern Roman empire, and was governed as such without event here worthy of note until the Mohammedan invasion in 640.

The period that ensued was one of turmoil. The Arab caliphs maintained their domination from 640 till 1250; the Sultan Mamelukes from 1250 to 1517. The Turks conquered the country in 1517, and held it in resistless subjugation until the French invasion and conquest in 1798. In 1801 the hold of the French was relaxed, and the overlordship of Turkey was soon afterward re-established and recognized. During all the period from 640 to the nineteenth century there are but few events that are worthy of note. The first of these was the destruction of the great library at Alexandria, which contained vast treasures of Greek literature and art. The invasion leading to the overthrow of Roman power was led by Amru, a general of the Caliph Omar, who, after the fall of Alexandria, wrote to the caliph: "I have taken a city which beggars all description, in which there are 4,000 palaces and 400 theaters." By the conquest and the destruction of the Alexandrian library, Greek civilization, after flourishing 900 years, came to an end, and the political domination was transferred from the Roman Government to caliphs, who resided first at Damascus and afterward at Bagdad. This power was not interrupted till about 970, when the country was conquered by the Fatimites, who established their dynasty at the new city of Cairo. The petty quarrels that characterized the following period were for a time raised to respectability by Saladin, the famous enemy of the crusaders. Saladin acceded to power in 1170. At his death in 1193 his sons were unable to unite the members of the empire; but the Saracens were strong enough to defeat the crusaders led by the French king, Louis IX., who was taken prisoner in 1248. Immediately after this important event a revolution of the MAMELUKES (*q. v.*) was successful, and the political and military power remained in their hands till the invasion of Bonaparte in 1798.

At the battle of the Pyramids, fought July 23, 1798, an army of 35,000 French, led by Bonaparte, completely overthrew the Mamelukes, whose power had filled the land with turbulence during two centuries. Bonaparte's purpose was to destroy the Turkish rule in Asia as well as in Africa, and thus make possible an attack upon Europe from the

East as well as from the West. But his failure at Acre defeated this purpose, and had an immeasurable influence on his subsequent career. After the first great battle Bonaparte left Egypt in the hands of Gen. Kleber, whose early death made it possible for the united forces of Turkey and England to acquire the ascendency. After the withdrawal of the French, however, in 1801, the several military elements lost their cohesive power, and the control was gained by Mehemet Ali, who was raised to the rank of Pasha of Cairo in 1804. In one respect an important service was rendered to Egyptology by the French invasion. Bonaparte took into Egypt with the army a large number of French savants, who were directed to explore the topography, natural history, and antiquities of the country; and their report, published in 1809–13 in 25 vols. (2d ed. 26 vols., 1821–30), with more than 900 very elaborate engravings, exerted a powerful influence on the advancement of the knowledge of ancient Egypt.

Mehemet Ali, though nominally a vassal of the Turkish sultan, acquired and maintained a substantial independence. He was fully imbued with the European spirit, and founded a vast number of schools and colleges. Manufactures were encouraged and commerce was organized. The full extent of his power and influence was not confined, however, to internal improvements. In 1830 he invaded and conquered Syria, and a few years later, encouraged by his military successes, he threw himself into revolt against Turkey. The Turkish army was defeated at the battle of Nizeeb in June, 1839. Two years later the great powers of Europe interfered to check the victorious progress of Mehemet Ali, and by treaty in 1841 established Egypt as a viceroyalty of Turkey, hereditary in the family of the viceroy. This most celebrated of modern Egyptian rulers, however, became imbecile in his last days, and the sultan, in July, 1848, appointed his adopted son Ibrahim regent. Ibrahim lived, however, only five months, and at his death was succeeded by Mehemet Ali's grandson, Abbas Pasha, whose ambition seemed to be limited to the restoration of Mohammedan power and the overthrow of the reforms begun by his grandfather. On his death, however, in 1854, he was succeeded by Said Pasha, a younger son of Mehemet Ali. In 1863 he was succeeded by Ismail Pasha (a son of Ibrahim), who received from the sultan in 1867 the title of khedive. Ismail Pasha devoted himself to internal improvements with great zeal, though not with equal intelligence. By various means he acquired great personal wealth while he was negotiating immense foreign loans for the improvement of the country. Taxes became so oppressive that the people refused to pay them. They finally rose in revolt, and in Aug., 1879, drove the khedive from power. He was succeeded by his son, Mohamed Tewfik, but the new khedive found the finances in such confusion that he was soon obliged to invoke the aid of European governments in order to raise the means necessary to pay the interest on the public debt. The British and French Governments were practically given control of all the sources of revenue. This course was so repugnant to the people that in the spring of 1882 a revolt broke out headed by Arabi Pasha, the Minister of War. The party cry of "Egypt for the Egyptians" seemed for a time destined to carry all before it. But the government was supported and sheltered by the army and navy of France and Great Britain. Accordingly, early in July the insurgents directed an attack upon the fleet lying near Alexandria for the protection of foreign interests. On the 11th the British fleet in return bombarded Alexandria, and two months later the British army defeated Arabi at Tell-el-Kebir, and reinstated Tewfik in power. The control of the finances now practically passed into British hands, and for the protection of this policy British troops remained in practical possession of the country. They were soon called into active service, for a formidable revolt of the Mahdi (*q. v.*) in the Sudan threatened not only the power of Egypt in the far south, but also the British as well as the Egyptian interest in the Suez Canal. The British, however, did not pursue a vigorous policy. Though Gen. Gordon with a small force had been sent to the Sudan in 1884, he was inadequately supported, and finally before relief could be secured was assassinated at Khartoum in Jan., 1885. The failure of the British in this expedition led to their withdrawal from the Sudan and the temporary abandonment of the southern part of the vast territory just north of the equator which a few years before had acknowledged allegiance to the khedive. With the support of the British the remaining years of Tewfik were free from turbulence. He was succeeded by his son Abbas Pasha in Jan., 1892. In 1896 a military expedition supported by British troops reconquered the province of Dongola, and it is intended in 1898 to proceed as far as Khartoum and Omdurman.

Land.—An expedition under Ismail Pasha, third son of Mehemet Ali, overran and occupied Nubia in 1821–22, and later expeditions pushed the frontiers to the S. as far as Berbera on the Red Sea and up the Nile valley to a point between Khartoum and the equator. When, in 1885, the Sudan was temporarily abandoned, Wadi Halfa (about 22° N. lat.), near the second cataract, became the most southerly point of Egypt proper. It now extends from about 18° N. lat. to the Mediterranean, and from the Red Sea on the E. to the Libyan Desert on the W. The total area, excluding the province of Dongola, is about 400,000 sq. miles, but the cultivated portion covers only about 12,976 sq. miles. The Egypt of politics and trade lies between the mouths of the Nile and the first cataract, in lat. 24° 3′ N., and consists of a narrow strip averaging only about 7 miles in width. This territory, however, broadens out at the north into a rich and prosperous plain known as the Delta. The fertility of this narrow belt is in striking contrast with the arid and desolate region lying on either side. The source of the country's fertility is its great river, the Nile, which, having its sources in the heart of Africa, pours down its volumes of fertility and annually distributes them over the surface of the adjacent country. Below the cataract it receives no tributaries, but the rainfall and the melting snows in the mountainous regions of the south are enough not only to overcome the loss from evaporation, but also to add so enormously to the volume of the water at periodical intervals as to prove a source of great fertility and wealth. For 3,000 years the average annual rise of the river at Thebes has been about 36 feet, and at Cairo about 25 feet, while near the mouths of the river it has been about 4 feet. The whole of the level country in the valley is inundated every autumn, and as the water subsides the soil is found to be covered with a thin film of fertilizing material. The average permanent addition to the soil by the inundations amounts to about 4½ inches in a century. The river discharges itself into the Mediterranean at the rate of more than 150,000,000,000 cubic meters per day during the low period, and at the rate of more than 700,000,000,000 during high Nile. Ordinarily it is from half to three-quarters of a mile wide, but from the middle of July to the middle of December it formerly gave the country the appearance of a "sea," as the Egyptians themselves described it. The ancient nilometers show that considerable changes of level have occurred since the twelfth dynasty; at Semneh, near the second cataract, the lowering has amounted to 24 feet. As the Nile is the only water-supply for land, man, and beast, it was found necessary to provide means for conserving it. To-day a very elaborate system of irrigation, especially in Lower Egypt, retains a considerable part of the water in reservoirs and canals for subsequent use.

Products.—In a great many localities the soil is from 10 to 15 feet in depth, and the climate is such that the agricultural year includes three crops. The inundation subsides in November, after which the winter crops, including nearly all cereals, are sown, and are ready for harvest in May and June. The summer crops, including cotton, sugar, and rice, are sown in July and harvested just before the autumn floods in September and October; while the autumn crops, consisting of vegetables, maize, sorghum, and rice, are sown in June and July and gathered in September and October. The most important products of the country are cotton and wheat; of the former, 906,000 acres were planted in 1899, and of the latter in the same year the acreage was 1,262. The area in maize was 1,592,000 acres; that in sugar cane, 67,120; in beans, 650,000; in barley, 400,000; and in rice, 175,000.

People.—The Turks, although the ruling class, constitute but a small portion of the population. The number of foreigners residing in Egypt in 1897 was as follows: Greeks, 38,175; Italians, 24,467; French, 14,155; Austro-Hungarians, 7,117; British, 19,557; Germans, 1,277; other nationalities, 7,778. The Arabs constitute the larger part of the population, though the Copts, who are supposed to be descended from the ancient Egyptians, number over 600,000. During the nineteenth century the average annual increase in the number of the population has been 1½ per cent. In 1800 the French Government estimated the population at 2,000,000. In 1846 the first census showed a population of 4,463,244. In 1872 there were 5,203,405, and in 1897 9,734,405. Of the

cities, Cairo had in 1897 a population of 570,062; Alexandria, 319,766; Damietta, 31,288; Tantah, 57,289; Mansourah, 34,997; Zagazig, 35,715; Assiout, 42,012; Port Said, 42,095; Fayoum, 31,262. See EGYPT, in the Appendix.

Government.—Egypt is ruled by a monarchy independent on certain conditions. Formerly subject to Turkey, it acquired substantial independence under Mehemet Ali, who was appointed governor of Egypt in 1804. Mehemet Ali and his immediate successors were recognized as viceroys on condition of paying a certain annual tribute to the sultan, and this title was recognized by the great powers of Europe. In 1867 the title was changed to khedive (or king), and the independence of Egypt was assured on condition of paying an annual tribute of $3,600,000 to the Turkish Government. In 1873 the sultan granted to the khedive the further right of concluding commercial treaties with foreign powers, and of maintaining an army and navy. The khedive has the advice of a council of ministers, which (in 1898) consists of six members: a Minister of the Interior, of Finance, of Justice, of War, of Public Works (including education), and of Foreign Affairs. Since 1883 the government has been further popularized by providing for a legislative council, a general assembly, and various provincial boards. These bodies are chosen by a modified universal suffrage, but their powers are only advisory. For purposes of administration the country is divided into six governorships of cities and fourteen provinces. The governors of cities and provinces are vested with extensive powers.

Finance and Commerce.—The system of internal improvements, undertaken about the middle of the nineteenth century, together with wasteful irregularities on the part of the Government, produced almost hopeless financial confusion. Accordingly, in Apr., 1880, the khedive was forced to appoint an international commission to examine the financial situation and draft a law to regulate the division of the income between the Government and the creditors. The commission estimated the income available at £8,361,622, and of this amount they assigned £3,463,734 to the payment of interest and the liquidation of the debt, and £4,897,888 to the Government for current expenses. The floating debt at the time was found to be about £8,000,000. In 1885 the representatives of Great Britain, Germany, Austria, France, Italy, Russia, and Turkey signed a convention agreeing to guarantee a new loan of £9,000,000 for the purpose of funding the floating debt, and enabling the Government to complete certain important works of irrigation. The guarantee thus afforded has given a constant influence to the European powers over the finances of the country. Since 1883, on the recommendation of the British Government, the khedive has had an English financial adviser, without whose concurrence no important financial measures have been taken. The financial situation has been somewhat complicated by the part of the foreign powers in the construction and maintenance of the Suez Canal. Of the stock owned by the khedive the British Government bought, in 1875, 176,602 shares for the sum of £3,976,582, an amount which enlisted the interests of the British in a proper administration and care of the canal. In 1898 the net profits of the Suez Canal were 48,789,818 francs, of which 15 per cent. must be paid to the Egyptian Government, 10 to the founders' shares, 2 to the employees of the company, 2 to the managing directors, and 71 to dividends on the shares of stock. In 1899 the exports of Egypt were £E15,351,908; the imports £E11,216,405. The income of the Government for 1899 was £E11,415,000, and the expenditures, including interest and principal on public debt, £E10,254,000, leaving a surplus of £E1,161,000. The railways in 1892 were 1,158 miles in length, and the telegraph lines 3,168 miles. Both railways and telegraph lines are for the most part under the administration of Europeans.

Religion and Education.—The prevailing religion of modern Egypt has been Mohammedan since the conquest in A. D. 640. The Copts, however, above 600,000 in number, are Christian descendants of the ancient Egyptians, and members of the Greek Orthodox Church. The Christian hierarchy consists of a patriarch, who resides at Cairo and has jurisdiction over Egypt and Abyssinia, and twelve bishops, besides a large number of priests, deacons, and monks. The priests are obliged to marry before they can be ordained. At the head of the Mohammedan hierarchy is the Sheik-ul-Islam, whose jurisdiction embraces the entire realm of the khedive. The history of education in Egypt is peculiarly interesting. The caliphs fostered learning at Alexandria and Cairo with a liberality which excelled anything that had previously been shown by Greeks or Romans. They not only founded libraries and colleges for higher education, but they encouraged secondary and primary schools in the cities and villages. The system of *wakfs* (religious foundations) threw the protection of the Church over property set apart for educational purposes, and secured it against spoliation at the time of the Turkish invasion. It was by reason of these foundations that, while Europe was passing through the gloom of the Middle Ages, learning flourished in Egypt as nowhere else, save possibly under the Moorish rule in Spain. After the conquest by the Turks, however, learning steadily declined. The savants who accompanied Bonaparte found few traces of the old learning, and the schools confined their instruction for the most part to lectures on the Koran, the lives and traditions of the prophets, the study of the Arabic language, and a little elementary arithmetic and geography. What was done by the French produced small results; but on the accession of Mehemet Ali new efforts were put forth. For the organization of the army on a European plan a staff school was established at Cairo, and placed under a young officer whom the viceroy had sent to Europe to be educated for this purpose. Special schools were also established for the education of army surgeons. This movement in behalf of the army was followed by the establishment of special schools for military engineering, veterinary medicine, languages, practical mechanics, and agriculture. The professors were either brought from France or were educated in France for this purpose. The impulse thus given to education by Mehemet Ali has been fruitful in the development of a more or less complete educational system. There are now established three classes of schools: (1) Those founded and supported wholly or in part by the Government; (2) the old mosque colleges and Arab primary schools; (3) the schools belonging to the non-Mussulman communities, which, though not under the state control, are liberally supported by the khedive. Of the first class there are nine special schools, the most important of which are the polytechnic, in which instruction is given in the higher mathematics, chemistry and physics, geology, mechanics, and other technical branches. The professions of law and medicine are taught in courses of four years each, and no less than eleven professors give instruction in history and language. Of the second class of schools the most famous is the celebrated college or university of El-Azhar (the splendid), which occupies the oldest mosque in Cairo. This has long been the most famous university of Islam. In 1881 the number of students attracted to El-Azhar was 11,095, and these were taught by a corps of professors as many as 325 in number. The instruction, however, consists largely of interpretations of the Koran and of Arabic literature. That the learning here taught is much less advanced than that which prevails in the higher Government schools may be inferred from the fact that the pre-Copernican theory of astronomy prevails, and that pupils are still taught that the sun moves around the earth, that the earth is flat, and that the firmament consists of seven superimposed canopies. In the whole country in 1887 there were 6,637 schools, in which there were 7,244 teachers. The teachers are generally paid by fees, and education is not compulsory. There are, however, 17 mosque schools with 2,000 pupils, and in all 15 Government schools of a higher grade. Besides these there are 21 national schools of a middle grade in the chief towns. For purposes of administration about 100 pupils are educated in Germany, France, England, Austria, and Italy at the expense of the Government.

AUTHORITIES.—On ancient Egypt, the first and most important work is that already mentioned, published by the savants who accompanied the expedition of Bonaparte (2d ed. 26 vols., 1821–30). Next in importance is Lepsius, *Denkmäler aus Ägypten und Äthiopien* (12 vols., 1849–59). Since Lepsius, the most worthy of note are the following: Brugsch Bey, *Recueil de monuments égyptiens* (2 vols., 1862–63); Mariette Bey, numerous works, all of which are important; Dümichen's *Hist. Inschriften* (2 vols., 1867–69); and *Gesch. des alt. Ägypten* (1878); Maspero, *Histoire ancienne des peuples de l'orient* (1875); Saul's *An Account of the Manners and Customs of the Ancient Egyptians* (2 vols., 1836; 5th ed. 1871); Wilkinson, *Manners and Customs of the Ancient Egyptians* (5 vols., 2d ed. 1878); Edwards, *A Thousand Miles up the Nile* (1876); McCoan, *Egypt as it is* (1877); Rawlinson, *History of Ancient Egypt* (2 vols., 1882); Paton, *History of the Egyptian Revolution from the Period of the Mamelukes to the Death of Mehemet Ali* (2 vols., 2d ed. 1869). For still more recent

history see the works of Vogt (1882); Royle (1886); Planchett (1889); and Maspero (1889). C. K. Adams.

Egyptian Architecture: the architecture of ancient Egypt; characterized by the grandeur of its conceptions, the simplicity of its constructive scheme, the massiveness of its forms, and its masterful use of carving and color to enhance the splendor of its architectural details. The Egyptians in all their important structures eschewed the arch, with whose form and principles they were nevertheless perfectly familiar, but produced overwhelming effects of solemn majesty by the use of enormous built-up columns bearing lintels of prodigious size. Their architecture, so far as known by its remains, was one mainly of temples and tombs, having bequeathed to us no important vestiges of palatial or domestic edifices, and its greatest works are buildings of one story, but of vast extent. Symbolic carvings, hieroglyphics, and paintings play a large part in its decorative scheme, but are never allowed to disturb the impressive repose of the architectural forms themselves. The temples of Karnak, Luxor, Medinet-Abou, Abydos, and the Ramesseum are the grandest examples of the art of the Ramesside epoch; Edfu, Denderah, and Philæ, of the Ptolemaic; while the temple-caverns of Abu-Simbel and the innumerable rock-cut tombs of the Nile valley exhibit another phase of Egyptian architecture, unrivaled unless by the cave-temples of India. The pyramids hardly rank as architecture, but evince the constructive resources and daring of the Egyptians in the time of the fourth dynasty, perhaps 3500 years B. C., and point to a previously existing architecture, of which no traces now remain. Limestone and granite, with a coarse sandstone for the rougher masses of masonry, and brick dried in the sun for exterior circuit walls, seem to have been the materials most in use. Further particulars may be found in the article Architecture. A. D. F. Hamlin.

Egyptian Language and Literature: the language and literature of ancient Egypt; covering the same period which the political history (given under Egypt) included, with the addition of the life of the Coptic language. Altogether, it must be reckoned at about 5,000 years, extending from the fourth millennium B. C. to the tenth or eleventh century A. D., having the antecedents of the pyramid texts at the beginning and the latest Coptic writings in the Boheiric dialect at the end. The Coptic was the only key to the elder forms of the language, and yet its earliest remains were separated by 3,000 years from the beginnings of the literature. But this immense interval was not the main difficulty. The language itself had undergone a development from a simple to an agglutinative character. The original form has been found to differ widely from the forms which characterize the Middle and the New Kingdoms, and these again from each other. The differences are so great that each period has to be provided with a special grammatical treatment of its peculiar features.

Periods of the Language.—Taking a broad view, there are five periods in the development of the tongue of Egypt, marked off more or less distinctly by breaks in the history of the land. (See historical sketch in the article Egypt.) The first belongs to the fifth and sixth dynasties, the second is that of the eleventh and twelfth dynasties, the third includes the eighteenth and following dynasties till the appearance of the fifth, in the Demotic character, and sixth the Coptic. (See Coptic Language and Literature.) Each one of these shows features unknown to the preceding, and in these altered features the linguistic development consisted.

Styles of Writing.—Similarly there were three styles of writing, exclusive of the Coptic. The earliest was the hieroglyphic, but of its origin nothing is known, since in its first appearance it is a finished product. This style of picture-writing remained unaltered in its essential features through all the grammatical changes which the language underwent, and was always the official script used for stone monuments. (See Hieroglyphics.) Out of it was developed, for more rapid writing on papyrus and similar materials, a shortened form known as the hieratic, so called because it was supposed to be the script used by the priestly scribes. The third style was the demotic, consisting of further contractions of the hieratic forms so abbreviated that all resemblance to the hieroglyphic entirely disappeared. The literature contained in this script forms a special field of study by itself. Under Greek and Christian influence it was replaced by the Coptic alphabet, borrowed from the Greek, which retained only six or seven letters from the old to represent sounds foreign to the Greek.

Alphabet and Graphic System.—The basis of the Egyptian writing was an alphabet representing twenty-four consonants, four of which were used in the later periods as vowels or semi-vowels. (For a careful statement of the values of the primitive alphabetic signs, illustrated by a wealth of special learning, see Dr. Georg Steindorff's article, *Das altägyptische Alphabet und seine Umschreibung*, in the *Zeitschrift der deutschen morgenländischen Gesellschaft*, vol. xlvi., 1892, pp. 709–730.) But these simple alphabetic signs were far from exhausting the wealth of characters possessed by the Egyptians. *Syllabic* and *word signs* were employed in large numbers and in an increasing proportion as time passed, either alone or in connection with alphabetic complements which served the purpose of indicating the particular value attaching to a sign in any given connection. *Determinatives* were also employed after individual words to indicate the nature or quality of the thing or act mentioned.

Relation to Hebrew.—The question of the relations between the Egyptian and other languages rose early. Lepsius (*Nubische Grammatik*, Berlin, 1880) investigated the languages to the south, but the difficulty exists that the comparisons which are possible are between phases of the languages which are separated by long intervals of time, and give no reliable results. Benfey (*Ueber das Verhältniss des Ägyptischen zum semitischen Sprachstamm*, Leipzig, 1844) compared the Coptic and Hebrew, but with misleading results. His knowledge did not extend far enough, and leading scholars are content to await the results of completer investigation before expressing a conviction. That there was some connection between the Semitic and Egyptian is clear from considerations deeper than the mutual borrowing of individual words. In fact these borrowed words which occur in the periods subsequent to the Hyksos domination are to be regarded with suspicion, unless they can be traced back to a period anterior to the thirteenth dynasty, i. e. to the Middle Kingdom. A large number of such words exist, and also some which have the appearance of a common origin. But the signs of linguistic relationship which are most striking are those which relate to grammar and syntax. As in Hebrew, the signification of a word depends on its consonantal constituents, while the modal relation depends upon the vowels, which remained for the most part unwritten in both the Semitic and Egyptian. The roots in both were formed by radicals numbering from two to five, the higher number being obtained usually by reduplication. The Hebrew *status constructus* is a single example of a general law of the Egyptian by which verb and subject, verb and object, the genitive construction, and even the verbal clause are combined as in a single word, with the accent at the end. The use of pronominal suffixes was similar, and the pyramid texts show a usage analogous to the *aleph prostheticum* of the Hebrew. See Erman, *Verhältniss des Ägyptischen zu den semitischen Sprachen* (*Zeitsch. d. deutsch. morgenl. Gesellsch*, 1892, vol. xlvi., pp. 93–129); Bondi, *Dem hebräisch-phönizischen Sprachzweige angehörige Lehnwörter in hieroglyphischen und hieratischen Texten* (Leipzig, 1886); Wiedemann, *Altägyptische Wörter welche von klassischen Autoren umschrieben oder übersetzt worden sind* (Leipzig, 1883), and *Die ältesten Beziehungen zwischen Ägypten und Griechenland* (Leipzig, 1883).

Grammar.—The study of Egyptian grammar in any proper sense is a work of recent date. Its slow progress is due to the peculiar difficulties which beset it. The script is confused, liable to be misunderstood, and defective in that it leaves the vowels unnoted and frequently omits even consonants. The texts are often in a ruinous condition, and their contents are of a nature difficult of comprehension. The only aid outside of the hieroglyphic writing itself is that supplied by the Coptic, which is not only widely separated in time, but has retained only the infinitive and a sort of participle from the many forms discovered in the ancient language. Nevertheless it has been found possible to learn much concerning the grammatical structure of the ancient language of the Old Kingdom, as distinguished from the Middle and New, in spite of the fact that it is largely composed of magical contents, and is written in a peculiar orthography new to Egyptologists.

Each word had a single accented long vowel, the others being merely serviles. When words were combined to form a compound expression, vowel changes occurred as in Coptic, and the accent went to the end. Pronominal relations

were expressed by suffixes; the possessive with nouns and the subject with verbs. Demonstrative pronouns are varied and rich. Substantives are masculine and feminine, the latter being used in most cases to express the neuter. Preformative *m* formed, as in Hebrew, a considerable number of nouns, and the *nisbe* ending in *i* is similar to the Semitic formation. The dual is also found. Adjectives are formed from nouns by an appended half-vowel. The names of the numerals 2, 6, 7, 8, and 9 were similar to the Hebrew. Verbs contain from two to five radicals, and are classed as active, intransitive, and passive. The only formation in the early language resembling the Hebrew conjugation, such as the Hiphil, and resulting in a change of signification, is the causative, obtained by prefixing an *s*; but this addition was treated as an integral part of the stem to such an extent as to alter the classification of the verb in question. Marks of inflection are present, but they can not be determined with accuracy. The only remnant is seen in the Coptic participle, which is a survival of an early intransitive or passive pseudo-participial form. Of the infinitive and participle little is known. The vocalization of the infinitive is conjectured on the basis of the Coptic. Verbal substantives were formed by peculiar endings, and verbal adjectives are also found. The original genitive relation was expressed by simple juxtaposition, later by a declinable adjective, which still later weakened into a preposition. The usual order of words in the sentence was verb, subject, object; but this was varied when the object was a pronoun, and also for emphasis. Demonstratives and attributive adjectives follow the noun. The object in the sentence is only known by its position; emphatic words are given a prominent place, and ellipsis occurs not infrequently.

The foregoing statement is based mainly on the pyramid texts of the fifth and sixth dynasties. Other texts of about the same period exist, but unfortunately they consist almost exclusively of lists of mere titles claimed by the deceased, and are almost absolutely valueless for grammatical investigations. See Erman, cited above.

Knowledge of the grammar of the Middle Kingdom has progressed mainly through the efforts of Erman and his pupils in Berlin, but no fuller statement has appeared than that in his *Sprache des Papyrus Westcar* (Göttingen, 1889), which he designates as a "preliminary study." Several papyri are extant from this period, but they are either medical (*Ebers*), mathematical (*Rhind*), didactic (*Prisse* and *Sallier II.*), or poetical (three in Berlin). Their style is so evidently artificial and stilted that it is difficult to base rules of correct usage upon them. Mortuary texts from this as from other periods are of little grammatical value.

In the New Kingdom the grammar developed still further, and sufficient material has been preserved to enable Erman to present the most complete treatise on Egyptian grammar that has ever appeared. (*Neuägyptische Grammatik*, Leipzig, 1880.) Many new forms are found, while many old ones have weakened and disappeared. The documents used as sources are more numerous, and they are written in the freer language of the common people. In official texts the effort to copy the ancient modes of orthography and speech is seen, but in the papyri this gave way to a style at once more natural and more appropriate to popular tales, songs, and prose narratives.

Sources.—The sources from which a knowledge of Egyptian literature is derived are the inscriptions on stone monuments or on such objects as sarcophagi, and texts written on papyrus and such other materials as parchment, wood, potsherds, etc. From the earlier periods the former only have survived, and in fact they comprise the larger proportion from all epochs.

Pyramid Texts.—The oldest long texts extant are those contained in the five pyramids of the kings of the fifth and sixth dynasties, and are usually called "pyramid texts." They were discovered in 1880, and have since been published by Maspero (*Recueil de travaux relatifs à la philologie et à l'archéologie égyptiennes et assyriennes*, Paris, 1882 ff). Their recovery dates a new epoch in Egyptological study, for while difficult to read even in the light of previously acquired knowledge, they have shed light upon old problems, though at the same time they have multiplied the problems awaiting solution. They contain an extensive collection of religious and magical texts engraved not later than 2500 B. C. Judging by antique features, they are only explicable on the assumption that they are the remains of a literature which flourished in the fourth millennium B. C.

Papyri.—The earliest papyrus purports to have been written by a prince of the fifth dynasty, Ptah-hotep by name (*Papyrus Prisse*), and another of ancient date claims Amenemhat I. of the twelfth dynasty for its author. The medical papyrus (*Ebers*) was compiled under Amenophis I. (Amenhotep, eighteenth dynasty) from more ancient documents, and the mathematical papyrus (*Rhind*) was copied under a late Hyksos king from an original dating from the time of Amenemha III. (twelfth dynasty). Other papyri from this period have been mentioned above. Numerous texts of a religious nature are also extant from this period, but the large majority of papyrus texts are those of the subsequent ages. Among the latter which deserve the name of literature are the following: Tales—*The Tale of the Two Brothers* (*Select Papyri*, published by the British Museum; *Orbiney Papyrus*; *Records of the Past*, ii.); *Capture of Joppa*, and *The Doomed Prince* (*Harris Papyrus*, the latter translated in *Records of the Past*, ii.); the *War against the Hyksos*, and the poem of the *Battle with the Hittites* (*Sallier Papyri*). Legal documents—*Proceedings against Grave-robbers* (*Amherst* and *Lee* papyri); *Process for High Treason* (*Turin*, *Rollin*, and *Lee* papyri); *Private Complaints* (*Salt* Papyrus). Original letters—in *Papyri Anastasi vi.*, *viii.*, *ix.*, *Mallet*, *Bologna ii.*, *Leiden*, *349*, *360–370*, and collections of letters in *Anastasi Papyri*, *iii.*, *iv.*, *v.* See Erman, *Neuägyptische Grammatik*, Leipzig, 1880, p. 2 f.

Authorship.—The question of authorship of Egyptian papyri is one of some uncertainty. Postscripts occasionally mention an individual with the statement that the writing was "made by" him. Whether this is an ascription of literary authorship or of mechanical execution such as that of a scribe is uncertain, but the weight of probability inclines toward the latter view.

Classifications of Egyptian Literature.—The earliest classification of Egyptian literature that we have is that of Clement of Alexandria, Christian bishop in the latter half of the second century, who designates (*Stromata*, vi., 4; cf Lepsius, *Chronologie*, 1849, pp. 45 ff.) five classes: 1. Ten hieratic books on the laws, the gods, and on priestly training. 2. Ten books relating to the priestly office, on offerings, festivals, hymns, prayers, processions, and the like. 3. Ten books for the sacred scribes, on hieroglyphics, cosmography, topography of temple lands, lists of temple furniture, etc. 4. Four books on astrology. 5. Two books for the singers, on hymns and on the royal life. But this classification is unintelligible to us on any known principle (see Brugsch, *Ägyptologie*, p. 149). The classification given by Brugsch himself (*id.*, p. 159 f.) is quite exhaustive. It consists of two departments. I. Sacred literature (in the hieroglyphic and hieratic character): 1. Hymnology; 2. Rituals and liturgies; 3. Books in reference to temple service and the priestly classes; 4. Charms; 5. Magical books and directions for the preparation of talismans; 6. Decrees in honor of gods and kings; 7. Worship of trees and beasts; 8. Tombstones and inscriptions in memory of the dead; 9. Writings in relation to the dead, with the RITUAL OF THE DEAD (*q. v.*) at the head. II. Profane literature: A. Scientific: 1. Astronomical; 2. Calendars and festivals; 3. Chronological; 4. Historical and biographical; 5. Mathematical; 6. Geometrical; 7. Statistical; 8. Geographical; 9. Natural science; 10. Medical; 11. Architectural. B. Belles-lettres: 1. Didactic; 2. Tales and adventures; 3. Dialogues of the dead; 4. Fables of animals; 5. Histories and legends of the gods. C. Mercantile, etc.: 1. Reports and letters; 2. Bills of sale; 3. Rental contracts; 4. Receipts for loans; 5. Partition agreements; 6. Documents relating to inheritances; 7. Marriage contracts; 8. Judicial proceedings; 9. Complaints to officers; 10. Market prices and bills; 11. Receipts; 12. Oaths; 13. Lists of persons and private papers.

Origin.—The Egyptians ascribed the origin of their literature to the god THOTH (*q. v.*), the number of whose literary productions was variously estimated in late times at from 1,100 to 36,525. Having thus a divine originator, Egyptian literature was regarded as sacred. Thoth communicated learning to men, and it was handed down by copyists, but the idea of a fixed text, too sacred to be altered, does not seem to have found lodgment. Commentators arose who had no compunctions about changing the sense and meaning even when these are clear. In many cases their procedure is so curious that it can only be explained upon the supposition that the ancient texts were no longer understood even in the Middle Kingdom. Similarly the knowledge of the forms of the ancient language, although it was recognized as the official standard, was largely lost. Owing to this many errors are found in ex-

tant texts, both formal and material, which are capable of no other explanation. The extent to which the most sacred religious text was changed and amended is seen in Naville's monumental edition of the *Ritual of the Dead* of the eighteenth dynasty (*Das Ägyptische Todtenbuch der xviii. bis xx. Dynastie*, 2 vols. fol., Berlin, 1886). The corruption of the text has proceeded so far that it is not in the power of textual criticism to restore it to its original form so that each word shall appear in its proper form.

Religious Literature.—Although the number of texts written in the hieroglyphic and allied characters is immense, the bulk of them is of a religious nature, consisting largely of copies of the *Ritual of the Dead*, complete or partial, written on fragile papyrus, on the bands and sarcophagi of the dead, on temple walls and in tombs. The literary activity of the living was exercised mainly in the preparation for the life in the fields of Amenti, the land of the West, the future home of the deceased. The gods and the dead were objects of especial care. But in spite of the wealth of materials there is difficulty in obtaining a clear view of the religious conceptions of the Egyptians, because behind all their formulæ and ritualistic observances there is a background of mythology as yet imperfectly comprehended, which is nevertheless essential to a complete understanding of the religion in its essence. The references to these myths are numerous, but the particular events intended do not appear in detail. The ritualistic books are mere directories of observances; the *Ritual of the Dead* is a conglomerate made up of accretions during long ages.

Zodiac of the Temple of Denderah.

Tales and Narratives.—Egyptian literature is at its best in the tales which have been preserved dating from the periods of the Middle and New Kingdoms. The Egyptian was so lacking in imagination that when he left the region of simple prose he became bombastic, grotesque, and absurd. Yet the literary Egyptian, even when relating a plain and simple story, was wont to interject speeches and long letters which were evidently intended as literary adornments. It is a remarkable fact that most of these tales, and all of those couched in simple prose speech, come from the period subsequent to the Hyksos invasion and occupation. The so-called prose narratives of the previous period are probably poetic in their structure, being more artificial, less intelligible, and in marked contrast to those of the eighteenth dynasty, which show a style truer to the contemporary idiom and more natural than the official texts and the inscriptions in the bombastic style and antique language of their ancient models.

Poetry.—Closely allied to the tales are the poetical writings. Music and singing were practiced in all periods to express joy and grief, and the song was the universal accompaniment of labor. The specimens from the ancient kingdom are valuable mainly as showing the origin of the folk song. In the more artistic pieces of later times, alliteration was practiced frequently, and plays on words were carried to a great length. The "parallelism of members," familiar to us in the Hebrew poets, is frequent and sometimes very artistic. This parallelism is sometimes strict, sometimes free, and a poetical composition is occasionally arranged strophically. Rhythm was also introdueed, with a regular beat of accents, dependent upon the usual laws of Egyptian phonology. Long lines are interrupted in some of the manuscripts of the Middle Kingdom by shorter lines which mark transitions of thought as well as of meter. At times these lines are marked in red.

Letters.—A peculiar form of literature has been preserved in the collection of letters prepared by teachers for their pupils. Some contain praise of the occupation and advantages of the learned scribe, who is released from the toil and fatigue of the soldier and the laborer. Others contain moral instruction, the precepts of etiquette, and the formulæ of elegant intercourse. They are cast in the form of instruction given to the young by their elders, or to pupils by their teachers, in a style that is to us often far from clear. In the later, and especially in the demotic, periods, letters, contracts, and private documents afford glimpses of

the life of the people which could scarcely be had from any other source.

Historical Writing.—Lists of kings engraved on temple walls and the single royal papyrus of Turin, containing the names of the kings and the length of their reigns, are all that can lay claim to this name. Most of the historical texts consist of brief accounts of the deeds of individuals and of kings, which may have been based upon official annals, but of such documents, if they ever existed, none have survived.

Astronomy.—The so-called astronomical writings are rather of an astrological nature. Our knowledge is derived mainly from the temple of Ramses II. at Thebes, the tombs of Seti I., Ramses IV. and VII., and the sarcophagus of Ramses IX. (cf. Lepsius, *Chronologie*, p. 62 ff.). Ptolemaic texts have been preserved at Philæ, Edfu, and Ombos, and they show similar characteristics. Only after the Roman period do the signs of the zodiac appear. Nevertheless, the Egyptians were close observers of the stars, and some of their charts are interesting.

Mathematics.—In mathematics the decimal system was employed. Single short lines, numbering from one to nine expressed units, while there were separate signs for 10, 100, 1,000, etc. In later times special signs were used for 9, 60, and 80, and later still for 5, 7, 8, 10, and 30. The *Papyrus Rhind* is the thesaurus of Egyptian mathematical lore. Eisenlohr, *Ein mathematisches Handbuch der alten Aegypter* (Leipzig, 1877).

Chemistry.—It can not be doubted that some chemical knowledge was possessed by the ancient Egyptians, since the existence of glass, artificial stones, and alloys bears witness thereto; but no writings have been found to set forth their attainments for our enlightenment.

Medical Writings.—The practice of medicine was empiric, and remedies were held in high esteem in proportion to their age. Incantation was an essential portion of the physician's stock in trade. The largest extant work is the *Ebers papyrus*, compiled in the eighteenth dynasty from documents then antique. The recipes bear the names of ancient personages, and are arranged under the name of the disease and its symptoms, with directions as to administration. Such texts are difficult to understand on account of uncertainty as to the internal bodily organs intended, the character of the particular illness and its symptoms, the articles of the pharmacopœia, and the values of the weights and measures. German translation, Joachim, *Papyrus Ebers, Das älteste Buch über Heilkunde* (Berlin, 1890). The original, by Ebers and Stern (Leipzig, 1875).

Judicial Texts.—There are many judicial texts, especially from the nineteenth and twentieth dynasties. They report legal prosecutions of persons accused of treason, murder, theft, body-snatching, robbery of tombs, defacement of temples, falsification, perjury, infliction of bodily damage, and the like. Documents have survived containing private complaints, made in due form. Among the most interesting documents are some reports upon the condition of royal tombs alleged to have been rifled. Some were found intact, while in the case of others the allegations were sustained. Chabas, *Une spoliation des hypogées de Thèbes; Traduction analytique du papyrus Abbott* (Paris, 1870).

The difficulties which beset the investigation of the Egyptian grammar affect all efforts at translation. Even a slight comparison of the various translations of the same text made by successive persons, or even by the same scholar after a lapse of years, shows the progress made in the interval. The method is one of approximation in the case of any long text. There can be no doubt that the best translations approach closely to the sense of the original, but this is by no means scientific in exactness of rendering. In the language of the New Kingdom the grammar is better settled than elsewhere, and consequently the translation of New Kingdom texts approaches nearest to perfection. But in the Middle and Old Kingdoms there is so much uncertainty that any rendering must be only provisional. It is one thing to give the meaning of a text in a general way and quite another to be able to render it upon the basis of a perfect understanding of grammar and syntax. To the latter no claim can be made. The most available translations into English are those of *The Records of the Past* (2 series, 18 vols., London and New York), though all histories of Egypt contain samples of Egyptian literature in modern dress.

CHARLES R. GILLETT.

Egyptian (or **Maltese**) **Vulture**, called also **Pharaoh's Hen**: a small vulture (*Neophron percnopterus*) of Southern Europe, Africa, and Asia, occasionally seen in England. The young birds are brown; the adult bird has almost perfectly white plumage, with black wing feathers. These birds are valuable scavengers, protected by law and custom, and are half domesticated.

Egyptology: the science which concerns itself with the writing, language, literature, monuments, and history of ancient Egypt, from the earliest time to the extinction of the old pagan religion and civilization between the fifth and sixth centuries after Christ. It is a new science, having its origin in the beginning of the nineteenth century. M. Boussard, a captain of engineers under Bonaparte (1799), discovered in the trenches of Fort Julien, near Rosetta, a large block of black granite with the remains of three inscriptions, the first in hieroglyphs, the second in the demotic character, the third in Greek. This *Rosetta stone* was taken to England after the capitulation of Alexandria (1801), and presented by King George III. to the British Museum. It contains a decree promulgated at Memphis in honor of Ptolemy V. Epiphanes by the priesthood of Egypt in synod assembled, thanking that sovereign for the benefits which he had conferred upon them. They ordered it to be sent to all the temples of the first, second, and third rank, there to be engraved on stelæ in the three forms of writing then used throughout the land. When found, half of the hieroglyphic portion of the Rosetta copy was wanting, but the demotic and Greek were nearly complete, and the work of decipherment began with them. The French Orientalist Silvestre de Sacy made out in the demotic some of the proper names mentioned in the Greek (*Lettre au Citoyen Chaptal sur l'inscription égyptienne du monument du Rosette*, Paris, 1802); and the Swede Akerblad, following in his steps, assigned phonetic values to most of the signs employed in the proper names (*Lettre sur l'inscription égyptienne de Rosette adressée au Citoyen S. de Sacy*, Paris, 1802). In 1814 Thomas Young, the celebrated English mathematician, succeeded in isolating a number of groups which express common names, and even in translating some fragments of demotic phrases. Turning to the hieroglyphs he tried to determine the power of the characters which, being inclosed in cartouches or rings, were known to indicate the names of kings. Thus he read the names of Ptolemy and Bereniee, but he failed to analyze them exactly; five only of the values which he proposed for the signs turned out to be true. (*Archæologia*, vol. xviii., p. 60, 1817; *Encyclopædia Britannica*, 4th edit., vol. iv., 1st part, 1818.) The problem with which Young had such poor success was solved four years later by JEAN FRANÇOIS CHAMPOLLION (*q. v.*). Champollion had felt attracted to the study of the Oriental languages from his early youth, and published when only twenty-four years of age, under the title *L'Égypte sous les Pharaons* (2 vols., Paris, 1814), the first two volumes of a large work on the history and civilization of ancient Egypt. Guided by his thorough knowledge of the Coptic, he applied himself to the decipherment of the inscriptions, and ascertained very soon that the three kinds of characters found on the monuments, far from representing three independent systems, were three successive developments of one system of writing, of which the hieroglyphs were the prototype, the hieratic and demotic the cursive forms (*De l'écriture hiératique des anciens Égyptiens*, Grenoble, 1821). He then dissected the cartouches which had been studied by Young and proved that the hieroglyphs in them were always taken alphabetically, and that the alphabet thus employed for the rendering of Greek royal names was the same that had been used from the time of the first dynasties, not only for proper names, but for the common parts of the language. He gave a general outline of his system to the Académie des Inscriptions (*Lettre à M. Dacier relative à l'alphabet des hiéroglyphs phonétiques employés par les Égyptiens*, Paris) on Sept. 22, 1822, a day famous in the annals of science as marking the foundation of Egyptology. Then he completed his revelations, and explained fully his method in his *Précis du système hiéroglyphique des anciens Égyptiens* (Paris, 1824; 2d ed. 1827–28). He spent the last eight years of his life in working out the principles which he had established for the resurrection of the old Egyptian world, trying to elucidate the religion in his *Panthéon Égyptien* (Paris, 1823–26), the chronology and political history in his *Lettres à M. le Duc de Blacas d'Aulps relatives au Musée*

royal Égyptien de Turin (2 vols., Paris, 1824–26), the general archæology in his *Notice descriptive des Monuments Égyptiens du Musée Charles X.* (Paris, 1827). In 1828–30 he searched Egypt from Alexandria to Wadi-Halfa with the help of a selected band of French and Italian archæologists. Upon his return he was made Professor of Egyptian Literature in the Collège de France, but his strenuous activity, and especially the hardships to which he had submitted during his recent journey, had overtaxed his strength. He was seized with a fatal fever and died Mar. 4, 1832, a few days after he had delivered his first lecture. His rapid success had raised up a host of detractors and opponents. Klaproth criticised his work with a bad faith and a virulence which even death did not abate (*Examen critique des travaux de feu M. Champollion sur les Hiéroglyphes*, Paris, 1832); Spohn and Seyffarth started a rival system, which was rejected in Europe after the death of Uhlemann (1855), but which continued to find some degree of acceptance in the U. S. for more than thirty years. The general public, however, had received his labors with delight and immediately proclaimed his discoveries as among the most wonderful ever achieved in the domain of antiquity. After his death, men of every nation took up his teachings and advanced the work he had begun so well: Nestor Lhôte, Charles Lenormant, and Dulaurier in France; Salvolini, Rosellini, Ungarelli, and Baruechi in Italy; Leemans in the Netherlands; Wilkinson, Birch, and Osborn in England. Champollion-Figeac devoted himself to the memory of his younger brother, and published the most important of his unfinished books, his *Lettres écrites d'Égypte* (Paris, 1833); his *Grammaire Égyptienne* (Paris, 1836–41); his *Dictionnaire Égyptien en écriture hiéroglyphique* (Paris, 1841–46); his *Monuments de l'Égypte et de la Nubie* (Paris, 1835–75), completed, however, only by Maspero. Since then the story of Egyptology has been a perpetual record of success and discoveries. Lepsius analyzed critically in his *Lettre à M. le Professeur Rosellini sur l'alphabet hiéroglyphique* (Rome, 1837) the structure of the old language, and elucidated the origin and mechanism of the syllabic characters, the existence of which had only been surmised by Champollion. Lepsius, however, early left philological for historical and archæological researches. From 1837 to 1885 nearly every year was marked by the appearance of some important work from his pen: *Das Todtenbuch der Ägypter*; *Ueber die xii. ägyptische Königsdynastie*; *Einleitung in die Chronologie*; *Ueber den ersten ägyptischen Götterkreis*; *Königsbuch der alten Ägypter*, and many more. Large portions of these have become antiquated, but they formed the solid ground upon which the chronology and history of ancient Egypt have been built up. His three years' stay in the Nile valley at the head of a commission of German draughtsmen and scientists (1842–45) produced the gigantic *Denkmäler aus Ägypten und Äthiopien* (12 vols., Berlin, 1849–59), in which all the historical texts known at the time were reproduced by the skillful hand of Weidenbach. Bunsen popularized the ideas of Lepsius in his *Ägyptens Stelle in der Weltgeschichte* (Hamburg, 1849); Heinrich Brugsch, then a young man, applied himself to demotic texts (*Scriptura Ægyptiorum demotica*, Berlin, 1848); *Grammaire démotique* (Berlin, 1855). While things went thus in Germany, Emmanuel de Rougé commenced his labors in France with his *Examen critique de l'ouvrage de M. le Chevalier de Bunsen*, in which the merits of Bunsen's and Lepsius's work were fully recognized, while their errors and fallacious hypotheses were pointed out with a vigor of method and a certainty which placed the young author at the head of living Egyptologists. Emmanuel de Rougé has been termed the second founder of Egyptology, and he has a perfect right to the title. He remodeled the grammar in his *Chrestomathie Égyptienne* (Paris, 1867–76); he called back to life the first dynasties in his *Recherches sur les monuments qu'on peut attribuer aux six premières dynasties de Manithon* (Paris, 1866); he gave the perfect models of the method in which Egyptian texts should be commented upon letter by letter and word by word in his *Mémoire sur l'inscription d'Ahmes, chef des nautoniers* (Paris, 1851), in his *Étude sur une stèle égyptienne de la Bibliothèque Impériale* (Paris, 1856–59), and in his smaller pamphlets, and he was the first who really translated whole Egyptian books and inscriptions, both hieroglyphic and hieratic. He gave a new impulse to Egyptology not only in France, where Mariette, Chabas, Devéria, Pierret, and Maspero took the field after him, but also in England, where his influence was felt by Birch, Hincks, Lepage-Renouf, and in Germany, where Brugsch, Dümichen, Ebers, and Eisenlohr seconded the efforts of Lepsius. The elders of the German school are nearly all practical archæologists, who, like Dümichen, copied texts in the temples of Egypt and interpreted them in their relation to history and religion, or, like Ebers, popularized in ingenious novels (*Die ägyptische Königstochter*, *Uarda*, *Die Schwestern*) the knowledge they had acquired in their scientific researches. They are headed by the veteran Heinrich Brugsch (Brugsch Pasha), who may be said to be the last of the heroic generation which did not specialize within a narrow branch of the science, but took the whole field for its specialty. His *Grammaire* (Leipzig, 1872); *Dictionnaire hiéroglyphique* (Leipzig, 1867–82); *Geographische Inschriften* (Leipzig, 1857–60); and *Dictionnaire géographique de l'ancienne Égypte* (Leipzig, 1877–80); his *Matériaux pour servir à la reconstruction du calendrier des anciens Égyptiens* (Leipzig, 1864); his *Geschichte Ägyptens* (Leipzig, 1877); his *Religion und Mythologie der alten Ägypter* (Leipzig, 1885–88); his *Thesaurus Inscriptionum Ægyptiacarum* (Leipzig, 1883–91); and his *Ägyptologie* (Leipzig, 1891) are fundamental works, the great faults of which are lost in greater merits. With the exception of Wiedemann, whose turn of mind is decidedly historical, the more recent German school inclines more and more to grammars and philology under the lead of Adolf Erman, the successor of Lepsius both in the Museum and at the University of Berlin. On the other hand, the French school, though not adverse to philology, has directed its strength toward history and archæology since the death of Emmanuel de Rougé (1872) and of Chabas (1885). Auguste Mariette (Mariette Pasha) had opened the way for them by his immortal labors among the Egyptian ruins in the interest of both the French (1849–54) and Egyptian (1858–81) Governments. He had discovered the Serapeum of Memphis, freed the temples of Edfu, Karnak, Deir el-Bahari, Denderah, and Abydos from the rubbish which cumbered them, explored the whole Nile valley from Tanis to Napata, and collected in Boulak in 1859 that museum of antiquities which, transferred to Gizeh (1889), is one of the wonders of modern Egypt. The direction of Egyptian excavations passed from his hands to those of G. Maspero (1881–86) and E. Grebaut (1886–92), and descended in 1892 upon De Morgan, all of them Frenchmen. Moreover, the French Government maintains in Cairo a *Mission archéologique permanente*, founded in 1880 by Maspero and directed under his supervision by Lefébure (1881–83), Grebaut (1883–86), and Bouriant. Young Egyptologists are sent every year to Egypt to excavate, draw, copy, and publish the monuments. They are helped in the work of finding and preserving the remains of antiquity by an Anglo-American society, the Egypt Exploration Fund, the first secretary and real promoter of which was Miss Amelia B. Edwards (1882–92). In 1883 they sent out their first agent, Édouard Naville, of Geneva, and he cleared the site of Pithom in the land of Goshen. Since then Naville, Flinders, Petrie, Griffith, Gardner, and Newberry have been at work. Naucratis has come to light, Tanis and Bubastis, the Pyramids of the Fayum, the tombs of Beni-Hasan and El-Amarna have yielded unexpected treasures of archæological and historical lore.

Records begin to appear with the third dynasty of Manetho. The Sphinx of Gizeh is certainly older, but being

Sphinx and pyramid.

anepigraphous it is not known to which king or dynasty it belongs. A few stelæ bear the name of Sondou (second dynasty), and the step pyramid of Saqqarah purports to be the tomb of King Tosiri (third dynasty). These, however,

are isolated instances, and an unbroken line of monuments begins only under Snofroui, the last Pharaoh of the third dynasty (about 4300 B. C.). From his time to the death of Pepi II. (about 3800 B. C.) the necropolis of Gizeh, Saqqarah, Dashour, and Midoum, the tombs of the feudal families at Zawiet-el-Maietin, at Sheikh-said, at Kasr-es-Sayad, at Assuan, the rock graffiti of Wadi Magharah in the Sinaitic peninsula, furnish material enough to trace the succession of the kings and call back to life the whole civilization of those primeval ages. The series breaks off after Pepi II., and although the extensive chasm which was supposed to intervene between the fall of the Memphite and the rise of the Theban empire never existed except in the minds of modern archæologists, yet a few small scarabs and objects in the Louvre, a few tombs at Siout and Bersheh, are as yet the only records which bear witness to the power of the Heracleopolitan house. With the eleventh dynasty the monuments come to light again in great numbers, but whereas the relics of the previous centuries were concentrated, so to say, in the neighborhood of Memphis, the mementoes of the middle kingdom (about 3200–2900 B. C.) are equally dispersed all over the Nile valley, in the grottoes of Beni-Hasan, Bersheh, Siout, Assouan, in the private tombs of Thebes and Abydos, in the temples of Nubia and in the Delta cities, in the pyramids of the Fayum and the inscriptions of Sinai and Hammamat. There are many inscriptions and statues of the thirteenth and fourteenth dynasties, and the area of ground they cover from the fourth cataract to the sea shows how much the strength of Egypt had grown to be at that time. The invasion of the Hyksos suspended for at least four centuries the production of monuments (about 2100 B. C.), and nothing remains of their kings except a few names rudely scratched on statues of the older Pharaohs. Egypt revived after their expulsion, and the three Theban dynasties of the new empire (about 1750–1100 B. C.), enriched by the spoils of Asia as well as by those of Ethiopia, covered the banks of the river with temples and palaces, the ruins of which are to be counted by hundreds even after nearly two thousand years of neglect and destruction. Thebes, of course, received the best part of their care. The small sanctuary of Karnak was enlarged from year to year, and nearly every king held it a duty to add to the existing buildings a new hall, chapel, or pylon. Ramses I. planned the great hypostyle which Seti I. executed and Ramses II. decorated. To enumerate the names of all the Pharaohs who worked upon it would be to make a compendium of the history of Egypt under the following dynasties: Amenophis III. built the temple of Luxor; Thoutmes II. and Queen Hatshopsitou the terraces of Deir el-Bahari; Seti I. the Memnonium of Gournah; Ramses II. the Ramesseum; Amenophis III. the chapel, now destroyed, in front of which he erected his two colossal statues (Memnon's Colossi); Ramses III. the migdol of Medinet-Habu. In the western valley and at Bab-el-Molouk the vaults were excavated where reposed the mummies of the kings from Amenophis III. to the last of the Ramses. The cities of the Delta were restored by Ramses II. and his successors; Abydos was adorned with two magnificent temples by Seti I. and Ramses II. It was Ramses II. again who cut in the solid rock most of the speos and hemi-speos of Nubia, the more perfect type of which is to be found at Ipsamboul. The kings of the twenty-first, twenty-second, twenty-third, twenty-fourth, and twenty-fifth dynasties had enough to do to carry out the work which had been prepared for them by the Ramessides. But a new era opens for Egypt with the twenty-sixth dynasty. Psamatik I. and his successors Apries, Amasis, Nectanebo showed themselves great restorers of old monuments and great builders of new ones. Even the invasion of the Persians and their short domination could not stop the renaissance of Egyptian sculpture and architecture; it reached its highest point under the Ptolemies, who rivaled in that respect the most celebrated native Pharaohs. The various temples of Thebes, which were little better than heaps of ruins, owing to the Assyrian and Ethiopian devastations, were renewed by them, and Karnak became a kind of sacred museum where foreign tourists came to admire the past splendors of Sesostris. The old temples at Edfu, Denderah, Philæ, Ombos, Esneh, which had been slowly decaying for centuries, were pulled down and replaced by more magnificent edifices. The Roman Cæsars continued the constructions, and the reigns of the Flavians and Antonines are recorded by as many monuments in Egypt as in the rest of the empire. The impulse slackened under the African house of Severus, and died out completely in the middle of the third century A. D.; Philippus is the last emperor whose name was engraved officially in the hieroglyphic character. Though cartouches are profusely inscribed everywhere on the public buildings and in the tombs, accompanied often with a mention of regnal years, yet since the Egyptians never knew what it was to use a fixed era by which to date current events, it would be nearly impossible for us to derive a chronology and history of Egypt from the inscriptions if we did not possess lists or tables in which the kings are entered, each in his proper place. Some of these lists have come down to us in the original, but the most important of them, a canon written in hieratic at about the time of Ramses II. and now preserved in the museum at Turin, is so sadly mutilated that a great part of it is lost forever, and the disposition of all the fragments is not certain as yet. It has been published by Lepsius (*Auswahl der wichtigsten Urkunden der ägyptischen Alterthums*, pl. iii.–vi.). and better by Wilkinson (*The Fragments of the Hieratic Papyrus at Turin*, London, 1851). It is supplemented by a few hieroglyphical documents: The two tables of Abydos (Lepsius, *Auswahl*, pl. ii.; Mariette, *Abydos*, i., pl. xliii.); the table of Saqqarah (Mariette, *Monuments divers*, pl. lviii.); the *Chambre des Ancêtres* of Karnak (Prisse d'Avennes, *Monuments*, pl. i.); the small altar at Marseilles (F. de Saulcy, *Étude sur la série des rois*, Metz, 1863). The complete catalogue of the kings and dynasties from Menes to the Macedonian conquest was given in the Greek work of Manetho, an extract of which has been preserved for us and forms the basis of the history of Egypt. Many editions of the fragments have been issued since Lepsius tried to harmonize them with the hieroglyphic texts in his *Königsbuch*, and some of the leading Egyptologists have tried to interpret or correct them, or to make out of them various systems of chronology. Lieblein, *Ägyptische Chronologie* (Christiania, 1863) and *Recherches sur la chronologie égyptienne* (Christiania, 1873); Lauth, *Manetho und der Turiner Königspapyrus* (Munich, 1865); *Ägyptische Chronologie* (Strassburg, 1877) and *Aus Ägyptens Vorzeit* (Berlin, 1881); Unger, *Chronologie des Manetho* (Berlin, 1867); Krall, *Die Composition und die Schicksale des Manethonischen Geschichtswerkes* (Vienna, 1879). The history of Egypt, so far as its reconstruction has been possible upon the basis of these rather contradictory elements, has been variously written. Maspero, *Histoire ancienne des peuples de l'Orient* (4th ed. Paris. 1884), and Édouard Meyer, *Geschichte des Alterthums*, i. (Stuttgart, 1884), have tried to give it its proper place in the general history of the Oriental world; most others have studied it in itself, without any reference to the other nations except in so far as these conquered the Pharaohs or were conquered by them: Brugsch, *Histoire d'Égypte* (Leipzig, 1859), *Geschichte Ägyptens* (Leipzig, 1877; English translation by Philip Smith, 2 vols., London, 1882; the same condensed and revised by Mary Brodrick, London and New York, 1891); Birch, *History of Egypt from the Earliest Time to B. C. 300* (London, 1879); Erasmus Wilson, *The Egypt of the Past* (2d ed. London, 1882); Wiedemann, *Ägyptische Geschichte* (Gotha, 1884); and J. Dümichen and Ed. Meyer, *Geschichte des alten Ägyptens* (Berlin, 1880–87). The several epochs or dynasties have been made the subject of more or less extensive monographs: thus we have for the Memphite times E. de Rougé's *Recherches sur les monuments qu'on peut attribuer aux six premières dynasties de Manethon* (Paris, 1867) and Maspero's *La carrière administrative de doux fonctionnaires Égyptiens* (*Études égyptiennes*, ii.); for the Middle Kingdom, Lepsius's *Ueber die XIIte Königsdynastie* (Berlin. 1852); for the Theban times, Wiedemann's *Geschichte der XVIIIten ägyptischen Dynastie bis zum Tode Tutmes III.* (*Zeitschr. d. D. Morgenl. Gesellsch.*, xxxi.-xxxii., 1878), and Maspero's *Les Momies royals de Deir el-Bahari* (Paris, 1889); for the Saite period, Wiedemann's *Geschichte Ägyptens vom Psametich I. bis auf Alexander den Grossen* (Leipzig, 1880), Mallet's *Les premiers établissements des Grecs en Égypte* (Paris, 1893). The religion and mythology have been studied from two widely different points of view. Many Egyptologists share the opinions expressed by E. de Rougé (*Explication d'une inscription égyptienne, prouvant que les anciens Égyptiens ont connu la génération du fils de Dieu*. Paris, 1851; *Études sur le Rituel Funéraire des anciens Égyptiens*, Paris, 1860; *Conférence sur la religion des anciens Égyptiens et sur le monothéisme primitifs*, Paris, 1869) on the monotheism of the Egyptians and the reduction of all their gods to one, and that a solar

deity: thus Pierret, *Essai sur la mythologie égyptienne* (Paris, 1879) and *Le panthéon égyptien* (Paris, 1880), and Brugsch, *Die Religion und Mythologie der alten Ägypter* (Leipzig, 1885–88). Le Page-Renouf (*Lectures on the Origin and Growth of Religion as Illustrated by the Religion of Ancient Egypt*, London, 1880) considers the Egyptian mythology as being a disease of the language, according to the principles of the Max Müller school, while Maspero (*Études de Mythologie et d'Archéologie Égyptiennes*, Paris, 1892–93) insists on the animistic and naturalistic character of the Egyptian myths, as does also Wiedemann (*Die Religion der alten Ägypter*, Münster, 1890). Detailed accounts of the common life have been drawn by Wilkinson (*Manners and Customs of the Ancient Egyptians*, edited by Samuel Birch, 3 vols., London, 1878); by A. Erman (*Ägypten und ägyptisches Leben im Alterthum*, 2 vols., Tübingen, 1889); and by Maspero (*Lectures historiques: Égypte et Assyrie*, Paris, 1890; *Life in Ancient Egypt and Assyria*, New York, 1892). The art and architecture of Egypt have been treated by Perrot and Chipiez in the first volume of their great *Histoire de l'art* (Paris, 1881; English translation, 2 vols., London, 1883), and more briefly by Maspero in *L'Archéologie Égyptienne* (Paris, 1887; English translation by Amelia B. Edwards, London and New York, 1887; German translation by Georg Steindorff, Berlin, 1889). Some very good reproductions of Egyptian statues are to be found in O. Rayet's *Monuments de l'art antique* (Paris, 1880–84). The materials for historical and artistic subjects has been collected in several great works, the first of which was the *Description de l'Egypt* (Paris, 1809–30; 2d ed. 1820–30, followed by Champollion's *Monuments de l'Égypte et de la Nubie* (Paris, 1835–79); Rosellini's *Monumenti d'Egitto e di Nubia* (Pisa, 1832–44); Lepsius's *Denkmäler aus Ägypten und Äthiopien* (Berlin, 1849–59); and the smaller collections of J. Dümichen, *Altägyptische Kalenderinschriften* (Leipzig, 1868); *Altägyptische Tempelinschriften* (Leipzig, 1867); *Die Flotte einer ägyptischen Königin* (Leipzig, 1868); *Historische Inschriften altägyptischer Denkmäler* (Leipzig, 1867–69); *Resultate der archaeologisch-photographischen Expedition* (Berlin, 1869–71); Brugsch and Dümichen, *Recueil de monuments Égyptiens* (1862–85); E. de Rougé, *Inscriptions recueillées en Égypte* (Paris, 1877–79); Mariette, *Monuments divers* (1871–90), and others. But the time is past for these unmethodical compilations of material, in which texts of all periods are mixed, some complete, some in a fragmentary state. The better custom of publishing monographs in which one temple or one class of monuments is described as completely as possible is illustrated by Mariette's *Denderah* (Paris–Cairo, 1869–80), *Abydos* (Paris, 1869–81), *Deir el-Baharî* (Leipzig, 1877), and *Karnak* (Leipzig, 1875); the *Notices of Theban Tombs*, published by the members of the French mission; by Roehemontiex's *Edfu* (Paris, 1892); Benedite's *Philæ* (Paris, 1893); Gayet's *Louxor* (Paris, 1893), which are yet in course of publication.

The bulk of Egyptian literature has been preserved in papyri, nearly all of which are scattered in the various museums of Europe. Nine papyri out of ten contain the religious books and rituals which were placed with the mummies in the coffins or in the sepulchral rooms. The most famous of them is the *Book of the Dead*, or *Rituel Funéraire*, a compilation of prayers and magical incantations intended to insure the security of the soul in the other world, and to serve it as a sort of password in the travels it was compelled to undertake before reaching the Hall of Judgment and the Elysian Fields. Several copies of this book have been reproduced in faesimile by Lepsius (*Das Todtenbuch der alten Ägypter*, Berlin, 1842) and by E. de Rougé (*Rituel Funéraire des anciens Égyptiens*, Paris, 1861–64), but the standard edition is that projected by the International Congress of Orientalists in London (1874) and executed in part by Naville in *Das thebanische Todtenbuch der xviii. bis xx. Dynastie* (Berlin, 1886). It gives, however, those chapters only which are to be found in the manuscripts of the Theban period; for those which belong to the twelfth dynasty one must resort to *Die älteste Texte des Todtenbuchs*, by Lepsius (Berlin, 1867), to Maspero's *Mémoires de la Mission française du Caire* (tom. i., fasc. 2), and to the *Ancient Texts from the Coffin of Amamu in the British Museum*, by Birch and Le Page-Renouf (London, 1887). Translations of the whole book exist in English, prepared by Birch (in Bunsen's *Egypt's Place in Universal History*, vol. v., 1866) and by Le Page-Renouf (in the *Proceedings of the Society of Biblical Archæology*, from vol. xiv.); in French, by Pierret (*Per-m-hru, le Livre des Morts*, Paris, 1882). Some of the principal chapters have been translated or edited by Pleyte (*Étude sur le Chapitre 125 du Rituel Funéraire*, in *Études Égyptologiques*, ii., Leyden, 1868–70, and *Chapitres supplémentaires du Livre des Morts 162–174*, Leyden, 1881–82); by Guieysse (*Rituel Funéraire Égyptien, Chapitre 64e*, Paris, 1876); by Goodwin (*On the 112th Chapter of the Ritual*, in the *Ägyptische Zeitschrift*, 1871); by Lefébure (*Traduction comparée des Hymnes au Soleil composant le 150e Chapitre du Rituel* (Paris, 1868), and by others. The most common books of this sort, next to the *Book of the Dead*, were, in Theban times, the *Book of Knowing what there is in the other World*, and, in the Saite period, the various *Books of Breathing Anew*. The former has been edited by Lanzone (*Le domicile des Esprits*, Paris, 1879), and by Lefébure, *Le Tombeau de Seti I.*, in *Mémoires de la Mission du Caire*, tom. ii.); and it has been translated by Maspero (*Études de Mythologie*, tom. ii.). The *Book of Breathing Anew* has been both edited and rendered into Latin by Brugsch (*Saï-n-Sinsin, sive liber metempsychosis veterum Ægyptiorum*, Berlin, 1851). Rituals proper—that is, collections of the ceremonies and prayers performed in the temples and tombs—are very numerous; such are the ritual for the cult of the Theban Amon (O. von Lemm, *Das Ritualbuch des Ammondienstes*, Leipzig, 1882), the ritual for the services celebrated in the seven chapels of the temple of Seti I. at Abydos (Mariette, *Abydos*, i.), the ritual used while preparing the mummies (Maspero, *Le Rituel de l'Embaumement*, in *Mémoires sur qqs. papyrus du Louvre*, Paris, 1879). The *Opening of the Mouth* and the other rites performed on the day of burial, whether inside or outside of the tomb, have been preserved to us in the pyramids of the fifth and sixth dynasties, Ounas, Teti, Pepi I. and II., Mihtimsasnf, and in the private and royal vaults of the Theban cemeteries. The texts in the pyramids have been collected and translated by Maspero (*Recueil de Travaux*, i. to xiv.), and those of the Theban hypogees by Schiaparelli (*Il libro dei Funerali degli Antichi Egiziani*, Rome, 1880–90) and by Dümichen (*Der Grabpalast des Patuamenemap in der thebanischen Nekropolis*, Leipzig, 1884–85). Books of magic abound, though they are not as numerous as the strictly religious or ritualistic works. Most of them are unpublished as yet, but the translations of Chabas (*Le papyrus magique Harris*, Châlons-sur-Saône, 1861), Pleyte (*Étude sur une rouleau magique de Musée de Leyde*, in *Études Égyptologiques*, i.), Golenischeff (*Die Metternich-Stele*, Leipzig, 1877), and Lefébure (*Un Chapitre de la Chronique Solaire*, in the *Ägyptische Zeitschrift*, 1883) give a sufficient idea of the ways in which Pharaoh's magicians were wont to conjure the demons. That they were sometimes prosecuted as adepts in the black art is proved by the proceedings in a trial for high treason at Thebes during the reign of Ramses III. (Devéria, *Le Papyrus judiciaire de Turin*, Paris, 1865–68). Magicians acted oftener as physicians or surgeons, and no remedy could be properly applied without their help. About twenty treatises on medicine are known to exist, of which only two have been published: the *Papyrus médicale de Berlin*, by Brugsch (*Recueil de monuments*, tom. ii.), and the *Papyrus Ebers*, by Ebers and Stern (*Papyrus Ebers: ein hieratisches Handbuch altägyptischer Arzneikunde*, Leipzig, 1875). Ebers studied and published comments upon the portions of his papyrus which relate to diseases of the eye (*Papyrus Ebers: die Maase und das Kapitel über die Augenkrankheiten*, Leipzig, 1892), and a German version of the whole has been published by Dr. H. Joachim (*Papyrus Ebers: das älteste Buch über Heilkunde*, Berlin, 1890). No papyrus treating of astronomy has yet been discovered, but the calendars, zodiacs, astronomical and astrological tables which abound on the walls of temples and tombs at Ombos, Esneh, Edfu, Denderah, the Ramesseum, the Memnonium of Abydos, the funerary rooms of Seti I. and the Ramessides of the twentieth dynasty furnish a large quantity of material. Very little remains of the papers of Biot, but the identification of Egyptian with modern stars and constellations by Brugsch (*Thesaurus Inscriptionum Ægyptiacarum*, i., *Astronomische Inschriften*, Leipzig, 1888) are, if not certain, at least very probable. Three mathematical papyri have been found, one at Tanis belonging to Roman times and one from the twelfth dynasty found in the Fayum by Petrie, the third at Thebes by Rhind. The last has been interpreted and annotated by A. Eisenlohr (*Ein mathematisches Handbuch der alten Ägyp-*

ter, Leipzig, 1877). The philosophy of the ancient Egyptians was not at all abstruse or theoretic. It confined itself to the rendition of moral precepts and aphorisms on the conduct of life. Some of these moral papyri are of very ancient date. The *Papyrus Prisse* in the Bibliothèque Nationale de Paris seems to have been written in the twelfth dynasty, and has been termed the "oldest book in the world." It was first analyzed by Chabas in the *Revue Archéologique* (ser. i., tom. xv., 1856), then translated into German by Lauth in the *Sitzungsberichte der Münchener Akademie der Wissenschaften* (1868–70), and into French by Virey (*Études sur le Papyrus Prisse*, Paris, 1887). A duplicate of the text, of a much later date, has been discovered in the British Museum by Griffith, but it still remains unpublished. The dialogue between Ani and Khonshotpou in the Museum of Gizeh, after being interpreted by E. de Rougé in *Les Maximes du Scribe Ani* (Paris, 1872), was edited again with annotations by Chabas (*L'Égyptologie*, tom. i., ii., Paris, 1876–78). Poems and songs are by no means rare in the manuscripts. The remains of two collections of love-songs have been studied by Maspero (*Études égyptiennes*, tom. i.), and the poem on the battle of Kadesh, in which Ramses II. is made to describe how he fought alone against the whole host of the Khitas (Hittites), is widely known outside the circle of professional Egyptologists. E. de Rougé gave it in several French translations, the last in the *Revue Égyptologique*. These versions have been rendered into nearly all the languages of Europe. There was a whole literature of stories akin to the tales of the *Arabian Nights Entertainments*. E. de Rougé discovered the first of them in 1852, and entitled it *A Tale of Two Brothers*; Brugsch in 1867 discovered the *Tale of Satni Khamois*, written in the demotic character, and since then the fragments of about twenty of these Egyptian novels have been published; the most curious among them are the *Tale of the Wrecked Mariner* (Golenischeff, *Sur un ancien conte Égyptien*, Leipzig, 1881) and the *Tale of Khoufoui and the Magicians* (Erman, *Der Papyrus Westcar*, Berlin, 1891). They have been collected by Maspero in his *Contes populaires de l'ancienne Égypte* (2d ed. Paris, 1890), where the analogies they present to similar stories in all parts of the world have been pointed out. Even fables were current in Egypt which the Greeks attributed to Æsop: the fable of *The Lion and the Mouse* (Lauth, *Thierfabel in Ägypten*, Munich, 1868) and *The Dispute of the Stomach and the Members* (Maspero, *Études Égyptiennes*, tom. i.). The demotic papyrus I., 384 of Leyden, contains, among other matters, a dialogue between a jackal, Koufi, and an Ethiopian cat, the general sense of which was indicated by Lauth. Révillout translated some of the most interesting passages into French (*Dialogue entre le petit chacal Koufi et une chatte éthiopienne*, in *Revue Égyptologique*). Private letters have come down, many of them sealed and unopened, others preserved in anthologies, where teachers of the nineteenth and twentieth dynasties had inserted specimens of descriptive and poetical epistles, official reports on administrative subjects, as models of elegant style for the young scribes, their pupils. Several of these collections were published by the trustees of the British Museum in the first volume of the *Select Papyri* (London, 1841–44; the *Papyrus Sallier I.*, the *Papyrus Anastasi II., III., IV., V.*), and others have been discovered in the Museum of Bologna (Lincke, *Correspondenzen aus der Zeit der Ramessiden*, Leipzig, 1878–79). They were analyzed for the first time by Goodwin (*Hieratic Papyri*, in the *Cambridge Essays*, 1856), and a selection of them was translated into French and annotated by Maspero (*Du genre épistolaire chez les Égyptiens*, Paris, 1872). The *Papyrus Anastasi I.*, which contains curious notices concerning the geography of Syria in the time of Ramses II., has been made the subject of a philological and historical work by Chabas, *Le Voyage d'un Égyptien* (Paris, 1866). The demotic manuscripts had been greatly neglected, and very few scholars had published papers on them (Brugsch, *Henry Rhind's zwei bilingue Papyri*, Leipzig, 1865; Pierret, *Préceptes de morale extraits d'un papyrus démotique du Musée du Louvre*, in the *Recueil de Travaux*, i., 1870; Maspero, *Études démotiques*, in the *Recueil*, i., 1870; *Une page du Roman de Satni transcrite en hiéroglyphes*, in the *Ägyptische Zeitschrift*, 1877–80) until E. Révillout made them accessible to the public, and showed the great interest that the private contracts possessed for students of Egyptian law and jurisprudence. (*Chrestomathie démotique*, Paris, 1876–80; *Nouvelle Chrestomathie démotique*, Paris, 1878; *Le procès d'Hermias*, Paris, 1884; *Corpus papyrorum Ægypti*, Paris, 1886–93.) The old Egyptian language has been made the subject of continued research from the days of Champollion's *Grammaire hiéroglyphique*, and all the Egyptologists of note have compiled complete grammars or prepared monographs on various grammatical points. Brugsch's *Grammaire hiéroglyphique* and *Grammaire démotique* and E. de Rougé's *Chrestomathie* have been already noticed, but Birch's *Egyptian Grammar* (in Bunsen's *Egypt's Place*, vol. v.) remains to be mentioned, as well as Le Page-Renouf's *Elementary Grammar of the Ancient Egyptians* (London, 1875); F. Rossi's *Grammatica Copto-Geroglifica* (Torino, 1878); V. Loret's *Manuel de la Langue Égyptienne* (Paris, 1889–93); and above all Erman's excellent treatise on the *Neuägyptische Grammatik* (Berlin, 1880) and on *Die Sprache des Papyrus Westcar* (Berlin, 1889). Lexicography is not so well advanced as the grammar. The *Dictionnaire Hiéroglyphique*, by Brugsch (Leipzig, 1867–82), is not a dictionary so much as an admirable collection of texts and materials for a dictionary. Pierret's *Vocabulaire Hiéroglyphique* (Paris, 1874–79) is but a reproduction on a smaller scale of Brugsch's great work, and S. Levi's *Vocabolario Geroglifico* (Torino, 1887–89) adds but little to our real knowledge of Egyptian words.

The foregoing are some of the necessary works which have been issued in the various branches of the science, but Egyptology owes its constant progress to the incessant publication of notes, papers, and small pamphlets which are inserted year after year in the journals and reviews of Europe, especially the *Transactions* and the *Proceedings of the Society of Biblical Archæology* and the *Memoirs of the Egypt Exploration Fund*, in England; the *Zeitschrift der Deutschen Morgenländischen Gesellschaft* and the *Zeitschrift für ägyptische Sprache und Alterthumskunde*, in Germany; and the *Journal Asiatique*, the *Revue de l'Histoire des Religions*, the *Revue Égyptologique*, the *Recueil de Travaux relatifs à la philologie et archéologie Égyptiennes et Assyriennes*, in France. A complete bibliography of the books relating to Egypt does not exist; the *Bibliotheca Ægyptiaca* of Jolowics (Leipzig, 1858–61) ceased in 1861, and *The Literature of Egypt and the Soudan*, by Prince Ibrahim Hilmy (London, 1886–87), brings the subject down to 1887. A list of the works which have appeared since that time is to be found in the Orientalische Bibliographie (Berlin), founded by A. Müller. G. Maspero.

Ehninger, John Whetton: See the Appendix.

Ehrenberg, ā'ren-bārch, Christian Gottfried, M. D.: naturalist and microscopist; b. at Delitzsch, in Prussian Saxony, Apr. 19, 1795; studied medicine at Leipzig; graduated in 1818; and spent about six years (1720–26) in the exploration of the natural history of Egypt, Arabia, and Syria. Having returned to Berlin, he obtained a chair of medicine in the university of that city. He published in 1828 *Scientific Travels through Northern Africa and Western Asia*, and *Physical Symbols of Birds, Insects, etc.* (in Latin). In 1829 Ehrenberg and Humboldt made an expedition to the Ural and Altai Mountains. Ehrenberg made interesting discoveries with the microscope, and published important works entitled *The Infusoria as Perfect Organisms* (1838) and *Mikro-Geologie* (1854–56). He discovered that cretaceous and other strata of great extent are composed of microscopic organisms. His reputation as an observer is justly great, while the conclusions he has drawn from his observations are frequently faulty. D. in Berlin, June 27, 1876. See the *Life* by Hanstein (Bonn, 1877).

Ehrenbreitstein, ā'ren-brīt'stīn (i. e. honor's broad stone): a fortified town of Rhenish Prussia; picturesquely situated on the east bank of the Rhine; opposite Coblentz, with which it is connected by a bridge of boats (see map of German Empire, ref. 5–C). It stands at the base of a rocky hill. On the summit of this hill stands the citadel of Ehrenbreitstein, situated on a rocky promontory which rises 400 feet above the water, inaccessible on three sides and defended on the N. and only attackable front by a double intrenchment. It contains casemates for the whole garrison, artillery, and stores, and forms the key of the whole fortified position of Coblentz. It has been a fortress from very early times, its origin dating from the time of Drusus, when the Romans erected various castles and strongholds on the Rhine, and a stone bridge over that river at Engers, between Coblentz and Neuwied, where Cæsar is also supposed to have constructed his first bridge. It was besieged without success in 1688 by the French, who took it after a long siege in 1799, and in

1801, after the peace of Lunéville, destroyed the works. The citadel was rebuilt in 1815 by the Prussian general Aster, the projector of all the works at Coblentz. Pop. (1890) 5,281.

Eibenstock, ī'ben-stok: town of Saxony; on railway, 16 miles S. S. E. of Zwickau (see map of German Empire, ref. 5–F). It has manufactures of muslin, lace, chemicals, and tinware. Pop. (1890) 7,166.

Eichberg, īch'bārch, JULIUS: composer and teacher; b. at Düsseldorf, Germany, June 13, 1824; received his first instruction from his father and afterward studied in the Brussels Conservatory. In 1857 he became a resident of New York, and in 1859 removed to Boston, where in 1867 he established the Boston Conservatory of Music. He composed much for the violin, on which he was an excellent performer, but is best known as the composer of the operas, *The Doctor of Alcantara* (Boston, Apr. 7, 1862); *The Rose of Tyrol*; *The Two Cadis*; and *A Night in Rome*. D. in Boston, Jan. 19, 1893. D. E. HERVEY.

Eichendorff, īch'en-dōrf, JOSEPH FREIHERR, von: lyric poet; b. near Ratibor, in Prussian Silesia, Mar. 10, 1788. He studied law at Halle, where he met Novalis, and at Heidelberg, where he became acquainted with the romanticists, Arnim, Brentano, and Görres. Eichendorff himself belongs to the later Romantic school, whose greatest representative he may be considered. His poems (1837) are of an unusual sweetness of melody, tenderness and depth of feeling, and elegance of form. He also wrote several dramas and a number of novels, of which *Aus dem Leben eines Tangenichts* is the best and most widely read. He was by faith a Roman Catholic, and from the standpoint of his faith wrote *Geschichte der poetischen Litteratur Deutschlands* (History of the Poetical Literature of Germany, 1857), which is an interesting and valuable work. See Richard Dietze, *Eichendorff's Ansicht über romantische Poesie* (Leipzig, 1883). D. at Neisse, Nov. 26, 1857. JULIUS GOEBEL.

Eichhoff, īch'hōf, FRIEDRICH GUSTAV: philologist; b. at Havre, France, Aug. 17, 1799; son of a merchant formerly of Hamburg. As a student in Paris he devoted himself particularly to Oriental languages; in 1830 became the king's librarian; in 1842 Professor of Foreign Languages at Lyons; in 1855 inspector-general of the University of Paris. Among his numerous works are *Parallèle des Langues de l'Europe et de l'Inde* (1836); *Études sur Ninive, Persépolis, et la mythologie de l'Edda* (1855); *Grammaire générale indo-européenne* (1867). He aided in compiling a *Dictionnaire étymologique des racines allemandes* (1840; new ed. 1855). D. in Paris, May 10, 1875.

Eichhorn, īch'hōrn, JOHANN GOTTFRIED: German scholar and biblical critic; b. at Dörenzimmern, Oct. 16, 1752; educated at Göttingen; became Professor of Oriental Languages at Jena in 1775. In 1788 he was called to the chair of Oriental and Biblical Literature at Göttingen, which he filled nearly thirty-eight years. He edited the *Allgemeine Bibliothek der biblischen Litteratur* (10 vols., 1787–1801), and wrote numerous works which display an eminent knowledge of Oriental and biblical antiquities. He is noted for having introduced to the German world the famous hypothesis of Astruc (if, indeed, he did not come upon the idea temporarily), and for having produced the first systematic introduction to the Old Testament, *Historisch-kritische Einleitung in das Alte Testament* (3 vols., 1783), which reached a fifth edition. Among his other works are *Einleitung in das Neue Testament* (3 vols., 1804–14); *Urgeschichte* (Primitive History, 2 vols., 1790–93); *Weltgeschichte* (Universal History, 5 vols., 1799–1814); and *Geschichte der Litteratur von ihrem Anfang bis auf die neuesten Zeiten* (6 vols., 1805–13). D. in Göttingen, June 25, 1827. Revised by C. H. TOY.

Eichhorn, KARL FRIEDRICH: jurist and historian; a son of Johann Gottfried Eichhorn; b. at Jena, Nov. 20, 1781; Professor of German Law at Göttingen from 1817 to 1828. He published, besides other works, *Deutsche Staats- und Rechtsgeschichte* (German Political and Legal History, 4 vols., 1808–23; 5th ed. 1843–45). D. in Cologne, July 4, 1854.

Eichler, īch'ler, AUGUST WILHELM: botanist; b. near Ziegenhain, Hessen, Apr. 22, 1839; educated in the University of Marburg; privat docent at Munich 1865–71; Professor of Botany at Gratz 1871–73; at Kiel 1873–78; and at Berlin 1878–87. His numerous published writings are mainly upon systematic botany and the structure of higher plants. For many years he was the editor of *Flora Brasiliensis*, to which he was a frequent contributor. His book on floral structure, *Blüthendiagramme* (1875–78), is a standard work. D. in Berlin, Mar. 2, 1887. CHARLES E. BESSEY.

Eichstädt, īch'stet (Lat. *Aurea'tum*, or *Dryop'olis*): town of Bavaria; on the river Altmühl; about 42 miles W. S. W. of Ratisbon (see map of German Empire, ref. 7–F). It has a Gothic cathedral founded in 1259, a ducal palace once belonging to Eugène de Beauharnais, a public library, a museum, and the castle of St. Wilibald, used as a barrack; also manufactures of hardware, cotton and woolen fabrics, stoneware, etc. The bishopric of Eichstädt was founded here about 745 A. D., and in 1802 became a principality, with the city of Eichstädt as capital. The principality was given to Prince Eugène de Beauharnais in 1817, and dissolved in 1855. Pop. of town (1890) 7,475.

Eichwald, EDWARD: See the Appendix.

Eider: a river of Germany. See the Appendix.

Eider Duck: any one of several species of sea-ducks, especially the European eider (*Somateria mollissima*), which furnishes the eider down of commerce. This duck also occurs in the northern parts of North America, but the common American eider is *Somateria dresseri*, while still another species (*S. v-nigrum*) is found on the Pacific coast. The eider duck is larger than the common duck, and the color of the plumage in the male varies with the changing

Eider ducks.

seasons. The female is of a light reddish-brown color, transversely marked with darker shades. The male displays in spring a very conspicuous pied plumage of sable beneath and creamy white above, with a patch of shining sea green on the head. But he does not acquire this plumage until his third year; before that time it resembles that of the female. The nest is constructed of fine mosses and seaweeds, and the eggs, from five to seven in number, are about 3 inches long and 2 broad, and of a light-green color. During incubation the female deposits in the nest the down which she plucks from her breast, and if this is removed by hunters she furnishes another supply. This down is an important article of commerce. The eggs also are highly prized as food. The northern range of the eider duck is not known. In Greenland, however, it has never been met with N. of the Danish settlements. The Farn islands, off the coast of Northumberland, approximately indicate its southern range. It generally has its haunts on low rocky islets near the coast. In Iceland and Norway it is carefully protected. A fine is inflicted for killing it in the breeding season, and even for firing a gun near its breeding-place. The king eider (*Somateria spectabilis*) is found in great numbers on the coasts of Alaska, Nova Zembla, Greenland, etc., but is rarely seen in Britain or the U. S. proper. Steller's eider and the spectacled eider are well-known species, the former found on the Arctic shores of Europe, Asia, and America, the latter inhabiting the northwest coast of North America. F. A. LUCAS.

APPENDIX.

Cochrane, Rev. WILLIAM, D. D.: b. in Paisley, Scotland, Feb. 9, 1831; educated at Glasgow University, Hanover College (Hanover, Ind.), and Princeton Theological Seminary; ordained in 1859; pastor of the Scotch church, Jersey City, 1859–62, since then of Zion Presbyterian church, Brantford, Ont. In 1874 he founded Brantford Ladies' College, of which he is a governor and lecturer in philosophy. He was moderator of the Presbyterian General Assembly of Canada in 1882, and was a delegate to the Pan-Presbyterian Alliances in Belfast, London, and Glasgow. He has written several religious works, including *The Heavenly Vision* (1873); *Christ and Christian Life* (1875); *The Church and the Commonwealth* (1887); *Memoirs and Remains of the Rev. Walter Inglis* (1887); *Future Punishment* (1888).

Cocos Island: a volcanic island, in the Pacific Ocean, S. W. of Costa Rica, lat. 5° 30′ N., lon. 87° W., with steep rugged coasts and quite level interior. It comprises about 9 square miles, is uninhabited, and is reputed to have been the place of concealment of a large amount of treasure, jewelry, and plate sent there by wealthy inhabitants of the Spanish colonies on the neighboring mainland early in the nineteenth century, during the wars in which they achieved their independence from Spain. The belief that many of these valuables were never recovered led to a number of unsuccessful search expeditions. C. C. ADAMS.

Comba, EMILIO, D. D.: Italian Protestant; b. in San Germano, Waldensian Valleys, Province of Turin, Italy, Aug. 31, 1839; studied at Torre-Pellice and Geneva (under Merle d'Aubigné). He was ordained as an evangelist in 1863, and in 1872 became Professor of Homiletics and of Historical Theology in the Waldensian College, Florence. Besides other scholarly works, he has produced a history of the Waldenses based upon independent research, which combats the favorite theory of his co-religionists that their belief antedates their historic founder, Peter Waldo, of Lyons, in the twelfth century (in French, *Histoire des Vaudois*, Paris and Florence, 1898 *sqq.*). This work supersedes his earlier ones on the same topic. S. M. J.

Commission Agent: in law, generally, any agent acting under a commission, or express order, or authority to do some act for the principal, especially one by which the principal is bound to a contract. Such a commission usually provides what remuneration or pay shall be received by the agent on the performance of his duties as agent, and the term commission is hence also commonly applied to such remuneration, and by a commission agent is usually meant an agent authorized to buy or sell on a commission or reward regulated by a percentage on the sums paid out or received, either by express agreement or by statute. Where there is a usage of trade in the particular business for which the agent is employed, or in the particular place in which the agent is engaged, the amount of the commission allowed to the agent, as to an auctioneer, broker, factor, or the like, is regulated by such usage, in the absence of a special agreement or of a statute regulating the matter. Where there is no such usage, agreement, or statute, the commission, if disputed, must be fixed by the jury or court, as the case may be, at what would be a reasonable reward for the services performed. Executors, trustees, etc., are often allowed commissions by special provisions of statutes, but they are not ordinarily called commission agents. F. S. A.

Commissioner of Assize: in the law of Great Britain, a judge of the High Court or Court of Appeal, or a sergeant-at-law, or queen's counsel holding a commission (called commission of assize) authorizing him to sit at the assizes for the trial of civil actions in each county. The courts held by these commissioners are distinct from the criminal assize courts which are held under commissions of oyer and terminer and commissions of jail delivery. The jurisdiction of the courts created by the commissions of assize is vested in the High Court of Justice by virtue of the Judicature Act of 1873 and the acts amendatory thereof. F. S. A.

Compayré, kom′pā′rā′, JULES GABRIEL: public man, philosopher, and educator; b. in Albi, France, Jan. 2, 1843; studied at the Collège de Castres, the Lycée Louis-le-Grand, and l'École Normale Supérieure; gained the degree of docteur ès lettres at the Sorbonne 1872. In 1865 he was nominated to the professorship of philosophy in the lycée at Pau; he accepted calls successively to the lycée at Poitiers 1868, the lycée of Toulouse 1871, the faculty of letters at Toulouse 1874. He chose as his special field of instruction the philosophy of education, and it is by his work in this field rather than as a philosopher that he is best known in the U. S. In 1880 he took charge of a course in pedagogy in l'École Normale Supérieure d'Institutrices at Fontenay-anx-Roses. He was elected deputy for the arrondissement of Lavaur in 1881, and again in 1885. In the Chamber he took an important part in the discussion of educational questions, especially favoring the measures for compulsory primary education (1882), and for the laicizing of the teaching force (1886). In 1887 he was elected a member of the Conseil Supérieur de l'Instruction Publique, to which he was afterward re-elected. He has published several important works on education: *Histoire critique des doctrines de l'éducation en France depuis le XVI^e^ siècle* (1879, 2 vols.): *Eléments d'éducation civique et morale* (1880); *Histoire de la pédagogie* (1884); *Cours de pédagogie théorique et pratique* (1887); *Abélard and the Origin and Early History of Universities* (first published in English in the Great Educators Series, New York). His *Histoire de la pédagogie*, translated by W. H. Payne, has been widely used in the U. S. as a manual of the history of education. M. Compayré visited the U. S. in 1893. He is the best known in the U. S. of all French educators. At present (1899) he is rector of the University of Lyons, where he takes a leading part in the movement now in progress for decentralizing French education. C. H. THURBER.

Comstock, GEORGE CARY, Ph. B., LL. B.: astronomer; b. in Madison, Wis., Feb. 12, 1855; Ph. B., University of Michigan, 1877; LL. B., University of Wisconsin, 1883; assistant engineer with Corps of Engineers, U. S. A., 1879–80; assistant astronomer, Washburn Observatory, University of Wisconsin, 1881–85; Professor of Mathematics, Ohio State University, 1885–87; associate director and director, Washburn Observatory, since 1887; author of *Method of Least Squares*, and five volumes of *Publications of the Washburn Observatory*.

Congress of Mothers, National: an organization effected in 1897, in Washington, D. C., where it holds annual conventions. Its objects are, in the words of its constitution, "to promote conference among parents upon questions most vital to the welfare of their children; to further develop the manifold interests of the home; to co-operate with educators and legislators to secure the best methods of physical, mental, and moral training of the young; to enlighten motherhood upon all the problems of race development; to uplift and improve the condition of mothers in all walks of life; and to these ends to promote the formation of mothers' and home-makers' clubs in all States and Territories of the U. S." Each mothers' and home-makers' club is entitled to send to the annual convention of this Congress its president or representative and one delegate, and one additional delegate for each twenty-five members after the first twenty-five. Any club or department of another organization pursuing lines of work germane to the objects of the National Congress of Mothers, and which has been approved by the executive committee, is entitled to send one delegate to the annual convention of the Congress.

Consciousness: the fundamental awareness which we have as beings having minds. The mere fact of awareness must be carefully distinguished from all the special functions and activities which go on *in* consciousness. Consciousness is the theater, the common background, the *Schauplatz* of mental events of whatever kind. This is in direct antagonism to the older doctrines of consciousness—an opposition of which modern psychology is fully aware, and upon which it insists. There are certain views long influential in philosophy to which this definition is directly opposed. First, consciousness has been considered a power or activity of the mind. This makes it possible for the mind to put forth more or less consciousness, to use consciousness while the real mind lies in some mysterious way back of its consciousness. This is quite untrue. Consciousness, instead of being a special power or activity, is the common character of all the powers; it is present alike with them all, and is necessary to them. We are equally conscious when we know, when we act, and when we feel. All these take place in consciousness. Second, another older theory makes consciousness an instrument of the mind, a sort of inner eye or glass through which the subject looks in upon mental events, just as it uses the senses to look out upon the world. This too is an error. Instead of perceiving mental events by consciousness, we are directly conscious of them as mental events; the consciousness is the aspect of the events which makes them mental; it underlies and so constitutes the very fact of mentality—this fact of being conscious. Third, yet another theory confuses consciousness with self-consciousness. This too is wrong. Self-consciousness is a higher and more complex thing than consciousness. Children are conscious of their sensations, emotions, etc., long before they become conscious of self. So low animals undoubtedly have consciousness—the simple awareness that changes take place within their minds—without consciousness of a personal self.

Besides all these there is a still more fundamental confusion regarding consciousness which the definition given above aims to meet—a confusion kept alive by writers claiming authority (see Fleming's *Vocabulary of Philosophy*, edited by Calderwood): consciousness is identified with knowledge. Whatever we are conscious of we are said to have knowledge of, and knowledge of greater certainty and value than other sorts of knowledge. This is a confusion of terms. Knowledge is an act of cognition, and involves some mental construction of relations and meanings. Consciousness accompanies knowledge, of course, as it does all the mental functions—indeed, consciousness is the theater in which all acts of knowledge take place; but consciousness is there just the same whether we are performing acts of knowledge, or those of any other function, as feeling and will. To be conscious is simply to have something taking place in the mind. In this sense consciousness is synonymous with a certain usage of the term FEELING (*q. v.*).

Consciousness and the Nervous System (following Baldwin, *Handbook of Psychology: Feeling and Will*):

General Nervous Conditions of Consciousness.—There are two great theories of the physical basis of consciousness: the first (represented by Lewes, Bain, Wundt) holds that the nerve-process, considered in its most general form as irritability, is everywhere conscious. On this view, consciousness is distinguished in a twofold way from the individual circumscribed area of personal experience. In the first place, it is distinguished from *self*-consciousness (see above); and, in the second place, from the vague early consciousness of the child, which exists only in connection with the brain. Each nervous center, each so-called arc, has its own consciousness, and the ordinary consciousness of the individual is only the highest of many that we all possess. The brain-consciousness is the only one we are conscious of, so to speak; but there is consciousness in the spinal cord and in ganglia wherever we find them. The other theory, or class of theories, holds (Maudsley, Schneider, James, Ferrier, and many physiologists) that a given degree of development is necessary before consciousness is found at all. In the development of the system, therefore, consciousness appears only at a certain stage of integration or "upward growth." In the nature of the case, however, it is impossible to disprove consciousness in lower centers.

It also seems true that consciousness represents a condition of slow, difficult, and impeded—consequently of highly developed and well-balanced—integration. The smoothest reflexes are least conscious; the hard-fought decisions are most conscious. It seems likely, therefore, that some degree of inhibition is necessary in the nervous basis—at any rate, for vivid consciousness.

On the other hand, there are considerations which are giving more prominence to the view of Mr. Lewes at present. They tend to show that our distinctions are arbitrary, and open the door at least for presumptive evidence that consciousness is coextensive with nervous reactions. Among these considerations are recent experimental proofs of multiple personalities which may be induced in the same nervous organism in the hypnotic state (Pierre Janet, *Automatisme Psychologique*; see PERSONALITY). The explanation is at least a tempting one, that, the higher centers being inhibited, their conscious content is wanting, and the lower centers supply experience which was before outside the conscious area. Biologists and psychologists alike are recognizing the need of finding consciousness wherever there is life (so Lloyd Morgan, Paulsen, Cope, Minot, etc.). The fact of a possible substitution of function between the brain and spinal ganglia would indicate a possible common element of consciousness. Again, in the scale of animal organisms it is difficult to draw a line denoting the point of nervous complexity below which there is no consciousness.

Particular Conditions.—A further question arises as to the immediate conditions of consciousness in the nervous centers. Given a nervous organism capable of consciousness, on what particular state or aspect of it does the continuous presence of consciousness depend? Here, again, recent views are little more than guesses. The view supported by Herzen (*La Condizione fisica della Coscienza*, reprint from the Proceedings of the Academy of Florence, 1879), seems to have most evidence, i. e., that consciousness arises from the breaking down or expenditure of the cellular structure in the highest centers. In unicellular organisms the analogous process takes place in the nucleus (Verworn). This is concluded from the fact that the attention, a state of concentration and expenditure, is the state of most vivid consciousness; that consciousness is most vague and indistinct when no brain-work is being done, as in cases of *dolce far niente* or diffused attention; that unconsciousness is most nearly reached in sleep and analogous states when all brain-processes have subsided from the lack of sensory stimuli or motor impulse. The chemical results of active thought, increased heat, and organic-waste deposits in the brain, would indicate chemical work and disintegration. Such a theory, however, to be consistent, would have its application only after the organism had attained the requisite development in general structure for the presence of consciousness—if we hold the current theory that consciousness is not co-ordinate with nerve-centers. Perhaps the possibility of applying the present hypothesis of Herzen to nerve-tissue generally may be an additional point of proof of a co-ordination of consciousness and nervous function throughout. It is also true that consciousness depends upon the normal condition of the mechanism as a whole. Any failure in the blood-supply (anæmia) leads to faintness and fainting, and the same result often follows from congestion of blood in the brain (hyperæmia). In general we may say that the healthful activity of the brain, in its normal physiological relations, underlies clear consciousness. It should be borne in mind, also, that all hypotheses as to the conditions in which it arises shed no light on what consciousness is.

Kinds of Consciousness as Dependent on Nervous Complexity. 1. *Passive Consciousness.*—The state of simple passive sensibility. In most cases passive consciousness is, by its very nature, undetected, and it exists as a normal state apart from active consciousness only in lower forms of organic life or in very young children. In adult life we catch it most nearly when just beginning to recover from a swoon; the sounds around us are heard, but have no meaning, relation, or escort. Of this state abstracted from the condition of our usual self-consciousness, we may make the following remarks: 1. It is a state of pure sensibility or simple awareness. 2. It carries no reference to an external object or to the body—that is, no such reference inside consciousness itself. That the nervous process has a direct reference to a particular local stimulus is seen in the particular character of the reaction which follows in each case. 3. It has no reference to self as an object of inner apprehension, no voluntary effort known as "my effort." 4. It has no relational or apperceptive quality. It is not knowledge, but pure feeling. It is the hypothetical affective state in all its purity.

2. *Reactive Consciousness.*—By reactive consciousness is meant the state usually called *involuntary attention*. In

passive consciousness only the reception of stimuli is a matter of sensibility: here consciousness seems to attach to both members of the nervous arc. There is as truly a reaction in consciousness as there is in the nervous system. We may accordingly analyze this form of consciousness for purposes of treatment into three elements, corresponding to the three elements of the nervous arc: first, the receiving consciousness, the stimulus—say a loud unexpected sound; second, the attention involuntarily drawn; and third, the muscular reaction following upon the sound—say flight from fancied danger. The analogy between the typical brain-process and the typical mental process finds here its most general force.

3. *Voluntary Consciousness.*—Voluntary consciousness may be characterized by several new characteristics. It exhibits, first, *deliberation.* By this is meant, in general, a doubleness of sensibility, a consciousness of being drawn apart, or of inward conflict—to limit the case to the feeling aspect, apart from the play of ideas involved. This feeling of deliberation leads on to another element of sensibility, namely, the feeling of decision or *consent*, in which the doubleness spoken of is resolved in a pleasant unity of consciousness again. And further, we find another possible element, apparently distinct from the preceding, the feeling of *effort.* In this sensation there is an active identification of ourselves with the reaction decided upon, a conscious putting forth of ourselves to re-enforce our decision. See WILL.

The results of the exposition may be set forth in a table showing the various aspects of consciousness, with the corresponding functions of the nervous system.

Consciousness	Passive		Automatic	Nervous Function
	Reactive	Apperceptive	Reflex	
		Motor		
	Voluntary		Voluntary	

Properties of Consciousness.—Even in its simplest forms consciousness shows those properties which characterize the developed mind. We find (1) that elementary creatures exercise—that is, they appear to do so—the property of *discrimination*, the ability in some degree to have consciousness of differences in circumstances. This is held by many psychologists to be the germ of the intellectual function in the higher forms. With it appears (2) to go the further property of SENSIBILITY or FEELING (*qq. v.*). The creatures show signs of variations of comfort and discomfort with commotions analogous to what in higher forms is called emotional excitement. Then (3) we find that they act differently, and with great appropriateness and adaptability, upon changes in the environment—the property of so-called *selection.* This in turn is considered the germ of will. With all of these, however, goes (4) that most peculiar of all the properties of consciousness, whatever its degree of development and complexity, its *unity.* Consciousness always has its own way of setting its own boundary, an awareness of the whole-of-itself-at-once, which we call the "unity of consciousness." It is seen in our human experience in the reference to all our experience to a center, the self which experiences; and whether or not we hold with the evolutionists that the higher forms of consciousness arise from the lower, at any rate we may say that without this property of being a unit, as found in the simplest consciousness, the richer sense of self-conscious unity would not be possible.

LITERATURE.—See the general treatises given under PSYCHOLOGY; also Carpenter, *Mental Physiology*; the older authorities given in *Fleming's Vocabulary of Philosophy*; Bastian, *Brain as the Organ of Mind*; Lewes, *Problems of Life and Mind*, 3d Series, 1, 11; Romanes, *Mental Evolution in Animals*, chaps. i.–vii.; Baldwin, *Mental Development in the Child and the Race*, chaps. vii., ix.; and *Dictionary of Philosophy and Psychology*, arts. *Consciousness* and *Feeling.* J. MARK BALDWIN.

Converse, CHARLES CROZAT: b. in Warren, Mass., Oct. 7, 1832, and studied music in Boston; went to Europe in 1855 and studied in Leipzig; in 1857 settled in Erie, Pa., where he has since remained, practicing law, but still following a musical career. His compositions are largely in manuscript. They include two symphonies, several overtures, string quartets and quintets, and much vocal music, both secular and sacred. His *Fest Overture* was performed by the Brooklyn Philharmonic Society in 1870. He published some compositions under the pseudonym of *Karl Reden.* D. E. H.

Cook, FRANCIS AUGUSTUS: naval officer; b. in Massachusetts, May 10, 1843; entered the Naval Academy in 1860, was promoted ensign Oct. 1, 1863, and was attached to the Seminole of the Western Gulf blockading squadron for two years. He was assigned to the Vanderbilt of the North Pacific squadron in 1865, and was commissioned master May 10, 1866. The next year he was assigned to the North Atlantic squadron. He was commissioned lieutenant Feb. 21, 1867, and lieutenant-commander Mar. 12, 1868. In 1869 he was assigned to duty at the Naval Academy, was on the Saranac of the Pacific fleet the following year, and on the receiving ship Independence in 1872. For the next two years he served on the Richmond, flagship of the South Pacific station, then on the receiving ship Sabine, and on the Plymouth of the North Atlantic station 1876–78. In 1880 he was stationed at the Naval Academy for three years, being promoted commander Oct. 12, 1881. He was lighthouse inspector 1883–86, and commanded the Ranger 1886–89. He was inspector of ordnance at the Boston Navy-yard 1890–93, and then for three years in the Bureau of Navigation. He was promoted captain Feb. 28, 1896, and was put in command of the Brooklyn Dec. 1 of the same year. In the war with Spain in 1898 he took part in the blockade of the Cuban ports, and was engaged in the battle of July 3, off Santiago. In 1899 he became a member of the examining and retiring board.

Copinger, WALTER ARTHUR, LL. D., F. S. A., F. R. S. A.: English jurist; b. in 1847; was called to the bar at the Middle Temple; has held many honorary positions, including that of president of the Biographical Society and of the Manchester Law Library Society, and is now (1899) Professor of Law in the Owens College and Victoria University. Has published *Index to Precedents* (1872); *Title Deeds* (1875); *An Essay on the Abolition of Capital Punishment* (1876); *The Law of Rents* (1886); *The Law of Copyright* (3d ed. 1891); supplement to Hain's *Repertorium Bibliographicum*; and other minor books, including *A History of the Copingers or Coppingers*; a *Treatise on Predestination, Election, and Grace*, etc. F. S. A.

Coppermine River: a river of Canada; runs through the western part of the Barren Grounds. Crossing the Arctic circle at about lon. 114° W., half of its course is within the polar zone. It empties into the Arctic Ocean, S. of Wallaston Land. It is about 360 miles long, and its valley is the northern continuation of that of Yellow Knife, affluent of Great Slave Lake. It derives its name from the native copper collected along its banks. Dr. G. M. Dawson, of the Geological Survey of Canada, said in 1888 that there was every reason to believe that rocks similar to those containing copper at Lake Superior occur along the river. On account of stories told by Indians and trappers as to its mineral wealth, the Hudson Bay Company in 1770 sent Samuel Hearne to the river to learn where the copper was procured; but though he reported finding copper, his book and map were unscientific and unreliable. Dr. Richardson in 1826 found the lower 40 miles full of rapids, and the river impracticable for boats drawing more than a few inches. The region has not yet been well explored. C. C. ADAMS.

Coppinger, JOHN J.: soldier; b. in Ireland in 1835; served in the Papal Guards in Rome. He came to the U. S. at the beginning of the civil war and obtained a captain's commission in the U. S. army in 1861. He was wounded in the battle of Bull Run, and in the course of the war he fought in twenty battles. He was made colonel of the Fifteenth Cavalry in 1865, was soon afterward honorably mustered out, and immediately transferred to the Twenty-third Infantry. He became major in 1879, and lieutenant-colonel of the Eighteenth Infantry in 1883. He was breveted for gallantry during the civil war and for bravery in fighting the Indians. He was commissioned brigadier-general in 1887. In the war with Spain he was sent to Puerto Rico in command of the Fourth U. S. Army Corps. On Oct. 11, 1898, he was retired as brigadier-general of the regular army on account of age.

Corbett, JULIAN STAFFORD, LL. D.: lawyer and author; b. in Surrey, England, Nov. 12, 1854; received his education first at Marlborough and later at Trinity College, Cambridge; was called to the bar in the Middle Temple in 1877, and practiced as a barrister until 1882, when he devoted his attention chiefly to literary pursuits, writing for the standard periodicals: was special correspondent for the *Pall Mall Gazette* for the Dongola expedition 1896. His writings include romances entitled *The Fall of Asgard, For God and Gold, Kophetua XIII., A Business in Great Waters*, etc., and sketches of the lives and doings of Monk and Drake in the work entitled *English Men of Action*, and a short story of *Drake and the Tudor Navy.* F. STURGES ALLEN.

Cormorant: A large, flightless cormorant, which has been named *Phalacrocorax harrisi*, was discovered on Narborough island of the Galapagos group in 1898. It exceeds in size any known recent species, and is extremely rare, but nine individuals having been seen. The specimens obtained were secured with great difficulty, as the birds frequent places where there is much surf. It is quite probable that the species will soon be exterminated. F. A. Lucas.

Coro'nium: a chemical element. During 1898 Prof. Nasini, of Padua, Italy, while investigating chemically the gases emanating from the earth in various parts of Italy with the object of detecting the presence of argon and helium, and possibly of other elements that they might contain, found in the spectrum of gases from the Solfatara di Pozzuoli a sufficiently bright line with the wave-length 531·5, corresponding to that of corona 1474 K, attributed to coronium, an element not previously discovered, and which should be lighter than hydrogen. This line had never before been discovered in earthly products, and had only been observed in the solar corona. Coronium would seem to be a substance with a vapor density far smaller than that of hydrogen, which is the lightest body with which we are familiar. This discovery, confirming the results of spectroscopic examination of the sun, is another proof of the identity of materials in the sun and the earth. M. B.

Corporal Punishment: punishment inflicted on the body. In the U. S., as a general rule, corporal punishment in schools is going out of vogue. In many places it is not allowed at all; where still tolerated the practice is greatly restricted by rule. In European countries the feeling against corporal punishment is not so strong as in the U. S. As a rule, the better the schools the milder the punishment. Horace Mann justified corporal punishment as a necessity on account of the heterogeneous character of the attendance and the lack of training on the part of the teachers. The question of school punishment is confessedly one of the most difficult with which teachers have to cope. Those who believe in and practice corporal punishment have a single, simple, and effective prescription to cure all ills. So far as mere police duty is concerned, corporal punishment meets all requirements, but from the point of view of moral training it is most inadequate. When administered all care must be taken not to injure the victim permanently. Careless blows on the head are always dangerous. Pulling the hair, ears, etc., are cruel amusements, not educative punishments. There is only one safe manner in which to apply corporal punishment. See Herbert Spencer's *Education* for his theory of natural punishments; Horace Mann's lecture on *School Punishments* for a defense of corporal punishment; and for discussions of school punishments in general, Rein, *Outlines of Pedagogics*; Thring, *Education and School* and *Theory and Practice of Teaching*; Tompkins, *Philosophy of Teaching*; Page, *Theory and Practice of Teaching*; White, *School Management*. C. H. Thurber.

Coudert, koo'dãr', Frederick René, LL. D., J. U. D.: b. in New York, Mar. 1, 1832; received his early education at his father's school in New York city; graduated at Columbia College 1850, and was admitted to the bar in New York city in 1852; one of the persistent opposers of the Civil Code of the State of New York; president for a term of the Association of the Bar of New York city. He has written largely for leading periodicals, and is a prominent and eloquent public speaker; is an active Reform Democrat, and was one of the committee appointed to go to New Orleans to secure a fair count of the vote of Louisiana during the Tilden-and-Hayes campaign; was one of the most prominent members of the so-called anti-snap organization, which was chiefly instrumental in causing the nomination of Grover Cleveland for President in 1892; was of counsel for the U. S. in the Bering Sea controversy before the board of arbitration in Paris; was for ten years president of the Benevolent Society of New York, the first president of the U. S. Catholic Historical Society, and has held many other positions of responsibility; is a Knight of the Legion of Honor of France, an officer of the Crown of Italy, and an officer of the Order of Bolivar of Venezuela. F. Sturges Allen.

Coville, Frederick Vernon: botanist; b. in Preston, N. Y., Mar. 23, 1867; educated at Oxford Academy, graduated at Cornell University in 1887, and held the appointment of instructor in botany there in 1887–88. During the summer of 1887 he was assistant in botany on the Geological Survey of Arkansas, a year later became assistant botanist in the U. S. Department of Agriculture in Washington, and was advanced in 1893 to the head of the department, which place he still holds. Mr. Coville has made extensive botanical explorations and investigations in the western part of the U. S., and served in 1890–91 as botanist of the Death Valley expedition. He is a member of various scientific societies, and was chosen secretary of the section of botany of the American Association for the Advancement of Science in 1893, and in 1899 was elected president of the Biological Society of Washington. His published papers have been for the most part contributed to official reports, and include the following: *Catalogue of the Plants of Arkansas* (Little Rock, 1891); *Botany of the Death Valley Expedition* (Washington, 1893); *Our Public Grazing Lands* (1897); and *Forest Growth and Sheep Grazing in the Cascade Mountains of Oregon* (1898). Marcus Benjamin.

Cox, Palmer: author and artist; b. in Granby, Quebec, Canada, Apr. 28, 1840; educated at Granby Academy, and after graduation resided in Springfield, Mass., and Lucknow, Ontario, until 1863, when he went to California. From 1863 to 1875 he wrote stories and drew cartoons for San Francisco periodicals, and in 1875 settled in New York and devoted his whole time to literary and artistic work, the latter chiefly in illustrating his own writings. Among his works are *Squibs of California* (1874); *Hans von Pelter's Trip to Gotham* (1878); *How Columbus Found America* (1878); *That Stanley* (1878); *Comic Yarns* (1888); *Queer People* (1888); and the "Brownie Stories," *The Brownies, their Book*, *Another Brownie Book*, *The Brownies at Home*, *The Brownies Around the World*, *The Brownies Through the Union*.

Cox, William Van Zandt: administrator; b. near Zanesville, Ohio, June 12, 1852; son of Col. Thomas J. Cox, who had charge of the Quartermaster's Department for the Armies of the Cumberland and Tennessee in Nashville during the civil war, and a nephew of S. S. Cox, who for many years was a member of Congress. As a boy he was with his father in Nashville, under whom he served as an orderly, and later graduated at the Ohio Wesleyan University in 1874. He studied law in Zanesville and was admitted to the bar in 1877, but relinquished his practice in 1878 to accept an office in the Ohio Senate. In 1879 he went to Washington and entered the service of the U. S. National Museum, of which in 1886 he became chief clerk and executive officer, an office that he has since held. In addition to his regular duties he has been prominent in connection with various expositions, serving in 1883 as secretary and disbursing officer to the International Fisheries Exposition in London. He represented the Smithsonian Institution at the Minneapolis Exposition in 1887, and also at the celebration held in Marietta in 1888 in honor of the centennial anniversary of the inauguration of General St. Clair as Governor of the Northwest Territory. He was the financial officer of the Smithsonian Institution and U. S. National Museum at the World's Fair held in Chicago in 1893, and served in a similar capacity to the Cotton States Exposition, held in Atlanta, Ga., in 1896. Later he was chosen to be the secretary and executive officer of the Government board of management at the Tennessee Centennial Exposition, held in Nashville in 1897, and also filled a similar office in connection with the Trans-Mississippi Exposition, held in Omaha in 1898. Mr. Cox has been vice-president of the Sons of the Revolution and also of the Sons of the American Revolution in the District of Columbia, and to their publications has contributed historical papers. Besides his various official reports he is the author, with H. M. Northrup, of the *Life of Samuel S. Cox* (Syracuse, 1899). Marcus Benjamin.

Crafts, James Mason, LL. D.: chemist; b. in Boston, Mar. 8, 1839; graduated at the Lawrence Scientific School of Harvard in 1858; spent a year in post-graduate study there and went in 1859 to Freiberg, Saxony, where he studied mineralogy and mining engineering, and thence passed to Heidelberg, where he came under the influence of Bunsen, whose assistant he became. From 1861–64 he was a student in Paris under Wurtz. He returned to the U. S. in 1865, and for a year devoted himself to the study of mines in Mexico and California. In 1867 he was called to Cornell University, and as dean of the chemical faculty organized the chemical department, and planned and equipped the laboratory in Ithaca. He was called to the chair of chemistry in the Massachusetts Institute of Technology in 1870, and held that place until 1874, when failing health compelled him to go abroad. His name, however, was retained

among the faculty as non-resident professor until 1880. During the years 1874 to 1891 he devoted himself to chemical and physical researches at the École des Mines in Paris, where in collaboration with Friedel he investigated the ethers of silicon and the compounds of that element with other organic radicals, the reactions of aluminium chloride with a large number of substances, and the density of halogens at high temperatures. It was at this time that he became the inventor of a special form of hydrogen thermometer, and, in recognition of the merit of his method of reducing the inaccuracies of mercurial thermometers by preventing the slow displacement of their fixed points, he was awarded the Jecker prize of 2,000 francs by the French Academy of Sciences, and made a Chevalier of the Legion of Honor by the French Government. In 1891 he returned to the Massachusetts Institute of Technology and continued his chemical and physical investigations, becoming later the head of the department of chemistry in that institution. He was chosen chairman of the faculty in January, 1898, and in the autumn of that year president of the institute. The degree of LL. D. was conferred upon him by Harvard in 1898, and since 1872 he has been a member of the National Academy of Sciences. He is a corresponding member of the British Association for the Advancement of Science, and a fellow of the American Association for the Advancement of Science. Besides publishing the results of his investigations and researches in the *Proceedings* of various societies of which he is a member, he is the author of a text-book on *Qualitative Analysis* (New York, 1869), of which six editions have been published. M. B.

Craig, Oscar John, Ph. D.: educator; b. in Madison, Ind., Apr. 18, 1846; A. B., De Pauw University, 1881, and A. M. 1883; Ph. D., Wooster University, 1887; superintendent of schools, Sullivan, Ind., 1881–84; principal of preparatory department of Purdue University 1884–87; Professor of History and Political Economy, Purdue University, 1887–95; president of the University of Montana since 1895. He is author of *Omatonon, a Study in Early Indiana History*, *The Bible in the Nineteenth Century*, and various magazine and review articles.

Craik, Robert, M. D., LL. D.: b. in Montreal, Canada, Apr. 22, 1829; graduated at McGill University in 1854, and became house surgeon of the Montreal General Hospital. In 1856 he was made demonstrator of anatomy in McGill University, in 1859 curator of the museum, in 1860 Professor of Clinical Surgery, and in 1867–69 was Professor of Chemistry. He became known as a successful ovariotomist when such operations seldom succeeded. He is said to be the first writer to assert, in the *Montreal Medical Chronicle* for Sept., 1854, an origin in specific cells or germs for infectious diseases.

Crane, Stephen: novelist; b. in Newark, N. J., Nov. 1, 1871. He received education in Newark, and at Lafayette College, Easton, Pa., breaking off his course at the latter place, at the age of 16, to become a newspaper reporter. In 1896 he published *The Red Badge of Courage*, a story of the civil war, which was widely read, and instantly gave him first rank among realistic writers. On his way to Cuba in 1897 he was shipwrecked and narrowly escaped death. During the Spanish-American war in Cuba he reported incidents for the New York *Journal*. Other published books of his are *Maggie: a Girl of the Streets* (1896); *George's Mother* (1896); *The Little Regiment* (1897); *The Third Violet* (1897); *The Open Boat* (1898); *The Eternal Patience* (1898); *Wounds in the Rain* (1900); and *Great Battles of the World* (1901). D. in Badenweiler, Germany, June 5, 1900.

Craven, Tunis Augustus Macdonough: naval officer; b. in Portsmouth, N. H., Jan. 11, 1813. He entered the Naval Academy in 1829, and after service on different vessels was attached to the coast survey; became lieutenant 1841; was afterward connected with the Pacific squadron, and took part in the conquest of California; was again associated with the coast survey 1849; commanded the expedition for surveying the Isthmus of Darien by way of the Atrato River for a ship-canal, 1857; in command of the Mohawk he coasted Cuba for the purpose of intercepting slave-ships, one of his captures being a vessel transporting 500 negroes, who were liberated and returned to Africa. The Queen of Spain presented him with a gold medal and other honors for gallantly saving the crew of a Spanish merchant vessel, and his wife was the recipient from the New York board of underwriters of a silver service of plate for his efficient aid to American merchant vessels. In command of the Crusader, at the commencement of the civil war, he was instrumental in defending from capture the fortress at Key West. Having been advanced to commander, and ordered to the Tuscarora, he engaged in searching for Confederate cruisers, and successfully blockaded the Sumter so long at Gibraltar that she was deserted by her crew. After brief service in the James River flotilla, he was attached to Farragut's squadron, off Mobile, his ship, the Tecumseh, being given the post of honor, and in the subsequent engagement firing the first shot. Here, in pursuing the Confederate ram Tennessee, Aug. 5, 1864, he ran upon a line of torpedoes, losing his vessel, his own life, and the lives of nearly all of his crew. It is related that as the Tecumseh was sinking he met his pilot at the foot of the ladder of the top turret, as both sought a place of safety; conscious of the fact that the pilot was not to blame for the fatal course taken, the commander stepped aside, saying, "After you, pilot." He has been called "the Sydney of the American navy."

Creighton, James Edward, Ph. D.: educator; b. in Pictou, Nova Scotia, in 1861; prepared for college in Pictou Academy; A. B., Dalhousie College, 1887; graduate student at Cornell University and University of Berlin; Ph. D., Cornell University, 1892; principal of academy, North Sydney, Nova Scotia, 1887–88; fellow in Cornell University 1888–89; instructor in philosophical department, Cornell, 1889–91; Associate Professor of Modern Philosophy, Cornell, 1892–95; Sage Professor of Logic and Metaphysics, Cornell, since 1895; author of *An Introductory Logic* and *The Will and its Mode of Action*; translator (with E. B. Titchener) of *Wundt's Human and Animal Psychology*; contributor to *The Philosophical Review*, *Kant-Studien*, etc.; co-editor of *The Philosophical Review*; American editor of *Kant-Studien*.

Crevaux, Jules, Dr.: a French naval officer; b. at Lorquin, 1847. His explorations in South America in 1876–82 were extensive, brilliant, and most painstaking. He was engaged in 1876–78 in exploring and mapping the river systems of French Guiana. He began his work in the upper Amazon basin in 1879, and was the first to follow the Içá river almost to its sources in the Colombian Andes, from the slopes of whose volcanoes it carries masses of pumice to the Amazon. He descended the Yapura to the Amazon, and threw considerable new light upon the hydrography of the northwest part of the great basin. He transferred his labors to the northwest (1880–81), ascended the Magdalena, crossed the Cordilleras, and descended the Guaviare to the Orinoco, and found that its extent of navigable waters was about equal to that of the main river. He then undertook the perilous mission of exploring the Pilcomayo tributary of the Paraguay river, known at its sources and its mouth, though the hostility of the Indians had defeated all attempts to trace its entire course. He followed the river from its source in Bolivia to its middle course, where he and nearly his entire party were massacred (Apr. 27, 1882) by the formidable Tobas. His specialty was the exploration of rivers, and his reports were full of fresh information; but, as all his life as an explorer was spent in the field, he had no time to record his travels in book form. C. C. A.

Criminology [from L. *crimen*, gen. *criminis*, crime, and Gr. λόγος, reason, discourse]: in general, the science of the study of crime. In particular, however, the term criminology is used to designate criminal anthropology, or that branch of sociology which treats of those actions of men which are commonly considered criminal, together with the causes of crime, the methods of correcting or preventing it, etc., and, in short, aims to do for the criminal what anthropology does for man in general. Criminology is one of the most recently developed sciences, and the first international congress to consider it was held in the year 1885 at Rome, in Italy. This congress for criminal anthropology, which consists almost entirely of university professors, jurists, and scientific specialists, is to be sharply distinguished from the international congress for prison and penitentiary systems, consisting almost entirely of prison wardens and others who have had to do with the practical side of the prevention and repression of crime.

At the time of this first congress the scientific study of criminology (or the study of the relations of criminals to society and the investigation of the causes of criminal conduct and of the proper methods of treating criminals, a correct plan of punishment of crime, and the true or best method of reforming criminals) was looked upon as purely theoretical and of no practical value, and the science is

still in its infancy, so far as practical results are concerned.

The "Schools" of Criminology.—The father of criminology, as he might well be called, is Cesare Bonesana Beccaria, an eminent Italian economist and writer on penal laws, who published, in 1764, a treatise on crimes and their punishments, in which he advanced eloquent arguments against the severities and abuses of the then existing criminal law. This work met with much admiration, was widely read, and was translated into many languages; it is the foundation of the modern "classical school" of criminology, so called. The purpose this school had, and still has, was a practical one; that is, to diminish the severity of all punishments, and to abolish some of them by bringing about a humanitarian reaction against the arbitrary harshness of the punishments of mediæval times. It studied crime by a method of its own, looking upon crime as an abstract entity dependent upon the law.

There have been several offshoots from the theory of Beccaria, among which is the so-called "correctional school" of criminology, holding that the chief object of the punishment of criminals is the reformation of the criminal. This school, which was brought into prominence by Roeder, and flourished in Germany, and to a less extent in Spain, Italy, and France, no longer has an independent existence, although all schools recognize the principle that punishment ought to have a reforming effect upon the criminal.

Practically speaking, the classical school has up to within a very few years stood alone, with varying shades of opinion, but with one distinct method, and a distinct and well-defined body of principles and consequences derived from them. As a result of its labors, in most of the penal codes there has been a large, and in some cases an excessive, diminution of punishments; and the followers of the school have written many works of great importance and weight, among which are Carara's *Programme of Criminal Law*, in which crime is stated to be "a fact dependent upon law, an infraction rather than an action." These schools have in turn largely given way to the so-called "positive school" of criminology, which now receives the most public notice, and has for its object and means the experimental study of the pathological phenomena of the social body. It aims primarily and fundamentally to study the natural growth of criminality in the criminal, and the social and psychical conditions of his life, so as to discover the most effectual remedies for the removal of the causes of crime, as well as the best means of reforming the criminal.

Scope of the Science of Criminology.—The study itself of criminology proper is now commonly divided into general, special, and practical criminology. *General criminology* may be said to consist in a summary and synthesis of all the facts known relating to the science, or a general treatment of the entire subject. *Special criminology*, as the name implies, is taken up with the investigation of special subject-matters, that is, individual cases, physically, psychically, and historically considered. This field affords one of the chief avenues or means by which progress in the study and the application of the science is to be made, and upon its conclusions is based *practical criminology*, which includes all of the methods and institutions for the prevention or repression of crime, and which is the branch of the study of criminology most familiar to the public and appealing most to the public mind.

The various subjects or branches of general criminology may be broadly classified as the *embryology* of crime, that is, the analogies of crime in the vegetable and animal kingdoms; the *anatomy* of criminals, including the craniology, cerebrology, histology, anthropometry, and physiognomy of the criminal (this branch of criminology affording one of the most striking and beneficial results of the modern study of criminology, that is, the Bertillon system of measurements for identification of criminals): criminal *psychology*, or the study of the psychical life of criminals, including their intelligence, sentiments, sensibilities, ethics, æsthetics, and religion: criminal *sociology*, which comprehends the association together of criminals, and their relation to the state, both economically and in connection with their own welfare; criminal *jurisprudence*, or the study of criminal laws, and the principles on which they are based; criminal *penology*, treating of the principles, degrees, and methods of punishment of criminals; *statistical criminology*, having for its object the arrangement, classification, and summary of all criminal data, and the deduction from them of the conclusions which they warrant; criminal *hypnology*, which treats of the hypnotic conditions, or partially hypnotic conditions, in which the crime is or may be committed, especially in the case of hysterical persons; criminal *epidemiology*, which treats of the imitation or springing up of crime by a sort of contagion (this feature in the occurrence of crime being especially noticeable, having lately been forcibly shown by studies of criminal statistics, which have proved that in the case of any specially atrocious or conspicuous crime being committed, other similar crimes are committed immediately after it in unusual frequency, the explanation being that the widespread publicity given to the crime through modern newspaper channels suggests a similar crime to those who are in such a condition of mind and surroundings as to need only the suggestion to occasion the commission of the crime); criminal *teratology*, treating of the pathological sexuality of the criminal; criminal *prophilaxy*, having to do with the methods of prevention of crime and the reformation of the criminal through alteration of social conditions, by means of education—physical, intellectual, moral, and religious—and by means of prisons, transportation, deportation, etc.; and lastly, criminal *philosophy*, which takes up and discusses the disputed questions and theories of criminology, such as atavism, infantilism (or natural depravity of children), degeneracy, the correct significance of psychical characteristics, etc.

Purpose and Method of the "Practical School."—The purpose of the modern positive or practical school of criminology is to make an experimental study of social pathology, as regards criminal symptoms, in order to bring the theories of crime and punishment into harmony with everyday facts. Its method is to study the natural growth or origin of criminality in the criminal and the physical and social conditions of his life, so as to apply the most effectual remedies to the different causes of crime.

This scientific study of the criminal means that first, in general, there are noted and carefully studied his name, age, country, profession, and civil state; and in addition other points are carefully noted, by making an anthropometrical examination, noting the development of skeleton and muscular system; color; tattooing; craniometry, including measurements of face, height, bizygomatic diameter, facial type, facial index; characteristics of the nose, teeth, eyes, neck, lungs, thorax, heart, and genital organs; disfigurements. An examination of sensibility, noting touch; sensibility to the electric current of the hands and the tongue; sensitiveness to æsthesiometer; algometrical sensitiveness; muscular, topographic, thermic, meteorological, magnetic, metallic, hypnotic, acoustic, and chromatic sensibility, etc.; first sensual relations; anomalies. An examination of motility, noting voluntary movements in gait, speech, language, writing; muscular force: manual skill, etc. An examination of vegetative functions, noting circulation; respiration; thermogeny; digestion; secretions, saliva, sweat, etc. A physical examination, noting perception; ideation; reasoning; memory, will, intelligence (works, writings); slang; conscience; sentiments (moral and religious); passions; instincts; moral sense; habitual expression of face; psychometry, etc. An anamnestic examination, noting particulars as to family, parents, history (diseases and crimes of parents), precedents (including education, instruction, political development), diseases, traumatic accidents, crimes, habitual character, occupation preferred, last crimes, repentance, admissions, nervous diseases, and mental anomalies.

The organic constitution of the criminal, as so studied, comprises anomalies of the brain and other vital organs, and nerve-sensibility, including reflex activity and all the other bodily characteristics taken as a whole, such as physiognomy, tattooing, etc.

The mental or psychical constitution of the criminal, as so studied, comprises the make-up of his mind as regards intelligence, feeling, moral sense, and the special criminal characteristics of handwriting and slang.

The personal characteristics include his purely biological conditions, such as race, age, sex; and his biosocial conditions, such as civil status, profession, domicile, social rank, instruction, education, etc.

The physical factors of crime itself are climate, the nature of the soil, relative length of day and night, length of the seasons, average temperature, meteoric conditions, agricultural or professional pursuits, etc. The social factors comprise density of population, public opinion, family circumstances, systems of education, industrial pursuits, alcoholism, economic and political conditions, the administra-

tion of justice, policing, and in general legislative and penal institutions. Upon these various things depend the frequency and nature of the crimes committed in any community.

The principles and tendencies of this school of criminal anthropology may be outlined as follows:

1. The renunciation of the law of retaliation and punishment, substituting for it the purpose of moral reclamation of the criminal or his separation from society.

2. In addition to the study of the effect of crime, the consideration of the criminal himself, the definition of the causes which produce crime, the study of the sphere of action of the criminal, and the measures to be taken for the safety of society against his acts, the analyzation of the criminal according to purely scientific results, with the aid of exact methods which are applied to the investigation of all scientific phenomena, as distinguished from the study of the criminal in the abstract and speculation over his guilt or responsibility.

3. The observance that in crime the results of two factors reciprocally react: first, the individual peculiarities arising from the nature of the criminal or his psychic and physical organization, and next the peculiarities of external influence, as climate, nature of country, and social surroundings.

4. Criminology relies upon exact results, and shows the criminal to be an organization more or less unfortunate, vicious, impoverished, ill-balanced, defective, and ill-adapted to struggle successfully with surrounding conditions, and consequently incapable of maintaining this struggle in legally established ways. It shows that this defect of adaptation is not absolute for the majority of criminals, but varies with their conditions.

5. The causes of crime are of three classes—immediate causes, which arise from the character of the criminal; those more remote, which arise in unfavorable surroundings, under the influence of which the criminal's organic peculiarities are developed into more or less constant tendencies or agents; and predisposing causes, which push this ill-proportioned and viciously developed organization toward crime.

6. Basing crime upon these scientific grounds, criminology has for its fundamental purpose the study of the actual criminal and his crimes as scientific phenomena to be investigated throughout their length and breadth from their beginning to their final development. Thus the phenomena of crime are closely akin to all of the great social questions.

7. Further, criminology logically recognizes an absence of good sense in repressive measures determined in advance as to their duration and specific character, and affirms the necessity of studying individual peculiarities before rendering decisions. The term of punishment should endure as long as the causes exist which necessitated it. It should cease as soon as the causes cease.

8. Those members of the community who are intrusted with the making and enforcement of criminal laws should receive a special training for that purpose, and the laws regulating criminal acts and punishment in the community should be based upon enlightened knowledge furnished by modern criminology, recognizing the rights of the criminal, the reformatory object of the law, and the scientific method of reformation.

Conclusions of Criminology.—The classical school divides crimes into ordinary and political, ordinary crimes being those which are recognized as offenses against the general law of morality, and political crimes those acts, in contravention of arbitrary laws, which in themselves have no moral quality. The positive school, however, maintains that we should not distinguish between ordinary and political crimes, but between criminals, whether ordinary or political, according to their motives. It is now generally recognized that just what crime is depends more upon time, place, and nationality than upon any intrinsic merit or demerit in the act performed.

The kind of crimes which formerly consisted in the revolt against the restraints of government have now nearly disappeared with the removal of individual restraints. The criminals of to-day are mostly those who can not properly use the freedom which they enjoy, and the purpose and aim of modern positive criminology is so to influence those weaker classes, by restraints, removal of temptation, and educative influences, that they shall be kept from falling into criminal actions. The value and proper use of education as a preventive of crime is far from agreed upon.

In 1870 an investigation of seventeen States of the U. S. showed eight times as many criminals from the illiterate stratum of the population as from an equal number of the population who could read and write. This investigation includes 110,000 prisoners. A recent study undertaken by the U. S. Bureau of Education shows that in the thirty prisons reporting for 1888 three and one-fourth times as many criminals came from the illiterate as their proportionate quota allowed; but the conclusions to be drawn from such statistics are not well settled.

The phases of crime are changed by the growth of modern inventions, and by changes in society and in the laws. Thus, the crime of piracy has been nearly done away with by the use of steam in navigation. Murders on railways, once common, are now rare; and the old highway robberies which were committed in the days of diligences and stage-coaches have nearly disappeared with the substitution of railways for the obsolete conveyances.

It is also still an unsettled dispute whether the tendency of modern times is toward the increase or decrease of crime. One school or party maintains that crime is on the increase considering the proportion of crimes to the population; and the other school maintains that crimes are on the decrease, but that, by reason of the more perfect record now kept of criminal acts and of the increased number of statutory crimes, and the greater number of crimes detected, the increase in crimes noted in the statistics is superficial only.

It has been noted that the number of crimes committed varies with the physical changes of climate. Thus, in cold weather the crimes against property become more frequent, and in hot weather the crimes against the person. In a season of drought or famine crimes against property increase. In a season of plenteous crops, especially wine products, crimes against the person increase. The so-called law of criminal saturation is one which looks upon the community as constantly containing individuals who are on the verge of the commission of crime, and who by any criminal suggestion, or any slight added inducement, would be driven or carried over into the ranks of the criminal classes.

One of the most important features of modern reform in criminal punishment is the separation of habitual offenders from those who are only occasional or chance offenders. Modern criminology has proved that the present system as at present administered is practically maintaining an enormous number of schools for the instruction of citizens in the commission of crime, by forcing the occasional criminal (such as a man who commits a murder or assault, or other crime in the eyes of the law, through some special provocation, without any criminal instincts or characteristics predominating in his general character) with the habitual criminal, whose profession is the commission of crime, or who habitually and intentionally commits criminal acts.

In the penal code of the German Empire, Ellero reckoned 203 crimes and offenses. The Italian code of 1859 enumerated about 180, the new code about 200, the French penal code about 150, and it has been estimated that the kind of crimes committed by habitual criminals is only about one-tenth of the complete list of crimes in a legal classification. The crimes most frequently committed by habitual criminals are thefts, vagrancy, homicides, swindling, forgery, rape, conspiracy, and incendiarism.

The study of criminology has shown that increasing the severity of the punishment does not necessarily decrease the number of crimes. The tendency is to lay more stress on certainty of punishment than on the rigor or severity of it.

Another feature of modern criminological reform is the indeterminate sentence, so called, in which, instead of a sentence for a fixed period of hard labor or confinement being imposed for a given crime, the length of the sentence is left to the discretion of the judge or is contingent upon the conduct and behavior of the criminal, providing for his release subject to good behavior.

Work has been proved to be, in criminal as well as in lunatic asylums, a better means of order and discipline than chains and castigation. More reformation is accomplished by inducing prisoners or criminals to cultivate their self-respect and interest than by threats and restraint, and the orderly habits and healthy feeling of occupation induced by work have been found a great aid to this end.

Isolation, absolute and continued, or, as it is commonly called, *solitary confinement*, has proved to be deleterious to the criminal, and practically certain to produce insanity

after a limited period of time. As a modification of this, *separate confinement*, so called, was introduced, in which the prisoners are confined separately day and night, but are allowed to receive as visitors certain officials or other persons specially designated, as the chaplain, and the governors and the representatives of vigilance and prisoners' aid societies.

The science of criminology, strictly speaking, began with the observations of English jail surgeons and other learned men, such as Forbes Winslow (1854), Mayhew (1860), Thomason (1870), Wilson (1870), Nicholson (1872), Maudsley (1873), etc. Yet criminal anthropology as an independent science may be said to have first asserted itself with the first edition of *The Criminal*, published in 1876 by Lombroso, and with this work, and the many other works published by the same author and by other Italian students and writers, may be said to have begun the modern school of criminology. Since that time there has been a flood of literature on the subject, but the science is still in its infancy so far as producing well-defined and well-recognized principles for the regulation and prevention of crime and the treatment of criminals is concerned. The question of the efficacy of various reform methods is unsettled; the proportionate number of relapses of reformed criminals has not been satisfactorily shown; the moral responsibility of criminals is still as much in dispute as before; and the same is true of most of the numerous other vitally important subjects investigated; but it would seem that with the accumulation of statistics of greater reliability and the continued research and increased understanding devoted to the subject, the day can not be far distant when great results shall be accomplished toward achieving the ends and purposes for which the science exists.

A few only of the more important criminological works that have been published are *L'homme criminel, étude anthropologique et medico légale*, by Lombroso (1887); *La criminologie, étude sur la nature de crime et la théorie de la pénalité*, by Garofalo (1888); *The Criminal*, by Ellis (1890); *Sociologia criminale*, by Ferri (1892); *Le crime*, by Joly (1888). In *Abnormal Man*, by Arthur MacDonald (1893), will be found a very full bibliography of works on the science of criminology. F. Sturges Allen.

Croes, John James Robertson: civil engineer; b. in Richmond, Va., Nov. 25, 1834. He was graduated at the College of St. James, near Hagerstown, Md., in 1853; and in 1856 he began the practice of civil engineering in the service of the N. J. R. R. Co. In 1857–1860 he was employed on the construction of the Ridgewood reservoir of the Brooklyn water-works, and 1860–1863 on the Croton reservoirs and the enlargement of High Bridge in New York city. In 1863–1865 he was principal assistant engineer of the Washington, D. C., water-works, and after a short time spent in examination of the Cincinnati, O., water-works, and the St. Louis, Mo., harbor improvements, took charge of the construction of the first storage reservoir dam in the Croton Valley, at Boyd's Corners, N. Y. Among other works, the water-works of Newark, N. J., Princeton, N. J., Lancaster, Pa., New Rochelle, N. Y., Syracuse, N. Y., and the sewers of Geneva and New Rochelle were built after his plans. He was one of the commissioners to report on the plans for the great Croton dam, and examined the rivers at Johnstown, Pa., with a view to the prevention of floods. He has furnished numerous contributions to engineering literature in journals and encyclopædias. Mr. Croes has been a member of the American Society of Civil Engineers since 1867; was treasurer of the society for ten years, its vice-president in 1888, and its president in 1901. He is a member of the Institution of Civil Engineers of Great Britain.

Cronje, Piet: Boer general; b. in Orange Free State (now Orange river colony) about 1850. At the beginning of the Transvaal war of 1899–1900 he was put in command of the Free State forces; he effected the sieges of Mafeking and Kimberley, and conducted the campaign on the Modder river. While retreating before the vastly superior force of Lord Roberts, he was surrounded with about 3,000 of his men at Paardeberg, and surrendered Feb. 27, 1900. He was deported to St. Helena.

Crowninshield, Caspar: soldier; b. in Boston, Mass., in 1837; graduated at Harvard in 1860; entered the army as a captain of volunteers in 1861, became a major in 1863, lieutenant-colonel March 1, 1864, and colonel Oct. 21, 1864; commanded a brigade of cavalry under Sheridan, serving through the Shenandoah and Appomattox campaigns, and was present at the surrender of Gen. Lee; was breveted brigadier-general May 20, 1865, and retired a month later. D. in Boston, Jan. 10, 1897.

Cuba: On Feb. 24, 1895, after several years of secret preparation, the latest of the rebellions against Spanish sovereignty in Cuba began. The causes that produced it were the same that had kept the island in insurrection or discontent for a half-century. The insurgents soon formed the Republic of Cuba, but their government sought in vain to secure recognition from the U. S.

At the close of 1897 the greater part of the interior of the island was in the hands of the insurgents, but all the large towns and the coasts were held by Spain, which, from first to last, had sent 200,000 soldiers to Cuba. General Martinez Campos, who had been appointed captain-general and instructed to put down the insurrection, having resigned, was succeeded by Gen. Weyler. Weyler, as a war measure, ordered all the dwellers in the rural districts, under pain of death if they disobeyed, to concentrate in the large towns. There they were known as *reconcentrados*. Hemmed in by the garrisons, large numbers of them perished of hunger, though relief was sent from the U. S.; and it is said the rural populace of the western provinces of Pinar del Rio, Havana, Matanzas, and Santa Clara was practically exterminated. Weyler was the object of so much indignation on account of his alleged inhuman methods that he was forced to retire, and was succeeded by Capt.-Gen. Blanco.

In earlier years the Spanish crown had repeatedly promised reforms, and, in particular, greater political privileges. No promise had been fulfilled, and the Cubans regarded the pledge of an autonomist government, granted late in 1897, as the merest subterfuge. The grievances of the Cubans, the alleged inhumanity of the Spanish conduct of the war, and the immense loss to the commerce of the U. S., which had declined $69,000,000 a year for three years, or over two-thirds of the normal trade with the island, had produced a profound impression in the U. S., which was greatly intensified by the blowing up of the U. S. battleship Maine in the harbor of Havana, on the night of Feb. 15, 1898, with the loss of more than 260 of her crew; and on Apr. 11 President McKinley sent a message to Congress recommending armed intervention in Cuba. On the 19th Congress demanded the withdrawal of Spain from the island; on the 21st the President sent an ultimatum to Spain, and on the same day the U. S. minister to Spain and the Spanish minister at Washington received their passports. On the following day a U. S. squadron set out to blockade the ports of Cuba from Cardenas, on the north coast, around the west end of the island to Cienfuegos, on the south coast.

The leading events of the war were the destruction on May 1 of the Spanish fleet in the Bay of Manila, in the Philippines, by Commodore Dewey's squadron; the hunt for the Spanish squadron under Admiral Cervera by the squadron of Rear-Admiral Sampson, ending in the bombardment of the forts at San Juan, the capital of Puerto Rico, on May 12; the blockade of the port of Santiago de Cuba, in which Cervera's squadron had taken refuge, beginning on May 24; the landing of the first U. S. force in Cuba, 600 marines, at Guantanamo Bay, on June 10; the vain attempts of the Spaniards to dislodge them on June 11–14; the landing of about 18,000 troops near Santiago, under command of Major-Gen. Shafter, on June 22, 23; the first land fight near Santiago, in which 16 of the attacking force were killed and 40 wounded; the assault on the outworks of Santiago on July 1, 2, the total loss in the fighting before Santiago being 236 killed, 1,274 wounded, and 84 missing; the destruction of Admiral Cervera's squadron, while attempting to escape, on July 3, by the North Atlantic fleet, under Rear-Admiral Sampson, the Spaniards losing 6 war-ships, about 600 killed, and over 1,300 prisoners; the surrender of Santiago and the eastern end of Cuba to Gen. Shafter, with about 22,000 Spanish troops, on July 14; the landing of Gen. Miles and about 20,000 troops in Puerto Rico, July 25 *et seq.*; and the capture of Manila by troops from the U. S. under Gen. Merritt, aided by Dewey's ships, Aug. 13.

On Aug. 12 a protocol was signed, providing for the cessation of hostilities, the surrender of Spain's title to Cuba, the cession of Puerto Rico and one of the Ladrones to the U. S., and the occupation of Manila by the U. S. until the conclusion of a formal treaty of peace.

By the treaty of peace, which was signed in Paris, Dec. 10, 1898, Cuba became practically a dependency of the U. S., and was at once put under a provisional military government. The U. S. assumed the responsibility of preserving order and protecting life and property until such time as

the Cuban people should organize a stable government capable of maintaining internal order, and fulfilling international obligations. Gen. John R. Brooke was the first military governor-general, and had control of the civil administration as well as military affairs; he was succeeded Dec. 13, 1899, by Gen. Leonard A. Wood. Cuban mayors and aldermen were appointed in every municipality, and a supreme court was established. The post-office was reorganized on the model of that of the U. S.; a new and more general system of public education was introduced: many burdensome taxes were abolished; and a customs tariff established. Strict sanitary measures were imposed in all parts of the island, and improvements begun on roads, railways, docks, and harbors. In 1900, by the gift of Harvard University, more than 2,000 Cuban school-teachers were enabled to attend the summer school of that institution. On Sept. 15, 1900, an election of delegates was held, for a constitutional convention, which met on Nov. 5 of the same year, looking toward the framing of a constitution for the government of the island. On June 12, 1901, the constitution was adopted, and afterward approved by the Government in Washington.

For Spanish views, see Cuyas, *The New Constitutional Laws for Cuba* (New York, 1897); for Cuban views, *Free Cuba*, edited by John Guitéras (Philadelphia, 1896). See also J. H. Clark, *Cuba and the Fight for Freedom* (Philadelphia, 1896); Richard Harding Davis, *Cuba in War Time* (New York, 1897); A. S. Rowan and M. M. Ramsey, *The Island of Cuba* (New York, 1896); C. Benoist, *L'Espagne, Cuba, et les États-Unis* (Paris, 1898). C. C. Adams.

Cui, Cesar Antonovitch: composer; b. in Wilna, Russia, Jan. 6, 1835, and educated in St. Petersburg as an engineer; studied music under Moniuszko and Balakireff, and wrote favorably in St. Petersburg papers of Schumann, Berlioz, and Liszt; wrote also for musical papers in Russia and France; composed four operas and much other music for orchestra, piano, violin, and voice. He has also written several books on the art of war, and was Professor of Fortification in the School of Engineering in St. Petersburg.
D. E. Hervey.

Cummings, Thomas Seir: painter; b. in England in 1804. He was taken to New York in childhood, and early in life studied under Henry Inman; became celebrated for his miniatures, which he produced rapidly until the introduction of photography, numbering among his sitters many persons of distinction; was one of the founders of the National Academy in 1826; commanded a militia regiment for several years, and was commissioned brigadier-general by Governor Seward in 1838. He retired to a farm in Connecticut about 1866, having published *Historic Annals of the National Academy from its Foundation to 1865*. D. in Hackensack, N. J., Sept. 24, 1894.

Curzon, George Nathaniel: statesman; b. in 1859, being the eldest son of the Rev. A. N. H. Curzon, Baron Scarsdale, rector of Kedelston, Derbyshire, England; he was educated at Balliol College, Oxford, and at Eton, where he took high rank in classics, winning prizes for essays and a fellowship at All Souls'; was prominent in the Oxford Union Debating Society, holding its chair for a term; became assistant private secretary to the Marquis of Salisbury 1885; entered Parliament 1886, winning the Southport division of Lancashire from the Liberals, and retained his seat by increasing majorities. His extensive travels in the East, several times as correspondent of the London *Times*, resulted in the publication of *Russia in Central Asia* (1889), *Persia and the Persian Question* (1892), and *Problems of the Far East* (1894). In 1895 the Royal Geographical Society awarded to him its gold medal, in recognition of his contributions to geographical knowledge. He became Under-Secretary for India 1891, holding that position until the fall of the Salisbury administration; in 1895 became Under-Secretary of State for Foreign Affairs, and was made a privy councilor; in the same year was married to Mary Victoria Leiter, of Chicago, Ill. On Aug. 30, 1898, he was appointed Viceroy and Governor-General of India, succeeding the Earl of Elgin at that post, having first been elevated to the peerage as Baron Curzon of Kedelston.

Cusack, Mary Frances (the *Nun of Kenmare*): b. near Dublin, Ireland, May 6, 1830; lived in England during most of her early life, and began writing for publication while very young. She became a member of a religious sisterhood of the English Church, but was soon converted to Roman Catholicism and returned to Ireland, where in 1859, at Newry, she joined the Irish Poor Clares, a community of Franciscan nuns, devoted to the education of poor girls. In 1861 she established a convent of Poor Clares at Kenmare, where she remained until 1884, in which year Pope Leo XIII. personally authorized her to found a new order called Sisters of Peace, with the purpose of establishing homes for friendless girls, teaching domestic service, and inculcating moral habits. The first house of the order was opened in 1884 in Nottingham, England. In 1885 a house of Sisters of the Peace was established in Jersey City, N. J., the first in the U. S. Efforts for the relief of the peasants of Kenmare led to controversies with many of the great landlords, and with some English Catholics; but most of the leading Irish Catholics, including the clergy, have been in sympathy with the movement. She visited the U. S. in 1886. She published many works, chief among them being a *Student's History of Ireland*, *Woman's Work in Modern Society*, *The Pilgrim's Way to Heaven*, *Jesus and Jerusalem*, *The Book of the Blessed Ones*, and lives of Daniel O'Connell, St. Patrick, St. Columba, and St. Bridget. D. June 7, 1899.

Cusack-Smith, Sir Berry, K. C. M. G.: b. in Dublin, Ireland, in 1859. He took his degree at Eton College, was called to the bar in 1884 at the Middle Temple, and received a law scholarship in 1885; spent some time in the volunteer army; chancellor of the Primrose League 1887-89; was appointed consul at Samoa and deputy commissioner for the Western Pacific 1890; consul-general at Valparaiso 1891; deputy commissioner for Tokelau islands and acting British resident 1892; special judicial commissioner in 1893, and jointly with the German and U. S. consuls acted as adviser to the King of Samoa, and as receiver and custodian of revenues of Samoa and president of the municipality of Apia, 1893–97. He was knighted in 1898. F. S. A.

Cust, Robert Needham, LL. D.: English lawyer and linguist; b. in Bedfordshire, England, Feb. 24, 1821; studied at Eton College 1834–40; East India College, Haileybury, 1840–42, and the College of Calcutta 1843–44, with high honors, going to India in 1843; held high civil positions in the East India Government, including membership of the Viceroy's legislative council, and the Home Secretaryship to the Government of India 1864–65. Among his published works are *Modern Languages of East India* (1878); *Modern Languages of Africa* (1883); *Modern Languages of Oceania* (1887); *Modern Languages of the Caucasian Group* (1887); *Modern Languages of the Turki Branch of the Ural-Altaic Family* (1889); *Poems of Many Years*; and numerous other essays and works on linguistic and religious subjects. He was called to the bar at Lincoln's Inn in 1857, and made LL. D. by the University of Edinburgh in 1885. He is honorary secretary of the Royal Asiatic Society and vice-president of the British and Foreign Bible Society. F. S. A.

Cutler, John, M. A.: English jurist; b. in Dorchester, England, Jan. 9, 1839; received his early and college education at King's College School, London, Exeter College, Oxford University, and at Edinburgh University; was called to the bar in 1863, and made queen's counsel in 1897; was made Professor of English Law and Jurisprudence at King's College, London, in 1865, which position he still holds. Has edited *Reports of Patent Design and Trade Mark Cases*, published by the Patent Office, since 1884; *Powell on Evidence* (7th ed. 1892, and several of the previous editions); the second *English Translation of Ortolan's History of Roman Law* (1896); and has published a *Treatise on the Law of Naturalization*; *Treatise on the Law of Voluntary Settlements*; and other minor works.
F. Sturges Allen.

Cutter, George Washington: poet; b. in Massachusetts, in 1801. Having studied law, he practiced in Kentucky until about 1845; was captain of a company of infantry in the Mexican war; became an active politician, and was noted for his oratory; held a clerkship in the Treasury Department at Washington through several administrations, during which time he wrote poems that attracted much attention, among them being *The Song of Steam*, *The Song of the Lightning*, and *E Pluribus Unum*. His published works are *Buena Vista and other Poems* (1848); *Song of Steam and other Poems* (1857); and *Poems, National and Patriotic* (1857). D. in Washington, D. C., Dec. 24, 1865.

Cutting, Hiram Adolphus: geologist; b. in Concord, Vt., Dec. 23, 1832. Having been a teacher of the natural sciences in the seminary of Montpelier and in Norwich University, he became curator of the State cabinet of natural history in

1871, and was made State geologist in 1872, afterward becoming fish commissioner. His experiments in fertilizing soil and on the growth of plants, and his observations on insects, attracted attention to his scientific knowledge. He delivered lectures on *The Bible: its History and Scientific Relations*, *God in Creation*, etc. Among his many published works are *Microscopic Revelations* (1878); *Farm-pests, including Insects, Fungi, and Animalcules* (1879); *Notes on Building-stones, also on Plant-growth* (1880); *Scientific Lectures* (1884); and *Farm-lectures* (1884). D. in Lunenburg, Vt., Apr. 18, 1892.

Cutting, James Ambrose: inventor; b. in Massachusetts, in 1814. While living in Haverhill he invented a beehive, the success of which induced him to move to Boston and experiment on a larger scale. After examining the art of daguerreotypy, he invented a process of making similar pictures on glass, which he called ambrotypes. An aquarium and the aquarial gardens were established by him in Boston. D. in Worcester, Mass., July 31, 1867.

Dahlgren, Madeline Vinton: author; b. in Gallipolis, Ohio, about 1835. She was married to Admiral Dahlgren in 1865, before which time she had become somewhat noted as the author of poems and sketches, under the pseudonym of *Corinne*. The woman-suffrage movement was strenuously opposed by her in 1870–73, when, with a large list of signers in sympathy with her views, she petitioned Congress against the extension of the franchise to women. The Literary Society of Washington, of which she was one of the founders, first met at her house, and continued to meet there for many years, her influence serving to make that organization judiciously exclusive and refined. At South Mountain, Md., she built, out of her own means, the chapel of St. Joseph's of the Sacred Heart of Jesus, and was for several years president of the Ladies' Catholic Missionary Society of Washington. For translating from the Spanish the *Catholicism, Liberalism, and Socialism* of Donoso Cortes she received the thanks of Pius IX. From the French she translated Montalembert's *Pius IX.*, also De Chambrun's *Executive Power*. Her original publications include *Idealities* (1859); *Thoughts on Female Suffrage* (1871); *South Sea Sketches* (1881); *Etiquette of Social Life in Washington* (1881); *South Mountain Magic* (1882); *A Washington Winter* (1882); *Memoirs of John A. Dahlgren* (1882); *The Lost Name* (1886); and *Lights and Shadows of a Life* (1886). D. in Washington, D. C., May 28, 1898.

Dakar: the best harbor on the coast of Senegambia, sheltered throughout the year, and near Cape Verde, the most western point of Africa. In spite of its advantages, however, and the bar that obstructs the entrance to St. Louis, the latter port attracts most of the shipping trade with Senegal. France and her colonies in 1897 furnished more than half the imports and brought more than half the exports of Senegal. The foreign trade in 1897 was, exports, $4,227,330; imports, $5,835,987. C. C. Adams.

Dale, James Wilkinson: clergyman and author; b. at Cantwell's Bridge, Del., Oct. 16, 1812. Having graduated at the University of Pennsylvania in 1831, he began the study of law, which he soon abandoned for theology, taking courses at Andover and Princeton. He was agent for the American Bible Society 1838–45, and, after holding various pastorates, retired in 1876, devoting himself to literature. His exhaustive *Inquiry into the Meaning of βαπτίζω as Determined by Usage* includes *Classic Baptism* (1867), *Judaic Baptism* (1869), *Johannic Baptism* (1871), and *Christic and Patristic Baptism* (1874). D. in Media, Pa., Apr. 19, 1881.

Dall, Caroline Healey, LL. D.: author; b. in Boston, Mass., June 22, 1822. She was privately educated, after which she became a teacher. In 1877 she received the degree of LL. D. from Alfred University. Early in life she devoted her pen to topics of reform, chiefly exploring new fields of labor for women; later she essayed various branches of literature. Among her numerous publications are *Essays and Sketches* (1849); *Historical Pictures Retouched* (1859); *Woman's Right to Labor* (1860); *Life of Dr. Marie Zabrewska, being a Practical Illustration of Woman's Right to Labor* (1860); *Woman's Rights under the Law* (1861); *The College, the Market, and the Court, or Woman's Relation to Education, Employment, and Citizenship* (1867); *Egypt's Place in History* (1868); *Patty Gray's Journey to the Cotton Islands* (1869–70); *Romance of the Association, or One Last Glimpse of Charlotte Temple and Eliza Wharton* (1875); and *What we Really Know about Shakespeare* (1885).

Daly, Joseph Francis, LL. D.: b. in Plymouth, N. C., Dec. 3, 1840; removed to New York with his parents in 1849, where he received his early education: studied law and was admitted to the bar in May, 1862; practiced his profession of law until 1870, when he was elected to the Court of Common Pleas of the State of New York; served continuously as judge of that court from 1870 until Jan. 1, 1896, when he was transferred to the Supreme Court under the amended Constitution of the State, where he served until the expiration of his term of office, Dec. 31, 1898. His judicial opinions are among the most highly respected of any in the State. Judge Daly has been active politically and socially, and was one of the founders of the Players' Club, and is (1899) the president of the Catholic Club of New York city. Besides his opinions as judge, he has written a large number of editorial articles and miscellaneous writings for various magazines. His reports appear in Daly's, Abbott's, and Howard's *Reports*, the *Miscellaneous Reports*, the *New York State Reporter*, and the *New York Supplement*. He is an active Democrat, but was nominated by the Republicans in 1898 for re-election to the Supreme Court and defeated.

F. Sturges Allen.

Daly, Thomas Mayne, Q. C.: lawyer; b. in Stratford, Ontario, Aug. 16, 1852; educated at Upper Canada College; admitted to the bar in 1876; settled in Brandon, Manitoba, 1881, and became its mayor in 1882. He was a member of the House of Commons 1887–96; became Minister of the Interior under Sir John Thompson Dec. 5, 1892, and held that portfolio until the retirement of the Bowell administration in Apr., 1896. In 1896 he went to England in the interest of Canadian immigration, and served as a delegate to the Third Commercial Congress in London.

Damages: in modern law, the equivalent in money, or estimated equivalent in money, of detriment or injury sustained; specifically, such equivalent as decided by a court or jury in a legal proceeding. The right to damages is peculiar to the common law, as distinguished from equity, equity aiming to give specific relief by enforcing the performance of the thing agreed to be done, executing trusts, compelling the giving of testimony, etc., but generally refraining from awarding pecuniary damages. The general aim of the common law, or the end accomplished by an action at common law, is a judgment awarding money damages to the party injured, as by breach of contract or tort. Among the systems of the more primitive races, where the reference of values to a money standard has not become thoroughly established, both now and anciently, damages are given more or less in kind or in some chattel representing a rough standard of value. Numerous instances of this occur in the laws of the Pentateuch; as in the case of the goring of an ox, cited below, where we see an equitable combination of assessment of damages in kind, in the dividing of the dead ox; and in money, in the dividing of the purchase price of the live ox.

Damages under Various Systems of Law.—In the Jewish law specific damages were assessed in almost all classes of cases without exact reference to the actual injury sustained in the particular case. Thus, in Exodus, chap. xxi., v. 32, it is provided that "if a man's ox push a manservant or maidservant, he shall give unto their master thirty shekels of silver, and the ox shall be stoned." And again, later, in chap. xxii., v. 9, "for all manner of trespass, whether it be for ox, for ass, for sheep, for raiment, or for any manner of loss in which another challengeth to be his, the cause of both parties shall come before the judges, and whom the judges shall condemn he shall pay double unto his neighbor."

Chapter xxxi., v. 35, provides, "if one man's ox hurt another's that he die, then they shall sell the live ox and divide the money of it, and the dead ox also shall they divide." In the Hindu law this same principle is found, and the same principle is applied to torts, it being provided that "where a claim is proved, the person who gains the suit is put in possession, and the judge exacts a fine of equal value from the defendant. And if the defendant loses his cause, he in like manner pays double the sum sued for." In the Roman law the subject was elaborately but not very definitely nor consistently treated. With the Roman jurists, until the despotic days of the empire, the same line was drawn between questions of law and questions of fact as in the Anglo-Saxon law. The magistrate who heard the cause did not decide it, but turned over the matter to a *judex*, or single juror or referee, charging him much as a jury is charged by the judge for his guidance in the decision; but

particularly with respect to the defendant's liability in damages the judex or referee seems to have had a large discretion, restrained, however, to a certain extent, by special statutes. In the Roman law the general definition of damages was the actual loss sustained and the profit which might have been made. Inquiry was made in each case as to whether the defendant was to be held guilty of fraud or evil intent (*dolus*), or of fault or negligence (*culpa*) only; and if of *culpa*, whether of *culpa lata* (gross negligence) or *culpa levis* (slight negligence), and in the determination of these questions the judex seems to have had a wide discretion. The awarding of damages (*compensatio*) seems to have been under no well-settled rules by which the judex was governed; but in cases of fraud or gross negligence the plaintiff (*actor*) was permitted to swear to the amount of the injury sustained, with little, if any, check, except the power of assessment by the judex. Later, various statutory provisions were made in the attempt to do away with this difficulty by fixing valuations. Thus, under the *Lex Aquilia* a trespasser who killed a slave or cattle except by mere chance was required to pay to the master as much as the property had been worth at any time within the year. In the civil law the early features of the Roman law seem to have been retained, the amount of the damages being left very much to the discretion of the tribunal. Under this system, as established in France, and previous to the adoption of the Napoleonic Code, damages were divided into interest and damages (*intérêts* and *dommages intérêts*).

Damages at the Common Law.—The common law differs materially from the preceding systems in the treatment of the question of damages. Its general rule may be stated to be, that for every invasion of a legal right the law grants a remedy by which compensation is made for the injury inflicted, or "wherever the common law gives a right or prohibits an injury it also gives a remedy by action"; and this remedy is co-extensive with the injury done, whether it be to property or the person or rights or reputation of the person. The remedy extends both to civil injury and breach of contract, the object of the remedy in either case being to give to the plaintiff the *actual loss* or damages suffered by him by reason of the action of the defendant. The question as to what constitutes *compensation*, however, under the common law is very technical, and the interpretation of the word compensation is very restricted; so that, unless the word be understood in its technical sense, it is inaccurate as an expression of the equivalent given as the measure of damages.

In general, the injuries which give rise to a right to damages may be classed as injuries to property, physical injuries, mental injuries, injuries to family relations, injuries to personal liberty, and injuries to reputation; and all of the facts or circumstances which constitute a right of action for damages may be brought under one or more of these heads. The measure of damages is governed by complex rules, difficult both of application and of concise treatment. See DAMAGES, MEASURE OF; TRESPASS, SLANDER, LIBEL, BREACH OF CONTRACT, etc. See also Sedgwick on *The Measure of Damages*; Guthrie Smith on *The Law of Damages*; Pollock on *The Law of Torts*; Mayne on *The Law of Damages*; Anson on *The Law of Contracts*. F. STURGES ALLEN.

Danes Island: a small island off the northwest coast of Spitzbergen, to which whalers occasionally resort. It was on the north side of this island that the aëronaut Andrée inflated his balloon and started northward on July 11, 1897. The mountains partly surrounding the air-ship protected it from the full force of the winds during the process of inflation. C. C. ADAMS.

Danforth, MOSELEY ISAAC: engraver; b. in Hartford, Conn., Dec. 7, 1800. Having studied bank-note engraving, in 1821 he settled in New Haven, where he executed a celebrated plate after Raphael Morghen's engraving of the *Parce Somnum Rumpere*, and subsequently moved to New York, where he became one of the founders of the New York Drawing Association in 1825, and of the National Academy of Design in 1826, during which period his full-length engraving of Lafayette was completed. In 1827 he went to England. He lived in London for ten years, studying in the Royal Academy, where his drawings from the Elgin marbles became celebrated. Although most of his work while in London seems to have been on plates for books, a number of his best-known engravings were done during that time, such as *The Sentry-box*, *Don Quixote*, and portraits of Washington Irving and Sir Walter Scott. Returning to New York, he worked chiefly on vignettes for bank-notes, became partner in a bank-note engraving firm which was merged in the American Bank-note Company in 1858, and was vice-president of that corporation when he died, in New York city, Jan. 19, 1862.

Daniel, JOHN MONCURE: editor; b. in Stafford co., Va., Oct. 24, 1825. He was educated privately, studied law in Fredericksburg, Va., and moved to Richmond in 1845, where, in 1847, he joined the staff of the *Richmond Examiner*, his biting invective leading to several duels. He was a pro-slavery advocate and unorthodox in religion. Under his management the *Examiner* became the leading Democratic newspaper of the South, and was noted for its high literary character. He was one of Virginia's first and most ardent secessionists. While filling the post of minister to the court of Victor Emanuel, to which he was appointed by President Buchanan, he demanded for Italians naturalized in the U. S. and visiting Sardinia the same immunities extended to any other American, and threatened a rupture of diplomatic relations, in which he was not supported by his Government. He caused several social scandals in Turin, first by escorting to a royal ball an uninvited lady (the Countess Marie de Solms, afterward Madame Ratazzi), and next by a letter (inadvertently made public by its recipient) ridiculing the habitués of the court. At the outbreak of the civil war he returned home, and served on the staff of Gen. A. P. Hill, when, his arm being shattered, he resumed editorship of the *Examiner*, through the columns of which he bitterly attacked Jefferson Davis and Elmore, the Confederate treasurer. Challenged by the latter to a duel, he accepted, though unable to point his pistol, on account of his wounded arm, and was shot in the leg. He died in Richmond, Va., Mar. 30, 1865, three days before the downfall of the Confederacy, which event he had confidently predicted.

Daniels, WILLIAM HAVEN: author; b. in Franklin, Mass., May 18, 1836. He received education at Wesleyan University; after traveling in Europe, became librarian of the Northwestern University in 1866, and Professor of Rhetoric in the Illinois Wesleyan University in 1868; after several years' service as a minister in the Methodist Episcopal Church, accompanied the evangelist Moody to Europe in 1875, and after 1881 devoted himself to evangelism and to literature, resigning connection with the New England Conference in 1885. He has published *D. L. Moody and his Work* (1875); *That Boy: Who Shall Have Him?* (1878); *The Temperance Reform and its Great Reformers* (1878); *Moody, his Words, Works, and Workers* (1879); *The Illustrated History of Methodism in the United States* (1880); *A Short History of the People Called Methodist* (1882).

Danks, HART PEASE: musical composer; b. in New Haven, Conn., 1834. *Lake Street*, his first composition, appeared in Bradbury's *Jubilee*; his first song, *The Old Lane*, came out in 1856, and was followed by several hundred others, two of which, *Silver Threads among the Gold*, and *Don't be Angry with me, Darling*, became widely popular.

D'Annunzio, GABRIELE: novelist and poet; b. in Italy, in 1864; was educated at the College of Prato, Tuscany, and at the University of Rome; has been a member of the Chamber of Deputies. His first book of verse, the *Intermezzo di Rime*, was published when he was barely twenty years of age; this was immediately followed by a collection of short stories, *Il Libro delle Vergini*, and by more poems; then came the novels *Il Piacere* (1889), *L'Innocente* (1892), *Giovanni Episcopo* (1892), *Trionfo della Morte* (1894), and *Vergini delle Rocce* (1896), the last named being the first part of a romantic trilogy: the three volumes *Il Piacere*, *L'Innocente*, and *Trionfo della Morte* comprise a series classified as *I Romanzi delle Rose*. He is a subtile interpreter of sex-emotions, the love motive predominating in all his work. His *Triumph of Death* has probably been more widely read in England and America than any other modern translation from the Italian. A capable critic has thus spoken of his work: "Of the female sex D'Annunzio accepts the conventional view that is still prevalent among the Latin nations. Woman exists for man, for his pleasures, his domestic comfort, often for his ruin, but she has no independent life, no separate entity, no ideals apart from those of sexual love. No higher possibility for the sex has dawned upon the novelist; even religion, save as a conventional accessory, is denied to her."

Darnell, Rev. HENRY FAULKNER, D. D.: b. in London, 1831; educated at Trinity College, Dublin, and at Cambridge;

taught mathematics and classics in Raphoe, Ireland, for a time, and was ordained a priest of the Church of England in 1859; served in various Canadian churches 1860–74; afterward principal of Hellmuth Ladies' College, London, Ontario, and of Dufferin College, in the same city; since 1883 rector of the Episcopal church in Avon, N. Y. He has written for American and English magazines, and published *The Cross Roads* (1856); *Songs by the Way* (1860); *Verses in Memory of Bishop Mountain* (1863); *Songs of the Seasons* (1885); *A Nation's Thanksgiving* (1886); *Philip Hazlebrook* (1887); *Flossy* (1889); *The Craze of Christian Englehart* (1890); *Kindesliebe* (1891); *Memorabilia of the Presidents of the United States* (1893); *A Four-leaved Clover* (1894); *Songs of the Season* (1895).

Daughters of the King: an order composed exclusively of women in the Protestant Episcopal Church. The object of the order is "the spread of Christ's kingdom among women and the strengthening of parish life." Members are admitted with a solemn service before the altar, invested with a cross, and pledged by a vow to prayer and service. The two principal rules are, first, to pray daily for the spread of Christ's kingdom, for God's blessing upon the order, and for the prosperity of the parish; second, to make an earnest effort, each week, to bring at least one woman within the hearing of the Gospel, and to aid the rector as he may deem necessary for the furtherance of the work of Christ. Any association of women communicants in any parish or mission of the Protestant Episcopal Church, under the name of Daughters of the King, with the approval of the rector or minister in charge of such parish or mission, the members of which ratify the constitution of the order, pledge themselves to obey the rules, and agree to wear the badge of the order habitually, is entitled to become a chapter. The badge is a Greek cross fleury of silver, charged on the horizontal with the words "Magnanimiter Crucem Sustine," and at the base of the perpendicular with the initials of the motto of the order, F. H. S.—"For His Sake." The order was first organized on Easter evening, 1885, in the Church of the Holy Sepulchre, New York city, and now exists in Canada and Australia. There are 640 chapters in America, with more than 15,000 members.

David, Laurent Olivier: journalist; b. in Sault au Recollet, province of Quebec, Mar. 24, 1840; educated at the College of Ste. Thérèse, and admitted to the bar in 1864. He assisted in founding the newspaper *Le Colonisateur* while he was a student, and has since been editor of *L'Opinion Publique*, *Le Bien Public*, and *La Tribune*. He was a member of the House of Commons 1886–90. He was president of the St. Jean Baptiste Society, Montreal, 1887–88. He has published *Biographies et Portraits* (1876); *Les Héros de Chateaugay* (1883); *Les Patriotes de 1837–38* (1884); *Mes Contemporains* (1894); *Les deux Papineau* (1896); *Le Clergé Canadien: sa mission et son œuvre* (1896), which was condemned by the Congregation of the Index in Rome.

Davidson, James Wood: author; b. in Newberry District, S. C., Mar. 9, 1829. After graduation at the South Carolina College, in 1852, he studied languages under private tutors; was Professor of Greek in Mt. Zion College, South Carolina, and became principal of the Carolina High School at Columbia; was adjutant of infantry in Jackson's corps of Lee's army; was literary editor of the New York *Evening Post* in 1873, and American correspondent of the London *Standard* 1873–78. He has done much critical writing for various periodicals. Among his published works are *Living Writers of the South* (1869); *The Correspondent* (1886); *Dictionary of Southern Authors*; and *Helen of Troy*.

Davidson, Leonidas Heber, M. A., D. C. L., Q. C.: lawyer; b. in Toronto, July 3, 1842; educated at Lennoxville and at McGill University, and admitted to the bar in 1864. He is especially esteemed as an authority on canon law, and has lectured thereon in Montreal Theological College. He was appointed Professor of Commercial Law in McGill University in 1881, and became dean of the law faculty in 1896, resigning in 1897. He was chairman of the Montreal citizens' committee formed to oppose the passage of the Jesuits' Estates Bill in 1889, and one of the originators of the Citizens' League and of the Good Government Association of Montreal.

Davidson, Lucretia Maria: poet; b. in Plattsburg, N. Y., Sept. 27, 1808. She received education at schools in Troy and Albany, but was prevented by ill health from following a course of study. She began writing verse at the early age of nine years, her first production being an *Epitaph on a Robin*. Under the title of *Amir Khan, and other Poems*, her writings were collected and published in 1829, with a sketch of her life by S. F. B. Morse, and a second edition, edited by her brother, M. O. Davidson, with illustrations by Darley, appeared in 1871. Southey said of her: "In our own language, except in the cases of Chatterton and Kirke White, we can call to mind no instance of so early, so ardent, and so fatal a pursuit of intellectual advancement." D. in Plattsburg, N. Y., Aug. 27, 1825.

Davidson, Margaret Miller: poet; sister of Lucretia Maria Davidson; b. in Plattsburg, N. Y., Mar. 26, 1823. She was noted for precocity and delicate sensibility, producing verses at the age of six years, and constructing a drama, called *Tragedy of Alethia*, at ten. Washington Irving introduced her verse to the public, and the poems of the two sisters were published together in 1850. D. in Saratoga, N. Y., Nov. 25, 1838.

Davis, Andrew Jackson: spiritualist; b. in Orange co., N. Y., Aug. 11, 1826. Owing to the poverty of his parents, his youth was passed at hard labor and with little education. Extraordinary clairvoyant powers are reputed to have been developed in him in 1843, and on Mar. 7, 1844, he is said to have fallen into a trance which lasted sixteen hours, during which time, according to his own assertion, he conversed with spirits and received instruction as to his future teachings. In Nov., 1845, while claiming to be clairvoyant, he dictated *The Principles of Nature, her Divine Revelations, and a Voice to Mankind*, his first work. Among his other many publications are *The Great Harmonia* (6 vols., 1850–61); *Philosophy of Spiritual Intercourse* (1851); *The Present Age and Inner Life* (1854–70); *The Approaching Crisis* (1852); *The Penetralia* (1856); *The World's True Redeemer* (1863); *Stellar Key to the Summer Land* (1867); *Arabula, or the Divine Guest* (1867); *Mental Diseases and Disorders of the Brain* (1871).

Dawson [named for Dr. George M. Dawson, director of the Geological Survey of Canada]: a steamboat landing, on the Upper Yukon river, of the Klondike mining district, Canada; situated in lat. 64° 5′ N., lon. 138° W. (see map of Canada, ref. 4–E). Gold was discovered on Bonanza creek on Aug. 16, 1896, from which event date the beginnings of Dawson. The town is 1,300 miles up the Yukon. The ascent of the river by steamers requires about forty days, and though the transportation companies send their goods by the river route, most miners prefer the shorter overland trails. The town is the distributing-point for all the gold-bearing creeks that compose the Klondike district. It has several hotels and restaurants, a theater, and a weekly newspaper (1898), sold at fifty cents a copy. Average pop. about 4,000. The mean temperature during the three coldest months is −24° F. C. C. Adams.

Dawson, Henry Barton: historian and editor; b. in Gosberton, England, June 8, 1821. Having settled in New York city in 1834, he edited the *Crystal Fount*, a temperance paper, 1845–46. His first attempt at historical writing, a *History of the Park*, was published in the *Corporation Manual*, 1855, and in 1858 he began the publication, serially, of his *Battles of the United States by Sea and Land*, which history brought about a spirited controversy concerning the merits of Gen. Israel Putnam. After serving in various editorial positions, in 1866 he became editor of the *Historical Magazine*, which he greatly enlarged. Other publications of his are *Current Fictions* (1864); *Recollections of the Jersey Prison-ship, by Capt. Thomas Dring, one of the Prisoners*, edited from the original manuscript (1865); and *Westchester County in the Revolution* (1886). D. in Morrisania, N. Y., May 23, 1889.

Day, James Roscoe, S. T. D., LL. D.: educator; b. in Whitneyville, Washington co., Me., Oct. 17, 1845. He studied at Bowdoin College with the class of 1874, but did not graduate. He entered the ministry of the Methodist Episcopal Church, and in 1893 became chancellor of Syracuse University, New York. S. M. J.

Day, William R.: statesman; b. in Ravenna, Ohio, Apr. 17, 1849; graduated from the University of Wisconsin in 1870, and returned to Ravenna to study law. While attending lectures in Ann Arbor he was made librarian of the university. In 1872 he was admitted to the Ohio bar, and two years later began to practice his profession in Canton, Ohio. In 1886 Mr. Day was elected Judge of the Common Pleas Court of the Ninth Judicial District. The next year

he resumed his practice, and later, on account of poor health, refused the position of U. S. District Judge for the Northern District of Ohio, to which he was nominated by President Harrison. Early in 1898 he was appointed Assistant Secretary of State, later became Secretary, and at the close of the war with Spain, having resigned the secretaryship, was one of the commissioners who arranged terms of peace in Paris.

De Bow, James Dunwoody Brownson: statistician; b. in Charleston, S. C., July 10, 1820. After seven years' service in a commercial house he was educated at Charleston College, where he graduated in 1843, and in the following year was admitted to the bar; edited the *Southern Quarterly Review* in 1844; in 1845 moved to New Orleans, where he established *De Bow's Commercial Review*, a periodical that soon became widely known and valued; became Professor of Political Economy and Commercial Statistics in the University of Louisiana in 1848, and was one of the founders of the Louisiana Historical Society; assumed charge of the census bureau of Louisiana in 1850; was appointed by President Pierce superintendent of the national census in 1853, during all which time he continued to edit the *Commercial Review*, which was suspended soon after the outbreak of the civil war. Having strenuously employed his pen and voice in advocacy of secession and in denunciation of the North, after the close of the conflict his views materially changed, and he admitted the superiority of the free-labor to the slave-labor system. His *Review* was resumed in New York city, and afterward moved to Nashville, Tenn. His principal works are *An Encyclopædia of the Trade and Commerce of the United States* (1853); *Industrial Resources and Statistics of the Southwest* (1853); *The Southern States. their Agriculture, Commerce, etc.* (1856). D. in Elizabeth, N. J., Feb. 27, 1867.

Decree: in law, the judicial decision of a court of equity or admiralty, answering to the *judgment* of a court of common law; the judgment of an equity or admiralty court. The decree of a court of equity, or a chancery court, differs from the judgment of a common-law court in that the judgment is simply for the plaintiff or for the defendant without qualifications or modifications; while the decree is the decision of the equity court pronounced after due hearing of all points in issue in the case, and deciding the relative rights and duties of the parties to the action or proceeding, according to equity and good conscience. The term judgment is now, however, used to include both the decree and the common-law judgment. (See Judgment.) Decrees are divided into interlocutory decrees, or those not deciding the cause itself, and final decrees, or those finally disposing of the cause so that there is nothing further for the court to adjudicate, the right of appeal in the U. S. being frequently restricted to final decrees.

In canon law, the term decree is applied to the first of the two main divisions of the *Corpus Juris Canonici*, or Gratian's decree. F. Sturges Allen.

De Garmo, Charles, Ph. D.: educator; graduated at Illinois State Normal University 1873; principal of public schools, Naples, Ill., 1873–76; teacher, Illinois State Normal University, 1876–83; student at Jena and Halle 1883–86; Professor of Modern Languages, Illinois State University, 1886-90; Professor of Psychology, University of Illinois, 1890–91; president of Swarthmore College 1891–98; became Professor of the Science and Art of Education, Cornell University, in 1898; president of National Council of Education 1898; president National Herbart Society 1892. He is the author of *Essentials of Method* (1889); *Herbart and the Herbartians* (1896); *Language Lessons* (1897); translator of Lindner's *Manual of Empirical Psychology as an Inductive Science* (1889); and editor of several works published under the auspices of the National Herbart Society. He is recognized as a leader of the Herbartian school in the U. S. C. H. Thurber.

De Lancey, Edward Floyd: b. in Mamaroneck, N. Y., Oct. 23, 1821; son of Bishop William Heathcote De Lancey; educated at the University of Pennsylvania and Hobart College, graduating at the latter in 1843; graduated at the Harvard Law School in 1845, and was admitted to the bar in New York in 1846, where he has since practiced his profession with intermissions. He traveled extensively in British America, Europe, Egypt, and Asia Minor, and made a special study of American history. He was president of the New York Genealogical and Biographical Society 1873–77, and of various other historical societies. He edited Jones's *History of New York during the Revolutionary War*, and *Secret Correspondence of Sir Henry Clinton* (the latter appearing in the *Magazine of American History*, 1883–84); is author of *Memoir of the Hon. Joseph De Lancey, Lieutenant-Governor of the Province of New York* (1851); *Capture of Fort Washington the Result of Treason* (1877); *Origin and History of Manors in the Province of New York* (1886); *History of Mamaroneck, New York* (1886); and various other memoirs and brochures. F. S. A.

Delcommune, Alexandre: African explorer; b. in Namur, Belgium, Oct. 5, 1855. Between 1886 and 1892 he traveled very extensively in the Congo basin, and after Stanley he is the most prominent figure in its exploration. He has added more detail to the map of the Congo system of waterways than any other man. Before engaging in exploration he had been in the African service since 1873, first as a trader on the lower Congo, and then as administrator and political agent for the Congo Free State. Leaving the state's service, he was engaged by the "Compagnie du Congo pour le commerce et l'industrie" of Belgium to conduct a commercial exploration of the upper Congo. In this service he explored throughout their navigable length the Kassai, Kwango, Lukenye, Sankuru, Chuapa, Lulonga, Lomami, Rubi, and other tributaries. Completing these investigations in 1889, he devoted the next three years to the exploration of the unknown upper waters of the Congo in the service of the commercial "Compagnie du Katanga" of Belgium. The geographical results were even more brilliant than his earlier achievements, particularly in the basin of the west or Lualaba headstream of the Congo, which he revealed, with its mysterious chaplet of lakes throughout its course. He also traced the Lukuga, which carries Tanganyika's waters to the Congo from the lake to the river, and proved that the mysterious Lake Landje of the Arabs, which was supposed to be the gathering-ground for the Congo's headstreams, and from which the true Congo issued, has no existence. He is still connected with the commercial development of the Free State in the interest of Belgian enterprises. C. C. Adams.

Dengler, Frank: sculptor; b. in Cincinnati, Ohio, 1853. He went abroad and studied in the Munich Academy of Fine Arts, where, in 1874, he was awarded a medal for his *Sleeping Beauty*; was for a time instructor in modeling in the Boston Museum Art School, resigning that position in 1877, when he moved to Covington, Ky., and afterward to Cincinnati. Among his more noted works are *Azzo and Melda*, and an ideal head of *America*.

Denio, Hiram: lawyer; b. in Rome, N. Y., May 21, 1799; studied law, was admitted to the bar, practiced in Rome and Utica, and in 1834 was appointed circuit court judge for the fifth circuit of the State of New York; in 1853 was appointed judge of the court of appeals, and subsequently twice elected to that office, retiring in 1866. He was one of the most eminent judges of the State of New York, and his opinions are frequently quoted. He edited, with William Tracy, an edition of the *Revised Statutes* of the State of New York (1852), and published five volumes of *Reports of Cases Argued and Determined in the Supreme Court and in the Court for the Correction of Errors* (1845–81). D. in Utica, N. Y., Nov. 5, 1871. F. Sturges Allen.

Denison, Charles Wheeler: author; b. in New London, Conn., Nov. 11, 1809. He edited the *Emancipator*, the first anti-slavery journal published in New York city; was U. S. consul to British Guiana 1853; during the civil war served as post chaplain in Winchester, Va., and as hospital chaplain in Washington city. He published *The American Village, and other Poems* (1845); *Paul St. Clair*, a temperance story (1867); *Out at Sea*, poems (1867); *Antonio, the Italian Boy* (1873); *The Child Hunters*, concerning the abuses of the padrone system (1877); and a number of short biographies, including *The Tanner Boy* (Grant), *The Bobbin Boy* (Banks), and *Winfield, the Lawyer's Son* (Hancock). D. in Washington, D. C., Nov. 14, 1881.

Denison, Mary Andrews: author; b. in Cambridge, Mass., May 26, 1826; wife of Charles Wheeler Denison. While with her husband in British Guiana, she wrote many sketches of tropical life for American periodicals. She wrote and published many books, but attracted little attention until the appearance of a farcical medley called *That Husband of Mine*, which was issued anonymously in 1874, and reached the phenomenal sale of more than 200,000 copies in a short time.

Denmark: For some years the winter climate has been abnormally mild, and in 1897–98 considerable quantities of ice were imported from Norway. In 1898 the Danish merchant steam fleet was increased by 49 steamships of 50,000 tons net, and nearly half of the increase was placed on the routes between Denmark and the U. S. This is due to the growth of trade between the two countries. The route from Copenhagen to Newport News and Norfolk was opened in Dec., 1897. The 6 steamers of this route also run to New Orleans, and carry freight from this country for all Baltic ports. Two large new steamers for the New York route were completed in 1898. Emigration from Denmark in recent years has amounted to about 4,000 a year, the larger part of which goes to Illinois. Agriculture, and particularly dairy farming, has had enormous development in the last few years. About 900 steam dairies, run on the share system, have greatly increased the butter product, and Denmark sells five times as much butter in England as France does. Butter-producers carefully consult the taste of purchasers, sending, for instance, light-colored and sparingly salted butter to England and yellow and heavily salted butter to South America. Refrigeration enables Denmark to share in the butter trade of the most distant countries. Denmark's sanitary control of cattle is unequaled in any other country. All cattle must be examined once a month by a veterinary surgeon. All the milk sold in Copenhagen must be from cows fed and treated in accordance with prescribed rules. Hog-raising is second in commercial importance, and bacon ranks next to butter in the exports. The trade in garden-truck with England is increasing. The growing interests of agriculture led in 1896 to the establishment of a Ministry of Agriculture as a branch of the Government. Manufacturing is less important. Only a few large manufactories are found outside of Copenhagen, whose machine-works, iron-foundries, and potteries are prominent. Cloth gloves, paper, tobacco, sugar, and tiles are also manufactured in various parts of the country, but Denmark requires large imports of textiles, iron and steel goods, and coal.

C. C. Adams.

Denver, University of: an institution of learning in Denver, Col., established as Colorado Seminary in 1864. It was reorganized in 1879 as the University of Denver. It has the following departments: A college of liberal arts, a school of medicine, Iliff School of Theology, a school of law, a school of dentistry, a graduate school, a school of music and fine arts, and a preparatory school. Its average enrollment at present is about 600 students. It has 500 graduates. It has nine buildings, costing $325,000. The Chamberlin Observatory, costing $50,000, was the gift of the late H. B. Chamberlin. The Iliff School of Theology was built and endowed by Mrs. Bishop Warren and Mr. William S. Iliff at a cost of $200,000. The total value of buildings, grounds, and endowment is not less than $1,000,000. Gov. John Evans, M. D., one of the founders of Northwestern University, was founder and first president of the board of trustees. The university is under the control of the Methodist Episcopal Church, but is non-sectarian in management. Since the reorganization there have been 3 chancellors, the Rev. David H. Moore, D. D., 1879–89, William Fraser McDowell, 1890–1900, and H. A. Buchtell, D. D.

De Reszké, de-res'kā, Édouard: bass singer; b. in Warsaw, Dec. 23, 1855, and studied first under his brother Jean, and later under celebrated teachers; made his first appearance as the King in Verdi's *Aïda* Apr. 22, 1876, at the Théâtre des Italiens, Paris. In 1880 he sang with success in Italy, and on Apr. 13, 1880, appeared in London as Indra in Massenet's *La Roi de Lahore*. Since then he has sung in England almost every season; he was engaged for the Metropolitan Opera-house, New York, in 1892, and has since been regular member of that company. D. E. Hervey.

De Reszké, Jean: tenor singer; b. in Warsaw, Jan. 14, 1852; received his first musical instruction from his mother; made his *début* under the name De Reschi in Venice, as Alfonso in *La Favorita*, in Jan., 1874, and for several seasons he sang baritone parts. On Apr. 11, 1874, he made his first appearance in London. Becoming convinced that his voice was a low tenor instead of a baritone, he began studying tenor parts, and made his *début* as a tenor at Madrid in 1879. Since then he has sung in all the principal opera-houses of the world. He came to New York with his brother Édouard as a member of the Metropolitan Opera-house company, and has since remained with that company. Within the last few years he has added the Wagner rôles to his repertory. D. E. Hervey.

Derwentwater, Floating Island of: Dr. H. R. Mill, who made a survey of Derwentwater in 1893, speaks of the floating island as a "small area of the weed-covered carpet of the lake which has risen to the surface like a huge blister." The surface was not solid enough to land on. A boat-hook was easily driven into the margin of the island to a depth of 5½ feet without meeting a solid foundation. On its withdrawal it was followed by a rush of gas smelling slightly of sulphuretted hydrogen. Dr. Mill inclines to the theory of Mr. Symons that the island was formed by the buoying effect of gas entangled in the vegetable felt. C. C. A.

Deshnef, Simeon: a Russian explorer of the seventeenth century, whose existence and work were almost wholly forgotten until his circumstantial report of his discoveries, preserved in the archives at Yakutsk, Siberia, was recently brought to light. In June, 1898, the Czar commanded that the name East Cape, by which the point of Asia nearest to North America has long been known, be renamed Cape Deshnef, in honor of the explorer who first sailed through Bering Strait and determined the eastern limit of Asia. It was not known in the middle of the seventeenth century that North America was not united by land with Asia, and Deshnef settled this weighty question. The political disorders that were greatly disturbing western Russia at that time diverted attention from Deshnef's discovery, and it was overlooked. Deshnef was prominent in the tide of exploration and adventure that set eastward through Siberia at that time. In 1648 he launched a small trading vessel on the Kolyma river, floated down to the Arctic Ocean, and turned east. Six other boats started with him, but in those stormy waters his craft was the only one to pass through Bering Strait and reach Kamtchatka. He did not see the North American mainland, but he proved that Asia was separated from it. About eighty years later, Captain Bering, ignorant of the work Deshnef had done, affirmed the separation of Asia from America, and the strait that divides them bears his name, while the pioneer explorer was not recognized in the geographic nomenclature of the region till 1898. Ninety-three years after Deshnef's journey, Bering found the neighboring American mainland and charted a long stretch of its coast. Thirty years earlier, in 1711, the Russian Popoff visited the Chukchi natives near the northeastern extremity of Asia, and the people told him of islands and a great land to the E. where the natives wore tails. Recent evidence has shown that the Chukchi narrative with regard to the tails was not so ridiculous as it was pronounced to be by those who heard Popoff's story. Dr. Dall and other explorers have shown that the Eskimos of the American side of Bering Strait, at their formal dances and festivals, fasten a wolf's or a dog's tail at the base of the spine. C. C. Adams.

Designs: In general, a design is any concrete realization of a conceived representation of form or shape. The word is specifically used, however, in the patent and copyright laws of the U. S. and Great Britain to designate certain realizations of form, color, or plan that may be protected by giving the inventor the monopoly of the use of the design for a limited period. Under the laws of the U. S., designs are protected by patent, and as such do not include engravings, cuts, prints, photographs or negatives thereof, paintings, drawings, chromos, statues, statuary, or models, or designs intended to be perfected as works of fine art. These latter are protected by copyright.

In Great Britain designs have always been protected by distinct statutes. These, however, were all repealed, and the regulation of the matter included in the Patents Act of 1883, by virtue of which designs may be patented or copyrighted for five years from the date of registration. The provisions of this act did not include engravings, photographs, paintings, drawings, sculptures, models, or copies of casts of human or brute figures, these being protected for longer periods under the copyright laws.

F. Sturges Allen.

Desire: the psychological state in which an end is held up for realization. Desire is distinguished from other active tendencies in the fact that the end desired is a consciously and clearly pictured one. In "impulse" we have an active state of a lower character, in which one is swayed largely by unconscious, deep-seated elements, and is often unaware of the real object on which the impulse goes out. In so-called "restlessness" this is still more the case. In

"appetite" the tendency is organic, and, while the end may be clearly pictured, it is not always so. But in desire consciousness sets up its own object, and the energies of action tend to go out for its attainment.

The psychological characteristics of desire are chiefly these:

(1) A sense of the so-called desirableness of the object held up before the mind. This is in most instances a matter of experience, and of pleasurable experience. We desire what we understand, and, further, what we think will bring on desirable consequences.

(2) The position that the quality which makes an end desirable is always pleasure of some sort is not now so commonly held as formerly. We often desire things which are immediately calculated to give us pain or discomfort. Yet in these instances the desire has its justification in some larger feature of the experience in question, which comes in as an additional circumstance to outweigh the immediate consequences. Furthermore—

(3) There is usually in desire a complex state of tension, of several active tendencies or appetencies aroused at once, all of which have more or less urgency of expression. We decide on the desirableness of the entire situation without weighing the single alternatives or elements separately, and certainly without adding up the contributions of each to our pleasure, or their tendency to produce pain. This position—that we always act for pleasure or to avoid pain—now very generally given up by psychologists, is the basis of so-called "hedonism" in ethics, and the balancing of pleasures and pains is called the "hedonic calculus."

(4) Desire is a matter of the attention. It always involves a relatively constant outgo and concentration of attention upon the object desired. So long as this lasts the thing desired grows more important for consciousness and more urgent in the life of action. Unless some break be made in the attention, action follows to attain the thing desired.

(5) This increased urgency is due probably to the stimulation in the brain of the equivalents of the actual movements necessary for the action. This brings into desire the sense of "means to ends." We always have a more or less clear sense of the actions necessary to the reinstatement of the desired experience, and the first act of will is in starting up this action. This is felt as urgency, restlessness, active strain, and it enters as an essential ingredient in the state of desire. It is often described as "incipient" action.

(6) The necessary inclusion of incipient action rules out of desire many things which would under other conditions be deemed desirable. For example: We do not desire things which are absolutely unattainable, or so remote that there are no means at our command to secure them. No American desires a seat in the House of Commons or a suit of uniform of the "Horse Guards." These things are not in the line of his "means"; he is not eligible; so the state of active desire is not aroused. Further, the desire becomes more vital, and its urgency more telling, in proportion as the means of attainment are more secure and within easy execution. It is this truth which makes so much of the more indifferent, and indeed the morally vital conduct of life, a matter of casual circumstance. The mere fact of availability, of easy means-to-ends or "open door," causes a temptation to get more ready entertainment. The incipient action which urges on the desire is aroused by the mere giving of attention to the channels of execution of the means: and so positive and strenuous effort becomes necessary to prevent calamity. We must then suppress the actions which have been more than commenced in their organic seats.

Finally, (7) desire is no longer desire when it has issued in action: desire then passes over into "volition." It is only while there is the state of relative tension, of more or less control and suppression, of waiting for opportunity, that desire is really present. The subsequent processes are summed up under the head of the "gratification of desire."

See the works of a general character given under PSYCHOLOGY. J. MARK BALDWIN.

Desty, ROBERT: jurist; b. in or near Montreal, Canada, Feb. 17, 1827; when fourteen or fifteen years of age went to New York city, where he entered upon the study of the law; abandoned this for a time to teach in Pennsylvania, and to serve in the Mexican war; then, after the declaration of peace, went to California with the "Argonauts"; was a member of the vigilance committee that rid California of lawlessness; continued his study of law, and was admitted to the bar in California, turning his attention first to legal editorial work; was elected a member of the California Senate by a large majority, but declared incompetent by reason of alleged non-naturalization; removed to St. Paul, Minn., in 1882, where for a time he was editor of the *Federal Reporter*, leaving which, he took up his work on *Taxation*; in 1885 removed to Rochester, N. Y., where he edited *Lawyers' Reports Annotated* until 1891, then taking up the final work on a treatise on contract law, which he had nearly finished at his death. Among his works, original or edited, are *Parker's California Digest* (1869); *Desty's California Citations* (1874); *Federal Citations* (1878); *Manual of Practice in the Courts of the United States* (8th ed. 1893); *Compendium of American Criminal Law* (1882); *Removal of Causes from State to Federal Courts* (3d ed. 1893). D. in Rochester, N. Y., Sept. 27, 1895. F. S. A.

Deutsch, SOLOMON: philologist; b. in Gleiwitz, Prussia, in 1816; cousin of Emanuel Oscar Menahem Deutsch; educated at the Universities of Breslau and Göttingen; accepted a call to a synagogue in Philadelphia in 1857, later was rabbi in Syracuse, Baltimore, and Hartford, and since 1885 devoted his entire time to literary and philological work. He published *Letters for Self-instruction in German*; *Medical German*; *Key to the Pentateuch*; and *Biblical History in Biblical Language*. D. in New York, Jan. 27, 1897, leaving unfinished two works on the study of languages.

De Vere, CLEMENTINE: soprano singer; b. in Paris, of a Belgian father and English mother, and went to New York in 1887, after having sung in various cities in France, Italy, and Spain, and made a concert tour with Campanini in 1888. She was engaged as the soloist of the choir of the West Presbyterian church. She joined the Metropolitan Opera Company as an extra soprano, but sang only a few times. Her American reputation has been made entirely in the concert-room. She is married to Romualdo Sapio, a teacher in the National Conservatory of Music.

D. E. HERVEY.

Devil's Island (*Ile du Diable*): a small island, 7 miles from the east coast of South America and 27 miles N. W. of Cayenne, the capital of French Guiana. It was the prison home of ex-Captain Dreyfus, formerly of the French army, who was degraded and sentenced to life imprisonment outside of France for the alleged crime of selling military secrets to a foreign power. Near the island are two others, St. Joseph and Ile Royal, and the group was first known as Iles du Diable. The unfortunate immigrants who had settled on the neighboring mainland fled to the islands from the pestilential coast in 1764 and renamed them Iles du Salut (Salvation islands), which name is still applied to the group. One of France's penal settlements has occupied St. Joseph and Ile Royal since 1854, but Dreyfus and his guards were the only tenants of Devil's Island. In the early days of French Guiana the islands were thonght to be of no value, and no use was made of them until the colonists took refuge on them. C. C. ADAMS.

De Vivo, DIEGO: manager; b. in Sarno, Italy, in 1822, and went to the U. S. in 1859, when he began his career as an operatic manager. He was associated with Strakosch, Maretzek, and other managers, and was also a frequent manager of opera and concert companies on his own responsibility. Under his management many well-known singers were introduced in New York. He was the first American manager of Mme. Parepa, before she was married to Carl Rosa. Wachtel and Carlotta Patti appeared in the U. S. under his management, and the tragic actors Salvini and Mme. Ristori also made their earliest American tours directed by him. In 1883 he went to Australia, but soon returned. D. in New York, Aug. 11, 1898. D. E. H.

Dewar, JAMES, M. A., F. R. S., F. R. S. E.: chemist; b. in Kincardine-on-Forth, Scotland, in 1842: graduated at the University of Edinburgh, and continued his study of chemistry there as assistant to Sir Lyon Playfair. Later, he went to Ghent to study with Prof. August Kekulé. After holding several comparatively unimportant positions, he became Jacksonian Professor of Natural Philosophy in the University of Cambridge and Fullerian Professor of Chemistry in the Royal Institution of Great Britain. His most noteworthy work has been done in connection with his researches into the behavior of gases under great pressures at temperatures approaching the absolute zero. In 1886 he liquefied oxygen and solidified nitrogen and air, and in 1897 he succeeded in liquefying fluorine, an element so elu-

sive that its characteristics had never been accurately observed until he reduced it to an inert liquid. Besides reports on liquefied gases, Prof. Dewar published *The Oxidation Products of Picoline*; *Specific Heat of Carbon at High Temperatures*; *The Physiological Action of Light*; *Spectroscopic Investigations*; and many other papers.

Dewey, John, Ph. D.: educator; graduated at the University of Vermont 1879; fellow Johns Hopkins University 1883–84; Ph. D., Johns Hopkins, 1884; instructor and assistant professor in philosophy, University of Michigan, 1884–86; Professor of Philosophy, University of Minnesota, 1888–89; Professor of Philosophy, University of Michigan, 1889–94; head Professor of Philosophy and Pedagogy, University of Chicago, since 1894. He is the author of a *Psychology*, *Psychology of Numbers* (with J. A. McLellan), and of numerous philosophical and educational essays. C. H. T.

Dexter, Henry: sculptor; b. in Nelson, N. Y., Oct. 11, 1806. Early in life he was apprenticed to a blacksmith, in Pomfret, Conn., where he also worked on a farm; excelling as a worker in metals, he determined to become an artist, and first essayed portrait-painting in Providence, R. I.; moved to Boston in 1836, and afterward to Cambridge, where the remainder of his life was spent. He began the study of sculpture in 1840, and thenceforth confined himself to that art. It is said that he never saw a sculptor model in clay or chisel the marble until years after he became master of the art. His portrait busts, numbering in all more than 200, were specially successful productions, among them being busts of Agassiz, Anson Burlingame, Longfellow, Dickens, and Henry Wilson. Some of his most noted statues are *The Backwoodsman*, *Gen. Joseph Warren at Bunker Hill*, and *Nymph of the Ocean*. His *Binney Child*, in Mt. Auburn cemetery, is claimed to be the first marble statue executed in America. He persistently refused to go abroad for study, holding that artists who did so, while gaining no finer inspiration, lost their distinctive Americanism. D. in Cambridge, Mass., June 23, 1876.

Dhanis, dăă′nċē′, Baron François: Belgian army officer; b. in London, Mar. 11, 1862; received his early education in Scotland; graduated at the military school of Belgium in 1884, and was assigned to the infantry service with the rank of lieutenant. In 1884 he went to the east coast of Africa as a member of the fifth expedition of the International African Association. In 1886 he began his service in the Congo Free State, where he still remains (1899). He explored the Koango river and some of its tributaries, established a number of stations, organized the government of the new province, and his organizing ability and energy led to his employment in organizing some of the provinces on the far upper Congo. Since early in 1892 he has been commander-in-chief of the military forces in the field, in which capacity he directed the entire campaign of 1892–93 against the revolting Arab slave and ivory dealers of the upper Congo, who attempted to exterminate the whites because the Free State prohibited them from extending their slave raids farther down the river. The campaign lasted twenty months, and a considerable number of desperate battles were fought, in which the Arab losses were very severe. Dhanis drove them first out of their stations on the upper Congo for a distance of 400 miles above the confluence of the Congo and Lomami rivers, and then forced them east through Manuema to Lake Tanganyika and out of the Congo State. The result of this brilliant campaign was to crush utterly the Arab influence and put an end to slave-raiding throughout the State's domain. C. C. A.

Dicey, Albert Venn, M. A., B. C. L., LL. D.: English jurist; b. in England in 1835; took his degree at Oxford University and was called to the bar at the Inner Temple in 1863; was appointed public examiner in jurisprudence 1874–75, and Vinerian Professor of English Law at Oxford University in 1882; his publications include *The Privy Council*, an essay (1860; 2d ed. 1887); *Treatise on Rules for Selection of Parties* (1870); *The Law of Domicil* (1879); *England's Case against Home Rule* (1886). F. S. A.

Dignities: in English law, titles of honor, considered as incorporeal hereditaments. Formerly, in Great Britain, dignities were annexed to territorial property rather than to the person, and alienation of the land carried the dignities with it; but they are now strictly personal, descending to the heir in the patent whereby they are granted, and not being transferable by voluntary alienation, or attachable for debt. In the classification of dignities as superior and inferior the names of baronet, knight, etc., designate the inferior dignities. No temporal dignity of any foreign nation can give to a man a higher title than that of esquire in Great Britain; in the U. S. titles of nobility can not be granted by either State or Federal Government (Constitution, Art. I., Sec. 9, cl. 8; Sec. 10, cl. 1), and all titles of dignity must be renounced by alien applicants for admission to citizenship (U. S. Rev. St., Sec. 2165). F. S. A.

Dillon, John Forrest, LL. D.: b. in Northampton, N. Y., Dec. 25, 1831; when seven years of age removed with his parents to Davenport, Iowa; attended the public school in Davenport, and later entered the medical department of Iowa University, where he graduated, and practiced medicine for six months; entered into business as a druggist; studied law and was admitted to the bar in 1852; was elected in 1858 judge of the seventh judicial district of Iowa, and at the expiration of his term was re-elected; during that time he prepared his digest of *Iowa Reports*; became by election justice of the Supreme Court of the State in Jan., 1863; re-elected in 1869, but before qualification was appointed by President Grant judge of the U. S. circuit court for the eighth judicial circuit, embracing the States of Iowa, Minnesota, Nebraska, Missouri, Kansas, Arkansas, and later Colorado. He founded and for one year edited the *Central Law Journal*, and wrote *Municipal Bonds* (1876); *Municipal Corporations* (1872); *Laws and Jurisprudence of England and America* (1891–92); prepared *U. S. Circuit Reports*, in five volumes (1871–80); in Sept., 1879, removed to New York city to accept a professorship of real estate and equity jurisprudence in Columbia College Law School, and a position of general counsel to the Union Pacific Railroad Company; in 1882 resigned his professorship in Columbia College. He was one of the commissioners appointed to draw up the charter of greater New York (1891–92); was Storrs Professor of Municipal Law in Yale University; in 1892 was elected president of the American Bar Association. F. Sturges Allen.

Dilolo, Lake: a small lake on the south border of the Congo Free State, Africa (about 12° S. lat., and 22° E. lon.), 4,000 feet above the sea, and so exactly balanced on the water parting between the Congo and Zambesi systems that one affluent carries a part of its waters to the Kassai branch of the Congo, while another flows to the Liba head-stream of the Zambesi. This discovery by Livingstone in 1853 proved that the Congo and the Zambesi form a continuous water-course across the continent, and placed Dilolo among the small number of lakes that send their waters to two different water-systems. C. C. Adams.

Dingley, Nelson: statesman; b. in Durham, Me., Feb. 15, 1832; graduated at Dartmouth College in 1855; studied law and was admitted to the bar, but never practiced his profession. In 1856 he bought the *Lewiston Journal*, and under his management it soon became an important Republican paper of wide influence. In 1861 he was sent from Auburn as Representative to the State Legislature, was re-elected in 1862, and in 1863 was chosen Speaker of the House. Later he was again sent from Lewiston as Representative and again chosen Speaker. In 1873 he was elected Governor, was re-elected in 1874, and declined nomination the following year. From 1872 to 1881 he was prominent in Republican politics, in 1881 was elected to Congress, and was re-elected eight times successively. He helped frame the McKinley tariff of 1890, and was an earnest opponent of the Wilson Bill of 1894. In 1897 the ways and means committee, under his leadership, framed the tariff bill commonly called the Dingley Bill. D. in Washington, D. C., Jan. 13, 1899.

Dionne, Narcisse Eutrope, M. D.: author; b. in St. Denis de la Bouteillerie, Quebec, Canada, May 18, 1848; educated at the College of Ste.-Anne, studied theology, and studied medicine at Laval University; practiced at Stanfold, Quebec, a few years, and then abandoned medicine for literature and journalism. Among his publications are *Le Tombeau de Champlain* (1880); *Les Cercles Agricoles dans la Province de Québec* (1881); *États-Unis. Manitoba et Nordouest* (1882); *Histoire de l'église de Notre Dame des Victoires* (1888); *Jacques Cartier* (1889); *La Nouvelle France—De Cartier à Champlain* (1891); *Samuel Champlain* (vol. i., 1891); *Vie de C. F. Painchaud* (1894).

Doane, Thomas: civil engineer; b. in Orleans, Mass., Sept. 20, 1821; connected as engineer with many railroads, but particularly identified with the Boston and Maine road;

chief engineer of the Hoosac tunnel; introduced nitroglycerine and electric blasting in the U. S., invented machinery for compressed air, and participated in the invention of pneumatic drills. He went to Nebraska in 1869, and while there aided in the establishment of Doane College, for the site of which he secured a square mile of ground at Crete, 20 miles E. of Lincoln. He returned in 1873 as consulting engineer to the Hoosac tunnel, and ran the first locomotive through it, Feb. 9, 1875. He was president of the Boston Society of Civil Engineers. D. in West Townsend, Vt., Oct. 22, 1897.

Dodge, Charles Richards: b. in Covington co., Miss., July 17, 1846; studied agriculture in the Sheffield Scientific School of Yale University in 1865–67, after which he entered the Department of Agriculture as assistant entomologist and was placed in charge of the museum of the department, beginning at that time his study of textile fibers. He prepared the exhibit of agricultural products, birds, and insects for the Department of Agriculture that was sent to the Centennial Exhibition in Philadelphia in 1876. A year later he resigned from the Department of Agriculture and became editorially connected with the magazine *Outing*, and also contributed on agricultural topics to various magazines and journals. He served on the tenth census as an expert in agriculture, and in 1890 was again called to the Department of Agriculture to fill the place of chief special agent of the office of fiber investigations. He represented the Agricultural Department at the exposition in New Orleans in 1885, and later aided in the preparation of the agricultural exhibit of the U. S. for the World's Fair held in Paris in 1889, where he was the technical expert in agriculture from the U. S., serving also on the jury of awards. He was officially connected with the World's Fair held in Chicago in 1893, where he was also a juror, and he directed the preparation and installation of the entire exhibits of the Department of Agriculture at the Cotton States Exposition, held in Atlanta in 1895, at the Tennessee Centennial Exposition, held in Nashville in 1897, and at the Trans-Mississippi Exposition, held in Omaha in 1898, at all of which he also served on the juries of awards. In 1899 he was appointed director of agricultural exhibits for the commissioner general of the Paris Exposition to be held in 1900, and is also the representative of the Secretary of Agriculture in that connection. Mr. Dodge is a fellow of the American Association for the Advancement of Science, and a member of other scientific societies, and in 1889 received the order of agricultural merit from the French Government. His publications include more than twenty official papers which relate to textile fibers, and of these the most important is his *Dictionary of the Fibers and Fiber Plants of the World* (Washington, 1897). Marcus Benjamin.

Dodge, Richard Elwood, A. M.: educator; b. in Wenham, Mass., Mar. 30, 1868; educated in Salem, Mass., high school and Harvard University; A. B., Harvard, 1890; A. M., Harvard, 1894; assistant in geology, Harvard University, 1891–94; instructor in geology, Harvard University, 1894–95; instructor in geology and geography, Teachers College, New York, 1895–96; associate Professor of Natural Science, Teachers College, 1896–97; Professor of Geography, Teachers College, since 1897; author of various scientific and educational papers; editor of *The Journal of School Geography*.

Dodge, Theodore Ayrault, LL. B.: soldier and author; b. in Pittsfield, Mass., May 28, 1842. Having received a military education in Berlin, he studied at University College, London, and at Heidelberg; received the degree of LL. B. from Columbia College in 1866. During the civil war he served in the Army of the Potomac, losing a leg at Gettysburg; rose to major of volunteers 1864; was breveted colonel in the same year; was made captain in the Forty-fourth U. S. Infantry 1866, and was breveted lieutenant-colonel U. S. Army; after serving as chief of a bureau in the War Department, was retired in 1870. His principal publications are *Chancellorsville* (1881); *A Bird's-eye View of our Civil War* (1883); *A Chat in the Saddle* (1885); *Great Captains* (1889); *Alexander* (1890); *Hannibal* (1891); *Cæsar* (1892); and *Riders of Many Lands* (1893).

Doe, Charles: jurist; b. Apr. 11, 1830; graduated at Dartmouth College in 1849; studied law at Harvard Law School, and after his admission to the bar practiced law at Dover, N. H.; was county solicitor for several years, assistant clerk and clerk of the Senate of New Hampshire; was appointed judge of the supreme judicial court Sept. 23, 1859; held this office until legislated out of it by a change in the court in 1874; was appointed chief justice of the Supreme Court July 22, 1876, and retained his office until his sudden death on his way to attend a law term of the court, Mar. 9, 1896. He was for thirty-four years a member of the court of final jurisdiction of the State, and during this time exercised a commanding influence over his associates. He was an advocate of reform in methods and procedure, and to him was due much of the reform in common-law pleading in the State which has given to the practice the flexibility of the practice of the code States without the hampering statutory restrictions. F. Sturges Allen.

Doolittle, Edwin Stafford: artist; b. in Albany, N. Y., in 1843. He opened a studio of painting in New York city in 1867, and in the following year went abroad, studying chiefly in Rome until compelled to return by failing health. His *Shadow of a Great Rock in a Weary Land*, of which he made several copies, was painted in 1869. His landscape and marine subjects include *Sunset on an Adirondack Swamp*: *Chimney Rock, North Carolina*; *Gray's Peak, Colorado*; *A Pool in the Warwick Woodlands*; *Ruins of the Claudian Aqueduct on the Roman Campagna*; *On the Giuadecca Canal, Venice*; *The Arch of Titus*; *Autumn in the Catskill Clove*; *The Oxenstrasse, Lake Lucerne*; *The Toll-gate*; and *Sunset on Schroon Lake*. His illumination of *A Prayer to the Virgin* is in the Convent of the Sacred Heart, at Savannah, Ga., and that of *The Soliloquy of Friar Pacificus*, done for the Centennial Exhibition at Philadelphia, was afterward presented to Longfellow. D. about 1880.

Doolittle, James Rood: jurist and U. S. Senator; b. in Hampton, Washington co., N. Y., Jan. 3, 1815; educated at Middlebury Academy and Geneva (now Hobart) College; admitted to the bar in 1837; elected district attorney of Wyoming co., N. Y., in 1845; went to Wisconsin in 1851, was elected judge of the first judicial circuit of that State in 1853, and represented Wisconsin in the U. S. Senate 1857–69, serving as chairman of the committee on Indian affairs and on other important committees. He was a trustee of Chicago University, was its president for one year, and for many years a professor in its law school. D. in Edgewood, R. I., July 27, 1897.

Dörpfeld, dörp'felt, Wilhelm, Ph. D., LL. D.: architect and archæologist; b. at Barmen, near Düsseldorf, Dec. 26, 1853; studied at the Bauakademie in Berlin; employed as assistant for the excavations at Olympia 1877–81; appointed assistant in the German Archæological Institute at Athens 1882; associated for several years with Heinrich Schliemann in his excavations, notably at Tiryns and Troy; second secretary of the German Institute at Athens 1886; first secretary since 1887; co-editor of *Ausgrabungen zu Olympia* 1877–81, and of later editions of *Troja* 1884–93; author of numerous articles in the *Mittheilungen des arch. Inst. zu Athen*. His chief work is *Das griechische Theater* (with Emil Reisch, 1896). He is the greatest living investigator and interpreter of Greek architecture; distinguished by his power of insight and practical sense as an investigator, and by his clearness of statement and logical force as a writer and lecturer. Benj. Ide Wheeler.

Dorr, Julia Caroline (*Ripley*): author; b. in Charleston, S. C., Feb. 13, 1825; went with her father to Vermont in 1830, where she married. She contributed to *Sartain's Magazine* 1848, taking one of its hundred-dollar prizes by her first story, *Isabel Leslie*. Her publications include *Farmingdale*, a novel, issued under the pseudonym of *Caroline Thomas* (1854); *Lanmere*, a novel (1856); *Sibyl Huntingdon*, a novel (1869); *Poems* (1871); *Expiation*, a novel (1872); *Friar Anselm, and other Poems* (1879); *Daybreak, an Easter Poem* (1882); *Bermuda* (1884); *Afternoon Songs* (1885).

Douls, dool, Camille: African explorer: b. in Bordes, France, in 1864. After qualifying himself by the study of Arabic and the manners of Saharan tribes, he induced a Canary Island fishing-boat in 1886 to land him on the west coast of Africa, between Cape Bojador and the Rio de Oro, S. of Morocco. Disguised as a Mussulman, he was left alone with his scanty stores. The nomads whom he first met proved to be the terrible Ulad Delim, the robbers of the western Sahara. They made him captive and maltreated him, but his knowledge of the Koran and Mohammedan forms of worship saved his life, and he gradually won the confidence of his captors, with whom he wandered for five months over unexplored steppes. He reached the limit of the desert of Uarau and El Juf, the great depression

of the Sahara, only 500 feet above the sea. His compass and barometer were returned to him, and he was able to make some interesting observations. Turning north again, he visited Tenduf, the great slave-market of the north Sahara. When near Morocco he escaped from his nomad friends and made his way through that country to Europe. His route was through wide tracts of country previously unknown, and he brought back much information important alike to geography and ethnology. The Paris Geographical Society printed an account of his journey. He started from Paris in June, 1888, to renew his explorations, and is believed to have been on his way to Timbuctoo when he was murdered by his guides between the oases of Alouef and Akabli, about 550 miles S. of Oran. C. C. Adams.

Driver, Samuel Rolles, D. D.: Church of England scholar; b. in Southampton, England, Oct. 2, 1846; had a brilliant career at Oxford, where he received his B. A. degree 1869 and M. A. 1872. He succeeded the Rev. Dr. Pusey as Professor of Hebrew and Canon of Christ Church, Oxford, in 1882. He was a member of the Old Testament revision company. His best-known books are his *Treatise on the Use of the Tenses in Hebrew* (Oxford, 1874: 3d ed. 1892); *Notes on the Hebrew Text of the Books of Samuel* (1890); *Introduction to the Literature of the Old Testament* (1891; 6th ed. 1897), in the International Theological Library, Edinburgh and New York, and the commentary on *Deuteronomy* (1895) in the International Critical Commentary, Edinburgh and New York. S. M. J.

Drumgoole, John Christopher: Roman Catholic priest; b. near the town of Granard, County Longford, Ireland, Aug. 15, 1816; taken to New York city in 1824; became a shoemaker, but in 1844 sexton of St. Mary's Catholic church, and in 1850 part owner of a small book-store. It had long been his ambition to become a priest, but it was not until 1863 that he entered upon his studies. These were carried on at St. Francis Xavier College in New York city, at St. John's College, Fordham, New York, and at the Seminary of Our Lady of Angels, Suspension Bridge, New York. At length he was ordained priest, May 24, 1869, and was assigned to St. Mary's, New York city. In 1871 he became superintendent of a lodging-house for destitute and homeless boys in the city, and the work prospered under his management so that enlarged accommodations were soon required. It also changed character. In 1881 the present building on the corner of Great Jones Street and Lafayette Place was opened. His statue now stands in front of it. The work is known as "The Mission of the Immaculate Virgin for the Protection of Homeless and Destitute Children." It is for the care, maintenance, and secular and religious education of homeless and destitute children of both sexes without distinction, and to teach them habits of industry and self-reliance. Children from four to fifteen years of age, whether committed by the courts or by relatives and guardians, are received in the Lafayette Place building, and in most cases are transferred to the country branch, which is at Mt. Loretto on Staten Island, in the buildings erected in 1883, which are thoroughly equipped for instruction in the various branches of manual and industrial training and can accommodate 1,200 boys and 150 girls. On the Staten Island property there is an asylum for blind girls under fourteen years of age. The Lafayette Place building is also a temporary home for healthy non-criminal boys from sixteen to twenty years old, whether Roman Catholics or not, who are out of work, and a boarding-house at $2 a week for newsboys, bootblacks, and other working boys able to pay. These are all instructed spiritually and mentally. Of these latter classes the home can accommodate 350. Father Drumgoole was the author of this extensive programme of usefulness, and his spirit animated the work. D. in New York city, Mar. 28, 1888. The money of the city and private contributions support the work. S. M. J.

Dufile, du-fē'le: the chief port for steamers on the upper Nile (lat. 3° 40′ N., lon. 32° 5′ E.), in the old equatorial province of Egypt. There is uninterrupted navigation between Albert Nyanza and Dufile, about 150 miles by the river to the N. N. E., but navigation is impeded by rapids about 20 miles below Dufile. It is situated in the Madi country, which is a rich agricultural district near the big bend of the Nile, where the river suddenly turns to the N. W. Four right and two left tributaries converge toward the town. These facts promise to give much commercial importance to Dufile. Emin Pasha was particularly proud of this station, which he did much to develop. C. C. A.

Dupuis, dü'pwee', Nathan Fellowes, M. A.: scientist; b. in Portland, Ontario, Apr. 13, 1836; graduated at Queen's University, Kingston, in 1866; has been a professor in Queen's University twenty-eight years, first of Chemistry and Natural Science, then of Mathematics; is a Fellow of the Royal Society of Canada, to whose *Transactions* he has contributed a number of papers; is editor of the *Canadian Educational Monthly*. His works include *Elements of Geometrical Optics* (1868); *Junior Algebra* (1882); *Geometry of the Point, Line, and Circle in the Plane* (1889); *Principles of Elementary Algebra* (1893); *Elements of Synthetic Solid Geometry* (1893).

Dy'ea, or **Taiya** [Indian word meaning pack or load]: an Alaskan coast settlement at the head of Dyea Inlet, Lynn Canal (see map of Alaska, refs. 4–H and 2–H). Here begins the Dyea or Chilkoot Pass route to the head-waters of the Yukon. The trail over Chilkoot Pass has been used by the Indians for generations, and until 1897 it was practically the only overland route followed by miners to the Yukon goldfields. At the head of Dyea Inlet are extensive shoals, and ocean vessels discharge their cargoes by lighters or upon a rocky point a mile from the settlement, to which they are carried by wagons. The trail over the pass (3,500 feet above the sea) is difficult, but the distance to Lake Bennett, beyond the pass, is only about 30 miles; and from this lake there is a waterway of 548 miles, through lakes, rapids, and rivers to Dawson, in the Klondike district. The population of Dyea is mostly transient, and varies from a few hundred to several thousand. C. C. Adams.

Earle, John: philologist; b. in Elston, England, Jan. 29, 1824; received education at the Plymouth New Grammar School and at the Grammar School at Kingsbridge; entered Oxford 1842; was in the first class of Litteræ Humaniores 1845 and took his B. A.; was elected fellow of Oriel; took the degree of M. A. 1849, and became Professor of Anglo-Saxon; was ordained deacon 1849; became college tutor 1852; was presented by Oriel to the rectory of Swanswick 1857; appointed to the prebend of Wanstrow 1871; made rural deacon of Bath 1873; became Professor of Anglo-Saxon in the University of Oxford 1876. His chief publications are *Gloucester Fragments* (1861); *Bath, Ancient and Modern* (1864); *Two of the Saxon Chronicles Parallel* (1865); *The Philology of the English Tongue* (1871; 5th ed. 1892); *A Book for the Beginner in Anglo-Saxon* (1877; 3d ed. 1884); *English Plant-names from the Tenth to the Fifteenth Century* (1880); *Anglo-Saxon Literature* (1884); *English Prose: its Elements, History, and Usage* (1890); *The Psalter of 1539: a Landmark in English Literature* (1894); and *A Simple Grammar of English Now in Use* (1897).

Ecuador: The Government expects to continue to Sibambe the railroad now in operation from Duran to Chimbo. The great disadvantage under which the country labors owing to the lack of wagon-roads or railroads is shown by the fact that, though fine wheat is grown in the higher and cooler regions, all the wheat and flour consumed in the coast regions is brought from San Francisco and Chili, as the freightage from these points costs less than transportation by mule-back from the interior. The U. S. sends larger quantities of goods, but the imports from Great Britain and France are of higher aggregate value. There is a good market for foreign manufactures if they are cheap, which is an all-important consideration. C. C. Adams.

Edkins, Joseph, D. D.: sinologue; b. at Nailsworth, Gloucestershire, England, Dec. 19, 1823. He took his B. A. degree in London University in 1843, in 1848 became a missionary in China in connection with the London Missionary Society, and so continued until 1880, when he entered the Chinese imperial maritime customs service as translator into Chinese of scientific and other books. In 1885 he retired. His works include numerous translations into Chinese, aids to the study of Chinese—*Grammar of the Shanghai Dialect* (Shanghai, 1853); *Grammar of the Mandarin Colloquial Language* (1857; 2d ed. 1863); *Progressive Lessons in the Chinese Language* (1862; 4th ed. 1886); *Introduction to the Study of the Chinese Characters* (1876)—and studies of the Chinese—*Religion in China* (1859; 3d ed. 1884); *Chinese Buddhism* (1880). S. M. J.

Edmunds, Lewis Humfrey, M. A., LL. M., D. S. C.: patent lawyer; b. about 1860; studied at University College School, London, St. John's College, London, and was called to the bar in 1884; was appointed queen's counsel 1895;

he has paid special attention to the subject of patents, copyrights, and trademarks, and his publications on these subjects include *Law and Practice of Letters Patent for Inventions* (2d ed. 1897); *Copyright in Designs* (1895); *Patents, Designs, and Trade Marks Acts Consolidated*, and other articles and brochures on taxation of inventors, electric lighting, rejection of hearsay evidence, registration of designs, etc.; was a member of Parliament in 1886.

F. Sturges Allen.

Edwards, Julian: composer; b. in Manchester, England, Dec. 17, 1855, and studied music under Sir George A. Macfarren and Sir Herbert S. Oakley. He was appointed pianist to the Carl Rosa Opera Company, and later became conductor of the Royal English Opera Company. He composed an opera entitled *Victorian*, the libretto being adapted from Longfellow's dramatic poem *The Spanish Student*. This was produced at Covent Garden, London, in Jan., 1884. He came to New York in 1888, and has since written a number of operas and operettas, including *Jupiter* (1892); *Friend Fritz* (1893); *King René's Daughter* (1893); *Madeline, or the Kiss* (1894); *Brian Boru* (1896); *The Wedding Day* (1897), besides a large number of songs and concerted vocal music.

D. E. Hervey.

Effort: The sense or feeling of effort has become, in recent discussion, one of the most important topics of psychological interest. Effort began to be discussed by the Scottish psychologists, especially Reid, who found in it direct evidence of a spiritual principle or soul. This lead was taken up and followed out by certain French philosophers—Royer-Collard and Maine de Biran—who developed the view that in the experience of mental effort we become aware of a kind of activity, a sort of personal expenditure of spiritual force, which is without analogy in external nature, and on the basis of which we reach our ideas of cause and activity in the world of mechanical fact. In psychology, the gauntlet was thrown down to this view by several writers at about the same time, all of whom took the psychological form of the effort theory as advocated by Prof. Wundt, of Leipzig, as their object of attack. Bastian and Ferrier in England, James in America, followed by Münsterberg in Germany, contended that the sense of effort was itself a complex of sensations, coming in from the muscular and vaso-motor systems, and that, in making an effort, instead of putting forth a mysterious form of mental energy, we are feeling the reverberation of earlier sensations of movement (kinæsthetic sensations) as they are brought up into a new sensational determination by the conditions of a new action. These writers made out so good a case and furnished so finished and truthful an analysis, that the opinion had steadily gained ground, until Prof. Wundt and many others of the advocates of the *sui-generis* view of mental effort have gone over to the so-called kinæsthetic view.

In weighing the matter, however, we should distinguish carefully between the psycho-physical and the epistemological questions. If it be true that every mental change and condition has its brain-state, and that changes in consciousness are accompanied by brain-changes, then, strictly from the psycho-physical point of view, it is merely a matter of fact as to what sort of physical action goes on when the sense of effort occurs; whether it be a feeling of incoming sensations, kinæsthetic in their origin, and memories of these, or whether it be outgoing discharges from the brain. In other words, it does not matter as to whether it be sensations, memories, or what, that we have in consciousness when we feel effort. Let there be a spiritual activity putting forth some form of force of its own, still, if the psycho-physical point of view be justified at all, we should expect to find certain nervous sensational processes going on in the brain just the same. To discover these processes, and to show that the state of mind called effort is a complex of these elements, is only to give a scientific illustration of the truth of psycho-physical parallelism. The epistemological question, on the other hand, still remains unanswered—the question of the value and meaning of the sense of effort in a theory of knowledge. If it be true, as many hold, that the idea of cause grows up on the basis of the sense of effort, and that our belief in activity in the external world is conditioned upon and derived from our belief in our own active effort, then we must either give up all activity, all causation, the validity altogether of some of the categories of knowledge, or, on the other hand, admit the essential contention of those who hold that sense of effort is primary for our knowledge, and irreducible to anything else.

In other words, it is not necessary, in the interests of a spiritual or idealistic philosophy, to deny thoroughgoing parallelism, nor to refuse to make thoroughgoing psychological analyses. Effort is a psycho-physical fact. The epistemological and philosophical interpretations of the facts are still open, and they become only richer and more secure by the details of scientific fact which psychological analysis furnishes.

Literature.—Bain, *Senses and Intellect* (4th ed.); Wundt, *Physiologische Psychologie* (4th ed.); Mach, *Die Bewegungsempfindungen*; Waller, *Brain* (1891, p. 179); James, *Principles of Psychology* (11, p. 480); Bastian, *Brain as the Organ of Mind*; Münsterberg, *Die Willenshandlung*; Ward, *Psychology*, in *Encyclopædia Britannica*.

J. Mark Baldwin.

Egbas: one of the large tribes of the Yoruba country, which, next to the lower Nile valley, is the most densely peopled part of Africa, extending from the Gulf of Guinea about 200 miles N. between Dahomey and the Niger watershed. The Egbas, like the kindred tribes, are described as a gentle, kindly, and hospitable people. Their chief occupation is agriculture, but in their large towns along the Ogun river they have many industries, including weaving and leather manufactures.

C. C. Adams.

Egga: a large town and the most important trade-center of the Abuja country, on the right bank of the Niger river, West Africa, about 70 miles above its confluence with the Benue. It is inhabited largely by Fulahs, is a collecting-point for the commodities of a wide region, and the town and territory form part of the domain of the Royal Niger Company of England. Its situation is in a swampy, malarious district.

C. C. Adams.

Eggs: The production of eggs for market from the domestic fowl is one of the greatest of the smaller industries. The number of hens in Great Britain is far too small to supply the demand for eggs, and in 1895 more than 1,526,000,000 eggs, worth more than $20,000,000, were imported. In 1896 Germany imported about 1,520,000,000 eggs. The reason why Germany does not produce enough eggs for her own consumption is on account of excessive dampness causing large mortality among young chickens, and also because large districts are occupied by extensive estates where the peasantry live in villages, which prevents the keeping of large numbers of flocks. Forty per cent. of the eggs consumed in Great Britain are from abroad, and 90 per cent. of those handled by merchants in Great Britain and Germany are foreign. In 1894 the consumption of imported eggs per head in Germany was 30, and in Great Britain 37. The chief hen countries of Europe are France, Austria-Hungary, Russia, Italy, Belgium, and Denmark. Russia exported 1,475,000,000 eggs in 1896. China contains more fowls than any other part of the world. Eggs are much used in Japan, but being much cheaper in China, are almost all imported from that country. Nearly all the eggs produced in the U. S. are consumed at home, and the value of all the U. S. poultry products in 1880, $200,000,000, was equal to the value of all the dairy exports in a single year up to the census report of 1890.

C. C. Adams.

Egypt: The census of 1897 shows a total population of 9,734,405, of whom the agricultural element (Fellaheen) forms 61 per cent.; 8,978,775, or over 92 per cent., are Moslems, and of the 730,162 Christians, 608,446 are Copts. The population of the leading cities is: Cairo, 570,062; Alexandria, 319,766; Tannah, 57,289; Port Saïd, 42,695; and Assiut, 42,012. Only 4.8 per cent. of the inhabitants can read and write. Jan. 1, 1899, there were 10,000 schools, with 16,500 teachers and 220,000 pupils. Seven-eighths of the schools are elementary, giving instruction only in reading, writing, and the rudiments of arithmetic. Egypt has prospered under the tutelage of Great Britain. Within the ten years ending in 1898 the annual revenue has been increased by $7,500,000, though taxes have been remitted to the extent of $5,000,000. In fifteen years the population has increased over 2,500,000. Production and commerce also have steadily advanced. The imports in 1899 were valued at $55,442,689.92, of which Great Britain supplied about one-third, Turkey one-fifth, and America $1,160,819.06. The exports in the same year were valued at $75,884,481.25, of which Great Britain took about one-half, Russia one-tenth, France and Algeria one-tenth, and America $6,653,441.12, mostly cotton. The U. S. buys more and more of the long-fibered Egyptian cotton every year, and it is regarded as indispensable in some branches of manufacturing. It is the chief export crop of Egypt.

In Jan., 1899, there were 1,166 miles of railroad owned and worked by the state and 72 miles owned by private companies, 825 miles in the Delta and 413 miles in Upper Egypt. All the railroads are profitable, but the income of the Government roads is pledged to European creditors for debts incurred by Ismail Pasha. The long-discussed enterprise of damming the Nile in order to store the large volume of water that runs to waste during the flood period and reserve it for the months of the low Nile was begun late in 1898, and the corner-stone of the great dam at Assouan, 800 miles from Alexandria, was laid in Feb., 1899. The dam will be a mile and a quarter long, 40 feet wide, and 70 feet high, and in the three summer months of flood it will retain an immense volume of water, which is expected to give the country below all the water it needs during the winter and spring. It is believed that the Nile for 140 miles above the dam will feel the influence of this impounding of waters. The amount of water that will accumulate in this reservoir is estimated at 255 billion gallons. Much land will be reclaimed from the desert, but this is not the chief efficiency claimed for the dam. It is expected to secure sufficient water to irrigate the fields throughout the year, and thus make it possible to raise two crops annually where only one is now produced. It is believed in particular that cotton-growing with the aid of this surplus water will be extended much farther up the Nile. The top of the dam will serve as a bridge. It will be built of granite from the Assouan quarries. In order to prevent the submerging of the two beautiful temples to Isis on the neighboring island of Philæ, a calamity against which archæologists most emphatically protested, the engineers finally modified their plans, and the dam will be one-third lower than was at first proposed. The enterprise is backed by British capital and is expected to cost $25,000,000, which will be paid by the Egyptian Government in yearly installments extending over thirty years. The dam will be supplemented by a barrage at Assiut, 330 miles farther down the river, which is intended to keep the level of the Nile at that point about 10 feet higher than the mean level, so that it will be possible at all seasons to divert the water there into the Ibrahimia canal, and thus distribute it far north among the fields on the west side of the Nile. The dam and barrage will not interfere with navigation, as locks will be built in which vessels may be raised or lowered to the differing levels.

The campaign begun in 1896 for the reconquest of the Egyptian Sudan, which had long been under the control of the Mahdi and his successor the Khalifa Abdullah-el-Taaisha, was pursued until the capture of Omdurman on Sept. 2, 1898, after a terrible battle in which half the Khalifa's force was killed or wounded and he saved himself only by flight into Kordofan with a few followers. The military operations, which were conducted throughout by the Sirdar Sir H. H. Kitchener (Lord Kitchener of Khartum, 1898) with the Egyptian army and a small force of British troops, were much facilitated by the building of a military railroad across the desert from Wady Halfa to Abu Hamed, thence up the Nile to the confluence with the Atbara. In 1899 it is being extended to Khartum, and its further extension to Fashoda has been authorized. Kassala, N. W. of Abyssinia, which had for some years been held by Italy, was restored to Egypt in Dec., 1897. Egypt has now reoccupied her Sudan provinces as far E. as Kassala and as far S. as Fashoda on the Nile. The country is under the control of Gen. Lord Kitchener as administrator, and he is authorized to enforce any regulations he may think proper to promulgate as the law of the land. He found at Fashoda Major Marchand, a French officer, with 130 men, who declined to surrender Fashoda, on the ground that the French Government had instructed him to hold the upper Nile to that point. In November, however, France decided to relinquish Fashoda. On the whole, the reoccupancy of the Sudan by Egypt has been received with acclamation by the tribes whom Kitchener has met. It is believed that the population of the Sudan, estimated in 1885 to be 12,000,000, is not more than 4,000,000 or 5,000,000 in 1901. C. C. Adams.

Ehninger, John Whetton: artist; b. in New York city, July 22, 1827. After graduating at Columbia College 1847, he studied art in Paris 1848–49, going abroad again 1851–52, visiting Düsseldorf and other art-centers. He illustrated with etchings Hood's *Bridge of Sighs*, Irving's *Dolph Heyliger*, and Longfellow's *Miles Standish*. His best-known paintings include *Peter Stuyvesant*, *A New England Farmyard*, *The Yankee Peddler*, *The Foray*, *Lady Jane Gray*, *Christ Healing the Sick*, *Vintage in the Valrella*, and *Twilight from the Bridge of Pau*. D. in Saratoga, N. Y., Jan. 22, 1889.

Eichwald, īch'vaălt, Edward: naturalist of German extraction; b. at Mitau, Russia, July 4, 1795. He visited the Caspian Sea and Persia, and became Professor of Mineralogy and Zoölogy at St. Petersburg in 1838, after which he made scientific excursions to several parts of Russia and Italy. Among his works are *Travels to the Caspian Sea and the Caucasus* (1834); *Fauna Caspio-Caucasia* (1841); *The Primitive World in Russia* (4 vols., 1840–47); and *The Palæontology of Russia* (1851). D. in St. Petersburg, Nov. 10, 1876.

Eider, ī'der (Lat. *Eidera*): a river of Germany, forming the boundary between Schleswig and Holstein; rises about 10 miles S. W. of Kiel, flows nearly westward, and enters the German Ocean at Tönning. It is about 90 miles long, and is navigable from its mouth to Rendsburg. A canal cut from Rendsburg to Kielfiord opens a communication from the Baltic to the North Sea.
