PECULIAR PHONETIC SYMBOLS

USED IN THE WRITING OR TRANSLITERATION OF THE DIFFERENT LANGUAGES.

ā, ē, etc.: long vowels; in the Scandinavian languages the accent (*á*, *é*, etc.) is used to denote length.

ą: a nasalized *a*; so used in the transliteration of the Iranian languages.

å: labialized guttural *a* in Swedish.

æ: open *a* of Eng. *hat*, used chiefly in O. Eng.

aí: used in Gothic to denote *e* (open), in distinction from *ái*, the true diphthong.

aú: used in Gothic to denote *o* (open), in distinction from *áu*, the true diphthong.

bh: in Sanskrit a voiced labial aspirate (cf. *ch*).

ƀ: voiced bilabial (or labio-dental?) spirant, used in discussions of Teutonic dialects.

ç: voiceless palatal sibilant, similar to Eng. *sh*, used especially in transliteration of Sanskrit.

č: frequently used, e. g. in Slavonic languages, to denote the sound of Eng. *ch* in *cheek*.

c: voiceless palatal explosive, commonly used in transliteration of Sanskrit and the Iranian languages.

ch: as used in the transliteration of Sanskrit, a voiceless palatal aspirate, an aspirate being an explosive with excess of breath; as used in German grammar, the symbol for a voiceless palatal or guttural spirant.

dh: voiced dental aspirate (cf. *ch*) in Sanskrit.

ḍ: voiced cerebral explosive, so used in transliteration of Sanskrit.

ḍh: voiced cerebral aspirate (cf. *ch*) in Sanskrit.

đ: voiced dental (interdental) spirant, equivalent to Eng. *th* in *then*; so used in the Teutonic and Iranian languages and in phonetic writing.

ĕ: a short open *e*, used in Teutonic grammar, particularly in writing O. H. G.

ə: the short indefinite or "obscure" vowel of Eng. *gardener*; used in the reconstruction of Indo-Eur. forms, and in transliterating the Iranian languages.

gh: in Sanskrit a voiced guttural aspirate (cf. *ch*).

ǥ: voiced velar (back-guttural) explosive, used most frequently in Indo-Eur. reconstructions.

ȝ: voiced guttural (or palatal) spirant. equivalent to Mod. Greek γ, and used in transliteration of Iranian languages and O. Eng.

ḥ: a voiceless breathing, the Sanskrit *visarga*.

hv: a labialized *h*, similar to *wh* in Eng. *what*; used in transliteration of Gothic and the Iranian languages.

ḫ: voiceless guttural (or palatal) spirant, equivalent to German *ch*, and used in transliteration of the Iranian languages.

i̯: the semi-vowel *y*, or consonant form of *i*; used in phonetic writing and reconstructions of Indo-Eur. forms.

j: in the transliteration of Sanskrit and the Iranian languages a voiced palatal explosive; in the Teutonic languages a semi-vowel (= *y*), for which in Indo-Eur. reconstructions *i* is generally used.

jh: in Sanskrit a voiced palatal aspirate (cf. *ch*).

kh: in Sanskrit a voiceless guttural aspirate (cf. *ch*).

ł: the guttural ("thick" or "deep") of the Slavonic and some of the Scandinavian languages.

l̥: vowel *l*; used in transliterating Sanskrit, in reconstructing Indo-Eur. forms, and in other phonetic writing.

n̥: nasal vowel; used in reconstruction of Indo-Eur. forms and in phonetic writing.

ṇ: in Sanskrit the cerebral nasal.

ñ: in Sanskrit the guttural nasal (see following).

ŋ: the guttural nasal, equivalent to Eng. *n* in *longer*; used in transliteration of Iranian languages.

ñ: palatal nasal, similar to *gn* in Fr. *regner*; used in transliterating Sanskrit and in phonetic writing.

ö: palatalized *o*; used in German and in phonetic writing.

ǫ: short open *o* in Scandinavian.

ø: short palatalized *o* (ö) in Scandinavian.

ph: in Sanskrit, voiceless labial aspirate (cf. *ch*).

ɋ: voiceless velar (back-guttural) explosive; used in reconstructions of Indo-Eur. forms and in other phonetic writing.

r̥: vowel *r*; used in transliterating Sanskrit, in reconstructions of Indo-Eur. forms, and in other phonetic writing.

š: voiceless cerebral sibilant, equivalent to Eng. *sh*; used in transliterating the Iranian languages and in phonetic writing.

ṣ: voiceless cerebral spirant; used in transliterating Sanskrit.

th: in Sanskrit a voiceless dental aspirate (cf. *ch*).

ṭh: in Sanskrit a voiceless cerebral aspirate (cf. *ch*).

ṭ: in Sanskrit a voiceless cerebral explosive.

ţ: a form of dental spirant used in transliterating the Iranian languages (represented in Justi's transliteration by ṭ).

þ: voiceless dental (interdental) spirant, equivalent to Eng. *th* in *thin*; used in Teutonic dialects and in phonetic writing.

u̯: consonant form of *u*; used in phonetic writing.

ž: voiced cerebral sibilant, equivalent to *s* in Eng. *pleasure*, and to *j* in Fr. *jardin*; used in Iranian, Slavonic, and in phonetic writing.

ʒ: a symbol frequently used in the writing of O. H. G. to indicate a voiced dental sibilant (Eng. *z*), in distinction from *z* as sign of the affricata (*ts*).

EXPLANATION OF THE SIGNS AND ABBREVIATIONS USED IN THE ETYMOLOGIES.

>, yielding by descent, i. e. under the operation of phonetic law.
<, descended from.
=, borrowed without change from.
: , cognate with.
+, a sign joining the constituent elements of a compound.
*, a sign appended to a word the existence of which is *inferred*.

KEY TO THE PRONUNCIATION.

aa..... as *a* in *father*, and in the second syllable of *armada*.

ăa..... same, but less prolonged, as in the initial syllable of *armada*, *Arditi*, etc.

a..... as final *a* in *armada*, *peninsula*, etc.

ă..... as *a* in *fat*, and *i* in French *fin*.

ay or ā.. as *ay* in *nay*, or as *a* in *fate*.

ăy or *ā*.. same, but less prolonged.

ã..... as *a* in *welfare*.

aw..... as *a* in *fall*, *all*.

ee..... as in *meet*, or as *i* in *machine*.

ĕe..... same, but less prolonged, as final *i* in *Arditi*.

e..... as in *men*, *pet*.

e..... obscure *e*, as in *Bigelow*, and final *e* in *Heine*.

ê..... as in *her*, and *eu* in Freneh *-eur*.

i..... as in *it*, *sin*.

ī..... as in *five*, *swine*.

ĭ..... same, but less prolonged.

ō..... as in *mole*, *sober*.

ō..... same, but less prolonged, as in *sobriety*.

o..... as in *on*, *not*, *pot*.

oo..... as in *fool*, or as *u* in *rule*.

o͝o..... as in *book*, or as *u* in *put*, *pull*.

oi..... as in *noise*, and *oy* in *boy*, or as *eu* in German *Beust*.

ow..... as in *now*, and as *au* in German *haus*.

ö..... as in *Göthe*, and as *eu* in French *neuf*, *Chintreuil*.

ŭ..... as in *but*, *hub*.

ŭ..... obscure *o*, as final *o* in *Compton*.

ü..... as in German *süd*, and as *u* in French *Buzançais*, *vu*.

y or *l*.... see *l* or y.

yu..... as *u* in *mule*.

yŭ..... same, but less prolonged, as in *singular*.

ch..... as in German *ich*.

g..... as in *get*, *give* (never as in gist, congest).

hw..... as *wh* in *which*.

*k*h..... as *ch* in German *nacht*, *g* in German *tag*, *ch* in Scoteh *loch*, and *j* in Spanish *Badajos*, etc.

ṅ..... nasal *n*, as in French *fin*, *Bourbon*, and nasal *m*, as in French *nom*, Portuguese *Sam*.

ñ or n-y.. Spanish *ñ*, as in *cañon*, *piñon*, Freneh and Italian *gn*, etc., as in *Boulogne*.

l or y.... Freneh *l*, liquid or mouillé, as (-i)ll- in Freneh *Baudrillart*, and (*-i*)*l* in *Chintreuil*.

th..... as in *thin*.

th..... as in *though*, *them*, *mother*.

v..... as *w* in German *zwei*, and *b* in Spanish *Cordoba*.

sh..... as in *shine*.

zh..... as *s* in pleasure, and *j* in French *jour*.

All other letters are used with their ordinary English values.

NOTE.

The values of most of the signs used in the above Key are plainly shown by the examples given. But those of ö, ü, *ch*, *k*h, ñ, and *v*, whieh have no equivalents in English, ean not be suffieiently indicated without a brief explanation, which is here given.

ö. The sound represented by this symbol is approximately that of -u- in *hurt* or -e- in *her*, but is materially different from either. It is properly pronounced with the tongue in the position it has when ā is uttered and with the lips in the position assumed in uttering ō.

ü. This vowel is produced with the lips rounded as in uttering oo and with the tongue in the position required in uttering ee, into whieh sound it is most naturally eorrupted.

ch and *k*h. These are both rough breathings or spirants made with considerable force, *ch* being made between the flat of the tongue and the hard palate, and *k*h between the tongue and the soft palate. *ch* approaches in sound to English sh, but is less sibilant and is made further back in the mouth; *k*h is a guttural and has a hawking sound.

l or y. These are both used to represent the sound of French l mouillé, in (-i)ll- and (-i)l, whieh resembles English -y- in *lawyer*. Final *l*, that is, (-i)l, may be approximated by starting to pronounce lawyer and stopping abruptly with the -y-.

ñ or n-y. The consonants represented by ñ (Spanish ñ, Freneh and Italian gn, etc.) are practieally equivalent to English -ni- or -ny- in bunion, bunyon, onion, etc., and, exeept when final, are represented by n-y. Final ñ, as French -gn(e), may be produced by omitting the sound of -on in the pronunciation of *onion*.

v. This may be pronounced by attempting to utter English v with the use of the lips alone.

See PREFACE (vol. i., p. xli.) and the artiele PRONUNCIATION OF FOREIGN NAMES.

THE
UNIVERSAL CYCLOPÆDIA.

Cleveland: city; capital of Cuyahoga co., O. (see map of Ohio, ref. 2–H); on both sides of the Cuyahoga river, where it empties into Lake Erie; 138 miles by rail N. E. from Columbus, the State capital, 255 miles from Cincinnati, 183 miles from Buffalo, and 343 from Chicago. The Court House on the Public Square is in N. lat. 41° 30′ 5″, W. lon. 81° 42′ 6″. The city has an area of 33 sq. miles. The site of Cleveland is a plateau, sloping gently from the high bank of the lake to an elevation of from 50 to 150 feet. This plain is cut into two unequal divisions, the larger lying on the E., by the Cuyahoga, which receives Walworth Run from the W. about 1½ miles above its mouth, and Kingsbury Run from the E. a mile farther up in a direct line. The river flows through bottom lands half a mile in width, known as the "flats." A score of bridges span the Cuyahoga within the city limits, and three great viaducts, crossing the entire valley at an elevation, unite the east, west, and south divisions of the city. The Cuyahoga river was the original harbor, and it still affords space along its banks, within the city limits, for 16 miles of lateral docks. In the lake outside the U. S. Government has inclosed a space of 400 acres within a breakwater which begins about a mile W. of the river-mouth, extends some 3,000 feet into the lake, turns E. and runs 4,000 feet to a point opposite the river-mouth, leaves an entrance of 500 feet, then begins again and continues easterly 4,000 feet.

Streets, Parks, and Buildings.—The commercial part of the city extends eastward from the lower reaches of the river, parallel with the lake-front, for about a mile. Its principal thoroughfares are Superior Street, 132 feet wide, 2,200 feet back from the lake, and following its shore-line for a considerable distance, and the first half mile of Euclid Avenue. The former intersects Ontario Street in the Public Square of nearly 10 acres, thus cut into four equal quadrangles. This is the trade center of the city. From it great thoroughfares from 80 to 130 feet wide radiate. The minor streets are mostly at right angles to these thoroughfares. Cleveland is conspicuous for the width of its streets, of which almost all are lined with shade-trees. On account of its abundant foliage, Cleveland has won the name of the "Forest City." The dwellings of the city seldom are found in blocks, and tenement-houses are rare. Euclid Avenue is celebrated for its beauty and its handsome residences. West of the river are the Circle on Franklin Avenue; Lincoln Park on Jennings Avenue, containing 9 acres; Fairview Park, of 6 acres; Edgewater Park, of 98 acres; Edgewater Boulevard, of 8 acres; and Brookside Park, of 149 acres. On the East Side are the little Clinton Park, near the business part of the city; Lakeview Park, a strip of 10 acres extending 2,500 feet along the shore; and the Public Square, called Monumental Park. Wade Park (83 acres) is 4½ miles from the Public Square, on Euclid Avenue, and Gordon Park (112 acres) is 2 miles N. on the Lake Shore. Wade and Gordon parks are connected by Rockefeller Park, of 253 acres, which also extends south of Wade Park, being continued by Ambler Parkway, of 46 acres, to Shaker Heights Park, of 278 acres. Garfield Park, farther southeast, has 160 acres.

Woodland Cemetery, in the central part of the East Side, stretching from an avenue of the same name to Quincy Street, contains about 60 acres and is opposite the Catholic Cemetery on Woodland Avenue. Riverside Cemetery, of 120 acres, is in the Brooklyn district. At the eastern boundary of the city, on Euclid Avenue, lies Lakeview Cemetery, crowning an elevation which reaches 250 feet above the lake in its highest part. It is celebrated for its beauty, as also for the tomb of President Garfield.

Among the conspicuous public buildings of Cleveland are the Central Armory, the Cleveland Grays' Armory, the Western Reserve Historical Society Library, Women's College, Lakeside Hospital, several lesser hospitals, U. S. building, Northern Ohio Insane Asylum, House of Correction, Adelbert College, Case School of Applied Science, Cleveland Medical College, city-hall, county court-house, and Union Railway Dépôt. In addition to a natural drainage, due to its light and porous soil, Cleveland has an extensive system of sewerage. The water-supply is obtained from the lake through two tunnels, about 9,100 feet long, which end in a crib reaching to the bottom of the lake. Thence the water is pumped into reservoirs on the East Side, having a capacity of 115,000,000 gal. A new tunnel, 26,000 feet long, is nearly finished.

Education, Libraries, and the Press.—The board of education has under it 73 schools (1901) with 58,000 enrolled pupils, of whom 3,460 boys and girls are in the five high schools. It controls property valued at $5,500,000, and an expenditure of over $1,500,000 a year. It is estimated that 16,000 other children are enrolled in Roman Catholic, Lutheran parish, and many private schools. The WESTERN RESERVE UNIVERSITY (*q. v.*) comprises ADELBERT COLLEGE (*q. v.*), a college for women, schools of medicine, music, law, and dentistry, and academies at Hudson, O., and Green Springs, O. The Cleveland Medical College (founded in 1834) has a fine museum and library, and occupies an imposing building; the Case School of Applied Science, with a productive endowment of $2,000,000, possesses handsome stone edifices. There are in Cleveland a homœopathic college, and the medical department of Wesleyan University. The Cleveland Public Library, opened in 1853, has about 150,000 volumes, and is free: the Case Library Association, with property valued at $600,000, maintains for subscribers a circulating and reference collection of over 45,000 volumes; the Law Library, opened in 1870, has 20,000 volumes; the Western Reserve Historical Society has 25,000 books and a valuable collection of antiquities. From the press issue 7 English, 1 German, and 2 Bohemian daily newspapers, and about 125 trade, religious, and popular weekly and monthly periodicals. There are in Cleveland about 300 places of public worship, including 14 synagogues, exclusive of 6 convents and 2 monasteries.

Charities.—Hospitals, dispensaries, and maternity wards are connected with the medical schools; the municipal hospital is supported by the city, and has connected with it an infirmary and a department for the out-door relief of the poor. There are in the city a U. S. marine hospital and a Bethel home for sailors, a house of correction, industrial schools, and Roman Catholic and Protestant orphanages. The Lake Side Hospital owns extensive grounds and buildings. The Northern Ohio Asylum for the insane is a State institution founded in 1855.

Government.—The city is governed by a mayor and a city council, comprising two representatives for each of the

11 districts formed from the 42 wards. The assessed valuation of property for 1900 was $167,432,060; the fixed charges and current expenses of the government were $4,700,000 in round numbers, which included school maintenance. The bonded debt (1900) was $9,674,859, against which the city held $1,822,518 as the net sinking fund.

Communications.—The prosperity of Cleveland began with the construction of the Ohio Canal, the termini of which are the Cuyahoga river within the city limits and Portsmouth on the Ohio river, a line now largely abandoned. The Lake Shore and Mich. Southern, the Erie, the N. Y., Chicago and St. L. (Nickel Plate), the Cl., Cin., Chic. and St. L., the Cleveland and Pittsburg, as part of the Pennsylvania system, and the Balt. and Ohio, are six great trunk lines carrying the traffic of Cleveland, while several smaller railways enter the city. The lake commerce is large and expanding, and fine passenger steamers run daily to various ports on the Great Lakes. Six suburban street railways radiate from Cleveland.

Manufactures.—The U. S. census of 1890 returned statistics for 2,300 manufacturing establishments, employing a capital of $56,826,496 and 48,771 persons; wages paid, $27,596,408; value of product, $104,199,169. The following are the figures for the 10 largest industries: 21 iron and steel establishments, capital $13,738,850, employees 9,310, wages $5,702,116, output $23,932,430; 104 foundries and machine-shops, capital $7,997,233, employees 8,155, wages $4,533,223, output $13,432,334; 16 malt liquor establishments, capital $3,708,045, employees 516, wages $446,372, output $3,011,555; 8 ship-building yards, capital $2,587,775, employees 2,083, wages $1,188,662, output $3,091,300; 93 printing and publishing houses, capital $2,527,435, employees 1,789, wages $1,191,230, output $3,147,426; 16 paint-works, capital $1,664,003, employees 365, wages $243,830, output $2,008,986; 24 clothing establishments, capital $1,618,178, employees 1,833, wages $868,179, output $3,972,392; 15 planing-mills, capital $1,346,648, employees 883, wages $500,265, output $2,208,997; 21 slaughtering and packing establishments, capital $810,957, employees 474, wages $288,673, output $8,673,966; 6 flour and grist mills, capital $448,582, employees 126, wages $80,476, output $2,345,588. In the building of iron and steel vessels Cleveland surpasses all lake ports, on the average of the last ten years. Sternposts and shafts for U. S. naval vessels built on the Atlantic coast are forged in Cleveland; also heavy castings and forgings for bridges, street-railway machinery, and lifts for unloading vessels. Here is the center of the malleable-iron trade in the U. S. Important optical instruments and their mountings are made in Cleveland. Petroleum refining, hardware, boots and shoes, and chemicals give rise to important industries.

Commerce and Banking.—Cleveland is favorably situated for receiving and distributing the coal and petroleum from Ohio and Western Pennsylvania, and the mineral and lumber products from the upper Great Lakes. In 1900 there were 4,202 entries and 4,195 clearances at this port, of which more than half were for steam-vessels, and the freight received and shipped by lake in 1900 amounted to 7,369,423 tons. In the same year the total freight movement by lake, river, and canal was 22,096,000 tons. Iron ore, coal, and lumber are the leading staples in point of tonnage. There are 17 national banks, having a capital of $10,965,000, a surplus (Feb., 1901) of $3,555,328, deposits $48,780,227, and discounts $43,296,473. Ten trust companies have deposits of over $40,000,000; 23 savings-banks of more than $70,000,000; and there are many building and loan associations.

History.—In 1796 a party of surveyors, headed by Gen. Moses Cleaveland, and acting for a company which had bought Western Reserve lands from the State of Connecticut, laid out a town site on the east side of the mouth of the Cuyahoga. Its inaccessibility, Indian troubles, and the war of 1812–15 long delayed its development. In 1810 there were but 57 persons in the hamlet. Dec. 23, 1814, the General Assembly of Ohio incorporated the settlement as a village; in 1836 a city charter followed. Meanwhile Ohio City sprang up as a rival city on the west side of the river. The two places were united in 1854 as one municipality. East Cleveland was annexed in 1872, Newburg in 1873, and West Cleveland and Brooklyn in 1893. Pop. (1820) 350; (1830) 1,075; (1850) 17,034; (1870) 92,829; (1880) 160,146; (1890) 261,352; (1900) 381,768. EDITOR OF "LEADER."

Cleveland: town; capital of Bradley co., Tenn. (for location of county, see map of Tennessee, ref. 7–H); on East. Tenn., Va. and Ga. R. Rs.; 30 miles E. of Chattanooga. Here are seven churches, a large college for women, woolen-mills, stove-works, lumber-mills, wagon-works, and an organ-factory. Pop. (1890) 2,863; (1900) 3,858.

Cleveland, (STEPHEN) GROVER, LL. D.: twenty-second President of the U. S.; b. in Caldwell, N. J., Mar. 18, 1837. His father, Rev. Richard Falley Cleveland, was a Presbyterian clergyman, and when his son was four years of age accepted a call to Fayetteville, near Syracuse, N. Y. At this place, and a little later at Clinton, Grover received a good academic education. In 1853 he went to New York city and became a teacher in an institution for the blind, but not finding his duties congenial he determined to go West in search of other employment. Through the interest of an uncle he stopped in Buffalo, where in 1855 he became a clerk in the law-office of Rogers, Bowen & Rogers. Admitted to the bar in 1859, he was managing clerk for the same firm until 1862. In 1863 he was appointed assistant district attorney for Erie County, a position which he held for three years. In 1865 he became the law partner of Isaac V. Vanderpool, and in 1869 a member of the firm Lanning, Cleveland & Folsom. From 1870 he was for three years sheriff of Erie County. After nine years of professional prosperity he was in 1881 nominated for mayor of Buffalo, and elected by the largest majority ever given to a candidate in that city. He became popularly known as the "veto mayor," and the use of his prerogative in arresting measures which he deemed unwise and extravagant saved the city nearly $1,000,000 in the first few months of his administration. His popularity as mayor brought him prominently before the representatives of his party, and in Sept., 1882, he was nominated for Governor by the Democratic State convention held in Syracuse. The election which followed in November proved to be one of the most remarkable in the history of the country. Mr. Cleveland was elected by a plurality over his Republican opponent of 192,894. In office his policy was an expansion of that which he had pursued while mayor of Buffalo. In July, 1884, the National Democratic convention at Chicago selected him as its candidate, giving him on the first ballot 392 of 820 votes, and on the second 683. In his letter of acceptance he made it plain that, in case of election, he should consider himself as the servant of the people, as he had done while Governor and mayor. The canvass, in which Mr. Cleveland took no personal part, was remarkable for its discussion of personal peculiarities rather than for its consideration of political issues. Of the 401 electoral votes Mr. Cleveland received 219, Mr. Blaine, his Republican opponent, 182. Of the popular vote Mr. Cleveland received 4,874,986, Mr. Blaine 4,851,981.

On the part of the advocates of a reform in the civil service (see CIVIL SERVICE REFORM) there was a strong desire that the principles of such reform should be respected in Mr. Cleveland's administration. To a letter addressed to the President-elect, Mr. Cleveland, in a carefully prepared communication dated Dec. 25, replied that he recognized the justice of the demand for reform, and regarded himself as pledged to carry out the statutes on the subject in good faith. While the general tenor of the letter was favorable to reform, it was evident that the President would hold himself free to exercise his discretion in all cases involving what he regarded as "offensive partisanship." His views on the subject were embodied in the following sentence: "But many now holding such positions have forfeited all just claims to retention because they have used their places for party purposes in disregard of their duty to the people, and because, instead of being decent public servants, they have proved themselves offensive partisans and unscrupulous manipulators of local party management." When the President-elect entered upon office he announced that, "with the exception of heads of departments, foreign ministers, and other officers charged with the execution of the policy of the administration, no removals would take place except for cause." By this policy he at once came into collision with many influential members of his party who advocated the general and speedy removal of Republicans from office. The President decided to pursue a medium course. He made "offensive partisanship" a ground for removal, and the phrase became a by-word not very long after his inauguration. In the course of his first year in office about 18 per cent. of the postmasters were removed, and about 8 per cent. of the clerks in the departments in Washington. As he had done while Governor, so now as President Mr. Cleveland exercised the veto power with great freedom. This was par-

ticularly true during the session of Congress which ended Aug. 5, 1886, when of 987 bills which passed both houses he vetoed 115. In Dec., 1887, he devoted his annual message to the presentation of his views in favor of a reduction of the tariff. He advocated a radical modification of the existing policy by the adoption of a law framed with a view to the speedy establishment of the principles of free trade. The Republicans immediately took up the issue thus presented, and the question at once became the predominant issue of the canvass. Mr. Cleveland was unanimously renominated by the National Democratic convention in St. Louis on June 5, 1888. The efforts of both parties were directed chiefly to the doubtful States of Indiana, New York, New Jersey, and Connecticut. Mr. Cleveland carried all the Southern States, and in the North New Jersey and Connecticut, while of the doubtful States Mr. Harrison received the votes of New York and Indiana. Of the electoral votes Harrison received 233, Cleveland 168. The popular vote for Cleveland was 5,540,329, that for Harrison 5,439,853.

At the close of his administration on Mar. 4, 1889, Mr. Cleveland retired to New York city, where he re-entered upon the practice of his profession. It soon became evident, however, that he would be prominently urged as a candidate for renomination in 1892. As time progressed, the probability of his nomination became more and more certain, and at the National Democratic convention, which met in Chicago June 22, he received more than two-thirds of the votes on the first ballot. In his speech of acceptance, delivered to a vast concourse in Madison Square Garden, New York, he reiterated his views as to the necessity of tariff reform, and thus made it certain that the tariff question would be the principal issue at stake at the election in Nov., 1892. In that election there was a remarkable reversal of the popular will of four years before. The Democrats carried twenty-three States, including, for the first time in years in a presidential contest, Illinois, Indiana, and Wisconsin. The popular vote stood 5,553,142 for Cleveland, 5,186,931 for Harrison, and 1,030,128 for Weaver of "the People's" party. In the electoral college Mr. Cleveland received 276 votes, Mr. Harrison 145, and Mr. Weaver 23. On Mar. 4, 1893, Mr. Cleveland was a second time inaugurated President at Washington. (See vol. xii., p. 63.) At the close of his second administration he retired to Princeton, N. J.

Mr. Cleveland married at the White House, June 2, 1886, Miss Frances Folsom, daughter of his former friend and partner, Oscar Folsom, of Buffalo. C. K. Adams.

Clev'enger, Shobal Vail: sculptor; b. at Middleton, Butler co., O., Oct. 22, 1812; worked as a stone-cutter in Cincinnati; executed portrait-busts directly in free-stone; opened an atelier in New York and made statues of eminent men, still preserved in the art collections of Boston, New York, and Philadelphia. In 1840 he visited Italy, where he passed three years, dying at sea on his way home, Sept. 23, 1843. His best-known work includes statues of Daniel Webster and Henry Clay, and a bust of Edward Everett and a *North American Indian*, which attracted attention in Italy from the novelty of the subject there.

Cleves (Germ. *Kleve*): chief town of the circle of Düsseldorf, Rhine province, Prussia; on three hills about 2 miles from the Rhine; 48 miles N. W. of the city of Düsseldorf (see map of German Empire, ref. 4–C). It has a castle dating from 1439; also manufactures of cotton, silk, and woolen fabrics, etc. Pop. (1890) 10,409.

Clichy, klēē'shee': a town of France; department of Seine; 4½ miles N. W. of Paris, of which it is a suburb (see map of France, ref. 3–F). Pop. (1881) 24,320; (1896) 33,895.

Cliff: an abrupt descent of the land-surface. Cliffs are of three kinds: 1. Those made by dislocation of the earth's surface, exposing the abrupt faces of fractures, as in the broken lava cliffs of South Oregon, and presumably in the colossal granite cliffs of the Yosemite Valley (*q. v.*). Many cliffs in the high plateaus of Utah have wasted back a moderate distance from original fracture faces of this kind. 2. Cliffs, bluffs, and escarpments mark the weathering and retreating outcrops of hard, nearly horizontal strata, surmounting a stony slope or talus that covers the underlying weaker strata. The Book cliffs of Western Colorado are remarkable examples of such forms. The chalk escarpments inclosing the Weald of Southeastern England are smaller examples of the same kind. Irregular cliffs and precipices also occur on slopes of deep valleys worn in the disordered rocks of mountains. 3. Sea or lake cliffs are formed by the undercutting of shore-waves. These are marked by a level base, independent of fractures or rock structure, by a variable height dependent only on the altitude of the coast in which they are cut, and by a comparative freedom from waste or talus at their base. The cliffs of Dover, England, are well known. The sea-cliffs of the Orkney islands are among the highest of their kind in the world. W. M. Davis.

Cliff-dwellers: those aboriginal tribes of the western parts of North America who habitually made their homes in the natural recesses of the cliffs. See Cliff-dwellings below.

Cliff-dwellings in the U. S.: dwellings and groups of dwellings built in natural recesses in the cliffs in the valleys of the Rio Grande and the Rio Colorado, and more especially upon some of the eastern tributaries of the latter stream. The walls are skillfully constructed of stone laid in mortar made of the native *adobe* clay. In some cases the stone is broken into somewhat uniform blocks, which are rudely dressed upon the exterior surface. The interiors of the houses are often plastered; in some instances the exterior also has received a coat of clay, and upon this has been laid in rare cases a wash of white clay.

Many of the houses are small and occur singly, occupying restricted niches or shelves in the cliffs, but when the recesses are large the plan is often expanded, and the structure becomes a communal dwelling or village of many rooms irregularly arranged to fill the spaces, and with exterior walls conforming to the irregular margin of the precipice. Two and even three stories are not unusual, and, although the work is all primitive, the effect of feudal architecture is suggested by the round towers, the diversified plan, and the irregular distribution of windows and doors over the crumbling façade.

The doors and windows, which are somewhat square, have wooden lintels, and appear to have been closed by stone slabs, skins, or blankets. The arch was unknown. The upper floors and roof were supported by poles set in and generally penetrating the walls. In many cases the overhanging ceiling of the recesses made roofs superfluous, the walls being carried the entire height.

The many striking features exhibited by these strange dwellings have excited much interest, and led to serious misconceptions as to the status and affinities of the peoples concerned in their construction.

The peoples now occupying the pueblo towns of this region undoubtedly represent to a large extent the ancient tribes, and not a little evidence has been collected bearing upon this point. This evidence is derived mainly from two sources—a study of the traditions of the modern peoples, and a comparative study of ancient and modern art.

The stories related by the town-builders of to-day are interesting and romantic. The Tusayan Indians, according to tradition, dwelt at first in the lower depths of the earth, but escaped finally by means of magic cane-stalks that sprang up with such vigor as to penetrate the multiple roofs of the lower world. Assisted by their magic guardians and divinities, they learned the ways and arts of the upper world. Their wanderings before they finally settled upon the mesas of Tusayan were long and full of adventure. One myth explains the existence of deserted dwellings scattered everywhere over the desert as follows: the snake gens lived at first, each family in a snake skin hung on the end of a rainbow, which, as it swung around in the sky, dropped them here and there upon the earth, where they immediately began to build their dwellings. At another stage of their wanderings a brilliant star arose, which would shine for a while and then disappear. The wise men said that beneath that star the people for whom they sought would be found. So they followed when the star shone, and when it disappeared built their dwellings to await its reappearance, and in the end a vast number of ruins were scattered over the land.

One of the halting-places of the Horn people, a gens of Tusayan, is described as a cañon with high, steep walls, in which was a running stream. Here they built a large house in a high, cavernous recess. Much time was spent in making ladders and in cutting stairways up the rocky approaches. The women and children gathered the stones and made the mortar for building, and portions of the tribe attended the gardens in the valley below. Many of these traditions are made to refer to special ruins, but, with a few exceptions, little reliance can be placed upon the identifications. The stories are not derived from the past, but are invented to

explain the puzzling culture-phenomena of the surrounding country.

The Zuñis and the tribes of the Rio Grande relate similar stories of the past. Although there is in a general way close analogy between the traditions, the arts, and the customs of the several pueblo tribes of to-day, the marked differences in language clearly indicate the presence of at least four stocks of people. A glance at the art remains seems to indicate greater unity in archaic times. Ancient art in stone and clay corresponds very closely over a wide region to the pottery of the cliff-dwellings. This unity of art is indicative in a measure of homogeneity of people.

Explorers tell us many wonderful things of the ancient ruins of the pueblo country—of ruined cities on the plains, of fortresses in the cliffs, of standing stones, of walls and towers and cisterns and causeways and canals, of cave-cities dug in the chalk-like bluffs, and of burrows beneath beds of lava or in the sides of cones of indurated ash. Much has been made of this remarkable diversity of remains and complexity of peoples and cultures, and a succession of periods of occupation has been assumed, but much of this diversity may be explained by calling to our aid the simplest principles of art growth. The dwellings of a people are to a great extent what the immediate environment of that people makes them.

The pueblo country is a semi-desert, made up of table-lands of varying heights, cut by the waters of rivers which rise in the mountains and radiate to the sea. This cutting gives a multitude of irregular plateaus of varied and remarkable outlines, with steep sides and escarped margins. The geologic formations lie to a great extent in horizontal beds, and consist of alternating groups of hard and soft strata. The streams as they cut down through these formations eat their way to the right and left by attacking the softer layers. These being removed, the hard strata above break down in masses of varying sizes all along the sinuous margins of the plateaus. These constitute nature's quarries, and furnish, ready-shaped to the hand of the home-maker, unlimited quantities of material. This method of erosion, by undermining the hard ledges, gives, besides these deposits of building-stones, a peculiar conformation of the cliffs, affording natural dwelling-places for men. Everywhere there are shelves, shallow shelters, and capacious recesses, and where the valleys are deep there are tiers upon tiers of these natural dwellings, many being beyond the reach of man.

Now, it is not hard to foresee the effect of these remarkable conditions. A tribe of wanderers approaching from the south, scorched by the sun and stifled by the alkali-dust of the plains, would seek the shadows of the great rocks and make their homes in the cool recesses. A boreal people, coming down from the north, would find shelter beneath the roofs of the desert into which they had wandered. Men approaching from any quarter, and from lands far or near, would at once make their homes in the cliffs, and before a generation had passed they would not only be cliff-dwellers but cliff-builders. For convenience of occupation, they would level up a floor. To shelter from the wind or to protect from an enemy, they would raise huge stones or build walls across the openings. Three walls and the roof were already furnished by the natural recesses, and the stones were at hand to close in the front and complete the dwelling. Nature, under such conditions and by such suggestions, would make cliff-dwellers of any race beneath the sun.

On occasion, when the accommodations of modified natural shelters became insufficient, when stone was plenty and enemies were not threatening, building extended to independent construction, and houses and communal dwellings of stone sprang up wherever land was fertile and the water-supply was abundant.

With these peoples dwellings in valleys and upon plains undoubtedly came first, as valleys had to be ascended and plains crossed before the plateau land was reached, but not until this land of ever-present stone environment was reached and adopted as a permanent abode would stone-building become a prevalent and a well-established art. At any period of the history of the peace-loving town-builders the approach of strong foes would lead to the occupation or the reoccupation of nature's strongholds.

It is not uncommon to see communal dwellings, round towers, cliff-houses of masonry, and excavated bluff-dwellings all in a single group, all connected, and grading in their features of construction one into the other.

Cliff and cave dwellings are not known to have been occupied extensively in recent times, but limited occupation has been recorded in a number of cases, and the newness of the masonry, the freshness of the plastering, the wonderful state of preservation of pottery, wooden tools and utensils, woven fabrics, baskets, sandals, mats, bows, arrows, and hafted tools of all kinds, and the practical identity of all these things with modern work, connect them definitely with the present period, and lead to the conclusion that the ancient and modern peoples are closely related in blood and in history.

Clifford, NATHAN, LL. D.: jurist; b. in Rumney, N. H., Aug. 18, 1803; educated in Haverill and Hampton in his native State; was admitted to the bar and settled in York, Me., in 1827. He served in the Maine Legislature 1830–34; attorney-general of the State 1834–38; member of Congress 1839–43; an effective Democratic speaker; Attorney-General in the Polk cabinet 1846–48, when he was sent to Mexico to arrange the terms of the treaty of peace; made associate justice of the U. S. Supreme Court by President Buchanan in 1858; member of the Electoral Commission which decided in 1877 the Tilden-Hayes contest; was the author of two volumes of *United States Circuit Court Reports* (1869). Died from the effects of an amputation of his foot in Cornish, Me., July 25, 1881.

Clifford, WILLIAM KINGDON, F. R. S.: mathematician; b. in Exeter, England, May 4, 1845; educated at King's College, London, and at Trinity College, Cambridge; was second wrangler in the mathematical tripos of 1867; Professor of Mathematics and Mechanics in University College, London, 1871–79. He was widely known as a versatile lecturer and an original thinker on philosophical and scientific subjects; contributed to the *Proceedings* of the London Mathematical Society; author of *Elements of Dynamics* (part i., 1878; part ii., edited by R. Tucker, 1887); *Common Sense of the Exact Sciences* (completed and edited by K. Pearson, 1885); *Mathematical Papers* (1881); *Seeing and Thinking*, a series of lectures (1879); *Lectures and Essays* (edited by L. Stephen and F. Pollock, 1879; 2d ed. 1886). D. in Madeira, Mar. 3, 1879.

Clifton: a fashionable watering-place of Gloucestershire, England; a western suburb of Bristol (see map of England, ref. 12–F). Clifton has an important public school and a suspension bridge spanning the Avon at a height of 245 feet. Pop. 30,000.

Clifton: a post-village of Stamford township, Welland co., Ontario, Canada; on the Niagara river at the suspension bridge, a mile below the Niagara Falls (see map of Ontario, Canada, ref. 5–E). It is the eastern terminus of the Great Western Railway, and is on the Erie and Niagara Railway. It has a very large export trade to the U. S. and a large museum. Pop. 2,347.

Clifton Springs: on the Auburn branch of the New York Central R. R.; situated in Manchester and Phelps townships, Ontario co., N. Y. (for location of county, see map of New York, ref. 5–E). It has copious sulphur springs, and is the seat of Clifton Springs Sanitarium, a noted resort. Pop. (1880) 902; (1890) 1,297; (1900) 1,617.

Climac'teric Year [from the Gr. κλιμακτερικός, from κλῖμαξ, a ladder]: the name given, especially in former times and by believers in astrology, to the years in which a critical change is supposed to take place in the human constitution or fortunes. These were supposed to be the years ending the third, fifth, seventh, and ninth period of seven years, the grand climacteric or most critical time of human life being supposed to be the sixty-third year. Some added the eighty-first year. The supposed mystical character of the number seven probably gave rise to this belief. There is an actual climacteric period in the lives of women, which usually occurs between the forty-fifth and fiftieth years.

Climate, Climatology, and **Climatography**: CLIMATE [from Fr. *climat*, viâ Lat. from Gr. κλίμα, κλίματος, slope, (supposed) slope of the earth from equator to poles, latitude, clime; deriv. of κλίνειν, to incline] is the average weather or mean of the atmospheric conditions of a place or region. CLIMATOLOGY is the science of climates, and CLIMATOGRAPHY is the descriptive part of climatology, or a description of climatal provinces. Weather is the instantaneous, passing, or current condition of the atmospheric elements. Clima-

tology and the science of the weather together make up meteorology. The science of the weather is often called meteorology proper.

The expression of the facts of climatology is made in terms of the same elements as in the science of the weather, but they have a different order of importance in the two branches of meteorology. In the weather the pressure of the air (barometric pressure) is the leading element, and is used as a key to the whole situation. In climatology the temperature is of leading importance, and after it come the forms of water (moisture, cloud, precipitation) and the winds. Climatology still gets its chief importance from its relations to man and his operations, its relations to organic life, and to the sculpture of the earth's surface: while meteorology proper has already reached a point where it is studied as a science, finding its nearest scientific relationships in hydrodynamics.

On climatological maps the data of air-pressure and temperature are usually reduced to what they would be at the level of the sea, thus eliminating the irregularities of the earth's surface and greatly increasing the simplicity of the map and the ease of comprehending it. The correction of the pressure to sea-level means the addition of about an inch to the reading of the barometer to each thousand feet of elevation. The correction of temperature is more difficult, because the rate of change varies greatly with the season, the time of day, the state of the weather, and the geographical position. In round numbers from 2° to 5° F. must be added for correction for each thousand feet of elevation. The rate of change of temperature decreases with increase of altitude. When the data thus corrected have been entered on maps, lines are drawn through the places having the same temperature, and these are called *isotherms*, while those through the same pressures are called *isobars*. The precipitation and cloudiness are not reduced for elevation, and the corresponding lines of equal precipitation and cloudiness are called *isohyetals* and *isonephs*. Snowfall is generally reduced to equivalent amounts of rainfall. It is found that on the average the corresponding depth of rain is one-tenth that of the snow. The direction of the wind is shown by arrows which fly with the wind. Thus for what is called a N. W. wind the arrow flies S. E. The customary paths of storms are indicated on the maps by heavy unbroken lines.

The above relates only to the mean data in the climate of a region. The applications of climate to man and organic nature make it necessary also to take into account the amount of variation from the mean values, and the frequency and rapidity with which these variations occur. Two places may have the same mean annual temperature of, say, 50° F.; but one may have a mild and equable climate, highly suitable for invalids, while the other may be severe and rigorous in the extreme. This would be the case if in the one the temperature changed only slowly between 20° and 80°, while the other had frequent and rapid changes with extremes at 10° and 110°. Two things are here involved, quite different but not usually distinguished: the range from lowest to highest, and the frequency or rapidity of large fluctuations. The distinction is of considerable importance, but the language lacks definite terms to distinguish them. To permit the free use of this distinction, the terms mild and severe will be used to express the quantity of the change, and equable and rigorous to express the frequency of the fluctuations, more especially in reference to temperature. Thus a *mild climate* is one in which the changes are slight, a *severe climate* one in which the changes are great, an *equable climate* one in which there may be considerable changes, but these are slow, a *rigorous climate* one in which serious changes occur frequently, and therefore rapidly. A severe climate is not dangerous to animals and plants, is not uncomfortable to man; but its action is rather that of a tonic to the human race, and may be used for this effect in some forms of disease. A rigorous climate, on the other hand, is tolerated by few forms of animals and plants, is inimical to the best development of the human race, and even rapidly disintegrates the rocks. The relative mildness or severity of climates is occasionally represented on maps by lines of equal divergence from the mean, called *isabnormals*. The relative equability and rigor of climates has been the subject of many studies, but there is as yet no general agreement as to the best way of graphically or numerically expressing it.

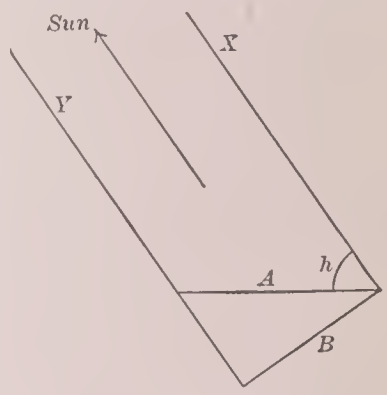
Questions of varying climatic phenomena are often treated on maps, frequently in terms of the probability of recurrence of the phenomenon.

Solar or Astronomical Climate.—Solar climate is concerned with supposed climatic effects, if the earth were a smooth, hard ball, and the surface homogeneous. The sun is the chief controller of terrestrial climate; the effect of the other heavenly bodies is, so far as known, insignificant, hence solar and astronomical climate are the same thing. The problem of solar climate is only that of climate reduced to the simplest possible elements. So far as the radiant field of the sun is concerned, it is the question of the quantity of the sun's heat which reaches the earth and of the effect of the atmosphere on this heat and of the heat on the atmosphere. The fundamental principles and facts underlying these questions are given with abundant fullness in the elementary physiographies and astronomies. In what follows, some conclusions of importance only will be given.

In every case considered it must be remembered that the earth as a whole and each individual point on it are both gaining and losing heat, and the resulting temperature strikes the balance between the two. The gain in heat is by insolation, and is doubly periodic, one period being due to the rotation of the earth on its axis, the other to the revolution around the sun. The earth loses heat by radiation in space, and this continues steadily and without interruption. With this premised, the following conclusions may be briefly stated:

If there is no air—

1. The isotherms will be parallel to the equator, because, on the average, each point of any parallel of latitude would receive just as much heat as any other point of the same parallel. This would be true also if a dry atmosphere were present.



2. The intensity of midday insolation in different latitudes varies as the sine of the sun's altitude. For let $X\,Y$ be a beam of sunshine when the arrow points in the direction of the sun, and the angle h is the sun's altitude. Then the beam which, if the sun were vertical, would be confined to the line B is by the slope spread over the horizontal line A. Its intensity is decreased in the ratio $\frac{B}{A} = \sin h$. As the average value of h for the year equals 90° minus the latitude, sine h can, with sufficient approximation, be put equal to cosine latitude, and we have the general climatic fact that the midday intensity of the sun's rays decreases as the cosine of the latitude. The mean daily intensity, however, includes the intensities for the hours before and after midday, when the sun is lower and h consequently smaller. It depends, therefore, on both the meridian altitude of the sun and on the length of the day, and no longer runs with the cosine of latitude. The expression for this is complicated, and can be found in Ferrel's *Recent Advances in Meteorology* (1885, pp. 75–84).

3. The increase in the length of the day poleward in summer compensates for the higher latitudes. The following are the values of the mean solar intensities for the first of each month and for each ten degrees of latitude for the northern hemisphere. The figures express the percentages of the mean intensities in terms of the intensity when the sun is constantly vertical.

MEAN INTENSITIES OF SOLAR RADIATION, OUTSIDE OF THE ATMOSPHERE.

Dec. 1.	0·30	0·27	0·22	0·18	0·12	0·07	0·02	....	....	....
Year..	0·30	0·30	0·29	0·27	0·24	0·21	0·17	0·14	0·13	0·13

This table brings out the surprising fact that the solar intensity is not always greatest at the equator, but that about the vernal equinox it is actually greatest at the pole—due to the continuous day then existing in that latitude. It is a well-known fact that in midsummer the heat in high latitudes in the afternoon is greater than in the tropics.

4. Defining a "thermal day" as the equivalent of an average day at the equator (in mean intensity of solar radiation), the table annexed will express the annual sum of solar radiation. It is taken from Hann's *Handbuch der Klimatologie* (1883), p. 67.

ANNUAL SUM OF SOLAR RADIATION.

Latitude.	Thermal days.
0°	365·2
10	360·2
20	345·2
30	321·0
40	288·5
50	249·7
60	207·8
70	173·0
80	156·6
90	151·6

From this it appears that the pole receives about 41 per cent. of the radiation received by the equator. If the sun remained on the equator, the pole would receive no heat.

5. The southern hemisphere attains a greater intensity of heat than the northern, because perihelion occurs during its summer. The intensity of the sun's rays in Australia and South Africa has frequently been mentioned by travelers.

6. The quantity of heat received by the entire earth is the same for equal times in all parts of its orbit. This is a result of the generalized form of Kepler's areal law (Ferrel, *op. cit.*, p. 82). As the winter occurs in the southern hemisphere at aphelion, and it has already been shown that the intensity of solar radiation is higher in summer, it follows that the climate of that hemisphere is more severe than that of the northern.

7. If the atmosphere is added, but without moisture, a large part of the solar radiation is absorbed by it and fails to reach the earth. The amount of absorption is, in round numbers, about one-fourth when the sun is vertical, and increases gradually with decrease of altitude of the sun until at the horizon all is absorbed or diffused. The average absorption and diffusion of the atmosphere is approximately two-thirds. The diffusion extends the hours of daylight by the length of morning and evening twilight.

8. There is also a selective feature in the absorption of the solar radiations, those of medium wave-length being best transmitted, while those of longer and shorter wave-length are more largely absorbed. The dark heat rays radiated from the earth are retained near the surface, and aid in keeping the surface temperature relatively high.

9. In the atmosphere itself a circulation is established, the air rising in the vicinity of the warmer equator, flowing off above toward the pole, to settle sooner or later to the surface and flow toward the equator to take the place of the air which rises in that region. These movements, which would be directly north and south if the earth were without motion, become changed in direction so soon as the earth begins to rotate, according to a general law first fully developed by Ferrel. Rotation causes a deflection to the right in the northern and to the left in the southern hemisphere. The result is that the inflowing equatorial surface current becomes the northeast and southeast trade-winds, and the outflowing, pole-seeking upper current becomes the westerly anti-trades.

10. The isobars theoretically would also be parallel to the equator on a non-rotating sphere, but the combined effect of the rotation of the earth and the circulation above given causes the isobars for greatest pressure to be at about 30° N. and S. latitude, and the minimum isobars to be at equator and poles. Ferrel, *Popular Treatise on the Winds*, 1889, pp. 133–145.

11. If, now, moisture is added to the air there are many quantitive and qualitive changes in the above statements, the most marked being due to the formation of clouds. It is highly probable that these clouds would not be symmetrically formed, in which case a long series of unsymmetrical arrangements would be set up and the pure solar climate would approximate the actual terrestrial climate.

The phenomena above mentioned all belong to the radiant field of the sun. Evidence is accumulating to show that the sun's coronal field also has appreciable meteorologic, and consequently climatic, effects, but this side of the subject is still too new (1893) to admit of more than a passing reference.

Actual or Physical Climates.—The introduction of the actual irregularities of the earth leaves the preceding still correct, except that the symmetry is destroyed, while variations of the material and elevation of the surface produce corresponding climatic variations, and give rise to storms which cause an independent series of fluctuations. The distribution of land and water, the ocean currents, the elevation of the land above the sea-level, the greater or less efficiency of mountain ranges as wind-breaks, and the clothing of the earth's surface are the leading causes of the variations on solar climate. The combined effect results in the following types of climate:

The *tropical* climate is usually mild, equable, and warm, not often disturbed by general storms, but subject to small local storms, usually coming on in the afternoon. Both seasonal and diurnal phenomena usually occur with great regularity. Hurricanes and typhoons are oceanic, autumnal, general, storms of great violence which originate in the tropics but pass into the temperate zones, where they take on the character of general storms of the temperate region.

The *sub-tropical* climate has the equability of the tropical, but not its mildness. The weather is generally settled, and storms are relatively infrequent. It is more liable to insufficient rainfall than the adjacent climates of higher or lower latitudes. General storms rarely originate in this latitude; local storms, though less regular than in the tropics, are frequent and sometimes violent. Areas of high pressure are more inclined to become stationary here than in higher latitudes.

The *temperate* climate is the climate of unsettled weather, and is consequently more severe and more rigorous than the preceding. It has more cloud and fog. Storm conditions pass frequently eastward. Local storms are usually confined to the warm season.

The *arctic* climate is cold and very severe, precipitation small, summers short and very hot.

The *alpine* climate, found on high mountains, is more rigorous than the arctic climate, and has a longer summer, with great solar intensity, because of the rarity of the air at high elevations.

Oceanic climates are relatively cool, mild, equable, cloudy, and moist. *Insular* and *littoral* climates partake of the same character. *Continental* climates are relatively severe, rigorous, clear, and arid. In *desert* climates the continental features are still more strongly accentuated.

Where mountains serve as wind-breaks, the air is forced upon the windward side, becoming chilled and losing its moisture. It descends on the other, already dry and becoming warm by the fact of the descent. When the wind is high this air becomes a warm, drying wind, called the *Föhn*, chinook, etc. *Windward* climate is consequently cool, cloudy, and wet. *Leeward* climate is warm, dry, clear, and subject to the chinook winds.

A glance at the isothermal map herewith shows some interesting cases of the causes of variation of climates mentioned above. For instance, the western coasts of continents are warmer in temperate regions, the eastern in the tropics. This is due to the prevailing winds, aided by the ocean currents. The most efficient current is the Gulf Stream, which gives Iceland the annual temperature of Newfoundland, causes a temperate climate far into the Arctic at North Cape, and even affects the annual isotherms of Spitzbergen and Nova Zembla. On the rainfall map which accompanies this article, the heavy littoral rainfall on the west coast of the Americas in the higher latitudes, combined with light rainfall inland, is due to the break of the winds by the Coast Range in the one case and the Andes in the other. Exactly the reverse prevails in tropical America. Similar considerations enable us to explain each great departure from symmetry on the maps.

CLIMATOGRAPHY.—1. *The United States* reach the tropical climate only in the southern part of the peninsula of Florida. The remainder of the area is sub-temperate and temperate in climate, except Northern Alaska, which is arctic. More than half of its sub-temperate area requires irrigation for successful agriculture. A large part of the western temperate region has a leeward climate, the windward part being confined to relatively narrow strips on the western slopes. The shores are all bathed with warm water, except New England, where the deflection eastward of the Gulf Stream permits access of colder northern waters. The Great Lakes moderate the continental features of the climate in the region to the east of them. The great fluctuations in the meteorologic elements are chiefly due to the general storms or areas of high pressure which traverse the country from west to east. The most of these appear first on the northwestern border, and, because of the lack of a transverse range of mountains to the north, these are apt in winter to bring severe cold with them. Few cross from the Pacific or orig-

ohnson's Universal Cyclopædia.

inate within the States. Still fewer come up northeastward from the Gulf of Mexico, but sometimes one skirts the eastern coast. The latter are hurricanes which have lost their dangerous violence by the time they strike the mainland. The local storms are phenomena of the warm season, and occasionally exhibit great energy as cloudbursts and tornadoes. The heaviest rainfall is on the northwest coast and on the Gulf coast of Florida. At Neah Bay, Washington State, the mean of eight years is 108 inches. In Florida, at Tarpon Springs, it averaged 84·5 inches for five years; at Fort Barrancas, 70 inches for twenty-three years. Nearly as heavy an annual rainfall occurs about Cape Hatteras. At Hatteras for seventeen years it averaged 68 inches. The smallest observed rainfall is in the Colorado desert in Southern California. At Mammoth Tank (lat. 33° 7′ N., lon. 115° 17′ W.), the mean of thirteen years is only 2 inches. In general, the valley of the Colorado river is the area with the smallest rainfall.

The climate of the southern extensions of Alaska (the Aleutian and Alexander islands) is mild, equable, temperate, wet. That of the southern part of the mainland is continental and sub-arctic, while the northern part is thoroughly aretic.

2. *Dominion of Canada*: temperate in the southern part, it is thoroughly sub-aretic and arctic over the most of its area. The great expanse of Hudson's Bay, open poleward, and the absence of mountains to the north give free access to Arctic weather over this great continental area, while Labrador and Newfoundland are chilled by an Arctic current. The leeward climate east of the Rocky Mountains extends farther northward than might be expected, reaching distinctly to the Peace river (lat. 56° N.), and perhaps farther north. The area E. of a line from Great Slave Lake to Lake Superior and N. of a line from the north shore of Lake Superior to Anticosti island is apparently too arctic for any possibility of successful agriculture.

3. *Mexico*, though for the most part within the tropics, has a climate which is temperate, mild, equable, and dry. The coolness of the climate is due to the elevation. The tropical climate is found on a relatively narrow fringe of coast where it is wet, and in the peninsulas of Lower California and Yucatan, which are dry. Rain in summer and autumn; dry in winter and spring.

4. *West Indies*: tropical and equable, with rain at all seasons, but chiefly in summer.

5. *Tropical Cordillera Province*: climate of perpetual spring; two rainy seasons, one in early summer, the other in autumn, with a short dry season between, and a long dry season in winter and spring.

6. *Tropical America*, not Cordilleran: tropical and equable; a single late summer or autumn rainy season S. of the Amazon, but a double one, as in the preceding, N. of that river, except in inner Guiana, where there is rain through the year, but most in winter.

7. *Chilian Province*: sub-tropical and dry in the north; temperate and very wet in the south; maximum rainfall in winter.

8. *Pampas Province*: rigorous and dry; rainfall in summer.

9. *West European Province*: temperate in the north and sub-temperate in the south; stormy, not strictly continental. Precipitation not clearly seasonal.

10. *East European*: like the preceding, but distinctly continental, and with a summer maximum of rainfall.

11. *Siberian Province*: strongly continental and growing more arctic to the pole of cold, which lies N. of Yakutsk in lat. 67° N.; the most severe climate known; precipitation small.

12. *Asiatic Plateau Province*: dry, severe, and rigorous.

13. *Chinese Province*: temperate and sub-temperate; rain in summer.

14. *Japanese and Philippine Province*: insular, temperate and tropical, wet; winter rains from Nipon northward, summer rains south.

15. *Monsoon Province*: summer and autumn rains; tropical, mild, equable.

16. *Desert Province*, from the Western Sahara to the basin of the lower Indus; dry and poor in plant life; very rigorous and severe.

17. *Tropical African Province*: warm, but tempered by the elevation, except on the coast; mild and equable; double summer and autumn rainy season.

18. *South African Province*: sub-tropical, dry, generally continental.

19. *Australia*: generally dry and continental, temperate and sub-temperate; in the north a single rainy season in summer; in the central and western part no rain; in the southwest rain in winter.

20. *Polynesia*: insular, tropical; rain generally in summer.

Climate and Mankind.—There are certain broad, general effects which require enormous periods of time to work themselves out. These belong rather to an account of the evolution of animal and plant forms. In this place opportunity will be taken only to point out some more immediate effects of climate on organic life. First, so far as man is concerned:

1. He evades climatic effects by a series of ingenious devices, which together form a large part of the apparatus of civilization. Man covers himself with clothing and regulates its quantity, material, and color in such a way as to protect himself from extremes of temperature and from precipitation. He constructs dwellings within which he creates climates to suit himself, and he even makes these dwellings peripatetic, in the form of railway-coaches. His furnaces and stoves raise the temperature when necessary, and his punkahs and artificial or natural ice can lower it when it is too high. By commerce he gets the food products of other climates; by means of hothouses he grows tropical productions in temperate climates; and by the numerous methods of the preservation of foods he can interchange the products of the seasons. By irrigation and drainage he overcomes the scarcity or surplus of water, and successfully raises plants in places where natural conditions had forbidden them to grow. In short, he can at will create for himself an artificial climate or remove himself to a new one, and he can force productions not belonging to his climate, or transport them from their home as he pleases.

2. Mankind as a whole is very tolerant of climatic extremes. He is entirely tolerant of reductions of air-pressure by one-fourth, and even changes of one-half the sea-level pressure cause him little inconvenience if the change is gradually made. Of the changes of 1 or 2 inches of the mercurial column (one-thirtieth to one-fifteenth of the total pressure) he is entirely unconscious from his sensations. He is tolerant of all climatic temperatures, if the simplest and most obvious precautions are taken. The temperature is nowhere continuously above blood-heat, and Peary has shown that if the poles have not been reached, it is for other reasons than that the climate is too rigorous for man to endure. The lowest temperature recorded as endured by man is −71° C., or −96° F., reported by Gilder, who accompanied Schwatka in his Franklin search-party. The highest at hand is that recorded by Buveyrier among the Tuaregs, viz., 67·7° C., or 154° F. While there is not every guarantee of the exactness of these numbers, yet there is no good reason for doubting them. The range from lowest to highest is 138·7° C., or 282° F., and this represents the greatest known range of temperature on the surface of the earth. At any one station the range is much smaller, rarely surpassing a half of the above. Man is also perfectly tolerant of the extremes of humidity, provided he can, in the one extreme, have a supply of water to drink, in the other a provision of something to float on. This capacity for toleration enables him to reside in practically any part of the earth's surface, but the toleration has some limitations. Mankind is not entirely tolerant of extreme conditions when long continued. An unusually severe winter is followed by an unusually large death-rate. A residence of a northerner in the tropics to be healthful must be interrupted from time to time by a visit to the mountains or to temperate regions. Another limitation is found in the character of the productions. To permit of continued and profitable residence, these must be suitable to support human life, and in the case of colonies the productions must be not too dissimilar from those of the home country. Mankind is fairly more tolerant of change of climate than of change of diet. Another limitation of the general toleration mentioned is to be found in the causes of disease, such as bacteria. The emigrant may be entirely tolerant of his home bacteria, as vaccination makes us tolerant of smallpox, but he may altogether lack this protection against the bacteria of his new home, and fevers or other endemic diseases and death may follow.

3. While mankind shows great tolerance in general, there is a great difference in individual races, as is shown in their capacity to spread over considerable parts of the earth's surface. The Eskimo leave their hyperborean region with

regret, and suffer greatly from homesickness while away from it. The U. S. Government find great difficulty in transplanting their Indian wards, especially if a considerable change in latitude is attempted. The Indians of the elevated plain of the Andes of Ecuador (elevation 7,000 to 12,000 feet) and those of the hot plains at the base, though they are probably members of the same stock, can not endure transplantation each to the other's climate. Indeed, in the coffee region, intermediate between the two, laborers from the sierra suffer from ague and dysentery and those from the plains from influenza and neuralgia, and neither can do more than remain during the harvest season of three or four months. A longer residence means sickness, and often death. The Hottentots whom Livingstone took with him into more tropical latitudes in Africa proved to be generally unable to stand the change in climate, and in general Livingstone endured these changes better than any of his black companions. On the other hand, the Jews have spread over almost the entire inhabited earth with equal tolerance everywhere, and, as they do not intermix with other races, it is a case of pure racial tolerance. They have multiplied to enormous numbers in the severe climates of Poland and Russia; in Sweden they are said to increase more rapidly than the native population; in Algeria they maintain their numbers; and they form permanent communities in Indo-China. The Chinese live in comfort in all latitudes from British Columbia to Australia. The Spaniards have spread from Louisiana to Chili, and are entirely acclimatized. In some places, as in Guayaquil (lat. 2° 13′ S.), the blood has been carefully preserved from any native admixture, but the acclimatization is none the less complete. The Portuguese live in entire comfort in the tropics throughout the world, and the Arabs are scattered throughout all Africa, wet and dry. The same thing is true, to perhaps a less degree, of the Teutonic stock. The British have peopled the U. S. and Canada (with if anything an improvement of physique), Australia and South Africa. Every port has its Scotchmen. The Dutch Boer of South Africa represents a remarkably persistent colonial stock, and the Dutch endure the East Indies rather better than the British endure Hindustan and Burma. Acclimatization seems to be rather a moral than a physical matter. The weaker and less civilized races have less pluck and courage, become homesick, and are not adaptable to changed conditions. Of the civilized races, it is noteworthy that the two most temperate and thrifty, viz., the Jews and Chinese, are the best colonizers, and something of the same thrift is found in the Spanish and Portuguese. Temperate habits are of the highest importance in the tropics, and it is in humorous allusion to this that the tropical British refer to a drink of spirits as a "peg," meaning a peg in one's coffin. The relative insuccess of the British and the Dutch in tropical colonization is due to their large consumption of liquors, and to their insistence in retaining their home clothing and diet.

4. The spread or subsidence of many diseases may be traced to climatic conditions. The germ diseases which become epidemic in temperate latitudes usually have their homes in the filth of tropical cities stewing under the vertical rays of the sun. Thus yellow fever is at home in the neglected parts of Havana, La Guayra, and Vera Cruz, and spreads northward in favorable summers and autumns, reaching Memphis, Tenn., or Cairo, Ill. The cholera is at home in tropical Asia, and in favorable seasons, spreading northward and westward, it passes through Turkey and Russia, and then spreads along commercial lines through the temperate world, where the germs are carefully preserved in warm houses through the winter to spread in the open air in the next summer.

Climatic extremes also cause sickness and death indirectly. A drouth condenses the drinking-water and increases the power of its impurities, thus producing dysentery, typhoid fever, and similar illnesses. Carried further it becomes a famine, and causes death by famine fever and other diseases of the same ilk, as well as by starvation. Rigorous climates cause people to herd together, and thus permit the spread of consumption, the germ of which is so delicate that it can pass from one to another only under the most favorable circumstances. Hot streets and hurry combined cause sunstroke, and the contrast between overheated houses and extreme cold outside brings on colds, catarrh, pneumonia, and a host of similar ills.

On the other hand, climate suppresses diseases and heals them. The approach of winter suppresses yellow fever and causes cholera to subside. Many climates are healing for the diseases of other climates. Southern California and Western Texas, and the region between them, Colorado, Northern Minnesota and North Dakota, the Adirondacks, and Western North Carolina, are all well known as resorts for the cure of consumption. Florida, and indeed the whole Gulf coast of the U. S., is a place of refuge from the ills of winter. Southern France, Algeria, the Riviera in Northern Italy, and Egypt, are celebrated as climatic health resorts in their season.

5. Climate makes a deep impress on man socially and intellectually. The family is the fundamental unit of social life, and its unity and coherency is largely a matter of climate. Thus the patriarchal family is a result of nomadic life, and the latter depends on climate as one of its essential elements. The cool, temperate climates give rise to homes of the Anglo-Saxon type, while arctic climates cause the association of a larger number of people of different families, giving occasion to communal houses. The prevailing winds and great ocean currents have given direction to conquest, commerce, and discovery. Commodore Maury's study of the climate of the ocean surface enabled him to improve the courses for ships between frequented ports, and gave these an economy of time in each voyage. Climate also determines the character of dwellings, which, beginning in the tropics with open, flimsy, single-storied structures, gradually expand with increase of latitude until the enormous "sky-scraper" is reached, inclosing in its walls a whole village, and made compact for economy of heating, lighting, and access, as well as economy of ground rent. With greater increase of latitude the dwellings dwindle, until far above the Arctic circle the final form is found in a low, tight, solid, hemispherical shell of ice, approached on hands and knees through a long, low, winding, covered passage. Architecture and other branches of engineering are especially dependent on climate for the varied forms their structures take.

Through the channels already mentioned climate affects the mind and soul indirectly, but it also has direct influences of the highest importance. The myths of the childhood of races often admit of purely climatic interpretations. What may be called atmospheric effects, including both climate and weather, comprise a large part of folk-lore, and pervade poetry, especially the poetry of races in their youth, as the *Vedas*, the *Iliad*, the *Kalewala*, and the *Shah-nameh*. The effect of climate on the disposition is familiar over the most of the northern hemisphere in the contrast between the more serious, laborious, and determined northerners and the more genial, leisure-loving, and diplomatic southerners. Whether we compare Scotch and English, Briton and Gascon, Catalonian and Andalusian, Lombard and Sicilian, and North and South German, Russian, or Chinese, the contrast always exists in popular estimation, and it is not entirely lacking in the U. S., though heredity, slavery, the civil war, and migrations of northerners southward have masked it. And this contrast in disposition carries with it differences in character and moral force. The greater labor in higher latitudes necessary to the support of life and to obtaining comforts, and due to the stronger contrast of the seasons, brings with it a stronger will, a more powerful frame, and a greater capacity to endure severe privations; causes money and power to accumulate in the hands of the northerners, and these cause the apparent paradox that the laborious climates yield men of the leisure necessary for a distinctly intellectual and artistic class. The conquering races have usually come from the north. From the southward migration of the early Aryan stock, wave after wave of northern peoples have swept over the lower latitudes, until the last wave has swept past the equator and fairly taken possession of the entire southern hemisphere.

6. While climate, as already pointed out, has had perhaps a formative influence in the lapse of ages on man's physical frame, its immediate and direct effects are of quite subordinate importance. The black, yellow, copper-colored, and white skins, with the other differences which go with them, are rather racial characters than climatic variations. The Negro was the same in ancient Egyptian times as now, and he holds his characters from the Sudan to the Cape of Good Hope, from Liberia to Australia, and from Canada to Brazil. Adjoining tribes offer far greater differences than those due to transportation to America and two centuries of residence there. Migration to hotter climates induces languor and lack of energy, as when the Vandals settled in what is now Tunis, and exposure gives a bronze to the skin which may become hereditary; but these never change the white

WORLD, SHOWING THE D

Drawn and engraved expr

TRIBUTION OF RAINFALL.

y for Universal Cyclopædia.

man into the Negro, nor does residence in the Northern States and Canada perform the reverse. In the adaptation of all the functions to climatic conditions certain minor characters are induced which may be readily observed. For instance, the tropical diet includes little fat, the Arctic consists almost entirely of fat. Mountaineers are more robust and hardy and less sensitive to changes of temperature than dwellers on the plains. For residents of arid regions the skin becomes filled with fine wrinkles, the voice is sharpened, the nervous system is affected by the constant stimulus on the skin, and they are more irritable and alert; while for residents in wet regions the skin is smooth, the voice is softened, the nerves are less stimulated, and they are more even-tempered but more lymphatic. These characteristics are not very deep-seated, and tend to reversal on change of climate. Man has gradually withdrawn himself from the direct influence of climate.

7. The reverse problem of man's influence on climate has been much discussed, but no generally accepted conclusions have been reached. There is no doubt as to man's influence in a small degree and to a very local extent, but to such questions as these, "Has the climate of Palestine changed greatly in 3,000 years, and is this change due to man?" very diverse answers are given by serious students of the subject. It may be safely admitted that to a small degree and close to the earth's surface such human operations as the cultivation of the fields, the clearing of forests, the drainage of marshes, and the conservation of natural waters may effect climatic changes; but we must also admit that in the presence of the great operations and changes of the atmosphere his pigmy efforts are without appreciable effect. The best discussion of the subject is that by G. P. Marsh, in his *Man and Nature*, afterward revised and issued under the title of *The Earth as Modified by Human Action*.

Climate and Other Forms of Life.—The relations of animals and plants to climate form a topic of very great importance in theories of evolution and in agriculture, but it is too extensive a subject to treat in full. A few of the salient facts will be pointed out.

Animals are more independent of climate than plants, because the former are generally capable of locomotion, while plants can not escape from unfavorable conditions which may surround them. The amount of tolerance of climatic change by animals decreases on the whole with decrease of rank, as has already been found to be the case with man. The medium also plays an important part. Fish are very sensitive to changes in the temperature of the water, and birds and insects living in the atmosphere and with bodies more completely permeated with the air are less tolerant than mammals which are confined to the surface. Tolerance is also a matter of species. Some species range over enormous regions, while others are confined to very limited districts. Thus the leopard ranges over the whole of Africa and over the south of Asia to East China and Borneo, while a certain species of the ibex is confined to the Pyrenees. The osprey ranges over all the continents southward to Brazil and Tasmania, while a beautiful sunbird is limited to the warmer part of the valley of the Jordan, and a species of humming-bird is confined to the wooded crater of Chiriqui, in Veragua. Range of species, however, depends on many other conditions as well as on the present climate. Thus Madagascar and adjacent Africa differ in their fauna, while Bali and Lombok, only 15 miles apart at their nearest parts, have very different bird faunas. Probably a more powerful controller than climate in the distribution for species is the competition with other forms in the struggle for existence.

Of very great interest are the means provided animals for the protection of the individual and the preservation of the species against injurious climatic effect. Protection from the rigors of winter is afforded by a suspension of vital activity called hibernation for species varying in size from the alligator to the house-fly, and in rank from the bear downward. The covering of the warm-blooded animals, hair, wool, feathers, serves as protection from extremes of temperature and sudden changes. The hairs and feathers are also directed in such a way that in the habitual position of rest on the part of the animal they will shed rain, and in some cases this capacity is increased by a plentiful supply of oil. In many species there is an adaptation in the hairy covering to the season; the hair thins out in warm weather to thicken again in cold.

Many of the instincts of animals have reference to protection against climate. The almost universal migration of birds with the seasons consists in a motion toward the tropics on the approach of winter, and a return to their old haunts with the approach of summer. The migrations of locusts are of different character, but they are seasonal in their time of occurrence, and therefore climatic directly or indirectly. The habits of animals are also largely controlled by climate. Numerous species lay up during the favorable seasons stores of food which can be used in unfavorable ones. When the direct rays of the sun are hot, animals remain generally under cover in the warmest part of the day, and become more or less nocturnal. Death Valley of California has a considerable fauna, but it is so completely nocturnal that an elaborate exploration was required to discover it. Tropical forests are very silent early in the afternoon, but they become very vocal in the early evening and at night with the cries of animals of all degrees.

Most animals are capable of flourishing under a much greater range of the climatic elements than that found in their habitats. Parrots will live and multiply in the English climate without protection, as has been proven in Norfolk. That they do not take possession of the woods is due to the competition of other animals rather than to climate. Many tropical birds live in apparent comfort in open aviaries in temperate regions even when the temperature falls to zero or below. The horse and domestic fowl, both natives of very warm climates, flourish with little protection over almost the entire habited parts of the globe. There are, however, some interesting cases of lack of tolerance of climatic change. The yak of Tibet thrives in some parts of Europe, but can not endure the plains of India. The Newfoundland dog will not live in India. Insects are often confined within narrow limits of temperature, and snakes, common in the tropics, decrease rapidly with increase of latitude, disappearing in lat. 62°. With climate certain changes often take place in the animal. In Angora dogs and cats have fine fleecy hair. Sheep transported from temperate climes to the West Indies undergo a change in the character of their wool, but it takes three generations to complete it. English oysters transported to the Mediterranean alter their mode of growth, and form prominent diverging rays like those on the shells of oysters native to that sea. Geese transported to Bogotá were at first quite infertile, but by degrees improved, until at the end of twenty years the product in eggs was as large as in the home climate. It is also found that in introducing domestic animals or plants into new climates it is well to make an intermediate station of acclimatization. Sheep bred at the Cape of Good Hope do much better in India than those brought directly from Great Britain.

In the case of plants the relations to climate are still closer. The range of species through climate, the widely differing tolerance of different species, the appliances for protection against climate, the subservience of plant-life to the seasons, and the phenomena of acclimatization, are of the same character qualitatively in plants and animals, but more marked in quantity in the plants.

The relations of the phenomena of animal and plant-life to the seasons, the advent of birds, their nesting, the hatching of the young, and the departure toward the tropics, the sprouting of the herbs or appearance of leaves on the tree, the flowering and fruiting, form a series of phenomena which are grouped together under the name of *phenology*. The phenology of plants has been an especial object of study, and the problem to solve can be stated as follows: To express in a simple mathematical form the relations of temperature to the different stages of plant-growth. The initial temperature—that at which vegetable life begins to stir after the winter sleep, the buds to sprout, and seeds to germinate—is generally put at 6° C., or 43° F. The relations to temperature of the stages following this have been variously expressed, but none of the methods is entirely satisfactory. The method most employed is that of accumulation of temperatures after sprouting—that is, the surpluses to temperatures over some selected one are added up. The selected temperature may be the initial above mentioned or may be the mean temperatures for the days observed. The latter is used to give some idea as to whether crops are advanced beyond or retarded behind their usual state at the date employed. The temperature at which the plant does its best is called the *optimum*, and this differs for different species. Many studies of the advance of flowering, leafing, or other stages of plant advancement have been made in Europe and charted, with a long series of interesting and valuable conclusions; but in general it may be said that in phenology observation is far ahead of theory.

The prevailing winds play an important part in the dispersal of plants by the transportation of the entire plant or of the seeds. Myriads of minute organisms, mostly low forms of plant-life, are transported bodily in this way. More than 300 species of diatoms have been found in deposits left by dust-storms. In some cases the plant is transported as a whole even when of large size. The tumble-weeds of the Western plains of the U. S., when mature, loosen their hold on the earth and are carried forward by the wind in a compact ball, 2 or 3 feet in diameter, scattering their seeds as they roll. They continue their journey to great distances, until they finally come to rest against a rock or in a ravine or stream. The so-called Russian thistle, recently introduced into the Dakotas, makes a new form of tumble-weed, and is spreading eastward with considerable speed; but, if not sooner rooted out, it will be stopped by the line of forests on the upper Mississippi and Red river. More often than the plant as a whole, the seeds are made with reference to easy transportation by the winds; and nature takes many methods to effect this. One of the most effective is that employed in the thistle, and one of the most elaborate is that of the common dandelion.

Plants are especially sensitive to the climatic element called humidity. Vegetable life of all grades attains its greatest development, other things being equal, where the humidity is greatest. The tropical forests of the valleys of the Amazon, of the upper Congo, and of the Brahmaputra, are in regions of great humidity; and on the west coast of the American continent, in Alaska and Chili, the heavy rainfall in high latitudes pushes the region of great forests into high latitudes, well toward the polar circles. On the other hand, in arid regions plant-growth is usually small and the number of forms limited, while at the same time these forms take on special and remarkable shapes, and assume a series of surface structures of defensive order to a degree not found elsewhere. The yucca, the century-plant or maguey, the cactuses of unique form and clothing, are typical of American arid or semi-arid plants, while plants of other families, but similar in form and surface, take their place in other arid regions. The plants of arid regions are usually hairy, woolly, thorny, spiny, or covered by fine prickles, primarily a protection against enemies, but indirectly climatic. It has been suggested that the innumerable spines and prickles of the cactuses also play some part in protecting from the burning rays of the sun through the diffractive phenomena occurring about slender bodies.

The mutual influences of forests and climate have been much discussed. The interior of the forest is undoubtedly cooler and its climate milder; the relative humidity is undoubtedly greater therein and the moisture is conserved; the evaporation is decreased both by the forest and by its litter; the ground underneath is kept more moist and springs therein are conserved; the outflow of water is made more regular and the snow within is more slowly melted, thus preventing dangerous floods; moreover, the roots hold the soil together, thus preventing it from being carried down mountain-slopes and overwhelming the cultivable fields below. These are all conclusions which are generally accepted. Forests also serve as wind-breaks for open regions about or within them; but that they increase the fall of rain over their area, or the intensity or frequency of rainfall, or in any way guide, attract, or repel local storms, are conclusions not yet universally received by competent judges. A strong case can be made out for each one, but it is not yet in any one strong enough to carry the matter into the region of certainty.

Climate in Physiography.—Physiography is a description of the earth's surface, with an account of the causes which produced the structures found on it. Among these causes are to be found the elements of climate in varying degree. Temperature appears in the freezing and thawing of standing and flowing waters, in permanent snow and ice, in questions relating to the paleocrystic sea and to glaciers, in the ocean currents and in the weathering of rocks and soils. The wind is important in consideration of loess and of waves. Humidity determines the occurrence of arid and semi-arid regions, while on precipitation depend the multiple problems of erosion by water, the balance of seas and lakes, the fluctuations of rivers, and the occurrence of floods. All these climatic elements appear as causes in physiography. They interact in such a way that each enforces the work of the others. Their work has been going on throughout the history of the globe, and to them is largely due the sculpture of the earth's surface. The operations of heating and freezing, wetting and drying, weathering and erosion, have not only gone on formerly; they are still going on, though the rate of change may be much less than formerly.

Climate, in relation to medicine:

I. *Climate a Cause of Disease.*—A study of vital statistics shows that many affections are directly caused by the unfavorable influences of the various elements of climate upon the human organism. While man is not alone in his susceptibility to these changes, his higher organization has made it possible to differentiate more closely in his case whatever alterations occur. The unfavorable effect of increased or diminished atmospheric pressure, of heat and cold, of moisture and dryness and alterations in the quality of the air, is most conspicuous in affections of the lungs and air-passages. The most serious of these is phthisis. Phthisis or consumption differs widely in its degree of prevalence throughout the world, among the various States and Territories in the U. S., in counties in the same State, and even in the several wards of a city. In Europe it attains its greatest prevalence in Austria, Hungary, and Germany. The Austrian mortality from phthisis, 1882–86, was 13·26 per cent. of total deaths, or 3,839 per million inhabitants. In the U. S. the rate in 1880 was 12 per cent. of total deaths, or 1,472 per million inhabitants, ranging from 20 per cent. in Vermont to 2 per cent. in New Mexico. The climate of the North Atlantic coast States is especially unfavorable for persons who contract tuberculosis; the influence of cold, associated with dampness of the air and soil, and the changeable meteorological conditions due to the frequent passage of storm-centers down the valley of the St. Lawrence, combine to render pulmonary disease in this portion of the U. S. exceedingly common. The South Atlantic and Gulf coasts

and the northern portion of the Pacific slope share, although to a less extent, the same atmospheric humidity and clouded skies, and yield a death-rate from phthisis far in excess of what is experienced in the interior Western plains and plateaus, where dryness of air and soil and an enormous preponderance of sunshine over cloud are hostile to the development of the tubercle bacillus.

Bronchitis, pneumonia, and pleurisy are distinctly cold-weather diseases. The areas of greatest prevalence of pneumonia in the U. S. are Northwestern Louisiana and Arkansas, the State of Nevada, and the western portions of Colorado and the Dakotas. Although altitude does not appear to be a factor in the production of pneumonia, the seasonal relations of the disease are well recognized, for it is four times as frequent in March and April as in July and August. Long-continued cold raises the mortality from pneumonia and bronchitis more than lower temperature lasting a shorter time. The dense, smoky fog occurring in England in conjunction with severe cold is invariably followed by increased mortality from these affections. Diphtheria and croup, pathologically identical, prevail more in rural districts than in cities, and are more strongly influenced by local climatic causes, such as soil-moisture due to imperfect drainage, than by general climatic conditions. Scarlet fever, puerperal fever, erysipelas, and cardiac rheumatism exhibit a striking uniformity with respect to seasonal relations. It has been demonstrated that years of scanty rainfall in England have been coincident with or followed by a rise in the number of deaths from these diseases, while excess of rain corresponds with the periods of greatest immunity. This is in accordance with our knowledge of the manner of the diffusion of affections of this class. During rainfall the floating matter in the air is beaten to the earth, and there retained until the surface dries; it is then widely disseminated by the currents of the air.

Diarrhœa and dysentery prevail in hot weather. Twelve times as many deaths occur from these diseases during July or August as in February. Cold and wet summers check the prevalence of these diseases. Dysentery is not a disease which is caused by heat alone, but it is believed to be a communicable zymotic disease which thrives best in hot weather, and the organisms of which seem dependent upon prolonged high temperatures for their activity.

Malarial fever is a distinctly climatic disease. It prevails in its characteristic forms at low altitudes and in hot climates. Wherever the requisite conditions of water, heat, and vegetation are found in connection with the soil containing the organisms, malarial disease is possible of development. The entire coast-line of the Gulf of Mexico and the Caribbean Sea presents these favorable conditions, and more virulent types of malarial disease are here met with than in any other portions of America. While a disease primarily of low altitude, it is believed to be identified in a modified form with an affection met with in the mountainous region of the Western U. S. termed "mountain fever." There is from year to year a wide variation in the prevalence of malarial disease at any given place.

Yellow fever, Chagres fever, jungle fever, and allied fevers originate in the torrid zone, but may be imported into temperate climates. The occurrence of frost invariably terminates an epidemic of yellow fever.

Affections of the nervous system are frequently aggravated by climatic agencies. Pain has a tendency to increase upon the approach of storms; neuralgic attacks are thus seen to bear a close and direct relationship to storm-tracks. Excessive cold and wind provoke pain. Attacks of chorea are far more prone to occur in the spring than at any other seasons, and the frequency of attacks is directly related to the passage of storm-centers. Infantile paralysis usually originates during hot weather. Apoplexy does not appear to bear any relation to temperature. Tetanus in the new-born, now demonstrated to be dependent on a bacillus, is common on the South Atlantic coast of the U. S., the West India islands, and in the northern seaports of South America.

Hepatic disorders are common in hot countries, abscess of the liver frequently causing death in Europeans who visit India and fail to adopt the simplicity of life, particularly with regard to food and drink, demanded in a tropical climate.

Diseases of the circulatory system are decidedly influenced by changes of altitude. In persons with valvular disease or dilatation of the heart and in all cases of atheroma, especially in the aged, removal to an elevation is attended with danger directly proportional to the degree of altitude attained. On the other hand, serious results attend subjection to increased atmospheric pressure. Those who work in caissons are liable to a form of paralysis attendant upon a too rapid transition from an artificial climate of high atmospheric pressure to that of the sea-level.

II. *Climate Favoring Recovery from Disease.*—For at least 2,000 years the value of change of climate has been recognized in the treatment of disease. The Romans sent patients with ulcerated lungs to Libya, and we are informed that by breathing the balsamic effluvia of the pines with which the country abounded they were said to have lived many years freed from their complaints. Change of climate has a powerful effect on both mind and body; in drawing inferences as to effect of a certain climate in a particular case, all the associated conditions, such as change of scene, diet, and personal associates, should be given their respective values. On the other hand, the best climate in the world may be futile if suitable food and shelter and attendance are not obtainable.

The principal diseases amenable to climatic treatment are phthisis, bronchitis, laryngitis, asthma, hay fever, catarrhs, dyspepsia, Bright's disease, melancholia, hypochondria and insomnia, and various forms of nervous fatigue, as well as convalescence from many acute diseases.

It is quite as desirable to seek a climate for the prevention of tuberculosis as for its cure. For consumptives the best climate is that which combines dryness, warmth, and the greatest proportion of clear days. Local conditions, such as a sandy soil and an atmosphere purified by passing over surrounding tracts of evergreen forests, may compensate to some extent for the lack of either of these characteristics. It is not absolutely essential that the locality should possess a high altitude, nor, on the other hand, need the climate be an entirely equable one. Great diurnal and annual ranges of temperature are found in the larger number of places where experience shows that phthisis is least prevalent and least likely to lead to a fatal termination.

The climates best suited to consumptives in the eastern hemisphere are those of Algiers, Morocco, and Egypt, the plains of Tartary, and the table-land of Persia. In the western hemisphere the best regions are those adjacent to the Rocky Mountains in the north and to the Andes in the south. As a rule, the climate exercises a more controlling influence in passing in a southern direction. In the U. S. favorable locations may be found in Montana, Idaho, and Wyoming, Utah, Colorado, Southern California, Arizona, and New Mexico. The last four of these furnish by far the best accommodations for invalids, and enjoy a wide reputation as health resorts. The Adirondack Mountains in New York and the mountains of Western North Carolina attract many by reason of their advantages for consumptives. Although the rainfall and humidity are greater than on the western plains and plateaus, much can be accomplished in the early stages of phthisis toward arresting and even curing the disease. The necessity of supervision and protection of patients from the indiscretions due to changes of weather, renders it possible to obtain much better results in sanatoriums than outside of them. To get the best influences of climate the open-air method of treatment, by which patients are gradually accustomed to spend a large portion of the time out of doors, should be adopted. By means of suitable shelter and clothing this may be carried out despite inclement weather. See CONSUMPTION.

In Colorado and Southern California, and in the high table-land of Mexico, changes of weather do not occur with such frequency as near the Atlantic coast, and out-of-door life is more readily enjoyed. The lofty plains of Honduras, San Salvador, and Costa Rica share with the table-land of Mexico a climate especially favorable for consumptives. The disease is said to be almost unknown in Bogotá, the mountainous region of the Argentine Republic, Peru, and Bolivia.

Insular climates and sea-voyages do not yield such gratifying results as those obtained in inland climates.

Bronchitis, especially if associated with much irritability of the air-passages, is usually relieved by moist coast climates. The dry Western plains are frequently rendered unfavorable by reason of violent storms of fine dust, often of an alkaline nature, filling the air and exciting great irritability of mucous surfaces. For this reason catarrhal affections are common in the Western States and Territories. Laryngitis for the same reasons requires a sedative, moist climate.

Asthma, not dependent on cardiac disease, is usually re-

lieved by residence at an altitude of from 5,000 to 8,000 feet. Hay fever is likewise avoided by elevated climates in which vegetation is scarce. Many find relief in the Rocky Mountains, portions of the White Mountains, or at the sea-level in those islands lying near the coast, yet distant sufficiently to be free from the offending vegetable products.

Gout and chronic rheumatism require a mild, equable climate, free from dampness. The sand hills of South Carolina and Georgia, the dryer portion of interior Florida, and San Diego in Southern California, present favorable conditions.

Disorders of the digestive organs, particularly cases of nervous dyspepsia, are frequently much benefited by change of climate. Warm, mild climates are to be chosen; cold and damp are particularly injurious to dyspeptics, aggravating their liability to cold hands and feet.

Warm, equable climates are also the most favorable for relieving acute and chronic Bright's disease. Exposure to wet and cold, and climates where rapid changes occur, lead to the production of this class of diseases. Warm seashores, such as those of Southern California, are advantageous.

For cases of insomnia, melancholia, and hypochondria, a change of climate may be of advantage. Insomnia usually vanishes upon going to the seashore, but often proves troublesome for a while in those who remove to a high altitude. Degenerative diseases of the nervous system are usually unfavorably influenced by a high altitude. Hypochondriacs are often benefited by travel. Camp life sometimes yields good results, especially in despondency the result of business anxiety. GUY HINSDALE.

Climatography and **Climatology**: See CLIMATE.

Climax [from Gr. κλῖμαξ, ladder]: a figure by which several propositions or several objects are presented in such an order that the proposition or object adapted to produce the least impression shall strike the mind first, and the others rise by successive gradations of impressiveness. A sentence in which the order is reversed is called an *anti-climax*.

Climbers (in ornithology): See SCANSORES.

Climbing Fern (*Lygodium palmatum*): a rare species of fern of the family *Schizæaceæ*; remarkable for its habit of climbing or twining upon shrubs and weeds. It occurs in the U. S. from Massachusetts and New York to Kentucky and Florida.

Climbing-perch: See ANABANTIDÆ.

Climbing Plants, or **Climbers**: those plants which support themselves upon rocks, walls, buildings, other plants, etc. They have weak stems which are unable to bear the weight of their foliage and fruit, and they trail upon the ground unless they find some support. They use various devices. Thus the morning-glory twines its stems tightly around suitable objects; the ivy sends out its innumerable roots from its stem, and these insinnate themselves into cracks and crevices. The vine twines certain special branches (tendrils) about the twigs of other plants, the clematis uses its leaf-stalks for the same purpose. Some plants again use their spiny leaves and smaller branches for lifting themselves, the spines catching upon the swaying branches. Darwin has pointed out that the free ends of many climbing plants, as in the morning-glory, are continually moving about with a swaying or somewhat circular movement (known as *nutation*), until they strike an object about which they may coil. See PHYSIOLOGY, VEGETABLE. C. E. B.

Clinch River: a stream which rises in the southwest part of Virginia; flows southwestward, and enters East Tennessee. Pursuing the same general direction between two ridges called Clinch Mountain and Powell Mountain, it unites with the Tennessee river at Kingston. The whole length is estimated at about 300 miles.

Clingman, THOMAS LANIER: U. S. Senator; b. in Huntsville, N. C., July 27, 1812; graduated at the University of North Carolina 1832; became a lawyer and settled in Asheville, N. C.; served in both branches of the State Legislature; was sent to Congress in 1843, and six times re-elected; appointed in 1858 to fill a vacancy in the U. S. Senate, and was elected thereto for the term beginning Mar., 1861; withdrew on the secession of his State and entered the Confederate service as colonel, and for three years held the rank of brigadier-general. He measured the highest peak in the Black Mountains, and it was called Clingman's Peak for him, as also is CLINGMAN'S DOME (*q. v.*). His investigations made known the existence of gems and rare minerals, as platinum, corundum, and the ruby, in North Carolina; published a volume of speeches and *Follies of the Positive Philosophers* (Raleigh, 1878). D. at Morganton, N. C., Nov. 3, 1897.

Clingman's Dome: in Swain co., N. C.; the highest peak of the Great Smoky Mountains, between North Carolina and Tennessee. It rises to 6,660 feet above the sea, and is the second in height in the Appalachians. It was named after Thomas L. Clingman, who ascended it in 1858.

Clinkstone: See PHONOLITE.

Clint, ALFRED: landscape and marine painter; b. in London, 1807; pupil of his father, George Clint, portrait-painter (1770–1854); president of Society of British Artists 1869. D. Mar. 22, 1883. His father's reputation grew out of an engraving of the trial of Queen Caroline, into which he introduced portraits of the Kemble family, and after this he became a famous delineator of actors and actresses. Some of his work is in the South Kensington Museum.

Clinton: town of Huron co., Ontario, Canada; on Buffalo and Goderich Branch of Gr. Tr. Railway; 13 miles from Goderich (for location, see map of Ontario, ref. 4–B). It has a collegiate institute, a model school, and churches of six denominations. There are here 2 extensive organ-factories, threshing-machine factory, tannery, 3 planing-factories, flax-factory, fanning-mill factory, large flour-mill, grain-elevator, 2 carriage-factories, 2 salt wells, the headquarters for the Canada Salt Association, and a large number of other industries. The town is lighted by electricity. Pop. (1881) 2,606; (1891) 2,635. EDITOR OF "HURON NEWS-RECORD."

Clinton: city; capital of De Witt co., Ill. (for location of county, see map of Illinois, ref. 6–E); on Ill. Cent. R. R.; 23 miles S. of Bloomington. There are here 6 churches, 2 public schools, railroad machine-shops, electric lights, and waterworks. Agriculture is the chief industry. Pop. (1880) 2,709; (1890) 2,598; (1900) 4,452. EDITOR OF "PUBLIC."

Clinton: city; capital of Clinton co., Ia. (for location of county, see map of Iowa, ref. 5–K); on Ch. and N. W., the Ch., B. and Q., the Ch., B. and N., the B., Ced. Rap. and N., and the Ch., M. and St. P. R. Rs., and on the Mississippi river, 42 miles above Davenport, and 138 miles by railroad W. of Chicago. The river is here crossed by an iron bridge which is about 4,000 feet long, and cost $600,000. The cars of the Ch. and N. W., the Ch., B. and Q., and Ch. B., and N. R. Rs. pass over this bridge. Clinton contains the repair-shops of the railroad company, foundries, sash and blind factories, a paper-mill, eight saw-mills, etc. Pop. (1880) 9,052; (1890) 13,619; (1900) 22,698. Lyons annexed since 1890.

Clinton: city; capital of Hickman co., Ky. (for location of county, see map of Kentucky, ref. 5–B); on Ill. Cent. R. R.; about 200 miles W. S. W. of Louisville. The city has churches of four denominations, two colleges (Baptist and Methodist), creamery, and a roller flouring-mill. It is located in the midst of a rich agricultural region. Pop. (1880) 506; (1890) 1,347; (1900) 1,462.
PUBLISHER OF "DEMOCRAT."

Clinton: capital of East Feliciana parish, La. (for location of parish, see map of Louisiana, ref. 9–E); 32 miles N. of Baton Rouge. A railway 25 miles long connects it with Port Hudson on the Mississippi. The parish ships yearly 30,000 bales of cotton. Pop. (1880) 1,129; (1890) 974; (1900) 960.

Clinton: town; Worcester co., Mass. (for location, see map of Massachusetts, ref. 3–F); on the Boston and Maine and the Old Col. Div. of N. Y., N. H. and Hart. Ry., and on Nashua river; 45 miles W. by N. from Boston and 16 miles N. E. of Worcester. It has manufactures of ginghams, Brussels and Wilton carpets, wire-cloth, machinery, worsted goods, etc. The Lancaster mills of this place employ about 1,500 hands, operating on 1,050 looms, and producing annually nearly 7,000,000 yards of ginghams and plaids. The city has a free library of 17,000 volumes, and is lighted with electricity. Pop., including township (1880) 8,029; (1890) 10,424; (1900) 13,667. EDITOR OF "COURANT."

Clinton: city; capital of Henry co., Mo. (for location of county, see map of Missouri, ref. 5–E); on the Mo., Kan. and Tex., the Kan. City, Osc. and So., and the Kan. City, Fort S. and M. R. Rs.; 90 miles S. of Kansas City. Clinton has colleges for men and women, excellent public schools, potteries, tile factories, iron-rolling mill, flouring-mills, grain-elevators, gas and electric lights, and a street railway. Pop. (1880) 2,868; (1890) 4,737; (1900) 5,061.
EDITOR OF "HENRY COUNTY DEMOCRAT."

Clinton: village; Oneida co., N. Y. (for location of county, see map of New York, ref. 4–H); on N. Y., Ont. and W.

R. R.; 9 miles W. by S. of Utica. It has two seminaries for girls and a large union school and academy. It is also the seat of Hamilton College. In the vicinity are large quarries of good building-stone. There are also various manufactures. Pop. (1880) 1,236; (1890) 1,269; (1900) 1,340.

EDITOR OF "COURIER."

Clinton, DE WITT: statesman; b. in Deer Park, Orange co., N. Y., Mar. 2, 1769; son of Gen. James Clinton, and nephew of Gov. George Clinton. His mother's name was Mary de Witt. Having graduated at Columbia College, New York, in 1786, he studied law, and became in 1790 private secretary to his uncle, then Governor of New York. He was a man of ardent temperament, dignified manners, inclined to reserve, and of noble personal appearance. He married about 1796 Maria Franklin, of New York city. He entered public life as a Republican or Anti-Federalist, and was elected a member of the popular house of the State Legislature in 1797, and of the State Senate in 1798, and soon became the most influential leader of his party in the State of New York. In 1801 he was elected a Senator of the U. S. Prof. Renwick states that he was on all sides looked up to as the most prominent of the rising men in the Union when he was appointed in 1803, by the Governor and council, mayor of the city of New York, which office he held by successive reappointments until 1814. He also served as Lieutenant-Governor of New York for two years (1811–13), and was one of the commissioners appointed in 1810 to examine and survey a route for a canal from the Hudson to Lake Erie. In 1812 he was nominated for the presidency of the U. S. by those who opposed the policy of President Madison regarding the war with Great Britain. He received eighty-nine electoral votes, cast by Massachusetts, Connecticut, New Hampshire, Rhode Island, New York, New Jersey, Delaware, and Maryland, but was not elected. His course and policy at this period offended many of the Republicans, and appear to have impaired his popularity for a time. After retiring from the mayoralty, about the end of 1814, he held no public office for some years. In 1815 he framed and presented to the Legislature a memorial favoring the construction of the Erie Canal, and early in 1817 that body passed a bill authorizing the construction of that canal. He was elected Governor of New York almost unanimously in 1817. In 1820 he was re-elected Governor over Daniel D. Tompkins. As Governor he distinguished himself by his liberal patronage of science and his efforts to promote the education of the people. He was at the same time president of the Board of Canal Commissioners. In 1822 he declined to be a candidate for the office of Governor. He was removed from the position of canal commissioner in 1824, and was again elected Governor by a large majority in the same year. The Erie Canal was completed in 1825, and its opening was celebrated in October of that year, when Gov. Clinton was conveyed in a barge with triumphal demonstrations from Lake Erie to the city of New York. He was re-elected Governor in 1826, and died at Albany before the expiration of his term of office, Feb. 11, 1828. See David Hosack, *Memoir of De Witt Clinton* (1829); James Renwick, *Life of De Witt Clinton* (1840); William W. Campbell, *Life of De Witt Clinton* (1849); and John Bigelow, in *Harper's Magazine* (1875).

J. JAMES R. CROES.

Clinton, GEORGE: fourth Vice-President of the U. S.; b. in Little Britain, Ulster (now in Orange) co., N. Y., July 26, 1739; son of Charles (1690–1773), who emigrated from County Longford, Ireland, to the American colonies in 1729, and was of kin to Admiral George Clinton, who was colonial Governor of New York 1741–53, to whom he was indebted for his introduction into political life. He was an uncle of De Witt Clinton. He practiced law in his youth, and was elected in 1775 to the Continental Congress, in which he did not vote for the Declaration of Independence, considering himself without authority to do so. It was adopted in a special provincial congress July 8, 1776, but he was absent when it was signed, having been called to take command of a brigade of militia. In 1777 he was a delegate to the convention which framed the first State constitution of New York, and with his brother James fruitlessly defended Forts Clinton and Montgomery. He was chosen Governor of New York in 1777, and continued in that office, by several re-elections, until 1795. As Governor he defended the Mohawk valley against the Indians under Johnson and Brant, and the Hudson valley against Sir Henry Clinton; suggested connecting the Mohawk with Lake Champlain by a canal; and marched to suppress Shays's rebellion in Berkshire co., Mass. In 1788 he presided over the State convention called to ratify the Federal Constitution, which instrument he disapproved, because it gave too much power to the central Government. He was afterward the principal leader of the Republican party in the State of New York, and was chosen Governor of that State in 1801. He received fifty electoral votes in 1792 and seven in 1796 for Vice-President of the U. S., and in 1808 received six such votes for the presidency. In 1804 he was elected Vice-President of the U. S. by the Democrats, who elected Jefferson as President; and was re-elected Vice-President in 1808, in which position his casting vote in 1811 defeated the rechartering of the U. S. Bank. D. in Washington, D. C., Apr. 20, 1812.

Clinton, Sir HENRY: an English general; grandson of the Earl of Lincoln, and son of Admiral George, a colonial Governor of New York; b. in 1738. He served in the guards in Hanover during the Seven Years' war, and as major-general at the battle of Bunker Hill June, 1775; led an expedition in 1776 to North Carolina, but it failed to land, owing to the failure of the fleet to co-operate; was driven in June of the same year from Fort Moultrie, in Charleston harbor; served under Gen. Howe from Long Island to Philadelphia; left in command at New York and failed to aid Burgoyne's expedition down the Hudson valley; was appointed commander of the British army in North America in April, 1778. He evacuated Philadelphia in June, 1778, and moved his army by land to the city of New York, encountering disaster at Monmouth on his retreat, and cruelly imprisoned and executed patriots, among them COL. HAYNE (*q. v.*); quarreled with Gen. Cornwallis, neglecting to support his campaign northward into Virginia. He conducted an expedition against Charleston, S. C., which he besieged and took, May 12, 1780, capturing Gen. Lincoln's army of 6,000 men. In Oct., 1781, he sailed from New York with about 7,000 men to relieve Cornwallis, but the latter surrendered at Yorktown before the arrival of Clinton. He was superseded by Gen. Carleton in 1781; was afterward member of Parliament, and became governor of Gibraltar in 1793, where he died, Dec. 24, 1795. He wrote *Narrative of Campaign in 1781 in North America* (London, 1783; n. ed. Philadelphia, 1865), in answer to the strictures of Lord Cornwallis.

Clinton, HENRY FYNES: chronologist; b. at Gamston, Nottinghamshire, England, Jan. 14, 1781; d. at Welwyn, Oct. 24, 1852. Graduated from Christ Church, Oxford, in 1799; tutor to Earl Gower 1803–06; member of Parliament from 1806–26, when he retired to devote himself to the works of his life, the still indispensable *Fasti Hellenici* (3 vols., 1824–34) and the *Fasti Romani* (2 vols., 1851). He also published epitomes of the two larger works. See *Literary Remains of H. F. Clinton* (3 vols., London, 1854); vol. i. *Autobiography*, vol. ii. *Literary Journal* (1819–52.)

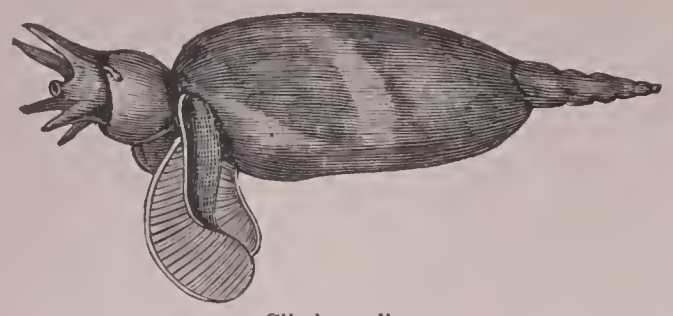
ALFRED GUDEMAN.

Clinton, JAMES: general; b. in Ulster co., N. Y., Aug. 9, 1736; was a son of Col. Charles Clinton, brother of Gov. George, and the father of the statesman De Witt Clinton. With his brother George he marched against Fort Frontenac under Bradstreet; commanded four militia regiments for the protection of Ulster and Orange Counties; became a colonel in 1775, and served under Gen. Montgomery in Canada. He was raised to the rank of brigadier-general in 1776; was compelled to retreat from Fort Clinton, which he commanded, before an assault of the British, after a spirited defense, Oct., 1777; took part in Sullivan's operations against the Indians in New York in 1779, when he carried his flotilla out of Otsego Lake by damming its outlet and riding out on the freshet caused by breaking this barrier, and participated in the defeat of the Indians at Newtown (now Elmira). In Oct., 1781, he assisted at the siege of Yorktown, after which he served in the Legislature and Constitutional convention of his native State. D. in Little Britain, N. Y., Dec. 22, 1812.

Cli'o (in Gr. Κλειώ): one of the nine Muses; daughter of Jupiter and Mnemosyne; presided over history and epics; was represented as holding in one hand a half-opened roll or scroll, and in the other a cithara. She is first mentioned by Hesiodus, and was sometimes portrayed sitting, often with an open chest of books beside her.

Clio, or **Clione**: a genus of molluscs belonging to the group of PTEROPODA (*q. v.*), embracing about a dozen species,

living chiefly in the Arctic and Antarctic seas. They are without shell, have a distinct head with two pairs of ten-



Clio borealis

tacles, and the body pointed behind. *Clio borealis* is from 1 inch to 1½ inches in length, *Clio australis* nearly 3 inches long. These forms occur in immense swarms and in the colder seas, and together with one or two other species form the "brit" of the whalers, the chief food of the whalebone whales, as well as of many other animals. *Clio borealis* rarely appears on the New England coast. J. S. K.

Clis'thenes, or **Cleis'thenes** (in Gr. Κλεισθένης): an Athenian statesman; the grand-uncle of Pericles; lived about 500 B. C., and took a prominent part in the expulsion of the Pisistratidæ. He increased the number of the tribes of Attica from four to ten, and made important changes in the constitution, which he rendered more democratic. He became very popular, and was the foremost Athenian statesman of his time. He instituted ostracism, and was himself the first sufferer from it.

Clith'eroe: a market-town of Lancashire, England; on the river Ribble; 28 miles N. of Manchester, with which it is connected by railway (see map of England, ref. 6–G). The houses are of stone. It is situated at the base of Pendle Hill, which is 1,831 feet high, and near Pendle Forest, which is reputed to be the scene of the exploits of the Lancashire witches. It has the ruins of a castle built in the twelfth century. Here are manufactures of cotton fabrics, and a grammar school founded in 1554. It returns one member to Parliament. Stonyhurst College is 4 miles to the southwest. Pop. (1891) 10,815.

Cli'tus, or **Cleitus** (in Gr. Κλεῖτος): a Macedonian officer, and foster-brother of Alexander the Great, whom he accompanied in his expedition against Persia, and saved his life at the battle of the Granicus in 334 B. C. He enjoyed the favor of Alexander, who appointed him satrap of Bactria in 328 B. C. In the same year a dispute occurred at a feast between them, and Alexander, excited with wine, killed Clitus with a spear.

Clitz, Henry Boynton: general; a son of Capt. John Clitz, U. S. army; b. in Sackett's Harbor, N. Y., July 4, 1824; graduated at West Point in 1845; served with honor in the Mexican war as an infantry officer; wounded at Yorktown, Va., and Gaines's Mill in 1862, and taken prisoner in the latter engagement; served as commandant of cadets and instructor in tactics at West Point (1862–64); became lieutenant-colonel Sixth Infantry, and in 1869 colonel Tenth Infantry. In 1865 he was breveted brigadier-general U. S. army. Retired July 1, 1885. According to the *Army Register* for Jan. 1, 1890, he was last seen at Niagara Falls, N. Y., Oct. 30, 1888.

Clitz, John Mellon Brady: rear-admiral U. S. navy; b. in Sackett's Harbor, N. Y., Mar. 10, 1823; brother of Gen. Henry Boynton (*q. v.*); entered the navy as a midshipman in 1837; retired with rank of rear-admiral Oct. 16, 1883. He served in the Mexican war at Vera Cruz and Tuxpan; was employed during the civil war in command of various vessels of the North Atlantic squadron, frequently in action with batteries on the James river while co-operating with the army in both the Fort Fisher fights, and recommended for promotion by Rear-Admiral Porter in his commendatory dispatch of Jan. 28, 1865. D. at Washington, D. C., Oct. 10, 1897.

Clive, Robert, Lord: soldier and statesman; b. at Styche, near Market Drayton, Shropshire, Sept. 29, 1725. The record of his school-days shows him to have had little fondness for study, but a fertile brain in devising mischief. He went to Madras in 1743, and became a clerk in the service of the East India Company. His work here was so uncongenial that he attempted to kill himself, but his pistol twice missed fire, and he accepted the failure as an omen of future usefulness. War having broken out between the British and French, he entered the service as an ensign in 1747. In this field he found scope for his talents. His military genius and resolute spirit procured his rapid promotion. In 1750 and 1751 he defeated the French at Arcot, the citadel of which he held for eleven weeks with 80 English and 120 Sepoy soldiers against 7,000 native and 120 French troops, and then overthrew his enemies at Arni, Kaveripak, Kovilam, and Chingalpat. He made a voyage to England for his health in 1753, taking with him his wife, a sister of Maskelyne the astronomer. In 1755 he returned to India as governor of Fort St. David. He waged war with success against the nabob Surajah Dowlah, and took Calcutta in 1757. In June of that year, with 3,000 men, he gained a decisive victory over the nabob's army of 60,000 men at the battle of Plassey. For this service he was rewarded with the office of governor of Bengal. He had become immensely rich by alleged imposition practiced on Jaffier Ali, who aspired to become Nawab of Bengal, and then he returned to England in 1760, and was raised in 1761 to the Irish peerage as Baron of Plassey. In 1764 he was again sent to India, with authority to rectify the disorders which prevailed after his departure from that region. He proved himself an able administrator, and restored discipline. He returned to England in 1767. His enemies in Parliament accused him of having enriched himself by a tyrannical abuse of power, and a committee was appointed in 1773 to investigate his conduct. This inquest resulted in his acquittal. He became addicted to the excessive use of opium, and committed suicide in London, Nov. 22, 1774. See Sir John Malcolm, *Life of Lord Clive* (3 vols., 1836); Macaulay's *Essays*; G. B. Malleson, *Founders of the Indian Empire, Clive* (London, 1882).

Cloa'ca [Lat., sewer, connected with *clu'ere*, purge; cf. Gr. κλύζειν, cleanse, Goth. *hlūtrs*, Germ. *lauter*, clean]: the common chamber, opening externally by the anus, which receives the products of the urinary, intestinal, and reproductive organs. This condition is found in some fishes, all reptiles and birds, and in the *Monotremata* among mammals, whence their name.

Cloa'ca Max'ima [Lat., largest drain or sewer]: the most remarkable sewer of ancient Rome, and one of the few now in use. It was completed in 588 B. C. by Lucius Tar-

Mouth of Cloaca Maxima at Rome.

quinius Priscus, the fifth king. (See Tarquinius.) It was first designed to drain the Forum and the adjacent low ground, but was afterward extended to include other localities. From the Forum it passes near the Temple of Vesta, and terminates at the Tiber, where its mouth is still seen. It is built with three thick concentric arches, the inner one 12 feet in interior diameter, and the entire structure being about 32 feet high. The masonry consists of blocks of tufa about 3 feet thick, laid without cement. The sewer was kept flushed by water admitted into it from the aqueducts. Agrippa passed through the Cloaca Maxima in a boat, and Nero caused some of his victims to be thrown into it. Notwithstanding its age of nearly 2,500 years, the structure is still in a good state of preservation. The mouths of two smaller cloacæ are still visible in the river wall near the Cloaca Maxima, one of which is shown on the left in the

illustration. A large number of these smaller sewers were built under the ancient city, and their inspection was one of the duties performed by the censors. See SEWERAGE.

MANSFIELD MERRIMAN.

Clocks: From the earliest period of human history men have sought for means to measure time. For the savage the divisions of time by the sun's rising, setting, and nooning were sufficient, when he could see them. But very early men began to divide the day into several portions, and soon the night also. At first these divisions were of about three or four hours each. After a time the division of the night and the day into twelve hours each was found to be more convenient, and then there came the necessity for means of measuring these divisions of time. The first in use was the dial, which by its shadow on a horizontal plate marked the passage of the hours by the progress of the sun. But as this could only be of service in the daytime, and when the skies were not obscured by clouds, something else was necessary. The hour-glass, which measured time by the flowing of sand through a narrow passage from one spherical vessel into another, and which was so graduated that all the sand would run out from the upper glass in just an hour, was a very good instrument to measure the lapse of an hour, but it could not be depended upon to give the time of day, and required watchfulness to turn it as soon as the sands had all run down. King Alfred's device of twelve candles, graduated so as to burn two hours each, was not much better, and in some respects even more inconvenient. The clepsydra was a step in advance of these. In its primitive form it was simply a jar containing a known quantity of water, which ran out from one or more small orifices in the bottom of the jar at such a rate that the quantity of water in the jar would be lowered to a certain point each hour, and the jar being filled at sunrise every day marked off the hours with tolerable regularity. As glass was not then used for the jar, the only way of determining the time from this primitive form was by looking into the jar or measuring the depth of the water by a graduated stick. In another form of clepsydra the time was measured by measuring the amount of water escaping from the vessel in which the water was kept at a given height. This remedied the defect due to the irregularity in the flow of the water caused by the decrease in pressure as it lowered in the vessel. It is not known just when or by whom these clepsydræ were invented. They are credited to Hermes Trismegistus, and were used by the Assyrians as early as the beginning of the sixth century B. C., were known to the Greeks in the fifth century B. C., and were introduced at Rome about 158 B. C. by Scipio Nasica. Eighteen years later they were improved by Ctesibius, by the addition of wheels which were driven by the water which flowed from the bottom of the jar, and caused the gradual rise of a small figure, thus indicating the time on an index attached to the instrument. Thus improved, these water-clocks have been in domestic use in the East for about 2,000 years, and were used in Europe as late as the seventeenth century. Tycho Brahe for astronomical purposes used a clepsydra, in which he substituted quicksilver for water. In the west of Europe there was a demand for further improvements.

The first of these, which possibly came from the Saracens, and perhaps from their Western empire in Spain, was the substitution of a weight for the water to turn the toothed wheel. It may have been introduced at a still earlier date than this, for Archimedes had discovered the advantage of weights in the turning of small machines some centuries earlier. But after this substitution there still remained the difficulty that the weight was not so regulated as to cause the index to pass over equal spaces of the dial in equal times. How this difficulty was obviated during the Dark Ages there is no means of knowing. There is a record of a clock of very elaborate workmanship having been sent by Pope Paul I. to King Pepin of France in 760, and of another being invented by Pacificus, Archdeacon of Genoa, in the ninth century. The invention of an escapement of some kind is attributed to Gerbert about A. D. 1000. Though rude, it probably answered the purpose, for within the next 380 years tower-clocks of great size were set up in Canterbury Cathedral (1292), in the Abbey of St. Albans (1326), at Genoa (1353), and one which struck the hours at Westminster in 1368. The clock whose construction is best known, and which was undoubtedly the best timekeeper of any of that period, was that made by Henry de Vick, a German, and set up in Paris for Charles V. in 1379. We have deemed the movement of this clock worthy of an illustration (see Fig. 1), as showing what were the methods of constructing a balance and escapement at that time. The toothed or crown-wheel I is the escapement-wheel; the pallets or levers *i h* having beveled edges, and projecting from the suspended upright spindle or vertical axis K M, on which is fixed the regulator or balance L L, give it a vibratory motion, as the motion induced by the weight A in uncoiling the cord and causing the cylinder B to revolve is communicated to the various toothed or cog wheels, and finally to the crown or escapement-wheel, causing them alternately to strike the teeth of that wheel. There would still be an irregularity in these motions, and a consequent defect in the clock as a timekeeper, were it not for the weights *m m*, placed on the balance or regulator, and which, by the distance they are removed from the spindle, increase or diminish the resistance of the pallets to the escapement-wheel. This was the principle on which all clocks were made for the next 270 years, but the English do not seem to have been successful in making good timekeepers till 1540, when one, set up at Hampton Court by an unknown maker, became celebrated for its accuracy. It was not until a century later (some time between 1641 and 1658) that either an English clockmaker named Harris or the Dutch philosopher Huyghens adapted Galileo's discovery of the substantial isochronism of the pendulum-beats to the marking of time by making the escapement or crown-wheel horizontal, instead of vertical, and attaching the pallets to the pendulum-rod. Subsequent improvements were made in the escapement, especially the substituting the anchor escapement for that of Huyghens by Dr. Hooke, 1666–80, and the further improvement of this in. the dead-beat escapement of George Graham, invented in 1700, in which the arms of the escapement are set at right angles, and the outer surface of the pallet B and the inner surface of the pallet C are arcs of circles, of which A, the point of attachment to the pendulum-rod, is the center. This insured great accuracy as timekeepers. Other escapements, as the duplex, detached, pin-wheel, gravity, etc., have been devised, but have not come into very general use, and are not, perhaps, preferable in all respects to Graham's. Other improvements have been attempted in the pendulum itself. These have been mainly in the matter of compensation for the expansion and contraction of the pendulum-rod by heat and cold. Graham's mercurial compensation pendulum, invented in 1715, in which a tube or ball having mercury in it was substituted for the bob of the pendulum, and the gridiron pendulum of Harrison, invented in 1726, composed of five rods of steel and four of brass, which, expanding differently, compensated by their action for the changes induced by heat or cold, were the principal of these.

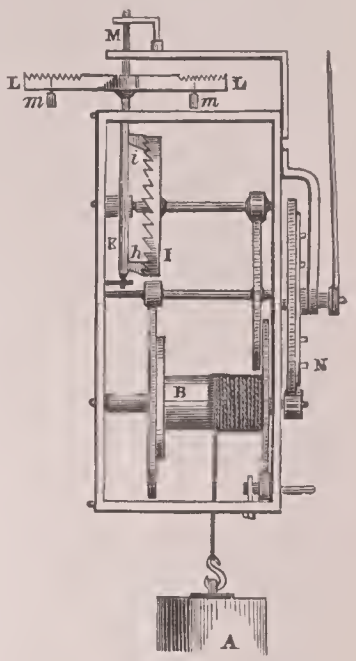


FIG. 1.

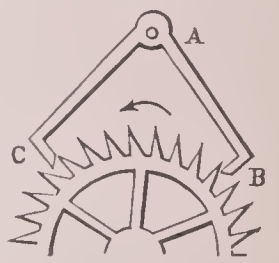

FIG. 2.

The clockmakers of the U. S., retaining the dead-beat escapement, made the pendulum-rod of wood and covered it with gold-leaf; and this has been found to be as effectual a contrivance as either the mercurial or gridiron pendulum. In the cheaper clocks, where absolute accuracy is not so important, they have obtained substantial accuracy by turning a screw thread upon the lower end of the pendulum-rod, and putting upon this a nut, which, while it holds the sliding pendulum-bob in place, can by one or two turns regulate it in accordance with the temperature of the season. To accommodate what is known as the cycloidal curve in the arc described by the pendulum, its attachment to the pinion moved by the weights, or afterward by the spring, was made by hammering its upper end into a thin slip of steel which passed into a slit in the pinion, and was held in place by two little cheeks or projections at the top. While the workmanship was gradually perfected, the prin-

ciples on which clocks were made in Great Britain, France, and Germany did not change, except in a single particular—that of a substitution of steel springs for weights—from the beginning of the eighteenth century to the present time. Even now, very considerable numbers of these brass-wheel clocks, with weights, and standing in cases 6 feet high, are still made, and some of them are still exported to the U. S. The manufacture of this description of clocks was introduced into the U. S. before the Revolutionary war, but comparatively few are made, though these were of good workmanship.

The tall, old-fashioned clock, with its long pendulum and heavy weights, seems very different from the little "nutmeg lever," but both depend upon the same principle.

Eli Terry, of Windsor, Conn., was probably the first clockmaker in the U. S. His clocks were made entirely of wood. They were good timekeepers, and were sold in large quantities by peddlers. In 1807 he undertook to make 500 clocks at one time, but overstocked the market and reduced the price from $25 to $15, and at last to $10. It was not till 1837 that brass-wheel clocks were made in the U. S. From 1806 to 1815 the number of clockmakers largely increased (Messrs. Seth Thomas, Silas Hoadley, Herman Clark, Asa Hopkins, and others engaging in the business), and many thousands were made. In 1814 Mr. Terry invented what was known as the "short-shelf clock," in which, by a change of arrangement and smaller weights, the pendulum being brought forward and greatly shortened, and the weights being carried and run on each side, the whole was reduced to a more compact form, and clock and case were sold together for a moderate price. This modification was adopted by other manufacturers, and soon became general. These clocks were made with wooden wheels, but after the introduction of rolled brass into the market, machinery was invented by which the blank wheels of the clock could be struck out of the rolled brass with a die, and the teeth afterward cut by machinery, and the brass-wheel clocks could be made cheaper than wooden ones.

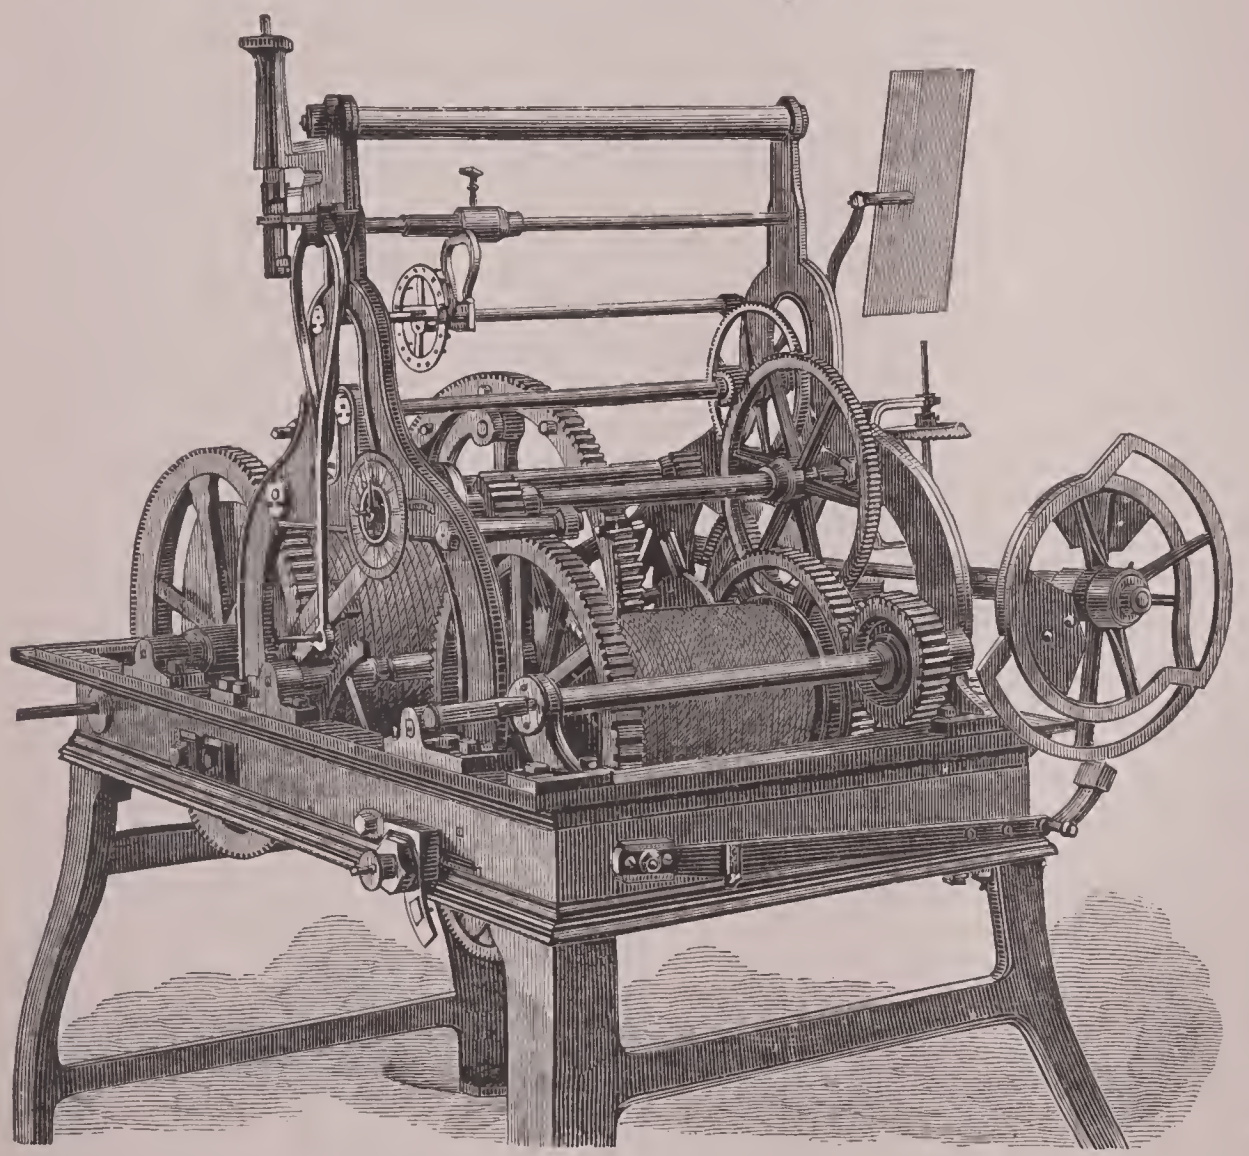

Fig. 3.

The next improvement was the substitution of coiled steel springs for the weights, thus assimilating the clock to the watch. This has been done in Europe for two hundred years, but only with the most costly parlor clocks, and the springs used were equal in quality to the best watch springs. Of course, this would not answer for cheap clocks for the million, and various experiments were tried with cheap springs. Coiled brass springs were used, but these soon lost what little temper they had, and so did their purchasers. An elliptic steel spring connected with a fusee was tried, but with no better success. Finally, a new and completely successful process of making a superior steel spring was invented in the U. S.; and the springs thus produced have for many years been sold at a price compatible with their use in cheap clocks. This, together with the cheapening by machine-labor of the production of all parts of the clocks, has led to their very general introduction, and to the reduction of the size of clocks, till now twenty-four of the smallest sized pendulum clocks can be packed in a box of a cubic foot in dimensions. One result of this reduction in the size and price of clocks was an enormous increase in the demand for them, both in domestic and foreign countries. Clocks to run thirty hours were made which sold in quantities at $9 the dozen, and a fair eight-day clock at $48 the dozen. Since then many improvements have been introduced, and clocks of all kinds made in the U. S. are now exported very largely to all the countries of Europe, to China and Japan, India, Western Asia, Egypt, South Africa, Mexico, and South America.

Turret-clocks, which were formerly imported, are now made of excellent quality. Fig. 3 represents the movement of a Hotchkiss tower-clock erected in Steubenville, O., and a similar one is on the City Hall, New York. These clocks are remarkable for their accuracy and the perfection of their mechanism, and have proved admirable timekeepers. They have the pin-wheel escapement (very clearly delineated on the second and third cross-bars), the pins having an ingenious contrivance of a shoulder to keep the oil upon them; and also a very remarkable arrangement (at the right of the figure) for regulating automatically the gas-jets which illumine the face of the clock, so that they may burn any required number of hours. Regulators, formerly imported in all cases, are now made of the best quality by several firms in the U. S. The wooden pendulum-rod, covered with gold leaf, which is one of the characteristics of these regulator clocks, is, it is believed, the invention of Silas B. Terry, a son of Eli, already mentioned. The French parlor or mantel clock, a costly and beautiful ornament to the homes of the wealthy, had so long been imported that it was considered hopeless to attempt to compete with it; but since 1866 these articles have been manufactured in the U. S., and in the perfection of their workmanship, their accuracy as timekeepers, and the elegance and variety of their patterns, as well as in their moderate price, compete so favorably with the foreign parlor clock that they have well-nigh driven it from the market. Of other special kinds there may be named the calendar clock, first successfully made for the general market in the U. S., which gives the day of the week and month, and sometimes the changes of the moon; the marine clock, a watch on a large scale, which, properly made, is an excellent timekeeper; the railway clock, which is of similar

but somewhat more delicate construction, and with a compensating arrangement for the jar to which it is exposed, etc. The

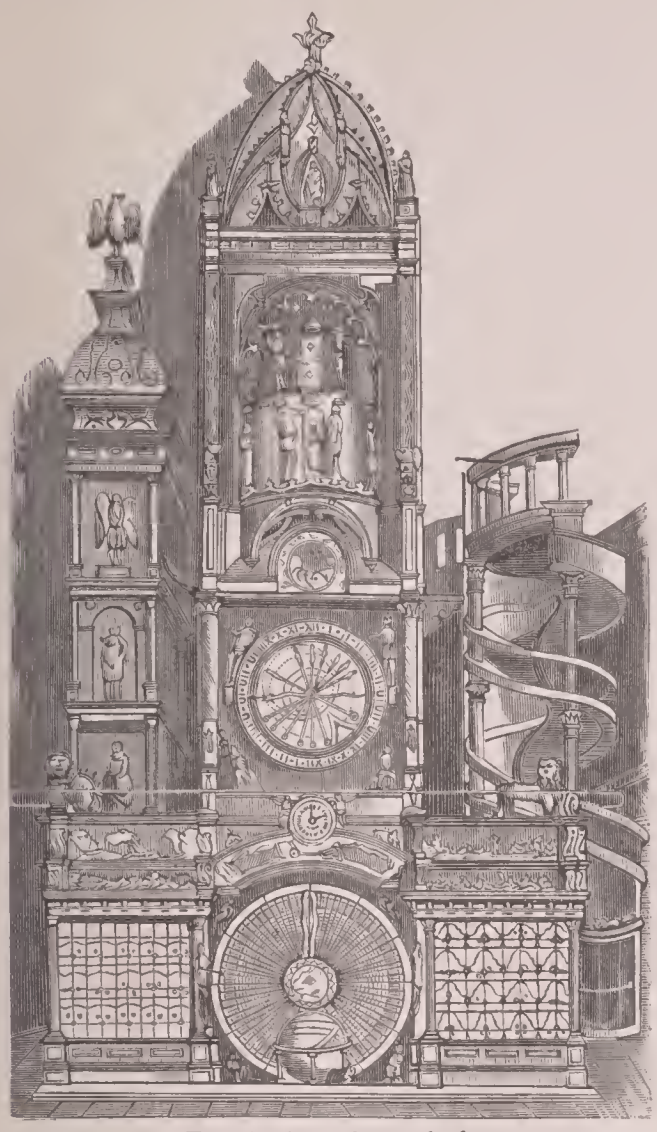

Fig. 4.—Strassburg clock.

electric or magnetic clock belongs properly to the departments of astronomy and telegraphy. See Electric Clocks, Escapements, Pendulum, and Strassburg.

Clo'dius [simply another form of the more common *Claudius*], Publius, surnamed Pulcher (i. e. handsome): a profligate Roman tribune and patrician; was a brother of Appius Claudius Pulcher, and is well known from Cicero's *Oratio pro Milone*, which, however, is in the highest degree exaggerated and false. Clodius served in Asia, in his youth, under his brother-in-law Lucullus, and in 62 B. C. committed sacrilege by intruding himself, disguised as a woman, into the mysteries of Bona Dea. At his trial for this offense he attempted to prove that he was not in Rome at that time, but Cicero testified that he saw Clodius in Rome on that day, and thus incurred his enmity. Clodius was acquitted by means of bribery, and was elected tribune of the people in 59 B. C. He persecuted Cicero by the enactment of a law that he should be interdicted from fire and water, and drove him into exile. Clodius was killed in 52 B. C. in an encounter with Milo, who was a partisan of Cicero and was the political enemy of Clodius, whom he succeeded as tribune.

Cloister [from O. Fr. *cloistre*: Ital. *chiostro* < Lat. *claustrum*, *clostrum*, bar, inclosed place]: an inclosed court or yard surrounded by covered walks, built for the use of clergymen and their assistants in a cathedral, or monks or nuns in a monastery. The open space surrounded by the covered walks is called the cloister-garth, and the walks themselves are the ambulatories or simply *the cloisters*. In a few cases these walks are built in two stories. They are always more or less open on the side toward the garth, and they are often very richly adorned with elaborately designed arcades and with statues and other sculpture. In some instances fountains or cisterns of running water are added.

Clonmel' (i. e. Vale of Honey, from the Gaelic): a municipal borough of Ireland; built on both sides of the river Suir: 14 miles S. S. E. of Cashel (see map of Ireland, ref. 12–F). It lies mostly in the county of Tipperary, and partly in that of Waterford. It has an endowed school dating from the year 1685, two lunatic asylums, and a church of the twelfth century. There is a trade in agricultural produce, cattle, and butter. In 1650 the town was taken by Cromwell and its fortifications dismantled. Pop. (1891) 8,480.

Clonmel, Earls of (1793): Viscounts Clonmel (1789), and Barons Earlsfort (Ireland, 1784).—John Henry Reginald Scott, fifth earl, born Mar. 2, 1839, succeeded his father, John Henry Scott, in Feb., 1866. D. in 1891. Succeeded by Thomas Charles Scott, b. in 1840.

Clontarf': a town and bathing-place of Ireland; on Dublin Bay, 3 miles E. N. E. of Dublin (see map of Ireland, ref. 9–J). Here in 1014 Brian Boru gained a great victory over the Danes. Near this town is Clontarf Castle, the residence of the Vernon family. Pop. (1891) 5,104.

Clootz, Jean Baptiste, Baron du Val de Grâce: a visionary character of the French Revolution; b. near Cleves, Prussia, June 24, 1755. Taking the name of Anacharsis, from the celebrated philosophical romance of Abbé Barthélemy, he traversed Europe, proclaiming the brotherhood of the human race. He contributed large sums to the French republican cause, to which he looked for the fulfillment of his hopes of universal freedom. He was excluded from the Jacobin Club at the instigation of Robespierre, and guillotined for a fictitious offense Mar. 23, 1794. See his *Life* by Avenal (Paris, 1865).

Closure: See Cloture.

Clot: See Blood and Coagulation.

Clothaire I.: b. in 497 A. D.; fourth son of Clovis, King of the Franks. He became King of Soissons in 511, when the dominions of Clovis were divided among his sons. By murdering two of his nephews he obtained the sovereignty of Austrasia and Orleans, and reigned at Paris over all the former dominions of Clovis. D. in 561 A. D., leaving four sons—Caribert, Gontran, Sigebert, and Chilperic I., who divided the realm between them.

Clothaire II.: son of Chilperic I.; was a minor when he inherited the kingdom of Soissons in 584 A. D. His mother Frédégonde was regent until 597. He put to death Brunehaut, Queen of Austrasia, and usurped the throne of that country in 613 A. D. He thus became sovereign of all France. D. in 628 A. D. He was one of the Merovingian dynasty.

Clothes-moth: See Moth.

Clo'tho: in classic mythology, one of the Fates (*q. v.*).

Clotho: an asteroid discovered by Tempel in 1868.

Clotho (a serpent): See Puff-adder.

Clotil'da, Saint: Queen of France; daughter of Chilperic, King of Burgundy. She was married in 493 A. D. to Clovis I., whom she induced to profess the Christian religion in 496. She opposed Arianism. D. in Tours in 545 A. D., and was canonized soon after.

Cloture, or **Closure**: a proceeding in the British House of Commons for closing debate and bringing on an immediate vote on the question under consideration. It is a term of French origin, and the rule of proceeding grew out of obstructions to business made by the Irish members of Parliament as an avowed policy. In 1882 the Speaker was authorized, when he was of the opinion that the House desired to come to a vote, to so inform the members, when a motion could be entertained thereupon to close the debate. In 1887 it was further provided that a member may claim to move "that the question be now put." Unless the chair holds this motion to be an infringement of the rules or an injustice to the minority, he proceeds to take the vote on the closure, and if not less than a hundred members sustain it the closure is determined in the affirmative. Like results are obtained in the popular branch of legislative bodies in the U. S. by moving the previous question (*q. v.*), but in Parliament the previous question has another purpose. See Law-making.

Cloudburst: an extremely heavy rain occurring over a small territory. Such rains occur only with local, not general, storms; are most common in the hottest season and at the hottest time of day; and occur most frequently in the arid regions or on mountain-sides. The rain sometimes falls at the rate of 4 or 6 (and possibly more) inches per hour, but it continues only a few moments. Meantime the phenomena of atmospheric electricity are usually very marked. The flood of water that descends flows off rapidly, coming down the streams with a head of water which is often very destructive. A distinction is usually drawn

between cloudbursts and torrential rains. The latter belong to general storms, the former to local ones, the remarkable cloud formations and sudden clearing afterward making the name very appropriate for the former and not at all for the latter. MARK W. HARRINGTON.

Clouds: collections of extremely minute particles of water suspended in the atmosphere. These particles are often ice crystals, in consequence of the elevation at which they float. Aitken's researches have shown that the nuclei of clouds and fogs probably consist of minute dust particles. While fog is principally formed by the cooling of the lower layers of the atmosphere, clouds owe their existence more especially to the rising currents which, when cooled to the dew-point, condense into cloud. The lower limit of the cloud region is therefore determined by the height at which the rising currents reach their dew-point, and the altitude of the cloud formation depends upon the humidity of the ascending currents; the drier it is, so much the higher must it rise to have its vapor condensed. The cloud masses, being heavier than the air, tend to sink, but the sinking takes place very slowly, partly because the water particles and the ice needles which compose the clouds are very small, and partly because the rising currents to which they owe their origin counteract the sinking process. Sometimes the rise and fall of the cloud is only apparent, being due to the condensation or vaporization of its particles. Frequently the rising current mingles with a horizontal current, which carries with it the upper portion of the cloud and covers the sky with a uniform stratum. The summits of mountains are often enveloped in clouds because they favor the ascent of air up their sides, and cause the condensation of the contained vapor. The wind drives these clouds over the summit, but when the air currents descend on the other side the vapor particles are again dissolved. A classification of clouds, according to strict scientific principles, has not yet been made. Existing classifications depend rather upon the form of the clouds than upon their origin. The classification most generally used is that originated by Howard in 1803. Another system, due to Abercromby and Hildebrandsson, was recommended for general use by the International Meteorological Congress at Munich in 1891. In all systems the chief forms are the cirrus, cumulus, and stratus, which, in the nomenclature last mentioned, have been subdivided into subordinate types, which may be defined as follows. The average heights and velocities of the different classes of clouds for the year, obtained from measurements by Clayton at the Blue Hill Observatory, are also given.

Cirrus are thin, fibrous, detached, feather-like clouds formed of ice crystals. They are the highest clouds, averaging over 29,000 feet, and move with the greatest velocity, their mean being 89 miles per hour.

Cirro-stratus form a thin white veil, more or less fibrous, which produces halos and other optical phenomena. This cloud has an average height of 27,000 feet, and an average velocity of 70 miles per hour.

Cirro-cumulus are flocks of small, detached, fleecy clouds, at an average height of 23,000 feet, and have an average velocity of 82 miles per hour.

Alto-stratus is a gray-blue veil, through which the sun and moon are faintly visible. Its mean height is about 15,400 feet, and its mean velocity 48 miles per hour.

Alto-cumulus consists of large, more or less rounded balls, flat rolls or disks of fleecy clouds in flocks, white in color, except a dark shading here and there. They average 10,000 feet in height, and move with an average speed of 34 miles per hour.

Strato-cumulus are large balls or rolls of dark clouds; average height, 6,200 feet; average velocity, 22 miles.

Cumulus are piled up clouds with conical or hemispherical tops and flat bases. They are formed of rising currents of heated air, and are therefore most common in summer and in tropical regions. Their average height is 4,700 feet, and average velocity 26 miles per hour.

Cumulo-nimbus is a massive cloud from which showers fall. Its mean height is 4,500 feet, and its average movement is 33 miles per hour.

Nimbus is a dark sheet of ragged cloud from which rain or snow usually falls. Its height averages only 2,900 feet.

Stratus is either elevated fog floating in the air or a thin uniform layer of cloud at a very low level (1,800 feet), which moves only 16 miles per hour. These heights agree with those found in Europe, but the velocities of the highest clouds measured at Blue Hill are nearly double those found in Europe.

Cloud-forms have been shown to be identical in all parts of the world, but their seasonal and diurnal distribution as regards both kind and amount varies. As weather prognostics, clouds have long been studied, but it is only recently that this has been systematically done by means of synoptic charts covering a large extent of country.

A. LAWRENCE ROTCH.

Clouet, kloo'ay', **Cloët**, FRANÇOIS: portrait-painter: descended from a family of Flemish artists: his father, JEAN (1485–1545), a court painter, was the first of the family born in France, and figures in the royal accounts as Jehannot or Jehannet Clouet, a name soon abbreviated to Janet, under which form François was popularly known. The son was born in Tours about 1510: became a court painter and a *valet de chambre* to the king on the death of his father. He was an emulator rather than an imitator of Holbein, and has left many portraits of distinguished people of the highest interest from their remarkable fidelity and technical excellence. Among these are *Henri II.*, *Charles IX.*, and *Elizabeth of Austria*, in the Louvre: the child *Francis II.*, at Hampton Court, and a notable *Dauphin Francis II. and Marie Stuart*. D. about 1580. W. J. STILLMAN.

Clough, klŭf, ANNE JEMIMA: educator; b. in Liverpool about 1822: sister of the poet Arthur Hugh Clough: lived in Charleston, S. C., from the age of three until sixteen; returning to England, became interested in national schools; began private day-school in 1842; became strongly interested in the idea of combined education; wrote on the subject in *Macmillan's Magazine* 1864; through her efforts in Liverpool and Manchester founded the North of England Council for Promoting the Higher Education of Women, from which came the idea of the Cambridge higher local examinations, first instituted for women only and afterward opened to men. Lectures for women were established at Cambridge 1869; Oct., 1871, Miss Clough took charge of a house of five women students at Cambridge; this number rapidly increased and Newnham Hall was built (1875), a second building, larger than the first, 1880, and a third handsome hall in 1888, and over the administration of these Miss Clough presided. Her powers of organization, tact, and sympathy contributed to her success as a leader in the movement for the higher education of women in England. D. Feb. 27, 1892. See NEWNHAM COLLEGE.

Clough, ARTHUR HUGH: poet; b. in Liverpool, England, Jan. 1, 1819; lived five years in Charleston, S. C.; educated at Rugby and at Balliol College, Oxford, where he took his bachelor's degree in 1841. From Balliol he was elected to a fellowship at Oriel, and he remained at Oxford until 1848, in which year appeared his first published poem, *The Bothie of Tober-na-Vuolich: a Long-Vacation Pastoral*. The poem is written in English hexameters, and recounts the adventures of a party of Oxford reading men in the Scotch highlands. Clough was deeply stirred by the High Church revival in Oriel, of which Newman was a leading spirit; was driven by the honesty of his mind to examine the basis of religious belief, and after a painful struggle felt compelled to withdraw from Oxford in 1848. He spent a year or two in travel on the Continent, going as far as the Italian lakes. On his return he published in 1849 a series of poems, of which the earliest date back to 1840, under the title of *Ambarvalia*.

He now passed from one employment to another: was warden of University Hall, London; visited America, and resided at Cambridge, Mass., for a few months in 1852, returning to England to accept an appointment in the education department of the Privy Council office. Clough was a man of strong religious feeling, but unfixed beliefs. In his *Poems on Life and Duty* and the subtle dialogue poem of *Dipsychus* he gives expression to this hesitation between doubt and faith. His other longer poems are *Amours de Voyage* and *Mari Magno*, a series of metrical tales. D. in Florence, Nov. 13, 1861. Matthew Arnold's fine elegy *Thyrsis* celebrates his "contention-tost" friend. See Clough's *Poems* (1862), with a memoir added by F. T. Palgrave, and his *Poems and Remains* (2 vols., 1869), edited by his wife.

H. A. BEERS.

Clove-bark: See CULILAWAN BARK.

Clover, or **Trefoil** [*clover* is from O. E. *clabre*, *clafre*: Low Germ. *klāver*: Fries. *klafer*; these represent a deriv. or comp. of the word appearing in High Germ.; cf. Mod. Germ. *Klee*. Not connected with Eng. *cleave*]: a name properly applied to plants of the genus *Trifolium*, family *Leguminosæ*, comprising about sixty indigenous species in

the U. S. and many in the Old World. The word is also used for other related plants which have three leaflets, as *Melilotus*, the sweet clover; *Medicago*, the bur clover; *Lespedeza striata*, the Japan clover; *Petalostemon*, the prairie clover, etc. The true clovers are invaluable agents in agriculture, not only because they make good hay and afford excellent pasturage, but chiefly because of their power of appropriating atmospheric nitrogen by means of their roots. Clovers have long been recognized as productive of great value to land, but the full meaning of this benefit has not been understood until within the last one or two decades. They are invaluable in the rotation, because, in addition to their power of nitrogen-gathering, they develop a deep and strong root-system, thereby bringing up fertilizing materials from the deeper parts of the soil and leaving them in available form near the surface, and also filling the earth with vegetable fiber which aids greatly in aërating and warming the soils, and therefore indirectly increasing its fertility. Clovers ordinarily require little fertilizing to bring them to profitable conditions, particularly little of nitrogen. In hard lands they are a most efficient means of loosening and pulverizing the soil when plowed under, and they add greatly to the power of light and leachy soils to hold fertility and moisture.

There are five chief species of clover in cultivation. The most important one is the common or red clover (*Trifolium pratense*). Others are the mammoth clover (*T. medium*); the crimson, scarlet, or carnation clover (*T. incarnatum*); the alsike clover (*T. hybridum*); and the common white or creeping clover or shamrock (*T. repens*). These are all natives of the Old World, although the last is supposed to be also native to the U. S. They are all perennials, except the crimson clover, which is an annual; but they usually begin to fail in vigor after they have occupied the land two or three years. The alsike persists the longest of those mentioned, and is best adapted to moist grounds. The white clover is generally sown only upon lawns, although it forms a very excellent "bottom" for mowing and pasture lands. The crimson clover has come into great prominence in the U. S. within recent years as a cover or catch crop for orchards, being sown when the regular cultivation of the orchard land is stopped, late in summer, and being plowed under early in the spring. It thus occupies the land at a time when the trees are not making great demands upon the soil, and it holds the rains and snows of winter and prevents the soil from puddling. When turned under, it affords much available plant food. Red clover is distinguished from the mammoth clover by a whitish spot on the leaves, and by having the head closely subtended by involucral leaves. In the U. S. the red clover is more used than the mammoth. The average feeding value of the green fodder is as follows: water, 70·8 per cent.; ash, 2·1; protein, 4·4; fiber, 8·1; nitrogen free extract, 13·5; fat, 1·1. The fertilizing value of the green fodder is as follows: moisture, 80 per cent.; nitrogen, 0·53; phosphoric acid, 0·13; potassium oxide, 0·46. The fertilizing analyses of the dry hay show: moisture, 11·33 per cent.; ash, 6·93; nitrogen, 2·07; phosphoric acid, 0·38; potassium oxide, 2·20. Mammoth clover is very like the common red clover, but attains to a larger size, and ripens a week or two later.

On account of its heavy growth it is more difficult to cure well than the common clover when made into hay, but its manurial value is thereby the greater when it is plowed under. In some tests it has given a greater yield of cured hay than the other, but in other tests the yields of the dry product have been practically alike. See the Reports and Bulletins of the different agricultural experiment stations, and *Clover Culture*, by Henry Wallace. L. H. Bailey.

Cloves [via Fr. from Lat. *clavus*, nail; so called from its resemblance to a nail]: the unexpanded flowers of *Eugenia aromatica* and family *Myrtaceæ*. They are officinal in the U. S. Pharmacopœia under the name of *Caryophyllus*. Unlike some of the other drugs possessing volatile oils, they do not appear to have been known to the ancients, although they were very early introduced into Europe by the Arabs.

They are derived from a handsome evergreen tree, which is supposed to have existed originally in only five small islands near the island of Jilolo, and which therefore obtained the name of the Molucca or Clove islands. No clove-trees are now to be found on these islands, but they are largely cultivated in Brazil, in many islands of the Indian Ocean, in tropical Africa, and in some of the West Indies. The height of the tree varies from 30 to 40 feet; it is well branched, the branches forming a handsome clustering crown. As soon as the buds change in color from green to red they are taken from the trees either by a process of beating or by picking, and spread upon cloths, after which they are dried by exposure to the sun and air, when they become brown in appearance. Ordinary unbroken cloves resemble very closely a small round-headed tack, and emit a peculiar oily aromatic odor. The taste is also spicy and pungent. The color is a deep brown, but on section the interior portion may be somewhat reddish. In addition to the volatile oil, cloves contain a resin or gum and a peculiar tannin. From cloves have also been isolated two substances, one known as caryophillin and caryophillic acid.

The oil of cloves, when freshly distilled, is quite fluid, clear, and devoid of color, and becomes yellowish and finally reddish brown on exposure. Its specific gravity varies from 1·034 to 1·061. It is soluble in an equal volume of alcohol and in ether and strong acetic acid. It is used as a flavoring substance, as a carminative, and sometimes as a local anæsthetic, particularly in cavities of carious teeth. H. A. H.

Clo'vis I., called also **Chlodwig**: King of the Franks; b. in 465 A. D. He was the son and successor of Childeric, who reigned at Tournay and died in 481. By a victory over the degenerate Romans and Gauls, commanded by the patrician Syagrius in 486 A. D., Clovis obtained possession of Soissons, which then became his capital, and here Remigius, Bishop of Rheims, became his counselor and friend. Under this influence he married in 493 Clotilda (*q. v.*), a Christian princess, and about three years later was converted to the new faith and baptized. The story of his conversion connects it with the battle of Tolbiac (Zülpich), near Cologne, at which, being hard pressed by the Alemanni, he appealed to the God of Clotilda, his wife, promising that if victory were granted to his army, both himself and his Franks would worship the Christian God. The Alemanni were routed, and Clovis kept his vows. He and a large number of his soldiers were baptized by Remigius, Bishop of Rheims, Christmas, 496. His conversion contributed to bring the Teutonic races generally into closer communication with the Christian Church and Roman civilization. In 507 he defeated Alaric, King of the Visigoths, in a great battle near Poitiers. By this victory he added Aquitaine to his dominions. He chose Paris as his capital in 507, and here he died, Nov. 27, 511 A. D. France was then divided among his four sons—Thierri, Clodomir, Childeric, and Clothaire. His descendants are called Merovingians, from Merovig, the grandfather of Clovis. With him the Salic Law entered France, and the alliance of the Church and state. With him, too, the distinctive history of France begins. See Barthold Zeller, *Les Francs mérovingiens, Clovis et ses fils* (1880).

Clowet, Clouet, or Clovet, Pieter: a Belgian engraver; b. in Antwerp in 1606; d. in his native city in 1677; and Albert, his nephew; b. in Antwerp in 1624; also an engraver; d. in the city of his birth in 1687. They reproduced works by Rubens, Van Dyke, Bourguinon, and Cortone.

Clown [M. Eng. *cloune, cloyne*; origin obscure]: a professional jester or buffoon. The character may have had its origin in the ancient Roman Pantomime (*q. v.*), which passed into the representations of the wandering acrobats of the Dark Ages, and thence into the Mysteries (*q. v.*) and miracle-plays, and later was developed into the Harlequin (*q. v.*) by the Italians. The clown or court-fool, who forms no inconsiderable a part of Shakspearean characters, just at the time when the private employment of buffoons was going out of vogue, was a part of the household of mediæval princes and great barons. The last of them was Archie Armstrong, who was attached to the court of James I. and Charles I. in Great Britain; suffered at the hands of Laud, and died in 1672. Triboulet, the court-fool of Francis I., was made immortal by Rabelais, and a number of others have become historical. The court and pantomime fools wore a characteristic dress, motley coat and tight breeches, and carrying a bauble or short staff with a ludicrous head. Sometimes asses' ears were added and a cock's comb. The clowns of Shakspeare are supposed to have been drawn from the "vice" in the mysteries, which the Italians again developed into the zany, a foil to the more serious and capable clown. It was the business of the zany to follow and caricature the clown. He was a merry-andrew, full of incompetencies, and bringing all the tricks of the clown into ridicule by absurd imitations of them, generally ending in failure. Where there was only a single clown he performed both functions, and in this shape he becomes the jester of

the modern circus. Court-fools were known to the Baghdad caliphs, and Bahalul, the jester of Harun al-Raschid, is a character in Arabian literature. See Doran, *History of Court Fools* (1858).

Club-foot, technically known as **Talipes**: a deformity, mostly congenital, which usually affects both feet. In the most common form the inner margin of the foot is elevated, the external one depressed, touching the ground; the middle and anterior portions are retarded in their growth, and the joints become immovable. This condition becomes more prominent when the child begins to walk, sometimes to such an extent that the upper part of the foot takes the place of the sole. Simultaneously the muscles of the leg become emaciated, and lose their characteristic texture. The cause has been sought for in diseases of the brain or spinal cord, contracted before birth; some are supposed to be due to a continued pressure in the womb; and a rational explanation for many cases is offered by considering the early condition of the fœtus. The lower extremities are formed at about the first month of pregnancy on the anterior aspect of the abdomen of the fœtus, under the skin, with the knee-pits facing the body; consequently to assume its normal position a rotation of the extremity around its axis, including the foot, is necessary. When this process, as far as the foot is concerned, remains incomplete, club-foot is the result. Some cases are the result of an abnormal obliquity of the small bones of the tarsus or posterior portion of the foot, and a primary shortness of the gastrocnemius muscle of the leg. Club-foot acquired after birth is due to muscular paralysis, bone disease, or traumatism. In paralysis one group of muscles permits the unrestricted action of the opposing group, which eventually results in a deformity of the foot. In mild cases manual stretching of the foot, proper bandaging, and the application of a plaster dressing will suffice. More marked cases require the cutting of one or more tendons and subsequent use of appropriate apparatus. In the acquired forms, especially cases due to traumatism, where the use of apparatus often is attended with pain, complicated operations are frequently necessary.

A. Jacobi and F. E. Sondern.

Club-mosses, or **Ground-pines**: small plants with a moss-like aspect belonging to the families *Lycopodiaceæ* (club-mosses and ground-pines) and the *Selaginellaceæ* (little club-mosses). These families, with the modern family *Isoetaceæ*, and several which are extinct (*Lepidodendreæ* and *Sigillarieæ*), constitute a well-marked class of the "fernworts" (*Pteridophyta*) under the name of *Lycopodinæ*, commonly called the Lycopods (*q. v.*). See Lycopodium.

Charles E. Bessey.

Clubs: societies of persons united for social, scientific, artistic, literary, or political ends, or for purposes of recreation. The etymology of club in this sense is obscure. It may be derived from the Saxon *cleofian*, to cleave, in allusion to the division of the reckoning of the guests of an ale-house; but in its present signification it is perhaps closely allied to *cleave*, to adhere. It is also said to be derived from the Swedish *klubb*, as meaning a clump, or tightly packed body of men; Carlyle, in his *History of Frederick the Great*, assumes that the vow of the chivalric orders ("Gelübde"), in vogue A. D. 1190, passes to us in the singularly dwindled condition of the modern word club. The Friday Street, or more correctly Bread Street, Club, in London, was long regarded as the first in England, but in the reign of Henry IV. there was a club called "La Court de bone Compagnie," of which the poet Occleve and probably Chaucer were members. About the beginning of the seventeenth century or the end of the sixteenth the famous club at the Mermaid Tavern in Bread Street was established. It had Shakspeare, Beaumont, Fletcher, Raleigh, Donne, Selden, etc., as members. About the same time Ben Jonson founded a club which met at the Devil Tavern, between Temple Bar and Middle Temple Gate. In 1659 the first political club, the Rota, was established, meeting at the Turk's Head in New Palace Yard. In 1669, three years after the great fire, the Civil Club, which exists to this day, was established in the city, all the members of which are citizens. Some of these early political clubs played important parts in the history of the times. Such was the October Club, named after the cheer for which it was famed, October ale, the members of which were ardent Tories. Swift was a leading spirit of the October, and frequently alluded to it in the *Journal to Stella*. The Saturday, Brothers, and Scriblerus Clubs, each having Swift as a member, and the Calves'-head Club, formed in ridicule of the memory of Charles I., the King's-head Club, founded by the unscrupulous Shaftesbury, and the Mug-house Club, so called from the ale-mugs used by the members, were among the more noted political clubs of the early part of the eighteenth century. Another unique club, the Kit-Kat, famous in literature, dates from the year 1700. Its curious name is said to be derived from a noted mutton-pie man, Christopher Katt, whose Christian name was shortened to Kit. Among the members were the Dukes of Marlborough and Devonshire, Lord Halifax, Sir Robert Walpole, Congreve, Granville, and Addison. The club had each of its toasting-glasses inscribed with a verse to some reigning beauty. Contemporaneous in origin with the Kit-Kat were the Tattlers Club in Shire Lane, and the famous Beefsteak Society, bearing as its badge a gridiron with the motto "Beef and liberty." Among the "Steaks," as the members were called, were Garrick and Hogarth.

Readers of Boswell are familiar with the Ivy Lane Club established by Dr. Johnson at the King's Head, a beefsteak-house in Ivy Lane, and the Literary Club, founded by Johnson and Sir Joshua Reynolds in 1764, which had among its members Boswell, Goldsmith, Burke, and others famous in literature.

The purely social club of the present day owes its origin to the famous coffee-houses of the eighteenth century, where congenial spirits used to meet for social intercourse and comradeship. In time the proprietor of the coffee-house was persuaded to exclude all but a chosen few from his doors, and none were to be admitted except those balloted for by the members. These coffee-house clubs were in most cases known by the names of the original proprietors, and many of them have remained in existence to the present day. Among these proprietary clubs may be mentioned Almack's (1764), Brooks's (1778), White's, originally established as White's Chocolate-house in 1698, and afterward removed in 1755 to its present site in St. James's Street, and Boodle's, the resort of country squires and hunting-men.

Of these White's and Brooks's were in the early days famous gaming-establishments, frequented by the young men of fashion, where such erratic geniuses as Fox and Sheridan gambled away their fortunes, and thousands of pounds changed hands in a single night. White's has retained its aristocratic exclusiveness to the present day, and is still among the most prominent of London clubs. About the close of the Napoleonic wars the modern-club era began with the organization of the Travellers' Club in 1814 by the Marquis of Londonderry, which is to-day one of the most exclusive of English clubs.

The period from 1815 to 1855 saw the establishment of the palatial modern clubs lining Pall Mall and Piccadilly, which form so important a part of English social life. Among these may be mentioned the Athenæum (1824), the resort of authors, artists, and patrons of the sciences and arts; the Garrick (1831), the home of patrons and professors of the drama; the Oxford and Cambridge (1835), for members of the two universities; the Carlton (1831), Conservatives (1845), and Reform (1830), composed of prominent members of the two great political parties; the United Service (1815), the Army and Navy (1851), the Guards' Club (1850), and the Junior United Service, in all of which the membership is confined to naval and military officers in her Majesty's service; the Marlborough, fostered by H. R. H. the Prince of Wales; and the Bachelors' and Wellington, where gentlewomen are admitted with certain restrictions. There are in addition to the famous political, literary, and social clubs, institutions devoted principally to athletic sports, such as the Marylebone Cricket Club; Thames and Leander rowing clubs; and the Hurlingham and Ranelagh country clubs, where polo and pigeon-shooting are the attractions. The word club, however, is not confined to the select social organizations owning their own buildings which line the prominent streets of great cities, but the organization of societies of men or women banded together for some specific interest or pursuit, and bearing the name "club," has become so general that clubs of some form are now found in every city in the civilized world. From England the designation "political clubs" was adopted by similar organizations on the Continent during the eighteenth century, where they played an important *rôle* in contemporaneous political history. In 1793 they were prohibited in Germany. In France they became the hotbed of the Revolution. The first French society that took the name club was the Club Politique, established at Paris in 1782, and shortly after, in 1785, a second was organized under the name of the Club de Boston, or

"des Américains"; and soon the appellation was adopted by the notorious Clubs des Jacobins, des Feuillants de Montrouge, des Cordeliers, etc. Purely social clubs have also been established on the Continent, but unfortunately they have in many cases become little better than gaming-houses. Of the most famous modern Parisian clubs the Jockey Club and the Cercle Royale deserve mention, for their exclusiveness and importance in the social life of the French metropolis.

In the U. S. club-life owes its origin to the Union Club, founded in New York, June 17, 1836. The Somerset Club of Boston, founded in 1857, the Maryland Club of Baltimore, 1857, and the Chicago Club of Chicago, established in 1869, indicate the rapid growth of club-life in the U. S. Among famous New York clubs may be mentioned the University (1865); Union League (1863); Authors', founded by Noah Brooks, R. W. Gilder, Edward Eggleston, Brander Matthews, and others; and the Players', counting Edwin Booth, Thomas Jefferson, and S.L. Clemens (Mark Twain) among its founders. Club-life is not confined to the wealthy, for workingmen's clubs have been successfully operated on both sides of the Atlantic. These institutions, modeled after the social clubs of the rich, are established by and in the interests of workingmen, and have proved very efficient in improving the social condition of the laboring classes. In many of them the sale of intoxicating liquors is prohibited, and the necessaries of life are supplied to members at cost prices.

H. C. Chatfield-Taylor.

Clubs for Women: the growth in the U. S. of clubs for women is one of the marvels of a century prolific in new movements. In Mar., 1868, the first club exclusively for women, Sorosis, was founded, in an experimental way, in New York city, "for the promotion of agreeable and useful relations among women of literary, artistic, and scientific tastes, and for the discussion and dissemination of principles and facts which promise to exert a salutary influence on women and on society." Its formation was due to the refusal of the committee on the Dickens dinner, from the Press Club, to allow women to participate equally with men on that occasion. Twelve ladies, including Mrs. J. C. Croly, the founder, organized Sorosis, whose name is a botanical term derived from a Greek word signifying a heap or collection. Its first president was Sarah (Willis) Parton, popularly known as "Fanny Fern." The interest in such associations has grown until it is estimated that there are in the U. S. 500 clubs with an aggregate membership of not less than 50,000.

To estimate properly this advance it must be remembered that prior to 1868 there were no associated movements among women outside the church, the suffrage, and the anti-slavery cause, and these were combined with, if they were not controlled by, men. Puritan influence aided the custom, and traditions of the ages were potent in limiting women to a subordinate place, and keeping them "silent," in and out of the churches. It is worth noting that the new movement was not in the nature of a revolt, but was more like an awakening. The central idea carried with it nothing belligerent, nothing antagonistic, nothing in a nature of a demand or an assertion. The cardinal principles were unity, fellowship of one woman with another on a platform of professed ignorance, and sincere desire to learn. The movement brought together women of all creeds and no creed, women of diverse social position and environment, women of widely differing opportunities and degrees of culture, and made of them an harmonious body, enriched by the contribution of each to the whole.

This club idea of kinship and unity on the basis of womanhood alone is distinctly modern, at least so far as any practical exemplification of it is concerned, and its inculcation has created a new social departure, and an active, many-sided social life before almost unknown.

What may be called the second period in the life of women's clubs, and their growth into a movement, began in 1889. At the suggestion of Mrs. Croly, a call for a convention of clubs was issued by Sorosis, which proposed to celebrate its twenty-first birthday by such a gathering.

Of 96 clubs addressed, 65 responded by sending delegates. The convention held its sessions Mar. 18–20, and a committee representing the New York Sorosis, the Woman's Club of Brooklyn, and the New Century Club of Philadelphia drafted a constitution and devised a plan of permanent organization to be submitted in the following year. The desirability of giving voice to and recording the history of this rapidly growing movement suggested the idea of a journal devoted to literary and club interests, and a periodical with this avowed object was begun in the autumn of 1889, under the name of *The Woman's Cycle*. Among its features were a directory of clubs and a record of club-work. The first convention of the "general federation" met by invitation of Sorosis at Scottish Rite Hall in New York, on Apr. 23–25, 1890, and was presided over by Mrs. Ella Dietz Clymer, then president of Sorosis. Sixty clubs, representing eighteen different States, participated in this ratification convention, and established the general federation of women's clubs upon a permanent basis, and elected Mrs. Charlotte Emerson Brown, of East Orange, N. J., president.

In the two years between the organization convention at Scottish Rite Hall in 1890 and the first biennial convention at Chicago in 1892 the federation gained an aggregate membership of upward of 200 clubs, representing a membership ranging from 15 to 500, and some with outgrowths of many hundreds more. These clubs covered 31 States, and to the list must be added India, with two federated women's clubs; one in Bombay, founded by a New York physician, Dr. Emma Brainerd Ryder, and one in Ceylon, also the result of Dr. Ryder's efforts. The first mentioned, which numbers more than 250 women, and includes Europeans and natives belonging to six different castes, is the first instance of a general overcoming of the caste spirit.

This rapid growth was accelerated by the federation system of organization. Under this method the president of a federated club became a vice-president of the federation. A federation correspondent from each State was also appointed, whose duty it was, and is, to act as the medium of communication between the individual clubs of her State or territorial area and the central board.

The motto of the general federation is "Unity in diversity." Naturally there are great diversities in clubs in different neighborhoods and different parts of the country, but they are usually differences of detail, not of basis or essential principle. A curious and predominant element in the woman's club idea is its flexibility and ability to lend itself to the needs of its locality and the growth of the membership. It would be easy to enumerate such important achievements as the building of club-houses and institutes, such as the Athenæum of Milwaukee, the Propyleum of Indianapolis, the New Century Club-house of Philadelphia, the club-house at Grand Rapids, and others; but the best result of the work of women's clubs has been seen in the new life of the small towns, the movement in the stagnant waters of quiet village neighborhoods, the uplifting influence of the higher thought, and the democratic spirit that has been fostered. In general terms it may truthfully be said to have changed the tone of whole communities. In particular, it has taught women how to think, how to speak, how to act for the best good of the community in which they live. It has made them acquainted with the best work, the best ideas, and the great thinkers of their own and all times. It has taught them values and proportion and the historic continuity of events, thus forming a basis for a new conception of the philosophy of life and duty, and destroying prejudice. Some clubs have done much in philanthropic directions, particularly in the farther West, where organizations for the benefit of women and children and neighborhood improvement hardly existed until the woman's club created it. Among the outgrowths are, protective and educational unions, provident funds, study-classes, reading-rooms for the benefit of workingwomen, as well as social centers.

London has several clubs for women, but they are not as broad in their aims as those of the U. S. The New Somerville Club, which is chiefly intended for professional women, devotes its Tuesday evenings to discussions and lectures, the subjects being treated in a general and non-partisan way. The Denison Club has for its object "the promotion of friendly intercourse and open discussion between men and women interested in social and industrial questions, and the encouragement of study and investigation." One or more meetings are held monthly, at which papers on practical subjects are read and are followed by a conversation. The University Club for Ladies admits only those who have or have had, as students or lecturers, connection with some college affiliated with a university, or who are registered medical practitioners of the United Kingdom. The Alexandra is a proprietary club of a fashionable and exclusive character. The Pioneer is composed wholly of women, and follows American ideas.

One of the strongest fears expressed in regard to women's clubs in the beginning was the fear that they would tend still more to the separation of sexes. This result has not followed. On the contrary, club-life is bringing men and women together, and the latest outcome of the woman's club is the mixed club of men and women, with higher standards than men's clubs have before known. But this would not have been possible had not women gained knowledge and experience in clubs of their own. J. C. CROLY.

Cluniacs, The, or **Congregation of Clugny** (*Cluniacum* in Burgundy, a very influential monastic institution): founded in 910 by Duke William of Aquitaine, who put his relative, Abbot Berno of Beaume, at the head of the new institution. As the aim of the duke was to effect a reform of monastic life, which had sunk very low in France, Berno enforced the strictest observance of the rules of St. Benedict; but just this severity struck a rich vein of sympathy in the time. Clugny became the reformer not only of the Benedictine order, but of monastic life in general, and its rules, *Consuetudines Cluniasenses*, were generally adopted. Three popes issued from its cells, Gregory VII., Urban II., and Paschalis II. Privileges and endowments were showered upon it, and it soon became one of the richest and most magnificent institutions of the Middle Ages. It received at one time Pope Innocent IV. and the King of France with their whole retinues in 1245. But lack of discipline and the dissipations of the abbots greatly impoverished the institution during the next two centuries. Under the Revolution the Constituent Assembly closed the convent, confiscated the property, and sold the buildings. The church was broken down. Some of its priceless literary treasures were saved, and are in the Paris Bibliothèque Nationale and the British Museum. The palace of the abbots in Paris became in 1833 a museum of antiquities.

AUTHORITIES.—Lorain, *L'Abbaye de Clugny* (Dijon, 1830); the works of Pignot, Cuchérat, and Champly; Duckett's *Record Evidence of Cluni* (1886); and *Charters and Records of Cluni* (1888).

Cluny, formerly **Clugni** (anc. *Cluniacum*): a town of France; department of Saône-et-Loire; on the Grône, here crossed by two stone bridges; 14 miles N. W. of Mâcon (see map of France, ref. 6–G). Here are the remains of a rich and famous Benedictine abbey, founded in 910 A. D. It has also the Church of Notre Dame of thirteenth century. Cluny has manufactures of gloves, lace, linen, paper, and pottery. Pop. (1896) 4,273.

Clupea: See ASPIS.

Clupeidæ [from Lat. *clupea*, a herring, the typical genus]: a family of fishes containing the herrings, shad, sprats, and closely allied species. Its members are characterized by having a compressed body, covered with easily detachable and usually rather large scales, sometimes forming a serrated ridge along the abdomen. The head is naked, mouth large and terminal. Maxillaries of three pieces; teeth, when present, small and numerous. Gill-openings large, gill rakers long and slender. There is no adipose dorsal fin; the anal is rather long; tail forked. The group contains about 130 species, found in all seas, although mostly near the coast; many species ascend fresh waters and some remain there. This group probably comprises more individuals than any other, as some species, like the common herring, assemble in immense schools and are taken in nets by tens of thousands. F. A. LUCAS.

Cluseret, klü'ze-ray', GUSTAVE PAUL: revolutionist; b. in Paris, France, June 13, 1823; aided to suppress the insurrections of 1848; served in Algeria and the Crimea, and reached the rank of captain; resigned in 1858 his place as captain in the French army because he had adopted the principles of Mazzini. In 1859 he commanded the contingent of French volunteers under Garibaldi, and in 1862 entered the volunteer army of the U. S., in which he became in 1862 a brigadier-general, serving on the staffs of Gens. McClelland and Fremont. In 1864 he published in New York the *New Nation*, to urge the nomination of Fremont for the presidency. His attempts, in 1870, to proclaim in Lyons and Marseilles the "Red Republic" failed. In Mar., 1871, the communists of Paris appointed him Chief of the War Department; on May 1 he was deposed, arrested, and impeached, but after a few days set free, and fled to England. After a short visit to the U. S. he settled at Geneva, Switzerland, in 1872.

Clusia [so called in honor of the botanist Lécluse or Clusius]: a genus of dicotyledonous trees and shrubs, many of which are epiphytic, belonging to the family *Guttiferæ*. About sixty species are known, all natives of tropical or sub-tropical America. They have opposite, coriaceous, entire leaves, and terminal, solitary or panicled, diœcious or polygamous, showy flowers. The sepals are from four to six, the petals from four to nine, the stamens numerous and indefinite, while the pistil is compound, with five to fifteen cells, with many ovules in each cell. On account of the yellow resinous juice which they contain some of them bear the name of balsam-trees, and in some cases this when dried into a resin is used for plasters, and for other medicinal purposes. One species, *C. flava*, is found in Southern Florida. It occurs also in the West Indies, and is known as the yellow balsam-tree on account of its medicinal yellow resin. *C. rosea* from the West Indies is grown in conservatories for its beautiful rose-colored flower. C. E. B.

Clustered Columns, or **Compound Piers**: piers which are composed or appear to be composed of several columns clustered together. They form one of the richest features of Gothic ecclesiastical architecture, in which they serve to support the pier-arches under the clerestory, and the vaulting of the side-aisles. The columns may have separate shafts grouped around a central core, or may be attached to each other and to the core throughout their whole length. In English Gothic they are frequently adorned with encircling bands or fillets at regular intervals. A. D. F. HAMLIN.

Clyde: the principal river on the west coast of Scotland; celebrated for the beauty of its scenery. It rises in the Lowther and Moffat Hills, and drains an area of about 1,500 sq. miles in the counties of Lanark, Renfrew, and Dumbarton. It flows at first N. as far as Biggar; it then takes a N. W. course, receiving the Douglas on the left at Harperfield. At Lanark, both above and below the town, are the Falls of Clyde, where the river descends about 350 feet in 4 miles. The highest fall is Corra Linn, in which there are three leaps aggregating 84 feet. The river then passes Hamilton, Glasgow, and Renfrew, and reaches the firth of Clyde at Dumbarton. Glasgow may be reached by the largest ocean steamers, and at Dumbarton the river is 1 mile wide. Total length, 73 miles. The valley of the Clyde is one of the most prosperous parts of Scotland.

Clyde: city; Clond co., Kan. (for location, see map of Kansas, ref. 4–G); on Mo. Pac., Ch., Rk. I. and Pac. and Union Pac. R. Rs., and on Republican river; has a trade in grain, hogs, etc. Pop. (1880) 956; (1890) 1,137; (1900) 1,157.

Clyde: village; Wayne co., N. Y. (for location of county, see map of New York, ref. 4–E); on the N. Y. C. and H. R. and the West Shore R. Rs., and on the Erie Canal and the Clyde river; 43 miles E. of Rochester. It has churches of five denominations, a large high school, 2 glass-factories, 6 malt-houses, canning-factory, 2 harness-factories, 2 grist-mills, tannery, steam-engine works, and a cooperage. Pop. (1880) 2,826; (1890) 2,638; (1900) 2,507. EDITOR OF "TIMES."

Clyde: village; Sandusky co., O. (for location of county, see map of Ohio, ref. 2–E); on the L. S. and M. S., the C. C. C. and St. L., and the W. and L. E. R. Rs.; 38 miles E. of Toledo and 75 miles W. of Cleveland. Here are eight churches, excellent schools, water-works (supplied by artesian wells), electric lights, piano-factory, edge-tool works, and other manufacturing industries. The village is situated in one of the richest agricultural regions of Ohio. Pop. (1880) 2,380; (1890) 2,327; (1900) 2,515. EDITOR OF "ENTERPRISE."

Clyde, LORD: See CAMPBELL, COLIN.

Clymer, GEORGE: statesman; b. in Philadelphia, Pa., in 1739; was brought up by his uncle, William Coleman, who made him his heir. Clymer resisted the sale of taxed tea in 1773, and subscribed liberally to the loans of the first Continental Congress. He was elected to the Continental Congress in 1776 in place of the Pennsylvania delegates, who refused to vote for independence, and signed the Declaration of Independence, although he was not present at its adoption. He was re-elected a member of Congress in 1780, and was a member of the convention which formed the Federal Constitution in 1787. He was the founder of the Pennsylvania Agricultural Society. D. in Morrisville, Bucks co., Pa., July 23, 1813.—His grandson, MEREDITH CLYMER, b. in Philadelphia, in June, 1817, became a distinguished physician in New York, where he was Professor of the Institutes of Medicine at the University of that city. He edited and wrote numerous treatises on nervous affections, fevers, and pulmonary disease.

Clysma: See EGYPT, ANCIENT.

Clytæmnes'tra, or **Clytemnestra** (in Gr. Κλυταιμνήστρα): the wife of Agamemnon, King of Mycenæ; was a sister of Castor and of Helen. She became the paramour of Ægisthus, and murdered Agamemnon and Cassandra on his return from Troy. She and Ægisthus were killed by her son Orestes. The legends concerning her were worked over by Homer, Euripides, and Sophocles.

Clyt'ia, or **Clyt'ie** (in Gr. Κλυτία, or Κλυτίη); the name of three mythical personages mentioned by Hesiod, Ovid, Pausanias, and Tzetzes. With Ovid (*Metamorphoses*, iv.) she is a nymph loved by Apollo, the god of the sun, but who, having offended and being forsaken by him, pined away with her eyes fixed on the sun, and was turned into a flower, which (from its ever turning toward the sun) was called *heliotropium* (ἡλιοτρόπιον).

Cnicin, nī'sin, or **Centan'rin**: the bitter principle of *Cnicus*, or *Centaurea benedictus*. It is in odorless, silky needles, having a pure bitter taste. See Blessed Thistle.

Cnidus, nī'dŭs (in Gr. Κνίδος), sometimes written **Gnidos**: an ancient Greek city of Caria, in Asia Minor; on the Ægean Sea and on the promontory of Triopion. It was one of the six cities of the Doric league called *Hexapolis*, and had an extensive commerce. Here were several famous temples of Venus, one of which contained a celebrated marble statue of Venus by Praxiteles. Cnidus was partly built on a small island, connected by a causeway with the mainland. Conon the Athenian defeated the Spartan fleet near Cnidus in 394 B. C.

Coach: See Carriages, etc.

Coadju'tor [Lat. *co-* + *adju'tor*, helper, subst. of *adjuva're*, help]: an assistant; in ecclesiastical law, a term technically applied to one appointed to assist a bishop or other dignitary. Coadjutant bishops in the Roman Catholic Church are usually bishops of sees *in partibus*. In the Protestant Episcopal Church of the U. S. they are called assistant bishops. The first one to be appointed in that Church was Benjamin Moore, who was made assistant to Bishop Provoost, of New York, and the diocesan's resignation of his jurisdiction refused. Since that time there have been many such prelates in this Church, who have been elected with the provision that they are to succeed the diocesan, but until he dies, resigns, or is deposed they perform only such duties as he may assign them. When Bishop Onderdonk, of New York, was suspended, J. Wainwright was given the exercise of all diocesan functions under the title of "provisional bishop." Under the present practice a bishop and his convention may fix the jurisdiction of the assistant and confer a title, usually from some city in the diocese, before the assistant is appointed. In England coadjutor bishops have no official appointment, title, or position, except by a purely private and personal arrangement between the diocesan and themselves. They are usually chosen from among bishops who have retired from colonial or missionary sees.

Coagulation [from Lat. *coagula'tio*, deriv. of *coagula're*, to curdle, *coa'gulum*, rennet; *co-*, together + *a'gere*, drive]: the changing of a liquid to a substance of semi-solid or curd-like consistency (the clot). Thus the white of an egg becomes solidified on the application of heat. The casein of milk is coagulated (curdled) by the action of rennet and by many acids. The fibrin in the blood, chyle, and lymph is coagulated after the removal of these fluids from the living animal. Coagulation of the blood has received a very great amount of patient study, and still there appears to be much obscurity. Fibrin does not exist as such in the blood, but is formed by the union of certain other substances. These seem to be fibrinogen, a substance found in the plasma of the blood, and fibrinoplastin, found in the white corpuscles, the whole process being stimulated by a ferment also found in the white corpuscles. In inflammation and inflammatory diseases the blood contains an excessive amount of the fibrin factors, and therefore the blood readily coagulates. Much importance was formerly attached to the rapidity of coagulation and the appearance of the clot. This was in the days of excessive phlebotomy, but to-day little, perhaps too little, is thought of the coagulability of the blood. In pneumonia, which is a decidedly inflammatory disease, the coagulability is so much increased that clots form within the heart, and the usual cause of death is failure of the heart from heart clots and general weakness. In certain other diseases, like Hæmophilia (*q. v.*), the blood does not clot readily, and hæmorrhages, in part due to the condition of the blood, are constantly seen. Coagulation is most important to the surgeon, for this alone makes amputations or any operations possible. Revised by William Pepper.

Coahuila, kō-ä'ä-wee'lä'ä: a northern interior state of Mexico; bordering on the Rio Grande; bounded N. by Texas, E. by Tamaulipas and Nuevo Leon, S. by San Luis Potosi and Zacatecas, and W. by Durango and Chihuahua. A small area near the center of its western border has independent political rights as the territory of Sierra Mojada. Area of the state, 63,538 sq. miles. The surface is much like that of the adjacent portion of Texas—dry, bare of trees, generally level, but with low, abrupt mountains. The last are most abundant in the central portion. The Rio Salado, a tributary of the Rio Grande, rises in these mountains. The southwestern quarter has several large lagoons which fluctuate greatly in size and form the sinks of extensive independent drainage basins. The mineral wealth is considerable, but the richest region has been segregated in the territory of Sierra Mojada. Cattle, wool, and fruits are the other chief products. The climate is generally temperate and healthy. Pop. (1895) 235,638. Capital, Saltillo, with 17,000 inhabitants. The International Railway crosses the state from Ciudad Porfirio Diaz (Piedras Negras) on the Rio Grande to Torreon in the southwest. M. W. H.

Coahuila Valley: See Colorado Desert.

Coahuiltecan Indians: a linguistic family of Indians; so named by Orozco y Berra in 1864, and Coahuilteco-Tejano by Pimentel in 1865. But the Mexican state of Coahuila, for which the family name was intended, now has a much smaller territory than in the eighteenth century, and the present Coahuiltecan Indians all live in the state of Tamaulipas.

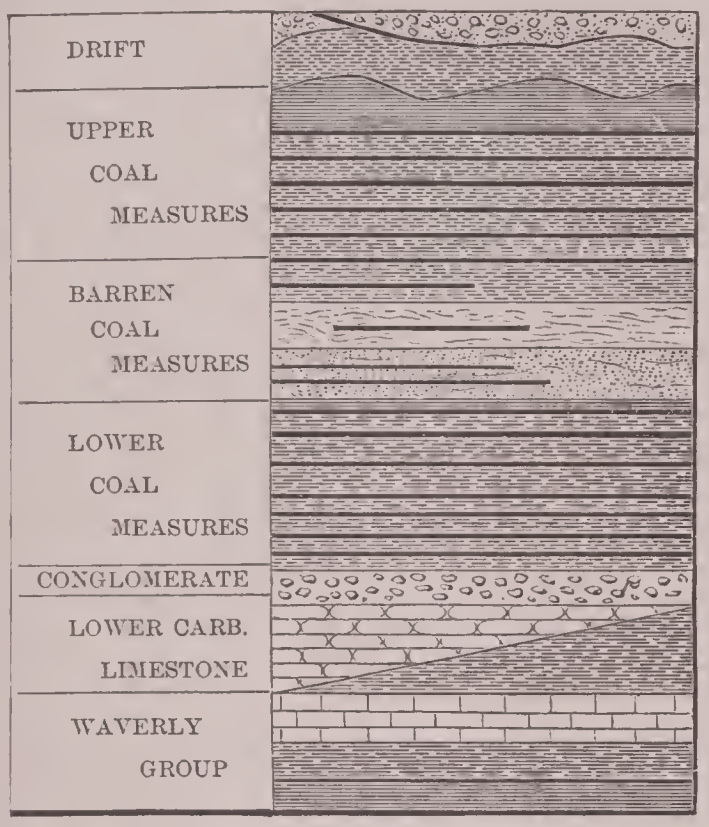
Tribes, Population, Language.—The majority of the tribes belonging to this stock are enumerated in Father Bartolomé Garcia's *Manual*, a sort of catechism dated Queretaro, 1760, and probably composed at the San Juan Capistrano Mission, near San Antonio de Bejár, Texas. Mention is there made of the Pajalates, Orejones, Pacaos (Pakawá, or Pintos, "the tattooed ones"), Pacóas, Telijayas, Alasapas, Pausanes, Pampôpas, and many others. Most of them lived between the Rio Nueces and the Rio Grande, a portion of Texas then belonging to Coahuila province. The feeble surviving remnants of this stock—the Comecrudos, Cotonames, and Pakawá—now live in Mexico between Camargo and Reynosa. They are generally tall in stature, and have an olive complexion. They remember their dialects but imperfectly, their principal means of intercommunication being Spanish, and they seem to have no knowledge of their early homes and migrations. In 1886 their population was about 30, only 10 of whom could converse in the Indian vernacular. The Comecrudo dialect is very simple in its phonetics and in its grammatic forms. See Indians of North America. A. S. Gatschet.

Coal: a name given to several carbonaceous substances derived from vegetable tissue. It was formerly limited to what is now known as charcoal, the residual carbon of wood, from which the volatile constituents have been expelled by heat; but it is at present almost universally used to denote the various kinds of mineral fuel. As these have no definite composition, the vagueness of the term has given rise to much discussion in scientific books and courts of law.

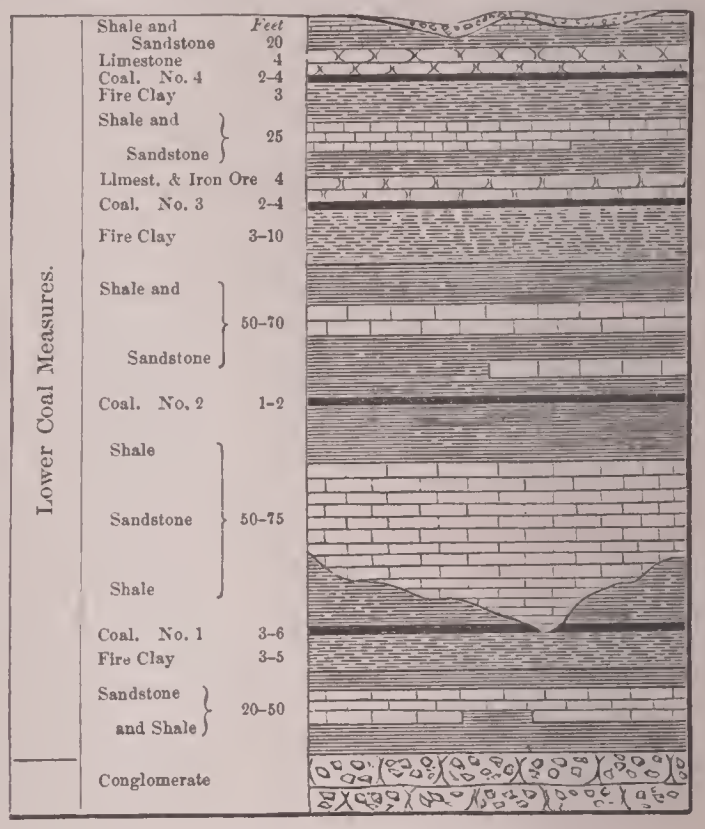
Origin, Theories of.—Mineral coals form part of an unbroken series which begins with woody fiber and ends with graphite. They are all derived from the decomposition of vegetable tissue when buried under water, earth, or rock. The different products of this progressive change, which is a sort of distillation, are peat, lignite, bituminous and anthracite coal, graphite, and asphaltum, which are solids; petroleum and water, which are liquids: carbonic acid, carbureted hydrogen, etc., which are gases. Of these all the solids, excepting asphaltum, are residual products, while that substance and the liquids and gases are the evolved products or distillates. The vegetable origin of coal is accepted generally by naturalists, because of the abundance of well-preserved fragments of plants frequently found in the roof and base shales, and in the partings of the beds, because of the distribution of microscopic fragments of vegetable origin in the coal, and because of the presence of ash in quantity averaging close to that of various vegetable species. Earlier investigators have assumed that coal-beds owed their origin to the decomposition and maceration of enormous forest-growths, while others based theories concerning their genesis upon the discovery in some seams of great quantities of spores, the seeds of lycopodiaceæ. Another hypothesis rested

upon accumulations of marine plants, like the sargassum fields of the Atlantic Ocean. The theory which, however, finds most general acceptance at the present time is that ably presented by Leo Lesquereux, of the Geological Survey of Pennsylvania, that the vegetable matter accumulated in peat-bogs. The accumulations thus formed in different geological periods, but having their greatest development in what is known as the Carboniferous age, were subjected to enormous pressures and to a slow and general distillation, resulting in the different varieties of coal, from the more modern lignite to anthracite and graphite. In isolated instances the chemical changes have been hastened by local volcanic eruptions and lava-streams, and in many districts widespread disturbances of the strata have facilitated the escape of moisture and volatile matter.

All the varieties of coal shade into each other, and we have lignites which exhibit every degree of approach to bituminous coals, semi-bituminous coals intermediate between these latter and anthracite, and graphitic anthracites by which the anthracites are connected with the graphites.



Carboniferous strata—W. Pennsylvania and Ohio.



Coal measures—N. Ohio.

Geological Formation.—The geological position of the different varieties of coal accords with the theory of their origin. For example, the oldest rocks known contain comparatively little carbonaceous matter, as they date from a period when the vegetation of the globe was scanty and mostly marine. Here we have only the residual products of the distillation of vegetable tissue, graphite and anthracite. In the Carboniferous age the terrestrial vegetation was luxuriant over large areas, and conditions prevailed favorable to the formation of beds of peat. These, submerged and deeply buried under sediments which were deposited upon them, have, as a general rule, been changed to our beds of bituminous coal—to anthracite where local causes have carried the process of distillation further. In formations more modern than the Carboniferous the accumulations of vegetable matter are usually classed as lignites. These contain more water and oxygen, and are less valuable fuels than the true coals, but shade into them imperceptibly. In the present period we see the formation of coal only in its initial stages—viz., the growth of vegetation and the accumulation of bitumenized vegetable tissue in peat-bogs and marshes, where oxidation is prevented or retarded by water. By artificial processes we can, however, hasten the changes in vegetable tissue, and by properly conducted distillation produce lignite, bituminous coal, and anthracite. We find, too, that nature is locally accelerating her processes, and by volcanic heat distilling lignites and bituminous coals to anthracite. In Colorado, New Mexico, and on Queen Charlotte's island, excellent anthracite has been produced by volcanic heat from Cretaceous lignites. At Los Bronces, in Sonora, Triassic coal is converted into anthracite by a similar cause. In Eastern America all the coal strata, except those of the small Triassic basins of Virginia and North Carolina, are of Carboniferous age. In the valley of the Mississippi, where they have suffered no local metamorphosis, they are all of the bituminous class. In the Alleghanies the same strata, having been somewhat affected by the causes which resulted in the upheaval of the mountains, have lost a portion of their volatile matter, and have become what are known as semi-bituminous coals. To this group belong the coals of Blossburg, Broad Top, Frostburg, and a belt running down to Alabama. Still farther E. the Carboniferous strata are more metamorphosed, and the coal which they contain is converted into anthracite. In Rhode Island a coal-basin of limited extent, and of the same age with those of Pennsylvania, seems to have been still nearer the focus of metamorphic action; and here the coal is partially converted into graphite, forming the variety known as graphitic anthracite.

The following sections, general and local, will serve to give an idea of the mode of occurrence of coal in the Carboniferous rocks, and of the nature of the associated strata:

As members of the stratified series of rocks the coal-beds were originally deposited horizontally, and large areas are known in the U. S. and elsewhere in which this position has been but little modified. In many cases, however, the strata often have undergone violent flexures and extensive faulting, and they frequently occur in basins. In thickness the strata vary from seams as thin as knife blades to beds above 100 feet through. The beds very rarely consist of one uniform mass of coal, but are subdivided by layers or strata of slate called "partings," and often these layers differ in physical structure and chemical composition. The coal itself is generally weathered along the outcrop, deteriorating it so that explorations must generally be carried to varying depths under cover before the fresh coal and its true value can be determined. In nearly all coal-fields there are a number of beds. The minimum workable thickness depends upon a large number of contingencies, the character of the foot, wall, and roof, the distance from market, the quality of the coal, the supply of labor, the flow of water, etc. Mining is rarely carried on in seams smaller than $3\frac{1}{2}$ to 4 feet. See MINING.

Chemical Constitution.—Chemically, coal is not a compound of free carbon with volatile hydrocarbons, but is regarded by more recent authorities, like Muck, as a mixture of a large series of hydrocarbons. The constituents producing the ash are derived both from the original vegetable tissues from which it was formed and from mechanical admixture of the mineral substances constituting the rocks in which the seams were imbedded. Sulphur, generally present, and important as affecting the economical value of the fuel, is partly traceable to true chemical combination with the hydrocarbons and partly to admixture of iron pyrites,

the latter being often found on strata and seams and in concretions of larger size.

Structurally, coal is often split up into cubes by innumerable cracks and seams, which often greatly facilitate the mining, but at times seriously interfere with the marketing of the coal. The fine coal or slack is frequently unsalable, and when it can not be used for coking represents so much waste. Some coals are hard and bear long transportation, others are fragile and do not bear carriage to distant markets. All coals deteriorate, so far as their fuel value is concerned, by prolonged exposure to the atmosphere; this loss of calorific efficiency through weathering being strongly marked in some varieties, while it is of little practical significance with others.

The spontaneous ignition of coal, which is particularly dangerous to vessels laden with fuel for distant ports, has been frequently attributed to heating caused by the oxidation of the pyrites it contains. More recent investigators incline to regard the oxidation and ignition of the lighter volatile hydrocarbons as the cause. Thorough ventilation is now acknowledged to be the best preventive measure.

Industrial Values.—The value of coal in the economy of civilization is now so well understood and so fully appreciated that it requires no lengthy exposition. In its combustion the heat of the sun, absorbed in the growth of the plants from which it is derived, is all given out again, subject to human control; and, as heat is but another name for physical force, coal becomes the most important source of power at our command. The power developed in the combustion of a pound of coal is theoretically equal to 11,580,000 foot-pounds. But by our imperfect methods of utilization not more than 1,500,000 foot-pounds are made available. This is about the amount of power exerted by a man of ordinary strength during a day of labor. Hence 300 lb. of coal will represent the labor of a man for a year. The current production of coal in the world is about 500,000,000 tons. While we possess no recent statistics of the percentage of consumption for power purposes, a fair estimate is one-quarter of the whole output for driving stationary locomotives and marine engines. This is equivalent to the labor of over 800,000,000 men who are producers and not consumers.

For the calculation of the calorific value of coal the Dulong formula has been used for a long time. It is:

$$CV = \frac{8080\ C + 34{,}462\ (H - \frac{1}{8}\ O)}{100}.$$

(C = per cent. carbon, H = per cent. hydrogen, and O = per cent. oxygen.) By dividing the calorific value thus obtained by 637, the quantity of carbon is obtained which converts water at the freezing-point into steam. Favre and Silbermann, Regnault, Berthelot, Scheurer-Kestner and Meunier, Gruner, Johnson, and others have made researches reviewing Dulong's formula, which resulted in showing that the practical calorific value is two-thirds of the theoretical thus calculated.

The distillation of coal in the manufacture of illuminating gas has been largely superseded by the manufacture of water-gas, subsequently enriched by naphtha. The tar produced in the distillation of gas-coals by the older method of manufacture forms the raw material for the great aniline industry, the annual profits of which in Germany are said to be greater than the sums paid to scientists engaged in original research in the German universities.

Distribution, General.—Such being the value of coal, its geographical distribution becomes of great interest and importance. Among the nations of Europe the British occupy a pre-eminent position, not only from the extent of their coal-fields, but from the industries dependent upon them. The British coal area is estimated to be 11,859 sq. miles. The coal area of France is about 2,000 sq. miles. Belgium has a coal area estimated at 500 sq. miles. In Prussia the coal area is 2,000 sq. miles of very deep and valuable coal strata. The coal area of Spain is not definitely known. Her coal-field in the province of Asturias is important, but as yet her coal production is small. Austria has 1,800 sq. miles of coal territory. Recent discoveries have shown that Russia has much larger coal-fields than were formerly credited to her, and it is estimated that she has 20,000 to 30,000 sq. miles of coal strata of different ages.

Coal also occurs in China, India, Australia, Japan, and Borneo. So far as known, it is all of Mesozoic age, though in China and Japan anthracite and well-formed bituminous coals are found, and have been worked for centuries.

Production.—The following table gives the world's production in short tons for the years named:

United States (1899)	tons.	253,739,992
Great Britain (1899)		246,495,539
Germany (1899)		149,719,766
Austria-Hungary (1898)		41,652,569
France (1898)		35,656,426
Belgium (1899)		24,159,925
Russia (1898)		14,173,960

United States.

Production.—When we turn to the U. S. we find a coal area which throws all those which have been mentioned into insignificance, and coal-fields which, although shallow compared with those of Nova Scotia and parts of Europe, are the most extensive and richest in the world.

STATES AND TERRITORIES.	1889.	1899.
Bituminous.		
Alabama (tons)	3,572,983	7,593,416
Arkansas	279,584	843,554

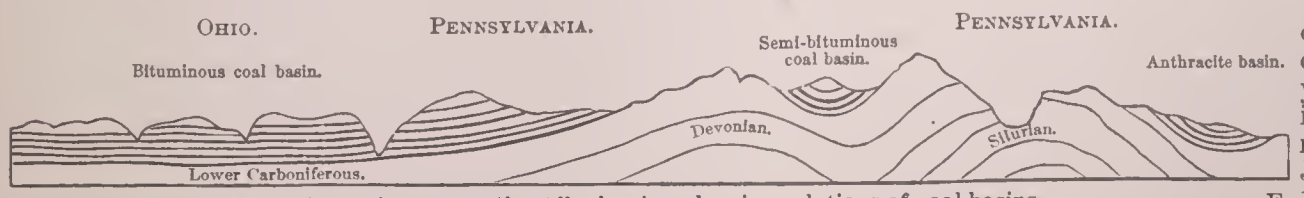
Total anthracite	45,600,487	60,418,005
Grand total	141,229,513	253,739,992



W. Profile section across the Alleghanies, showing relations of coal basins.

The production of coal in the U. S. during the fiscal year 1889, according to the census report of John H. Jones, and during E. 1899, according to the report of E. W. Parker to the U. S. Geological Survey, is shown in the table given above. In the latter report the anthracite product outside of Pennsylvania is included in the general total.

The distribution of the coal product was as follows:

DISTRIBUTION.	1889.		1899.	
	Anthracite.	Bituminous.	Anthracite.	Bituminous.
Loaded at mines for shipment.....tons.	40,166,818	73,609,883	47,088,581	133,871,530
Sold to local trade.....	1,163,889	6,418,647	1,238,066	7,687,848
Used by employees.....	327,491	598,672		
Used for steam at mines...	3,942,289	1,439,976	5,055,997	2,865,292
Manufactured into coke....	.....	13,561,848	.....	22,167,353

Labor and Wages.—The census reports show in detail the number of men employed in the collieries, the length of employment, and the average wages. In the calendar year 1889 there were employed above ground 2,285 foremen, 8,603 mechanics, 38,413 laborers, and 17,836 boys under 16 years; below ground there worked 2,859 overseers, 158,060 miners, 58,771 laborers, and 9,796 boys: total, 296,623 employees, to whom an aggregate of $106,937,058 was paid in wages. The data for the leading producing States are given below:

EMPLOYEES.	Pennsylvania, anthracite.	Pennsylvania, bituminous.	Illinois.	Ohio.
Above ground.				
Foreman and overseers:				
Number.....	564	378	217	221
Av. wages per day.....	$2 71	$2 57	$2 34	$2 26
Av. no. of days worked.	291	250	262	244
Mechanics:				
Number.....	4,720	1,028	625	334
Av. wages per day.....	$1 92	$2 11	$2 03	$1 91
Av. no. of days worked.	257	237	266	235
Laborers:				
Number.....	23,779	3,366	1,678	1,420
Av. wages per day.....	$1 29	$1 67	$1 52	$1 51
Av. no. of days worked.	198	208	201	192
Boys under 16 years:				
Number.....	17,091	207	64	83
Av. wages per day.....	$0 62	$0 86	$0 80	$0 77
Av. no. of days worked.	185	200	200	187
Below ground.				
Foremen and overseers:				
Number.....	737	606	305	221
Av. wages per day.....	$3 05	$2 56	$2 38	$2 32
Av. no. of days worked.	291	256	256	245
Miners:				
Number.....	36,739	40,100	15,386	14,733
Av. wages per day.....	$2 40	$1 93	$1 98	$1 95
Av. no. of days worked.	179	210	177	181
Laborers:				
Number.....	35,376	5,303	5,062	1,955
Av. wages per day.....	$1 63	$1 85	$1 77	$1 63
Av. no. of days worked.	184	220	199	185
Boys under 16 years:				
Number.....	4,770	2,144	597	376
Av. wages per day.....	$0 89	$0 78	$0 90	$0 73
Av. no. of days worked.	180	217	176	181
Total employees.....	123,676	53,132	23,934	19,343
Total wages in 1889.....	$38,867,331	$20,327,805	$8,429,553	$6,730,778

These figures may be accepted as fairly representative of the wages earned and the average number of days of employment. The boys enumerated as working above ground at the anthracite collieries are employed chiefly as slate-pickers in the coal-breakers. Those working underground are generally engaged in watching ventilation-doors.

Cost of Production.—For some of the leading States the expenditures incurred in mining, according to the preliminary reports of the census office for 1889, the final figures, including those for the Pennsylvania mines, not having been published (1893), are tabulated as follows:

STATES.	Wages.	Salaries to office force.	Supplies.	To contractors.	All other mining expenses.	Total mining expenses.
Pennsylvania anthracite..	.....	.....	.....	.....	.....	.....
Pennsylvania bituminous.	.....	.....	.....	.....	.....	.....
Maryland....	.....	.....	.....	.....	.....	.....
Illinois.....	$8,429,553	$264,794	$966,927	$26,662	$678,133	$10,366,069
Ohio.....	6,730,778	161,826	568,020	58,767	702,792	8,232,183
Indiana.....	2,144,566	56,478	241,094	5,807	133,724	2,581,669
West Virginia	3,748,721	139,991	462,591	47,099	443,394	4,841,796
Kentucky....	1,669,524	86,839	237,321	45,099	117,765	2,156,548
Tennessee....	1,548,392	60,918	271,390	13,324	219,268	2,113,292
Virginia.....	604,796	16,470	46,754	932	13,456	682,408
Alabama.....	.....	.....	.....	.....	.....	.....

Out of total expenditures, for the States enumerated, of $30,973,965, the outlay for wages was $24,876,330, thus showing that the labor cost is 80·3 per cent. of the total.

Classification.—Prof. Persifor Frazer, of Philadelphia, has suggested a classification of coals based upon the ratio of fixed carbon to volatile hydrocarbons. He has proposed the following:

CLASSES OF COALS.	Ratio, fixed c. to vol. hydroc.
Hard-dry anthracites.....	from 99 : 1 to 12 : 1
Semi-anthracites.....	" 12 : 1 to 8 : 1
Semi-bituminous.....	" 8 : 1 to 5 : 1
Bituminous.....	" 5 : 1 to 0 : 1

Arbitrary commercial divisions are, however, locally made, which do not accord with the classifications established by scientists.

The most recent and comprehensive classification of the bituminous coal-fields of the U. S. has been made by the late Charles A. Ashburner, with an estimate of the areas of some of the fields:

	Area, sq. miles.	
(1) *Triassic*:		
Virginia.....	180	
North Carolina.....	2,700	
		2,880
(2) *Appalachian*:		
Pennsylvania.....	9,000	
Ohio.....	10,000	
Maryland.....	550	
Virginia.....	185	
West Virginia.....	16,000	
Kentucky.....	9,000	
Tennessee.....	5,100	
Georgia.....	200	
Alabama.....	8,660	
		58,695
(3) *Northern*:		
Michigan.....	6,700	
		6,700
(4) *Central*:		
Indiana.....	6,450	
Kentucky.....	4,000	
Illinois.....	36,800	
		47,250
(5) *Western*:		
Iowa.....	18,000	
Missouri.....	26,700	
Nebraska.....	3,200	
Kansas.....	17,000	
Arkansas.....	9,100	
Indian Territory.....	20,000	
Texas.....	4,500	
		98,700
Total area.....		214,225

(6) Besides the *Rocky Mountains* includes large coal-fields in North Dakota, Montana, Idaho, Wyoming, Utah, Colorado, and New Mexico, the areas of which are not even approximately determined; and (7) the *Pacific coast* includes coal areas in Washington, Oregon, and California.

The first five groups embrace an area of 214,225 sq. miles. It is surmised that the sixth group has between 200,000 and 300,000 sq. miles more, while not even a guess has been made concerning the seventh.

Triassic Field.—The eastern Triassic area is composed principally of the Richmond basin in Virginia and the Deep river and Dan river fields in North Carolina, the former having been one of the earliest districts developed in the U. S. It produced 28,353 tons in 1899, and is only slightly developed.

Appalachian Field.—The Appalachian field, from which 129,843,906 tons of coal were mined in 1899, lies immediately W. of the eastern frontier of the Appalachian Mountains, and extends from the State of New York to the State of Alabama, its length being a little over 900 miles in a N. E. and S. W. direction, and its width varies from 30 to 180 miles. All the coals are bituminous and are of great variety, both in chemical composition and physical structure. Although it is difficult to make any general comparisons, the best and most productive coal-beds lie probably in the Pittsburg district and in West Virginia. Some of the best coals in the field are mined in basins detached from the main body of the field, such as the Blossburg and Broadtop basins in Pennsylvania, and the Cumberland in Maryland. The thickness of the coal measures in the different sections of the field varies from 100 to over 3,000 feet.

Northern and Central Fields.—The coal of the northern field is inferior and is mined only for local consumption.

The central field, in which there were mined 33,181,247 tons in 1899, includes the coal areas of Indiana, Illinois, and Kentucky. On account of the great extension of the field in that State it is often simply called the Illinois field.

Western Field.—The most extensive mining operations in the western field are carried on in Iowa and Missouri. The best coal so far mined is that from the Indian Territory, the total product of the field in 1899 having been 15,320,393 net tons. The coals are of great variety, and, since the

region in which they lie is a rich agricultural country, it is probable that the beds will be very extensively developed to supply local demands.

In the Rocky Mountains the coal-beds have been found in the geological formations from the Carboniferous to and including the Cretaceous. They include large areas of lignites.

Pennsylvania.—The Pennsylvania bituminous coal formation has been divided by the Geological Survey of that State into—1, the Upper Barren Measures; 2, the Upper Productive or Monongahela River Series, containing the Waynesburg, Uniontown, Sewickley, and Redstone coal-beds and the famous Pittsburg bed at its base; 3, the Lower Barren Measures; 4, the Lower Productive or Alleghany River Series, including the Freeport group at the top with three coal-beds, the Kittanning group in the middle with three coal-beds, and the Clarion group at the bottom with three coal-beds: but of these nine coal-beds not more than two, or at most three, are anywhere found workable directly one over another, so great is their variability in size and quality; 5, the Pottsville Conglomerate Series (No. XII.), containing small beds of coal and resting on the Sharon coal-bed, celebrated for its black coal in Ohio but worthless in Pennsylvania except in Mercer County; 6, the measures down to and including the Pocono sandstone (No. X.). As indicating the enormous amount of coal, it may be stated that Dr. H. M. Chance in 1881 estimated the tonnage of available bituminous coal in Pennsylvania at 33,547,200,000 tons, of which nearly one-third was assigned to the Pittsburg bed.

In Pennsylvania the most important bed is the Pittsburg, in Connellsville, varying in thickness between 6 and 12 feet, the coal containing from 59 to 64 per cent. of solid carbon, 30 to 24 per cent. of volatile matter, 3 to 6 per cent. of ash, 1 per cent. of sulphur, and 1 per cent. of water. It is mined in the Monongahela river coal region, which ships upward of 4,000,000 tons annually by river alone to the markets along the Ohio and Mississippi rivers to New Orleans. From it come the coals which are manufactured into coke in the great Connellsville region, and the steam and gas coals of Allegheny and Westmoreland Counties. The Moshannon, or Lower Freeport, 3 to 5 feet thick, and the Lower Kittanning beds are mined in the Clearfield districts, which is one of the principal sources of supply for the Atlantic coast trade, the total shipments of the district having been about 5,500,000 tons in 1899. A third leading district is the Reynoldsville of Jefferson County, in which the Lower Freeport is mined, the coal being shipped chiefly for steam purposes to Buffalo and the lakes, Western New York, and New England. The annual production is about 4,500,000 tons.

Maryland.—One of the most important coal districts in the Appalachian field is the Cumberland, Frostburg, or George's Creek, in Western Maryland, 20 miles long, with an average width of 4½ miles. The bed, which dips steeply, varies in thickness, but is generally thicker than the Pittsburg bed which it represents. The product is a famous steam coal used largely in the Atlantic tidewater trade. The 1899 output was about 6,000,000 tons.

The Virginias.—The youngest and most vigorous competitor for the seacoast trade is the Pocahontas Flat Top region, which is situated along the line separating the two Virginias, in Tazewell co., Va., and Mercer and McDowell cos., West Va. It produces a coal of exceptional purity, making an excellent coke, from the great Pocahontas or No. 3 bed, which is 10 to 12 feet thick, and in some portions of the field is split into two distinct workable seams, yielding about 9 feet of coal. It is cheaply mined, not requiring any pumping. The district in 1899 shipped nearly 1,800,000 tons of coal and 400,000 tons of coke, and is expanding rapidly.

West Virginia is pre-eminent for its coal resources, the Pittsburg seam underlying the whole northwestern half of the State. Mining is on a large scale in the Kanawha and New River valleys, where a gas-coal seam, running from 4 to 7 feet in thickness, is quite cheaply produced and is largely shipped by river, being a formidable competitor in the lower markets of the Monongahela district in Pennsylvania. The shipments from the Kanawha and New River districts in 1899 were 6,544,956 tons; the Flat Top district, 6,033,344 tons; and the Fairmount and Elk Garden districts, 5,160,192 tons. The Elk Garden district is contiguous to the Cumberland district of Maryland and supplies the same markets.

Kentucky.—Kentucky includes in its boundaries portions of both the Appalachian and the Central field and has shared in the generally rapid development of the coal resources of the Southern States during the past few years. In the eastern area, which is a part of the Appalachian field, the coal-beds lie stratigraphically in two subdivisions, the upper of which represents the lower coal measures of Ohio, West Virginia, and Pennsylvania, and the lower the conglomerate and subconglomerate coals.

Tennessee.—The coal of Tennessee is confined to what is known as the Cumberland plateau, which is broken into by the Sequatchie valley. That part of the plateau to the W. of the valley retains the name Cumberland, while that to the E. is generally known as Walden's Ridge. A large percentage of the coal mined is used for the manufacture of coke for the blast furnaces of the State.

Alabama.—The coal measures of Alabama occupy the extreme southern part of the Appalachian coal-field, and include the Warrior, Cahawba, and Coosa districts, so named after the rivers which drain them. The area of the first is nearly ten times that of the latter two combined, and practically supplies alone the fuel for the great Birmingham iron industry, the coal for coking being mined from the Pratt seam, which averages 4 to 4½ feet in thickness. The total product in 1899 was 7,593,416 tons, of which 2,656,296 were made into coke. The Alabama mines during the past few years have developed an important trade with the countries on the Gulf of Mexico.

Ohio.—More than one-fourth of the State of Ohio is underlaid with coal-bearing strata. The coal measures are divided into three series: the Lower, about 500 feet in thickness; the Barren, 400 to 500 feet thick; and the Upper, 600 feet in thickness. The coal is now chiefly drawn from four to five different seams. The coal-producing portions of the State are divided into twelve districts: 1, Jackson; 2, Ohio valley, including Lawrence, Gallia, Meigs, Monroe, Belmont, Jefferson, and Medina Counties; 3, Hocking valley, including Vinton, Hocking, Athens, and a part of Perry Counties; 4, Cambridge, in Guernsey County; 5, Macksburg, including Washington and Noble Counties; 6, Carrollton valley, in Harrison County; 7, Muskingum valley, including Muskingum and a part of Perry Counties; 8, Tuscarawas valley, including Coshocton, Tuscarawas, Stark, Summit, and Wayne Counties; 9, Salineville, in Columbiana County; 10, Carrollton valley, in Carroll County; 11, Mahoning valley, including Mahoning and Trumbull Counties; and 12, Palmyra, in Portage County. Among these, the most important, their production in 1899 being appended, are the following: Jackson, 2,032,233 tons; Ohio valley, 2,762,186 tons; Hocking valley, 3,876,745 tons; Muskingum valley, 1,878,132 tons; and Tuscarawas valley, 2,533,488 tons—about 80 per cent. of the total product of the State.

The Central field includes the coal areas of Indiana and Illinois, and a part of the coal area of Kentucky.

Illinois.—Sixty counties of Illinois are underlaid with coal, the field containing sixteen distinct seams of bituminous coal, furnishing an excellent steaming fuel, but little suitable for coking or gas-making. The beds which are available for mining generally lie at considerable depth and are reached by shafts. The Carboniferous system has an aggregate thickness of between 1,200 and 1,400 feet in Southern Illinois, while in the northern portion of the State the entire thickness of the system does not exceed 600 to 800 feet. The seams are numbered from the base to the top, No. I. being the characteristic coal of Rock Island and the adjoining counties. Bed No. II. has its greatest development in the Big Muddy region. Bed No. V. is chiefly mined in Sangamon and Macoupin Counties, while No. VI. is most extensively worked in the Belleville district, E. of St. Louis, where it is 6 to 8 feet in thickness, and is easily mined. No. VII. has its maximum development in Williams County in the southern part of the State. The other beds are rarely of any importance.

Indiana.—The Central field extends eastward over the southwestern portion of Indiana, and includes nineteen counties, Warren County lying at the northern limit and a line drawn through the eastern boundary of Greene County marking its extent eastward. The coal measures are only 650 feet in thickness, and include eleven beds, aggregating 20 to 30 feet of coal, in strata about 260 feet thick. They are designated by the letters A to N inclusive, no beds having been discovered, however, to represent the letters C, D, and E. The principal seams worked are J and I, ranging between 3 ft. 3 in. and 5 feet, which produce the "block" coal, and L, or the Staunton bed, which is 3 feet to 7 feet thick, yielding bituminous coal.

Kentucky.—The Central field covers also that part of

Kentucky which lies S. of the Ohio river, between the Rolling Fork and Cumberland rivers. The thickness of the coal measures is about 600 feet. Twelve coal-beds are identified in this district, but only five are worked to any extent. In the western as well as in the eastern district in the same State are found some of the finest beds of cannel coal known in the country, which is distributed widely for domestic grate fuel in the Eastern cities, and has been shipped abroad into markets hitherto controlled by English cannel.

Iowa.—The coal-field of Iowa forms the northern part of the Western, or, as it is frequently called, the Fourth Coal-field of the U. S. The coal measures of the State have been divided into three groups, the Upper, Middle, and Lower, the former occupying the southwestern corner of the State and carrying only one insignificant bed, and the middle measures cropping out along the line of the Des Moines river, from a little above Fort Dodge to near Keokuk, throughout a belt of country some 50 miles in width. These are the measures which contain all the larger beds of coal in the State. In the main coal-field are eight counties which have beds ranging from 5½ to 9 feet in thickness. The coal is of a quality generally well adapted for steam and heating purposes. No cannel or gas coal is found in the State.

Missouri.—A line drawn from the junction of the Des Moines river with the Mississippi to the southwest corner of Missouri will have N. W. of it nearly all the coal territory of the State. An arm of this territory, however, follows the course of the Missouri river E. for a short distance, and coal is found in the vicinity of St. Louis. The lower coal series is considered to contain the most important and the most productive coal-beds. The coal is semi-bituminous, and is adapted for steam and heating purposes, as well as for smithing.

Nebraska.—The southwestern corner of Nebraska is covered by a portion of the Missouri coal-field, but the outcrops belong entirely to the upper measures, and no deposits of value have yet been discovered in this State.

Kansas.—The coal measures of Kansas underlie the entire eastern part of the State, and have been divided into—1, the Cherokee and Crawford County coal-field; 2, the Osage, Shawnee, and Coffey County field, the most important; 3, the Neosho County field; 4, the Franklin County field; and 5, the Bourbon and Linn County field. The coals are bituminous in character, similar to the coals of other States in the Western field, and are found to be excellent for coking, steam, gas, smelting, and domestic purposes. Lignite deposits have also been worked to some extent for local trade along the western limits of the coal areas in Cloud, Republic, Ellsworth, Russell, and Jewell Counties. In the coal measures there are 22 different seams, varying from a few inches to 7 feet; ten of these are over a foot thick.

Arkansas.—The coal deposits of Arkansas are located in the western part of the State, upon either side of the Arkansas river, extending with more or less persistency between Fort Smith and Little Rock. The principal districts in the State are—1, the Western, or Sebastian County district; 2, the Coal Hill; 3, the Philpott; and 4, the Ouita district. The beds vary in thickness from 20 inches to 7 feet. The coal is mostly semi-bituminous, but much of it deserves to be classed as semi-anthracite.

Indian Territory.—The coals mined in the Choctaw coal-fields, Indian Territory, are pronounced by far the best mined in the Southwest, and vastly superior to Kansas, Missouri, and Iowa coals. The Choctaw field is a direct westward extension of the Arkansas coal-field, but its coals are not like those of that State, except in the county immediately adjoining the line. Dr. H. M. Chance estimates that the coal measures are at least 8,500 feet thick. They include the Grady group of coals at the bottom of the series, and above them, in succession, are the McAlester coal, 4 feet thick; the Norman coal, 3 feet thick; the Secor coal, 2½ feet thick; and the Mayberry, 4 to 6 feet thick.

Texas.—The principal body of bituminous coal in Texas lies in the northern central portion of the State, extending S. W. from the Red river, in Montague County, to the Colorado river, this basin forming the southern extremity of the Western field. Along the Rio Grande lies another, called the Nueces coal-field, the lower measures yielding a fair semi-bituminous product, while the upper measures are somewhat lignitic. An extended area, bounded by lines drawn from Clarksburg in Red River County southwesterly to the Rio Grande and thence N. E. to the Sabine river, is said to contain important deposits of lignite.

The Dakotas.—Very little mining has thus far been done in North and South Dakota in the Rocky Mountain field. The ascertained coal areas lie in the western counties between a line drawn from the Turtle Mountains in the N., through Burleigh County, to the southern borders of the Black Hills and the western boundary-line. The seams of what is a fair lignite vary from a few inches to 12 feet.

Montana.—Montana possesses quite extensive coal and lignite fields, among them the Bozeman, with their distinct beds, producing good coal which makes fair coke, and the Judith, Belt creek, Sand Coulée and Deep creek field in which the lignite lies under the prairie. Besides these there are the Rock creek field, with seven workable seams aggregating 46 feet, and the Gardiner field on the upper Yellowstone.

Wyoming.—The coal-fields of Wyoming are of great extent, but no systematic surveys have been made of all the areas which will permit of an estimate as to their size or the relative value of the beds which they contain. The coal is a typical lignite, which is mined quite largely in Carbon County, where the bed is 9 feet thick, at Rock Springs, Sweetwater County, and at Almy, Minta County. Quite recently important developments have been made near Newcastle, Weston County, where the lignite has been partially metamorphosed to a coking coal by heat.

Colorado.—The coal resources of Colorado are particularly extensive and varied, the beds of the State furnishing the entire range of coal from lignite to anthracite. The State is grouped in four divisions—the Northern, including Weld, Boulder, Jefferson, Arapahoe, and Routt Counties, furnishing lignite of fair quality, except in the last-named county, where some anthracite is found. The veins worked range in thickness from 3 to 12 feet, the principal mining operations being in Boulder County. The Middle Division includes Park, Fremont, Douglas, and El Paso Counties. The former, which predominates as a producer, furnishes a fair semi-bituminous coal, while the cañon coal from Fremont County ranks among the first for domestic purposes. The other counties mine some average grade lignite. The Southern Division is the most productive in the State, including Huerfano County, with the Rouse, Walsenburg and Soma mines, Las Animas County with the El Moro coking coals, La Plata and Dolores Counties. The field of the Western Division, in Pitkin, Garfield, Mesa, and Gunnison Counties, is remarkable from the fact that it produces anthracite coking and non-coking coals, the alteration being chiefly due to the vast eruptions of porphyries which built the Elk Mountains.

Utah.—The principal producing mines of Utah are at present confined to Summit, Sanpete, and Emery Counties. It is estimated that the following areas in Utah are underlaid with coal: 500 sq. miles in the vicinity of Sunnyside and Castle Gate; 200 sq. miles on the Weber river and its tributaries; Grass creek, Chaw creek, etc., from 100 to 200 sq. miles in the vicinity of Pleasant valley; 150 sq. miles back of Cedar City; and 1,000 sq. miles in Castle valley.

New Mexico.—The New Mexican coals range through all the varieties from lignite to anthracite. The principal districts are the Raton, from which a coking coal is obtained, and the Gallup, in Bernalillo County, where lignite is mined from two beds. The Cerillos district produces both bituminous and anthracite coal.

Pacific States.—Although coal deposits of more or less importance have been discovered in many of the counties of California W. of the Sierras, from Siskiyou in the vicinity of Mt. Shasta in the north to San Diego in the south, no mining operations upon a commercial scale have been prosecuted, except in Amaden and Contra Costa Counties. In Oregon outcroppings of coal have been found in nineteen counties, both E. and W. of the Cascade Range, but mining operations are reported only in Coos County. Washington is known to possess very extensive deposits of lignite, semi-bituminous, and bituminous coal, and several important coal areas have been opened both on the western and the eastern slopes of the Cascade Range. See map of North America for coal-fields.

Uses of Varieties.—The different chemical and physical properties exhibited by the various kinds of coal fit them for a wide range of uses in the arts. Coals are primarily divided into two great groups—the hard and soft, or the anthracite and bituminous coals—but each of these groups is capable of subdivision into several varieties. For example, we have at the base of the series—1. *Graphite*, which is a coal deprived of all its volatile matter, and consisting only of a por-

tion of its carbon, mingled with all its ash. This is practically incombustible, and is never used as a fuel or classed as a coal. 2. *Graphitic anthracite*, containing 1 or 2 per cent. of gaseous matter, igniting with difficulty, and forming an inferior fuel. This is the prevailing variety of coal in the Rhode Island coal basin. 3. *Anthracite*, containing from 3 to 10 per cent. of volatile matter, sometimes 95 per cent. of carbon. (See ANTHRACITE.) 4. *Semi-bituminous coal*, containing from 10 to 18 per cent. of gaseous matter, but generally caking in the fire; of little value as an illuminator, but kindling readily, with high heating power. It is the most highly valued of all coals for the generation of steam. The semi-bituminous coals produce a dense coke, and in the raw state are preferred to all others for blacksmiths' use, as they form a hollow fire and produce intense heat in combustion. 5. *Bituminous coals*, which have been subjected to no local metamorphic action, but are the natural product of the slow and general distillation of vegetable tissue buried in the earth since the Palæozoic ages. In bituminous coals the volatile matter varies in quantity from 18 to 50 per cent. of the mass. They are subdivided into *coking*, *furnace*, and *cannel* coals. Of these the coking coals melt and adhere in burning, and when the gaseous matter has escaped a mass of "coke" is left which has the properties of anthracite, but is cellular or spongy from the expansion of the gases. (See COKE.) Most bituminous coals belong to this variety, of which the Pittsburg coal may be taken as a type. They are extensively employed for the generation of steam, as household fuels, and, when coked, for smelting the metals, their adhesive character preventing their being used for this purpose in the raw state. Caking coals which are sufficiently free from sulphur, their great contaminating ingredient, are termed "gas coals," as they were chiefly employed for the production of illuminating gas. In the volume and illuminating power of their gas they are exceeded by the cannel coals, but their deficiency in this respect is more than compensated for by the greater value of the coke which is derived from them. The furnace coals are those bituminous coals which do not melt or adhere in the fire, and can therefore be employed in the raw state in the blast furnace. These are termed *open-burning* and sometimes *splint coals*, but the latter term is more appropriately applied to a kind of cannel coal which contains a large percentage of carbon, comparatively little gas, and has high heating power. The famous Brier Hill coal of Ohio and the Brazil coal of Indiana are typical furnace coals. The cannel coals have a more homogeneous texture, and are less pitchy and brilliant than the other bituminous coals. They represent the carbonaceous mud which accumulated in the open lagoons of the coal marshes, while the surrounding mass of spongy vegetable tissue formed the cubical coal. The cannels are rich in gas, but have comparatively low heating power. They are favorite household fuels, and have been employed for the production of oil by distillation, but are nearly valueless for metallurgical purposes. Nearly all coal-fields contain more or less cannel, which is either interstratified with the cubical coal or gradually passes into it in one or another direction. As a general rule, the cannels contain more ash than the furnace or gas coals; and as the earthy matter increases in quantity, they shade off imperceptibly into bituminous shale.

Revised by C. KIRCHHOFF.

Coalfish: an English name for the pollack, *Gadus*, or *Pollachius*, *virens*, a fish nearly related to the common cod. Given on account of the dark color of the back, due to a peculiar pigment, which rubs off on the hands when the fish is handled. The coalfish is found on both sides of the North Atlantic, and is taken in considerable quantities for food, being used fresh, salted, or dried. Its average weight is 10 or 12 lb., but it sometimes reaches 20 lb. The oil derived from the liver is used in the adulteration of codliver oil. F. A. L.

Coal-gas: See GAS-LIGHTING.

Coal Measures: See CARBONIFEROUS PERIOD.

Coal-oil: See PETROLEUM.

Coal-tar: a substance obtained in the manufacture of illuminating gas from coal. It is thick, black, and sticky, and consists of a very large number of compounds, many of which are now isolated from it and furnish the foundation of important industries. Pre-eminent among the compounds obtained from coal-tar are benzene, toluene, xylene, phenol or carbolic acid, naphthalene, anthracene, etc. The statement that a thing is "made from coal-tar" should be understood as meaning that the thing itself is generally not contained in the tar, but it is made from some one or more of the things obtained from the tar. Thus the coal-tar colors, saccharin, etc., are not contained in coal-tar, but are made by rather complicated methods from benzene and toluene. IRA REMSEN.

Coal-tar Colors: dyestuffs made from the hydrocarbons prepared from coal-tar. Prominent among these are the ANILINE COLORS (*q. v.*), the AZO-COLORS (*q. v.*), the colors from BENZIDINE (*q. v.*), etc.

Coalville: capital of Summit co., Utah (for location of county, see map of Utah, ref. 3–M). It is the southern terminus of a branch railroad, 5 miles long, from Echo City on the Union Pacific R. R., and has beds of valuable Cretaceous coal. Pop. (1880) 911; (1890) 1,166; (1900) 808.

Coan, TITUS: missionary; b. in Killingworth, Conn., Feb. 1, 1801; son of Gaylord Coan and Tamze Nettleton, an aunt of the evangelist Nettleton. Under the preaching of Finney he decided to become a missionary, and in June, 1831, he entered Auburn Seminary, graduating in 1833. Aug. 16, 1833, to May 7, 1834, he was absent with one companion, the Rev. Mr. Arms, on a perilous exploring tour in Patagonia. He married Miss Fidelia Church, of Churchville, N. Y., Nov. 3, 1834, and sailed for the Hawaiian islands Dec. 5, viâ Cape Horn, arriving at Honolulu, June 6, 1835. He occupied the Hilo station for forty-seven years, and his labors were among the most successful in the history of missions, 14,000 of the natives having been gathered into the churches of Hilo and Puna under his pastoral care. The great volcano of Kilauea was in his parish, and he became its constant observer and historian, contributing to the *American Journal of Science* and the *Missionary Herald* scores of papers upon the phenomena of volcanic action in Hawaii. His published books are *Adventures in Patagonia* (New York, 1880) and *Life in Hawaii* (New York, 1881). He was greatly aided in his work by the devotion and the loving energy of his wife, who died in Hilo, Sept. 29, 1872. D. in Hilo, Dec. 1, 1882.

Coan, TITUS MUNSON, M. D.: son of Titus Coan and Fidelia Church; b. in Hilo, Hawaiian islands, Sept. 27, 1836; educated at the Royal School and Punahou School, in Honolulu, at Yale College, at Williams College, and at the College of Physicians and Surgeons, New York, where he graduated in 1861. After serving two years in the civil and military hospitals, he entered the U. S. navy as assistant surgeon Oct. 27, 1863, serving for the most part in the West Gulf squadron, and was honorably discharged Dec. 26, 1865. Dr. Coan has contributed essays and verse to the leading magazines of the U. S., and has written on climate and mineral waters. Author of *Ounces of Prevention* (New York, 1885); of the *Pronouncing Gazetteer* in *Webster's International Dictionary*; and editor of *Topics of the Time* (6 vols., New York, 1883). His home is in New York city, where in 1880 he founded the New York Bureau of Literary Revision for authors and publishers.

Coast: the margin of a land-area, limited by the ocean or its gulfs or bays. The character of a coast-line depends chiefly on two things: 1. Geological change of level, by which the sea is placed on the slope of the land-mass; if by elevation of a smooth sea-bottom the coast-line is of simple form; if by depression of a land-area the coast-line is irregular, the more so the more varied the relief of the submerged land. 2. The time during which the sea has stood at a given level, allowing its waves to cut back headlands into cliffs and form beaches and bars, and permitting rivers to build out deltas, thus simplifying the coast-line from its first irregularity. A flat sea-bottom, as the uplifted littoral plain of Southwestern France, forms a straight coast-line. The coast-line of Texas is almost as simple, with the addition of long sand-bars built off shore by the waves and inclosing linear lagoons. The Carolina coast is of somewhat greater irregularity, the result of gentle submergence of coastal lowlands after rivers had cut shallow valleys, thus producing sounds, as Albemarle and Pamlico, inclosed by extensive off-shore bars, locally called banks, sweeping in long current-made curves concave to the ocean, and joining in pointed capes, as Hatteras, Lookout, and Fear, with sandy shoals drifting out to sea. Norway is an example of extreme irregularity of coast-line, produced by strong submergence of a deeply dissected mountainous region; its deep inlets are called FIORDS (*q. v.*). Many broken coast-lines have risen somewhat since their depression, but

only enough to reveal sea deposits in local coastal plains, without entirely overcoming the effects of earlier and greater submergence. The Maine coast is thus of composite character, its low sandy plains alternating with rocky headlands and long bays; the partial emergence of its submerged land contrasts with the coast of the Carolinas, where there is a partial submergence of an emerged and somewhat dissected sea-bottom. The diversity of a coast-line has much influence in determining the development of maritime pursuits, by affording shelter from heavy waves, and by tempting exploration of outlying islands. Europe is remarkable among the greater land divisions for the diversity of its coast-line, the result of the comparatively small scale of its geological construction, as well as of marginal submergence. Its influence over the rest of the world may be in no small part ascribed to the numerous harbors on its broken coast. The coast-line of Europe is nearly 20,000 miles to an area of 3,816,400 sq. miles; of Africa, 15,000 to 11,600,000; of Asia, 30,000 to 17,310,000. The Atlantic coast-line of the U. S. is 23,000 miles long; that of the Pacific coast, exclusive of Alaska, 15,500 miles. See Beach, Cliff, Delta, Dune, Estuary, Fiords, Harbor, and Islands. W. M. Davis.

Coastal Plain: one of the physiographic provinces of North America, comprising a system of lowlands bordering the Atlantic Ocean and the Gulf of Mexico from New York Bay to the state of Vera Cruz in Mexico. It is in general from 50 to 200 miles broad, but extends northward in the valley of the Mississippi as far as the mouth of the Ohio. Topographically it consists of a plain or a series of plains, interrupted at the north by a great system of estuaries, and everywhere more or less dissected by stream-valleys. Geologically it includes Cretaceous, Eocene, Neocene, and Pleistocene formations, which retain approximately the position acquired during deposition, except that they have been bodily uplifted above the ocean. On the landward side these formations rest upon and against older formations, which have suffered serious disturbance and been greatly eroded. In the Atlantic district a cataract is usually found in each stream just where it passes from the older formations to those of the coastal plain. A line connecting these cataracts, known as the *Fall Line*, indicates approximately the western boundary of the coastal plain. G. K. G.

Coast Castle, Cape: See Cape Coast Castle.

Coast and Geodetic Survey: a bureau of the Treasury Department of the U. S. Government, whose principal office is in Washington, and whose field operations are co-extensive with the territory of the U. S., including Alaska, together with that portion of the ocean which is under the jurisdiction of the U. S. or of which an accurate knowledge is essential to the interests of commerce, as the Gulf Stream and such parts of the Atlantic Ocean and Gulf of Mexico as are closely related thereto.

The Coast and Geodetic Survey is the oldest of the scientific bureaus of the Government. It may be most conveniently treated under three heads: (1) History, (2) Organization, (3) Operations.

History.—To all nations whose territory touches the sea or other water navigable to any extent, or who have any interests in the commerce of the sea, a complete knowledge of the coast, of its nature and form, of the character of the sea-bottom near it, of the location of reefs, shoals, and other dangers to navigation, of the direction and strength of currents, and of the character and amount of magnetic disturbance, is of the greatest moment. To supply this knowledge the governments of all maritime nations have executed in modern times surveys of their coasts by the most exact methods, publishing elaborate and accurate charts for the guidance of the navigator, on which are indicated the location of lighthouses, buoys, and other aids to navigation, together with currents, tides, and compass directions.

About the year 1800 the only charts of the U. S. coasts and harbors were those prepared during the latter half of the preceding century under the direction of the British Admiralty. These were in the nature of a preliminary reconnoissance, and were inadequate to the demands of the increasing commerce of a rapidly growing nation. The demand for a thorough survey of a high character was felt very early, and its importance was urged by Thomas Jefferson. On his recommendation while President of the U. S., Congress in 1807 passed an act authorizing him to inaugurate such a survey, and declaring that it should include a designation of the islands, shoals, and places of anchorage within 20 leagues of the shores, and such other matter as might be deemed proper for completing an accurate chart of every part of the coast; it also authorized the survey of St. George's bank, and the soundings and currents beyond the limits aforesaid to the Gulf Stream.

The execution of this work was assigned to Ferdinand R. Hassler (*q. v.*) a native of Switzerland, who, by his previous experience in Europe and the high character of his attainments, was admirably fitted for the difficult task. His first step was to proceed to Europe for the purpose of obtaining the instruments necessary for the operations of the survey. His standard of excellence was high, and he was content with nothing short of the best appliances for his work, which at that time could not be procured in this country. The instruments had to be specially constructed, and there was naturally much delay incident to the new enterprise; so much, in fact, that the work was entirely arrested by the war with Great Britain in 1812, and it was only in 1817 that sufficient progress had been made to justify a commencement in the important harbor of New York. It had scarcely begun when it was again suspended on account of failure on the part of Congress to provide the necessary funds for its support.

It was not until 1832 that Congress, urged by the Secretary of the Navy and others, made an appropriation for carrying out the plan of 1807, placing the work again under the direction of Mr. Hassler. This was the real beginning of the continuous operations of the Coast and Geodetic Survey. Mr. Hassler was authorized to employ astronomers and such other experts as he deemed necessary, and officers of the army and navy were detailed as assistants. He continued to direct the work until his death in 1843.

The connection of Mr. Hassler with the survey, and especially at its inception, was a matter of great importance to its welfare. He may be said to have "set the pace" for its work. He had been highly educated in a school of precision, and he knew the importance of the sixth decimal place. He was the first to introduce accurate standards of length and mass, and to him was assigned the construction and adjustment of the Government standards of weights and measures. During his superintendency a good beginning of the great work which he had planned was made. A base line was measured in the vicinity of New York, the triangulation was extended thence eastward as far as Rhode Island and south to the head of Chesapeake Bay. A "primary" triangulation had been begun, the topography and hydrography had kept pace with the triangulation, and many charts had been issued.

The work did not go on, however, without meeting obstacles such as had more than once confronted it during its sixty years of continued activity. People who were unaccustomed to operations of precision protested against the unnecessary refinement of the work of the survey, and declared that its results did not justify the expenditure necessary to maintain it. Clamors against the administration of the survey arose, and finally a severe and unfriendly investigation of the service was made by a congressional committee. The result of this was a complete indorsement of the principles on which the survey had been conducted by Mr. Hassler. At the same time a plan was developed for a more comprehensive organization of the service, which shortly brought it into the form in which essentially it exists at the present time.

It was fortunate for the survey that Mr. Hassler's successor was Prof. Alexander Dallas Bache (*q. v.*). Under his administration the work was rapidly expanded, the Pacific coast was taken into the scheme, and the general system of triangulation extended and enlarged. His leadership covered the period of the civil war, during which the regular work of the survey was practically suspended. It was then discovered that the accumulated knowledge of the service, including not only that in the archives in the form of maps, charts, etc., but as well that of the officers of the survey, was of incalculable value in conducting the operations of the army and navy. Many civilian members of the corps were detailed to the various fleets on account of their special knowledge of the coast, and served so well as to receive special recognition at the hands of general officers. Others joined the armies at different points to aid in making reconnoissances, surveys, etc. Officers who had been detailed from the army and navy for service in the bureau at once joined their respective corps. There had been accumulated in the archives a collection of all maps issued of any part of the country, and by means of these the superintendent was able to compile and publish maps of the

Southern States which were of great value in guiding the movements of the Union troops.

At the close of the war the regular operations were resumed on an enlarged scale, demanded by the increased commercial activity of the country. Prof. Bache died in 1867 after a lingering illness, and was succeeded by Prof. BENJAMIN PIERCE (*q. v.*), who served until 1874. During his administration the scheme of transcontinental triangulation was developed and inaugurated.

He was succeeded by Mr. CARLILE POLLOCK PATTERSON (*q. v.*), who had been connected for many years with the survey as hydrographic inspector. Mr. Patterson served until his death in 1881, and Prof. JULIUS E. HILGARD (*q. v.*) was appointed as his successor. Prof. Hilgard had been an assistant in the survey for many years, having been in charge of the office in Washington during the long incapacitating illness of Prof. Bache. During his long service his professional papers, published mostly as appendices to his *Annual Reports*, were numerous and varied. He represented his Government in the International Bureau of Weights and Measures at Paris, serving upon its executive committee. He resigned in 1885, and was succeeded by FRANK M. THORN (*q. v.*), who assumed the superintendency of the survey under peculiar circumstances. Shortly after the beginning of the administration of President Cleveland charges were made involving the integrity of the management and of some of the principal officers of the survey. Pending their investigation, a task which had been assigned to Mr. Thorn by the President, he was directed to assume charge of the bureau, and to perform the duties of superintendent. He continued to discharge these duties until July 1, 1889. Without possessing any special technical or scientific knowledge he made a careful investigation of the business operations of the service, and introduced methods of importance, as affording protection to those charged with the expenditure of money against charges of irregularity or corruption.

While finding that in a few cases the business of the survey had been loosely conducted, he discovered that most of the charges were either entirely unfounded or based on technical grounds, and that, except in rare instances, the work of the service had been honestly done. The later directors were Dr. Thomas Corwin Mendenhall, 1889–94; William W. Duffield, 1894–97; Henry S. Pritchett, 1897–1900; and Otto H. Tittman, 1900–.

Organization.—The plan upon which the Coast and Geodetic Survey is organized is the outgrowth of trial and experience during the first fifty years of its existence. Almost every year has seen some new feature added or some old one discarded.

There are two great divisions of its work: the field and the office.

Field work includes the operations of the survey on land and at sea. Work upon the land is directly conducted by what has been called the "normal force" of the survey, a body of civilian experts permanently attached to it, numbering between fifty and sixty. They are of three grades, namely, assistants, sub-assistants, and aids. The hydrographic work is in general conducted by naval officers temporarily detailed to the survey, and commanding men especially enlisted for the service from the navy. Their connection with it usually lasts about three years, during which time they receive the title of assistants. The service owns a fleet of about fifteen vessels, eight of which are steamers. Special hydrographic work is sometimes executed by members of the civilian staff. All field officers, civilian or naval, receive their instructions directly from the superintendent. For convenience of administration, however, the naval assistants are under the immediate direction of the hydrographic inspector, who is held responsible for all details in the organization of naval parties and for the proper execution of the work assigned them.

The office is that part of the establishment which receives the records, original sheets, etc., representing the results of the field work. They are registered and deposited in the archives, until in turn they are taken up for examination, computation, and adjustment, and finally published. Original charts are reduced or enlarged, engraved, electrotyped, and printed.

The divisions of the office are as follows: Computing, tidal, drawing, engraving, chart, miscellaneous, instrument, archives, and library.

Each division is directed by a chief, who is usually an assistant (field officer) temporarily detailed to this duty. The whole is under the charge of an officer known as the "assistant in charge of the office."

Most of the hydrographic material when received goes at first to the office of the hydrographic inspector. In this office there are the hydrographic division and the coast pilot division, the chiefs of which are usually naval officers.

In addition to the above there is an accounting division with a disbursing agent, and the required force of clerks, writers, draughtsmen, computers, engravers, instrument-makers, printers, etc., numbering in all about 125 at the office in Washington.

There are sub-offices at San Francisco and Philadelphia under the immediate charge of assistants.

Operations of the Field.—All the field operations of the survey being geodetic, a system of primary triangulation, together with the determination of geographical position by means of astronomical methods, must furnish the foundation upon which the whole rests. Such a system was begun under Mr. Hassler shortly after the creation of the bureau. On the Atlantic coast a chain of triangles beginning at Bangor, Me., extends southward to the Gulf of Mexico, constituting an oblique arc which, besides serving as a basis for the coast triangulation, will, when entirely completed and discussed, add much to our knowledge of the figure of the earth. There is another extensive system of triangles extending across the continent along the thirty-ninth parallel of latitude. Short gaps still occur in it in the States of Kansas and Colorado. The parts of this transcontinental system extending E. from the Mississippi river and W. from the Atlantic coast were joined in the year 1890 in Southern Indiana, the junction being very satisfactory. A check base was measured near the points of junction at Holton, Ind., in the year 1891, the length of which was about 5,500 meters. This measurement was taken advantage of for the purpose of testing and studying several methods of base measurement, in order to determine the practice of the survey in the future. To this end extraordinary precautions were taken to ascertain the true length of the line by the most perfect method that could be devised. The principal method for accomplishing this was the use of a 5-meter steel bar imbedded in ice as a unit, this being the first time in the history of work of this character in which the errors arising from temperature were thus eliminated.

Considerable extensions of the principal systems of primary triangulation referred to above have been made in the New England States, New York, and in several of the Western States, including California, where some exceptionally large figures were introduced. The longest lines observed are in California, Nevada, Utah, and Colorado, that from Mt. Helena to Mt. Shasta, over 190 miles in length, excelling all others.

A tertiary triangulation for topographic and hydrographic purposes has been completed along the entire Atlantic and Gulf coasts, and over more than half of the Pacific coast, except Alaska. Much progress has been made in the survey of the coast of the latter Territory, by methods which, while they are more in the nature of a reconnoissance than anything else, possess a sufficient degree of accuracy for immediate use, and are capable of rapid execution. The principal work thus far has been in Southeast Alaska, where it has been generally conducted by naval assistants, the steamer Patterson having been almost exclusively devoted to this field since the year 1885.

In the determination of astronomical positions the service has maintained the accuracy which it was first to inaugurate. In latitude the use of the zenith telescope and in longitude the use of the telegraph have been constantly improved and perfected, so as to leave little to be desired in the way of precision. The survey in co-operation with the International Geodetic Association has maintained continuous observations for latitude at Rockville, Md. (near Washington), San Francisco, Cal., and during 1891–92 at Honolulu, for the purpose of settling, if possible, the vexed question of the supposed periodic change in the position of the earth's axis, relative to a point on its surface. It was also engaged some years since in the determination of longitude in reference to European stations by means of the telegraph, making use of the first successful Atlantic cable for the first comparison.

The topographic operations of the survey have been mostly restricted to a narrow margin, not often over 3 to 5 miles wide, along the coast and surrounding harbors, bays, rivers, up to the head of tide water, and other loca-

tions where hydrographic surveys have been made. In some cases it has been more extensive, and in the District of Columbia a survey was executed by order of Congress in which the scale was $\frac{1}{1200}$, and contour-lines were developed separated by only 5 feet. The plane table was very early adopted by the topographers of the service, and their work has always been distinguished for accuracy of representation.

The hydrographic operations of the survey have extended as far out from the coast as was necessary for the interests of navigation, and have included all harbors, channels, bays, etc., as far as the work has gone. Deep-sea soundings have been made extensively, especially in and about the Gulf Stream, and two important volumes upon the subject have been published. Some idea of the magnitude of the topographic and hydrographic operations can be formed when it is remembered that the shore line of the U. S., as surveyed, has a length of about 30,000 miles, exclusive of that of Alaska, which is several times longer. Much attention has also been given to the tides, and continuous series of tidal records have been maintained at several important points.

Limited space will not permit more than a brief reference to the extensive operations of the survey in the study of terrestrial magnetism, the fruitful results of which are exhibited in its numerous publications on the subject. In addition to the determination of the magnetic elements at many widely distributed points, and their frequent redetermination for secular variation, it has long maintained a photographic registering magnetic observatory, which is moved from one part of the country to another, remaining a series of years at one point.

The study of the force of gravity as a part of the great geodetic problem has received attention within recent years, and the survey has developed methods and instruments which will lead to a great extension of the work at a less cost than by older processes, but without lowering the standard of accuracy.

A system of precise or geodetic leveling, extending across the continent nearly in the line of the great chain of triangles, and checked by lines extending to the Gulf, the Great Lakes, and in other directions, is in process of execution.

The survey is authorized by act of Congress to furnish, under certain conditions, points to State surveys, which it has done quite extensively by extending its triangulation into the States, or by determining geographical positions, or by extending its line of precise levels. To enable it to do this it is authorized to employ during certain months of the year acting assistants in the States receiving this aid, who are generally professors of engineering or physics in the leading institution of learning.

Throughout its history it has constantly been called upon to determine boundary-lines which have been in dispute. One of its officers is a member of the International Commission for fixing the boundary-line between the U. S. and Mexico. Another is by law a member of the Mississippi River Commission; others are called upon for temporary service on harbor commissions and many other national, State, or municipal boards, for which their special training and experience fit them.

The operations of the office consist in general of the reduction, discussion, and proper preparation of the results of the operations of the field force, and the publication in such a form as to be of the most value to the public. Finished charts from the original field sheets and notes are prepared in the office, including drawing, photography, copperplate engraving, electrotyping, plate-printing, etc., except in the case of such charts as receive preliminary publication by means of photolithography.

An important part of the office is the instrument division, where most of the extremely accurate and delicate instruments used in the survey are constructed, adjusted, and repaired. This division is equipped with a well-stocked professional library.

Publications.—Those of most interest to the mariner are charts, coast-pilots, tide-tables, and notices to mariners. About 500 different charts in all are published. These include the main series of coast charts, mostly on a scale of $\frac{1}{80000}$, numbering about 220. A series on a smaller scale and of a more general character includes about 35, while harbor charts on a very much larger scale, varying according to circumstances, number about 250. These charts require constant revision, and frequent resurveys are necessary on account of the ever-changing character of the sea-bottom, and, in some localities, of the configuration of the coast.

Elaborate *coast-pilots*, or books of sailing directions for the Atlantic and Pacific coasts, are published, and are continually revised that they may be kept correct to date.

Tide-tables containing the predicted tides for all principal and many minor ports are published annually about six months in advance, the predictions being mostly made by a tide-predicting machine invented by the late Prof. William Ferrel during his connection with the survey. An edition of about 10,000 copies of a circular known as *Notices to Mariners* is issued monthly, and circulated gratuitously, containing notes of all changes in bars, soundings, etc.

The *Report of the Coast and Geodetic Survey* is published annually in an edition of about 5,000, copies, by joint resolution of Congress. It contains the report of the superintendent, together with those of the assistant in charge of the office, the hydrographic inspector, and the chiefs of the various divisions. It gives a detailed account of the expenditure of the sums appropriated by Congress for the support of the survey, together with progress sketches showing the condition of the various lines of work on which it is engaged and the various localities in which the field-parties have been employed. It also contains the report of the Office of Weights and Measures, the important operations of which have always been under the charge of the superintendent of the Coast Survey. In addition to these the *Annual Report* contains as appendices an extensive series of special reports upon the various technical and scientific operations of the service. Bulletins are also occasionally issued for the purpose of making public such discoveries or results of the work of the survey as are of immediate importance to the public. T. C. MENDENHALL.

Coastguard: a body of men stationed on the coasts of Great Britain and Ireland, under charge of the Admiralty, for the purpose of preventing smuggling and serving as a defensive force with certain powers of a police. With regard to the coastguard service the coasts of the United Kingdom are divided into eleven districts, each having a chief port, in which there is a guardship. The latter is used as a training vessel for boys preparatory to their entering the naval service. The revenue cruisers and gunboats of the defensive branch are attached to these ships as tenders and obtain their complement of men from them. Each district is in charge of a naval captain. The coastguard service is divided into the several classes of commissioned officers, chief officers of stations, petty officers, and boatmen. They are instructed in gunboat exercise, naval gunnery, flag-signaling, etc. They are liable to be called out for active service in the navy in case of war. Their total number was 4,200 in 1895. This service originally belonged to the customs department and was solely designed to prevent smuggling; it was hence called the preventive service. In 1856 it was transferred to the Admiralty, which was empowered to raise the number of the coastguard by additions at any time, so that the total should not exceed 10,000.

Coasting-trade: the trade carried on by vessels sailing along the coast between different ports of the same country as distinct from oversea and foreign trade. In a looser sense the term is applied to trade between ports of neighboring countries on the same coast. The coasting-trade is governed by special regulations. In the U. S. a a statute, called the Coasting Act, was passed in 1793 for enrolling and licensing ships engaged in the coasting-trade. No foreign vessel can engage in the coasting-trade of the U. S., but since 1854 the coasting-trade of Great Britain is open to vessels sailing under any flag. The coasting-trade of the U. S. is very extensive. Formerly this trade was chiefly carried on by means of schooners and sloops, but of late years its character has much changed. It is restricted to registered vessels carrying the U. S. flag. Since the introduction of screw steamers for this service there is a prospect that they will to a great extent supersede the use of schooners.

Coast Province: same as MARITIME PROVINCE (*q. v.*).

Coast Range, or **Coast Ranges**: a title applied to the mountains adjoining and near the Pacific coast within the U. S. From Cape Flattery nearly to the south line of Oregon they constitute a single range, sometimes called the Olympic, separated from the Cascade Range by a series of fertile valleys. The highest peak reaches over 7,700 feet. The Chehalis, Columbia, Umpqua, and Rogue rivers here cut across from E. to W. Thence to the latitude of Mt.

Shasta in Northern California the Coast Ranges merge with the extremities of the Cascade Range and the Sierra Nevada, and in this region they are traversed by the Klamath river. Thence to Point Concepcion they constitute an important composite chain, with narrow included valleys, and this is everywhere separated from the Sierra Nevada by the great valley of California. Midway the chain is divided by San Francisco Bay, the estuary of the Sacramento river. Near Point Concepcion the range is joined by the terminal spur of the Sierra Nevada, and thence to the Mexican boundary the arrangement of its component mountains is irregular. San Bernardino peak, 100 miles from the Mexican boundary, has an altitude of 11,800 feet. G. K. G.

Coat'bridge: a town of Lanarkshire, Scotland; on the Caledonian Railway; 8 or 9 miles E. of Glasgow (see map of Scotland, ref. 12–G). It has 7 churches, 2 academies, and several banks; also 8 malleable-iron works. It is the center of a mineral district in which are numerous smelting-furnaces, and derives its prosperity from the manufacture of iron. It is a place of rapid growth, due to the expansion of the Gartsherrie iron-works. Pop. (1901) 36,981.

Coatesville: borough; Chester co., Pa. (for location of county, see map of Pennsylvania, ref. 6–I); on the Pa. and the Wilm. and No. R. Rs., and on the Brandywine Creek; 39 miles W. of Philadelphia. It is in the rich and beautiful Chester valley, and has several rolling-mills, very large boiler-works, woolen and paper mills, water-works, electric lights, and gas-works. Pop. (1880) 2,766; (1890) 3,680; (1900) 5,721. EDITOR OF "CHESTER VALLEY UNION."

Coati, kō-a-tee', or **Coati Mondi** [the native Tupi (Brazilian) name]: a plantigrade, carnivorous animal belonging to the raccoon family, *Procyonidæ*. The coatis are rather more than 3 feet in total length, the hair coarse, brownish or reddish gray, according to the species. The body is long, the legs short, the tail long, thickly covered with hair, and usually carried erect. A peculiar feature is the long, sharp, flexible nose, which is turned upward in drinking. Coatis climb with ease, associate in troops, are nocturnal in habits, and live on birds, eggs, insects, and worms. There are two species, the Mexican coati (*Nasua narica*), found from the Isthmus of Panama to Southern Texas, and the Brazilian (*Nasua rufa*), distributed over the greater part of South America from Surinam to Paraguay and the seacoast to the Andes. F. A. LUCAS.

Coaticook, kō-ăt'i-kŏŏk: a town of Stanstead co., Quebec, Canada; between the Vermont boundary and Sherbrooke; on the Coaticook river and Grand Trunk Railway (see map of Quebec, ref. 6–C). It is an enterprising place, with many mills and factories. Pop. 3,086.

Coat-of-Arms: originally the garment worn over his armor by a man of noble birth, and embroidered with the wearer's armorial bearings. Hence, in modern heraldry, an escutcheon with its bearings, as distinguished from the crest, motto, supporters, etc., and also, though less properly, a tabard or official garment of a herald, which is always charged with the arms of the prince who is his sovereign.

Coat-of-Mail: a defensive garment for the body; whether made of CHAIN-MAIL (*q. v.*), or by sewing rings or small plates of metal upon leather or cloth.

Cobalt: a hard white metal of sp. gr. 8·5 to 8·9, with a granular fracture, quite malleable at red heat, attracted by the magnet, and even capable of receiving weak magnetic power when rubbed with a magnet, though arsenic destroys this property. It is unalterable in air and water at ordinary temperatures, though at red heat it decomposes water. The metal was first obtained in an impure state by Brandt in 1733, but the ores had already been used since the middle of the sixteenth century for imparting a blue color to glass. Their use was apparently known to the Greeks and Romans, as some of their pigments have been found to contain cobalt. The name is derived from the German word *Kobold*, an "evil-minded sprite," the miners believing that the presence of ores which were heavy and had a metallic luster, but were, so far as they knew, of no value, containing no copper or silver, was due to his influence.

Ores of cobalt are found in various parts of the world, though they are never very abundant. They are almost invariably associated with nickel compounds, and the metal is generally united with arsenic and sulphur.

The metal is nowhere found native, except in some meteorites, some of which have been found to contain from 0·1 to 1 per cent.

The metal may be reduced from its oxide by heating in a current of hydrogen. If the heat has been too low, the cobalt is pyrophoric, and burns with a red flame when brought in contact with the air. It forms several oxides, of which the most important are the protoxide, CoO, and the sesquioxide, Co_2O_3, both of which give a series of salts.

Cobalt salts are prepared by extracting the roasted ore with an acid, precipitating out the arsenic by means of sulphuretted hydrogen or by an iron salt, and then precipitating out the cobalt by means of chlorine water, which converts it into sesquioxide, or by the use of nitrate of potassa, filtering, and dissolving. The chloride is used as a sympathetic ink. The writing, which is an extremely pale pink color, almost invisible, becomes blue when the water of hydration is removed by heat; but it gradually absorbs water and disappears again. The presence of nickel salts gives a greenish cast to the lines. In the arts the compounds of cobalt are applied for coloring either as pigments or enamels. The principal preparation is *smalt*, or azure blue, which is a double silicate of cobalt and potassium, prepared by fusing the roasted ore with carbonate of potassium and clean white quartz sand. The nickel, arsenic, and other impurities settle to the bottom, forming what is termed by the workmen a "speiss." The glass is poured off into water, then ground, and elutriated. The coarser qualities are called "blue sand," and contain some arsenic. The best quality contains little or no arsenic, and is known as "king's blue." The color is very intense, one part of oxide of cobalt being sufficient to give a decided color to 250 parts of glass.

Zaffre, zaffer, or safflor is the roasted ore mixed with twice its weight of quartz sand. It is used for coloring glass, enamels, and pottery glaze. The well-known willow-pattern plates are colored by this substance. *Thénard's blue*, or cobalt ultramarine, is a pigment obtained by calcining phosphate or arseniate of cobalt with alumina. *Rinman's green*, or cobalt green, consists of the mixed and ignited oxides of zinc and cobalt; it is also used as a pigment. Revised by CHARLES KIRCHHOFF.

Coban, kō-baan', or **Vera Paz**, vā'răă-paaz': a city of Central America; department of Alta Vera Paz, Guatemala; about 90 miles N. of the city of Guatemala (see map of Central America, ref. 3–D). Built on the slopes of a rounded hill, the cathedral occupying the top, its streets, radiating in all directions from the central square, look like rural avenues, the low houses with their gardens being screened behind high, dense hedges. It originated in the sixteenth century as the center of the Dominican mission, and was afterward made the political capital of the province of Vera Paz. The missionary occupation gone and the government moved to Salama, it is now falling into decay. Pop. 6,000.

Cobb, DARIUS: portrait and landscape painter; son of SYLVANUS COBB (*q. v.*); b. in Malden, Mass., Aug. 6, 1834; studied from nature without instruction with his twin-brother, Cyrus Cobb. Both brothers served in the civil war 1861–65. Among his portraits are those of Gov. Andrew, of Massachusetts, and Prof. Agassiz, both at Harvard University. He and his brother furnished the design for the Soldiers' Memorial Monument at Cambridge, Mass. Studio in Boston. WILLIAM A. COFFIN.

Cobb, DAVID: a soldier of the Revolution; b. in Attleboro, Mass., Sept. 14, 1748; graduated at Harvard (1766); practiced medicine for many years in Taunton; was a lieutenant-colonel in the continental army, where he served on Washington's staff; negotiated with Carleton the evacuation of New York; member of Congress as a Federalist from Massachusetts (1793–95); was a judge of common pleas, and courageously enforced the proceedings of his court during Shays's rebellion; was Lieutenant-Governor of Massachusetts in 1809; resided as land agent in Maine (1796–1820); a justice of Hancock co., Me., court of common pleas. D. in Taunton, Mass., Apr. 17, 1830.

Cobb, HOWELL: Democratic politician; b. in Cherry Hill, Jefferson co., Ga., Sept. 7, 1815; graduated at Franklin College, Athens, Ga., in 1834; two years later he became an attorney and entered politics. He was a member of Congress 1843–51, during two terms of which he was Speaker of the House, and again a member 1855–57. In Congress he was an imperious debater, mingling declarations of strong Union sentiment with the advocacy of State-rights and new guarantees for slavery. He became Governor of Georgia in 1851 as the candidate of the Union party, and, after a passionate

campaign, was appointed Secretary of the Treasury by President Buchanan in 1857, when he lowered the credit of the Government by buying its bonds at a premium of 18 per cent. and then borrowing money at 12 per cent. to meet current expenses. He was one of the three Southern cabinet officers who paralyzed the U. S. Government during the secession conspiracy. On Dec. 10 he resigned his portfolio. He was president of the Congress of secessionists which met in Feb., 1861, and framed the Confederate Constitution, but Jefferson Davis's aversion kept him afterward in the background. In the civil war he became a major-general of the Confederate army. Died suddenly in New York city, Oct. 9, 1868.

Cobb, Sylvanus, D. D.: Universalist minister; b. in Norway, Me., in July, 1799; was pastor at Malden and Waltham; the author of a *Commentary on the New Testament* (Boston, 1864) and other works, and editor of a denominational newspaper, *The Christian Freeman*, 1838–58. D. in East Boston, Mass., Oct. 31, 1866.—His son Sylvanus (1823–87), twin-brother of Darius (*q. v.*), was the editor of temperance journals and a contributor of popular tales to weekly papers. He published with a memoir the *Autobiography* of his father (Boston, 1867).

Cobb, Thomas R. R.: general; a brother of Gen. Howell Cobb (*q. v.*); b. in Jefferson co., Ga., Apr. 10, 1823; had a high reputation as a lawyer and author of legal works. He was a member of the Confederate Congress and a general in the army of the Confederate States; killed at the battle of Fredericksburg, Va., Dec. 13, 1862.

Cobbe, Frances Power: a rationalistic writer; b. in Dublin, Ireland, Dec. 4, 1822. In early youth she was much troubled with religious doubts. "As she was one day musing on the great problem of existence, she said to herself that although she knew nothing of God or of any law beyond her own soul, she would at least be true to that, and merit the approbation of her own conscience. This resolution, we are told, brought almost immediately a renewed faith in God." She afterward read with great interest the writings of Theodore Parker, whose views on all essential points she appears to have cordially adopted. She became interested in philanthropic work, and was associated for several years with Mary Carpenter in her ragged schools near Bristol; subsequently led a crusade against the practice of vivisection, founding a society in London to restrain it and editing its periodical. Among her numerous works may be named *Intuitive Morals* (London, 1855; 3d ed. 1859); *Broken Lights, an Inquiry into the Present Condition and Future Prospects of Religious Faith* (1864; repr. Boston, 1864; n. ed. 1883); *Dawning Lights* (1868); *Religious Duty* (1857; 2d ed. 1864; repr. Boston, 1865; n. ed. 1883); *Italics: Italy in 1864* (1864); *Hours of Work and Play* (1867); *Alone, to the Alone: Prayers for Theists* (1871; 3d ed. 1881); *Darwinism in Morals, and Other Essays* (1872; repr. Boston, 1883); *Hopes of the Human Race, Hereafter and Here* (1874; repr. New York, 1876); *Re-echoes: Essays* (1876); *False Beasts and True: Essays on Natural and Unnatural History* (1875); *Duties of Women: Lectures* (1880, 3d Engl. ed.; 8th Amer. ed. Boston, 1889); *The Peak in Darien, with Inquiries Touching Soul and Body: an Octave of Essays* (1881; Boston, 1882); *The Scientific Spirit of the Age, and Other Pleas and Discussions* (1888; repr. Boston, 1888); *The Modern Rack: Papers on Vivisection* (1889). She has also edited a complete edition of Parker's works.

Revised by John W. Chadwick.

Cob'bett, William: writer on politics and economies; b. at Farnham, Surrey, England, Mar. 9, 1762. He abandoned the plow, betook himself to London, and became an attorney's serivener; enlisted in the British army, and at Chatham devoured the books of a lending library; served in New Brunswick 1785–91; returned to England and got his discharge in 1792; married and emigrated by way of France in the same year to the U. S.; settled in Philadelphia, where he edited a Federalist paper called *Peter Porcupine's Gazette*, in which he derided the French Revolution and its American sympathizers, and ridiculed the phlebotomy of Dr. Rush in the treatment of yellow fever; was mulet in $8,000 costs and damages for libeling the doctor, and thus was forced to return to England in 1800, and began to issue in London, in 1802, *The Weekly Political Register*, which was at first a Tory paper, but gradually changed and became a strenuous opponent of Pitt and an advocate of radicalism. He was prosecuted for libeling the Government because he denounced the flogging of militiamen by Hessian officers, and sentenced in 1810 to a fine of £1,000 and imprisonment for two years. He continued to publish the *Register* until his death. From 1817 to 1819 he resided on a farm on Long Island, N. Y., to escape prosecution under recent statutes leveled against the independent press. The rest of his life was passed in England and devoted to authorship. Among his popular works were an excellent *English Grammar* (1818); *Rural Rides* (n. ed. 1885); *History of the Reformation* (1827); *Cottage Economy*; and *Advice to Young Men and Women*. He was the originator of the parliamentary reports known as *Hansard's Debates*. In 1832 he was elected a member of Parliament for Oldham. D. near Guildford, June 18, 1835. He was a vigorous writer, and distinguished for his common sense. A selection from his political works, in nine volumes, was published in 1848. See his *Life* (Philadelphia, 1823), and also E. Smith, *Life of Cobbett* (London, 1878).

Revised by H. A. Beers.

Cob'den, Richard: statesman and economist; b. near Midhurst, Sussex, England, June 3, 1804; a son of a poor farmer who lost his freehold in 1814. He was for five years at a miserable school in Yorkshire, then learned mercantile business in the warehouse of his uncle in London, for whom he was a commercial traveler. In 1828 he formed a partnership to sell calico fabrics in London; and three years later the company founded print-works in Manchester, a city with which his name is inseparably linked. Between 1834 and 1838 he traveled in Egypt, Greece, France, and the U. S. In 1837 he offered himself as a candidate for Parliament in the borough of Stockport, but was not elected. He was the most prominent member and orator of the Anti-Corn-law League (*q. v.*) formed in 1839. In 1841 he was returned to Parliament for Stockport. From 1839 to 1846 he was a ceaseless and uncompromising opponent of the duties imposed by the corn laws, and advocate of free trade; and his canvass of the country in behalf of these measures was one of the most memorable in the history of political agitation. After the corn-laws had been repealed in 1846, Sir Robert Peel acknowledged that Mr. Cobden was entitled to more credit for this reform than any other man. In 1847 he was chosen to represent the West Riding of Yorkshire. He was one of the leaders of the Manchester party or school, which advocated electoral reform, a pacific foreign policy, and non-intervention in foreign quarrels. He was defeated in the election of 1857 because he opposed Lord Palmerston's Chinese policy. In 1857 he revisited the U. S., and was elected a member of Parliament for Rochdale. Lord Palmerston in that year offered him a seat in the cabinet as President of the Board of Trade, but he declined it because he disapproved the foreign policy of Palmerston. He negotiated in 1860 a notable commercial treaty with France in the interest of free trade, which expired in ten years, when the Thiers government refused to renew it and France returned to protective tariffs. He was one of the few British statesmen who sympathized with the Union cause in the American civil war. D. in London, Apr. 2, 1865. His influence extended far beyond England, his free-trade principles having found followers and energetic advocates in all civilized lands. His great contribution to free trade was not in originality of speculation, but in putting its doctrines forward as ethical laws and giving his crusade on its behalf a moral character, thus arousing enthusiasm for it. See J. Garnier, *R. Cobden, les Ligueurs et la Ligue* (1846); J. McGilchrist, *Life of Richard Cobden* (1865); *Life*, by John Morley (1881–83); *Political Writings* (1886).

Revised by C. K. Adams.

Co'bet, Carl Gabriel: Dutch philologist; b. in Paris, 1813; Professor of Greek at Leyden for nearly forty years; one of the greatest text critics and palæographists of modern times. His work was chiefly confined to classical and very late Greek writers. Among his publications may be mentioned *Oratio de arte interpretandi* (1847); *Diogenes Laertius* (Didot, Paris, 1840); *Variæ Lectiones* (1873, 2d ed.); *Novæ Lectiones* (1858); *Miscellanea Critica* (1876). Founder and editor of the philological periodical *Mnemosyne*. (See J. J. Hartmann, *Biograph. Jahrbuch*, xii., p. 53–67, 1889.) D. at Leyden, Oct. 26, 1888.

Alfred Gudeman.

Cobija, kō-bee'hăă: a seaport-town of Chili; in the province of Atacama; lat. 22° 34′ S. (see map of South America, ref. 6–C). It was formerly the capital of the Bolivian littoral province of Atacama or Lamar, and the official name was Puerto Lamar, in honor of the first president of Peru.

The place was then important as the principal seaport of Bolivia. Taken by the Chilians in 1879, it has been supplanted by other ports, and is now a mere village. The landing is bad, and the surrounding country is a desert without water. HERBERT H. SMITH.

Cob'leigh, NELSON EBENEZER, D. D., LL. D.: clergyman, educator, and journalist of the Methodist Episcopal Church; b. in Littleton, N. H., Nov. 24, 1814; graduated at the Wesleyan University, Conn., in 1843; joined the New England Conference 1844; was elected professor in McKendree College, Ill., 1853; professor at Lawrence University, Wis., 1854; president of McKendree College 1858; editor of *Zion's Herald* (Boston, Mass.) 1863; president of East Tennessee Wesleyan University, Athens, Tenn., 1867; and editor of the *Methodist Advocate* (Atlanta, Ga.) 1872. He was author of numerous and able reviews. D. at Atlanta, Feb. 1, 1874.

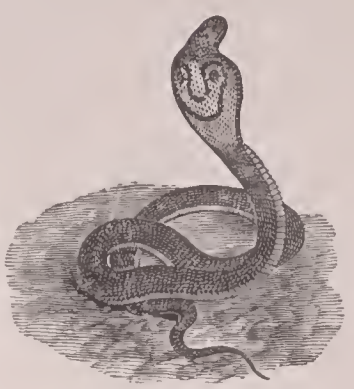
Co'blenz (anc. *Confluentes* or *Confluentia*): fortified city of Rhenish Prussia: finely situated at the confluence (whence its name) of the Rhine and the Moselle; 50 miles S. S. E. of Cologne, with which it is connected by rail (see map of German Empire, ref. 5–C). The Rhine is crossed by a bridge of boats 485 yards long, and the Moselle by a fourteenth-century stone bridge, and both rivers by fine railroad bridges of iron. The old castle of the Electors of Treves, the Church of St. Castor (begun in 1836 A. D.), and the Florins church are the most interesting buildings. The city has a gymnasium, Real-gymnasium, and a normal school for women. Coblenz is a free port, and has an active trade in wine, grain, etc.; also manufactures of cotton and linen fabrics and japanned wares. On the opposite side of the Rhine is the strong fortress of Ehrenbreitstein. Coblenz was the capital of the ephemeral department of the Rhine and Moselle created by the French republic in 1798, but it became Prussian by the treaty of 1815. Pop. (1890) 32,671.

Cob'leskill: village; Schoharie co., N. Y. (for location of county, see map of New York, ref. 5–I); on Del. and Hudson Canal Co. R. R. and on Cobleskill creek; 45 miles W. of Albany. Here are four churches, a high school, agricultural-implement manufactory, sash and blind factory, shirt-factory, building-stone quarries, etc. The village is a center of trade for the surrounding district. Pop. (1880) 1,222; (1890) 1,822; (1900) 2,327. EDITOR OF "TIMES."

Cob-nut: the English name for the nuts of the HAZEL (*q. v.*). It is also applied to certain West Indian fruits, the product of *Omphalea triandra*, a tree of the family *Euphorbiaceæ*. This plant sometimes attains a height (in conservatories) of 12 feet. Its leaves are oblong, oval, or cordate, and are placed alternately upon the stem. The fruit is yellow, globose, furrowed, and about 1½ inches in diameter, and contains three nut-like seeds, whose endosperm is edible after the removal of the poisonous embryo. C. E. B.

Co'bourg: a port of entry and capital of Northumberland co., Ontario, Canada; on Lake Ontario and on the Grand Trunk Railway; 69 miles E. by N. of Toronto, and the south terminus of the Cobourg, Peterborough and Marmora Railway (see map of Ontario, ref. 4–F). It has a good and commodious harbor, and regular lines of steamers to many of the principal lake and river ports of Canada and the U. S. The town is finely laid out, well built, lighted with gas and electricity, and supplied with a system of water-works. Among the finest buildings are Victoria Hall, owned by the town, and Victoria College (Wesleyan Methodist), connected with Victoria University, the Arlington hotel, a summer resort for tourists from the U. S. Cobourg has manufactures of woolen goods, railway-carriages, castings, lumber, beer, etc., and exports lumber, provisions, flour, and iron ore. Pop. (1891) 4,829.

Co'bra de Capel'lo [Portug. hooded snake; *cobra*: Span. *culebra*: O. Fr. *culuevre* < Lat. *co'lubra*, adder; *capello*: Fr. *chapeau*, from deriv. of Lat. *cappa*, head-covering]: a venomous serpent of the genus *Naja*, of the family *Najidæ*. The name is usually limited to *Naja tripudians*, a native of the East Indies, one of the most venomous of known reptiles. Other species of *Naja* are found in the warmer parts of Asia, Africa (*Naja haje*), and the East Indian islands. The term cobra de capello is derived from a singular faculty possessed by these snakes of expanding and elevating the skin of the back of the neck into the resemblance of a hood. This phenomenon is shown when the creature is angry or excited, and is produced by the structure and action of the skeleton, as well as of the skin and muscles. The back of the hood is usually ornamented with two eye-like spots joined by a curved dark stripe, the whole resembling a pair of spectacles; hence it is often called the "spectacle-snake." The color of cobras is not uniform; some are brownish olive, having the spectacles white, edged with black. Another variety has cross-bands of black. Specimens without spectacles have been found in Java, Borneo, and other islands. The cobra attains a length of from 3 to 5 or more feet. It is sluggish in its habits, and easily destroyed. It feeds on lizards and other small animals. Its venom is secreted by two large glands in the head, and is extremely powerful, often causing death in two hours or less. This poison, though generally fatal if introduced through a wound, is said to be harmless when taken into the stomach. The only successful treatment is immediate excision or thorough cauterization of the wound, but Fayrer believes that artificial respiration will save many cases. The cobra, together with other serpents, is an object of worship among many of the Hindus. Thousands of people perish annually in British India from the bite of this and other snakes, and the Government pays a bounty for the destruction of dangerous serpents.



Cobra de capello.

Co'burg (Lat. *Melocabus*): a town of Central Germany; duchy of Saxe-Coburg-Gotha; on the river Itz and on the railway from Dresden to Munich; 26 miles N. of Bamberg (see map of German Empire, ref. 5–E). It is the capital of the duchy of the same name, and contains one of the residences, erected in 1549, of the Duke of Saxe-Coburg-Gotha, and is the seat of all the high courts of the duchy. It has a ducal palace with a large library, a theater, an observatory, an evangelical gymnasium, and a large arsenal. On a hill 500 feet high is an old castle in which Luther was concealed in 1530; used as a prison 1782–1838; then restored and turned into a museum of art and natural history. A palace of the Duke of Edinburgh is here, and a statue of his father, Albert, Prince Consort of Great Britain. Here are manufactures of cotton, linen, and woolen fabrics, etc. Pop. (1895) 18,689.

Co'ca: a drug derived from the leaves of *Erythroxylon coca*, of which there are two distinct species, one in Bolivia and one in Peru. The drug is also cultivated in British India, Java, and Ceylon. It contains an alkaloid known as cocaine, which, when it comes in contact with any one of the mucous membranes, produces local anæsthesia. The leaves closely resemble the ordinary tea-leaf, and are 2 inches or more in length and about 1 inch wide. Coca has been used for many years by the natives of Peru as a nervous or sexual stimulant. From it are now prepared a large number of official preparations, of which the wine of coca and the fluid extract of coca are the ones most commonly employed. In cases where poisoning by coca has taken place there are evidences of great nervous excitement, consisting in mania with delusions and hallucinations, sometimes followed by collapse and excessively high temperatures. Coca belongs to that class of drugs which should always be used cautiously by both physicians and the laity. H. A. H.

Cocaine, kō'ka-in: an alkaloid ($C_{17}H_{24}NO_4$) obtained from the leaves of the *Erythroxylon coca*, a South American shrub. It crystallizes in colorless, odorless prisms, and has a slightly bitter taste. Its salts are soluble in water, and it is generally used in the hydrochlorate. The leaves from which it is obtained are enormously used in South America as a powerful nerve stimulant and intoxicant. In the natives of South America they are said to produce a most agreeable intoxication, with extraordinary emotional exaltation, and a most vivid series of visions. It is doubtful whether the activity of the leaves depends solely upon the cocaine or in part upon a volatile substance which is lost during transportation. Certainly the symptoms produced by cocaine in Europeans are essentially different from those described by travelers as caused by coca.

Cocaine is one of the most powerful drugs introduced into the pharmacopœia in modern times. While known for many years as an alkaloid, its powers as a local anæsthetic were not recognized in medicine until 1884. Since its introduction it has been employed in diseases of the eye and ear, and in

minor surgery generally. It can not penetrate the skin, and therefore is never used to affect nerves protected by that covering, but it paralyzes the peripheral sensory nerves of mucous membrane.

A number of fatal cases of poisoning have been caused by cocaine, many of them following the local use of the drug. The symptoms are extreme weakness, frequency of the pulse and of the respiration, muscular twitchings; in severe cases followed by nausea, vomiting, almost imperceptible, rapid, or slow pulse, great perspiration and collapse. Convulsions are usually present, may come on early, and may be very violent; often they are partial. When cocaine is taken into the system in moderate doses, it acts as a stimulant to the brain and to the spinal cord. It is also a muscle poison. Clinical experience has shown that cocaine is of very little value in the treatment of mental depression, or for the relief of constitutional depression of any kind. It has value as a respiratory stimulant in the treatment of narcotic poisonings, but it is chiefly administered internally in irritability of the stomach, upon which organ it acts locally.

The dose of cocaine is one-fourth of a grain. In the U. S. cocaine has been habitually used in excess as a stimulant by a few persons, but the effects are rarely sufficiently pleasant for the habit to become general. H. C. Wood.

Cocce'ius, Nerva: an eminent Roman jurist; a grandfather of the Emperor Nerva. He was elected consul in 22 A. D. His learning is highly extolled by Tacitus. D. about 33 A. D.

Cocce'jus, Cocceius, Koch, or **Koken**, Johannes: theologian; b. in Bremen, Aug. 9, 1603. He was Professor of Hebrew at Franeker from 1636 to 1650, when he became Professor of Theology at Leyden, where he died Nov. 5, 1669. He wrote commentaries of great learning and ability on nearly the whole of the Old Testament, but is best known as the founder of the so-called "Federal School" in theology. His doctrine of the covenants of works and grace is drawn out in the treatise *Summa Doctrinæ de Fœdere et Testamento Dei* (Leyden, 1648; 2d ed. 1653). His *Hebrew and Chaldaic Lexicon* (1669) was one of the earliest complete Hebrew dictionaries.

Coccejus, Samuel, Baron: statesman; son of Heinrich Coccejus (1644–1719), a civil-law jurist; b. in Heidelberg in 1679: became in 1727 Prussian Minister of State, and in 1746 Chancellor to Frederick the Great. He was the author of a new code of laws (*Codex Fridericianus*, 1747–50). D. in 1755. See Trendelenburg, *Friedrich der Grosse und sein Grosskanzler Samuel von Coccejus* (1863).

Coccol'oba [Gr. κόκκος, berry + λόβος, pod]: genus of evergreen trees of the Buckwheat Family (*q. v.*), natives for the most part of tropical America. Several of the species have been grown in conservatories, viz.: *C. obovata*, a large tree of New Granada, *C. pubescens* and *C. uvifera*, smaller trees of the West Indies and Florida. C. E. B.

Cocco-root: the root of any one of several species of aroids of the family *Araceæ*. These belong to the genera *Colocasia*, *Caladium*, and others, whose starchy root-stalks are collected and, after roasting, used as human food.

Coccos'teus [from Gr. κόκκος, grain, berry + ὀστέον, bone, in allusion to the prominences on its bony armor]: a genus of fossil ganoid fishes found in the Devonian of Europe and Canada. The head has distinct bones, covered by bony plates, and the front part of the body was protected by a shield-shaped dorsal plate, flanked by smaller plates, and by a single plate beneath. The hinder part of the body was unprotected. There was a dorsal and anal fin, but no pectorals. F. A. L.

Coc'culus In'dicus, or **Fishberries** (sometimes called *Indian berries*): berries derived from a climbing shrub of the family *Menispermaceæ*, which is a native of India. They occur as somewhat kidney-shaped masses about as large as a pea, with a dry, black, somewhat wrinkled covering. They possess no odor, but an extremely lasting bitter taste. From them is prepared a tincture which is, however, practically never employed in medicine. Most commonly cocculus indicus berries are used for the purpose of destroying lice in the hair of the head, or elsewhere, but as they contain a very poisonous alkaloid known as picro-toxin it is not safe to employ them in too strong a solution or too large quantity lest they cause convulsions. Particular caution must be employed if the surface to which they are applied is broken. H. A. H.

Coc'cus [from Gr. κόκκος, grain, berry, seed; so called because formerly supposed to be the seed of a plant]: the typical genus of the family *Coccidæ*, a group of bugs (see Hemiptera) including the scale-insects, bark-lice, mealy-bugs, etc. They are the most aberrant of all the bugs, they vary greatly in appearance, and even the two sexes of the same species bear but the slightest resemblance to each other. The male undergoes a complete metamorphosis, has but a single pair of wings, and in the adult stage has no organs for taking food; the female is wingless and has a scale-like or grub-like body, frequently covered with a mealy powder or a wax-like secretion. She inserts her beak in the plant on which she lives and through it sucks her food. As these insects usually occur in large numbers they occasion great injury by destroying the vitality of the plants on which they feed. Various washes of soap or alkali are used in killing them. The cottony cushion-scale (*Icerya purschasi*), which at one time threatened the orange industry of California, has been almost completely exterminated by the Australian ladybug. From bugs of this family are produced the dyes Kermes and Cochineal (*qq. v.*), while to others we owe Lac (*q. v.*) and China wax. J. S. K.

Cochabam'ba: a central department of Bolivia; bounded N. by Beni, E. by Santa Cruz, S. by Chuquisaca and Potosi, and W. by Oruro and La Paz; area, 26,768 sq. miles. It lies to the E. of the highest mountain-chains, but the average elevation is probably 5,000 feet, and it is crossed by many spurs and ridges, some of them lofty. The elevated valleys and plains between these have a delightful, spring-like climate, and are very fertile. There are extensive forests on the mountain-sides, containing cinchona and other valuable trees. Wheat, corn, potatoes, and coca are extensively raised on the open lands, and there are large flocks and herds. The department is said to be rich in gold, but it is not regularly mined. The principal exports are wheat, cheese, wool, and coca, which are carried over mountain-roads to Oruro and La Paz. Pop. (1888) 196,766. Capital, Cochabamba.
Herbert H. Smith.

Cochabamba: a city; capital of province of same name in Bolivia; situated in a fertile plain, surrounded by mountains; 8,400 feet above sea-level (see map of South America, ref. 5–D). A large proportion of the population are Indians, still speaking the Aymará language. Cochabamba was founded in 1465, and has a number of ancient churches and other interesting buildings. Hand-woven cotton and woolen cloths, pottery, and leather work are manufactured in considerable quantities, and the city is a trading-point for all Central Bolivia. It is very healthful, the mean annual temperature being about 63° F. Pop. of city (1888) 19,500; with surrounding villages about 40,000. Herbert H. Smith.

Coche, Island of: See Margarita.

Cochimi: See Yuman Indians.

Co'chin: a feudatory state of Madras, British India; on the Malabar coast; bounded S. W. by the ocean, and on several sides by Travancore and Malabar. Area, 1,361 sq. miles. The climate is very wet. Here are extensive forests of teak and other trees. Rice, pepper, ginger, yams, and sweet potatoes are among the productions of the soil. Pop. 600,000. Chief town, Cochin.

Cochin: a seaport-town; formerly the capital of the state of the same name. It is situated at the entrance of an extensive back-water or lagoon, 80 miles S. S. E. of Calicut (see map of South India, ref. 7–D). The lagoon, which is nearly 120 miles long, and is navigable, affords valuable facilities for communicating with the interior. Cochin has great natural advantages for trade and ship-building. The Jews, of whom there are many both of the white and black castes, have a synagogue, almost the only one in India. Cochin is also a Roman Catholic episcopal see. Here the Portuguese erected in 1503 their first fort in India. They were expelled from Cochin by the Dutch in 1663. The town was ceded to the British in 1814. The chief articles of export are teak-timber, cardamoms, coir, etc. Pop. 15,000.

Cochin-China: a name applied to the eastern part of the Indo-Chinese peninsula. See Annam, Tonquin, and Cochin-China (*French*).

Cochin-China (*French*, or *Lower*): a French colony on the delta of the Mekong river; extending from Cape Camao to about 11° 30′ N., and from lon. 104° E. to 107° 30′ E.; bounded N. by Cambodia, N. E. by Annam, and elsewhere by the Chinese Sea and Gulf of Siam. It is a portion of the former Annamese province of Champa. Area, 23,082 sq. miles. The surface is composed of alluvial deposits, is very flat, and is said to be in places below the level of the sea.

The great number of rivers and the very small slope of this vast plain permit the tide to be felt generally over the territory, causing the river flats to be ultimately covered with water and exposed to the vertical rays of a tropical sun. All the coasts are covered with mangroves, indicating unhealthiness. The mean temperature is high (83° F.), and the greatest heat falls in April and May (97° F.). The humidity is always high, and there is less than the usual difference between the day and night. About one-sixth of the total area is cultivated. The chief crop is rice; cocoanuts, sugar-cane, and tobacco are grown. There are four provinces (Saigon, Mytho, Vinh-Long, and Bassac), and one deputy is sent to the French legislature. The total population in 1900 was estimated at 2,252,034; of these 2,537 were French, 153,000 Cambodians, 56,000 Chinese, 9,600 savages, and some Malays, the remainder being Annamese; 5,800 were Roman Catholics and 1,688,270 Bûddhists. There were 628 schools, with 115 European and 1,183 native teachers, and 25,397 pupils. The colony has 51 miles of railway (from Saigon to Vinh-Long) and 1,840 miles of telegraph line. The annual revenue and expenditure (local) for 1890 balanced at $6,000,000. The expenses of maintaining the colony appear in the French budget annually at about $650,000, and in 1893 required a further sum of $1,000,000 to be raised in Cochin-China for military expenses in Annam and Tonquin.

M. W. H.

Cochineal [viâ Fr. from Span. *cochinilla*, Ital. *coccinìglia*, deriv. of *coccino*, scarlet robe; Lat. *coccum*, berry, the kermes; see Coccus]: the insect which yields the dyestuff carmine. It is native in Mexico, but it is cultivated in several other hot countries, as, for example, West Indies, Teneriffe, Madeira, Algeria, and Java. It lives on a species of cactus, and is the size of a small ladybird. It fastens itself to the plant and remains in contact with it until death. Just before they lay their eggs the insects are particularly rich in the coloring-matter, and they are therefore then gathered. They are killed either by hot water or by steam, and dried in the sun in ovens or on plates. About 70,000 of the insects are required to make a pound of cochineal. When the cochineal is placed in water it swells up, and the form of the insects can then easily be recognized. Several different varieties of cochineal are found in the market, some of them being adulterated with barium sulphate and other substances. The value of a given specimen can be approximately estimated by dissolving a certain weight of it in a certain volume of water and comparing the color of the solution thus obtained with that of a solution of a standard specimen prepared in the same way. It has been shown that the best specimens of cochineal contain only about 10 per cent. of the coloring-matter. It was at one time stated that this coloring-matter is a Glucoside (*q. v.*), but the latest investigation of this subject by Liebermann has furnished no evidence in favor of this view. When cochineal is extracted with benzene and the benzene evaporated, a waxy substance is obtained which is called *coccerin*. This is accompanied by some *myristin*. From the former by saponification two substances are obtained—*cocceric acid*, $C_{31}H_{62}O_3$, and *cocceryl alcohol*, $C_{30}H_{30}(OH)_2$. Myristin when saponified yields myristic acid, $C_{14}H_{28}O_2$, and glycerin, and is therefore similar to the common Fats (*q. v.*). Cochineal colors were formerly used for dyeing wool or silk crimson or scarlet. The colors are, however, not very permanent, though brilliant and attractive. Carmine is prepared by treating a solution of cochineal with cream of tartar, alum, or acid oxalate of potassium. When a solution of cochineal is treated with an alkaline carbonate and alum, a compound known as carmine-lake is obtained.

Ira Remsen.

Cochituate Lake: in Middlesex co., Mass.; 18 miles W. from Boston; 3½ miles long, about 1,800 feet wide in its broadest part, and has an area of 800 acres at high-water mark. Dug Pond (44½ acres) and Dudley Pond (81 acres) are tributary to it. The lake is connected by an artificial channel with Sudbury river, and is the principal source of water-supply for the city of Boston.

Coch'ran, John, M. D.: b. in Sudsbury, Chester co., Pa., Sept. 1, 1730; studied medicine with Dr. Thompson, of Lancaster; served as surgeon's mate in the hospital department in the French war of 1755; at the end of the war he settled in Albany, N. Y.; removed soon after to New Brunswick, N. J.; Apr. 10, 1777, he was appointed on Washington's recommendation physician and surgeon-general in the middle department; in Oct., 1781, he was made director-general of the hospitals of the U. S. After peace was declared he removed to New York, and was made commissioner of loans by Washington. D. at Palatine, Montgomery co., N. Y., Apr. 6, 1807.

Cochran, John: general; b. at Palatine, Montgomery co., N. Y., Aug. 27, 1813; grandson of Dr. John Cochran (*q. v.*); graduated at Hamilton College, Clinton, N. Y., in 1831; became a lawyer and removed to New York city in 1846; was surveyor of the port of New York for four years; Democratic member of Congress (1856–62); appointed brigadier-general of volunteers in 1862; assigned a brigade in Couch's division of the Potomac army; led the reserve in the battle of Antietam; took part afterward in the pursuit of the retreating enemy; resigned from the army in 1863 on account of ill-health; in 1864 was nominated for Vice-President on the Fremont ticket. He was attorney-general of New York in 1865, and a delegate to the Philadelphia National Union convention of 1866, and to another of the same name in Chicago in 1868. He was appointed revenue collector for the sixth district of New York in 1869; supported Horace Greeley for President in 1872; served in the city council of New York, and was acting mayor when Oakey Hall temporarily retired on account of the Tweed fraud investigations; in 1883 again became a member of the council. D. in New York, Feb. 7, 1898.

Cochrane, John Dundas, Captain: a British naval officer; son of Admiral Sir Alexander Cochrane (1758–1832), who fought in Chesapeake Bay during the Revolutionary war and commanded the British fleet in the war with the U. S. of 1812–15; was called the "pedestrian traveler"; b. about 1780. He purposed a journey round the globe on foot, and traversed Russia and Siberia in that manner. When he arrived in Kamtchatka, however, he married and abandoned his original project. He returned by way of Russia to England in 1823, and published a narrative of his travels the next year. Died in South America, Aug. 12, 1825, having gone thither to engage in mining speculations.

Cochrane, Thomas, Tenth Earl of Dundonald: a British naval officer; b. at Annsfield, Lanarkshire, Scotland, Dec. 14, 1775. He joined the navy in 1793, became lieutenant in 1796, and made a brilliant record in the Mediterranean. Commissioned in 1809 to take fire and explosive ships against a French fleet in Aix Roads, he made the attack Apr. 11, drove most of the enemy's ships ashore, and four were destroyed; but Cochrane claimed that he had not been properly supported, and the official quarrels which followed ruined his naval prospects. Elected to the House of Commons, he devoted himself to exposing abuses in the navy, a course which made him many bitter enemies. In Feb., 1814, he was accused of complicity in a fraudulent affair connected with the Stock Exchange. He always claimed to have been perfectly innocent of this, but he was found guilty, imprisoned for a year, fined, expelled from Parliament and the navy and from the number of Knights of the Bath, an order which he had received for his Mediterranean services. Cochrane's constituents immediately returned him again to Parliament, and after his release he was a virulent opposer of the Government. In 1817 he accepted an invitation from the Chilian Government to organize and command its navy. He reached Valparaiso with several English officers Nov. 28, 1818. To oppose the powerful squadron of the Spaniards he found only seven vessels, one a frigate that had been captured and the rest condemned English ships or old merchantmen. Yet with these he destroyed Spanish commerce on the Pacific coast of South America, blockaded the enemy's ships under shelter of their forts, and opened the way for the land forces to act against Peru. In Jan., 1820, by a brilliant series of actions, he took Valdivia, Chili, with the garrison and a large amount of stores. In Aug., 1820, he conveyed San Martin's army to Peru, and he subsequently made independent movements which largely contributed to the capture of Lima and Callao. His feat of cutting out the Esmeralda frigate from under the guns of Callao castle (Nov. 5, 1820) was one of the most brilliant in naval history. But Cochrane's faculty for quarreling impaired his usefulness. He was unable to agree with the dictator, San Martin, and after he had seized a treasure at Ancon to pay his sailors, he was summarily ordered to leave Peruvian waters. Shortly after he quarreled with the authorities in Chili, and finally left the service in Jan., 1823. In March following he was appointed first admiral of the Brazilian navy. He immediately sailed for Bahia, forced the Portuguese to evacuate that city (July 2, 1823), pursued their fleet, and took several vessels. Passing

to Maranhão, he reduced that place, remaining there until 1825, when without leave he made a cruise to England. He claimed that the health of the crew required this, but he was accused of desertion and ordered home, whereat he resigned. In 1827 and 1828 he had charge of the Greek navy, but accomplished nothing. He obtained in 1832 a "free pardon" for the offense for which he had been convicted in 1814, was restored to the order of the Bath and to his naval rank, becoming rear-admiral by seniority in 1854. His father's death in 1831 had left him a peer of England. Much of his later life was devoted to mechanical invention, and he claimed to have perfected a system for the destruction of a fleet or fortress at a blow. He wrote *Narrative of Services in the Liberation of Chili, Peru, and Brazil*, and *Reminiscences of a Seaman*. D. at Kensington, Oct. 31, 1860.

HERBERT H. SMITH.

Cochrane, Rev. WILLIAM: See the Appendix.

Cocinic Acid: a volatile acid found in the butter or oil of the cocoanut.

Cock: in its common and restricted sense the male of the domestic fowl; in a wider sense used for the male of various birds. While domesticated in the East at an early date, since it is figured on Babylonian cylinders six or seven hundred years before the Christian era, the cock does not appear on Egyptian monuments, nor is it mentioned in the Old Testament, nor by Homer. The first reference to the bird in Greek literature occurs in the works of Theognis, somewhere about 600 B. C., where it is spoken of as "the awakening cock of dawn." The cock has figured largely in literature and art, being sacred to Mars, on account, perhaps, of his having been at an early date the god of agriculture. In allusion to St. Peter it is frequently introduced into paintings of the passion of our Lord, and it is the emblem of St. Peter. Among the early Christians the cock was symbolical of vigilance, and it was carved on tombs as an emblem of the resurrection, metaphorically signifying the coming of light after the night of death, or announcing the general awakening of the resurrection. See also FOWL. F. A. L.

Cockade: a badge, usually in the form of a knot or rosette, worn on the hat or cap by officers of the army or navy; also at times by citizens as a party distinction. The Bourbon cockade in France was white, that of Spain red. During the Revolution of 1789 the French people generally assumed the tricolored ribbon (red, white, and blue) as a badge of patriotism or the symbol of the new *régime*. The army also wore the tricolored cockade until the Restoration, when the legitimists resumed the white color. It became also in the U. S. a badge of the Jeffersonian Republicans until war seemed impending with France in 1798. In Great Britain a white rose was the badge of the Stuarts, and became a favorite theme in Jacobite songs after the Stuarts had ceased to reign; the yellow cockade was introduced into Great Britain with William of Orange, and the black with the house of Hanover, and was a mark of both civil and military rank. Thence it passed into use as a part of the livery of coachmen and other servants.

Cockatoo [a word derived from the cry of these birds]: a common name for the members of the family *Cacatuidæ*, a group of large parrots inhabiting Australia, New Guinea, the Philippines, and some of the adjacent islands. They are distinguished by conspicuous crests, large bills, moderate wings, and large, slightly rounded tails. They usually associate in large flocks, breed in hollow trees or crevices in the rocks, and feed on fruit, seeds, and the larvæ of insects. Their cry is harsh, and as a rule they do not readily learn to pronounce words. The sulphur-crested cockatoo, so frequently seen in menageries, is the best-known species. It is a native of Australia, and in some localities does great damage to growing crops, being in consequence shot without mercy by farmers. Leadbeater's cockatoo (*Cacatua leadbeateri*), an allied species also from Australia, is white, tinted with rose color, which deepens to salmon under the wings. The base of the crest is crimson; but this, like the yellow of the preceding bird, does not show unless the crest is open. The great black cockatoo, *Microglossum aterrimum*, found in New Guinea, is the largest of the parrots. It is distinguished by its enormous bill, bare, red cheeks, glossy black plumage, and long cylindrical tongue which is tipped with a horny point.

The raven cockatoos, of the genus *Calyptorhynchus*, have longer tails and smaller crests and beaks than those previously described, and also differ from them in not assembling in large flocks. The general color of their plumage is black or dark brown, and the tail usually has a band of red or yellow. They are residents of Australia and Van Dieman's Land, and, with other species, formerly played an important part as an article of food among the natives, who killed great numbers with the kiley, or boomerang. Like the Carolina parrakeet, they hover about a dead or wounded comrade, and several may be killed in quick succession before the rest take the alarm and leave the spot. F. A. LUCAS.

Sulphur-crested cockatoo.

Black cockatoo.

Cockatrice: a fabulous monster or venomous serpent, which has been sometimes identified with the BASILISK (*q. v.*). It was said to be hatched from the cock's egg, and its breath and look were fatally poisonous. The word occurs in the

English version of the Old Testament as the name of a venomous serpent.

Cockburn, kō′bŭrn, Sir Alexander James Edmund, Bart.: jurist; b. Dec. 24, 1802; graduated LL. B. at Trinity Hall, Cambridge, in 1829; was called to the bar, and subsequently became Q. C. in 1841. He made a large fortune as a promoter of railway legislation during the speculative times of 1846; was elected to Parliament as a Liberal in 1847; defended Palmerston's headstrong foreign policy of 1850 in a memorable speech in the House of Commons; was appointed attorney-general in 1851. In 1856 he became chief justice of the court of common pleas, and in June, 1859, lord chief justice of the court of queen's bench; presided in the Tichborne case; succeeded to the baronetcy of his uncle, the Dean of York, in 1858. He was selected by the British ministers as an arbitrator in the tribunal for the settlement of the "Alabama claims" at Geneva, in 1871–72. D. Nov. 20, 1880.

Cockburn, Sir George, G. C. B.: British admiral; b. in London, Apr. 22, 1772; entered the navy in 1781; lieutenant 1793; captain of a frigate in 1794; rear-admiral in 1812; assisted in the capture of Washington, D. C., in Aug., 1814; conveyed Napoleon Bonaparte to St. Helena 1815; Lord of the Admiralty 1818 and 1828; member of Parliament for many years. D. at Leamington, England, Aug. 19, 1853.

Cockburn, George Ralph Richardson: Canadian educator; b. in Edinburgh, Scotland, Feb. 15, 1834, and graduated at Edinburgh University in 1857. He moved to Canada in 1858; the same year became rector of the Model Grammar School for Upper Canada; in 1861 was appointed principal of Upper Canada College, an office which he held for twenty years. He entered the Dominion Parliament in 1887, and was re-elected in 1891. He was a member of the University of Toronto for twenty years.

Neil Macdonald.

Cockburn, Henry Thomas, Lord: Scotch judge and author; b. Oct. 26, 1779; called to the bar in 1800; solicitor-general for Scotland 1830; became one of the lords of session 1834. He wrote for the *Edinburgh Review*, and published the *Life and Correspondence of Jeffrey* (1852), and *Memorials of his Time* (1856), the latter of an autobiographical character. D. Apr. 26, 1854.

Cockchafer: a common English name for the May-beetle (*Melolonthus vulgaris*) of Europe, represented in America by the June-bugs, of which there are more than sixty species, belonging to another genus (*Lachnosterna*). These, both as larvæ and adults, are to be regarded as pests. The adults eat the leaves of trees, sometimes completely defoliating them, but as their life in the adult state is but a few days they do comparatively little damage. The larvæ, known as "white grubs," live from two to four years. These burrow beneath the soil, especially in meadows and pastures, where they feed on the roots of the grass, sometimes completely killing it. At times they also ruin strawberry patches in the same way. No satisfactory method has yet been devised for combating these insects. When a field has become infested with them it is sometimes of advantage to let hogs run in it. These root in the soil and eat the grubs. The cockchafers and June-bugs, like other insects, occur at times in enormous numbers, while in other years they are comparatively few. Especially noticeable are two seasons in Europe. In 1574 they clogged the water-wheels along the river Severn, and in 1688 they were almost as abundant. J. S. K.

Cocker: a small active spaniel, weighing from 15 to 25 lb., with a thick wavy coat. There is no particular standard for color, but black is perhaps the most popular. The small size of the cocker fits it for ranging in coverts, and it is much employed by British sportsmen in pheasant and woodcock shooting; but it can not easily be trained to wait for the sportsman. It is sometimes called the "cocking-dog," probably taking both its names from the game it is employed to flush. F. A. Lucas.

Cocker, Edward: English teacher and educational writer; b. in 1632; resided in London. His famous *Arithmetic*, published after his death, had an enormous circulation, having passed through fifty-five editions from 1677–1758, and became a model for numerous later works upon the subject. D. about 1677.

Cock'erell, Charles Robert, R. A.: b. in London, England, in 1788; visited Italy, Asia Minor, etc., 1810–17; discovered Æginetan and Phigaleian marbles in 1811; in 1819 was appointed surveyor to St. Paul's, and held that office till his retirement from business; was elected a Royal Academician in 1836, and in 1840 became Professor of Architecture in the Royal Academy. He designed many important public buildings, and was for some years chief architect of the Bank of England. His most successful edifice was St. George's Hall, Liverpool. He published *On the Iconography of Wells Cathedral*; *On the Sculptures of Lincoln and Exeter Cathedrals*; *Tribute to the Memory of Sir Christopher Wren*. D. in London, England, Sept. 17, 1863.

Cock'erill, John: an English engineer and promoter of modern commerce; b. in Lancashire, Aug. 3, 1790. In 1802 he went to Belgium, where his father had long been employed as a machinist, and in 1816 established at Seraing, near Liège, a large machine-shop, the King of Holland being for a time in partnership with him. He also established coal mines, iron mines, and large factories in many parts of Europe. In 1839 he failed. D. in Warsaw, June 19, 1840.

Cock'ermouth: a town of Cumberland, England; on the river Derwent; at the mouth of the Cocker; 24 miles by railroad S. W. of Carlisle (see map of England, ref. 4–E). It is irregularly built, but presents a clean appearance. It has the remains of an old castle in which Mary Stuart was imprisoned. There are manufactures of linen and woolen goods, hats, hosiery, and paper. St. Mary's church, rebuilt in 1850, has a memorial window to the poet Wordsworth, who was born in this town. There are extensive coal mines in the vicinity. Pop. (1891) 5,464.

Cock-fighting: a sport which consists in setting two cocks to fight. It was formerly practiced by the Greeks and Romans, and probably also by the inhabitants of various parts of Asia. The ancients used partridges and quails also for this sport. It was popular in Great Britain for several centuries, and it was a recognized custom for schoolboys to spend Shrove Tuesday in cock-fighting, the masters also taking part in the sport. Henry VIII. added a cockpit to the palace at Whitehall. The sport has been prohibited by law several times in Great Britain, finally in 1849, since which time it has become practically extinct. At present it is carried on in the Spanish countries and in the East. It has also been popular in the U. S.

The cocks were specially bred and selected for the sport. Those of the breed called game fowl were used. They were neatly cut and trimmed for the battles to make them lighter and give less for their antagonists to lay hold of. They were frequently provided with artificial spurs made of silver or steel. There were usually heavy betting on the results of a main, which consisted in setting several cocks to fight. Cocks which were most nearly of the same weight were matched. Those not matched fell out of the main and fought byes. In the Welsh main the survivors of the first set of fights were matched with each other, and so on, until there was only one survivor.

Cockle [from Fr. *coquille*: Ital. *cochiglia*, from a vulg. Lat. variant of *conchylia*, plur. of *conchylium*, Gr. κογχύλιον, small mussel]: a name given to various mollusks, chiefly of the genus *Cardium*. The *Cardium edule*, or common cockle, and other species, constitute an important supply of food in the British islands and other European countries. The species are very numerous, and are chiefly tropical. *Cardium junonis* is one of the finest species. Several species occur on the Atlantic and Pacific coasts of the U. S.

Cockle, or **Corn-cockle** (Fr. *coquelicot*): a common name of the *Lychnis githago*, an annual plant of the family *Caryophyllaceæ*; a native of Europe; often occurring as a weed in the wheat-fields of the U. S. It produces black seeds, which are injurious to the appearance and quality of wheat flour. The lobes of the calyx are linear, and longer than the corolla, which is purple red.

Cockney [M. Eng. *coken-ey*, cock's egg; *coken*, of cocks + *ey*, egg. The development of meaning was: cock's egg, effeminate fellow, milk-sop, an inhabitant of city as distinguished from country, a Londoner]: In 1517 Henry VIII. made an order with reference to the feast of the King of the Cockneys, held on Childermas Day. The term Cockney school was applied to a literary coterie consisting of Hazlitt, Keats, Leigh Hunt, Shelley, etc.

Cock of the Plains: See Grouse.

Cock of the Rock (*Rupicola rupicola*): a bird of the family *Cotingidæ*, found in well-watered, mountainous districts of Guiana and Northeastern Brazil. The male is a foot long, of a rich orange color, with high purplish-red crest extending from the back of the head to the tip of

the bill, the feathers of the forehead pointing forward. The females and young are brown. The bird builds a nest, something like that of a chimney-swallow, on a large scale, in holes and fissures among the rocks. The feathers are much used by the Indians in ornamental work, and the skins are largely exported. F. A. Lucas.

Cock of the Woods: See Capercailzie.

Cockpit: in a ship of war, a room where the wounded men receive surgical treatment during an action. Formerly it was situated under the lower gun-deck.

Cockran, William Bourke: b. in Ireland, Feb. 28, 1854; educated in France and in his native country; removed to America when seventeen years of age; soon after his arrival received the appointment of teacher in a private academy; was principal of a public school in Westchester co., N. Y.; while engaged in teaching read law, and was admitted to the bar in 1876; was a member of the Fiftieth Congress; was a member of the commission to revise the judiciary article of the constitution of the State of New York; was elected to the Fifty-second and Fifty-third Congresses as a Democrat. Mr. Cockran is a prominent leader in Tammany Hall, and has won national distinction as an orator.

Cockroach, or **Roach**: a common name for a large number of flattened insects belonging to *Blatta* and allied genera of Orthoptera (*q. v.*). They are adapted for running, and have the head drawn back under the plate-like prothorax so that it is not visible from above. The wings are of little use in flight, and in the females of some species they remain undeveloped. The females lay their eggs in a satchel-shaped cocoon, which they carry about with them for a time. The young which hatch from the eggs closely resemble the parent in all but size and lack of wings. The larger proportion of the species live in the forests, where they feed upon decaying wood, etc., and are of little importance to man. A few species, however, exhibit a considerable partiality for human society and have followed man over the world. Of these the most ubiquitous in the U. S. is the small imported species known as the "Croton bug," or "black beetle" (*Phyllodromia germanica*), which multiplies rapidly and is difficult to exterminate. It is most apt to congregate about waterpipes, and with its flattened body can hide in the narrowest cracks. Most efficacious in ridding the premises of these pests is borax or insect-powder, liberally and perseveringly applied. The larger "common cockroach" (*Blatta* or *Periplaneta orientalis*) is fortunately less common with us. It is about an inch in length, blackish brown in color, and omnivorous in its diet. It infests houses, and especially mills, bakeries, and ships, and gives a disgusting smell to everything over which it passes. Its original home is unknown; it first appeared in Europe 200 years ago. Some of the tropical species are even larger, reaching a length of 2 inches. Fossil cockroaches occur in the Coal period. See Entomology (Fig. 7). J. S. Kingsley.

Cocks'comb [from the resemblance of the head of flowers to the comb of a cock]: the *Celosia cristata*, a tropical plant of the Amaranth family, cultivated for its showy flower-crests. These crests are clusters of very numerous small and inconspicuous flowers which are aggregated on a more or less flattened or fasciated stem, the brilliant scarious bracts producing the ornamental effects. The species is an annual of easy cultivation. It was formerly very popular, but it has suffered somewhat in reputation in recent years from the introduction of more graceful plant forms.

Cocles, kō'kleez, Publius Horatius: hero of Rome who in 507 B. C., with two companions, defended the bridge over the Tiber against the whole army of Lars Porsena while the bridge was destroyed behind him, whereupon he plunged into the river, and, although encumbered with his armor, reached the opposite shore in safety. He was rewarded with as much land as he could plow around in a day, and a statue was erected in his honor. His memory was held in great esteem. Macaulay has familiarized the legend in his *Lays of Ancient Rome*.

Cocoa: See Cacao.

Cocoanut: the fruit of the *Cocos nucifera*, a tree of the Palm Family (*q. v.*). The genus *Cocos* [from *coco*, the Portuguese for monkey, in allusion to the resemblance of the end of the nut to a monkey's face] includes about thirty species, all tropical, and nearly all American. They are tall or low trees, with slender or stout stems, bearing upon their summits a crown of widely spreading, mostly smooth, pinnately compound leaves. The stems are at first covered with the closely crowded bases of the old leaves, and when these fall away the surface is ringed and nearly smooth. The flowers are monœcious and are borne in spadices which appear in the axils of the leaves. The staminate flowers are irregular in shape, and contain small sepals and petals and six stamens. The pistillate flowers consist of sepals, petals, and a three-celled ovary, each with one ascending ovule. In the after-development of the ovary but one of the ovules continues its growth at the expense of the others; the fruit is therefore one-celled and one-seeded, there remaining nothing but mere vestiges of the other cells in the form of narrow crevices in the fruit-wall. The embryo is relatively small and consists of an elliptical or nearly cylindrical mass (in the cocoanut from a third to half an inch long) lying in the great mass of endosperm. The position of the embryo may be made out externally by the thinner areas in the bony shell. It will be seen that there are three thin areas, one for each of the ovules originally formed, and the most marked of these indicates the position of the embryo which is developed. In some species the endosperm is solid throughout, but in the cocoanut only the exterior becomes firm, the central portion being filled with watery contents, the so-called "cocoanut milk."

The cocoanut proper appears to have come originally from the East Indies, but it has been so long in cultivation that it has become widely distributed in all hot regions. The tree attains, when well grown, a height of 50 to nearly 100 feet, and its leaves may be as much as 20 feet in length. The nuts are borne in clusters of a dozen or more, and on the tree are covered with a thick covering of fibers, while each nut is imbedded in a firm, woody husk. It is impossible to enumerate here all the uses of this most valuable tree, and we may well quote the old adage, its uses "are as numerous as the days in a year." No part of the plant appears to be useless, and these uses are not confined to tropical climates. Thus the fiber from the spathe is used in the making of ropes, matting, brushes, brooms, etc.; the fiber from the stems is extensively used in the manufacture of brushes; the shells are made into ornaments; the nuts furnish a nutritious food throughout the civilized world, and yield a valuable oil used in making candles and burned in lamps. C. E. B.

Cocoa-plum: the edible fruit of the *Chrysobalanus icaco*, a shrub of the family *Rosaceæ*, growing in the southern part of the U. S. and the West Indies. The fruit resembles a large plum, yellow, purple, or black in color.

Cocoon: See Chrysalis and Silkworm.

Cocos Island: See the Appendix.

Cocos-Keeling Islands: See Keeling.

Cod: the *Gadus morrhua*; a fish of the family *Gadidæ*, the most abundant and important member of the group. The general appearance of the fish, which ordinarily reaches a length of 3 to 5 feet and a weight of 10 to 40 lb., is shown

Common cod.

by the cut. Fish of 50 or 60 lb. weight are not uncommon, and exceptional individuals have been taken weighing from 100 to 150 lb. The color is somewhat variable, being influenced by food and surroundings, but is usually brownish or greenish, although it may have a red or yellowish cast. The back and sides are marked with numerous dark spots: the lateral line is light and the fins dark. It is found at moderate depths, 10 to 150 fathoms, in the North Atlantic and Pacific, and while ranging south to Japan, Oregon, and Virginia, is most abundant in the northern portion of its habitat. Cod migrate with considerable regularity from deep into shallow water, or *vice versa*, being influenced by temperature, or by the pursuit of food, or for the purpose of spawning. The eggs are small and extremely numerous, a fish weighing 21 lb. containing 2,700,000 eggs, and one weighing 75 lb. the almost incredible number of 9,100,000. The period of spawning is protracted, lasting, on the coast of

Massachusetts, from September until the following May. Notwithstanding the vast number of eggs, so few reach maturity that the drain of continued fishing has made perceptible inroads on the numbers of cod, and hatcheries have been established for their artificial propagation. Nothing edible seems to come amiss to the cod, which eats squids, small fishes, hard-shelled mollusks, worms, crustaceans, and other invertebrates, while two ducks were found in the stomach of an unusually large specimen. F. A. Lucas.

Codazzi, kō-daăt'sĕe, Agustin: engineer and geographer; b. in Lugo, near Ferrara, Italy, 1792. He joined the Italian army as a volunteer, and took part in the campaign in Saxony, 1813, and in the defense of Mantua, 1814. Subsequently he traveled for commercial purposes in nearly every country of Europe. In 1817 he went to the U. S., and thence joined an expedition of Venezuelan revolutionists against the island of Margarita; he served with the patriot army in several campaigns, entering the service of Colombia; went to Europe in 1823, but returned to Bogotá in 1826, where he again took service with the rank of lieutenant-colonel of artillery. He was employed in making charts and maps until the separation of Venezuela from Colombia, when he was engaged by the latter country to make maps of all its departments. This great work occupied him from 1831 to 1838, and to complete it he made an expedition into the unexplored regions south of the Orinoco, penetrating nearly to the head-waters of that river. He was rewarded with the grade of colonel, and was commissioned to publish the results of his work in Paris; they appeared in 1841 with the title *Resumen de la Geografía de Venezuela* (8vo, with atlas and a large map). Returning to America, Col. Codazzi was employed after 1848 by the Colombian Government. Among his later works were surveys of the Panama Isthmus, with special reference to the discovery of routes for a ship-canal. D. in Colombia, June, 1859.

Herbert H. Smith.

Cod'dington, William: b. in Lincolnshire, England, in 1601; was sent as a crown magistrate to Salem, Mass., in 1630; was a merchant of Boston; opposed Winthrop and the clerical party with Vane, defending the Antinomianism of Anne Hutchinson and Wheelwright; led a dissenting party to Aquidneck, or Rhode Island, in 1638; was chosen chief magistrate to be guided by God's laws; from 1640 was officially called governor until 1647; went to England in 1649, and in two years obtained a life commission to rule Aquidneck and Conanicut islands; his commission was revoked in 1652 at the instance of Williams and Clark, but until 1655 he refused to submit, and still retained possession of the records; in 1665 he became a Quaker and an advocate of liberty of conscience. He was again governor (1674–75). D. Nov. 1, 1678. See No. 4, *Rhode Island Historical Tracts* (Providence, 1878).

Code (Lat. *codex*): a collection of laws made by public authority. In modern law it more commonly means a methodical arrangement of law, either customary or statutory, in chapters and sections. In a number of the U. S. the general statutes (see Statutes) are arranged in this manner under the title of *Revised Laws*, *Revised Statutes*, or *Codes*. How far it is practicable to accomplish useful results in the codification of customary or common law is a subject of much controversy among jurists. On the one hand, it is claimed that as law of this nature can be enunciated or stated, the statement can be reduced to writing in the form of general and particular propositions. It is added, as to the common law of England, that it has been for ages in writing, and that all that is now known of it is derived from written sources, such as reports and treatises of recognized authority. The rules there found are susceptible of collation, analysis, and systematic arrangement. The materials thus obtained may be recast by the codifier, and molded into the form of positive and authoritative statement in *his own language*. True, the judge in deciding a cause states a principle as applied to the particular cause before him; the codifier may seize upon the principle that underlies the specific case, and state it in a positive and precise form. From this mode of collecting and arranging legal propositions it is claimed that a number of benefits will be secured, such as reducing the labor of lawyers, decreasing the size of their libraries, introducing legal reforms by comprehensive legislation, and affording to the public increased opportunities to become acquainted with general rules of law. On the other hand, it is urged that a code, being inflexible in its character, prevents the true growth of law. Discussions in court will turn upon the construction of *words* used in the code, instead of there being an examination of legal principles. The interpretation of specific words is to the last degree attended with uncertainty. Leading inquiries concerning the great statute of frauds passed in the reign of Charles II. are still regarded in the courts as open to consideration. This objection is truly formidable. Where customary law prevails, little if any attention is paid in the decision of causes to the particular language in which the court in a former case cited as a precedent expressed its views. The principle of the decision is seized upon and stated in perhaps wholly different words. The arguments applied to the construction of statute or codified law must, from the nature of the case, be in the main textual criticism. There must be interpretation of particular words, reconciliation of discordant phrases, and minute consideration of mere forms of expression. While a rule of law is in process of formation discussions as to its true principle should be as free and unfettered as possible until, after a long interchange, and perhaps collision, of opinions, the true rule is evoked, with its various qualifications and limitations. This process, so beneficial in its character, could not be made available if the rule in its early stages had already been hardened into fixed forms of statute law. Mr. Austin, in his great work on jurisprudence, though from the bent of his mind inclined to favor codification, sees the great difficulties attending it in its more perfect forms, and suggests that the work can only be accomplished successfully, if at all, by lawyers of the very highest ability and most comprehensive views, for no others can see the full scope of the subject and draw the needful sections. It may be added that in a country like the U. S., where legislation is fluctuating and often inconsiderate, there would be great danger, even though a well-devised code of laws were once introduced, that its symmetry would shortly be marred and the coherence of its provisions broken up. No argument for a code in the modern sense can be derived from the work of Justinian on the Roman law. The *Pandects*, the great body of the Roman law, is, in the main, a mere collection of extracts from distinguished writers in *their own language*, and which had already become settled law. The *Institutes* are substantially a bare reproduction of a well-known work of Gaius, a distinguished Roman jurist. Besides, the development of the Roman law was different in some respects from our own. In that system much was made of the opinions of text-writers, while nearly the whole development of English jurisprudence has taken place through the medium of adjudged cases or "case law." The true method of growth would seem to be that the courts should render decisions, while text-writers of ability should collect them, arrange the principles in a scientific manner, criticise them when faulty, and call the attention of the courts to needful improvement. By the work thus done law would make a steady progress, and adapt itself to the wants of the community. Radical changes must be produced by legislation. It is in vain to hope that a code will reduce libraries or make thorough study unnecessary. Jurisprudence will take on an historical form, for courts must apply the code to specific cases, and a body of case law will soon grow up, the roots of which will be sought in the past as heretofore, and its results modify the code itself, just as great masses of case law collect around an instrument so brief as the U. S. Constitution. See Austin *On Jurisprudence*, vol. ii., p. 1129; Pomeroy's *Introduction to Municipal Law*, chap. iii.; and the works of Savigny.

Some of the leading codes may be referred to.

1. *Justinian's Code of Roman Law.*—The word *code* is used here as describing the whole mass of codified Roman law under the order of the Emperor Justinian, including the *Code* of that system; the *Institutes*, *Pandects*, and *Novels*. These, taken together, constitute the *corpus juris civilis*, or whole body of civil law. These will be more fully considered under Law, Civil (*q. v.*). The Theodosian code of Roman law may also be referred to, which is of comparatively little interest. See *Foreign Quarterly Review*, vol. ix., 374.

2. *French Codes.*—Of these there are five principal ones—the civil code, of civil procedure, of commerce, of criminal procedure, and of criminal law. There are also codes upon special subjects. French codification is largely due to the Emperor Napoleon I.

3. *Code of Louisiana*, based on the *Code Napoléon*, and principally prepared by Edward Livingston. It is divided into three books, and is concerned with the civil as distinguished from the criminal law. Mr. Livingston also pre-

pared a draft of a penal code for the State, which was not adopted, as well as one for the U. S. These are to be found, together with introductory reports explaining the grounds of them, in a work published by the National Prison Association, with an introduction by the late Chief Justice S. P. Chase, A. D. 1873.

4. *New York Code of Procedure.*—The object of this is to assimilate law and equity, and to have but one form of action. It assumes to regulate in a general way both pleadings and practice, and to state in a condensed form the general rules. A large body of case law has grown up in connection with the code regulations. The results of these decisions are collected in *Annotated Codes*, or in works of practice. The system has been adopted in substance in a considerable number of the States. Penal codes, embracing both the principles of the criminal law and its practice, have been enacted in New York. Commissioners in that State have also reported a political code and a civil code which have not become law.

Mention may also be made of various collections of maritime rules, such as the *Consolato del Mare*; *Laws of the Hanse Towns*; *Ordonnance de la Marine* (of the time of Louis XIV. of France); *Laws of Oléron*; and the *Laws of Wisby*, which will be noticed again in connection with maritime law, as well as of the code of Prussia, etc.

T. W. Dwight.

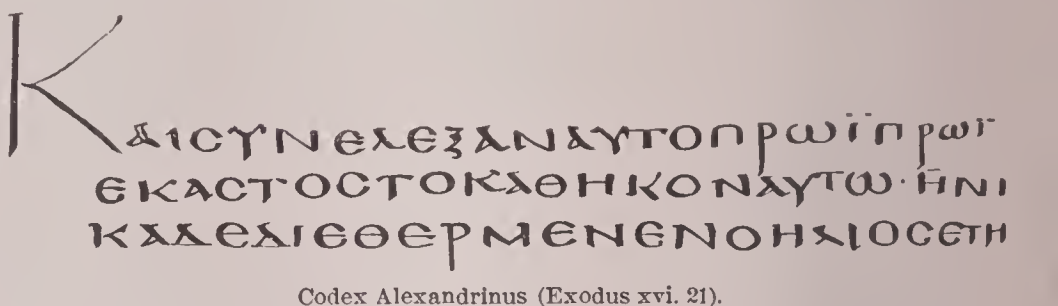
Codeine, kō-dee'in [from Gr. *κώδεια*, poppy-head]: one of the alkaloids ($C_{18}H_{21}NO_3$) to which opium owes its hypnotic powers. Its salts are sometimes administered in place of morphine. It is asserted that it possesses many of the valuable properties of that drug, without its disadvantages. The dose is much larger than that of morphine. See Opium.

Co'dex (plu. **Cod'ices**) [Lat., trunk of a tree, wooden tablet, document, writing]: In modern Latin, codex is a manuscript volume, and is especially applied to a manuscript copy of the Scriptures. They are divided into *uncial* and *cursive*. The former are older, written on parchment in large or capital letters (*literæ unciales* or *majusculæ*); the latter date from the eighth to the fifteenth century, and are written in small or minuscule letters (*literæ minusculæ*). The uncial codices of the Greek Testament are for the sake of beauty designated by the large letters of the Latin alphabet (A, B, C, D, etc.), the cursive by figures (1, 2, 3, etc.). We have now over one hundred uncial MSS. (counting all the fragments; only three or four are complete) and 3,553 cursive MSS., as counted by Gregory in 1890. *Codex rescriptus* is a synonym of Palimpsest (*q. v.*). Of the New Testament, as well as of any other ancient book, other things being equal, the older the MS. the greater its authority, because nearer the original source; but later testimony has also its proper weight. Scholars have very carefully compared and considered the later MSS., as well as the older, the citations from the Bible in the Fathers, the old versions, and every document of every kind which could assist in determining the original text. It was upon a thorough and careful consideration of all these witnesses, by the most competent scholars and experts, that the revisers of the translation of the New Testament in 1881 based the text which they adopted, and accordingly that text stands on impregnable ground. See Bible; also Tischendorf, Schaff (*Companion to the Greek Testament*, 4th ed. 1892), and Gregory (*Prolegomena* to Tischendorf's 8th ed., part i. 1884; part ii. 1890; the third part is not yet published).

Philip Schaff.

Co'dex Alexandri'nus, or **Alesandri'nus** (designated A since Wetstein, 1751): the third in antiquity of the great uncial (or large letter) extant manuscripts of the Bible in the Greek language. It contains 773 leaves of the Old Testament (in the Septuagint version), with some deficiencies in the Psalms, and all the books of the New Testament, with a few chasms (Matt. i.–xxv. 6; John vi. 50, viii. 52; 2 Cor. iv. 13, xii. 6) where leaves are wanting. To these it adds the one genuine, and a fragment of the apocryphal, Epistle of Clement of Rome to the Corinthians. The Catholic Epistles follow the Acts; then come the Pauline Epistles, then that to the Hebrews before the Pastoral Epistles: the Apocalypse, which is rare in extant manuscripts, stands at the close of the New Testament.

This codex is now in the British Museum, having been presented to Charles I. in 1628 by Cyril Lucar, Patriarch of Constantinople, who had previously been Patriarch of Alexandria, from which city he brought the manuscript. It is in quarto form, about 13 inches high and 10 broad, each page being divided into two columns of fifty lines each, having about twenty letters or upward in a line. It is written on thin, fine, and very beautiful vellum, in uncial letters of an elegant yet simple form, and without any space between the words. The punctuation, which is infrequent, consists merely of a point placed at the end of a sentence, usually on a level with the top of the preceding letter; and a vacant place follows the point at the end of a paragraph, the space being proportioned to the break in the sense. The black ink in which the body of the codex was written has turned to a yellowish brown; but the vermilion, freely used in the initial lines of the different books, is still bright. The manuscript bears an ancient Arabic inscription on its margin, asserting that it was written by the martyr Thecla; Tregelles, however, explains the origin of this inscription by remarking that the New Testament in the codex as we have it commences with Matthew xxv. 6, this lesson (Matthew xxv. 1–13) being that appointed by the Greek Church for the festival of St. Thecla. The Egyptian, therefore, who wrote this Arabic note, observing the name of Thecla on the now mutilated upper margin of the codex, where such *rubrical* notes are commonly placed by later hands, hastily concluded that she wrote the book. But though not by Thecla, it may be that the neat chirography of the codex is due to a female hand, for we know that women as well as men were employed as copyists at Alexandria.



Codex Alexandrinus (Exodus xvi. 21).

Καὶ συνέλεξαν αὐτὸ πρωΐ πρωΐ, ἕκαστος τὸ καθῆκον αὐτῷ· ἡνίκα δὲ διεθέρμενεν ὁ ἥλιος, ἐτή-*

The general consent of palæographers refers this manuscript to the beginning or middle of the fifth century of our era. In the general style of the writing and in the shape of the letters (especially those which furnish the best tests, as *α*, *δ*, *ε*, *π*, *σ*, *φ*, and *ω*), it holds a middle place between copies of the fourth and sixth centuries. There are no accents or breathings, and the contractions of words (as ΘC, IC, XC, ΠΗΡ, KC, etc., for *Θεος*, *Ιησους*, *Χριστος*, *Πατηρ*, *Κυριος*, etc.) are only such as are found in other manuscripts of the more ancient class. Of itacisms (as the interchange of *ι* and *ει*, *η* and *ι*, *ε* and *αι*) it contains no more than others of the same date. The references in the margin to the tables of parallel passages called the *Canons of Eusebius* (A. D. 268–340?), and the insertion, before the Psalms, of the epistle to Marcellinus by Athanasius, Patriarch of Alexandria (A. D. 300?–373), prove that the manuscript was not written before the fourth century; while the absence of the so-called Euthalian divisions of the Acts and Epistles into chapters, which came into vogue very soon after 458, and the shortness and simplicity of the *subscriptions* at the end of the books, appear tolerably decisive (says Scrivener) against a later date than about 450. The insertion of the Epistles of Clement points to a period when the canon of Scripture was in some particulars unsettled, or about the age of the Synod of Laodicea (363). It appears from the table of contents that the manuscript formerly contained the apocryphal Psalms of Solomon, but these are separated from the other books in the list, as different in kind. This separation conforms to the prohibition of such psalms, at the Synod (or, as it is sometimes called, Council) of Laodicea, from being read in churches.

This manuscript is of great importance to the critic, and exhibits a text more nearly approaching that found in later copies than is read in others of its high antiquity. It is designated, in critical editions, by the letter A. It has been published in elegant style, in *quasi* fac-simile, uncial type,

* For *διεθέρμαινεν*.

bearing a general resemblance to the written characters, having been cast for the purpose, and (what is more important) the edition exhibiting the manuscript page for page, line for line, and letter for letter. The handsome folio volume containing the New Testament appeared in 1786, edited by Charles Godfrey Woide; the four folio volumes containing the Old Testament were edited by Henry Hervey Baber, and published in 1816–28. An edition of the New Testament, in small letter, in which Woide's text has been corrected from the manuscript itself, was published in 1860, edited by B. H. Cowper. The Old Testament has been edited by Field. The trustees of the British Museum have published a beautiful photographie fac-simile which supersedes all former editions (London, 1879 and 1882).

THOMAS CHASE.

Co'dex Be'zæ or **Cantabrigien'sis** (designation, D): an uncial manuscript, probably of the sixth century, containing the four Gospels and the book of Acts in Greek and Latin on opposite pages. It was presented to the University of Cambridge in 1581 by Theodore Beza, who obtained it during the Freneh civil wars in 1562, when it was found in the monastery of St. Irenæus at Lyons. This manuscript has several peculiar features. The Gospels stand Matthew, John, Luke, Mark, an order found also in some of the manuscripts of the Old Latin version. The peculiarities in the text are striking, consisting of interpolations, sentences reeast, and occasional omissions. The interpolations had probably been introduced into some still older eopy from the margin of another manuscript, where they had been subjoined by some who wished to *add* whatever they could obtain from tradition and various sources to make the narrative more full and complete. Among the most interesting additions is the following at the end of the fourth verse of the sixth chapter of Luke: "And on the same day he saw a man working on the Sabbath: and he said unto him, O man, if thou knowest what thou art doing, blessed are thou; but if thou knowest not, thou art accursed and a trangressor of the law." These additions removed, the text which remains is valuable for comparative eriticism, and is strongly corroborative of the other most ancient MSS.

The text of this codex, both Greek and Latin, was published by Dr. Thomas Kipling at Cambridge in two handsome folio volumes in 1793, in type cast for the edition, so wonderfully exact that it possesses nearly all the advantages of an actual fac-simile. A more scholarly and accurate edition was brought out in 1864 by F. H. Scrivener. Whiston, who had an extravagant admiration of the manuseript, published an English translation of it in 1745. A valuable study of this *Codex*, by J. Rendell Harris, is published as the eighth number of *Haverford College Studies*.

THOMAS CHASE.

Co'dex Ephrae'mi, or **Co'dex Ephrae'mi Sy'ri Rescrip'tus** (designation, C): an ancient and valuable palimpsest manuscript of portions of the Greek Bible, preserved in the National Library in Paris. It was brought from the East by Andrew John Lascar, a learned Greek patronized by Lorenzo de' Medici, and Catherine de' Mediei carried it to France. The ancient writing is read with difficulty, having been erased about the twelfth eentury in order that the vellum night be used for transcribing some Greek works of the Syrian Father Ephraem. The treasure which lay below was first noticed by Peter Alix in the latter part of the seventeenth century. Several readings from the palimpsest were published by Küster in 1710 in his reprint of Mill's *Greek Testament*. In 1716 Bentley sent Wetstein to Paris to collate the whole manuscript. This work, for whieh £50 was paid, was performed as far as was then possible. Wetstein told Bentley that it had cost him two hours to read one page. This eollation Wetstein used in his own edition of the Greek Testament (1751–52). In 1834 a ehemical preparation (*tinctura Giobertina*) was applied to the leaves in order to revivify the ancient writing. But although mueh that had been illegible was thus brought fully to light, every part of the manuscript was stained and discolored in the process, and some passages made more difficult to read than before. The conquest of all the difficulties which beset the deciphering of this eodex is one of the greatest triumphs of Tischendorf. This enthusiastic, patient, keen-sighted, and skillful palæographer occupied himself from Dec., 1840, till Sept., 1841, in examining and eopying the manuscript for publication, and has given the world the first complete transcript of it; the New Testament portion being published at Leipzig in 1843, the Old Testament in 1845.

Codex C is an uncial manuscript, about the size of Codex A, but written in eharaeters a little larger and somewhat more elaborate, and with but one eolumn on a page. All its characteristics point to a date as early as the fifth century. Three correctors at least have left on it traees of their work; the earliest may have been of the sixth century, the second (who revised such portions only as were used for ehurch lessons or other ecclesiastical purposes) perhaps of the ninth. By him and by the third hand (whose changes are few) small crosses were interpolated as stops, and there are marks of cantillation as guides in intoning. In critical authority Tregelles places this MS. next to the Sinaitic and the Vatican.

T. CHASE.

Co'dex Sinait'icus (designated ℵ *aleph*): the most recently discovered of the nearly complete uncial manuscripts of the Greek Bible, and inferior to no other in antiquity, authority, and completeness.

In 1844 Constantine Tischendorf—who, although but twenty-nine years old, was already famous as an editor of the *Greek Testament* and as the deciphercr of the *Codex Ephraemi*—in a journey undertaken in search of ancient manuscripts of Holy Writ, arrived at the ancient Greek convent of St. Catharine on the range of Mt. Sinai. Here he was shown a beautiful codex of the Gospels, the pride of the eonvent, written upon exquisite white parehment in letters of gold, and adorned with beautiful paintings of the four Evangelists, our Saviour, the Virgin Mary, and the apostle Peter, and said to have been the gift of Theodosius III. From the charaeter of the writing it must date from the seventh or eighth century; but Tischendorf found it very inaccurate, and of slight eritical value. Something much more precious than this costly codex had been thrown aside as worthless by the guardians of the convent library. In a large basket filled with remains of torn and damaged manuscripts which stood in the middle of the room, Tischendorf found a considerable number of vellum leaves of a Greek manuscript of the Septuagint version of the Old Testament, which his practiced eye at onee reeognized as one of the oldest in existence. The contents of the basket had been destined for the flames, two baskets full of similar materials having been already burned in the stove. Tisehendorf easily obtained possession of forty-three sheets, about one-third of the number whieh he rescued, but was not permitted to take the other portions, nor even to copy more than a single leaf. Unfortunately, he had betrayed the value of the treasure of which the monks had been so uneonseious. Of the portion he obtained he published a lithographic fae-simile in 1846, under the name of *Codex Friderico-Augustanus*, in honor of his patron, Friedrich August, the King of Saxony. Of eourse, Tischendorf was hoping all the time that he should at length obtain the rest of the manuscript. He made proposals for it through a friend whom he had found at the eourt of the Viceroy of Egypt, but only to learn that the monks, having learned its value, would not part with it for any sum of money. In 1853 he visited the monastery a second time, in the hope of being permitted to eopy those parts of the eodex whieh he had left behind, but he could gain no tidings of them. He found, however, one trace of the eodex—a single shred, in a roll of parchment, containing eleven lines from the first book of Moses. But few years passed before Tischendorf felt impelled for a third time to journey to the East, in the hope of prosecuting his search for ancient copies of the sacred text over a wider field and more fully than before. To faeilitate his researehes, he gained the powerful patronage and protection of the Emperor Alexander II. of Russia, the great champion of the Oriental Orthodox Church, and of his imperial consort. Near the beginning of the year 1859 the enthusiastie scholar presented himself for the third time at the gates of the eonvent. After repeated ealls from below, a door in the convent wall was opened 30 feet above the ground, and a rope let down to receive the letters whieh the traveler brought. Ordinarily, guests are reeeived through this same door, seating themselves on a cross-piece of wood at the end of the rope, and being then drawn up by the servants of the eonvent. Tischendorf's eredentials proeured him a more distinguished reception. In honor of his imperial commission the steward of the convent soon appeared in person, in the name of the prior, and conducted the guest, through a door seldom used, "into the still, friendly asylum." The luggage and the dragoman took the usual journey through the air.

After five days' tarriance, during whieh Tisehendorf had carefully examined the treasures of the library, as well as

ascended Mt. Sinai, when he was preparing to take his departure, and had sent his Bedouins after the camels, as he was taking a walk with the steward, the conversation turned upon the text of the Old Testament. Returning at twilight to the convent, the steward invited him to partake of a luncheon in his cell, and while they were eating remarked that *he* had here a copy of the Septuagint, thereupon bringing out of a corner of the room a large manuscript, wrapped in a red cloth, according to the Oriental custom, which he had brought to his own cell from the library of the σκευοφύλαξ, or keeper of the sacred utensils. Glancing at the pile of vellum, Tischendorf soon recognized it as belonging to the same codex of which he had rescued some leaves from the basket of fuel fifteen years before; and, eagerly turning over the sheets, beheld, to his astonishment, in addition to a large part of the Old Testament, the beginning and the end of the New, and the Epistle of Barnabas. It appears that soon after the original discovery in the waste-basket the monks had found these sheets, and placed them with the fragments which Tischendorf rescued from destruction. The German guest, concealing his emotion, begged the privilege of taking the manuscript to his chamber; to his unspeakable joy, he found that it contained the New Testament *entire*, whereas all the other manuscripts of the first class (as regards antiquity) are more or less imperfect; and he could not withhold an offering of praise and thanksgiving to that Being who had suffered so valuable a boon for the Church of Christ to come into his hands. The first night he spent in transcribing the Epistle of Barnabas (now found for the first time entire in the original Greek), in spite of a dim lamp and the cold temperature; "indeed, it seemed impious to sleep."

Understanding the aversion of the monks to part with manuscripts in their possession, Tischendorf asked and obtained, after some opposition, permission to copy the whole codex at Cairo, where there were greater facilities for the work than at the convent. Assisted by two of his own countrymen, with incessant toil he completed his transcript, but he was not able to give his copy that careful revision and comparison with the original without which it would be unfit for publication. At Tischendorf's suggestion the monks were at last persuaded to offer the whole codex as a gift to the great monarch whom they recognized as the shield and bulwark of the Eastern Church; and in a little less than eight months after his discovery of the treasure they committed it to his hands to be borne to St. Petersburg—to be held for a time, however, as a loan made simply to facilitate the publication of an accurate edition, until the confirmation of their new archbishop's election should enable him to present it formally to the emperor, as he afterward did.

The *Codex Sinaiticus* is written upon vellum sheets of extreme fineness and beauty, the delicate skins of antelopes or of wild asses (probably the former). It consists of 346 leaves, of which 199 contain 22 books of the Old Testament and Apocrypha in the Septuagint version, beginning at the first book of Chronicles; while the remaining 147 present *the whole* of the New Testament, the Epistle of Barnabas, and a part of the Shepherd of Hermas. (To these should be added the 43 leaves of the *Codex Friderico-Augustanus*.) It is written in uncial letters of exceeding beauty and simplicity of shape, approaching closely to the forms of the best papyri. Such testing characters as alpha, delta, epsilon, pi, and sigma are as unadorned as possible, without flourishes, knobs, or thickened points at their extremities—a proof of antiquity. It resembles the *Vatican Codex* in the absence of *initial* letters larger than the rest, which seem to have been regularly used after the beginning of the fifth century. It has but little punctuation, and that in the oldest manner. Its peculiarities of orthography and etymology belong to a period as early as the fourth century of our era. It is conspicuous for the brevity of its titles and subscriptions—e. g. "According to Matthew," "Acts," "To (the) Romans." Longer titles, as "The Holy Gospel according to Matthew" (wrongly translated in our version "The Gospel according to St. Matthew"—*Horne's Introduction*, 3d ed., p. 410), were not introduced until a later date.

It has, moreover, certain other signs of antiquity peculiar to itself. It has always been regarded as one of the striking proofs of the remote age of the *Vatican Codex* that it is written in three columns on each page, presenting to the eye, when the book is open, six narrow columns at once, thereby the more closely resembling the appearance of the ancient *volumina* or papyrus scrolls when extended for reading. Just as in the first books printed after the invention of printing many of the peculiarities of the manuscripts were carefully imitated, so when manuscripts began to be written on leaves instead of scrolls it is natural to suppose that some of the peculiarities of the older form would be retained. A very few other manuscripts have been found with the same number of columns on a page as the *Vatican*. But the *Sinaitic Codex* stands *alone* among known manuscripts in presenting *four* narrow columns on a page, seldom exceeding 2 inches in breadth, and *eight columns* at once when the book is opened; so that its claims to the benefit of this argument for antiquity are the strongest. This fact, with certain other indications, renders it probable that this codex was copied directly from an old Egyptian papyrus manuscript. The remarkably large size and great beauty of the vellum sheets is another proof of high antiquity. In size, indeed, they are the largest known, "each page being even at present as large as 13½ inches in length, by 14⅞ inches high, although marginal notes have sometimes been partially cut off by the ancient binder." A single animal could contribute only two leaves, or one sheet, of such unusual size. As time went on, smaller and coarser sheets of parchment took the place of the exquisite vellum used in the oldest manuscripts. The peculiar order in which the books of the Bible follow each other corresponds with what Epiphanius, who flourished toward the end of the third century, testifies to as existing in some manuscripts of his day, and proves that the codex was written before our present order had become established; while the presence of the Epistle of Barnabas and the Shepherd of Hermas is a strong indication that it was written before the age of Cyril of Jerusalem and the so-called Council of Laodicea (about A. D. 363). Those divisions called "the larger chapters," with their corresponding summaries of contents, which appear in all the copies of the Gospels written from the fifth century downward, are wanting in the Sinaitic and Vatican manuscripts alone. On the other hand, the *Sinaitic Codex* exhibits the Ammonian sections and Eusebian canons in red ink in the margins; which, if written by the original copyist, prove that the manuscript can not be ascribed to an *earlier* date

FORMYSAKEFORATES

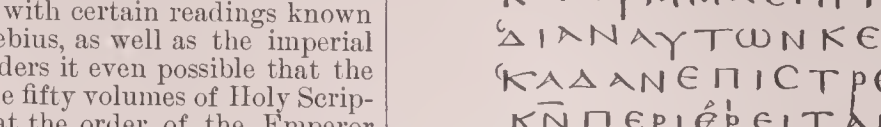
than some time within the first half of the fourth century, for Eusebius died in 340.

There is a striking agreement between the readings of this codex and those defended by Origen (186–253); while the marked coincidence of its text with certain readings known to have been approved by Eusebius, as well as the imperial beauty of the manuscripts, renders it even possible that the *Codex Sinaiticus* was one of the fifty volumes of Holy Scripture which Eusebius himself, at the order of the Emperor Constantine, caused to be prepared on beautiful skins by skillful calligraphists in the year 331, soon after the foundation of Constantinople. At any rate, we can assign it with moral certainty to the fourth century of our era, and with the highest probability to the first half of the same.

The publication of the original text of this and other ancient manuscripts is rendered difficult by the various *corrections* they have undergone in different ages. The *Codex Sinaiticus* abounds in such alterations, "brought in by at least ten different revisers, some of them systematically spread over every page, others occasional or limited to separate portions of the manuscript, many of them being contemporaneous with the first writer, far the greater part belonging to the sixth or seventh century, a few as recent as the twelfth." In many cases nothing short of the skill of a Tischendorf can identify with certainty the original writing under the alterations.

The *Codex Sinaiticus* was published in a style worthy of its importance and value. The enlightened sovereign of Russia was easily persuaded to signalize the thousandth anniversary of the establishment of his empire, in 1862, by bringing out an edition of the manuscript—now properly characterized by the additional title of *Petropolitanus*—in a style surpassing in splendor and in accuracy of imitation any previous work of the kind. The text is printed in three folio volumes (ii.–iv.), the leaves of the shape and size of those in the manuscript itself; the first volume contains valuable introductory matter, and twenty-one admirable fac-simile plates, representing chiefly pages of the manuscript, and two being covered with fac-simile specimens of other important manuscripts for comparison. The work is "printed upon paper at once thick and fine, the ink being made to resemble that of the original in color, and the type being greatly varied, so as to imitate the various shapes and sizes of the letters employed by the scribe: the very spaces, too, between the letters have been carefully measured and represented with all faithfulness." Only 300 copies of this truly imperial edition were printed, 200 of which were distributed by the emperor himself as presents to various public bodies and learned men; the rest were given to Tischendorf for sale, their price being fixed by him at 230 Prussian thalers. Several of the foremost colleges and libraries in the U. S. possess this valuable work, in a few instances as a donation from its imperial patron. A cheap manual or popular edition, containing the New Testament and its appendages in ordinary Greek type, was published in 1863; and an octave edition of the New Testament, together with the variations of the Vatican manuscript and of the Elzevir edition from the Sinaitic readings, appeared in 1865, with a supplement of additions and corrections in 1870. English readers will be interested in examining the various readings of the three most celebrated manuscripts of the original Greek text as presented by Tischendorf in his edition of the authorized English version of the New Testament, which was published by Baron Tauchnitz in 1869 as the thousandth volume of his *Collection of British Authors*. Tischendorf himself has told the romantic story of his most important discovery in several publications, most fully in his *Die Sinaibibel, ihre Entdeckung, Herausgabe und Erwerbung* (Leipzig, 1871). Revised by PHILIP SCHAFF.

Co'dex Vatica'nus (designation, B): a beautiful uncial manuscript of the Greek Bible in the Vatican Library, dating from the fourth century. Its marks of antiquity are similar to those of the Sinaitic codex; and indeed Tischendorf is confident that it is one of thirty copies of the Scriptures which Eusebius, the Church historian, had prepared by order of the Emperor Constantine in 330 for the churches of Constantinople. It presents three narrow columns on a page, except in the poetical books of the Old Testament, which, as in the *Codex Sinaiticus*, are written stichometrically (in verses clause by clause, according to the sense) in two columns. It is written on fine, thin vellum, in a square, plain, and noble style of handwriting, being a close resemblance in shape to that of the Herculanean papyri. The manuscript contains the greater part of the Old Testament, and the new as far as Hebrews ix. 14. It appears to



Codex Vaticanus (2 Corinthians iii. 15, 16).

κάλυμμα ἐπὶ τὴν καρδίαν αὐτῶν κεῖται· ἡνίκα δ' ἂν ἐπιστρέψῃ πρὸς κύριον, περιαιρεῖται τὸ κά-*

* $\overline{\text{KN}}$ is a contraction for KYPION.

have belonged to the Vatican Library from the latter part of the fifteenth century. Its earlier history is unknown, but Tischendorf regards it as the work of an Alexandrian scribe. In critical authority it is inferior to no other manuscript.

This codex has always been difficult of access. Scholars all over the world rejoiced when it was announced that Cardinal Mai was preparing an edition of it. After a long delay, his edition appeared in the Christmas holidays of 1857, three years after his death; but it proved to have been so carelessly executed as to be of little value; a smaller edition, also prepared by the cardinal, appeared in 1859, avoiding some of the errors of the former, but introducing almost as many new ones. Mai's edition was reprinted in several places—in Berlin with corrections by Philip Buttmann. In 1867 the New Testament was published in Leipzig, in common cursive characters, by Tischendorf; but he had been allowed to collate the whole manuscript no farther than partly through the third Gospel, and only to consult it on difficult or doubtful passages beyond that point. While falling short of the *highest* character, on account of the restrictions placed upon his use of the manuscript, this edition will generally be held decisive on the disputed points on which its editor gives his deliberate judgment upon personal examination of the passage. The codex was soon afterward published by papal authority, in magnificent style, edited by Carlo Vercellone and Giuseppe Cozza. The size and shape of the manuscript are accurately represented, and it is copied line for line and letter for letter, in printed characters approaching fac-simile, Tischendorf having lent for the purpose the type which had been cast for the imperial edition of the *Sinaitic Codex*, and the writing being astonishingly alike in the two manuscripts. The first volume published, but the fifth of the entire work, containing the New Testament, appeared in 1868. In one of the subsequent volumes containing the Old Testament, Vercellone was replaced by Caietano Sergio. The New Testament was published in a photographic fac-simile (100 copies, at $50 per copy), in Rome, 1889.

Revised by PHILIP SCHAFF.

Codicil (Lat. *codicillus*, dimin. of *codex*): an addition to or qualification of a will. It may add to or take from, explain, alter, confirm, republish, or revive any will with which it is incorporated. A will may have several codicils, in which case all the codicils form a part of the will to which it is attached or refers. A codicil revokes so much of a will as is inconsistent with it. Codicils must be executed with all the formalities required for the execution of wills; and due execution of a codicil cures all defects in the execution of the will to which it relates, and proof of the execution of the codicil makes unnecessary proof of the execution of the will itself. A codicil need not be physically annexed to the will to which it relates, but it is sufficient that the language of the codicil clearly identifies the will which it supplements. HENRY WADE ROGERS.

Codlin, or **Codling**: any one of several varieties of apples, some of which are highly esteemed in England, and are used chiefly for culinary purposes. The codlin ripens in summer or autumn, and can not be kept long.

Codling Moth, or **Codlin Moth**: the *Carpocapsa pomonella*, a small moth, the larva of which is one of the most important enemies of the fruit-grower. The larva is the well-known worm found feeding near the core of apples. The moth lays her eggs in the blossoms just as the petals fall, and the remedy is to spray the tree at this time with Paris green.

Cod-liver Oil (*Oleum morrhuæ*): an oil obtained from the cod (*Gadus morrhua*), in which the tissue containing the oil is almost entirely confined to the liver. Cod-liver oil is prepared in Great Britain, Newfoundland, and the U. S.,

but chiefly in the northern part of Norway. There are three varieties in the market—pale, pale-brown, and dark-brown oil.

Until the year 1853 cod-liver oil as a food and therapeutic agent was, in fact, no more than a crude product of domestic industry, difficult of ingestion, and not well supported by patients, who, indeed, would not have touched it had they known of the loathsome details of its preparation. Physicians, though in a measure aware of the objectionable features attendant upon its manufacture, and cognizant of its tendency to injurious decomposition, continued as a matter of necessity to prescribe it, while they were unable to employ it in those cases in which it was most needed—that is, for those conditions of phthisis and struma in which the digestive organs were in a supersensitive condition. Peter Möller, of Norway, took the manufacture of cod-liver oil out of the hands of the fishermen, and in 1853 he succeeded in introducing his celebrated steam process. In this process the livers are taken from the fish and treated as soon as possible after being received. Small, bruised, and diseased livers are rejected, and the selected livers are washed until free from blood, membrane, and other impurities. They are then minced to a pulpy mass, which is placed in an apparatus and heated externally by steam to the degree of 100° to 102° F. The oil as it exudes is drawn and filtered. Fresh livers and low temperatures give a pure, sweet, light, but brilliant amber-colored oil. Very pale or colorless oils are articles which have been subjected to deleterious bleaching processes. The darker oils prepared in the old way are now considered as unfit for therapeutic use. The light oil prepared by the Peter Möller process is not a refined product, but the pure, fresh oil, as it existed in the hepatic cells of the living fish.

The constitution of cod-liver oil has, ever since its appearance as a therapeutic remedy, been an object of curiosity to scientists, who, armed with the latest and best analytical weapons of chemistry, have tried to solve the mystery surrounding this valuable agent. The first chemical research on cod-liver oil dates as far back as the year 1828 by Wurzer (*Hufel Journ.*, 1832); the most elaborate work by later investigators was done by De Jongh in 1843 (*Disquisitio comparativa chemica medica de tribus olei jecoris aselli speciebus*, 1843). Among more recent workers may be mentioned Schafer (*Wigger's Jahresb.*, 1869); P. Charles (*Ph. Centralh.*, 1882); Kremel (*Ph. Centralb.*, 1884); Hager (*Ph. Centralh.*, 1885); Gautier and Morgues (*Les alcaloides de l'huile de foie de morue*, 1888). All these agreed that the main part (95–98 per cent.) of the oil consisted of the three glycerides, olein (about 70 per cent.), palmitin, and stearin (together about 25–28 per cent.). These compounds being the regular constituents of well-known fats, no importance was attached to them, but diligent search was made to find the active principle in the remaining part of the oil. A variety of things was thus found, one by one of them being in succession presented by their discoverers as the much-wanted panacea. Such was the state of affairs when P. Heyerdahl, Peter Möller's chemist, in 1891 succeeded in establishing the fact that the three above-named glycerides do not form the chief constituents of the oil, but, if present at all, they are so to a very limited extent. On the other hand, he found that the fats of the oil consist of some hitherto unknown glycerides. The acids of two of them he succeeded in presenting—one as a bromide, the other as a hydroxy acid. To the former he gave the name of therapic acid ($C_{17}H_{26}O_2$) and to the latter the name of jecoleic acid ($C_{19}H_{36}O_2$), each being presented in the oil to the extent of about 20 per cent. Therapic acid in the form of a glyceride is easily attacked by oxygen, forming hydroxy acids, which doubtless cause the well-known repeating after a dose of cod-liver oil, because this unpleasant effect does not appear after taking the oil never exposed to the action of air. The isolated acid is still less stable, so much so that it has hitherto frustrated all attempts to present it, no matter how carefully the experiments are made. As will be seen from the formula $C_{17}H_{26}O_2$, it is an unsaturated acid with four double bonds, consequently belonging to a series of organic acids, which has hitherto remained completely unknown, though the possibility of their existence has for a long time been theoretically maintained with much certainty. After Heyerdahl's discovery there can be no doubt that cod-liver oil owes its unsurpassed efficacy as a material for building up the human system to this acid, on account of the great ease with which it is broken up and adapted to the formation of those other compounds of which the organism in its expenditure and change of matter is constantly in want. The many and varied compounds which have been found in the rest of the oil and proclaimed as the active principle, such as gaduin, morrhuin, morrhuol, asellin, etc., are nothing but decomposition products formed during the process of analysis, or by living micro-organisms after the oil has left the hepatic cells. The jecoleic acid and one or two other acids, with one double linkage, have not yet been sufficiently examined, together with therapic acid—all of them in the form of glycerides make up the bulk of the oil, palmitic acid being present to the extent of about 5 per cent. Of stearic and oleic acid there is still less, if any at all. That part of the oil (2–5 per cent.) in which the active principle formerly used to be looked for consists of cholesterin, albumen, traces of iron, manganese, sodium, calcium, magnesium, phosphor, chlorine, bromine, iodine, coloring-matter (lipochrom), and some other not yet recognized compounds, probably decomposition products of the pure oil. From this it follows that cod-liver oil should be kept from any contact with the air until it is to be taken by the patient. It is commonly taken in doses of from a dessert-spoonful to a tablespoonful three times a day.

RASMUS B. ANDERSON.

Codman, JOHN, D. D.: Congregational divine; b. in Boston, Mass., Aug. 3, 1782; graduated at Harvard in 1802; studied in Edinburgh, and became pastor of a church at Dorchester, Mass., in 1808, and so remained till death. He was a prominent advocate of clerical education. He published many sermons, and bequeathed his large library to the Andover Seminary. D. in Dorchester, Dec. 23, 1847. See his *Memoir*, with six sermons, by Rev. Dr. William Allen (Boston, 1854).

Cod'rington, Sir EDWARD, G. C. B.: an English admiral; b. in Gloucestershire, Apr. 27, 1770. He served as captain of the Orion at Trafalgar in 1805, and became a vice-admiral in 1821. He commanded the English, French, and Russian fleets which defeated the Turks at Navarino in 1827, and was recalled on the pretext of having gone beyond his orders; became admiral in 1837. D. in London, Apr. 28, 1851.

Codrington, Sir WILLIAM JOHN, G. C. B.: general; a son of the preceding; b. in Nov., 1804; educated at Harrow and Sandhurst; entered the army in 1821; went with the Coldstream Guards to Bulgaria in 1854; was made major-general by brevet while at Varna, and distinguished himself both at the Alma and at Inkerman in 1854, and directed the attack on the Redan of Sebastopol in Sept., 1855. In November of the same year he became commander-in-chief of the army in the Crimea, a member of Parliament in 1857, and in 1859 governor of Gibraltar. In 1863 he was promoted to the rank of general, and in 1877 he was placed on the retired list. D. Aug. 8, 1884.

Co'drus (in Gr. Κόδρος): the last King of Athens; is supposed to have reigned about 1060 B. C. According to tradition, he sacrificed his life for his country during a war between the Athenians and the Dorians. An oracle having predicted that the people whose king was slain by the enemy should be victorious, Codrus went in disguise to the Dorian camp, and provoked a quarrel in which he was killed. His son Medon was then chosen archon of Athens. See ATHENS, ANCIENT.

Coefficient [from Lat. *co-* + *effi'ciens*, *-entis*, effecting a result, pres. ptc. of *effi'cere*]: in algebra, one of two simple or compound factors whose product constitutes a term. Thus in the term $2ab^2c$, $2ab^2$ is the coefficient of c, $2a$ of b^2c, and 2 of ab^2c. In the latter case 2 is frequently called the "numerical coefficient" of the term, the others being distinguished as "literal coefficients." In an algebraical expression, and especially in quantities whose terms involve constant as well as variable factors, it is usual to restrict the term "coefficient" to the former.

Coehorn, kō'horn: so named from Baron van Coehorn, who invented it; a small mortar, frequently a 24-pounder. Coehorns, being easily moved and taking little powder, are found very useful in sieges, if grouped in great numbers. They are generally made of bronze.

Coehorn, koo'hōrn, Lieut.-Gen. MENNO, Baron van: Dutch military engineer; a contemporary and opponent of Vauban; b. near Leeuwarden, Friesland, 1641; received from his father, a captain of infantry, his first lessons in the art of war; early showed talent for the construction of fortifications; studied at Franeker; captain in the Dutch service

at the age of sixteen; became famous by the invention and use of the small mortar that bears his name at the siege of Maestricht 1674; colonel 1674; brigadier-general 1688; distinguished himself at Fleurus and in the defense of Namur against Vauban; introduced the bayonet among the Dutch infantry about 1680; built numerous fortifications on a plan which was a modification of the bastioned system adapted especially to the flat surface of Holland (see FORTIFICATIONS); retook Namur 1695; as lieutenant-general of engineers had charge of all the fortresses of Holland; commanded a corps in the war of the Spanish Succession, and distinguished himself by the capture of Bonn and numerous other important posts; had been summoned to The Hague to consult with Marlborough on the plan of campaign, when he died on the way from a stroke of apoplexy, Mar. 17, 1704. Coehorn's genius has been universally recognized. Zastrow called him "the prince of engineers," and Vauban himself urged Louis XIV. to offer him inducements to enter the French service. See *Life of Coehorn*, by J. Watts de Peyster. C. K. ADAMS.

Coel, or **Koel**: See ALIGARH.

Cœlentera'ta [Gr. κοῖλος, hollow + ἔντερα, intestines]: a class of animals formerly included in Cuvier's unnatural group *Radiata*. The Cœlenterates are sac-like animals with no distinction between digestive and body cavities; with but a single opening for the ingestion of food and the voidance of rejectamenta. The body-wall consists of but two germ layers, ectoderm and entoderm (see EMBRYOLOGY), with occasionally a gelatinous layer of considerable thickness between them. From the ectoderm are developed muscles, nerve centers, and sense organs; the inner layer is more adapted for digestive and excretory purposes. A peculiarity of both layers is the formation of thread-cells or nettle-cells (whence the name acalephs, from Gr. ἀκαλήφη, a nettle, formerly given to the medusæ), which are used as a means of defense and for killing the prey. These thread-cells are sacs filled with a poisonous fluid, and provided with a long hollow thread through which upon irritation the poison can be conveyed into the tissues of other animals. The larger forms, like the Portuguese man-of-war, produce severe effects upon the human flesh, but the smaller ones usually are without effect on man. Most of the Cœlenterates are marine, a few only occurring in fresh water. Some (the jellyfish or medusæ) are free swimming, others (sea-anemones, corals, hydroids) are fastened to some object during their mature life.

The Cœlenterates afford some interesting instances of ALTERNATION OF GENERATIONS (*q. v.*). Thus many common hydroids which are attached to plant-like forms produce reproductive buds from which at maturity there escape jellyfishes or medusæ, which bear only a remote resemblance to the parent and which swim freely through the water. These medusæ in turn produce eggs from which other hydroids like the grandparent are produced, thus completing the cycle. In some instances the process is even more complicated.

The Cœlenterates are divided into two sub-classes, the Hydrozoa, in which the throat is lined with entoderm, and the Scyphozoa, in which the throat is lined with ectoderm. In both groups there are several parallels. Thus in both we have fixed forms and free-swimming jellyfishes; both reproduce by eggs and by budding, both have alternations of generations, and some members of each produce the hard calcareous substance known as CORAL (*q. v.*). The Hydrozoa are divided into *Hydromedusæ* (see HYDROID) and *Siphonophoræ* (*q. v.*). The *Scyphozoa* are divided into *Scyphomedusæ* (see MEDUSÆ) and *Actinozoa* (see POLYP). The Ctenophores (comb-bearing jellyfishes) are now not regarded as true Cœlenterates, and are given a separate article.

In general words, it may be said that the Cœlenterates lack many characters which are commonly but erroneously regarded as characteristic of animals. Thus there is no brain, but the deeper portion of the skin performs functions as a nervous system. There is no heart, nor excretory system, and blood-vessels are wanting. That they are true animals is beyond a doubt. They have eyes and ears, muscles, a stomach, and reproduce by eggs. J. S. KINGSLEY.

Cœlestine: See CELESTINE.

Cœ'le-Syria (in Gr. ἡ κοίλη Συρία, the hollow Syria): a beautiful valley of Syria between the mountain-ranges of Lebanon and Anti-Lebanon: about 90 miles long, and of an average width of 7 miles, but in some parts its breadth is far greater. It is now called El Bukaa. It is intersected by the river Litany (anc. *Leontes*). The chief city of Cœle-Syria was Baalbec (*Heliopolis*).

Coelho, kō-āl'yō, DUARTE DE ALBUQUERQUE: eldest son of Duarte Coelho Pereira; b. at Olinda, Pernambuco, in 1537. By the death of his father in 1554 he inherited the captaincy of Pernambuco as second donatario. He was at that time in Europe, where he had been sent for his education, and the captaincy was governed *ad interim* by his mother; returning in 1558, he governed the captaincy personally until 1577, when he went to Portugal to join in the invasion of Africa under Dom Sebastião. At the battle of Alcacer-Quivir (Aug. 4, 1578) he was taken prisoner by the Moors, and died in captivity, probably in 1579. HERBERT H. SMITH.

Coelho, DUARTE DE ALBUQUERQUE: son of Jorge de Albuquerque Coelho, Marquis of Basto and Count of Pernambuco; b. in Lisbon, Dec. 22, 1591. He inherited the captaincy of Pernambuco, and governed it personally from 1627 until driven out by the Dutch invasion. In the subsequent struggles with the Dutch he did good service, especially distinguishing himself in the defense of Bahia in 1638. At the separation of Portugal from Spain he remained faithful to the Spanish king, and was gentleman of the bedchamber to Philip IV. He published in 1654 his *Memorias diarias de la guerra del Brazil*, an account of the wars in Brazil from 1630 to 1639, of great historical value. D. in Madrid, Sept. 24, 1658. HERBERT H. SMITH.

Coelho, FRANCISCO ADOLPHO: Portuguese philologist and educator; b. at Coimbra in 1847; since 1878 Professor of Comparative Philology in Lisbon. Among his more important works are *A Lingua Portugueza* (1868); *Origem da lingua portugueza* (1870); *Os dialectos romanicos, ou neolatinos na Africa* (1881). His *Contos populares portuguezes* (1879) was the first important collection of Portuguese popular tales. One or two of Coelho's books upon education are important: *A questão do ensino*; *Bibliotheca d'educação nacional* (3 vols., 1882, *seq.*). Since 1875 he has edited with Braga and Vasconcellos a review entitled *Bibliographia critica de Historia e Litteratura*; also, since 1880, a *Rivista d'Ethnologia e de Glottologia*.

A. R. MARSH.

Coelho, GONÇALO, or GONZALO: Portuguese navigator, who in 1488 commanded a ship on the coast of Senegambia, bringing a Negro chief or "king" prisoner to Lisbon. Later he was sent by the king, with six caravels, to seek a route to the Moluccas to the S. of the newly discovered "land of Santa Cruz" (Brazil). Amerigo Vespucci was captain or pilot of one of the caravels. They left Lisbon on June 10, 1503, and reached the island of Fernando de Noronha in safety. Soon after the ship in which Coelho sailed was wrecked, and he had to take refuge in one of the others. Two other ships, including that of Vespucci, separated from him and returned to Lisbon in 1504. Coelho, with the remaining ships, explored as far S. at least as Rio de Janeiro, and only returned in 1506. The historian Porto Seguro believes, with much reason, that Coelho formed a regular settlement on the site of Rio de Janeiro, and that one of his ships, sent to explore southward, attained the Rio de la Plata. Beyond the voyages mentioned nothing is known of Coelho's life. There is no proof that he had commanded the previous expedition of 1501 to the Brazilian coast, though he may have accompanied it. HERBERT H. SMITH.

Coelho, JORGE DE ALBUQUERQUE: a Portuguese soldier; second son of Duarte Coelho Pereira; b. at Olinda, Pernambuco, Apr. 29, 1539. He was early sent to Europe, returned in 1558, and his brother, who had inherited the captaincy, gave him command of the little army of the colonists. At the head of this he routed the hostile Cahatés Indians, and pushed far into the interior, exploring the river San Francisco for several hundred miles. Going to Portugal in 1565, he was captured on the way by French corsairs, who plundered his ship and then abandoned it, leaving him and his companions almost without provisions and exposed to a terrible storm. They reached Portugal only after great suffering. In 1578 he and his brother followed the king, Dom Sebastião, to Africa, and both were captured at the disastrous battle of Alcacer-Quivir, where the king was killed. Jorge Coelho was ransomed two or three years after. His brother having died in captivity without leaving children, he was now hereditary ruler of Pernambuco; but his fortune had been exhausted by the Moorish wars and in paying his ransom, and he was unable to bear the expenses of the colony, or even to return to it. He wrote several memoirs

on the wars of Brazil, which apparently were never published, but were used by contemporary historians. D. in Lisbon some time after 1596. HERBERT H. SMITH.

Coelho Pereira, DUARTE: Portuguese soldier and statesman; b. about 1485. He early entered the service of the king, and was sent to the East Indies, where he distinguished himself in various land and naval actions; he discovered Cochin China, and visited Siam and China as ambassador of the Portuguese. Returning to Portugal in 1527, he married a sister of Jeronymo de Albuquerque. In 1530 he cruised on the coast of Brazil, where he destroyed a French trading-colony which had been established near the present site of Pernambuco, and routed the Potiguares Indians, allies of the French. In Apr., 1534, he was granted the captaincy of Pernambuco, then established in perpetuity, and in 1535 he took possession and founded Olinda, at the mouth of the harbor of Pernambuco; this was long the capital and most important city, not only of Pernambuco, but of all Northern Brazil. The infant colony had to sustain a war with the savage Cahatés Indians, but these were beaten by the aid of the friendly Tabayres, and in a few years Pernambuco was the most flourishing captaincy of Brazil. Coelho from the first avoided wild enterprises, concentrated the strength of his colony, and encouraged agriculture. D. at Olinda, Aug. 7, 1554. HERBERT H. SMITH.

Cœ'lius, LU'CIUS CŒ'LIUS ANTI'PATER (also spelt **Cælius**): a Roman historian of the second century B. C., who composed a history of the second Punic war in seven books. He paid more attention to style than his predecessors, and dedicated his work to L. Ælius Stilo, the famous grammarian. Livy, Plutarch, and other writers used him as a source. For the extant fragments, see Peter's *Historicorum Romanorum Fragmenta* (Leipzig, 1883, pp. 98–108).

Cœlom [from Gr. *κοίλωμα*, a hollow, from *κοῖλος*, hollow]: in anatomy, the primitive body-cavity of animals above the Cœlenterates and Platyhelminthes. It arises in various ways, but in all it is distinct from the digestive tract, and is lined with epithelium. (See HISTOLOGY.) In the higher forms portions have different fates, but in all vertebrates the major portion is known as the pleuro-peritoneal cavity.

J. S. K.

Cœn'obites, or **Synodites** [*cœnobite* is from Eccles. Lat. *cœnobi'ta*, deriv. of *cœnobium*, monastery = Gr. *κοινόβιον*, community life; *κοινός*, common + *βίος*, life; *synodites* is from same source as SYNOD (*q. v.*)]: those ascetics who lived in communities instead of alone as did the anchorites or hermits. Pachomius of Egypt first founded a cœnobium in the fourth century. Basil, Benedict, and Jerome express decided preference for communal life, and it became the rule in Western monachism. Female cœnobia may have preceded the male as more necessary.

Cœur d'Alène Indians: See SALISHAN INDIANS.

Coevius, JACOB: See RAABE, WILHELM.

Coeymans, kwee'manz: town (founded in 1640); Albany co., N. Y. (for location, see map of New York, ref. 5–J); on West Shore R. R. and on the Hudson river; 12 miles from Albany; has a mineral spring, flagstone quarries, brickworks, an iron foundry, etc.; graded schools, four churches, and a weekly newspaper. Pop. of township (1880) 2,912; (1890) 3,669; (1900) 3,952. EDITORS OF "HERALD."

Coffee [Fr., Span., and Portng. *café*; Ital. *caffé*; Germ. *kaffee*; etc. First used in the seventeenth century]: (1) the berries of *Caffea arabica*, a tree which when wild reaches a height of 10 to 30 feet, and bears but few branches; and (2) a beverage made from these berries after roasting and grinding. The tree grows wild in Central Africa and in Mozambique, and originally was a native of Abyssinia and Arabia.

It was first cultivated in Java during the seventeenth century, and later in the West Indies and South America. The tree is at present cultivated in nearly all the tropical and sub-tropical countries of the world. A distinct species of coffee-plant is the so-called Liberian coffee-plant, which seems to be more hardy than the *Caffea arabica* and therefore more easily cultivated.

Most of the coffee of commerce comes from coffee-plantations which are laid out in quadrangles, the ground in which they grow being kept well weeded. When cultivated the tree is very frequently pruned, so that it is only 6 to 10 feet in height, while its branches almost touch the ground. The leaves of the coffee-tree are oblong, and 3 to 5 inches in length, leathery and shiny, while the flowers are snow-white, exceedingly fragrant and small, being clustered in the axiles of the leaves. It has a succulent fruit which, when it is ripe, is of a dark-red color, and which contains two cells, each of which contains a single seed. These seeds are hard, semi-ellipses, and form what is known in commerce as coffee-nibs, coffee-berries, or coffee-beans.

There are a number of species of coffee which vary in their characteristics according to the portion of the world in which they are grown. One of the most noteworthy of the various varieties of coffee is that which is known as Mocha, which comes from Arabia, and which many persons think is superior to any other form. Mocha coffee-beans occur as small greenish-gray masses of the shape first described. The Java or East Indian beans are large and yellow and the Jamaica smaller and of a greenish tint.

These berries when they are roasted develop an empyreumatic oil which is known as caffeol or caffeone, and when ground into a powder of varying coarseness are used for the purpose of making the beverage which is called "coffee," in which the active principles of the coffee—namely, the empyreumatic oil and the alkaloid caffeine—produce a characteristic and agreeable flavor, and provides the person that drinks the beverage with a powerful nervous, circulatory, and respiratory stimulant. Coffee has been in general use as a beverage for about 300 years.

Aside from its effects as an oil caffeol, the empyreumatic oil of coffee, possesses no known influence upon the animal economy, according to the investigations of Reichert, Marshall, and Harc.

Caffeine, the alkaloid of coffee, is employed in medicine both as caffeine and as citrated caffeine, being soluble in about 75 parts of water. It is to be noted that citrated caffeine is not the citrate of caffeine, for chemists do not consider that a definite chemical compound is formed between caffeine and citric acid.

When taken internally, coffee, or its alkaloid caffeine, produces a rapidly stimulating effect, which is chiefly exerted upon the intellectual portions of the brain and the reflex tracts of the spinal cord. As a result of this, it produces a marked increase in the rapidity of thought, and enables the individual who takes it to do more intellectual work in a given space of time than he could do otherwise, but this is always accomplished at the expense of nervous energy. A period of reaction is very apt to follow its use, and ultimately a brain driven along by caffeine breaks down, or at least is incapable of doing as much good work as before coffee or caffeine were resorted to. Coffee also stimulates the heart-muscle and the general circulatory system. The kidneys under its influence are also stimulated, and both the liquids and solids of the urine are increased in quantity. At the same time it diminishes the waste of tissues. The empyreumatic oil of which we have spoken is probably the cause of the "biliousness," so called, which is produced by coffee-drinking in some persons. As much as from 20 to 30 minims of this oil is present in an ordinary cup of strong coffee. Either when in the form of a beverage coffee is prepared in such a way as to be exceedingly black and strong, or as caffeine, it is exceedingly useful in many cases of heart and kidney disease, and is of the utmost value in the treatment of opium-poisoning. Sometimes when too much caffeine is given for a considerable period of time as a medicament, it causes so much nervous excitement as to produce delirium.

Caffeine is an alkaloid which is closely allied to guaranine, theine, and theobromine, and it is stated on good authority that most of the so-called caffeine of commerce is in reality theine derived from damaged tea, as this source is a much cheaper one than coffee. It is worthy of note that while coffee is more apt to produce biliousness than is tea, tea, on the other hand, is more apt to produce constipation, because of the tannic acid which it contains.

Unfortunately, a number of substances in powdered form have been introduced into commerce as adulterants of this valuable substance, notably chicory root, barley seeds, buckwheat, rye, and dandelion root, and sometimes charred bread crusts are employed. It is unnecessary to state that these adulterant substances are not only fraudulent, but that in all instances they lack the active principles of coffee. See the article ADULTERATION.

It is said that in Sumatra the leaves of the trees are used instead of the seeds in preparing a drink. Not only have coffee-leaves been employed as a substitute for the ordinary coffee of commerce, but in addition the pericarp of coffee-fruit has been recommended as a substitute. It is free

from caffeine, and therefore fails to produce the stimulant influence of that drug, but the pericarp of the seed or husks do contain small quantities of caffeine, and have been employed for the purpose of improving the flavor of the coffee-berries themselves. Such a coffee is known as Sultan or Sacca coffee.

The object of roasting coffee is to render the seeds more readily pulverizable, and to develop the peculiar aroma and taste which is due to the presence of an empyreumatic oil, of which we have spoken. The seeds under these circumstances become a chestnut brown, and lose about 18 per cent. of their weight. H. A. Hare.

Coffee-houses (in Fr. *café*): houses or saloons where coffee and other refreshments are served out to customers. Coffee houses were established at Constantinople in 1554, in London in 1652, and at Paris in 1662. For many years the use of coffee and the frequenting of coffee-houses were assailed by various writers. Before the general introduction of newspapers, coffee-houses were, particularly in England, important centers or sources of information, where people assembled to learn the news and discuss politics. See Clubs.

Coffer: a casket for keeping jewels, money, etc. In architecture this term is applied to the sunken panels in vaults and domes, or to deep panels in ceilings. In fortification, coffer is a particular kind of caponnière.

Cofferdam [*coffer*, a strong box; from O. Fr. *cofre*: Ital. *cofano* < Lat. *cophinus* = Gr. *κόφινος*, basket]: in civil engineering, a watertight inclosure for laying the foundation of bridge-piers, dams, wharves, etc. Cofferdams are often constructed of piles in two rows, with clay packed between. When finished, the water is pumped out by steam-power. Where the water is too deep for cofferdams, various forms of the Caisson (*q. v.*) are used; in which case the pier is sometimes gradually lowered to the bottom of the stream. See Foundation.

Cof'feyville: city and railroad center; Montgomery co., Kan. (for location of county, see map of Kansas, ref. 8–I); on Mo., Pac., Atch., Top. and Santa Fé and other R. Rs., and on the Verdigris river. There are here five natural gas-wells. The city draws a large trade from Indian Territory. Pop. (1880) 753; (1890) 2,282; (1900) 4,953.

Editor of "Journal."

Coffin [viâ Fr. from Lat. *cophinus* = Gr. *κόφινος*, basket; *coffin* and *coffer* are doublets]: a box intended to contain a corpse for burial. Among peoples who do not burn their dead there is a general disposition to keep the body inclosed and separate, instead of allowing it to pass at once into the earth as common sense and the laws of health would dictate. The Egyptian practice of embalming the dead had, however, a different origin. (See Egypt: *Future Life.*) The Egyptian coffins were commonly made of wood and often richly painted; they are commonly called mummy-cases. Stone coffins were also used by the Egyptians, and in this they were imitated by the Roman artists of the empire (cf. Sarcophagus); and the bodies of persons of high rank are often found in stone coffins in more recent times. Thus many of the ornamental sarcophagi forming part of Italian tombs of the fifteenth and sixteenth centuries actually contained the bodies of the persons commemorated. Modern coffins have generally been of the familiar "coffin-shape," until in very recent times a desire to make the associations less gloomy has caused the introduction of coffins with straight parallel sides, often called caskets.

Coffin, Charles: poet; b. at Buzancy, department of Ardennes, France, 1676; d. in Paris, June 20, 1749. He was educated in the Collège Duplessis, Paris, and was in 1701 appointed assistant, and in 1712 principal, of Collège Dormans-Beauvais, which position he held to his death. He cultivated Latin poetry with great success. In his earlier days he wrote convivial songs, and his *Ode to Champagne* became very popular, and every year brought him a basket of that costly wine from the wine-merchants of Rheims. When he grew older he wrote hymns, and several of those Latin hymns which he contributed to the Paris Breviary are found in English collections in John Mason Neale's and John Chandler's translations. His works appeared in Paris, 1755, 2 vols.

Coffin, Charles Carleton: journalist and lecturer; b. in Boscawen, N. H., July 26, 1823. During the civil war he was war-correspondent of the *Boston Journal*. Among his books are *Days and Nights on the Battle-field* (1864); *Four Years of Fighting* (1866); *Boys of '76* (New York, 1879); *Story of Liberty* (1878); *Old Times in the Colonies* (1880); *Building of the Nation* (1883); *Marching to Victory* (1888); *Freedom Triumphant* (1891). D. Mar. 2, 1896.

Coffin, Admiral Sir Isaac, Bart.: b. in Boston, Mass., of a Nantucket family, May 16, 1759. His father was a Tory, and collector of the port of Boston. Young Coffin entered the navy in 1773, serving against the U. S. in the Revolutionary war. He had, however, throughout life a strong regard for his native land. He was rapidly promoted, and attained in 1830 the rank of admiral of the white. In 1826 he visited Nantucket, where he founded and endowed the Coffin School. D. July 23, 1839.

Coffin, John: inventor; b. at Chatham, N. Y., Sept. 18, 1856; was foreman at the Cambria iron-works, Johnstown, Pa., but died early from typhoid fever, Sept. 3, 1889. He discovered two singular properties of steel: the welding of surfaces at a temperature lower than carbon changes can occur, and the yielding of steel by its own weight at that temperature. See *Trans. Am. Soc. Mech. Eng.*, vol. xii.

C. H. T.

Coffin, John Huntington Crane, LL. D.: b. in Wiscasset, Me., Sept. 15, 1815; graduated at Bowdoin College 1834; in 1836 was appointed Professor of Mathematics in the U. S. navy. He served at sea and in nautical surveys, was detailed in 1844 for duty at the Naval Observatory, and prepared descriptions and discussions of the work with the mural circle in the *Washington Observations* (1846–49), and a great part of those for 1845. He published also a discussion of the personal equation in bisecting a star by a micrometer thread (*Astronomical Journal*, iii., p. 121). He was Professor of Mathematics or Professor of Astronomy and Navigation in the U. S. Naval Academy (1853–65), and from 1866 in charge of the preparation of the *American Ephemeris and Nautical Almanac*. D. Jan. 8, 1890.

Coffin, Joshua: genealogist; b. at Newbury, Mass., Oct. 12, 1792; graduated at Dartmouth in 1817; was a teacher of the poet Whittier, and published *The History of Ancient Newbury* (1845), and numerous papers, etc., upon family genealogies. D. in Newbury, June 24, 1864.

Coffin, William Anderson: landscape and figure painter; b. in Allegheny City, Pa., Jan. 31, 1855. Pupil of Bonnat, Paris; second Hallgarten prize, National Academy, New York, 1886; third-class medal, Paris Exposition, 1889; Webb prize for landscape, Society of American Artists, 1891; member Society of American Artists (1886) and of Architectural League, New York. His picture *The Rain* (1891) is in the Metropolitan Museum, New York. He graduated from Yale College in the class of 1874, studied a year in the art school connected with the university 1875-76, and went to Paris in 1877. Principal works: *Mandolin Player* (1881); *An Examination* (1882); *Close of Day* (1883); *Moonlight in Harvest* (1886); *Early Moonrise* (1888); *September Breeze* (1889); *A Pennsylvania Farm—after the Thunder-shower* (1890); and *Evening* (1892).

Coffinhal, kō'fĕĕ'naal', Jean Baptiste: one of the most atrocious characters of the French Revolution; b. at Aurillac, in the department of Cantal, France, 1754; d. in Paris, 1794. He studied first medicine, afterward law, and was practicing in Paris when the Revolution broke out. He embraced the new ideas with fanaticism, acted for some time as president of the Jacobin Club, and was in 1792 appointed first justice, then vice-president, of the revolutionary tribunal. Some of the most odious verdicts of that tribunal must be laid to his charge. When Lavoisier asked for a respite of some days in order to complete a chemical discovery he had made, Coffinhal answered him: "The republic has no more use for any chemists." As an adherent of Robespierre he was implicated in his fall. He succeeded in escaping, but was delivered up to the police by a friend.

Coghetti, kō-get'tĕĕ, Francesco: an Italian painter; b. at Bergamo, Oct. 4, 1804; produced powerful fresco-paintings for several Roman palaces. He made a long study of Raphael, and founded an excellent school, marked by a serious study of the masters. His *Condemnation of St. Stephen* procured for him an order of knighthood. D. at Rome, Apr. 21, 1875.

Cognac, kōn'yaak' (anc. *Condate*; Modern Lat. *Conacum*): a town of France; department of Charente; on the river Charente; 24 miles W. of Angoulême (see map of France, ref. 6–D). It has an old castle, in which Francis I. was born. In 1526 an alliance of France, England, the pope, Milan, and Venice, against Charles V. was concluded here. Brandy of

excellent quality is made here, and is the chief article of export. About 6,000 butts of Cognac brandy are produced annually. Pop. (1896) 20,228.

Cogniet, kōn'yi-ā', Léon: historical and portrait painter; b. in Paris, Aug. 29, 1794; d. there Nov. 20, 1880; pupil of Guerin; Grand Prix de Rome 1817; first-class medal, Paris Exposition, 1855; officer Legion of Honor 1846; member of the Institute 1849. He was the master of many of the most distinguished artists of the present French school. His work is academic in style, but shows realistic tendencies. His *Magdalen* is in the Church of the Madeleine, Paris.

W. A. C.

Cognizance [M. Eng. *conisance* = O. Fr. *conissance*: Ital. *conoscenza* < Lat. **cognoscentia*, deriv. of *cognos'cere*, know]: in general, knowledge or notice. Specifically: (*a*) In law, authoritative notice or recognition, as of a fact; jurisdiction over or legal power to determine a particular cause or suit; also an acknowledgment or submission, as in pleading. (*b*) Badge worn by a retainer or dependent to indicate the party or person to which he belongs: also, in heraldry, cognizance is a crest, coat-of-arms, or similar badge of distinction.

Revised by F. Sturges Allen.

Cogno'men: a Latin word signifying a surname; the last of the three names usually borne by ancient Romans of good family. Cicero, for example, was the *cognomen* of the great orator, Marcus Tullius Cicero. It served to designate the family (*familia*) to which he belonged, as the other two names—viz., the *prænomen* and the *nomen*—served respectively to denote the individual and the class (*gens*) to which his family belonged.

Cogno'vit Actio'nem [Lat., he has recognized the action]: in common law pleading, a confession of a defendant subscribed by him or his atttorney, giving authority to a plaintiff to enter up judgment against him. It is executed after an action has been commenced, and is supposed to be given in court. In Great Britain the subject is regulated by statutes protecting the interests of the defendant, and in some of the U. S. there has been provided by statute a convenient substitute for a *cognovit*, in which, upon written offer by the defendant and acceptance by the plaintiff in a prescribed manner, judgment may be entered accordingly. It is distinguished from a Warrant (*Warrant of Attorney*) (*q. v.*).

Revised by F. Sturges Allen.

Cogre'dients [from Lat. *co-*, together + *-gre'diens*, form in compp. for *gra'diens*, proceeding, ptc. of *gradi*: things meeting together or agreeing. In mathematics, two sets of facients or variables, each set containing the same number, are said to be cogredient if on replacing the variables of the first set by certain linear functions of themselves those of the second set become also replaced by the same linear functions of themselves.

Cogswell, Jonathan, D. D.: a Calvinistic divine; b. in Rowley, Mass., Sept. 3, 1782; graduated at Harvard in 1806; was a tutor in Bowdoin College 1807–09; studied theology at Andover 1809; pastor at Saco, Me., 1810–28, and at New Britain, Conn., 1829–34; Professor of Ecclesiastical History in the Theological Institution at East Windsor, Conn. (1834–44), and lived without charge afterward. He published *The Hebrew Theocracy* (1848); *Calvary and Sinai* (1852); and other works. D. at New Brunswick, N. J., Aug. 1, 1864.

Cogswell, Joseph Green, LL. D.: scientist and librarian; b. at Ipswich, Mass., Sept. 27, 1786; graduated at Harvard in 1806; visited the East Indies; after his return studied law, and became a tutor in Harvard in 1814. He afterward studied in Europe, and became a librarian and Professor of Mineralogy at Harvard (1820–23). With the historian Bancroft he founded the celebrated Round Hill School at Northampton, Mass. He was superintendent of the Astor Library 1848–60, where his bibliographical work was of prime importance in library organization in the U. S. He contributed much excellent matter to periodical literature, and enriched the botanical and mineralogical collections at Harvard University with thousands of European specimens. D. at Cambridge, Mass., Nov. 26, 1871.

Cogswell, Mason Fitch, M. D.: b. at Canterbury, Conn., in 1761; graduated at Yale in 1780; became an eminent surgeon of Hartford, Conn., and was one of the founders of the asylums at Hartford for the deaf and dumb and for the insane. D. in Dec., 1830.

Cogswell, William, D. D.: a Congregational divine; b. in Atkinson, N. H., June 5, 1787; graduated at Dartmouth in 1811; became general agent of the American Education Society in 1829; Professor of History at Dartmouth (1841); Professor of Theology and president of Gilmanton Theological Seminary in New Hampshire (1844); was the author of works on theology, etc. D. in Gilmanton, N. H., Apr. 18, 1850.

Cohesion [from Lat. *cohære're*, cohere; *co-*, together + *hære're*, stick]: in natural philosophy, the force by which the particles of homogeneous bodies are kept attached to each other, and with which they resist separation. Adhesion denotes the attractive force existing between two different bodies brought into contact, as a drop of water on a plate of glass; or between two bodies of the same matter, as two lumps of lead when their smooth surfaces have been pressed together.

Cohn, Ferdinand Julius: German botanist; b. in Breslau, Jan. 24, 1828; Professor of Botany in the University of Breslau. Has made many investigations, especially relating to the structure and life-history of the fungi. Of his numerous published works the following may be mentioned: *Ueber Bacterien* (1872); *Kryptogamen-Flora von Schlesien* (1877–89); *Die Pflanze* (1882).

Charles E. Bessey.

Cohoes, kō-hōz': a city and railroad center of Albany co., N. Y. (for location of county, see map of New York, ref. 5–J); on the right bank of the Mohawk river, at its junction with the Hudson river; on the Erie and Champlain Canals, 9 miles N. of Albany. It has 3 ax-factories, several cotton-mills (one of which is one of the largest in the world), 40 knitting-mills, 2 spring knitting-needle factories, a pipe manufactory, a rolling-mill, and electric street railways connecting it with suburban towns, and a horse-railroad connecting with the city of Troy, 3 miles S. The city receives its supply of water for all purposes from the Mohawk river. The Cohoes Falls are in the city limits. Pop. (1880) 19,416; (1890) 22,509; (1900) 23,910.

Editor of "Dispatch."

Co'hort [from Lat. *cohors*, *-ortis*, inclosure, one-tenth of a legion; *co-*, together + *hortus*, inclosure]: in the armies of ancient Rome, the tenth part of a legion, and consisted usually of 600 men. The prætorian cohort was a body of picked troops who attended the commander of the army, and at a later period formed the guard of the emperor.

The term "cohort" is applied by some botanists to groups or assemblages of natural orders.

Coimbatore: a district of British India; presidency of Madras; bounded N. by Mysore, E. by the river Cauveri, which separates it from the district of Salem, S. by the states of Madura and Travancore, and W. by the state of Cochin, the district of Malabar, and the Nilgherri Hills. It is a flat, open country about 900 feet above the level of the sea, surrounded N., W., and S. by mountains rising 9,000 feet, but opening eastward into the plains of the Carnatic. The principal rivers are the Cauveri, Bháwani, Noyel, and Amarawati, from which numerous canals have been cut in all directions for the purpose of artificial irrigation. Of the total area (7,842 sq. miles), 3,877½ sq. miles, or 2,488,000 acres, are reported as being under cultivation. Excellent cotton and tobacco and good crops of grain, oil-seeds, and fruit are raised. Extensive teak-forests are found. Pop. 1,657,690, nearly all Hindus. The district of Coimbatore was acquired by the British in 1799, when the war closed, after the death of Tippu. Capital, Coimbatore. Pop. (1891) 46,383.

Coimbra, kō-eem'braă (anc. *Comembrica*): a city of Portugal; capital of the province of Beira; on the river Mondego; 115 miles N. N. E. of Lisbon (see map of Spain, etc., ref. 15–A). It is built on rising ground, and seen from a distance has an imposing aspect, but the streets are narrow and the houses mean. Coimbra derives its importance from its university, the only one in Portugal. It was founded in 1291, but at Lisbon, and not finally established at Coimbra until 1527. It has a library of 84,000 volumes, and in 1892 had 1,166 students and 74 professors. It also has a military college, a royal college of arts, and a botanic garden. There are several fine churches; also manufactures of linen and woolen fabrics, pottery, articles of horn, etc. Coimbra was founded by the Goths, and afterward occupied by the Moors, from which it was taken by Ferdinand I. of Castile in 1064. It became the capital of Portugal in 1139 and continued so until 1422. Pop. (1890) 17,329.

Coimbra: a Brazilian fort and settlement; on the right bank of the river Paraguay, at lat. 19° 55′ S. The river is

here narrowed by two opposing hills, and the point has long been regarded as the key to the navigation of the upper Paraguay. The fort was founded in 1775, and, as the navigation of the lower Paraguay was closed to the Portuguese, heavy cannon were brought up the Amazon, Madeira, and Gnapure, thence dragged overland to the Paraguay, and floated down to Coimbra. The Spaniards attacked the fort in 1801, but were repulsed; in Dec., 1864, it was taken by the Paraguayans. About a mile above Coimbra there is a remarkable and very large cavern, the Gruta do Inferno.

HERBERT H. SMITH.

Coin, kō-een′: a town of Spain; province of Malaga; about 22 miles W. of Malaga (see map of Spain, ref. 20–E). It has an episcopal palace and several convents; also fine public walks and gardens in the environs. Here are manufactures of linen and woolen fabrics, paper, and soap. Pop. 1887) 9,825.

Coinage: 1. The art, act, or practice of stamping metallic money. 2. Coin, coined money; a piece of metal of a certain weight and fineness issued as a measure of value and instrument of exchange by the government and bearing its authorized stamp. See MINT, MONEY, NUMISMATICS, and WEIGHTS AND MEASURES.

Before the invention of the art of coining, traffic consisted of barter. Among pastoral people values were estimated in the produce of the land. This practice gave way to the use of different kinds of metals, definite quantities of which by weight passed as measures of value of commodities, such as oxen and sheep. Hence the names early given to money: e. g. the Latin *pecunia*, from *pecus*; the English "fee," from the same root as the German *Vieh*; and the Indian *rupee*, from the Sanskrit *rupa*, all meaning "cattle." So, too, with the shekel of the Book of Job, there called *kesitah*, and rendered by the interpreters as "lamb."

The art of coining was practiced in Lydia in the time of Gyges and in the Peloponnesus in the reign of Phidon of Argos, but from the earliest times it has been a question as to priority of invention between Asia Minor and the ancient Greeks. The system of weights used in both coinages is supposed to be of Assyrio-Babylonic origin, and to have been transmitted to the shores of the Ægean Sea by the early Phœnician traders by sea and land. The scale of ancient coinage weights is believed to have been further transmitted from Peloponnesus to Italy, Spain, Gaul, and Britain, and thus to have been the derivation of later systems of weights.

The coinage of William the Conqueror was derived from the Romans, the same as that of Charlemagne in France. The measure of value throughout Western Europe was the Roman pound weight of silver bullion, and known in England as the Troy pound of 12 oz. This was originally divided into 240 coins called pence (*denarii*), 12 of which were called a shilling (*solidus*). The solidi, or 20 shillings, therefore, actually weighed a pound of silver bullion. Down to the time of George IV. numerous alterations of the coinage took place in England; so that the pound of silver in coin came to be much less than a pound of metal in bullion, until in the time of Elizabeth the pound weight was coined into 744 pence, or 62 shillings, representing the nominal value of £3 2*s*. In Scotland the depreciation of the coinage proceeded to much greater lengths, and still further in France and Italy. The French *livre* has dwindled to a *franc*, the basis of the modern metrical system of coinage, and the original *solidus* to a *sou*.

Gold coinage was first successfully introduced into England by Edward III., but it was not until the reign of Charles II. that the quantity of gold coin was sufficient to prevent its disappearance from circulation. Then gold from the Guinea coast of Africa was coined into pounds sterling or guineas intended to be of the value of 20*s*. in silver. Disagreement between mint rating and market value of gold and silver and debasement of the silver coinage caused guineas to rise in value and to disappear from circulation. Though partially rectified by the recoinage of 1697, it was not till 1717 that the value of the guinea was settled at 21*s*., or 4*d*. above the parity as determined by Newton, when gold was fixed at the mint price of £3 17*s*. 10½*d*. per Troy ounce. Gold and silver were then declared to be unlimited legal tender. But, as the true value of the guinea was overrated by 4*d*. and silver underrated by the same amount, debts were preferably paid in gold, while silver coins were exported. Thus gold became the recognized measure of value in Great Britain, though exchanges were still in terms of silver, and for an exactly opposite reason silver became the recognized measure of value in France. At the great recoinage of 1816 this custom passed into law. Gold was then declared to be the only legal measure of value and legal tender to an unlimited amount, and the sovereign (£1) was struck to represent the value at that time of 20*s*. in silver. Sixty-six shillings, 22 carats or $\frac{11}{12}$ fine, are coined to a pound Troy weight, 66 pence to an ounce, giving a value-ratio between gold and silver of 1 : 14¼ (14·28). In the French Revolution, at the time of the adoption of the metric system of weights and measures, the basis was established for a reform in the currency; the *franc*, a silver piece of 5 grammes, $\frac{9}{10}$ fine, being made the unit. Gold and silver were both to be coined freely at a ratio of 15½ to 1. Many other countries conformed to the example set by France. See LATIN UNION.

The coinage of American colonies was based on that of England, but became much depreciated about the time of the Revolution. In the reform of 1792 the Spanish milled dollar was taken as a model. The law of 1792 provided for the coinage of *eagles* of the value of ten dollars, to contain 247½ grains of pure gold; half and quarter eagles of corresponding weights; dollars, to contain 371¼ grains of pure silver, with halves, quarters, dimes, and half-dimes of corresponding weights, and cents and half-cents of copper. The law of 1834 reduced the weight of gold in the eagle to 232 grains of pure metal, or 258 grains actual weight, including alloy, and other gold coins were reduced proportionally. The law of 1837 slightly changed the proportion of alloy in the silver coins, reducing the gross weight of the silver dollar from 416 grains to 412½, but leaving the amount of pure metal unchanged. The law of 1849 authorized the coinage of gold dollars and of double eagles. The law of 1851 authorized the coinage of silver three-cent pieces. The law of 1852 reduced the weight of fractional silver coins to 192 grains for the half-dollar, and corresponding amounts for smaller pieces. It also provided for a three-dollar gold-piece. In 1857 the coinage of half-cents was wholly discontinued, and a nickel cent substituted for that of copper. In 1864 the bronze cent was substituted for nickel, and two-cent pieces of the same metal were authorized. In 1865 the coinage of the nickel three-cent was instituted, and in 1866 the nickel five-cent. The act of 1873 discontinued the silver half-dime and three-cent coinage, which had practically ceased long before. The act of 1873 discontinued the coinage of the silver dollar (see SILVER COINAGE for this and for the acts of 1878 and 1890); it established a trade dollar of 420 grains for use in eastern trade, whose coinage was limited in 1876 and abolished in 1887. The coinage of the three-dollar and one-dollar gold-pieces and three-cent nickel-piece was abolished in 1890.

Relative Value of Gold and Silver in Coinage.—Without reference to ancient periods, from about 1687 accurate data are at hand as to the relative value of gold and silver. The annual ratio from 1687 to 1800 did not vary materially from 1 of gold to 15 and a fraction of silver, reaching 1 to 14·14 in 1760 and 1 to 15·74 in 1799. From 1800 to 1872 the ratio kept with even more uniformity between 1 to 16·25 (in 1813) and 1 to 15·19 (in 1859). Between the period of 1687 and 1872 the relative value of gold and silver was thus practically maintained at 1 to 15 and a fraction. The average price of silver in 1873 was 59¼ pence, and its value-ratio to gold 15½ to 1, notwithstanding differences in coinage ratios, as in the U. S. and India. The difference in the relative value of the precious metals has gradually widened since 1873, until at present it is about 1 to 24, the decline to 38 pence representing a fall of 36 per cent. in twenty years against 2 per cent. in the preceding period of forty years.

The closing of the mints of the world to the coinage of silver has had a material influence in altering the stable ratio which existed for over two hundred years. Germany adopted in 1873 the gold standard. The silver coins were called in and new gold and silver coins issued, the latter being a limited tender. A large stock of silver coins was melted into bullion and put on the market. In the same year Norway, Sweden, and Denmark adopted the gold standard. Holland, which had been on a silver basis from 1847, nominally adopted in 1875 the double standard at the anomalous ratio of 1 to 15⅝, but in fact prohibiting the coinage of full legal-tender silver. The states of the Latin Union (i. e. France, Switzerland, Italy, Belgium, and Greece) in 1874 limited, and afterward suspended, the coinage of full legal-tender silver. By the law of Sept. 9, 1876, Russia

suspended the coinage of silver except such as was necessary for trade with China. In Austria-Hungary gold only has been coined for individuals since 1879, except trade silver coins called levant-thalers. The only mints open to the coinage of silver for individuals at this time are those of Mexico and Japan.

Millesimal Fineness.—The purpose of alloying gold and silver with a base metal in the manufacture of coins is no longer, as in earlier periods, to debase the coins, but to increase their durability.

For the purpose of determining the proportion of alloy best suited to resist wear, experiments have been made from time to time—notably in England in 1798, and afterward at the Royal Mint in London. The composition of 900 parts of pure metal and 100 parts of copper, first prescribed in France in the coinage law of 1795, being in consonance with the decimal system of coinage, has proved the most durable, and in all respects the most desirable—at least, for gold coins.

Among nations whose coinage is important, Great Britain may be said to be the only one whose gold coins do not now conform to the millesimal standard of 900 parts of pure metal to 100 parts of copper; the British proportion being $\frac{11}{12}$ instead of $\frac{9}{10}$. In the composition of full legal-tender silver coins there is even greater uniformity than in gold coins. The standard of 900 parts of pure silver and 100 parts of copper is almost universal. The more noteworthy exceptions are the two great silver-coining countries of India and Mexico. India has the same standard for silver as for gold coins—viz., $\frac{11}{12}$ of pure metal to $\frac{1}{12}$ of copper. Mexico employs the anomalous standard of 902·7. Holland has a standard of 945 parts of pure silver to 55 of copper.

There is more diversity in regard to the composition of limited-tender silver coins. The majority of countries employ either the standard of the U. S.—namely, 900 parts of pure silver to 100 parts of copper—or the standard of the Latin Union, 835 of pure silver to 165 of copper. In some countries a difference between legal-tender silver coins and silver coins of limited tender is made by adoption for the latter of a lower degree of fineness, or else, as in the case of the subsidiary coins of the U. S., of less proportional weight, but of the same fineness as compared with standard coins. See Latin Union.

The following countries have the same system of coins as the Latin Union, although the South American states, with the exception of the Argentine Republic, have the silver standard—viz., Argentine Republic, Bolivia, Bulgaria, Central American states, Colombia, Ecuador, Peru, Roumania, Servia, Spain, and Venezuela.

Free and Gratuitous Coinage: Seigniorage.—Free coinage exists where any man can take bullion to the mint and have it made into coin, either gratuitously or with a deduction not to exceed the actual expenses of coinage. Both Great Britain and the U. S. have free coinage of gold; but in Great Britain it is gratuitous, while in the U. S. it is not. Any deduction in excess of the actual cost of coinage is known as seigniorage. The objects of seigniorage are many—sometimes to debase the coin for the sake of the fiscal exigencies of the government; sometimes to secure money like the fractional coins which shall be secure from the danger of being melted down for exports or for use in the arts. In all cases of this kind the government makes an apparent profit on the issue of all such coins; but, if this is carried far, especially in the "legal-tender" coins which anyone must receive in payment of all debts, it is subject to great danger.

Value of Foreign Coins.—An authorized statement on this subject is published quarterly by the Secretary of the Treasury. The statement for Apr., 1901, is as follows:

VALUES OF FOREIGN COINS, APRIL 1, 1901.

COUNTRY.	Standard.	Monetary unit.	Value in terms of U. S. gold dollar.	Coins.
Argentine Republic	Gold and silver	Peso	$0 96, 5	Gold: Argentine ($4 82, 4) and ½ Argentine. Silver: peso and divisions.
Austria-Hungary	Gold	Crown	20, 3	Former system—gold: 4 florins ($1 92, 9), 8 florins ($3 85, 8), ducat ($2 28, 7), and 4 ducats ($9 15, 8). Silver: 1 and 2 florins. Present system—gold: 20 crowns ($4 05, 2) and 10 crowns.
Belgium	Gold and silver	Franc	19, 3	Gold; 10 and 20 francs. Silver: 5 francs.
Bolivia	Silver	Boliviano	45, 1	Silver: Boliviano and divisions.
Brazil	Gold	Milreis	54, 6	Gold: 5, 10, and 20 milreis. Silver: ½, 1, and 2 milreis.
British possessions, N. A. (except Newfoundland)	Gold	Dollar	1 00	
Central American States: Costa Rica, Guatemala, Honduras, Nicaragua, Salvador	Silver	Peso	45, 1	Silver: peso and divisions.
Chili	Gold and silver	Peso	36, 5	Gold: escudo ($1 25), doubloon ($3 65), and condor ($7 30). Silver: peso and divisions.
China	Silver	Tael. Shanghai	66, 6	The tael, however, is not a coin, but a money of account, being simply one Chinese ounce of fine silver (sycee), equal to 1⅓ oz. avoir.
		Tael. Haikwan (customs)	74, 2	
Colombia	Silver	Peso	45, 1	Gold: condor ($9 64, 7) and double condor. Silver: peso.
Cuba	Gold and silver	Peso	92, 6	Gold: doubloon ($5 01, 7). Silver: peso (60 cents).
Denmark	Gold	Crown	26, 8	Gold: 10 and 20 crowns.
Ecuador	Silver	Peso	45, 1	Gold: condor ($9 64, 7) and double condor. Silver: sucre and divisions.
Egypt	Gold	Pound (100 piasters)	4 94, 3	Gold: pound (100 piasters), 50 piasters, 20 piasters, and 10 piasters. Silver: 1, 2, 5, 10, and 20 piasters.
Finland	Gold	Mark	19, 3	Gold: 20 marks ($3 85, 9), 10 marks ($1 93).
France	Gold and silver	Franc	19, 3	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
German empire	Gold	Mark	23, 8	Gold: 5, 10, and 20 marks.
Great Britain	Gold	Pound sterling	4 86, 6½	Gold: sovereign (pound sterling) and ½ sovereign.
Greece	Gold and silver	Drachma	19, 3	Gold: 5, 10, 20, 50, and 100 drachmas. Silver: 5 drachmas.
Hayti	Gold and silver	Gourde	96, 5	Silver: gourde.
India	Gold	Rupee	32, 4	Gold: sovereign ($4 86, 65). Silver: rupee and divisions.
Italy	Gold and silver	Lira	19, 3	Gold: 5, 10, 20, 50, and 100 liras. Silver: 5 liras.
Japan	Gold	Yen	49, 8	Gold: 1, 2, 5, 10, and 20 yen.
Liberia	Gold	Dollar	1 00	
Mexico	Silver	Dollar	49	Gold: dollar, 2½, 5, 10, and 20 dollars. Silver: dollar (or peso) and divisions.
Netherlands	Gold and silver	Florin	40, 2	Gold: 10 florins. Silver: ½, 1, and 2½ florins.
Newfoundland	Gold	Dollar	1 01, 4	Gold: 2 dollars ($2 02, 7).
Norway	Gold	Crown	26, 8	Gold: 10 and 20 crowns.
Peru	Silver	Sol	48, 7	Gold: libra ($4.86, 65). Silver: sol and divisions.
Portugal	Gold	Milreis	1 08	Gold: 1, 2, 5, and 10 milreis.
Russia	Gold	Rouble	51, 5	Gold: imperial ($7 71, 8), and ½ imperial * ($3 80). Silver: ¼, ½, and 1 rouble.
Spain	Gold and silver	Peseta	19, 3	Gold: 25 pesetas. Silver: 5 pesetas.
Sweden	Gold	Crown	26, 8	Gold: 10 and 20 crowns.
Switzerland	Gold and silver	Franc	19, 3	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
Turkey	Gold	Piaster	04, 4	Gold: 25, 50, 100, 250, and 500 piasters.
Uruguay	Gold	Peso	1 03, 4	Gold: peso. Silver: peso and divisions.
Venezuela	Gold and silver	Bolivar	19, 3	Gold: 5, 10, 20, 50, and 100 bolivars. Silver: 5 bolivars.

* Coined since Jan. 1, 1886. Old half-imperial=$3 98, 6.

In estimating the value of foreign coins the same practice has been followed as heretofore. The value of the monetary unit of countries having a gold or double standard was ascertained by comparing the amount of pure gold in such unit with the pure gold in the U. S. dollar, and the silver coins of such countries were given the same valuation as the corresponding gold coins with which they are interchangeable by law.

In countries having a silver standard, the values of the silver coins were fixed at the commercial value of the pure silver contained in such coins.

The world's coinage for the years 1898 and 1899 was estimated by the bureau of the U. S. mint to be as follows:

COUNTRIES.	1898.		1899.	
	Gold.	Silver.	Gold.	Silver.
United States	$77,985,758	$23,034,033	$111,344,220	$26,061,520

Minor.		
Five-cent nickels	30,749,992	$1,537,499 60
One-cent bronze	70,551,761	705,517 61
Total minor	101,301,753	$2,243,017 21
Total coinage	184,373,793	$141,351,960 36

Of this total, $71,428,477.61 was coined at Philadelphia, $54,026,012.75 at San Francisco, and $15,897,470 at New Orleans.

Compare the *Annual Report* of the Directors of the Mint, published with *Finance Report* of the Secretary of the Treasury. Revised by ARTHUR T. HADLEY.

Coinage of Silver (Free, and Restricted): See SILVER COINAGE.

Coir: the fiber of the cocoanut and other palms. It is a valuable material for ropes, mats, etc. Coir is one of the best materials for cables, on account of its lightness, elasticity, and strength. Coir is produced from the fiber of various trees, especially the GOMUTI PALM (*q. v.*). It is largely produced in the Malay islands.

Cojedes, ko-hā'dās: a former state of Venezuela, now included in ZAMORA (*q. v.*).

Cojutepec': a town of Central America, in the republic of Salvador and province of Cuscatlan, about 15 miles E. of the capital (see map of Central America, ref. 4–F). From 1854 to 1858 it served as the seat of government, San Salvador having been ruined by a succession of earthquakes. Pop. less than 5,000.

Coke [origin obscure]: the residue obtained from bituminous coal by distillation or by heating with an almost entire exclusion of air. Certain kinds of bituminous coal, when heated to a temperature varying somewhat with their character, swell, become pasty, and throw off bubbles of gas which burn with a bright flame. The coals thus heated lose all traces of their original form, appearance, and structure, becoming a semi-fused mass, of strong luster, ringing when struck, and filled with cells and cavities. The coke produced in gas manufacture is a by-product, used locally for heating and steaming; that specially manfactured in ovens is employed in the melting of pig iron in cupolas, in the smelting of iron, copper, and lead in blast furnaces. The use of coke in the manufacture of pig iron was first successfully achieved by Darby in 1735 at Coalbrookdale, Shropshire, England, and became general in that country in 1750. In the U. S. William Firmstone first made pig iron successfully with coke in 1835, but it was not until 1837 that coke was used for any considerable length of time in the Lonaconing furnace in Maryland. In the Connellsville coke region in Pennsylvania, which has become the foremost seat of this great industry in the U. S., the first unsuccessful attempt at manufacture was made by Provance McCormick and James Campbell in 1841. Regular manufacture in that district did not begin until 1860. Coking was formerly largely carried on in piles or mounds, a method analogous to that used in the manufacture of vegetable charcoal, but is now generally done in ovens or kilns of brick or stone. The standard oven in England and in the U. S. is the "beehive," generally 11 to 12 feet inside diameter, and 5 to 6 feet from the floor to the crown of the roof. They are charged with coal from an opening in the roof, a track commanding the whole bank of ovens. They are discharged by raking from an orifice or door on the side, the coke being drawn on to a wharf from which it is forced into railroad cars, standing on a depressed track along the wharf. The coking lasts from forty-eight to seventy-two hours, the hot coke being quenched with water when withdrawn. On the Continent, and to a limited extent in England and the U. S., other forms of coke ovens are used, being generally massive chambers of fire-brick, in whose sides and bottom flues are arranged, in which the waste gases are burnt, thus heating the coal more rapidly. These ovens, among which the Simon-Carvès, Coppée, Appolt, Otto, and Bauer are the widest known, possess the advantage that they do much quicker work, afford a greater yield, and permit of the manufacture of good coke from coal which could not be used in the "beehive" oven. They admit also of the recovery of the by-products—the tar and ammonia in the gases of distillation. In Germany a very large and prosperous industry has grown up in the utilization of the by-products, some concerns having contracted for the delivery of the coke, free of cost, from coal furnished, provided they are allowed to recover and utilize the tar and ammonia. According to the report of the Geological Survey for 1899 there were in the U. S. 344 establishments operating 49,667 coke ovens, with 4,037 ovens building. They produced 19,668,569 short tons of coke from 30,219,343 short tons of coal, a yield of 65.1 per cent., the total value of the product at oven being $34,670,417, or an average of $1.76 a ton. The principal producer is Pennsyl-

vania, which made in 1899 13,577,870 tons of coke, of which the Connellsville district made 10,390,335 net tons. The Connellsville coal basin is in the southwestern part of Pennsylvania, some 50 or 60 miles from Pittsburg. It is a slender prong, separated from the Upper Coal Measures, and may be regarded as extending from S. of Latrobe, in a southwesterly direction to the Virginia line, forming a basin some 3 miles wide and 50 miles long, almost without a fault, the beds yielding from 8 to 10 feet of workable coal. The same trough that contains the Connellsville coal extends northwesterly from Latrobe, but the Connellsville region is regarded as extending no farther N. than the point indicated; the district N. of it being designated as the Upper Connellsville, or "washed coal" district, which in 1899 produced 609,893 tons of coke. The other leading districts of Pennsylvania, with their output in 1899, are as follows: Allegheny Mountain, 478,340 net tons; Clearfield Center, or Snowshoe, 130,965 net tons; Broad Top, 107,258 tons; Pittsburg, 644,467 tons; Reynoldsville-Walston, 972,933 tons; and Irwin, 133,085 tons. The State next in importanee is West Virginia, with a product of 3,802,825 net tons. Tennessee produeed in 1899 779,995 tons; Colorado, 898,207 tons; Virginia, 994,635 tons; and Alabama, to supply the heavy requirements of the Birmingham iron region, 3,028,472 tons. Southern Colorado makes nearly all the eoke used by the loeal industry and the lead and copper smelters. In the last few years experiments have been made in coking at the head of Lake Superior coal conveyed to that point from Pennsylvania, in order to smelt the cheap and rich ores of Lake Superior, using the pig iron made as the basis of iron manufacture to cover the requirements of the growing Northwest. See Jos. D. Weeks's *Manufacture of Coke*; Report Tenth Census and Annual Reports, by Joseph D. Weeks, in the *Mineral Resources of the United States*, published by the U. S. Geologieal Survey.

C. Kirchhoff.

Coke, Sir Edward: jurist; b. at Mileham, Norfolk, England, 1552; educated at Trinity College, Cambridge, Clifford's Inn, and the Inner Temple; rose rapidly in his profession, becoming solicitor-general (1592), Speaker of the House of Commons (1593), attorney-general (1594), chief justice of the common pleas (1606), and chief justice of the king's bench and privy counellor (1613). During the early part of his eareer his regard for royal favor betrayed him into a certain harshness and unfairness toward those brought before him for trial, as, for example, in the cases of Southampton and Essex (1601) and in that of Raleigh (1603), but after his appointment to the common pleas his attitude changed to that of a strong supporter of civil rights against royal encroaehments. The attempt of the king to give to the royal proclamation the force of law was stoutly resisted by Coke, who won over the other judges to eoncurrence in the opinion that such an assumption of power was in violation of the traditional rights of Englishmen. His appointment as chief justice of the king's beneh was designed to bring him to a more compliant spirit, while at the same time it made way for the promotion of his old enemy, Sir Franeis Bacon, but the warning was insufficient to deter him from opposing the exereise of arbitrary power by the king, and three years later he was removed from office. Then followed the most brilliant period of his life. He became an enemy to the eourt party, and as member of Parliament in 1621 was one of the foremost champions of parliamentary privilege against the king's attacks. He drew up the great protestation in support of the right of freedom of debate. The king tore it from the journal of the house, dissolved Parliament, and Coke paid the penalty of his zeal by a nine-months imprisonment in the Tower. He carried his opposition into the next reign, and the petition of right (1628) was framed and passed largely through his efforts. He died at Stoke Poges in 1634. An acute and able lawyer and a man of deep learning and fearless charaeter, he laeked the self-poise and calmness of temper that should distinguish the judge. Of his *Four Institutes*, the so-ealled *Coke upon Littleton* is the most famous, and is still a work of real value. His *Law Reports* are equally well known.

Coke, Thomas, D. D., LL. D.: the first bishop in the U. S. of the Methodist Episcopal Church; b. in Brecon, Wales, Sept. 9, 1747; educated at Oxford; became a minister of the Church of England, but subsequently joined Wesley, and was a most laborious and faithful itinerant. He was made a bishop for Ameriea by Wesley in 1784; ordained Asbury the same year as joint superintendent of the church in Ameriea, but did not confine his labors to this country. He traversed Great Britain and Ireland frequently, and crossed the Atlantic eighteen times. He founded the Wesleyan missions in the East and West Indies, in Gibraltar and Sierra Leone, and expended nearly all his large fortune in these undertakings. D. May 2, 1814, on a voyage to India, and was buried at sea. He was a voluminous writer and left a *Life of Wesley* (1792); *Commentary on the Holy Scriptures* (6 vols., 1803–07); *History of the West Indies* (1808), etc. See Stevens's *History of Methodism*, and *History of the Methodist Episcopal Church*.

Cola (more eorreetly *kola*): the nut of the *Cola acuminata*, a tree growing in Africa. . It depends for its activities upon two alkaloids, colanine and caffeine. Its action upon the body is partly that of coffee and partly that of coea. As a drug its exact value has not yet been determined. It has been used in siek headache, sea-siekness, and feebleness of the eirculatory and nervous systems.

Col'ban, Adolphine Marie (*Schmidt*): Norwegian novelist; b. in Christiania, Dec. 18, 1814; d. in Rome, Mar. 27, 1884. Her best story is perhaps *Jeg lever* (I Live, 1877); others are *En gammel Jomfru* (An Old Maid, 1879); *Cleopatra* (1880); *Thyra* (1882). She also wrote translations and short tales.

G. L. K.

Colberg, kōl'bārch: seaport-town of Prussia; province of Pomerania, on the river Persante near its entrance into the Baltic; about 143 miles N. E. of Berlin (see map of German Empire, ref. 2–H). It has a handsome Rathhaus, an old cathedral, salmon and lamprey fisheries, commerce, and salt-works. It has sustained several protracted sieges. Pop. (1890) 16,999.

Colbert, kōl'bār', Jean Baptiste: statesman and financier; b. at Rheims, France, Aug. 29, 1619; entered the service of Cardinal Mazarin 1648; became secretary to the queen 1654. Mazarin at his death recommended Colbert to the king, who in 1660 appointed him controller-general of the finances, which were then in a ruinous condition. The annual revenue exacted from the people in 1660 was about 84,000,000 livres, but only 32,000,000 were reeeived into the treasury, the rest being kept by the farmers of the revenue. Colbert reformed the financial system, and established order and economy in the government. In the eourse of twenty years he raised the gross revenue to 115,000,000, while the expense of collecting it was reduced to about 30,000,000. He promoted commerce and manufactures, opened canals and roads, and founded eolonies in America. He also made reforms in the Department of Marine, of which he was appointed minister in 1669. No minister perhaps ever contributed so much to the prosperity of France. He was a liberal patron of literary and seientific men, and was the founder of the Academy of Inscriptions and Academy of Sciences. His influence at eourt was undermined by Louvois, and his efforts to dissuade Louis XIV. from his ruinous wars and extravagant expenses were unavailing; but he retained the offiee of eontroller-general until his death. D. in Paris, Sept. 6, 1683. See Gourdault, *Colbert, Ministre de Louis XIV.* (n. ed. 1885).

Revised by C. H. Thurber.

Colborne, Langdon: organist and composer; b. in London in 1837, and educated there. In 1860 he was organist of St. Michael's College, Tenbury, and remained in that position for fourteen years, taking his degree Mus. Bac. during that period from Cambridge University. In 1877 he sueceeded the late Townshend Smith as organist of Hereford Cathedral, where he still remains. His compositions are chiefly chureh musie, but they include one oratorio, *Samuel*, for the Hereford festival of 1888.

D. E. Hervey.

Colburn, Warren: mathematician; b. in Dedham, Mass., Mar. 1, 1793; graduated at Harvard 1820; became a school-teacher in Boston. In 1821 he published his *Mental Arithmetic*, one of the most famous and most widely translated and circulated text-books ever issued. He also wrote some other edueational books. D. in Lowell, Mass., Sept. 13, 1833.

C. H. T.

Colby, Charles Carroll: Canadian statesman; b. in Derby, Vt., Dec. 10, 1827; graduated at Dartmouth College in 1847. He was admitted to the bar of Lower Canada in 1855; has been a member (Conservative) of the Dominion Parliament 1867–91; deputy-speaker of that body 1887–89; and appointed president of the Privy Counеil of Canada in 1889.

Neil Macdonald.

Colby University: an institution of learning under control of the Baptists; situated at Waterville, Me. It was chartered by Massachusetts in 1814, went into operation in 1818, and was incorporated as Waterville College by the first legislature of Maine 1820. In 1867, in recognition of the munificent gifts of Mr. Gardner Colby, a merchant of Boston, the name was changed to Colby University. It has six large college buildings of brick and stone, besides a gymnasium, an observatory, and three houses occupied by young women. The endowment funds amount to $473,353. The faculty is composed of sixteen professors. The university has a fine library of 34,500 volumes. In 1900 the number of students enrolled was 195, of whom 68 were young women. In 1891 "co-education" was reorganized into "co-ordinate colleges." The young men and the young women pursue identical courses of study, if they so elect, and under the same instructors. They recite separately, are not competitors in rank, and have separate groups of prizes.

Colchagua: a province of Chili; bounded N. by Santiago and O'Higgins, S. by Curico, and extending from the Pacific to the top of the Andes. Area, 4,630 sq. miles. The western portion is crossed by the coast range, and the eastern lies in the Andes; all the central part is included in the rich plain or "valley" of Chili, and some of the finest wheat and pasture land is in this province. Pop. (1895) 157,566. Capital, San Fernando (7,447 inhabitants).

HERBERT H. SMITH.

Colchester, kōl'ches-ter (anc. *Camalodunum*): a parliamentary borough and river-port of England; in Essex; on the river Colne; 12 miles from the sea, and on the Great Eastern Railway, 51 miles N. N. E. of London (see map of England, ref. 11–L). It is well built on the sides and summit of an eminence, and has imposing remains of a castle built in the twelfth century. It was of much importance when the *Domesday Book* was compiled. Great quantities of Roman remains have been found here, including coins of Roman emperors, vases, urns, lamps, etc. The borough returns one member to Parliament. There are manufactures of silk and a large oyster-fishery, formerly very valuable. The town contains a grammar school, a literary institute, a theater, a large hospital, and an asylum for imbeciles and idiots. The import and export trade is conducted at Hythe, a suburb. Colchester is in an extensive agricultural district, and possesses large corn and cattle markets. Pop. (1891) 34,559.

Colchester: town on Air Line Div. of N. Y., N. H. and H. R. R., New London co., Conn. (for location of county, see map of Connecticut, ref. 10–J); has manufactures of india-rubber and paper, and is the seat of Bacon Academy. Pop. of township (1880) 2,974; (1890) 2,988; (1900) 1,991; borough, 858.

EDITOR OF "ADVOCATE."

Colchicine, kol'ki-sin ($C_{17}H_{19}NO_6$): a very powerful alkaloid extracted from all parts of *Colchicum autumnale* (meadow saffron). It produces, even in very small doses, violent vomiting and purging, but in still smaller doses is a useful remedy in gout.

Colchis, kol'kis (in Gr. Κολχίς): an ancient province of Asia; bounded on the N. by the Caucasus, S. by Armenia, W. by the Pontus Euxinus (Black Sea). It was celebrated in ancient fable and poetry as the place to which the Argonauts sailed for the golden fleece, and as the home of Medea. It was noted for its wines and fruits, and was the native country of the pheasant, which derived its name from Phasis, a river of Colchis. It is now part of the Russian dominions.

Cold: absence of heat. In the popular usage cold is a relative term, the distinction between it and heat depending upon the assumption of some arbitrary standard of comparison, as, for instance, the normal temperature of the human body. At various times, however, physicists have sought for the greatest cold, and in the older literature one meets with various freezing mixtures which were supposed to produce the lowest possible temperature. More recently, however, the matter has been put upon a scientific basis, and we may now speak of absolute cold. According to the modern "dynamic theory" HEAT (*q. v.*) is a mode of motion, the minute particles or molecules of which any body is composed being in constant vibration; and the more rapid this molecular vibration, the warmer the body; the slower they become, the colder it is. In this way we can readily conceive a condition at which this molecular vibration should entirely cease, and this would be the absolute cold or absolute zero of the physicist. Although this point has never been actually attained, it is readily computed, and is 273° of the centigrade scale below the freezing-point of water, or 459·4° below zero by the ordinary or Fahrenheit thermometer. The speculations regarding the conditions of matter at absolute zero are most interesting. There is much evidence to show that chemical affinity would disappear, gases would not exist, and that matter would break up into its constituent atoms.

The greatest degree of cold as yet obtained is about — 200° C. (about 330° below zero Fahrenheit) produced by boiling liquid oxygen under reduced pressure. Turning now to the ordinary significance of the word cold—a lower temperature than the normal—some interesting physiological phenomena are to be noticed. There are certain degrees of cold below which life can not exist. These limits vary somewhat widely, and death from cold may be produced in several ways. Thus in man death occurs by a retardation of the circulation and a slowing of the action of the heart accompanied by loss of heat, until finally respiration and circulation cease and death supervenes, and this may occur, as in the case of persons long immersed in cold water, without the lowering of the temperature to freezing. On the other hand, many animals and plants flourish in the Arctic seas, and some forms can withstand an even greater extreme than this. Thus yeast may be frozen and cooled to — 5° C. (23° F.) without injury, and, if dry, the temperature could be reduced to that of solid carbonic acid (— 60° C., —76° F.) without being killed.

J. S. KINGSLEY.

Cold: EFFECTS UPON MAN. The effects of cold upon man depend upon its degree, method of application, the extent and region of the body affected, and the general condition of the bodily structures. They are of a local and general character, the former being manifest at the region of the application, and the latter by the organism as a whole. When the cold is moderate in degree and transient, as when an individual enters a cool room, is subjected to a cold douche or draft, or plunges into a cold bath, the chief immediate effects are a reduction in the temperature of the skin, constriction of the cutaneous capillaries, a sensation of cold, shivering, and roughening and paleness of the surface of the skin, which becomes like "goose-flesh." The secondary or after effects are those of an opposite character, or those of "reaction," and there is experienced a sense of exhilaration and well-being. In healthy individuals douches, baths, and similar applications, when followed by reaction, are of a decidedly stimulating and tonic character; but in those weakened by disease or otherwise enfeebled the system may not properly react, so that the secondary effects may be those of depression, continued chilliness, etc., and prove injurious. Indeed, even among healthy people we find those who at times or always do not seem to have the power of healthy reaction from sudden, though transient, changes in surrounding temperature, and who are likely as a consequence to suffer from various sequelæ which depend upon the nervous irritation and the temporary congestion of the interior of the body caused by the driving of the blood from the skin, so that bronchitis, pneumonia, diarrhœa, kidney troubles, etc., are frequently observed.

When the cold is applied for a prolonged period the effects depend in a large measure upon its suddenness and degree. When the change of temperature occurs slowly, as when the individual travels to a cooler climate, our systems so readily accommodate themselves to the alterations in the temperature that no phenomena of importance are manifest, save the consciousness of cooler surroundings, and usually a mild exhilaration and stimulation of the vital processes. But when the reduction of temperature is sudden, persistent, and of decided degree, the primary effects are the same as those observed in the cold bath or douche, but more intense, and the reaction is greater and lasts for a longer period; or, if reaction does not properly occur, the pernicious after effects are commonly of a more serious nature. Long-continued intense cold, such as that produced by a freezing mixture, causes the blood-vessels of the skin to become intensely constricted, with the consequent deprivation of nearly all of the normal blood supply of the skin and the production of internal congestion; heat is rapidly lost, owing to the marked disparity between the temperatures of the body and the surroundings, so that bodily temperature falls; heat production is increased to make up for this loss, with the consequent consumption of the tissues and of the nutritive substances stored in the organism; and the circulation and respiration

are increased. These effects are soon followed by dilatation of the cutaneous vessels, with attendant congestion, and owing to this there is an increased tendency to a loss of heat and diminution of the body temperature; the heart's action becomes enfeebled, and the circulation grows more and more sluggish, so that there is insufficient oxygenation, the blood is unduly robbed of its oxygen by the tissues, causing lividity of the skin; the sensory nerves are first irritated and then depressed, owing to the lowered temperature and deficient blood-supply, causing first pain, then numbness, and finally complete paralysis. The lowered bodily temperature and the impairment of the circulation depress all the vital processes; the vessels in the interior of the body also undergo dilatation, so that the lungs, brain, and other important organs are in a profound condition of congestion, with an extremely sluggish circulation; the action of the heart becomes feebler and feebler; the waste products which result from the consumption of the tissues and nutritive substances rapidly accumulate, owing to the lessened activity of the excretory organs, and act as depressants to the already weakened organs; the nerve centers are more and more depressed, which is specially marked in a sense of fatigue, mental apathy, drowsiness, sleep, impairment of all the special senses, coma, general paralysis, and death. When the action of intense cold has been carried to a dangerous stage the after effects may be apparent for hours, days, or even indefinite periods, and commonly are manifest in a slow recovery of the normal conditions, but the dangers of serious sequelæ are very great.

Portions of the body that have been frozen can generally be restored by proper treatment, the usual method being to gradually restore the temperature of the affected parts by rubbing with snow or by the application of iced water, but any undue rubbing and any movement of the frozen structures must be avoided sedulously, lest the delicate tissues be torn or cut by the crystals of frozen blood and lymph.

The moderate use of iced water as a beverage is not only a source of great refreshment to most people, but is rarely attended with evil consequences; yet when taken in excessive quantities, especially when the body is overheated, it may cause serious internal disturbances, particularly congestive and inflammatory disorders of the stomach, liver, intestines, and kidneys. Iced water, ices, etc., taken with meals do not seem to exert any pernicious influence on the digestive processes, but digestion is always more or less seriously interfered with if they are taken during the time when active digestion is going on, i. e. during the two or three hours immediately after a meal.

In the treatment of diseased conditions cold has proven of great value, and its use as a remedial agent is of increasing importance. As a local application it is of great benefit in benumbing the sensory nerves, thus relieving pain and other phenomena due to irritation. So powerful are its effects in this respect that by appropriate means the sensory nerves may be completely paralyzed, and thus a condition of local anæsthesia produced. This may be accomplished by holding a piece of ice to the part for a few minutes, or better and commonly by the use of a spray of ether, rhigoline, or other highly volatile fluid, projected upon the part by means of an ordinary hand-atomizer. The fluid by its rapid evaporation abstracts the heat from the part, constricts the capillaries, benumbs and then destroys the irritability of the sensory nerves, and ultimately freezes the area. By means of an ice poultice (ice and sawdust), an ice bag (rubber bag with ice in it), moist clay, or a compress of a number of thicknesses of wet cloth, cold is often applied to the chest in the treatment of pneumonia and pleurisy, to the abdomen in peritonitis, to the head in meningitis, and to other parts when inflamed. Iced water is sometimes used as an enema in dysentery. Cold applications are frequently made to nerves in cases of neuralgia, and to parts chronically inflamed. Cold baths have proven of inestimable value in the treatment of certain fevers, especially thermic fever (sunstroke), typhoid, typhus, scarlet fever, etc. In the treatment of thermic fever and typhoid no other form of therapeusis has proven as valuable. In such cases the individual is placed in a bath of about 90° F., but in cases of thermic fever the temperature of the bath is frequently greatly lowered by the addition of ice, the object being to cause a rapid abstraction of heat from the body, to the excess of which the serious condition is due. In the treatment of scarlet fever and kindred disorders the bathing is usually done by means of a sponge or rag, one part of the body after another being successively bathed and dried. The results of such applications are usually almost immediately manifest in an improvement of the febrile state, which continues for variable periods in different cases. EDWARD T. REICHERT.

Col de la Seigne, kol'de-laă-sāñ': an Alpine pass leading from Savoy into the Val d'Aosta in Piedmont; 7 miles W. S. W. of Mont Blanc. Height, 8,422 feet.

Colden, CADWALLADER: Lieutenant-Governor of the province of New York from 1761 to 1775; repeatedly acting as governor in the absence of the chief executive; b. in Dunse, Scotland, Feb. 17, 1688; emigrated about 1708 to Pennsylvania, where he practiced medicine; invited to New York in 1718 by Gov. Hunter; was the first surveyor-general of the colonies. He was a royalist and incurred odium for his efforts to enforce the stamp tax in New York. D. on Long Island, Sept. 28, 1776, of grief, it is said, at witnessing the destruction caused by the great fire of that year. Among his works are numerous essays on medical subjects, and others on natural philosophy, natural history, and the mathematics. He carried on a long correspondence with Linnæus, to whom he sent great numbers of American plants. His memoir upon them, entitled *Plantæ Coldenshamiæ*, etc., was published by Linnæus in the *Acta Upsaliensia*, and is, perhaps, the earliest botanical treatise written in North America. Linnæus gave the name *Coldenia* to an East Indian plant.

Cold Harbor: a locality in Hanover co., Va.; about 10 miles N. E. of Richmond.

In May, 1864, Gen. Grant, continuing his movement from Spottsylvania, had reached the vicinity of the Chickahominy, and on the 31st, Sheridan, with his two divisions, occupied Cold Harbor, driving the Confederates from the place, and maintaining his position until relieved, June 1, by the Sixth Corps and the Eighteenth Corps (Gen. W. F. Smith), which latter had just arrived (viâ White House) from Butler's army on the James river. About 5 P. M. both Wright and Smith attacked Lee, carrying a good part of his first line, but were unable to force him from his second line, and the effort was abandoned after a loss of 2,000 men. The portion of the army not engaged in the main attack received repeated assaults, all of which were repulsed with great loss to the enemy. Ineffectual attempts were made by the Confederates during the night to regain the ground lost during the day. June 2 was devoted to the rearrangement of the army. The Second Corps (Hancock) was moved forward, and placed on the left of the Sixth, which was resting on the left of the Eighteenth; the Ninth Corps (Burnside) was drawn into Bethesda Church, and the Fifth Corps (Warren) extended to the left, to connect with Smith. In executing this operation both Warren and Burnside sustained attacks, which were repulsed, with the loss of some prisoners, however.

The morning of June 3 opened with rain, but at 4.30 A. M. the Second, Sixth, and Eighteenth Corps furiously assaulted the Confederates in their intrenchments. Barlow's and Gibbons's divisions of the Second Corps carried a portion of the enemy's line, but were compelled to withdraw before reenforcements could reach them. An equally gallant and vigorous assault was made by the Sixth and Eighteenth Corps, which reached the enemy's outer rifle-pits before it was stopped. Although not able to carry the Confederate works these troops seized and fortified a line well in advance of that originally occupied, and very near the Confederate works. Warren, whose line was much extended, and Burnside also moved forward and prolonged this advanced line; and Burnside later in the day worked well around the Confederate left flank, but made no further advance, owing to the failure of the attack on the right; and the army intrenched themselves in their position, close to the Confederates' main line of works. The attack lasted only about half an hour, yet in that short time Grant's loss was not less than 7,000, while Lee's loss, which is nowhere accurately reported, was very small. His losses from June 1 to June 12 were probably between 1,500 and 2,000 men. The oft-repeated statement that Gen. Grant ordered a repetition of the attack, and the army lay still and refused to obey, is not true. An attack was made on Gibbons's division about 9 P. M., which was repulsed. The total Federal loss at and around Cold Harbor was 12,738.

The two armies remained confronting each other till June 12, when Grant, moving rapidly, crossed the Chickahominy at the lower crossings, reaching the James river on the 15th, which was also successfully crossed on pontoons and ferry-boats, and took up his position near Petersburg.

Cold Spring: village; Putnam co., N. Y. (for location of county, see map of New York, ref. 7–K); on N. Y. C. and H. R. R. R., and on the east bank of the Hudson, 52 miles N. of New York. It is pleasantly situated among the Highlands, a mile above West Point, and has 5 churches, 2 graded schools, a bank, a library, a furnace, and manufactures of cannon, machinery, brass castings, etc. Pop. (1880) 2,111; (1890) of Phillipstown, including Cold Spring and Nelson villages, 4,113; (1900) 4,642; village, 2,067. EDITOR OF "RECORDER."

Cold Spring, or (in U. S. Postal Guide) **Cold Spring Harbor**: village; Suffolk co., N. Y. (for location of county, see map of New York, ref. 8–K); on Long Island R. R., and on the east side of Cold Spring Harbor; has some manufactures and ship-building, and formerly was a whaling-port. The artificial hatching of fish, for which the place presents special opportunities, is very successful here. Pop. (1880) 857; not since returned separately.

Coldstream: a border-town of Berwickshire, Scotland; on the left bank of the Tweed; 15 miles S. W. of Berwick (see map of Scotland, ref. 12–J). The river is here crossed by a bridge. Before the Reformation it was the seat of a priory famous as the place where, in the reign of Henry VIII., the papal legate issued a bull against the printing of the Bible. In the nineteenth century the production of Bibles at cheap prices was carried on on the site of the building from which the bull was issued. Near this place is the famous ford where the English and Scottish armies formerly crossed the Tweed. Here Gen. Monk raised the regiment still known as the COLDSTREAM GUARDS (*q. v.*). Pop. 2,500.

Coldstream Guards: one of the three regiments of Foot Guards in the British army. It was first called Monk's regiment, but received its present name when it was given to Charles II. as part of his Household Brigade.

Coldwater: a city: capital of Branch co., Mich. (for location of county, see map of Michigan, ref. 8–I); on the Lake Sh. and Mich. So. R. R., and on Coldwater creek; midway between Detroit and Chicago. It has manufactures of iron, wood, oil, flour, etc. There is a park, two libraries, and a high school. The State school for pauper children is in Coldwater. Pop. (1880) 4,681; (1890) 5,247; (1900) 6,216. EDITOR OF "REPUBLICAN."

Cold Wave: a sudden and general fall of temperature which advances from a cold region over a warmer one. In the Eastern U. S., during the cold months, cold waves from the northern plains often cause a fall of 18° F. or more, and bring the temperature down to or below freezing. Cold waves usually cross the border of the U. S. between Lake Superior and the Rocky Mountains, and gradually spread eastward—sometimes also southeastward or southward. They usually follow sharply on a winter storm, and rarely continue more than two or three days. They are objects of forecast by the Weather Bureau, and the success in prediction is good. M. W. H.

Cole, JOSEPH FOXCROFT: landscape-painter; b. in Jay, Me., Nov. 9, 1837; pupil of Lambinet and Jacque, Paris; medal, Centennial Exhibition, Philadelphia, 1876, for his *Twilight*, *Melrose Highlands*, and *Coast Scene in Normandy*. Member of the Society of American Artists 1880. His professional life was spent in France and in Boston. His latest work inclined to impressionistic methods, and his pictures are good in composition and color. D. in Boston, May 2, 1892. WILLIAM A. COFFIN.

Cole, THOMAS: landscape-painter; b. in Bolton-le-Moors, Lancashire, England, Feb. 1, 1801; d. at Catskill, N. Y., Feb. 11, 1848; removed to the U. S. with his parents in 1819, and began his art studies in Ohio, where his father had settled, under a local portrait-painter named Stein. Went to New York in 1825, and first attracted attention by the exhibition of pictures of Hudson river scenery. Among other works he painted an allegorical series of pictures entitled *The Voyage of Life*, which were very popular and were engraved. His *Angel Appearing to the Shepherds* is in the Boston Athenæum, his *Course of Empire* and other works are owned by the Historical Society, New York, and his *Expulsion from Paradise* is in the Lenox Library, New York. His work possesses very small artistic value, but is interesting in the development of American art. He was one of the founders of the National Academy, New York. WILLIAM A. COFFIN.

Cole, VICAT: landscape-painter; b. in Portsmouth, England, 1833; pupil of his father, George Cole, a landscape-painter (1810–83); Royal Academician 1880; third-class medal, Paris Exposition, 1889. Many of his scenes are taken from Surrey, and his *Heart of Surrey* (1874) is one of his best works. D. in London, Apr. 6, 1893. W. A. C.

Colebrooke, New Brunswick: See GRAND FALLS.

Colebrooke, HENRY THOMAS: Orientalist; b. in London, June 15, 1765; went to India in 1782, and was employed in the civil service of the East India Company. He became Professor of Sanskrit in the College of Fort William. He published a *Sanskrit Grammar* (1805); a *Dictionary of the Sanskrit Language* (1808); *Miscellaneous Essays* (2 vols., 1837); *On the Sacred Books of the Hindus*; and *Algebra of the Hindus*. His translation of *Sankhya Karika* was posthumously published. His works display sound critical judgment and great learning. D. in London, Mar. 10, 1837. See Max Müller, *Biographical Essays* (1884).

Coleman, CHARLES CARYLL: figure and landscape painter; b. in Buffalo, N. Y., 1840; associate National Academy, New York; has studied abroad, and has resided in Italy and France since 1866. Studio in Rome. W. A. C.

Coleman, LEIGHTON, D. D., LL. D.: b. in Philadelphia, May 3, 1837; graduated at the General Theological Seminary in New York city in June, 1861; settled as rector of the memorial church of St. Luke in Philadelphia; in 1863 became rector of St. John's church in Wilmington, Del.; three years later rector of St. Mark's church at Mauch Chunk, Pa., remaining there nearly eight years, when he removed to Toledo, O., assuming the rectorship of Trinity church. In 1875 he was elected Bishop of Fond du Lac, Wis., but declined. In 1888 he was consecrated Bishop of Delaware.

Coleman, LYMAN, D. D.: scholar, teacher, and author; b. at Middlefield, Mass., June 14, 1796; graduated at Yale 1817; traveled and studied in Europe and the East; was connected with several literary institutions and was Professor of Ancient Languages in Lafayette College, Easton, Pa., 1861–82. He published *Antiquities of the Christian Church* (New York, 1841); *Ancient Christianity Exemplified* (Philadelphia, 1852); *Historical Text-book and Atlas of Biblical Geography* (1854); *Prelacy and Ritualism* (1869); and other works. D. in Easton, Pa., Mar. 16, 1882.

Colenso, JOHN WILLIAM, D. D.: b. in St. Austell, Cornwall, England, Jan. 24, 1814; d. in Durban, Natal, Africa, June 20, 1883. He graduated from Cambridge, was appointed rector of Forncett St. Mary, Norfolk, in 1846, and enjoyed a reputation as a mathematician, some of his treatises being used as text-books in the schools and universities. In 1853 he was elected Bishop of Natal, and in 1855 he published *Ten Weeks in Natal* and in 1862 the first volume of *The Pentateuch*, etc. (7th and last part 1879), in which he called in question many of the statements of Moses and denied the inspiration of the Old Testament. The book was condemned by both Houses of Convocation, and the author was nominally deposed by Bishop Robert Gray, of Capetown, who claimed to be his metropolitan. This deposition was recognized by the Convocation of Canterbury, England, and by the General Convention of the American Episcopal Church. The Privy Council, however, ordered the income of his see and arrears to be paid to him, and a fund of $15,000 was raised in England and given to him. He was inhibited from preaching in several dioceses of England. He espoused the cause of the Zulus, and secured the sending of Cetewayo to Great Britain. In view of the legal complications attending the filling of the see of Natal, a bishop, in communion with the English and American Churches, was consecrated for Maritzburg, South Africa, comprising the territory of Natal. See his *Life* by G. W. Cox (London, 1888, 2 vols.; 2d ed. same year, 1 vol.). Revised by W. S. PERRY.

Coleop'tera [from Gr. κολεόπτερος, sheath-winged; κολεός, sheath + πτερόν, wing]: the largest order of true insects, commonly known as beetles. The Coleoptera have the mouth parts fitted for biting, the prothorax distinct, and the mesothorax and metathorax (see INSECTS) each bearing a pair of wings. The hinder pair of these are of use in flight (except in degenerate forms), while the anterior pair are hardened into protective covers (or elytra), which sheathe the other pair when at rest. The Coleoptera pass through a metamorphosis, there being distinct larval, pupal, and adult stages. From the economic standpoint the beetles may be grouped as injurious or beneficial. To the former belong all those forms which destroy human possessions. Thus the larvæ of many feed upon vegetable matter; the larvæ of the "June bugs" feed upon the roots of the grass, of the spring-beetles on various crops, while those

of the so-called long-horn beetles (*Cerambycidæ*) form the borers of various orchard and forest trees. Other larvæ feed upon animal matter. The bacon-beetles will eat hides or other animal matter; the carpet-beetles (buffalo-bugs) show great fondness for any woolen or silk material. The beneficial beetles aid man by destroying the injurious forms or by acting as scavengers in removing decaying animal or vegetable matter. The number of species of Coleoptera is enormous, over 100,000 species being already (1893) described. Probably the total number of existing species will aggregate 200,000. J. S. Kingsley.

Colepeper: See Culpeper.

Coleraine: a seaport-town of Ireland, in the county of Londonderry; on the right bank of the river Bann, 4 miles from its mouth, and 47 miles N. N. W. of Belfast (see map of Ireland, ref. 3–H). A fine stone bridge connects Coleraine with its suburbs on the opposite shore of the Bann. Vessels of 200 tons can go up to the town, and steamers ply to Liverpool and Glasgow. It has a court-house and a custom-house; also manufactures of fine linen fabrics called "coleraines," and of paper, soap, etc. Pop. 6,000.

Coleridge, Hartley: poet; son of Samuel T. Coleridge; b. near Bristol, Sept. 19, 1796, and brought up by Southey. He was a dreamy, wayward, and eccentric genius. He became a fellow of Oriel College in 1818, but he soon lost his fellowship by his intemperance. He published a volume of admired poems in 1833. Among his other works is *The Worthies of Yorkshire and Lancashire* (1835). He had marvelous conversational powers. D. Jan. 6, 1849.—A younger brother, Derwent, b. Sept. 14, 1800, was prebendary of St. Paul's Cathedral, had some reputation as a writer, and died Mar. 29, 1883. He published an edition of his brother's poems (1851).

Coleridge, Henry Nelson: a cousin of Hartley Coleridge; b. in 1800; was called to the bar in 1826; published an *Introduction to the Study of the Greek Classic Poets* (1830) and *The Table-talk of Samuel T. Coleridge* (1835). D. in London, Jan. 26, 1843.

Coleridge, John Duke, Lord: b. in London, 1821; son of John Taylor Coleridge; educated at Eton and at Balliol College, Oxford; called to the bar at the Middle Temple in 1846. He was appointed recorder of Portsmouth 1855, created a queen's counsel in 1861, and became attorney-general in 1871, lord chief justice of the court of common pleas in 1873, and lord chief justice of England in 1880. He was made Baron Coleridge of Ottery St. Mary in 1873. D. in London, June 14, 1894. Revised by F. Sturges Allen.

Coleridge, John Taylor, D. C. L.: British jurist and author; nephew of S. T. Coleridge; b. at Tiverton in 1790. In 1812, after a brilliant career at Oxford University, where he became the intimate friend of John Keble, he took the degree of B. A.; was called to the bar at the Middle Temple in 1819; appointed serjeant-at-law and recorder of Exeter in 1832, justice in the King's Bench in 1835, and sworn of the Privy Council in 1858. He was a sound and fair-minded but not a great lawyer, and a literary critic of high reputation. He edited one of the best editions of *Blackstone's Commentaries* (1825), and wrote a life of *John Keble* (1869). D. at Heath's Court, Ottery St. Mary, Feb. 11, 1876.
Revised by F. Sturges Allen.

Coleridge, Samuel Taylor: an English poet and critic; b. at Ottery St. Mary, in Devonshire, Oct. 21, 1772; son of the vicar of that parish. In 1791 he entered Jesus College, Cambridge, where he attained great proficiency in classical learning. He abruptly quitted Cambridge in 1792, and enlisted in a regiment of dragoons under the assumed name of Silas Tomken Comberbatch. His relatives soon procured his discharge from the army. He visited Bristol in 1794, and became an associate of Robert Southey and other young men who, like himself, had adopted democratic and revolutionary ideas. They formed a project to emigrate to the banks of the Susquehanna and to found a "pantisocracy," in which they proposed to enjoy a community of goods. As they could not raise money enough for the outfit, they were compelled to abandon the enterprise. His friend and patron, Joseph Cottle, of Bristol, paid him thirty guineas in advance for a volume of poems (published in 1796). In 1795 he married Sarah Fricker, whose sister, Edith, soon after married Southey, and became a resident of Nether Stowey, Somersetshire, where he associated with the poet Wordsworth, and remained nearly three years. During this period he composed the *Ancient Mariner* and other poems. Coleridge and Wordsworth wrote in partnership a collection of *Lyrical Ballads*. He held Socinian views in this early part of his mature life, and began to preach in the Unitarian churches, but his success as a preacher was hindered by his instability and want of punctuality. In 1798 he visited Germany with Wordsworth, and studied at Göttingen. He removed to Keswick, in the lake country, in 1801, and resided with Southey and Wordsworth. The unfriendly critics of the reviews applied to these three friends the appellation of "Lake Poets," in reference to their local habitation. In 1808 he lectured on poetry and the fine arts in London, and in 1809 commenced the publication of the *Friend*, a periodical. His wife and family remained at Keswick, dependent on Southey, while Coleridge led a wandering life and formed many speculative and literary projects, which he failed to realize. His natural infirmities of character were increased by the use of opium. He passed many of his later years in the house of Mr. Gillman, at Highgate, near London, where he began to reside in 1816. Coleridge was the first to introduce to English readers some of the valuable points of German philosophy. Before his time only vague traditions of that philosophy had arrived and mere caricatures of it had been published. He has been truthfully called the creator of the higher criticism in England, which had accomplished so much in Germany in the hands of Lessing and Goethe. His *Aids to Reflection* (1825) stimulated a profounder method of thinking in England and America. His distinction between reason and the understanding may be said to have given rise to the transcendental school of New England. Among his other works are *Christabel* (1816); *Zapolya*, a drama (1818); *Literary Remains* (1836); *Biographia Literaria* (1847). *Osorio, a Tragedy* (first printed in 1873), was the original drama from which his *Remorse* was adapted. D. at Highgate, July 25, 1834. See Gillman, *Life of S. T. Coleridge* (1838); Cottle, *Reminiscences of Coleridge and Southey* (1847). Revised by W. T. Harris.

Coleridge, Sara Henry: only daughter of Samuel Taylor Coleridge; b. at Keswick, Dec. 22, 1802. She passed many of her early years in the house of her uncle, Robert Southey, and was married in 1829 to her cousin, Henry N. Coleridge. She edited several works of her father, and wrote an admired imaginative tale called *Phantasmion* (1837). D. May 3, 1852. Her memoirs and letters, edited by her daughter, were published in 2 vols., 1873.

Colet, John: Dean of St. Paul's and founder of St. Paul's School; b. in London, 1466: son of Sir Henry Colet, a wealthy merchant and mayor of the city; educated first in London, then in the University of Oxford, about 1483, and probably at Magdalen College. About 1493 he set out for the Continent, and studied in the universities of France and Italy. Returning to England he lectured gratuitously on theological subjects in Oxford, where he made the acquaintance of Erasmus and Sir Thomas More. Ordained deacon in Dec., 1497, he held various preferments, and was in 1505 made Dean of St. Paul's, where he acquired great influence by his preaching. On the death of his father he inherited a considerable property, and in the year 1509 he set about founding St. Paul's School, which, according to the statutes, was actually founded in 1512. The founding of St. Paul's was a great fact in the history of education, because this school was the first in England in which Greek became a regular part of the curriculum. William Lily, whom Colet had met in Rome, was appointed the first head master. Colet and Lily compiled together a famous Latin grammar, which became the foundation of the celebrated Eton grammar. Erasmus also wrote a phrase-book for the new school. Colet endowed the school with the greater part of his considerable fortune. In regard to the methods of classical instruction, he held that "Latin speech was before the rules and not the rules before the Latin speech." Best biography, *Life of John Colet*, by the Rev. J. H. Lupton (London, 1887). See also Joseph Payne's *Lectures on the History of Education* (new ed. 1892).

Colfax: capital of Whitman co., Wash. (for location of county, see map of Washington, ref. 5–J); on Union Pac. R. R., 85 miles S. of Spokane; has an academy. Pop. (1880) 444; (1890) 1,649; (1900) 2,121.

Colfax, Schuyler: statesman; b. in the city of New York, Mar. 23, 1823; was a grandson of Gen. William Colfax, who commanded Washington's Life Guards. In 1836 he removed with his mother, who was then a widow, to Northern Indiana. He settled at South Bend and studied law,

and became in 1845 editor of the *St. Joseph Valley Register*, a Whig paper issued at South Bend. In 1850 he was a member of the convention which formed a new constitution for Indiana, and he opposed the clause that prohibited colored men from settling in that State. As a Whig candidate for Congress he was defeated in 1851, but was elected in 1854; was six times re-elected, and continued to represent that district until 1869. In 1856 he made an eloquent speech in Congress on the subject of the conflict in Kansas. He was chosen Speaker of the House of Representatives in Dec., 1863 and again in 1865 and 1867. During the civil war he was a friend and confidential adviser of President Lincoln. In Nov., 1868, he was elected Vice-President of the U. S. by the Republicans on the ticket with Gen. Grant. Mr. Colfax died Jan. 13, 1885. A bronze statue of him, erected in University Park, Indianapolis, Ind., by the Odd Fellows, was unveiled May 18, 1887.

Colgate, James Boorman: philanthropist; b. in New York city, Mar. 4, 1818; prepared for college, but decided on a business career; after experience in the wholesale dry-goods business in the firm of Colgate & Abbe, formed a partnership with John B. Trevor. The firm entered Wall Street in 1852 as dealers in stocks and other securities, and for many years did the largest stock and bullion business in Wall Street. Mr. Colgate has been for many years a prominent advocate of the remonetization of silver. Apart from his business, he is known for his connection with educational interests and Christian benevolence. Since 1861 he has been prominently identified with Colgate (formerly Madison) University, to which he has given the academy building, the library building, and an endowment of a million dollars known as the Dodge Memorial Fund. He has also given largely to other educational and benevolent institutions.

C. H. Thurber.

Colgate, Samuel: philanthropist; b. in New York city, Mar. 22, 1822; president of the New York Baptist Education Society for twenty-nine years; trustee of Colgate University for thirty years; member of the finance committee of the American Tract Society for twenty-four years; president of the Society for the Suppression of Vice for eighteen years; member of the executive committee of the American Baptist Missionary Union for twenty-nine years. Mr. Colgate spent much time in collecting the documentary history of the Baptist denomination, and brought together 30,000 volumes of reports, which are preserved in the library of Colgate University. D. at Orange, N. J., April 23, 1897.

Colgate University: an institution of learning located at Hamilton, N. Y.; had its origin in 1820, when the Hamilton Literary and Theological Seminary was opened, with Rev. Daniel Hascall, A. M., as principal. Vigorous growth caused expansion, until in 1834 three distinct courses were developed—preparatory, collegiate, and theological. The first collegiate class was that of 1835. The charter, under the name of Madison University, was obtained in 1846. A removal controversy ensued in 1847 and terminated in 1850. Up to this time the institution had been without endowment.

The first president, Dr. Nathaniel Kendrick, having died in 1848, was succeeded in 1851 by Dr. Stephen W. Taylor, and upon his death in 1856 Dr. George W. Eaton became president. Under each the university gained strength, but funds grew slowly. To the earlier buildings were added West College (1827), East College (1834), and Alumni Hall (1861); but up to 1864 the endowment was only $52,000. Between 1865 and 1868 about $100,000 more was secured.

During the administration of President Ebenezer Dodge (1868–90) funds increased to more than $500,000. Dr. P. B. Spear was treasurer 1864–88. Departments were added, facilities improved and multiplied. A separate building for the preparatory school (Colgate Academy) was erected in 1873, a chemical laboratory for the college in 1884, and Eaton Hall for the theological department (Hamilton Theological Seminary) in 1886. A fireproof library building, costing $150,000, was erected in 1889 by James B. Colgate, of New York. In recognition of the munificence of the Colgate family, the trustees at their meeting in 1889 voted to change the name of the institution to Colgate University. This act was approved by the alumni, and was legally ratified Apr. 22, 1890.

At the commencement in 1891 Mr. James B. Colgate added $1,000,000 to the endowment, as the Dodge Memorial Fund, in tribute to President Dodge, who died Jan. 5, 1890. This enlargement of financial resources affords assurance of stability and growth. In 1899–1900 the university (college proper) had 16 professors and 131 students; Colgate Academy had 9 instructors and 141 students; Hamilton Theological Seminary had 8 professors and 49 students. George E. Merrill, D. D., was chosen president Dec. 20, 1898.

Colhoun′. Edmund R.: rear-admiral U. S. navy; b. in Pennsylvania, May 6, 1821, ; entered the navy as a midshipman Apr. 1, 1839. He served on the east coast of Mexico during the Mexican war; commanded the steamer Hunchback and rendered efficient aid at the capture of Roanoke island and Newbern, N. C., in 1862; was in several engagements with batteries on Black Water river, Va., during the autumn of that year; commanded the monitor Weehawken during the summer and autumn of 1863 in her various engagements with the forts and batteries of Charleston harbor. Retired May 6, 1883. D. Feb. 17, 1897.

Colic [from Gr. κωλικός, pertaining to the colon (κῶλον)]: a term applied to diseases attended with severe pain of the abdomen; the supposed particular connection of the pain with the large intestine is not always certain. The disease is caused, at least in part, by irregular contractions of the muscular coat of the intestines. Several causes may lead to the production of intestinal colic, such as irritating food, in which case castor oil or similar quick purgatives bring relief; or cold may cause a true neuralgia of the intestines; or lead-poisoning may lead to violent spasmodic colic. Painful affections of other abdominal organs are also spoken of as colics—as "renal colic," the form dependent on passage of a stone from the kidney, or "hepatic colic," the painful discharge of gall-stones. Intestinal colic is technically called "enteralgia." The pain of colic is spasmodic, centers about the navel, and is often very greatly relieved by pressure, so that the patient may lie over the back of a chair for relief. When colic resists mild and simple remedies, medical assistance should be procured, for colic is closely allied, as a symptom, to several severe and dangerous diseases.

Revised by William Pepper.

Coligny, kō′lĕĕn′yĕ′, Gaspard de Châtillon, Count: French admiral and Huguenot; b. at Châtillon-sur-Loing, Feb. 16, 1517; served with distinction at the battle of Cérisoles 1544; became admiral of France 1552; taken prisoner by the Spaniards at St.-Quentin in 1557; second in command of the Protestant army in the civil war which began 1562; when the Prince of Condé was killed at Jarnac in 1569 he succeeded him as commander-in-chief. The war was suspended in 1570 by a treaty of peace, in which the court acted a treacherous part. Coligny went to Paris to attend the marriage of Henry of Navarre in Aug., 1572, and was received with feigned kindness by Charles IX. He was wounded in the street by a partisan of the Duke of Guise, and was killed, two days later (Aug. 24), in the general massacre of St. Bartholomew. See Pérault, *Vie de Coligni*; Brantôme, *Discours sur l'Amiral de Châtillon*; Dufey, *Coligny, Histoire Française* (4 vols., 1824); and biographies by Delaborde (1880) and Bersien (early life only, 1885, Eng. trans.).

Colima: a western state of Mexico; between Jalisco on the N., Michoacan on the S. E., and the Pacific on the S. W. Area, 2,704 sq. miles. Principal port, Manzanillo. The northeastern part is in the Sierra Madre, and the Nevado de Colima, on the boundary, is one of the highest peaks in Mexico (14,364 feet). The volcano of the same name attains 12,743 feet. The southwestern part of the state is lower, but much diversified by mountain-ridges, with fertile and well-watered valleys between. Colima, though one of the smallest Mexican states, leads many of the others in enterprise and prosperity. It is one of the principal coffee regions; sugar-cane, cotton, rice, and indigo are largely grown, and the manufactures, especially of cotton cloth, are important. Pop. (1895) 55,677. Capital, Colima.

Herbert H. Smith.

Colima: city of Mexico; capital of the state of same name; in a fertile plain; 80 miles from the port of Manzanillo (see map of Mexico, ref. 7–F). It is a center of the cotton-manufacturing industry, and has several thriving mills. The streets are regularly laid out, and the residences, often of more modern style than is usual in Mexico, are adorned with tasty courts and gardens. Colima was founded by order of Cortés about 1523. Pop. (1895) 19,305.

Herbert H. Smith.

Colise′um, or Colosse′um [from Lat. *colosseus*, colossal]: the Flavian Amphitheater in Rome, dedicated A. D. 80, now

one of the most magnificent ruins in the world. See AMPHITHEATER.

Colladon, DANIEL: civil engineer and savant; b. in Geneva, Switzerland, in 1802, where he studied and wrote until 1825, when he went to Paris, remaining ten years. He invented the rock drill operated by compressed air for the Mont Cenis tunnel, and was employed as consulting engineer for the St. Gothard tunnel. He wrote on almost every department of physics; was a correspondent of the Institute of France, of the Royal Academy of Sciences, Turin, member of the Geological Society of Vienna, officer of the Legion of Honor, and commander of the order of St. Maurice and Lazarus. D. in Geneva, June 20, 1893.

Col'lamer, JACOB, LL. D.: lawyer and U. S. Senator; b. in Troy, N. Y., in 1792; removed to Vermont in his youth; graduated in 1810 at the University of Vermont; admitted to the bar in 1812. He became eminent in his profession, and was a judge of the Supreme Court of Vermont from 1833 to 1841; member of Congress in 1843, 1844, and 1846, and was appointed Postmaster-General by President Taylor in Mar., 1849. In July, 1850, he resigned in consequence of the death of Taylor. He was elected a U. S. Senator in 1854, and re-elected in 1860. D. Nov. 9, 1865.

Collao, kōl-yaă'ō: that portion of Southern Peru which lies within the Titicaca basin, or which would be defined by an irregular line, including the heads of all the Peruvian streams which flow into the lake. It consists of elevated plains nowhere less than 12,000 feet high and bordered by lofty mountain-chains. The Collao is included in the modern department of Puno. HERBERT H. SMITH.

Collateral Inheritance Tax: See INHERITANCE TAX, in the Appendix.

College [from Lat. *colle'gium*, a body of colleagues, a fraternity]: originally a body of persons associated together for the purpose of performing common functions; a body of colleagues. Under Roman law there were the colleges of augurs, of pontiffs, of tribunes, and of artisans. In mediæval and modern times the term has been applied in a similar manner to bodies quite dissimilar in their purposes. Thus it is common to speak of the college of bishops, the college of cardinals, and the college of presidential electors. But it is in educational matters that the term has come to have the most marked and important significance.

It is probable that colleges organized for academic purposes had their origin about the end of the twelfth century at the University of Paris, where persons at the university who had common ends in view associated themselves together for a mutual advantage. A little later the term was applied to institutions of learning in other countries. In Germany and Italy, however, the term *collegium* did not, as in England, come to be applied to institutions or corporations, but only to associations of scholars coming together simply in a voluntary capacity. It was in England that the word came to have its most important significance. In the thirteenth century colleges were established in considerable numbers at Oxford and Cambridge; and these institutions were bound together in what we know as the university. It is probable that the origin of the college in England was not unlike that in France. Students went to the universities in large numbers and for different purposes, and found it convenient to separate into groups of persons having a common end in view. It is recorded that at one time the number of students at Oxford was 30,000; the number of halls occupied by students 300. As time passed on the aggregation of students in buildings where they could at once advance their common interests and receive protection in their common and personal rights was encouraged by princes and bishops, as well as by private benefactors. In this way the group of buildings known as the colleges at Oxford and Cambridge came into existence. The colleges at Oxford, with the dates of their foundations, are the following: All Souls, 1437; Balliol, 1262; Brasenose, 1509; Christ Church, 1525; Corpus Christi, 1516; Exeter, 1413; Hertford, 1874; Jesus, 1571; Keble, 1870; Lincoln, 1427; Magdalen, 1456; Mansfield, 1888; Merton, 1264; New, 1380; Oriel, 1324; Pembroke, 1624; Queen's, 1340; St. John's, 1555; Trinity, 1555; University, 1249; Wadham, 1610; Worcester, 1283. Those at Cambridge are the following: Caius, 1348; Catharine, 1473; Cavendish, 1873; Clare, 1326; Christ's, 1439; Corpus Christi, 1352; Downing, 1717; Emmanuel, 1584; Jesus, 1496; King's, 1441; Magdalene, 1542; Pembroke, 1348; Queen's, 1448; St. John's, 1510; St. Peter's, 1257; Selwyn, 1882; Sidney-Sussex, 1596; Trinity, 1546; Trinity Hall, 1350. The college in England is not so much an institution for teaching as one for furnishing a residence for students where they will be surrounded with the most encouraging and inspiring opportunities. Formerly all students were required to live in the dormitories furnished by the college, and to take their meals at the common table or college hall. Those who, on account of distinguished attainments, were appointed after graduation to fellowships were required also to occupy rooms in the college and eat at the common table. Until recently the fellows forfeited their fellowships in case of marriage. In the colleges at Oxford and Cambridge the student is entirely at liberty to seek whatever instruction he may choose, but, if he is a candidate for a degree, regularity of work is generally secured by the knowledge that success in his final examinations will depend very largely upon the excellence of his instruction, as well as upon his own diligence. Students of any college may take instruction in any other. The colleges of Oxford and Cambridge hold no examinations. Students, when prepared for final examinations for a degree, must apply to the university, the special function of which is to hold examinations and grant degrees. The course of undergraduate study at an English college ordinarily continues about three years. The number of students in all the colleges at Oxford is usually about 3,500; in Cambridge the number is slightly less.

Colleges in the U. S. were founded on the English model. Among the early settlers of Massachusetts a large number of influential men received their education at Emmanuel College, Cambridge. Harvard College, founded in 1636, was organized in imitation of Emmanuel; the College of William and Mary, in Virginia, and Yale College, in Connecticut, imitated the organization of Harvard; and they in turn were imitated by the colleges established during the next 150 years. In England students offering themselves for degrees were formerly examined for the most part either in the ancient classics or in the mathematics. This fact gave great preponderance to those studies. The training was purely disciplinary and preliminary to professional study. The same was true in the colleges of the U. S. that were organized on the English model.

Early in the nineteenth century, however, there began to be not a little distrust of this method of organization. President Wayland, of Brown University, at Providence, R. I., and President Nott, of Union College, Schenectady, N. Y., were pioneers in the general movement that now took place. Soon after 1850 President Barnard, of Columbia College, published elaborate statistics, the result of careful investigations, which showed conclusively that the proportion of students going to college in the U. S. was steadily growing less and less. This tendency was believed by very many to be the result of a deep-seated and wide-spread dissatisfaction with the limited range of studies offered by the ordinary college. In 1852 Dr. Henry P. Tappan, on entering upon the duties of his office as president of the University of Michigan, boldly proclaimed the doctrine that science, the modern languages, and history were entitled to the same prominence in the college curriculum that should be given to the ancient languages and the mathematics. On this theory the college of literature, science, and the arts was remodeled. The success of the university seemed to justify the change, and the newly modified course of study became the model in the organization of the other State universities. The spirit which led to this change in the course of a few years also very greatly modified the colleges that had been established on the old model. While Greek, Latin, and the mathematics continued to have a dominant influence in the first two years of the course, the modern languages and the natural sciences, as well as history, economics, and the modern literatures, forced their way into the arrangement of courses for the third and fourth years. Technical studies also pressed for recognition. Colleges of engineering, agriculture, and architecture were established. Some of these formed a part of institutions already established, and some were established on an independent basis. From every point of view, however, it was apparent that the old exclusiveness was giving way, and a modern method was taking its place. The natural consequence of this movement was that great variety and even chaos ensued. Some of those in charge of colleges were conservative; others were fond of change. The former very generally adhered to the classical model, the latter as generally advocated the introduction of what were called studies of modern importance. There is therefore a marked

absence of uniformity both in the requirements for admission to college and in the studies pursued by collegiate students. In general it may be said, however, that the requirements for admission have been steadily increased, and that the average age at which students are now admitted to college is about two years greater than it was about the middle of the nineteenth century. Meantime the number of colleges has multiplied even more rapidly than the population of the country. Throughout the Middle and Western States young women are generally admitted to the same colleges as men. In the Eastern and Southern States such is ordinarily not the case. For the education of women, however, generous provisions have been made. The most prosperous of the colleges established for women alone are Vassar College, at Poughkeepsie, N. Y., Wellesley College, at Wellesley, Mass., Smith College, at Northampton, Mass., Mt. Holyoke College, at South Hadley, Mass., and Bryn Mawr College, at Bryn Mawr, Pa.

The college in the U. S. is sometimes identical with the university. For example, Columbia College and the College of New Jersey are in the true sense of the term universities. With no more than a few exceptions, the university is but an aggregation of colleges. The name "university," however, has often been ambiguously applied to small institutions whose hopes of greatness were larger than their prospects.

TABLE OF COLLEGES IN THE UNITED STATES.

The following list of colleges, compiled from the most authentic sources, and arranged alphabetically by States and colleges, has been brought down to the year 1893. In some cases the figures have been taken from the latest report of the Commissioner of Education; in others they have been obtained by direct inquiry:

NAME.	Location.	Denomination.	Chartered.	Opened.
Alabama, University of..	University, Ala.	Non-sect.	1819	1819
Howard College	East Lake, "	Baptist	1843	1841

C. K. Adams.

College Fraternities: a class of organizations prevalent among the students of the higher institutions of learning in the U. S. With one exception they are secret in character, though this element is in reality a mere concession to the youthful love of the mysterious. They are composed of lodges called "chapters." A fraternity has only one chapter in any one college.

Nomenclature and Insignia.—The names of many of the fraternities are composed of Greek letters, and they are hence called "Greek letter societies." The chapters also bear Greek names, sometimes in the regular order of the dates of their establishment, sometimes with the name of the State added, and sometimes they are named from the colleges or towns in which they are located. Membership is commonly indicated by badges, which usnally display the name and some of the symbols of the fraternity.

Origin and Development.—The first society bearing a Greek name was the *Phi Beta Kappa*, founded at the College of William and Mary in Virginia in 1776. It was social and secret. In December, 1779, it authorized the establishment of branches at Yale and Harvard, and the next year ceased to exist, on account of the confusion incident to the Revolutionary war. The chapter at Yale was established in 1780 and that at Harvard in 1781, these two chapters afterward uniting to establish branches elsewhere. This society became a literary organization; admitting members from the higher classes only, it gradually grew formal and perfunctory, its ritual and so-called secrets were disclosed, and finally admission to its ranks was based entirely upon grounds of scholarship, and after a time its honored badge became simply a symbol of high collegiate rank. It was revivified in 1881, but still remains an honorary society. In 1825 the first of the men's general fraternities, the *Kappa Alpha*, was formed at Union College. In external features it closely copied *Phi Beta Kappa*; it was secret, it had a Greek name, it confined its membership to upper class men, it named its chapters on the same plan, and its badge was, like that of *Phi Beta Kappa*, a watch-key. This society was opposed by the faculty and students, and was accused, on account of its small membership and the exclusion of outsiders from its meetings, of promoting a college aristocracy. In 1827 two other societies of the same nature, *Sigma Phi* and *Delta Phi*, were founded at Union. In 1831 *Sigma Phi* placed a chapter at Hamilton College, and this resulted in the formation there of a rival society, called *Alpha Delta Phi*, in 1832. So the system spread, the establishment of a chapter at a college leading soon to the organization of a rival society or chapter, until in 1898, the last year for which reliable statistics are obtainable, there were nearly 800 chapters in existence.

Organization and Government.—Previous to 1861 the prevalent system of government among the fraternities was a weak supervision by one chapter, usually called a "grand" chapter, modified by the enactments of infrequent conventions of delegates from the chapters. The chapters were otherwise independent. Since the year 1870, or thereabouts, this has changed into a system composed of a legislative body, or convention of chapter delegates, meeting regularly, its sessions being accompanied by public exercises and a banquet, and an administrative body composed of an executive, usually called a president, and assisted by a board of trustees and several minor officials with limited jurisdiction. The aims of the majority of the chapters are purely social. They all endeavor to secure as members students of social or intellectual prominence, and the contest for such between rival chapters is intense at the beginning of each collegiate year. This "cultivation" of prospective members is usually termed "rushing." The act of admitting a member is termed his "initiation," or he is said to have "swung out." The chapters are gradually becoming householders, and in the older colleges it is common for the members to live together in a house owned or rented by them. Many such houses are handsome and costly. In 1898, 142 such buildings were owned by chapters, and 282 were rented, and the number of both are increasing annually. Members of a chapter are said to be *active* when they are in college attendance, *alumni* when they are not, and *honorary* when they have not been initiated while undergraduates. This last-mentioned class of members is being discontinued by the better fraternities. Membership in two fraternities simultaneously is forbidden except under peculiar circumstances, and if a member leaves one and joins another he is said to be "lifted," a practice which is generally condemned as disloyal and unmanly. The alumni frequently form clubs in the larger cities, and sometimes, as in New York, rent buildings.

Literature.—The fraternities have issued publications in the form of catalogues, histories, song-books, music, and magazines. All but one or two have published catalogues. Previous to 1879 such compilations contained merely lists of the members' names. At that time a great advance was

made, and the catalogues have until recently contained full but condensed biographies of the members, historical sketches of the fraternity and the institutions at which the chapters are located, the geographical distribution of the members, and various statistical tables of interest. This elaborate form of catalogue soon became burdensome, and the more widespread fraternities are now returning to a simpler form, leaving catalogues with minute memorabilia to the enterprise of individual chapters. Psi Upsilon, Sigma Chi, and Beta Theta Pi have also published histories, and Phi Delta Theta, Sigma Alpha Epsilon, and Phi Kappa Psi have works of this class in an advanced state of preparation. Song-books have been generally issued. They do not differ materially from current collections of college songs.

Periodicals.—Aside from purely ephemeral attempts at publishing journals made by Delta Upsilon in 1868 and Theta Delta Chi in 1869, the first fraternity journal was the *Beta Theta Pi*, issued by the fraternity of that name in 1872, and still published regularly. Other journals, with the dates of their establishment, are as follows: The *Palm*, of Alpha Tau Omega, 1880; the *Purple and Gold*, of Chi Psi, 1884; the *D. K. E. Quarterly*, 1883; the *Rainbow*, of Delta Tau Delta, and its predecessor, the *Crescent*, 1887; the *Quarterly*, of Delta Upsilon, 1882; the *Journal*, of Kappa Alpha, 1879; the *Caduceus* of Kappa Sigma, and its predecessor, the *Quarterly*, 1885; the *Scroll*, of Phi Delta Theta, 1876; the *Quarterly*, of Phi Gamma Delta, 1879; the Phi Kappa Psi *Shield*, and its quarterly and monthly predecessors, 1875; the Phi Kappa Sigma *Quarterly*, 1890; the Sigma Alpha Epsilon *Record*, 1880; the Sigma Chi *Quarterly*, 1881; the Sigma Nu *Delta*, 1881; the Theta Delta Chi *Shield*, 1884; and the *Garnet and White* of Alpha Chi Rho, 1900. In addition to this list, Alpha Delta Phi published the *Star and Crescent* from 1880 to 1885; Psi Upsilon, the *Diamond* from 1878 to 1886; Chi Phi, the *Quarterly* from 1884 to 1897; and Zeta Psi the *Monthly* and *Quarterly* from 1884 to 1886. The women's societies have also issued similar journals, the first of which was the *Golden Key*, of Kappa Kappa Gamma, 1882, which since 1886 has been called the *Key*; others are the *Arrow*, of Pi Beta Phi, 1885; the *Anchora*, of Delta Gamma, 1884; the *Quarterlies* of Kappa Alpha Theta and Alpha Phi, 1885 and 1888; the *Trident* of Delta Delta Delta, 1891; the *Lyre* of Alpha Chi Omega, 1897; and the *Eleusis* of Chi Omega, 1900. Nearly all of these journals have been irregular in their publication, or have suspended one or more times. But they are all now in fair condition. At first they were secret, and designed to circulate only among members, but now they generally receive subscriptions from outsiders at the nearly uniform price of $1 per annum. Sigma Chi, Sigma Alpha Epsilon, and Phi Delta Theta issue secret periodicals in addition to their regular journals.

The fraternities may be conveniently grouped into men's general and local fraternities, women's societies, and professional societies. A few details only can be given, and those only in regard to the more prominent in the following list. The name of the fraternity is first given, then the total membership, the place and date of origin, the characteristics of the badge, the colors and flower if any, and the number of inactive and active chapters, with their general location. The statistics are given for the summer of 1898. This is the latest date at which trustworthy figures in regard to most of them are available. Later data in regard to a few, though obtainable, would, if given, prove misleading for purposes of comparison.

Men's General Fraternities.—*Alpha Delta Phi*, 7,933; Hamilton College, 1832; badge, a star and crescent; colors, green and white; inactive chapters, 7, active 23, mostly in the East; owns ten buildings. *Alpha Chi Rho*, 76; Trinity (Conn.), 1895; active chapters, 3. *Alpha Tau Omega*, 4,261; Virginia Military Institute, 1865; a Maltese cross; gold, white, green and blue; inactive chapters 19, active 42; chiefly in the South; three buildings. *Beta Theta Pi*, 10,577; Miami University, 1839; an eight-sided oblong shield; pink and blue; the rose; inactive chapters 19, active 62; widely distributed; ten buildings. *Chi Phi*, 4,048; formed by the union of three societies of the same name, the earliest of which was founded at Princeton in 1854; monogram of the letters; scarlet and blue; inactive chapters 24, active 19; in the East and South; five buildings. *Chi Psi*, 3,718; Union College, 1841; monogram of the letters; purple and gold; inactive chapters 9, active 19; in the South and East; eight buildings. *Delta Kappa Epsilon*, 12,948; Yale, 1844 (called generally D. K. E. and the members "Dekes"); a rhomb; blue, gold, and crimson; inactive chapters 13, active 35; mostly in the East; nine buildings. *Delta Phi*, 2,914; Union, 1827; a Maltese cross; blue and white; inactive chapters 4, active 12; mostly in the Middle States; four buildings. *Delta Psi*, 2,989; Columbia, 1847; St. Anthony's cross; light blue; inactive chapters 11, active 8; in the East and South; seven buildings. *Delta Tau Delta*, 5,670; Bethany College, 1860; a four-sided shield; purple, gold, and white; the pansy; 29 inactive and 38 active chapters. The fraternity owns 2 chapter-houses. *Delta Upsilon* (non-secret), 6,275; formed by a confederation of local societies, the oldest of which was founded at Williams, 1834; a monogram of the letters; blue and gold; inactive chapters 5, active 31; mostly in the East; ten buildings. *Kappa Alpha*, 1,395; Union, 1825; a watch-key; scarlet; inactive chapters 2, active 6; in the East; three buildings. *Kappa Alpha*, 3,855 (called the "Southern Order," and has no connection with the fraternity last mentioned); Washington and Lee, 1865; a shield; cardinal and gold; inactive chapters 10, active 37; wholly in the South; owns five buildings. *Kappa Sigma*, 3,466; University of Virginia, 1867; a crescent and star; gold, blue, and red; the lily-of-the-valley; inactive chapters 16, active 47; mostly in the South; owns one building. *Mu Pi Lambda*, 43; Washington and Lee, 1895; active chapters 4; owns no building. *Phi Delta Theta*, 9,609; Miami University, 1848; a shield; white and blue; the carnation; inactive chapters 23, active 63; widely distributed; six buildings. *Phi Gamma Delta*, 6,330; Jefferson College, 1848; a rhomb; royal purple; inactive chapters 27, active 44; mostly in the West; owns two buildings. *Phi Kappa Psi*, 7,435; Jefferson College, 1852; a shield; inactive chapters 18, active 56; mostly in the West and South; nine buildings. *Phi Kappa Sigma*, 2,153; University of Pennsylvania, 1850; a Maltese cross and skull; black and gold; inactive chapters 19, active 12; mostly in the East and South; two buildings. *Phi Sigma Kappa*, 554; Mass. Agricultural College, 1873; a monogram; 8 active chapters. *Phi Phi Phi*, 74; Austin College, 1894; a book and spear; black, white, and blue; active chapters 4, inactive 1. *Pi Kappa Alpha*, 1061; University of Virginia, 1868; a shield and diamond; garnet and gold; inactive chapters 8, active 11; all in the South; no buildings. *Psi Upsilon*, 8,585; Union, 1833; a rhomb; garnet and gold; inactive chapters 1, active chapters 21; mostly in the East; thirteen buildings. *Sigma Alpha Epsilon*, 5,668; University of Alabama, 1856; a rhomb; purple and gold; inactive chapters 30, active 54; mostly in the South; two buildings. *Sigma Chi*, 6,051; Miami University, 1855; a white cross; blue and gold; inactive chapters 21, active 50; mostly in the South and West; during the war had a non-collegiate chapter in a brigade of the Confederate army; five buildings. *Sigma Nu*, 2,864; Virginia Military Institute, 1869; a five-paneled cross; black, white, and gold; inactive chapters 13, active 39; mostly in the South; one building. *Sigma Phi*, 2,190; Union, 1827; a monogram; blue and white; inactive chapters 2, active 8; in the East; owns seven buildings. *Theta Delta Chi*, 3,411; Union, 1847; a shield; black, white, and blue; inactive chapters 17, active 21; in the East; three buildings. *Zeta Psi*, 4,827; New York University, 1846; a monogram; white; inactive chapters 11, active 20; mostly in the East and two in Canada; seven buildings.

Men's Local Fraternities.—While a few of these show a reasonable degree of permanence, the majority are formed for the purpose of securing a charter from some general fraternity. The more permanent ones are *Delta Psi*, University of Vermont, 1863; *I. K. A.*, Trinity, 1829; *Kappa Kappa Kappa*, Dartmouth, 1842; *Lambda Iota*, University of Vermont, 1836; and *Phi Nu Theta*, Wesleyan, 1837.

Women's Societies.—*Alpha Phi*, 832; Syracuse University, 1872; monogram badge; 9 chapters; owns one building. *Chi Omega*, 136 (estimated); Arkansas University, 1895; monogram badge; 9 chapters. *Delta Delta Delta*, 643; Boston University, 1888; crescent badge; 15 chapters. *Delta Gamma*, 1,205; University of Mississippi, 1872; anchor badge; 13 active 10 inactive chapters. *Gamma Phi Beta*, 633; Syracuse University, 1874; monogram badge; 8 chapters. *Kappa Alpha Theta*, 2,339; De Pauw University, 1870; kite-shaped badge; 23 chapters. *Kappa Kappa Gamma*, 2,937; Monmouth College, 1870; badge, a golden key; 27 chapters. *Pi Beta Phi*, 3,119; Monmouth College, 1867; badge, an arrow; 27 chapters.

Professional Societies.—There are *Alpha Chi Omega*, musical; *Alpha Epsilon Iota*, *Alpha Kappa Kappa*, *Alpha*

Mu Pi Omega, *Alpha Upsilon Mu*, *Delta Epsilon Iota*, *Mu Sigma Alpha*, *Nu Sigma Nu*, *Omega Psi*, *Omega Upsilon Phi*, *Phi Alpha Gamma*, *Phi Chi*, *Phi Sigma Psi*, *Pi Mu*, and *Phi Rho Sigma*, medical; *Beta Phi Sigma*, and *Phi Chi*, pharmacal; *Delta Chi* and *Phi Delta Phi*, legal; *Delta Sigma Delta*, dental; and *D. G. K.* and *Theta Xi*, scientific. *Phi Delta Phi*, *Nu Sigma Nu*, *Phi Rho Sigma*, and *Delta Sigma Detta* publish creditable and more or less professional periodicals.

WILLIAM RAIMOND BAIRD.

College of New Jersey: See PRINCETON UNIVERSITY, in the Appendix.

College Point: formerly a village; now a part of the borough of Queens, New York city; on the Long Island R. R. and on East river; has manufactures of hard rubber and silk ribbon. Pop. (1880) 4,192; (1890) 6,127.

Collegeville: village; Montgomery co., Pa. (for location of county, see map of Pennsylvania, ref. 6–I); on Perkiomen R. R. Here are Ursinus College (Reformed German), Pennsylvania Female College, and two popular summer resorts (Glenwood Hall and Prospect Terrace), and machine-works. The chief industry is agriculture. Pop. (1900) 611.

EDITOR OF "INDEPENDENT."

Collegiants: a sect of Christians in Holland; so called from their assemblies, which they called "colleges." The original members were Remonstrant (Arminian) laity, and the leaders were three brothers, John, Adrian, and Gilbert van der Kodde, of Warmond. The sect arose about 1620, transferred its headquarters after a little to Rhynsburg, near Leyden, hence they were called popularly *Rhynsburgers*; after 1625 it spread all over the country, but died with the century. They rejected all creeds, had no regular ministry, but claimed that their preachers spoke under the guidance of the Spirit. They forbade military service and public office to their members, and had no form of church government. They practiced immersion as the only baptism, and open communion.

Collegiate Education of Women: until about the middle of the nineteenth century it was held by a majority of mankind that although collegiate education might be good for men it was not good for women. Accordingly, institutions for the higher education of women were few in number and inadequately equipped and endowed. For many years the seminary at Mt. Holyoke, Mass., was regarded in the North as the foremost institution for the education of women in the U. S. With advancing thought in regard to the position of women, however, public opinion was gradually modified in regard to the facilities that should be provided for woman's education. This changing public opinion assumed two distinct forms. One class of people held that young women should not be educated with young men, but should receive their higher training in colleges designed for young women alone; while another class held that the most desirable results are likely to be obtained when young men and young women are educated in the same institution, and, for the most part at least, in the same classes. These two forms of belief soon made two classes of colleges available to women. Elmira College, chartered as "Elmira Female College" in 1855, was the first of the colleges designed and generously equipped for the exclusive use of women; and Oberlin College, in Ohio, founded in 1834 "for both sexes and all colors," was the first of the larger colleges to offer its advantages to men and women alike. Wellesley College, at Wellesley, Mass., was opened in 1875; Smith College, at Northampton, Mass., in 1875; and Bryn Mawr College, at Bryn Mawr, Pa., in 1885. These institutions all arose at once to a flourishing condition, and, as will be seen by the figures given below, have come to be numerously attended. The courses of study for undergraduates in all these colleges are substantially equivalent to the courses offered in the colleges designed for young men. Bryn Mawr is entitled to the distinction of having organized the work with special reference to the needs of graduate students, and the number of graduate students in attendance shows that efforts in this direction have been appreciated. In all of the colleges just named the young women in attendance live, for the most part or wholly, in buildings provided by the college corporation, and are constantly under the more or less rigid supervision of the college authorities. At Smith College the policy of cottage life is predominant; at Bryn Mawr a medium course is pursued; while at Wellesley and Vassar the young women live in large and elegantly appointed buildings, which provide lodging-rooms as well as lecture-halls, libraries, and museums. At Wellesley the resident teaching corps is made up exclusively of women; at Vassar, Smith, and Bryn Mawr the teaching force is partly of men and partly of women. In all these colleges lectures by non-resident scholars of distinction are frequently provided. The degrees conferred are the same as at colleges for young men.

While the colleges just named have been offering their advantages to young women in the Eastern part of the U. S., opportunities of another nature have been opened in the Middle and Western States. The University of Iowa opened its doors to women on equal terms with men in 1860, and the example thus set was rapidly followed by Michigan and the other State universities. The colleges founded on a denominational basis have so generally imitated the same example that what is called coeducation may be regarded as the prevalent method in institutions W. of the Alleghanies. While none of the older and larger colleges and universities of New England and the South have opened their doors to women, none of the more prominent institutions of the Middle and Northwestern States have been organized for men alone. The Leland Stanford Junior University, which was opened in 1891 with a richer endowment than that of any other educational institution in the U. S., offers its advantages to women as well as to men. The same is true of the University of Chicago, which was opened in 1892. While the schools of law, medicine, and theology have, at least in the Western States, been more or less generally accessible to women, the number of women in the professional schools has not been large, excepting in the schools of medicine. Since 1869 the department of medicine and surgery in the University of Michigan has offered its instruction to women, and large numbers have availed themselves of the advantages offered. To a majority of the medical schools of the country, however, women have not been admitted.

It would be a mistake to suppose that the collegiate education of women has advanced without serious opposition. During the years between 1860 and 1880 much was written on the subject. While few of the writers ventured to question the propriety of affording women opportunities for higher education, yet whenever such opportunities assumed a concrete form there was aroused a more or less active opposition. In general, however, the objections to colleges for women alone were far less numerous than the objections to colleges for men and women in the same classes. Although the opposition assumed a variety of phases, it made its impression chiefly by means of three different assertions. The first was that the health of young women was not so firm and so steady as to enable them to pursue a collegiate course with advantage. This argument was pressed with special force in opposition to the education of young women in institutions where their progress and proficiency would be constantly compared with those of the young men. Some of the highest medical authorities asserted that the result of such coeducation would be disastrous. A second objection often urged was that the mental capacities and aptitudes of young women are not such as to enable them advantageously to carry on collegiate work in the same classes as young men. It was urged either that the young women would be obliged to work so hard as to endanger their health, or that the young men would have to be held back in order to accommodate the slower pace of their weaker classmates. A third objection urged was that young men and young women of collegiate age can not be brought into the social relations ordinarily, if not necessarily, involved in coeducation without such distractions from study as will interfere with their educational progress. To the first two of these objections experience has given a positive answer. Not only is the attendance upon college duties quite as regular on the part of young women as on the part of young men, but the general health of young women has been adequate to the demands made upon it. Where opportunities for gymnastic training and exercise are as generously provided for young women as for young men, it has been found that the average health and strength of the young women is higher at the time of graduation than it was at the time of entering college. In the matter of scholarship, moreover, experience is no less decided. While it is true that to certain phases of certain studies the feminine mind is not quite so well adapted as the masculine mind, still it is probably correct to say that, taking all studies as a whole, the attainments of the young women, as shown in regular class-work and in examinations, are slightly higher

than the attainments of the young men. This result appears to have been unmistakably shown by statistics prepared at the University of Michigan, at Cornell University, and at the University of Wisconsin. While this fact should not be regarded as proving too much, it does at least show that under ordinary circumstances young women are capable of collegiate proficiency that will compare favorably with that of young men in the same classes. But in regard to the third objection experience has not given so unambiguous an answer. It is certain that social distractions from study are often very considerable, and it is probable that college officers of much experience with coeducation would generally admit that objections to the system on this ground are the only ones that any longer can be urged with any appearance of reason. And on this point all that can be said is included in the statement that until a young woman is so mature and serious in her purpose as to discriminate wisely between her studies and her social recreations, she is not in a position to profit in a coeducational institution.

While the higher education of women has been making rapid progress in the U. S., similar advances have been made in some of the countries of Europe. At Oxford and Cambridge women have not yet been admitted to academic degrees; but at both of those venerable institutions colleges for women have been founded, and instruction is given by teachers of the highest rank. At Paris and at a few of the universities of Germany women are admitted to lectures, though they are not yet entitled to examinations for degrees. Of the few European institutions in which the higher degrees are given to women on the same conditions as to men, the University of Zurich in Switzerland is the best known.

The following tables, made up from official reports, show the number of women pursuing either graduate studies or a collegiate course of four years in the larger colleges to which women are admitted in the U. S. The figures, unless otherwise indicated, are for the years 1898–99:

I. COLLEGES IN THE U. S. EXCLUSIVELY FOR WOMEN.

NAME OF COLLEGE.	Graduates.	Undergraduates.
Wellesley College, Wellesley, Mass.	26	633

C. K. ADAMS.

Collem'bola [from Gr. κόλλα, glue + ἔμβολον, peg, wedge]: a sub-order of insects, so called in allusion to a sucker-like organ at the base of the abdomen. See THYSANURA.

Colleton, JAMES: colonial Governor of South Carolina. He was a brother of one of the proprietaries, and in 1686 was appointed Governor in the interest of the proprietaries, with the rank of landgrave; endeavored to enforce the laws in the constitutions which the colonists refused to recognize as binding upon them. He met with bitter opposition from the majority of the colonial Parliament, and excluded them from their seats. In 1687 a new Parliament was elected, and the assembly resorted to open defiance, and in 1690 he was impeached, disfranchised, and banished from the province. Revised by F. STURGES ALLEN.

Collett, JACOBINE CAMILLA: Norwegian novelist and woman of letters; sister of Wergeland; b. Jan. 23, 1813. Of her works may be mentioned *Amtmandens Døttre* (The Magistrate's Daughters, 1885), the first and perhaps the best of her novels; *Fortællinger* (Tales, 1861); *I de lange Nætter* (In the Long Nights, 1863), *Mod Strømmen* (Against the Stream, 1879; 2d series 1885); *Sidste Blade, Erindringer og Bekjendelser* (Last Leaves, Recollections and Confessions, 1868, 1872, 1873). The emancipation of woman was, in one way or another, the underlying purpose of most of this author's literary work. D. in Christiania, Mar. 7, 1895. G. L. KITTREDGE.

Collet'ta, PIETRO: an Italian historian and general; b. at Naples, Jan. 23, 1775. He was a general in the army of Murat (1812–14), and was Minister of War at Naples in 1820; exiled in 1821; wrote a *History of the Kingdom of Naples from 1734 to 1825* (1834). D. Nov. 11, 1833.

Collidine: an alkaloid ($C_8H_{11}N$), found with many others in the products of the destructive distillation of bones and other animal substances, of coal, of quinine, and of cinchonine. It is a colorless oily liquid, having an aromatic odor.

Collier, JEREMY: an English non-juring bishop; b. at Stow Qui (or Quire), in Cambridgeshire, Sept. 23, 1650. He graduated at Cambridge in 1676, was ordained a priest in 1677, and bishop among the non-jurors 1713. He was a zealous Jacobite, and wrote several works against the Government of William III. In 1696 he gave absolution to Friend and Parkyns, who were condemned to death for treason. A sentence of outlawry was passed against him, and never revoked, but he was allowed to live as usual. His chief works are a *Short View of the Profaneness and Immorality of the English Stage* (1698), which caused a great commotion; *Essays on Several Moral Subjects* (3 vols., 1697–1705); and *An Ecclesiastical History of Great Britain . . . to the End of the Reign of Charles II.* (1708–14, 2 vols., fol.; n. ed. with life by T. Lathbury, 1852, 9 vols.) The *Short View* provoked replies from Congreve, Vanbrugh, and Dr. Filmer, but finally the playwrights were worsted, and the bellicose tract of the sturdy moralist shamed the English stage out of its grossness. D. in London, Apr. 26, 1726.

Collier, JOHN: portrait and figure painter; b. in England; contemporary. He has painted portraits of many well-known Englishmen; Legion of Honor 1878. His work is serious and good in color. Studio in London. W. A. C.

Collier, JOHN PAYNE: b. in London, Jan. 11, 1789; died there Sept. 18, 1883. One of his earliest works was *The Poetical Decameron* (1820), followed in 1825 by his edition of *Dodsley's Old Plays*, and in 1831 by his *History of Dramatic Poetry*. Gradually he approached the central figure of the whole period, and in 1835 he published *New Facts Regarding the Life of Shakspeare*; in 1836, *New Particulars*; in 1839, *Further Particulars*; and in 1842–44, his *Life of Shakspeare*, which in 1846 he followed up by his *Memoirs of the Principal Actors in the Plays of Shakspeare*.

Collieries: See MINES and MINING.

Collima'tion, Line of [*collimation* is from the spurious Lat. word *collima're*, due to an erroneous reading for *collinea're*, bring together into a straight line; *con*, together + *li'nea*, line]: in astronomy, the central axis of a telescope, or the line passing through the center of the object-glass and the center of the eye-piece when the latter is in some standard position. In the case of the transit instrument, the line of collimation is defined as that which

passes through the optical center at right angles to the axis on which the instrument turns. In the case of a telescope furnished with a revolving micrometer and position circle, the line of collimation is that which passes through the center of the object-glass and the center of revolution of the micrometer. S. N.

Col'limator: a fixed telescope, used to adjust another telescope. It was the invention of DAVID RITTENHOUSE (*q. v.*), of Philadelphia, an eminent astronomer of the eighteenth century, but its advantages were first made widely known by Bessel. It consists of a small telescope, with spider lines stretched across its focus in the usual way. If this telescope be now set in a fixed position, and another telescope be pointed so as to look through its object-glass, the observer at the second telescope will see the spider lines in the collimator as if they were at an infinite distance from him. Thus when a collimator is firmly fixed it may be used as a line of sight, the threads in the focus representing infinitely distant lines on which another telescope may be sighted. The peculiar feature of the collimator is that it is not mainly used to look through, but that light is sent through it in the reverse of the usual direction, so that rays emanating from a point in its focus are parallel after they emerge from the objective. S. N.

Collin, kŏl'lăn', LOUIS JOSEPH RAPHAEL: figure and portrait painter; b. in Paris; contemporary; pupil of Cabanel; second-class medal, Paris Salon 1873; medal of honor, Paris Exposition 1889; Legion of Honor 1884. His *Idyl*, a composition of two nude figures, a youth and a young girl in the open air, is a beautiful work showing fine drawing and subtile modeling. His portraits are refined in character and admirably painted. Studio in Paris.

WILLIAM A. COFFIN.

Collin d'Harleville, -dăarl'veel', JEAN FRANÇOIS: a French dramatist and poet of much merit whose works still survive on the stage; b. May 30, 1755. His first work was a comedy, *l'Inconstant*, performed at the Théâtre Français in 1786. This was followed by *l'Optimiste* (1788); *M. de Crac dans son petit castel* (1791); *Le Vieux Célibataire* (his masterpiece, 1793); *Châteaux en Espagne* (1803). These all show the poet a writer of the school of Regnard, witty, gay, master of a pointed and clever, though somewhat superficial, style. His dramatic works form four vols. in 8vo (best ed. 1822, with notice of the author by Andrieux). D. Feb. 24, 1806. Revised by A. R. MARSH.

Col'lingwood: a port of Lake Huron, on the south shore of Georgian Bay, in Nottawasaga township, Simcoe co., Ontario, Canada; on the Breton and Collingwood and the Medford Branches of Gr. Tr. Ry, 94 miles N. by W. of Toronto (see map of Ontario, ref. 3–D). It has large manufactures of lumber, leather, flour, beer, etc.; has good schools and a large trade. It has regular lines of steamers to various lake-ports. Pop. 4,940.

Collingwood: a northeastern suburb of Melbourne, Victoria, Australia. Pop. (1888) estimated, 32,334.

Collingwood, CUTHBERT, Lord: an English admiral; b. in Newcastle-upon-Tyne, Sept. 26, 1750; entered the navy in 1761. He was an intimate friend of Lord Nelson, and was distinguished as a naval tactician; followed Admiral Graves to America (1774), and was made lieutenant after the battle of Bunker Hill (1775). In 1780 he became a post-captain. He took part in the naval victory which Lord Howe gained over the French in June, 1794, and rendered important services at the battle off Cape St. Vincent in Feb., 1797. In 1799 he gained the rank of rear-admiral; in 1804 that of admiral. He was the second in command at the battle of Trafalgar, Oct., 1805, and the chief command devolved on him before the end of the action in consequence of the death of Nelson. For his part in this victory he was raised to the peerage. D. at sea near Minorca, Mar. 7, 1810.

Collingwood, FRANCIS: civil engineer; b. at Elmira, N. Y., Jan. 10, 1834; was graduated from the Rensselaer Polytechnic Institute in 1855. He has been actively engaged in the work of his profession, and has held the positions of city engineer of Elmira, assistant engineer of the East river suspension bridge, chief engineer of Newport News dry-dock, and since Jan. 1, 1891, secretary of the American Society of Civil Engineers. He is the author of a number of valuable papers published in the *Transactions* of the American Society of Civil Engineers and in other technical journals. For his paper on repairs to the Allegheny suspension bridge he was awarded the Telford premium and the Telford medal by the Institution of Civil Engineers of Great Britain. He is a member of several engineering societies of this country and Europe, a fellow of the American Association for the Advancement of Science, a member of the New York Microscopical Society, and of the New York Academy of Science.

Collins, ANTHONY: an able and liberal English writer on theology; b. either at Isleworth or at Heston, near Hounslow, in Middlesex, June 21, 1676; educated at Cambridge. He was an intimate friend of John Locke, and was a subtle disputant. Among his works, which excited much commotion and were censured by the clergy, are *Priestcraft in Perfection* (London, 1709); *Vindication of the Divine Attributes* (1710); *Discourses on Free Thinking* (1713); and *Discourse on the Grounds and Reasons of the Christian Religion* (1724). D. Dec. 13, 1729. See Cairns, *Unbelief in the Eighteenth Century*, Edinburgh (1881).

Collins, PATRICK ANDREW: lawyer and politician; b. in Fermoy, Ireland, Mar. 12, 1844; in 1848 settled in Chelsea, Mass.; was for eight years an upholsterer; studied law in the Harvard Law School and in Boston, where he has practiced since his admission to the bar in 1871. He was member of the Massachusetts House of Representatives 1868–69; State senator 1870–71; judge advocate-general in 1875; delegate-at-large to the Democratic national conventions of 1876 and 1880; member of U. S. House of Representatives 1883–89. He was chosen president of the Land League at the convention in Buffalo, N. Y., in 1884. In 1893 he was appointed by President Cleveland U. S. consul at London.

Collins, WILLIAM: English lyric poet; b. at Chichester, Dec. 25, 1721; educated at Oxford. He became a resident of London in 1744, and was a friend of Dr. Johnson. He produced in 1747 an admirable ode on *The Passions*, and lyric poems, among which are odes to Mercy and Evening. He was subject to melancholy, and was confined in an asylum in the latter part of his life. D. June 12, 1759. Among his works is the *Dirge in Cymbeline*. See Johnson, *Lives of the Poets*.

Collins, WILLIAM: landscape and genre painter; b. in London, Sept. 18, 1788; d. there Feb. 17, 1847. Pupil of Royal Academy; traveled and studied on the Continent, especially in Italy, 1836–38. His pictures are feeble in color and drawing, but were popular on account of their subjects, which showed scenes of rustic life. Royal Academician 1810. W. A. C.

Collins, WILLIAM WILKIE: novelist; b. in London in 1824. He was first articled to a tea-merchant; then entered Lincoln's Inn. His tastes, however, were decidedly literary, and in 1848 he published an excellent biography of his father, with selections from his journals and correspondence, in two volumes. After this success he devoted himself exclusively to literature and published a number of novels, which, though sometimes of a rather questionable taste, became very popular, and were translated into both French and German. The most remarkable among his novels are *Antonina* (2d ed. 1850); *Basil* (1852); *The Dead Secret* (1857); *Woman in White* (1859–60); *Armadale* (1866); *Man and Wife* (1870); *No Name*, *The Moonstone*, *Poor Miss Finch* (1872); *The New Magdalen* (1873); *Two Destinies* (1876); *The Haunted Hotel* (1878); *The Fallen Leaves* (1879); *Heart and Science* (1883), etc. His drama *The Lighthouse* was first played in private at Tavistock House, and afterward produced with great success at the Olympic theater, London. The same was the case with another drama of his, *The Frozen Deep*. D. Sept. 23, 1889.

Collinsville: village; in Canton township, Hartford co., Conn.; on the Farmington river, and the New England, and the N. Y., New Haven and Hartford railways (for location, see map of Connecticut, ref. 8–F); has four churches, good schools, a large ax-factory, and manufactures of cutlery, etc. Pop. (1880) 1,376; township (1890) 2,500: (1900) 2,678.

Collinsville: city; Madison co., Ill. (for location of county, see map of Illinois, ref. 8–D); on Vandalia R. R.; 11 miles E. by N. of St. Louis. Pop. (1880) 2,887; (1890) 3,498: (1900) 4,021.

Collision: in maritime law. See ROAD, LAW OF THE.

Collision [from Lat. *colli'sio*, deriv. of *colli'dere*; *con*, together + *lae'dere*, injure by striking]: in mechanics, the impact of two bodies, one or both of which were previously in motion. The laws of the direct impact of two spherical bodies are deduced from the principle that the sum of the momenta of the impinging bodies, estimated in a fixed di-

rection along the line of motion, is not altered by the collision. The velocities of the bodies after impact, however, depend upon the hardness and elasticity of these bodies. If inelastic and completely incompressible, they will move after impact as one body, with a velocity and in a direction which is ascertained by dividing the algebraical sum of their previous momenta by that of their masses. If compressible and not wholly without elasticity, a certain compression takes place on collision, and is immediately followed by a more or less perfect restitution of form, according to the degrees of elasticity which the bodies possess. In this case the bodies will *not* move as one body after collision, but the impinging body will move more slowly than the other, and may even have the direction of its motion reversed.

Col'litz, Hermann, Ph. D.: philologist; b. at Bleckede, Germany, Feb. 4, 1855; educated in Lüneburg Gymnasium 1869–75; Göttingen and Berlin 1875–82; assistant librarian, Halle, 1883; lecturer in the university of Halle 1885; and Professor of Comparative Philology at Bryn Mawr College 1886; author of *Die Flexion der Nomina mit dreifacher Abstüfung im Allind. und Griech.* (1885); *Die Verwandtschaftsverhällnisse der Griech. Dialekte* (1885); *Die Neuesle Sprachforschung und die Erklärung der indogerm. Ablaules* (1886); *Sammlung der griechischen Dialektinschriften*; and numerous essays and reviews both in German and English. C. H. Thurber.

Collo'dion or **Collodium** [from Gr. κολλώδης, glue-like, viscous; κόλλα, glue + εἶδος, appearance]: a clear, colorless, gummy liquid, insoluble in water or alcohol, but soluble in ether, consisting of pyroxylin or guncotton dissolved in a mixture of alcohol and ether. When dried, it gives a transparent residue, becoming electric by friction, and exploding less readily by heat, percussion, etc., than ordinary guncotton. It is used principally in photography, though it also finds application in surgery and medicine for covering wounds to exclude the air, coating caustic substances, etc. Small quantities of guncotton for the preparation of collodion are made by immersing cleaned cotton in a solution formed by dissolving nitrate of potassium in concentrated sulphuric acids. Larger quantities are made by treating cotton with a mixture of concentrated commercial sulphuric and nitric acids. Some water is added, in order to cause the formation of the lower nitro-compounds of cellulose; but if too much water is added, the cotton dissolves, instead of forming the desired compound. The operation is conducted at a temperature of about 150° F., and great care and judgment are required throughout the process. After treatment the cotton is washed with cold water, the use of alkalies for neutralizing the excess of acid having a bad effect on the quality of the collodion if it is to be used for photography. The best guncotton for this purpose shows an increase of 25 per cent. in weight over that of the cotton originally employed. In making the solution of the guncotton, if too much alcohol is employed the sensitiveness of the film and its capacity for adhering to glass are impaired; if too little, the film is apt to contract after sensitizing. Photographers make use of two kinds of collodion—the "plain" and the "iodized," the latter being the plain collodion which has received the addition of some iodides or bromides, generally the iodides of cadmium and ammonium. Plain collodion is often of two kinds—"positive" and "negative"—the pyroxylin for these being prepared according to a slightly different formula. For the "positive collodion" less water is used in the preparation of the pyroxylin.

Small balloons, lighter than those made from gold-beater's skin, are sometimes made with collodion. The liquid is poured into a flask and shaken about until the interior is completely covered; the ether and alcohol are then evaporated off by a blast directed into the flask. By drawing the air out of the flask by means of a tube suitably adjusted, the film is detached, the balloon collapses, and may be drawn out. It is then distended and dried.

Collop-Monday: the Monday after Quinquagesima Sunday; so called because on that day the faithful began to abstain from the use of flesh meat or collops.

Collot-d'Herbois, kōl'lō'dăr'bwăă', Jean Marie: French Jacobin; b. in Paris in 1750; originally a strolling player; was a member of the convention, and a partisan of Robespierre, notorious for his violence and cruelty. He became a member of the committee of public safety in 1793, and was sent to Lyons, where he caused hundreds to be put to death. In the crisis of the 9th Thermidor, 1794, he acted with the enemies of Robespierre. In 1795 he was transported to Cayenne, where he died Jan. 8, 1796.

Collu'thus: Greek epic poet of Lycopolis in the Thebaid; lived in the time of the Emperor Anastasius (491–518). One poem, *The Rape of Helen* (Ἁρπαγὴ Ἑλένης), 385 verses, has been preserved. Ed. with commentary by Lennep (1247); repeated by Schäfer (1825); text ed. by Lehrs (1841) in the Didot collection, and by Abel (1880).

Coll'yer, Robert, D. D.: Unitarian divine and a popular lecturer; b. in Keighley, England, Dec. 8, 1823. In 1847 he removed to the U. S., and became a Methodist lay preacher. Three years later he embraced Unitarian views, and, abandoning his mechanic's trade, entered the ministry. He was pastor of Unity church, Chicago, from 1859 to 1879, when he became pastor of the Church of the Messiah in New York city, where he still remains. Besides many sermons and addresses, he has published the following books: *Nature and Life* (sermons; Boston, 1867); *A Man in Earnest* (1868); *The Life that Now Is* (sermons; 1871); *The Simple Truth* (1877); *Talks to Young Men* (1887).

Colman, kōl'man, Benjamin, D. D.: Congregational divine; b. in Boston, Mass., Oct. 19, 1673; graduated at Harvard in 1692. On a passage to England he was taken prisoner by a French vessel in 1695, but finally visited England, and returned to the U. S. in 1699. He became pastor of the Brattle Street church, Boston (at that time an independent church), with which he was connected till his death. D. in Boston, Aug. 29, 1747. He was distinguished for his eloquence in the pulpit. See his biography by Rev. Ebenezer Turell, Boston, 1749. Revised by George P. Fisher.

Colman, George: English dramatic author; b. in Florence, Apr. 28, 1733. He produced in 1760 *Polly Honeycomb*, and in 1761 the *Jealous Wife*, comedies, and a good metrical translation of Terence (1764). In 1777 he became the proprietor of the Haymarket theater, London. He wrote and adapted several other dramas. D. Aug. 14, 1794.—His son, George Colman, b. Oct. 21, 1762, became director of the Haymarket theater in 1785, and wrote numerous successful comedies and farces, among which are *John Bull* (1805); *Inkle and Yarico*; and *The Heir-at-law*. He published autobiographic memoirs, entitled *Random Recollections* (2 vols., 1830). D. Oct. 26, 1836.

Colman, Samuel: landscape-painter; b. in Portland, Me., 1832. Pupil of A. B. Durand, New York; National Academician 1862; has traveled extensively abroad, and painted pictures in Italy, Spain, France, North Africa, etc. He is proficient in the use of water-colors, and frequently paints in that medium. He was one of the founders of the American Water-color Society, and its first president (1866–71). His work is notable for attractive color schemes. Studio at Newport, R. I. William A. Coffin.

Col'mar, or **Kolmar** (Lat. *Columbarium*): a city of Alsace; finely situated on the river Lauch; near the base of the Vosges, 41 miles S. S. W. of Strassburg (see map of German Empire, ref. 7-C). It is well built, and contains a cathedral built in 1363, a theater, and a college with a library of 60,000 volumes. The old ramparts have been converted into boulevards. Colmar has extensive manufactures of cotton fabrics, cutlery, paper, hosiery, and ribbons. It grew up around a royal residence called "Columbaria" (the "dovecot"), first mentioned in the eighth century. It obtained a charter of incorporation in 1226, was made a free imperial city by Frederick II., and was ceded to France in 1697. Pop. (1880) 26,106; (1890) 30,411.

Colne, kōln: a market-town of Lancashire, England; on an affluent of the Calder; 26 miles N. of Manchester by railway (see map of England, ref. 6-G). It has manufactures of calicoes, and mousseline-de-laine. Slate and limestone are quarried in the neighborhood. Among notable buildings are the Church of St. Bartholomew and the cloth-hall. Pop. of Colne and Marsden (1891) 16,774.

Col'obus [from Gr. κολοβός, docked; in allusion to the usual absence of the thumb]: a genus of long-tailed, slender-limbed African monkeys, having the thumb rudimentary or absent. There are about a dozen species, some very brightly colored, among them the Guereza monkey, whose fur has of late years been in much demand. F. A. Lucas.

Colocasia: See Cocco-root.

Colocynth [from Gr. κολοκυνθίς]: the fruit of *Citrullus colocynthis*, a plant with a perennial root and hairy, many-lobed leaves. It is said to be indigenous to Japan, but is

found very largely throughout Western Asia and Greece and in the neighborhood of the Cape of Good Hope. It is also cultivated in Spain. The colocynth fruit is prepared for use in medicine by triturating five parts of colocynth pulp and one part of powdered gum acacia with sufficient water to form a paste, which is then dried and pulverized. Chemical analysis shows that it contains a bitter principle called colocynthin and a crystallized principle which has been called colocynthitin. When taken internally colocynth acts as a powerful purgative, producing large watery movements. For this reason it is used to unload the bowels in cases of obstinate constipation, and also for the purpose of removing dropsical effusions. Because of its powerful purgative properties it has also been used as a vermifuge. It has also been used in cases of melancholia depending upon hepatic torpor, and some physicians think it possesses the property of stimulating the kidneys. H. A. H.

Cologne [in Germ. *Köln*; anc. *Oppidum Ubiorum*, afterward *Colonia Agrippina*]: a fortified city of Prussia; the capital of the province of Rhenish Prussia; on the left bank of the Rhine, 24 miles S. E. of Düsseldorf; lat. 50° 56′ N., lon. 6° 58′ E. (see map of German Empire, ref. 5–C). It is at the intersection of several important railways, and is connected with Deutz by a handsome iron bridge across the river and by a bridge of boats. Cologne is a fortress of the first rank. It is built in semicircular form close to the river. The streets are narrow. Outside the walls are fine gardens and promenades. Among the public buildings are: archbishop's palace, observatory, botanic and zoölogical gardens, public library, museum, theater, arsenal (with a curious collection of armor), seminary for the education of Catholic clergymen, three gymnasia, pro-gymnasium, normal school, and a fine city-hall. Cologne is noted for its churches, chief of which is the world-renowned cathedral, the largest specimen of Gothic architecture in the world. The cathedral was begun by Gerhard under Archbishop Konrad, of Hochstaden, in 1248. The work progressed slowly through centuries, being retarded by the Reformation. Early in the nineteenth century the Germans, moved by national enthusiasm, raised large sums of money for the repair and completion of the work, at first under the direction of Ahlert and then of Zwirner. The completion of the cathedral in 1880 was an event of world-wide interest. The structure is in the form of a cross, 510 feet long and 231 feet wide, with twin towers in front attaining the height of 525 feet. Other interesting churches are the St. Gereon's, the oldest in the city; St. Severin's, rich in old German paintings; St. Mary's, Church of the Apostles, St. Kunibert's, and St. Ursula's, the latter containing the bones of 11,000 virgins massacred by the Huns. Cologne has large manufactures of silk and woolen fabrics, cotton yarn, velvet, hosiery, lace, hats, thread, clocks, and *eau de cologne*. About 1,500,000 bottles of this perfume are annually exported from this town. It derives also much prosperity from the navigation of the Rhine, and has an active trade in grain, wine, oil, etc. Cologne originated from the Roman colony planted on that spot by Claudius in 51 A. D., and called, in honor of his wife, *Colonia Agrippina*. It was annexed to the German empire in 870 A. D., and was afterward one of the most populous and wealthy cities of the Hanseatic league. The archbishops of Cologne were princes and electors of the German empire during several centuries. Pop. (1900) 372,229. For an illustration of the cathedral see ARCHITECTURE.

Revised by C. H. THURBER.

Colombia: a South American republic, occupying the northwestern portion of the continent, and including the isthmus of Panama in Central America; bounded N. by Costa Rica and the Caribbean Sea, E. by Venezuela and Brazil, S. by Brazil and Ecuador, and W. by the Pacific. Area, by official figures, about 514,000 sq. miles; estimated population (1895) 5,000,000. It should be remembered that the limits with neighboring states are all unsettled. The Costa Rican boundary and a portion of the Venezuelan are approximately established; but vast portions of the southeastern plain are claimed, with about equal justice, by Venezuela, Brazil, and Ecuador. These regions are unexplored, and it will be impossible to settle the division of them for a long time to come. This does not, however, affect the statistics of population, the disputed lands being occupied only by wild Indians.

Topography.—The Andes, entering from Ecuador, divide in Southwestern Colombia into three great branches: the Western, Central, and Eastern Cordilleras. The Western Cordillera, at first parallel to the Pacific coast, recedes from it northward and becomes lower and broken until it dies out E. of the Gulf of Darien. The Central Cordillera is the culminating range, many of the peaks rising above the snow limit; separating the valleys of the Cauca and Magdalena, it is continued nearly to the junction of those rivers. The Eastern Cordillera, properly a branch of the Central one, takes a general N. N. E. direction until it passes into Venezuela S. of Lake Maracaybo; it has few very lofty peaks, but broadens out into elevated hilly regions and plateaus from 5,000 to 12,000 feet high, the finest and most thickly populated portions of Colombia. A branch extends northward on the Venezuelan frontier, nearly to the sea. W. of the northern extremity of this branch, on the Caribbean coast, is an isolated mountain region with a culminating mass, the Sierra Nevada de Santa Marta, 17,018 feet high (Brettes and Nuñes, 1891). Tolima, in the Central Cordillera, attains 18,426 feet, and is probably the highest peak in Colombia. The ISTHMUS OF PANAMA (*q. v.*) is hilly rather than mountainous, and its central ridge is much broken. A branch of the Panama hills is continued southward along the Pacific coast to about lat. 5°. Farther S. the coast region is low and often swampy.

Between the mountain-ranges and their attendant table-lands are three great north and south depressions, the valleys of three rivers which flow to the Caribbean Sea. The westernmost and smallest of these is the Atrato valley, between the Western Cordillera and the coast range, and hardly separated at its head from the San Juan valley, which opens to the Pacific. The whole Atrato depression is low, and much of it is swampy. The Cauca and Magdalena depressions occupy the spaces respectively between the Western and Central and the Central and Eastern Cordilleras; broadening out northward, they unite in the great plains of the Caribbean coast, with wide flood-lands along the rivers.

From the Eastern Cordillera a table-land of unknown extent stretches E. and S., with an average elevation of 1,500 or 2,000 feet, and with several ranges of higher hills. This table-land is similar to the plateaus of Brazil and Guiana, and structurally may be regarded as a portion of them. It is cut deeply by river-valleys, and the edges fall abruptly to the low plains of the Amazon and Orinoco, an immense, trackless forest. The escarpments are the so-called Caquetá Mountains.

Rivers.—The MAGDALENA (*q. v.*) is the great interior highway, small steamers and boats ascending it to Honda, not far from Bogotá. Its tributary, the Cauca, is navigable for a considerable distance. The Atrato has been described as a moving swamp; it is partly covered with floating vegetation, but there is generally a clear channel, and steamers can ascend it during the floods. On the Pacific side there are no important rivers. Colombia lays a vague claim to the northern shore of the Amazon from the Napo nearly to the Rio Negro, with the whole of the great branches, the Putumayo or Içá, and the Caquetá or Japurá. Both of these branches are navigable, and their upper courses are certainly in Colombian territory. At present they are frequented only by Brazilian rubber-gatherers; river steamers of the Amazonian Company ascend them for some distance in the rubber season, and occasional travelers have reached the highlands of Colombia by the Içá. There can be no doubt of their future importance as channels of communication. The Uapés, flowing into the Rio Negro, and the Guaviare and Meta, branches of the Orinoco, are hardly less important. Numberless smaller streams in these plains are as yet unexplored.

Volcanoes and Earthquakes.—In Southeastern Colombia there is a group of active and extinct volcanoes, the most important being Puracé (near Popayan), Huila, Azufral, Pasto, and Chiles. Tolima and other peaks of the Central and Western Cordilleras are extinct volcanoes. All the mountain region is subject to earthquakes.

Climate.—This varies extremely in different parts, not only with the elevation, but as the winds have free access or are cut off by the mountain-chains. Generally speaking, the coasts, lower river-valleys, and the northern and southeastern plains are hot, damp, and in parts very unhealthful; the central plateaus and mountain-flanks have a delightful temperate climate, with abundant rains. In Southwestern Colombia some of the elevated plains are so dry as to be practically deserts.

Vegetation.—In proportion to its area Colombia has more forest than any other country in South America. The Isth-

mus of Panama, the Pacific, and Caribbean coasts, the valleys of the northern rivers, and the great southwestern plains are all covered with dense tropical growth, and similar forests extend far up the mountain-sides. On the plateau they give place, where the land has not been cleared, to woods of oaks and other trees of temperate climates, and still higher to pines. E. of the Eastern Cordilleras are extensive llanos, or grassy plains, occupying much of the Caquetá table-lands and continuous with those of Venezuela. The low flat lands extending from the lower Magdalena around the southern side of the Santa Marta Mountains are in great part covered with grass, and there are similar plains W. of the Magdalena.

Minerals.—Gold and silver are almost the only metals extracted, and the mountain regions are rich in both. The principal gold district is in the central department of Antioquia, between the Cauca and Magdalena, where the present annual production is about $2,000,000; the entire gold output of Colombia is about $3,000,000. The yearly output of silver is valued at about $1,250,000, the richest mines being in Tolima and Cauca. During the colonial period the yield of precious metals was very large. Copper, lead, and platinum exist, but are not extensively mined. The emerald mines of Muso, department of Boyacá, are the richest in the world, and the principal source from which this gem is obtained. Coal-beds are reported in various parts of the country, and there are extensive beds of rock-salt and salines, at present worked only for home consumption.

Plants and Animals.—These have a general resemblance to those of other parts of tropical America. (See AMERICA, SOUTH.) The number and variety of species of both is wonderful; Colombia has been called the paradise of naturalists. The birds and insects are especially numerous and beautiful. Among the common mammalia are jaguars, tapirs, deer, wild hogs, monkeys, ant-eaters, and in the mountains bears and llamas. The forest products include rubber, cinchona, ivory nuts, vanilla, mahogany, and other cabinet woods, and various drugs.

People and Government.—The civilized population is confined to the northern and western portions, and in great part to the highlands and plateaus. E. of the Cordilleras the vast forests are inhabited only by savage Indians, and but small portions have ever been explored; the Panama isthmus and the lower river-valleys are very thinly populated. The chief towns are Bogotá, the capital (120,000 inhabitants); Medellin (40,000); Bucaramanga (20,000); Cali (16,000); and the ports of Panama (30,000) and Cartagena (20,000). Probably three-fourths of the people are of Indian or mixed race; the African element is small. Spanish is the universal language, except with uncivilized Indians. Colombia is a centralized republic, somewhat resembling France in theory. The president and vice-president are chosen by an electoral college for six years, and the ministers, nominated by the president, are theoretically responsible to the senate for their acts. There is a council of state of six members. Congress consists of a senate and house of representatives. There are twenty-seven senators, chosen by the departmental legislatures, three from each department, and one representative for every 50,000 inhabitants; the suffrage is limited by educational and property qualifications. Practically, the president has almost absolute power, the more so as he is eligible to immediate re-election. The country is divided into nine departments (corresponding nearly to the old states), each with a governor appointed by the president, and an assembly elected by the people. The department of Panama, however, is ruled directly by the national government. The state religion is Roman Catholic, but other sects are tolerated. There have been great improvements in the educational system. Nearly 100,000 pupils are taught in the public schools, and there are numerous private schools. The state supports 14 normal schools; there are 3 universities, several seminaries, good libraries in some of the cities, and an observatory at Bogotá. The legal system of weights and measures is the metric.

Finances.—Interior debt (1900) about $11,359,074; foreign debt, $17,080,188. The estimated revenue for the fiscal year 1899–1900 was $29,918,640, and the estimated expenditure $29,918,640. These figures do not include the finances of the departments. The peso is nominally a dollar, but is actually worth from 50 to 85 cents, depending on the coinage. Gold is no longer coined; the circulating medium is silver and paper.

Industry and Commerce.—Agriculture and grazing are the principal industries, and do little more than supply the home demand. Manioc, plantains, sugar-cane, cacao, and tropical fruits in the lowlands, coffee and tobacco on the slopes, and maize, potatoes, beans, etc., on the plateaus, are the common crops. Extensive herds of cattle, and smaller ones of horses and mules, are pastured on the llanos. Coarse cotton and woolen cloths, unrefined sugar, molasses and rum, cigars, leather-work, furniture, and hats are about the only manufactures. The annual exports average about $15,000,000, the principal items being coffee, gold, silver, hides, tobacco, cacao, india-rubber, and cabinet woods. The largest export and import trade is with Great Britain. In 1900 the imports from the U. S. were officially valued at $2,710,688, and the exports to that country at $4,307,814. The transit commerce across the Isthmus of Panama is free of duty, and exceeds $90,000,000 annually.

Colombia has as yet very few railroads, consisting of the Panama line and a few short isolated tracks, connecting the cities with navigable waterways. In 1898 the aggregate in operation was 389 miles. Interior commerce is mainly by the rivers and by ox-carts and mule-trains, often over very bad roads.

History.—Before the conquest the highlands about Bogotá were dominated by the Chibcha or Muysca Indians, a powerful tribe which had attained some degree of civilization. (See CHIBCHAS.) The lowlands and coasts were inhabited by savage hordes. The northern coast was discovered by Bastidas in 1500, and Columbus followed the shores of Panama in 1502. Darien was founded in 1510 and Panama, Santa Marta, Cartagena, and Nombre de Dios within a few years after. In 1535 Benalcazar marched N. from Quito and conquered Popayan, and in 1536 Queseda, at the head of a band of Spaniards from Santa Marta, reached and captured the Chibcha capital. On the highlands of Bogotá, Queseda, Benalcazar, and a third band, that of Federmann from Venezuela, met, and their united forces soon reduced the Indians. Spanish settlements rapidly sprung up. For a long time the provinces of this region were subordinate to the Viceroys of Peru; but in 1740 the viceroyalty of New Granada was formed, including the present Colombia, to which Quito and Venezuela were attached later. An insurrection against Spain began in 1811, following that of Venezuela in the general revolution in Spanish South America. The first movement was crushed, and hundreds of patriots were shot in cold blood; but the war broke out again, and on Aug. 7, 1819, Bolivar's victory at Boyacá opened his way to the capital. In December of that year Venezuela and New Granada were united in the republic of Colombia, with Bolivar at the head; Ecuador was annexed soon after. The union was dissolved in 1831, and the republic of New Granada was formed. But the country was in a restless state; political struggles and revolutions followed, and the form of government was modified or changed as the federalists or centralists were in power. In 1861 a federal constitution was adopted, and the country took the name of the United States of Colombia. The present constitution dates from 1886.

HERBERT H. SMITH.

Colom'bo: a seaport-town and the capital of Ceylon; on its west coast, in lat. 6° 55′ N. and lon. 79° 45′ E.; near a rocky headland, the *Jovis extremum* of Ptolemy (see map of S. India, ref. 8–E). It is fortified and defended by seven batteries, besides several bastions, etc. The harbor is small, and is only safe during the southeast monsoon. The mean temperature is about 80° F., and the average annual rainfall is 72·4 inches. Colombo has a lighthouse, a military hospital, a government-house, and churches for the English, Dutch, and Portuguese. The houses are mostly of one story, each having a veranda in front. Many of the Europeans reside in the suburb Colpetty. Most of the foreign trade of Ceylon is transacted at this port. It was occupied by the Portuguese in 1517, taken by the Dutch in 1603, and conquered in 1796 by the British, who still possess it. Pop. (1891) 126,926. See Carpenter, *From Adam's Peak to Elephanta* (1892).

Colombo, REALDO: Italian anatomist; b. at Cremona; succeeded Vesalius as professor at Padua in 1544; was re-

puted discoverer of pulmonary circulation. He wrote *De Re Anatomica*, an important work (1559). D. about 1576.

Colombo Root: the root of *Jateorhiza palmata*, a menispermaceous vine from Eastern Africa. It contains colombin, berberine, and colomic acid, starch, coloring-matter, etc. It is one of the most useful of the mild tonics.

Co'lon (in Lat. *colon*; Gr. κῶλον): in anatomy, that part of the large intestine which leads from the cæcum to the rectum. In the adult of the human species it is about 4½ feet long, and consists of four portions—the right or ascending, the transverse, and the descending colon, and the sigmoid flexure (so called from its resemblance in shape to the ancient form C of the Greek letter *sigma*, Σ). The colon, owing to the peculiar arrangement of its muscular fibers, consists of a series of pouches which serve to detain the contents of the intestines on their way to the rectum. The colon is provided with numerous glands, which assist in removing the waste matters from the blood. It is believed also to have the power to some extent of digesting food; and it is certain that persons who are unable to swallow food have often been kept alive for a long time by nourishing liquids thrown into the intestinal canal by enemata.

Colon, kō-lōn′, Colombia: See ASPINWALL.

Colon: a territory of Venezuela, comprising the islands lying off the state of Guzman Blanco, in about lat. 12° N., and between lons. 66° and 68° W. It consists of the two groups Aves (birds) and Roques (rooks), and the island of Orchilla. The capital is on the Gran Roque, but it consists of little but the administrative buildings. The total area is 166 sq. miles. Pop. (1890) 238, chiefly fishermen.

M. W. H.

Colon: a northeastern department of Honduras; bounded N. and N. E. by the Caribbean Sea, S. by Olancho and Yoro, and W. by Yoro. Area, 7,000 sq. miles. It includes all the northern coast E. of lon. 87° 10′. The coast lands and most of the eastern portion are low, flat, and unhealthy; the interior is diversified by mountain-ridges with fertile valleys between. Much of the surface is covered with forest, and mahogany-cutting and rubber-gathering are the principal industries. Pop. less than 15,000, besides a few thousand wild Indians. Capital, Truxillo.

HERBERT H. SMITH.

Colon de Portogallo, PEDRO NUÑO, de: a Spanish nobleman; b. about 1600. He was a descendant of Christopher Columbus, and inherited from his line the titles of Duke of Veragua and Marquis of Jamaica. These titles were contested in 1620 by Luis de Avila, another descendant, but after a lawsuit, continued until 1664, the claim was settled in favor of Pedro Nuño. He was appointed twenty-sixth Viceroy of Mexico in 1763, but died six days after taking the office at Mexico city, Dec. 13, 1673. HERBERT H. SMITH.

Colonel, kėr′nel [in sixteenth century *coronel*, whence the present pronunciation = Fr. *coronel*, by dissimilation of *l-l* from Ital. *colonello*, chief or commander of a column, deriv. of *colonna*, column]: a military title formerly applied to the chief of a body of men varying in size from a band of partisans to a brigade or division. For many years it has been restricted to the commander of a regiment whose rank is next below that of a general. With the modern organization of regiments into battalions commanded by majors, the personal presence and voice of the colonel can no longer direct all the men of the regiment, and his command on the field assimilates more nearly to that held by a brigadier-general. As the regiment is still the administrative and historical unit, however, he still retains his position as its responsible head, and is permanently attached to it.

Colonia: a department of Uruguay; occupying the southwestern part, with a coast of about 180 miles on the Plata and Uruguay. Area, 2,193 sq. miles. Portions of the northern and eastern parts are covered by high hills, and are somewhat sterile; the remainder consists of beautiful grassy plains well adapted for agriculture and grazing. Cattle raising and wheat culture are the principal industries. There are several thriving immigrant colonies. Pop. (1890) 38,233. Capital, Colonia. HERBERT H. SMITH.

Colonia: town of Uruguay; capital of department of same name; on the Rio de la Plata (see map of South America, ref. 8–E). It has one of the best harbors of the Platine estuary, and is regarded as an important strategic point. The trade is considerable, small steamers plying daily to Buenos Ayres and Montevideo. A submarine railway and graving-dock have been constructed here. Colonia is one of the oldest towns on the Plata. In 1670 the Portuguese from Brazil formed a settlement here which they called Colonia do Sacramento. The Spanish disputed their right to the place, and it was long a bone of contention between the two governments. It was more than once bombarded, and in 1777 was quite destroyed. In 1807 it was occupied by the English. The present population is about 2,000.

HERBERT H. SMITH.

Colonial Congress, The First: the Congress held in the city of New York in May, 1690. Immediately after the attack on Schenectady the government of Massachusetts sent a circular letter to all the colonies as far S. as Maryland, inviting them to send commissioners to New York to discuss and adopt some common plan of defense; and, indeed, the Congress, consisting of delegates from Massachusetts, Connecticut, and New York, planned the campaign against Canada.

Colonial System: the restriction of the trade between a mother country and its colonies to the ships, agencies, and channels of that nationality only. This policy was thought to bind the colony closer to its parent; to keep in their hands jointly all the profits of their commercial intercourse; also to build up a commercial marine as a reservoir for ships and men in time of war. Now in case of war with an important naval power like England, the connection between the parent and its colonies became very hazardous. So it became the practice under such circumstances to throw this colonial trade open to the neutral. To meet this the British prize courts put in force what is called the rule of 1756. Neutral ships taking part in time of war in a carrying trade closed to them in time of peace were considered by this theory to have become so identified with the interests of the belligerent as to have become incorporated into his commercial marine, and therefore to be subject to capture. This rule in turn was evaded by the neutral ship-owner by touching at some home port on the voyage between colony and mother state and going through the form of trans-shipment. The British admiralty courts cut away this defense by applying the doctrine of *continuous voyages*. By this the character of the voyage was not held to be altered in spite of the touching and entry of goods at an intermediate neutral port. The voyage was one continuous voyage between the colony and its parent, nevertheless. Unrestricted trade between all countries has long since done away with the colonial system, though perhaps the policy of permitting the coasting trade of a country to be engaged in only by its ships may be considered a survival of its spirit. See CONTINUOUS VOYAGES. THEODORE S. WOOLSEY.

Colonization Society: See LIBERIA.

Colon'na: the name of a celebrated noble and powerful Roman family which has produced many eminent generals, ecclesiastics, cardinals, and authors. This family acquired distinction as early as the twelfth century. In the succeeding centuries they were adherents of the Ghibelline party. Otho Colonna was elected pope in 1417. (See MARTIN V.) The Colonna Palace in Rome is celebrated for its rich treasures of art.

Colonna, Cape: See CAPE COLONNA.

Colonna, Fra FRANCESCO: a Dominican monk; b. at Venice about 1449; Professor of Theology at Padua, and author of a work, *Hypnerotomachia Poliphili* (1499), a singular *mélange* of fables, antiquities, and architecture, which Symonds (*Renaissance in Italy*, vol. iv.) regards as a kind of epitome of the spirit of the early Renaissance. D. in 1527. A. R. M.

Colonna, VITTORIA: Italian poet; b. in 1490; daughter of the grand constable of Naples. She made an early marriage (Dec. 27, 1509) with Ferrante d'Avalos, Marquis of Pescara, who became later one of the most noted soldiers of his time. Her fame, however, is due in the first place to her own poetical gifts, and in the second place to the fact that aged Michael Angelo conceived for her an affection which made of her, as it were, the Beatrice or Laura of his declining years. Her earlier poetry was the outcome of love and admiration for a husband who had little affection to give her in return, and who, in fact, had a character of very mixed quality. Nevertheless, after his death (Nov. 25, 1525), she idealized him and celebrated him in ardent lyrics. Later in her widowhood religious impulses acquired ascendency over her, and her *Rime Spirituali* constitute perhaps the most important part of her poetical achievement. She was,

however, a woman of broad culture, familiar with the then new-found world of classical literature and art, interested in the philosophy of the ancients as well as in the teachings of the Church. She found sympathy from Michael Angelo both on the side of art and on that of her religious aspirations. He admired and celebrated her both while she lived and after her death. D. Feb. 25, 1547. See *Vittoria Colonna, Rime e Lettere* (Florence, 1860); Giuseppe Campori, *Vittoria Colonna* (Modena, 1878); A. v. Reumont, *Vittoria Colonna. Leben Dichten, Glauben im 16 Jahrhundert* (1881); Mrs. Henry Roscoe, *Vittoria Colonna, her Life and Poems* (1868). A. R. Marsh.

Colonnade [Fr. deriv. of *colonne*, column]: an architectural feature; a row of columns with all that goes with them, as the entablature above, the stylobate (if any) below, sometimes the space inclosed behind them, with its roof, etc.

Colony [from Lat. *colo'nia*; deriv. of *colo'nus*, planter, farmer]: a foreign settlement formed by emigrants under the protection or control of the mother country. The term is no longer limited to its original meaning of a body of farmers or cultivators (*coloni*), but includes any group of settlers whatever be their purpose or occupation, so long as they remain in any form of political dependence upon the home country, and it is sometimes loosely applied to such a settlement even after the tie between it and the parent state is broken. The chief colonizing nations of antiquity were the Phœnicians, Carthaginians, Greeks, and Romans. The Phœnicians established their colonies as commercial outposts on the coasts of the Mediterranean as far west as Spain, and traces of a Phœnician settlement have been found in the island of Britain, where the tin mines of Cornwall are said to have been worked by their colonists. Carthage, itself a Phœnician colony, became an independent state, and founded colonies of its own which added greatly to its commercial power. The Greeks began to plant colonies before the beginning of authentic history, and the Æolian, Dorian, and Ionian settlements in Asia Minor, named according to the tribes from which they sprang, were bound by no definite political ties to the people of Greece proper, though they recognized them as kinsfolk. The same is true of Magna Græcia (Southern Italy), and of Syracuse in Sicily. With Rome, however, colonization was for political rather than commercial ends. It was a part of her system of universal dominion, the means by which she Romanized her conquered provinces and fused them into an empire. Each new conquest was followed by the planting of colonies, which were not permitted to forget their origin or establish their independence. From the fall of Rome to the end of the Dark Ages no colonies in the proper sense of the word were established, though the map of Europe was frequently changed by the migration of whole peoples. With the rise of the Italian cities colonization was renewed and Venice and Genoa owed their main strength to their colonies in the Levant. After the voyages of Columbus and Da Gama, the nations of Western Europe took the lead in colonization. Portugal planted colonies in Africa, India, and South America; Spain in North and South America and the West Indies; while England, France, and Holland contended with varying success for a share of the new lands. In the sixteenth century Spain's colonial dominion was the greatest in the world and she herself the wealthiest nation. While the Christianization of the natives was a part of her general scheme, the paramount object was the enrichment of the mother country, and little concern was felt for the welfare of either natives or colonists. This policy, carried out by those restrictions on colonial trade which made up the so-called Colonial System (*q. v.*), was common to all these nations. The decline of Spain's colonial power began in the seventeenth century and continued steadily, until, in the early part of the nineteenth century, she lost all her South American colonies; while Great Britain, after driving the French and the Dutch from India, and the French from Canada (1763), succeeded to her place, becoming, as she has since remained, the greatest colonial empire in the world.

For details, see Leroy Beaulieu, *De la Colonization chez les Peuples modernes* (1886). F. M. Colby.

Col'ophon [from Lat. *colophon*, finishing stroke = Gr. κολοφών]: an inscription, monogram, or other design placed on the last page of a book. The colophon formerly gave the date, printer's name, etc., with much of the information now conveyed on the title-page.

Colophon (Gr. Κολοφών): an ancient Greek city of Ionia, in Asia Minor; on the river Ales or Halesus; about 9 miles N. of Ephesus. It was one of the seven cities which claimed the honor of being the native place of Homer.

Col'ophony [from Lat. *Colopho'nia re'sina*, resin of Colophon, its former place of export]: resin of pine; rosin: a name now obsolescent. See Rosin.

Color: The structure of the eye and of the elaborate nervous system connected with it enables us to distinguish form and degrees of light and shade, and in addition to these to recognize differences in the *quality* of the light which falls upon the retina. This power of distinguishing between kinds of light constitutes the color-sense. The sense of color has often been compared with that by means of which we distinguish the pitch and *timbre* of musical notes, but the analogy is not a very close one. In many respects the function of the eye seems much more complex and highly developed. The entire group of light waves which affect the retina are comprised within a single octave, so that the range of sensibility of the eye may be said to be less than that of the ear. Within that narrow range, however, at least 1,000 monochromatic tints are distinguishable. These may be taken in combination with each other and with white, the total number of distinct color-impressions thus capable of being formed being very large (according to Rood, about 2,000,000). The sensitiveness of the eye to dilute mixtures of coloring-matter with white is astonishing. The average observer of fifty-four persons whose power in this respect was tested could detect the presence of

25·2 parts of red lead in 100,000,000 of white;
23·9 " chromate of lead in 100,000,000 of white;
864·2 " chromic oxide in 100,000,000 of white;
126·5 " ultramarine in 100,000,000 of white.

Nichols, *American Journal of Science*, vol. xxx., p. 39.

The amount of energy which is necessary to produce vision is even less than that which will give the impression of color. Langley found that when the energy of a light ray of green reached 0·0000001 erg, an observer became aware of its action, but that the wave-length as indicated by the color could not be detected until the ray was much stronger.

Complicated as color-effects at first appear to be, it is found that they can all be explained as the resultant of three primary color-sensations: the sense of red, of green, and of violet. It is generally assumed that there is a triple mechanism in the nervous system of the eye, by means of which these three fundamental sensations are received and transmitted to the brain. The absence of one of them, usually that of red or green, constitutes "color-blindness" or Daltonism. The color-blind eye, then, possesses a color system which depends upon *two*, the normal eye a system which involves *three*, primary sensations.

Whenever, in the case of the normal eye, all three primary impressions are produced in equal strength, the resultant is white. All other colors, even those induced by monochromatic light, differ from white simply in the relative strength of the three components.

The chief source of color in external objects is the selective absorption of the different wave-lengths of light by the various substances in question.

Selective absorption is a property common, so far as known, to all forms of matter. Light reflected by the surface-layer is, in general, unchanged in composition. This, however, is only a small portion of the light which the body reflects. The greater part penetrates the body and is reflected from within. In its path within the substance the various wave-lengths which go to make up the incident ray suffer loss in various degrees. Some, to which the body is opaque, will be entirely suppressed; others will pass with but little diminution of brightness. The result is that the ray finally reflected and reaching the observer's eye differs more or less in composition from the incident ray, and it is upon this difference that the color of the body depends. A body reflecting light without modification would be a *true white*. No such body, so far as known, exists. A body which absorbs all light reaching it and reflects none would be a *perfectly black* body. The nearest approach to such a perfect black is probably lampblack, but the reflection from it amounts to nearly 3 per cent. It should be described as a white of low intensity. Lampblack illuminated by direct sunlight is as bright as the average cloudless sky at 45° from the sun.

A monochromatic tint in color is one produced by some ray of single-wave length. Such are the colors of the pure spectrum. The colors of the spectrum, however, are not simple, from the physiological point of view, since each sep-

L.L. POATES, ENGR., N.Y.

arate wave-length of the visible spectrum excites, in some degree, all three of the primary color-sensations already described, so that the resulting impression is of the same degree of complexity as that due to sunlight or to any ordinary source.

The color of pigments is never even approximately monochromatic. It is always simply white, with certain wave-lengths weakened by absorption within the body of the pigment itself.

Next to selective absorption, and scarcely secondary to it as a source of color, is *diffraction*. To the class of diffraction colors belong the tints of the bubble and of all thin films, the colors of mother-of-pearl, of the brilliant tropical beetles, and much of the coloring in insect life. Also to this class belong the hues presented by the plumage of the humming-bird, and, indeed, all those colors in nature to which the term "iridescent" may be applied. Color in these cases is due to *interference* of the light rays reflected from the surfaces in question. See COLOR-BLINDNESS, COMPLEMENTARY COLORS, INTERFERENCE OF LIGHT, OPTICS, and THIN PLATES, COLORS OF. See also Rood's *Text-book of Color*; Church's *Chemistry of Paints and Painting*; Campbell and Garnett's *Life of James Clark Maxwell* (part ii.); Abney and Festing in *Trans. Royal Soc.* (vol. clxxix.); Nichols and Snow in *Phil. Mag.* (vol. xxxii., series 5, p. 401).

EDWARD L. NICHOLS.

Colors, Accidental: colors depending on the momentary fatigue of a portion of the retina for any color to which it has been exposed. Neutral surfaces then appear of a shade complementary to that which produced the fatigue. If we look for a short time steadily with one eye upon any bright-colored spot, as a wafer on a sheet of white paper, and immediately after turn the same eye to another part of the paper, a similar spot will be seen, but of a different color. If the wafer be red, the imaginary spot will be green; if blue, it will be changed into yellow; the color thus appearing being always what is termed the complementary color of that on which the eye was fixed.

Colorado, kol-ō-raa'dō: a river of Texas; rises in the high table-lands in the northwestern part of the State. Its general direction is southeastward. It passes by Austin City, Bastrop, and Columbus, and enters Matagorda Bay near the town of Matagorda. Total length estimated at 850 miles. Steamboats can ascend it above Austin City.

Colorado (called the "Centennial State," because admitted into the Union in 1876): a central State of the "New West"; between 37° and 41° N. lat. and 102° and 109° W. lon.; 280 miles from N. to S. and 370 from E. to W. Area, 103,925 sq. miles; equal to New York, Pennsylvania, New Jersey, and Delaware.

Colorado seal.

Colorado, by census of 1900, ranked thirty-first among the States in population.

Topography and Surface. — The Great Plains, from the Missouri river to the Rocky Mountains, rise gradually till at the foot-hills they are 6,000 to 7,000 feet high. The east third of Colorado belongs to this lofty plateau; the Rocky Mountains and their parks and the valleys beyond occupy the rest of the State. The principal chains are Colorado Front range; North Colorado or main range, uniting at South Park with Front and Saguache ranges, and forming Sangre de Cristo range; the Park range, W. of the great parks; the Saguache range, which is now conceded to be the Great Divide of the Rocky Mountains; W. of this, numerous spurs and short chains running N. W., W., and S. W., and beyond and between them a lofty plateau extending to the east wall of the great Utah basin. Through this plateau the Grand, Green, and Gunnison rivers, affluents of the Colorado of the West, cut their deep cañons. The parks, of which the North, Middle, South, San Luis, Egeria, Estes, Animas, and Huerfano are the largest, are broad valleys, originally the beds of inland lakes or seas. There are about forty peaks in Colorado over 14,000 feet, and some hundreds between 11,000 and 14,000 feet high. The rivers of Colorado are the north fork of Platte, South Platte, Republican, Arkansas, Rio Grande, San Juan, Gunnison, Grand, White, Green, and their affluents. None of these is navigable. The cañons of the Arkansas, Rio Grande, San Juan, Gunnison, Grand, and Green are from 2,000 to 5,000 feet deep, and of wonderful and terrible magnificence. Wonderful results of ages of erosion can be seen in the "City of the Gods" in the N. W., the "Garden of the Gods," etc. There are numerous small lakes; San Luis is the largest.

Minerals.—Gold and silver are found in about two-thirds of the counties of the State; copper alone and with gold, lead alone and with both silver and gold, zinc alone and with silver, iron with gold and alone in great quantities; platina, quicksilver, tellurium in combination with gold, silver, and copper; coal, both bituminous and anthracite (the latter probably from the Tertiary altered by volcanic action); gypsum, salt, kaolin, pottery clays, and many precious stones.

Vegetation and Soil.—The arable lands of Colorado comprise 15,000 miles or more of its area, and the grazing lands at least 70,000 miles or more. The arable lands are generally fertile, but most of them require irrigation, and produce enormous crops under its influence. The grazing lands require less water—only enough to water the flocks and herds. Some of the irrigating canals, both in the north and south parts of Colorado, are very large and long. One, of an English company, is 54 miles long; another 34 miles; others less. The mountain-slopes are generally covered with forests of pine, spruce, fir, etc., but the consumption of timber is enormous. The native grasses of Colorado are rich and nutritious; the flowers mostly sub-alpine, but very beautiful.

Animals.—The grizzly bear W. of Rocky Mountains, the black and brown bear and the jaguar in the W., the cougar in the N. W., the gray wolf E. and W., the prairie wolf E. of Rocky Mountains; the elk (wapiti), Virginia, and mule deer are numerous; antelope frequent the plains; the big-horn or mountain sheep and the Rocky Mountain goat are found in the mountains, and all the rodents and munchers are numerous. The buffalo formerly ranged over the grand parks and along the extensive plains. Birds of prey and game-birds are very plentiful, and song-birds in the mountains. The Rocky Mountain locust and the Colorado beetle, or potato-bug, if originating here, do most of their mischief elsewhere. There are remarkable fossils of mammals and reptiles. The returns of 1899 report 145,713 horses, 8,580 mules and asses, 1,115,421 cattle, and 2,185,327 sheep. The value of live stock in 1899 in Colorado was $42,400,146.

Climate.—Owing to the general elevation, the climate of Colorado is temperate; rather too cool than too hot. The mean annual temperature of the towns, which range from 5,000 to 11,000 feet above the sea, is from 48·5° to 49·3°; summer mean, 64·6° to 69·2°; winter mean, 31·3° to 32·8°; extremes, 93° to 99° maximum in summer, with from six to thirty days, according to elevation, above 90°; minimum in winter, — 3° to — 12°, with an average of six to twenty days below zero. The nights are always cool; average rainfall, 18·84 inches, which is increasing. Consumptives do well if they do not seek an elevation much above 6,000 feet, and if they remain there.

Industries.—Agriculture is an important industry, especially in the northeastern part of the State, where the conditions under which agricultural operations are carried on are similar to those in the western portions of Kansas and Nebraska. The total area under cultivation in 1900 was 1,434,412 acres; the total value of products $22,448,178. In 1900 Colorado produced: wheat, 7,207,117 bush.; corn, 3,188,941 bush.; oats, 3,272,390 bush.; barley, 314,266 bush.; rye, 39,480 bush.; potatoes, 1,863,288 bush.; hay, 1,783,133 tons. Fruit culture is extensively carried on. The mining, smelting, and reducing of the precious and other metals have made the State a prominent one. Gold-mining has passed through three stages since 1859—placer and hydraulic mining; refractory ores, sulphurets, and tellurides of gold and iron; and the present era of free milling gold and easily reducible ores. In silver-mining there has been a constant succession of surprises. Sulphurets of lead and silver, the argentiferous galena so common elsewhere, do not abound in Colorado, but instead there are silver and

copper, silver and zinc, silver and iron, ruby silver, horn silver, silver with manganese and iron, chloride of silver, tellurides, and, largest and best of all, carbonates of lead and silver. Then, too, the way in which the silver ores occurred was new. There were some pockets, some fissure veins, some chloride belts, and in and around Leadville no fissure veins, but blankets or layers of carbonate of lead charged more or less with silver and of great extent, but not of great depth. These new conditions have made silver-mining very important in Colorado, which produces more than one-third of the total yearly output of silver in the U. S. It was not till 1872 that the annual output of silver exceeded that of gold; and though the gold product has greatly increased, it is still somewhat less than that of silver. The value of gold from Colorado deposited at the mints from 1893–99 was $113,516,914, of silver $209,721,399. The product of silver in 1899 was $29,301,527, that of gold $25,-982,800. In 1899 iron ore was produced to the amount of 307,557 tons. In 1898, 91,222 tons of pig iron were manufactured. The coal industry is important; 4,776,224 tons were mined in 1899. Cattle-herding, sheep-raising and the wool traffic are active industries.

Education.—There is an excellent public-school system in Colorado: graded and high schools in the larger towns; a State university at Boulder, a college at Colorado Springs, a State agricultural college at Fort Collins, State school of mines at Golden; special schools and collegiate schools of high character. The school census of 1899 showed 143,335 children of school age, that of 1900 gave 153,634. This indicates an enrollment of over 118,000.

* Reference for location of counties, see map of Colorado.

Churches.—All the religious denominations are well represented, the Roman Catholics perhaps leading in adherent population.

Population.—In 1860 Colorado had 34,277 inhabitants: in 1870 39,864, besides 7,480 tribal Indians; in 1880 194,327; in 1890 412,198 (white 404,468, colored 7,730, besides 612 Chinese and 1,083 Indians); in 1900 539,700; 1,700 Utes were removed to Utah in 1880, mostly living on reservations.

The *principal towns* are Denver (capital), population in 1900, 133,859; Pueblo, 28,157; Colorado Springs, 21,085; Leadville, 10,384; Cripple Creek, 10,147; Boulder, 6,150; Trinidad, 5,345; Victor, 4,986; Cañon City, 3,775; Florence, 3,728; Salida, 3,722; Grand Junction, 3,503; Durango, 3,317; Aspen, 3,303; Central City, 3,114; Fort Collins, 3,054; Greeley, 3,023; Colorado City, 2,914; Longmount, 2,201; Ouray, 2,196.

History.—Civilized Cherokees attempted to explore Colorado in 1857, but were driven back by Indians; in 1858 it was explored at two points—near Pike's Peak by a company from Kansas, and in the S. W. by Georgians under Baker, who was afterward killed by the Indians at the Colorado River; both found gold. In 1859 Clear Creek gold deposits were discovered; great emigration in 1859, 1860, and 1861. Territory organized in 1861; gold plenty, but difficult of extraction; not much silver till after 1870; fine climate and fine grazing lands; soil very rich and productive when irrigated; irrigation practiced in the N., herding in the E., and gold-mining in the central part. Attempts were made for its admission as a State in 1865–67, but were vetoed by President Johnson, and in 1873 denied by Congress; admitted in 1876, and, soon after, great discoveries of carbonates of lead and silver in Lake County turned the tide of immigration to the new State.

Colorado: city; capital of Mitchell co., Tex. (for location of county, see map of Texas, ref. 3–F); on Texas and Pacific Ry.; 230 miles W. by S. of Fort Worth; has large salt-works, and is in a wool-producing and cattle-raising district. Pop. (1890) 1582; not returned separately in 1900.

Colorado Chiquito: See Little Colorado River.

Colorado City: El Paso co., Col. (for location of county, see map of Colorado, ref. 4–E); on Denver and Rio Grande and Colorado Midland Rys.; 3 miles N. W. of Colorado Springs. Pop. (1880) 347; (1890) 1,788; (1900) 2,914.

Colorado College (Colorado Springs, Col.): the oldest institution for higher education in the Rocky Mountain region. It has four handsome stone buildings, and a gymnasium, with a campus of 56 acres. The meteorological observatory contains a number of continuous self-registering instruments. The college, which was chartered in 1873 and opened in 1874, has been completely reorganized since 1888, and its standard of work is now the same as that of the best Eastern colleges. The associate preparatory school, Cutler Academy, fits for admission to the freshman class of any college in the U. S. The Rocky Mountain region furnishes unsurpassed facilities for the study of geology, mining, metallurgy, and kindred branches; and the trustees aim to make the college a center for scientific work in all lines. Three courses of study are offered, the classical, the Latin-scientific, and the scientific.

Colorado Desert: an arid basin traversed by the Southern Pacific R. R. between Fort Yuma and San Bernardino. Its principal depression is also called the Coahuila valley and its eastern continuation is termed the Yuma desert. The lower part of the Coahuila valley, including an area of about 17,000 sq. miles in extent, lies below the level of the ocean. It was formerly part of the Gulf of California, but in prehistoric times was separated therefrom by the growth of the delta of the Colorado river, which gradually extended from E. to W. until it joined the peninsula of Lower California, and thus shut out the sea. The river now flows across the south part of its delta and contributes its water to the gulf, but at some earlier time, and probably at several different epochs, it has flowed down the northwestern side of

its delta into Coahuila valley, which was then occupied by a fresh-water lake. From this lake there was an outlet to the gulf by way of a channel known as "Hardy's Colorado," which follows the western margin of the delta. Since the occupation of the country by white men the river has occasionally, during high flood, discharged a portion of its water toward the Coahuila valley by means of a channel called New river, and in 1891 such a discharge was continued for several months, producing in the bottom of the valley a broad but shallow lake known as Salton Lake.

G. K. Gilbert.

Colorado, Rio: a river in the southern part of Argentina, rising in the Andes and flowing with a general E. S. E. course to the Atlantic near lat. 39° 50′ S. It is formed by the junction of the Barrancas and Rio Grande, and the length from the source of the latter is about 620 miles. It is navigable for vessels drawing 7 feet of water to Pichemahuida, about 200 miles. The Colorado separates the Argentine territories of Pampa and Rio Negro. Along the lower course it is bordered by pasture lands and in some places by woods. The upper river flows through an arid waste.

Herbert H. Smith.

Colorado River (of the West): a river which drains a large plateau and mountain area of Wyoming, Colorado, Utah, and Arizona, which is well watered above 8,000 feet, but is arid and desert at lower altitudes. Its head branches are the Green from the north and the Grand from the east, uniting in Southeast Utah. The Green, 450 miles long, rises in the Wind River Mountains of Wyoming, and flows south across a broad basin containing horizontal coal-bearing beds of an extinct lake, now much dissected by branch streams. The river then transects the Uinta Mountains in several deep cañons. The Grand river rises in Middle Park, on the west slope of the front range of the Rocky Mountains, Colorado, and flows west, receiving many tributaries in deep valleys and cañons. Below the junction of the Green and Grand, the Colorado erodes the plateaus of Southeast Utah and North Arizona for 180 miles, passing through the Marble Cañon, 3,600 feet deep, on the south margin of the Paria plateau, before receiving the Little Colorado river, which comes from the southeast through a cañon in the broad plateau of East Arizona. An irregular course then leads 218 miles, with only three considerable tributaries, through the Grand Cañon in the Kaibab, Kanab, Uinkaret, and Sheavwits plateaus. Passing out of the plateau province, near the southeast corner of Nevada, the Colorado enters a lower desert region, which it traverses almost without tributaries and in summer with diminishing volume for 240 miles, forming the western boundary of Arizona to the entrance of the Gila river at Fort Yuma, and thence in Mexico, 70 miles across its delta to the present head of the Gulf of California.

The geological history of the Grand Cañon is, in brief, as follows: North Arizona consists of a vast series of Carboniferous and Mesozoic marine strata, covered by a series of Eocene lacustrine beds; in all originally some 15,000 feet thick. A great dome-like uplift, central in Northwest Arizona, occurred during Eocene time, and exposed much of the Eocene and Mesozoic series to denudation, whereby they were eroded 5,000 to 10,000 feet deep over thousands of square miles, reducing the uplifted region to a lowland of moderate relief, except where the edges of the more resistant strata remained around the margin in retreating escarpments, such as the Vermilion cliffs (Trias) on the Utah-Arizona line, or where heavy volcanic cones and lava flows protected the strata beneath them, as about the San Francisco Mountains of Central Arizona or the Aquarius plateau of South Utah. The lowland of denudation thus produced was again uplifted with much volcanic action about the close of Miocene time; but this uplift dislocated the region in great blocks separated by deep fractures trending about N. and S. To the S. E. the dislocations were less apparent; there the uplifted area is called the Colorado plateau, its altitude being 7,000 to 7,500 feet. The dislocations were more marked in Northwest Arizona and Southwest Utah, forming the Wahsatch, Aquarius, and other plateaus. The wasted faces of the blocks now form rugged cliffs, 1,000 to 2,500 feet high and 30 to 76 miles long, generally facing W. The several plateaus traversed by the Grand Cañon are thus formed. The Kaibab is the highest, 7,500 to 9,300 feet; and there the river has cut down the deepest cañon, 5,000 to 6,000 feet deep, with walls 5 or 6 miles apart at the top, and greatly varied by side cañons and promontories. During the elevation of the blocks there appears to have been a pause after an uplift of about 2,000 feet; for there is a broad esplanade beneath the plateau surface, about 5 miles wide and inclosed by cliffs 2,000 feet high. It is within this esplanade that the deep and narrow cañon is sunk from 2,000 to 3,000 feet, showing a revival of uplift after the esplanade had been eroded. The dislocation of the blocks was in greater part accomplished after the esplanade was formed, for its platform is displaced by the fractures that dislocate the blocks. The cañon proper is therefore not older than Pliocene time. The location of the cañon is not only independent of the fractures that separate the plateau blocks, but the direction of river flow is in several cases against the slope given by the latest uplift to the plateau surfaces; hence it is believed that the river cut down its cañon almost as fast as the blocks were uplifted. The work of deepening and widening the cañon still progresses with geological rapidity; the river flows along level reaches, alternating with plunging rapids, averaging a fall of 5 to 12 feet to the mile in the Grand Cañon. The waste of the walls slides down in great volume every melting season. The cañon ends where the river flows out of the Sheavwits plateau, whose escarpment forms a ragged cliff face, 2,000 feet high, called the Grand Wash.

The early belief that this cañon and others of similar nature but less depth were fractures of the earth's crust was disproved by Newberry, who examined the lower part of the cañon with the Ives expedition of 1858; his conclusions were confirmed by Powell, whose party descended the river in boats ten years later; and again by Dutton, who approached the cañon from the plateaus in 1875 to 1880, and from whose report (Monograph II., U. S. Geol. Survey) this account is abridged.

The 70 miles below Fort Yuma lead the Colorado over the gentle slope of its broad delta, built across the trough of the Gulf of California. The depression of the gulf extends 100 miles farther N. W., where it is known as the Colorado desert, or the Coahuila basin; but this upper portion, cut off from the main gulf by the delta, and receiving no large rivers, is evaporated to a desert, whose surface is 200 to 300 feet below sea-level. The Southern Pacific R. R. crosses this district. At times of high flood, when a distributary of the Colorado happens to flow N. W. across the delta plain, a shallow temporary lake is formed at the lowest part of the depression, as in the summer of 1891. The course of one of the chief distributaries is known as New river. When the lake rises high enough to overflow, its waters escape along the west margin of the delta, where a channel has been cut, known as Hardy's Colorado.

W. M. Davis.

Colorado Springs: city; capital of El Paso co., Col. (for location of county, see map of Colorado, ref. 4–E); on five trunk-line railroads; 75 miles S. of Denver. It was originally Fountain Colony. The city is situated at the mouth of the Ute Pass at the foot of Pike's Peak, and is surrounded by most magnificent scenery. The proximity of the famous mineral springs at Manitou and the equableness and dryness of the climate have made the place a popular health resort. It has the State institution for the mute and the blind, a college, and good schools. Pop. (1880) 4,226; (1890) 11,140; (1900) 21,085.

Editor of "Republic."

Colorado, The University of: a State university; founded in 1876; situated amid most picturesque scenery at Boulder; on the Union Pacific R. R., 28 miles N. W. of Denver. The institution is liberally supported by direct taxation and legislative appropriations. Tuition is free; the cost of living is not great. The university presents collegiate courses leading to the bachelor's degree in arts, philosophy, science, and letters, and post-graduate courses for the corresponding master's degree and the doctor's degree. It also sustains thorough courses in medicine and law. The facilities for instruction are of the best—able faculties, excellent library, well-equipped laboratories and museum, unsurpassed hospital and clinical advantages. The Denver Medical College is a department of the university. The university admits students on approved diplomas from several high schools in the State without examination. Presidents: Joseph A. Sewall 1876–85; Horace M. Hale 1886–91; James H. Baker, Jan., 1892.

Color-blindness, or **Daltonism**: want of sensitiveness in the eye to certain color impressions. This defect is not usually accompanied with any other imperfection of vision, but it shows a peculiar tendency to transmission from

parent to child. When the nervous system of the eye is normal there are three fundamental or primary sensations —red, green, and violet. From the combinations of these in varying intensities all color impressions are formed. The absence of one of these primary sensations constitutes color-blindness. The lacking component is usually red or green, very rarely violet. Normal vision is therefore said to be "trichroic," color-blind vision to be "dichroic." About 4 per cent. of all men are either red blind or green blind; of women only a very small number possess dichroic vision. Temporary violet-blindness may be produced by doses of the drug santonin. The excessive use of tobacco also sometimes induces partial color-blindness.

Color-blindness is detected by the use of a proper selection of colored worsteds, a test which has been applied with infallible results to over 100,000 individuals in the U. S. and in Europe. The method was devised by Prof. Holmgren, of Upsala. (See COLOR.) The name of Daltonism was given to color-blindness because the distinguished John Dalton and his brothers suffered from it. See also Jeffries's *Color-blindness and its Detection*; Helmholtz, *Handbuch der physiologischen Optik*; Campbell and Garnett, *Life of Maxwell* (part ii.). E. L. NICHOLS.

Colored Methodist Episcopal Church: See METHODISM.

Coloring-matters: Nature abounds in these principles, and art has added to the number. The colored appearance is not an inherent property of the body itself, but due to its effect upon ordinary light. See COLOR.

Color-mixer and **Color-wheel**: See RECORDING APPARATUS, PSYCHOLOGICAL, in the Appendix.

Colos'sæ (in Gr. Κολοσσαί, or Κολασσαί): an ancient city of Asia Minor, situated in Phrygia, on the river Lycus. It was nearly destroyed by an earthquake in 65 A. D. St. Paul's Epistle to the Colossians was addressed, in 62 (some say 58–60) A. D., to the believers at Colossæ. Its site is about 3 miles N. of the modern *Chonas* or *Khonos*.

Colossal [from COLOSSUS (*q. v.*)]: in the fine arts, a term applied to any work remarkable for extraordinary dimensions. It is, however, more especially applied to works in sculpture. According to the Book of Daniel, the palaces of Babylon contained statues of great size, and in the ruined temples of India are statues of extraordinary dimensions. The Egyptians surpassed the Asiatics in these gigantic monuments, their chief statues of very great size being set against the outer walls of temples and often cut out of the solid rock. The taste for colossal statues prevailed also among the Greeks, some of the most notable being the chryselephantine statues (*q. v.*). The famous bronze statue of Pallas-Athena on the Acropolis at Athens was visible many miles at sea. The principal Roman colossus was the figure of Nero, representing him as the sun god, set up by himself before the Golden House; it was in bronze, the work of Zenodorus; and Pliny says it was 110 feet high.

Colosseum: See AMPHITHEATER.

Colos'sians, The Epistle of St. Paul to the: one of the books of the New Testament; written at the same time and place as the Epistles to the Ephesians and Philemon, probably during the apostle's first imprisonment at Rome, about 62 A. D. It seems to be directed against certain Jewish heresies of the Alexandrian or Gnostic type. The best commentary is that by J. B. Lightfoot (8th ed. London, 1886).

Colossus [from Gr. κολοσσός, cf. Gr. κολωνός, hill, Lat. *collis*, hill, *excel'tere*, rise up]: a statue of a size much greater than life. Modern ones are more generally called *colossal statues*, and the term colossus is applied to the gigantic figures, in Egypt and elsewhere, of antiquity. The Colossus of Rhodes was a bronze statue of Apollo, standing near the mouth of the harbor. It was thrown down by an earthquake in 224 B. C. See CHARES.

Colos'trum [Lat.]: the first milk yielded after accouchement or delivery of offspring. The colostrum of a cow is also called beestings. The colostrum contains more sugar, more butter, and rather less casein than true milk, and also contains a much greater proportion of phosphates and chlorides, which may possibly give to colostrum the evacuant properties which it is said to possess. It also has a great number of leucocytes, or "colostrum corpuscles." See MILK.

Colquhoun, kō-hoon', ARCHIBALD ROSS, A. M., C. E., F. R. G. S.: traveler; b. off the Cape of Good Hope, Mar., 1846; entered Indian Public Works Department in 1871. In 1881–82, in conjunction with Mr. Wahab, he explored Southern China and the Chinese Shan states, and in 1883–84, with Mr. Holt Hallett, the Siamese Shan states, in view of a projected railway connecting India and China and opening up Siam and Central Indo-China. On his return to England he was awarded the gold medal of the Royal Geographical Society and published *Across Chrysé*, an account of his travels, in two volumes. Appointed deputy commissioner of the Sagier district in Upper Burma in 1885, he has since endeavored to further in every possible way the proposed railways connecting China and Siam with the British possessions in India.

Colquhoun, Sir PATRICK (or MAC CHOMBAICH DE): lawyer; grandson of Patrick Colquhoun, mentioned below; b. Apr. 13, 1815; educated at Westminster, St. John's College, Cambridge, and Heidelberg, and was called to the bar in 1837. Author of *Summary of the Roman Civil Law* (4 vols., 1849–60) and *Mediæval Roman Law*, and various treatises. He was long in the diplomatic service, and was chief justice of the Supreme Court of the Ionian islands when that archipelago was owned by Great Britain. Succeeded to the baronetcy on the death of his cousin, Sir Robert Colquhoun, in 1870. D. May 18, 1891.

Colquhoun, PATRICK: a Scottish political economist; b. at Dumbarton, Mar. 14, 1745. He became a merchant in Glasgow, and promoted the manufacture of muslin in Scotland. In 1761 he went to Virginia, and in 1789 settled in London. He published *On the Population, Wealth, etc., of the British Empire*, and other works. D. Apr. 25, 1820.

Colt, SAMUEL: American inventor; b. at Hartford, Conn., July 19, 1814. He invented a pistol called a revolver, for which he obtained a patent in 1835. He began about 1848 to manufacture revolvers at Hartford, where he erected an extensive armory. Colt's revolvers soon attained a world-wide reputation. (See REVOLVER.) D. Jan. 10, 1862.

Colton: city; San Bernardino co., Cal. (for location of county, see map of California, ref. 12–G); on the So. Pac. and the So. Cal. R. Rs.; 48 miles from Los Angeles. The city has good schools, four churches, fruit cannery and packing-house, cement-works, marble and lime works, brick-kilns, flouring-mill, winery, electric lights, and electric railway to Riverside and San Bernardino, and artesian wells. It has an elevation of 1,000 feet above the sea-level and a dry, mild climate. Fruit culture is the principal industry. Pop. (1880) about 150; (1890) 1,315; (1900) 1,309.

EDITOR OF "NEWS."

Colub'ridæ [from *Col'uber*, the typical genus]: a family of non-poisonous snakes, containing the great majority of serpents. They have numerous teeth, but no fangs; the head is covered with plates, the tail is long, with a double row of scales on the under side, and there are no rudimentary hind legs.

The family is widely distributed, and its members are varied in their habits. Some dwell upon the ground, some climb trees, and some, like the water-snake, *Tropidonotus sipedon*, seek their food in the water. The group contains the snake consecrated to Æsculapius, *Coluber æsculapii*, and such familiar species as the green snake (*Cyclophis vernatis*), black snake (*Bascanium constrictor*), garter snake (*Eutaenia sirtalis*) and misnamed blowing viper (*Heterodon platyrhinus*). F. A. LUCAS.

Colu'go: a local name for the species of *Galeopithecus*, or FLYING LEMURS (*q. v.*).

Colum'ba, SAINT, called also SAINT COLM: missionary; b. of noble parents, probably at Gartan, County Donegal, Ireland, Dec. 7, 521. In 563 A. D. he set out on his mission to Scotland. He founded in Iona, one of the Hebrides, an abbey and college which had a high reputation. Died on the island of Iona, June 9, 597. See his *Life* by Adamnan (n. ed. by Skene, Edinburgh, 1871).

Columbæ [from Lat. *columba*, a dove]: an order of birds containing the pigeons. The skull is schizognathous and schizorhinal, and basipterygoid processes are present. The sternum is narrow, deeply keeled, and has two notches on either side, although the inner may be reduced to a mere perforation. The crop is capacious, more or less completely divided into two portions, and during the breeding season secretes a milky fluid on which, mixed with partly digested food, the young are fed. The gizzard is powerful, cæca are absent or small, and the gall bladder is generally absent. The oil gland is bare, and in some genera lacking. The base of the bill is covered with a fleshy membrane, often very conspicuous, pierced by the nostrils. The tarsi

are short, scutellate, or extensively feathered, and the feet are on the whole better fitted for perching than for scratching up the earth. The syrinx has a single pair of muscles, and the feathers are devoid of after-shafts. The young are born naked and helpless.

The order is commonly divided into five families, as follows: *Dididæ*, the extinct Dodo (*q. v.*) and its allies *Didunculidæ*, the Samoan tooth-billed pigeon; *Gouridæ*, the crowned pigeons of New Guinea; *Columbidæ*, the true pigeons, as distinguished from the *Carpophagidæ*, the brilliantly colored fruit pigeons of Australasia. See Pigeon.

F. A. Lucas.

Colum'ban, or **Columban**, Saint: Irish monk; b. in Leinster, Nov. 21, probably in 543. He founded the monastery of Luxeuil, near Besançon, in France, about 590, and was the author of a monastic rule. He was a man of real learning and genius. D. in Bobbio, Italy, Nov. 15, 615, after two years' residence there.

Columba'rium [Lat., a dove-cote; hence a place of deposit, as below, from the resemblance of the niches to holes for pigeons' nests]: a building for the storage of sepulchral urns containing ashes of the dead. Those known to us are nearly all near Rome. At epochs when bodies of the poor and slaves were burned, columbaria were built to receive their urns, sometimes by burial societies, sometimes by wealthy families for their dependents. R. S.

Columbia, or **Oregon**: a river of the U. S.; the largest American river that enters the Pacific Ocean. It rises on the western slope of the Rocky Mountains in British Columbia, about lat. 50° N. and lon. 116° W. It flows northwestward nearly 150 miles, and then southward to the State of Washington, in which it unites with a large branch called Clark's river. Below this junction it pursues a very tortuous course to the northern boundary of Oregon. From this point it flows westward in a nearly direct line, and forms the boundary between the States of Oregon and Washington until it enters the Pacific. It is a rapid stream, passing through many mountain-gorges, and its navigation is much obstructed by falls. The tide ascends to the Cascades, a series of rapids, where the river passes through the Cascade Range, 140 miles from its mouth. A jetty at its mouth now makes it possible for ocean-going vessels to enter safely and proceed as far as Portland (*q. v.*), 120 miles. At the Dalles, in Oregon, the river is contracted to a channel about 100 yards wide between basaltic rocks. Steamboats ply daily on the Columbia, both below and above the Dalles (*q. v.*). Entire length, estimated at 1,400 miles. A large affluent, called Lewis or Snake river, enters it near lat. 46° 20′ N. The scenery of the Columbia is sublime, especially where it passes through the Cascade Range.

Columbia: town; capital of Boone co., Mo. (for location of county, see map of Missouri, ref. 4–G); on Wabash R. R.; 10 miles N. of the Missouri and 24 miles E. of Boonville. It is the seat of the State university and Christian College and Stephens (Baptist) College for women. It has a library. Pop. (1880) 3,326; (1890) 4,000; (1900) 5,651.

Columbia: borough; Lancaster co., Pa. (for location of county, see map of Pennsylvania, ref. 6–H); on the Pa. and the Phil. and Reading R. Rs., and on the left bank of the Susquehanna river (here nearly 1¼ mile wide); 80 miles by railroad W. of Philadelphia. A railroad bridge across the river connects Columbia with Wrightsville. It has electric lights, water-works, 2 rolling-mills, a mill for making grooved skelps, engine and boiler works, 3 iron-furnaces, stone-works, planing-mill, laundry-machine works, and a shirt-manufactory. Here is an extensive market and dépôt for lumber, which is brought down the river by rafts. Here are also an institute for girls and a fine library. Pop. (1880) 8,312; (1890) 10,599; (1900) 12,316. Editor of "News."

Columbia: a city; capital of South Carolina and of Richland co. (for location of county, see map of South Carolina, ref. 5–E); on Southern, Atlantic Coast Line and Seaboard Air Line railways, and on the E. bank of the Congaree river, just below the confluence of the Saluda and Broad; at the head of steamboat navigation; 137 miles by railroad N. N. W. of Charleston; lat. 33° 57′ N., long. 81° 7′ W. It is the seat of South Carolina College, a State institution, founded in 1804. Columbia has a State-house, penitentiary, a State hospital for the insane, a Presbyterian theological seminary, a Presbyterian "College for Women," a Methodist female college, an Ursuline institute, several excellent high schools, and an exceptionally good system of graded schools, and many churches. Six cotton factories are in operation (three of them among the largest in the south), with 240,000 spindles and 6,000 looms, employing 4,500 operatives, and representing an investment of $4,850,000. There are also the Southern Railway's construction and repair shops, two hosiery-mills, engine-works, two cotton-oil mills, two fertilizer manufactories, ice-factory, foundries, sash and door and other wood-working factories, an orphanage, a colored industrial home, two colored colleges, city hospital, water-works, a public library, and large libraries connected with the theological seminary and South Carolina University. There are electric street cars with 15 miles of excellent city and suburban lines, and electric light and power systems. It was taken by Gen. Sherman's army Feb. 17, 1865, and was much injured by fire. Pop. (1880) 10,036; (1890) 15,353; (1900) 21,108.

Columbia: city and railway center; capital of Maury co., Tenn. (for location of county, see map of Tennessee, ref. 7–E); on Duck river; 47 miles S. S. W. of Nashville. It has Jackson College, two female seminaries, large U. S. arsenal, cotton-mills, flouring-mills, grain-elevator, pump-factory, stock-yard, excellent water-works, etc. Pop. (1880) 3,400; (1890) 5,370; (1900) 6,052.

Columbia, British: See British Columbia.

Columbia City: capital of Whitley co., Ind. (for location of county, see map of Indiana, ref. 3–F); on the Pa. and the Wabash R. Rs.; 19 miles W. by N. of Fort Wayne. Pop. (1880) 2,244; (1890) 3,027; (1900) 2,975.

Columbia College (since 1897 *Columbia University*): an institution of learning in the city of New York. It was originally called King's College, and was chartered by George II. Oct. 31, 1754. Moneys had been previously raised for it under acts of the colonial assembly authorizing lotteries for the purpose, of which the first was passed in 1746. It received also a liberal grant of land from Trinity church, and on a portion of this its first building was erected. Its original site was in what was subsequently the block bounded by College Place, Barclay, Church, and Murray Streets. In 1857 the college was removed to the block bounded by Forty-ninth and Fiftieth Streets, Madison and Fourth Avenues. This was deemed from the beginning and throughout as a temporary location, though commodious buildings were erected upon it. In 1892 purchase was made, at a cost of $2,000,000, of a plot of land lying between 116th and 120th Streets, Amsterdam Avenue and the Boulevard, containing about 17½ acres, to which the college was removed in 1897. The occurrence of the public troubles which led to the war of the Revolution seriously interfered with the business of the college, and finally arrested its operations altogether. Early in 1776 the building was converted into a military hospital, and all the students were dispersed. In May, 1784, the college, then named Columbia, was placed under the government of a board which was styled "the regents of the university," and resumed its functions. In 1787 it was placed under trustees of its own. In 1767, a medical faculty was established, which was discontinued in 1813, that the professors might unite themselves with the College of Physicians and Surgeons of New York, then recently organized. In 1860 a partial union between these two institutions was effected, and on July 1, 1891, the College of Physicians and Surgeons became an integral part of Columbia. In 1793 instruction in law was provided by the appointment of James Kent, afterward eminent as chancellor, as professor of law, but a law school in the proper sense was not established till 1858, since which time a flourishing department of law has been maintained. A school of mines was organized in 1864, and has developed into four schools of applied science, viz.: Mines, chemistry, engineering, architecture, all under a faculty of applied science; there are eight distinct courses of scientific study: (1) mining engineering; (2) civil engineering; (3) metallurgy; (4) analytical and applied chemistry; (5) architecture; (6) sanitary engineering; (7) electrical engineering; (8) mechanical engineering. In 1880 there was established a school of political science, at which time also an extensive system of post-graduate instruction was provided for. In 1890 a school of philosophy was organized, and in 1892 a school of pure science. The college has in its seven faculties 375 professors and other officers of instruction, and 4,333 students (1900–1901). In 1883 the libraries of the various schools were concentrated into one general library, which now embraces, exclusive of pamphlets, 310,620 volumes (June, 1901), and increases at the rate of about

20,000 volumes yearly. The cabinets and apparatus of the college for the illustration of the various branches of physical, chemical, and medical science, of geology, mineralogy, natural history, architecture, and mathematics, are excellent and extensive, and are annually increased by gift and purchase. The income of the college from all sources for 1899–1900 was about $800,000. In 1890–91 the college was reorganized on the basis of a university, and its segregated parts made into a homogeneous whole; each school is, as to its specific work, in charge of its own faculty, with a dean at the head, while all university work and the educational interests of the college at large are committed to a university council consisting of the president, the deans of the several schools, and a delegate from each faculty.

The presidents of the college have been Samuel Johnson, D. D. (1754–63); Myles Cooper, S. T. D., LL. D. (1763–75); Rev. Benjamin Moore (*pro tem.* 1775–76); William S. Johnson, LL. D. (1787–1800); Charles H. Wharton, S. T. D. (1801); Rt. Rev. Benjamin Moore, S. T. D. (1801–11); William Harris, S. T. D. (1811–29); William A. Duer, LL. D. (1829–42); Nathaniel F. Moore, LL. D. (1842–49); Charles King, LL. D. (1849–64); Frederick A. P. Barnard, S. T. D., LL. D., L. H. D., D. C. L., Ph. D. (1864–89); Henry Drisler, LL. D. (acting, 1888–90); Seth Low, LL. D. (1890–). J. H. Van Amringe.

Colum'biad: a seacoast howitzer, of cast iron, proposed by Col. George Bomford, chief of ordnance, U. S. A., and introduced about 1812. Some of these guns were in service during the war between England and the U. S. 1812–15. Three calibers were recommended—50-pounders, 100-pounders, and 150-pounders—for coast defense, particularly against shipping, as a single shell of the larger sizes exploding in a vessel's side, or on her decks, would, it was thought, produce great injury, if not complete wreck.

Meyer's *Technologie des Armes à feu* mentions, under date 1815, "the explosion of an English vessel hit by an American shell before New York"; and again, under the same date, "Very good results were obtained in America from ovoidal (spherico-cylindrical) percussion shells of the caliber of 100, which are fired from a kind of carronade designated by the name of Columbiad." This is the first notice given by this diligent and accurate author of the existence of such a gun, or of a percussion shell, in the world. He seems to have searched thoroughly from the commencement of the Christian Era.

Halleck (*Military Art and Science*, page 280) states (in a note), after designating large howitzers as "*Paixhans guns*," or "*Columbiads*"—"the description of one of Col. Bomford's columbiads which was at Governor's island, New York harbor, was taken to France by a young French officer, and thus fell into the hands of Gen. Paixhans, who immediately introduced them into the French service."

Whether Gen. Paixhans received as above the description of the columbiad or not, there would seem to be no doubt that this gun was the first howitzer of cast iron of like caliber and length that was successfully used for shell-firing. Eight-inch and 10-inch howitzers had been proposed and made at earlier dates—that is, chambered guns shorter than cannon and longer than mortars, and having trunnions in advance of their vents, and near the center of gravity of the gun—but these guns were of bronze, generally shorter than the columbiads, and were not designed or used for shell-firing at low angles, but for heavy projectiles, to obtain great range.

In 1749 France adopted the 8-inch siege howitzer, but suppressed it in 1803 as useless, upon Gassendi's recommendation, retaining only a 5½-inch field howitzer. In 1804 9-inch and 11-inch howitzers, proposed by Villantrois, were made at Douai of eight calibers length, and were fired with lead-filled shells at high angles; and in 1810, at Seville, in Spain, a 10-inch howitzer of seven calibers length was cast to obtain a long range at the siege of Cadiz.

From 1809 to 1819, according to Meyer, Paixhans was interested in experiments to prove the superiority of hollow projectiles over hot shot for naval warfare, and the destructive effects of bursting shells. In 1819 he presented his treatise *Nouvelle Force Maritime*, but not published until 1822, in which he first proposes his *canon-obusier*, an 8-inch howitzer shell gun of cast iron. The English claim that Gen. Millar, who introduced a like gun in 1824, proposed it in 1820.

In the U. S. the 8-inch howitzer and 10-inch howitzer shell guns were remodeled in 1841 and 1844, intending these last, called *columbiads*, to be fired with solid shot and with one-sixth their weight of powder; but subsequently they were reserved for shell-firing only, and a new pattern was adopted in 1858; two of which (one cast solid and one hollow, and as proposed by Gen. Rodman, cooled from the interior) were subjected to comparative proof, both enduring the remarkable number of 4,082 rounds, with solid shot and service charge, without destruction.

In 1861 the Rodman exterior form of guns was adopted for the columbiads, as for all others, and calibers of 13, 15, and 20 inch smooth-bore, 10-inch and 12-inch rifled, and 13 and 15 mortars, adopted for seacoast guns.

Col. Bomford also proposed the 12-inch gun of 1846, and while testing its capabilities carried on a series of experiments proving the best and simplest form of fuse-shells fired from heavy guns, with the safety-caps sufficient to protect the fuse from extinction by ricochet on land or water. Revised by James Mercur.

Columbian Exposition, World's: an international exposition held at Chicago, May 1–Oct. 30, 1893, celebrating the four hundredth anniversary of the discovery of America by Christopher Columbus in 1492.

Organization and Plan.—As this anniversary approached, the fitness of the commemoration of the event by the people of the U. S. by means of a "world's fair" was universally recognized. Washington, New York, St. Louis, and Chicago urged their fitness as sites for the Fair, and Congress, by an act approved Apr. 25, 1890, selected Chicago, recognized the World's Columbian Exposition, an Illinois corporation previously formed, and appointed the World's Columbian Commission, a national commission of delegates, two from each State and Territory, two from the District of Columbia, and eight at large. Later a Board of Lady Managers and a World's Congress Auxiliary were added, and these four bodies managed the fair through their representatives. In direct control of the Exposition were Thomas W. Palmer, president of the National Commission; Harlow N. Higinbotham, president of the local corporation; George R. Davis, director-general; Mrs. Potter Palmer, president of the Women's Board; and C. C. Bonney, president of the Congresses.

The site selected was Jackson Park (533 acres), 6 miles S. of the center of Chicago, and extending for a mile and a half along Lake Michigan, and to this was added the adjoining Midway Plaisance (80 acres), a driveway between Fifty-ninth and Sixtieth Streets, which extended a mile westward and connected with the park system of the city.

The designing and construction of grounds and buildings were in charge of Daniel H. Burnham, chief of construction; John Root, his partner; F. L. Olmsted and Henry Sargent Codman, landscape architects. Mr. Root's death put the brunt of the work upon Mr. Burnham, after the general plans were adopted, and the ill-health of Mr. Olmsted caused him to leave the planning of the landscape work to Mr. Codman, who, however, died in Jan., 1893. The designer-in-chief was Charles B. Atwood, and the sculptor St. Gaudens at first acted as director of sculptures, and afterward unofficially in an advisory capacity. By the advice of Mr. Burnham and his colleagues, the most prominent architects of the U. S. were directly chosen to plan the buildings, separate buildings being assigned to each, but all superintending the general effect. This plan insured unity of purpose with freedom in detail.

Upon the Fair grounds there were in all about 150 different buildings. Of the main ones, that of Manufactures and Liberal Arts (Fig. 1; 787 by 1,687 feet) was built from plans and designs prepared by George B. Post; the Administration Building (Fig. 2; 262 feet square), by Richard M. Hunt; Machinery Hall (Fig. 3; 494 by 842), by Peabody & Stearns; the Agricultural Building (500 by 800), by McKim, Mead & White; Electricity Building (345 by 690), by Van Brunt & Howe; Mining Building (350 by 700), by S. S. Beman; Transportation Building (Fig. 4; 256 by 960), by Adler & Sullivan; Fisheries Building (162 by 361), by Henry Ives Cobb; Horticultural Building (250 by 997), by W. L. B. Jenney; the Fine Arts Building (320 by 500; for cut, see Chicago), by Charles B. Atwood, who also designed the Forestry Building, the Peristyle, Music Hall, and Casino; and the Woman's Building (Fig. 5; 200 by 400) by Miss Sophia G. Hayden, to whom it had been awarded after competition.

The chief engineer of the fair was E. C. Shankland, who designed and built the enormous arches of the largest building.

Full advantage was taken of the site upon the shores of Lake Michigan. Two inlets permitted boats to pass from the lake, one into an interior pond at the southern end of the grounds, and another, a little N. of this, passing beneath an excellently designed bridge and colonnade into a long basin. The open space about the Basin was called the Court of Honor, and in the impressive group of buildings around this was centered the main interest of the fair.

the canal giving admission to the North Pond. The effect of these interior waterways was to rest and refresh the eye, to reflect and double the architectural features along their shores, and to furnish means of agreeable transportation in gondolas, electric launches, and other craft.

The general artistic and popular verdict has declared the fair unrivaled for unity of effect and variety of architectural beauty. "Staff," first used in the Paris Exposition of 1889, proved an ideal material for the construction of the main buildings of the Fair, appropriately called the White City.

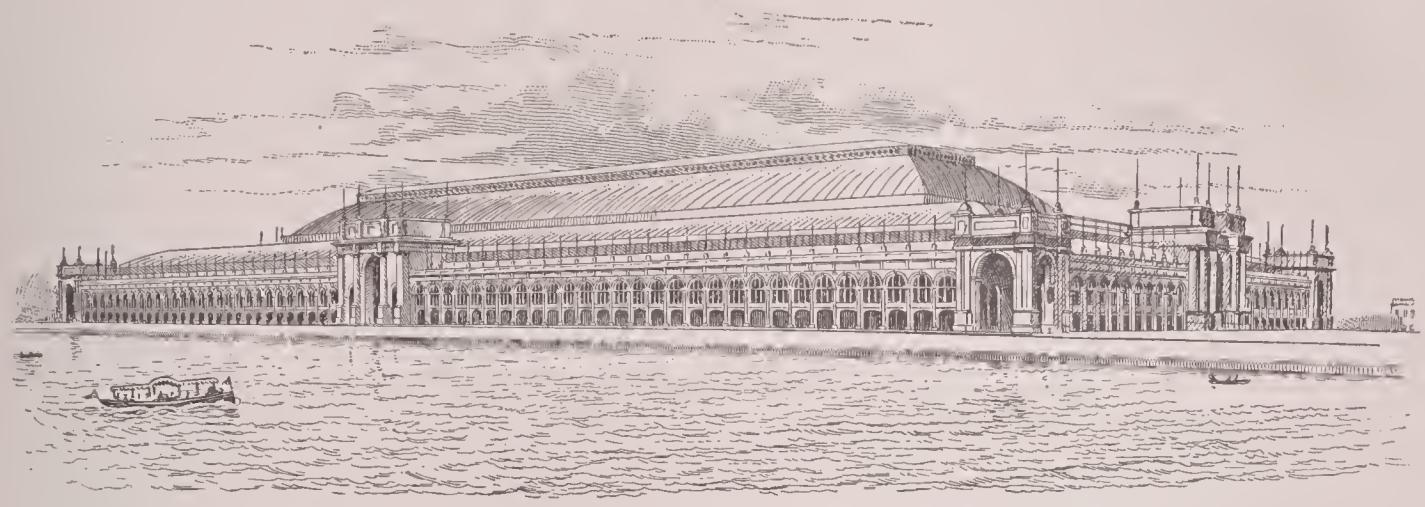

FIG. 1.—Manufactures and Liberal Arts Building.

From the Basin an artificial canal led to the Lagoon, a miniature lake containing a large and a small island, and another canal connected with a northern pond lying in front of the Art Galleries. At the head of the Basin and Court of Honor was the Administration Building, which, opening by four large arched doorways, served as an effective gate to the grounds; still farther westward lay the terminal stations for the railways, flanked by the richly colored Transportation Building. Northward of the Administration Building were the structures devoted to mines and electricity, and southward lay Machinery Hall and its annex. The Basin, having at the west end the fountain of Progress, and at the east end the colossal statue of the Republic, led to the lake

It is light, easily worked, readily takes any form and color, and when painted is exceedingly durable. It is a composition of plaster and jute fiber, but gave at a short distance the effect of marble. From the main group of buildings, dignified in style, the visitor passed gradually through buildings of less severity of design, until he reached on the N. the fantastic Fisheries Building, or on the S. the Forestry Building—the one quaintly decorated with marine forms, and the other consistently rustic in construction. This prepared him for freedom and variety shown in the State and National buildings, or the lofty mound of imitation rock wherein the cliff-dwellers' exhibit was housed. Then in the Midway Plaisance the visitor found a "street of all nations,"

FIG. 2.—Administration Building.

and Peristyle, and was between the Manufactures and Liberal Arts Building and the Agricultural Building. Beyond the Peristyle was a pier 1,200 feet long.

The Lagoon was so nearly filled by the Wooded Island as to be really two waterways, the westerly one extending from in front of the Golden Doorway of the Transportation Building, past the Horticultural Hall with its enormous crystal dome, and ending just beyond the front of the Woman's Building, while the easterly channel led past the Liberal Arts Building and the U. S. Government Building, and, just beyond the west wing of the Fisheries Building, opened into

where a native Javanese village stood between a German town and a Japanese bazaar. The great Ferris Wheel, rising to a height of 264 feet, stood half way down the Plaisance, and dignified its strange surroundings.

Between the north pier, near which was the model of the man-of-war Illinois, and the south pier with its moving sidewalk, the lake shore was dominated by the massive front of the Liberal Arts Building, and formed the best setting possible for frequent displays of fireworks and exhibitions of the life-saving service. Upon a rocky point of land just S. of the south inlet was a model of the Convent of La Ra-

bida, so closely connected with the history of Columbus's first voyage.

During the six months of the Fair special days were set apart for celebrations of the most varied character, including the reception of distinguished visitors, such as the Duke of Veragua, a lineal descendant of Columbus, and the Infanta Eulalia of Spain, the holding of State days for the principal States of the Union, and of national days for foreign nations; there were also concerts by musical organizations, conventions of orders and societies, addresses and congresses, commemorations of anniversaries—an endless array of meetings and *fêtes* and pageants on land and water, by day and by night.

Opening the Fair.—The erection of buildings began in June, 1891, and on Oct. 23, 1892 (corresponding to Oct. 12, old style), the grounds were turned over to the national commission, and the buildings were dedicated by the Vice-President of the U. S. The ceremonies took place in the Manufactures and Liberal Arts Building, in the presence of 130,000 people. A Columbian ode, by Harriet Monroe, was read and there were addresses by officials of the Fair and by Chauncey M. Depew and Henry Watterson, the singing of an anthem, and of a Columbus hymn by J. K. Paine, followed in the evening by fireworks. The Exposition was not formally opened, however, until May 1, 1893. After an address by the director-general, President Cleveland declared the Fair open and set in motion the great Allis engine; at the same moment a salute was fired, the various national flags were unfurled, the electric fountains were turned on, Mr. French's gigantic statue, The Republic, was unveiled, and all present sang *America*, while upon the waterways bells tolled and whistles blew.

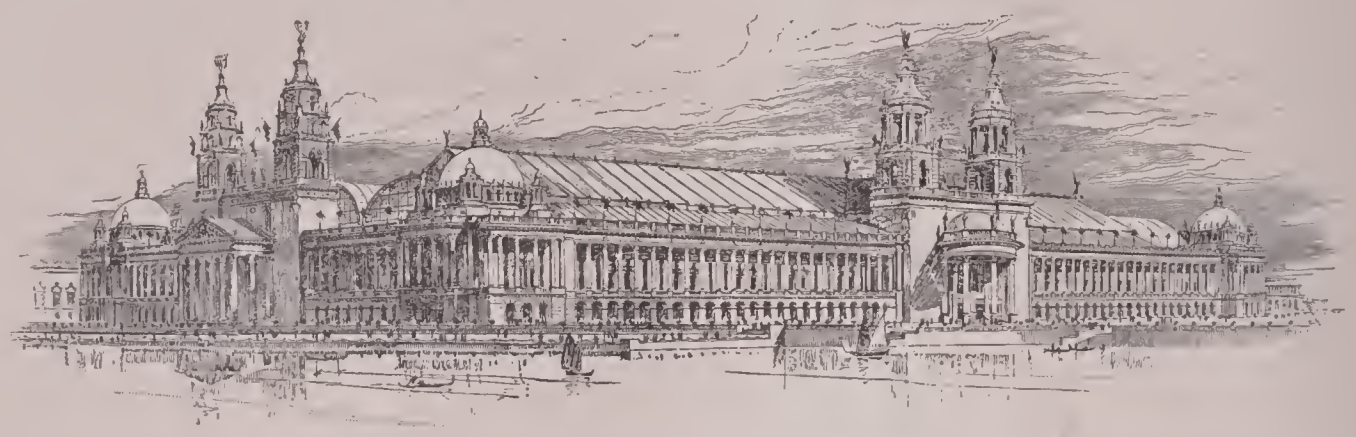

Fig. 3.—Machinery Hall.

Attendance.—The attendance varied greatly, increasing largely in the closing weeks, but averaged for the whole period 172,712 paid admissions daily. The first notable day was July 4, American Independence Day, when there were more in attendance than on any day before Oct. 9; but on that date—Chicago Day—there were gathered the greatest number of people that ever met within that area, 716,881 visitors entering the Fair. The best record of the Paris Exposition of 1889 was not much over half of this number, while the Centennial never exceeded 257,000. The total attendance during the whole Chicago Exposition was over 27,500,000. The principal days and the number of paid admissions on each were: May 1, Opening Day, 128,935; May 30, Decoration Day, 115,578; June 8, Infanta Eulalia Day, 135,281; June 15, Germany's Day, 165,069; June 17, Massachusetts Day, 148,994; July 4, U. S. Day, 283,273; July 20, Sweden's Day, 129,873; Aug. 12, Bohemia's Day, 151,971; Aug. 15, Rajah Rajagan Day, 123,530; Aug. 18, Austria's Day, 123,428; Aug. 19, Great Britain's Day, 168,861; Aug. 24, Illinois Day, 243,951; Aug. 26, Machinery Day, 168,036; Sept. 2, Roman Catholics' Day, 148,560; Sept. 4, New York State Day, 160,382; Sept. 6, Wisconsin Day, 175,409; Sept. 7, Pennsylvania and Brazil Day, 203,460; Sept. 8, Cymrodorian Day, 180,746; Sept. 9, California Day, 231,522; Sept. 11, Kansas Day, 160,128; Sept. 12, Maryland Day, 167,108; Sept. 13, Michigan Day, 160,221; Sept. 14, Ohio Day, 198,770; Sept. 15, Vermont and Costa Rica Day, 157,737; Sept. 16, Texas Day, 202,376; Sept. 19, Fishermen's Day, 174,905; Sept. 20, Iowa Day, 180,552; Sept. 21, Sportsman's Day, 199,174; Sept. 23, Knights of Honor Day, 215,643; Sept. 26, Odd Fellows' Day, 195,210; Sept. 27, Indiana Day, 196,423; Sept. 30, Ireland's Day, 108,885; Oct. 5, Rhode Island Day, 180,404; Oct. 7, Poland's Day, 222,176; Oct. 9, Chicago Day, 716,881; Oct. 10, North Dakota and Firemen's Day, 309,294; Oct. 11, Connecticut Day, 309,277; Oct. 12, Italian and Trainmen's Day, 278,878; Oct. 13, Minnesota Day, 221,607; Oct. 21, New York City Day, 298,928; Oct. 24, Mary Washington Day, 243,178; Oct. 25, Marine Transportation Day, 252,618; Oct. 27, Coal, Grain, and Lumber Dealers' Day, 250,583; Oct. 28, Reunion of Cities Day, 240,732; Oct. 30, Closing Day, 210,622.

Casualties.—In spite of the vast multitudes that came together there was the slightest possible disorder. Ex-Inspector Bonfield, of the Chicago police, by the aid of 300 picked men, effectually kept all lawlessness in check. Of goods to the value of $32,988 reported lost by stealing, $31,875 worth was recovered, and there were only 845 arrests with 400 convictions. The sole serious disaster attending the Exposition was the burning on July 10, 1893, of the cold storage building, a warehouse at the southern end of the grounds. A number of firemen sent into its tower were cut off by the flames and perished. The receipts of the last Sunday upon which the Exposition was kept open were set aside as a benefit fund for the families of these firemen.

Exhibits.—Apart from the grounds and buildings, the most generally sought exhibits were naturally those relating to Columbus. The model of La Rabida was made a museum for the display of portraits, paintings, maps, and relics of all that related to early navigation, and particularly to the great discoverer. There were specimens of Columbus's handwriting, original documents from the Spanish court, including the commission from Ferdinand and Isabella, Columbus's will, and a few of his letters, and the remains of the first town in the New World. Near by were the caravels—facsimiles of the discoverer's three vessels, built by Spain and presented to the U. S.; and the Viking ship—a reproduction of that unearthed at Gokstadt in Norway, built by popular subscription and presented to the U. S. by Norway. It had just been sailed across the ocean by Magnus Andersen.

Fig. 4.—Transportation Building.

The exhibits in the main buildings can receive here but the briefest mention. Sculpture and mural painting were prominent features of the Administration Building; the Transportation Building was noteworthy for a collection of

all methods of carrying passengers and merchandise, from the waxwork human pack-carrier to a complete section of an ocean steamer, palace-car trains of the latest design, and the fastest locomotive in the world; and the Mining, Electricity, Machinery, and Agricultural buildings each contained a complete exposition of the progress and present state of its department of human industry. The Building of Manufactures and Liberal Arts included whatever relates to education, engineering, architecture, publishing, music, and the drama, together with the professions, technical arts and design, and the domestic arts. The enormous roof was reached by elevators running to a height of 220 feet, and from it could be had a fine view of the entire grounds of the fair. The U. S. Government showed in its especial building a complete *résumé* of the work of its departments, including many priceless historical relics. The Fine Arts Building contained loan collections from the U. S. and foreign nations, including scores of masterpieces in painting and sculpture, while the Woman's Building for the first time displayed a collection of woman's work in all departments of activity; a special building was given up to children, and contained a *crèche*, a gymnasium, schools, and a library. The Fisheries and Horticultural buildings were as well equipped as the others, displaying fully all that related to their departments. The State buildings, besides containing reception rooms, were devoted to the history and productions of the respective States, and were, in some cases, reproductions of famous buildings, as Washington's home at Mount Vernon, Va.

The spectacular effects of the Exposition were largely due to the electric lights. At night the great buildings were outlined and illuminated by incandescent and arc lights.

FIG. 5.—The Woman's Building.

Search-lights played along the façades and brought every architectural feature into startling relief, making the great domes like cameos against the dark sky, and sending paths of beamy light to be reflected from the rippling water. The electric fountains danced in changing colors, suggesting enchantment to the most prosaic spectator, and shedding luster upon the white sculptures. Electricity gave light, heat, and power, and brought all parts of the vast grounds within instant communication.

Previous world's fairs had their one novel feature, such as the Eiffel Tower of the Paris Exposition; but the Chicago Exposition had too many characteristic features to allow pre-eminence to any, unless to the harmonious effect of buildings and grounds. There were, however, points of especial interest not yet touched upon that are worthy of comment. The Ferris Wheel was, at least in magnitude, a novel achievement. G. W. G. Ferris, a young engineer, designed and constructed, between Dec. 28, 1892, and June 21, 1893, a tension-spoke wheel 250 feet in diameter, carrying between its two rims 36 coaches, seating 60 persons each. The wheel was driven by gear teeth along its periphery. It ran perfectly from its first revolution until the end of the Exposition, and besides being an engineering success proved popular and immensely profitable. Noteworthy among other features of the Midway Plaisance were Lady Aberdeen's Irish village, the Hagenbeck animal show, the Javanese village, the street in Cairo—a collection of bazaars, donkey-boys, camel-drivers, and a reproduction of the appropriate buildings, the Samoan and Dahomey villages, with exhibitions of native rites and ceremonies, Old Vienna, and the German mediæval museum. Summed up, the Midway Plaisance was an informal and amusing medley of ethnology and miscellaneous catchpenny shows.

Closing the Fair.—The assassination of Carter Harrison, mayor of Chicago, on Oct. 28 caused the abandonment of an elaborate programme arranged for the closing day, and instead the exposition was only formally declared closed and the flags lowered on Oct. 30. The work of dismantling began next day. There seemed to be a strong desire to set fire to the empty buildings, and on Jan. 8, 1894, the Liberal Arts Building and Peristyle were burned. On Feb. 10, 1894, four incendiary fires occurred, but did comparatively little damage. The attempt was renewed in March, and on July 5, during the great railway riots at Chicago, unknown incendiaries succeeded in burning six of the largest buildings.

Field Museum.—The Fine Arts Building is to be preserved as a permanent museum, containing many of the exhibits of the Fair. The Field Columbian Museum has been incorporated, being endowed by Marshall Field, L. Z. Leiter, George M. Pullman, and others, thoroughly equipped with an efficient staff of officers, and beginning with a collection of an estimated value of $2,000,000. A central rotunda contains models of the chief sculptures of the Fair.

Financial.—The act of Congress giving the Fair to Chicago required the city to raise $10,000,000. One-half of this amount had already been pledged, and Chicago issued bonds for the other $5,000,000. Afterward a loan of Federal credit was applied for, and Congress responded by the gift of a special mintage of $2,500,000 in souvenir half-dollars, of which over $500,000 was retained by a subsequent act to provide compensation for the juries of award. The Exposition authorities then issued $5,000,000 of debenture bonds, payable Jan. 1, 1894, of which nearly all were sold. To these funds were added, from interest and miscellaneous sources, including floating liabilities, some $3,000,000 more, making in all about $20,000,000 expended by the opening day. Subsequently $5,500,000 more was expended out of gate receipts, increasing the total cost of the Exposition proper to $25,500,000. The U. S. Government appropriated to its exhibits $2,250,000; foreign governments, $6,000,000; the States, $7,000,000; and the Midway concessionaries invested in their enterprises about $350,000. Thus the grand total cost of the Fair exceeded $40,000,000. The following is a condensed balance-sheet of the receipts and expenditures:

Gate receipts		$10,626,330 76
Concession receipts		3,699,581 43
Miscellaneous receipts		686,070 49
Interest		86,981 82
Souvenir coins and premium		2,448,032 28
Capital stock		5,604,171 97
City of Chicago		5,000,000 00
Total		$28,151,168 75
Construction expenditures		$18,322,622 56
General and operating expenses		7,127,240 32
Preliminary organization		90,674 97
Assets	$2,698,291 01	
Liabilities	87,660 11	
Net assets		2,610,630 90
Total		$28,151,168 75

From the net assets must be deducted the sum of $748,147, representing all outstanding debts and obligations. On Oct. 9, Chicago Day, by a check of over $1,000,000 the treasurer of the Exposition discharged its final indebtedness by redeeming the debenture bonds with interest. The profit on the Fair was about $1,850,000.

Sunday Closing.—The souvenir-coin gift from Congress required that the Fair should be closed on Sunday, and on

the first Sunday the Fair was closed. After some controversy between the national commission and the local directory, the Fair was opened on Sunday, May 28, but closed again on July 23, contrary to an injunction that had been granted May 14 by Judge Stein, who fined the director-general $250 and five directors $1,000 apiece for contempt of court. An appeal was taken, but remained undetermined until the Fair closed, the gates remaining open on every Sunday thereafter. The attendance on Sunday, however, was much smaller than on other days, and many exhibits were closed.

Awards.—The awards were made according to a fixed standard of excellence, and not in competition, and bore the smallest proportion to exhibits in the history of similar expositions.

World's Congresses.—During the Exposition conventions were held under the auspices of the World's Congress Auxiliary, wherein were discussed philosophical, intellectual, religious, and economic problems from an international standpoint. Among the results was a memorial in favor of international arbitration signed by the commissioners of forty nations and presented to the President of the U. S. and the Secretary of State. Of these gatherings the World's Parliament of Religions attracted the most attention, conventions of religious bodies being held from Aug. 27 until Oct. 15.

History.—The preparation of the official history was intrusted to a committee consisting of Harlow N. Higinbotham, Lyman J. Gage, and Edwin Walker, who chose D. Appleton and Co. as the publishers and Rossiter Johnson as the editor. It is in four royal octavo volumes, beautifully illustrated, and differs from all other histories of expositions in that it is not a verbatim printing of official reports, but a readable narrative with such reports and other matter for its basis.

Columbian University: an institution of learning, situated in Washington, D. C.; founded mainly by members of the Baptist denomination, but unsectarian in its administration. It was incorporated by act of Congress in 1821 under the name of Columbian College, which name was changed to Columbian University by an act of Congress, approved Mar. 3, 1873. In 1883 a new and stately university building was erected in the heart of Washington, and in 1884 a new department of instruction was added to its system, called the Corcoran Scientific School in honor of W. W. Corcoran, the great benefactor of the university and the founder of its largest endowment. In 1892 a school of graduate studies was erected as a part of its university system. In 1899–1900 its faculty comprised 173 teachers, and the number of its students in all schools was 1,041. James C. Welling.

Colum'bidæ [from *Columba*, the typical genus]: a family of birds containing the true pigeons and doves, of the order Columbæ (*q. v.*). See also Pigeon.

Col'umbine: a perennial plant of the genus *Aquilegia* and family *Ranunculaceæ*. Columbines have five petals, all alike, with a short spreading lip, produced backward into large hollow spurs, much longer than the calyx; pistils five. The *Aquilegia vulgaris*, or common columbine, a native of Europe, is cultivated in gardens for its showy flowers. The *Aquilegia canadensis*, a native of the U. S., has beautiful scarlet flowers of curious structure. Several pretty species grow in the Rocky Mountains.

Revised by Charles E. Bessey.

Colum'bium, or **Nio'bium**: a rare metal originally discovered in columbite from Massachusetts by Hatchett in 1801. Wollaston in 1809, in investigating minerals containing columbium, expressed the belief that the metal was identical with tantalum, and this view was generally accepted until 1846, when H. Rose showed that the two were distinct, though tantalum occurs in many of the columbium minerals. Rose, indeed, inclined to the belief that what had been described as columbium really consisted of two metals, which he called niobium and pelopium. Further investigations showed him that but one metal was the basis of the supposed two; so the name pelopium was dropped and the name niobium was retained, the symbol Nb being now used for columbium. The black powder produced by heating columbium compounds with sodium has been supposed to be the metal, but Delafontaine states that this powder is the protoxide, and that the metal is a steel-gray powder obtained by igniting the chloride $NbCl_5$ in a current of hydrogen. With tantalum, columbium forms a group distinct from the other elements. The principal minerals in which columbium is found are columbite, a columbate of iron and manganese; bragite, a columbate of yttrium and iron; samarskite, a urano-columbate of yttrium and iron; pyrochlore, a columbate of lime, cerium, etc.; æschynite, a titano-columbate of cerium, iron, lanthanum, etc. Some of these minerals contain tungsten. They are found in small quantities in a few localities in Europe and the U. S. The atomic weight of columbium is 94. Revised by Ira Remsen.

Columbo: See Colombo Root.

Columbus: city; capital of Muscogee co., Ga. (for location of county, see map of Georgia, ref. 5–F); on Cent. of Ga., Col. So., Ga. Mid. and G., and So. West. R. Rs., and on the east bank of the Chattahoochee river, which here forms the boundary between Georgia and Alabama. It is 100 miles W. S. W. of Macon and 292 by railroad W. of Savannah. Steamboats ply at all seasons between Columbus and Appalachicola, Fla., light draughts only being used in summer. It has six cotton-factories, and the falls of the river at this point afford a water-power sufficient for 100,000 spindles. It has machine-shops and foundry, besides planing and flouring mills. The public schools for white and colored are unsurpassed by any in the State. The suburbs of Columbus are noted for the beauty of their scenery and the taste of their private residences. Pop. (1880) 10,123; (1890) 17,303; (1900) 17,614. Editor of "Enquirer-Sun."

Columbus: city; capital of Bartholomew co., Ind. (for location of county, see map of Indiana, ref. 8–E); on the Pittsb., Cin., Ch. and St. L. and the Cl., Cin., Ch. and St. L. R. Rs., and on East Fork of White river; 41 miles S. S. E. of Indianapolis. The principal industries of Columbus are manufactures of cerealine, starch, flour, agricultural implements, furniture, etc. The city has complete systems of water-works, street railways, and electric lights, and contains handsome public buildings and churches. Pop. (1890) 6,719; (1900) 8,130. Editor of "Republican."

Columbus: city; capital of Cherokee co., Kan. (for location of county, see map of Kansas, ref. 8–K); on Kan. C., Ft. S. and M., and St. Louis and San Fr. R. Rs.; 50 miles S. of Fort Scott. It is an agricultural district; coal, iron, and zinc are mined in the vicinity. Pop. (1880) 1,164; (1890) 2,160; (1900) 2,310.

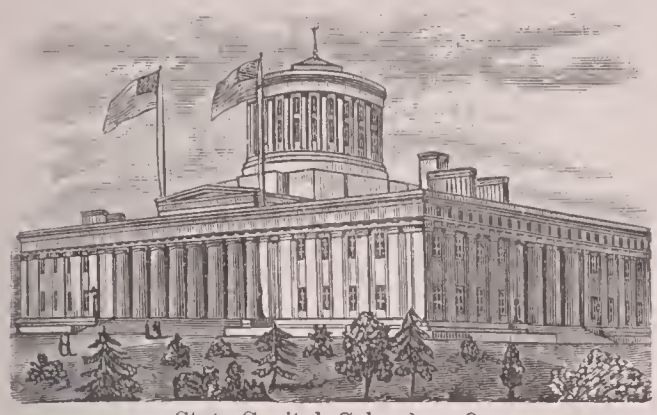
Columbus: a city of Hickman co., Ky. (for location of county, see map of Kentucky, ref. 5–B); on the Mississippi river; 196 miles by rail below St. Louis; the northern terminus of the Mobile and Ohio, and the St. Louis, I. M. and S. R. Rs. Pop. (1880) 1,338; (1890) 873; (1900) 1,235.

Columbus: city; capital of Lowndes co., Miss. (for location of county, see map of Mississippi, ref. 5–H); on Ga. Pac. and Mob. and Ohio R. Rs., and on the (navigable) Tombigbee river; 123 miles from Birmingham, Ala.; in the center of an iron and coal mining region. The city has many fine churches, very good public schools, State industrial institute and college for the education of white girls in the arts, sciences, and trades; cotton-mills (employing 300 operatives), wagon-factory, three machine-shops, oil-mill, and grist, lumber, and shingle mills. Pop. (1880) 3,955; (1890) 4,559; (1900) 6,484. Editor of "Dispatch."

Columbus: a city; capital of Platte co., Neb. (for location of county, see map of Nebraska, ref. 6–J); on the Platte and Loup rivers and the Union Pacific and Burlington and Missouri R. Rs.; 92 miles W. of Omaha. It has bridges across the Platte and Loup, a high school, a Roman Catholic academy, and various industries. Pop. (1880) 2,131; (1890) 3,134; (1900) 3,522. Editor of "Telegram."

Columbus: city; capital of the State of Ohio and of Franklin County (for location of county, see map of Ohio, ref. 5–E). It ranks third among the cities of the State in population, manufactures, and wealth. It is situated within less than 25 miles of the geographical center of the State, in lat. 39° 57′ and lon. 83° 3′ W. Its finest public building is the State-house, a noble structure 304 feet long by 134 feet wide, covering 55,936 sq. feet. An annex nearly half as large as the original building, which it adjoins, has been completed recently. Ohio is noteworthy for her benevolent institutions, and those for the blind, the deaf and dumb, the feeble-minded, and the Central Ohio Hospital for Insane are located at Columbus, all having very large and attractive buildings, that for the insane being a mile around the outer walls. The U. S. Government has a fine building for the post-office and U. S. court; and the Franklin County court-house is excelled by but few in beauty of architecture and completeness of finish. The State Board of Agriculture has

large fair-grounds adjoining the city, handsomely improved with fine buildings and landscape designs. The Ohio peni-



State Capitol, Columbus, O.

tentiary has 3,052 cells, and shop-room enough for all the inmates to work.

Churches and Benevolent Societies.—There are 103 Protestant and 19 Catholic churches in the city. The former are occupied by 15 different denominations, and many of the recent structures are very handsome. There are 50 organizations classed as "benevolent" societies (not secret), and among them several of long standing and great usefulness, and some of them well endowed.

Schools.—There are 4 high schools and 33 other public schools, which in 1900 were valued, including furniture and libraries, at $2,450,000. They have a seating capacity of 20,000, and the enrollment of pupils in 1900 was about 18,381. The Roman Catholics have 9 parochial schools, 2 academies, 1 convent, and 1 papal college. The Columbus Art School is a well-equipped and prosperous institution.

Colleges.—The Ohio State University has (1901) 106 professors and instructors and 1,450 students, with the following buildings: University Hall, Chemical Hall, Mechanical Hall, Electric Hall, Botanical Hall, Hayes Hall (manual training), Orton Hall (geology and library), Veterinary Building, Townshend Hall (college of agriculture), Biological Hall, Armory and Gymnasium, power-house, boiler-house, Emerson McMillin Observatory, Horticultural Hall, 2 dormitories, and a farm of 345¼ acres. The estimated value of land and buildings is $2,300,000. The cost of equipment and apparatus, $200,000; total endowment, $553,893.62. The total expenses for the year 1900 were $308,491.34. The library contains 35,000 volumes. A law school forms a part of the university, and had in 1900 5 professors, 3 lecturers, and 250 students. Capitol University (Lutheran) is a well-equipped college. Starling Medical College is an old and well-established school, with an attractive building and a valuable museum, and a well-fitted chemical laboratory. Ohio Medical University has a large and well-arranged and fully equipped building. The Ohio State University is in part supported by a State levy, which yields annually $180,000.

Libraries.—The State Library has 71,293 volumes; the Law Library (State) 20,570 volumes; the Public Library 31,357 volumes; the Public School Library 47,248 volumes.

Newspapers.—There are 4 daily and 1 weekly newspapers.

Banks.—There are 6 national and 12 private banks, with a capital of $3,600,000, surplus $601,900. The clearings at the clearing-house in 1900 were $269,269,000.

Manufactures.—The census of 1900 shows 407 manufactories, with a capital of $13,438,358; average number of hands employed, 10,776; wages paid during the year, $5,445,032; value of products, $8,347,678. Among the factories are 16 for carriages and wagons, which turn out more vehicles than are manufactured in any other place.

The Water-works.—Water-works are constructed on the Holly system, with 200 miles of pipe laid, and pumped in 1900 an average of 24,000,000 gal. daily.

There are 105 miles of gas mains laid, besides which a large part of the city is supplied with natural gas.

Thirteen standard-gauge railroads use the Union Depot, and a little more than an average of 120 passenger trains enter daily. The two divisions of the Ohio Central lines and the Columbus and Lima Northern use the Ohio Central Depot, making the entire number of standard-gauge railroads entering the city 16. Besides these, a dozen interurban electric railways are in operation and under construction, connecting all the surrounding county seats with the capital. There are 98 miles of electric street railway in operation. There are 116.73 miles of well-paved streets, 17.319 miles asphalt; 9.482 stone block, 75.116 brick, 9.196 boulders, 5.620 macadam; and all the streets well lighted by electricity.

The total valuation of taxable property in 1900 was $66,847,000, or $532 per capita; and the city debt was $5,155,500.

Railroads.—Columbus has railroad lines leading to all parts of the State and country, among which are four of the great trunk lines—the Norfolk and Western, the Baltimore and Ohio, the Pennsylvania lines, and the "Big Four."

History.—The town was laid out in 1812, and was adopted as the location for the permanent capital of the State: the first sale of lots occurred June 18, with no resident in the city. Owing to its healthful situation, its pure water-supply, and its thorough sanitary regulations, the city death-rate is as low as 13·73 per 1,000 inhabitants. The population in 1850 had reached only 17,882. That for the succeeding decades was (1860) 18,554; (1870) 31,274; (1880) 51,647; (1890) 88,150; (1900) 125,560.

EDITOR OF "OHIO STATE JOURNAL."

Columbus: city; capital of Colorado co., Tex. (for location of county, see map of Texas, ref. 5–I); on So. Pac. R. R. and the west bank of the Colorado river. It is the seat of Colorado College, and is a cotton-shipping point. Pop. (1880) 1,959; (1890) 2,199; (1900) 1,824.

Columbus: city; Columbia co., Wis. (for location of county, see map of Wisconsin, ref. 6–D); on Ch., Mil. and St. P. R. R. and on Crawfish river; in an agricultural district. Pop. (1880) 1,876; (1890) 1,977; (1900) 2,349.

Columbus: BARTHOLOMEW (in Spanish, BARTOLOMEO COLON): brother of Christopher Columbus; born probably at Genoa about 1445. He seems to have preceded his brother to Portugal, and in 1486–87 he was with the expedition of Bartolomeo Diaz which explored the west coast of Africa to the Cape of Good Hope. In 1488 he went to England to interest Henry VII. in his brother's project. The common story is that Henry was finally induced to undertake the business when it was too late. On his return through France Bartholomew heard of the admiral's arrival from his first voyage. Reaching Spain after his brother had sailed on the second voyage, he was given command of a supply fleet for Hispaniola, and arrived there in June, 1493. On the admiral's return from the exploration of Cuba he made Bartholomew his lieutenant or *adelantado*, an appointment which at first displeased Ferdinand, but was afterward confirmed. In the history of the island during the next seven years he took a prominent part, governing during the absence of the admiral, 1496–98, founding San Domingo 1496, subduing the Indians and marching to Xaragua in 1497. (See the following article.) Carried a prisoner to Spain when the admiral was (1500), he was released at the same time, followed his brother in the fourth voyage, led a land expedition in Veragua, and commanded in the fight with Porras at Jamaica. After the admiral's death he appears to have been in Rome. In 1509 he accompanied Diego Columbus to Hispaniola as chief *alguazil*, and was given the government of the island of Mona for life, with the superintendence of mines and other lucrative offices. D. in San Domingo in May, 1515. He was never married.

HERBERT H. SMITH.

Columbus, Don CHRISTOPHER: a Genoese navigator, the discoverer of America. On account of contradictory statements in the early authorities, it is impossible to determine with confidence either the time or the place of his birth. It is probable, however, that he was born at Genoa about the year 1446. His father, Dominico, was a wool-comber by trade, and the son Christopher was trained in this vocation, though early in life he manifested a taste for other pursuits. His education, though neither comprehensive nor exact, was sufficient to give him considerable knowledge of geography and some facility in the use of Latin. The report that he was at one time a student at the University of Pavia, which appears to have originated some years after his death, must be rejected as apocryphal. Genoa was an important port, and at the age of fourteen the youthful Christopher yielded to the temptations of the sea. The order of events in his life between 1460 and 1484 it is impossible to fix with any measure of confidence. The dates of the more important, however, may be determined with some precision. It was at some time between 1470 and 1473 that he left Genoa and established his home at Lisbon, the capital of Portugal, where his brother Bartholomew had set up a business as a maker and seller of maps. In this vocation Christopher also acquired considerable skill, and as Lisbon was at that period the seat of the most active maritime interests

of Portugal, he had every encouragement to increase his knowledge of geography and of navigation. His tastes in these directions received a great impulse in the year 1474 by some letters from the distinguished Italian geographer Toscanelli. This correspondence makes it evident that Columbus had already conceived the idea of reaching the East Indies by sailing westward. Toscanelli assured him not only that such a voyage was practicable, but also that the size of the earth was such that he could reach Cipango and Cathay (Japan and China) by sailing westward about 3,000 miles. There is positive proof that from the writings of John de Mandeville, of Ptolemy, and especially of Cardinal d'Ailly, Columbus at this time had acquired a confident belief in the sphericity of the earth. He believed that it could be circumnavigated, and for some years before 1484 he directed all his energy and tact to the work of convincing the King of Portugal that Portuguese interests would be subserved by attempting a westward course instead of persevering in the effort to discover a passage by way of Southern Africa. In these efforts he was not successful. But during this period of waiting he had many experiences that encouraged his belief and re-enforced his zeal. In 1477 he sailed to the far north, and came to an island which was probably Iceland. Here he may have learned of the discovery of America nearly 500 years before by the Norsemen. The matter, however, is conjecture, as Columbus nowhere in all the writings of his that have been preserved alludes to any such information or report. During the same period the navigator went upon a slave-trading expedition to Guinea, and served on several piratical expeditions under the much-dreaded corsair Casseneuve. Not long after 1473 he married Felipa Moñiz, of whom very little is known. There is conflicting evidence as to whether his wife died before he left Portugal in 1484, for one authority says that Columbus abandoned the country because of grief at the death of his wife, while the navigator himself, in a letter to the Spanish court at a later period, says that in order to enter the Spanish service he "abandoned wife and children, whom he never again saw." If Columbus was correct in this statement, he had at least three children when he left Portugal, for he took his son Diego with him on going into Spain. All efforts to acquire further information in regard to the wife and younger children have been fruitless.

Columbus entered Spain in the autumn of 1484 or the spring of 1485. Before leaving Portugal he had sent his brother Bartholomew to England with instructions, in case of failure to interest the English court in his new project, to go to France on the same errand. He at once set about the task of persuading the monarchs Ferdinand and Isabella to render him the assistance that had been denied by the King of Portugal. But he was destined to a long period of waiting and to many bitter disappointments. The time was not propitious. Spain was not yet a consolidated monarchy. The resources of the various provinces had been depleted by numerous wars. For the extirpation of heresy the Inquisition had recently been established, and it was still a problem whether this terrible engine of persecution was to be successful. The plague was sweeping off the people in some of the most populous parts of Aragon and Castile, and, worst of all, the sanguinary contest with the Moors had made such drafts upon the treasuries that the coin had been debased, and had so exhausted the resources of the people that no other project could receive a favorable hearing. It is not singular that under these circumstances the monarchs were slow to render the coveted assistance. But they were not inclined to answer him sharply in the negative. From the first they seemed disposed to give to his cause a respectful hearing. Whether this was because of a generous sympathy with his enterprise, or whether it was merely to prevent another court from getting the credit of such discoveries as might be made, is a question that must probably forever be very largely a matter of conjecture. The course pursued, however, was not an unnatural one. The project was again and again referred to a commission consisting of the learned men in the vicinity of the court. The decisions, though never quite unanimous, were uniformly unfavorable. Columbus pleaded his cause eloquently, and he had a few firm supporters and ardent followers. But the vicissitudes of war made the court migratory, and consequently it was never possible to give to the subject the careful and protracted consideration at any one time that was necessary to bring it to a final decision. At length, however, when the banner of the cross was planted on the last Moorish citadel at Granada, the monarchs had no longer any good reason for postponing a final decision. But notwithstanding this fact the slowness of the monarchs discouraged the suppliant. On the very eve of success he decided to abandon the court and betake himself to France for aid. The money with which from time to time he had been supplied by the royal treasurer was exhausted, and he was obliged, on his way to the port, to travel on foot as a mendicant. In this plight he presented himself with his little son at the door of the monastery La Rabida, and begged for a crust of bread. The abbot Parez de Marchena listened to the story with great interest, for he had himself at one time been the confessor of the queen. He believed that he might have influence with the court. It was soon arranged that he should set out at once on a mission of persuasion to Queen Isabella. The journey required several days, but in the end it was successful. The monarchs ordered a sufficient sum of money to be sent to enable Columbus to present himself at court in a respectable manner. He appeared, and Ferdinand and Isabella at length decided that they would render the needed assistance. But the terms demanded by Columbus threatened to defeat the whole project. He asked to be made admiral of the ocean and viceroy of all the territory he might discover; that he should have a tenth of all the gold and other wealth that might in any way be acquired; that he should have sole right to nominate judges and other subordinate officers; and that all his rights and titles should be hereditary. The monarchs very naturally regarded these terms as inadmissible, and Columbus, rather than abate any part of his claim, decided to withdraw. He left the court at Santa Fé, but the enthusiasm of the queen, re-enforced by the persuasive words of the Duchess de Moya and the minister Santangel, was finally successful. Columbus was at once brought back, and it was soon agreed that three vessels should be fitted out at the port of Palos for the expedition. Though the articles were signed on Apr. 17, 1492, the expedition was not ready to sail before the summer was well advanced.

First Voyage.—The difficulties and delays in fitting out the first fleet were owing to a number of untoward causes. For some misdemeanor the people of Palos had been condemned to furnish the Government gratuitously with three vessels and all necessary equipments. But as soon as the nature of the contemplated expedition became known, the imaginations of the populace began to conjure up all conceivable horrors. It seemed to be impossible to enlist a crew. Finally it was proclaimed that a pardon would be issued to debtors and criminals in case they would enlist. Many availed themselves of the privilege thus offered and then deserted. It was many weeks before the necessary men, about 120 in number, could be secured. Of the ships, the Santa Maria, the Niña, and the Pinta, the first, which was the largest, was only about 75 feet in length, and about 100 tons burden. The character of the crew increased the difficulties of the expedition. The fleet, after the crew had all confessed themselves and secured absolution, set sail at sunrise on Friday, Aug. 3, 1492. But the rudder of the Pinta soon needed repairs, and the fleet was delayed more than a month at one of the Canary islands. Setting out again on Sept. 6 the little expedition once more set its sail for the unknown. Fertile imaginations have done much to crowd this famous voyage with perilous experiences. But Columbus's journal, published early in this century, shows that it was not remarkable for incident. There is no evidence that the crew mutinied, or that Columbus's life was at any moment in danger. During most of the passage the prows of the vessels were turned due west. Early in October there began to be increasing indications of land. Loose seaweed and bits of floating wood gave unmistakable intimations that land was not far away. Flocks of birds flying to the S. W. finally led Columbus to turn his course a little to the S. of W., a change which prevented the first landing from taking place on the coast of Florida. At ten o'clock on the evening of Oct. 11 Columbus thought he saw a light. If he was correct in his conjecture, the light was in a boat, for they were running at the rate of about 10 miles an hour, and it was two o'clock on the morning of the 12th when land was first seen. Sails were shortened and the ships drifted before a strong east wind until daylight. There has been much conjecture as to the exact spot where the first landing occurred, but recent studies have led to the belief that the landfall was on Watling's island, and that the exact spot was near Riding Rocks, a little N. of the middle of the west coast. The conjecture of Rudolf Cronau, who explored the islands in 1890, is that the fleet was car-

ried beyond Watling's island by the strong easterly wind and sea in the course of the night, and that on the morning of the 12th it turned about and landed on the lee shore. This theory enables us to reconcile the present appearance of the island with the account given by Columbus.

After a short delay at Watling's, the fleet explored several of the adjacent islands. The most important of these was Cuba, along the northern coast of which Columbus sailed 200 or 300 miles. Retracing his course, he turned to the S. E., where, after exploring several smaller islands, he determined to effect a landing upon the north coast of a large island which he called Hispaniola. The landing was made on Christmas Day, and in commemoration of the fact he called the place La Navidad. The natives on all the islands showed a spirit of friendliness, everywhere regarding the newcomers as visitors from heaven. Remarkable evidence of this spirit was shown when one of the admiral's vessels was wrecked, and the natives, as Columbus says, "came to the assistance of the Spaniards with tears in their eyes," and begged them to accept of "as many of their houses as would be necessary for storage." Here he decided to establish the first settlement. Leaving about forty of his crew with abundant supplies, he turned the two remaining ships homeward, where, at the end of a very stormy passage, he arrived Mar. 15, 1493.

The report of his expedition was received with astonishment and joy. The king and queen at once summoned him for a reception at court. His passage through Spain was a triumphal procession. He had brought a few Indians as captives, and these, with such trappings as he could put upon them, he displayed as evidence of his success. He reported that the islands he had found were off the coast of Asia, and that the untold wealth of Cipango and Cathay would be the reward of further explorations. Ferdinand and Isabella were so much pleased with his reports and assurances that they confirmed him in all his rights and titles, and at once authorized the equipment of a new and a larger fleet.

Second Voyage.—Columbus's second fleet consisted of seventeen vessels. The crew and company were made up of adventurers of every kind. The reports that had been circulated concerning the gold to be found drew into this peculiar service every species of the indolent, the needy, and the avaricious. The voyage, begun on Sept. 25, 1493, was without important incident, except that the navigator passed nearly a month in exploring the small islands S. E. of Porto Rico and observing the customs of the inhabitants, whom he found to be cannibals. On Nov. 27 the fleet reached La Navidad, only to find that every one of the colonists had perished. Investigation made it plain that internal dissensions had been followed by open hostilities, and that disintegration of authority, succeeded by lawlessness in dealing with the natives, had provoked a systematic attack which had ended only with the death of all the settlers.

After due contemplation of this sad spectacle, Columbus determined to seek another site for the establishment of a more permanent settlement. The spot selected was about 10 leagues E. of La Navidad, where nature had furnished many facilities for a fortified camp. Here he planted the first European city in America, and gave it the name of the Spanish queen, Isabella. But the colony was made up of men ill adapted to the work of building a fortified city. To many of them hard manual labor was intolerable. Food was poor, and soon became scarce. Maladies peculiar to a new country broke out with violence. The ravages of disease threw over the whole enterprise the appearance of gloom. Columbus himself was ill at one time for several weeks, and a little later for several months. He had hoped to send back glowing accounts of what had been accomplished by the colony at La Navidad, but, in fact, he was now able to do no more than give a gloomy report of death and disappointment and suffering. In this disheartening state of affairs he determined to fit out two expeditions in search of gold, one of which was to penetrate the island to the S., the other to the E. Neither had much success, though both heard glowing reports from the hospitable natives of the gold that was to be found at a distance. In consequence of these favorable reports Columbus determined to send back twelve of the ships with the news. He also made certain important recommendations. Besides informing the monarchs of the more pressing wants of the explorers, he recommended the formal establishment of the slave-trade as a means of furnishing the colonists with needed supplies and the Government with ample remuneration. He proposed that a fleet of ships should be fitted out to carry cattle from Spain to the islands, and Indian slaves from the islands to Spain. The plan was not approved by Ferdinand and Isabella, but their disapproval was not so pronounced as to dismiss the subject from the mind of the admiral. He resolved to take advantage of the doubt, and sent back five shiploads of slaves. The methods of the explorers soon turned the friendly hospitality of the natives into deadly enmity. It became evident that the island would have to be subdued. The most formidable of the chiefs was captured by treachery, and the ill-organized natives were defeated in a pitched battle.

As a means of replenishing his empty treasury, Columbus now decided to impose tribute of gold upon the natives. Every adult was required to produce a hawk's bell full of gold once in three months, on penalty of manual labor on the farms of the Spaniards. As the requisite gold could not be found, a system of serfage ensued, and the way was rapidly prepared for a succession of disastrous revolts. The natives determined to get rid of their enemies by destroying the crops, and thus bringing on starvation. This, however, did not succeed, for the Indians suffered no less than the invaders. Columbus saw that no favorable report could be made in regard to Hispaniola, and accordingly, in Apr., 1494, he determined to leave the colony for a time in the hands of his brother, Diego, and explore the unknown lands at the west.

But here no better fortune awaited him. For several weeks he skirted along the coasts of Cuba, in the confident belief that he was nearing the city of Cathay, with all its golden treasures. On June 12, however, the crew would go no farther, and he was obliged to turn back. Before doing so he caused eighty of the men to swear that they had reached the continent, and that it would be possible to return to Spain by a continuous journey to the W. by land. Any one who should on his return renounce his oath was to be fined 10,000 maravedis and have his tongue cut out.

On the return of this fruitless expedition to Hispaniola it was found that affairs had in no way improved. Bartholomew Columbus had arrived, and now the admiral placed him second in command. But discontent verging upon insurgency presented a problem even more difficult than that presented by the natives. Two of the most influential of the malcontents, Margarite and Boyle, had taken advantage of Columbus's absence and had sailed for home. They not only gave a doleful picture of the colony to the Spanish court, but they charged the admiral with cruelty and deceit. They asserted that no gold of any amount had been discovered, that the most intolerable cruelties were practiced upon the Spaniards as well as upon the natives, and that all reports from the islands of a favorable nature were misleading and false. The Government decided that these reports justified an official inquiry. The monarchs appointed Don Juan Aguado to make the inquiry; he was a friend of Columbus, who had come out with him on the second voyage and returned to Spain with letters from the admiral. He arrived at Hispaniola in October of 1495. Columbus saw at once from the comprehensive commission of the agent that his position was in imminent peril. He soon decided to present his cause in person to the king and queen. After due preparation he took ship, and after an absence of two years and eight months reached the bay of Cadiz on June 11, 1496.

Third Voyage.—The sovereigns not only manifested a friendly spirit to Columbus, but they even gave exceptional evidence of their approval. They renewed his commissions, and confirmed his brother's appointment as *adelantado*. Best of all, they granted his request to fit out a new fleet of eight ships for a third voyage. But these favors did not conceal or obscure the general disappointment. The friends of those who had manned the second expedition had been made too well aware of the extent of the sufferings and the barrenness of the results. It was not singular therefore that it was now difficult to recruit a crew. Volunteers were few; and at length, after long delays, the admiral obtained the privilege of transporting all criminals to the Indies to serve for a term of years. This unfortunate provision, while it did something to enable the commander to fill up his crew, put a stamp of ignominy upon all service in the colony, and exerted a blighting influence upon all colonial life. The numerous difficulties in the way of preparation occasioned the most annoying delays, and it was not until May 30, 1498, that the expedition was ready to sail. A southerly course was taken for the purpose of reaching and crossing the

equator, but the heat was so great that the plan was abandoned. Turning to the W. the admiral discovered the three mountains which he called Trinidad, and a few days later the lowlands of the continent about the mouth of the Orinoco. This discovery, Aug. 1, 1498, was the first sight the Spaniards obtained of the mainland. Passing through the rush of waters of the Orinoco and the channel which he named the Bocea del Drago, or Dragon's Mouth, he lingered for a few days along this interesting coast, and then sailed directly for Hispaniola.

The harbor of San Domingo was reached on Aug. 30. There Columbus found affairs in a deplorable condition. The criminals transported to the Indies had already begun to exert a baleful influence. The system of *repartimientos*, or personal service, had converted the friendliness of the natives into the most active hostility. Whenever there had been any resistance on the part of the natives, the persons adjudged guilty had been reduced to slavery and sent to Spain. The iniquitous traffic thus thrived apace, and its very prosperity intensified the hostility that had now become universal. To add to the difficulties of the situation the *adelantado* had become involved in a war with a formidable chief in the western part of the island. Though the natives were easily subdued, when they were subjected to tribute they only added to the numbers of those who, on the least chance of success, were ready to break out into open insurrection.

The occasion soon presented itself. Before departing for Spain Columbus had appointed Francis Roldan chief justice for the island. He had an ambitious, arrogant, and turbulent temper, and soon found it easy to gather a strong following about him. He planned to assassinate the *adelantado*, and then make himself master of the island. No effort to bring him to terms was successful. Columbus afterward wrote, concerning the condition of affairs on his arrival, "that he found nearly half the colonists of Hispaniola in a state of revolt." It was not until November that a form of settlement was reached. Columbus agreed to transport the followers of Roldan to Spain with ample provisions, and to allow one slave, "man or woman," to each of Roldan's men. But vessels could not at the moment be obtained, and it was midsummer of the next year before the necessary ships were put at the disposal of Roldan and his men. This delay was unfortunate, for Roldan now refused to be bound by the old contract. It was a year and a half after Columbus's arrival before terms were finally adopted. Roldan submitted only when Columbus agreed to appoint him perpetual judge and write a letter to the Spanish monarchs exonerating him from all blame. But it could hardly have been expected that so conspicuous a reward of insubordination would promote good discipline. No sooner was Roldan brought into subjection than another revolt broke out under a turbulent spirit named Ojeda. Meanwhile accounts of the condition of affairs were finding their way back to Spain. Unfortunately there were no favorable reports to relieve the dark colors. Matters seemed to be growing worse and worse. The returns of gold had been trifling in amount, and even the slaves had proved to be of very little value. Every ship brought demands for further supplies, without bringing any word of improvement in the condition of the colonists. During all this period the old enemies of Columbus in Spain were busy with their work of denunciation.

The monarchs were at length persuaded that the admiral must be suspended from authority. The arrival of a cargo of slaves seems to have completed their determination. The agent selected to execute their authority was an officer of the royal household named Francis de. Bobadilla. He was authorized to look into the condition of affairs, and send back to Spain "any cavaliers or other persons" in case he should find such a course desirable. It is not probable that the monarchs intended to include Columbus in the list of persons subject to arrest, but the language of the commission provided no immunity. Bobadilla arrived at San Domingo on Aug. 23, 1499, and found affairs in extreme disorder. His efforts during more than a year to bring order out of chaos were unsuccessful. Almost his first act showed an energy that amounted to brutality; Columbus was thrown into chains and sent back to Spain, where he arrived in Nov., 1499.

The outcry against the brutality of Bobadilla was universal, and the monarchs made haste to disavow the arrest and set the admiral free. But the affairs of the island were in such a condition that not even Isabella was in favor of restoring him to his command. The most she was willing to do was to provide for the protection of his estate and furnish him with a fleet for further explorations. The squadron of four ships was ready to sail on May 4, 1502.

Fourth Voyage.—The purpose of Columbus in his fourth expedition was to press on still farther to the west, and put himself into definite relations with the Asiatic mainland. He was still unshaken in the belief that the islands thus far explored were only a little E. of Japan and China. After asking in vain for admission to the port of San Domingo to exchange one of his unseaworthy vessels, he began the most perilous portion of his career. Sailing between Cuba and Jamaica he turned to the S. W., and soon found himself skirting the coast now known as Central America. But all the fates seemed to have conspired against him. Tornado after tornado drove his ships about and threatened them all with destruction. However, in the course of the winter months he explored the coast from the Isle of Pines to a point E. of Darien. But want of supplies forced him to turn back. Gale after gale followed, and finally, after experiencing nearly every form of vicissitude, the last of his vessels was wrecked on the northern coast of Jamaica, Aug. 12, 1503. Reduced at times to the point of starvation, he saw that the only hope of rescue was in the possibility of reaching San Domingo in an open boat. One of his companions, Mendez, volunteered to make the attempt. The first effort failed, but the second was successful. It was June 25, 1504, when the admiral and his little crew, after ten months of suffering, were gladdened by the sight of approaching relief.

The turbulent career of Columbus was now practically at an end. After passing a few weeks at San Domingo, he set out with two vessels for Spain, where, after a tempestuous voyage he arrived on Nov. 7. Though scarcely sixty years of age, he was old and broken. It was evident that his work was done. He wrote numerous letters for the purpose of interesting the king in behalf of his son; but to these importunities Ferdinand paid very little heed. Columbus sank rapidly, and, after providing for the disposition of his estate by will, died at Valladolid, May 20, 1506.

After temporary interment at Valladolid and Seville, the remains of the great explorer were transferred to the cathedral at San Domingo at some time before the year 1549. At a later period the remains of other members of the admiral's family found the same resting-place. In the year 1796 a vault in the cathedral, supposed to contain the bones of the discoverer, was opened and its contents were conveyed, with imposing ceremonies, to Havana. In 1877 and 1891, however, evidence was discovered that the vault opened in 1796 was not that of the admiral, but that of one of the other members of the family. It may therefore be regarded as established almost beyond doubt that the ashes of the discoverer still rest in the cathedral at San Domingo.

C. K. ADAMS.

Columbus, DIEGO (in Italian, GIACOMO COLOMBO, and by Latin writers called JACOBUS): brother of Christopher Columbus; b. probably at Genoa about 1450. He accompanied the admiral on his second voyage, and when the latter went to explore Cuba was left in charge at Isabella. He subsequently had a good deal to do with the affairs of Hispaniola; but his character was not fitted for command in such turbulent surroundings, and, though he seems to have been kindly and good, he effected little. In later life he became a priest, and in 1509 he accompanied his nephew, Diego Columbus, to San Domingo, where, probably, he died.
HERBERT H. SMITH.

Columbus, or **Colon**, DIEGO: son of Christopher Columbus; b. either at Lisbon or on the island of Porto Santo, near Madeira, about 1476. He went with his father to Spain in 1484, and when the latter left on his first voyage (1492) Isabella made Diego a page at court, where he remained until after his father's death. He inherited the revenues of Hispaniola, but King Ferdinand evaded his claim to the titles and powers of which the admiral had been shorn in his later years; at length he obtained permission to sue for them before the council of the Indies, and

the result was in his favor. Meanwhile he had married Doña Maria de Toledo, niece of the Duke of Alva, and this powerful alliance probably brought Ferdinand to confirm him as Admiral of the Indies and governor of Hispaniola. The title of viceroy, with the appointing power, was withheld. On July 10, 1509, he arrived at San Domingo as governor, bringing his wife and a large retinue. He ruled with a splendor unknown before in the New World, sent Velasquez to conquer Cuba in 1511, and even obtained permission to make settlements on the continent. But some of his measures made him enemies among the colonists, his powers were restricted, and after two visits to Spain he was finally called back in 1523. He went, leaving his wife in charge of the government, and, after following the court in its migrations for two years, seeking redress, he died at Montalvan, near Toledo, Feb. 23, 1526. His widow died at San Domingo in 1549. HERBERT H. SMITH.

Columbus, FERDINAND (or FERNANDO COLON): son of Christopher Columbus by Doña Beatrix Henriquez, a lady of Cordova; b. in Cordova about Aug. 15, 1488. In 1498 he became a page of Queen Isabella; was with his father on the fourth voyage, 1502–04, and was duly recognized in the admiral's will, receiving a large income. He went to San Domingo with his brother in 1509, and probably made a subsequent visit to America. As an attendant on Charles V., he traveled over most of Europe; probably visited Asia and Africa; was employed by Charles in important matters connected with geography; and was about founding an academy and school of mathematics when he died at Seville, July 12, 1539. He wrote a history of the Indies, and a biography of his father, the latter having been used by Las Casas; but both the works in the original are lost. The *Historie*, or Italian version of the biography, first appeared in 1571, and is probably a faulty translation of the work of Ferdinand Columbus, whose name it bears; but even this is somewhat doubtful. Unsatisfactory as such an authority must be, it is the basis of nearly all biographies of Columbus. It has been translated into Spanish, English, and Dutch. Ferdinand Columbus collected a library of over 20,000 volumes, which he willed to the cathedral chapter of Seville. It fell into neglect, and of its priceless treasures hardly 4,000 volumes remain there. It is known as the *Colombina*. HERBERT H. SMITH.

Columbus, or **Colon**, LUIS: son of Diego and grandson of Christopher Columbus; b. at San Domingo, 1521 or 1522. His mother took him to Spain in 1529, and he received the title of Admiral of the Indies, with augmented revenues. He instituted proceedings to recover the title of viceroy, but after long litigation he was forced in 1536 to give up all his claims, receiving in return the island of Jamaica in fief, an estate of 25 leagues square in Veragua, an annuity of 10,000 ducats, and the titles of Duke of Veragua and Marquis of Jamaica. From 1542 to 1551 he was captain-general of Hispaniola. In 1556 his titles and income were further curtailed. He was a person of dissolute habit, was arrested in 1559 for having three wives, remained in prison until 1563, and was then banished to Oran, in Africa, where he died Feb. 3, 1572. His daughter Felipa married her cousin Diego, who became Duke of Veragua, but died childless in 1578. With him the male line of Columbus became extinct. A lawsuit for the title followed, lasting thirty years, and later there were other suits, with several changes. The present Duke of Veragua (b. 1837) is descended from Columbus through Diego, Cristoval, son of Diego, and Francesca, daughter of Cristoval. HERBERT H. SMITH.

Columbus Grove: village and railway junction; Putnam co., O. (for location of county, see map of Ohio, ref. 3–D); 84 miles N. of Dayton; in an agricultural district. Pop. (1880) 1,392; (1890) 1,677; (1900) 1,935.

Columel'la: in botany, the remaining central column or axis formed of the placentas when the carpels of certain fruits have separated; also the axis of the capsules of mosses. In conchology, the upright pillar around which the whorls of univalve shells are wound is called the columella.

Columel'la, LUCIUS JUNIUS MODERATUS: the celebrated Latin writer on agriculture; a native of Gades (Cadiz), in Spain; owned a great estate, Ceretanum (whose location, however, is uncertain); served as tribunus militum in the Sixth legion; traveled much in Spain, Gaul, Italy, Cilicia, and Syria, and spent the latter part of his life in Rome, where he wrote his twelve books *De re Rustica* in the middle of the first century A. D. The work, which is written in a somewhat diffuse though not inelegant style, treats, in many cases with great minuteness, of the soil, the animals, the grains, vegetables, fruits, etc. Very interesting are his remarks on the cultivation of the vine, nearly the same as would be made on the subject in our time. The tenth book, on gardening, is written in dactylic hexameters. A separate book, *De Arboribus* (on trees), which has been preserved, must have belonged to an earlier and less elaborate treatise by Columella on agriculture. The best edition is that by Schneider (Leipzig, 1794). There is an English translation dated 1745. Revised by M. WARREN.

Column: in architecture, a decorated vertical member supporting a lintel or an arch; more slender and ornate than a *pier* (which is a support composed of built-up masonry or brickwork), and more decorative and important than a *post* (which is a single prop or vertical beam destitute of architectural character). A column consists usually of base, shaft, and capital. The base serves to increase the supporting area under the column, and to mediate between its rigid verticality and the horizontal floor or basement; while the capital, the most ornate portion of all, gathers upon the shaft the various superincumbent pressures, and effects a transition from the vertical lines of the shaft to the horizontal or curved lines of the superstructure. The shaft, usually, but not always, cylindrical, is made up of several sections called *drums*, or of a single piece, in which case it is called *monolithic*. See ARCHITECTURE.

Although sometimes executed in stuccoed brick, as in Pompeii, or in metal, as in some modern work, the column is essentially a feature of stone architecture.

The Egyptians employed columns of various forms, but always of great massiveness of proportion. The shafts were sometimes circular, sometimes clustered or quatrefoiled in section, and usually had a slight base and a large and showy capital. The latter was usually either suggestive of a lotus bud or blossom, or campaniform (i. e. shaped like an inverted bell); though sometimes formed like palm branches, or with four heads of Hathor surmounted by a shrine. The whole column was often richly carved and painted with symbolic pictures and hieroglyphics, and at Karnak reached the enormous size of 11½ feet in diameter and over 60 feet in height. Some very early structures, as the tombs at Beni-Hassan, exhibit columns with shafts having eight, sixteen, or more slightly concave sides or faces, surmounted by a plain square abacus. These have been called *proto-Doric*, from their fancied, but by no means demonstrated, influence in the creation of the Greek Doric order.

The forms of columns used by the Greeks were few, but were developed by them to an unrivaled perfection of beauty and refinement. These forms were designed according to a certain established succession of parts which has given rise to the *orders*. Of the three Greek orders the Doric affords us the most ancient examples (as at Corinth and Selinus), although some authorities ascribe to the Ionic an equal antiquity in Asia Minor. The Corinthian was not in use until the Alexandrian period (330 B. C.), and then but rarely by the Greeks, who never perfected its base and entablature. The columns of the orders are distinguished by their *proportions*, the Greek Doric being the most sturdy (4 to 7 times the lower diameter in height); the Ionic next (8 to 10 diameters); and the Corinthian the most slender (10 to 10½ diameters); by their *capitals*, of which the Doric is the simplest and shortest, the Corinthian the tallest and most ornate, and the Ionic a mean between them; by their *flutings*, which are shallower and fewer in the Doric than in the others. The Romans borrowed the magnificent columnar architecture of the Greeks, added the Tuscan and Composite orders, perfected the Corinthian base and entablature, modified the profiles and minor details of all the orders, making them less refined but more ornate, and finally employed the column as a merely decorative adjunct to their national architecture of arches by imbedding it, as it were, in the masonry between the arches. Here it supported nothing in reality, though to the eye it seemed to carry the strongly projecting entablature of each story. But the Romans also employed columns to support their porticos and the vaulting of their baths and temples, preferring in such cases monolithic shafts of polished porphyry or other semi-precious material, and this practice was afterward imitated by early Christian and Byzantine architects.

Early Christian architecture made free use of columns taken from earlier pagan-Roman structures in the erection of its basilicas, where the columns became once more true

supports, carrying the arches under the clerestory. From this time on the column is a feature of interior architecture rather than of the exterior, as was the case with the Greeks. The Byzantine builders, with better logic than that of the early Christians of Rome, rejected the classic base and capital, and devised new forms better adapted to the function of supporting ponderous masses of vaulting. This adaptation of form was, however, carried to much greater perfection by the mediæval architects of Europe, who shook off the last vestiges of classic conventionality. The column was now used more often in groups or clusters than singly; was made sturdy or slender as each case might demand, and its shaft left smooth, or painted with chevrons, stripes, or bands, in brilliant color. Sometimes, as in early French and Norman porches, the shafts were carved in intricate diaper-patterns.

The practice of Renaissance and modern architects has usually followed Roman precedents; but the development of construction in iron and steel has given rise to frequent innovations in the forms of metal columns. The use of monumental colonnades is in our day very rare, those of the Louvre and of the Capitol at Washington being among the finest modern examples.

Columns have been in all ages erected as monuments, standing isolated in the open, to commemorate important names or events, and in most cases surmounted by statues. The Romans excelled in such monuments, of which the Trajan and Antonine columns at Rome are conspicuous examples, and the Vendôme and July columns in Paris the best modern imitations. But such columns are more properly called *pillars*. See Architecture, Byzantine Art, Composite, Corinthian, Doric, Ionic, and Tuscan Orders.

A. D. F. Hamlin.

Column: a military formation of relatively great depth and little front, as distinguished from a "*line*," which has an extended front and little depth. Troops in column are easily moved along roads and over broken country, whereas it is difficult to cause a deployed line to advance or retire over favorable ground without great irregularity or even disruption, and in broken ground it is almost impossible. For this reason lines are always ployed into columns for any extended movement. A column may consist of a company, battalion, regiment, brigade, division, or corps. Upon marches not in the vicinity of the enemy they usually have a front of four men, great depth, and are composed of all arms. Upon the battle-field they were formerly much used for the attack with the bayonet, and varied in strength from a single battalion to a large division. In modern fields they seldom exceed a single company, and are used for manœuver only, being deployed into line before they are exposed to the full effect of small-arm fire. Jas. Mercur.

Colu'sa: capital of Colusa co., Cal. (for location of county, see map of California, ref. 5–C); on the Sacramento river, 60 miles N. N. W. of Sacramento. It is the eastern terminus of the Colusa and Lake R. R., and has 5 churches, 2 public schools, a convent school, flouring-mill, and canning-factory. Pop. (1890) 1,336; (1900) 1,441.

Editor of "Sun."

Col'ver, Nathaniel, D. D.: Baptist divine; b. at Orwell, Vt., May 10, 1794; d. at Boston, Sept. 25, 1870. He received only a very limited education, was by trade a tanner, and served as a volunteer in the war of 1812. He began his ministry in 1836, and was successively settled in Boston (1839), South Abington, Mass. (1852), Detroit (1853), Cincinnati (1856), and Chicago (1861). He was an able preacher, of great power with the masses, and eminent as an abolitionist. After the war he founded in Richmond, Va., the Colver Institute for educating young colored men for the ministry, and was president 1867–70. He published three lectures on Odd Fellowship (Boston, 1844).

Colville Indians: See Salishan Indians.

Colvin, Sidney, M. A.: English author; b. in Norwood, Surrey, June 18, 1845; educated at Trinity College, Cambridge; Slade Professor of Fine Art at Cambridge 1873–86; director of the Fitzwilliam Museum there 1876–84, resigning to become keeper of the department of prints and drawings in the British Museum. He has written for the leading periodicals many critical and historical articles on art and literature; is author of *Children in Italian and English Design* (1872); *Landor* (1881) and *Keats* (1887) in the English Men of Letters series; and has edited *Selections from Landor* (1884), and *Life and Letters of Robert Louis Stevenson*.

Coly, or **Colie**: any one of several small birds of the genus *Colius*, restricted to Africa. All four toes are directed forward, but the inner and outer can be turned backward; the plumage is soft and hair-like, and of a grayish cast (whence they are sometimes called mouse-birds); the tail feathers are long and stiff. The structure of the colies is peculiar, and they are related to the woodpeckers and kingfishers. They creep about the branches, assuming very curious attitudes, and often roost in companies, hanging head-downward.

F. A. Lucas.

Colym'bidæ [Mod. Lat., from Gr. *κόλυμβος*, a diver]: a family of diving birds of the order Pygopodes (*q. v.*). The family comprises the grebes only. See Grebe.

Col'za: a variety of rutabaga or Swedish turnip (*Brassica campestris*) which is cultivated for its seeds, from which oil similar to rapeseed oil is made in Europe. The oil is used for lamps, lighthouses, and machinery, and the leaves and refuse seeds after the oil is expressed are fed to cattle and sheep. The roots are not bulbous. The term is sometimes applied rather loosely to other but similar cruciferous oil-plants.

Co'ma [from Gr. *κόμη*, hair]: in astronomy, the nebulous envelope of a comet's nucleus. (See Comet.) In botany, the name is sometimes given to the head or top of a tree, and also to the hairy crest of certain seeds.

Coma [from Gr. *κῶμα*, deep sleep]: a condition of deep sleep or stupor from which the patient can not be aroused is a symptom of great gravity. The face of the patient is usually congested, the conjunction of the eyes injected with blood, the pupil small or large, the breathing labored, often "stertorous." A variety of causes produce coma, and the symptoms vary with the cause. Among the important causes may be mentioned narcosis from alcohol and opium; Bright's disease; diabetes; apoplexy and injury to the brain; epilepsy; sun-stroke and heat exhaustion; pernicious malarial fever; and severe infectious diseases of various kinds. The stuporous condition of extreme drunkenness is the commonest form, but is unfortunately sometimes assumed to be present when the coma is in reality the outcome of some of the other conditions named. This mistake is all the more apt to occur, because a person feeling faint or ill may take spirits to revive him, and then fall into coma with the odor of alcohol still noticeable, or an intoxicated person may fall and injure the head, or may suffer apoplexy, when again the odor of drink might deceive the ordinary observer. It should therefore be made an invariable rule in prisons, or where drunken persons are kept, that in every case of unconsciousness, no matter whether mere drunkenness be suspected or not, a physician be summoned. The diagnosis of the various causes of coma is so difficult, and the necessity of active treatment so urgent, that to none but experienced physicians should be intrusted the care of these cases.

There are besides coma a few other conditions of unconsciousness, such as hypnotic sleep, trances, and the like, but the rarity of these and the essentially different appearance of the patient readily separate them. The face in these cases rarely presents the same appearance of serious illness as in coma, but rather appears placid or death-like, and it may or may not be possible to arouse the patient.

William Pepper.

Co'ma Berени'ces (i. e. Berenice's hair): a small constellation of the northern hemisphere, between Boötes and the tail of Leo. It is formed of a cluster of very small stars, which may be seen near the zenith in April and May. See Berenice.

Comacchio, kō-mäk'kē-ō (anc. *Comacula*): a fortified town of Italy; province of Ferrara; 3 miles from the Adriatic and 29 miles E. S. E. of Ferrara. It is situated in the marshes of Comacchio, in which great numbers of eels are caught. These and other fish are cured in an excellent manner. It is the seat of a bishopric, and has salt-works. Pop. 9,974.

Comalcalco: See Central American Antiquities.

Coman, Katherine: professor of history; b. 1857 at Newark, O.; educated at University of Michigan, mainly under Prof. (now president) C. K. Adams; succeeded Alice E. Freeman as Professor of History and Economics in Wellesley College 1886; author of *Outlines in Constitutional History of England* (1888); *Outlines in Industrial History* (1892). C. H. T.

Coma'na: an ancient city of Cappadocia, generally surnamed Chryse or Aurea (the golden), in order to distin-

guish it from Comana in Pontus; stood on the river Sarus (Sihun), in a deep valley of the Anti-Taurus range, and was celebrated for the magnificence and splendor with which the goddess Mā, the Greek Enyo, was worshiped there. Indeed, the city was nothing more than an appendix to the temple, and was governed by the high priest. More than 6,000 persons were engaged in the service of the temple, and enormous estates, yielding a royal revenue, were set apart for defraying the expenses. Its site has not been identified.

Comana: an ancient city of Pontus, in Asia Minor; stood on the river Iris (Tocatsu), and is said to have originated as a colony from Comana in Cappadocia. The goddess of the moon was, at all events, worshiped in the city with a pomp and magnificence which reminds one of the Mā-worship in Cappadocia. This circumstance, as well as its central position, made the city a favorite emporium of the Armenian and other merchants. Remains of Comana are still to be seen near the village of Gumenek, which stands on the Tocatsu, 7 miles from Tocat.

Coman'che: town; capital of Comanche co., Tex. (for location of county, see map of Texas, ref. 3–G); on Fort Worth and Rio Grande R. R.; 111 miles from Fort Worth. The town is in a rich agricultural and stock-raising district. Pop. (1880) 704; (1890) 1,226; (1900) 2,070.

EDITOR OF "EXPONENT."

Comanche Indians: See SHOSHONEAN INDIANS.

Comatula: See FEATHER-STAR.

Coma-vigil (i. e. wakeful coma): a name sometimes applied to the semi-comatose state, in which the patient lies apparently comatose, but with constantly open eyes. It occurs in typhus, and more rarely in other fevers. See COMA.

Revised by WILLIAM PEPPER.

Comayagna, kō-mī-aa'gwăă (formerly **Valladolid**, văăl-yăă-dō-leed'): a city of Hondu'ras, in a valley of the same name at the head of the Humaya river, 2,800 feet above sea-level and nearly midway between the Caribbean and Pacific coasts (see map of Central America, ref. 4–G). Until 1883 it was the capital of Honduras; it is still the episcopal city and capital of the province of Comayagua, which has an area of 4,800 sq. miles and a population of about 70,000. The city has a fine cathedral, an ancient university now little frequented, several old convents, a hospital, etc. It was founded by Alonzo de Cáceres in 1540, and was formerly considerably larger than at present. Pop. in 1893 about 10,000.

HERBERT H. SMITH.

Comb [O. Eng. *camb*: O. Sax. *camb*: O. H. Germ. *chamb* > Mod. Germ. *Kamm*, orig. an instrument with teeth; cf. Gr. *γόμφος*, peg, tooth, Skr. *jambha-s*, tooth]: a toothed instrument used for cleaning the hair, as well as for adjusting it and keeping it in place. Combs are made of tortoise-shell, ivory, horns and hoofs of cattle, boxwood, bone, vulcanite, celluloid, German silver, aluminium, and other metals. In all fine combs and in all combs made of bone, ivory, and boxwood the spaces between the teeth are cut out by circular saws mounted on a spindle that revolves rapidly. The plates of the material used are clamped in a holder, which is alternately raised and lowered. The space between two teeth is cut out at each contact between the plate and the saw. At the same time the holder is automatically moved along the breadth of a tooth. The gearing may be arranged so as to make teeth of the length required at an operation. Another process, called twinning, enables two combs to be cut out of a single plate, so that all the material is utilized. The plate of tortoise-shell or horn which is to be used, having been softened by heat, is attached to a carriage that travels under a pair of cutting chisels, which rise and descend alternately while the carriage advances the space of a tooth. The chisels, being inclined to each other at a small angle, make a wedge-shaped cut, so that the pointed end of one tooth is cut out from the roots of the adjacent ones of the other comb. Combs of vulcanite are made by molding india-rubber to the required shape by pressure, and vulcanizing them afterward. See INDIA-RUBBER.

Comba, EMILIO: See the Appendix.

Combaco'num: an ancient city of Hindustan; in the Carnatic; 20 miles E. of Tanjore (see map of S. India, ref. 7–E). It is regarded as a holy city by the Hindus, and has numerous pagodas and tanks, the water of which is supposed to be capable of washing away sin. Pop. (1891) 54,000.

Combe, ANDREW, M. D.: physiologist; b. in Edinburgh, Scotland, Oct. 27, 1797; author of *The Principles of Physiology Applied to the Preservation of Health* (1834; 15th ed. 1860); *The Physiology of Digestion* (1836; 10th ed. 1860); and a *Treatise on the Physiological and Moral Management of Infancy* (10th ed. 1870). D. Aug. 9, 1847.—His brother GEORGE (b. in Edinburgh, Oct. 21, 1788; d. in Surrey, England, Aug. 14, 1858) was a noted phrenologist, and the author of *The Constitution of Man* (1828).

Com'bermere, STAPLETON COTTON, Viscount: British general; b. Nov. 17, 1773. He served in India, and in 1810 obtained command of the cavalry under the Duke of Wellington. At the battle of Salamanca, 1812, he was severely wounded. In 1814 he was raised to the peerage; in 1825 became commander-in-chief in India; and in 1855 a field-marshal. D. Feb. 21, 1865.

Combination: See CO-OPERATION, and TRADES-UNIONS.

Combination, Alternation of Position: See PERMUTATION.

Combs, LESLIE: general and lawyer; b. in Kentucky in 1794. He served with great distinction as an officer in the war of 1812; afterward practiced law in his native State, and became a prominent Whig politician and general of militia. D. Aug. 21, 1881.

Combustion [from Lat. *combu'rere*, *combus'tus*, consume with fire]: the process of burning. In its widest sense combustion means any chemical act accompanied by an evolution of light and heat, though it generally signifies the act of combining with oxygen, and more especially with the oxygen of the air. Fire in its various forms has been the subject of wonder, thought, and investigation, from the earliest times, and the progress of chemistry is intimately connected with the study of combustion. In the article CHEMISTRY (*q. v.*) some account is given of a theory of combustion which controlled the thoughts of chemists for 120 years. This is the phlogiston theory. It is also shown how Lavoisier, toward the close of the last century, succeeded in proving that oxygen is the cause of ordinary combustion. We now know that, when a substance burns in the air, the act consists in a combination of the substance with oxygen, a new product or new products being formed. The heat and light are results of the act of combination. Why heat and light are caused by the combination we do not know, but we do know that whenever two things combine chemically heat is evolved. Whether light is evolved or not depends upon the temperature and the nature of the products formed. If the temperature is high and the product solid, the light is bright. Very few substances combine with oxygen at the ordinary temperature under ordinary conditions. Some substances take fire and burn more easily than others. Thus phosphorus takes fire easily and burns rapidly; charcoal takes fire with difficulty, and burns slowly. Some substances combine slowly with oxygen, without evolution of light. It has been found, however, that whether a certain substance combines slowly or rapidly with oxygen, the quantity of heat evolved by the combination of a given weight of the substance with oxygen is the same. In the tissues of the animal body processes of oxidation are constantly taking place with evolution of heat, and the temperature of the body is thus maintained. These processes of oxidation are accomplished at much lower temperatures than most of those which take place in the open air. Then, again, the processes of decay which are so important are to some extent due to the action of oxygen, the products formed being essentially the same as those formed in active combustion.

When copper or arsenic or antimony is introduced into a jar filled with chlorine gas (see CHLORINE), action takes place, and this action is accompanied by an evolution of light and heat. In principle this act is perfectly analogous to that of ordinary combustion, but the act is much less common. So, too, a candle or gas will continue to burn in chlorine, but of course the products of combustion are quite different from those formed in the air. When hydrogen burns in air, water, a compound of hydrogen and oxygen, is formed. When hydrogen burns in chlorine, hydrochloric acid, a compound of hydrogen and chlorine, is formed. IRA REMSEN.

Comecrudo: See COAHUILTECAN INDIANS.

Comedy [from Gr. *κωμῳδία*; *κῶμος*, merry-making, rout + *ᾠδή*, song; deriv. of *ἀείδειν*, sing]: a species of drama, of which the characteristics in modern usage are that its incidents and language resemble those of ordinary life; that the termination of its intrigue is happy; and that it is distinguished by greater length and greater complexity of plot

from the lighter theatrical piece entitled a farce. The original Attic comedy was a burlesque tragedy in form, in substance a satire on individuals, and founded on political or other matters of public interest. The Attic comedies are usually assigned to three schools—the "old," the "middle," and the "new" comedy. The old comedy lasted till the end of the Peloponnesian war. It was characterized by personalities, great freedom and irregularity, and was a powerful political engine. The middle comedy was more finished, less personal and direct in its aims, satirizing systems and opinions rather than individual men; it ceased with the Macedonian conquest. The new comedy was very much like our modern comedy in scope and general character. See DRAMA.

Comenius, JOHN AMOS (or *Komenski*): educational reformer; b. at Nivnitz, in Moravia, Mar. 28, 1592. His father was a miller, and the family belonged to the sect generally known as the Moravian Brethren. His parents died while he was still a child. He attended first an elementary school at Strassnick, not entering a Latin school until he was sixteen years of age. Later he studied at the College of Herborn, in Nassau, where he first saw the report on Ratich's proposed innovations issued by the universities of Jena and Giessen. Shortly after he wrote his book *Grammaticæ facilioris Præcepta*, published at Prague in 1616. After traveling and studying at Amsterdam and Heidelberg he was appointed to the Brethren's school at Prerau on his return to Moravia, 1614. In the same year he was ordained and in 1618 was placed in the most flourishing of all the churches of the Brethren at Fulneck, where he also had the superintendence of the schools, and where he married and enjoyed some years of happy life. In consequence of the battle of Prague and the occupation of the country by the Spanish troops, Comenius lost his entire property, including his library and manuscripts, in 1621. A year after his wife died and then his only child. In 1624 all Protestants were proscribed, and in 1627 the proscription became so warm that Comenius, who had been in retirement, was obliged to leave the country and retire to Lissa, in Poland, where he was charged with the supervision of the Protestant schools, and became superintendent of all the Moravian churches of that country. Here he devoted himself to the study of educational matters, especially to the question of method, and composed his *Didactica Magna*, or *Great Didactic*, which, however, was not immediately published. In 1631 he published his *Janua Linguarum Reserata* (Gate of Tongues Unlocked), which brought him sudden and world-wide fame. Having formed a scheme of universal knowledge, to impart which a series of works would be necessary that were beyond his resources, he needed a patron. He presently received a call to improve the schools of Sweden, which he declined on account of the unsettled condition of the country. The English Parliament, however, summoned Comenius to England, whither he went in 1641. His coming had been prepared for by his friend, Master Samuel Hartlib, who had even published a sketch Comenius had sent him of his plans (*Conatuum Pansophicorum Dilucidatis*) without his knowledge. At first his prospects in England seemed bright, but the country was in the midst of the civil war, and Comenius, deeply disappointed, finally prepared to return to Lissa. At this moment he received a letter from Louis De Geer, a rich Dutch merchant, who offered Comenius a home and means for carrying out his plans. The offer was accepted, and Comenius joined his patron, who was then living in Sweden. He was most favorably received both by De Geer and Oxenstiern. While approving of his Pansophic plans, these two and the chancellor of the university, John Skyte, both urged him to devote himself first to the reform of the schools and "to bring the study of the Latin tongue to a greater facility." Dependent upon his friends for support, he felt constrained to devote himself to this work in the main for eight years, having settled for the purpose of quiet work in Elbing, in West Prussia. In 1648 he returned to Lissa, where he became senior bishop of the Moravian Brethren. His work at Elbing had received the approval of a commission of learned Swedes, and was published at Lissa as a *Methodus Linguarum Novissima*, the most elaborate of all his treatises on method except his *Great Didactic*. While occupied with his duties as head of the Moravian Church he was called in 1650 to Transylvania by Prince Sigismund Ragotzki to undertake the reform of the schools there. Accordingly he went to Saros Patak, where a model school was formed, and there he labored from 1650 to 1654 and published his most celebrated work, the famous *Orbis Pictus*. This was really an abridgment of his *Janua*, with the important addition of numerous illustrations. It was published at Nuremberg in 1657. Having organized the school he returned to Lissa. The active Protestantism of the Brethren led to the burning of the city by the neighboring Poles, and Comenius again lost all his worldly possessions, including his valued work on *Pansophia* and a Latin-Bohemian dictionary on which he had been at work for forty years. Ultimately, Lawrence De Geer, son of his former patron, gave him an asylum in Amsterdam, where his remaining years were passed in ease and dignity. He earned a sufficient income by giving instruction, and was enabled by De Geer's liberality to publish a fine folio edition of all his writings on education, completed in 1657. Unfortunately in his old age he became the dupe of political and religious impostors. He died Nov. 15, 1671, and was buried at Naarden. The literature concerning Comenius is large.

Comenius may perhaps rightly be considered the founder of method. He strove for a natural instead of an artificial education, for the subordination of Latin to the mother tongue, for the introduction of geography and history into the schools and thus enlarging the scope of school instruction, and for the universality of education as opposed to the idea that only certain special classes and individuals were worthy of it. From the standpoint of to-day it would be easy to criticise him, but in the light of four centuries of experience his works remain among the most important accomplished by any individual in the development of education. He himself said that his objects in school reform were "to give a compendium for learning the Latin tongue that would make the acquisition of it pleasant: to introduce a higher and better philosophy in school-work so as to fit youth for the investigation of the causes of things; and to create a higher tone of morals and manners" (Von Raumer). His personality is among the noblest and his life among the most inspiring in the whole long list of educational heroes and martyrs. The three hundredth anniversary of his birth was widely celebrated both in Europe and America. On Oct. 1, 1891, the Comenius Society was founded for the study and publication of his works. See *Life of Comenius*, by S. S. Laurie (London, 1881; 2d ed. 1884; Am. ed. Syracuse, N. Y., 1893); essay on Comenius in Quick's *Educational Reformers*; *The Educational Review*, Mar., 1892; Joseph Payne, *Lectures on the History of Education* (1892). See CZECH LITERATURE.

C. H. THURBER.

Comes [Lat., orig., a companion]: among the later Roman emperors, the title of an officer with territorial jurisdiction. It was nearly equivalent to count or earl. See COUNT.

Comet-finder: a telescope of low magnifying power and large field of view, used in searching for comets. In the most approved form the telescope is bent at a right angle, with the eye end horizontal, so that the observer can sweep from the zenith to the horizon without moving from his seat.

Comets [from Gr. κομήτης, having long hair, deriv. of κόμη, hair]: heavenly bodies, of a kind wholly distinct from all others yet known, and in some points enveloped in a mystery which science has not been able to penetrate.

The brighter comets, those visible to the naked eye, differ little in their constitution. They consist of three parts: a nucleus, a coma, and a train or tail. The nucleus is a star-like point of light, which in the telescope looks like a small, ill-defined planet. The coma is a cloudy or nebulous light surrounding the nucleus, and growing brighter toward its interior, so that it is difficult to define the exact boundary between the nucleus and the coma. The tail is a train of light, generally fan-shaped, more or less curved, and always extending away from the sun. It shades away so gradually toward its end that it is difficult to assign a definite length to it. In great comets it is the most impressive feature, extending over a long arc of the heavens.

Orbits and Origin of Comets.—It would appear that comets are not, like the planets, permanent members of our system, moving in their orbits through indefinite ages without change. They appear to be fragments of nebulous matter, possibly scattered portions of the raw material from which systems were formed, which have wandered through the stellar spaces for unknown ages, perhaps since the formation of the solar system. One by one they are attracted toward the sun. Revolving around the latter in parabolic orbits, their momentum carries them off again

into the great void from which they came, there perhaps to remain for many ages, until they are once more attracted sunward. This would be the case with all comets if the sun alone were the attracting body. It is the case when the comet, in its path around the sun, does not approach a planet. But when such approach occurs a new action takes place. The planet may so act as to increase the velocity with which the comet is moving. In this case the latter will be sent off in a hyperbolic orbit, and will certainly wander off into space never to return. But the planet may also so act as to diminish the comet's velocity. Then the orbit will be changed to an ellipse, and the comet will become, apparently, a permanent member of our system.

It now appears, when they are thus made members of our system, that comets, like animated beings, are mortal, and that in astronomical measurement their lives may be considered short. As they repeat their revolutions around the sun, their tails, striking and brilliant at first, gradually fade away, and then the nucleus seems to evaporate into the coma, so that, after the lapse of a few centuries, or perhaps a few thousand years, nothing is left but the coma. The coma is gradually reduced to a mere patch of nebulous light. This patch grows fainter and fainter, until at length the most powerful telescopes fail to show a trace of its existence. The comet is completely dissipated. There has been at least one instance during the present generation of the dissipation of a comet in this way, and there are one or two others which will probably never again be seen, although they have long moved in well-defined orbits.

As to their orbits, comets are divided into periodic and non-periodic. The former are those which are known to return at certain definite intervals, generally a few years. The latter can never, so far as we can know from experience, be seen more than once. They move in apparently parabolic orbits, and will certainly not return until centuries at least have elapsed. From what has been said, it will be seen that all the orbits were originally parabolic, and that periodic comets become such only through having been captured by a planet, and thus made a member of the solar system. The theory of the capture of comets by planets has been developed by Prof. H. A. Newton, of the U. S., and Tisserand, of France, so completely that the laws according to which it occurs are now fully understood.

Number of Comets.—To the number of comets it is impossible to set any limit. As a general rule, between twenty and forty appear in each century, which are visible to the naked eye. They may therefore, on the average, be expected to appear at intervals of three or four years. But half a dozen or more are found with the telescope nearly every year, the majority of which are new ones. Of those which actually visit the sun, only a very small fraction are ever seen with the telescope, so that we can hardly doubt the soundness of the view of Kepler that the celestial spaces are as full of comets as the sea of fish. As the great majority of those which visit our system do so only at intervals of many thousands, possibly hundreds of thousands, of years, we can not set any limit to the actual total number of such bodies.

Constitution of Comets.—When a bright comet is carefully examined with a powerful telescope, a bow will sometimes be seen, partially bent around the nucleus on the side toward the sun. If watched from night to night, this bow will be found to expand from the nucleus, become diffused, and finally lose itself in the nebulosity of the coma. Before it does so, however, one or more new ones will be found rising to take its place. These bows seem to be formed of hemispherical envelopes of vapor, which rise from the nucleus itself, dissolve themselves in the coma, and are gradually repelled from the sun so as to form the material of the tail. If this be so, it accounts for the gradual disappearance of the nucleus by evaporation; the nebulous coma is simply the matter which has evaporated from the nucleus. That the tail of a comet is not a solid appendage carried with it must be evident. The centrifugal force which a coherent body would suffer if swung around the sun like the tails of many comets would be such that no known substance could be strong enough to sustain it. There can be no doubt that the tail is simply of the nature of a stream of a vapor, continually thrown off from the comet. Its direction shows that it is always repelled by the sun. That it is so repelled by the sun, while the nucleus is attracted, is one of those mysteries which science has not yet been able to solve. The constant evaporation of cometary matter to form the tail explains the shortness of life of these bodies.

Spectroscopic observations upon the light of comets have only served to deepen the mystery which surrounds them. The spectrum of a bright comet is found to consist principally of three bands, and bears so striking a resemblance to that of certain hydrocarbons that no doubt of their identity seems possible. But when a spectrum is obtained from a hydrocarbon the latter must be so hot as to be self-luminous. Now, it would seem certain that a comet is neither hot nor self-luminous. All the laws of heat would lead us to suppose that it must rather be intensely cold, except when it comes inside the orbit of the earth; and were it self-luminous, we should see it when very distant from the sun. As a matter of fact, observations seem to show that its brilliancy varies with its distance from the sun, according to the same law as that of an opaque body. On the other hand, the spectrum of sunlight reflected from a body having an atmosphere of hydrocarbons ought to be the negative of that shown by the comet; it should be dark just where the comet spectrum is bright. All we can say, therefore, is that the light of the comet must be subject to some action which we have no means of producing in our laboratories.

Among the most remarkable of known comets is one with which the names of Lexell and Chandler may be associated. In 1770 Messier discovered a comet, known as Lexell's, which remained visible a long time, and observations showed the orbit to be an ellipse whose major axis was only three times the diameter of the earth's orbit, and indicated a period of five and a half years. It was impossible to identify this comet with any before observed, and yet it was very difficult to conceive that a bright comet with so short a period should have previously escaped observation. What was still more remarkable, it was never seen again, though carefully looked for in the places where according to previous observations its orbit should have been. It gave occasion to many sarcasms by the wits of the day at the expense of astronomers. At present the explanation is easy. The comet was never seen before 1770, because of its nearest point to the sun having been as distant as the orbit of Jupiter. In 1767 it was in such close proximity to Jupiter, moving in the same direction, and nearly in the same plane, that the attraction of this great planet entirely changed its orbit. Its passage to the perihelion in 1776 took place by day, and in 1779, before another return, it again encountered the vast body of Jupiter, the attraction of the planet deflecting it into more distant regions, and so changing the form of the orbit that it was not again seen for more than a century.

In 1889 a comet was discovered by Brooks, of New York State, which proved to have a period of only about seven or eight years, and yet to be moving in an orbit not before recognized. A very little computation solved the mystery, by showing that in the year 1886 it had passed in close proximity to the planet Jupiter, which must have captured it. Mr. S. C. Chandler, of Cambridge, was able to compute the disturbing action of Jupiter upon it, and show that in all probability it was identical with Lexell's comet, which had in the meantime been moving in an orbit completely outside that of Jupiter. It had been brought into the system by the attraction of this planet, and thrown into a new orbit by the same cause.

The comet of 1843 was remarkable for its near approach to the sun. A very slight change in its direction would have thrown it into the body of the sun itself. When it passed perihelion it was visible to the naked eye in full day, causing alarm the world over, and becoming connected in men's minds with the prediction of Miller that the world would end in that year. What is most remarkable about its orbit is that in 1880 another comet was found to be moving in an orbit so near to it that it was at first questioned whether the two bodies might not be identical. This, however, is impossible; indeed, the theory was set at rest by the speedy appearance of a third body, in 1882, following in the same orbit. It would therefore seem that these three comets were originally in each other's neighborhood in the stellar spaces. Perhaps they were pieces of one fragment of nebulous matter, and were gradually attracted toward the sun, one by one.

Halley's Comet.—The history of this earliest and most celebrated of all the periodic comets has been so often written that little need be said of it here. Its period ranges from seventy-five to seventy-seven years. Its last return

was in 1835; it may therefore be again expected about the year 1911. It is the only periodic comet conspicuous to the naked eye. That its tail at the last appearance did not correspond in brilliancy and extent with that recorded in earlier centuries may be accounted for by the gradual dissipation of the cometary matter, already described. It was the object of very remarkable observations by Bessel and others. The orbit was so carefully calculated that the last return to perihelion was predicted within three days. In all probability the next return will be predicted with yet greater precision.

Biela's Comet.—This comet is remarkable because it is one of which the annihilation has undoubtedly been ascertained. It was first observed in 1772, and the fact of its discovery at that time shows that it could not have been what we should now call a faint comet. It was again observed in 1805, but not recognized. It was rediscovered for the third time in 1826 by the Austrian whose name it bears, and now was found to be periodic and identical with those seen in 1772 and 1805. The period was found to be six years and eight months. In 1845 the first symptom of dissolution was seen in the separation of the coma into two distinct parts, so that there were two comets, a large and a small one. The latter grew at the expense of its companion until they were nearly equal. The next return took place in 1852. The two companions were then found to be more than a million miles apart, and of nearly equal brightness. Neither of them has since been seen; but in 1872, when the earth passed the point in its orbit near where the comet ought to have been passing, a meteoric shower was observed, the result of the passage of the invisible fragments of the vanished comet through our atmosphere. This meteoric shower is now well recognized, and the meteors which caused it are known as the Andromeds, because they radiate from the constellation Andromeda.

A more complete account of the relation between meteors and comets will be found in the article on the former subject.

The following is a list of the comets which have been found to revolve around the sun in periods of less than one hundred years. They are named after their discoverers. The second column gives the time of one revolution around the sun; the third, the year and month of the last-observed perihelion passage. Several of them were looked for in vain at their last return, and have quite likely ceased to exist, but, as a new one is discovered every two or three years, there is no danger of their becoming extinct.

LIST OF PERIODIC COMETS.

NAME.	Period (in years).	Last observed perihelion passage.

SIMON NEWCOMB.

Comfort, GEORGE FISK, L. H. D.: educator; b. Sept. 20, 1833, at Berkshire, N. Y.; graduated at Wesleyan University 1857; taught in Amenia Seminary 1857–58; Fort Plain Seminary 1858–59; Norman's Female College 1860; traveled and studied in Europe and the East 1860–66; Professor of Modern Languages and Æsthetics, Alleghany College, 1866–68; chief originator and organizer of the American Philological Association 1869, and secretary of the same 1869–73; one of the principal founders of the Metropolitan Museum of Art, New York, 1869–72; lecturer on Christian Archæology, Drew Theological Seminary, 1868–73; art editor *Northern Christian Advocate* 1874–92; Professor of Modern Languages and Æsthetics 1872–87, and dean of the College of Fine Arts, Syracuse University, 1873–92; president of the Southern College of Fine Arts, La Porte, Tex., 1892; author of *Æsthetics in Collegiate Education* (1867); *Art Museums in America* (1869); *Modern Languages in Education* (1870); a series of text-books for the study of the German language and literature (1870); *Woman's Education and Woman's Health* (1874); *The Land Troubles in Ireland* (1878).

Comfrey, kŭm′frē: the name given to several plants, natives of Europe and Asia, of the genus *Symphytum* and family *Boraginaceæ*. They have a fine-toothed calix and the throat closed by five converging awl-shaped scales. *Symphytum officinale* is often cultivated in gardens. Its roots are used in decoctions in diarrhœa, etc. The prickly comfrey, *S. orperrimum*, is cultivated as a forage plant.

Comines, kō′meen′, or **Commines**: a town on the S. W. frontier of Belgium; divided by the river Lys into two nearly equal parts, one of which is in France. It is 9 miles N. of Lille (see map of Holland and Belgium, ref. 10–B). Here are important manufactures of ribbons, threads, etc. Pop. of the French town (1891) 5,435; of the Belgian (1890) 4,803.

Comines, PHILIPPE, de: Lord of Argenton; historian and statesman; b. near Menin, Flanders, in 1445. The son of an ancient race, his education was conducted with the greatest care, notwithstanding he had early lost his parents. He entered the service of Charles the Bold, who employed him in important diplomatic business. About 1472 he proved untrue to the duke, forming a secret compact with Louis XI. while he was held a prisoner by Charles, who took him captive at Peronne, and became a minister of the French king, his enemy. After the death of Louis XI., Comines was an adherent of the Duke of Orleans, aiding that prince in his ambitious plans against the French Government. This cost Comines his ministerial office; whereupon he aided the Bourbon prince the more zealously. His last years were spent in quasi-disgrace, Louis XII. making no use of his political talents. This period of his life he employed in writing his *Mémoires*, for which he is now chiefly known. They cover the years from 1464 to 1498, and show the writer to have been a profound statesman, an acute and impartial observer, a man devoid of moral enthusiasms. His fresh and naïve style reflects impartially the splendors and the weaknesses of his time; but the new application of political reflection to historical events entitles him to be deemed the first modern historian of France. The *Mémoires* first appeared in 1523; later editions are those by Dupont (1840–47); Kervyn de Lettenhove (1867–74); Chantelauze (1881). See also F. van Holst, *P. de Comines*, and R. Chantelauze, *P. de Comynes, étude biographique d'après nouveaux documents*, in his *Portraits historiques* (Paris, 1886). D. Oct. 18, 1511.

Revised by A. R. MARSH.

Comiso, kō-mee′sō: a town of Sicily; province of Noto; about 41 miles W. S. W. of Syracuse (see map of Italy, ref. 10–F). It has manufactures of paper. Pop. 20,000.

Comitan: city in the east part of the state of Chiapas, Mexico (see map of Mexico, ref. 9–J). It is noted for its fairs, which are much frequented by traders and by the country population. Pop. (1889) about 7,000.

Comitia, kō-mish′ĕe-a [Lat. plur. of *comitium*, assembly, place of assembly; *com*, together + *ire*, go]: in ancient history, were certain political assemblies of the Roman people. The comitia were of three kinds, distinguished by the epithets *curiata*, *centuriata*, and *tributa*. The comitia curiata were the assemblies of the patrician houses or *populus*, and in these, before the plebeians attained political importance, was vested the supreme power of the state. The name curiata was given because the people voted in *curiæ*, each curia giving a single vote, representing the sentiments of the majority of the members composing it, which was the manner in which the tribes and centuries also gave their suffrages in their respective comitia. After the institution of the comitia centuriata, the functions of the curiata were nearly confined to the election of certain priests and passing a law to confirm the dignities imposed by the people. The comitia centuriata were the assemblies of the whole Roman people, including patricians, clients, and plebeians, in which they voted by centuries. By the constitution of the centuries these comitia were chiefly in the hands of the plebeians, and so served originally as a counterpoise to the powers of the comitia curiata, for which purpose they were first instituted, it is said, by King Servius Tullius. These comitia quickly attained the chief importance, and public matters of the greatest moment were transacted in them, as the election of consuls, prætors, etc. The comitia tributa were the assemblies of the plebeian tribes. According to tradi-

tion they were first instituted after the expulsion of the kings, and in them were transacted matters pertaining to the plebeians alone, as the election of their tribunes, etc.

Comity of Nations: See INTERNATIONAL LAW, PRIVATE.

Commander: a naval officer of the grade next below that of captain, and ranking with lieutenant-colonel in the army. In the English navy a commander may be the executive officer of a large ship, or he may, as in the U. S. navy, command a smaller vessel. There are eighty-five commanders allowed on the active list of the U. S. navy.

Commander-in-chief: the officer in whom is vested the supreme command of all the land or naval forces of any nation. In Great Britain he is appointed by the sovereign and holds office for life. His duties have never been clearly defined as distinguished from those of the cabinet minister who presides over the War Office. He is responsible for the discipline and efficiency of the army. The office of the commander-in-chief, technically called "Horse Guards," comprises the departments of the military secretary, the adjutant-general, and quartermaster-general. He is now strictly subordinate to the Secretary of War, and is responsible to Parliament. The office is usually vacant, and its duties performed by a "field-marshal commanding in chief." In the U. S. the President is *ex-officio* the commander-in-chief.

Commander Islands (Russ. *Komandorski*): two Russian islands lying in the line of prolongation of the Aleutian islands; near the Kamtchatkan coast; in about lat. 55° N., lon. 167° E. The name was given in honor of Bering (known in those regions as the commander), whose death occurred on the westernmost, which is also called by his name. Bering island is 50 miles long, with a greatest breadth of 17 miles. Medny or Copper island is about 30 miles long, but not more than 5 broad. Copper has been found here, but in small quantities. The islands are mountainous and without trees. The climate is mild for the latitude. Earthquakes are frequent. Pop. about 300. M. W. H.

Commandments: See DECALOGUE.

Commandments of the Church: rules imposed upon the laity of the Roman Catholic Church. It is held by Roman Catholics as taught by the Scriptures that the Church, being a perfect society, has power to make rules for her members, so that things lawful in themselves become unlawful by the Church's prohibition. The Roman catechism makes no special enumeration of these commandments; but such an enumeration is generally found in popular elementary catechisms, and the number is reduced to five or six. They are frequently called the six commandments, and are variously given. Those most commonly taught are as follows:

1. The Catholic Church commands her children on Sundays and holy days of obligation to be present at the holy sacrifice of mass, to rest from servile works on those days, and to keep them holy.
2. She commands them to abstain from flesh on all days of fasting and abstinence, and on fast days to eat but one meal.
3. She commands them to confess their sins to their pastor at least once a year.
4. She commands them to receive the blessed sacrament at least once a year, and that at Easter or during the paschal time.
5. To contribute to the support of their pastor.
6. Not to marry within the fourth degree of kindred, nor privately without witnesses, nor to solemnize marriage at certain prohibited times. Revised by JOHN J. KEANE.

Commemoration Day: the day on which solemnities are annually held in the University of Oxford, England, in remembrance of the founders and benefactors of the university, when speeches are made, prize compositions in prose or poetry recited, and honorary degrees conferred on distinguished persons. The same term is used to designate the degree day of the University of King's College, Windsor, N. S., the oldest British colonial college. In "'varsity" slang the word is shortened to "commem." W. S. P.

Commen'da [Late Lat., charge, trust, deposit]: originally the conferring of a vacant benefice for temporary administration on a clergyman already provided with one; afterward it came to be the bestowal of such a benefice for a long period or for a lifetime. As, however, after the eleventh century abuses crept in, and influential ecclesiastics especially availed themselves of the commenda to increase their incomes, it was found necessary to oppose it. This was done by Gregory VII. and Innocent X., and also at the Councils of Constance and Trent. Formerly in the Church of England, when a clergyman was promoted to a bishoprie, all his other preferments became void, but the interest in the living was retained by its being *commended* to the care of a bishop (called the commendatory) by the crown till there should be provided for it a proper pastor. Such a living was called an *ecclesia commendata*, and it was said to be held *in commendam*. The holding of benefices and livings *in commendam* in England has been abolished by law since 1836. Among the ecclesiastical orders of knights the name *commenda* (commandery) was given to the domain over which the members (*commendatores*) exercised jurisdiction.

Commensalism [from Lat. *com*, together + *mensa*, table]: that association of animals which is not a true parasitism, but where each gains an advantage from the other's presence, or at least does not suffer by it. Instances are comparatively numerous, and vary from a mere association of freely moving forms to instances where they become closely united. Of the first type may be mentioned those fishes which live among the tentacles of certain jellyfishes, and profit not only by the defense afforded by the nettle cells of the latter, but get certain choice morsels of food from the particles dropped by the host. Somewhat similar are the associations between ants and plant-lice. Of the second type may be mentioned those combinations which occur between certain crabs and sea-anemones. Here the crab fastens a sea-anemone to his back and carries it about with him. He profits by the protection of the nettle cells. The anemone gets his food from the particles which drop from the crab's meals. For another type, see SYMBIOSIS. J. S. KINGSLEY.

Commensurable [from Lat. *com*, together + *mensura'bilis*, that can be measured; deriv. of *mensu'ra*, measure]: Two quantities are said to be commensurable when some common unit can be found which will measure them both, or when their magnitudes have the ratio of some two whole numbers. When no such unit or common measure exists they are called incommensurable. See INCOMMENSURABLE. S. N.

Commentry, kom'măăn'tree': a town of France; department of Allier; on the Œil; 8 miles S. E. of Montluçon; in the center of important coal-fields (see map of France, ref. 6–F). It derives its prosperity from coal mines and ironworks, and has increased rapidly in recent times. Its manufactures of looking-glasses are very celebrated and remunerative. Pop. (1896) 12,632.

Commerce: the exchange of goods in considerable quantities between producers remote from one another.

Exchange arises out of the division of labor, and is the only means by which division of labor can be secured. If A has superior skill in farming, B in weaving, and C in shoemaking, the necessity for a system of exchange arises in order that the community as a whole may secure the most aggregate comfort with the least labor. As long as this exchange takes the form of barter between individuals who produce goods for one another to order, we can not speak of commerce; but when money is substituted for barter, and when the producers either carry their wares to market themselves or sell them to a storekeeper as an intermediary, we have the beginning of a commercial system.

In the Middle Ages commerce was carried on by markets. (See MARKET and FAIR.) Down to about the twelfth century each village, as a rule, formed an independent community, having its own blacksmith, its own miller, and its own craftsman, as far as handicraft was developed, while the operations of spinning and weaving were carried on by each household for itself. But as towns grew up they acquired market privileges from the king. Certain days were set on which the country people would carry their goods to town and make their purchases. These market-towns became more and more the residence of craftsmen, and the place in which the various forms of manufacture first developed. Stores or shops, in the modern sense, did not as yet exist. The farmer sold his produce at the market and bought his goods of the craftsman. But the first step toward commerce had been taken, for he had ceased to depend upon himself for all his supplies. Survivals of this system of markets are to be seen in almost every town of continental Europe and even in the United Kingdom. In America such markets are chiefly used for the sale of certain specific classes of perishable goods. Those goods which can be kept

without damage are now sold in another fashion. Instead of being brought to market by the producers and sold on their own account, they are purchased by merchants or storekeepers, who act as intermediaries, furnishing a constant series of supply to those who wish to buy goods, and a more or less constant demand for those who have goods to sell. We find a mercantile class organized, possessing capital, which it uses in the purchase of goods from the producers, to be sold at higher prices to those who want them, at such times and in such quantities as they may choose. This substitution of stores for markets, of regular channels of trade for irregular ones, forms the basis of the modern commercial system.

The first race to carry on commerce on a large scale was the Phœnician, which furnished the most daring mariners of the ancient world; first in Sidon and Tyre, whose greatness goes back some ten centuries before the Christian era; and later on an even larger scale in the Phœnician colony of Carthage. Much of the commerce of the later Roman republic and the early empire partook of the nature of tribute rather than of trade. With the downfall of the empire the lack of public security caused a great contraction of commerce as part of the general lapse into barbarism. Not until the rise of free or half-free cities on the shore of the Mediterranean was there a renewal of commercial activity. Towns like Venice, Pisa, or Genoa derived much of their wealth from trade with the East; and the crusades, by developing intercourse between East and West, laid the foundation of the wealth of these cities. A few French trading cities also rose to importance; while the Moors in Spain showed themselves patrons of commerce as well as of science and art. Most important of all in some respects was the Hanseatic League (*q. v.*) of free towns centering in Germany, but extending as far as England in the west, Norway and Sweden in the north, and the very heart of Russia in the east.

With the substitution of the modern system for fendalism, beginning about the year 1300, national commerce began to take the place of municipal. The mariner's compass, already known to the Chinese, was introduced into Europe in 1302; and this rendered possible the substitution of open-sea voyages for the coasting trade. The Portuguese were the first to take advantage of this invention, discovering in rapid succession Porto Santo, Madeira, the Azores, and the various coast localities of Africa as far as the Cape of Good Hope. In 1497 Vasco da Gama made the sea-passage to the East Indies. For the time being Lisbon seemed destined to become the commercial center of the world; and the Catholic Church supported the claims of Portugal to the eastern discoveries. Meantime the Spaniards were not idle, and songht to discover a *westward* passage to the Indies, in the hope of counterbalancing the claims of Portugal. It was in connection with this attempt that Columbus, an Italian under Spanish patronage, discovered America (1492), and paved the way for the Spanish conquests of Mexico by Cortez (1520), Peru by Pizarro (1529), and Chili by Almagro (1535). Meantime, in 1514, Magellan had actually made the westward passage to the East Indies, sailing through the strait which bears his name; and there ensued a period of active rivalry between Spain and Portugal in the establishment of stations for Indian and American commerce. But the power of Spain and Portugal as leading commercial nations was short-lived. Less than a hundred years after the period named it gave place to that of Holland and England. (See East India Company and Navigation Laws.) The century following was signalized by the rise of France as a great commercial power, while the nineteenth century witnessed a similar development first of the U. S. and then of Germany.

Thus far we have spoken chiefly of foreign commerce. The development of inland or internal commerce has come later, but has been of even more importance in modern times. Down to the end of the seventeenth century the badness of the roads formed an efficient check upon transportation of all kinds. The only good roads in many parts of Europe were actually the work of the Roman empire. For details as to the substitution of good roads for bad, the introduction of canals, and the development of the railroad as a chief means of movement of goods and passengers, see Transportation. Hand in hand with the development of the physical means of commerce is found a development of the modern credit system which is of equal importance in facilitating commercial transactions. (See Money, Currency, and Credit.) For an account of the commercial legislation looking to the removal of restrictions, see Free Trade and Reciprocity. The upshot of all this is that the commerce of the world in a single day is now probably greater in value than that of any year in the eighteenth century or any decade in the seventeenth.

Until a comparatively recent period government policy has been, as a rule, rather unfavorable to the development of commerce. In the first place, taxes on trade furnish such an easy method of raising revenue that wholly disproportionate burdens of this kind were put upon the community. In France a system of local trade taxes continued down to the Revolution of 1789. In other parts of continental Europe the case was quite as bad. Remnants of these taxes survive in the *octroi*, the municipal tax levied on articles of food which enter the city limits. It is needless to add that such taxes of this kind were, as a rule, very bad in their working, and that they are prohibited by the Constitution of the U. S. The case is somewhat different with customs duties at the frontiers. Such taxes are easier to collect than local taxes of the same sort, and have at times seemed to further the development of national independence. The whole subject is discussed in the articles Free Trade and Protection.

The second reason why commerce was looked upon unfavorably was due to the fact that the governments of mediæval Europe were in large measure in the hands of the landed classes, while commerce was managed either by the artisans or by the capitalists, more commonly the latter. Anything which helped agriculture was a direct help to the governing classes. Anything which helped commerce tended to raise rivals against them. Under these conditions a public sentiment arose which, in continental Europe at any rate, made it impossible for a nobleman to engage in commerce, and stigmatized it as a distinctly subordinate operation to that of land-holding.

The attempts to favor commerce did almost as much harm as the attempts to tax it. The ordinary method in mediæval times was by the grant of a monopoly or special trading privilege to certain individuals. Such monopolies may have been necessary at the outset, but they were almost always liable to be abused, and to prevent subsequent progress. A marked instance is furnished by the history of the East India Company. At first it was important to give a monopoly of trade to a group of men who would take the responsibility of maintaining the police service, a system of defense against pirates or natives which the government was unable to organize. But when the government grew stronger and pirates and natives grew weaker, the monopoly which had been at first justifiable became more and more liable to abuse. (See East India Company.) An interesting attempt to develop a large kind of monopoly is found in the navigation laws, whereby England attempted to secure to her own subjects a monopoly of the carrying trade. An attempt was made to restrict the trade between England and any other country to the ships belonging either to England or to the country with which it dealt, and to prohibit the employment of third parties in the carrying trade. These laws were directed against the Dutch, and were in some measure successful. But the universal belief now is that Holland's loss was by no means England's gain. It constituted a general burden on the trade of the world by preventing it from being done in an efficient and economical manner; a burden in which all nations, through retaliatory laws, suffered in greater or less measure, so that in the second quarter of the present century such laws were gradually abolished. The injury done to the British colonies in America by these navigation laws is specified in the Declaration of Independence as one reason for absolving allegiance to the crown.

With the abolition of navigation laws and the cheapening of transportation, the amount of commerce has developed enormously. It is estimated that the effective carrying power of the commercial marine of the world in the decade from 1830 to 1840 increased 2·10 per cent. annually; from 1840 to 1850, 3·65 per cent. annually; from 1850 to 1860, 5 per cent. annually; from 1860 to 1870, 2·74 per cent. annually; from 1870 to 1880, 3·56 per cent. annually; and from 1880 to 1890 probably more than from 1870 to 1880. It is probable, though statistics are not equally accessible, that the internal commerce and the means of carrying it have increased in even more rapid ratio. Dr. Neumann-Spallart has made an estimate of the international trade of the world in the years from 1868 to 1885 from which it appears that, in spite of the fall in prices, the total value of the foreign commerce of all nations had increased during that period from $10,500,000,000 annually

to nearly $15,000,000,000. Taking the fall in prices into account, this means nearly a doubling of the amount of goods moved. Of this foreign commerce in the year 1885 not quite $10,000,000,000 was to be found in Europe, something over $2,000,000,000 in America, and the balance chiefly in Asia. Of all the individual nations the commerce of Great Britain is the most important, amounting to nearly 20 per cent. of the whole. France, Germany, and the U. S. are not far apart, each with something like 10 per cent., while the Netherlands, Russia, British India, Austria, Belgium, Italy, and Australia follow in the order named. The change from 1885 to 1900 would not materially alter these proportions. It is to be understood that these figures refer to the actual commerce, as measured by imports and exports, and not to the tons handled by the ships of the different nations.

The following table shows the value of the imports and exports of merchandise of the U. S. carried respectively in U. S. vessels and in foreign vessels, during each fiscal year from 1857 to 1900, inclusive, with the percentage carried in vessels of the U. S.:

YEAR ENDING JUNE 30—	IMPORTS AND EXPORTS—			Percentage carried in U. S. vessels.
	In U. S. vessels.	In foreign vessels.	Total.	
1857	$510,331,027	$213,519,796	$723,850,823	70·5
1858	447,191,304	160,066,267	607,257,571	73·7

Iron and steel, and manufactures of, including ore	70,441,109	93,782,431	121,992,590
Wood, and manufac. of	37,513,252	41,489,526	50,598,416
Tobacco, and manufac. of	26,990,073	30,646,216	35,432,512
Leather, and manufac. of	21,113,640	23,466,985	27,293,010
Coal	11,683,749	13,661,028	19,502,813
Oil cake and oil-cake meal	12,581,534	14,531,142	16,757,519
Copper, and manufactures of, including ore	32,829,202	36,864,679	59,871,536
Sugar and molasses	2,111,658	2,953,888	3,697,671
Chemicals, drugs, dyes, and medicines	9,441,763	10,995,289	13,203,610
Fish	4,674,659	5,169,811	5,427,469
Agricultural implements	7,609,732	12,432,197	16,099,149
Carriages, cars, and other vehicles, including cycles	10,270,948	9,860,164	9,905,610
Vegetable oils	12,019,069	13,809,335	16,345,056
Totals	$1,110,864,762	$1,086,981,572	$1,229,512,940
Total domestic exports	$1,210,291,913	$1,203,931,222	$1,370,763,571

In cotton and provisions there has been a slight increase, and in breadstuffs a slight decrease. The most remarkable increases are shown in iron and steel and in copper, which increased 73 per cent. and 52 per cent. respectively.

The following table shows the distribution of the commerce of the U. S. by leading countries and grand divisions of the globe, during the year ending June 30, 1900:

COUNTRIES AND GRAND DIVISIONS.	Exports.	Imports.	Total exports and imports.	Excess of exports + or of imports −.
United Kingdom	$533,819,545	$159,582,401	$693,401,946	+$374,237,144
Germany	187,347 889	97,374,700	284,722,589	+89,973,189
France	83,335,097	73,012,085	156,347,182	+10,323,012
Netherlands	89,386,676	15,852,624	105,239,300	+73,534,052
Belgium	48,307,011	12,940,806	61,247,817	+35,366,205
Italy	33,256,620	27,924,176	61,180,796	+5,332,444
British North America	95,319,970	39,369,074	134,689,044	+55,950,896
Mexico	34,974,961	28,646,053	63,621,014	+6,328,908
West Indies	47,436,677	52,125,379	99,562,056	−4,688,702
Brazil	11,578,119	58,073,457	69,651,576	−46,495,338
China	15,625,679	26,901,762	42,527,441	−11,276,083
British East Indies	4,892,323	45,355,976	50,248,299	−40,463,653
Japan	29,087,475	32,748,902	61,836,377	−3,661,427
All others	180,115,040	180,033,789	360,148,829	+81,251
Totals	$1,394,483,082	$849,941,184	$2,244,424,266	+$544,541,898
Grand divisions.				
Europe	$1,040,167,763	$440,567,314	$1,480,735,077	+$599,600,449
N. America	187,594,625	130,035,221	317,629,846	+57,559,404
S. America	38,945,763	93,666,774	132,612,537	−54,721,011
Asia	64,913,807	139,842,330	204,756,137	−74,928,523
Oceanica	43,391,275	34,611,108	78,002,383	+8,780,167
Africa	19,469,849	11,218,437	30,688,286	+8,251,412

This shows an increase in total commerce of $515,027,260, and of excess of exports of $504,977,284 over 1891.

ARTHUR T. HADLEY.

Commerce: a game played with cards and counters; of the latter, each player puts an equal stake into the pool. The dealer is called the banker, gives each player three cards, and then inquires, *Who will trade?* The eldest hand can either *barter* or *trade for money*. Barter means the exchange of a card with the right-hand player, and can not be refused unless the right-hand player declines the exchange. To *trade for money* is to forfeit a counter to the pool for the privilege of exchanging a card for one in the stock or pack. When the trading and bartering is completed, three like cards are reckoned as a *tricon*, and the best tricon wins the pool. If there is *no* tricon, the best sequence of three cards in the same suit will win; and if there is no sequence, the best *point* takes the pool; that is, the three cards having the smallest number of pips—aces reckoned as 11, and court-cards as 10—but the rules vary among different sets of players.

Commercial Agencies: See MERCANTILE AGENCIES.

Commercial Crises: periods of depression in trade. Every line of business is subject to seasons of prosperity and adversity. As industry makes progress, and its different branches become more and more dependent on one another, we have recurring seasons of general prosperity and general adversity, which affect nearly all forms of industry to a greater or less degree. First, we find a period of speculation, in which every business man strives to extend his operations. Prices are rising, prosperity seems to be increasing, wages are high, and employment steady. Then comes a shock to credit at some weak point in the industrial system; confidence is destroyed, prices begin to fall, business men contract their operations, wages are reduced, and working time reduced still more. General adversity for merchants, capitalists, and laborers alike succeeds the general prosperity of the former period. To this condition of things the name commercial crisis is applied.

Crises are often confounded with panics. There is almost always a connection between the two; but a crisis really means something much wider and longer than a panic. A panic starts among a group of speculators—perhaps in Wall Street, perhaps in the Chicago Produce Exchange, perhaps in the London money market. There are many failures, with much forced liquidation; but when the liquidation is accomplished the matter may be soon over. The panic is purely financial; the crisis which may follow is industrial. It affects not merely the speculators, but the producers; not merely the dealers in securities, but the laborers; not merely the bankers, but the community as a whole. Panics are

possible under any system, but the chance for crises, affecting all industry for such a long time, is peculiar to modern industry, and forms perhaps the gravest charge which the socialists can make against the existing industrial system.

The first crisis of the modern type occurred in 1720. It developed in France and Great Britain almost simultaneously. In the year 1716 John Law, a native of Edinburgh, under the authority of the French monarchy, founded a bank whose operations were extremely successful. Not satisfied with this success he soon afterward developed his Mississippi scheme, first known as the Western Company. Actual operations began in 1718; in 1719 it was in possession of twenty-one ships and nearly a million of dollars of money and goods. All sorts of financial operations were intrusted to it by the Government. The shares went up to many times their original value. A fever of speculation set in which lasted until the beginning of 1720. Then there was a sudden collapse and an overwhelming reaction. About the same time similar speculation was carried on in Great Britain, not by a single company, but by a large number of companies, known as "bubbles," the largest being the "South Sea Bubble." There was no currency inflation in Great Britain, as there was in France; but except in this respect the speculative fever was wilder and the reaction equally widespread.

There were commercial crises of less importance in 1763 and 1799 in Hamburg, and there were inflation and depression in connection with the currency of the French Revolution, but no general crisis until after the close of the Napoleonic wars. During the reign of Napoleon the continental ports had been closed to English manufactures. Great Britain at once took advantage of the peace of 1815 to make up for lost time. It flooded the Continent with British goods, and made arrangements to produce such goods for the continental market on a scale which could not possibly be maintained. The reaction was terrible. The cessation of the demand for British manufactures threw large numbers of men out of employment. Another crisis developed about ten years later. In 1824 and 1825 speculative companies were formed and speculative loans placed in the London market to an amount for which the bubbles of 1720 alone furnish a parallel. At the end of 1825 the unsoundness of these speculations had begun to show itself. A few failures were sufficient to destroy all credit. Only by most radical measures was the Bank of England enabled to give enough support to the business community to prevent general suspension of payments.

The last-named crises were peculiar to Great Britain. That of 1836, with its consequences, was shared by the U. S. also. In fact it may be said to have been primarily a U. S. crisis. It had two distinct sets of causes, one financial, the other industrial. The financial causes are to be found in the unsound organization of banks in different parts of the country, not excluding the U. S. Bank itself. The industrial causes were to be found partly in the overproduction of cotton on a credit basis, partly in the system of internal improvements which had locked up much capital in works which were not productive, some on account of their incompleteness, some on account of their inherent worthlessness. As long as the speculative fever lasted the unsound concerns were able to support one another, but with the failure of a few the whole commercial fabric went to pieces. A crisis which took place in 1837 seemed for the moment to be checked by bold financiering and by the hopeful spirit of the people, but it recurred in equally disastrous form in 1839, and this time it seemed impossible to stem the disaster or to recover from its consequences. The British crisis of 1836–39 was much slighter than that in the U. S., and was chiefly notable for the reform in the British currency system whereby the danger of inflation was done away with.

The next crisis of importance was that of 1847 in the British islands. Although railroads had been invented as early as 1830, it was not until 1845 that railroad operations were developed on a large scale. In that year and the two years following the amount of railroad construction in Great Britain was enormous. Unnecessary roads were brought into operation, while other roads were chartered and begun which could not be put on a paying basis for some time to come. The mania for railroad-building in Great Britain was worse than that for internal improvements in the U. S. ten years earlier, and the reaction in 1847 even sharper and more widespread, though not of such long duration.

In the year 1857 there was a general crisis that affected the financial world as a whole and not any one or two particular countries. The discovery of gold in California in 1849 had started a fever of speculation which culminated in 1856. The Crimean war, producing an artificial demand for special supplies, had tended to increase this speculation. France had become deeply involved in the tide. The Crédit Foncier, the Crédit Agricole, and the Crédit Mobilier encouraged the investment of capital in all possible lines of productive industry. Germany followed suit, and attempts at restriction of bank-note issues by the Prussian Government seemed of little avail. Railroads were built in Prussia and in Austria on a large scale. British industry felt the force of foreign speculation. In the U. S. matters went quite as far as on the continent of Europe, and further than in Great Britain. Railroads were extended from the seaboard to the lakes and the Mississippi. The policy of land grants caused unnatural development of certain sections of the West and South with greater rapidity than would have been caused by the legitimate demands of trade. Meantime the bank reserves began to fall, while the liabilities were constantly rising. On Aug. 22, 1857, the loans of the New York banks were $120,000,000, their coin reserves but $10,000,000, their circulation less than $9,000,000, their deposits but $89,000,000. Such a state of things could not continue. Yet the banking conditions in New York were far better than in any other part of the country. So loose were the State bank laws of the time that "wild-cat" notes without any proper specie reserve formed a constant menace to commercial credit. When speculation failed at any point the banks were useless; when the banks were useless the means of payment failed at all points. The failure of the Ohio Life and Trust Company on Aug. 24 began the difficulty. Other failures followed. On Sept. 30 109 large houses had failed, forty banks were ruined, and many more were in such straits as to be of no service in helping their customers. On Oct. 13 the crisis culminated in New York city. The suspension of payments followed on the 14th. Two months more and the large railroad and industrial companies were failing to meet their interest obligations. Prices fell ruinously, cotton dropping from sixteen cents a pound to nine cents. In New York alone 30,000 laborers were out of employment. Nor could Great Britain remain untouched by such a disaster, loaded as were some of the British financiers with American investments. Early in November several important failures took place. On the 9th the largest Scotch bank suspended payments, and this was followed by a general run on Scotch banks as a whole. The resources of the Bank of England were inadequate to stem the tide. On Nov. 11 the reserves had fallen to $7,000,000. On Nov. 12 the Bank Act was suspended and the directors given authority to issue notes in violation of the provisions of the act of 1844. This checked financial panic, but did not prevent the industrial crisis that followed, with the inevitable result of throwing large numbers of laborers out of employment. The same conditions ensued in Germany, in Austria, and in fact almost all over the Continent; nor did anything like thorough recovery take place until after the close of the civil war in the U. S.

There was a crisis in 1866 in London, and on Sept. 23, 1869 (Black Friday), in New York; but each of these was a financial panic rather than an industrial one, and was strictly localized in its effect, the latter especially being connected with gold speculation. The crisis of 1873, on the other hand, was industrial rather than financial, and was, on the whole, the severest and most general one through which the world has passed. From 1869 to 1873 there was an enormous amount of investment of capital in machinery and transportation agencies. Several causes combined to produce this effect. The opening of the Suez Canal had given a great stimulus to trade. The substitution of steel rails for iron had created possibilities of cheap and profitable railroad transportation undreamed of ten years before. This cheap transportation facilitated the interchange of manufactured goods with farm produce, and rendered the concentration of manufacturing capital and the consequent economy in production easier than ever before. It also made it possible to develop new land which was previously out of reach of any market. This was an important factor in the growth of the West, a growth which was stimulated by the renewal of the land-grant policy already described. Taking all these things together, we find unprecedented building of new railroads, new factories, and new ships, and side by side with it a development of new land on a wider scale than ever before. Much of this was done with bor-

rowed capital, a rate of interest being fixed on the basis of the high prices which prevailed in 1870, 1871, and 1872. As long as these high prices continued all went well, but by the year 1872 capital had been duplicated to such an extent that it was no longer possible for all the products to be sold at the old prices. First in manufactures, then in railways, then in farm products, there was a decided fall. The beginning of this fall occurred in the latter part of 1873. On Sept. 18 the great banking-house of Jay Cooke & Co., in New York, failed, and this brought trouble to the house of Fisk & Hatch and to the London house of McCulloch, with which it was connected. Involved as the whole financial world was in unsound speculation, this meant disaster everywhere. It was not so sudden as the crisis of 1857, because the banking system was better, especially in the U. S., but the results were even more lasting. The short-time loans were better covered in 1873 than they had been sixteen years before, but not the mortgages and other long-time loans. Capital had been borrowed for investment on false estimates of land value. The year 1874, as far as general industrial condition was concerned, was worse than in 1873, and 1875, 1876, and 1877 involved still greater distress in Europe and America alike. The trouble was intensified by unwise legislation in various forms, and perhaps showed itself at its worst in the middle of 1877, at the time of the great railroad strikes. After this there was a slight improvement, slow in 1878, very much more rapid after the resumption of specie payments in 1879.

The years 1879, 1880, and 1881 formed a time of active but, on the whole, sound speculation. People had not wholly forgotten the lessons of the crisis of 1873. Land was mostly held at a moderate valuation. Much capital was borrowed, but the security for such loans was better and the rate of interest lower than it had been the ten years before. But in 1882 railroad-building was carried to such a point that it was impossible for the business of the country as it then stood to pay interest on the investments, and with this excessive railroad-building there was an excessive demand for iron and coal which could be only temporary. At the close of 1882 clear-headed people feared a repetition of the experience of 1873. These fears did much to prevent the recurrence of the danger in the form which it took ten years previous. Although a financial panic occurred in May, 1884, it was a comparatively slight one, but there was a period of industrial depression, intensified and prolonged by the unwise action of certain labor organizations in 1885 and 1886.

Toward the close of 1886 confidence was restored—in certain lines too much restored—for the railway-builders repeated the mistakes of 1882, and paved the way for adverse legislation in 1887–88 and for a depression in railway securities.

Europe was somewhat affected by the depression of 1884–85, but not at all by that of 1888, which was in its nature local and partial. The European markets were far more disturbed at the end of 1890 by the failure of a series of speculations in which the U. S. had taken little or no part. European houses had invested largely in African and in Argentine securities. The financial movements in the Argentine Republic in 1889 were closely parallel to those in the U. S. in 1856 or 1872, but in some respects even worse, and the reaction was correspondingly severe. Meantime French houses had been speculating in copper on a large scale. The failure of the copper syndicate, coupled with the collapse of Argentine credit immediately following, involved leading bankers both on the Continent and in England in difficulty. Public confidence was shocked beyond measure by the suspension of payment of Baring Brothers, a house whose name had for generations stood perhaps higher than any other private concern. The industrial crisis did not at first appear to be proportionate to the financial danger, but the resulting depression, though not acute, has been widespread and lasting.

Such is the history and general character of commercial crises. It remains to examine the theories which have been urged as explanations.

An ingenious but unsound one is the *sun-spot* theory. It was observed that there were crises of more or less severity in 1815, 1825, 1836, 1847, and 1857, periods of about ten or eleven years elapsing between each successive crisis. Now it happens that sun spots attain a maximum once every ten and a half years, and it occurred to certain ingenious observers that these sun spots probably had an effect on the harvest, producing prosperity at one time and depression at another. This theory was defective in several points: first, it could not be proved that there was any possible connection between sun spots and good or bad harvests; second, commercial crises sometimes occurred just after a good harvest and sometimes just after a bad one; finally, the civil war in the U. S. quite broke up the regular ten-year round of crises, and, as it did not have any appreciable effect on the sun spots, it may be said to have broken up the theory also.

The second theory, and a better one, is that of *misdirected production*. The advocates of this theory say that a commercial crisis is due to the investment of unnecessary capital in wrong lines of industry. They deny the possibility of general overproduction, or anything like it. They say that the so-called general overproduction is really local or partial overproduction, and means underproduction elsewhere. There is a special demand for particular lines of manufactured goods or for the development of internal improvements in certain localities. Capitalists rush to take advantage of the special opportunity for profit and overdo the matter, investing twice as much capital as is necessary and contracting large obligations in connection with such investment. This capital, once invested, can not be withdrawn, nor can it be profitably transferred to any other line than the one originally proposed. Naturally, however, the overproduction of particular lines of goods or the overdevelopment of particular localities brings its reaction. The expected prices can not be realized; the obligations can not be met. Producers and banking-houses alike suffer severely from the misjudgment of investors, and such suffering must continue until a part of the misapplied capital is worn out, or until the needs of the country grow up to the volume of capital invested. This theory is true in a great many particulars, but it fails to take account of two sets of facts. In the first place, the commercial crisis, instead of being local or partial, applies, to a greater or less extent, to all lines of industry. Under the theory just outlined, if manufactures become unprofitable, we should expect to find farmers rejoicing in being able to sell their goods to advantage and buy those things that they wish cheaper than before. But, in point of fact, the farmers suffer at the same time with the manufacturers. We also find that the financial disaster, instead of being a result of the fall in prices of certain goods, usually precedes it—that credit collapses first and production suffers afterward; whereas the misdirected production theory would put these events in the opposite order.

The true explanation can be understood only by a knowledge of the existing credit system. Suppose a merchant wishes to extend his business. Does he borrow the cash to do it? Not generally. He goes to a bank to get his bills discounted. If A has sold goods to B, an agreement to pay this bill at some time in the near future serves as a basis on which A can increase his line of bank deposits, and can draw more checks than would otherwise be possible. As long as A and B are both good, and as long as the bill represents an actual transaction, the bank will be glad to discount such paper. On the line of deposits thus created a large proportion of the expanding business is based. These bank deposits are for many purposes the chief currency of the country. The large business payments are made by check and not by cash. The amount of such checks that can be drawn is based on the amount of the deposits in the bank. The amount of deposits in the bank depends in considerable measure upon the amount of accepted bills. If prices, for any reason, begin to go up, this fact increases the size of the bills and creates an increased line of deposits, particularly as the banks are readier to furnish accommodation on a rising market than on a falling one. But this increase of checks tends in its turn again to increase prices; and thus matters go on, higher prices producing more deposits, more deposits involving more checks, more checks acting as a virtual inflation of the currency and producing still higher prices. But this can not continue indefinitely. By and by the deposits of the bank increase out of proportion to their coin reserve. Such operations must be contracted. This contraction of bank accommodation, like a contraction of the currency, begins to produce a fall in prices. As prices fall it is harder to get bills discounted. This increased difficulty of obtaining accommodation increases the contraction and lowers the price still further. Men who incurred obligations on the basis of inflated prices now find themselves unable to meet those obligations, even though their business has remained the same.

The contraction thus described may be either sudden or gradual. If there is a panic, as in 1857, it will be sudden. If there is no panic, as in 1884, it will be gradual. But in any event the effect is the same. Producers who have borrowed money and used it in making investments which can only be profitable on a high-price level now find themselves forced to sell the goods at a sacrifice. More than that, they must in some measure contract their operations, reducing their wages and their working time, and spreading the distress from purely financial circles to the community as a whole. Business is done with capital borrowed at rates based on temporary high prices. If there is a general fall in prices, all business is liable to suffer. The credit system is an exceedingly delicate means of getting goods into the right hands. A general failure of credit renders such a result impossible, and may create all the appearances of general overproduction, whether we call it by that name or not, simply because the product can not be put into the places where it is needed. Every producer finds it hard to sell his goods; if his financial solvency depends upon selling them at a remunerative price, he goes under, and some one else takes his place.

As long as any one who can save or borrow capital is given the right to control industry, it will be impossible wholly to prevent this state of things. Some conditions, however, may increase the danger, while others tend to diminish it. A country with a metallic currency, accepted all over the world, is very much less liable to such dangers than a country with a paper currency which may be inflated, or even with a metallic currency which other nations are unwilling to accept in payment of debts. Again, laws may be so framed as to encourage the borrowing of capital on insufficient security by giving every facility to reckless speculators to manage unsound enterprises and then escape liability; or they may be so framed as to hold all such speculators responsible for damages, and liable in cases of fraud to actual imprisonment. The U. S. is behind most other civilized nations in this respect, especially in the matter of the personal liability of directors, which is much greater both in Great Britain and in Germany. Such liability does not seriously interfere with honest enterprises, and it prevents many of the dishonest ones, which do the most harm.

Socialists claim that crises are a result of individual business activity, and would be averted in a large measure if the conduct of industry were intrusted to the hands of government. They say, with some plausibility, that it would be better to decide where and how capital should be invested on the basis of industrial statistics instead of taking the chance of individual gain with great possible loss to the community. To this view it may be answered that no government has been found wise enough to conduct affairs of this kind on the scale proposed, and that the few experiments of the sort, like that in Paris in the revolution of 1848, have indicated that such action would produce more trouble than it would avert. While private industry *may* produce goods that are not needed, government industry, under the direction of a socialistic authority, is almost sure to do so. Whether government action in these matters is to be increased or diminished, the remedy must be sought in higher education of the business instincts of the community. If the community can not look five years ahead, it will be liable to the results of miscalculation, whether its business be managed by private individuals or by government. If the community can look five years ahead, it will be comparatively free from these evils. Whether individuals or governments are to be intrusted with this work of prevention depends chiefly on the question whether individual capitalists or government officials are likely to possess this business intelligence and foresight in the higher degree.

See Hyndman's *Commercial Crises of the Nineteenth Century*. D. A. Wells's *Recent Economic Changes* may also be consulted with advantage on some points. See Banks, Currency, and Political Economy.

A. T. Hadley.

Commere, kō′mār′, Léon François: genre and portrait painter; b. at Trélon, Nord, France, Oct. 10, 1850. Pupil of Cabanel; Grand Prix de Rome 1875; second-class medal, Salon, 1881; Legion of Honor 1885. He is a very able technician. His *A Star* (1882), a portrait of a ballet-dancer, is owned in the U. S. and is a brilliant piece of painting. Studio in Paris. W. A. C.

Commerson, kom′mār′sōn′, Philibert: French botanist; b. at Châtillon-les-Dombes, Nov. 18, 1727. He accompanied as naturalist the expedition of Bougainville, which sailed in 1767, and he visited South America and explored Madagascar, etc. He died in 1773, leaving some works in manuscript. He was elected a member of the French Academy in 1773. *Commersonia*, a genus belonging to the family *Sterculiaceæ*, commemorates his name.

Revised by Charles E. Bessey.

Commination [from Lat. deriv. of *commina're*, threaten, because in it God's threatenings against sin are repeated]: a penitential service in the Liturgy of the Church of England. In that of the American Episcopal Church the greater part of this service was omitted at the revision of 1789. In the new *Standard* of 1892 portions of this ancient office have been restored, with the title *A Penitential Office for Ash-Wednesday*, and are placed in the Prayer-book after the special *Prayers* and *Thanksgivings* following the *Litany*. The commination in the English Book of Common Prayer comes with little change from the old missals of Sarum and York. The Greek and Latin Churches retain the commination, but only for Ash-Wednesday. The commination is in substance a repetition of the curses found in Deut. xxvii., and at the reading of each sentence the congregation responds *Amen*. It is read in the English Church upon Ash-Wednesday, and upon such other days as the ordinary shall direct. Its use is traced back to about 700 A. D.

Revised by W. S. Perry.

Commines: See Comines.

Commire, kō′meer′, Jean: Jesuit teacher of theology and Latin poet; b. at Amboise, in France, Mar. 25, 1625; d. in Paris in 1702. He was remarkable for his frank and upright character and for spirituality. He is now remembered only for his Latin poems (*Poemata*, Paris, 1678; n. e. 1753, 2 vols.), which are mostly upon religious and moral themes, and are remarkable for elegance of diction rather than for power or originality. He produced some fine Latin fables in verse.

Commissariat [Fr., from *commissaire*, commissioner]: that department of the military administration which has in charge the furnishing of food, forage, clothing, camp-equipage, quarters, etc. In ancient Rome the quæstors attended to the victualing of the troops. In the U. S. these functions are divided between the subsistence department, which furnishes the food-supplies, and the quartermaster's department, which furnishes camp-equipage, quarters, etc. The first English commissary-generals were called proviant-masters. The British commissariat is now under the charge of the quartermaster-general. That of the U. S. at present is under an officer who has the rank of a brigadier-general and the title of commissary-general of subsistence.

Commissary (in Fr. *commissaire*): a term nearly synonymous with deputy, signifies one to whom the power and authority of another is committed. It is sometimes used in a sense nearly equivalent to that of commissioner. In the army the officers of the commissariat department are styled *commissaries of subsistence*. The officers having charge of musters in and out are *commissaries of musters*. In ecclesiastical law, a commissary is formally appointed by a bishop to exercise jurisdiction in his name or on his behalf. The bishops of London, in whose jurisdiction the North American colonies were before the Revolution, appointed commissaries in the various provinces who convened the clergy, adjudged causes referred to them for settlement, and administered discipline, subject of course to appeal.

A papal commissary is a bishop or other high functionary deputed to perform duties properly belonging to the pope. There are *temporary* commissaries appointed for the performance of a single act or a few particular acts; and *perpetual* commissaries, who regularly represent the pope or some superior prelate in a specified place or district. Often the duty of a commissary is performed by a board of officers, who together constitute a *commission*.

In Scotland the sheriff of each county is called also *commissary* of that county. When the Reformation drove the papal commissaries from Scotland, there was established a supreme commissary court in 1563 for administering the law in such cases as had been formerly decided by the ecclesiastical courts of the papal representatives. The commissary court gradually lost its powers, its duties being performed by the civil courts. In 1836 it was abolished; but there are still commissary courts for the counties presided

over by the sheriff. They transact some of the business which in the U. S. comes before the probate courts.

Commission: a written warrant of authority; an instrument issued by a government, as in letters patent, or by a court, clothing a person with authority to act in designated matters, usually of a public or quasi-public nature, or commanding the performance of certain duties. The term is also applied to persons jointly invested with an office or trust. The higher officers in the army and navy hold their authority by virtue of commissions, and are called *commissioned officers*. The lowest grade of commissioned officer in the British army is sub-lieutenant, that in the U. S. army is second lieutenant. The buying and selling of commissions under the rank of colonel formerly prevailed in the British army, but it was abolished by royal warrant, against the will of the House of Lords, in 1871. F. Sturges Allen.

Commission Agent: See the Appendix.

Commission Merchant: See Factor.

Commissionnaire [Fr.]: an attendant at European hotels, employed to attend at the arrival of railway trains and steamboats to secure customers, to take charge of baggage, see it passed by the custom-house officers, and send it on to the hotel. A corps of commissionnaires, consisting of retired soldiers and sailors, is in existence in the United Kingdom. It was founded in 1859 by Capt. Sir E. Walter, K. C. B., and consisted at first of men who had served in the Crimea or in the Indian mutiny. It numbers nearly 2,000, and has divisions in all the large cities and towns. It has recently (1896) extended its sphere to Australia and other British colonies. The men are employed in every capacity.

Commissioner: a person acting under a commission. Various State and U. S. officials are designated by this title, as the commissioner in lunacy in New York, the commissioner of pensions of the U. S., whose duty it is to attend to the execution of the pension and bounty-land laws, etc. The commissioner of patents of the U. S. is invested with large discretionary powers, and under the direction of the Secretary of the Interior superintends or performs all duties respecting the granting and issuing of patents directed by law, and has the charge of all books, records, papers, models, machines, and other things belonging to the Patent Office. He may establish, subject to the approval of the Secretary of the Interior, regulations not inconsistent with law for the conducting of proceedings in the Patent Office. The commissioners of the U. S. circuit courts are appointed to take bail and affidavits, also to take preliminary examination of persons charged with crime under the U. S. laws, and also of persons claimed for extradition, in doing which they sit as a court. F. Sturges Allen.

Commissioner of Assize: See the Appendix.

Com'missure [from Lat. *commissu'ra*, a joining together; *com*, together + *mittere*, send]: in anatomy, the union of any two parts or the structure which unites any two parts. Thus at the outer and inner angles of the eye there are *commissures* between the lids; and in fact the angles of the eye, the mouth, etc., are often spoken of as the commissures of the lids, the lips, etc. Among the parts named commissures are the following: the *commissura simplex*, a little lobe of the cerebellum situated near the posterior incisure, and forming a part of the superior vermiform process; the *commissura brevis*, a lobule arising from the inferior vermiform process of the cerebellum, within the posterior incisure; the *great commissure* of the brain, called often *corpus callosum*, which unites the hemispheres of the cerebrum; the *anterior*, *middle* or soft, and *posterior commissures* of the brain, bands which cross the cavity of the third ventricle; the *optic commissure*, or chiasma, the point of the decussation of the optic nerves.

Committee: in law, one or more persons to whom a matter has been intrusted for examination, supervision, or other action. The term is especially applied to a person appointed by a court to take charge of the person or the estate, or both, of a lunatic, spendthrift, or habitual drunkard. The committee of the person corresponds to the "tutor," and the committee of the estate to the curator of the civil law. Contrary to the ancient custom the next of kin is now favored for committee of the person, and the heir-at-law for the committee of the estate. F. Sturges Allen.

Commodia'nus: a Christian Latin poet of the middle of the third century A. D.; commonly called a native of Gaza, in Syria, but he was probably an African. His language is very faulty, and his hexameters curiously irregular, being based partly upon quantity, partly upon accent. He shows also a fondness for acrostics and telestichs. His two works are entitled *Carmen Apologeticum adversus Judaeos et Gentes* and *Instructiones per litteras versuum primas*. The latter is found in Migne, vol. iii., pp. 202–262; best complete edition by Dombart (Vienna, 1887); English prose translation of the *Instructions* in *Ante-Nicene Fathers* (New York, vol. iv., 203–18). M. W.

Commodore: formerly a courtesy title given in the U. S. navy to the senior officer of a squadron; in 1857 the title flag-officer was substituted by act of Congress. In 1862 commodore was established as the grade next above that of captain, and made to rank with brigadier-general in the army. The grade of commodore in the active list was abolished by act of Congress in 1899. In the English navy the title is one of courtesy only given to the senior captain of a squadron when no admiral is present, or to the captain commanding a naval station abroad, as at Hongkong. A commodore when in command afloat flies a broad pennant. The title is one much affected by yacht clubs. Revised by C. Belknap.

Com'modus, Lucius Ælius Aurelius: Roman emperor; b. in 161 A. D.; the son of Marcus Aurelius; succeeded his father in 180, and soon manifested the excessive cruelty and sensuality of his disposition. His mistress Marcia, who had found her name marked down in his tablets for death, conspired with two of his officers, Eclectus and Lætus, and caused him to be strangled in 192.

Common: See Hereditaments, Incorporeal.

Common Carriers: See Carriers, Common.

Common Council: a name given in some cities of the U. S. to one of the governing bodies which control the municipal and local affairs.

Commoner: one of the common people, applied in general to all persons except the hereditary nobility; also a student of the second rank in the University of Oxford (England), who pays for his board or *commons* and other charges. The term "great commoner" has been applied to the English patriot Hampden, and to the elder William Pitt before he entered the House of Peers.

Common Law: that body of English law which does not rest for its authority upon any express and positive declaration of the will of the Legislature. It is opposed to written or statute law. In the several States of the U. S. the term common law means both the common law of England and the statutes passed by the English Parliament before the emigration of the first settlers to America. The common law constitutes the basis of the jurisprudence of all the States of the U. S., with the exception of Louisiana, in so far as it conforms to the circumstances and institutions of the country, and has not been otherwise modified by statutory provision. It is presumed to exist in the original colonial States and in States the population of which has been formed by emigration from the original States.
Henry Wade Rogers.

Common Pleas, Court of: See Courts.

Common Prayer, Book of: a collection of all the forms of worship used in the Church of England. The King's Primer, published by Henry VIII. in 1546, was the first form of this book, but it contained only the Creed, Lord's Prayer, Commandments, and Litany. Edward VI. had this primer twice revised and republished (in 1549 and 1552), and his second Liturgy is very similar to that which now exists. He caused the Sentences, Exhortation, and Confession and Absolution to be prefixed to the Daily Service, and introduced the Decalogue into the Communion Service (1548). In the reign of Elizabeth the Liturgy was again revised (1559), but with few alterations. After the conference with the Presbyterians at Hampton Court, James I. instituted another revision, and added the explanation of the sacraments in the Catechism (1604). It was again revised under Charles I. (1633). After the restoration of Charles II., when a conference had been held with the Dissenters at the Savoy, the Common Prayer-book was further revised in 1662. Certain forms were added, and slight changes were made in the services; and a very few have been made since that time. In the American Episcopal Church a revision of the English Prayer-book was rendered necessary by the necessity for the omission of the "State Prayers." Other changes were suggested, and what is known as the *Proposed Book* was published in 1786 (reprinted in England

1789, and again in Hall's *Reliquiæ Liturgicæ*, and again as the *Bishop Cummins Prayer-book of the Reformed Episcopal Church*). This compilation was chiefly the work of the Rev. Dr. William Smith, formerly provost of the College and Academy of Philadelphia (now the University of Pennsylvania). This failed of general acceptance. A return to the English book, with certain necessary modifications, was set forth in 1789, which has been superseded by the present *Standard* issued in 1892, and more closely conforming to the English book than its predecessor. The standard histories of the Prayer-book are by F. Procter (London, 1855; 18th ed. 1889) and W. G. Humphrey (London, 1853; 6th ed. 1892). Revised by W. S. Perry.

Common Schools: schools in which the common or elementary branches are taught. In the U. S. the term common schools means schools for the common people, directed and supported by the people themselves, and the term is used in that sense in this article when treating of education in the U. S.

Common Schools before the Reformation.—In the despotic civilizations of the East education was universally controlled by the Church, confined to special classes, and paid for by the recipients. The political and religious organizations were such as could only exist if supported by the ignorance of the masses.

In Greece, all the Spartan children were trained physically, and taught the severe virtues of the time under the direction of the state, but the individual had to meet the expense. In Athens, the state cared for physical training, and to some extent supervised the training of intellect and morals.

In Rome education was largely military and religious, and such schools as existed were private, and dominated by religion rather than by the state.

Throughout the Middle Ages, the state rarely interested itself in education. Such schools as existed were established and maintained by the Church. The troubles of the times, however, and the opposition to any free thought discouraged intellectual activity. The schools of Charlemagne and Alfred were but spasmodic attempts, and did not affect the masses of the people directly. Not until the beginning of the twelfth century did any considerable interest in learning appear, and then it was confined to the higher institutions of learning. Universities sprang up, but common schools were not started.

The Reformation.—Schools of the people, for the people, and directed by the people, began four centuries later, under the influence of the Reformation. The new faith preached by Luther was not only favorable to common schools, but it could be realized only through common schools. If individuals are to be personally responsible for their beliefs, and if those beliefs are to be based on a personal study of a great mass of writings, then each individual must be taught to read and to express himself, and he must be given a trained judgment. From the days of Luther, the Church has been compelled to found and support common schools. All the other great movements of the early sixteenth century greatly strengthened this new interest in public education. The discovery of printing and of cheap paper, the broadening of knowledge through voyages, the study of the classics, and the development of new arts and industries, all greatly aided the movement toward common education.

In Germany.—In Germany, one would naturally expect the most rapid development of schools after the Reformation. Luther vigorously favored schools for the people, and a number of famous teachers arose. But the schools they established were mainly confined to the cities. The Thirty Years' war destroyed nearly all the German schools, and left Germany in 1648 almost a desert. Schools began to grow up a few years later, and they, like the manners of the time, were formed after French models. In 1713 a general school-law for the Prussian monarchy was passed. In 1763 Frederick the Great promulgated a code making attendance compulsory, and establishing the leading features of later school-laws in Prussia. The Church authorities were to retain supervision of the schools.

The modern system of German common schools dates back to the terrible disasters which brought Prussia to the brink of national extermination. After the treaty of Tilsit, which marks her lowest estate during the Napoleonic wars, Prussian patriots turned their thoughts toward an intellectual and moral regeneration of their people, and naturally turned to the public school as one of the most powerful aids they could command. National education became a distinct and important branch of the administration of the state, and under the direction of such men as Stein and Humboldt new ideas were introduced, largely Pestalozzian, and the schools of Prussia became the educational models for the world.

In France.—In France, as in Germany, the Reformation encouraged popular education, and the Huguenots established a large number of elementary schools, mainly for religious instruction. To oppose these Protestant tendencies, the older Church established schools, especially in the provinces most tainted with heresy. There was, however, no general system adopted by either Church. After the Revocation of the Edict of Nantes, which in 1685 drove the most intelligent part of the middle class out of France, the constant decline in revenue made any considerable government aid to education impossible. The Revolution, from the first, declared itself in favor of general education. Various measures were proposed, but none was carried out until the consulate. Public primary schools under the direction of the state were first established in 1833, under the direction of M. Guizot, Minister of Public Instruction.

After the terrible disasters of 1870, France turned her attention to her public schools, as the only means of rehabilitating the country. She studied the German and Dutch schools, and within twenty years made her elementary schools second to none in Europe. They are under the direction of a Minister of Public Instruction and Fine Arts, who exercises very large directive powers. Inspection is in the hands of Government officials, who inspect even private schools and home instruction. Instruction is free, and attendance is obligatory.

In Scotland.—Superior schools for the common people seem to have existed in Scotland before the Reformation. From the first the Reformed Churches took the schools under their charge, and tried to make elementary education universal. In 1696 a statute was passed under which common schools were generally established. They were supported by local effort and directed by the clergy. In 1861 the schools were in some degree freed from the Church and made more dependent on the state and the universities. From the first the schools had been truly national; a conscience clause protected the rights of Roman Catholics, and all classes attended the schools. In addition to parish schools there were what we should call high schools, that were a part of the general system. In 1872 a new school law was passed in Scotland by which schools were still further secularized, and attendance was made compulsory and funds were supplied by national grants, by local taxes, and by school fees. In 1883 the compulsory laws were strengthened.

In England.—In England no such interest was manifested in common schools. Both the form of the Government and the form of the Church were opposed to a general education of the masses.

During the Reformation 250 grammar schools were founded for the boys of the middle classes. These schools were well endowed and cheap, but they were not "common" schools, as the term is used in the U. S., though they are called common schools in England. In some parishes the Church established schools, but these were uncertain and poor. Not until the close of the eighteenth century, under the influence of Bell and Lancaster, was any considerable interest shown. The Dissenters, following Lancaster, established the British and Foreign School Society; the established Church, following Bell, established the National Society. These two bodies controlled and for the most part supported such schools for the people as existed in England down to 1832. They drew revenue from voluntary contributions and from tuition. Several attempts to obtain aid from the state were made by Mr. Whitbread in 1807, and by Mr. Brougham in 1816–20, but the jealousy of the Churches made state assistance impossible.

In 1832, acting on its own responsibility, the Government granted £20,000 to aid education, and it was divided between the societies already mentioned. In 1839 the grant was increased to £30,000, and a special department was created to supervise the work, but it could act only through the two religious societies. An inspector of schools was appointed, but he could only see that the money was fairly spent.

Various measures were brought forward in Parliament from 1840 to 1870 looking toward state control of common education. It was proposed to establish schools for poor factory operators, to raise a local tax in aid of the schools, to pass a conscience clause excusing children from attendance

at religious exercises of which the parents did not approve. All these measures were lost. Meantime the treasury, through the educational department, which had no existence in law, was disbursing constantly increasing annual grants through the two great religious societies. In 1861 this department adopted a revised code, determining the conditions under which public money should be granted. They demanded approved premises, certificated teachers, a considerable attendance, and an examination of results.

In 1870 the Government first passed a law by which it actually took charge of certain lines of the common school work. School districts were organized, schools were increased, children were freed from attendance at religious teaching, all schools were inspected and directed by Government inspectors. The work was still, however, under the immediate direction of the great religious societies, where they had schools organized or where they wished to organize them. Where the Church did not act local school boards were established. A public school fund was provided, and school boards could, under certain restrictions, compel attendance. In the next six years accommodations were nearly doubled, and the quality of work greatly improved.

In 1876 an act of Parliament declared it to be the duty of every parent to educate his child, and regulated in some degree the school attendance. In 1880 a compulsory attendance law was passed.

From 1870 to 1891 the average daily attendance increased from 1,152,389 to 3,754,493, and the number of teachers from 30,130 to 105,148. In 1891 an act was passed making elementary education practically free in England and Wales; but three-quarters of the schools still remain under the direction of voluntary societies.

In the United States.—Whether the fundamental ideas embodied in the common-school system of the U. S. originated in England or in Holland is a question involved in too much controversy to be taken up here. Certain it is that all the early settlers who were driven to North America by persecution turned instinctively to the school as a means of perpetuating their religious views and maintaining their liberties.

Puritans in New England, Dutch in New York, Swedes in Delaware, Germans in Pennsylvania, and Huguenots and Scotch-Irish in all colonies made great sacrifices to secure education for the young. At first all the schools were connected with the Church, but as Government became secularized the schools followed the Government.

From 1635 schools existed in New England, intended for common people, partly supported by public funds, and under public supervision. The legislation of 1642 recognized the right of Government to demand that its citizens be educated. In 1647 Massachusetts passed an act requiring all townships having fifty householders to establish schools under a certain forfeit, which was increased by subsequent legislation. In 1650 Connecticut passed a similar law. Both of these laws required the establishment of a grammar school in larger towns.

It is claimed that in New York, under the Dutch, schools were so common that in 1664 nearly every town had its school, but it is certain that after the English occupation the schools of New York were inferior to those of New England. In Pennsylvania, while schools were favored by Penn and by the Germans, they did not flourish as in New England. Throughout the South the scattered life on plantations and the social customs of the time did not favor common schools. Instruction was mainly private.

During the whole colonial period common school instruction was meager, books were few, teachers were poorly prepared, and the payment of school fees kept the poor away from the schools or raised unfortunate distinctions between pay and pauper scholars.

During the long period of the Revolutionary war, from 1775–83 and down to 1815, the resources of the States were too heavily strained to admit of any considerable extension of the common schools. With the close of that struggle the strength of the nation was thrown into industrial lines—repairing the ravages of war, settling the lands over the Alleghanies, developing agriculture, commerce, and manufactures. Some advance had, however, been made during this long period. In many places schools had been established for girls, though seldom on a basis of equality with boys, some experiments had been made in school supervision, high or grammar schools had been established, and funds had been set aside for the support of schools.

By 1820 the industrial problems were so well in hand that attention could be turned to other things, and during the next decade there was a revival of learning marked by educational discussions in the press, in legislative halls, and in city councils; by improved organization of city schools; by the establishment or revision of the public school system in a majority of the States; by experiments in infant schools and manual training schools; by the establishment of mechanics' institutes, lyceums, and teachers' conventions; and by the broadening of programmes so as to include more science.

The growth from this period has been steady and most rapid. Since the civil war the South has developed her schools with a rapidity very remarkable, when one considers the destitution in which these States were left.

Present Systems in the United States.—There are at present in the U. S. as many systems as there are States. The national Government collects and distributes information through the bureau of education, cares for the military and naval instruction, controls the schools in the Territories and in the District of Columbia, and sometimes grants public lands to aid education in the various States. A strong effort has been made to use national funds for educational work in the South, but up to the present time it has been unsuccessful.

While each State has its own system of education, there is, nevertheless, a considerable uniformity. The schools in all the States are secular, and no religious instruction is allowed, though in most places the Bible is read at the beginning of the session and some special moral training is given. No exposition of the Bible is allowed and no religious formula can be taught.

The schools are all free, and the doctrine that all the property of the State should be taxed for educating all the children of the State is universally recognized. School money is drawn from permanent educational funds, derived originally from public lands or special State grants; from a State tax, disbursed on a basis of school population and school attendance; and from local school taxes.

The local unit for purposes of school administration is generally the township, but sometimes it is the county, or small school districts. The township system is most in favor, and seems destined to prevail. City schools are generally under a distinct city school administration.

Supervision is receiving constantly increasing attention. Each State has at its head a State superintendent of public instruction or a State board of education, sometimes both, and these officers have general supervision over its educational interests. Next below these officials come the county and city superintendents, who visit and criticise the schools and sometimes license teachers. Still below these come the trustees or township and district officials, who engage teachers, purchase school supplies, look after school buildings, and attend to the business details of the school-work.

Teachers are licensed by county or State examinations or by normal schools.

Most schools, except in some country districts, are classified. Children from six to ten form the primary classes, and those from ten to fourteen form the grammar grade. Above the grammar grade many cities and States provide high schools. These furnish an education adapted to scholars from fourteen to eighteen years of age.

Present Problems.—In the States thus hastily examined the movement has been steadily toward compulsory, free, secular education. In all of them these aims are realized in large measure. There are, however, many important questions now pressing upon the attention of the people of the U. S.

In some parts of the country large bodies of the citizens, believing that education should rest on a religious basis, are maintaining parochial schools in addition to the taxes they pay for the support of public free schools. They naturally demand that they be freed from school taxes unless a part of the taxes be devoted to the parochial schools. This question appears under many forms—centering about Bible-reading in the schools, use of particular text-books, and appointment of teachers.

Political interference, city normal schools, and the employment of special teachers for single subjects are some of the questions forcing themselves upon the attention of cities.

Methods of teaching are undergoing a very great change, under the influence of the better universities and the kindergartens. This change may be described by saying that the present aim of education is primarily to develop the powers

of the individual child, while the older education sought primarily to give information to a mass of children.

The high school is becoming more firmly fixed with every year as a part of the common school system, and in many of the cities the kindergarten school is being added.

One may say that the whole tendency is toward stronger State supervision. Text-books are regulated in most States, and in some they are published directly by the State. Cities seem inclined to place their schools under the direction of strong superintendents, and county and State superintendents are gradually being granted larger powers.

The curriculum has been steady. Elementary science has taken a most important place, and is even made the basis of much of the primary work. Physical training, manual training, cooking-schools, commercial courses, and courses in modern languages have been added to meet the demand for more practical results. This change has not been made without opposition, and the whole tendency toward introducing a larger range of elective studies is being seriously questioned by many educators.

The teaching force is steadily improving; normal schools are increasing, and courses for teachers are being added to colleges and universities. The teacher's remuneration is steadily rising, and a professional literature is growing up. Since 1840 women have gradually superseded male teachers in common schools, until to-day, in some cities and States, they practically have a monopoly. EARL BARNES.

Commons, House of: See PARLIAMENT.

Commonwealth: a state; a body politic; properly a free state; a republic. The official title of commonwealth is used by the States of Massachusetts, Kentucky, Pennsylvania, and Virginia.

Commonwealth of England: in history, the form of government established in England on the death of Charles I. in 1649, and which existed during the protectorate of Oliver Cromwell and his son Richard, until the restoration of Charles II. in 1660. The substitution of a democratic for a monarchial form of government was provided for and enjoined by two successive charters. The first charter of the commonwealth was drawn up in Dec., 1653; it was styled the "Instrument of Government." The second charter, called the "Petition and Advice," was framed in May, 1657. Under the first charter the English Government may be classed among republics, with a chief magistrate at its head; under the second it became substantially a monarchy, and Oliver Cromwell, from 1657 to the period of his death, was virtually monarch of England.

Commune of Paris: an organized band of socialists, outlaws, and *prolétaires*, connected with the International Association, who revolted against the new *régime* or Versailles government on Mar. 18, 1871. Paris had, a few days before this date, been evacuated by the Germans, who had taken it after a long siege. The National Guard of Paris had been permitted to retain their arms, and a large part of that guard supported the Commune, whose headquarters were in the quarters of Belleville and Montmartre. Among the prominent leaders of the Commune were Flourens, Félix Pyat, Assi, Delescluze, Paschal, Grousset, Gen. Cluseret, Dombrowski, Arnould, Jules Vallès, Blanqui, and Rochefort. Their principles and aims are thus defined by one who was a member of the Commune: "Their philosophy is atheism, materialism, the negation of all religion; their political programme is absolute individual liberty by means of the suppression of government, and the division of nationalities into communes more or less federated; their politieal ecomony consists essentially in the dispossession, with compensation, of the present holders of capital, and in assignment of the coin, land, etc., to associations of workmen."

As those members of the National Guard who favored the cause of order were irresolute and not inclined to fight, the Communists quickly became absolute masters of Paris. Their ranks were re-enforced by many convicts, whom they released from the prisons, and by many foreign refugees. The leaders who had some intelligence, some definite purpose, and some lingering scruples were soon discarded one after another and imprisoned, and the control of the Commune was obtained by desperadoes and outlaws, who initiated a reign of terror. On Mar. 26 an election was held in Paris to choose members of the Commune, but as the party of order declined to vote, only 180,000 votes were cast, and the election resulted in the triumph of the insurgents. The government organized at Versailles sent an army to suppress the insurrection. On Apr. 2 a large body of insurgents marched against Versailles, but they were repulsed at Meudon, and much injured by the fire of Fort Mont Valérien. The army of the republic began to besiege Paris under the command of Marshal MacMahon. The chief command of the besieged forces was held successively by Dombrowski, Cluseret, Rossel, and Delescluze. Violent dissensions disturbed the counsels and hindered the success of the Commune. On Apr. 5 they arrested Darboy, Archbishop of Paris, and other persons, whom they kept in prison as hostages. The insurgents, who occupied several forts in the environs, made an obstinate resistance to the besiegers. Having captured several of the forts, the besieging army, about 90,000 strong, entered Paris on May 22 by several gates, inclosing the insurgents in a great semicircle. The latter continued for five days fighting behind barricades in the streets, and revenged their defeat by atrocious acts of cruelty and vandalism. They set fire to the public buildings, and endeavored to destroy the ancient monuments and treasures of art. Among the finest edifices that were burned were the Tuileries, the Palais de Justice, the Palais Royal, and the Hôtel de Ville. The Louvre was partly consumed. During the last days of the power of the Commune they shot Archbishop Darboy, Bonjean, president of the court of cassation, and other persons whom they held as hostages. In order to execute their incendiary designs on a grand scale, they ignited petroleum, gunpowder, and other explosive materials in many parts of the city. Delescluze was killed while fighting in the street on May 26. The civil war ended on the 27th, when M. Thiers issued a bulletin stating that 25,000 Communists had been taken prisoners. Large numbers of these were put to death, and several thousand were punished with deportation. The ringleaders of the Commune who survived the battles were mostly captured and executed.

Revised by C. K. ADAMS.

Communica'tio Idiom'atum [Lat., conjoint possession of attributes; *idioma* = Gr. *ἴδίωμα*, peculiarity: deriv. of *ἴδιος*, peculiar]: the name marking the doctrine that the one person of Christ has conjoint possession of the attributes of the two natures—that the attributes of the two natures are so held together in the one person as *in it* to have fellowship with each other; the person which conjoins the nature conjoins their attributes in itself. The two natures are inseparable, both actively and passively. What is proper to either nature in the abstract belongs to Christ in the concrete; and what the divine, which is the assuming nature, has in itself, the human, which is the assumed nature, has in and through its personal conjunction with the divine. See Krauth's *Conservative Reformation* (476–481).

Communion Service: See EUCHARIST.

Communism: the theory which teaches that property should be held in common—a theory which Plato advocates in his *Republic*, and which was probably practiced before his time by the followers of Pythagoras. In later times the Neo-Platonist Plotinus attempted to establish community of goods upon the plan which had been proposed by Plato. Among the Jews the Essenes and Therapeutæ practiced a sort of communism. The so-called communism of the apostolic Church in Jerusalem lacked the essential features of communism. It was only partial and voluntary, was not patterned after by other Christians, and was a failure. Bûddhism and other Oriental religious systems have for ages had followers who have practiced a rude communism. In Europe there were numerous mediæval sects (Catharists, Brethren of the Free Spirit, etc.) who advocated some practice of the kind. Later came the Anabaptists of Münster, the Libertines of Switzerland, the Familists of England. Still later we find the Herrnhuters, the Shakers, the Harmonists, the Buchanites, and numerous other religious communists—some practically successful and others not.

The ONEIDA COMMUNITY (*q. v.*) is perhaps the best-known example in the U. S.

Bacon, More, and other English theorists long ago wrote treatises which looked toward the ultimate establishment of communism, but Robert Owen was the first great advocate of the doctrine in the United Kingdom. The first French revolution brought forward a number of communistic theories, but none survived long; the best-known writer of that

time was Babœuf. Subsequently these ideas were taken up by Saint-Simon, Fourier, Proudhon, and others. (See ANARCHIST and SOCIALISM.) A large number of socialists, including the whole Russian wing of the party, believed that property should be held and industry controlled, as far as possible, by communities, or "communes," modeled more or less on the village communities of Russia. In thus laying stress on the commune they wished to weaken the powers of the central government, and adopted the doctrines of *anarchism* as distinct from *socialism*, which would increase the central government's power. In 1871, at the close of the Franco-German war, the communists gained control of Paris by revolution; but being unable to maintain it, they indulged in murder and arson in such a way as to throw universal discredit on the name which they bore and the theories with which they were identified.

Revised by A. T. HADLEY.

Community Property: in law, property acquired by husband and wife or either of them during marriage, when not acquired as the separate property of either of them. It includes the product of their industry and all property vesting in them by purchase, donation, bequest, or descent. The institution of community property is borrowed from the civil law, and has many of the incidents of partnership, but is not identical with it. It is recognized by statute in Louisiana and California, and in a number of other States created out of what were once French or Spanish dominions, and whose laws have consequently been influenced by the civil law. In these States all property held by either husband or wife during coverture is *prima facie* presumed to be community property. During coverture the wife's rights are passive, and the husband has full power to dispose of it absolutely and without her consent, but he can not dispose of any interest in it by an instrument to take effect after his death. The survivor has, in general, one-half of the community property and the other half goes to the heirs.

F. STURGES ALLEN.

Commutator (in electricity): a device for converting the alternating currents, generated in the armatures of dynamo-machines, into continuous currents. (See ALTERNATE CURRENTS and DYNAMO.) In its usual form it consists of a series of copper blocks arranged symmetrically around the armature-shaft, and insulated from the latter and from each other. To these are attached the terminals of the various coils, the current from which is to be commuted. Brushes of copper or of carbon are brought to bear at proper points upon the commutator, making connection with each coil or set of coils in turn, and conveying the currents induced in them to the outside line. The essential point of the device is so to arrange the contacts that while the currents within the armature are reversed, at least twice in every revolution of the machine, the current in the outer circuits shall always have the same direction. E. L. NICHOLS.

Commute [from Lat. *com*, with + *muto*, change]: to change or exchange (one thing for another); thus one penalty is often commuted as an act of clemency for another which is less severe, as a sentence of death to imprisonment. Officers in the army are sometimes allowed to commute their allowances for quarters, forage, etc., for cash.

Comne'nus (in Gr. Κομνηνός): the name of a Byzantine family of Italian origin, from which descended six Emperors of the East and all the Emperors of Trebizond. See ALEXIS I., ANDRONICUS I., ISAAC I., MANUEL I., and ANNA COMNENA.

Co'mo (anc. *Comum*): a province of Italy; bounded N. by Switzerland and Sondrio, W. by Novaro, S. by Milan, E. by Bergamo and Sondrio. Area, 1,049 sq. miles. It consists of the territory about Lake Como and the eastern part of Lake Lugano, and reaches westward to Lago Maggiore. This province contains several magnificent regions; the finest of them is the tract called Brianza, lying between Monza and the two southern branches of Lake Como, which is as much as 25 miles long and from 1 to 3 miles broad, and watered by the Adda. The province produces much silk and wine. The principal industry is the rearing of silkworms. Pop. (1880) 518,372; (1890) 551,617.

Como: a city of Italy; in Lombardy; capital of province of same name; at the southwestern extremity of the Lake of Como; 24 miles N. of Milan, with which it is connected by a railway (see map of Italy, ref. 2–C). It is beautifully situated in a valley inclosed by verdant hills, covered with gardens and groves of orange and olive trees. On a hill overlooking the town are the ruins of the castle Baradello, which was destroyed by Frederick Barbarossa. It has a fine cathedral founded in 1396, by the side of which is a clock-tower built in 1463. Here are also an ancient town-hall, a public library, a museum, theater, and botanic garden. Here are manufactures of cotton yarn, silk and woolen fabrics, and soap. It has a trade by the lake with Ticino and Germany. Pop. 27,000. *Comum* was an important town under the Romans. Pliny the Younger and Volta were natives of this place.

Como, Lake (in Ital. *Lago di Como*; anc. *Larius Lacus*): a lake of Italy, in Lombardy; is an expansion of the river Adda, which enters it at the foot of the Lepontine and Rhetian Alps, and issues from the southeastern extremity of the lake. It is divided into two branches, one of which, extending southwestward, is called the Lake of Lecco. It is 698 feet above the sea, and about 35 miles from Como to the northern end, and is nearly 3 miles wide. Its greatest depth is 1,925 feet, the superficial extent 62 sq. miles. It is celebrated for the beautiful scenery of its shores, covered with elegant villas. Numerous steamboats ply on this water.

Comonfort, IGNACIO: Mexican general; b. at Puebla, Mar. 12, 1812. He early took part as a soldier in political struggles, held various civil and military offices, served in the war with the U. S., and was several times elected to Congress. In 1853 Santa Anna dismissed him on false charges from the inspectorship of the custom-house at Acapulco. In Apr., 1854, he revolted at Acapulco, and withstood a siege there by Santa Anna with 7,000 men. In the campaign which followed he took a leading part, and after the flight of Santa Anna he was made Secretary of War by Alvarez (Oct., 1855). Alvarez, being bitterly opposed, retired Dec. 11, appointing Comonfort his successor as acting president. From the first Comonfort had to contend with the Church and conservative party and with opposition in the army. A revolt which broke out at Puebla the day after his succession was put down after hard fighting, but the Bishop of Puebla continued to incite opposition, and was finally deported, May, 1856. This and some confiscations of ecclesiastical property increased the alarm of the Church party. There were other revolts at Puebla and elsewhere, and Mexico itself became a center of plots. A new constitution was promulgated Feb. 7, 1857, and under it Comonfort was regularly elected president for four years, assuming office Dec. 1, 1857. Less than three weeks after conspirators at Tacubaya declared against the constitution, and demanded that Comonfort should assume dictatorial powers pending the call for a new constitutional assembly. Without definitely adhering to this sedition Comonfort encouraged it by his weakness. Thus he at once lost the support of public opinion, his own minister, Juarez, heading the opposition. Congress voted his deposition, and on Jan. 11, 1858, a portion of the garrison of Mexico declared against him. A series of bloody fights followed in the streets of the capital. Deserted at last by nearly all his friends, Comonfort fled, and on Feb. 7 embarked at Vera Cruz, going to the U. S., and thence to France. He was allowed to return in 1862, was restored to his rank of general of division, and during the resistance to the French invasion commanded the army of the center. His defeat at San Lorenzo (May 8, 1863) forced Orteaga to surrender at Puebla. Comonfort was Minister of War in the Juarez cabinet, formed after Mexico had been lost. He was killed by irregular troops or bandits between Guanajuato and San Luis Potosí, Nov. 13, 1863. HERBERT H. SMITH.

Comorin, Cape: See CAPE COMORIN.

Co'morn, or **Komorn**: a county of Hungary; bounded on the N. by the counties of Presburg, Neutra, and Bars, on the E. by Gran, on the S. by Stuhlweissenburg, and on the W. by Raab. Area, 1,146 sq. miles. It is divided into nearly equal parts by the Danube, besides which it is also traversed by the Waag river. In the north it is level, but in the south it is mountainous. The country at the entrance of the Waag into the Danube consists of large swamps. The soil is generally fertile and well cultivated; sheep-raising is extensively pursued. Chief town, Comorn. Pop. (1890) 159,397.

Comorn, or **Komorn**: a fortified town of Hungary; capital of county of same name; on the left bank of the Danube; at the mouth of the river Waag; 46 miles W. N. W. of Pesth; on the Great Schütt island at its eastern extrem-

ity (see map of Austria-Hungary, ref. 5–G). The streets are narrow and irregular. The Danube is here crossed by a bridge of boats. The fortress of Comorn, originally built by Matthew Corvinus, is considered one of the strongest in Europe, and requires for its defense 15,000 men. It was besieged and bombarded by the Austrians in 1848 and 1849 without success, but finally capitulated of its own choice Sept. 27, 1849. Pop. 13,100.

Com'oro Isles: a group of four larger islands and several smaller ones situated in the Mozambique Channel about half-way between Africa and Madagascar (see map of Africa, ref. 7–H). They are volcanic in origin and mountainous, and the highest peaks rise about 8,500 feet above the sea. The soil is fertile. The prolific tropical vegetation includes the cocoa and arcca palms, excellent rice and maize, yams, bananas, mangos, pincapples, oranges, lemons, cotton, wild indigo, and sugar-canc. Excellent wood for ship-building is found. The principal exports are palm oil and tortoise-shells. Thc people are partially Arab and partially Malagasy in blood, and arc mostly Mohammedans. They support themselves chiefly by tillage; there are among them skillful cutlers, weavers, and jewelers. Mayotte, one of these islands, has long been a French colony. The island of Johanna is celebrated for its beauty. The entire group was ceded to France in 1886. The islands once had considerable trade, which extended to India. Pop. estimated, 47,000, exclusive of Mayotte, which in 1889 had 12,270 inhabitants.

Company: See JOINT-STOCK COMPANY and PARTNERSHIP.

Company: in military usage, a body of troops commanded by a captain, assisted by his lieutenants, sergeants, and corporals. The Greek tetrarchia of sixty-four men corresponded to the company of infantry, which until quite recently varied in strength from about 60 to 100 men, the size being regulated so that the captain could personally watch and by his voice and example control the action of every man, making the company thc strict "unit of combat." The strength of the company of cavalry (troop) and of artillery (battery) is determined by the same considerations. In the European armies of to-day the companies arc much larger, giving fewer officers, and consequently reducing the pay-rolls. The war strength of the German company is 250 men. The captain is mounted. JAS. MERCUR.

Comparative Anatomy: See ANATOMY, COMPARATIVE.

Comparative Philology: This term, when used as it commonly is among English-speaking people, in the narrower sense of comparative grammar, denotes that branch of the science of language which seeks by a comparison of the grammatical phenomena of cognate languages to reconstruct the parent speech from which these languages are derived, and so to aid in tracing the historical development of the single languages. The former of its aims makes it an auxiliary of anthropology, of ethnography, and of history in general; the latter makes it an auxiliary of historical grammar. Historical grammar occupies itself with the attempt to explain the grammatical phenomena of a language as developments out of precedent phenomena; i. e. it views them according to their *becoming*, in distinction from descriptive grammar which notes and studies them simply as *being*. Historical grammar, apart from the help of comparative grammar, can pursue its investigation of the development of a sound, a form, or a construction no further back than the point where the language first obtained a record. (See LANGUAGE.) Thus among the various branches of the Indo-European family the Slavic can be followed back to the ninth century A. D., the Celtic to the eighth, the Armenian to the fifth, the Teutonic to the fourth, the Italic to the early part of the third century B. C., the Greek to perhaps the ninth B. C., and the Indian or Sanskrit to perhaps the fifteenth B. C. Without the help of comparative grammar Teutonic grammar would be compelled to begin the history of the word for *yoke* with Gothic *juk*, Greek grammar with *ζυγόν*, Latin with *jugum*, Slavic with *igo*, Sanskrit with *yugám*; but comparative grammar, by demonstrating that the Indo-European form from which all of these were differentiated was *yugo'm*, adds a new and all-important point through which to construct each separate line of development. In like manner, from Gothic *sibun*, seven, O. Bulg. *sedmĭ*, Lat. *septem*, Gr. *ἑπτά*. Skr. *saptá*, is reconstructed an Indo-European *septṃ̄*. From Fr. *chance*, Ital. *cadenza*, Span. *cadencia*, Ruman. *cădeuță*, is reconstructed an unrecorded Vulg. Lat. subst. **cadentia*, a fall, derived from *ca'dere*. A consideration of the fact that the Gr. genitive and the Lat. ablative share, among the various forms of verbal relation which they denote, only the *from*-relation, leads to the conclusion, which is also supported by other evidence, that the original value underlying the use after comparatives of the genitive in Greek and the ablative in Latin is that of separation, so that, e. g., the original meaning of the ablative in Lat. *filius minor est patre*, "the son is less than the father," properly is "measured from the father." The conscious beginnings of a science of comparative grammar were made by Franz Bopp (1791–1867), whose first work, *Ueber das Conjugationssystem der Sanskritsprache in Vergleichung mit jenem der griechischen, lateinischen, persischen und germanischen Sprache*, appeared at Frankfort-on-the-Main in 1816. The immediate occasion of the development of the science was the attention which had been called to the Sanskrit language in the latter part of the eighteenth century, and especially the discovery first made and proclaimed in distinct form by William Jones, an English resident at Calcutta, that the Sanskrit stood in definite relationship to the languages of Europe. The immediate purpose of Bopp's work as followed in the above-mentioned book and in his *Vergleichende Grammatik des Sanskrit, Zend, Griechischen, Lateinischen, Litauischen und Altslavischen, Gothischen und Deutschen* (1833–52; second edit. 1857–61), was the explanation of the force and signification of the different elements composing the forms of inflected words. Thus he isolates the personal endings of the verb *-mi*, *-si*, *-ti*, and seeks to identify them with the pronouns of first, second, and third person respectively. The augment he identifies with alpha-privativum, and attributes to it originally the power of negating the present and so of expressing past time. The case-endings of the nouns he believes to have had their origin largely in pronominal roots; thus the *-s* of the nominative was the pronoun, Skr. *sa* = Gr. *ὁ*.

While the honor of originating the comparative method rests with Bopp, the real founder of historical grammar, in the service of which the comparative method has found its chief application, was Jacob Grimm (1785–1863). To him we owe the first formulation of a law of sound, and the consequent perception that changes of sound take place according to definite historical lines. His *Deutsche Grammatik* (1819–37, 4 vols.) was not only the first example of an historical grammar, forming the prototype for the later great works of the kind, such as Dicz's (1794–1876) *Grammatik der romanischen Sprachen* (1836–43) and Miklosich's *Vergleichende Grammatik der slawischen Sprachen* (1852–74, 4 vols.), but constituted also an application of the comparative method to the various branches of a single language. As such it exercised in its turn a marked influence upon the plan and method of Bopp's *Vergleichende Grammatik*.

The application of the comparative method to the vocabularies of the Indo-European languages in the interest of etymology was the pre-eminent service of August Friedrich Pott (1802–88), whose chief work is the *Etymologische Forschungen* (1833–36, 2 vols.; 2d ed. 1859–76, 5 vols.).

In the rapid development of the science of Indo-European comparative grammar since the foundation period, two definite points may be noted, each marked by the appearance of a great summarizing work. The first is August Schleicher's (1821–68) *Compendium der vergleichenden Grammatik der indogermanischen Sprachen* (1861); the second Karl Brugmann's *Grundriss der vergleichenden Sprachwissenschaft der indog. Sprachen* (1886–92, 2 vols.; also an Engl. transl.). In the progress of the science have shared in most eminent degree, besides the above-mentioned scholars, Theodor Benfey, Adalbert Kuhn, G. Ascoli, Georg Curtius, B. Delbrück, August Fick, August Leskien, Johannes Schmidt, Ad. Bezzenberger, Hermann Osthoff, Hermann Paul, Karl Verner, Fr. de Saussure, J. Wackernagel, Heinrich Zimmer, H. Hübschmann, Gustav Meyer, Fr. Kluge, Hermann Collitz, Rudolph Thurneysen, Maurice Bloomfield, K. F. Johansson, and others.

In the following bibliography only works of present importance are given, and inasmuch as the progress of the science in other fields has generally followed in the wake of Indo-European philology, the selections are made chiefly from that discipline.

LITERATURE.—*History, Principles, and Method.*—Benfey, *Geschichte der Sprachwissenschaft und orientalischen Philologie in Deutschland seit dem Anfang des 19 Jahrhunderts* (1869); Steinthal, *Geschichte der Sprachwissenschaft bei den Griechen und Römern* (1863; now in 2d ed.); von der Gabelentz, *Die Sprachwissenschaft* (1891); Delbrück, *Ein-*

leitung in das Sprachstudium (1880; in Engl. transl.); Brugmann, *Zum heutigen Stand der Sprachwissenschaft* (1885); Paul, *Principien der Sprachgeschichte* (2d ed. 1886); Strong-Logeman-Wheeler, *Introduction to the Study of the History of Language* (1891).

Etymological Dictionaries.—Fick, *Vergleichendes Wörterbuch der indogermanischen Sprachen* (3d ed. 1874–76; vol. i. in 4th ed. 1890); Curtius, *Grundzüge der griechischen Etymologie* (5th ed. 1879; in Engl. transl.); Vaniček, *Griechisch-lateinisches etymologisches Wörterbuch* (1877); Kluge, *Etymologisches Wörterbuch der deutschen Sprache* (4th ed. 1889); Skeat, *Etymological Dictionary of the English Language* (2d ed. 1884); Miklosich, *Etymologisches Wörterbuch der slavischen Sprachen* (1886); Meyer, G., *Etymologisches Wörterbuch der albanesischen Sprache* (1891); Prellwitz, *Etymologisches Wörterbuch der griechischen Sprache* (1892).

Phonology, Word-formation, and Inflexion.—Brugmann, *Grundriss* (see above); Brugmann, *Griechische Grammatik*, *Müller's Handb. der Altertumswissenschaft* (vol. ii.); Meyer, G., *Griechische Grammatik* (2d ed. 1886); Stolz, *Lateinische Grammatik*, *Müller's Hdb.* (vol. ii.); King and Cookson, *The Principles of Sound and Inflexion in the Greek and Latin Languages* (1888); Henry, *Précis de grammaire comparée du Grec et du Latin* (2d ed. 1888; in Engl. transl.); Meyer, L., *Vergleichende Grammatik der griechischen und lateinischen Sprache* (2d edit. 1882); Osthoff and Brugmann, *Morphologische Untersuchungen* (5 vols., 1878–89); Kluge, *Vorgeschichte der altgermanischen Dialekte*, *Paul's Grundriss der Germ. Philologie*, i., 300 ff.

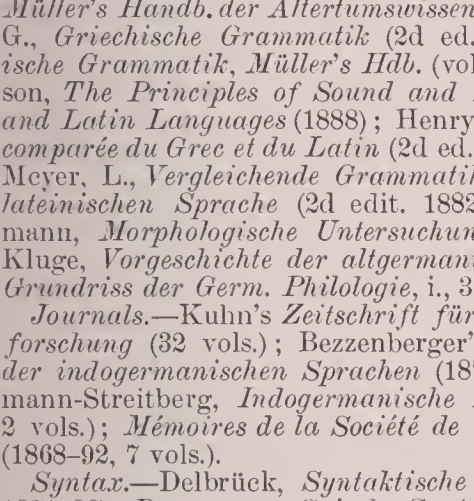
Journals.—Kuhn's *Zeitschrift für vergleichende Sprachforschung* (32 vols.); Bezzenberger's *Beiträge zur Kunde der indogermanischen Sprachen* (1877–92, 18 vols.); Brugmann-Streitberg, *Indogermanische Forschungen* (1891–92, 2 vols.); *Mémoires de la Société de Linguistique de Paris* (1868–92, 7 vols.).

Syntax.—Delbrück, *Syntaktische Forschungen* (5 vols., 1871–88); Brugmann, *Griech. Syntax*, *Müller's Hdb.* (vol. ii.); Schmalz, *Latein. Syntax*, *Müller's Hdb.* (vol. ii.); Ziemer, *Syntax der indog. Comparation* (1884).

Applications to History.—Hehn, *Kulturpflanzen und Haustiere in ihrer Wanderung von Asien nach Europa* (3d ed. 1877; Eng. transl., *The Wanderings of Plants and Animals*); Schrader, *Sprachvergleichung und Urgeschichte* (2d ed. 1890; in Engl. transl.). BENJ. IDE WHEELER.

Comparet'ti, DOMENICO PIETRO ANTONIO: Italian philologist; b. in Rome, June 27, 1835; became Professor of the Greek Language and Literature in Pisa in 1859, and subsequently in Florence. Later, as professor emeritus, he has directed the course in Greek antiquities in the University of Rome. His reputation, however, does not solely or even mainly rest upon his Greek studies. He is a Romance philologist of excellent quality, and is particularly familiar with the intellectual history of the so-called Dark and Middle Ages. Among his productions may be mentioned *Saggio dei dialetti greci dell' Italia Meridionale* (1866); *Edipo e la Mitologia comparata* (1867); *Virgilio nel Medio Evo* (1872); *Le antiche rime volgari*, etc. (with A. D'Ancona, 1875, *seq.*); *Canti e racconti del popolo italiano* (1875, *seq.*).
A. R. MARSH.

Compass [from O. Fr. *compas*, measure, pair of compasses, derived from a verb of Lat. type **compassa're* (Eng. to *compass*), measure off with steps (*passus*, step)]: an instrument used to show the magnetic meridian or the position of objects with reference to it. Among its various forms are the *mariner's* compass, the *surveyor's* compass, and the *variation* compass. These several applications each demand a special construction, but the essential parts are invariably the same. These parts are the needle, which consists of a magnetized bar of steel, and, fitted to its center, a cap which is supported on a pivot upright and sharp at the point to lessen the friction, and on which the needle may move with the slightest attraction. A circular card is attached to the needle of the *mariner's* compass, which turns with it, and indicates the degrees, which with the thirty-two points, divided into half and quarter points, are all marked on its circumference. The pivot is fastened to the bottom of a circular box, which contains the needle and card, and has a glass cover to protect the needle from the air. This is called the compass-box, and is suspended in a larger box or binnacle by two concentric brass circles called gimbals; the outer one is attached by horizontal pivots to the inner circle and to the outer box, the two sets of axes being at right angles to each other. Thus the inner circles, carrying the compass, box, needle and card, is sustained in a horizontal position, and is not subject to the rolling of the ship.



Mariner's compass.

"Boxing the compass" is the enumeration, by name, of the thirty-two points which are marked upon the compass-card. These points are—north, north by east, north-northeast, northeast by north, northeast, northeast by east, east-northeast, east by north, east, etc.

The *surveyor's* compass has its circle divided into degrees or half degrees, and is furnished with vertical sights in order to secure accurate pointing. It is graduated from 0° to 90° from both N. and S. around to E. and W., so that the position of the north end of the needle indicates the magnetic bearings of the line on which the sights are pointed.

The *variation* compass shows such changes as occur daily in the deviation of the magnetic from the true meridian. The needle is much longer than in the mariner's compass, in order to make minute variations more apparent. Another form of variation compass is a surveyor's compass with a movable limb which can be set, with the help of a vernier, so that the readings are true bearings instead of magnetic ones. See magnetic declination, etc., in the article MAGNETISM, TERRESTRIAL.

The origin of the compass is undoubtedly to be ascribed to the Chinese, who more than a thousand years B. C. made use of the loadstone to guide their cars or carriages without the aid of the sun or stars. It is certain that they employed the magnetic needle in the navigation of vessels soon after the Christian era, if not earlier. There is, indeed, every reason to believe that the mariner's compass was not an original European invention, but was introduced from China. None of the early European writers speaks of it as invented in Europe; and it is certain that the compasses used by the Italians in the thirteenth century were constructed exactly like those made in China about the same period. The compass is mentioned by a Spanish Arab poet as early as 853, by Guyot of Provence, 1190, and by Raymond Lully, 1286. Revised by MANSFIELD MERRIMAN.

Compass-plant: the *Silphium laciniatum*, a remarkable plant of the order *Compositæ*. It grows on the rich prairies of the Mississippi valley, and its radical leaves have, while growing, especially in midsummer, the property of pointing quite nearly to the N. and S. It was first made known to the scientific world by Gen. Benjamin Alvord in communications to the National Institute in Aug., 1842, and Jan., 1843. The accuracy of his statement being questioned by the botanists, he made another communication in Aug., 1849, to the American Association for the Advancement of Science. The truth of his observation was then admitted by Dr. Asa Gray, who attributed its polarity to the action of light. W. F. Whitney, in the *American Naturalist* for Mar., 1877, gives the result of a microscopic examination of the leaves, showing on each face an equal number of "stomates" or "breathing-pores," which confirms the conclusion that its position, facing the rising and setting sun, is due to the action of light. All the other experiments confirm this theory. Longfellow, in *Evangeline*, made a noteworthy allusion to it, in the latest edition using "vigorous plant" instead of "delicate plant." See *Nature*, Feb. 1, 1877. For illustration, see SILPHIUM.

Compasses: See DIVIDERS.

Compayré, JULES GABRIEL: See the Appendix.

Compensation of Errors: the neutralizing in instruments for accurate measurement (e. g. of time, pressure, temperature, distance, etc.) of errors caused by certain properties of the material agents used, by the introduction of other material agents which, acting alone, would produce errors of an opposite character. Thus the expansion of the pendulum-rod by heat may be counteracted by making

its weight of a much more expansive material, as lead or mercury, and connecting it with the rod by its lower end.

Competition: See Political Economy.

Compiègne, kōn′pi-āñ′: a town of France; department of Oise; on the Oise and on the railway from Paris to St.-Quentin; 44 miles N. N. E. of Paris (see map of France, ref. 3–F). It has a communal college and a public library of 28,000 volumes; also manufactures of muslin, hosiery, and cordage. The town contains an interesting Romanesque church (St. Jacques) and a beautiful town-hall of the sixteenth century. The neighboring palace (Château de Compiègne) was completed nearly in its present form by Louis XVI.; it is largely made up of older structures, and, although its exterior is agreeable in style, it is not an important building. It is now used chiefly as a museum. It was while heading a sortie from Compiègne (1430) that Joan of Arc was captured by the English who were besieging it. Pop. (1896) 15,225.

Complement [from Lat. *complemen'tum*, that which fills up; deriv. of *comple're*, fill up]: a full quantity or number; the number required or limited; that which completes or fills up. In mathematics, the complement of any magnitude is a second magnitude, which, added to the first, gives a sum equal to a constant third magnitude, which is purely arbitrary and conventional. Thus the complement of an angle is its defect from a right angle. The arithmetical complement of a number is its defect from the next higher power of ten. The arithmetical complement of 64 is 36.

In astronomy the complement of a star is its angular distance from the zenith.

Complement, in music, the quantity required to be added to any interval to complete the octave; for example, a sixth is the complement of a third, and is formed by the higher note of the third, and the note an octave above the lower note of the third.

Complementary Colors: any two colors which when mixed produce white. The mixture should be that of the light reflected from the surfaces to be compared, and not a mechanical mixture of the pigments themselves. The method which gives the best results is that of revolving disks painted in sectors with the colors to be compared. Owing to the persistence of vision, such a particolored disk when in rapid rotation presents a uniform surface to the eye. When the two colors with which it is painted are complementary, and are arranged so as to occupy proper relative areas on the disk, this surface will be white, or a neutral gray. This method is due to Clerk Maxwell. Prof. Rood, using a modification of Maxwell's method, has established the following set of complementary colors:

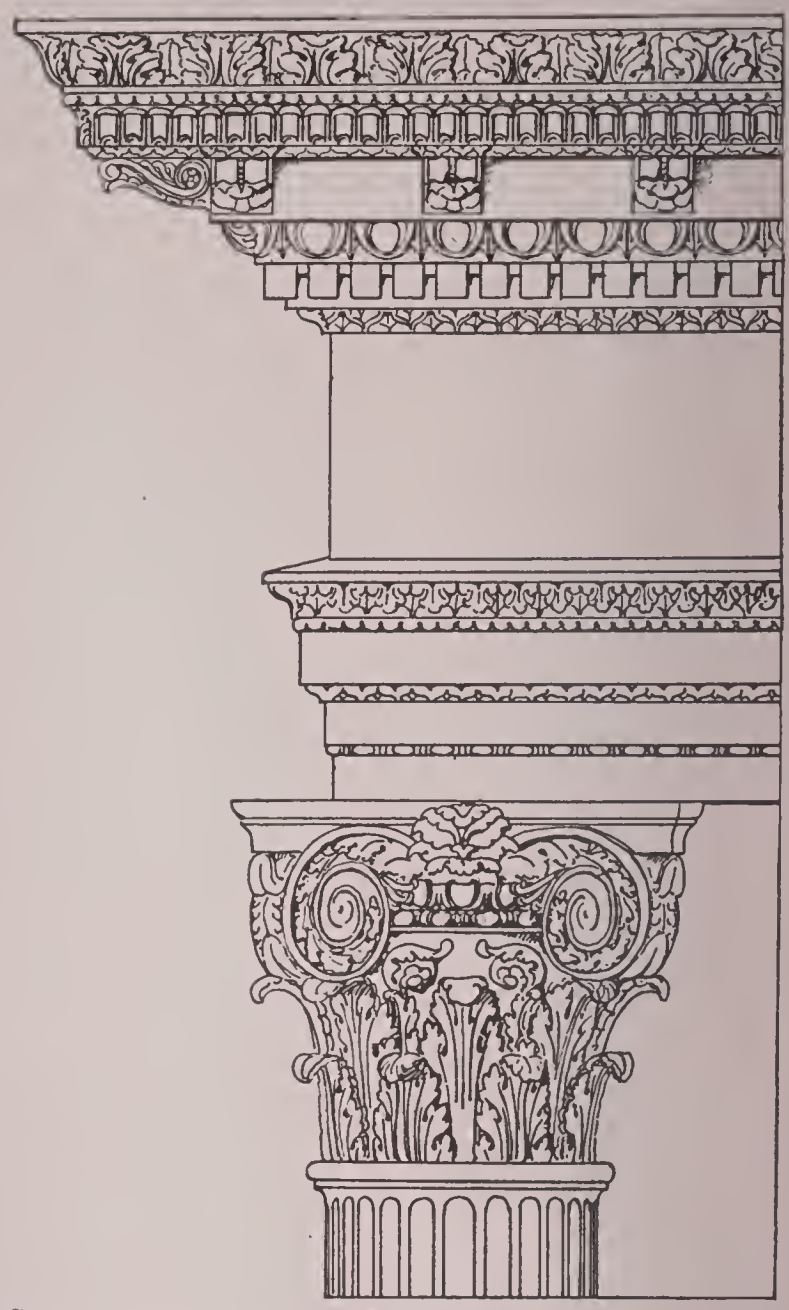
Carmine and blue green.	Greenish yellow and French blue.
Vermilion and green blue.	
Orange and greenish blue.	Green yellow and violet.
Yellow and blue.	Green and purple.

See Rood's *Text-book of Color*, chapter xi. E. L. Nichols.

Com'plin, or **Com'pline** [deriv. of Lat. *complere*, complete; so called because it closes the services for the day]: the last of the canonical hours in the Roman Catholic Church, following vespers. It consists of a general confession, four psalms, a hymn, the *Nunc Dimittis*, prayers, and a commemoration of the Blessed Virgin. The corresponding office in the Greek Church is called *apodeipnon* (the after-supper service).

Compluten'sian Bible: a polyglot in six volumes, folio, so called from *Complutum*, the Latin name of Alcalá in Spain, where it was printed. It contained the original texts, the Vulgate, the Septuagint, the Targum of Onkelos on the Pentateuch; the last two with a literal Latin translation. It was projected by Cardinal Ximenes, who spent about $150,000 upon it. It was commenced in 1502, printed between 1514 and 1517, authorized by Pope Leo X. in 1520, but apparently not circulated before 1522. Only 600 copies were printed, which were sold for about $20 a copy. A copy purchased for Union Theological Seminary in New York city in 1883 cost about $750.

Composite Order: in architecture, a form of column and entablature invented by the Romans, and characterized by a combination of Ionic and Corinthian elements in the capital. This was composed of an Ionic abacus and echinus with large corner volutes, and the lower half of a Corinthian capital with its two rows of acanthus leaves. The proportions of the column and the entablature were identical with the Corinthian, of which it was a mere variant (arch of Septimius Severus, baths of Caracalla, etc.). The architects of the later Italian Renaissance invented various forms of entablature to accompany this capital. The composite order has never had any great vogue in modern times, being at best a patchwork of forms. A. D. F. Hamlin.



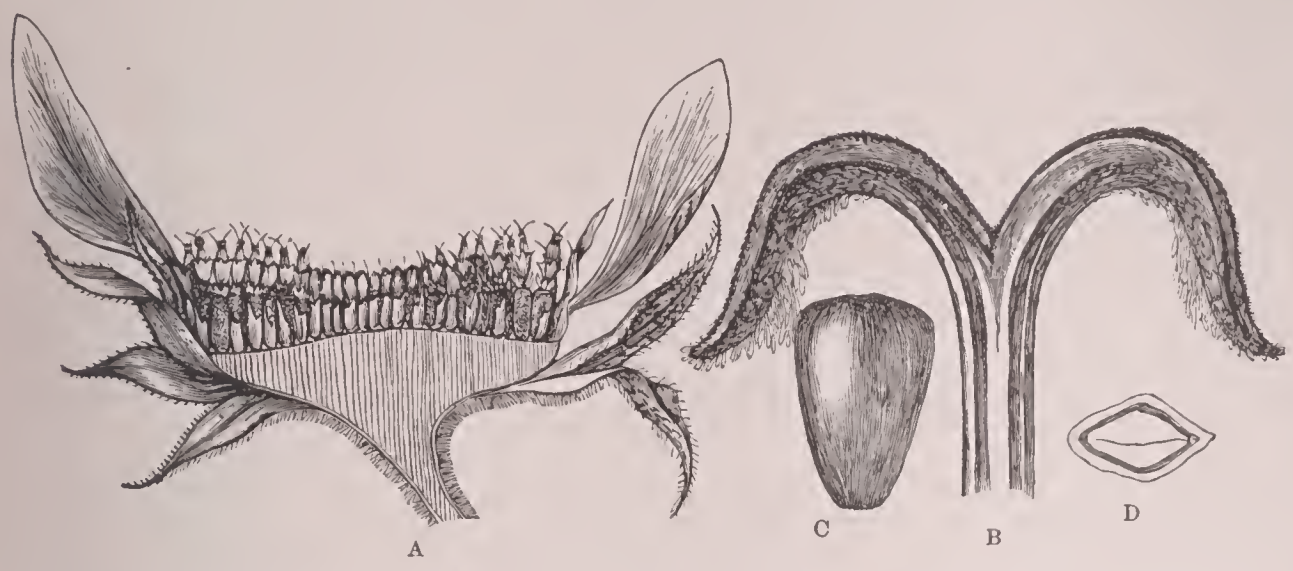
Composite order. From arch of Titus. Drawn by A. D. F. Hamlin.

Compos'ites [from Lat. past ptc. of *compo'nere*, put together, construct]: an enormous family (*Compositæ*) of flowering plants (containing 12,000 or more species) now generally regarded as representing the highest development of the dicotyledonous structure. All parts of the plant-body are well developed, and in the floral structure we find the widest departure from the primitive dicotyledonous flower (presumedly somewhat like that of the buttercups—*Ranunculus*). The compound pistil is compacted into a one-celled, one-seeded, inferior ovary, the stamens are united into a single anther-ring, the petals are united into a narrow tube or a flat blade, and the calyx, when present, is usually modified specially (as a pappus) for the dispersion of the seed. Moreover, the small flowers are massed into heads, which are often given prominence by the special modification of the marginal flowers.

Common examples of the composites are afforded by the sunflowers, thistles, asters, and golden-rods, and the family is often called the sunflower family. They are widely distributed throughout all parts of the world, being especially abundant in America. In temperate and cold climates they are mostly herbaceous annuals or perennials, but in warmer regions many are shrubby or tree-like. On the Great Plains of North America and in the Rocky Mountain region species of *Artemisia*, known as "sage brush," are shrubs from 3 to 10 feet in height.

Some composites are of economic interest, yielding food or medicines, e.g. lettuce (*Lactuca sativa*), artichoke (*Cynara scolymus*), Jerusalem artichoke (*Helianthus tuberosus*), wormwood (*Artemisia* of several species), arnica (*Arnica mon-*

tana), etc.; many are important for ornamental purposes, e. g. species of *Aster*, *Solidago* (golden-rods), *Chrysanthemum*, *Zinnia*, *Dahlia*, etc. Some of the most troublesome weeds in the U. S. are members of this family, as the thistles



Structure of the sunflower (*Helianthus annuus*). A, section of a head of flowers; B, end of the pistil showing the two-lobed stigma; C, ripe fruit (achene) containing a single seed; D, cross-section of an achene showing the large embryo.

(*Cnicus* of several species), ragweeds (*Ambrosia* of several species), cockleburs (*Xanthium*), Spanish-needles (*Bidens*), ox-eye daisy (*Chrysanthemum leucanthemum*), etc.

CHARLES E. BESSEY.

Composition with Creditors: an agreement between a debtor and two or more of his creditors, by the terms of which he is to pay, and they are to receive, a certain percentage upon their claims in lieu of full payment. Such a contract is valid, as it is held that the mutual agreement of the creditors is a sufficient consideration. F. S. A.

Composition of Forces: in mechanics, the discovery of one or a limited number of forces which shall be the equivalent of a system of given forces acting on a body. The single force or combination of forces to which the given ones are reduced is called their *resultant*. When the body is considered as a material particle or point on which all the forces act, any number of forces will have a single resultant, which may be determined as follows:

Imagine each force to be represented as a straight line going out in the direction of the force, and proportional in length to the intensity of the force. Arrange the lines thus found end to end in any order whatever, the first line going out from the point in the direction of the force to which it corresponds; the second line from the end of the first one, in the direction of the force to which it corresponds; the third line to begin at the end of the second line, and to be drawn in the direction of the third force, etc.; then a single line, drawn from the beginning of the first line to the end of the last one, will represent the resultant, both in intensity and direction.

We readily see that if there are but two forces, the resultant will be the diagonal of the parallelogram, two of whose adjacent sides represent the given forces. The theorem of the composition of two forces in this way is therefore called the parallelogram of forces. The composition of any number of forces, in the way we have described, is equivalent to the drawing of a series of parallelograms, the diagonal of each being a side of that next following.

When the forces act on a solid body, and the lines in which they act do not all pass through the same point, the simplest form to which the resultant can always be reduced consists of two actions: first, a force acting along a certain line, with a certain intensity; second, a couple, tending to turn the body around an axis parallel to this line. This is Poinsot's theorem of the composition of forces.

Intimately connected with the composition of forces is their resolution, which consists in resolving a single force into three different forces, acting in given directions. The directions being given, the condition which the forces must fulfill is that, when these two directions are combined in the manner above explained, the resultant force must be equal to the given one, both in intensity and direction. By combining the two operations, any forces whatever acting on a point can be resolved into three acting in any given direction. The couples of rotating forces may be compounded and resolved in the same way, the resultant being then represented as equivalent to three couples, each tending to rotate the body around one of three given axes. See COUPLE OF FORCES.

S. NEWCOMB.

Compost [from Lat. *compo'situm*, neut. of past ptc. of *compo'nere*, put together]: an indefinite agricultural term used to designate any pile or mass of fermenting material which is to be used for the enrichment of the land. Formerly composts were very much used, but they have been largely superseded in recent years by the concentrated or chemical fertilizers, in which the fertilizing materials are present in known and definite amounts, and which are much lighter and cheaper to handle. The compost still has a very important use upon the farm, however, because land often needs the loosening effect which fibrous and bulky materials alone can give, because it affords a ready means of utilizing refuse, and because the escaping or leaching elements of farm manures and other materials may be caught and saved if these materials are mixed in a compost heap. The organic acids engendered by the fermentation of the compost heap are often powerful agents in the reduction of the insoluble phosphates in bone. The compost heap is ordinarily a long, narrow, and low pile, which should be "turned" three or four times a year to insure uniform fermentation and to prevent heating. Gardeners usually prefer compost at least a year old. L. H. B.

Compostella: See SANTIAGO DE COMPOSTELLA.

Compound Animals: organisms of low grade (although some are comparatively high) in which parts generally regarded as individuals, and which are certainly distinct in many vital functions, are merged into one compound system. The living mass in all truly compound animals appears to originate from a single ovum, and the subsequent development of the individual parts by gemmation resembles in some respects the growth of vegetables. Examples of compound animal life are found in coral-polyps, ascidians, bryozoans, etc. Revised by F. A. LUCAS.

Compound Fracture: in surgery, a fracture of any bone when the skin and tissues covering the bone are so lacerated that air may enter the fracture. The treatment of compound fracture requires the highest surgical skill. See FRACTURE.

Compound Interest: See INTEREST.

Compounding of Felony: in law, the criminal offense of forbearing to prosecute a felony in consideration of a reward or some other benefit moving to the person exercising the forbearance. Similar forbearance with respect to a misdemeanor is also criminal in the U. S., but in Great Britain may be exercised with the consent of the court. A note or other promise taken on such a consideration is illegal in its inception, and can not be enforced in a court of justice by the promisee. The act of merely receiving back one's goods or of taking reparation is not an offense. See FELONY.

Revised by F. STURGES ALLEN.

Compound Microscope: See MICROSCOPE.

Compressed Air: as an agent for the transmission of motive-power, is extensively used in tunneling, mining, and quarrying, and in other operations where belts or shaftings can not be employed on account of the great distance between the motive-power and the point of application. The air is conveyed through strong pipes and tubes from the compressing plant to the drills or other machinery, and is utilized in a cylinder similar to that of the STEAM ENGINE (*q. v.*). An additional advantage in mines and tunnels is that the exhaust aids in ventilation and in keeping down the temperature. It was first used extensively in the con-

struction of the railway tunnels of Mont Cenis and Hoosac Mountain in Massachusetts. In many cases it has been superseded by electricity.

Compressibility: the property of being compressible into smaller space; susceptibility of being reduced by pressure to smaller dimensions. All bodies are compressible, the degree of compressibility being greatest in gases and least in compact solids. Liquids hold an intermediate place. The compressibility of most solids and liquids is so slight that for all ordinary pressures they may be regarded as incompressible. If the pressure upon a body of water be increased by one atmosphere (one megadyne per square centimeter of surface), the decrease in volume will be about $\frac{5}{100000}$. Steel under the same conditions would lose only about $\frac{5}{1000000}$ of its volume.

Any gas subjected to a like change of pressure, i. e. from one to two atmospheres, would lose half of its volume, and under further increase of pressure compression would go on at the same rate (pressure and volume being always inversely proportional), until, if the experiment be tried at a proper temperature, condensation would occur, and the gas would go over into liquid form.

Revised by E. L. Nichols.

Compromise: something promised or agreed upon mutually; an amicable agreement between two parties or persons who have been involved in a legal controversy that they will settle the difference by mutual concessions.

Compton, Henry: an English prelate who had a large share in the revolution of 1688; b. at Compton Wynyates, Warwickshire, 1632; held for a few months a commission in the army, then after study at Cambridge entered the Church 1662; became Bishop of Oxford in 1674; was transferred to the see of London in 1675; was the instructor of the daughters of the Duke of York (afterward James II.), who became consequently attached to the Protestant faith. He incurred thereupon the bitter hostility of James, who, through the infamous Judge Jeffreys, deposed him from his episcopal functions (1686). This was one of the grievances done to the Protestant religion alleged by William in his proclamation on landing (1688). James, in alarm, re-established Compton, who, however, openly joined himself to the party of the invader, and with his own hands crowned him king Apr. 11, 1689. D. at Fulham, July 7, 1713.

Comptroller, kon-trōl′*er* [see Controller for etymology]: an officer charged with certain duties in the regulation of the fiscal affairs of a government or municipality, such as the auditing or in other ways superintending and preserving the public accounts. In the U. S. the office of comptroller was first created upon the organization of the board of the Treasury by the Continental Congress in 1778, and by the act of Congress constituting the Treasury Department of the U. S. the office was continued under the title of Comptroller of the Treasury. The U. S. officers now designated by the title of comptroller are:

The First Comptroller of the Treasury, who countersigns warrants drawn by the Secretary of the Treasury upon the treasurer, examines the accounts of the first and fifth auditors, receives appeals from the sixth auditor, superintends unsettled accounts of the Treasury, Navy, War, and Interior Departments, prosecutes all debts and delinquencies in behalf of the U. S., etc.

The Second Comptroller of the Treasury, who examines the accounts of the second, third, and fourth auditors, countersigns warrants for the pension and Indian bureaus, and performs duties in the Navy and War Departments analogous to those of the first comptroller in the Treasury Department.

The allowance of a claim by the proper comptroller is final; when a claim has been refused, appeal may be made to the court of claims.

The Comptroller of the Currency, who issues printed notes to the national banks, exchanges new currency for that which is worn out, superintends the national banks, reports their condition annually to Congress, and has numerous other important duties. He gives heavy bonds before entering upon his duties, and is not allowed to be interested directly or indirectly in any institution issuing notes under the U. S. banking laws. There is also a deputy comptroller of the currency. Revised by F. Sturges Allen.

Comstock, Anthony: b. Mar. 7, 1844, at New Canaan, Conn.; educated at the academies of New Canaan and New Britain, Conn.; served in the Union army 1863–65. He has been post-office inspector since Mar., 1873, and secretary and chief special agent of the New York Society for the Suppression of Vice since its organization in 1873. In the interest of good morals, Mr. Comstock and his associates have made many arrests and seized and destroyed a great amount of obscene matter and gambling materials. He is author of *Frauds Exposed* (1880); *Traps for the Young* (1883); *Gambling Outrages* (1887); *Morals versus Art* (1887); and is a contributor to the *North American Review*, *Our Day*, and other magazines.

Comstock, Cyrus Ballou: U. S. military officer and scientist; b. Feb. 3, 1831, in Massachusetts; graduated at West Point in 1855; colonel Corps of Engineers Apr. 7, 1888. He served in constructing fortifications 1855–59; as assistant professor at the Military Academy 1859–61; in the civil war in erecting defenses of Washington 1861–62; in Maryland campaign 1862, at South Mountain and Antietam; as chief engineer Army of the Potomac 1862–63; in Rappahannock campaign 1862–63, engaged at Fredericksburg and Chancellorsville; in the department of the Tennessee 1863, engaged at Vicksburg (brevet major), and as chief engineer Army of the Tennessee; assistant inspector-general of the military division of the Mississippi 1863–64; as senior A. D. C. to Lieut.-Gen. Grant, rank of lieutenant-colonel, 1864–66; in Richmond campaign 1864–65, engaged at Wilderness (brevet lieutenant-colonel), Spottsylvania, Cold Harbor, assaults of Petersburg and mine, and Fort Harrison; as chief engineer of the expedition to Cape Fear river, N. C., 1865, engaged at Fort Fisher (brevet colonel U. S. army and brevet colonel and brigadier-general U. S. volunteers); as senior engineer in Mobile campaign 1865, engaged at the siege of Spanish Fort, storming of Blakely, and capture of Mobile (brevet brigadier-general U. S. army) and brevet major-general U. S. volunteers); and A. D. C. to the general-in-chief, rank of colonel, 1866–70. He was superintendent of the geodetic survey of the northern lakes 1870–83; president of the Mississippi river commission Dec. 1, 1882; member of board of engineers for fortification and river and harbor improvements 1882; of board of visitors of Engineer School of Application 1885; member of National Academy of Sciences 1884, etc. Retired, Feb. 2, 1895.

Comstock, George Cary: See the Appendix.

Comstock, Grover S.: preacher; b. at Ulysses, N. Y., Mar. 24, 1809; graduated at Hamilton College, Clinton, N. Y., in 1827; studied law, and admitted to the bar in 1830. Moved by the preaching of Rev. C. G. Finney, he studied theology at the institution at Hamilton, N. Y., and became a Baptist minister; sailed in 1834 as a missionary to British Burma, and finally went to Aracan. In 1837 he founded a church at Kyouk Phyou. In spite of the deadly climate, which carried off his wife and children, he remained here until his death, Apr. 25, 1844.

Comstock, John Henry. B. S.: entomologist; b. at Jaynesville, Wis., Feb. 24, 1849, and educated at Cornell University, where he has been successively instructor in Entomology, assistant Professor and since 1882 Professor of Entomology and General Invertebrate Zoölogy. He is also non-resident Professor of Entomology in Leland Stanford Junior University. From 1879 to 1881 he was U. S. entomologist, and during this time published two official reports as well as a report on cotton insects. Among his more important contributions to entomological literature are a *Monograph of the Diaspinæ* (Ithaca, N. Y., 1883) and *An Introduction to Entomology* (Ithaca, 1888). F. A. Lucas.

Comstock, John Lee: writer on physics; b. at East Lyme, Conn., in 1789; served as an army-surgeon in the war of 1812–15. His work on *Natural Philosophy* is said to have reached a sale of about 1,000,000 copies. Besides numerous works for schools on natural and physical science, he published a *History of the Greek Revolution* (1829) and other books. D. at Hartford, Conn., Nov. 21, 1858.

Comstock Lode: a silver and gold bearing lode situated in the western part of the State of Nevada, in Storey County, at a point about 12 miles N. E. of Carson City, and about 19 miles E. of the California State-line, in lat. (about) 39° 22′ N. and lon. 119° 39′ W. from Greenwich. It lies on the eastern slope of the Virginia Mountains, a nearly due north and south offshoot of the Sierra Nevada, near the base of Mt. Davidson, the loftiest peak of this secondary range, which is 7,827 feet above the sea-level. The most important portion of the lode is included within the limits of Virginia City, which at C Street is 1,635 feet below the sum-

mit of this peak, or about 6,192 feet above the level of the ocean.

According to J. Ross Browne, as well as Henry Degroot (*Overland Monthly*, June, 1873), the discovery of the Comstock lode was a fortuitous occurrence.

The Comstock, though properly characterized as a single lode, is rather a broad metalliferous belt or ore-channel, carrying a congeries of subordinate lodes, bunches, and chimneys of ore, all reposing in as many distinct clefts, separated by "horses" and dikes of porphyry, belts of quartz, seams of clay, making up a body of vein-matter unparalleled for magnitude and complexity in the history of mining.

The ores of the Comstock lode consist chiefly of native gold, native silver, vitreous silver ore (argentite), stephanite, and argentiferous galena imbedded in a quartz gangue. Besides these, ruby silver, horn silver, polybasite, pyrargyrite, and sternbergite occur in small quantities; also iron and copper pyrites, zinc blende, and several carbonates and sulphates.

The productive masses—variously designated as bonanzas, ore-bodies, ore-chambers, chimneys, zones, etc.—are irregular in shape, with a general tendency to a lenticular form, something like a concavo-convex lens. They usually occur in the swells of the vein, and their position is more vertical than the dip of the lode.

Bullion Product.—It is difficult to obtain trustworthy data in relation to the bullion product of the Comstock lode. The amount of precious metals yielded by this group of mines has indeed been enormous, but there is scarcely a doubt but that there has been a tendency to publish exaggerated estimates. The following figures, taken from a careful estimate furnished by Mr. James D. Hague and Mr. J. J. Valentine, and from 1884 to 1889 inclusive by Dr. David T. Day, exhibit, probably, a more accurate statement of the annual bullion production of this lode since the date of its discovery than any that has heretofore been published:

YEAR.	Value of bullion.	YEAR.	Value of bullion.
1860	$100,000	1876	$37,000,000
1861	2,000,000	1877	37,911,710
1862	6,000,000	1878	21,295,043
1863	12,400,000	1879	8,830,562
1864	16,000,000	1880	5,312,592
1865	16,000,000	1881	1,726,162
1866	11,739,100	1882	1,333,018
1867	13,738,618	1883	1,725,486
1868	8,479,769	1884	2,838,752
1869	7,405,578	1885	3,144,602
1870	8,254,272	1886	3,736,218
1871	10,644,704	1887	4,511,231
1872	13,159,093	1888	7,627,268
1873	23,216,062	1889	5,949,923
1874	23,051,496		
1875	24,885,617	Total	$340,016,876

The proportional value of *gold* contained in the bullion product varies from 33 to 70 per cent. In the Big Bonanza it is stated at 42 per cent.; in the product of the Comstock lode for 1876 it is estimated at 46 per cent. In the total product of the lode from its discovery to the end of 1883 the value of the gold can not, therefore, be less than 40 per cent.; hence we have to the end of 1889, adding the actual gold and silver products from 1883 to 1889:

Total bullion product = $340,000,000.
" gold " = 138,160,000.
" silver " = 201,840,000.

By reference to the table it will be seen that the bullion product of the lode attained a maximum in 1864–65, diminished until 1869–70, and then increased again until 1876–77, at which time it reached its second maximum, since which it has rapidly diminished, but has again recovered. In recent years the output has much decreased on account of the development of rich mining districts of both gold and silver in Colorado and elsewhere.

Revised by Charles Kirchhoff.

Comte, kōnt, Isidore Auguste Marie François Xavier: French philosopher and mathematician; founder of the positive school of philosophy (see Positivism); b. at Montpelier, Jan. 19, 1798. He entered in 1814 the Polytechnic School in Paris. He became about 1820 a disciple of Saint-Simon, and contributed articles to his journal *L'Organisateur*, in which the germ of his ideas already appeared. He was intrusted by his master with the preparation of a Saint-Simonian *Politique Positive*, which proved unsatisfactory to the old philosopher. In 1826 he began a series of lectures, soon discontinued by a cerebral derangement, but resumed in 1828; tutor of mathematics and examiner of candidates at the Polytechnic School 1832–52. Comte's central thought is the idea of the evolution of humanity. There are three steps of intellectual development for the race: (1) theological, (2) metaphysical, (3) the positive. In the first stage man refers all phenomena to the immediate action of some supernatural being; in the second to some abstract force or essence; in the third he no longer seeks a cause or essence beyond the phenomena, but is content with discovering laws of uniform action—that is to say, with the reduction of particular facts to more general facts. He lived obscurely, with straitened means, and died Sept. 5, 1857. His writings were *Cours de Philosophie Positive* (6 vols., Paris, 1830–42), and *Système de Politique Positive, ou Trinité de Sociologie, Instituant la Religion de l'Humanité* (1851–54); besides *Calendrier Positiviste* (4th ed. 1852), and *Catechisme Positiviste* (1853). A clearer exposition of his doctrines is contained in Littré's *Comte et la Philosophie Positive* (1863). His *Cours*, etc., was published in English in a condensed form by H. Martineau (2 vols., 1853). See Robinet, *Notice sur l'œuvre et sur la vie de Comte*, and Lewes, *Exposition of the Principles of the Positive Philosophy*.

Revised by W. T. Harris.

Comte, Pierre Charles: genre and historical painter; b. at Lyons, Apr. 23, 1823. Pupil of Delaroche, Horace Vernet, and Robert Fleury; second-class medal, Paris Exposition, 1855; third-class medal, Paris Exposition, 1867; Legion of Honor 1857. His work is scholarly and possesses good qualities of color and drawing. *Henri III. and the Duc de Guise* (1885) is in the Luxembourg Gallery; *Scene at Fontainebleau* (1874) at the Corcoran Gallery, Washington. D. at Fontainebleau, France, Nov. 29, 1895. W. A. C.

Co'mus (in Gr. Κῶμος): originally, the Greek name of those songs of carousal which young people would sing when passing the houses of their friends or lovers. Thence it became the name of the god of such revel; and Philostratus gives a description of a picture in which Comus was represented as a youth, drunken, sleeping, leaning forward on a down-turned torch. Milton makes him a foul sorcerer, the son of Bacchus and Circe.

Conant, Roger: colonist; b. in Devonshire, England, in 1593; settled in Plymouth colony in 1623; founded Salem, Mass., in 1626, and became a justice of the quarterly court. D. Nov. 19, 1679.

Conant, Thomas Jefferson, D. D.: b. at Brandon, Vt., Dec. 13, 1802; graduated at Middlebury College in 1823; Professor of Greek, Latin, and German in Waterville College (now Colby University) 1827–33, and appointed in 1835 Professor of Biblical Literature in the Theological Seminary at Hamilton, N. Y. From 1850–57 he occupied a similar position in the Theological Seminary at Rochester, N. Y. In 1857 he resigned, and from thence till 1877 was in the service of the American Bible Union, and brought out their revision of the New Testament and of portions of the Old. In 1839 he published a translation of Gesenius's *Hebrew Grammar*; in 1856 a new version, with notes, of *The Book of Job*—a work which has attained a European reputation; *βαπτίζειν, its Meaning and Use Philologically and Historically Investigated* (New York, 1864). By common consent he was one of the most accomplished Hebraists in America. D. in Brooklyn, N. Y., Apr. 30, 1891.

Cona'rium [from Gr. κωνάριον, from κῶνος, a corn]: a name formerly in vogue for the pineal gland. See Parietal Eye.

Concan: a maritime tract of Western India. See Konkan.

Concave [from Lat. *con'cavus*, hollowed out; *con* + *cavus*, hollow]: a curve is said to be *concave* at a given point when the lines joining the latter to adjacent points on the curve fall between the spectator and the curve, and *convex* when the curve is interposed between the spectator and the small chords in question. A surface is said to be concave or convex at any point when the plane sections through that point and the spectator's eye are all concave or convex; when some of these sections present their concavity and others their convexity to the spectator, the surface is sometimes said to be concavo-convex. This is the case with the hyperboloid of one sheet. When at a point on a curve the center of curvature and the point of view fall on the same side of the tangent, we have concavity; when on opposite sides, convexity. See Lens.

Concealment: in law, the suppression of the truth to the injury of another who has a legal right to know and rely upon the truth. A distinction is taken between such facts as are extrinsic to the contract, such as the existence of war or peace, and those which are intrinsic. Concealment of extrinsic facts is not, in general, fraudulent. See FRAUD.

Revised by F. STURGES ALLEN.

Concepcion: a maritime province of Chili; bounded by Maule on the N., Nuble on the E., and Bio-Bio on the S. Area, 3,535 sq. miles. It is traversed by the Bio-Bio. The climate is mild and favorable for tillage and pasturage. Wheat and wine are the staple agricultural products, and there are important coal mines. Pop. (1895) 188,190.

Concepcion: a town of Paraguay; capital of a department of the same name; on the Paraguay river, 135 miles above Asuncion, and just within the tropic of Capricorn (see map of South America, ref. 6-E). Pop. (1887) estimated, 9,950.

Concepcion del Urugnay, or simply **Urugnay**: a city of Argentina, province of Entre Rios, on the river Uruguay (see map of South America, ref. 8-E). It is connected by railroad with Paraná, and has a large trade in grazing products; the salting establishments, built by Gen. Urquiza, are among the largest in Argentina. Concepcion was formerly the capital of the province, and is still the episcopal town. The deserted palace and immense estates once owned by Urquiza are near the town. Pop. 10,000. H. H. S.

Concepcion, La: a city of Chili; capital of the province of Entre Rios; on the river Bio-Bio, 7 miles from its mouth; lat. 36° 49′ S. (see map of South America, ref. 9-C). It is a bishop's seat and the terminus of a railway system. The port, Talcahuano, 8 miles distant, is one of the best in Chili, having an extensive foreign trade and exporting large quantities of hides and tallow. Concepcion was founded by Valdivia, Oct., 1550; destroyed by Araucanian Indians 1555; refounded by Garcia Hurtado de Mendoza 1557. It was ruined by earthquakes in 1730, 1752, and 1825. Pop. (1885) 24,000; (1895) 39,837.

Concept [from Lat. *conceptum*, something conceived, brought together and grasped; *con*, together + *ca'pere*, take]: in metaphysics, a thing which may be conceived; a collection of attributes united by a sign, and representing an object of possible intuition. Kant and his followers use the word concept to indicate notions which are general without being absolute. They divide these into three different classes: "Pure concepts," which derive nothing from experience; "empirical concepts," wholly derived from experience; "mixed concepts," ascribable partly to experience and partly to the pure understanding. A concept is "clear" when its object can be distinguished from any other; "distinct," when its component parts can be defined.

Conception [from Lat. *conceptio*, deriv. of *conci'pere*, gather together and take, take and hold, take effectively; *con*, together + *ca'pere*, take]: in psychology, the last, finishing process by which consciousness takes possession of an object. It is distinguishable from sensation as active from passive. As long as an object is allowed to impress the mind through the senses, immediately and directly, without any reaction or interference from the side of the mind, consciousness is in a merely passive state; and this passive state of consciousness is called sensation. In order to master an object, the mind can not stop, however, at the mere sensation; it must make the sensation itself the subject of a scrutiny and discrimination; and this active part of the whole psychological process by which the mind takes possession of an object is called perception and conception; the former referring to the sensation as representing the details of the object, the latter as involving the whole of it. As we go over an object with the finger-tips to ascertain the exact position and relations of its outlines, thus perception runs over all the outlines given in the sensation, partly verifying their truth with respect to the object, partly lifting them into perfect clearness of consciousness. Conception does not begin its work until perception is through with its task. The mode and the meaning of an object as a whole is the task of conception, and thus the conception of an object corresponds very nearly to that which we generally call a view of the object; with this difference only, that a view always is understood to be more or less influenced by the individuality of the subject, while the conception always is supposed to be, strictly and scientifically, the subjective equivalent for the idea of the object. The difference between conception and imagination is simply that conception is a process and imagination a faculty; in the process of conceiving the faculty of imagination is very largely used.

Conception, in physiology: See EMBRYOLOGY.

Conception, Immaculate, Doctrine of the: See IMMACULATE CONCEPTION OF THE VIRGIN MARY.

Conception, Orders of the Immaculate: Among the orders of the Roman Catholic Church there have been the following: (1) The Knights of the Immaculate Conception of the Blessed Virgin, an order founded in 1618, at Vienna, with the intention of bearing arms against heretics and infidels. The institution was confirmed by Pope Urban VIII. in 1623, but the brotherhood did not flourish, and soon was extinct. (2) The Nuns of the Immaculate Conception of Mary, founded at Toledo, in Spain, in 1484, by Beatrix de Sylva, and confirmed by Pope Innocent VIII. in 1489. They afterward joined the Clarisses, and took their rule, which rule was changed by Pope Julius II. in 1511. They are often called Conceptionists. (3) The Congregation of the Immaculate Conception of the Blessed Virgin is the appellation of the lay sisters attached to the nuns of Notre Dame, who were established by the blessed Peter Fourier (1565–1640).

Conceptualism: a doctrine of the Schoolmen intermediate between realism and nominalism. The Realist asserts that genera and species have an independent existence—that there exist certain "ideas," the pattern after which single objects are fashioned. The Nominalist asserts that nothing exists but things and names of things—that universals are mere names. The Conceptualists assign to universals an existence which may be called psychological—that is, independent of single objects, but dependent on the mind of the thinking subject in which they exist as conceptions. Abelard is considered the founder of this doctrine, which was held by Reid, but the distinction arises from a misconception of the doctrine of REALISM (*q. v.*), and is, after all, only NOMINALISM (*q. v.*).

Concertina, kon-sėr-tee'na: a musical instrument invented by Sir Charles Wheatstone in 1829. It is hexagonal in shape, with a keyboard at each end and an expansible bellows between the two. The air from the bellows pressing on free metallic reeds produces the sound, and this is effected both by drawing out and by pressing the bellows, the same note resulting in each case. The compass of the treble concertina is four octaves, through which there is a chromatic scale.

Concer'to: in music, (1) a composition for two or more instruments of the same or of a different kind, or (2) for a single instrument accompanied by an orchestra, designed to show the skill of an executant. The modern concerto was invented by Giuseppe Torelli in 1686. Its form was finally settled by Mozart.

Concetti, kon-chet'tee [plur. of Ital. *concetto*, a conceit, a fanciful notion or expression < Lat. *conceptus*]: ingenious thoughts or turns of expression, points, *jeux d'esprit*, etc., in serious composition. In the sixteenth century the taste for this species of brilliancy, often false, and always dangerous, spread rapidly in the poetical composition of Europe; and toward the end of the century famous representatives of the tendency appeared in at least three countries, i. e. Lyly (author of *Euphues*) in England, Gongora in Spain, and Marino in Italy. Each gave a name to the style—Euphuism, Gongorism, Marinism. During the early part of the seventeenth century literature was everywhere afflicted by the passion for concetti, as witness Filicaia in Italy, the Hôtel Rambouillet and the Précieuses in France, and Donne and Cowley in England. Revised by A. R. MARSH.

Conch, kongk, or **Conch-shell**: the shell of certain carnivorous gasteropods of the genera *Triton*, *Strombus*, etc., found chiefly in tropical seas. Many tons of these shells are annually exported from the Bahamas to Europe, where the finest are used in cutting shell-cameos, and the rest are useful in the porcelain manufacture.

Concha, José. de la, Marques de la Habana: Spanish general and statesman; b. at Cordova, viceroyalty of Buenos Ayres, 1809. His father was shot in the revolution of 1814, and his mother took him to Spain, where he entered the army. In the Carlist struggles he attained the rank of lieutenant-general (1839); was captain-general of the Basque provinces 1843–46 and of Cuba 1849–52; on his return joined the oppositionists, and was exiled for a time; was again cap-

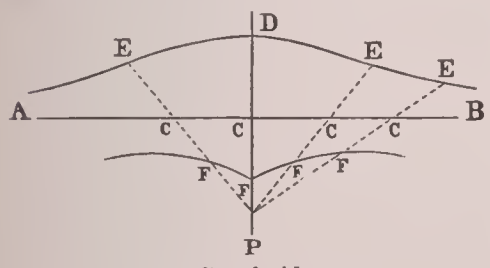
tain-general of Cuba 1854–59; on his return became senator and subsequently minister to France (1862); was Minister of War in the Miraflores cabinet 1863, and president of the senate 1864, having also attained the military grade of marshal, though he had seen little active service. In Sept., 1868, Queen Isabella, then in France, appointed him president of the council and Minister of War and Marine; but he was forced to resign by the revolution of Sept. 28, which overthrew the monarchy. He retired for a time to France, and by his own request on his return was again made governor-general of Cuba (Apr., 1874), but he was unsuccessful against the revolutionists there, and was relieved in Mar., 1875. During his administrations of Cuba he was accused of encouraging the slave-trade. He published two works on the political condition of the island. HERBERT H. SMITH.

Concha, Don MANUEL GUTIÈRREZ, de la, Marques del Duero: brother of Don José Concha; b. in Madrid, 1794. He was educated for the army; made his first campaigns in the war against Napoleon; served against the revolution in Buenos Ayres 1816–24, afterward against the Carlists; was made a general in 1839 and field-marshal in 1840. In politics he belonged to the moderate and conservative party. Nevertheless, in 1853 he, together with O'Donnell, Bravo, Soto, Mayor, and others, issued that address to the queen which led to the revolution. After the fall of the queen he retired for some time into private life. He was serving with great success at the head of the republican army against the Carlists when he fell in the battle of Muro, June 28, 1874.

Conchifera, kong-kif'*e*-ra [from Lat. *concha*, bivalve (Gr. *κόγχη*) + *ferre*, bear]: in Lamarck's arrangement of mollusks a class containing those which have bivalve shells, including also the *Brachiopoda*. The term is now used to indicate the class usually called *Acephala*, but it does not include the *Brachiopoda*. In Gegenbaur's classification the term is used to include all mollusks save the Chitons, the mollusca of authors generally. F. A. L.

Conchoidal: shell-like; used in mineralogy to describe a variety of fracture. When the fractured surface of a mineral exhibits curved concavities similar to the valve of a bivalve mollusk, it is said to have a conchoidal fracture, as flint, anthracite coal, etc.

Conchoid of Nicomedes [*conchoid* is from Gr. *κογχοειδής*, mussel-like; *κόγκη*, mussel + *εἶδος*, appearance]: a curve of the fourth degree, invented by Nicomedes as a means of trisecting an angle, of constructing two geometrical means between two given straight lines, and of finding a cube double a given cube. The curve may easily be described, and is occasionally used in architecture as a bounding line of the meridian section of columns. It is generated as follows: Let A B be a straight line, and P any point not upon it; then if lines P E, P E′, etc., be drawn, cutting A B, which is called the directrix, in points C C′, and let C E, C F be laid off from the points of intersection, each equal to a given line, the curves traced by the successive points E and F form the conchoid. That branch which is most remote from P (the "pole" of the conchoid) is called the first or superior conchoid, and the other branch, traced by points F F′, is the second or inferior conchoid. Both branches may extend to infinity, and they have the line A B for a common asymptote. The constant distance C E of the points E and F from the points of intersection is called the modulus of the curve. If we take C in the line D P as origin, and the lines A B and D P, at right angles to one another, as co-ordinate axes, the equation to the conchoid is $x^2 = \frac{(b+y)^2(a^2-y^2)}{y^2}$, where a is the modulus of the curve, and b = the perpendicular distance of P from A B. If $a = b$, P becomes a cusp point of the first species.



Conchoid.

Conchology [from Gr. *κόγχη*, mussel, shell + *λόγος*, word, reason]: that branch of natural history which treats of the shells of mollusks and similar animals. See MOLLUSCA.

Conchos, kon'chōs: a river of Mexico, an affluent of the Rio Grande; flows through the state of Chihuahua. Its general direction is N. N. E. Length about 330 miles.

Conclave [from Lat. *concla've*, an apartment that may be locked; *con*, together + *cla'vis*, key]: the apartment in which the cardinals of the Roman Catholic Church assemble to elect a new pope, or more frequently the assembly itself. When a pope dies, nine days are allowed for the funeral solemnities. The cardinals assemble on the tenth day, and voting begins on the eleventh. The large halls of a papal palace in Rome or the city where the pope dies are so divided by wooden partitions as to furnish a number of sets of small apartments, all opening upon a corridor. All the entrances to the building are closed but one, which is given in charge to officials. No intercourse with the public is held while the election is going on. From their separate cells, or rather wooden stalls, the cardinals come together twice a day till some one of their own number is made pope by a majority of two-thirds of all the votes. Each cardinal is attended by one or two waiters, called *conclavists*, sworn to secrecy like the cardinals. This method, in its main features, dates from 1273, a constitution, known as that of Gregory X., regulating the mode of electing the pope, having been carried in the Œcumenical Council of Lyons, July, 1273. Since Gregory XV. (1621–23) the choice has been either by scrutiny (ballot), by quasi-inspiration, or by compromise, usually the first. The scrutiny, or voting by ballot, is performed by means of specially prepared voting-papers, which conceal the name of the voter. See S. B. Smith, *Elements of Ecclesiastical Law* (6th ed. New York, 1887). See CARDINAL. Revised by JOHN J. KEANE.

Concomitance, Sacramental: the doctrine of the Roman Catholic Church that the body and blood of Christ *sacramentally accompany* each other, so that *both* are *sacramentally* received under *either* species, whether of bread or wine; hence that the communion in one kind imparts all that is received sacramentally in both kinds. Aquinas substituted this term for the older one, "Unio naturalis." *Catholic Dictionary*, s. v. *Eucharist*, and the article TRANSUBSTANTIATION. JOHN J. KEANE.

The Lutheran Church maintains that from a *natural* concomitance we can not argue to a *sacramental* one, which is wholly supernatural and dependent on the will of Christ; that this doctrine implies that the officiating priest receives both body and blood twice; and that it holds equally good for *one kind* in the sacrifice of the mass. See Krauth's *Conservative Reformation* (620, 621).

Concom'itant [from Lat. *conco'mitans*; pres. ptc. of *concomita'ri*, accompany; *con*, together + *comita'ri*, attend as companion, deriv. of *comes*, *co'mitis*, attendant]: in modern algebra a quantic which is related to a given system of quantics in the following manner: Let u, u_2, etc., be a given system of quantics, which by linear transformation of their variables become converted into u'_1, u'_2, u'_3, etc., and let u and u' be quantics respectively derived from these two systems according to the same definite rule; then if u is converted into $m\,u'$, where m denotes some power of the modulus of transformation, by the same or by reciproeal systems of linear transformations of its variables or facients, u is said to be a concomitant of the given system u_1, u_2, etc. If u should contain no variables, and be therefore identically equal to $m\,u'$, it is called an invariant of the given system of quantics; if, containing variables, it should be converted into $m\,u'$, by the same linear transformations, it is called a covariant; but if its conversion into $m\,u'$ should require linear transformations reciprocal to those first employed, it is called a contravariant. Lastly, if u should contain two sets of variables, and still become converted into $m\,u'$ by transforming one set by the original and the other by the reciprocal substitutions, it is called a mixed concomitant of the given system of quantics. Concomitants therefore embrace covariants and contravariants.

Concord: town of Middlesex co., Mass. (for location of county, see map of Massachusetts, ref. 2–H); on Bos. and Me. and Fitchburg R. Rs., and on the Concord river; 20 miles N. W. of Boston. Incorporated in 1635, it was the first settlement in New England not on the coast. The first Provincial Congress of Massachusetts assembled in its old church Oct., 1774, and made the town the place of deposit for the military stores of the colony. On Apr. 19, 1775, at the North Bridge, in an affair known as Concord Fight, a body of American soldiers, organized under legal authority, advanced against British troops, who had been sent to seize those stores, received their fire, by command of their officers returned it, forced the enemy to retreat, and by this first attack under military orders upon the soldiers of the king

began the war of the Revolution. Concord was the home of Alcott, Emerson, Hawthorne, Thoreau, and other persons of literary distinction. It has a high school, a fine public library, and manufactures of cotton and woolen flannels and of wooden-ware. The State prison is in the western part of the town. Pop. (1880) 3,922; (1890) 4,427; (1900) 5,652.

Concord: city; capital of Merrimack County, and of the State of New Hampshire (for location of county, see map of New Hampshire, ref. 8-F); is pleasantly situated on the W. bank of Merrimack river; 75 miles by rail N. N. W.

State Capitol, Concord, N. H.

from Boston; lat. 43° 12′ 20″ N., lon. 71° 29′ W. It is one of the largest railroad centers in New England. It has an area of 64 sq. miles, with gas and electric lights, a generous supply of aqueduct water for all purposes, a complete system of sewerage, electric fire-alarm, steam fire department, etc.

Streets and Public Buildings.—The streets are wide, have fine sidewalks, and are beautifully shaded. The State-house was built of Concord granite at a cost of $250,000, and contains collections of portraits of the State's distinguished sons. The State library building (costing $300,000) contains a large law and reference library, chambers of the supreme court, offices of State departments of education and agriculture, a collection of New Hampshire minerals, and a valuable portrait gallery. The court-house and city-hall cost $45,000. New Hampshire Historical Society library has a large collection of books, pamphlets, and historical pictures. The city contains the State asylum for the insane, a State prison, a Government building for post-office, pension-office, U. S. courts, etc., an orphans' home, an opera-house, and other public halls.

Manufactures.—The most important manufactures are of granite quarried and dressed, carriages, belting and leather hose, foundry and machine work, harnesses, flour, woolen goods, cotton goods, tanned leather, pianos, shoes. The B. and M. railroad has large car manufacturing and repair shops here. The water-power is valuable.

Churches, Education, etc.—The several religious denominations are represented by 25 churches. Concord has graded schools and high schools fitting pupils for college, St. Paul's, a noted Episcopal training-school for boys, a good public library, 2 daily and 3 weekly newspapers, and a monthly magazine.

Finances.—It has 3 national and 4 savings banks. Valuation of the city, $11,000,000.

History.—This place was the headquarters of the Penacook tribe of Indians, under Passaconway, who were friendly to the English. It was granted by Massachusetts as Penacook in 1725; incorporated Rumford in 1730; came under the jurisdiction of New Hampshire, and was incorporated Concord in 1765; became State capital in 1816; shire-town of Merrimack County in 1823, and adopted city charter in 1853. A bronze statue of Daniel Webster, presented by Benjamin P. Cheney to the State of New Hampshire, was unveiled in the State-house park June 17, 1886. A companion statue of John P. Hale, presented by William E. Chandler, was erected in 1892. In 1890 the State erected a statue of Gen. John Stark. Pop. (1870) 12,241; (1880) 13,843; (1890) 17,004; (1900) 19,632. EDITOR OF "EVENING MONITOR."

Concord: city; capital of Cabarrus co., N. C. (for location of county, see map of North Carolina, ref. 3-E); on Rich. and Danv. R. R., 20 miles N. E. of Charlotte. It has a cotton factory and two public gins, iron manufactories, foundry, machine-shops, etc.; large mines are in the vicinity. Pop. (1880) 1,264; (1890) 4,339; (1900) 7,910.

Concordance [from Late Lat. *concordantia*, deriv. of *concordans*, pres. ptc. of *concorda're*, agree; *concors*, of one mind; *con*, together + *cor*, *cordis*, heart]: an index or dictionary in which all the important words used (*verbal* concordance) or subjects treated of (*real* concordance) in any work are arranged alphabetically, and reference made to the places where they occur. Of biblical concordances the number is very large. The earliest real concordance was to the Vulgate by Antony of Padua (b. in 1195; d. in 1231 A. D.); the first verbal one by Cardinal Hugo de S. Caro (1244). Next in order was the Hebrew concordance of Rabbi Isaac Nathan (finished in 1448, published in Venice 1524). The first Greek concordance to the New Testament, by Xystus Betuleius (whose real name was Birck), appeared in Basel, 1546. Conrad Kircher's concordance to the Septuagint appeared in 1607 in Frankfort, and was the first of its kind. The best are—for the Hebrew, Fürst (1840); for the New Testament Greek, K. H. Bruder (Leipzig, 1842); for the Septuagint, Trommius (1718), which will be superseded by Edwin Hatch and H. A. Redpath (London and New York, 1892, *sqq.*); for the Vulgate, F. P. Dutripon (Paris, 1838; 7th ed. 1880). The first English concordance was by John Marbecke (London, 1550); the best by Alexander Cruden (1737), Robert Young (Edinburgh and New York, 1879; n. e. 1892), and James Strong. The *Englishman's Greek Concordance to the New Testament* (London, 1840; 5th ed. 1868) is very valuable; also Thom's *Concordance to the Revised New Testament* (1833). Among the chief concordances to the German Bible are those of Lanckisch (Leipzig, 1677); Schott (1827), and Hanff (1828–34), but the German Cruden is Gottfried Büchner (Jena, 1740; 20th ed. Brunswick, 1890). There is a French concordance by Mark Wilks (Paris, 1840). There is a concordance to Shakspeare by Mrs. Mary Cowden Clarke (1845), and to Tennyson by D. B. Brightwell (1869). And there are concordances to Milton and Pope. The special lexicons, as to Homer by Crusius, and to Plato by Ast, are essentially concordances. See DICTIONARY.

Concor'dat [Fr., from Lat. *concorda'tum*, thing agreed upon, past ptc. of *concorda're*; *con*, together + *cor*, *cordis*, heart]: a treaty between the pope as head of the Roman Catholic Church and a civil government in relation to all or some of the ecclesiastical affairs of the Roman Catholic Church in the respective state. Usually the subjects treated of in concordats are those which have at once a civil and a religious aspect, hence called "mixed" matters, though purely temporal and purely spiritual matters are occasionally contained in them. The concordat is sometimes published by a papal bull, followed by the ratification of the respective state, sometimes by a formal treaty signed by the plenipotentiaries of the contracting parties. They are generally looked on as international contracts or treaties, binding on either side, but revocable by either party when the express conventions are violated, when their fulfillment is physically or morally impossible, etc. The most famous of the ancient concordats are (1) the Concordat of Worms (*Pactum Calixtinum*, 1122) between Pope Calixtus II. and Emperor Henry V., by which the quarrel of the investitures was ended. The emperor gave up his claim to invest with ring and crozier, and allowed the full liberty of episcopal elections and consecrations, while the pope conceded that the episcopal elections should take place in presence of the emperor, exclusive of force and simony; the disputed elections to be settled by the emperor after hearing the judgment of the respective provincial bishops. The elect could be invested by means of the scepter, in Germany before, in Burgundy and Italy after, the consecration. (2) The Concordats of Constance, made by Martin V. in 1418 with the representatives of the German (inclusive of Poland, Hungary, Scandinavia), the French (inclusive of Spain and Italy), and the English nations. In these concordats were treated the special reform demands of these nations; a number of general decrees had been shortly before issued and agreed to by all. (3) The Concordat of Feb., 1447, between Eugene IV. and the imperial Electors of Germany. (4) The Concordat of Vienna (or Aschaffenburg), of Feb., 1448, between Nicholas V. and the imperial estates, in imitation of the Concordat of Constance. (5) The Concordat of Leo X. and

Francis I. (1516), by which the Pragmatic Sanction of Bourges was abolished and an overwhelming influence in French ecclesiastical affairs granted to the young king, which both he and his successors abused, though at the beginning the parliaments and the university were opposed to this concordat.

The principal modern concordat is that agreed upon in 1801 between Pius VII. and Napoleon I., in seventeen articles, which recognizes the Roman Catholic religion as that of the great majority of French citizens, provides for the free exercise of Catholic worship, the salary of its ministers, etc. The pope, on his side, recast the hierarchy in France, accorded to the first consul the right of indicating candidates for the episcopal sees, reserving to himself the canonical institutions, and renounced the claims of the Church to the confiscated ecclesiastical goods. This concordat does not hold good in case the head of the French Government should cease to be a Roman Catholic. The holy see does not recognize the "organic articles" added in 1802 by Napoleon. A new concordat was projected in 1817 between Pius VII. and Louis XVIII., but failed to receive the confirmation of the assembly. Since the beginning of the nineteenth century the holy see has made concordats with Bavaria (1818), Prussia (1821), Baden (1827, 1859), Hanover (1824), Oldenburg (1830), Würtemberg (1857). Sardinia, Naples, Tuscany, Spain, the Netherlands, Switzerland, and Russia have also made concordats with Rome in the course of the nineteenth century. The Austrian Concordat of 1855, which aimed at being favorable to the Catholic Church, was vehemently opposed as too favorable to the Church. It was abolished by the Government in 1870. Special arrangements in 1881 permitted the regulation of the Catholic hierarchy in Bosnia and Herzegovina. The South American republics have concluded concordats with the Roman Catholic authorities: Venezuela (1862), Ecuador (1862), Bolivia (1851), Guatemala (1852), San Salvador and Honduras (1862), Nicaragua (1861), Costa Rica (1852), Haiti (1860). In these concordats the Roman Catholic religion is recognized as the religion of the state, without exclusion of other cults, the support of the clergy provided for, the freedom of Roman Catholic worship guaranteed, while the president can name the candidates (within a year) for vacant bishopries, and in the case of vacancies of parishes three candidates who have previously sustained the Tridentine concursus are proposed to the president, who can choose one of the candidates for the parish.

The text of the concordats is to be found in Walter, *Fontes Juris Ecc. Antiq. et Moderni* (Bonn, 1862); Nussi, *Conventiones de rebus ecc. inter S. Sedem et Civitem potestatem* (Mayence, 1870). See Balve, *Das Concordat* (Munich, 1863). For the Roman Catholic view of the many intricate questions, see Wetzer and Welte's *R. Lexicon*, art. Concordat; for the Protestant, Richter and Dove's *Kirchenrecht* (8th ed. 1878). JOHN J. KEANE.

The term is also applied to the covenant entered into by the Scottish bishops Skinner, Kilgour, and Petrie with Seabury at the time of the latter's consecration as the first Bishop of Connecticut, Nov. 14, 1784, at Aberdeen, Scotland. This ecclesiastical State paper is printed in full in Hawks and Perry's *Conn. Ch. Documents*.

Concord, Book of: the collection of the Confessions which are received either by the entire Lutheran Church or by the larger part of it. It was published in 1580, and supplanted a great number of bulky Corpora Doctrinæ. It contains—1, the three General Creeds (the Apostles', Nicene, and Athanasian); 2, the Augsburg Confession; 3, the Apology of the Confession; 4, the Smalcald Articles; 5, the Smaller and the Larger Catechism of Luther; and 6, the Formula of Concord, to which the *Book of Concord* is related as the whole to a part, though the two are often confounded. An English translation of the *Book of Concord* in two volumes, the second consisting of historical introduction, illustrative documents, and indexes, edited by H. E. Jacobs, was published in Philadelphia 1882–83.

Revised by HENRY E. JACOBS.

Concord, Formula of: the last part of the *Book of Concord*, in which it appeared, for the first time, in 1580. It consists of two parts, of which the first may be said to be the text and the second the commentary. It was occasioned by the vacillations of MELANCHTHON (*q. v.*), real and seeming, the Crypto-Calvinistic and other controversies, and the appearance of a number of Corpora Doctrinæ objectionable in various respects. Protracted and patient conferences and labors, in which the greatest divines of the Lutheran Church, especially Andreæ and Chemnitz, took part, preceded and accompanied the preparation of it. Eighty-six of the states of the empire united in it. Augustus of Saxony was among its most important promoters.

Revised by HENRY E. JACOBS.

Concor'dia: a goddess of the Roman mythology; may be considered a personification of domestic concord and of harmony between several classes of the body politic. Several temples were erected to her in ancient Rome. The sessions of the senate were sometimes held in the Temple of Concord (*Ædes Concordiæ*).

Concordia: village; 35 miles N. E. of Venice; on the site of the old city of Concordia; founded by Augustus after the pacification of the empire, and destroyed by Attila in 452 (see map of Italy, ref. 3–E). In 1873 the old Christian cemetery of the city was discovered, and 160 stone coffins, some of great archæological interest, were dug up.

Concordia: a city of Argentina; in the province of Entre Rios; on the river Uruguay, nearly opposite Salto (see map of South America, ref. 8–E). Steamers ascend the river to this point, and the East Argentine Railway connects it with the agricultural and grazing districts of Corrientes, being a large and constantly increasing trade. Pop. (1889) 11,500, and rapidly growing. H. H. S.

Concordia: city (founded in 1870); capital of Cloud co., Kan. (for location of county, see map of Kansas, ref. 4–G); on Mo. Pac., Atch., Top. and S. Fé and Un. Pac. R. Rs., and on the Republican river. It has a U. S. land-office, Nazareth Academy, a high school, iron-works, plow, wagon, and cigar factories, roller flouring-mills, excellent water-power, etc. Pop. (1880) 1,853; (1890) 3,184; (1900) 3,401.

EDITOR OF "CONCORDIA EMPIRE."

Concord River: a river of Middlesex co., Mass.; formed by the junction of the Assabet and Sudbury rivers, at Concord. It flows northward, and enters the Merrimac near Lowell.

Con'crete [from Lat. *concre'tus*, solidified; past ptc. of *concres'cere*, grow together]: in philosophy, said of any quality which is considered in connection with the object to which it belongs; a quality not concrete is abstract. Thus "wisdom" is an abstract quality; but when we speak of a "wise man" the quality becomes concrete.

Concrete: a hardened mixture of mortar (generally hydraulic) with coarse materials, such as fragments of brick or stone, gravel, pebbles, or shells. The volume of mortar should be slightly in excess of the volume of voids in the coarse materials. Among engineers in the U. S. it is customary, in making concrete by hand, to (1) mix the cement and sand, or cement, lime, and sand, together, dry; (2) then add water, and mix to a stiff mortar; and (3) then spread the mortar evenly over the platform; (4) the coarse fragments are then spread out upon the mortar, and the whole mixed together thoroughly with shovels. The coarse materials should be kept damp, or sprinkled with water before they are incorporated with the cement and sand. After mixing the concrete is conveyed away in wheelbarrows, and compacted in position by ramming in layers 6 inches to 8 inches thick. Concrete should not be mixed with too much water, but when ready for use should be quite coherent, and capable of standing at a steep slope without the water running from it; otherwise it will be impossible to compact it by ramming. It should not be plastic and jelly-like under the rammer.

In carrying on large operations it is advantageous, on many accounts, to make the concrete in a mill, of which there are several kinds. Any box or cylinder to receive the ingredients, revolving slowly about either a diagonal or concentric axis, will answer the purpose. A cubical box, measuring 4 feet in length on each edge, was used upon the fortifications on Staten Island with entire success. The box was rigidly mounted upon an iron axle passing through opposite diagonal corners, and was provided with a trap-door, about 2 feet square, close to one of the angles farthest from the axis, through which the materials were introduced. Eight revolutions of the box, made in less than one minute, were found to be quite sufficient to secure a thorough incorporation of the mortar with the coarse material (broken stone and pebbles). In using a mill of this description it is not necessary that the mortar should be first prepared by a distinct and separate process, but all the ingredients of the concrete—the cement, lime (if lime be used), sand, water, and

coarse materials—may be introduced promiscuously into the box. The mill may be charged by wheelbarrows from a platform arranged at the proper height, or preferably by a large tub manœuvered by a derrick. The proper charge for the box, in order to insure thorough mixing, should not exceed one-half to five-eighths of its total capacity. One tub-ful (36 to 40 cubic feet) should charge the box.

A standard formula for making Rosendale cement concrete upon U. S. public works is—

Concrete No. 1.

1 barrel of cement } = 3·27 barrels of concrete mortar;
3 " " sand }
5 " " broken stone, or brick, gravel, oyster-shells, or a mixture of two or more of them.

This batch will make 21·75 cubic feet of concrete rammed in place. The mortar of this concrete, tested by itself, possesses a crushing strength of 130 lb. per square inch when two months old, the test being applied to 5-inch or 6-inch cubes. For unimportant works, 6 to 6½ barrels of broken stone, instead of 5, may be incorporated, and the concrete may be cheapened still further by replacing a portion of the cement by common lime, as in No. 2.

Concrete No. 2.—In foundations above water the concrete mortar may be composed as follows:

1 barrel of Rosendale cement = 3·70 cubic feet of paste,
⅓ " " common lime = 2·50 " "
3½–4 bbl. " sand, loosely measured.

The concrete should contain 1 volume of this mortar to about 2½ volumes of ballast.

Concrete No. 3.—Portland cement concrete possessing a little more strength than the No. 1 above may be made as follows:

1 barrel of Portland cement } = 10·37 barrels of concrete mortar;
1 " " slaked lime-powder }
10 " " sand }
16 " " broken stone or other good ballast.

This batch will produce 69½ cubic feet of concrete rammed in position. The mortar of this concrete will sustain a crushing weight of 154 lb. to the square inch when two months old.

Omitting the common lime, the following formula will give a good concrete:

Concrete No. 4.

1 barrel of Portland cement } = 5·4 barrels of concrete mortar.
5½ " " sand }
6 " " gravel and pebbles } = 12½ barrels mixed and shaken down, containing 26½ per cent. of voids.
9 " " broken stone }

This batch of concrete produces 50 cubic feet rammed in position, and is suitable for the best quality of concrete work.

It is desirable in all cases that the mortar for concrete should be hydraulic, in order to secure simultaneous induration throughout the entire mass after it has been compacted in position. Having established the quality of the mortar, whether of cement and sand, or cement, lime, and sand, the proportion of mortar to the coarse materials should be adjusted, so that the volume of the former should be somewhat in excess of the volume of voids in the latter.

In building the Mississippi jetties blocks of concrete were used which weighed from 25 to 72 tons each. The materials in this concrete were 9·6 per cent. of Portland cement, 27·1 per cent. of sand, 14·5 per cent. of clean gravel, and 48·8 per cent. of broken stone. After setting, the volume of the concrete was only 60 per cent. of the dry materials, and the contraction during hardening was 4 per cent.

The word *beton* is sometimes used as synonymous with concrete, but strictly beton is merely hydraulic mortar, in which the cement and sand have been thoroughly mixed by prolonged trituration when wet.

Concrete is extensively used for the foundations of piers, buildings, and street pavements, and for the general purposes of a rough artificial stone. Monolithic structures in the shape of abutments, arches, and walls of factories, have been built *in situ* and wholly of concrete. For instance, the lower part of the pedestal of the statue of Liberty in New York harbor is a solid mass of concrete 91 feet square at the base, 65 feet square at the top, and 52 feet in vertical height. Concrete can be deposited under water by inclosing it in paper bags which burst when thoroughly wet, and sometimes it is allowed to slide down through the water in a long box or tube, called a *trémie*.

The ultimate compressive strength of concrete ranges from 700 to 3,000 lb. per square inch when two years old. Like cement, it is supposed to harden and strengthen with age. Its cost ranges from $2 to $10 per cubic yard, depending upon the quality of the cement and the methods of mixing it with the other constituents. See CEMENT and STONE. See Gillmore's *Limes, Hydraulic Cements, and Mortars*; Newman's *Notes on Concrete and Works in Concrete*; and Baker's *Treatise on Masonry Construction*.

Q. A. GILLMORE. Revised by MANSFIELD MERRIMAN.

Concretion [from Lat. *concre'tio*, deriv. of *concres'cere*, grow together]: in medicine, an extraneous solid which accumulates within the body. Concretions may be chemical precipitates from the secretions, and as such occur in the bladder, the gall-cyst, or salivary ducts. These are called calculi, and are sometimes of organic and sometimes of non-organic matter. Again, concretions may be of phosphate or carbonate of lime, occurring in tubercular or other degenerate masses; while in the joints they are sometimes of urate of soda, as in "gouty concretions." Within the alimentary canal they are often composed of hair which has been swallowed, or of cholesterin, and sometimes of magnesia salts.

Concu'binage [Fr. deriv. of *concubin*, concubine, from Lat. *concubi'na*; *con*, together + *cuba're*, lie in bed]: the relation of a man and woman who habitually cohabit without lawful marriage; or, more frequently, a kind of inferior marriage, which does not give the woman the legal position of a wife. Concubinage was lawful among the ancient Hebrews, as the cases of Abraham, Jacob, and many other examples show. Concubinage in ancient Rome was often a union between persons who could not legally intermarry on account of difference in rank. It appears that in general the children of a concubine were illegitimate among the Romans, though many examples of their apparent legitimacy have been adduced. The Church of Rome never formally forbade concubinage until the Council of Trent. The Protestant Churches have uniformly opposed it, as contrary to the spirit of Christianity. The only relic of legalized concubinage in enlightened countries is MORGANATIC MARRIAGE (*q. v.*).

Concurrent: literally, moving in conjunction; hence, in law, having the same authority; contributing to the same effect. A *concurrent consideration* occurs where the considerations are mutual promises. A *concurrent jurisdiction* (the most important use of the term) is jurisdiction which may be exercised by any one of two or more courts in the same cause. In such a case the court which first claims and exercises jurisdiction in the cause acquires the exclusive right of determining it. In the U. S. the Federal courts and the courts of the several States often have concurrent jurisdiction, and in such cases where suit is first brought in the State court an appeal lies to the U. S. courts on questions of law arising under the Constitution, laws, or treaties of the U. S.

F. STURGES ALLEN.

Concussion [from Lat. *concus'sio*, deriv. of *concu'tere*, *concus'sus*, clash together; *con*, together + *qua'tere*, clash, strike]: in *medicine*, a disturbance produced by blows or falls, attended with violent shaking as of the brain or other parts of the body. The word is used particularly in regard to the disturbance of the brain in this way. *Concussion of the brain* generally results from a fall or blow in which the head is directly struck, or in which much violent shaking of the brain occurs in consequence of falling upon the feet, buttocks, etc. The first effect is shock, the patient becoming pale and collapsed, the pulse small and feeble, and consciousness only partially preserved. When the shock has spent itself, and the symptoms of concussion proper are present, the patient lies senseless, his pupils dilated, his breathing feeble, and the skin cold and livid or pale. Involuntary discharges of the bowels and bladder may take place, and the patient may gradually sink and die, or he may become more conscious, and at the same time irritable, crying constantly, and perhaps delirious and talkative. This condition may persist for a short time and subside, or it may pass into one of cerebral inflammation with eventual dissolution. The treatment of concussion consists, first, in the treatment of the primary shock, for which external heat, mustard plasters, and other stimulating measures may be required. For the concussion itself, the patient is to be placed at rest in a cool room, and cold applied to the head. No food or merely light liquid diet should be given; the bowels should be kept open by mild laxatives, and the urine drawn with a catheter. Opium and other sedative remedies may be required.

Concussion Fuse: See Fuse.

Condamine, kōn'daă'meen', Charles Marie, de la: See La Condamine.

Condé, kōn'day', or **Condé-sur-l'Escaut**: town of France; department of Nord; situated at the confluence of the Haine and the Scheldt; 7 miles N. N. E. of Valenciennes (see map of France, ref. 2–G). It is well built, and has strong fortifications constructed by Vauban. It has a town-hall, an arsenal, and a military hospital; also manufactures of chicory, starch, cordage, and leather. It has been several times besieged, and was taken by the Austrians in 1793. The Princes of Condé derived their title from this town. Pop. (1896) 4,481.

Condé, Henri I. de Bourbon, Prince de: b. Dec. 9, 1552; was a son of Louis I. (see below). He was a cousin of Henry of Navarre, and joined the Protestant army about 1584. He died Mar. 5, 1588, and it is supposed he was poisoned by his servant. He left a son, Henry II., Prince de Condé (d. in 1646), who was educated a Roman Catholic, and was the father of the Great Condé.

Condé, Louis Henri Joseph, Prince de (styled also *Duke of Bourbon*): the last of the line of Condé; b. Apr. 13, 1756. He was the father of the Duc d'Enghien, who was murdered in 1804. Condé fought against the French Republic (1792–1800), and was found dead in 1830, having died by violence, perhaps by his own hand.

Condé, Louis I. de Bourbon, Prince de: French general; founder of the house of Condé, a branch line of the house of Bourbon; b. at Vendôme, May 7, 1530; a son of Charles de Bourbon, Duc de Vendôme; brother of Antony of Bourbon, and uncle of Henry IV. As an adversary of the family of Guise he took a prominent part in the conspiracy of Amboise in 1559. He was the general-in-chief of the Huguenots in the civil war which began in 1562. He was defeated and taken prisoner at Dreux in that year. In 1567 he commanded at the battle of St.-Denis. Having been defeated and wounded at the battle of Jarnac, Mar. 15, 1569, he was shot after he had surrendered. See Desormeaux, *Histoire de la Maison de Condé*; *Mémoires de Louis de Bourbon, Prince de Condé.*

Condé, Louis II. de Bourbon, Prince de (styled *The Great Condé*): celebrated French general; b. in Paris, Sept. 8, 1621; was a son of Henri II., Prince of Condé. In his youth he was called the Duc d'Enghien. He married, in 1641, Clarie Clémence de Maillé-Brézé, a niece of Cardinal Richelieu. In May, 1643, he gained a signal victory over the Spaniards at Rocroi. He defeated the Bavarian general Mercy at Nordlingen in 1645, and inherited his father's title in 1646. He gained a decisive victory over the Spaniards at Lens in 1648. In the civil war of the Fronde, which began in 1649, he at first supported Mazarin and the Royalist party. Early in 1650 he was arrested by Mazarin, whom he offended by his haughty conduct. After he had been confined nearly a year he was released, and raised an army to fight against the court. He marched in 1652 against Paris, which was defended with success by Turenne. In 1653 he was condemned to death, and entered the service of the King of Spain, who gave him command of an army in Flanders. He was there opposed to Turenne, over whom he could not gain much advantage. The war was ended by a treaty between France and Spain in 1659. The Prince of Condé was then pardoned, and returned to the service of the French king. Having obtained the command of an army in Flanders, he fought an indecisive battle at Seneffe against William, Prince of Orange, in 1674. D. Dec. 11, 1686. "The art of war," says Voltaire, "seemed in him a natural instinct." Bossuet pronounced a funeral oration on him. See Desormeaux, *Histoire de Louis, Prince de Condé* (4 vols., 1768); Lord Mahon, *Life of the Prince of Condé* (1840); Voltaire, *Siècle de Louis XIV.*: biography by Fitzpatrick (2 vols., 1874).

Condé, Louis Joseph de Bourbon, Prince de: the only son of the Duke of Bourbon; b. Aug. 9, 1736. He served with distinction in the Seven Years' war (1755–62), and emigrated as a royalist in 1789. He led the French emigrants who in 1792 fought against the republic in co-operation with the Austrian army. He disbanded his corps of emigrants 1801, returned to France 1814, and died May 13, 1818.

Condensation: the act of rendering a body more dense and compact by bringing its particles into closer proximity and increasing its specific gravity. The term is usually applied to the conversion of a vapor or gas into a liquid either by pressure or by the agency of cold.

Condensed Milk: See Milk.

Condenser (in electricity): a device in which the electrostatic induction between charged bodies is made use of for the accumulation and storage of considerable quantities of electricity.

The inductive action between charged conductors depends upon their distance and the nature of the intervening medium, the so-called dielectric. The capacity of a condenser will increase directly as the surface used, and with the specific inductive capacity (*q. v.*) of the dielectric. The capacity increases also as the distance between the plates or coatings diminishes, according to a law which varies with the form of the condenser.

Where the condenser consists of two parallel plates, the distance between which is negligible as compared with their size, the law for capacity is—

$$Q = \frac{K S}{4 \pi d}.$$

Where Q is the quantity of electricity necessary to bring about a unit difference of potential between the plates, S is the surface of one of them, d is the distance between them, and K is the specific inductive capacity of the medium.

Fig. 1.

The *simplest* form of condenser consists of two parallel metallic disks separated by a layer of air. The *best-known* form is the Leyden jar (see Fig. 1). Condensers of large capacity are made by separating many sheets of tinfoil by means of mica or of paraffined paper. Such condensers are usually constructed so that their capacity will be exactly a micro-farad (see Farad), or some simple multiple of that standard.

E. L. Nichols.

Condensing Steam-engine: See Steam-engine.

Condé-sur-Noireau, kōn'day'sür'nwaă'rō': a town of France; department of Calvados; on the river Noireau; 23 miles S. S. W. of Caen (see map of France, ref. 3–D). It has manufactures of muslin, linen, woolens, cutlery, and leather. Pop. (1896) 6,663.

Condillac, kōn'dĕe'yaăk', Étienne Bonnot, de, Abbé de Mureaux: French philosopher; b. at Grenoble in 1715; brother of the Abbé de Mably. He associated in his youth with J. J. Rousseau and Diderot. In 1746 he published *Essai sur l'origine des connaissances humaines* (2 vols.; translated by Th. Nugent in 1756), and in 1749 *Traité des Systèmes* (2 vols.). His reputation was widely extended by his admirable *Traité des Sensations* (3 vols., 1754). He was chosen a member of the French Academy in 1768. He adopted the theory that our knowledge and ideas are derived from the operations of the senses. D. Aug. 3, 1780. Among his works is *Art de Raisonner*, forming part of a series entitled *Cours d'Etudes.* He argues that man owes the development of his faculties to the use of signs. His complete works appeared in 1798 (23 vols.; new ed. 1824, 16 vols.). See Robert, *Les Théories logiques de Condillac* (1869), and Lewes's *History of Philosophy.*

Condition [from Lat. *condĭ'cĭo*, compact, agreement, terms, circumstances, situation; *con*, together + reduced grade of root of *dī'cere*, tell, declare; cf. *abdĭca're*, *dī'cio*, *jurĭ'dĭcus*, *index*, *in'dĭcis*, etc. The spelling *conditio* occurs in the poorer MSS., and is due to the later confusion of palatalized *c* and *t*]: the particular mode, state, or circumstances of a person or thing. In logic it is that on which something else is contingent; something which must precede a cause, and render its operation possible. An inked pen in the hand of a writer may be the cause of a certain writing, but the condition is the capacity of the paper to absorb ink.

Condition, in law, has several significations. 1. *In the Civil Law.*—The principal case here is a clause in a contract, whereby a party, anticipating that an event may produce some change which he is desirous to guard against, provides what shall be done in case the event happens. For example, if it is provided that if a house that is sold is found to be subject to a certain burden or servitude the sale shall be void, the provision is a condition. Conditions were classified in an artificial manner (for which see Pothier on *Obligations*, Domat, and other text-writers). 2. In common law it means the *status* of a person in respect to his legal rights, capacities, and disabilities. (The subject is more fully considered under the word Status.) 3. In common law it further means a qualification or restriction annexed to an estate arising either upon a conveyance or under a will, whereby the estate is created or enlarged or defeated,

or a like clause affecting the existence of an instrument or the operation of a contract. The leading instance to be considered is a qualification annexed to an estate. It is important at the outset to distinguish between a *condition* and a *covenant*. A condition either enlarges or defeats an estate; a covenant is a mere engagement under seal to do an act. If a condition be broken, the estate either does not exist at all, or, if vested, the grantor may by appropriate means defeat it. In case a covenant is broken the remedy is to sue for damages, or to compel the covenantor to perform it, or to prevent him by injunction from breaking it. The same act may by suitable words have imparted to it both the character of a condition and a covenant, when a grantor will have his choice of remedies. Conditions as to their form are either express or implied; as to their relation to the estate they are either precedent or subsequent. A condition is said to be precedent when it precedes the vesting or enlarging of the estate; it is subsequent when, the estate having vested, its regular effect is to defeat it. The distinction does not depend upon any form of words, but upon the intent of the parties. It will be observed that the regular effect of a condition subsequent is to lead to a forfeiture. As the spirit of the law is opposed to forfeiture, it is governed by technical rules that would not be applied in case of a mere action upon a promise or covenant. Great care must be taken not to confound rules which appertain to the one subject with those which prevail in the other. It is an elementary rule that a condition subsequent does not affect the nature of the estate; it only qualifies it to this extent, that in the happening of the specified event it may be made to terminate before its natural expiration. Thus an estate in fee or for life or for years remains a member of its class, though it may be defeated by the happening of the event which is called a condition. It should also be stated that the happening of the prescribed event does not *of itself* defeat the estate. There must be an affirmative act on the part of the grantor whereby he repossesses himself of his estate. This is technically called a "re-entry." In well-drawn instruments a power of re-entry is expressly reserved. This rule is so rigidly adhered to that if a lease should prescribe that an estate of a tenant should, on the happening of an event, be null and void, a re-entry would still be necessary. This rule leads to an important principle, that the right to take advantage of the forfeiture may be waived expressly or by implication, as where rent upon a lease is accepted with knowledge of the cause of forfeiture. The technical rules of the common law do not apply to testamentary provisions or legacies of personal property, as that branch of jurisprudence was developed by the ecclesiastical courts from the Roman law. Much caution is accordingly necessary in discriminating between devises of land and legacies of personal property, for, though in the same instrument, they will be governed by different rules. The rule that the grantor must re-enter is to be confined to a strict case of *condition*. It does not apply to a *conditional limitation*. The distinction between the two should be pointed out. In a condition the estate on the happening of the prescribed event is to return to the grantor; in a conditional limitation it is to pass over to a third person. An illustration will show the difference between them. Thus if a testator should give his daughter an estate to be defeated in case she entered a convent, there would be a condition: but if he had added that in the event supposed it should go to his brother, it would be a conditional limitation. The main importance of the distinction is that in case of the conditional limitation no re-entry is necessary, and the estate on the happening of the event passes at once to the person designated. The law of conditions will be found in the works on real property, such as Washburn, Crnise, and Hilliard, and to a certain extent in works on landlord and tenant, such as Taylor.

T. W. Dwight.

Conditional Limitation: See Condition (in law).

Conditioned, Philosophy of the: a name given to the system of Sir William Hamilton. It is a development and application of the general principle of the Antinomies of Kant, although claimed by Hamilton as an original discovery (*Metaphysics*, 647). It regards the judgment of causality as derived from an impotence of the mind—the principle of the conditioned—the law that the conceivable has always two opposite extremes, and that the extremes are equally inconceivable. We conceive of existence as conditioned in time, and thus expressing at once and in relation the three categories of thought which afford us in combination the principle of causality, the law of which is that when an object is presented phenomenally as commencing, we can not but suppose that the complement of existence which it now contains has previously been. See Hamilton's *Metaphysics*, lect. xxxviii., xxxix. See refutation of the supposed law in *Jour. Spec. Philos.*, vol. iv. (p. 283).

Revised by W. T. Harris.

Condom, kōn′dōn′: a town of France; department of Gers; on the Bayse, here crossed by two bridges; 24 miles N. N. W. of Auch (see map of France, ref. 8–E). It has a church, formerly a cathedral, and manufactures of cotton, mixed fabrics, and porcelain. It was founded in 721 A. D. Pop. (1896) 7,045.

Condonation (in Lat. *condonatio*): in the law of divorce, the conditional forgiveness (express or implied) of an offense for which, without such forgiveness, a divorce may be obtained. Condonation will be implied from cohabitation of the parties with knowledge that the offense has been committed, and with the means of establishing its commission in a court of justice, but in other cases it is sometimes difficult to decide whether the offense was condoned or not. Condonation is conditional in this sense, that a repetition of the offense revives the original charge. According to some authorities the original charge may be revived by the commission of an offense of an inferior grade.

Revised by F. Sturges Allen.

Condor [Span. form of the native Peruvian name *cuntur*]: the great vulture of the Andes, *Sarcorhamphus gryphus* (family *Cathartidæ*). The adult male is glossy black, with a conspicuous ashy white mark upon the wing; a ruff of soft white down encircles the neck, which, as well as the head, is bare and wattled. It is somewhat under 4 feet in length, and its spread of wing is 9 feet. The legs are powerful, but the feet are not fitted for seizing and tearing. The female is duller colored than the male and lacks the wattles. The condor is a resident of the Andes from Ecuador to the Strait of Magellan, and breeds upon precipices, laying two dull-white eggs on the bare rock. Its favorite food is carrion, but it is said to attack and kill young or sickly animals. Its powers of flight are wonderful, and it has been seen soaring above the summits of the Andes at a height of 5 miles above the sea. It is captured with the lasso when gorged with food, and also, we are told, by enticing it to descend upon carrion placed in a small pen, from which it is unable to rise, as the bird takes wing with some difficulty.

Condor.

The California vulture (*Pseudogryphus californianus*) is also sometimes called condor. It is of a brownish black, with a whitish line, formed by the tips of the greater coverts, running across the closed wing, and a broad band of white extends along the under side of the wing, forming a conspicuous mark when the bird is sailing overhead. It is rather more lightly built than its southern relative, but has a little the greater expanse of wing, sometimes measuring 10 feet from tip to tip. In habits the two birds are similar. It is remarkably restricted in its range, which extends only from the Colorado river to the Columbia river and from the Sierra Nevada to the sea.

F. A. Lucas.

Condorcanqui, José Gabriel: See Tupac Amaru II.

Condorcet, kōn′dōr′sā′, Marie Jean Antoine Nicolas Caritat, Marquis de: French philosopher and mathematician; b. at Ribemont, in Picardy, Sept. 17, 1743, of an ancient family of Dauphiné. He studied in the College of Navarre, and became, in 1762, a resident of Paris. Having written an *Essay on the Integral Calculus*, he was admitted

into the Academy of Sciences in 1769. He was an intimate friend of D'Alembert. In 1777 he was chosen perpetual secretary of the Academy of Sciences, and in 1782 was admitted into the French Academy. He had a large share in the *Encyclopédie*. He favored the popular cause in 1789, wrote several able political treatises, and published the influential *Feuille villageoise*, and was elected to the National Convention in 1792. He was a moderate republican, and voted generally with the Girondists. He married, in 1786, Sophie, sister of Gen. Grouchy, noted for her beauty (b. in 1764; d. in 1822). Having been proscribed by the Jacobins in May, 1793, he remained secreted in the house of a friend in Paris for eight months. During this period he wrote *Esquisse d'un Tableau historique des Progrès de l'Esprit humain* (1795). This is regarded as his greatest work. He believed in human perfectibility, and had noble ideas of human destiny. He quitted his place of refuge early in 1794 in order to enjoy a rural excursion, was arrested, and confined in prison at Bourg-la-Reine, where he took poison and died Mar. 28, 1794. "Thus died," says Lamartine, "this Seneca of the modern school. The day of recognition has not come for him, but it will come and will exculpate his memory from reproach." A collection of his numerous works was published by O'Connor and Arago (12 vols., 1847–49). See D. F. Arago, *Biographie de Condorcet* (1849).

Condottieri, kon-dot-tyā'rē̆ē [Ital. plur. of *condottiere*, deriv. of *condotto*, conduct]: Italian mercenaries who, during the Italian wars in the fourteenth and fifteenth centuries, took service under any prince or government that chose to engage them. They consisted principally of heavy-armed cavalry, and for a long period the wars of Italy were left entirely to them. There came to be an understanding between them to spare their troops as much as possible, until at length battles were fought with little more hazard than would be incurred in a tourney. Among the most celebrated were Lodrisio, about 1339; Fra Moreale, 1350; Guarmeri, Lando, and Francesco di Carmagnola, about 1412; Francesco Sforza, about 1450; and the English Hawkwood.

Conduction: See HEAT and ELECTRICITY.

Conductor: a substance through which electricity can pass freely, or on which, if insulated, a charge of electricity can be maintained. Different substances conduct electricity with greater or less readiness. Conductivity varies also according to circumstances, and even substances usually nonconductors sometimes transmit electricity.

Cone [from Lat. *co'nus* = Gr. *κῶνος*, cone, pine-cone]: in geometry, a solid, the curved portion of whose bounding surface is generated by the motion of a line, called the *generatrix*, constantly passing through a fixed point called the *vertex* of the cone, and intersecting a fixed curve along which it moves, called the *directrix*, the moving line extending indefinitely on both sides of the vertex. Two surfaces are generated, meeting in a point at the vertex. These are called *nappes* of the cone; that containing the directrix is called the *lower*, the other the *upper* nappe. In the higher geometry the surface thus generated is called the cone, and the directrix may be any curve whatever, open or closed. In elementary geometry the directrix is restricted to a plane closed curve, and the generatrix extends only from the vertex to the directrix. The cone is *circular*, *elliptic*, etc., according to the form of the directrix. If the latter has a center the line joining the center and the vertex is called the *axis*. If the axis is perpendicular to the plane of the directrix the cone is called *right*; otherwise *obtique*.

Conecte, kō'nekt', THOMAS: martyr; b. at Rennes, France, toward the close of the fourteenth century; burned at the stake in Rome in 1434. He was a Carmelite monk, and produced a deep impression by his preaching denouncing the vices of society at large, and more especially the corruption of the Church. From France he passed into Italy, where his success was still more pronounced. But, as he also preached against the secular power of the pope and the hierarchy, he was accused of heresy, seized, and burnt.

Conegliano, kō-nāl-yaa'nō: a town of Italy; province of Treviso, on a railway from Venice to Trieste; 30 miles N. of the former city (see map of Italy, ref. 3–E). It has a cathedral and silk and woolen manufactures, a triumphal arch erected in honor of Francis I., Emperor of Austria, and a number of fine frescoes by Pordenone, who was born here. Pop. 8,938.

Coney Island: an island situated on the west end of Long Island (annexed to Brooklyn, N. Y., in 1894); 5 miles long from E. to W., and averaging less than a mile in width. It is separated from the mainland by a narrow creek, which runs from Gravesend Bay to Sheepshead Bay. Some 60 acres are arable, but the land is mainly composed of white sand liable to be displaced by the winter storms. It is the most popular watering-place in the vicinity of New York. Until 1874 it was a comparatively neglected waste, only the west end being used to any extent for bathing and recreative purposes. Its rise and growth have been phenomenal, for in four years a few rude restaurants and bathing-houses on a desolate beach were replaced by splendid hotels, concert-halls, bathing-houses, and all the minor amusements suited to great and varied congregations of people. Its great attraction is its fine beach, 5 miles long, fronting the Atlantic Ocean. The water deepens gradually, there is but little undertow, and the surf is rarely boisterous. It is considered the safest beach, extensively used for bathing purposes, upon the coast. Henry Hudson discovered this island on Sept. 3 or 4, 1609. A crew from his ship landed on the shore and trafficked with the Canarsie Indians. Subsequently there was a quarrel, and John Coleman, a sailor, was killed by the savages, and two of the seamen were severely wounded. Coleman was buried at what is now known as Norton's Point. Coney Island therefore has an historical interest as the scene of the first landing of Europeans in the State of New York and as holding the grave of the first white man. To accommodate the travel to this place there are many steam railways and steamboat lines running from Manhattan, Jersey City, Newark, and many points in Brooklyn. The larger part of the amusement-seeking population of the metropolis find their way to Coney Island during the summer season. This great pleasure resort has practically four divisions—Manhattan Beach, Brighton Beach, West Brighton, and the West End. These points are connected by railways and carriage lines. Manhattan Beach is at the extreme eastern end of the island. Coney Island is 10 miles distant from Manhattan. Pop. of Coney Island village (1880) 1,184; (1890) 3,313.

Confederate States, or **Southern Confederacy**: The earlier authentic assertions of a right (alleged to have been reserved by the States in ratifying the Federal Constitution) to resist the constituted authorities and subvert the laws of the Union when one or more of those States should adjudge any exercise of Federal authority unwarranted by the said Constitution were made by the Legislature of Kentucky in 1798, and by that of Virginia in 1799; the Kentucky resolves in which this doctrine was formulated having been prepared by Thomas Jefferson, as those of Virginia were by James Madison. In neither case did these resolves appear to contemplate disunion, but rather a *nullification* of the obnoxious Federal act by the sovereign power of a State. The first distinct avowal of disunion sentiment was made on the floor of the House of Representatives by Josiah Quincy (of Boston, Mass.), who, in opposing the purchase of Louisiana, asserted that this measure (which he agreed with its author, President Jefferson, in pronouncing unconstitutional) virtually dissolved the Union, so that the States were freed from its obligations and should prepare for peaceable or forcible separation. This avowal elicited little sympathy or approval. Again, during the war with Great Britain in 1814–15 some of the more ardent Federalists of New England, being intensely hostile to that war, openly advocated secession, and a convention held by them at Hartford, Conn., was popularly and not unreasonably regarded as impelled by a spirit inimical to the Union. Hence the members of this convention were ever after under the ban of public opinion, and the Federal party never regained the public confidence. Again, when the North and South came into fierce collision respecting slavery on the question of admitting Missouri as a slave State, menaces of disunion if she were excluded were heard—this time from the South. When in 1828 Congress passed a stringently protective tariff, South Carolina, under the lead of John C. Calhoun, George McDuffie, and Gen. James Hamilton, Jr., threatened to nullify the operation of that act within her own borders; and, though that tariff was modified in 1832, she adhered to her resolve and proceeded to call a convention whereby the existing tariff was pronounced null and void. Gen. Jackson, then President, denied her right to do this with effect in a vigorous and masterly proclamation, whereof Edward Livingston, Secretary of State, was understood to be the scribe, and, in some degree, the author. Congress proceeded to modify still further the tariff, and South Carolina there-

upon waived the execution of her ordinance; so a collision was averted.

African slavery, which, though the slaves were few at the North, had been all but universal, became at length distinctively Southern, and was reprobated by an intelligent, conscientious, growing minority at the North. They agitated for the overthrow of human bondage, regardless of the fact that the Federal Constitution conferred on Congress or the non-slaveholding States no power over the domestic institutions of the South. Prophecies and threats of disunion were now freely uttered in the slave States. The question of organizing new Territories from the public domain constantly inflamed this controversy; the South insisting that her people had a right to migrate to any Territory, and there hold their slaves as in their own States; the North denying this, and demanding the conservation of the national domain to free labor. Another compromise in 1850 essayed to end this dispute, but with poor success, the collisions between free and slave labor which followed the organization (in 1854) of Kansas as a Territory widening and deepening the agitation. An attempt to array the South under the banner of State rights against the compromise of 1850 had broken down, even South Carolina refusing to sustain it; but when, in 1860, Abraham Lincoln had been chosen President, on a platform of resistance to slavery extension, by all the electoral votes of the free States except three of the seven cast from New Jersey, the long-meditated struggle for disunion was inaugurated by South Carolina, whose Legislature was then holding a called session. A convention was summoned, which promptly met, and by ordinance (Dec. 20) declared the State no longer in the Union—Georgia, Alabama, Mississippi, Florida, Louisiana, and Texas following her example, making seven States in all which had declared themselves out of the Union before Mr. Lincoln was inaugurated (Mar. 4, 1861). Some of these were barely carried for secession, and in none but South Carolina was the step taken with an approach to unanimity. The other eight slave States, though urged to unite in secession, refused to do so, mainly by overwhelming majorities. In pursuance of an invitation from South Carolina, the seceded States, forming an aggregate population of 2,656,948 free persons and 2,312,046 slaves, sent delegates to a convention which met at Montgomery, Ala., Feb. 4, 1861, and promptly formed a confederacy under a constitution modeled on that of the Union, except that it expressly asserted the right to take slaves into any State or Territory of said Confederacy, and there hold them as property. Of this Confederacy, Jefferson Davis, of Mississippi, was made President, and Alexander H. Stephens, of Georgia, Vice-President—at first *pro tem.*, but they were in due time chosen without opposition for a regular term of six years. Montgomery was continued as the capital of the Confederacy, and its first Congress there assembled.

Hostilities against the Union were inaugurated by Confederates while Mr. Buchanan (who offered no resistance) was still President. Gen. David E. Twiggs had willingly surrendered (Feb. 18) to them at Indianola, Tex., the largest Federal force anywhere embodied; the detachments guarding the Mexican and Indian frontiers were likewise captured, and their arms and munitions treated as spoils of war; the Federal sub-treasury at New Orleans, containing $500,000, had been turned over to the new government, as had several national fortresses and vessels; so that when Mr. Lincoln assumed the duties of President the war had been fairly inaugurated on the side of the Confederacy, but not on that of the Union. Still, he forbore to initiate hostilities—unless the sending of food to the hungry garrisons of the Southern forts still held for the Union could be deemed such—until fire was opened (Apr. 12) by express repeated orders from the Confederate War Department upon Fort Sumter in Charleston harbor, South Carolina, on an islet which had been all but created by Federal effort and expenditure. Batteries had been erected without opposition so near it that this fort was reduced within thirty-six hours; its garrison of seventy men, under Maj. Robert Anderson, being allowed to march out, salute their flag, and be transported northward, not prisoners of war.

A tremendous excitement was produced throughout the country by tidings of this almost bloodless cannonade. At the South it was regarded as at once a general call to arms and an omen of easy, speedy triumph. At the North, where the hope of a peaceable solution had till this time been obstinately cherished, it was received with momentary amazement, followed by intense indignation. "It is an impeachment of our manhood—a challenge to fight!" was the general exclamation. Partisanship, hitherto rampant, of the South, as wronged and outraged by Northern abolitionism, was overawed and silenced; the national flag was everywhere displayed; President Lincoln called for three months 75,000 militia to "repossess the forts, places, and property which had been seized from the Union." But part of the regiments called out were to be furnished by Virginia, North Carolina, Kentucky, Tennessee, Missouri, and Arkansas, whose Democratic governors spurned the call as a usurpation, and by Maryland and Delaware, whose authorities were little better inclined to the suppression of secession by force of arms. Virginia, whose convention, then in session, had previously refused by two to one to secede, now passed an ordinance of secession, and North Carolina soon followed the example, as Tennessee and Arkansas did somewhat later, Gov. Claiborne F. Jackson tried to lead Missouri the same road, but the convention called at his beck utterly refused, so that he was obliged to raise Confederate troops and inaugurate civil war by virtue solely of his executive authority. He was speedily arrested by the prompt, decisive action of Capt. Nathaniel Lyon and Francis P. Blair, Jr., who raised a force which captured his "Camp Jackson," near St. Louis, and most of the men he had assembled; and he was soon forced to flee the State, which, though its people were pretty evenly divided, adhered to the Union, as did Kentucky under kindred auspices. These last two were for years ostensibly represented in the Confederate Congress, but not by their own choice. When the Confederacy was full grown it embraced the States of Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Florida, Tennessee, Arkansas, Louisiana, and Texas—eleven in all—covering nearly half of the inhabited area of the Union, with rather less than a third of its people. Considering, however, that Kentucky, Missouri, and Maryland contributed largely, persistently, to the Confederate armies, it is fair to estimate the practical Confederate strength at one-half that of the States which remained loyal to the Union.

The Confederate Congress, two days after Mr. Lincoln's inauguration, had authorized the raising of a military force of 100,000 men, to be under the chief command of President Davis. The States which had seized forts, arms, vessels, money, and other public property of the Union, were requested to turn them over to the Confederacy, and generally did so. Commissioners were sent from Montgomery to Washington to negotiate for a peaceful adjustment of all questions arising between the Union and its new-born competitor. They were courteously received by Hon. William H. Seward, Mr. Lincoln's Secretary of State, but no reconciliation of the antagonist pretensions was practicable, and they left, asserting that they had not been frankly, candidly met. The Confederacy had organized its revenue system, and commenced collecting duties on imports from the loyal States and elsewhere, before striking the blow at Sumter, which was deemed necessary to draw Virginia and other hesitating States out of the Union. Two days after President Lincoln's call for militia, President Davis, by proclamation, accepted that as a declaration of war, and authorized (May 17) the issue of letters of marque and reprisal against the commerce of the U. S. A loan of $5,000,000 was advertised at Montgomery, to which $8,000,000 were subscribed. Before the close of April the Confederacy had 35,000 men in arms, of whom 10,000 were being pushed rapidly northward, and the Confederate Congress, which organized at Montgomery on Apr. 20, adjourned on May 21 to meet at Richmond, Va., (the newly chosen capital), on July 20. Treasury notes had already been authorized, and a heavy loan, based on a pledge of cotton by the planters to the Confederacy. All debts due from inhabitants of the Confederate to those of the loyal States were impounded, and directed to be paid into the Confederate treasury. This act was obeyed to the extent of not paying the loyal creditors, but the Confederate treasury was but slightly replenished from this source. At length, when war had begun in earnest, all male citizens of the U. S. over fourteen years old were required by law and proclamation (Aug. 14) either to swear allegiance to the Confederacy or leave its borders within forty days. The Confederate marshals were directed to apprehend and imprison all who disobeyed this edict. A Confederate privateer having been captured and her crew imprisoned in New York as criminals, President Davis, by proclamation (July 6), declared that he would retaliate upon Union prisoners of war any infliction upon those Confederates, and proceeded to make good his word. President

Lincoln recoiled before this menace, and thenceforth treated privateersmen as prisoners of war. Regular exchanges of prisoners between the belligerents were initiated in the winter of 1861–62, and thenceforth accorded without objection. The Confederate authorities, however, did not scruple to treat belligerent Unionists resident within their borders, especially those of East Tennessee, as traitors. Jefferson Davis as President and Alexander H. Stephens as Vice-President were unanimously elected (Nov. 6) for a term of six years ensuing, their previous election having hitherto been provisional only.

The civil war, formally initiated by the bombardment and reduction of Fort Sumter, was prosecuted thenceforth during 1861 with varying fortunes, but with a preponderance of success for the Confederacy. Its first signal triumph was the easy capture (Apr. 20) of the Norfolk navy-yard, with three or four national vessels, including the frigate Merrimack (which some months afterward, having been transformed into the ironclad Virginia, wrought fearful havoc among the national vessels in Hampton Roads), with nearly 2,000 cannon, besides small-arms, munitions, etc., of immense value—all abandoned without firing a shot by the naval officers who should have defended and saved them. The Sixth Regiment of Massachusetts militia, hastening to the relief of menaced Washington city, had just before been assailed (Apr. 19) in the streets of Baltimore by a mob, which showered hardware, paving-stones, and other missiles upon it from housetops as it peacefully traversed their city, killing three and wounding fifteen of the Massachusetts men, while eleven of the mob were killed, and four severely wounded. The militia passed on, but Baltimore was held by the mob, and communication by telegraph or otherwise between the Federal capital and the North arrested until Gen. B. F. Butler reoccupied it, unresisted, by an advance from Annapolis (May 5–13). That important city was henceforth firmly held for the Union. Gen. Butler, being in command at Fortress Monroe, ordered an advance under Brig.-Gen. Pierce against a Confederate outpost at Big Bethel, Va., but the ill-directed attack was repulsed by Gen. J. B. Magruder with considerable loss to the Unionists. That portion of Virginia westward of the Alleghany range having opposed secession, and still adhering to the Union, a Confederate army was sent across the mountains to overbear this (alleged) disloyalty to the State, but was promptly met by a greater Union force under Gen. George B. McClellan, and driven from Philippi (June 2), then beaten at Rich Mountain, and also at Laurel Hill, and again at Carrick's Ford (July 12), and the remnant driven in disorderly flight over the dividing ridge. Hostilities were renewed on the Kanawha by the advance (Aug. 1) of a fresh Confederate force under Gen. John B. Floyd, afterward succeeded by Gen. Robert E. Lee, but these were met and baffled by a stronger Union army under Gen. William S. Rosecrans, and indecisive actions ensued at Carnifax Ferry, on Cheat Mountain, and at Alleghany Summit, which left West Virginia almost wholly under the flag of the Union at the close of 1861. In Eastern (or old) Virginia hostile armies confronted each other near Harper's Ferry and Winchester under Gens. Robert Patterson (Union) and Joseph E. Johnston (Confederate) for a month without fighting, until a stronger Union force, under Gen. Irwin McDowell, was pushed forward by Scott from Washington and Alexandria to Centreville, menacing the Confederate force concentrated around Manassas Junction, and advancing (July 21) to attack its left near Sudley Church. The advance was gallantly made and for a time promised success; but Johnston's army from Winchester arrived by rail at the critical moment and was hurried forward to the support of the recoiling regiments, so that the fortunes of the day suddenly changed, and the Union troops, exhausted by twelve hours' marching and fighting under a July sun, had to give way before this unexpected effort, and retired in a disorder not uncommon on battle-fields, even among veteran troops. The Confederates, unaware of the completeness of their victory, did not pursue it, though their President, Davis, had arrived on the field about the close of the battle. The Union loss in this affair was not less than 4,000 men, mostly wounded and prisoners, with at least twenty cannon and large quantities of small arms; the Confederates lost about 2,000, including two generals (Bee and Bartow) killed. The men who fought were not far from 25,000 on each side, but quite as many more Union soldiers listened to the sound of the guns at Centreville, Fairfax Court-house, in Washington, and on the Potomac, who should have been on the bloody field.

Gen. McClellan was now called from West Virginia, and soon made commander-in-chief, vice Gen. Scott retired; but there was no more serious fighting on this line till Oct. 20, when a Union force of 1,900, pushed across the Potomac opposite Harrison's island, was attacked near Ball's Bluff by Gen. Evans's brigade, mainly Mississippians, and nearly destroyed: its commander, Gen. E. D. Baker, of Oregon, being killed, with 300 of his men, and more than 500 taken prisoners. Two months after, Gen. E. O. C. Ord, with the Third Pennsylvania brigade, having advanced, also on Gen. McClellan's right, to Dranesville, was there attacked by a rebel brigade under Gen. J. E. B. Stuart, who was quickly repulsed with a loss of 230 men. This closed the campaign on the Potomac. Meantime Gen. Butler, sailing from Fortress Monroe (Aug. 20), had captured Forts Hatteras and Clark at the entrance to Pamlico Sound, taking 700 prisoners under Commodore Bowen, 25 guns, 1,000 muskets, and some stores. A more formidable expedition, 10,000 strong, under Gen. T. W. Sherman and Commodore S. V. Dupont, left Hampton Roads Oct. 29, and steered for Port Royal, S. C., where it bombarded and reduced the Confederate forts on Hilton Head and Phillips's island, driving out their defenders and taking undisputed possession of the Sea islands adjacent, which were thenceforth firmly held by a Union land and naval force which menaced both Charleston and Savannah and repeatedly, though unsuccessfully, struck at the railroad connecting them.

In the West, Missouri was this year the arena of a violent though desultory conflict. Maj.-Gen. John C. Fremont, who had been appointed to command here, was hastening westward to organize at St. Louis an army under the depressing influence of the Bull Run disaster in the East, when Gov. C. F. Jackson returned from a two months' sojourn in the Confederacy and prepared to dispute possession of the State, though a convention of her people had declared (July 20) his office and those of his adherents vacated by treason, and all their disloyal acts null and void. He thereupon assumed to take Missouri out of the Union by proclamation (July 31), negotiated a close alliance with the Confederacy, and was raising a large army, in good part from Arkansas, when Gen. Nathaniel Lyon, commanding 6,000 Unionists at Springfield, took the field against Jackson's far more numerous but not so well-provided army, led by Gen. Sterling Price, who suddenly resigned his command to Gen. Ben McCulloch from Arkansas. Lyon, having advanced to Wilson's creek, sent Gen. Sigel with 1,200 men to flank the enemy, whom he assailed in front, but his force was too small; Lyon fell mortally wounded, and the Union attacks in front and flank were repulsed; but the Unionists retired deliberately and unpursued to Springfield, insisting that they had fought quadruple their numbers and not been beaten. Maj. Sturgis, who succeeded Gen. Lyon, soon afterward retreated to Rolla, abandoning all Southern Missouri to the Confederates. McCulloch returned to Arkansas, but Price advanced in large force to the Missouri river at Lexington, where he invested Col. Mulligan and his Irish brigade, numbering 2,780 men, and pressed them so vigorously that Mulligan was forced to surrender (Sept. 20) before Fremont could relieve him. Fremont took the field directly afterward, and pushed down to Springfield at the head of 30,000 men; but Price avoided him by retreating, and there was no fight, except that Col. Zagonyi, with 300 Union cavalry, routed a far larger force which held Springfield, capturing that city. Fremont was still looking for Price when he was relieved (Nov. 2), and ordered to turn over his command to Gen. David Hunter, who, in pursuance of his orders, retreated to Rolla, again abandoning all Southern Missouri to the enemy. Brig.-Gen. U. S. Grant was at this time in command of the important post of Cairo, at the junction of the Ohio with the Mississippi, watched by a Confederate force at Columbus, Ky. Grant, with 2,850 men on four steamboats, dropped down the river to Columbus, landing at Belmont, in Missouri, and attacked the Confederate camp on that side. The attack was spirited, and at first successful; but Maj.-Gen. (Bishop) Polk, commanding at Columbus, crossed with five regiments, increasing the Confederate force to 5,000, by which Grant was beaten off and driven to his boats with a loss of 500 men. The Confederate loss was rather more. One month later Col. Jefferson C. Davis, acting under Gen. John Pope, commanding in Central Missouri, surprised a Confederate camp at Milford, and captured 1,000 prisoners (including three colonels) and as many horses and muskets. Gen. Pope reported 2,500 prisoners taken this month, with a loss on his part of barely 100. So closed the campaign of 1861.

The battles of the bloody year 1862 were initiated at Mill Spring, near the Cumberland river, in Southern Kentucky, where Gen. George B. Crittenden, having just supplanted Gen. F. K. Zollicoffer in chief command of the Confederate force in that quarter, ordered an attack on the Unionists in their front, who, being in superior numbers and led by Gen. George H. Thomas, repulsed them (Jan. 19) after a hot struggle of two hours, and, following them to their camp, found it deserted—Crittenden having fled across the Cumberland, leaving 10 guns, 1,500 horses, etc. Gen. Zollicoffer was killed while leading the attack. This blow was soon followed by one more serious, directed from St. Louis by Gen. Halleck, who sent from Cairo Brig.-Gen. U. S. Grant with 15,000 men, and Commodore A. H. Foote with seven gunboats, to open a way into Tennessee. Fort Henry, 80 miles up the Tennessee river, was quickly reduced (Feb. 6) by the gunboats, the garrison mainly escaping to Fort Donelson, 12 miles eastward, commanding the navigation of the Cumberland, leaving their chief, Gen. Lloyd Tilghman, a prisoner. Gen. Grant followed the fleeing Confederates, and with considerably increased forces nearly invested their stronghold, situated 2 miles below Dover, and held by about 15,000 men under Gen. John B. Floyd, of Virginia. Commodore Foote, ascending the Cumberland, first attacked (Feb. 14) the river-batteries, but was repulsed with considerable loss. Floyd, seeing Grant proceeding leisurely to cut off his retreat, anticipated that result by an advance under Gen. Simon B. Buckner on Grant's right toward Dover, commanded by Gen. John A. McClernand, of Illinois, who was overpowered and driven back after a protracted deadly struggle, losing a six-gun battery. The Union center, under Gen. Lew Wallace, sent two brigades to McClernand's support, by which the Confederate advance was arrested, and Gen. Grant, arriving on the field at 3 P. M. from a conference with Commodore Foote, ordered a general attack, which was crowned with success. Wallace recovered by it the ground previously lost by McClernand, while Gen. C. F. Smith led the Union left clear over the breastworks in their front, and the day closed with a decided Union victory. A cold night of suffering followed, during which Gen. Floyd, despairing of cutting his way out, surrendered his command to Gen. Gideon J. Pillow, who passed it to Gen. Buckner, who, after some parley, surrendered next morning (Feb. 16) not less than 14,000 men, besides 2,000 sick and wounded. Gen. N. B. Forrest, with 800 cavalry, escaped up the bank of the swollen river, while Floyd, Buckner, and a remnant got across by boat before daylight and fled. One result of this success was the immediate evacuation of the Confederate camp at Bowling Green, Ky., as also of Nashville and all Northern Tennessee; Gov. Isham G. Harris and his legislature being among the fugitives. Nashville was promptly occupied by the Unionists, while the main army of Tennessee, under Gen. A. Sidney Johnston, retreated unmolested to Corinth, Miss., leisurely followed by Gen. Don Carlos Buell, who had commanded the Union forces in Kentucky. Gen. Grant's army, now confided to Gen. C. F. Smith, was embarked and moved up the Tennessee to Savannah and Pittsburg Landing, nearly opposite Corinth. These Union successes compelled the evacuation of Paducah and Columbus, while Gen. Pope, with 40,000 Unionists, marching down through Eastern Missouri, drove Maj.-Gen. McCown, with 9,000 Confederates, from New Madrid, taking thirty-three cannon and many thousand muskets, also tents, wagons, etc., without a serious contest. Brig.-Gen. Makall, with 6,700 men, 123 cannon, and 7,000 small-arms, was now caught between Pope's army and Foote's fleet on Island No. 10 in the Mississippi, and compelled to surrender. Commodore Foote, dropping down the river, routed the Confederate flotilla in a brief engagement before Memphis, which thereupon surrendered without a blow. By July 1 the Mississippi river saw none but the Union flag floating above Vicksburg, which successfully resisted successive attempts at its reduction by Commodore Foote from above and Commodore Farragut from below.

Gen. C. F. Smith was soon disabled by sickness and died, and the command of his army again devolved upon Gen. Grant, who, while awaiting the arrival of Gen. Buell from the North, was attacked at Pittsburg Landing by an advance in force of the Confederates from Corinth, 50,000 strong, under Gen. A. S. Johnston, while Gen. Grant was still at Savannah, 8 miles below. The Unionists, about 40,000 strong, were completely surprised without intrenchments or even abatis, and were driven with heavy loss from Shiloh Church, 3 miles inland, to the brink of the river, having lost heavily in guns, killed, wounded, and prisoners. Meantime Gen. A. S. Johnston had been killed, the Union gunboats on the Tennessee had come into play, Gen. Grant had joined his shattered army, while the advance of Gen. Buell's force was beginning to come to its relief. Night brought a cessation of hostilities, and Gen. Beauregard had succeeded to the chief command of the Confederates. On the Union side, Gen. W. H. L. Wallace had been killed at the head of his division. Gen. Nelson's division of Buell's army had crossed the Tennessee in boats at 5 to 6 P. M., and taken position on the field by 7. Two more divisions were on hand by sunrise next morning, when the battle was reopened by an advance of the Union forces, of whom 25,000 (including Gen. Lew Wallace's division of Gen. Grant's army) were fresh, while only 3,000 of the Confederates had not yet been engaged. The fighting throughout the forenoon was spirited, but the forces were unequal, and the Confederates had lost by 4 P. M. all the ground they had gained the day before, and were soon afterward in full retreat. There was but a faint show of pursuit. The reported Union loss in the two days' fighting was 1,735 killed, 7,882 wounded, 3,956 missing; total, 13,573. Beauregard reported the Confederate loss at 1,728 killed, 8,012 wounded, 957 missing; total, 10,699.

Gen. Grant was soon superseded by Gen. Halleck, who, taking command of the combined army, advanced by approaches to Corinth, which was evacuated by Gen. Beauregard, who retreated with little loss into the heart of Mississippi. Meantime Gen. O. M. Mitchel, with part of Buell's army, had advanced eastward up the Tennessee, taking Huntsville and other towns on the river, but failing to carry Chattanooga. Mitchel was now transferred to the command on the coast of South Carolina, where he sickened and died.

The war in the Territories was early initiated by an effort of Cols. Loring and G. B. Crittenden to carry over the 1,200 regulars stationed at New Mexico to the Confederacy; but their intrigues were repulsed on every hand, and they were constrained to flee to El Paso, where Maj. Lynde, who had 700 men, made a pretense of resistance, advancing 20 miles to meet a much smaller Texan force, then retreating, and surrendering his entire command, which was paroled and marched northward for exchange, suffering terribly from heat and thirst. Gen. H. H. Sibley, commanding a Confederate force of 2,300 Texan volunteers, undertook the conquest of New Mexico in the fall of 1861; but his advance was retarded by lack of supplies till the opening of 1862, when he met Col. E. R. S. Canby, commanding a much larger Union force, at Fort Craig. The Unionists were first drawn out of their stronghold, and then defeated by a brilliant charge on McRae's battery, which was taken. Canby's men fled precipitately to the fort, which Sibley could not reduce; so he turned it and pushed on to Apache Pass, where his further advance was opposed by 1,300 men, mainly Colorado volunteers, under Col. John P. Slough, whom he defeated by another Texas charge, which routed Slough's motley crowd and cleared the road to Santa Fé, which Sibley soon entered in triumph. But his brilliant victories proved barren; he could not feed and clothe his little army from all the resources of New Mexico, while Canby was in the way of his receiving supplies from Texas, had any been sent. Forced to evacuate the capital of New Mexico for Albuquerque, whence (Apr. 12, 1863) he moved down the Rio Grande, he encountered Canby at Peralta, but escaped him, after some fruitless long-range fighting, by destroying his train and dragging his guns over a desolate, waterless, mountainous region E. of the river, and thus made his way down to Fort Bliss, Tex., having left half his force dead or prisoners, though never defeated; and returned to report his sage conclusion that New Mexico was not worth a quarter of the cost of taking and holding it.

Some of the largest of the semi-civilized tribes settled in the Indian Territory were incited by their old Democratic agents and other influential whites to link their fortunes with the Confederacy soon after the Union defeats at Bull Run and Wilson's creek. Their aid proved, however, of little worth, and they were glad to return to the protection and alliance of the Union so soon as the progress of events had made it probable that this was the stronger side.

Gen. Sterling Price, after Pope's successes in Missouri near the close of the campaign of 1861, unable to fight a pitched battle, retreated rapidly through Springfield and Cassville, closely pursued, and fighting when he must, till he had reached Arkansas and formed a junction near Bos-

ton Mountain with Gen. Ben McCulloch, commanding a division of Texas and Arkansas volunteers, which raised his force to an equality with that of his pursuers. Gen. Albert Pike now added to the ration-consuming power of the Confederates a brigade of Indians, swelling their total to nearly 20,000 men. Earl van Dorn, late a captain of Union regulars, now a Confederate major-general, assumed chief command, and resolved to fight the Unionists (now led by Gen. Samuel R. Curtis, of Iowa) before they could be concentrated. Advancing rapidly from his camp at Cross Timber Hollows, Van Dorn fell upon Gen. Franz Sigel, holding the extreme Union advance at Bentonville. Sigel retreated (Mar. 3, 1862) fighting, and falling back coolly, until re-enforced at 4 P. M., when he encamped at Leetown on Curtis's right. Curtis held a good position on Sugar creek, which Van Dorn avoided by moving far to the left and attacking in overwhelming force the extreme Union right under Col. Carr, holding a swell of ground known as Pea Ridge. Carr, fearfully overmatched, resisted stubbornly for seven hours, during which he was repeatedly wounded, lost a fourth of his men, and was driven back half a mile. Curtis, who had but scantily re-enforced him up to 2 P. M., now ordered Gens. Asboth and Sigel to the support of Carr, himself accompanying Asboth, whose batteries were soon engaged, and he severely wounded. Night closed the combat as Sigel was coming into position on Asboth's left. Next morning Gen. Curtis, having completed his dispositions, ordered his center to advance, and the cannonade was re-opened on both sides, but the Confederates soon desisted and disappeared, fleeing through Cross Timber Hollows in their rear so rapidly as to defy pursuit. The Union loss in this battle was 1,351 out of 10,500 men. Van Dorn's force was at least 16,000, including 5,000 Indians. Among his killed were Gens. Ben McCulloch and McIntosh: among his wounded Gens. Price and Slack. Lack of ammunition was the reason alleged for his hasty retreat. Gen. Curtis then advanced without resistance to Batesville, Ark., and thence marched to Helena on the Mississippi, but once resisted by 1,500 cavalry under Gen. Albert Rust, who were easily routed with a loss of 100 to 8 Unionists.

Curtis's movement southeastward opened Missouri once more to Confederate incursions. Tidings of Union reverses in Virginia filled the invading ranks with volunteers from all quarters. Col. Porter, commanding some 2,000 of these raw levies, was attacked near Kirksville by Col. John McNeil with 1,000 cavalry and a battery, and after a desperate fight was defeated and his force virtually destroyed. Col. Poindexter, with 1,200 Confederates, was attacked by Col. Odin Guitar while crossing the Chariton river, and his command likewise captured or destroyed. After several more petty conflicts the Confederates were again chased out of Missouri and compelled to take refuge in Arkansas, where Gen. T. C. Hindman was now in chief command. Gen. Blunt commanded the Unionists, who had again entered that State some 5,000 strong; Gen. F. J. Herron, encamped at Wilson's creek with 7,000 men, hastened to his aid when apprised of his danger, reaching Fayetteville, Ark., Dec. 7. Hindman, deceiving Blunt by a threat of fighting, turned his left, and with 10,000 men fell upon Herron's 4,000 infantry and artillery at Prairie Grove, his cavalry having been pushed forward to help Blunt. A spirited fight ensued, Herron, desperately charged, bravely holding his ground until 2 P. M., when the welcome sound of Blunt's batteries was heard opening on his left. The forces engaged were now nearly equal, and the battle raged till after dark, little ground being gained on either side. Next morning the Confederates had left the field. Hindman's loss was 1,317, including Gen. Stein, killed. The Union loss was 1,148, of whom 953 were from Herron's 4,000.

An expedition consisting of thirty-one steamboats and 11,500 men, led by Gen. A. E. Burnside and Commodore L. M. Goldsborough, sailed from Fortress Monroe Jan. 11, 1862, for Roanoke and Albemarle Sounds, N. C., landing (Feb. 5) on Roanoke island a force by which Fort Bartow, its main defense, was speedily taken by assault, with a Union loss of 300, while about 2,500 Confederates were captured. The next point of attack was Newbern, which was likewise carried by assault (Mar. 14). Among the captures were 2 steamboats, 69 cannon, and 500 prisoners. The Union loss in the assault was 600. Fort Macon, on the coast, was next invested and taken, with its garrison of 500 men. This was the first of the regular Union fortresses retaken from the enemy. Washington, Plymouth, and other North Carolina ports fell without resistance, but Gen. Reno was repulsed in a fight at South Mills, and Gen. Foster in an attempt on the important railroad junction at Goldsboro.

Gen. Benjamin F. Butler, having raised in New England six regiments of 1,000 men each for the purpose, and being aided by a fleet under Capt. David G. Farragut, left Fortress Monroe (Feb. 25, 1862) for his rendezvous on Ship island, Miss., whither one of his brigades, under Gen. J. W. Phelps, had preceded him, and where his troops were soon augmented to 15,000. His objective point was New Orleans, a city of 170,000 inhabitants, defended by 3,000 men under Gen. Mansfield Lovell, but the strong forts St. Philip and Jackson, half-way between the city and the mouths of the Mississippi, were Lovell's main reliance. Earnest efforts to strengthen them by a raft or boom across the river were all but thwarted by the high stage of the heavily swelling current. Capt. Farragut, with his fleet of forty-seven armed vessels and 310 guns, appeared before the forts Apr. 17, opened fire next morning, and destroyed or evaded three fire-rafts sent down to annoy him. After three days' ineffective bombardment, the Itasca, Capt. Caldwell, steamed up to the great boom or chain, and cut it with sledge and chisel, when another fire-raft was sent down to no purpose, and two more days were wasted in fruitless cannonading; then Farragut, with his fleet in three divisions, resolved to fight his way by the forts against the sweeping current; which he successfully did, fighting and capturing or scattering the Confederate gunboats above, with a net loss of the Varuna steamship sunk and some 200 men. The forts, thus rendered useless, were soon surrendered. Capt. Farragut, with nine of his vessels, steamed directly up to the city, whence a thick black smoke apprised him that the Confederates were burning ships, steamboats, etc., laden with cotton, sugar, flour, etc. Lovell drew off his men, and the city signified that it could make no resistance. Passing up to Carrollton, 8 miles above, Farragut found its works abandoned and in flames. Gen. Butler, having reduced the forts, soon came up and took possession, which was not thenceforth disputed.

All the towns on the Mississippi below Vicksburg were easily captured by Farragut, and an attempt to retake Baton Rouge (Aug. 5), by a force of 2,500 Confederates under Maj.-Gen. John C. Breckenridge, was repulsed by an equal Union force under Gen. Thomas Williams, who was killed. The Confederates lost 300 men, including Gen. Clarke and six colonels. The Union loss was 250. The lower parishes of Louisiana hereupon fell to the Unionists without serious resistance. Butler was relieved by Gen. N. P. Banks Dec. 16, having just before been outlawed as a felon by Jefferson Davis.

Gen. George B. McClellan had been called from West Virginia to the command of the Army of the Potomac soon after the Union disaster at Bull Run, and on the retirement of Gen. Scott made commander-in-chief of the Union armies. A very large force, fully 200,000 strong, was rapidly gathered around him and drilled into the coherence of a regular army. The far weaker Confederate force confronting him gradually withdrew to Centreville and Manassas Junction, where they spent the winter of 1861–62. Gen. McClellan remained quiet till expressly ordered (Feb. 22) by President Lincoln to advance, when he moved out to Manassas Junction, to find it evacuated by the Confederates, who, under Gen. Joseph E. Johnston, had quietly retired behind the Rapidan. Gen. McClellan now transferred the bulk of his army by water to Fortress Monroe, preparatory to an advance on Richmond up the peninsula between the James and York rivers. Meantime Gen. Banks was left in command in the valley of Virginia, and had just left for Washington, when his 7,000 men, now under Gen. James Shields, well posted near Kernstown, were attacked by Stonewall Jackson with but 4,000 men, who were defeated with a loss of at least 1,000. Gen. Shields's loss was about 600.

Just before McClellan reached the James, the Confederate ironclad Virginia (late the U. S. steam-frigate Merrimack) had sallied out of Norfolk (Mar. 8), and, attended by two gunboats, made directly for the Union frigates Congress and Cumberland, lying near Newport News, and disdaining to reply to their rapid cannonade, of which the balls rebounded from her sloping roof of iron as though they were peas, struck the Cumberland with her iron beak, smashing in the frigate's bow, so that she filled and sank in half an hour, carrying down a part of her crew. The Congress, seeing the fate of her consort, set sail and ran aground under the batteries of Newport News, where she was raked by

the ram until her commander, Lieut. Joseph B. Smith, and most of her officers and men were either killed or wounded, when her flag was hauled down; but her captors were prevented from burning her by a fire from the Union batteries on shore. The Merrimack afterward returned and bombarded her until she was set on fire and blown up, half her crew of 434 men having fallen. The steam-frigate Minnesota and frigate Lawrence, hurrying to the aid of the Cumberland and Congress, had severally grounded in the harbor. The Lawrence soon got off and returned to port, but the Minnesota, still aground, was cannonaded for hours by the entire Confederate flotilla, the Merrimack being unable to approach nearer than a mile, owing to the shallowness of the water. At 7 P. M. all three desisted and steamed toward Norfolk. At ten the new Union ironclad Monitor, Lieut. John L. Worden, steamed into the roadstead on her trial-trip from New York. At 6 A. M. the hostile fleet reappeared and made for the Minnesota, but the little Monitor interposed, and the strange combat was renewed and continued with varying fortunes until the Confederate fleet sheered off and stood for Norfolk. The Merrimack was badly crippled, her commander, Buchanan, having been wounded in the fight with the wooden ships. She never fought again, and was blown up when Norfolk was evacuated by the Confederates not long afterward. The little Monitor (styled a "cheese-box on a raft") remained master of the situation, but was lost, months afterward, in passing Cape Hatteras.

Gen. McClellan reached Fortress Monroe Apr. 2. Of his army 58,000 had preceded him, and as many more soon followed. Advancing up the peninsula, he was soon arrested by Confederate batteries on Warwick creek (which nearly crosses the peninsula abreast of Yorktown), manned by Gen. J. B. Magruder, who had some 11,000 men in all wherewith to hold a line 13 miles long. Thirty days were spent here. When McClellan had planted his breeching-batteries, and was nearly ready to open fire, it was found that Magruder had retreated. On reaching Williamsburg, McClellan's advance was stopped by works known as Fort Magruder, where Hooker's division fought nine hours and lost heavily. At length the Confederate position was flanked by Gen. Hancock of Sumner's division, and Magruder retreated during the night, leaving 700 men severely wounded. The total Union loss was 2,228, that of the Confederates probably less. West Point, at the head of York river, was occupied May 6 with a Union loss of 200. This movement up the peninsula, coupled with Burnside's successes in North Carolina, compelled the Confederates to evacuate Norfolk, with its navy-yard, about 200 guns, and some worthless vessels. That city they never recovered. Gen. McClellan, no longer resisted, advanced to the Chickahominy on the 20th.

Here he halted and fortified with over 100,000 effective men, believing the Confederate army in his front nearly if not quite equal in numbers to his own. Meantime Gen. Fremont, to whom Western Virginia had been assigned as a department, advanced into the Alleghanies and threatened Staunton from the direction of Monterey. Jackson sent Gen. Edward Johnson to oppose Fremont's advance under Milroy, who retreated and was joined by Gen. Robert C. Schenck near McDowell, where a battle was fought, with a Union loss of 461, the Unionists retreating after nightfall. Jackson recrossed Shenandoah Mountain, and marched rapidly down the valley to Front Royal, where he surprised and routed Col. John R. Kenly, taking 700 prisoners. Pushing on to Strasburg, Jackson compelled Banks to retreat rapidly to Winchester, where he fought five hours, and then, being greatly outnumbered, retreated hurriedly to Martinsburg and Williamsport, where he crossed the Potomac, having lost about 1,000 men, besides the sick and wounded in his hospitals. Jackson's cavalry pursued to Martinsburg, but most of his infantry were halted not far beyond Winchester, and soon retreated rapidly to confront Fremont and McDowell, who were hastening to bar his way. Fremont, crossing the Alleghanies by a rugged route, reached Strasburg June 1, a few hours after Jackson had passed that point. Jackson, still retreating, destroyed the numerous bridges behind him, and turned to fight (June 8) at Cross Keys, where he checked Fremont; then, again retreating, he crossed the South Fork at Port Republic, falling with a superior force upon Gen. Tyler, who, with a part of Shields's division of McDowell's army, was forced back with loss. Jackson thus balked all his foes, having lost but 1,167 men since he left Winchester. His baffled pursuers were now recalled, and he, triumphant, was soon ordered to join Gen. Robert E. Lee, now in chief command at Richmond. The rebel general Heth had attacked Col. Crook at Lewisburg, West Va., and been routed on the same day with Jackson's demolition of Kenly.

An unsuccessful attack (May 15) on Drewry's Bluff, 8 miles below Richmond, by a Union fleet under Commander John Rodgers, was followed, May 27, by a fight near Hanover Court-house between the Union Fifth Corps, Gen. Fitz-John Porter, and Gen. L. O'Brien Branch's North Carolina division, which was driven off with a loss of 700, to 400 on the Union side.

Keyes's Fourth Corps having been thrown forward across the Chickahominy to Seven Pines on its right and Fair Oaks on its left, was attacked (May 28) by the Confederates under Gen. Joseph Johnston, who judged that Keyes might be overwhelmed before he could be sufficiently supported. Four divisions, under Longstreet, D. H. Hill, Huger, and G. W. Smith, were designated to make the attack, supported by all the rest of the Confederate army. Hill, at 1 P. M., first attacked Casey's division at Fair Oaks, surprising it while its defenses were still uncompleted, and pushing it back on Couch's division near Fair Oaks, with a loss of six guns, two of its colonels killed, and many men. Keyes barely held his ground at Fair Oaks till Sumner's corps, thrown across the Chickahominy, came to his aid. Heintzelman's corps, though nearer, came into the fight later, and the Union right was now attacked by Smith's corps, directed by Joseph Johnston as commander-in-chief till he was struck by a shell, and so badly wounded that he was disabled for months. Lee succeeded him. McClellan was at New Bridge, several miles up the Chickahominy, with the corps of Fitz-John Porter and Franklin, which were not brought into action. The battle raged without much advantage to either side till dark, when the Confederates drew off. They made a pretense of attacking next morning, to cover their removal of arms and stores from the camp of Keyes's corps, but the fighting amounted to little. Hooker, by Heintzelman's order, made a reconnoissance in force to within 4 miles of Richmond, meeting no resistance, but was recalled to Fair Oaks by McClellan. The Union loss in this affair was 5,739, including five colonels killed and seven generals wounded. Of Keyes's 12,000 men, 4,000 fell or were captured. Gen. McCall's division of McDowell's corps now joined McClellan, raising his total to 156,828, and his effective force to 115,102.

No further offensive movement was made by him until Jackson, whose movements had been studiously concealed, came in on Lee's left, and was pushed forward to assail and turn McClellan's extreme right at Mechanicsville, being supported by Branch, D. H. Hill, Longstreet, and A. P. Hill, with the bulk of the Confederate army.

A. P. Hill, on Jackson's arrival, crossed the Chickahominy and attacked Fitz-John Porter's corps of 27,000 strong, which, recoiling from Mechanicsville, took up a strong position behind it across Beaver Dam creek, but was repulsed (June 26), Jackson having not yet got into position. Porter now retreated by order to Gaines's Mill, where he was at once re-enforced by Slocum's division of Sumner's corps, raising his force to 35,000 men. But opposed to them were 50,000 veterans, led by their ablest commanders, including Longstreet and Jackson. After fighting gallantly for several hours, he telegraphed for aid to McClellan, who sent two brigades of Sumner's corps to his assistance, but the field was lost before their arrival. Porter lost nineteen guns, but halted just off the field, and was not pursued. The Union loss that day was 8,000, that of the Confederates about 5,000. But McClellan's base of supplies, West Point, had been captured by Stuart's cavalry, and he decided to retreat by his left flank through White Oak Swamp to the James. This movement puzzled Lee, who did not pursue with vigor, and the first attacks upon the Union rear were easily repulsed. Finally, McCall's division, serving as rear-guard, was assailed (June 30) in great force at Glendale, and after hard fighting defeated and driven; McCall himself being captured, with most of his guns. The struggle ended at 9 P. M., Hooker's and two brigades of Slocum's division having arrived too late to win the battle, but in time to check pursuit. The loss of men in this action was about 3,000 on either side.

The Union forces were now concentrated at Malvern Hill on James river, where they were attacked by the entire Confederate army, which was signally defeated in one of the most desperate actions of the war. The first attack was made at 3 P. M.; the most desperate charge was made at 6, and repulsed with great slaughter. The Confederate loss

in this struggle must have been nearly or quite 10,000, that of the Unionists perhaps half as many. McClellan during the evening moved down the James to Harrison's Landing, where Lee did not choose to assail him. He claimed 10,000 prisoners, 52 guns, and 35,000 small-arms as captured during the seven days' fighting, from Mechanicsville to Malvern inclusive. The Union loss during those days is reported by McClellan at 1,582 killed, 7,709 wounded, and 5,958 missing; total, 15,249. Jackson's and A. P. Hill's losses during those days were reported by them as 1,585 killed, 7,688 wounded; total, 9,336. This is probably about half the total Confederate loss, which included Gen. Griffith and three colonels, killed. Gen. Hooker soon afterward reoccupied Malvern Hill without resistance, taking 100 prisoners, but the Union army was soon withdrawn by the President's order to the Potomac. Its retreat and embarkation were unmolested. Gen. McClellan and his staff reached Aquia Creek Aug. 23.

Maj.-Gen. John Pope had been called from the West to Washington, and given the chief command of Fremont's, Banks's, and McDowell's forces, aggregating 50,000 men. Maj.-Gen. Halleck was also called from the West to Washington, and made general-in-chief. Pope concentrated his forces near Culpeper Court-house, and sent Banks forward with 8,000 men to Cedar Mountain, where he was confronted by Stonewall Jackson, from Richmond, with 25,000 men. Banks attacked (Aug. 9) under every disadvantage of position, and was steadily repulsed, losing 2,000 men; Jackson's loss was 1,314. Pope arrived at nightfall with Ricketts's division and part of Sigel's (late Fremont's) corps, but Jackson, seeing that Pope was about to move against him in superior force, soon retreated across the Rapidan.

Pope, continuing to act on the offensive, soon found the whole army of Virginia concentrating upon him, and retreated across the Rappahannock. Lee did not choose to force a passage on his front, and sent Jackson around by a long flank march up that river. Encamping at Salem, and emerging through Thoroughfare Gap, he struck the Alexandria R. R. at Bristow Station, in Pope's rear, and captured two trains of cars running westward from Warrenton. He now sent Stuart with two regiments to Manassas Junction, 7 miles farther north, which he surprised, taking 8 guns, 300 prisoners, and 7 trains laden with provisions, etc. Col. Scammon, with two Ohio regiments, now crossed Bull Run and assailed Jackson, but was easily beaten off, and Gen. F. G. W. Taylor, with four New Jersey regiments, renewed the experiment with like result; all of Jackson's and A. P. Hill's divisions being by this time at the Junction.

Pope, by this time aware that something was wrong in his rear, began to fall back on Bristow Station, where Hooker drove Ewell, capturing part of his train. Ewell fell back on Manassas, which Pope's gathering force compelled Jackson to abandon, moving westward, leaving the captured provisions, which he could not remove. Moving toward Thoroughfare Gap, he encountered Rufus King's division of McDowell's corps, which fought him stoutly, but did not bar his way. The loss on either side was heavy, Maj.-Gen. Ewell being among the Confederates wounded.

Pope, now at Centreville, still hoped to envelop and crush Jackson, but was baffled by the non-arrival of Fitz-John Porter at Manassas Junction, and by the emerging of Longstreet's corps through Thoroughfare Gap, driving off Ricketts's division, which attempted to push it back. Before noon (Aug. 29) Longstreet had come in near Gainesville, on the right of Jackson's hotly engaged corps at Groveton, and the battle raged furiously till night, when Pope claimed advantage, and expected to crush the enemy next day. But the re-enforcements he reasonably expected from McClellan's army did not come up; and Pope, unsupported, was beaten and retreated on Centreville, near which Franklin's corps, 8,000 strong, had stood idle all that day (Aug. 30). Here Pope was re-enforced by Sumner, as well as by Franklin; and Lee, now in command, did not choose to attack him in front, but sent Jackson to gain his rear again by a flank march to the northward. Gaining Pope's rear, Jackson attacked his flank rear near Chantilly, where Reno's two divisions and Phil Kearny's confronted him. Gen. Kearny was killed, as was Gen. Isaac I. Stevens, commanding one of Reno's divisions; but Jackson gained no victory. Pope quietly retreated to the Potomac unassailed, and resigned his command, which was given to Gen. McClellan. The Union loss in this brief and bloody campaign was hardly less than 25,000, including 9,000 prisoners; the Confederate loss was hardly less than 15,000. Cols. Fletcher Webster (son of Daniel), of Massachusetts, Roberts, of Michigan, O'Connor, of Wisconsin, Koltes, of Pennsylvania, Cantwell, of Ohio, and Brown, of Indiana, were among the Union killed. Maj.-Gen. R. C. Schenck was wounded.

Gen. Lee, re-enforced from Richmond by D. H. Hill's fresh division, crossed the Potomac, unopposed, opposite Leesburg, and advanced to Frederick, whence he issued (Sept. 8) an address to the people of Maryland, implying that he came as a liberator, but obtained few recruits. Intent on capturing a Union force of 12,000 men holding Harper's Ferry, he divided his army. McClellan followed Lee's right wing, moving west toward Hagerstown, overtaking it at Turner's Gap of South Mountain, and driving it westward, after a fight (Sept. 14) in which he lost 1,568 men and took 1,500 prisoners. Franklin simultaneously cleared Crampton's Gap on the left. Harper's Ferry was surrounded by the Confederates in great force under Stonewall Jackson, and after a brief cannonade was surrendered (Sept. 15) by Gen. D. S. Miles, who was killed by a ball just as he had raised the white flag. Col. Davis had escaped with 2,000 cavalry during the night, but 11,583 men and 73 guns were the trophies of this triumph.

Lee rapidly concentrated his army around Sharpsburg, along a ridge facing Antietam creek. McClellan soon confronted and attacked him (Sept. 17), and a bloody, determined battle was fought there between 87,000 Unionists and 70,000 Confederates, of whom but 40,000 were in position at the outset. McClellan's loss was 2,010 killed, 9,416 wounded, and 1,043 missing; total, 12,469; Lee's, 1,842 killed (including Gens. Branch, of North Carolina, Starke, of Mississippi, and G. B. Anderson, of Georgia), 9,399 wounded, and 2,292 missing; total, 13,533. That was the bloodiest day America has known. Many regiments lost more than half their men. It was in one sense a drawn battle, yet when McClellan, after a day's rest, advanced to renew it, he found that Lee had recrossed the Potomac into Virginia. An irresolute attempt by Gen. Porter to follow was repulsed by Lee's artillery, with a Union loss of 200 prisoners. Lee retreated at leisure by Bunker Hill and Winchester, while Stuart, with 1,500 cavalry, made a raid to Chambersburg, Pa., where he paroled 275 sick and wounded Unionists and destroyed valuable stores, passing around McClellan's army and recrossing the Potomac below Harper's Ferry. McClellan, facing Lee, had moved down to Warrenton, Va., where he was relieved of his command (Nov. 7). Gen. Burnside succeeded him, and, still moving to the left as Lee faced him, at length threw a bridge across the Rappahannock at Fredericksburg, and assailed (Dec. 13) Lee's army, holding the heights south of that river, attempting also to flank his right; but the attack in front, 60,000 strong, led by Hooker and Sumner, was repulsed with great slaughter, while that by 40,000 men under Franklin, in flank, was unsuccessful. The Union loss in this disastrous affair was 1,152 (including Maj.-Gen. G. D. Bayard) killed, 9,101 wounded, and 3,234 missing; total, 13,771. The Confederate loss was about 5,000, including Gen. Maxcy Gregg (just chosen Governor of South Carolina) and Gen. T. R. R. Cobb, of Georgia. Burnside purposed to renew the attack next day, but was dissuaded, and recrossed the Rappahannock unassailed during the night of the 15th–16th. Burnside attempted (Jan. 20, 1863) to cross the Rappahannock by fords above Fredericksburg, but was baffled by a terrible storm, and desisted. Eight days later he was relieved of the command.

Gen. Halleck had taken command of Grant's and Buell's combined forces, now swelled to 100,000 men, directly after the battle of Pittsburg Landing, and by slow and regular approaches had forced Beauregard to retreat with little loss from his fortified position at Corinth. Beauregard was pursued by Pope as far as Baldwin and Guntown, Miss., but to little purpose. Meantime Gen. O. M. Mitchell, with a division of Buell's army, had struck eastward up the Tennessee, occupying Huntsville, Bridgeport, Tuscumbia, etc., and making considerable captures of munitions, railroad cars, etc., with little loss. An attempt on Chattanooga under Gen. Negley was repulsed by Kirby Smith. Subsequent to this the war in that quarter languished under Buell's command, while daring raids were made in all directions by Confederate guerrillas and cavalry under Gens. N. B. Forrest and John Morgan. Clarksville, Tenn., Henderson, and Cynthiana, Ky., were among the towns thus pounced upon, while at Murfreesboro, Tenn., Forrest captured some 1,500 Union troops. The general result of these partisan conflicts was adverse to the Union cause.

Gen. Bragg, having succeeded Beauregard in chief command in this quarter, advanced in June with 45,000 men from the heart of Mississippi into Tennessee, crossing the Tennessee just below Chattanooga, and striking boldly northward through a rugged, mountainous, thinly peopled region. At Richmond, Ky., his advance, under Kirby Smith, fought (Aug. 29) and routed in detail a Union division under Gen. M. D. Manson, of Indiana, who was taken prisoner with nearly 5,000 of his men. Smith boasted that his prisoners equaled in number his entire force. Smith entered Lexington in triumph. Munfordsville, Ky., was captured (Sept. 16) by Bragg, who claimed 4,000 prisoners. Thence Bragg advanced unopposed through Bardstown to Frankfort, where he inaugurated (Oct. 1) Richard Haines as Confederate Governor of Kentucky. Cincinnati, in great alarm, fortified the Kentucky approaches to the Ohio, and Louisville seemed in imminent peril.

Gen. Buell, leaving Nashville strongly garrisoned, had of late been marching northward on Bragg's left with an army finally swelled by raw levies to 100,000, or at least twice the number of Bragg's much better disciplined force. Still, Buell hesitated to attack, distrusting the effectiveness of his men, but at length moved (Oct. 1) from Louisville to Bardstown and Springfield, Bragg retiring and concentrating before him. Moving thence on Harrodsburg, his left was struck (Oct. 9) near Perryville by five divisions of Bragg's army under Gen. L. Polk, which outnumbered and drove the inferior force directly opposed to it, killing Maj.-Gen. James S. Jackson, a Kentucky member of Congress. The fight was maintained from 2 P. M. till dark, with advantage at last on the Union side, but Buell's total loss this day was 4,348, and Bragg's but 2,500. Buell had 58,000 men under his command, but not half of them were engaged, as he did not know his left wing was in action until 4 P. M. Advancing at sunrise the next morning to renew the battle, he learned that Bragg had decamped, and he did not stop till he was behind the Cumberland Mountains in East Tennessee.

Gen. Grant, left in command of West Tennessee, with Rosecrans in Northern Mississippi, the two attempted a combined movement on Gen. Stirling Price at Iuka, Miss. Rosecrans alone attacked (Sept. 19), but Price held his ground firmly, abandoning it during the ensuing night. His loss was at least 1,000; Rosecrans's was 782. Price retreated to Ripley, Miss., where he was succeeded by Van Dorn, who now, with at least 30,000 men, undertook to drive or capture Rosecrans and his 20,000, holding the former Confederate fortifications at Corinth. One of the great charges of the war was made by Price, but failed, because Van Dorn was seven minutes too late on his side. The Confederate loss in this repulse was at least 5,000, including 1,423 killed and 2,248 prisoners. On the Union side 315 were killed, including Gen. P. A. Hackleman, of Indiana, 1,812 wounded, and 232 missing; total, 2,359. Van Dorn and Price retreated precipitately.

Gen. Rosecrans was hereupon given command of the Army of the Ohio (renamed the Army of the Cumberland), in place of Gen. Buell. He had 65,000 effective men, mainly clustered around Bowling Green, Ky., whence he soon transferred his headquarters to Nashville, and prepared to advance. Meantime the brigade of Col. A. B. Moore, of Illinois, at Hartsville, nearly 2,000 strong, was surprised and captured by John Morgan with 1,500 cavalry. Rosecrans, with 46,910 men in three divisions, led by Gens. Thomas, McCook, and Crittenden, left Nashville Dec. 26, advancing slowly, with some desultory fighting, to Stone river, opposite Murfreesboro, where his right under McCook was surprised and crushed by Hardee at 7 P. M., Dec. 31, McCook losing twenty-eight guns and nearly half his men. But when Rosecrans's center was assailed in turn by the triumphant Confederates, his firmness and soldiership, with those of Gen. Thomas, saved the day. Heavy fighting continued throughout the day, with little to boast of on either side since McCook's disaster. But the Confederates had assailed him at all points without success, losing heavily, having been so roughly handled that they did not care to try again. Next day (Jan. 1, 1863) there was a little desultory fighting, mainly at long range. On the day following (Jan. 2) a heavy cannonade was begun by the Confederates, and replied to with spirit; and at 3 P. M. a great charge was made on the Union left by Breckenridge's corps, aided by a heavy enfilading fire from Polk's artillery, but was repulsed after a bloody struggle by the divisions of Negley and Jefferson C. Davis, supporting the fire of Crittenden's batteries, and charging in turn. The Confederates lost four guns and some prisoners, and were pursued across Stone river, where the victors intrenched and rested for the night. The next day passed with little fighting. Bragg at 11 P. M. began to evacuate Murfreesboro, where Rosecrans, on advancing next morning, found only the desperately wounded. Rosecrans reported his losses in this protracted struggle at 1,533 killed, 7,245 wounded, and 2,800 prisoners; total, 11,578 out of 43,400. Bragg reported his loss at over 10,000, including 9,000 killed and wounded, out of 35,000. Cavalry raids by Forrest in West Tennessee, John Morgan in the heart of Kentucky, and Wheeler on the Cumberland, were made this winter to little purpose. Col. A. D. Streight, of Indiana, was sent by Rosecrans (Apr. 10) with 1,800 cavalry to operate on Bragg's rear, but was surrounded near Rome, Ga., by Forrest and Reddy, and compelled to surrender. Sundry minor conflicts in this quarter inflicted in the aggregate about equal losses on either belligerent.

Commodore Foote had triumphantly swept down the Mississippi from Cairo to Vicksburg, co-operating with Gen. Pope on the Missouri and Gen. W. T. Sherman on the Kentucky side. Columbus, Ky., was abandoned on his approach; New Madrid, Mo., and Island No. 10 in the Mississippi, were successively taken by Pope, compelling Gen. Makall to surrender 123 guns and 6,700 men; then Forts Pillow and Randolph, which opened the river to Memphis, where a Confederate fleet of steamboats undertook to bar the way, but was soon demolished (June 4), when Memphis was quietly surrendered. An expedition thence up White river, to open communications with Gen. Curtis, did not find him, but lost the steamboat Mound City, with 150 men, by a ball through her boiler in an attack on St. Charles, which was taken. Commodore Davis steamed down to Vicksburg, and communicated with Farragut below it from New Orleans; but a combined naval attack (July 1) on that stronghold was repulsed, and the siege raised July 24.

Gen. Grant, now at Jackson, Tenn., after the battles at Iuka and Corinth had his department enlarged so as to include Mississippi, while 11,500 men were sent him under McPherson. He had advanced as far as Oxford, Miss., on the way to Vicksburg, when Van Dorn struck (Dec. 20) with cavalry at Holly Springs in his rear, where Grant's stores were awaiting a further reopening of the railroad. The place was occupied by Col. R. C. Murphy, of Wisconsin, who surrendered nearly 2,000 men, nearly half of them in hospital. Grant at once cashiered Murphy in a stinging order, but meantime his stores, worth $4,000,000, had been destroyed or carried off, and he was compelled to turn back into Tennessee.

Gen. W. T. Sherman, with 30,000 men, left Memphis on steamboats, Dec. 21, and fell down the Mississippi to cooperate in the reduction of Vicksburg. Ascending the Yazoo, he made (Dec. 22) a resolute attack on the Confederate batteries commanding Chickasaw Bayou, but the ground was difficult, the banks strong and well manned, and he was repulsed with a loss of 2,000, while Gen. Pemberton reported the Confederate loss at 267.

Gen. John A. McClernand now superseded Gen. Sherman, and at once resolved on the reduction of Fort Hindman (known as Arkansas Post), 50 miles up the Arkansas river. His force was so large, and his dispositions so well made, that his first assault compelled its surrender, with 5,000 prisoners and seventeen guns. The Union loss in the assault was 977. Gen. Grant arrived from Memphis and assumed chief command Feb. 2, 1863.

Attempts to cut a channel across the narrow isthmus opposite Vicksburg on which the Union army was encamped proved failures, and a boat expedition under Gen. L. F. Ross from the Mississippi, through Yazoo Pass, into the Coldwater and Tallahatchie rivers, was stopped and turned back by Confederate works at the head of the Yazoo, returning to the Mississippi unmolested; and one or more kindred attempts to circumvent the defenses of Vicksburg were likewise baffled. At length Gen. Grant decided to gain their rear by the south rather than the north, and, defying high water and other impediments, marched his army 70 miles to Hard Times, nearly opposite Grand Gulf. Commodore Porter, commanding the Union fleet above Vicksburg, ran the batteries of that city with eight gunboats and eight barges, whereof but two were destroyed by their fire, the rest appearing before Grand Gulf in season to bombard its defenses, but to no purpose. Grant thereupon crossed (Apr. 30) at Bruinsburg, some miles below, and, taking them in reverse, easily took possession of Port Gib-

son and Grand Gulf, defeating Gen. Bowen, who had been sent from Vicksburg to resist him, with a loss of nearly 1,000 on each side. Moving up the Big Black, Gen. Grant's advance easily crushed at Raymond two brigades under Gregg; Union loss, 443; Confederate, 723. Advancing to Jackson, the capital of the State, McPherson was there resisted by Gen. W. H. T. Walker, who was promptly defeated, with a Confederate loss of 845 to 265 Union. Here seventeen guns were taken and much material destroyed.

By this time Gen. Joseph Johnston had arrived with reenforcements, and assumed chief command of the Confederates, directing Pemberton to join him with the defenders of Vicksburg. Grant of course moved rapidly westward to bar such junction, and at Champion Hills encountered (May 16) Pemberton, who attempted too late to move northward and join Johnston, but was compelled to fight thrice his force, and was beaten with a loss of Gen. Tilghman among the killed, 2,000 prisoners, and 15 guns. Gen. Loring's division was cut off from Pemberton's, and escaped southward to Jackson. At the crossing of the Big Black, Pemberton fought again, but was soon put to flight, with a loss of 18 guns and 1,500 prisoners. Pemberton, with whatever he still had left, fled into Vicksburg, necessarily abandoning his strong defenses on the Yazoo, with a number of heavy guns. The Confederate navy-yard and hospital at Yazoo City, with 1,500 sick and wounded, were among the fruits of these successes. Grant followed Pemberton closely, and tried to carry his stronghold by assault, but was repulsed with heavy loss. He then sat down to patient sapping and mining, fortifying his rear against Johnston, who was threatening him from Clinton and Jackson, and worked away until Pemberton was starved into a surrender (July 3), having still 15,000 men fit for duty, besides 10,000 in hospitals. Grant reports his total loss from his landing at Bruinsburg to his triumphant entry (July 4) into Vicksburg at 943 killed, 7,095 wounded, and 537 missing; total, 8,515, of whom 4,236 fell before Vicksburg; and claims 37,000 prisoners, of whom a large part were sick or wounded, with arms and munitions for 60,000 men. Among the Confederates killed were Gens. Tracy, Tilghman, and Green. Grant now turned, with a force raised to 50,000, upon Johnston, who had but 24,000, pushed him back to Jackson, and there besieged him, with a loss of 600 on either side, until he decided to decamp, retreating by Brandon to Morton.

During these momentous operations Col. B. H. Grierson, with 1,700 cavalry, raided southward from Lagrange, Tenn., through Pontotoc, by Jackson and Natchez, to the Mississippi at Baton Rouge, taking 500 prisoners and 3,000 small-arms, having traversed 600 miles of mainly horrible roads in sixteen days, losing but twenty-seven men. Milliken's Bend, on the Mississippi, held by Gen. E. A. Dennis with 1,400 men, was attacked by the Confederate general Henry McCulloch with a superior force, which was repelled with a loss of some 500 to either side. Helena, Ark., held by Gen. B. M. Prentiss with 4,000 men, was likewise attacked (June 30) by the Confederate general Holmes with 7,646, losing 1,636, whereof 1,000 were captured. Helena was thereafter let alone.

Gen. Banks, commanding at New Orleans, found Galveston already surrendered (Oct. 8, 1862), without resistance, to a Union fleet of four gunboats, and thence quietly held till he sent down a regiment, of which part was debarked (Dec. 28), when Gen. Magruder, just appointed to command in Texas, organized a fleet of mercantile steamers, shielded by cotton-bales and manned in good part by volunteers, with which he proceeded down the bayou in the night (Dec. 31) and boldly attacked the Union fleet in the harbor, captured the Harriet Lane, sunk the Westfield, and compelled the troops ashore to surrender. And the Confederate privateer Alabama, arriving off the bar soon after, silenced and took the Union gunboat Hatteras, Capt. Blake, which sunk six minutes afterward. Maj. O. M. Watkins, blockading the mouth of the Sabine with two gunboats, was attacked by two Confederate gunboats from up-river, and easily captured.

Gen. Banks had 30,000 men, which sickness, desertion, and detachments soon reduced to 14,000. Having pushed these westward, so as to clear the country of all enemies to the Atchafalaya by an easy fight at Carney's Bridge, he at once returned and laid siege to Port Hudson on the Mississippi, where the Confederates had established batteries to dispute the passage of the river. Commodore Farragut, with four frigates and five gunboats, passed the batteries, losing one of his best vessels in so doing. Banks, deeming the garrison too strong to be successfully assaulted by his force, again moved westward to Alexandria, driving Gen. R. Taylor and taking 2,000 prisoners, several steamboats, and 22 guns. Again Banks returned to the Mississippi at Port Hudson, which he invested, and soon tried to carry by assault, but was beaten off with a loss of 2,000 against 300. He now besieged in due form, and at length made (June 14) a second assault, which likewise failed. But no relieving army appeared, supplies were very short, and the garrison were on short allowance, with little to eat left, when a tremendous salute from the investing Union batteries and gunboats gave notice (July 6) that Vicksburg had fallen. Upon being convinced of this fact, Gen. Gardener surrendered the fort with its garrison of 6,408 men, of whom many were sick or wounded. Banks's effective force was that day about 10,000; his total captures during the campaign, 10,584 men, 73 guns, and 6,000 small-arms.

Brashear City, on the Atchafalaya, was surprised and captured by the Confederate general R. Taylor (June 22), with a Union loss of 1,000 men and 10 guns. The Union camp of Gen. Dudley near Donaldsonville was in like manner surprised (July 12) by 1,200 Texans, and 300 prisoners taken. Banks returned to New Orleans, and sent Gen. Franklin with a fleet and 4,000 men to take the fort at Sabine Pass; but the naval attack was repulsed with a loss of 2 gunboats, 15 guns, and 250 men, which exceeded the whole number opposed to them.

Gen. Banks pushed out a part of his command, under Gen. C. C. Washburne, to Opelousas, to make his own movement on Texas. On his retreat to the Teche, Gen. Washburne's right was attacked (Nov. 1) by Gen. R. Taylor, and roughly handled, the Sixty-seventh Indiana being captured entire. Re-enforcements being brought up, Taylor drew off, having inflicted a loss of 716, and suffered but 425.

Gen. Banks, with 6,000 men, steamed from New Orleans to the Rio Grande, thence capturing Brazos Santiago, Brownsville, Aransas Pass, Fort Esperanza (commanding Matagorda Bay) with little opposition and hardly any loss, there being no considerable force to oppose him. He then returned to New Orleans, leaving Gen. N. J. T. Dana in command, but the latter found no hostile force in that part of Texas, and accomplished very little.

When the spring of 1864 had fairly opened, Gen. A. J. Smith's corps from Sherman's army, supported by Commodore Porter with a powerful steam-fleet, advanced up Red river, menacing Shreveport, while Gen. Steele was to co-operate by a movement from Little Rock, which had been taken by an advance with 12,000 men from Helena six months before. Gen. Price, who was in command there, was far outnumbered and easily routed. He burned six steamboats and some stores, falling back to the vicinity of Red river. Steele lost but 100 killed and wounded in this advance, and took 1,000 prisoners.

Banks's advance, which should have passed Alexandria before Mar. 1, only reached that point on the 16th, and he was not ready to advance farther till about Apr. 1, at which time the river was rapidly falling, and barely navigable for gunboats. By this time his 40,000 men had been reduced by details and sickness to 20,000, whereof the van had reached Sabine Cross-roads, near Mansfield, when, as it moved carelessly through a pine-woods region, it was attacked in great force, outflanked and routed, and an attempt to re-form was baffled by the presence of a supply-train which should have been elsewhere. Retreating, or rather fleeing, 3 miles to Pleasant Grove, the routed van re-formed upon Gen. Emory's division, and was again charged headlong by the flushed Confederates, and brisk fighting ensued, in which the Confederate general Mouton was killed. Every attack was repulsed, and darkness closed the combat. Gen. Banks retreated during the night 15 miles to Pleasant Hill, where Gen. Smith's corps was awaiting him, raising his entire force to 15,000. At 11 A. M. the Confederates appeared, and skirmished continuously till 4 P. M., when they made a grand attack, and were again beaten off, losing 400 prisoners. Gen. M. Parsons (Confederate) and Col. Lewis Benedict (Union) were among the killed. Banks's loss in these fights was 3,969, mainly taken prisoners at the first collision. Though successful in the last struggle, he did not again advance, but marched to the Red river at Grand Grove, thence convoying the fleet, which was often hard aground, back to Alexandria. His rear and his vessels were repeatedly and sharply assailed; in one attack, Gen. Thomas Green, of Texas, was killed. The Eastport, one of the gunboats, being hard aground, was blown up. The rest of the fleet was

saved, and taken down to the Mississippi, passing Alexandria with great difficulty by the help of dams. Having now A. J. Smith's corps to spare, Banks continued his retreat, forced to fight and push aside Gen. Bee with 8,000 men, with a loss of 250 on either side. One steamboat was burned and three captured by Confederates near Dean's Bayou, 30 miles below Alexandria, some 500 Unionists being made prisoners. Part of them were retaken in repulsing (May 6) a Confederate attack on Banks's advance near Mansura, and an attack on his rear (May 19) at Yellow Bayou on the Atchafalaya.

Gen. Steele's advance from Little Rock to co-operate with Banks was, by the retreat of the latter, exposed to great peril. The Confederates under Gen. Fagan turned upon him in great force, drove in or captured his foraging parties, and at length struck his advance a heavy blow (Apr. 25) at Marks's Mill, taking some 1,500 prisoners. Steele thereupon retreated, and was attacked (Apr. 30) by Kirby Smith at Jenkins's Ferry on the Sabine; but the Unionists, though inferior in numbers, had the advantage in position, and repulsed their assailants after a sharp contest, in which the Union loss was 700; the Confederate 2,300, including three generals. Steele's retreat to Little Rock was thenceforth unmolested. Several spirited contests were afterward had in different parts of Arkansas with varying results, but the northeastern half of its area was generally held by the Unionists, the other half by the Confederates nearly to the last.

In 1864, Gen. Rosecrans being now in command in Missouri, Gen. Price entered it from Batesville, Ark., first resisted at Pilot Knob by Gen. Hugh S. Ewing, who held his post throughout a day's fighting, and then retreated. Price advanced to Jefferson City, but, finding it too strong to attack, pushed westward to Lexington, and thence to the Little Blue, sharply followed by Gen. Pleasanton with a superior force, and overtaken at the Big Blue, where he made a stand, but was soon driven westward. Sharply pursued, Price was again overtaken at the Little Osage, where he was again routed with the loss of 8 guns and 1,000 prisoners, including Maj.-Gen. Marmaduke, a brigadier, and five colonels. The residue were chased to Fayetteville, Ark., but without much fighting.

Gen. Hooker, on succeeding, Jan., 1863, to the command of the Army of the Potomac, found it exceedingly demoralized by its disaster at Fredericksburg, the desertions averaging 200 per day. After devoting two months to reorganizing and reinspiring it, during which its force had been gradually raised to 100,000 infantry, 13,000 cavalry, and 10,000 artillery, he judged himself ready to assume the offensive. Dispatching most of his cavalry under Stoneman to destroy railroads, dépôts, etc., in Lee's rear, his van forded the Rappahannock at Kelly's Ford, above Fredericksburg, advancing rapidly to Chancellorsville, where he established his headquarters and paused. Gen. Anderson, who had been watching the fords, being too weak to resist, fell back quietly before him to within 5 miles of Fredericksburg, where Lee met him with two divisions. Meanwhile Stonewall Jackson with two more moved rapidly from Lee's right below Fredericksburg, and passed silently around Hooker's right, several miles W. of Chancellorsville. Suddenly, just before sunset (May 2), Howard's corps, holding the Union right, was struck in flank and rear while ignorant of danger, and in part at supper with arms stacked, by Stonewall Jackson's corps, 25,000 strong, which burst from the thick woods of that region and literally demolished it. Ten minutes after the first shot its men were rushing in wild consternation toward Chancellorsville and the river beyond; thousands of them were unarmed, while very many of them were made prisoners. Two or three regiments were sacrificed in unsuccessful attempts to stay Jackson's impetuous rush. Finally, Gen. Pleasonton got his battery of horse artillery into position, and arrested the advance by murderous discharges of grape at short range. Here fell Stonewall Jackson, mortally wounded: it was said by a volley from some of his own men. It was dark, and they were in the woods; all that is certain is that he died of his wounds eight days afterward. The flight was here stopped, and some of the lost ground regained, but the Eleventh Corps was temporarily extinct; so Hooker drew back his right toward Chancellorsville.

The Confederates next morning followed up their decided success by charge after charge in great force on Gen. Sickles's corps, now holding the Union right, and caused it to give some ground during the day. The carnage of that day was frightful, Sickles having 4,000 out of 18,000 killed or wounded. Hooker had been stunned by a cannon-ball striking a pillar of the Chancellorsville house against which he leaned, and hence failed to support Sickles when support was needed.

Sedgwick, with 22,000 men, had been left in front of Fredericksburg. He crossed the river early that morning just below that city, and was re-enforced by Gibbon, who crossed on a pontoon bridge, raising his troops to 30,000. By noon he had stormed and carried Marye's Heights, taking some guns and prisoners, thence pushing out 4 miles to Salem Church. But this brought him full upon Lee's army, which, having crossed to assail Hooker, now turned upon him, fighting him till darkness interposed. Next morning (May 4) Hooker remained passive, and Sedgwick, finding himself overpowered, retreated across Banks's Ford, having lost nearly 5,000 men. Lee might now have turned in full force upon Hooker, but his men had been overworked, and he hesitated. Hooker recrossed the Rappahannock unassailed during the ensuing night, claiming that he brought back one more gun than he took over, and that he had inflicted greater loss than he suffered, though his own (including Sedgwick's) was no less than 17,197 men. Lee's loss must have been heavy, but was not made public. Stoneman's cavalry returned May 8, having inflicted little loss and suffered little.

Lee soon after recalled Longstreet from a fruitless demonstration against Suffolk, Va., and while Hooker was planning to flank him by crossing the Rappahannock below Fredericksburg, was himself executing a more extensive and daring flank movement by Culpeper Court-house and Sperryville into the Shenandoah valley, and down that across the Potomac. This movement was first fully developed to Hooker by an advance in great force under Gen. Early on Winchester, held by Gen. Milroy, of Indiana, who evacuated it when too late, and lost 29 guns and 4,000 men in his hurried flight across the Potomac. Ewell pursued unresisted to Chambersburg, Pa., which Jenkins, with his cavalry, had reached some days before (June 17). Early's division of Ewell's corps moved forward to York, Pa., while Johnson's division pressed northward to Carlisle, and Imboden's brigade swept the valley of the Potomac westward to Cumberland, Md. By June 25 all of Lee's army had forded the Potomac, and was advancing into Pennsylvania. Ewell's van reached Kingston, but 13 miles from Harrisburg. As counted by two Unionists as it passed through Hagerstown, Lee had 91,000 infantry, 280 guns, and 6,000 cavalry, while 5,000 cavalry under Stuart entered Pennsylvania without traversing Hagerstown.

Gen. Hooker had waited long below and around Washington, incredulous that Lee would invade the free States. At length he too crossed the Potomac with 100,000 men, of whom 15,000 were spared him from the defenses of Washington. He wished to draw 10,000 more from Maryland Heights, opposite Harper's Ferry, but was forbidden to do so by Gen. Halleck. Hooker thereupon asked (by telegraph) to be relieved from the command, and was promptly directed by Halleck to turn it over to Gen. Meade, which he did, and was no more seen in the Army of the Potomac.

A cavalry fight (June 28), inaugurated by Stuart and repelled by Kilpatrick, was the first notice that the two great armies were nearing each other. They casually encountered near Gettysburg, Pa., where Gen. Buford's division of Unionists met the Confederate van under Heth, and drove it back upon its corps (Hill's), by which they were driven in turn. The sound of guns brought up Gen. Wadsworth's division of Reynolds's (First) corps, Reynolds himself going forward to reconnoiter, and being shot dead as he did so. Gen. Doubleday assumed command, but his force, being too weak, was driven back, capturing 800 prisoners as they retreated. Doubleday halted on Seminary Ridge, just W. of the village, where the residue of Reynolds's and all the Eleventh Corps soon came up, Howard assuming command. Ewell's (Confederate) corps next came up from York, and again gave the ascendency to their side, driving the Unionists through Gettysburg, with the loss of their wounded in hospital and several guns. Howard took position on Cemetery Hill, just S. of the village, and dispatched couriers to Meade and Sickles for aid. Sickles was at Emmittsburg, 10 miles away, but hastened to the scene of conflict; Meade, who was at Taneytown, expecting and preparing to fight on Pike Creek, sent Hancock at once to take command at Gettysburg, directing his corps under Gibbon to follow. Slocum arrived at 7 P. M., and took command, Hancock re-

turning to report to Meade. Before morning (July 2) each army had been concentrated around Gettysburg, save that Sedgwick's (Sixth) corps, which was 30 miles distant at 7 P. M., did not arrive until 2 P. M. of that eventful day. One hour later Sickles, who held an advanced position on the Union left, was attacked in overwhelming force by Longstreet just as he was about to recede, and was crushed back with heavy loss, losing a leg by a cannon-shot. Meantime Sykes's (Fifth) corps had seized Round Top, the highest point on that wing, and firmly held it. Hancock rushed to Sickles's relief and Longstreet's advance was arrested, but he held the ground from which Sickles had been driven. Ewell also had assailed and driven the weakened Union right, and the second day's fighting closed with the advantage still on the side of the Confederates.

The third day (July 3) opened with an advance of the Union right under Slocum, who had now been rejoined by a division sent over the day before to support the imperiled left. Slocum retook the ground he had lost, and rested upon it. Then there was a lull of an hour or more.

At 1 P. M. the roar of 115 heavy guns from Hill's and Longstreet's front, crossing their fire over the Union center at Cemetery Hill, announced the crisis of the struggle. For two hours they plowed the Union lines, being less effectively replied to by the less numerous Union artillery. At length the Union guns stopped firing in order to cool their pieces, and now the grand Confederate column of assault emerged from behind their suddenly silent batteries and pressed swiftly toward the Union lines. Pickett's and Heth's (now Pettigrew's) divisions led, charging up to the mouths of the Union guns, but were repulsed with terrible carnage. Pettigrew's brigade, having lost 2,000 out of 2,800 men, retreated under the command of a major. When the remnant regained their own lines the battle of Gettysburg had been lost and won, though a charge was afterward made by Crawford's division of Sykes's corps on the Union left, capturing a battery with 260 men, and retaking 7,000 small-arms, with Sickles's wounded, who had lain for twenty-four summer hours unguarded within the Confederate lines.

Gen. Meade reports his total loss in these three bloody days at 2,834 killed, 13,709 wounded, and 6,643 missing (mainly taken prisoners on the 1st). He claims as trophies 3 guns, 24,978 small-arms, and 13,621 prisoners, including wounded. He estimates the Confederate loss as much greater, which is probable, as about 7,000 of them were buried at Gettysburg, with 4,000 Unionists. Among the Confederate killed or mortally wounded were Gens. Pender, Barksdale, Garnett, Armistead, and Semmes. Had Meade known how badly the Confederates were beaten, he might probably have crushed them; but he doubted and hesitated while Lee retreated to the Potomac, sorely annoyed by the way. Lee says his rear remained near Gettysburg till after daylight of the 5th. He might have been assailed at the Potomac, as his bridge had been burned by Gen. French in his absence, and the river was swollen by heavy rains; yet he rebuilt his bridge, and crossed (July 12–13) his infantry and guns without loss; but a cavalry charge by Gen. Kilpatrick on his rear-guard drove it across with a loss of 125 killed (including Gen. Pettigrew) and 1,500 prisoners. Lee retreated the length of the Shenandoah, and resumed his position behind the Rappahannock, Gen. Meade following and facing him on the north bank.

Gen. Keyes, with 3,000 men, was ordered from Fortress Monroe to capture Richmond during Lee's absence in the North, but though few troops had been left to defend it, he desisted without a serious effort.

A series of partisan affairs ensued on either bank of the Rappahannock, the most important of which was the capture by storm of Rappahannock Station with 1,000 men by the Union brigades under Gen. David A. Russell. The Confederate rifle-pits at Kelly's Ford were in like manner taken, with 400 prisoners.

Meade, aware that Longstreet had been detached for service in Georgia and Tennessee, now advanced to attack Lee's depleted army at Mine Run, but, finally concluding that its position was too strong, desisted and retreated across the Rapidan, and thus closed the campaign of the Army of the Potomac in 1863.

Gen. Morgan made a fresh raid clear through Kentucky, striking and crossing the Ohio (July 7) at Brandenburg, 40 miles below Louisville, with a mounted force said to number 4,000. He then made his way through Indiana and Southern Ohio to Buffing island, not far below Parkersburg, but found the river patrolled by armed steamboats, while a considerable land force was pressing in his rear. Ultimately, less than 400 of his men escaped; all the rest were made prisoners with little fighting. Morgan himself was taken prisoner and confined in the State prison at Columbus, O., whence he escaped and regained the Confederate lines, but was surprised and shot in East Tennessee not long afterward.

Gen. Burnside had been sent from the East to the Ohio, taking his (Ninth) corps with him. Having dispatched a cavalry force under Col. H. S. Saunders across the Cumberland Mountains to burn railroad bridges and destroy stores, in which it was quite successful, with little loss, he crossed those mountains with 20,000 men, and suddenly appeared (Sept. 3) at Knoxville, where he was hailed by the long-suffering Unionists as a deliverer. He next moved on Cumberland Gap, where he captured Gen. Frazier with 14 guns and 2,000 men. But his activity was here arrested by the reverse encountered by Rosecrans at Chickamauga.

Rosecrans had stood idle at Murfreesboro since Jan. 1, 1863, awaiting re-enforcements and supplies, till June 24, when he advanced, taking 3 guns and 500 prisoners at Shelbyville, and soon cleared all Middle Tennessee of armed Confederates; Bragg retreated before him with little loss. Crossing the Tennessee at several points, Rosecrans compelled him to evacuate Chattanooga without fighting, retreating down the railroad that led into Georgia. Rosecrans, misled by his easy success, was pursuing in hot haste, when Bragg, having been re-enforced by Longstreet's corps from Virginia, turned suddenly on his widely scattered divisions, compelling him to concentrate hastily behind the Chickamauga creek. He had 55,000 men; Bragg had scarcely more, and the first day's fighting (Sept. 19) was indecisive. Next morning Rosecrans's right, while attempting to close down on his center, was struck heavily by Longstreet and torn to fragments, the *débris* flying in impotent dismay to Chattanooga, and sweeping Rosecrans along with it. But Gen. Thomas, farther to the left, stood firm, gaining ground somewhat, but maintaining a bold front, and, resting on a wooded ridge, repulsed all attacks until night closed the bloody encounter, when the Confederates drew off, and Thomas stood still through the following day (Sept. 21). At night, still unassailed, he retired to the position assigned him by Rosecrans in front of Chattanooga.

The Union loss in this bloody, protracted struggle was 1,644 killed (including Gen. W. H. Lytle, of Ohio), 9,262 wounded, 4,945 missing; total, 15,581. Bragg's admitted loss was 18,000, but he claims to have taken 8,000 prisoners (including wounded) and 51 guns. But he failed to take Chattanooga, which Rosecrans firmly held, though suffering badly for forage, owing to the barring in of the Tennessee river below him and the raids of Wheeler's Confederate cavalry on the trains coming to supply his rear, until he was directed to turn over his command to Gen. Thomas.

Gen. Longstreet, with his corps, was now detached from Bragg's army, and sent to drive Burnside out of East Tennessee. Longstreet drove the Union forces W. of Knoxville, but here Burnside was found too strong, and an assault made (Nov. 28) on an outpost known as Fort Sanders was repulsed with a loss of 800 Confederates, including two colonels killed. The Union loss was but 100. Longstreet thereupon raised the siege, and returned to the army of Virginia.

Gen. Grant succeeded to the command of Rosecrans's army, while Sherman was ordered from Vicksburg still further to re-enforce it, Gen. Hooker having already been sent in haste with the Eleventh and Twelfth Corps from the Army of the Potomac. Meantime Wheeler had burned a supply-train of 1,000 wagons in the Sequatchie valley, and another at McMinnville, fighting several cavalry commands sent against him, burning many railroad bridges, and escaping into Alabama with but little loss.

Grant found Hooker at Bridgeport, below Chattanooga, and directed him to clear the river, so that supplies could reach the hungry army around Chattanooga. Hooker crossed the Tennessee unmolested, and advanced to Wauhatchie, overlooked by Law's division from Lookout Mountain. At 1 A. M., Oct. 29, Geary, in Hooker's front, was attacked with great impetuosity, but easily beat off his assailants, with a loss of about 400 on each side.

Sherman arrived Nov. 15, soon followed by his army, which was diverted to Grant's left, up the Tennessee. All being at length ready, Grant advanced against Bragg, who was still looking down into Chattanooga from the west of Lookout Mountain. Gen. Grant's Fourth Corps first moved

out (Nov. 22), directly in front of Chattanooga, seizing the Confederate outposts before they could be supported, and taking 200 prisoners; then Hooker's command, during a heavy mist, mounted (Nov. 24) the south and west sides of Lookout Mountain, climbing, fighting, and at length intrenching themselves on the ground they had won. Meantime Sherman crossed the Tennessee in his front, and having firmly intrenched himself assaulted the north end of Mission Ridge, Thomas's cavalry raiding and burning stores in Bragg's rear, while his infantry felt their way up the river till they clasped hands with Sherman's left; and now Hooker crossed the Chattanooga valley from Lookout Mountain to Mission Ridge, pushing the enemy before him and taking 2,000 prisoners. Meanwhile Sherman, stubbornly opposed, was making little progress on the left, until Grant at 2 P. M. gave Hooker orders to advance in the center. His men obeyed with alacrity, charging right up the long, steep ascent, and reaching the crest on six points at once, when the Confederates were seized with panic and fled, abandoning forty guns and losing many prisoners. Darkness alone prevented the destruction of the beaten army, which retreated rapidly to Dalton, Ga., Cleburne in their rear repulsing with ease an attempt to drive his men through a narrow gap in White Oak Ridge, inflicting a loss of 439 to 130. Pursuit was maintained to Ringgold, Ga.

Gen. Grant states his losses at the above battles at 757 killed, 4,529 wounded, and 330 missing; total, 5,616; and claims 6,142 prisoners. The Confederate loss in killed and wounded was undoubtedly the smaller.

Charleston, S. C., and the railroad connecting it with Savannah, Ga., were often menaced, and sometimes struck at, by the Union forces at Port Royal and the adjacent Sea islands, but nothing decisive was effected, save the reduction (April 11, 1862), by Gen. Q. A. Gillmore, of Fort Pulaski, commanding the main entrance to Savannah, until Commodore Dupont, having easily taken possession of the islands and most of the coast-towns of Georgia, steamed down to Jacksonville, which, with Pensacola and other Florida ports, was conceded to him without a struggle. Attempting upon his return to Port Royal to advance upon Charleston off Stono Inlet and river, he was stopped by batteries, and an attack (June 16) by Gen. H. G. Wright with 6,000 Unionists on Secessionville was repulsed with a loss of 574 men. Several kindred but feebler attempts to reach Charleston were baffled, as was one by Commodore Dupont to reduce Fort McAllister on the Ogeechee. The Confederates made in the dark a sally of rams and gunboats (Jan. 31, 1863) out of Charleston, disabling two of the blockading gunboats and alarming the residue, but taking refuge behind Fort Sumter when daylight appeared. The blockade was not interrupted.

Dupont, with nine ironclads, next (April 6) bombarded that port at close quarters, but found his way to Charleston impeded by all manner of piles, chains, etc., and was compelled to retire with little loss on either side. The Atlanta, a Confederate gunboat, steaming down from Savannah, was met by the Weehawken, Capt. John Rodgers, as she emerged from Wilmington river, and torn to pieces in fifteen minutes. She surrendered four large guns and 165 men.

Gen. Quincy A. Gillmore having succeeded Gen. Hunter in command, and being considerably re-enforced, commenced operations by seizing the north end of Morris island, S. of Charleston, and thence besieging Fort Wagner, near its north end, which was regularly assaulted after bombardment July 18, but the storming-party was quickly repulsed with a loss of 1,500, including Gen. Strong and Cols. Shaw and Chatfield, killed. The Confederate loss was but 100.

Gillmore, undismayed, next established a battery of great guns on a platform in a marsh W. of Morris Island, whence he could shell Charleston, 5 miles distant. Eleven batteries rained shot and shell on Forts Wagner and Sumter, and the batteries on Cummings Point. Pushing steadily his approaches to Wagner, he had ordered Gen. Terry to assault (Sept. 7), when he found that the Confederates had evacuated both fort and island, leaving eighteen guns in Wagner and seven in Battery Gregg. Next night Rear-Admiral Dahlgren, now commanding the besieging fleet, sent a large force in row-boats to scale the walls of Fort Sumter, but it was repulsed with a loss of three boats and 200 men.

Gen. Gillmore early in 1864 dispatched Gen. Truman Seymour with a fleet and 6,000 troops to Florida, where he easily took possession of Jacksonville and Baldwin, capturing valuable stores, but advancing rashly westward to Olustee, he was there suddenly attacked by Gen. Finnegan, and beaten with a loss of 2,000 to 730 Confederates. Seymour retreated to Jacksonville, burning $1,000,000 worth of stores.

In North Carolina the Confederate general M. Hoke besieged and captured (Apr. 20, 1863) Plymouth, held by Gen. Wessels with 2,000 men. Among the spoils were 25 guns, 7,000 small-arms, and 1,600 men. Hoke's loss was but 300.

Gen. Grant, having been made (Mar. 1, 1864) lieutenant-general of the Union armies, repaired to Washington and assumed the more immediate direction of the Army of the Potomac, which had been largely re-enforced. Gen. Kilpatrick had just led his cavalry on a raid to within 6 miles of Richmond, whence, after some indecisive fighting, he made his way unharmed to Fortress Monroe. But Col. Ulric Dahlgren, with 400 of his men, having advanced by a separate route on Kilpatrick's right, reached Richmond a day later, and striking thence by a more northerly route was stopped and killed by a regiment of militia at Dabney's Ferry on the Mattapony, his men dispersed, and most of them captured.

Gen. Grant, with Meade's army, crossed the Rapidan unresisted (May 4–5) at Germania and Ely's Fords, striking due S. into the Wilderness. Lee, though looking for him at a higher crossing, at once turned to the right, and attacked in full force. The ground, thickly covered for the most part with small trees, and thoroughly familiar to the Confederates, while strange to the Unionists, was especially favorable to the army which must match its superior knowledge and determination against superior numbers. Two days of desperate fighting, with great slaughter and little advantage to either side, were closed at dark on the 6th with a dashing attack on the Union right by Gen. Gordon, who took 4,000 prisoners, including Gen. Truman Seymour.

Next morning, Gen. Lee awaiting an attack behind his intrenchments, Gen. Grant put his army in motion southward, and was unmolested save by Stuart's cavalry during his march to Spottsylvania Court-house. He had lost in the Wilderness no less than 20,000 men, including Gen. James S. Wadsworth, of New York, killed, and seven generals wounded. Gen. Sedgwick, of Connecticut, was killed two days afterward. The Confederate loss was 8,000, including Gens. Samuel Jones, wounded, Stafford, killed, and A. G. Jenkins, wounded, and Longstreet was disabled for months.

There was heavy fighting around Spottsylvania Court-house for two or three days. On the 11th, at daybreak, Hancock's corps carried by assault a part of the Confederate works, capturing Gens. Edward Johnson and George H. Stewart, with 3,000 men. Gen. Lee narrowly escaped. Hancock captured thirty guns, but after holding them for hours only brought off twenty of them. But he was unable to advance, and days of desperate fighting, which cost the Unionists at least 20,000 men at this point, proved Lee's position impregnable. Acting on the defensive and behind strong works, his loss was much less than Grant's, but it included Gens. Daniels, Perrin, and J. M. Jones, killed.

Grant again moved southward, transferring his right to his left, while his cavalry under Sheridan made a fresh raid toward Richmond, fighting (May 11) and killing Gen. J. E. B. Stuart a few miles N. of that city. Crossing the Chickahominy at Meadow Bridge, Sheridan returned with little loss to Grant's army.

Gen. Butler, with 30,000 men, embarking all but his cavalry, moved up the James and occupied City Point, below Richmond. He was to have seized Petersburg, but missed it. Gen. Beauregard being hastily summoned from Charleston to aid D. H. Hill in defending it. Butler even failed to cut the railroad between that city and Richmond, and was rather worsted by Beauregard in a fight near Proctor's creek, which cost the Unionists 4,000 and the Confederates 3,000 men. Butler was further assailed on several succeeding days, but held his ground with little loss.

Gen. Grant, moving by poorer and more circuitous roads than the direct one held by Lee, on approaching the North Anna (May 17) found his enemy strongly posted, well intrenched, and ready to receive him. There was more fighting here, generally with results favoring the Unionists, but Lee's position could only be stormed at an immense cost of life, and Grant, again moving by his flank, pressed on to Cold Harbor, where he ordered a general assault on the Confederate lines here, as before, confronting him. Those lines were defended by deep and strong abatis of slashed timber, the limbs so intertwisted with each other as to defy speedy untying. The assault was deployed at sunrise (June 3), and in a few minutes was repulsed with great slaughter.

The Union loss was 1,705 killed, 9,072 wounded and 2,406 missing. Gens. P. A. Porter, L. O. Morris, and F. F. Wood (all of New York) were among the killed, with six colonels.

Gen. Grant, unable to interpose between Lee's army and Richmond, now decided to pass the James below that city, while Sheridan was sent on a fresh raid around Lee's left, to tear up railroads and burn stores in his rear. Disappointed in his expectation of finding Hunter in possession of Gordonsville, he was soon surrounded by enemies, with whom he fought an indecisive battle at Trevilian's, returning to Grant with 370 prisoners, having lost in all 735 men.

Grant appeared S. of Richmond in time to have seized Petersburg, but the precious moment was squandered by uninformed or timid subordinates until Lee's army was in good part behind its defenses. Assault after assault was now made (June 16–18) on those defenses with heavy loss, and no result but the knowledge that they could not be thus carried. Then abortive attempts were made (June 21–24) to turn them by the S., which A. P. Hill resisted and baffled, taking in all at least 5,000 prisoners. Then Wilson, with 8,000 cavalry, raided down the Weldon and Danville R. R., but was fought and beaten at Stony creek and Reams's Station, losing 13 guns and 1,000 prisoners.

Grant now moved the Second Corps from his extreme left to his extreme right, and threw it across the James, as if about to attack Richmond from the E. And now (July 30) a mine which had been skillfully run from the center of the Union lines under one of the forts or bastions of Petersburg, was exploded, blowing 300 Confederates into the air and opening a gap in their lines. Hereupon the cannon thundered all along the Union front; but the column of assault, which should have rushed forward on the instant, did not move for several minutes, and then advanced bravely into the chasm made by the explosion, and there halted. The Confederates of course rallied from every side, and poured volley after volley upon the helpless crowd huddled together in the "crater," inflicting on the Unionists a loss of 4,400 men, mostly prisoners, while the entire Confederate loss was but 1,000.

Again (Aug. 12) Hancock assailed Lee's extreme left below Richmond, but with little advantage, the Union loss in operating on this flank aggregating 5,000, while the Confederate was much less, but included Gens. Chambliss and Gherardie, killed.

Lee having necessarily sent several divisions from his right to his left, Grant ordered Gen. Warren southward to seize and hold the Weldon R. R.; but Warren's divisions were struck in flank by A. P. Hill at the critical moment, and twice rolled up on themselves, with an aggregate loss of 4,455 men, mainly prisoners. The Confederates had lost but 1,200, but Warren had seized the Weldon R. R., and he thenceforth held it.

Hancock was sent to seize this road also at Reams's Station, farther down, which he did, but was in turn attacked and driven off by Hill, with a loss of 5 guns and 2,400 men. Hill lost only half that number.

Again, after a pause, Warren advanced (Oct. 1) by order, with four divisions, to the Squirrel Level road in his front, fighting for two days and losing 2,500 men, but holding his ground, and intrenching it so firmly that it could not be taken from him. To cover this advance, Gen. Butler on the Union side had assaulted Fort Harrison with the Tenth and Eighteenth Corps, taking the fort, with fifteen guns. He next attempted Fort Gilmer, but was repulsed with a loss of 300, including Gen. Dunnovan, killed. Gen. Field attempted next morning to retake Fort Harrison, but was beaten off with heavy loss. A few days later Gen. Kautz, whose Union cavalry had been pushed up the Charles City road to within 5 miles of Richmond, was there surprised and driven, with a loss of 9 guns and 500 men. The Confederate general Gregg, of Texas, was killed in the ensuing fight, which had no result.

Hancock was next ordered farther to the Union left to find and turn the Confederate flank, and in a fight with Hill's corps, which attempted to interpose between his divisions, took 1,000 prisoners. Darkness arrested the fighting, but Hancock drew off in the night, having lost 1,500 men and inflicted equal loss upon the enemy. Thus closed on this point the campaign of 1864, with Warren holding the Weldon R. R., and Butler threatening Richmond, the losses of the Army of the Potomac during the year having aggregated 88,387 men.

When Virginia separated from the Union her western counties, including most of those lying beyond the Alleghanies, strongly protested against the ordinance, voted "No" when it was submitted to the ordeal of popular suffrage, and refused to be bound by it. Calling a convention at Wheeling, they decreed a separation from the old State and the formation of a new one, first named Kanawha, but since known as West Virginia. They had previously organized a loyal State government for Old Virginia, which (hardly an eastern county being represented in it) readily agreed to the organization of the new State. Meantime the Confederates had seized Harper's Ferry and destroyed the Baltimore and Ohio R. R. for some distance W. of it, and they soon sent a force over the Alleghanies to secure obedience to the Confederate authorities at Richmond. It was promptly confronted by Gen. McClellan with a far larger army, organized in Ohio, but largely composed of West Virginians. A part of it routed (June 3, 1861) the enemy at Philippi, another detachment at Rich Mountain (July 12), and the main body under Gen. Garnett, who, in full retreat, was overtaken and routed at Carrick's Ford on the Cheat river, where Garnett was killed and some prisoners were taken. The residue escaped over the Alleghanies.

Gen. J. D. Cox, advancing up the Kanawha, drove the Confederates under Gen. Wise before him, Wise burning (July 28) Gauley bridge to arrest the pursuit.

Gen. John B. Floyd now assumed command of the Confederates, inspirited by their triumph at Bull Run, and had an indecisive conflict (Aug. 10) with Gen. Rosecrans at Carnifex Ferry. Floyd held his ground, but retreated during the ensuing night.

Gen. R. E. Lee now assumed command in this quarter, and there was much marching with little serious fighting till winter closed the campaign, and little of consequence occurred here the next year, when Gen. J. C. Fremont succeeded to the command of the Union forces, but was hurried over the mountains to resist Stonewall Jackson's raid down the valley. Thereupon the Confederate general Heth raided across the mountains and attacked (May 23, 1862) Col. George Crook at Lewisburg, but was beaten off with loss. Thenceforward the operations on either side in this quarter were limited to inconsiderable raids and surprises.

Gen. Franz Sigel was assigned chief command (Union) in the valley in the spring of 1864, when, with 10,000 men, he advanced to New Market, where he was met by Gen. John C. Breckenridge with an equal force, and routed with a loss of 6 guns and 700 men.

Breckenridge was unable to follow up his victory, being obliged to send much of his force over the mountains to oppose Crook, who, with 6,000 men, had beaten McCausland's far inferior but well-posted force near Dublin Station, and had broken the Virginia and Tennessee R. R. at that point. Gen. Averell, with 2,000 cavalry, raiding farther west, had tried to destroy the Confederate salt-works near Wytheville, but had been beaten off by John Morgan. Both Crook and Averell thereupon retreated.

Gen. David Hunter was now assigned to the command of Sigel's beaten army, which was strengthened, while Breckenridge had been called off to re-enforce Lee at Richmond. Hunter advanced to Piedmont, near Staunton, where he was confronted by Gen. W. E. Jones with a hastily collected army, which was beaten (June 8) in a spirited action, wherein Jones was killed and 1,500 of his men captured.

Hunter thereupon occupied Staunton, where he was joined by Crook and Averell, and then, with 20,000 men, pressed on to Lynchburg and fiercely assailed it, but was met and beaten off by a superior Confederate force under Early, hastily dispatched by rail from Lee's army. Outnumbered and short of ammunition, he retreated over the Alleghanies into West Virginia, whence he regained the Potomac by a long and toilsome circuit. Meanwhile the valley was left without any considerable Union force, and Early hurried down it with 20,000 triumphant veterans, Sigel retreating and burning stores till he had crossed the Potomac and took post on Maryland Heights, where Early did not choose to assail him, but crossed into Maryland, scouring the country for cattle, horses, and provisions of all kinds, threatened Pennsylvania, and then turned upon Baltimore. Gen. Lew Wallace could hardly muster 5,000 men to oppose him, but fought him (July 9) at the passage of the Monocacy, near Frederick, and was of course defeated, losing 2,000 men (mainly prisoners), while the victors lost but 600. Early now turned upon Baltimore, and menaced Washington, skirmishing (July 12) with its outpost defenses, but made off rapidly into Virginia with 2,500 captured horses and 5,000 cattle.

Gen. Wright's Sixth Corps had just been sent from Grant's army to the relief of Washington, as had Emory's Nineteenth Corps, just arrived by sea from New Orleans. Wright followed Early to the Shenandoah, where his rear was sharply turned upon and repulsed (July 19), with a loss of 500. Wright retired to Leesburg, and turned over his command to Crook, while Averell had (July 20) a cavalry fight near Winchester, and took 4 guns and 200 prisoners.

Wright's and Emory's corps being now recalled to the James, Crook, supposing Early gone likewise, advanced to Winchester, and was there beaten (July 24), and driven to Martinsburg and across the Potomac, with a loss of 1,200, including Gen. Mulligan, killed.

Early now sent B. T. Johnson with 3,000 cavalry on a raid into Pennsylvania, where they burned without resistance Chambersburg and the barracks at Carlisle. Averell, with an equal cavalry force, soon encountered the raiders, but they escaped with little loss into Virginia. Pursuing to Moorefield, Averell at last struck the raiders (Aug. 4) and worsted them, with a loss of their guns, wagons, and 500 prisoners.

Gen. Grant now sent Sheridan to command in this department, where Hunter's army, just arriving from the West, the Sixth and Nineteenth Corps (whose recall to the James had been countermanded), and Torbert's and Wilson's divisions of cavalry from Grant's, had raised his effective force to 30,000 men.

Sheridan, after taking time to reorganize his army, advanced to Winchester, and found Early strongly posted and fortified on Opequan creek, whence he dislodged him (Sept. 19) after an obstinate fight, in which his loss was fully 3,000 prisoners, including wounded, while among his killed were Gens. Rhodes and Godwin.

Early rallied his beaten army at Fisher's Hill, a very strong position S. of Winchester, where his flanks were guarded by two mountains. Here Sheridan again attacked and routed him (Sept. 22), taking 16 guns and 1,100 prisoners. Pursuing the remnant to Port Republic, he sent his cavalry to Staunton and to Waynesboro, destroying provisions and munitions, then retired down the valley to Winchester, burning all the grain and forage as he passed, so that the enemy should find no subsistence there. This devastation was made an excuse for the attempts to burn New York and other cities by incendiaries soon afterward.

Sheridan had encamped on Cedar creek, and, apprehending no danger, had gone on a visit to Washington, when Early, re-enforced, having stealthily followed down the valley, determined to surprise the unsuspecting army before him. In this he succeeded perfectly, flanking Crook's force on both sides in the dense darkness, and rushing into the camps with a fearful yell just before daylight, and in fifteen minutes Crook's army was a fleeing, panic-stricken mob, having lost 24 guns and 1,200 prisoners. Sheridan was at Winchester on his return when the disastrous tidings met him, and, riding at full speed, reached his beaten army at 10 A. M. He spent two hours in reviving the spirits of his men, and, after repulsing one fresh attack on his left, ordered at 3 P. M. a general advance, which was successfully made, followed by a second charge, which was still more successful—though the Confederates opposed to them nearly all the cannon of both armies—facing the foe to the rear, and driving them through Staunton, recovering the 24 guns lost in the morning, and taking 23 others, with 1,500 prisoners. The total loss of men this day was about 3,000 to each side, including the Confederate general Ramseur and the Union general Bidwell, of New York, killed. This closed the campaign in that quarter.

There were various partisan conflicts in Alabama, Mississippi, and West Tennessee during 1864, but none of consequence save at Fort Pillow, Tenn., which was assailed and taken (Apr. 13) by the Confederate general Forrest, killing Major L. F. Booth, who commanded, with most of his garrison of 557 men, of whom 262 were blacks, many of them after resistance had ceased. This was in accordance with the threats previously made by Confederate officers that colored troops should in no case receive quarter.

Gen. S. D. Sturgis with 12,000 men was sent from Memphis in quest of Forrest, whom he found at Guntown, Miss., where Sturgis was speedily routed and driven back to Memphis with a loss of at least 4,000, mainly prisoners. Forrest's entire force was not much greater than this. Gen. A. J. Smith now assumed command, and pressed Forrest back to Tupelo, Miss., where the Confederates thrice assaulted his lines, and were repulsed with loss, but with no decisive result. Smith retreated, and again advanced to Holly Springs, not seriously opposed, while Forrest raided into Memphis with 3,000 cavalry and took a few prisoners, but failed to capture the Union generals of whom he was in quest or to liberate the captured Confederates.

East Tennessee was this year the scene of several partisan conflicts to little purpose, and John Morgan raided through Pound Gap into Eastern Kentucky, capturing and paroling Gen. Hobson with 1,600 Unionists in a field at Licking River. Gen. Burbridge struck the raider at Mt. Sterling, and again near Cynthiana, capturing or dispersing at least half his force, and chasing the rest into Southwestern Virginia. Attempting here to destroy the salt-works near Abingdon, Burbridge was beaten off (Oct. 3), with loss, by Gen. Breckenridge.

Gen. Sherman, on Grant's transfer to the East, was left in chief command at the West. Advancing with 100,000 men from Chattanooga early in May, 1864, he was confronted by Joseph E. Johnston, who, having but 54,000, declined a pitched battle, but availed himself of the broken country and fortified positions on the rugged road to Atlanta. He was stubbornly resisted (May 10) at Resaca, where the railroad crosses the Oostenaula river, and was at first repulsed with loss, but soon flanked the position and compelled its abandonment. Checking Sherman's advance at Adairsville and Cassville, Johnston made his next determined stand at the Allatoona Pass, and days were expended in fighting and flanking before he could again be driven. He next made a stand at Kenesaw Mountain, flanked by Pine and Lost Mountains, connected by strong field-works, where he for several days resisted every effort to move him. In one assault (June 27) Sherman lost 3,000 men, including Gens. Harker and Dan McCook, killed; Confederate loss, 442. And now, by again advancing his right, Sherman forced Johnston out of his impregnable position, compelling him again to retreat, which brought him to Atlanta. Here he was relieved by Gen. Hood, who condemned his cautious policy, which had only depleted his army by 14,700 men in two months' constant fighting. Re-enforcements had nearly kept its ranks full, its present strength being 51,000. Sherman advancing his left under McPherson to break Hood's railroad connection with the East, Hood struck heavily (July 20) at his right under Thomas, but was repulsed after a bloody struggle, which cost the Confederates at least 4,000 men, including Gens. W. S. Featherston, of Mississippi, Armistead, of Georgia, and George M. Stevens, of Maryland, killed. The Union loss was but 1,500. Supposing that Atlanta had been silently evacuated, the Unionists thereupon rushed up to within 2 miles of the city, but found here strong works well manned, and were repelled with loss. Maj.-Gen. McPherson, of Ohio, was killed, as was Gen. Greathouse, of Illinois, and another bloody struggle resulted, with advantage to the Unionists, though it cost them over 4,000 men. The Confederate loss was nearly double, including Gen. W. H. T. Walker, of Georgia, killed.

A pause in the fighting now ensued, and Gen. Stoneman with 5,000 Union cavalry raided upon the railroads and stores in Hood's rear, but, scattering or dividing his forces too much, he was surrounded and captured with 1,000 men, as Col. Harrison, with 500 more, had just been.

Sherman now moved the Army of the Tennessee, led by Howard, from his extreme left to his extreme right, initiating a new flanking movement, when Hood assailed Logan's (Fifteenth) corps on the new Union right, but was repulsed with heavy loss. Hood now sent Wheeler's cavalry to raid on the Union rear, while Kilpatrick's Union cavalry pressed to the Confederate rear, breaking both the railroads leading southwardly from Atlanta, and returning to camp Aug. 22. Sherman again threw forward his right till most of his army was behind Atlanta, holding firmly the railroad to Macon. Hood had already sent off part of his army to Jonesboro, whence Hardee with two corps attacked (Aug. 31) Howard fiercely, but was beaten off with a loss of 2,000 to Howard's 500. And now Jonesboro was assailed in its turn by Jefferson C. Davis's corps and carried, eight guns, Gen. Govan, and many men being captured. Hood thereupon exploded his munitions and burned his stores in Atlanta and escaped eastward. Slocum took quiet possession of what was left Sept. 1. Sherman returned to the city, and gave his men a well-earned rest.

Wheeler's raid was prosecuted throughout Northern Georgia and East Tennessee, returning through the Sequatchie valley, and being chased across the Tennessee near Florence.

He destroyed much property, but with little influence on the fortunes of the war.

Hood, rejoined by Hardee, now passed Sherman's right, and sent French's division to capture the Union post at Allatoona, which Gen. J. M. Corse held with 1,944 men, but so gallantly that assault after assault by quadruple numbers was repulsed with fearful slaughter. Gen. Cox at length relieved Corse, who was wounded, as were most of the higher officers. He had lost in all 707 men, while French left 231 dead, 411 prisoners, and 800 muskets. Hood, still marching northward, surrounded Resaca, but did not assault it, Sherman being too near. Sherman, at length learning that Hood had advanced into Middle Tennessee, gave up the pursuit, sending the Fourth and Twenty-third Corps to Chattanooga, with orders to report to Thomas at Nashville, while he, facing about, returned to Atlanta and reorganized and equipped his remaining forces for his march to the sea.

Hood, with 35,000 infantry and artillery, struck boldly for Nashville, preceded by Forrest with 10,000 cavalry. Of course there was immense destruction of stores, bridges, and dépôts—$1,500,000 worth of boots and provisions having been burned at Johnsonville, Tenn., to save them from capture.

Thomas concentrated 30,000 men at Pulaski, but was unable to cope with Hood's army, now swelled to 55,000 in all, which still clung to the Tennessee river till assured that Sherman had cut loose from Atlanta, marching southward when he set his columns in motion northward. Gen. Schofield, on his part, retreated from Pulaski to Columbia, and thence to Franklin, in a bend of the Harpeth, where he, with less than 20,000 men but a good position, was assailed (Nov. 30) with desperate resolve. The Confederates were repulsed with a loss of at least 4,500, including Gens. Cleburne, Gist, Adams, Trahl, and Granbury. The Union loss was 2,320, but no guns. Schofield continued his retreat that night. Hood followed, and soon sat down before Nashville.

The movement was audacious, as Thomas was at least his equal as a commander, and could soon concentrate a larger force than that which attempted to besiege him. But Thomas would not strike till he was ready, while severely cold weather impeded operations. At length Thomas struck out (Dec. 15), and, after two days' skillful fighting, drove his besiegers at all points, heading them toward Alabama, and taking 53 guns and 4,462 prisoners, including a major-general. Hood got across the Tennessee at Bainbridge with a few guns and barely the *débris* of an army. Thomas had taken in this brief campaign 72 guns and 11,857 prisoners, besides administering the amnesty oath to 2,207 deserters from the Confederate service. The aggregate Union loss in this campaign was 10,000. And Gen. Stoneman, moving eastward from Knoxville, had cleared East Tennessee of armed Confederates, captured Wytheville and the lead mines and salt-works, driving Breckenridge's depleted force over the mountains into North Carolina.

Gen. Sherman, after dispatching Thomas with two corps to the defense of Tennessee, had still with him four corps, numbering in all 65,500 men. Concentrating these around Rome and Kingston, Ga., he destroyed the railroads about him, cut the telegraph which still connected him with the North, and stood clear of all communications as he commenced his famous march to the sea. There being no considerable army in his front, he advanced rapidly through Atlanta, Macon, Milledgeville, and Millen to Savannah, slightly opposed at several river-crossings, while Kilpatrick with his cavalry covered his flanks and screened his movements, so that Augusta seemed to be his objective point. Fort McAllister on the Ogeechee was assaulted (Dec. 13) by Hazen's division, and communication at once opened with Dahlgren's fleet, when Savannah was evacuated (Dec. 20) by Hardee, after destroying his vessels and stores. Thus far Sherman had on this march lost but 567 men, and had taken 167 guns with 1,328 prisoners. He remained a month in Savannah, while Gens. Dana, Davidson, and Grierson, who had been sent out from Vicksburg and Memphis to distract attention from his march, swept over large portions of Mississippi and Alabama, breaking up railroads, destroying stores, and taking prisoners. These raids were uniformly successful, but Gen. Foster, who had ascended Broad river from the Sea islands to break the railroad connection between Charleston and Savannah near Gordonsville, was beaten off, losing 746 men.

Sherman, leaving Savannah well garrisoned, set his column again in motion (Feb. 1, 1865), traversing the heart of South Carolina with little resistance, except from its flooded swamps, and compelling Hardee to evacuate Charleston and its harbor-defenses, retreating northward with 12,000 men. Columbia, the State capital, though undefended, was undesignedly burned. Kilpatrick, who, with 5,000 cavalry, still covered the advance on the left, was surprised and routed by Wade Hampton near the north line of the State, but soon rallied his men and beat off his assailants. Reaching Fayetteville, N. C., Mar. 11, Sherman found himself confronted by Joe Johnston with 40,000 men, collected by Hardee, Beauregard, Cheatham, and Bragg, and including Wheeler's and Hampton's cavalry. After halting three days, Sherman once more advanced, when his left wing was attacked (Mar. 15) in a narrow pass by Hardee, who was soon driven; but Slocum on the right was next assailed (Mar. 18), when approaching Bentonville, by Johnston with his main body. The Confederates withdrew after a sharp action, in which Sherman lost 1,643 men and took 1,625 prisoners, including wounded, burying 267 Confederate dead. Next day, Sherman advanced to Goldsboro, and halted his troops while he made a hasty visit to Gen. Grant at City Point.

Wilmington, N. C., had long been the principal port through which blockade-runners found access to the Confederacy. Gen. Butler, with Commodore Porter, led an army and fleet to reduce it (Nov. 16, 1864), but returned to Fortress Monroe unsuccessful. Gen. A. H. Terry was next dispatched with a stronger force, which, after a heavy bombardment by Porter's fleet, carried Fort Fisher by assault (Jan. 16, 1865), killing Maj.-Gen. Whiting, its commander, and taking 169 guns and 2,083 prisoners, with a Union loss of 110 killed and 536 wounded; but 300 more were lost by the explosion next day of the fort's chief magazine.

Gen. Schofield was now sent to Terry's aid, ranking him, and raising his force to 20,000, with which Schofield entered Wilmington, Feb. 22, Hoke retreating after a sharp fight, burning two privateers and other vessels, with heavy stores, but leaving sixty-five guns. Schofield now advanced inland, losing 700 men by a surprise, but beating off (Mar. 10) an attack on his left by Hoke, who here lost heavily and retreated, enabling Schofield to communicate and co-operate with Sherman on his arrival at Goldsboro.

Gen. Canby, commanding at New Orleans, moved eastward in the spring to menace Mobile, while Gen. James H. Wilson, with Grant's and Thomas's cavalry, 15,000 strong, pushed southward from Eastport, Miss., the head of steamboat navigation on the Tennessee, confronted only by Forrest with but 5,000, whom Wilson easily defeated near Maplesville and routed (Apr. 2) at Selma, Ala., which he took, with 32 guns and 2,700 prisoners. Crossing the Alabama, Wilson entered Montgomery, which Adams had just left, burning 125,000 bales of Confederate cotton. Turning eastward, Wilson soon appeared at Columbus, Ga., where he took 52 guns and 1,200 prisoners, burning a gunboat, 250 cars, and 115,000 bales of cotton. Taking by assault Fort Tyler on the Chattahoochee, Wilson pushed on to Macon, Ga., where he learned that the war was virtually at an end.

Gen. Canby, with nearly 30,000 men, aided by Porter's powerful fleet, invested Mobile, which was held by Dick Taylor with some 15,000 men. Investing Spanish Fort, he reduced it by bombardment, taking 652 prisoners, and then assaulted Blakely, which was carried by assault, with a Union loss of 1,000 to 500 Confederate killed and wounded, with 3,000 prisoners. Mobile was then evacuated by Gen. Maury, who, with 9,000 men, escaped up the river, abandoning 150 guns.

Gen. Grant, still before Petersburg, had bloodlessly (Dec. 7, 1864) extended his left 20 miles down the Weldon R. R. to Hicksford, which he fortified and held. He next essayed to advance his left to Dabney's Mill, but was resisted and driven back to Hatcher's Run, where the Confederates were in turn repulsed (Feb. 6, 1865), and the ground up to this point held and fortified. The Union loss in this operation was 2,000; the Confederate, 1,000, including Gen. Pegram, killed.

Gen. Sheridan moved up the valley from Winchester with 10,000 mounted men, drove Early (Mar. 2, 1865) from his intrenched camp at Waynesboro, taking 11 guns and 1,600 prisoners, thence rode into Charlottesville, where he destroyed immense stores and miles of the Richmond and Lynchburg R. R., and, passing behind Lee's army, reported to Grant at Petersburg Mar. 27.

Lee, assuming the offensive, sent Gordon with two divi-

sions against the center of the Union line before Petersburg. Charging at daybreak (Mar. 25), Gordon surprised and took Fort Stedman in his front, capturing three batteries and some prisoners, but, not being properly supported, he was attacked and routed in turn by the Ninth Corps, losing 2,000 prisoners; besides which the loss to either side was about 2,500. Grant interpreted this rash assault as premonitory to a Confederate evacuation of Richmond and Petersburg, which he resolved to harass, if not intercept. Again throwing forward his left (Mar. 29) to seize the Boydton plank-road, while Sheridan's cavalry on its flank advanced to Dinwiddie Court-house, he was opposed by Lee with most of his army, who suddenly struck Warren's corps in flank and rear, with intent to repeat the lesson of Chancellorsville. Two divisions were then broken, but Griffin's, behind them, stood firm while the fugitives were rallied, and Warren was thus enabled to repel his assailants with heavy loss; but an attempt to carry their works was defeated in turn. Meantime Sheridan had gained Dinwiddie Court-house, but, attempting to advance thence to the Boydton plank-road, was foiled, but advanced again next morning (Apr. 1) to Five Forks, where he connected with Warren, advancing on his right, and ordered a general charge on the Confederate works in their front, held by two divisions, who were fearfully overpowered and routed, with a loss of 5,000, mainly prisoners. The Union loss was but 1,000, including Gen. Frederick Winthrop, killed. And now, sending two divisions eastward to Gravelly Church, Sheridan again connected with the Union lines before Petersburg, whence a general cannonade preluded the assault, which was delivered at daylight next morning (Apr. 2), Wright's Sixth Corps gaining the rear of these works by the south, and taking many prisoners, while Ord's corps carried Forts Gregg and Alexander by storm, losing 500 men. A. P. Hill, in attempting to retake some of the captured works, was shot dead, and his corps utterly defeated.

Lee now, at 10.30 A. M., telegraphed to Davis that Richmond must be evacuated at once, and it was evacuated between that time and next morning, while its immense warehouses, filled with provisions, munitions, and stores of all kinds, were fired by the departing Confederates, burning out the heart of the city. Flames and explosions notified the Unionists in front that the Confederate capital was abandoned, and Gen. Weitzel at 4 A. M. (Apr. 3) was assured by a Negro from the city that Davis and all his official or military adherents had departed. Picking his way through the abatis, earthworks, rifle-pits, torpedoes, etc., which encircled the burning city, Weitzel at 6 A. M. led his men into the city, soon followed by President Lincoln, who was at City Point. Petersburg was simultaneously abandoned, Lee retreating up the railroad toward Danville, while ringing of bells and immense gatherings all over the North and West hailed the relinquishment of Richmond as the downfall of the Confederacy.

Davis escaped by train to Danville, while Lee halted two days at Amelia Court-house, vainly seeking provisions for his hopeless army, now reduced, mainly by prisoners, to 35,000 men. Grant was soon on his trail. The fleeing host was first seen from Deatonsville, and was struck near Sailor's creek by Custer's horse, supported by Crook's and Davis's divisions. Here 16 guns, 400 wagons, and some prisoners were taken, while Ewell's thinned corps was cut off from Lee's rear, and so enveloped that it was obliged to surrender. Ewell himself was among this day's 6,000 prisoners.

Lee crossed the Appomattox at Farmville, repelling Gen. Theodore Read, who tried to stop his way with two regiments. But Humphrey's Second Corps was again so close on his rear that he was obliged to turn and fight a few miles beyond Farmville, repulsing his assailants with a loss of 600. But this lost a day, which was wasted by attempts to bar the Danville road, while Lee was really making for Lynchburg. Undeceived on this point, pursuit was resumed on the morning of the 8th, Grant having meantime sent Lee a courteous note inviting a surrender. Sheridan pushed his troops 28 miles on the 8th, reaching Appomattox Court-house, heading Lee's army, intercepting its sorely needed supplies from Lynchburg, and planting himself across the road whereon it must move on the morrow, and sending word to Grant, who ordered a forced march of Griffin's and Ord's corps to Appomattox Station during the night. Lee had meantime sent a note to Grant inviting a meeting, with a view to peace, at 10 A. M. In the morning (April 9) Grant replied, saying he had no authority to make peace, but urging a surrender. Lee's weary, famished army set forth as usual this morning, and, seeing cavalry in their front, advanced to push it aside, when it was withdrawn to the flanks, disclosing solid regiments of infantry behind it. Lee, seeing that further fighting would be a useless slaughter of his men, at once called a parley, which resulted in a surrender, "each officer and man to be allowed to return to his home, not to be disturbed by U. S. authority so long as they observe their paroles and the laws in force where they may reside." The number thus paroled at this point was 27,000. Johnston's army in North Carolina surrendered on the same terms to Sherman at Raleigh, Apr. 26, and Dick Taylor's to Canby at Citronelle, Ala., May 4. E. Kirby Smith, commanding the Confederates W. of the Mississippi, attempted to make a stand after the surrender of Lee, but his men all deserted him, and, taking whatever Confederate property they could lay hands on, dispersed to their several homes.

Jefferson Davis halted at Danville, anxiously awaiting advices from Lee, until astounded (Apr. 10) by tidings of his surrender. He then fled southward to Greensboro, N. C., and again halted till it was evident that Johnston would soon capitulate, when he flitted again to Washington, Ga., with a cavalry scout, which at first numbered 2,000, but rapidly wasted. Here he abjured the state of a ruler, and was making his way to the coast with his family and a few faithful followers when he was surprised and captured (May 10) while encamped near Irwinsville by two detachments of cavalry sent out from Macon by Gen. Wilson to look for him. His family was liberated at Savannah, but he was held a close prisoner in Fortress Monroe for two years, then released on bail, and never brought to trial. So ended the Southern Confederacy. HORACE GREELEY.

The above account of the causes and the progress of the civil war was compiled for the most part from the author's *American Conflict*, and is generally so free from errors that it has not been thought necessary to give it any revision whatever. It therefore stands as Mr. Greeley wrote it. For students who would study the subject at length, the following are the most important authorities: Horace Greeley, *The American Conflict* (1864–66); *Personal Memoirs* of U. S. Grant (1885–86); Jefferson Davis, *The Rise and Fall of the Confederate Government* (1881); A. H. Stephens, *A Constitutional View of the Late War between the States* (1868–70); *Memoirs* of Gen. William T. Sherman (1875); *Personal Memoirs* of P. H. Sheridan (1888); the Count of Paris, *History of the Civil War in America* (1876–88); Nicolay and Hay, *Abraham Lincoln* (1890). C. K. ADAMS.

Confederation [from Lat. *confœdera'tio*, league: *con*, together + *fœdus*, treaty, covenant, from I.-E. root *bheidh-* in its form *bhoidh-*; cf. *fido*, *fides*, and Gr. *πείθω*, *πέποιθα*, *πίστις*]: a league, a federal compact, an alliance of princes, states, or nations; nearly synonymous with confederacy. The republic of Mexico is called the *Mexican Confederation*. The numerous states of Germany were united in 1815 by the Congress of Vienna, and formed the Germanic confederation (*der Deutsche Bund* in German). Before the adoption of the Federal Constitution of the U. S. in 1788, the Government of this country was a weak confederation of thirteen independent States, which recognized no superior or central authority.

Confederation, Articles of: a document drawn up by the Congress of the U. S., Nov. 15, 1777, and adopted finally July 9, 1778, but not ratified by the States until Mar. 1, 1781, by which the several States united in a league of perpetual friendship "for the common defense, the security of their liberties, and their mutual and general welfare." These articles, thirteen in number, proved very inadequate to the needs of the situation, because Congress had very limited powers, and the executive had no means of enforcing its authority in opposition to the will of individual States. For these reasons a convention called by Congress met at Philadelphia, May 14, 1787, with Washington as its president, and on Sept. 14 of that year the convention closed its labors and reported the CONSTITUTION OF THE UNITED STATES (*q. v.*). The following were the Articles of Confederation:

ARTICLES OF CONFEDERATION.—*To all to whom these presents shall come, we, the undersigned, delegates of the States affixed to our names, send greeting*: Whereas the delegates of the United States of America in Congress assembled did, on the fifteenth day of November, in the year of our Lord one thousand seven hundred and seventy-seven, and in the

second year of the independence of America, agree in certain articles of confederation and perpetual Union between the States of New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, in the words following, viz.:

Articles of Confederation and perpetual Union between the States of New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia.

ARTICLE 1. The style of this confederacy shall be "The United States of America."

ART. 2. Each State retains its sovereignty, freedom, and independence, and every power, jurisdiction, and right, which is not by this confederation expressly delegated to the United States in Congress assembled.

ART. 3. The said States hereby severally enter into a firm league of friendship with each other for their common defense, the security of their liberties, and their mutual and general welfare; binding themselves to assist each other against all force offered to or attacks made upon them, or any of them, on account of religion, sovereignty, trade, or any other pretense whatever.

ART. 4. The better to secure and perpetuate mutual friendship and intercourse among the people of the different States in this Union, the free inhabitants of each of these States, paupers, vagabonds, and fugitives from justice excepted, shall be entitled to all privileges and immunities of free citizens in the several States; and the people of each State shall have free ingress and regress to and from any other State, and shall enjoy therein all the privileges of trade and commerce, subject to the same duties, impositions, and restrictions, as the inhabitants thereof respectively: provided that such restrictions shall not extend so far as to prevent the removal of property imported into any State to any other State, of which the owner is an inhabitant; provided also, that no imposition, duties, or restriction shall be laid by any State on the property of the United States or either of them.

If any person guilty of or charged with treason, felony, or other high misdemeanor, in any State, shall flee from justice, and be found in any of the United States, he shall, upon demand of the Governor or Executive power of the State from which he fled, be delivered up and removed to the State having jurisdiction of his offense.

Full faith and credit shall be given in each of these States to the records, acts, and judicial proceedings of the courts and magistrates of every other State.

ART. 5. For the more convenient management of the general interests of the United States, delegates shall be annually appointed in such manner as the Legislature of each State shall direct, to meet in Congress on the first Monday in November in every year, with a power reserved to each State to recall its delegates, or any of them, at any time within the year, and to send others in their stead for the remainder of the year.

No State shall be represented in Congress by less than two, nor by more than seven members; and no person shall be capable of being a delegate for more than three years in any term of six years; nor shall any person, being a delegate, be capable of holding any office under the United States, for which he, or another for his benefit, receives any salary, fees, or emoluments of any kind.

Each State shall maintain its own delegates in a meeting of the States, and while they act as members of the committee of the States.

In determining questions in the United States in Congress assembled, each State shall have one vote.

Freedom of speech and debate in Congress shall not be impeached or questioned in any court or place out of Congress; and the members of Congress shall be protected in their persons from arrests and imprisonments during the time of their going to and from and attendance on Congress, except for treason, felony, or breach of the peace.

ART. 6. No State, without the consent of the United States in Congress assembled, shall send any embassy to, or receive any embassy from, or enter into any conference, agreement, alliance, or treaty, with any king, prince, or state; nor shall any person holding any office of profit or trust under the United States, or any of them, accept of any present, emolument, office, or title of any kind whatever, from any king, prince, or foreign state; nor shall the United States in Congress assembled, or any of them, grant any title of nobility.

No two or more States shall enter into any treaty, confederation, or alliance whatever, between them, without the consent of the United States in Congress assembled, specifying accurately the purposes for which the same is to be entered into, and how long it shall continue.

No State shall lay any imposts or duties which may interfere with any stipulations in treaties entered into by the United States in Congress assembled, with any king, prince, or state, in pursuance of any treaties already proposed by Congress to the courts of France and Spain.

No vessel of war shall be kept up in time of peace by any State, except such number only as shall be deemed necessary by the United States in Congress assembled for the defense of such State or its trade; nor shall any body of forces be kept up by any State in time of peace except such number only as, in the judgment of the United States in Congress assembled, shall be deemed requisite to garrison the forts necessary for the defense of such State; but every State shall always keep up a well-regulated and disciplined militia, sufficiently armed and accoutred, and shall provide and have constantly ready for use, in public stores, a due number of field-pieces and tents, and a proper quantity of arms, ammunition, and camp equipage.

No State shall engage in any war without the consent of the United States in Congress assembled, unless such State be actually invaded by enemies, or shall have received certain advice of a resolution being formed by some nation of Indians to invade such a State, and the danger is so imminent as not to admit of a delay till the United States in Congress assembled can be consulted; nor shall any State grant commissions to any ships or vessels of war, nor letters of marque or reprisal, except it be after a declaration of war by the United States in Congress assembled, and then only against the kingdom or state, and the subjects thereof, against which war has been so declared, and under such regulations as shall be established by the United States in Congress assembled, unless such State be infested by pirates, in which case vessels of war may be fitted out for that occasion, and kept so long as the danger shall continue, or until the United States in Congress assembled shall determine otherwise.

ART. 7. When land forces are raised by any State for the common defense, all officers of or under the rank of colonel shall be appointed by the Legislature of each State respectively, by whom such forces shall be raised, or in such manner as such State shall direct, and all vacancies shall be filled up by the State which first made the appointment.

ART. 8. All charges of war, and all other expenses that shall be incurred for the common defense or general welfare, and allowed by the United States in Congress assembled, shall be defrayed out of a common treasury, which shall be supplied by the several States in proportion to the value of all land within each State granted to or surveyed for any person, as such land and the buildings and improvements thereon shall be estimated according to such mode as the United States in Congress assembled shall from time to time direct and appoint.

The taxes for paying that proportion shall be laid and levied by the authority and direction of the Legislatures of the several States, within the time agreed upon by the United States in Congress assembled.

ART. 9. The United States in Congress assembled shall have the sole and exclusive right and power of determining on peace and war, except in the cases mentioned in the sixth article—of sending and receiving ambassadors—entering into treaties and alliances; provided, that no treaty of commerce shall be made whereby the legislative power of the respective States shall be restrained from imposing such imposts and duties on foreigners as their own people are subjected to, or from prohibiting the exportation or importation of any species of goods or commodities whatsoever—of establishing rules for deciding in all cases what captures on land or water shall be legal, and in what manner prizes taken by land or naval forces in the service of the United States shall be divided or appropriated—of granting letters of marque and reprisal in times of peace—appointing courts for the trial of piracies and felonies committed on the high seas, and establishing courts for receiving and determining finally appeals in all cases of captures; provided, that no member of Congress shall be appointed a judge of any of the said courts.

The United States in Congress assembled shall also be the

last resort on appeal in all disputes and differences now subsisting or that hereafter may arise between two or more States concerning boundary, jurisdiction, or any other cause whatever; which authority shall always be exercised in the manner following: whenever the legislative or executive authority or lawful agent of any State in controversy with another shall present a petition to Congress, stating the matter in question, and praying for a hearing, notice thereof shall be given by order of Congress to the legislative or executive authority of the other State in controversy, and a day assigned for the appearance of the parties, by their lawful agents, who shall then be directed to appoint by joint consent commissioners or judges to constitute a court for hearing and determining the matter in question; but if they can not agree, Congress shall name three persons out of each of the United States, and from the list of such persons each party shall alternately strike out one, the petitioners beginning, until the number shall be reduced to thirteen; and from that number not less than seven nor more than nine names, as Congress shall direct, shall, in the presence of Congress, be drawn out by lot; and the persons whose names shall be so drawn, or any five of them, shall be commissioners or judges, to hear and finally determine the controversy, so always as a major part of the judges, who shall hear the cause, shall agree in the determination; and if either party shall neglect to attend at the day appointed, without showing reasons which Congress shall judge sufficient, or being present shall refuse to strike, the Congress shall proceed to nominate three persons out of each State, and the secretary of Congress shall strike in behalf of such party absent or refusing; and the judgment and sentence of the court, to be appointed in the manner before prescribed, shall be final and conclusive; and if any of the parties shall refuse to submit to the authority of such court, or to appear, or defend their claim or cause, the court shall, nevertheless, proceed to pronounce sentence or judgment, which shall, in like manner, be final and decisive, the judgment or sentence and other proceedings being in either case transmitted to Congress, and lodged among the acts of Congress for the security of the parties concerned; provided, that every commissioner, before he sits in judgment, shall take an oath, to be administered by one of the judges of the Supreme or Superior Court of the State, where the cause shall be tried, "well and truly to hear and determine the matter in question, according to the best of his judgment, without favor, affection, or hope of reward"; provided, also, that no State shall be deprived of territory for the benefit of the United States.

All controversies concerning the private right of soil, claimed under different grants of two or more States, whose jurisdiction as they may respect such lands and the States which passed such grants are adjusted, the said grants or either of them being at the same time claimed to have originated antecedent to such settlement of jurisdiction, shall, on the petition of either party to the Congress of the United States, be finally determined, as near as may be, in the same manner as is before prescribed for deciding disputes respecting territorial jurisdiction between different States.

The United States in Congress assembled shall also have the sole and exclusive right and power of regulating the alloy and value of coin struck by their own authority, or by that of the respective States—fixing the standard of weights and measures throughout the United States—regulating the trade and managing all affairs with the Indians not members of any of the States; provided that the legislative right of any State within its own limits be not infringed or violated—establishing and regulating post-offices from one State to another throughout all the United States, and exacting such postage on the papers passing through the same, as may be requisite to defray the expenses of the said office—appointing all officers of the land forces in the service of the United States excepting regimental officers—appointing all the officers of the naval forces, and commissioning all officers whatever in the service of the United States—making rules for the government and regulation of the said land and naval forces, and directing their operations.

The United States in Congress assembled shall have authority to appoint a committee to sit in the recess of Congress, to be denominated "a committee of the States," and to consist of one delegate from each State; and to appoint such other committees and civil officers as may be necessary for managing the general affairs of the United States, under their direction—to appoint one of their number to preside, provided that no person be allowed to serve in the office of president more than one year in any term of three years—to ascertain the necessary sums of money to be raised for the service of the United States, and to appropriate and apply the same for defraying the public expenses—to borrow money or emit bills on the credit of the United States, transmitting every half year to the respective States an account of the sums of money so borrowed or emitted—to build and equip a navy—to agree upon the number of land forces, and to make requisitions from each State for its quota, in proportion to the number of white inhabitants in such State; which requisition shall be binding, and thereupon the Legislature of each State shall appoint the regimental officers, raise the men, and clothe, arm, and equip them, in a soldier-like manner, at the expense of the United States; and the officers and men so clothed, armed, and equipped, shall march to the place appointed, and within the time agreed on by the United States in Congress assembled; but if the United States in Congress assembled shall, on consideration of circumstances, judge proper that any State should not raise men, or should raise a smaller number than its quota, and that any other State should raise a greater number of men than the quota thereof, such extra number shall be raised, officered, clothed, armed, and equipped, in the same manner as the quota of such State, unless the Legislature of such State shall judge that such extra number can not safely be spared out of the same; in which case they shall raise, officer, clothe, arm, and equip as many of such extra number as they judge can be safely spared. And the officers and men so clothed, armed, and equipped shall march to the place appointed, and within the time agreed on by the United States in Congress assembled.

The United States in Congress assembled shall never engage in a war, nor grant letters of marque and reprisal in time of peace, nor enter into any treaties or alliances, nor coin money, nor regulate the value thereof, nor ascertain the sums and expenses necessary for the defense and welfare of the United States or any of them, nor emit bills, nor borrow money on the credit of the United States, nor appropriate money, nor agree upon the number of vessels of war to be built or purchased, or the number of land or sea forces to be raised, nor appoint a commander-in-chief of the army and navy, unless nine States assent to the same; nor shall a question on any other point, except for adjourning from day to day, be determined, unless by the votes of a majority of the United States in Congress assembled.

The Congress of the United States shall have power to adjourn to any time within the year, and to any place within the United States, so that no period of adjournment be for a longer duration than the space of six months; and shall publish the journal of their proceedings monthly, except such parts thereof relating to treaties, alliances, or military operations, as in their judgment require secrecy; and the yeas and nays of the delegates of each State on any question shall be entered on the journal, when it is desired by any delegate; and the delegates of a State, or any of them, at his or their request, shall be furnished with a transcript of the said journal, except such parts as are above excepted, to lay before the Legislatures of the several States.

ART. 10. The committee of the States, or any nine of them, shall be authorized to execute, in the recess of Congress, such of the powers of Congress as the United States in Congress assembled, by the consent of nine States, shall from time to time think expedient to vest them with; provided that no power be delegated to the said committee, for the exercise of which, by the articles of confederation, the voice of nine States in the Congress of the United States assembled is requisite.

ART. 11. Canada, acceding to this confederation, and joining in the measures of the United States, shall be admitted into, and entitled to all the advantages of, this Union; but no other colony shall be admitted into the same unless such admission be agreed to by nine States.

ART. 12. All bills of credit emitted, moneys borrowed, and debts contracted, by or under the authority of Congress, before the assembling of the United States, in pursuance of the present confederation, shall be deemed and considered as a charge against the United States, for payment and satisfaction whereof the said United States and the public faith are hereby solemnly pledged.

ART. 13. Every State shall abide by the decision of the United States, in Congress assembled, on all questions which, by this confederation, are submitted to them. And the articles of this confederation shall be inviolably observed by every State, and the Union shall be perpetual; nor shall any

alteration at any time hereafter be made in any of them, unless such alteration be agreed to in a Congress of the United States, and be afterward confirmed by the Legislature of every State.

And whereas it has pleased the great Governor of the world to incline the hearts of the Legislatures we respectively represent in Congress to approve of and to authorize us to ratify the said articles of confederation and perpetual union: *know ye*, that we, the undersigned delegates, by virtue of the power and authority to us given for that purpose, do, by these presents, in the name and in behalf of our respective constituents, fully and entirely ratify and confirm each and every of the said articles of confederation and perpetual union, and all and singular the matters and things therein contained; and we do further solemnly pledge and engage the faith of our respective constituents, that they shall abide by the determinations of the United States in Congress assembled, on all questions which, by the said confederation, are submitted to them; and that the articles thereof shall be inviolably observed by the States we respectively represent; and that the Union be perpetual.

In witness whereof, we have hereunto set our hands, in Congress. Done at Philadelphia, in the State of Pennsylvania, the ninth day of July, in the year of our Lord one thousand seven hundred and seventy-eight, and in the third year of the independence of America.

Confederation of the Rhine (in Germ. *Rheinbund*): the name of a league formed in July, 1806, by sixteen German states under the protection of Napoleon. The princes of these states signed an act of confederation, dissolving their connection with the Germanic empire and forming an alliance with the French emperor. They were the Kings of Bavaria and Würtemberg, the arch-chancellor, the Elector of Baden, Murat, Duke of Berg, the Landgrave of Hesse-Darmstadt, the Princes of Nassau-Usingen, Nassau-Weilburg, Hohenzollern-Hechingen, Hohenzollern-Sigmaringen, Salm-Salm, Salm-Kyrburg, the Duke of Aremberg, the Count of Leyen, and the Princes of Isenburg-Birstein and Lichtenstein. In Sept., 1806, the confederation was joined by the Elector of Würzburg; in Dec., 1806, by the Elector (subsequently king) of Saxony, and the Saxon Dukes of Weimar, Gotha, Coburg, Meiningen, and Hildburghausen; in 1807, by three Dukes of Anhalt, two Princes of Lippe, three Princes of Reuss, the Prince of Waldeck, and the new kingdom of Westphalia; in 1808, by the Dukes of Mecklenburg-Strelitz, Mecklenburg-Schwerin, and Oldenburg. The confederation had an area of 126,075 sq. miles, and a pop. of 14,608,877. In 1810 a part of the confederation was incorporated with France, and its territory reduced to 114,467 sq. miles, with 13,475,000 inhabitants. In consequence of the downfall of Napoleon the confederation was dissolved in 1813, and its members united with the other German states to form the Germanic Confederation.

Conference [viâ Fr. from a Mediæv. Lat. deriv. of *confer're*, bring together, compare, alluding to the different parties bringing together or comparing their thoughts]: the act of conversing on a serious subject; an oral discussion; a formal discourse; a meeting for consultation or instruction; a meeting of two branches of a legislature by their committee when they disagree respecting the passage of a bill. In such cases each house appoints a committee of conference, in order to settle the difference by a compromise. In English law, conference signifies also the interview of an attorney or solicitor with a counsel when consulting him.

In a political sense, conference denotes the meeting of plenipotentiary ministers of several states for the peaceable settlement of international complications. Of special importance in modern history are the conferences of Vienna, held in 1820 and 1834, the Paris conference of 1856, and the London conferences of 1864, 1867, and 1871. International conferences have also been held on many non-political questions during the nineteenth century. Among the most important of these are the conferences of Geneva, Aug., 1864, for the organization of the sanitary commission, and of Paris, June and July, 1867, for the examination of the monetary question.

Conference is also an ecclesiastical term used in various senses. In the Roman Catholic Church the term was formerly applied to certain assemblies of priests or canons presided over by an arch-priest or dean. They originated in the eleventh century, but are now seldom convened.

Pastoral Conferences are meetings held annually, quarterly, or monthly by pastors of various Protestant churches for the discussion of pastoral duties, and for other similar purposes. They are held in the French Protestant churches, also among English Dissenters, and in many churches of the U. S., etc.

The Wesleyan Church in England has an annual meeting of its preachers called the "conference," which has administrative and other powers, defined by Wesley's Deed of Declaration (1784). A similar conference is held in Ireland. (See Stevens, *History of Methodism*.) In the Methodist Episcopal Church and the Methodist Episcopal Church South a General Conference meets every four years. It has full power to make rules and regulations, subject to certain restrictions found in the *Discipline*, part ii., chapter 1. It is presided over by the bishops. In the same churches the territory where preachers are stationed is divided into conferences, which are again divided into districts. The preachers and certain lay delegates of each conference meet in an annual conference, where preachers receive their appointment for the year from the presiding bishop. There are quarterly conferences held in each circuit or station.

General (triennial) and annual conferences are also held by the Free-will Baptists, and yearly conferences by the Six-principle Baptists, the minor Methodist bodies, and others.

The Conference of Hampton Court, in 1604, was a meeting of King James I., nine bishops, and nine other divines of the Anglican Church, and four Puritan theologians, held with reference to the differences between the Anglicans and the Puritans. This meeting led to some slight changes in the Anglican Liturgy.

The Savoy Conference at the palace of the Bishop of London in the Savoy, in 1661, consisted of thirteen Anglican bishops and eleven Nonconformist divines, with a number of other theologians on each side as counselors. Instead of healing the breach, the Savoy Conference (*q. v.*) increased the differences between the two parties.

The Evangelical Church Conference (*Evangelische Kirchenconferenz*) is the name given to the regular (annual or biennial) meetings of delegates of the governments of the German states and Austria-Hungary for the discussion of important Church questions.

Conference, Wesleyan: See Methodism.

Conferva [Lat. *confer'va*, a water-plant mentioned by Pliny]: a genus of fresh-water algæ, of the family *Ulotrichiaceæ* and order *Confervoideæ*. As now restricted the genus includes twenty-five to thirty species of filamentous, unbranched, green, aquatic plants, which reproduce by means of zoöspores, produced apparently by any of the cells. The zoöspores after a period of activity come to rest, and, inclosing themselves in a wall of cellulose, develop directly into new plants. In some related genera other zoöspores come together in pairs, and after fusing into a single mass the whole becomes covered with a thick wall, thus constituting a resting-spore. This process probably occurs in Conferva, but has hitherto escaped observation.

Formerly the name Conferva included all the filamentous green algæ, and it is still so used popularly, but scientifically it is restricted as above. Confervæ are abundant in springs, brooks, rivers, ponds, and lakes, and, while typically inhabitants of fresh waters, a few are found in saline springs.

Charles E. Bessey.

Confession [from Lat. *confessio*, deriv. of *confite'ri*, acknowledge; *con*, intensive + *fate'ri*, avow, connected with *fā'ri*, Gr. *φάναι*, assert]: the declaration of one's sins to a duly authorized priest with a view of obtaining absolution. Confession, thus understood, is only a part of the sacrament of penance. Roman Catholics and the Eastern Churches hold that confession is of divine institution, and therefore imposed by Church authority in the fourth Lateran Council (1215 A. D.), and that it was practiced from the very beginning of Christianity. Confession must (1) be *entire*, i. e. must include all the mortal sins committed after baptism, so far as the penitent can recall them by a diligent examination of conscience; (2) *humble* and *sincere*, and (3) accompanied by *supernatural sorrow* for sin, and a *firm purpose* of amendment for the future.

Most Protestants assert that such confession is not enjoined in the New Testament. The Greek Church regards this discipline as necessary for the reception of the Eucharist. The Lutheran professes that private confession may be retained in the Church, but that particular statement of sin is not necessary. The Church of England employs a general form of confession in its services, but retains private confession in the rubric for visitation of the sick. The Scottish and most of the other Protestant Churches do not recognize it at all.

The SIGILLUM CONFESSIONIS (seal of confession) in the Roman Catholic Church means the obligation of a confessor or priest not to divulge the secrets of the confessional. This obligation rests, 1, on the natural ethical law; 2, on positive divine law (for it belongs to the very essence of this sacrament); 3, on ecclesiastical law, promulgated at least as early as A. D. 527, in the synod of Dovin, Canon 20 (Hefele, *Councils*, vol. ii., p. 718), and reaffirmed in the fourth Lateran Council. A violation of this law by a priest would make him subject to the severest ecclesiastical penalties.

Revised by JOHN J. KEANE.

Confession: in criminal law, an admission by a person that he has committed or participated in a crime. Confessions are either judicial or extra-judicial. It is said to be judicial when made before a magistrate or in court in the course of legal proceedings, as where the prisoner pleads "guilty." An extra-judicial confession does not have the same weight as one that is judicial, and is insufficient for conviction unless corroborated by proof of the actual commission of the offense (*corpus delicti*). A confession must be voluntary—that is, not elicited by the influence of fear or hope of favor applied to the prisoner by one having authority, such as a public official or the party against whom the act was committed (prosecutor). A confession made by a person under oath is not admissible, as it is held that he is then under a species of restraint. It is not necessary that it should be spontaneous, nor that a warning should be given to the person making it that it will be used against him. The question of the admissibility of a confession in evidence is decided by the judge; its credibility after its admission is determined by the jury. Revised by F. STURGES ALLEN.

Confessional: in the Roman Catholic Church, a place reserved for the hearing of confession with a seat for the priest and a place for the penitent to kneel. This has been commonly since the Middle Ages an inclosed cabinet or closet of wood, sometimes ornamental, and forming part of the church furniture. The priest's compartment has a penitent's compartment on each side of it.

Confession of Faith: See CREED.

Confines, AUDIENCE OF THE (Sp. *Audiencia de los Confines*): the supreme Spanish court of the Central American region. When the "new laws" were promulgated in 1542 it was ordered that the audience of Panama should be abolished, its functions being divided between the two audiences of Los Reyes (Lima) and Los Confines (Central America). The latter had jurisdiction over Chiapas, Yucatan, Guatemala, Honduras, Nicaragua, and Castilla del Oro (Isthmus of Panama). Its powers were very great. In criminal cases there was no appeal from it, and in civil cases an appeal lay to the Council of the Indies only in cases involving over 10,000 *pesos de oro*. It appointed temporary governors, and was superior to the crown governors on all legal points, being, in fact, the highest representative of the king in Central America. It consisted of four *oidores* (auditors or judges), one of whom, as president, practically ruled the others. Comayagua was chosen for the seat of this audience, but it was found inconvenient, and the first session was held at Gracias á Dios in 1545. In 1549 it was changed to Guatemala, where it remained until the revolution, except from 1563–70, when it was at Panama. The new audience of Panama, established in 1595, took the isthmus region from the Audience of the Confines.

HERBERT H. SMITH.

Confirmation, or **Laying-on of Hands** [*confirmation* is from Lat. *confirma'tio*, deriv. of *confirma're*, make firm, establish]: a sacramental rite evidently referred to in the Epistle to the Hebrews (vi. 1, 2), as one of "the principles of the doctrine of Christ." Notices of the administration of this rite are found in Acts viii. 5–20; xix. 1–8. In primitive times, and still in the Eastern Church, this rite was known as the "seal" and the "unction of the Spirit"; and under these names it appears to be alluded to again and again in the New Testament (e. g. 2 Cor. i. 21; Eph. i. 13; iv. 30; 1 John ii. 20, 27). Notices of the continued and universal use of this rite are found in Tertullian (A. D. 196–201), who, after describing the manner of baptizing as practiced in his day, adds, "Next to this the hand is laid upon us, calling upon and inviting the Holy Spirit through the blessing" (*De Bapt.* viii. 7–8). There can be no doubt, from the testimonies of the Fathers, that this rite, universally observed in the apostolical Church, was continued in use, the Church believing that, although the miraculous gifts which at first sometimes attended the rite had ceased to be seen, the more important, because more lasting, graces of the Holy Spirit were still conveyed. As St. Augustine says (*Pol.* v., lxvi. 4), "Not by gifts of tongues is the Spirit known in the laying on of hands, but invisibly and secretly it is felt." In the Eastern Churches it has always been the practice to administer confirmation directly after baptism, or as soon after as might be; but in the East priests were permitted to administer confirmation, using chrism consecrated by the bishop. In the West the rite of confirming was restricted to the bishop in person. Bede informs us that in his time, the early part of the eighth century, after the special seasons of baptism—Easter and Whitsuntide—the bishop made a visitation of his diocese for the purpose of confirming those just baptized. The pontifical of Egbert, Archbishop of York, *circa* 750, contains the confirmation service of the English Church at that period. The earliest confirmation service extant is found in the Gelasian Sacramentary (A. D. 492). Its opening words, closely followed in the English and American confirmation offices, are: "Then (after baptism) by the bishop is given to them (the baptized) the sevenfold Spirit. He lays his hand upon them to seal them with these words: 'Almighty God, Father of our Lord Jesus Christ, who hast regenerated thy servants by water and the Holy Ghost, and hast given them remission of all their sins, thou, Lord, send unto them thine Holy Ghost the Comforter, and give them the spirit of wisdom and understanding, the spirit of counsel and fortitude, the spirit of knowledge and piety, fill them with the spirit of the fear of God, in the name of the Lord, with whom thou livest and reignest, God, ever with the Holy Ghost, through all ages of ages. Amen.'" Anointing with chrism in the sign of the cross on the forehead was of very early use in the administration of the rite, but the laying on of hands was the essential act. All three were in use in the English Church down to the end of the reign of King Henry VIII. In the first book of King Edward VI. the chrism was discontinued. "Then the bishop shall cross them on the forehead, and lay his hand upon their heads." In the second book of King Edward VI. the crossing was also discontinued. "Then shall the bishop lay his hand upon every child 'severally.'" The office in the English and American Prayer-books is almost identical. In the American revision of 1892 the use of the "preface," originally a rubric, is made permissive instead of being mandatory; a form of presentation to the bishop is added, and the reading of the account of the laying on of hands given by St. Luke in Acts viii. is required. A rubric is added at the close of the service as follows:

"*The minister shall not omit earnestly to move the persons confirmed to come, without delay, to the Lord's Supper.*"

W. S. PERRY.

Confiscation [from Lat. *confiscatio*, deriv. of *confisca're*, confiscate; *con* + *fiscus*, basket, receptacle for money, treasury]: the forfeiture of land or other property to the public treasury as part of the punishment of certain crimes. During the French Revolution a large quantity of land owned by the Church was confiscated—i. e. was taken from the Church in order to convert it into a source of national revenue.

Conflict of Laws: See International Law, Private.

Confucianism: the ethico-political system of Confucius (*q. v.*), sometimes erroneously called a "religion," and described as "one of the three religions of China." This erroneous notion had its origin in the imperfect information of those who wrote about China in the early days of foreign intercourse with that country, and has been perpetuated by other more modern writers, who needlessly include in the term the ancient religion of China which had been in existence for more than two thousand years before Confucius, and with which he had nothing to do, as well as the teachings of the sage himself. His saying, "Respect the gods! but have as little as possible to do with them," represents his position in regard to religion.

The key to the Confucian teaching is found in the state of the empire in his day. The house of Chow, which had come to the imperial throne about 1122 B. C., had lost all influence with the feudal princes, who warred with each other or against the emperor. "Right principles," Mencius tells us, "had faded away, and oppression and bloodshed prevailed." To remedy this state of things, to renovate the people, and inaugurate a time of universal peace and prosperity, was what Confucius aimed at. "Fond of antiquity and earnest in seeking knowledge there," he had observed that in the good old times of "the ancient kings" peace and prosperity were found hand in hand with beneficent government, the observance of "the rules of propriety," and the cultivation of virtue. Yao and Shun, twenty-three centuries B. C., had blotted evil, and poverty, and ignorance out of the empire simply by their virtue and example. "The upright were advanced to office and the crooked set aside." The result was "universal concord," a kind of golden age, which might again be brought about by imitating the ancient kings. Hence his inculcation of the five cardinal virtues, the observance by all classes of the duties pertaining to the five relationships of life, viz., those of ruler and subject, parent and child, husband and wife, brother and brother, and friend and friend.

"When the prince is prince," said Confucius, "and the minister is minister, when the father is father, and the son is son," then there is good government, and having good government righteousness will prevail and the people will be happy. The system of Confucius can perhaps best be shown by an extract from the *Ta Hioh*, or "Great Lesson," a fragment of 275 words attributed to Confucius, and commented on by Tsŭng Sin, a disciple. The object of this great lesson is said to be "to illustrate illustrious virtue, to renovate the people, and to rest in the highest excellence." It says:

"The ancients who desired to illustrate illustrious virtue throughout the empire first ordered well their own states. Wishing to order well their own states, they first regulated their families. Wishing to regulate their families, they first cultivated their own persons. Wishing to cultivate their persons they first rectified their hearts. Wishing to rectify their hearts, they first sought to be sincere in their thoughts. Wishing to be sincere in their thoughts, they extended their knowledge to the utmost; and this extension of knowledge lay in the investigation of things. Things being investigated, knowledge became complete. Their knowledge being complete, their thoughts were sincere. Their thoughts being sincere their hearts were then rectified. Their hearts being rectified, their persons were cultivated. Their persons being cultivated, their families were regulated. Their families being regulated, their states were rightly governed. Their states being rightly governed, the whole empire was made tranquil and happy. From the emperor down to the mass of the people, all must consider the cultivation of the person the root of everything besides." *Chinese Classics*, translated by J. Legge, vol. i., p. 222.

Wŭn Wang, the founder of the Chow dynasty, in the twelfth century B. C. illustrated these principles. The commentator tells us that as a sovereign he rested in benevolence, as a minister in reverence, as a son in filial piety, as a father in kindness, and in communication with his subjects in good faith.

Confucianism concerns itself exclusively with man, first as an individual, and second in his relation to the family and the state, and makes no attempt to solve the problem of his origin and destiny. Its highest good is the temporal wellbeing of the community. See Legge's *Chinese Classics* and Faber's *Systematical Digest of the Doctrines of Confucius* (Hongkong and London, 1875). R. Lilley.

Confu'cius [Latinized form of Chinese K'ung-fu-tsze, the Master K'ung]: Chinese philosopher; b. B. C. 551 in Lu, one of the feudal states into which China was then divided, now a part of the province of Shantung. Though he did not himself commit his teachings to writing, thanks to the pious care with which his disciples recorded not only his sayings but also his manner of life hardly any character of antiquity is so well known to us. His father, a soldier distinguished for deeds of strength and daring, died when Confucius, the child of his old age by a second marriage, was only three years old, leaving him to his mother's care. He married at the age of nineteen, and for two years held subordinate posts in the public service. At twenty-two he entered on what was to be the chief occupation of his life—that of a public teacher. To all who resorted to him he gave instruction, however small the fee offered, if only they gave evidence of capacity and zeal for improvement. As his fame spread abroad the number of his disciples increased, until it is said at one time to have reached 3,000. The political disorders growing out of the quarrels of the feudal states, which the authority of the emperor was too weak to restrain, naturally directed his attention to the principles of good government, and this became one of his most frequent topics of discourse. At the age of fifty-one he was made chief magistrate of the town of Chung-tu, and had at length an opportunity to put his theories into practice. The immediate and marked improvement in the manners of the inhabitants led to his advancement, first to the post of assistant superintendent of public works and next to that of minister of crime in Lu. Here also similar results followed, but the jealousies and fears of the neighboring states were now aroused, and unworthy means were taken to create a breach between the Marquis of Lu and his minister. Confucius, finding it impossible to retain his office with dignity, withdrew from Lu, and for thirteen years journeyed from one to another of the neighboring states, everywhere received with honor, but nowhere finding a ruler willing to be guided by his counsels. He returned to his native state B. C. 483, and until his death in 478 was mainly occupied with literary pursuits. He had been all his life a student of the early history and literature of his country, and the editorship of four of the "five classics" is with more or less justice ascribed to him, while the fifth, the *Spring and Autumn Annals*, a brief record of events in Lu from 721 to 480 B. C., is his own work, though hardly worthy of his reputation.

The principal source of our knowledge of his character and teaching is the *Lun yu*, which might be aptly styled the "Memorabilia of Confucius." Two other of the "four books"—the *Great Learning* and the *Doctrine of the Mean* (the latter ascribed to K'ung Keih, the grandson of Confucius)—contain digests of his teaching, but in a less original and therefore for us less valuable form. Confucius put forward no claim to originality. He spoke of himself as a "transmitter and not a maker, believing in and loving the ancients"; again, "I am not one who was born in the possession of knowledge; I am one who is fond of antiquity and earnest in seeking it there." This reverence for antiquity extended even to its forms and ceremonies, in the observance of which, however, his evident sincerity preserved him the appearance of formalism. He was preeminently a teacher of ethics. The whole tendency of his mind was practical rather than speculative. We are told that "there were four things which he taught—letters, ethics, devotion of soul, and truthfulness." He held to the native goodness of human nature, and his system of morals rested on no sanctions of future rewards and punishments. Many of his recorded sayings are admirable, but of highest value is his enunciation of the "golden rule." One of his disciples asked, "Is there one word which may serve as a rule of practice for all one's life?" The master said, "Is not *reciprocity* such a word? What you do not want done to yourself do not do to others." The progress of his own development he has thus described: "At fifteen I had my mind bent on learning; at thirty I stood firm; at forty I had no doubts; at fifty I knew the decrees of heaven; at sixty my ear was an obedient organ; at seventy I could follow what my heart desired without transgressing what was right."

The reserve with which Confucius spoke of man's relation to the powers above and of the future life may be due in part to the influence of the early Chinese religion. This, like the Government, was patriarchal in character; the emperor, as the representative of his people, alone offered sac-

rifices to heaven, while the popular religion was little more than ancestor-worship. But Confucius was also, by the native temper of his mind, inclined to positivism and secularism. Among the subjects on which he did not talk were "extraordinary things" and "spiritual beings." One of his disciples, Ki Loo, "asked about serving the spirits of the dead. The master said: While you are not able to serve men, how can you serve their spirits? Ki Loo added: I venture to ask about death. He was answered: While you do not know life, how can you know about death?" This attitude he has communicated to his followers, and that the Confucianists have escaped the degrading superstitions and magical practices into which the Bûddhist and Taoist sects of China have fallen is largely due to the influence of Confucius.

Measured by any standard, a high ethical value must be accorded to the teaching of Confucius. It was, moreover, peculiarly adapted, even in its limitations, to the genius of the Chinese people, already predisposed, like himself, to the conservatism which he has done so much to strengthen. But his teaching alone, even with the aid of his strong personality, would hardly account for the vast influence which he has held and still continues to hold over the Chinese mind. To explain this we must take into account also the place which the classical books, and through them the doctrines of Confucius, occupy in the educational and administrative systems of China. For centuries they have been the foundation, and we might almost say the sum, of the instruction given in the schools, and the main subjects in the examinations which guard the entrance to and regulate promotion in the public service. The Government by lavish honors paid to his memory has added further to the weight of his authority. His family is ennobled, and the oldest representative in the direct line has the rank and revenues of a duke, the sole hereditary dignity of Chinese origin which was respected by the reigning Manchu dynasty. Twice a year the emperor himself makes offerings in his honor in the hall of the imperial college at Peking. Temples dedicated to him are attached to the examination halls, more than 1,500 in number, scattered throughout the empire. In Japan and Korea also, among the educated classes, his authority as a teacher is hardly less than in his native land.

Addison Van Name.

Congaree': a river of South Carolina; is formed by the Broad and Saluda rivers, which unite at Columbia. It flows southeastward, and joins the Wateree to form the Santee river. Steamboats ascend the Santee and Congaree rivers to Columbia.

Congé d'élire, kōn'zhā'dā'leer': a French phrase signifying "permission to choose," is the name given in England to the king's warrant or license to the dean and chapter in the older dioceses to elect a bishop for a vacant see. The king's warrant, however, always contains the name of the person whom the dean and the chapter are to elect, and they have, according to 25 Henry VIII., c. 20, no means whatever of asserting a wish of their own.

Congenital Diseases: diseases produced or existing at birth. These conditions are to be distinguished from hereditary affections, and from malformations of the infant, which result either from arrested development or disease contracted during intra-uterine life; they are described elsewhere. Congenital diseases proper may be classed as follows: First, those transmitted from a diseased mother before or during birth: such as syphilis, various conditions caused by a septic puerperal infection, and gonorrhœal infection. Second, those acquired shortly before birth; such as acute general fatty degeneration of the fœtus and newly born, and tumors of various kinds. Third, those acquired during birth, without direct maternal influence; such as asphyxia, atelectasis (unexpanded condition of the lungs), and cephalhæmatoma, or a sanguineous tumor of the head. Syphilis may affect the infant by transmission from the mother to it at any period of intra-uterine life. When the genital tract of the mother is infected with a syphilitic ulcer, the child in passing through it may develop a primary infection. Antisyphilitic treatment is urgently indicated in all cases. From a septic puerperal infection of the mother a direct transmission to the child may occur, in consequence of which a puerperal erysipelas, an infective peritonitis, a septic jaundice with inflammation of the umbilical vein, a purulent inflammation of the eye, and a pyæmic condition with the formation of multiple abscesses, may be developed; these are several of the manifestations resulting from the same cause, as seen in different infants. They are all accompanied with high fever, and generally soon terminate fatally. Gonorrhœa, when affecting the vagina of the mother, gives rise to the most dangerous form of purulent inflammation of the infantile eyelids, which unless immediately treated, is apt to result in blindness. In this condition the eye must be frequently opened and washed with mild antiseptic lotions; also applications of nitrate of silver solution, and ice-water soaked pads locally. An acute general fatty degeneration of numerous organs is not frequently seen; the epithelium of lungs, bronchial tubes, uriniferous tubes of kidneys, intestine, liver cells, blood-vessels, or even the whole body may be affected. Such a condition interferes with the normal functions of these parts, and usually terminates fatally; uncontrollable hæmorrhages from the stomach, bowels, or umbilical cord, frequently being the direct cause of death. Congenital tumors are rather frequent, and generally call for operative interference. Asphyxia is a condition most frequently observed after protracted labors, especially in those cases due to abnormal presentation of the infant, where the breech or lower extremities are born before the head. This oftentimes causes a greater or less degree of compression of the umbilical cord, resulting in a temporary or permanent arrest of its circulation, and consequent premature respiratory movements. Thus the child is born almost or apparently lifeless, blue or pale, with no respiratory attempts, and possibly no pulsation of the heart. This condition demands immediate application of respiratory stimulants, or artificial respiration. Slapping the buttocks, alternate immersion in warm and cold water, slapping the chest with a wet cloth, forcible swinging in the air, electric current to the chest, etc., may induce respiratory movement. Artificial respiration by Marshall Hall's, Sylvester's, or Howard's method, or by mouth to mouth inflation, is of value. Atelectasis is the result of an absence of the normal expansion of the lungs, following the entrance of air. This condition may be caused by an insufficient development of the chest muscles, or their innervation may be faulty, due to some disease of the brain; the lungs may be the seat of an inflammation, or they may be filled with mucus, or some foreign substance aspirated during birth, such as blood, mucus, amniotic fluid, etc. To relieve this condition, emetics cause a discharge of the foreign matter, tickling the fauces frequently sufficing. To excite nerve action the electric current is used, and mustard plasters are applied locally. Cephalhæmatoma may result from one of two causes. The external layer of the cranial bones of the new-born, being but slightly developed, affords but little protection to the blood-vessels ramifying in it, and in consequence of which little violence, and sometimes practically none at all, is necessary to cause a rupture. Or a hæmorrhage due to one of many causes may occur between the bone and its periosteum, or enveloping membrane; this extravasation of blood, small at first, may in the course of from four to six days increase to the size of a walnut or small apple. Such hæmorrhages are most common near one of the parietal bones. The condition in itself is usually not dangerous, and the extravasation will generally be absorbed in from four to ten weeks if undisturbed. Surgical interference is but rarely indicated, and is apt to result in suppuration unless the most stringent antiseptic measures are observed.

A. Jacobi and F. E. Sondern.

Conger: a marine eel, *Conger conger*, having a more pointed tail than the common species. The skin is scaleless; head depressed and pointed; mouth deeply cleft; under jaw slightly projecting beyond the upper; outer series of teeth in either jaw so closely set as to form a cutting edge. Color dark brown above, dirty white below: dorsal and anal fins pale, edged with black, or sometimes entirely black. It is a widely distributed species, being found on the coasts of Europe, Japan, Tasmania, and the Eastern U. S., preferring a rocky bottom. It reaches a length of 8 feet and a weight of 100 lb., and, although not particularly good eating, is sometimes used for food in Great Britain, the principal fishery being off the Cornish coast. It is voracious, active, and powerful, and large specimens require careful handling when caught. It seems remarkably susceptible to cold. In California the name is applied to *Sidera mordax*, one of the Murænas, and in the Eastern U. S. to *Zoarces anguillaris*, the eel-pout.

F. A. L.

Congestion [from Lat. *conges'tio*, deriv. of *conge'rere*, carry together, heap together]: in pathology, fullness of blood or repletion of the blood-vessels. Congestion may be arterial or active when the over-filling of the vessels is due to increased flow of blood to the part, or passive or venous when it is due to obstruction to the outflow of blood. Active congestion results from excitement of the circulation by emotional disturbances, exercise, alcohol or other poisons, from exposure to cold, or direct irritation of the part; passive from mechanical obstruction of the circulation; and localized passive from pressure upon the venous trunks of different parts. When active the affected part is light red in color; when passive the color is dark red or bluish. W. P.

Congestive Chill: See CHILL.

Con'gleton: a market-town of Cheshire, England; in a deep valley on the river Dane; 22 miles S. of Manchester (see map of England, ref. 8–G). It has manufactures of silk ribbons and other silk fabrics. Pop. (1891) 10,744.

Congleton, HENRY BROOKE PARNELL, Lord: British statesman; b. July 3, 1776; for many years a Liberal member of Parliament. He became Secretary at War in 1830, and paymaster of the forces in 1835. He was well versed in financial affairs, and wrote several works, one of which was *On Financial Reform* (1830). Committed suicide June 8, 1842.

Conglomerate: See SANDSTONE.

Congo Eel: See CONGO SNAKE.

Congo Free State: an area in Central Africa embracing two-thirds of the Congo river basin. It was constituted and defined under this name in 1885 by the International Congo Conference at Berlin, and was placed under the sovereignty of the King of the Belgians as an individual, but he bequeathed all his rights to Belgium, and she has reserved the right of annexing the state after 1900. See below

Area and Boundaries.—The state includes a small strip along the lower Congo from the coast. From lon. 14° E. the boundary follows the Congo to the mouth of the Ubangi, then the Ubangi and Mbomu to Lado on the Nile; thence S. to Lake Bangweolo, or Bemba; thence westward to the Kassai river in 24° E. lon.; then along the Kassai to 7° S. lat.; then westward to the Kwango river in about 8° S., down which the boundary follows to 5° 50′ S.; thence W. to the Congo, and down that stream to its mouth. The area is estimated at 802,000 sq. miles, making it nearly one thirteenth of Africa. This enormous area is varied, having only the two common characteristics of being tropical and of being included in the basin of a single river. Civilized control extends over most of the larger rivers; in other parts of the state the numerous wild tribes are entirely uncontrolled, and to some extent unvisited. One of the purposes of the original formation of the state was the suppression of the slave-trade, and this has been fairly accomplished, not, however, so much by interior control as by watchfulness in the British, German, French, and Portuguese territories that surround it, except to the north.

Government.—The central government is at Brussels, and consists of its sovereign, the King of the Belgians, and the heads of the departments, namely, the Ministers of Foreign Affairs and Justice, of Finance, and of the Interior. There is also a local government comprising a governor-general and vice-governor, a state inspector, a general secretary, a director of justice, a director of finance, and a commander of the forces. The local capital is Boma, 50 miles from the river mouth. There are fifteen administrative divisions. There is an armed force of 6,120 blacks, commanded by white officers. There are about sixty steam vessels on the lower and upper Congo. Navigation for the lower Congo ends at Matadi, 90 miles up the river. From this to Stanley Pool or Leopoldville it is unnavigable because of rapids. Between these points a railway has been built, and was opened for business in June, 1898. It is 235 miles long, and runs about 30 miles S. of the river. A regular steamer service connects the state with Europe, and it is included in the postal union.

Trade and Commerce.—The principal articles of export are palm-oil, rubber, ivory, orchilla, copal, ground-nuts, cam-wood, and coffee. The general exports amounted in 1895 to 12,135,656 francs; in 1898 to 22,354,005 francs. The chief articles exported were ivory, rubber, palm-oil, and nuts. The imports, chiefly from Belgium, in 1898 aggregated 23,207,281 francs. The population is probably about 10,000,000.

Revenue.—The revenue is derived (1) from a subsidy of 1,000,000 francs by King Leopold; (2) from advances of 2,000,000 francs annually for ten years, promised by the Belgium Government; (3) from taxes; and (4) from the sale, etc., of public lands. Revenue (1899) 20,087,782 francs; expenditure, 19,842,087 francs.

HISTORY.—As an independent sovereignty, recognized by the powers, the Congo Free State dates from 1884. Its origin is to be found in the companies formed for trade and exploration in that region. The first of these was the African International Association, founded in 1877. The plan of this company was to send several exploring parties into the interior from the east coast, and to erect a line of stations along their routes. In 1878, after Stanley's return to Europe, another society was formed to study the country, its native tribes, its possibilities of travel and transportation, and its commercial resources. This was called the Comité d'Études du Haut Congo. It became the International Association of the Congo. In 1879 this second association sent Stanley up the great river. He and his men explored much more of the country, founded stations, built roads, and made over 400 treaties with native chiefs. These treaties conveyed the sovereignty which resided in the petty chiefs, contracting parties of the one part, to the International Association of the Congo, of the other. It then appealed to the powers to enable it to combine these many little sovereignties into one independent state.

The U. S. led the way. The Committee on Foreign Relations reported to the Forty-eighth Congress that the acts of cession of the native chiefs were within their rights, and that the association could lawfully accept them. This Government accordingly, Apr. 22, 1884, recognized the International Association of the Congo as a sovereign and independent power under the title of the Congo Free State. Within a year Austria, France, Germany, Great Britain, Italy, the Netherlands, Portugal, Russia, Spain, and Sweden followed the example of the U. S. Both France and Portugal, whose territories adjoin the Free State, made treaties of delimitation with it. Though an independent power, this new state, from th nature of its origin, from the objects of its formation, and from its dependence upon its sponsor, Belgium, occupies a position unlike that of any other member of the family of nations. Its character was constituted and defined by the general act of the International Congo Conference, signed at Berlin Feb. 26, 1885. It was thereby declared neutral and free to the trade of all nations, though the powers reserved for twenty years the right to decide as to the freedom of imports from taxation. The free navigation of the Congo and its affluents was provided for under an international commission. Religious freedom was proclaimed. Equality of treatment was promised to all settlers of whatever nationality. The slave-trade and slavery were to be assailed, the education and civilization of the natives attempted. All the powers represented at the conference ratified this important act except the U. S., which excused itself on the ground that such action would impose upon it international obligations at variance with its traditional policy.

In Apr., 1885, Leopold II., King of the Belgians, became sovereign of the Congo Free State; by will, Aug. 2, 1889, however, he bequeathed to Belgium all his sovereign rights over it. On July 31, 1890, the territories of the state were declared inalienable; a convention earlier in the same month between the two had reserved to Belgium the right of annexing the Congo State after ten years. There is a peculiar propriety in this close connection with Belgium, since both are declared perpetually neutral under the protection of the powers.

To provide revenue the International Conference at Brussels, 1890, participated in by seventeen powers, authorized the Congo State to levy duties on certain imports. By treaty of amity, commerce, and navigation, 1891, the U. S. provides for commercial intercourse and a consular system, accepts the laying of import duties, and agrees to settle by arbitration any dispute arising under the treaty.

THEODORE S. WOOLSEY.

Congo River: the second largest river in Africa, the knowledge of which (not yet complete) is due to modern explorations, especially those of Stanley. It receives various names in different parts of its course. It begins in the Chambezi river, which rises in about lat. 9° S., lon. 32° E., in the mountains S. of Lake Leopold, or Hikwa, between Tanganyika and Nyassa. This flows S. W., and is lost in Lake Bangweolo, or Bemba. Beyond this lake it reappears as the Luapula (believed by Delcommune to be the main stream), which flows northward into Lake Moero. Passing through this it reappears as the Luvua, and still flowing northward receives in its course the great Lualaba river, and takes its name. The Lualaba, which rises far to the S. (about lat. 12° S. and lon. 25° E.) and passes through a string of little-known lakes on its northward course, may be the main stream. From about lat. 4° S. its course has been explored, and it is known to be the Congo. From this point it is a noble stream, full of islands and sometimes dividing into two or more parts. At the equator there is a series of falls and cataracts called the Stanley Falls. From this place it passes northwestward to lat. 2° N., then southwestward to Stanley Pool (Leopoldville) in lat. 4° S., a distance of 1,000 miles or more, all navigable, and in this distance it receives the four great tributaries, the Lubilash (or Lomami) from the S., the Novelle (called Arnwimi at its mouth) from the E., the Ubangi (or Mobangi) from the N., and the Kwa (or Kassai) from the E. From Stanley Pool to Vivi, a distance of 200 miles or more, it is not navigable. From Vivi to the mouth, 90 miles, navigation is free. There is no delta; in this the Congo differs from the other great African rivers—the Nile, Niger, and Zambesi. The total length has been estimated at 2,900 miles, of which not more than half is navigable. The whole basin has an area of about 1,200,000 sq. miles. The Congo Railroad, passing around 235 miles of rapids in the lower Congo, was completed in July, 1898, giving steam communication with Europe.

Congo Snake, or **Congo Eel**: a popular name in the Southern U. S. for *Amphiuma means*, a slender eel-like batrachian, inhabiting the swamps and rice-fields of the Southern U. S., where it burrows in the soft mud. The animal reaches a length of 2 feet, has gill openings, four rudimentary limbs, with two or three toes on each, and a smooth slaty black skin, a little lighter on the under side.

Congregation of Clugny: See CLUNIACS, THE.

Congregationalism: a system of Church polity which embraces the principle of self-government in the local church, and the duty of churches to stand in fellowship or communion with one another. It gives to each congregation the right of regulating, without external interference, the details of its worship and discipline according to its own understanding of the principles of the New Testament, while it inculcates the duty of maintaining the fraternal communion of separate assemblies of believers, especially of such as profess the same faith and accept the same order.

According to the fundamental principle of Congregationalism, any association of believers, united by formal covenant for mutual watchfulness and help, the maintenance of divine worship, the observance of Christian rites, and combined efforts to promote the kingdom of God, is a Church of Christ, and as such is competent to elect and ordain its own officers, admit or reject applicants for membership, exclude unworthy members, control its own property, and transact its own business. The orderly prosecution of church-work calls for the appointment of various officers, on whom is laid the special responsibility of oversight and direction; and long usage, based upon the instructions of the New Testament, recognizes the office of pastor and that of deacon as needing to be perpetuated in the Church. The pastor holds the office of a bishop or elder. By virtue of his ordination he becomes a minister, whose function is not only to preach but to officiate in the administration of sacraments, as well as at the marriage service and the burial of the dead; and this rank of a minister he retains, even though his position as a pastor of a particular church may have been resigned. On this point, it may be remarked, an opposite view was prevalent in the early days of New England. Ordinarily each church has but one pastor, and for his support provision is made in the form of a stipulated salary, voluntarily contributed by the congregation. Among ministers, whether installed as pastors or not, there is no disparity of rank. The deacons are not salaried officers, nor technically ministers, but they are helpers of the pastor, and have special charge of receiving the charities of the church, and making distribution for the relief of the poor. They receive from the minister and hand to communicants the bread and wine at the Lord's Supper.

The Congregational system holds to the Holy Scriptures as the sufficient and exclusive rule of ecclesiastical polity, but leaves to the discretion of churches to establish forms and arrangements which are deemed expedient, provided they are not repugnant to the teaching of the Bible. It recognizes no organized and visible Church apart from local and particular assemblies of believers, and repudiates all claims of superior bodies to exercise legislative or judicial authority over the brotherhood.

Nevertheless, the relation of neighboring churches is most intimate and friendly, and is manifested in various ways; especially by mutual consultations and co-operation, the occasional transfer of members, and formal or informal associations for common work. The principal instrument of Church communion is ecclesiastical councils, whose function is to give counsel and to express fellowship, but never to issue commands. Thus Congregationalism differs from independency in maintaining the fellowship of distinct churches, and from Presbyterianism in denying the right of a presbytery or synod to exercise authority over the churches. It is through this feature of the communion of churches by means of councils that Congregationalism in the U. S. differs from Congregationalism in Great Britain. (See INDEPENDENTS.) In 1891 an International Congregational Council was held in London.

In its principles this system is remarkably unsectarian and liberal, and its development during the last 250 years has been closely identified with increased liberty of religious thought, and with the practical union of men holding different tenets in common works of philanthropy and beneficence.

As a system of church order, Congregationalism is not necessarily connected with any school of theology or any class of doctrine. Its methods of administering church affairs may be adopted alike by Calvinists, Arminians, Socinians, and Arians. The church government of the different denominations of Baptists is, for the most part, simply congregational. Some Methodists have followed the same order. The Churches in the U. S. known as Unitarian are built upon the same platform. This is true also of Christians and Universalists. All these denominations are to be grouped together as occupying common ground in opposition to the idea of a Church comprising many local congregations, and of a government administered by a priesthood. The rise, during the nineteenth century, in Sweden, Holland, and other European countries of organizations of Christians almost identical with the evangelical Congregational churches of English-speaking countries is one of the most interesting facts in the history of Congregationalism.

At the same time, the churches which are generally known as Congregational have held to positive and evangelical views of truth, being Calvinistic rather than Arminian, Trinitarian rather than Socinian or Arian, accepting the doctrine of a future state of endless retribution, recognizing the families of believers as fit subjects of baptism, and regarding the mode of administering baptism as of comparatively small importance. Modifications of theological opinion, however, have appeared from time to time. Each church has its own articles of belief, which with greater or less fullness indicate the system of doctrine taught from the pulpit and accepted by the members. Some churches have taken as their standards the Confession and Catechisms of the divines who met at Westminster, London, in 1648; but the creeds in common use are much briefer. They vary in their phraseology, and are commonly used as formulas for the reception of members.

The Congregationalists of the U. S., when assembled in a national council at Boston in 1865, declared in general terms their "adherence to the faith and order of the apostolic and primitive Churches held by their fathers," but "extended to all believers the hand of Christian fellowship upon the basis of those great fundamental truths in which all Christians should agree." They framed a comprehensive creed, called the "Burial Hill Declaration." So also at Oberlin in 1871 the elders and messengers of the Congregational churches of the U. S., in forming a permanent national organization to meet triennially for discussion thought it sufficient to define their doctrinal position by these words: "They agree in the belief that the Holy Scriptures are the sufficient and only infallible rule of religious faith and practice; their interpretation thereof being in substantial accordance with the

great doctrines of the Christian faith commonly called evangelical, held in our churches from early times, and sufficiently set forth by former general councils." In 1884 a new creed was put forth, prepared by a commission of representative men. These were selected by a committee of seven, appointed by a national council at St. Louis in 1880.

The early home of Congregationalism was New England, to which it was brought at the earliest settlement of the colonies. The Pilgrims who settled Plymouth and the Puritans who settled Massachusetts and Connecticut united in its adoption. As the population has moved westward, this form of Church order has spread extensively through the West and Northwest, till more than half of the churches designated as Congregational are W. of the Hudson river, while in the South and Southwest this denomination until recently was but little known. Recognizing the importance of culture and an educated ministry, the Congregationalists have been distinguished as the founders and liberal supporters of schools, colleges, and theological seminaries. Their theological schools are at Bangor, Me., Andover, Mass., Hartford and New Haven, Conn., Oberlin, O., Chicago, Ill., and Oakland, Cal. The Congregationalists have earnestly co-operated with other denominations in missionary and benevolent organizations which, like the American Bible Society, have invited to united effort. Among the societies which are now chiefly under their direction are the American Board of Commissioners for Foreign Missions, the American Congregational Home Missionary Society, the Congregational Church Building Society, the American Education Society, the American Missionary Association, and the Congregational Sunday School and Publishing Society. These, however, are not strictly ecclesiastical organizations, but associations of individuals over which the churches, as such, have no control. For the control of these agencies some form of confederated union of churches would be requisite. Tendencies in this direction are apparent, but encounter resistance.

Among the Congregationalists of the U. S. there have arisen numerous theological leaders, in earlier and more recent days. The most eminent of them was Jonathan Edwards. Many who have been trained under the influences of Congregationalism have become leaders in other Christian communions, especially in the Presbyterian Church, and many of its clergy have been trained in other communions.

The theory and practice of Congregationalism have been much discussed in the present generation. A valuable repository of essays may be found in the *Congregational Quarterly*, established in Boston in 1859, of which fourteen volumes were published. Other authorities are *Debates and Proceedings of the National Council of Congregational Churches* at Boston, 1865; Dexter's *Congregationalism*: Pond's *Manual*; Bacon's *Congregational Order*; Upham's *Ratio Disciplinæ*; Punchard on *Congregationalism*; Cumming's *Dictionary of Congregational Usages and Principles*; Buck's *Massachusetts Ecclesiastical Law*; *Contributions to the Ecclesiastical History of Connecticut*; and numerous local histories and church manuals.

Statistical summaries of the Congregational churches may be found each year in the *Congregational Year-book*, representing the numerical strength of the denomination and its changes during the preceding statistical year.

The returns thus published in 1900 for the U. S. showed 5,604 churches, 5,614 ministers, and a membership of 629,874, representing 400,249 families. The Sabbath-school enrollment was 682,907 and the number of members received on confession during the year 24,514. In 1862, thirty-eight years before, the aggregate returns showed 2,555 churches, 2,678 ministers, 255,034 members, and 246,178 in Sabbath-schools. For Congregationalism in England, see INDEPENDENTS. For further details, see A. E. Dunning, *Congregationalists in America*; H. M. Dexter, *Congregationalism as Seen in its Literature*; and *The History of Congregationalism*, by Prof. Williston Walker.

Congregation of Rites: See RITES.

Congress [from Lat. *congres'sus*, meeting; deriv. of *con'gredi*, go together; *con*, together + *gra'di*, walk: cf. *gradus*, step]: in international law, a meeting of the sovereigns of states or their representatives for the purpose of arranging international matters. The first general European congress was after the conclusion of the Thirty Years' war in Germany, at Münster and Osnabrück, 1648. Remarkable general congresses have been—of the Pyrenees (1659); at Aix-la-Chapelle (1668); at Nimeguen (1676); at Ryswick (1697); at Utrecht (1713); at Aix-la-Chapelle (1748); at Teschen (1779); at Paris (1782); at Versailles (1785); at The Hague (1790); at Rastadt (1797); at Erfurt (1808); at Vienna (1814, concluded at Paris 1815); at Aix-la-Chapelle (1818); at Troppau (1820); at Laybach (1821); at Verona (1822); at Berlin (1878). More recently the word CONFERENCE (*q. v.*) is commonly applied to international meetings of statesmen for the settlement of international complications. See Phillimore, *On International Law* (ii. 45).

CONGRESS also comes into use as a name for international meetings of scholars of a particular science, as statistical congress, archæological congress, etc.

CONGRESS, the title of the national Legislature of the U. S. of America. It consists of a House of Representatives and of a Senate. The former is composed of members chosen every second year. The qualification of electors is the same as that required in their respective States for electors to the lower house in the State Legislature. The number of representatives is apportioned according to the population of each State, and a new apportionment is made every ten years after the census is taken by authority. The Senate is composed of two members from each State; the Senators are chosen for six years by the Legislature of the State. The House of Representatives chooses its own Speaker; the Vice-President of the U. S. is *ex-officio* president of the Senate. Bills for revenue purposes must originate in the House of Representatives, but are subject to the proposal of amendments by the Senate. The Senate has the sole power of trying impeachments, but it can only convict by a majority of two-thirds of the members present, and its sentence extends only to removal from office and disqualification to hold any office of honor or profit under the U. S. The regular meeting of Congress is on the first Monday in December, annually. Every bill which passes the two houses is sent to the President for approval or disapproval; in the latter case he returns it, with his reasons, to the house in which it originated; if on reconsideration it is passed again by a majority of two-thirds in each house, it becomes law. The powers of Congress are limited, and separated from those of the State Legislatures by the Constitution. Members of Congress can not legally have any interest in any contract with or claim against the Government; they are forbidden to prosecute cases before the court of claims, or to present claims to any of the departments. The Senate consists (in 1901) of 90 members, and the other house of 357 members. The apportionment among the several States is as follows:

Alabama	9	Maine	4	Ohio	21
Arkansas	6	Maryland	6	Oregon	2
California	7	Massachusetts	13	Pennsylvania	30
Colorado	2	Michigan	12	Rhode Island	2
Connecticut	4	Minnesota	7	South Carolina	7
Delaware	1	Mississippi	7	South Dakota	2
Florida	2	Missouri	15	Tennessee	10
Georgia	11	Montana	1	Texas	13
Idaho	1	Nebraska	6	Utah	1
Illinois	22	Nevada	1	Vermont	2
Indiana	13	New Hampshire	2	Virginia	10
Iowa	11	New Jersey	8	Washington	2
Kansas	8	New York	34	West Virginia	4
Kentucky	11	North Carolina	9	Wisconsin	10
Louisiana	6	North Dakota	1	Wyoming	1

No person is eligible to the Senate under the age of thirty years, nor to the House of Representatives under the age of twenty-five. For a full statement of the origin, character, and powers of Congress, see CONSTITUTION OF THE UNITED STATES. Revised by A. T. HADLEY.

Congress of Mothers: See the Appendix.

Congress Spring: a saline mineral spring at Saratoga, N. Y. For analysis, see MINERAL WATERS.

Congressional Term, Limits of: The Constitution of the U. S. provides that members of the House of Representatives in Congress shall be elected every second year. This determines the duration of each succeeding Congress. The Constitution also provides that Congress shall meet at least once a year, and that in the absence of specific legislation on the subject such meeting shall be on the first Monday in December. The time of elections is determined by the individual States; but members of the House of Representatives are commonly elected in November of the even-numbered years, taking their seats in the Congress which begins its existence on Mar. 4 following. As, however (unless a

special session is called by the President), Congress does not meet until the first Monday in December, newly elected members do not take their seats until about fifty-six weeks after their election. The congressional term is divided into two sessions. The first session begins on the first Monday of December of the odd-numbered years and continues until adjournment, ordinarily in August. The second session begins on the first Monday of December in the even-numbered years, and continues till 12 M. of Mar. 4 following. By a law of the Congress elected under the Articles of Confederation, passed Sept. 13, 1788, Wednesday, Mar. 4, 1789, was appointed for the assembling of the first constitutional Congress and the inauguration of the new Government. No quorum, however, was obtained in the House of Representatives on that day, or until Apr. 1 following, and the President was not inaugurated till the 30th of the same month. Subsequently, by an act of the constitutional Congress, passed Mar. 1, 1792, it was declared that "the term of four years for which a President and Vice-President shall be elected, shall in all cases commence on the 4th day of March next succeeding the day on which the votes of the electors shall have been given." At Washington's second inauguration, and at the inauguration of every President since his time, the oath of office has been administered, in each fourth succeeding year, on Mar. 4, at 12 o'clock M.; and until 1851 it was understood that his term of service expired on Mar. 3 at midnight of the fourth year following. The limit of the congressional term was supposed to be the same; so that the legislative powers of each succeeding Congress were presumed to cease at midnight of Mar. 3 of each alternate odd-numbered year. At the close of the Thirty-first Congress, however, in 1851, a discussion arose in which the propriety of this limitation was called in question, and the point was made that, since in the presidential years a new administration is not inaugurated until 12 o'clock on Mar. 4, the interpretation of law commonly received would create an interregnum of twelve hours' duration. In conclusion, Mr. Speaker Howell Cobb, of Georgia, ruled that the term of an outgoing Congress did not expire until 12 o'clock noon of Mar. 4, and that rule has since stood. In conformity with this rule, on Feb. 25, 1853, President Fillmore, in calling a special session of the Senate to organize the administration of his successor, Franklin Pierce, issued a proclamation in the following words: "The attention of the President having been called to the proceedings of Congress at the close of its session on the 4th of Mar., 1851, from which it appears that the constitutional term of that body was held not to have expired until 12 o'clock at noon of that day; and a notice having been issued, agreeably to former usage, to convene the Senate at 11 o'clock A. M. on the 4th of March next, it is apparent that such call is in conflict with the decision aforesaid. Now, therefore, as well for the purpose of removing all doubt as to the legality of such call, as of establishing a precedent of what is deemed a proper mode of convening the Senate, I, Millard Fillmore, President of the United States, do issue this my proclamation," etc. (convening the Senate for Mar. 4 at 12 o'clock noon).

In 1867 a statute was passed declaring the rule specifically as follows: "In addition to the present regular times of the meeting of Congress, there shall be a meeting of the Fortieth Congress of the United States, and of each succeeding Congress thereafter, at 12 o'clock, meridian, on the fourth day of March, the day on which the term begins for which the Congress is elected, except that, when the fourth of March occurs on Sunday, then the meeting shall take place at the same hour on the succeeding day." (Approved Jan. 22, 1867.) This act was repealed Apr. 20, 1871, but as an authoritative declaration of the limits of the congressional term it must be regarded as still of force. A new Congress therefore comes into existence at 12 o'clock at noon on Mar. 4 of each odd-numbered year, and ceases to exist at the same hour of the same day in the second year next following, unless one or the other of those days happens to be Sunday, when Mar. 5 is taken instead of Mar. 4. Under this rule it further appears that the political day throughout the sessions of Congress properly begins, for legislative purposes, at 12 o'clock M. of the calendar day of the same name. This rule was enforced in a manner to attract public attention during the progress of the count of the presidential vote in Feb., 1877, when the Speaker, in the midst of an exciting debate, repeatedly arrested the discussion at 12 M. by announcing the beginning of a new political day, and the chaplain appeared and opened the new session with prayer.

Revised by C. K. Adams.

Congressman at Large: a member elected to the House of Representatives by the voters of the entire State, instead of by those of a district in accordance with the ordinary plan. This mode of election is necessitated by changes in the apportionment after each decennial census. (See Apportionment Bill.) Thus by the act of Feb. 7, 1891, a new apportionment was made of members of that House, the number being fixed at 356. A specific number of members was assigned to each State. It was then provided that in each State entitled under the apportionment to more than one Representative the number to which such State may be entitled in the Fifty-third and each subsequent Congress shall be elected by districts composed of contiguous territory, and containing as nearly as possible an equal number of inhabitants, the number of such districts equaling the number of Representatives to which the State is entitled; but "in case of an increase in the number of Representatives which may be given to any State under this apportionment, such additional Representative or Representatives shall be elected by the State at large, and the other Representatives by the districts now prescribed by law until the Legislature of such State in the manner herein prescribed shall redistrict such State." This apportionment went into effect Mar. 3, 1893.

Con'greve, Richard, M. A: author; b. at Leamington, England, Sept. 4, 1818; educated at Rugby under Dr. Arnold, and at Wadham College, Oxford (B. A. 1840); taught there and at Rugby, finally resigning his tutorship at Wadham when he became a disciple of Comte. He edited *Aristotle's Politics*, with notes (1855; 2d ed. 1874), and published *The Catechism of Positivist Religion* (1858); *Elizabeth of England* (1862); *Essays: Political, Social, and Religious* (1874). D. in Hampstead, July 5, 1899.

Congreve, William: English dramatic poet; b. near Leeds, Feb., 1670. He was educated at the University of Dublin, and entered the Middle Temple as a student of law, but he never devoted much time to its study. His first literary attempt was a novel published under the pseudonym of Cleophil. In 1693 he made a great success with his first play, *The Old Bachelor*, which was performed at Drury Lane. The next year *The Double Dealer*, a better play, was received unfavorably, though it had the warm commendation of Dryden. He produced in 1694 a comedy called *Love for Love*, which added much to his fame and fortune, and in 1697 *The Mourning Bride*, a tragedy, which was greatly admired. He obtained several lucrative civil offices. His comedy called *The Way of the World*, though one of his best plays (1700), failed so completely that he renounced the drama in disgust. He affected to depreciate his dramatic triumphs, and was ambitious to pass for a man of fashion. D. Jan. 19, 1729. See Charles Wilson's *Memoirs of the Life of W. Congreve* (1730).

Co'ni (Ital. *Cuneo*): a town of Italy; in Piedmont; capital of the province of Cuneo; on the river Stura; 54 miles by railway S. by W. from Turin (see map of Italy, ref. 4–B). It has a cathedral, a fine town-hall, a royal college, a theater, several convents, and palaces. It was a strong fortress before 1800, and was dismantled by the French after the battle of Marengo in that year. Here are manufactures of linen and hemp. Coni has an extensive trade. Pop. 24,924.

Conic Sections: in mathematics, the sections of a right cone by a plane. If the cutting plane is perpendicular to the axis, the section is a *circle*; if it is parallel to one side of the cone, the section is a *parabola*; if it makes a greater angle with the base than is made by the side of the cone, the section is a *hyperbola*; if it makes a less angle with the base than the side does, the section is an *ellipse*. The circle, the line, and the point may each be regarded as particular cases of the ellipse; the line as a particular case of the parabola; the triangle as a particular case of the hyperbola. The study of conic sections is specially interesting and important on account of its connections with the laws of moving bodies. The orbits of planets, the paths of projectiles, the undulations of light and sound are all either circular, elliptic, parabolic, or hyperbolic.

Conifers [Lat. *coni'ferae*, fem. plur. of *co'nifer*, cone-bearing; *conus* (= Gr. *κῶνος*), cone + *ferre*, bear]: an order of woody plants (*Coniferæ*, class *Gymnospermæ*), characterized (1) by having hard woody stems consisting of pith, wood, and bark, and which increase in diameter by the growth of layers of wood and bark, the former outside and the latter inside of the older growths; (2) by the development of the seed upon an open bract or scale. In many

cases the seed-bearing bracts or scales are in compact "cones," as in the pines, spruces, firs, etc. Many of the species are evergreen, hence they bear the popular name of Evergreens (*q. v.*).

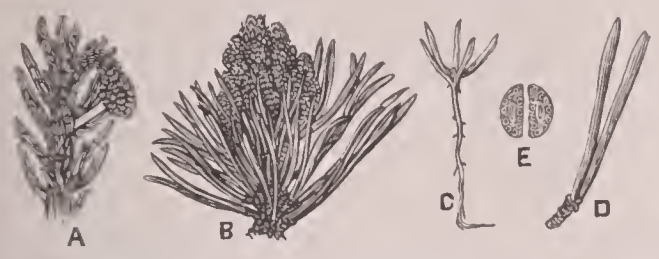

Fig. 1.—Structure of the pine (*Pinus sylvestris*): A, young ovuliferous cone; B, a cluster of polleniferous cones; C, a young plant; D, two leaves; E, sections of two leaves, enlarged.

The conifers constitute a very old order of plants, having originated in Devonian or Subcarboniferous times. At present there are about 350 species, widely distributed throughout the world, representing thirty-four genera, which are often widely separated, through the disappearance of related older forms. The two families are *Taxaceæ* (without cones), and *Pinaceæ* (with cones).

I. The *Taxaceæ* include about ninety species, mostly confined to the south temperate zone and the southeastern Asiatic region. The yew-tree (*Taxus baccata*) of Europe and Asia and the American yew (*T. canadensis*) of Eastern U. S. are good representatives of this family. *Torreya californica*, the California nutmeg-tree, *Gingko biloba*, the gingko-tree of China and Japan, with species of *Phyllocladus* and *Dacrydium* in Tasmania, New Zealand, and Borneo, and *Podocarpus* in Southeast Asia are other representatives, occasionally seen in botanic gardens.

II. The *Pinaceæ* are readily separable into two tribes, *Cupressineæ*, the cypresses (with opposite or whorled leaves and erect seeds), and *Abietineæ*, the firs, pines, etc. (with spirally arranged leaves and mostly inverted seeds).

1. The *Cupressineæ* include the junipers (*Juniperus*, thirty species, all of the north temperate zone); the white cedars (*Thuya*, four species, of which *T. occidentalis* is the common arbor-vitæ of the Eastern U. S., and *Chamæcyparis* of North America and Japan, including *C. sphæroïdea*, the white cedar of Eastern U. S.); the cypresses (*Cupressus*, twelve species of the Mediterranean region, Mexico, and California, including *C. lawsoniana* and *C. macrocarpa*, both fine ornamental trees of California).

2. The *Abietineæ* include the genus *Araucaria* (ten species of large trees of the southern hemisphere); the redwoods (*Sequoia gigantea*, the big-tree, and *S. sempervirens*, the redwood, both of California); the bald cypress (*Taxodium distichum* of the Southern States and Mississippi valley); the firs (*Abies*, eighteen species of the northern hemisphere, including *A. balsamea*, the balsam fir of the Eastern U. S.); the hemlocks (*Tsuga canadensis*, the hemlock of the Eastern U. S., and *Pseudotsuga taxifolia*, the "Douglas spruce" of the Western U. S.); the spruces (*Picea*, twelve species of the northern hemisphere, represented by *P. alba*, the white spruce of Northern and Eastern North America, and *P. engelmanni*, Engelmann's spruce of the Rocky Mountains); the larches (*Larix*, e. g. *L. decidua* of Europe, and *L. pendula*, the "tamarack" of Eastern U. S.); the cedars (*Cedrus* of Europe and Asia, e. g. *C. deodara*, the deodar-cedar of India, and *C. libani*, the cedar of Lebanon of Western Asia); the pines (*Pinus*, of seventy species, widely distributed in the northern hemisphere).

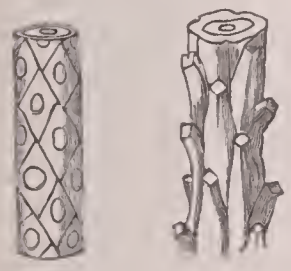

Fig. 2.—A, a twig of a fir (*Abies*), with the leaf-scars on the surface; B, a twig of a spruce (*Picea*), with the leaf-scars elevated.

Charles E. Bessey.

Coniine, kō'ni-in, also called **Conine**, **Conicine**, and **Cicutine**: an alkaloid contained in all parts of the hemlock (*Conium maculatum*). It is extracted most advantageously from the seeds, either by treating with a dilute solution of sodium carbonate and distilling in steam, or by treating the ground seeds in a vacuum with dilute acetic acid, evaporating, adding magnesia, and treating with ether. Coniine is an oil of disagreeable odor, suggestive of mice. It is a violent poison, acting on the motor nerves and producing paralysis. It is an interesting fact that this substance has been prepared artificially by Ladenburg. The artificial product is identical with that found in the hemloek. Coniine is shown to be closely related to piperidine, an alkaloid found in pepper, and piperidine is in turn closely related to pyridine, a substance formed when bones are heated.

Ira Remsen.

Con'ington, John: classical scholar, translator, and writer; b. in Boston, England, Aug. 10, 1825; educated first at Rugby under Dr. Arnold, and then at Oxford, where he became a fellow of University College in 1848. While still a B. A. he published an edition of the *Agamemnon* of Æschylus, with a poetical version, in which he inaugurated the double career, which he successfully followed up, of critical editor and translator. In 1852 he had begun, in conjunction with Mr. Goldwin Smith, an edition of the works of Vergil, the first volume of which was published in 1858. In 1854 he was appointed to the chair of Latin in the university, and from this time to his early death in 1869 his pen was constantly busy. His Æschylean studies were continued in the edition of the *Choëphoræ* in 1857, but after this he felt drawn more particularly to the studies connected with his chair. In 1863 appeared a version of the Odes of Horace, and the second volume of his Vergil. In 1866 he published a spirited translation of the *Æneid* in the ballad measure of Scott, which he followed up the next year by completing the version of the *Iliad* begun by his friend Mr. Worsley. He completed his translation of Horace, and prepared an edition of the *Satires* of Persius, with a translation, just before his death in 1869. The last volume of his edition of Vergil appeared after his death, under the supervision of his friend and fellow-worker, Mr. Nettleship, in 1871. Two volumes of miscellaneous writings, with a memoir prefixed, were issued in 1872, the second volume containing a prose translation of the *Eclogues*, *Georgics*, and *Æneid* of Vergil.

Henry Drisler.

Coniros'tres [from Lat. *conus* (= Gr. κῶνος), cone + *rostrum*, beak]: a group of passerine birds established by Cuvier for the finches, crows, orioles, and others characterized by a stout, conical bill. The term was employed in much the same way by G. R. Gray for the fourth tribe of his order *Passeres*. By later ornithologists the group *Conirostres* was restricted to the finches, tanagers, and weaver birds, and at present the use of the term is practically obsolete.

F. A. Lucas.

Coni'um (in Gr. κώνειον): a genus of plants of which *Conium maculatum* or the poisonous hemlock is the prineipal species. It is an Old World umbelliferous plant naturalized in the U. S. Its leaves are used in medicine as a sedative, hypnotic, and anodyne. In overdoses it produces a dangerons paralysis. With this drug Socrates and Phocion were poisoned. Stimulants and emetics are the best antidotes.

Conjeveram' (anc. *Cauchipura*, or Golden City): a town of Hindustan; on railway; 45 miles S. W. of Madras, in the presidency of Madras (see map of South India, ref. 6–F). It consists mostly of mud cabins, extends over considerable ground, and contains large gardens and cocoa-groves. It is noted for two interesting pagodas with very fine sculptures. Pop. (1891) 42,548.

Conjugation [from Lat. *conjugatio*, a yoking together (*con* + *jugum*, yoke); in the technical language of grammar a translation of Gr. συζυγία (ef. *syzygy*); σύν, together + ζυγόν, yoke]: in grammar, a regular distribution of the several inflections of verbs into their different voices, moods, tenses, numbers, and persons; a synopsis or statement of the changes of form or inflections to which a verb is subject. In Latin grammar there are four different forms of regular verbs, which are called the first, second, third, and fourth conjugations, and in some languages the number is even greater. See Grammar.

Conjugation is also a process occurring among the lower forms of organic life, in which the substance of two distinct organisms, coming into contact, is passed into a single mass. In plants it is always attended with reproduction, sometimes also in animals. It has been observed in numerous algæ and in some fungi.

Conjunction [from Lat. *conjunc'tio*, joining together; *con*, together + *jun'gere*, join]: the aspect of a planet when it is in or near the same straight line with the earth and the sun. When between the earth and the sun, it is said to be inferior; if beyond the sun so that the latter is the central body of the three, or if outside the earth so that the latter is the central body, the conjunction is called superior. Ow-

ing to the inclination of the planes of the several orbits, the three bodies are never mathematically in the same straight line. The conjunction is said to be in longitude or in right ascension, according as the planet and the sun have the same right ascension and the same longitude, or have right ascensions and longitudes differing by 180 degrees. S. N.

Conjunction: in grammar, a part of speech used to connect words with words or sentences with sentences. It may serve to express the relation of propositions to each other. Conjunctions are co-ordinate when they unite expressions of logically equal importance: subordinate when they unite a dependent clause to a principal one. They are called copulative when they imply an addition, as *and*; alternative when they imply a choice, as *or*; adversative, implying an opposition, divergence, or check, as *but*; concessive, implying like the adversative an opposition, but unlike them introducing the opposed rather than the opposing, as *though*: hypothetical, implying supposition, as *if*; causal, implying reason, as *because*; final, implying purpose, as *that*; consecutive, implying effect, as (*so*) *that*; temporal, implying time, as *when*. Historically they are the result of differentiation out of adverbs or pronouns through displacement in their interpretation. Revised by BENJ. IDE WHEELER.

Conjunctiva: See EYE.

Conkling, ROSCOE, LL. D.: statesman: b. at Albany, N. Y., Oct. 30, 1829; studied and practiced law. In 1846 he removed to Utica, of which place he became mayor in 1858; was elected to represent his district in the U. S. Congress four times, and in 1867, 1873, and 1879 to the U. S. Senate. Throughout the war he was the staunch supporter of the administration, figuring prominently from the first in debates and on committees. As Senator he took an active part in the reconstruction of the Southern States, opposed President Johnson's policy, and zealously championed Grant's administration, even advocating his nomination for a third term in 1880. Resigned May 16, 1881, in consequence of President Garfield's assumption of the control over appointments in New York State and the Senate's confirmation of the President's policy; confirmed as associate justice of Supreme Court of U. S. Mar. 2, 1882, but declined the office. D. in New York city, Apr. 18, 1888. See *Life and Letters* (1889).

Conlie: a French village; in the department of Sarthe; 14 miles W. of Le Mans (see map of France, ref. 4–D). Near it the French Government established in Oct., 1870, a large fortified camp. After the battle of Le Mans the camp was, on Jan. 14, 1871, occupied by the Germans.

Con'naught: the most western province of Ireland; bounded N. and W. by the Atlantic Ocean, E. by Ulster and Leinster, and S. by Munster. Area, 6,863 sq. miles. It is divided into the counties of Galway, Leitrim, Mayo, Roscommon, and Sligo. The surface in the western part is mountainous. The coast is deeply indented and affords good harbors. The river Shannon forms the eastern boundary of the province. Connaught was formerly a kingdom of the Irish pentarchy. Pop. (1881) 821,657; (1891) 723,573.

Connaught, ARTHUR WILLIAM PATRICK ALBERT, Duke of: Prince of the United Kingdom, Duke of Saxony, Prince of Coburg and Gotha; b. at Buckingham Palace, May 1, 1850; the third son of Queen Victoria. Entered the Military Academy at Woolwich in 1866; was rapidly promoted, becoming general of brigade in 1880; was created Duke of Connaught and Strathearn and Earl of Sussex, May 26, 1874, taking his seat in the House of Lords June 8. On Mar. 13, 1879, he married Princess Louise Margaret of Prussia, the grand-niece of Emperor William I. of Germany.
C. H. THURBER.

Conneaut, kon'nĕe-awt: village; Ashtabula co., O. (for location of county, see map of Ohio, ref. 1–J); on Lake Sh. and Mich., So. and N. Y., Ch. and St. L. R. Rs., and on Conneaut creek; 68 miles E. N. E. of Cleveland; has a good harbor at the mouth of Conneaut creek, 2 miles from the village, which is the Lake Erie terminus of the Pittsb., Shen. and L. E. R. R., and is a large coal-shipping and ore-receiving port. The village has five churches, fine public schools, large railroad shops, sundry manufactories, water-works, electric lights, and is a shipping-point for produce. The first settlers of the Western Reserve landed here in 1796. Pop. (1880) 1,256; (1890) 3,241; (1900) 7,133.
EDITOR OF "REPORTER."

Connecticut, kon-net'i-kŭt: a river of the U. S.; rises in the extreme northern part of New Hampshire, near the frontier of Canada. Its west bank forms the entire boundary between New Hampshire and Vermont. (See NEW HAMPSHIRE.) It flows in a general S. S. W. direction until it enters Franklin co., Mass. It afterward intersects Massachusetts and Connecticut, flowing nearly southward to Middletown, Conn., below which its course is S. E., and enters Long Island Sound at Saybrook. Length about 450 miles. The valley of the Connecticut is celebrated for the beauty of its scenery, the fertility of its soil, and the luxuriant growth of the tobacco-plant known as the Connecticut seed-leaf, which is used principally as wrappers in making cigars. It is not an uncommon thing for the crop to exceed 2,000 lb. to the acre. The head of steamboat navigation is at Hartford, which is about 50 miles from its mouth. Its principal affluents are the Deerfield, Farmington, and Chicopee rivers.

Connecticut: one of the New England States; situated between 41° and 42° 3′ N. lat. and 71° 55′ and 73° 50′ W. lon.; bounded N. by Massachusetts, E. by Rhode Island, S. by Long Island Sound, W. by New York. Area, 4,990 sq. miles; coast-line, 100 miles; length, E. to W., 86 miles; average breadth, N. to S., 55 miles.

Connecticut seal.

Connecticut, by the census of 1900, ranked twenty-ninth among the States in population.

Topography, Rivers, etc.—There are no elevations deserving the name of mountains in the State. Numerous ranges of hills; in the east rounded and fertile, in the west often broken and precipitous, with bold bluffs of trap-rock. Three principal rivers, with their affluents and some smaller ones, drain the State—viz., the Connecticut, Thames, and Housatonic. The river-valleys are generally very fertile, but the Sound shore is sandy. The hills furnish good grazing lands. The Connecticut, Housatonic, and Thames are navigable to the head of tide-water. The numerous falls on the smaller streams afford abundant water-power. There are no lakes, but there are many ponds in the State.

Minerals.—Copper and lead, both combined with silver, are found in considerable quantities, but have not been worked profitably hitherto; bog-iron ores, hematite in the northwest yielding excellent iron, and nickel; limestone for lime, marble, and the brownstone (old red sandstone) of the Portland quarries; flagstones, granite, and gneiss; sulphate of barytes, hydraulic lime, verd-antique, tiling slate, fire-clay and kaolin, and many mineral springs.

Vegetation and Vegetable Products.—There is yet considerable timber in Connecticut, including hickory, white, red, and yellow oak, chestnut, butternut, tulip-tree, beech, birch, hop-hornbeam, four species of maple, ash, elm, wild cherry, sassafras, and many shrubs and small trees. The soil is good in the valleys, and with judicious cultivation yields liberal crops. Tobacco is the largest crop in the Connecticut valley, and Indian corn, oats, rye, and buckwheat are largely grown, with some wheat and barley; potatoes and hay are large crops; orchard fruits are plentiful. The west and southwest parts of the State produce large quantities of market vegetables and small fruits for the New York market. Dairy, cattle, and sheep farming are favorite pursuits, and the milk, butter, and cheese of Western Connecticut are famous. The returns for 1900 show the following products in Connecticut: Indian corn, 1,771,180 bush.; oats, 578,987 bush.; rye, 239,802 bush.; buckwheat, 60,304 bush.; wheat, 6,864 bush. In 1900 2,478,528 bush. of potatoes and 427,411 tons of hay were produced; in 1896 the pounds of tobacco raised were 10,197,450.

Animals.—There are few wild animals except the smaller game. There were in 1899 in Connecticut 44,119 horses, 210,717 cattle, and 31,808 sheep.

Longitude West from Greenwich

The *climate* is not so harsh in winter as that of the States bordering on the ocean, the extreme range of the thermometer for the year not exceeding 90° F.; maximum 93°, minimum 3°; summer mean about 68° or 69°, and winter mean from 27° to 29°; mean annual rainfall, from 51 to 52·5 inches. The State is generally healthy, pulmonary complaints being somewhat prevalent, and zymotic diseases occurring in the river-valleys. Miasmatic fevers, formerly unknown, now prevail in most parts, but are not severe.

Manufactures.—Connecticut is essentially a manufacturing State, and excels any other in the variety of its industries, while the amount of manufactured products is large for its population. All descriptions of textiles; wares of gold, silver, brass, copper, zinc, nickel, iron, steel, leather, wood, etc.; clothing, clocks, watches, carriages, books and printing, firearms and ammunition, sewing-machines and other machinery, flour and food preparations, glass and lamps, hats, hooks and eyes, hoop-skirts and hosiery, jewelry, musical instruments, needles and pins, paper and perfumery, spectacles, straw goods, varnish, veneering, vinegar, and whips are a few of the varied productions of its factories. The census returns of 1890 showed that 6,822 manufacturing establishments reported. These had a combined capital of $227,004,496; employed 149,939 persons; paid $75,990,606 for wages and $123,183,080 for materials; and had products valued at $248,336,364. The combined textile industries employed 198 establishments, with invested capital of $59,262,994; hands employed, 31,539; wages paid, $11,472,070; value of products, $46,042,392. In wool manufacture, 109 establishments were employed with total capital of $25,090,116; value of products, $20,843,965. There were 35 establishments engaged in silk manufacture, with aggregate capital of $9,037,042; value of finished products, $69,154,599. In 1899 10,129 tons of pig iron were produced, and (with Massachusetts) 29,611 tons of iron ore were mined.

Finances.—The State debt, Sept. 30, 1900, was $2,108,873.29. The assessed valuation is about $500,000,000. State receipts for the year ended Sept. 30, 1900, $2,876,856.83; expenditures for the same year, $2,528,514.13.

Commerce.—The direct foreign commerce from the ports of Connecticut for the year ending June 30, 1900, aggregated $1,820,084. The commerce of Connecticut through the port of New York was very large, the business of Connecticut covering an immense import and export trade, but figures are not separately given. The internal commerce and coasting trade are also very large. In 1892 the registered, enrolled, and licensed vessels in Connecticut were 825, of 140,684 tons; of these, 186 were steam craft, of 47,937 tons. In foreign commerce, 86 vessels, of 17,263 tons, entered in year ending June 30, 1894.

Banks, etc.—Number of national banks in operation in Connecticut Sept. 5, 1900, 84; capital, $20,635,050; circulation, $9,833,529.50; deposits, $42,911,891.41; 8 State banks and 14 trust companies with $4,015,000 capital and $15,685,935 deposits, and 88 savings-banks with $174,135,195 deposits. There are 25 fire and marine insurance companies —8 joint-stock, 17 mutual; the assets about $36,000,000; also 12 life and 2 accident insurance companies; aggregate assets, nearly $140,000,000.

Education, Libraries, etc.—Connecticut had in 1899 a school population of 194,817, of whom 151,325 are enrolled in public schools, with an average attendance of 109,951. There were also 77 public kindergartens with 6,895 pupils. Number of school-houses, 1,620. Schools were taught an average of nine months in each year. There were 771 school libraries, toward which the State has contributed $113,105, and districts and individuals $244,061, since 1875. There were 4,085 teachers—men, 372; women, 3,713; average monthly pay of men, $89.87; of women, $43.61; income and expenditure for public schools, about $3,000,000. There are high schools in all the larger towns, 4 normal schools with 1,053 pupils, and 7 teachers' institutes. There are many collegiate schools and seminaries for both sexes, 3 universities or colleges, all well endowed, and 1 (Yale University at New Haven) having schools of law, medicine, theology, physical science, engineering, music, agriculture, and philosophy; Trinity College, and Wesleyan University. The 3 colleges had 2,970 students in 1900. There are in the State more than 100 public libraries of more than 300 volumes each, with an aggregate of about 750,000 volumes. In 1900 the whole number of newspapers published in the State was 45 daily, 113 weekly, and 36 others.

Churches.—There are about 1,200 churches of all denominations, and over $17,000,000 of church property. The Congregationalists are the leading denomination, followed in their order by the Methodists, Episcopalians, Baptists, Roman Catholics, Universalists, Presbyterians, Lutherans, Jews, etc.

Population.—Constant emigration has prevented a very rapid growth in Connecticut. In 1790 the population was 237,946; in 1850, 370,792; in 1870, 537,454; in 1880, 622,700; in 1890, 746,258 (white, 733,438; colored, 12,820; besides 129 Asiatics and 24 Indians); in 1900, 908,355. The principal towns are Hartford (capital), 79,850; New Haven, 108,027; Bridgeport, 70,996; Waterbury, 45,859; New Britain, 25,998; Meriden, 24,296; New London, 17,548; Norwich, 17,251; Danbury, 16,537; Stamford, 15,997; Ansonia, 12,681; Naugatuck, 10,541; Middletown, 9,589; Willimantic, 8,937; Torrington, 8,360; Derby, 7,930; Rockville, 7,287; Winsted, 6,804.

History.—The territory now embraced in the State of Connecticut, as well as the eastern part of Long Island, was first explored by the Dutch from the neighboring colony of New Netherlands, who laid claim to it, before 1620, but made no settlement within its limits till 1633. First white settlement, June 8, 1633, by Dutch, at Dutch Point, Hartford; second, also 1633, by a party from Plymouth colony, at mouth of Tunxis (Windsor); third, Wethersfield, 1634, autumn; fourth and fifth at Saybrook, 1635, and additions to Windsor and Wethersfield; sixth, Hartford, 1636; the last three united in 1637, and in May of that year, under Capt. Mason, attacked and destroyed Pequot fort near New London. In 1638 Quinnipiac (afterward New Haven) settled by Davenport, Eaton, etc.; with adjacent towns remained a separate colony till 1665, when, after earnest resistance, it united with the river-towns known as Connecticut under charter of Charles II., granted in 1662 to John Winthrop (second). In 1685–87 James II. attempted to annul all the New England charters and put the colonies together under a royal governor—Sir Edmund Andros—appointed by the crown. The demand was made on Connecticut in Oct., 1687, but after some debate the lights were extinguished and the charter secretly conveyed away and hidden in the hollow of a large oak on the Wyllys estate, ever after known as the CHARTER OAK (*q. v.*). Sir Edmund Andros took possession of the government, and for a year and a half ruled tyrannically, but was deposed on the fall of James II., and the charter of 1662 continued to be recognized as the supreme law of the colony for 129 years thereafter. The general court or colonial legislature held two sessions a year, and from 1701 to 1875 these and the annual sessions which succeeded them were held alternately in Hartford and New Haven. Hartford is now the sole capital. During the first and second French wars the colony of Connecticut furnished her full quotas promptly, and in the Revolution she furnished more men and more money in proportion to her population than any other colony. Her Governor (Jonathan Trumbull) was Washington's wisest counselor, and her general assembly were among the earliest petitioners for the Declaration of Independence. Connecticut was the fifth State to adopt the Constitution of the U. S., Jan. 9, 1788. Connecticut suffered severely from the events which preceded the war of 1812, but furnished her full quota of men and means for the war. The so-called "Hartford Convention" of Dec., 1814, composed of delegates from all the New England States, was not, as is often alleged, an unpatriotic or treasonable body, but its action was rendered unnecessary by the speedy conclusion of the war. In 1818 Connecticut adopted her present constitution, which abolished all relics of slavery and of a State Church. It has been modified since then, but never abrogated. The State took part in the

Mexican war, and early dedicated its Western lands in Ohio to an educational fund for all its children. Since 1818 the State has been generally prosperous and peaceful. She took an active part in the war of 1861–65, and sent her full quota of men into the field as thoroughly equipped and supplied with all that was needful to their efficiency as those of any State in the Union. Her soldiers were distinguished on all the battle-fields of the war, and her war Governor, Buckingham, was one of President Lincoln's most trusted counselors. Politically, the State is very equally balanced between the Democratic and Republican parties. The arms of the State are three vines in fruit, two and one, all proper. The motto is *Qui transtulit sustinet*—He who transplanted sustains.

GOVERNORS.

Connection of Ideas: See ASSOCIATION OF IDEAS.

Con'nellsville: borough and railroad junction; Fayette co., Pa. (for location of county, see map of Pennsylvania, ref. 6–B); on the Youghiogheny river: 57 miles S. S. E. of Pittsburg; has first-class graded schools, churches of seven denominations, Armory Hall, and a State hospital; has electric lights, gas, natural gas, water-works, paved streets, and electric cars. It is the center of the famous Connellsville coke region, which stretches away for 20 miles N. and S. and embraces 84 mines and coke-works, the latter aggregating 18,000 ovens, and the whole employing upward of 20,000 men. Connellsville is an historic point, having been settled in 1767 by Washington's friend, Col. William Crawford, who was burned at the stake by the Indians at Sandusky, O., in 1782. Pop. (1880) 3,609; (1890) 5,629; (1900) 7,160. EDITOR OF "COURIER."

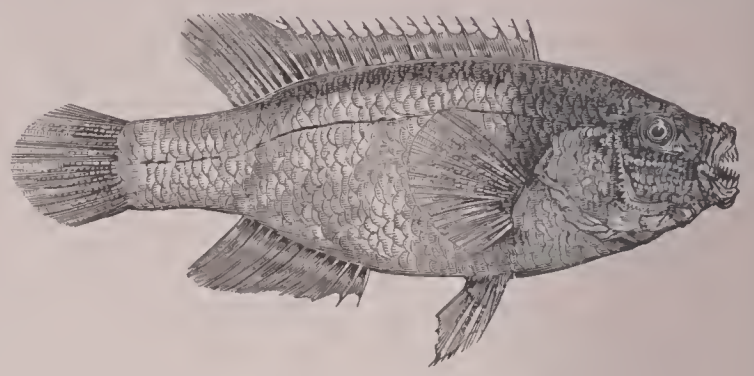
Connema'ra: a district forming the western part of County Galway, Ireland; about 30 miles long and 20 miles broad; noted for its wild and picturesque scenery. Its lakes and inlets abound in fish, and it is much visited by tourists.

Conner, DAVID: naval officer; b. in Harrisburg, Pa., in 1792; entered the U. S. navy as midshipman in 1809; served with great honor in the war of 1812–15; as commodore in the Mexican war, effectively blockaded the Mexican ports on the Gulf; became commandant of the Philadelphia navy-yard. D. in Philadelphia, Mar. 20, 1856.

Conner, JAMES: b. at Charleston, S. C., Sept. 1, 1829; graduated at South Carolina College in 1849, and was admitted to the bar in 1852. In 1856 he was appointed U. S. district attorney for South Carolina; resigned that office Dec., 1860. He was appointed Confederate States district attorney for South Carolina, but did not actively assume the duties of the office; entered the Confederate army in 1861 as captain, and became acting major-general; was engaged in many battles, and after the war again practiced law. In 1876 he was made chairman of the State Democratic executive committee, and was elected attorney-general on the ticket with Hampton for Governor; resigned in 1877. D. June 26, 1883.

Connersville: city; capital of Fayette co., Ind. (for location of county, see map of Indiana, ref. 7–G); on Cin., Cl., Ch. and St. L., Cin., Ham. and Dayton, and Ft. Wayne, Cin. and L. R. Rs., and on the Whitewater river; 67 miles N. W. of Cincinnati. The chief industries of the city are manufactures of furniture, carriages, and blowers. It has water-works, electric lights, and natural-gas wells. Pop. (1880) 3,228; (1890) 4,548; (1900) 6,836. EDITOR OF "NEWS."

Connor, or **Cunner**: a small European marine fish (called also *gilt-head* and *golden maid*), the *Crenilabrus melops*. A somewhat similar fish is the connor, blue perch, chogset, or bergall of the Atlantic waters of the U. S. (*Ctenolabrus*



The connor, or gilt-head.

adspersus). It is a tolerable fish for the table, for which it is extensively caught.

Connor, SELDEN: b. Jan. 25, 1839, at Fairfield, Me.; graduated at Tufts College, Medford, Mass., in 1859; studied law, but before commencing the practice of it he enlisted as a private in a Vermont regiment at the commencement of the civil war; became afterward a lieutenant-colonel in a Maine regiment; received a commission as colonel, and was severely wounded in the battle of the Wilderness in 1864; he then became a brigadier-general; was mustered out Apr., 1866, was appointed an assessor of internal revenue in 1868, a collector of internal revenue in 1873, and was Governor of Maine from Jan., 1876, to Jan., 1879, and U. S. pension agent from 1882 to 1886.

Co'noid [from Gr. κωνοειδής, cone-like; κῶνος, cone + εἶδος, appearance]: a skew surface, generated by the motion of a line which remains parallel to a plane, and has a rectilinear director. When the directing plane and line are perpendicular to each other, the latter is a line of striction on the surface. This line being taken as axis of z, the equation of the surface may be written $z = f\left(\frac{y}{x}\right)$, whatever the nature of its second director may be. Should the latter be also a right line, not in the same plane with the first director, the conoid will be an equilateral paraboloid. The cono-cuneus of Wallis is also a conoid; and another example is the skew helicoid, the curvilinear director of which is a helix, having the rectilinear director for its axis. The under surface of a spiral staircase presents a familiar illustration of this conoid. A conoid may be regarded as having three directors—one curvilinear and two rectilinear; one of the latter being at infinity. If the first of these directors be a curve of the mth order, then the order of the conoidal surface will be $2m$, and each rectilinear director will be a multiple curve on the conoid of the mth order of multiplicity. The directing plane being horizontal, the lines of level on the surface will be the generators; the lines of greatest slope, since they cut the former lines perpendicularly, will be projected into circles on the directing plane. Formerly it was a custom to give the name *conoid* to any solid generated by the rotation of a conic section around one of its axes. In this acceptation the term is obsolete, and has been replaced by that of a *quadric of revolution*.

Co'non, or **Ko'non** (in Gr. Κόνων): an Athenian general of high reputation; entered public life about 413 B. C. He was one of the ten generals chosen in 407, and was defeated by Lysander at Ægospotami in 405. He commanded the combined fleets of Persia and Athens which defeated the Spartans at Cnidos in 394 B. C. He afterward rebuilt the Long Walls of Athens. His son Timotheus was an eminent commander.

Conon of Samos: Greek geometer and astronomer; was a friend of Archimedes, who expressed in one of his works a high estimation of his sagacity. He lived at Alexandria about 250 B. C. Conon invented the curve called the spiral of Archimedes. His works are all lost.

Conquest: See INTERNATIONAL LAW.

Con'rad I.: Emperor of Germany; elected in 911 A. D. He was previously Duke of Franconia, and related to the Carlovingian house. He waged war against Henry the Fowler, of Saxony, from whom he conquered Thuringia; Charles the Simple, of France, from whom he conquered Alsace and Lorraine; and Arnulf of Bavaria, whom he

drove into Hungary. He fell in a battle against the Magyars Dec. 23, 918.

Conrad II. (called *The Salic*): son of Henry, Duke of Franconia. He was elected King of Germany in 1024, and was crowned as emperor by the pope in 1027. He is said to have been the author of the written feudal law of Germany. D. June 4, 1039, and was succeeded by his son Henry III.

Conrad III., of Germany: b. in 1093; was the first of the Hohenstaufens and a grandson of Henry IV. He was elected emperor in 1138, and waged war against Henry the Proud, Duke of Saxony. The party names of Guelph and Ghibelline originated in this war. In 1147 he led a crusade. Excited by St. Bernard of Clairveaux, he took the cross and hastened to Asia Minor at the head of a splendid armament, but his plans were foiled by the treachery of Manuel Comnenus. He besieged Damascus without success, and returned in 1149. D. Feb. 15, 1152, and was succeeded by Frederick Barbarossa. See Gundling, *Geschichte und Thaten Kayser Conrads III.*, 1720.

Conrad IV.: son of Frederick II., Emperor of Germany; was born in Apulia in 1228. He was crowned King of the Romans in 1237, and on the death of his father in 1250 assumed the title of emperor. He was supported by the Ghibellines, but the pope and the Guelphs recognized his competitor, William of Holland. Conrad marched into Italy in 1251, and took Naples. D. May 27, 1254.

Conrad V., or **Con'radin**: the son and heir of Conrad IV.; was born in 1252. The kingdom of Naples was usurped by his uncle Manfred. Instigated by the pope, Charles of Anjou waged war against Manfred and conquered Naples. Conrad was captured at Tagliacozzo in 1268 by Charles, by whose order he was beheaded.

Con'salvi, Ercole, Cardinal: an Italian statesman and reformer; b. in Rome, June 8, 1757. He became, in 1800, chief minister of Pope Pius VII., and negotiated the concordat with Bonaparte in 1801. He promoted art and learning, and was an able diplomatist. D. Jan. 24, 1824. See Crétineau-Joly, *Mémoires du Cardinal Consalvi.*

Consanguin'ity [from Lat. *consanguin'uitas*, blood-relationship; *con*, together + *sanguis*, blood]: in law, relationship by blood, or that subsisting between persons descending from a common ancestor, or where one descends from the other—distinguished from Affinity (*q. v.*). It is either lineal or collateral. It is said to be lineal when one of the persons whose relationship is to be traced is descended from the other. It is said to be collateral when they are descended from a common ancestor, and one is not descended from the other. There are two principal modes of reckoning collateral consanguinity. One method is to count the degrees intervening between the one farthest removed from the common ancestor and such ancestor. Thus the son of the nephew of A on that system of computation is related to A in the third degree, as being three removes from the common ancestor, the father of A. This is the method of the canon and common law. The civil law reckons the degrees from the one relative to the other, ascending, on the one hand, from one of the parties to the common ancestor, and then counting downward to the other. On that theory A would be related to the son of his nephew in the fourth degree. The civil-law method is generally employed in the U. S. In reckoning lineal consanguinity the two systems do not differ. Thus the father and son are related in the first degree, the grandfather and grandson in the second. It frequently becomes necessary to resort to these rules not only in considering the transmission of estates, but in ascertaining persons who are disqualified to act as judges or jurymen by reason of relationship.

Conscience [from Lat. *conscien'tia*, the sharing of knowledge with another, common understanding, knowledge with one's self, moral consciousness, conscience; *con*, with + *scire*, know]: the sense of right and wrong. There are two great questions concerning what we call conscience:

I. The psychological theory of conscience turns upon the question of what the mind is concerned with when it has the sense of "ought" or "ought not." There are certain great theories which have been maintained in the history of psychology and philosophy. First, the intuitional theory, which claims that man has an inborn and absolutely perfect knowledge of the moral relations of actions, and only has to recognize the moral quality when he sees it. This theory is combated by the second great theory, which recognizes the gradual growth in the mind of the moral sense from incomplete beginnings up to the more adequate judgments which the adult possesses. This theory takes on several forms. The intuitionists, in view of the child's evident growth as a moral being, have divided into two camps, one of which still holds to the view that conscience is a perfect faculty, and can not grow or be educated, and the other admits that conscience grows more perfect as the child and race grow up, but says that it is always correct, even in the child, as far as it goes. To these latter, conscience is not based upon experience, but nevertheless profits by experience in its growth. In the camp of the opponents to intuitionism we have two great schools: the naturalists, who hold that conscience, like all the other mental functions, is a product of evolution; that it has arisen in the development of the race on account of its social utility, and that each individual gets his conscience gradually by growing up into the system of social relationships which represent law and order to him. The naturalistic theory does not necessarily deny final authority to conscience, but only says that whatever its authority it is, in its origin, not inborn, but a thing developed both by the race and by the individual. The other great theory is the idealistic, which holds generally to the opinion that conscience is capable of education and growth, but goes on to find in it the final statements of the real value-system of the world and the foundation of philosophy.

II. On the metaphysical side there are, again, three great classes of solutions. The materialists say that the naturalists are right, that conscience is an outcome of evolution; and since to them evolution is a process from material beginnings, the outcome is also relative, and conscience, like all the mental faculties, is a function of brain action. The intuitionists say that conscience, being inborn, was implanted once for all, and supports the metaphysics of spiritualistic theism. The idealists hold that in all evolution there is the working out of an absolute principle which fully reveals itself, though gradually yet most completely, in the moral sense, both in the race and in the individual.

As to this last point, the authority or so-called "imperative" of conscience, none of the theories deny it, as a matter of fact. J. Mark Baldwin.

Conscience, kōn'si-ăns', Henri: b. at Antwerp, Dec. 3, 1812. From 1830 to 1836 he served in the Belgian army as simple soldier, but made his name known throughout the whole country by his patriotic songs, to which he often set the tune himself. Nevertheless, from 1836 to 1838 he had to fight hard to make a living as a journeyman gardener, a village schoolmaster, etc., but in 1838 he began to write for the Anti-French League, an association working for the expulsion of the French language from Belgium and the adoption of the Flemish. Although he wrote all his novels in Flemish (*The Lion of Flanders, Jacob van Artevelde, Valentyn, The Lost Glove*, etc.), he soon became one of the most widely read novelists of the day. His books were translated into German, French, English, Danish, etc. The King of Belgium made him teacher of Flemish to his children, and the city of Antwerp erected a statue in his honor before his death. D. in Brussels, Sept. 10, 1883.

Consciousness: See the Appendix.

Conscript Fathers [Lat. *patres conscrip'ti*, those enrolled as fathers, i. e. in the senate]: an appellation given to the senators of ancient Rome, because, after the expulsion of Tarquin, when Brutus added another hundred to the number of senators, the names of the new members were "written together" with those of the old, and the whole body received the appellation of Conscript Fathers.

Conscription [Lat. *conscrip'tio*, a putting together in writing, description in writing, a writing; *con*, together + *scri'bere*, write. The word was first employed in the sense "a compulsory enlistment" by the French republic in 1798]: a compulsory enrollment of men for military service. This is the system by which the armies of France and some other countries are recruited. The soldiers who are thus compelled to enter the army are called conscripts. The conscription was established in France during the Revolution of 1789. The number required for the service is drawn by lot from the number of young, able-bodied men who are not exempt.

Consecration [from Lat. *consecra'tio*, deriv. of *consecra're*, make sacred, dedicate; *con* + *sacra're*, deriv. of *sa'cer*, holy]: 1. The act or ceremony of separating a person or a thing from a common to a sacred use. 2. The act by which

a priest, duly and canonically chosen to "the office and administration of a bishop in the Church of God," receives the grace of the episcopate by the imposition of the hands of three bishops. 3. The act of the priest by which, at the celebration of the Eucharist, by the recital of the words of institution and the use of the appointed manual acts, through the operation of the Holy Ghost, the offered bread and wine are sacramentally made the body and blood of Christ. 4. The act of a bishop or priest when setting apart for holy uses a church, an altar, the sacred vessels, vestments, etc. "The Form of Ordaining or *Consecrating* a Bishop" is a part of the ordinal appended to the English and American Prayer-books. The form of service generally, though not necessarily, used in consecrating churches in England was drawn up by both Houses of Convocation in 1712, but failed to receive the royal assent. "The Form of Consecration of a Church or Chapel" set forth by the authority of the General Convocation of 1799 is, with slight changes adopted in 1886, one of the offices of the American Church, and is found in the new Standard of 1892.

W. S. PERRY.

Consecrator: in the Holy Communion, the bishop or priest who celebrates. The officiant in the act of setting apart a church or its furniture for sacred uses. In conferring the episcopate, the archbishop or metropolitan or the bishop presiding at the function. In the Protestant Episcopal Church, the senior bishop at a consecration, or the bishop to whom the commission of the presiding bishop is addressed authorizing him with two other "consecrators" to admit a bishop-elect to the episcopate by the laying on of hands and by prayer.

W. S. PERRY.

Consen'tius: a Latin grammarian of the fifth century A. D., from Gaul. His two works, *On the Noun and Verb* and *On Barbarisms and Metaplasms*, are printed in Keil's edition of the *Grammatici Latini*, vol. v., pp. 329–404.

Conservation of Force: See ENERGY; also DISSIPATION OF ENERGY.

Conservatives [from Fr. *conservatif*, from a deriv. of Lat. *conserva're*, preserve; *con* + *serva're*, keep]: in politics, those who oppose radical changes in institutions or laws. In England those formerly called Tories are now termed Conservatives. See POLITICAL PARTIES.

Conserva'tors of the Peace: formerly, in England, the wardens of the peace, answering to the modern justices of the peace, appointed to maintain order and police supervision in their counties. The term is now specifically applied to the sovereign, who is the principal conservator of the peace, the lord chancellor, the lord treasurer, the lord high constable, the justices of the queen's bench, and the master of the rolls, who, by virtue of their offices, have power to commit breakers of the peace anywhere.

Revised by F. STURGES ALLEN.

Conservatory [as if from a Lat. **conservatorium*, deriv. of *conserva're*, *conserva'tus*, preserve, like *audito'rium*, *deverso'rium*, and signifying a place where things are preserved, a repository]: a glass-house in which plants are kept while blooming or in an ornamental condition. The plants are grown in a general greenhouse or forcing-house, and taken to the conservatory house or room as they reach their ornamental stage. The term is often loosely applied to any ornamental greenhouse. See GREENHOUSE.

Conservatory [same word as preceding, but serving as a translation of Ital. *conservatorio*, in which the special meaning "a home for orphans and foundlings" had developed into "school of music" on account of the instruction in music given at these homes or hospitals]: a school or place of public instruction and training designed to conserve and promote the study of some branch of science or art, but more particularly music. Such schools are of ancient origin, and were probably founded by ecclesiastics for the purpose of improving the character of church music. They were originally charity schools, recruited from foundlings and orphans of both sexes. The first conservatory was the famous one of Santa Maria di Loreto in Naples, founded by Giovanni di Tappia in 1537. Among the most famous modern conservatories may be mentioned the Conservatoire de Musique, of Paris (founded in 1874), those of Vienna (1816), Brussels (1833), and Leipzig (1842). There are several successful schools of music in the U. S. called conservatories, among which is the National Conservatory, in New York.

Conshohock'en: borough; Montgomery co., Pa. (for location of county, see map of Pennsylvania, ref. 6–I); on Pa. and Phil. and Reading R. Rs., and on the Schuylkill river and canal; 13 miles N. W. of Philadelphia. It has 10 churches, free library, 6 schools, rolling-mills, blast furnaces, potteries, tube-works, quarries, cinder-crusher, planing-mills, engraving-works, manufactories of woolen and cotton goods, shoddy, boilers, machinery, and towels. The borough has water-works and electric and gas light plants. Pop. (1880) 4,561; (1890) 5,470; (1900) 5,762.

EDITOR OF "RECORDER."

Considérant, kōn'sĕĕ'dā'raăn', VICTOR: French socialist; b. at Salins, Oct. 12, 1808; was the chief disciple of Fourier. He became the editor of the *Démocratie Pacifique* in 1845, and a member of the National Assembly in 1848. He wrote *Destinée Sociale* (3 vols., 1834–44). He afterward founded a colony called Reunion, near San Antonio, Tex., but returned to France in 1869. D. in Paris, Dec. 27, 1893.

Consideration [from Lat. *considera'tio*, deriv. of *considera're*, examine, contemplate; literally, observe the stars; *con* + *sidus*, constellation. The word was probably, like *desidera're*, a technical term of astrology]: mature thought, serious deliberation, meditation; also motive of action, reason. In law, the material cause of a contract, the reason which induces a contracting party to make a contract. The leading distinction respecting considerations is that they are either *good* or *valuable*. A *valuable* consideration either confers some benefit on the promisor or causes some inconvenience or damage to the promisee. Under these rules marriage is a valuable consideration. A good consideration is based upon relationship or natural love or affection, and is of avail only in an executed contract, e. g. in case of a deed of land where it has been delivered. The term good consideration is also used in a broader sense, including valuable considerations, for any consideration sufficient to sustain a contract. See CONTRACT and FRAUDULENT CONVEYANCE.

Revised by F. STURGES ALLEN.

Consignee: in mercantile law, the person to whom goods are sent or transferred, either as his own or for the carrying out of some purpose, such as sale or safe keeping. See BILL OF LADING and SHIPPING.

Consignment: in mercantile law, the act of consigning; also the goods sent or transferred to a consignee.

Consistory [from Lat. *consisto'rium*, meeting-place, deriv. of *consis'tere*, take one's place, locate one's self]: the place of meeting of the cabinet of the Roman emperors; the name is also applied to the council of cardinals, sometimes assisted by other prelates, who attend in person or by proxy, which meets in the Vatican to advise the pope in ecclesiastical and temporal affairs. A court under this title for the regulation of discipline and worship, composed of civil and ecclesiastical jurists, was established by the Lutheran princes of Germany at the time of the Reformation. The earliest was that of Wittenberg, founded in 1537. The lower Church courts of the Reformed ("Dutch" and "German") Churches in the U. S. are also called consistories.

Consolato del Mare: a code of early maritime law, to govern the states trading together along the Mediterranean, supposed to date from the fourteenth century. This code is not to be considered a body of maritime law promulgated by the power and authority of a single people, but rather as a compendium of the sea laws and usages then in vogue on the shores of the Mediterranean, in which all powers trading together within certain limits could unite because the local law of each was represented in it and formed a part of it. Founded upon the Roman law, it includes (1) those rules governing the maritime relations of commercial states and their subjects in time of peace; and (2) the rules relating to a state of war. It is the recognized basis of modern maritime law, both English and continental. Thus it lays down the rule that the nationality of property, both ships and goods, determines its liability to capture, a principle still in vogue unless altered by treaty.

THEODORE S. WOOLSEY.

Consols [clip-form of *consolidated* (*annuities*); cf. *cab* for *cabriolet*, *gents* for *gentlemen*]: the funded debt of Great Britain, so called from the interest, which was termed "consolidated annuities." This debt was contracted by loans negotiated at different times and at various rates of interest. To obviate the confusion which arose from the variety of stocks thus created, they were consolidated into one fund in 1750–57. Consols or the consolidated three per cents. were converted in 1888 into consolidated stock bearing $2\frac{3}{4}$ per cent. interest until 1903 and $2\frac{1}{2}$ per cent. thereafter.

Consonance [from Lat. *consonan'tia*, harmony; *con*, together + *sona're*, sound]: in music, a combination of notes sounding together smoothly, without any of the harshness produced by the disturbance of beats. Such beats, as has been long known, are produced by the coincidence or opposition of the overtones, which almost always accompany the fundamental notes. This must be taken with some limitation, as the fourth is regarded as a dissonance, though it has no beats. The effect of a consonance is due to the simplicity of the ratio of the vibration numbers of the constituent tones. Within the limits of the octave the consonances and the ratios are: the octave, $\frac{1}{2}$; the fifth, $\frac{2}{3}$; fourth, $\frac{3}{4}$; major third, $\frac{4}{5}$; minor third, $\frac{5}{6}$; major sixth, $\frac{3}{5}$; minor sixth, $\frac{5}{8}$. There is thus but one chord of consonances in music, namely, the common chord, being a bass note with its third, fifth, and octave. The consonances of the unison, the octave, the fifth, and fourth are called perfect. The imperfect are the major and minor thirds and the major and minor sixths. Two perfect consonances following each other in simple progression are not permissible.

Consonant [from Lat. *con'sonans*; *con*, with + *sona're*, sound]: a sound so named because it is generally used in the mechanism of speech only in association with another sound called a vowel. This method of defining vowel and consonant according to their respective *functions* in the formation of the syllable is open, however, to the objection that it forbids of a definite and final classification of existing sounds. Vowel-sounds may be used as consonants, as *i* in *eye* (pron. *a i*), and consonant-sounds may be used as vowels; cf. *little* (pron. *litl*), *pst!* If, therefore, we are to give a definition by which vowels and consonants may be always identified, it must be based upon their physiological character rather than their functions. The terms "syllabic" and "non-syllabic" may then be substituted to denote the classification according to function. Vowels may be defined according to their character as free currents of breath for which the organs of the mouth and nose serve only to give resonance, not to add noise (Ger. *Geräusch*). Consonants are produced by narrowing or checking the current of breath, and involve noise produced by the closing or opening of the organs of the mouth or by the friction of the current against their walls. Sounds which lie near the boundary between the two classes are the liquids *r*, *l* and the nasals *m*, *n*, etc.; but the characteristic noise produced at the beginning or end of these sounds through the narrowing or closure classes them with the consonants. Consonants which are produced by a friction of the current of breath against the walls of the narrowed organs of the mouth are called *spirants* (also *fricatives*; Germ. *Reihelaute*, *Dauerlaute*, *Schleifer*), thus *s*, *z*, *f*, *v*, þ, ð. Those which are produced by stoppage of the current, as *t* in *at*, or by bursting the obstruction, as *t* in *to*, are called *explosives* (also *stops*, *checks*, *mutes*; Germ. *Verschlusslaute*, *Explosivlaute*, *Momentanlaute*, *Schlaglaute*, *Klapper*). Consonants are *voiced* (also called *sonant*, *mediæ*; Germ. *tönend*, *stimmhaft*) when the vocal chords are trilled by the breath producing them, otherwise *voiceless* (also *surd*, *tenues*; Germ. *tonlos*, *stimmlos*). Thus voiced are *g*, *d*, *b*, *z*, *v*; voiceless, *k*, *t*, *p*, *s*, *f*. BENJ. IDE WHEELER.

Consort [from Lat. *con'sors*, *consor'tis*, having equal share with, fellow-participant; *con*, together + *sors*, lot]: the name given in Great Britain to the husband or wife of the sovereign. The name queen-consort is used to distinguish the wife of the king from a queen who reigns in her own right, as, for example, Queen Victoria, and also from a queen-dowager, the widow of a former king. In 1857 Prince Albert, the husband of Queen Victoria, received the title of Prince Consort.

Conspiracy [from Lat. *conspira'tio*, agreement, co-operation, plot, literally breathing together; *con*, together + *spira're*, breathe]: an agreement between several persons to commit some crime, as to kill a ruler or deprive him of power. In law, an agreement of two or more persons to carry into effect some unlawful purpose, or to accomplish some lawful purpose by unlawful means. It is a crime of which the true basis is the unlawful combination, and at the common law is complete, and may be prosecuted, though no overt act has been performed. By statute, however, in many of the States the offense is not complete without the commission of an overt act with a view to the accomplishment of the design agreed upon. Statute law in some instances makes a conspiracy a grave offense, as, e. g. to destroy a ship with intent to injure insurers. Revised by F. STURGES ALLEN.

Constable: [from O. Fr. *conestable* (> Mod. Fr. *connétable*); Ital. *contestabile* < Lat. *comes stabuli*, i. e. chief hostler]: an officer of many of the mediæval monarchies, particularly France, England, and Scotland, who had high military and judicial rank. The office at first was one of comparative unimportance, but its importance gradually increased until the constable became *ex-officio* commander-in-chief of the army, the supreme military judge, and chief arbitrator in questions of chivalry. In France, Mathieu de Montmorenci, who became constable in 1218, was the first who had the supreme command. The office was abolished in 1627. Napoleon I. appointed his brother Louis constable of the empire, and Berthier vice-constable. Under the Restoration the dignity was again abolished. In England, Henry VIII., finding the fees of the office burdensome to the crown, in 1514 discharged the Duke of Buckingham from the office, and since that date a lord high constable has been appointed only for occasions of great state ceremonies, such as a coronation. In Scotland the office has been hereditary in the family of Hay, Earls of Errol, since 1314, but without its ancient powers. A constable in the general sense of the word is now an inferior civil officer charged with the duty of keeping the peace, invested with limited judicial powers, and having authority to arrest without process on a reasonable suspicion of felony, to execute civil and criminal processes, etc. In Great Britain there are two classes, constables of the hundred, or high constables, whose office is now largely fallen into disuse, and petty constables or constables of the vill. In the U. S. a constable answers to the petty constable of Great Britain. In many cities the chief constable is called high constable.
Revised by F. STURGES ALLEN.

Constable, JOHN: landscape-painter; b. at East Bergholt, Suffolk, England, June 11, 1776; d. in London, Mar. 30, 1837. Pupil of Royal Academy, Joseph Farrington, and R. R. Reinagle, London. He first painted figures and portraits, but took up landscape, and exhibited his first picture in that branch of art in 1802. He was not appreciated in England, but in France his work was very highly considered and he was recognized as a master. The modern French school of landscape-painting is founded on Constable. He was elected Royal Academician, London, in 1829, when his worth had been recognized on the Continent. His pictures are wonderfully harmonious in tone, and depict generally landscape "effects." Several of his works are in the Louvre and *Cornfield* (1826), *The Valley Farm* (1835), and *Barnes Common* are in the National Gallery, London. Two works in the Metropolitan Museum, New York, do not well represent him, but there is a remarkably fine one in the collection of William H. Fuller, New York. WILLIAM A. COFFIN.

Constance: a city of Baden; on the Rhine and the southwest shore of the Lake of Constance; 35 miles N. E. of Zurich (see map of German Empire, ref. 8–D). It is one of the oldest towns in Germany, and was formerly a free imperial city. It has a magnificent cathedral, founded in the eleventh century; also manufactures of silk and cotton goods and watches. Here was held in 1414–18 an important council of the Church. Pop. (1895) 18,671.

Constance, Council of (Lat. *Concilium Constantinense*): the seventeenth of the œcumenical councils of the Roman Catholic Church; was convened by writ of the German Emperor Sigismund, with the consent and concurrence of John XXIII., and opened on All Saints Day, 1414, by John XXIII., one of the three claimants of the papacy. There were present during parts of the session, besides the emperor, seven patriarchs, twenty-one cardinals, 114 bishops and archbishops, besides many princes, nobles, and ambassadors from most of the Catholic powers and from the Emperor Michael Palæologus. Representatives were also present from the principal universities of Europe. One of the objects of this council was the ending of the schism caused by the rival popes (John XXIII., Gregory XII., and Benedict XIII.). This object was accomplished by the deposition of John XXIII. and Benedict XIII., and the voluntary abdication of Gregory XII., 1415, and choosing Martin V. in their stead. The council also condemned the opinions of Wickliffe and Huss, and cited the latter to appear before it (1414). In the following year Huss was burned at the stake for heresy, at Constance. On the imperial safeguard, and the questions connected therewith, see Palacky, *Geschichte von Boehmen* (vol. iii., pp. 317, 352); *Historisch-politische Blätter* (vol. iv., p. 402); Duex, *Nicolaus von Cusa* (vol. i., p. 51); Wetzer and Welte's *Kirchenlexikon* (2d ed.), art. Huss (Hefele) (see Huss).

The acts of the council have been collected by von der Hardt, *Magnum Concilium Constantinense* (Frankfort-Leipzig, 1697–1700, 6 vols. fol.). The chronicle of Ulrich von Reichenthal (Augsburg, 1536) and the compendium of Schelstrate (Rome, 1686) contain rich materials for the history of the council, which has been treated by Lenfant, *Histoire du Concile de Constance* (Berlin, 1714), from a non-Catholic view point. Fresh materials have been added by the late publications of Dr. Finke, of Münster.

The Roman Church has always recognized the œcumenical character of the Council of Constance in the sessions following the election of Martin V. (42–45), and in the other sessions so far as they treated of matters pertaining to the interest of the faith and the salvation of souls, and did not derogate from the rights, dignity, and supremacy of the apostolic see. Hence the famous early sessions (3–5) have not been accepted by her because of their revolutionary principles. See Hefele, *Conciliengeschichte*, 2d ed., vol. i., pp. 61–62. Revised by J. J. KEANE.

Constance, Lake of [anc. *Brigantinus Lacus*; Germ. *Boden See*]: a lake of Central Europe; borders on Baden, Bavaria, Switzerland, the Tyrol, and Würtemberg; 1,290 feet above the ocean-level. Area, 184 sq. miles. It is about 40 miles long, and 9 miles wide at the broadest part. The greatest depth is 912 feet. The Rhine enters this lake near the southeastern end, and issues from the northwestern extremity. In 1770 the water rose in one hour 20 feet above the ordinary level. This lake is said to contain twenty-five species of fish, including salmon. Several steamboats ply on it.

Con'stans, FLAVIUS JULIUS, **I.**: b. about 320 A. D.; was the third son of the Emperor Constantine I. On the death of his father, in 337, he became the sovereign of Italy, Africa, etc. His brother Constantine invaded Italy, and was killed in battle in 340, after which Constans was master of all the Western empire. He was defeated and killed by Magnentius early in 350 A. D.

Constans, JEAN ANTOINE ERNEST: French politician; b. May 3, 1833, in Béziers; Professor of Law in Toulouse; republican member Chamber of Deputies 1876; Minister of the Interior 1880–82; minister to China 1885–87; governor-general of Indo-China 1887–88; elected senator 1889; Minister of the Interior 1889–92. His vigorous measures overthrew Boulangism. He was one of the few public men of France untouched by the Panama scandal, and remains one of the strongest men in French political life. C. H. T.

Constant, JEAN JOSEPH BENJAMIN: French painter. See BENJAMIN-CONSTANT, JEAN JOSEPH.

Constant de Rebecque, kōn'staṅ'de-rā'bek'. BENJAMIN: French political writer; b. at Lausanne, Oct. 25, 1767; d. in Paris, Dec. 10, 1830. Of French descent, he studied at Oxford, Erlangen, and Edinburgh, and finally settled in 1795 in Paris, where he joined the moderate republican party, but, having become obnoxious to Napoleon, he was expelled from the Tribunate in 1802, and soon after found it advisable to retire from France, together with Madame de Staël. After spending several years in Germany, chiefly engaged in literary pursuits, he returned to France immediately after the overthrow of Napoleon. When the July revolution broke out, he was in his country-house; but he immediately repaired to Paris, and aided in placing Louis Philippe on the throne. His principal political works are *On the Spirit of Conquest and Usurpation* (1813) and *Cours de Politique Constitutionelle* (1817–20, 4 vols.). His principal philosophical works are *On Religion, Considered in its Sources, Forms, and Developments* (1823–31, 5 vols.), and *Religion of Rome* (2 vols.). His speeches were collected by T. P. Pagés (1832–33, 3 vols.).

Constan'tia: a superior wine from the Cape Colony, South Africa, produced upon the three Constantia estates, 12 miles S. of Cape Town. It is free from the earthy taste which characterizes ordinary Cape wines. It owes its excellence to the highly alkaline soil, the choice variety of grape employed in making it, the genial exposure of the estates, and perhaps more than all to care and skill in its preparation. There are white and red Constantia wines.

Constantine (anc. *Cirta*, or *Kirtha*): city of Algeria; capital of province of same name, and seat of a Roman Catholic bishop; on a high hill surrounded on three sides by ravines; lat. 36° 24′ N., lon. 6° 8′ E. (see map of Africa, ref. 1–D). It is over 2,000 feet above the level of the sea. It is surrounded by walls built by the Arabs, and has been greatly improved, resembling a modern French town with broad streets. Here are manufactures of woolen cloth and saddlery. Remains of the ancient Roman *Cirta*, which was a great city of Numidia, are visible here. This place was besieged by the French in 1836; Oct., 1837, it was taken by assault. Pop. (1891) 46,581.

Constantine: village; St. Joseph co., Mich. (for location of county, see map of Michigan, ref. 8–H); on Lake Shore and Mich. So. R. R. and on St. Joseph river; 94 miles by railroad S. W. of Lansing. Has abundant water-power and a large peppermint-oil industry. Pop. (1880) 1,405; (1890) 1,346; (1900) 1,226.

Constantine, FLAVIUS VALERIUS AURELIUS, surnamed THE GREAT: the first Christian Emperor of Rome; b. Feb. 27, 274 A. D. He was a son of Constantius Chlorus and his wife Helena, and was originally a pagan. In the reign of Diocletian he gained distinction by his military talents, and became a favorite of the army. He was at York when his father died in July, 306, and was then proclaimed emperor by the army under his command. Galerius, who regarded him with jealous enmity, granted to him the title of cæsar, and conferred the higher rank of augustus on his own son, Severus. Maximian and his son Maxentius assumed imperial power at Rome, so that in 307 A. D. six men became competitors for the empire. Constantine married Fausta, a daughter of Maximian. After the death of Galerius (311), Licinius and Maximian were masters of the eastern provinces of the empire, and Constantine reigned in Gaul. In 312 Maxentius was defeated and killed by the army of Constantine, who then entered the city of Rome and became master of all the western part of the empire, including Italy and Africa. On the eve of this decisive battle, he is said to have seen a sign of the cross in the sky, bearing the inscription: Ἐν τούτῳ νίκα (By this conquer). He afterward treated the Christians with increasing favor, and adopted wise measures for the promotion of public prosperity and order.

In 314 he waged a short war against Licinius, who was the sole emperor of the eastern provinces. This war was followed by a peace of nine years, during which Constantine devoted himself to political reforms, organized a better form of government, and adopted a more humane code of laws, which recognized Christianity as the religion of the state. He renewed in 323 the war against Licinius, whom he defeated near Adrianople. After another decisive victory he reigned over the Roman empire with undivided power. He assembled at Nicæa, in 325 A. D., the first general council of the Church with the consent and concurrence of the pope, and moderately favored orthodoxy in the controversy against the Arians. He had a son, Crispus, who was accomplished and popular. Having been falsely accused of a crime by Fausta, his stepmother, Crispus was put to death. Constantine selected Byzantium as his capital, and enlarged or rebuilt that city, to which he gave the name of New Rome or Constantinople—"city of Constantine." This was founded by imposing ceremonies in May, 330 A. D. In the latter part of his life he showed favor to the Arians, and was baptized by an Arian bishop only a week before his death. The question is still warmly debated whether the man, or only the emperor, was converted. He died at Nicomedia, May 22, 337 A. D., having divided the empire between his three sons, Constantine, Constantius, and Constans. He has a high reputation as a statesman and emperor.

AUTHORITIES.—Eusebius, *Vita Constantini*, a translation of the same in *The Nicene and Post-Nicene Fathers*, (2d series, vol. i., 1890); Gibbon, *Decline and Fall of the Roman Empire*; Joseph Fletcher, *Life of Constantine the Great* (1852).

Constantine (or **Constantinus**) **VII.**: Emperor of the East, surnamed PORPHYROGENITUS [Gr. Πορφυρογέννητος, i. e. born to the purple or born in purple]: b. in 905 A. D. He was a son of the Emperor Leo VI., who died in 911. Romanus Lecapenus usurped the imperial power in 919, after which Constantine passed many years in retirement and study. He began to reign in 944. He wrote several works of some merit. D. in 959.

Constantine XIII., surnamed PALÆOLOGUS: the last Emperor of Constantinople; b. in 1394. He succeeded his brother, John VII., in 1448. The Turkish sultan, Mahomet II., besieged Constantinople with an army of 250,000 men, and took it by storm in 1453. Constantine was killed, fighting bravely to the last, May 29, 1453.

Constantine, Nikolaevitch: Grand Duke of Russia; second son of the Emperor Nicholas; b. Sept. 21, 1827. He became grand admiral of the fleet and a favorite leader of the old Russian party. In the Crimean war (1854–55) he commanded the Baltic fleet and acted on the defensive. He married the Princess Alexandra of Saxe-Altenburg in 1848. He was in 1862 governor-general of Poland, but resigned in 1863. In 1865 he was appointed, and in 1878 reappointed, president of the Council of State, but in 1881 was dismissed from office and from command of the fleet on suspicion of intriguing with the revolutionary party. He lost his reason in 1890, and died Jan. 25, 1892.

Constantine, Pavlovitch: grand duke: second son of the Emperor Paul of Russia; b. May 8, 1779. He commanded a corps at the battle of Austerlitz (1805), and displayed in several actions a courage bordering on rashness. In 1814 he was appointed generalissimo of the Polish troops and viceroy of Poland. When Alexander died without issue in 1825, Constantine was the legitimate heir, but he renounced the throne in favor of his younger brother, Nicholas. In the reign of Nicholas he was Viceroy of Poland, and by his tyranny provoked the Poles to revolt in 1830. Died of cholera, June 27, 1831.

Constantinople [Gr. Κωνσταντινούπολις, Constantine's city The Turkish name is *Istamboul* or *Stamboul*; the Arabic and official Turkish *Constantinié*; the Mod. Gr. ἡ Πόλις, (The City); and the Eccles. Gr. ἡ Νέα Ῥώμη (The New Rome)]: the capital of the Ottoman empire; often styled the Queen of the East; situated upon the Sea of Marmora in Europe, at the southwest extremity of the Thracian Bosphorus. Lat. 41° 1′ N., lon. 28° 59′ E. of Greenwich, 106° E. of Washington; 5,622 miles E. of New York; two days' journey by rail from Vienna and three days' from Paris (see map of Turkey, ref. 4–E).

Situation.—The city occupies a triangular peninsula, having the Golden Horn, an inlet of the Bosphorus, on the N. Two pontoon bridges across this inlet, one of iron, connect the city proper with the populous suburb of Galata-Pera, where foreigners reside and the European legations and embassies are located. A mile distant eastward across the Bosphorus is the Asiatic city of Scutari. Constantinople spreads over seven hills (greatest altitude, 291 feet); six extending S. are nearly parallel, while the seventh, the southernmost and largest, is cut off from the rest by the river Lyeos, which traverses the city. This diversified surface, covered with numerous palaces, mosques, minarets, gardens, and cypresses, presents an aspect marvelously picturesque and imposing. The site combines in almost unequaled degree capability of defense, facility of trade, the choicest gifts of nature, and exquisite scenery. Its commanding geographical situation renders Constantinople the key of Eastern Europe and Asia Minor. The Golden Horn affords a safe and commodious harbor, nearly 5 miles long and from 1 to 4 furlongs wide. Its depth and entire freedom from tides enable the largest vessels to approach close to the shore and discharge with ease.

The *internal appearance* of Constantinople is distinctively Oriental. The streets without sidewalks, bordered by small wooden houses, are generally crooked, narrow, badly paved, dirty, and swarm with dogs. In the regions ravaged by terrible conflagrations in 1865, 1866, 1870, 1878, and 1890, however, broad thoroughfares and sidewalks and spacious stone houses have been substituted. All the streets are named, the houses numbered, and street-lamps have become common. Quays, tramways, a tunnel (Galata-Pera), a railway, omnibuses, public cabs, and telegraph wires somewhat Europeanize Constantinople. A funereal aspect is given by its vast and crowded cemeteries.

Public Buildings.—Constantinople and its suburbs contain 641 mosques, 12 called imperial; 158 churches and chapels (41 Armenian, 30 Roman Catholic, 68 Greek, 19 Protestant); 40 synagogues; 209 khans (Oriental inns); 178 imarets (mosque hospitals); over 300 tekiés (dervish convents). The principal mosques are Aya Sophia, with four minarets; originally a Christian church, designed by Anthemius (*q. v.*), and built by Constantine, successively rebuilt in 360, in 415, and lastly by Justinian 532–37. It was converted into a mosque by Mohammed II. (1453), and repaired (1847–49) at an expense of over $1,500,000 by the Fossatis. It is a Greek cross, 253 feet by 239, surmounted by a flattened dome 108 feet in diameter, its apex 180 feet high. It is adorned with 107 columns from the chief ancient temples, and is rich in marbles and mosaics, the latter now covered over and invisible. (See Architecture.) The mosque of Suleïman I., also with four minarets, a grandiose imitation of St. Sophia; mosque of Achmet I., rich in tiles, with six minarets, only the Kaaba at Mecca having a larger or equal number; the mosque of Mohammed II., of Bayezid I., of Selim I., the Yeni Validé Djami (mosque), and the Nouri Osmanié, the two latter built entirely of white marble. Other most interesting mosques that had once been Christian churches are Kioutchouk Aya Sophia, an octagon, built by Justinian; Kilissé Djami and Mir Achor Djami, both erected in the fifth century, the latter a basilica; and Kachrié Djami, with exquisite, well-preserved mosaics. The Government buildings are generally unpretentious. Outside the offices of the grand vizier is the elaborate gate from which the Government takes the name of the Sublime Porte. The imperial palaces and the residence of the sultan are on the Bosphorus. The barracks are enormous yellow buildings, clean and well kept. There are two museums—one of Turkish costumes, one of antiquities. In the latter are the famous eighteen sarcophagi from Sidon, one perhaps that of Alexander the Great. The Grand Bazar (Tcharshi) consists of connected covered streets, lined with 3,217 little shops, and is the city's commercial center and its most Oriental feature. The Seraï (seraglio), the residence of the sultans from 1520 to 1839, occupies the eastern extremity of Constantinople, almost the entire site of Byzantium. Three gates in parallel walls admit to the "Abode of Felicity." Here in splendid gardens are the divan, throne room, treasury, library, kiosks (summer houses), harem, (former residence of the imperial ladies), and the Chamber of the Holy Mantle. Successive conflagrations have destroyed many buildings and much impaired the beauty of the Seraï.

The *climate* is at all seasons variable, subject to sudden and extreme changes. One year furnishes small indication of the next. North and south winds predominate. From 1856 to 1888—highest temperature, 99·14° F.; lowest, 17·24°; average, 57·74°: barometer, Fortins system, greatest, 771·2; least, 755·1; annual average, 762·1: greatest yearly rainfall (1877), 42 inches; least (1882), 19 inches; yearly average, rainy days, 84; tempest, 15; snowy, 14; other days, 252.

The *inhabitants* of Constantinople and suburbs, according to the official census of 1885, numbered 873,565; in 1893 about 925,000. Probably 450,000 are Ottomans, 250,000 Greeks, 165,000 Armenians, 30,000 Jews, and 30,000 foreigners, Levantines, and members of less numerous subject races. Formerly each nationality was confined to its own quarter, a restriction gradually relaxed. The Greeks center at Phanar on the Golden Horn, around the patriarchal church and palace; there in the monastery of the Holy Sepulcher of Jerusalem Bishop Bryennios discovered the Teaching of the Twelve Apostles. The Armenian quarter and patriarchate are at Koum Kapon, on the Marmora: the Jews crowd unsavory Balat, while the Ottomans monopolize all the most desirable localities. Constantinople is the residence of Greek, Armenian, and Armeno-Catholic patriarchs, of a Bulgarian exarch, a Protestant vekil (representative), and a grand rabbi; also of the Sheik ul Islam (high priest of Islam), who under the sultan is spiritual head of the Mussulman Church. The principal foreign nations have their own post-offices, hospitals, and schools.

Education.—Schools are numerous, one being attached to every mosque and church, but not generally of a high order. The Armenians, and especially the Greeks, have fine institutions. The American College at Scutari and Robert College on the Bosphorus are excellent. The Ottoman Government maintains good naval, military, medical, and polytechnic schools, and the school of Galata Seraï, modeled after a French *lycée*. The stately Bible House is the headquarters of the Protestant Bible societies and missions throughout the empire. A library, mostly MSS., is attached to each principal mosque; and there is a respectable international library on the third hill. Forty-three newspapers are published in ten languages—Arabic, Armenian, Bulgarian, English, French, Greek, Hebrew-Spanish, Italian, Persian and Turkish—none wholly in English. Nineteen of these are dailies.

Manufactures and Commerce.—The former hardly exist, having steadily declined since 1839. Even the importance of Constantinople as entrepôt or commercial center has been largely transferred since 1878 to Batoum, Odessa, and Smyrna. Shipping is almost entirely in the hands of foreigners. Exports: Wool, raw silk, carpets, tobacco, rags, hides, and valonea. Imports: Grain, sugar, coffee, cattle, drugs, and all kinds of manufactured articles.

History.—Constantine founded Constantinople on the site of Byzantium (*q. v.*), with largely increased territory, and dedicated it May 11, 330, "to the service of Christ." Since then, though besieged thirty-one times, it has been captured only by the Latin crusaders (1203–04) and by Mohammed II. (1453). Among the most memorable sieges may be mentioned that by the Goths in 379; by the Arabs and Persians in 616–26; and by the Arabs themselves in 672–79, and also 717–18; by the Bulgarians in 813 and 843; by the Russians in 865 (who also made attacks in 904, 951, and 1043); by Bayezid II. in 1391–98: and by Murad II. in 1422. The chief events in the history of the city are as follows: The introduction of the silkworm in 530; the separation of the Eastern and Western Churches in 1054; the death of 160,000 persons from the plague in 1812; destruction of the janizaries in 1826; the proclamation of reforms by Hatti Sheriff in 1839; the first Protestant Church organized in 1846; railway to Adrianople was opened in 1873; the accession of Sultan Abdul Hamid Khan II., the thirty-fourth Ottoman sovereign, in 1876; in 1878 the treaty of San Stefano; railway to Vienna was completed in 1888. Several œcumenical councils have been held in Constantinople in 381, in 553, and in 680, in 754 and in 869.

Antiquities.—(*a*) The walls entirely surround the city; that on the west side (erected in 413) is 4 miles long, and has seven gates. It is a triple wall with 179 high towers and a moat 60 feet wide, all kept in scrupulous repair till 1453, but now a magnificent ruin. (*b*) The sixteen cisterns, two dating from Constantine, are the largest in the world; one of Philoxenos, 196 feet long, 173 feet wide, with 224 columns in 16 rows, supporting the roof; one Basiliké, now Yeri Batan Seraï (underground palace), also roofed, 390 feet by 174 feet, with 336 marble columns in 28 rows. (*c*) The columns: the "Burnt Column," erected by Constantine; the columns of Theodosius, of Marcian; the column in the Atmeïdan (Hippodrome); the "Built Column" of Constantine VII.; the obelisk of Thebes; and the brazen serpent of Delphi. The last mentioned (consecrated 476 B. C. by the Greeks to Apollo) was brought from the oracle by Constantine. On it are still visible the names of Greek cities which fought the Persians. This is the most precious antiquity in the city. (*d*) Ancient Christian churches, many of which are now mosques. (*e*) The "Tower of Christ" in Galata, first erected in the fifth century. (*f*) Sarcophagi in various parts of the city, one near the Church of St. Irene, probably that of Constantine. (*g*) The palaces of Justinian and the Hebdomon (Tekour Seraï); prison of Anemas; the Seven Towers (Yedi Koulé), formerly a Greek fortress called Heptapyrgion; and the aqueduct of Valens.

EDWIN A. GROSVENOR.

Constan'tius I., called **Constantius Chlo'rus**, FLAVIUS VALERIUS: a Roman emperor; b. about 250 A. D.; the father of Constantine the Great. The Emperors Diocletian and Maximian chose Constantius and Galerius in 292 A. D., and gave to each the title of cæsar. Constantius ruled over Gaul, Britain, and Spain, and became emperor in 305, when Diocletian abdicated. D. July 25, 306 A. D.

Constantius II., FLAVIUS JULIUS: second son of Constantine I. and Fausta; b. at Sirmium in 317 A. D. He inherited, in accordance with his father's will, the Asiatic provinces and Egypt in 337. He waged war against the Persians, by whom he was several times defeated. He vanquished Magnentius on the Drave in 351, and in Gaul in 353. In 355 he gave the title of cæsar to his cousin Julian. He showed favor to the Arians. He died Nov. 3, 361 A. D., and was succeeded by Julian.

Constellation [from Lat. *constella'tio*, the position of the stars, grouping of the stars, group of stars; *con*, together + *stel'la*, star]: a group or collection of stars. The use of the term has arisen from the obvious fact that the stars are not scattered equally over the heavens, but appear to be collected, to a greater or less extent, into groups. In prehistoric times names were given to these groups, which were sometimes supposed to have been suggested by a fancied resemblance to figures of men, animals, or other objects. In most cases, however, this resemblance is so fanciful that we can hardly suppose the name to have been determined by it. It would seem from Ptolemy's descriptions of the stars and his list of the constellations that long before his time maps of the stars were formed on which the animals, heroes, or objects after which the constellations were named were drawn so as to include all the brighter stars of each constellation. The latter were then designated by the particular part of the man, animal, or object where the star was situated. For example, Aldebaran was in the eye of the bull; three conspicuous stars in Orion formed his belt; a small group formed his head; two bright stars were in his shoulder, etc. Thirty-six constellations are recognized by Ptolemy in the Almagest. In modern times fifty-six have been added to Ptolemy's list, sometimes by dividing up his constellations, and sometimes by adding new ones. At the present time the figures of animals are no longer used, but the entire heavens are divided up into regions bounded by somewhat arbitrary lines, straight or curved, drawn so as to pass through the spaces containing as few conspicuous stars as possible. This inclusion of every part of the heavens in some constellation is the principal point in which the modern system differs from the older one. In the latter many minute stars were regarded as not belonging to any constellation. Within each constellation the brighter stars are distinguished by numbers, or by letters of the Greek alphabet. See STAR.

The following list comprises all the constellations now generally recognized, although some of the more recent ones are understood to be temporary. The first twenty are known as Ptolemy's northern constellations; next come the twelve zodiacal, and then the fifteen southern constellations of Ptolemy; the forty-eighth was added by Tycho Brahe, though first named by Conon the Samian; the next ten are from Hevelius. All after the fifty-fifth are S. of the equator. Those from Indus to Apus inclusive were named by Bayer; the next thirteen are from Lacaille, and the last two from Royer:

1. Ursa Minor, the Lesser Bear.
2. Ursa Major, the Greater Bear.
3. Draco, the Dragon.
4. Cepheus.
5. Boötes, the Herdsman.
6. Corona Borealis, the Northern Crown.
7. Hercules.
8. Lyra, the Lyre.
9. Cygnus, the Swan.
10. Cassiopeia.
11. Perseus.
12. Auriga.
13. Ophiuchus or Serpentarius, the Serpent-bearer.
14. Serpens, the Serpent.
15. Sagitta, the Arrow.
16. Delphinus, the Dolphin.
17. Equuleus, the Little Horse.
18. Pegasus, the Winged Horse.
19. Andromeda.
20. Triangulum Boreale, the Northern Triangle.
21. Aries, the Ram.
22. Taurus, the Bull.
23. Gemini, the Twins.
24. Cancer, the Crab.
25. Leo, the Lion.
26. Virgo, the Virgin.
27. Libra, the Scales.
28. Scorpio, the Scorpion.
29. Sagittarius, the Archer.
30. Capricornus, the Goat.
31. Aquarius, the Water-bearer.
32. Pisces, the Fishes.
33. Cetus, the Whale.
34. Orion.
35. Eridanus, the River Po.
36. Lepus, the Hare.
37. Canis Major, the Greater Dog.
38. Canis Minor, the Lesser Dog.
39. Argo, the Ship Argo.
40. Hydra, the Water-serpent.
41. Crater, the Cup.
42. Corvus, the Crow.
43. Centaurus, the Centaur.
44. Lupus, the Wolf.
45. Ara, the Altar.
46. Corona Australis, the Southern Crown.
47. Piscis Australis, the Southern Fish.
48. Coma Berenices, the Hair of Berenice.
49. Canes Venatici (the Greyhounds, Asterion and Chara).
50. Lacerta, the Lizard.
51. Lynx, the Lynx.
52. Sextans Uraniæ, Tycho's Sextant.
53. Cameleopardalis, the Giraffe.
54. Vulpecula et Anser, the Fox and Goose.
55. Leo Minor, the Lesser Lion.
56. Monoceros, the Unicorn.
57. Indus, the Indian.
58. Grus, the Crane.
59. Phœnix, the Phœnix.
60. Musca, the Fly.
61. Pavo, the Peacock.
62. Toucan, the Toucan.
63. Hydrus, the Water-snake.
64. Dorado, the Swordfish.
65. Piscis Volans, the Flying-fish.
66. Chamæleon, the Chamæleon.
67. Triangulum Australe, the Southern Triangle.
68. Apus, the Bird of Paradise.
69. Apparatus Sculptoris, or Sculptor, the Sculptor's Workshop.
70. Fornax Chemica, the Chemical Furnace.
71. Horologium, the Clock.
72. Recticulum Rhomboidale, the Rhomboidal Net.
73. Cœla Sculptoris, the Graving Tools.
74. Equus Pictorius, the Painter's Easel.
75. Antlia Pneumatica, the Air-pump.
76. Octans, the Octant.
77. Norma, the Square-rule.
78. Circinus, the Compasses.
79. Telescopium, the Telescope.
80. Microscopium, the Microscope.
81. Mons Mensæ, the Table Mountain.
82. Crux Australis, the Southern Cross.
83. Columba Noachi, Noah's Dove.

SIMON NEWCOMB.

Constipation [from Lat. *constipa'tio*, deriv. of *constipa're*, crowd close together; *con*, together + *stipa're*, stuff—referring to that state of the rectum in which it is impacted with fecal matter]: the diseased condition in which there is sluggish action of the bowels. The term is more or less relative, but as a rule a motion of the bowels should occur every twenty-four hours in health. The principal causes which lead to constipation are sedentary habits and errors in diet, digestive disturbances, and a general sluggish condition of the system. There may be special want of secretion of the intestinal juices due to diseases of the intestines, and mechanical constipation may result from narrowing or com-

pression of localized parts of the bowels. In itself constipation is merely a symptom and may lead to no further disturbances. On the other hand, considerable discomfort may result, and headache, drowsiness, or loss of appetite are frequent symptoms. Obstinate constipation may lead to fermentative changes in the intestines and absorption of products of fermentation which are poisonous to the system.

In the treatment of this affection regulation of diet and of exercise claim first attention. Indiscriminate drugging is more frequently harmful than otherwise. The diet should be varied, and should contain food such as brown bread, oatmeal, fruit and vegetables containing slightly irritating refuse. Soothing bland diet is required. Regular exercise and a morning bath followed by vigorous friction are good. Obstinate cases may call for enemata of water, etc.

Constituição: city of Brazil. See PIRACICABA.

Constitution [from Lat. *constitu'tio*, structure, composition, establishment, decree; *con*, together + *statu'ere*, establish]: in the U. S., a written statement of the fundamental rules of government, either of a State or of the U. S. The word as thus used has a widely different signification from that which prevails in Great Britain, where it means simply the leading rules of government, without reference to any formal statement. The British "constitution" thus consists of documents emanating from time to time from the king or from Parliament, and of traditions and customs. These may be collected in treatises and reduced to a systematic form, but have never received the legal sanction indispensable in the U. S.—that of recognition by the nation as distinguished from Parliament. In the U. S. "the people," consisting in each State of those who hold the elective franchise, are by prescribed forms called upon at intervals either to establish the constitution or to amend it. It thus has an authority superior to that of the government organized under it. One extremely important result is that if any of the departments exceed the limits marked out in the constitution, the act is irregular and void. An illustration of the doctrine is found in an act of the legislature which transcends the constitution; the judicial department will declare it void. The courts have no such power in Great Britain. An act of Parliament is commonly said to be "omnipotent"; there is no judicial power which can exercise the function of arresting the regular operation of the act. The power of the courts in the U. S. is, in the best sense of the word, a "veto"—forbidding a direction which has actually been clothed with legislative forms from being carried into effect, on account of its repugnance to the will of the people. The further examination of the subject with reference to the U. S. may be conducted under the following general divisions: I. The mode of originating a constitution; II. The relation between a State and the U. S. Constitution, and the office of each; III. Principal provisions in American constitutions, including "constitutional limitations."

I. The prevailing method of generating or amending a constitution is the "constitutional convention." It is certainly not the only method, since it sometimes happens that a constitution provides special and different modes of amendment, as is the case with the U. S. Constitution and some others. A distinction has been taken between a "constitutional" and a "revolutionary" convention. These do not differ necessarily in their internal character or in their modes of conducting business, but in their origin. A constitutional convention originates by orderly processes—is the creature of law. A revolutionary convention is irregular in its origin. Its ordinances may have a *de facto* validity, and become law on receiving the sanction of the people. The regular method is to have a law of the legislature or a constitutional provision as a basis for the existence of the convention. When a body of delegates of this kind is assembled by legal methods, its powers become a subject of much importance, and are not yet definitely ascertained. Some hold that the convention has all the powers which inhere in the "people" that created it. In other words, it is sovereign. This is startling doctrine, and will scarcely command general assent. Another extreme view in the other direction is that it is a mere deliberative body, having power to discuss propositions, to agree upon them, and to recommend them for adoption. Under this view the convention is but little more than a debating society, with very limited powers for preserving order or securing itself from the intrusion of strangers. The true view would seem to be that while the convention is itself acting in subordination to law, yet it has, as *incidental* to the accomplishment of its purposes, such powers as are necessary to carry them into effect. It may accordingly preserve order, punish contempts of its authority, provide for submission to the vote of the people of its proposed ordinances, and do such other acts as reasonably serve to make deliberation free and complete, and also to secure the full expression of the popular will. There are cases where the constitution of the State itself or the act of the Legislature provides for the calling of a convention in a prescribed manner and with specified powers. While the restrictions of a constitution must be accepted as binding, it may well be doubted whether an act of the Legislature can deprive a convention sanctioned by the people of powers which have been already referred to as incidental to its complete working.

The common method of transacting business is to parcel out among different standing committees the various topics to be provided for, such as a committee on "the bill of rights," "the judiciary," "the legislative department," etc. These committees, after due consideration of the subjects intrusted to them, report to the convention, when the matter is taken up by the entire body, discussed, approved, or rejected. (For detailed information see Jameson, *On Constitutional Conventions.*) The debates in conventions are frequently published in a permanent form, and contain much information of great value on legal and constitutional topics. Reference may be made to the *Madison Papers*, containing debates on the U. S. Constitution; Elliot's *Debates*, and those published in New York, Virginia, Massachusetts, Illinois, and Pennsylvania.

II. *The Relation between a State and the United States Constitution, and the office of each.*—A State constitution is adopted to regulate the action of the various departments of the Government and to secure the rights of the people. It is a common statement that a State government has all the powers possessed by the English Parliament, except so far as it is restrained either by the State or national constitution. The object of a State constitution is not so much to confer power as it is to restrict and define that which already exists. It is to subject the will of the people to prescribed forms, which can not be overcome by an ordinary act of legislation, but only by an amendment of the constitution itself. On the other hand, the U. S. Government is called into existence by a written instrument. It has no powers except those which are contained within it, either in express terms or by reasonable implication. The acts done under its legitimate powers, such as the laws of Congress or treaties with foreign nations, are the supreme law of the land, and all State laws or State constitutions are so far subordinate. It is plain, however, that a State constitution or law may be in conflict with some provision of the U. S. Constitution or law or treaty, or an act of Congress may trench upon legitimate State authority. There must be some power intrusted with the function of deciding these questions in such a way as to keep the two governments within their proper sphere of action. This power appertains to the Supreme Court of the U. S., and in the exercise of its appellate jurisdiction it may review the decisions of State courts for this purpose, under clauses of the "judiciary acts" of Congress passed under the provisions of the Constitution. It thus becomes the final interpreter of the Constitution, and may declare a State law or constitutional provision void as being repugnant to the U. S. Constitution or the laws of Congress or treaties with foreign powers. So, when an act of Congress is not warranted by constitutional rules, it will be declared void. In this way the complex system of government works harmoniously, sound judgment dictating that the rights of the States should be preserved by the courts with the same jealous and scrupulous care as those of the U. S. The court can not exercise this power by the promulgation of an edict or ordinance, but only through the medium of a "case" or controversy between litigating parties. In deciding the case it may proceed upon principles which become a rule for the future, and a body of constitutional law is thus formed which either truly expounds the Constitution or departs from it. If an error be omitted, it can only be rectified by a subsequent act of the court overruling the decision or by an amendment of the Constitution. Another point may be adverted to. A State law may be opposed to a State constitution. The duty of deciding this point regularly devolves upon the courts of the particular State, and the U. S. court follows their lead. However, having once acceded to the State interpretation, if that be subsequently reversed in

the State court, it will not feel bound to change its view, but may adhere to the first construction. There is thus to be collected from the decisions of State courts a mass of what may be called "State constitutional law." Much of this is special in its nature, having but little value beyond State limits. Other parts of it are general in their character, while some portions of it are coincident with decisions in the U. S. court, as in some instances the same restrictions are found in both instruments.

III. It is not intended under this head to advert to the general scheme of the various State and U. S. constitutions. The text of the latter is given hereafter in full. (See CONSTITUTION OF THE UNITED STATES.) Reference will only be made to such provisions in the nature of restrictions as are of a general nature. These are restrictions upon unsound legislation, such as prohibitions of bills of attainder and ex-post facto laws, or laws impairing the obligation of contracts; some of the States in the same spirit prohibit divorces by the Legislature. Or they may be limitations upon legislation opposed to the spirit of American institutions. Under this head may be ranked prohibitions against granting titles of nobility. There are also limitations for the protection of individual rights addressed to all departments of government. They tend to secure liberty of speech and of the press, religious freedom, to prevent deprivation of rights except through orderly processes in courts of justice, including trial by jury; also to prevent renewed trials for the same offense, to check excessive punishments, etc. A number of such provisions are found in the earlier amendments to the U. S. Constitution. It is an important remark that these were only intended to bind the action of Congress or other departments of the general government. For this reason like clauses are inserted in the State constitutions. The last three amendments (thirteenth, fourteenth, and fifteenth) are operative upon the States as well as upon Congress. Many of the provisions now considered are taken from the English law, and in the very words of statutes or text-writers. They thus become fundamental law in the sense in which they were used in the country whence they were derived. The last three amendments of the U. S. Constitution were specially intended to secure rights to citizens of African descent, though not confined to them. (See CITIZEN.) Fundamental provisions of this sort, when considered together, are frequently termed a "bill of rights." (See BILL OF RIGHTS.) There is in some instances a tendency to insert in the State constitutions matters which are more properly the subject of legislation. Sometimes a political party desires to make its policy on a question like that of internal improvements a permanent one, and secures to that end a provision in the constitution; or perhaps legislatures prove themselves to be unwise or even corrupt, and it is thought well to reduce their capacity to do mischief by shearing them of their legitimate powers. Provisions framed to accomplish such objects do not long prevail, and a reaction in public sentiment soon leads to an amendment of the constitution. The better view is that constitutions should only deal with fundamental law. When legislators are ignorant or vicious, the true remedy is at the ballot-box, where the voters may show their will to have more suitable men. See on the general subject, Cooley, *On Constitutional Limitations*; Hough's *Collection of State Constitutions*; also the same author's *Annotated New York Constitution of 1846*; Story, *On the United States Constitution*; Kent's *Commentaries*; and the treatises of Rawle, Sargent, and Paschal. The most complete view of the principles governing the whole subject may be obtained from the opinions written by the judges of the Supreme Court of the U. S. in deciding specific cases involving the construction of the Constitution. These are collected in the reports of Dallas, Cranch, Wheaton, Peters, Howard, Black, Wallace, etc. Abstracts of the points decided may be found in Brightly's *Digest* and Abbott's *National Digests*. These works may be used for easy reference to the volumes of the reports above named. Full expositions of questions arising under the various State constitutions will in like manner be found in the public reports of the decisions of the courts of the respective States.

T. W. DWIGHT.

Constitution of the United States: the fundamental or organic law of the union of the States, thereby united. This, with all acts of the States in Congress assembled, and all treaties made in pursuance of its provisions, constitutes the supreme law of the land throughout the Union. The first Constitution of the U. S. was the Articles of Confederation, adopted by the States during the war for their independence. (See CONFEDERATION, ARTICLES OF; and consult Curtis, *History of the Constitution of the United States*, p. 139; Sparks, *Writings of Washington*, letter to Henry Lee, Sept. 22, 1788, to Benjamin Lincoln, Oct. 26, 1788, and to James Monroe, Feb. 22, 1789.) The first Articles proving inefficient for the accomplishment of the objects of the Union, mainly upon the grounds that they conferred no power upon the central head to regulate commerce with foreign nations, or to act directly upon the citizens of the several States respectively in the collection of the quotas levied upon the States to meet the public expenditures and to sustain the public credit, etc., the Congress, being urged by appeals from several quarters, took up the subject of amendment and general revision on Feb. 21, 1787, and then came to the following resolution upon it:

"*Resolved*, That, in the opinion of Congress, it is expedient that, on the second Monday in May next, a convention of delegates, who shall have been appointed by the several States, be held at Philadelphia, for the sole and express purpose of revising the Articles of Confederation, and reporting to Congress and the several State Legislatures such alterations and provisions therein as shall, when agreed to in Congress and confirmed by the States, render the Federal Constitution adequate to the exigencies of government and the preservation of the Union." See Elliot's *Debates on the Federal Constitution*, vol. i., p. 120.

It was under this resolution of Congress, and in response to it by eleven of the States in choosing and sending delegates, that the ever-memorable Federal Convention assembled in Philadelphia, May 14, 1787. Each of the old thirteen States then composing the Union was represented in it, except Rhode Island. George Washington, almost universally styled the "Father of his Country," was unanimously chosen president of the convention. As a whole, it was unquestionably the ablest body of jurists, legislators, and statesmen that had ever assembled on the continent of North America. The convention remained in session from May 14 till Sept. 17 ensuing. Their deliberations and proceedings were with closed doors. The journal of these proceedings was not published until over forty years afterward. The actual and practical result, however, of their labors in the execution of the high trust committed to them was immediately communicated to Congress, and, being approved by that body, was speedily communicated to the respective States. This was their grand work in framing and proposing that matchless system of federal government set forth and embodied in the new Constitution for the government of the U. S. of America, which was adopted and ratified by eleven States before the close of the year 1788; so that it went into operation between the States ratifying at the time appointed in 1789. The other two, North Carolina and Rhode Island, adopted and ratified it in less than two years afterward. The last of the old thirteen which came into the Union, so remodeled in its federal structure, was Rhode Island. Several features in this new form and constitution of government for separate States and communities are without a parallel in ancient or modern times. It was in contemplation of one of these peculiar features that De Tocqueville, an authority thoroughly versed in the science of politics, made the following commentary: "This Constitution, which may at first be confounded with the federal constitutions which have preceded it, rests, in truth, upon a wholly novel theory, which may be considered as a great discovery in modern political science. In all the confederations which preceded the American Constitution of 1789 the allied States, for a common object, agreed to obey the injunctions of a federal government, but they reserved to themselves the right of ordaining and enforcing the laws of the Union. The American States which combined in 1789 agreed that the federal government should not only dictate, but should execute, its own enactments. In both cases the right is the same, but the exercise of the right is different, and this difference produced the most momentous consequences." See De Tocqueville's *Democracy in America*, vol. i., p. 198.

As to how far under the Constitution the Federal Government had a right to coerce a State was not so clearly stated in the Constitution as to afford a guaranty against future disputes. Important questions of interpretations on this subject arose in the early history of the Government. During the first half century the New England States, in consequence of dissatisfaction with the course of the Federal Government, asserted the right to nullify the acts of Con-

gress, and similar ground was taken by South Carolina a few years later. This important question was the occasion of the most momentous debate ever held in the history of the Government. Senators Hayne and Calhoun took the one side and Daniel Webster the other. The views of Webster came to be generally held in the North, while the South maintained those of Hayne and Calhoun with similar tenacity. But the question involved too many interests to be settled by discussion alone, and it thus became what may be called the Constitutional occasion of the civil war.

Revised by C. K. Adams.

The following is the text of the new Constitution proposed by the convention of 1787, and adopted by a number of the States sufficient for it to go into operation in 1789, beginning with the preamble and ending with the last of the Amendments:

Constitution of the United States.—We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America.

Article I., Sec. 1. All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Sec. 2. The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislature.

No person shall be a representative who shall not have attained to the age of twenty-five years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

Representatives and direct taxes shall be apportioned among the several States which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of representatives shall not exceed one for every thirty thousand, but each State shall have at least one representative; and until such enumeration shall be made the State of New Hampshire shall be entitled to choose three, Massachusetts eight, Rhode Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

When vacancies happen in the representation from any State, the executive authority thereof shall issue writs of election to fill such vacancies.

The House of Representatives shall choose their Speaker and other officers, and shall have the sole power of impeachment.

Sec. 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six years; and each Senator shall have one vote.

Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the Senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the Legislature of any State, the executive thereof may make temporary appointments until the next meeting of the Legislature, which shall then fill such vacancies.

No person shall be a Senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

The Vice-President of the United States shall be president of the Senate, but shall have no vote, unless they be equally divided.

The Senate shall choose their other officers, and also a president *pro tempore*, in the absence of the Vice-President, or when he shall exercise the office of President of the United States.

The Senate shall have the sole power to try all impeachments; when sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present.

Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law.

Sec. 4. The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the Legislature thereof; but the Congress may at any time, by law, make or alter such regulations, except as to the places of choosing Senators.

The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall, by law, appoint a different day.

Sec. 5. Each house shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members, in such manner and under such penalties as each house may provide.

Each house may determine the rules of its proceedings, punish its members for disorderly behavior, and, with the concurrence of two-thirds, expel a member.

Each house shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may in their judgment require secrecy, and the yeas and nays of the members of either house on any question shall, at the desire of one-fifth of those present, be entered on the journal.

Neither house, during the session of Congress, shall, without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two houses shall be sitting.

Sec. 6. The Senators and Representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the session of their respective houses, and in going to and returning from the same; and for any speech or debate in either house they shall not be questioned in any other place.

No Senator or Representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States, which shall have been created or the emoluments whereof shall have been increased during such time; and no person holding any office under the United States shall be a member of either house during his continuance in office.

Sec. 7. All bills for raising revenue shall originate in the House of Representatives; but the Senate may propose or concur with amendments, as on other bills.

Every bill which shall have passed the House of Representatives and the Senate shall, before it becomes a law, be presented to the President of the United States; if he approve, he shall sign it; but if not, he shall return it, with his objections, to that house in which it shall have originated, who shall enter the objections at large on their journal, and proceed to reconsider it. If after such reconsideration two-thirds of that house shall agree to pass the bill, it shall be sent, together with the objections, to the other house, by which it shall likewise be reconsidered; and if approved by two-thirds of that house, it shall become a law. But in all such cases, the votes of both houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each house respectively. If any bill shall not be returned by the President within ten days (Sunday excepted) after it shall have been presented to him, the same shall be a law in like manner as if he had signed it, unless the Congress by their adjournment prevent its return, in which case it shall not be a law.

Every order, resolution, or vote to which the concurrence of the Senate and the House of Representatives may be necessary (except on a question of adjournment) shall be presented

to the President of the United States; and before the same shall take effect, shall be approved by him, or, being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the rules and limitations prescribed in the case of a bill.

Sec. 8. The Congress shall have power to lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States;

To borrow money on the credit of the United States;

To regulate commerce with foreign nations, and among the several States, and with the Indian tribes;

To establish a uniform rule of naturalization and uniform laws on the subject of bankruptcies throughout the United States;

To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures;

To provide for the punishment of counterfeiting the securities and current coin of the United States;

To establish post-offices and post-roads;

To promote the progress of science and useful arts, by securing for limited times, to authors and inventors, the exclusive right to their respective writings and discoveries;

To constitute tribunals inferior to the Supreme Court;

To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations;

To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water;

To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years;

To provide and maintain a navy;

To make rules for the government and regulation of the land and naval forces;

To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions;

To provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress;

To exercise exclusive legislation in all cases whatsoever over such district (not exceeding 10 miles square) as may, by cession of particular States and the acceptance of Congress, become the seat of the Government of the United States, and to exercise like authority over all places purchased by the consent of the Legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dockyards, and other needful buildings; and

To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof.

Sec. 9. The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by the Congress prior to the year one thousand eight hundred and eight; but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.

The privilege of the writ of *habeas corpus* shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

No bill of attainder or *ex post facto* law shall be passed.

No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken.

No tax or duty shall be laid on articles exported from any State.

No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another; nor shall vessels bound to or from one State be obliged to enter, clear, or pay duties in another.

No money shall be drawn from the treasury but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

No title of nobility shall be granted by the United States; and no person holding any office of profit or trust under them shall, without the consent of the Congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign state.

Sec. 10. No State shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money; emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts, or grant any title of nobility.

No State shall, without the consent of the Congress, lay any impost or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

No State shall, without the consent of Congress, lay any duty of tonnage, keep troops or ships of war in time of peace, enter into any agreement or compact with another State or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II., Sec. 1. The executive power shall be vested in a President of the United States of America. He shall hold his office during the term of four years, and, together with the Vice-President, chosen for the same term, be elected as follows:

Each State shall appoint, in such manner as the Legislature thereof may direct, a number of electors, equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative, or persons holding an office of trust or profit under the United States, shall be appointed an elector.*

The Congress may determine the time of choosing the electors, and the day on which they shall give their votes; which day shall be the same throughout the United States.

No person, except a natural-born citizen, or a citizen of the United States at the time of the adoption of this Constitution, shall be eligible to the office of President; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years, and been fourteen years resident within the United States.

In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice-President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice-President, declaring what officer shall then act as President, and such officer shall act accordingly, until the disability be removed, or a President shall be elected.

The President shall, at stated times, receive for his services a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them.

Before he enter on the execution of his office, he shall take the following oath or affirmation: "I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect, and defend the Constitution of the United States."

Sec. 2. The President shall be Commander-in-chief of the Army and Navy of the United States, and of the militia of the several States, when called into the actual service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment.

He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur; and he shall nominate and, by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law; but the Congress may by law vest the appointment of such inferior officers as they think proper in the President alone, in the courts of law, or in the heads of departments.

The President shall have power to fill up all vacancies that may happen during the recess of the Senate, by grant-

* This mode of election of President and Vice-President has been modified by the Twelfth Amendment, *post*.

ing commissions which shall expire at the end of their next session.

Sec. 3. He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may on extraordinary occasions convene both houses, or either of them, and in case of disagreement between them, with respect to the time of the adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

Sec. 4. The President, Vice-President, and all civil officers of the United States shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

ARTICLE III., Sec. 1. The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the supreme and inferior courts, shall hold their offices during good behavior, and shall, at stated times, receive for their services a compensation, which shall not be diminished during their continuance in office.

Sec. 2. The judicial power shall extend to all cases, in law and equity, arising under this constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers, and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States; between a State and citizens of another State; between citizens of different States; between citizens of the same State claiming lands under grants of different States; and between a State, or the citizens thereof, and foreign states, citizens, or subjects.

In all cases affecting ambassadors, other public ministers, and consuls, and those in which a State shall be party, the Supreme Court shall have original jurisdiction. In all the other cases before mentioned the Supreme Court shall have appellate jurisdiction, both as to law and fact, with such exceptions and under such regulations as the Congress shall make.

The trial of all crimes, except in cases of impeachment, shall be by jury; and such trial shall be held in the State where the said crimes shall have been committed; but when not committed within any State, the trial shall be at such place or places as the Congress may by law have directed.

Sec. 3. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort.

No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court.

The Congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood or forfeiture except during the life of the person attainted.

ARTICLE IV., Sec. 1. Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

Sec. 2. The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States.

A person charged in any State with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime.

No person held to service or labor in one State, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

Sec. 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the jurisdiction of any other State; nor any State be formed by the junction of two or more States, or parts of States, without the consent of the Legislatures of the States concerned as well as of the Congress.

The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this Constitution shall be so construed as to prejudice any claims of the United States, or of any particular State.

Sec. 4. The United States shall guarantee to every State in this Union a republican form of government, and shall protect each of them against invasion, and, on application of the Legislature, or of the executive (when the Legislature can not be convened), against domestic violence.

ARTICLE V. The Congress, whenever two-thirds of both houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the Legislatures of two-thirds of the several States, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes as part of this Constitution, when ratified by the Legislatures of three-fourths of the several States, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided that no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the ninth section of the first article; and that no State, without its consent, shall be deprived of its equal suffrage in the Senate.

ARTICLE VI. All debts contracted and engagements entered into before the adoption of this Constitution shall be as valid against the United States under this Constitution as under the Confederation.

This Constitution, and the laws of the United States which shall be made in pursuance thereof, and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every State shall be bound thereby, anything in the Constitution or laws of any State to the contrary notwithstanding.

The Senators and Representatives before mentioned, and the members of the several State Legislatures, and all executive and judicial officers, both of the United States and of the several States, shall be bound by oath or affirmation to support this Constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII. The ratification of the conventions of nine States shall be sufficient for the establishment of this Constitution between the States so ratifying the same.

Done in convention, by the unanimous consent of the States present, the seventeenth day of September, in the year of our Lord one thousand seven hundred and eighty-seven, and of the independence of the United States of America the twelfth. In witness whereof we have hereunto subscribed our names.

AMENDMENTS.*

ARTICLE I. Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the Government for redress of grievances.

ARTICLE II. A well-regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed.

ARTICLE III. No soldier shall, in time of peace, be quar-

* Articles I. to X., inclusive, were proposed by the First Congress in 1789-90, Article XI. in 1793, Article XII. in 1803, Article XIII. in 1865, Article XIV. in 1868, and Article XV. in 1870.

tered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law.

ARTICLE IV. The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated; and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched and the persons or things to be seized.

ARTICLE V. No person shall be held to answer for a capital or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war and public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb, nor shall be compelled in any criminal case to be a witness against himself; nor to be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

ARTICLE VI. In all criminal prosecutions the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ARTICLE VII. In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

ARTICLE VIII. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishment inflicted.

ARTICLE IX. The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

ARTICLE X. The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

ARTICLE XI. The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state.

ARTICLE XII. The electors shall meet in their respective States and vote by ballot for President and Vice-President, one of whom at least shall not be an inhabitant of the same State with themselves. They shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President; and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit, sealed, to the seat of the Government of the United States, directed to the president of the Senate. The president of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted; the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President shall be the Vice-President, if such number be a majority of the whole number of electors appointed; and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

ARTICLE XIII., Sec. 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

Sec. 2. Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XIV., Sec. 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

Sec. 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male inhabitants of such State being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

Sec. 3. No person shall be a Senator or Representative in Congress, or elector of President and Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath as a member of Congress, or as an officer of the United States, or as a member of any State Legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each house, remove such disability.

Sec. 4. The validity of the public debt of the United States authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

Sec. 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

ARTICLE XV., Sec. 1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude.

Sec. 2. The Congress shall have power to enforce this article by appropriate legislation.

See CONSTITUTION.

Constitutions of Clarendon: See CLARENDON.

Construction [from Lat. *construc'tio*; *con*, together + *stru'ere*, build]: the act of building; fabrication; structure; the mode of putting together the parts of a building or system. In grammar, it signifies syntax, or the arrangement and connection of words in a sentence; their meaning or interpretation. In architecture and engineering, construction is that branch of the science which relates to the practical execution of the works required to realize the artist's design; it is immediately connected with the distribution of the different forces, the strains of the parts and materials of a building, and the properties of the various materials used.

Construction (in law): See INTERPRETATION.

Consubstantiation [from Lat. *con*, together, like + *substan'tia*, being, substance]: the transformation, transition, or union of substances originally distinct into a common substance—substantial conjunction; a term used in antithesis to TRANSUBSTANTIATION (*q. v.*), which means the transition of one substance into another, either by transmutation or by annihilation and substitution—one substance *in*

place of two; while consubstantiation results in one substance *out of* two. The term consubstantiation has been used in the controversies on the REAL PRESENCE (*q. v.*), the mode of the presence of the body and blood of Christ in the EUCHARIST (*q. v.*). The theories of presence may be thus classified:

I. SUBJECTIVE: 1. Natural—Zwingli.

2. Supernatural—Calvin.

II. OBJECTIVE: 1. *Monistic*; *one* substance only really present; the body and blood: Roman Catholic *transubstantiation.*

2. *Dualistic*; the two substances really present—bread and wine, body and blood.

a. Substantial conjunction of the two—consubstantiation, IMPANATION (*q. v.*), as held by John of Paris and Rupert; falsely charged on the Lutheran Church.

b. Sacramental conjunction—mystical mediating relation of the natural (bread and wine) to the supernatural (body and blood), each unchanged in its substance, and without substantial conjunction; the *Lutheran* view.

This tabular view at once accounts for the fact that the charge of holding this doctrine has been so commonly made against the Lutheran Church, and shows how groundless the charge is. (See Krauth's *Conservative Reformation*, 757–775.) The same charge, with an equal want of accuracy, has been made against Dr. Pusey and his school.

Consul [Lat., of uncertain etymology, but most probable is derivation from a subst. **cōnsā*, corporation: Goth. *hansa*, Mod. Germ. *Hanse.* Other attempts at explanation connect it with *consu'lere*, or with *con* + *sede're*]: the supreme magistrate of ancient Rome after the expulsion of the kings. The number was two, and the period of office one year, but there was no restriction as to the number of times the same individual might be elected, although a certain interval was at length required before again holding the office. Consuls were the supreme executive officers, but had no legislative authority. They were originally chosen only from the patricians, but afterward from the plebeians also. The age required by law was forty-three years, but besides this it was requisite to have passed through the inferior offices of quæstor, ædile, and prætor. They were elected at the *comitia centuriata* some months before their entrance into office, which took place at different periods of the year at different times, but finally in January. During the interval they were termed *consules designati*, or "consuls elect." Soon after the entrance into office they cast lots for the provinces to fall to the share of each, the superintendence of which was conferred on them by the senate. Under the emperors the nominal office of the consulate was preserved, but its substantial power destroyed; the elections became mere forms, the emperor appointing whom he pleased. Then, too, the custom was introduced of having several sets of consuls in one year; those admitted on the first day gave their name to the year, and were distinguished from the others, who were termed *suffecti* (substituted), by the title *ordinarii* (regular). Persons also were sometimes dignified with the title without enjoying the office, and were then styled *honorary consuls.* Under Justinian the year ceased to be called by the name of the consul.

Consuls in French history were the persons to whom, after the dissolution of the Directory in Nov., 1799, was intrusted the provisional government of the country. According to the constitution thus framed, Bonaparte, Cambacérès, and Lebrun, called first, second, and third consuls, were elected at the same time by the conservative senate, each for ten years, and invested with different degrees of authority. But the senate having passed various decrees which curtailed the powers of the second and third consuls, and augmented those of the first, the government was gradually assimilated to a monarchy, and after the lapse of four years and a half an easy transition was made from the consular to the imperial form; the title of emperor was substituted for that of consul, and the exercise of the sovereign authority was delegated exclusively to Napoleon Bonaparte.

Consuls: agents clothed with no diplomatic or political power, residing in a certain district in order to protect the interests, chiefly commercial, of the country which commissions them. Their special duties are determined by their own government, and they receive a permission to perform their duties from the foreign authorities. This is called an *exequatur*, and may be withdrawn for reasons judged sufficient by the same authorities. Consuls have no exterritoriality unless by special treaty, but are subject to the laws of the country where they reside. A gross insult to the consular flag would be a ground of complaint, and so an insult to the consul's person might be resented as an insult to his country, but in general, and where his representative character is not attacked, he is like other men in his privileges. He may engage in business; he need not be the subject of the country commissioning him; he may even be a citizen of the state in which he serves. This will all be determined by the laws of each country for itself.

The office of consul bears some analogy to that of the *proxenus* in Greek states, whose business it was to aid the citizens and pay attention to the envoys of the city which appointed them. They were, however, always citizens of the place where they acted as *proxeni*, and the office, which was an extension of the relation between host and guest, remained in the same family. But the true origin of the consul, in the modern acceptation of the word, is to be traced to the times when commerce began to be active in the Middle Ages. The merchants of the cities on the Mediterranean had already officers who were called by this name, and who settled disputes that arose in the course of business. It was a short step, when bodies of merchants from the same place went for business purposes to the eastern parts of the Mediterranean, that a consul should go out with them or should be sent to live among them, invested with similar powers.

Besides judging the disputes of their countrymen, their residences and warehouses, having an exterritorial character, served as places of safe deposit for their fellow-citizens' goods during the frequent wars. But as resident ambassadors became common, the exterritorial privileges of consuls were largely withdrawn, and their importance declined, except in certain semi-civilized states.

Modern consuls are divided into classes, differing somewhat in different states. There are consuls-general and consuls, vice-consuls and deputy-consuls, consular and commercial agents. The first have in charge the consular service in an entire country. They may unite a diplomatic with the consular character. Consuls will usually report through their consul-general, though not really dependent upon him. A vice-consul will fill the consul's place during his absences. He is usually nominated by him, while in the U. S. consuls are appointed by the President and confirmed by the Senate. By the usage of the U. S. commercial and consular agents are distinguished according to their uses, the former being rather agents of the executive, sent abroad for special purposes, and needing no *exequatur*. The classes of consuls employed by the U. S. and their duties are fully described in the *United States Consular Regulations*, and in a handbook for the use of consuls in the U. S., 1870.

Duties of Consuls.—These depend upon treaty, usage, and statute. In general they relate to the issuing of passports; the authentication of documents; the care of their countrymen's property, particularly in case of death or shipwreck; the certification of births, marriages, and deaths; the arbitration (voluntary) of disputes, as between master and crew; the relief of destitute seamen; the control of their country's shipping; an examination of their country's trade, with suggestions for its increase; in fine, a general care over the rights and interests of their countrymen, so far as they lie within their districts, to secure their just treatment by the foreign government. One provision of U. S. law may be mentioned. By the act of June 22, 1860, all marriages in the presence of any consular officer in a foreign country, between persons who would be authorized to marry if residing in the District of Columbia, shall have the same validity as if the marriage had been solemnized in the U. S. The officer is directed to give to each of the parties a certificate of marriage, stating their names, ages, places of birth, and residence, and to forward a duplicate to the department of State at Washington.

Exterritorial Rights of Consuls in Oriental Countries.—These depend solely upon treaty stipulations, and are not reciprocal. They are based upon the belief that in the laws and judicial procedure of certain countries resident foreigners can not find a guaranty for the protection of person and property. If such a country comes under the control of another state which *can* give such guaranty, as when Algiers became French territory, these privileges disappear. The same should be true when a country like Japan by its change of law and growth in civilization can secure to the resident foreigner protection and justice.

Since resident foreigners in such countries are exempt from the native law, and since they must be under some law, jurisdiction over them is granted by treaty and statute to their diplomatic and consular officers sitting as judges in

consular courts. The system of the U. S. is a fair illustration.

Under U. S. statutes of Aug. 11, 1848, and June 22, 1850, jurisdiction is granted diplomatic and consular officers, where authorized by treaty, to be exercised in conformity "with the laws of the U. S.; with the common law, including equity and admiralty"; and with certain diplomatic regulations. The consuls have exclusive jurisdiction in minor criminal cases, and in civil cases involving $500 or under. Appeal may be taken to the minister resident, and to the circuit court in California. In capital cases the consul summons four associates, his countrymen, to sit with him; their verdict must be approved by the minister to secure conviction. The question of how cases between citizens of the U. S. and natives shall be tried is settled in Art. IV. of the treaty of 1857 between Japan and the U. S., which provides that citizens of the U. S. committing offenses in Japan shall be tried by the U. S. consul-general or consul, and shall be punished according to U. S. laws. Japanese committing offenses against citizens of the U. S. shall be tried by the Japanese authorities, and punished according to Japanese laws. Thus the case is tried in the court of the defendant. Where the parties to a suit are a U. S. citizen and a foreigner, the case is tried in accordance with the special rules existing between the U. S. and the state to which that foreigner belongs.

Much complaint has been made of this system of consular jurisdiction, and amendments to it suggested. The mixed courts in Egypt, consisting of two bodies, their members both natives and foreigners, present another and different example of exterritorial judicial privileges.

Foreign Consuls in the U. S.—The U. S. Circuit and Supreme Courts have original jurisdiction in all cases affecting foreign consuls, who may, however, enter State courts as plaintiffs, but with the right of appeal to the U. S. court at any stage of the case. They may also defend the property rights of their countrymen before U. S. courts. Foreign consuls are not excused from the duty of acting as witnesses before U. S. courts, except under treaty, and it is not the policy of the U. S. to grant such exemption.

Revised by T. S. Woolsey.

Consumers' Co-operation: See Co-operation.

Consumption [from Lat. *consum'ptio*, the wearing away; *con*, altogether + *su'mere*, take]: the popular name for tuberculosis of the lungs or *phthisis pulmonalis*. This disease, which carries off one in every seven human beings, though studied with the greatest attention and care from the earliest days of scientific medicine, was little understood until the present century, and served as the occasion of the most active controversies and as the basis of conflicting schools of pathology until the most recent years. The general manifestations of the disease, its clinical aspects, had been well enough studied, but of the nature of changes in the lungs nothing but the most vague and erroneous ideas had been formed, until in 1794 Baillie called attention to the little nodules in the lungs, formations which are now called tubercles. Closely following this observer, Boyle (1810) still further described these nodules, though perhaps not with as much accuracy as his predecessor, and after these pioneers many others investigated the disease from the same standpoint of structural changes. The results achieved were, however, far short of the meed of the labor, and, with the exception of Laennec, who was in these studies led to found the science of physical diagnosis (see Auscultation and Percussion), few of the observers added much to lasting knowledge. The error of this early pathology lay in the confusing and inaccurate nomenclature, and in ascribing to one of the more or less unessential elements in the structural changes (the cheesy necrosis of the tubercles) the principal *rôle* in the disease. Nothing of any moment was now added to our knowledge of phthisis until the introduction of Virchow's cellular pathology. This investigator finally described the minute structure of the small nodule or tubercle which forms the essential element in the morbid anatomy of the disease, and thereby laid the foundation on which rest all of our present conceptions. The problem of phthisis seemed now to be solved, but there yet remained the more important question of the cause, and this, too, has at length been determined. The most important contribution to the new science of Bacteriology (*q. v.*) that has thus far been made was unquestionably the demonstration by Koch of the tubercle bacillus. The magnitude of his announcement of necessity called forth the liveliest opposition, but Koch's investigations have now been so often repeated, and with such uniformly convincing results, that it may be stated absolutely that the bacillus is not alone the accompaniment but also the cause of the disease. With this knowledge much may be hoped and expected in the way of prevention and of cure; without it aims in this direction must have remained as before, uncertain and empirical. The tubercle bacillus is a minute microscopical organism which occurs abundantly in the expectoration of consumptives, and may gain access to the air by the drying of this and the subsequent dissemination as dust. This fact has been determined not alone by theoretical reasoning, but by actual observation by Cornet, who found the bacilli abundant in the air of hospital wards in which lay cases of phthisis; more sparingly in other wards, and least of all in rooms to which consumptives had no access. The obvious lesson taught by this observation is that in cases of phthisis every precaution should be taken to insure the destruction of the bacilli in the sputum, and, above all, to prevent the drying of this upon carpets, floors, etc., whence the germs are readily spread through the air. Long before the discovery or even suspicion of the existence of the tubercle bacillus, accurate observers had noted cases which seemed to prove direct contagiousness of tuberculosis, as from husband to wife, parent to child, and the like, but no rational plan of prevention could be formed until the nature of the germ had been made known.

Once introduced into the lungs, the bacillus sets up by its direct action or by operation of poisons generated in its growth the inflammatory changes constituting the disease phthisis. These consist mainly in the formation of small grayish nodules, the tubercles, which show a marked tendency to degenerative change, whereby cheesy masses, formerly considered so essential, result. In the further progress of the case two classes of changes may follow, the unfavorable, when the destruction of tissue advances, with breaking down and liquefaction of the nodules, cavities resulting; or the more favorable, when a capsule of fibrous tissues surrounds the nodule, which itself may or may not become infiltrated with calcareous matter, the result in this case being a more or less complete cessation of the disease.

The symptoms of the disease are very obscure in the early stages, but generally begin with slight cough of a dry, hacking nature, lassitude, and tendency to flushing or fever. Following these come the more pronounced signs: excessive cough with yellowish expectoration; hectic fever, the temperature becoming elevated in the afternoon or evening, and the cheeks presenting the characteristic spots of redness; drenching night-sweats and progressive weakness and wasting. It is this type of disease to which the popular term "decline" has been aptly applied. In the further progress of the case intensification of the above symptoms is noted, and in addition there may be obstinate and debilitating diarrhœa and the much-dreaded hæmorrhages. The latter are due to ulceration of the blood-vessels within the lungs, usually in the walls of cavities. They may be very copious, and death may be directly due to loss of blood, though such a result is comparatively rare. In spite of this most pitiable condition, however, the patient generally continues serene and hopeful, and the mind remarkably clear and active.

The recognition of the disease in its earliest stages is of the utmost importance, and often taxes the most experienced physician. Much may be assumed from the general appearance and previous health of the patient. It is unquestionably true that certain persons are peculiarly liable to tuberculosis, and it is this liability which is transmitted from parent to offspring. The possibility of direct transmission of the disease is still an open question, though the weight of authority inclines to such a belief. Those of tuberculous or scrofulous habit are generally spare, long limbed, with narrow chests, large joints, dark hair and eyes, sallow complexion, and a tendency to bronchitis on slight exposure. In such persons, and to a less degree in others, any unusual fatigue, illness or exposure may so depress the general vitality that infection is apt to occur, the immediate cause of the disease in all cases being entrance of the specific organism. Besides these there is a variety of other conditions which predispose to the disease. Thus it was found by Bowditch and others that phthisis is apt to prevail where the air and soil are charged with moisture, as in houses densely shaded by trees or the like. Climate and race are likewise of importance. In America the Negro is especially prone, probably owing to various causes: bad hygiene, improper food, as well as special liability. Particular occupations predispose, especially such as occasion constant in-

halation of small particles, as of iron in steel grinders, coal in miners, clay in potters, etc. Finally, phthisis is a not uncommon sequel of certain debilitating diseases in which there is generally also bronchitis, such as measles, whooping cough, and typhoid fever.

The treatment of consumption is of greatest importance in the first stages, before serious and unremediable destruction has occurred, and it is of vital importance to recognize the earliest symptoms. Of far greater import and promise, however, is the prevention of the disease. Those of scrofulous habit or of tuberculous parentage must at all times guard against unnecessary exposure or fatigue; they should follow a regular plan of life, in work, diet, recreation, sleep, and exercise, and should, above all, use the greatest care in preventing attacks of bronchitis, and in caring for such when they do occur. Regulated and especially pulmonary exercise will in many cases serve to develop a body far from healthy to a fair state of tolerance of exposure, and doubtless if generally observed would reduce the number of cases very materially. Once the actual onset of the disease is noted the treatment must be active, for recent observation would indicate that much may be hoped for in the early stages, whereas it is well known that little can be done in its subsequent course. The numerous observations at autopsies of localized and healed tubercular lesions at the summit of the lung, where the process generally begins, are convincing proof of the curability of the disease had we but the power of recognizing the very earliest manifestations. In these early cases no treatment compares with the hygienic and climatic. (See CLIMATE.) In the selection of a climate adapted to a particular case many elements enter into consideration. Thus the stage of the disease; its evident character, whether slow or rapid, with much or little cough and expectoration; the condition of the general health, of the heart, the nervous system, etc., all must be carefully weighed, and, above all, care must be had that the patient is not hastily sent away to strange places, among strange people, utterly alone, a prey to all manner of fears and depressing mental conditions. The cool, dry, and bracing air of Colorado may serve one, the more equable climate of Southern California another, while a third is best suited in the dry regions of New Mexico. The advantages of such warm, moist climates as Florida are palliative rather than curative, and serve the purpose of rendering the last days of life as painless as possible, by checking excessive cough or restlessness and the like.

Of the drug treatment very little need be said. Tonics, such as cod-liver oil, iron, and whisky or brandy; remedies to reduce excessive cough and favor expectoration; others to prevent the debilitating sweats and diarrhœa, with any other medication that may be called for by the various symptoms of different cases, form the most important part of the treatment by drugs.

A recent plan of treatment, suggested by Koch, the discoverer of the bacillus, consists in the injection of dilute solutions of a glycerin extract of the bacillus itself. This plan of treatment has been extensively used, but offers no hope in its present method of application, and is not free from the danger of causing a rapid dissemination of the tubercular disease throughout the body; that is, general tuberculosis. In certain forms of external tuberculosis affecting the skin, bones, and joints, some good seems to have been achieved. There is still much to learn regarding the action of products of the growth of the bacillus, and there is great reason to expect much from protective inoculation.

WILLIAM PEPPER.

Contagion [from Lat. *contā'gio*; *con*, together + a form of root *tag-*; cf. *tan'gere*, touch, *taxa're*, attack, *contāmina're*, *tactus*, etc.]: the communication of disease from one person or brute to another by contact, direct or indirect. See EPIDEMIC, INFECTIOUS DISEASES, and BACTERIOLOGY.

Contarini, kōn-tăă-ree'nĕĕ: the name of a noble family of Venice that produced numerous doges, senators, generals, artists, and authors. The most famous were—AMBROGIO, a senator, who was sent as ambassador to the King of Persia in 1473. He returned in 1477, and published in 1487 a curious account of his mission and travels.—ANDREA, elected doge in 1367. He gained in 1380 an important victory over the Genoese, and saved Venice from imminent danger. Died in 1382.—DOMENICO, elected doge in 1659; waged war against the Turks, who took Candia in 1667 after a famous siege. Died in 1674.—GASPARO, a cardinal and writer; was born at Venice in 1483. He was sent as ambassador to the court of Charles V., and was papal legate at the Diet of Ratisbon in 1541. Died in 1542.

Contempt [from Lat. *contemptus*, indifference; deriv. of *contem'nere contemptus*, despise]: in law, a willful disregard or disobedience of a public authority.

Contempt of Legislature.—By the Constitution of the U. S. each house of Congress may punish its members for disorderly behavior, and with the concurrence of two-thirds expel a member. The power to punish for contempt is also possessed by either house of Congress, as incidental to the complete exercise of the authority granted by the Constitution, and extends to strangers or persons who are not members. This power of punishing for contempt must be exercised during the session of Congress, and the punishment itself can not extend beyond the existence of the Congress. The power of the British Parliament to punish for contempt rests upon principles peculiar to it, and not upon any general rule applicable to all legislative bodies. Before its separation into two houses Parliament was a high court of judicature, and possessed of the general power incident to such a court of punishing for contempt. After its separation into two houses, both the House of Lords and the House of Commons retained the power of punishing for contempt, as each was regarded as a court of judicature. In the U. S. neither house of Congress ever constituted a part of any court of general jurisdiction. The power of either house must be found in some express grant in the Constitution, or be found necessary to carry into effect such powers as are therein granted; so that the power of either house of Congress to punish for contempt can exist in no case when the house attempting to exercise it invokes its aid in a matter to which its authority does not extend. The power of punishing for contempt does not under any circumstances belong to inferior legislative bodies, such as the common councils of cities.

Contempt of Court.—Courts of justice have an inherent power to punish all persons for contempt of their rules and orders, for disobedience of process, and for disturbing them in their proceedings. Disobedience of the order of a court which had no jurisdiction is not a contempt. A court will of its own motion notice and summarily punish a contempt committed in its presence, but contempts not so committed must be usually brought before it by affidavits, and the offender is ordered to show cause why an attachment should not issue against him, or a rule is made directing him to appear and answer. He has no right in such cases to a trial by jury. The penalty for contempt is usually fine or imprisonment. All courts of record possess the power to punish for contempt. In Great Britain and in some of the U. S. justices of the peace can punish summarily contempt committed in their presence, while in other States they can only bind the offender over and compel him to find sureties for his good behavior.

When a person is regularly adjudged to be in contempt he can not be discharged by another court or judge on a writ of *habeas corpus*. In some of the U. S. the law of contempt is carefully regulated by statute.

HENRY WADE ROGERS.

Conti, kōn'tee', ARMAND DE BOURBON, Prince de: b. in Paris in 1629; brother of the great Prince of Condé and a son of Henry II., Prince de Condé, and Charlotte of Montmorency. He studied at the Sorbonne, being designed for the Church, but did not take orders. In the civil war of the Fronde he commanded a royalist army against the Prince of Condé. He married a niece of Cardinal Mazarin. He wrote several tracts, one of which was directed against stage plays. D. in 1666.

Conti, FRANÇOIS LOUIS DE BOURBON, Prince de: French general; son of the preceding; b. in Paris in 1664. He had so high a reputation for valor and other popular qualities that he was chosen King of Poland by a large party in 1697, but Augustus of Saxony obtained the throne. He served with distinction at Steenkerke in 1698, and received the command of an army in Flanders in 1709, but died Feb. 22 of the same year. According to Saint-Simon he was the "idol of the soldiers and the hero of the officers." See Saint-Simon, *Mémoires*.

Contiguity, Law of: See ASSOCIATION OF IDEAS.

Continent [from Lat. *continens*, continuous, uninterrupted, continent (sc. *terra*); *con*, together + *tene're*, hold]: a natural division of land larger than an island. Modern usage recognizes four continents—Eurasia, Africa, North

America, and South America—and is divided as regards Australia, which is variously styled a continent and a continental island. The title Antarctic Continent is sometimes given to a great body of land supposed to occupy the south polar region. Formerly Europe and Asia were accounted as two continents.

Each of the Americas is characterized by a lofty mountainous belt along its western border and by great plains extending thence with little interruption to its eastern coast. Each is also somewhat triangular in outline, with an angle toward the S. These resemblances have led to much search for homologies in the configuration of continents, but without valuable result. More fruitful inquiries have been prosecuted by the aid of the plummet and dredge in oceanic depths, which are the complement of continental heights. It is found that the gentler slopes of continental surfaces are continued under water about many coasts, constituting shoals, and that from the edges of these shoals or "continental shelves" there is rapid descent to depths much greater. It is found, moreover, that the detritus carried from the land by rivers covers the ocean bottom only near coasts, that the sediments of the deeper parts of the ocean are of an entirely different character (see Ocean), and that the upraised sediments studied by geologists are of the coastal and not of the pelagic type. From these facts it is inferred that the continental plateaus of the earth, including the continents and continental shelves, have had their present positions and extent from the remotest geologic times, and that the ocean depths are equally permanent. If this view is correct, the complex series of changes in the distribution of land and water demonstrated by geologic phenomena have been restricted to the continental plateaus, and the geologic record of earth's history is less fragmentary than has been supposed. See the article Geology, and also the contour map of land height and ocean depth illustrating the article Earth.

The following tables of continental dimensions and drainage areas are based on estimates by Murray (*Scottish Geog. Mag.*, vols. ii. and iv.). In the tables Eurasia includes the British, Baltic, and Mediterranean islands, and Ceylon; North America includes Newfoundland, the Aleutian islands, and the Arctic islands W. of Greenland; and South America includes Terra del Fuego and the Falkland islands:

TABLE OF CONTINENTAL HEIGHTS.

CONTINENT.	PERCENTAGE OF AREA—			Mean height, in feet.
	Below 3,000 feet.	Between 3,000 and 12,000 feet.	Above 12,000 feet.	
Eurasia	67·8	27·3	4·9	2,450
Africa	75·2	24·6	0·2	1,750
North America	77·8	21·8	0·4	1,650
South America	83·4	12·1	4·5	1,850
Australia	98·1	1·9	...	700

TABLE OF CONTINENTAL DRAINAGE DISTRICTS.

DRAINAGE DISTRICTS.	AREAS OF DRAINAGE DISTRICTS, IN THOUSANDS OF SQUARE MILES.				
	Eurasia.	Africa.	North America.	South America.	Australia.

G. K. Gilbert.

Continental [originally used in the U. S. in contradistinction to *provincial*; belonging to the whole North American continent, and not to any one province or colony]: an epithet applied to the money and troops of the revolting colonies during the Revolutionary war. It was introduced in the early part of that contest by the colonists to distinguish their own forces from those of the British Government. The latter were called "ministerial forces," being under the control of the British ministry. The "Continental Congress" was the Congress of the colonies, and after the Declaration of Independence it was the Congress of the U. S. previous to 1788, when the Constitution came into force. It had only one house.

Continental System: Napoleon's policy of excluding from the continent of Europe goods borne in British vessels or in neutral vessels that had touched at British ports. His first attempt to establish this system was by the Berlin decree, Nov. 21, 1806, which prohibited all European countries allied with France from carrying on commerce with Great Britain, or admitting any merchandise that had been produced either in Great Britain or in her colonies. Great Britain retaliated by the Orders in Council of Jan. 7 and Nov. 11, 1807, declaring all harbors and places of France, her colonies and allies, in a state of a blockade; whereupon Napoleon issued a decree at Milan, Dec. 17, 1807, and another at the Tuileries, Jan. 11, 1808, carrying the system a step further. Any ship submitting to search by a British vessel, or sent on a voyage to Great Britain, or paying a duty to the British Government, was declared to be a lawful prize of war. Finally, at Trianon, Aug. 3, 1810, and Fontainebleau, Oct. 18, 1810, the policy was completed, and it was ordered that all British goods when captured should be burned. At the Peace of Tilsit in 1807 the Czar agreed to close the Russian ports. Thus almost the entire continental coast was in a state of blockade, which, though only partially effective, was still sufficient to cause a general depression of trade, and to exasperate the people with Napoleon's rule, especially in Germany. In the large trading centers merchants were subjected to a most galling system of espionage, and their goods were liable at any moment to be seized on suspicion. The policy was not only unjust and oppressive, it was a serious mistake. Russia's abandonment of the system in 1810 was the chief cause of the war between her and France. The war of 1812 between Great Britain and the U. S. was due largely to the former's attempt to enforce her retaliatory Orders in Council. F. M. Colby.

Continued Fraction: one whose numerator is an integer, and whose denominator is an integer plus a fraction repeated in the same way. Thus in the continued fraction

$$3 + \cfrac{1}{7 + \cfrac{1}{15 + \cfrac{1}{1 + \cfrac{1}{25 + \cfrac{1}{1 + \cfrac{1}{7\frac{1}{4}}}}}}}$$

the whole number 3 is followed by a fraction of which the numerator is 1, and the denominator is 7 plus another fraction whose numerator is 1, and whose denominator is 15 plus another fraction, etc.

To convert a proper fraction into a continued fraction, divide the denominator by the numerator, and make of the mixed-number quotient a new denominator to the numerator, 1. Proceed in like manner with the fractional part of this new denominator, and so continue as long as the division leaves a remainder, or as is necessary for the object in view. If the given fractional number is, as in the foregoing case, an improper fraction, it must first be reduced to a mixed number, after which the above rule applies to the fractional part.

Revised by S. Newcomb.

Continuity, Law of: a principle of considerable use in investigating the laws of motion and of change in general, and which may be thus enunciated: *Nothing passes from one state to another without passing through all the intermediate states.* Leibnitz claims the merit of having first made known this law; but, in so far as motion at least is concerned, it is distinctly laid down by Galileo, and ascribed by him to Plato. But, though a perception of its truth seems to have been felt long before, Leibnitz was certainly the first who applied the principle to test the consistency of theories or supposed laws of nature. The argument on which he attempted to establish it *a priori* is that, if any change were to happen without the intervention of time, the thing changed must be in two different conditions at one and the same instant, which is obviously impossible. A remarkable application of the law of continuity was made by John Bernoulli in an *Essay on the Laws and Communication of Motion*, which gained the prize of the Academy of Sciences in Paris (1724), to prove that perfectly hard bodies can not exist, because in the collision of such bodies a finite change of motion must take place in an instant—an event which, by the law now explained, is impossible. This conclusion was objected to by D'Alembert and Maclaurin,

who, on account of it, were disposed to reject the law of continuity altogether; but the difficulty is got over by supposing (which on various grounds is extremely probable) that there is no real contact, and that bodies begin to act on each other when their surfaces, or what seem to be their surfaces, are yet at a distance.

Continuity, Principle of (in mathematics): See PROJECTION.

Continuous Voyages: in international law, voyages by vessels carrying contraband of war or goods intended for a blockaded port, deemed completed though such vessels may have stopped short of the port at which discharge of cargo would be considered unlawful, and transshipped the goods at that point. (See CONTRABAND.) This doctrine was invented by the famous British judge of admiralty, Sir William Scott, to check evasions of the rule of 1756. (See COLONIAL SYSTEM.) When the direct carrying trade between colony and mother country, of a state at war with Great Britain, was forbidden the neutral shipowner, because such trade was opened to him in war time only, he at once began to sail from the colony to one of his own ports and then to the mother country. These considered apart as two voyages were lawful, but the new doctrine pronounced them one continuous voyage, and therefore subject to the provisions of the rule of 1756. The test was this. Has a cargo of goods from a certain colony been added by genuine sale to the common stock in trade of the country, or has it been put through the forms of entry and sale without removing the ultimate intention of transport and delivery at a port of the parent state? Has a link been added to the chain without altering its direction? This question of the intent governing an importation was an exceedingly difficult one, and the decisions of the admiralty courts gave rise to much complaint. The U. S. accepted neither the rule of 1756 nor the doctrine of continuous voyages, but its protests at the time were without result. An explanation of this doctrine would be hardly worth while here but for its new application by U. S. courts during the civil war, 1861–65. It was notorious that a brisk trade had sprung up both at Nassau and at Matamoras, for the purpose of putting goods, contraband and otherwise, into Confederate hands. The main object was to bring goods as near their real ultimate destination as might be, without risk, by sailing for a neutral port. Here the U. S. courts interfered, asking, are these goods to be sold in open market at Nassau or Matamoras, or are they not rather imported with the intent of immediate re-exportation to a Southern port under blockade, which would constitute one continuous voyage? Here again the question of intent was difficult, to be inferred from a dozen different circumstances, the character of the ship's papers, the bills of lading of the cargo, its nature and adaptation to warlike use, and so on. In the case of the Springbok (Blatch. Pr. Ca., 380, 434, and 5 Wall. 1) the ship and cargo were condemned by the district court, the ship released, but the confiscation of the cargo reaffirmed on appeal to the Supreme Court by a bare majority. She was captured 150 miles from Nassau, and the goods plainly intended for the Confederate service formed less than a hundredth part of her cargo. This decision was severely criticized by all the publicists of Europe. But the claims commission under the treaty of Washington decided that no award for damages was due on account of it. During the Crimean war a neutral ship, the Vrow Houwina, loaded with saltpeter, sailed from Lisbon to Hamburg, a neutral port. She was seized on suspicion of carrying contraband, and condemned by an English court on the ground that Hamburg, fully supplied with saltpeter as it was, was not the ultimate destination of the cargo, but that the intention of conveying it overland to Russia was clearly attached to it and must infect it. This was a new application of the doctrine of continuous voyages to prevent evasions of the war right of a belligerent to capture contraband destined for his enemy. So during the civil war in the U. S. goods, in themselves contraband, bound for Matamoras, a Mexican town on the Rio Grande river, and opposite the Texan city of Brownsville, were similarly condemned as being really destined by land carriage for a Confederate point.

In conclusion, it may be said that the doctrine of continuous voyages in the hands of a belligerent, always tempted to stretch his rights of capture, is a dangerous one; that it is based upon a question of intent in importation which is apt to be inferred on insufficient grounds; and that it is contrary to the greater liberty which is and should be given to neutral trade by the policy of the present age. THEODORE S. WOOLSEY.

Contours: lines traced on the surface of the earth at uniform elevations above the mean ocean-level. A contour map showing a number of these lines gives a better absolute idea of the surface of the ground than any other method of representation on a plane. These maps are made for earthwork estimates, railroad surveys, sewerage plans, as well as for the general purposes of topographical representation. Contours are located in the field by a combination of the methods of LEVELING (*q. v.*) and SURVEYING (*q. v.*). M. M.

Cou'traband [from Ital. *contrabbando*, prohibited, illegal, whence also Fr. *contrebande*; Ital. *contra*, against + *bando*, edict: Fr. *ban*, a Germ. loan-word; cf. Engl. *ban*, Germ. *bann*]: in commercial language, goods exported from or imported into a country against its laws. *Contraband of war* are such articles as a belligerent has by the law of nations the right of preventing a neutral from furnishing to his enemy. Articles contraband of war are, in general, those which relate directly to the carrying on of war. To make them liable to capture two facts must be proved: (1) their contraband character; (2) a hostile destination. Thus neither spool cotton bound to an enemy's port nor gunpowder destined for a neutral port would be contraband. As to what articles are in themselves contraband there is as yet no general agreement, belligerents striving to stretch their war rights and neutrals desiring their trade to be as unrestricted as possible. It is therefore useful for states to agree upon a list of contraband articles by formal treaty. The U. S. has in force eleven such treaties, but few are with European powers.

Many articles could never be held to be contraband; many others must always be so considered; there remains a third class which are doubtful, being capable of being made contraband by circumstances. Here, for instance, are naval stores unmanufactured, horses, provisions, money, the machinery of ships, and other like articles. If no treaty determines the character of these, it must be decided by the special circumstances of each case. Thus provisions could be held contraband only when destined for a place whose reduction by famine is attempted. This is provided in the treaty of the U. S. with Salvador of 1870. An article formerly innocent may become contraband by being made capable of new uses—e. g. iron plates, which after ironclads came into use could be made into ship's armor. If an article is one of the chief products of a country, as lumber in Sweden, it is less likely to be considered contraband by the courts. As a fair example of articles which are contraband the list in the treaty made with Italy by the U. S. in 1871 is here given.

The following articles, and no others, shall be considered as contraband:

1. Cannons, mortars, howitzers, swivels, blunderbusses, muskets, fusees, rifles, carbines, pistols, pikes, swords, sabers, lances, spears, halberds, bombs, grenades, powder, matches, balls, and all other things belonging to, and expressly manufactured for, the use of these arms.

2. Infantry belts, implements of war and defensive weapons, clothes cut or made up in a military form and for a military use.

3. Cavalry belts, war saddles, and holsters.

4. And generally all kinds of arms and instruments of iron, steel, brass, and copper, or any other materials, manufactured, prepared, and formed expressly to make war by sea or land.

Ships made ready for war are not here specifically mentioned, though contraband in the highest degree. Of course, the same ship with a man-of-war's crew on board becomes not an article of commerce, but an armed expedition, and the state permitting the equipment would be held responsible for its acts.

The neutral state is not bound to prevent its subjects from trading in contraband articles. The burden of prevention lies on the shoulders of the belligerent who would suffer. Thus the Winchester Arms Company, of New Haven, Conn., supplied Turkey with rifles in the war with Russia, subject to capture on the way by Russian cruisers. Moreover, a belligerent merchantman may buy war material at a neutral port lawfully, as the Chilian steamer Itata did off the harbor of San Diego in 1891. The penalty for carrying contraband is confiscation of the goods first, but also of the ship if under the same ownership. Goods not contraband are not infected unless collusion or fraud is shown connecting them with the transaction. This penalty may attach at the outset of the voyage, if the ship's papers or the ab-

sence of them or other suspicious circumstance may warrant. And the doctrine of continuous voyages may be applied, so that a nominal neutral destination does not shelter goods. In the case of the Vrow Houwina during the Crimean war, the cargo of saltpeter was confiscated, though bound for Hamburg, a neutral port, since eventual transport overland to Russia was inferred by the court. See CONTINUOUS VOYAGES.

Carrying Dispatches.—These are commonly classed under the head of contraband. By hostile dispatches is not meant the correspondence of a belligerent in the ordinary mails. Mail-bags are sometimes especially exempted from search, as in a treaty between France and Great Britain to govern the Dover and Calais postal service. The same principle was adopted by the U. S. in the latter part of the civil war. But where a neutral ship acts as a dispatch-boat for one belligerent, carrying military orders it may be which might otherwise be prevented, or serving to unite the scattered portions of a fleet, it so identifies itself with that belligerent as to give the other the right to confiscate it.

In this connection may be cited the famous Trent affair of Nov., 1861. The Trent was a neutral mail-steamer sailing between two neutral points. Mason and Slidell, agents of the Confederate Government, though having no recognized diplomatic character, ran the blockade and took passage in her. She was stopped and searched by a U. S. man-of-war, and Messrs. Mason and Slidell were extracted and lodged in a Northern prison. Mr. Seward defended this high-handed act, though asserting that it had not been authorized, under the plea that the Confederate agents were contraband and equivalent to dispatches. Because Capt. Wilkes had released the Trent, thus failing to have her character passed upon by a prize court, Mr. Seward surrendered the prisoners. In fact, the search was lawful, but the arrest unlawful. Persons are not dispatches. The Trent was pursuing her route as a mail-steamer. She was in no sense a dispatch-boat. These persons could not be contraband, having neither a contraband character nor a hostile destination.

Again, if a neutral ship takes on the character of a transport by carrying troops or seamen for either belligerent, it is liable to confiscation.

The class of articles of doubtful character which may or may not be contraband has been mentioned. The right to declare such articles confiscable is called the doctrine of *occasional contraband*. It is a great hardship to the neutral, since he can not certainly know in what he may lawfully trade, and he has never accepted the theory unless through superior force. Thus in the wars with Napoleon when Great Britain made provisions destined for a French port contraband, the U. S., whose trade was largely in breadstuffs, consistently protested, except in one treaty. This has led to a softening of the rigor of the rule called *pre-emption*. This was the purchase at a fixed rate, none too high, of goods of doubtful character instead of their confiscation. If the doctrine of occasional contraband is illegal, pre-emption also falls to the ground, for the one is but a corollary to the other.

Revised by T. S. WOOLSEY.

Contrabands: fugitive Negro slaves received and retained by the Union army during the civil war in the U. S. in 1861–65. The name originated from Gen. Butler. The day after his arrival at Fort Monroe a sally was made into Hampton, and three Negroes held as slaves by Col. Mallory of that place escaped into the Union lines. They were brought before Gen. Butler, who was very much in need of laborers for field-works he was about to construct. When asked what he would do with the runaways, he answered, "Keep them as contrabands."

Con'tract [from Lat. *contrac'tus*, agreement, a drawing together; *con*, together + *tra'here*, *trac'tus*, draw]: an agreement in which a party undertakes to do or not to do a particular thing. Contracts are distinguished according to their form, either as contracts of record, specialties, or simple contracts. Contracts of record are such obligations as are evidenced by judicial records, as, for example, recognizances and judgments. (See these titles severally.) Specialties are contracts under seal, such as deeds, bonds, and covenants. Simple or parol contracts include those agreements which are not comprised within the first two classes, and may be either oral or in writing. As regards the mode of their creation, contracts are further distinguished as express or implied. They are express when stated by the parties thereto consenting in direct and formal terms; implied, when they derive their origin and validity from construction of law, as being of such a nature that reason and justice dictate their fulfillment. Contracts are still differently classified in reference to the time of their performance, as executed and executory. They are said to be executed when the obligations therein created have been already carried out; executory, when their fulfillment is yet to be accomplished. Contracts of every variety include four essential constituent elements: First, there must be competent parties; second, there must be mutual consent to the terms of the agreement; third, there must be a valid consideration, either actual or presumed; and, fourth, there must be a definite and legal subject-matter to be acted upon. As regards the first point, all persons are capable of binding themselves by their contracts except certain important classes of individuals who labor under some natural infirmity, either from want of sufficient age (as infants), or from lack of requisite mental soundness (as idiots and lunatics), or who are placed arbitrarily under disability in consequence of their legal status (as married women). Drunkards, seamen, aliens, and bankrupts are also incapacitated in certain instances. Infancy at law is the condition of persons under the age of twenty-one, though in some States women become of age at eighteen. It is a general principle, though subject to exceptions, in accordance with modern judicial decisions, that an infant's contracts are not void, but voidable; i. e. they may be confirmed or disavowed by him at his option. Disaffirmance, in general, may take place either before majority, or within a reasonable time afterward; confirmation, only after majority. The chief important exception to this rule is an infant's contracts for necessaries, which are considered binding upon him. The term "necessaries" comprises different articles according to the wealth and station of the infant. The validity of these obligations is established for the same reason that others are considered voidable—that the infant's welfare may be insured until he arrives at years of discretion. Moreover, the contract of marriage may be entered into by males at the age of fourteen, and by females at the age of twelve, unless there is some statutory provision to the contrary; but an infant's contract to marry is voidable. Idiots and lunatics are relieved from responsibility for their contracts, because they are incapable of understanding the nature of the promises they make, and of giving a valid assent. But it is likewise true of them, as of infants, that contracts for necessaries suitable to their station, if entered into with other parties who act in good faith, are obligatory. Insane persons may also have lucid intervals, and would be liable for agreements made under such circumstances. Temporary mental weakness resulting from intoxication will relieve from liability when it is sufficient in degree to preclude reasonable action. Mere mental feebleness, however originating, which is not so excessive as to prevent a comprehension of the nature of a contract, will be no ground of exemption unless a person affected by it is led into a contract by imposition. Married women, at common law, are placed under an almost entire inability to contract. Their legal existence is deemed to be merged in that of their husbands. In some instances they have power to bind their husbands, as when they act as agents or make engagements for necessaries which their husbands refuse to supply; but agreements of this kind are not their own personal obligations. Courts of equity and recent statutory provisions have considerably extended the powers of married women to enter into engagements which will be binding upon their property, and the tendency of modern legislation is to give married women the same power to contract that single women have. This result in equity has been accomplished through the medium of trusts. The incapacity of aliens extends mainly to their ability to acquire a valid title to real estate, and in some States has been removed. Seamen are relieved, in certain instances, from their stipulations, to protect them from the consequences of their own improvidence; while the engagements of bankrupts are in some instances nullified to prevent injury to their creditors. Persons who are forced into contracts by duress, either through imprisonment or reasonable fear of injury to life or limb, or by abuse of legal process, are excused from their fulfillment.

As regards the nature of the obligations which they assume, parties to contracts may act either severally or jointly, or jointly and severally. When any joint liability exists, as in the last two instances, and one of the parties discharges it by paying more than his share of the indebtedness, he may, under the notion of an implied contract,

recover from the others their just proportion. This is termed "contribution." It rests on a doctrine of natural justice, and is more completely enforced in a court of equity. The right to enforce agreements against others may also be either several or joint; that is, it may inhere in a single individual or in two or more collectively. No right of this kind, however, can be both joint and several at the same time, and in this respect it differs from the corresponding liability. Parties may also act on their own behalf, or in a representative capacity as agents or partners. For the purpose of making a contract, a corporation, however numerous its members may be, is regarded as a single person. The second element of contracts, assent, is necessarily implied in the term "agreement"—a meeting of minds. Assent must be mutual, and have reference to exactly the same stipulations. There must not only be a proposal, but an acceptance, and if any modification in the terms of the original offer is made by the party by whom it is received no contract is established. The entire concurrence of all the parties concerned is indispensable. Such proposed change would be in itself a new offer which would need acceptance. It is not necessary that a proposal when made should be acceded to at once. An offerer may contemplate a continuance of the offer for a certain definite or understood period, within which assent may be expressed by the offeree and a valid contract created; or an offer to enter into an agreement may be sent to a person at a distance, who must reply by mail. In cases of this kind the contract, according to the prevailing opinion, is deemed to be completely formed from the time when the letter of acceptance is posted, without regard to the fact of its being received.

The element of consideration is that which gives contracts a legal, as distinguished from a moral, validity, for, as a rule, promises are not enforceable in law which do not rest on such a basis. The consideration is the cause of a contract, the return for a stipulation, the price for a promise. It may be something actually rendered, as is requisite in nearly all simple contracts, or its existence may be conclusively presumed, as in negotiable paper which has passed into circulation, and in contracts under seal. The formal execution of the latter dispenses with the requirement of an actual consideration. In the case of negotiable paper, a proper consideration will only be conclusively presumed when it is necessary to protect the interests of innocent purchasers for value into whose hands the paper has passed before maturity. The requisites of a valid consideration are that it shall either be some benefit to the party promising or some disadvantage or injury to the party to whom the promise is made. Considerations are distinguished as good or valuable. The former term is applied to inducements of relationship and natural affection, and is sufficient only in courts of equity; the latter, to some mode of making return which is either directly pecuniary or estimable pecuniary through its probable consequences in occasioning profit or loss. Marriage also is included within this latter designation. A good consideration will only support an executed contract, and then simply between the parties themselves. As illustrations of a valuable consideration may be mentioned the payment of money, the performance of work, the forbearance to sue, the delivery of property, the making of a promise for a promise, and the like. In such cases it is not necessary that the consideration be an equivalent for the agreement made, the adequacy of the consideration is in general unimportant. A moral obligation will constitute no legal consideration for a promise, except in cases where there has been a pre-existing legal obligation which is no longer enforceable in a court of justice, as where a debt has existed, but is barred by lapse of time under the provisions of statutes of limitation; or where some positive rule of law has prevented a legal obligation from arising, the effect of which rule has now ceased. If a consideration be illegal or impossible, the contract founded upon it will, in consequence, be rendered nugatory. Considerations are also distinguished, as regards the time of their fulfillment, as executed, executory, and concurrent. They are said to be executed when performed before the promise founded upon them is made, and are insufficient to support such promise unless they grew out of a previous request, express or implied, since the agreement can not be the reason of their accomplishment; executory, when they are to be performed in the future; concurrent, when they and the promises based upon them are simultaneous. The last two forms of consideration are sufficient to support all agreements otherwise unobjectionable.

The general principle in regard to the subject-matter of contracts is that parties may enter into agreements of any character they may choose. Certain important exceptions are, however, established on grounds of public policy. Thus the subject-matter must not contemplate any illegal undertaking. Such agreements are necessarily nugatory, and if attempted to be enforced their illegality may be alleged as a valid defense. But when the terms of the parties' stipulations are not thus contravened, it is the object of the courts to arrive at the exact meaning of the language employed as expressing the intentions of the persons contracting, and to enforce all unfulfilled obligations thence resulting. For this purpose certain definite rules of interpretation and construction have been established, which are adapted to remove ambiguities and resolve uncertainties. These are principally applicable to agreements in writing. If the application of these shows a comprehensible agreement, and no defenses alleged prove its invalidity or that its terms have been satisfied either wholly or in part, an adequate remedy will be given for its violation. In courts of law this consists of pecuniary recompense or damages for the injury sustained, while courts of equity, in proper instances, will decree a specific performance of the engagements undertaken.

Certain contracts are required to be in writing, for the better prevention of fraud and convenience in proving their stipulations. This requirement depends upon the so-called "statute of frauds." The principal classes of agreements within its provisions are contracts made upon consideration of marriage, contracts to answer for the debt, default, or wrongful act of another, contracts which are not to be performed within one year, contracts for the sale of any interest in land, and contracts for the sale of personal property of a specified value—usually fifty dollars and upward. In all these cases the agreement, or some memorandum thereof, when written, must also be signed, or in some States subscribed, by the party charged therewith or his agent. In the sale of goods, the delivery by the seller and the acceptance by the purchaser of a portion of the goods will render a reduction of the contract to writing unnecessary.

The remedy upon contracts by action at law is confined by "statutes of limitations" within certain prescribed periods after their maturity. The provisions generally made are that no action can be brought upon a simple contract after the lapse of six years, or upon sealed instruments after twenty years, from the time when they become due. (See LIMITATIONS, STATUTES OF.) Important and difficult questions also arise as to the effect of the laws of different States upon contracts when obligations are assumed in one country and sought to be enforced in any other (for which, see INTERNATIONAL LAW, PRIVATE, and MARRIAGE).

The Constitution of the U. S. provides that "no State shall pass any law impairing the obligation of contracts." Much discussion has arisen upon the effect of this prohibition. It has been decided that it applies as well to executed contracts or grants as to those which are executory. Not only agreements between individuals, but with States, as the charters of corporations, confer privileges which are inviolable, unless there is some prior reservation of a power to make alterations. An exception is, however, established in the case of municipal corporations, which are considered mere instruments of government, and continually subject to legislative authority. Moreover, contracts by which States undertake to resign necessary governmental functions are not generally deemed unchangeable by subsequent legislation, though an exception to this rule has been established in the case of taxation. A deprivation by a State of all remedy to enforce contracts is held to be an impairment of their obligation, and therefore unlawful; this is not true, however, when, on a change of remedies, one that is substantial and sufficiently convenient remains or is supplied.

Reference must be made for different forms of contracts to such topics as AGENCY, BILLS OF EXCHANGE, PARTNERSHIP, SALE, GUARANTY, BAILMENT, SHIPPING, INSURANCE, etc., and for defenses to PAYMENT, ACCORD, AWARD, RELEASE, SET-OFF, RECOUPMENT, USURY, etc. Convenient books of reference are the works of Anson, Pollock, Leake, Hare, Bishop, Parsons, Addison, Chitty, Hilliard, Metcalf, Smith, Story, Pothier, *On Obligations*, Kent's *Commentaries*, and Domat, *On Civil Law*.

T. W. DWIGHT.

Contract, Breach of: in law, the failure to comply with, or a default in the performance of, the conditions of a contract. The breach of a contract by one party where the breach is in a matter which is of the essence of the contract

gives the other party a right to reseind the contraet, bring an aetion for damages, or sue for speeific performance, as the case may be. The only relief obtainable in a court of law is damages as a eompensation for non-performanee; specific performanee ean be enforeed only in special eases, and by resort to a court of equity jurisdiction. See Rescission and Specific Performance. F. Sturges Allen.

Contractility [from Lat. *contra'here*, draw together]: a property by which the partieles of some bodies resume their original position when the force applied to separate them is withdrawn; also the vital property which gives to eertain parts (museles, for example) the power of contraeting, by means of whieh animals perform their motions. Contraetility, in the latter sense, is a property confined to living organisms. It is not peculiar to animals, but is shared by the vegetable kingdom; being, among plants, most apparent, as a rule, in the protophytes, which are microscopic plants of a low grade. Among the lowest forms of animals the whole substance of the organism usually possesses contractility, but in the higher animals this property is, by differentiation, limited more or less completely to the organs called muscles. But such motions as those of cilia are common to both the vegetable and the animal kingdoms; and among animals are common to man as well as to the protozoon. The existence of this important class of motions shows that in no organism is contractility entirely limited to the muscles. Contractility in such cases is quite independent of any will or self-determining power. But at a very low point—if not at the very lowest—in the animal seale we begin to find signs of a self-determining power, or will, residing within the organism, and having a certain degree of control over that contraetile quality of the tissues. Upon the exercise of this control depends the power of voluntary motion. Contraction of a musele may indeed be quite independent of volition or consciousness, as in the beating of the heart and in all motions of non-striated muscles. But all organic motion or contractile action appears to depend upon some stimulus, whether it be the mysterious nervous force or the not less mysterious influences called heat and electrieity. The immediate cause of muscular contraetion is quite unknown. The theory that it depends solely upon the oxidation of museular tissues is quite exploded. It is now held by many theorists that oxidation of non-organized blood-plasma within the capillaries of the muscles is one of the causes of muscular contraction, and that this oxidation liberates heat, which by the nervous influence is transmuted into kinetic energy. Electricity also appears to have intimate relations with some forms at least of organic contraetion.

Contraction: in surgery, the diminution or obliteration of the ealiber of any hollow vessel, more frequently called Stricture (*q. v.*). But frequently contraction denotes the permanent shrinkage in bulk (of an organ), in area (of a surface), or in length (of a muscle, tendon, or other elongated part). Contraction may result (1) from acute inflammation, with the formation of neoplasms; the latter afterward degenerating, or rather drying up, into ordinary connective tissue, which occupies less than the space of the original intrusive tissue. This is well illustrated in the case of burns which destroy much skin: the scar contracts and often causes shocking deformity. Yet it is the result of a process whieh is essentially reparative, and which is necessary to the recovery of a healthy condition. (2) From nervous irritation, direct or reflex. Thus the pain of a severe accident to the ankle has been known to be immediately followed by permanent strabismus. (3) From paralysis. Thus when only one of a pair of antagonistic museles loses its functional contraetility, the other by its normal exercise may produce a permanent deformity.

Contralto [Ital. *contra*, opposite + *alto*, high, the high (male) voiee < Lat. *al'tus*]: in vocal music, the part immediately below the treble, formerly called also the *countertenor*. It is often popularly called Alto (*q. v.*).

Contravallation [from Lat. *contra*, against + *valla'tio*, intrenehment, deriv. of *vallum*, rampart]: in fortification, an intrenchment formed by the besiegers between their camp and the plaee besieged, to secure themselves and cheek the sallies of the garrison. The line of *contravallation* is thus, as the name implies, a sort of counter-fortification.

Contrayer'va [Span. *contrayerva*, antidote; *contra*, against + *yerva*: Fr. *herbe*: Ital. *erba* < Lat. *herba*, herb]: the root of *Dorstenia contrayerva* of the natural order *Urticaceæ*. The plant is indigenous to the West Indies, Central America, and portions of Peru, and is also found in some parts of Brazil and other countries of South America. The root, which is the part employed in medicine, has one or two short heads, is fusiform, and about 2 or 3 inches long, dividing at the end into fine fibers. Its color is reddish brown, but internally it is white. It is somewhat acrid and bitter, and it has a disagreeable odor. It contains a volatile oil, resin, starch, and a bitter principle which is not crystallizable. Internally it aets as a stimulant tonic bitter, and is much used in eertain portions of South America in the treatment of fevers of the typhoid type. Its name contrayerva, meaning "antidote plant" or "antidote herb," is derived from the faet that it has been used, futilely of course, as an antidote to the bites of serpents. The dose of the powdered root is said to be from 10 to 20 grains. H. A. H.

Contreras, kon-trā'rāas: a battle-field 14 miles S. of the city of Mexico. The battle was fought Aug. 19–20, 1847, between the U. S. forces of Gen. Scott and the Mexican division of Gen. Valencia. See Churubusco.

Contreras, Hernando, de: son of Rodrigo de Contreras; b. in Spain about 1520. After the downfall of his father, 1549, he and his younger brother, Pedro, remained in Niearagua. Maddened by what they regarded as an unjust loss of their rights, they formed a wild seheme for seizing Peru, which they claimed to have inherited from their grandfather, Pedrarias. They were joined by some 300 adventurers, many of them fugitives from Hernando Pizarro's army. The plan was to seize the Isthmus of Panama, destroy the towns and plantations there so that a Spanish army attempting to cross should find no supplies, then to sail to Peru, where Hernando de Contreras was to be proclaimed king. As a preliminary they murdered the Bishop of Nicaragua, Valdiviero, who would have opposed them. They then seized ships and sailed to Panama, arriving just after the licentiate Gasca had passed on his way from Peru to Spain with an immense treasure. The conspirators easily took Panama (Apr. 20, 1550), where they seized part of the treasure that was still there. Hernando then followed Gasca nearly to Nombre de Dios, and another party went to Chagres to seek for more treasure. Panama being thus left weakly guarded, the citizens rose, reeovered it, and defeated the foree which hurried baek from Chagres. Hernando, hearing of the disaster, disbanded the rest of the men and fled. After wandering for a time with a few companions, he was drowned in trying to cross a river (May, 1550). Pedro had fled from Panama in a ship. Being pursued, he took to the shore and was never heard of again.

Herbert H. Smith.

Contreras, Juan Senen, de: a gallant Spanish general; b. in 1760 at Madrid; entered the Spanish serviee in early youth, and in 1787 visited Franee, England, and Germany on public affairs. In 1788 he fought against the Turks. In 1795 he began to serve against the French. He fought at Talavera in 1809; as a captain-general he defended Tarragona obstinately, but without success. He was taken prisoner and sent to France in 1811, eseaped in 1812, returned to Spain in 1814, and died in his native city in 1826. He wrote several books, chiefly military.

Contreras, Pedro Moya de: See Moya y Contreras.

Contreras, Rodrigo, de: a Spanish administrator; b. at Segovia about 1495. He was of a noble family, and married Maria de Peñalosa, the daughter of Pedrarias who had been betrothed to Balboa. In 1531 he was appointed governor of Nicaragua, and though he was opposed by Las Casas, Bishop Osorio, and other ecclesiastics, his rule was in the main prosperous. From Leon he sent an expedition under Diego Machuea, whieh explored Lake Nicaragua and its outlet, the San Juan (then called the Desaguadero), arriving at Nombre de Dios. There Machuca was seized by the governor, Robles, who sent two parties to take possession of the Desaguadero; but these were driven out by Contreras. The promulgation of the "New Laws" relating to Indian *encomiendas* (1542) threatened to deprive Contreras of a large number of slaves which he held. He went to Spain, where he was confirmed both in the *encomiendas* and in his offices; returned in 1544, but got into disputes with the Audience of the Confines. Charges were made against him, and in 1549 the *encomiendas* were confiseated. He again went to Spain, but could secure no redress. From 1554 to 1557 he was in Peru, where, probably, he died.

Herbert H. Smith.

Contribution [from Lat. *contribu'tio*, a lending of aid jointly; *con*, together + *tribu'ere*, furnish, pay]: in common law, an obligation imposed upon several persons who are under a common duty, or who own estates subject to a common burden, to share between them the charge of performing the duty of relieving their property of the burden. It is emphatically a rule of equity jurisprudence, and an illustration of the familiar maxim that "equality is equity." The illustrations of it are numerous. Such instances may be cited as general average in the law of shipping; the case of co-sureties, including insurers; that of owners of parcels of land subject to a single mortgage or other lien, where there are no special reasons for casting the burden of payment on one owner more than another; of joint debtors, etc. Contribution is sometimes exacted in a court of law on the theory of an implied contract, but the remedy is not so complete as in equity. It is usually said that there is no contribution among wrong-doers. This proposition must be received with some qualification, for while the rule must be rigidly applied to willful wrong-doers, and perhaps to such as are guilty of negligence, it could not be properly extended to persons who, acting in good faith, commit a technical wrong, as e. g. to sureties who execute a bond of indemnity to a sheriff to secure him against the consequences of a trespass in selling property which he has reasonable grounds for supposing belongs to a debtor against whose property he has an execution, while it turns out that the property does not belong to the debtor.

T. W. Dwight.

Contributions: in war, forced payments of money exacted from a conquered territory over and above the taxes used for its own government. They can be levied only by officers of the highest authority. The Germans in France in 1870 frequently made use of contributions, dooming particularly those towns or communes which had permitted attacks upon German soldiers, breaks in the transportation system, or other hostile acts, after occupation. They thus served as penalties. The Brussels conference of 1874 tried to restrict their employment, but without result. Though a harsh measure, they are lawful in modern warfare. See War and Requisitions.

Theodore S. Woolsey.

Contrition [from Lat. *contri'tio*, a wearing away, deriv. of *conte'rere*, rub in pieces; *con* + *te'rere*, rub]: in ordinary usage, denotes thorough repentance for sin. In the Roman Catholic Church contrition (*contritio cordis*) is the complete sorrow and utter detestation which the penitent feels for past sin, joined with the purpose to sin no more. Contrition, confession, and satisfaction are essential parts of the sacrament of penance. (*Canons of Trent*, s. xiv., c. 4.) But some, with Dens (*Theol.*, vi., 51), hold that *attrition*, or imperfect repentance, joined with confession, satisfaction, and absolution, is sufficient. Others teach that attrition is but a step leading toward contrition.

Controller [from deriv. of O. Fr. *contre-rolle*, duplicate roll or register (> Mod. Fr. *contrôle*) < Lat. *con'tra*, against + *ro'tulus*, roll. The spelling *comptroller* rests upon a false etymology]: an officer appointed to exercise certain duties in the superintendence of public finances, as the supervision of the accounts of other officers, etc. The Minister of Finance in France was formerly called *contrôleur-general*. The word is more commonly written Comptroller (*q. v.*).

Con'tumacy [from Lat. *contuma'cia*, deriv. of *con'tumax*, defiant, stubborn]: in law, especially in ecclesiastical law, a willful disobedience to any lawful summons or judicial order; contempt for the order of a court or legislature. See Contempt.

Convection: in physics, any circulatory movement in a fluid caused by inequalities of pressure, temperature, or electric potential. The direction of the convection current is always such as to tend to diminish the inequalities to which it is due. Well-known examples are trade winds, cyclonic storms, and the Gulf Stream. The circulatory flow in a vessel of water which is being heated and the air-currents to and from an electrified metallic point are also cases of convection.

E. L. Nichols.

Convent [from Lat. *conven'tus*, assembly, society, union; *con*, together + *veni're*, come]: literally, a meeting; a religious house inhabited by a society of monks or nuns, or, more strictly, the society itself. But in exact language the term convent designates a meeting (*conventus*) of all the members of a religious community, or, more properly, of those who can vote in the assembly. These voters are called conventuals, though the latter term is often used in other senses. On certain questions it is customary in some congregations to assemble the convent either for the counsel to be obtained from the brethren or for their consent to some ordinance. All the abbots of a congregation may be called upon in like manner to meet in a "provincial" or "general convent." See Monachism.

Conventicle [from Lat. *conventi'culum*, a lesser assembly; dimin. of *conven'tus*, meeting]: literally, an assembly or meeting of people. This term was early applied distinctively to the meetings of Dissenters from the established Church in England, first to the meetings of Wickliffe's followers, and afterward and more especially to those of the Scottish Covenanters. Severe laws for their suppression were passed, and hence the term came to be applied to almost any unlawful, secret religious assembly. An early act was passed in the reign of Elizabeth (1593) making the frequenting of conventicles punishable by imprisonment and death; but this was laxly enforced, and the best-known act for the suppression of conventicles was that passed by Parliament in 1664, making it unlawful for more than five persons over sixteen years of age, unless belonging to one family, to meet together for domestic or social worship. The first violation made the leader and the occupant of the premises liable to three months' imprisonment, or a fine of £5. A married woman who attended a conventicle was liable to imprisonment for one year, unless her husband paid a ransom of 40*s.* sterling. The punishment for the second offense was twice that for the first, and that for the third offense was transportation, or a fine of £100.

F. Sturges Allen.

Convention [from Lat. *conven'tio*, assembly, agreement; *con*, together + *veni're*, come]: in political language, an assembly of national representatives meeting on extraordinary occasions without being convoked by the legal authority. (See Convention-parliament.) In French history the name convention is applied to that assembly which met after the legislative assembly had pronounced the suppression of the royal functions (Sept., 1792), and proclaimed the republic at its first sitting. This body dissolved itself on the establishment of the Directory in Oct., 1796. The Scottish assembly which met on the flight of James II. of England was entitled the Convention of Estates. In the U. S. meetings of representatives specially chosen by the people of separate States to revise and amend the State constitutions are termed State conventions. The term convention is also applied to the meetings of delegates of the several political parties for the nomination of candidates for office.

Convention, in the language of diplomacy, is generally synonymous with treaty, with the vague distinction that a convention relates to a few or unimportant or non-political points. Contracts between belligerents as to certain rules to be adopted on both sides in carrying on the war are technically termed general conventions. Treaties between the pope and Protestant powers have been often termed conventions.

Convention, in military affairs, is a treaty between military commanders concerning terms for a temporary cessation of hostilities, generally between a victor and a defeated general for the evacuation of a district or position by the latter. The two most celebrated conventions of modern times were that of Closter-Seven (1757), between the Dukes of Cumberland and Richelieu, and that of Cintra (1808), between Junot and the English generals. See Constitution.

Convention-parliament: in Great Britain, a parliament convened without the authority of the sovereign, when the crown is in abeyance. As parliaments have no right to assemble without royal authority, the acts of convention-parliaments must afterward be ratified by a parliament summoned in accordance with the provisions of the constitution. Two convention-parliaments have occurred in English history—the first, that which met in Apr., 1660, and restored Charles II. to the throne, the Lords assembling by their own authority, and the Commons by virtue of writs issued in the name of the keepers of the liberties of England, by the authority of Parliament; the second, that which met in 1689, each house by its own authority, and when James II. fled from the kingdom, declared that his flight was equivalent to abdication, and offered the crown in joint sovereignty to William and Mary. See Convention.

Converse, Charles Crozat: See the Appendix.

Conversion [from Lat. *conver'sio*, a turning about, deriv. of *conver'tere*]: in metallurgy, the process by which steel

is produced from iron or from iron carbide (cast iron). Iron is converted into steel by long heating in contact with carbon. Cast iron is converted by "puddling," or by the well-known process of Bessemer. The theory in both cases is the same —viz., to oxidize the excess of carbon in the carbide.

Conversion: In law this word has two significations: 1. In equity jurisprudence it means the theoretical or presumed change of property from real into personal or personal into real. The will of an owner of property to change into personal property, expressed in legal forms, is in some instances equivalent, in legal intendment, to an actual change, as where a testator directs his land to be sold and converted into money. It is deemed to be sold from the moment of his death, and to have the qualities of personal property. This is termed *equitable conversion*. If it becomes impossible to carry out the purpose of the donor, testator, or the like, reconversion is said to take place, and the property is treated according to its real nature. 2. In the law courts the word "conversion" is applied to an unauthorized exercise of acts of ownership over the personal property of another. It is deemed to be a wrong or "tort," and the owner of the property may either reclaim it or treat the wrong-doer as having become owner and recover the value of it. Conversion lies at the foundation of the common-law action of trover, which word is derived from the French word *trouver*, to find. There is a legal fiction that the defendant found the plaintiff's property and converted it to his own use. The material part of the case is the conversion. To constitute a case of conversion it is not necessary that there should have been any intent to deprive the owner of his interest. It is enough if there were an intent to appropriate the goods or to exercise an act of ownership over them, even though that were done in entire ignorance of the owner's right. Thus if an auctioneer should sell stolen goods, not knowing of the theft, he would be deemed to have converted the goods to his own use. As the intent is a main ingredient in the case, it has been considered that a mere trespass, or an accidental loss of property by a carrier, or the use of property as an act of kindness to the owner without any intent to convert it, does not amount to a conversion. There is an important distinction between the case where the original taking of the goods is lawful and where it is not. In the former case there must in general be a demand and a refusal before the conversion takes place. Thus if a book is lent to another to be returned on request, there is plainly no conversion until the book is demanded and there is a refusal to return it, since until that time there is no exercise of ownership. When the original taking is unlawful, no demand is necessary. The better opinion is, when an action is brought for conversion, that the title to the chattel does not pass to the wrong-doer by mere force of the judgment of the court, but that there must be actual satisfaction of the judgment on his behalf. T. W. Dwight.

Conversion, in logic: See Logic.

Converter: in metallurgy, the receptacle used to hold the iron or carbide of iron which is subjected to the process of conversion into steel. See Steel.

Conveyance: in law, a deed transferring property from one person to another. In the transference of personal property the term, though strictly applicable, is not generally used.

Conveyancer: in law, one who makes a specialty of the drawing up of conveyances. In Great Britain conveyancers are persons whose sole business is the preparation of deeds, assurances, or other conveyances of property. They are obliged to take out a yearly certificate, upon which a considerable stamp duty is imposed. F. Sturges Allen.

Convict [from Lat. *convic'tus*, past ptc. of *convin'cere*, refute, triumph over; *con* + *vin'cere*, conquer]: a person adjudged guilty of a crime, whether by a verdict of a jury or by a judge alone. The method of treating convicts in any particular country or jurisdiction is termed its *convict system*. The question as to what is the best convict system is still unanswered. Experience has shown that none of the many that have been tried are free from very serious defects, both in their effects upon the community and upon the criminals. Some of the older convict systems, such as that of transportation and penal servitude, have been abandoned rather out of regard for their effect upon the non-criminal class, than out of any regard for the present or future welfare of the convicts. Others have been discontinued as a result of a feeling against the infliction of cruelty upon convicts, as well as out of regard for the community and the moral welfare of the convicts. F. S. A.

Convocation [from Lat. *convoca'tio*, a calling together; *con*, together + *voca're*, summon]: a meeting of the clergy of the Church of England to discuss ecclesiastical matters in time of Parliament. There is one convocation for the province of Canterbury and one for the province of York, but the voice of the latter is only a feeble echo of that of the former. Each convocation has two houses—the upper consisting of bishops, and the lower of deans, archdeacons, and proctors. Acts of convocation were formerly of great importance in the canon law, but since the time of Henry VIII. they have no force when opposed to statute law. The convocations have been recently revived, but with little or none of their ancient importance. There is an Irish convocation with even smaller powers than those of the English Church. In the U. S. the word is usually applied to voluntary associations of the clergy of the Protestant Episcopal Church. In Connecticut, during the episcopate of the first bishop, Seabury, the clergy met in convocation under the bishop's presidency each year, and even more frequently as need required. Revised by W. S. Perry.

Convol'vulus [from Lat. *con*, together + *volvere*, to roll, in allusion to the twining habit of most of the species]: a genus of dicotyledonous plants of the Morning-glory Family (*q. v.*), including about 150 species, widely distributed in temperate and sub-tropical countries. Many of these are twining climbers, while some are erect herbs or even undershrubs. The leaves are alternate, undivided or lobed, the flowers funnel-shaped and usually showy and mostly solitary, the ovary two-celled and four-ovuled, and the stigmas two and linear, filiform or thickened. Many of the species have been cultivated for their beautiful flowers—e. g. *C. arvensis*, *C. chinensis*, *C. mauritanicus*, and *C. ocellatus* from Africa, *C. pannifolius* from the Canary islands, *C. suffruticosus* from Madeira, and *C. tricolor* from Spain. The purgative drug scammony is a resinous exudation from the root of *C. scammonia* of Western Asia. C. E. B.

Convoy [from subst. to O. Fr. *convoier*, to conduct: Ital. *convia're* < Lat. **convia're*, make the way (*via*) together; cf. the subst. Ital. *convoglio*, Fr. *convoi*]: one or more ships of war employed to protect a fleet of merchant-vessels against an enemy by escorting them to their destination.

The right of convoy is a limitation in favor of the neutral upon the war right of visitation and search, and rests solely upon treaty agreement. In theory the convoying ship is supposed to have accurate knowledge of the lading, destination, and character of each vessel in the convoy, and to be answerable that it violates no belligerent right, that it carries no contraband, that it is not bound for a blockaded port. An inquiry of the convoying ship by a belligerent cruiser is therefore substituted for the actual examination of the vessel suspected. In practice it is very doubtful whether such complete knowledge of the character and cargoes of a fleet of merchantmen can be obtained by the convoying officer, particularly as there may be strong temptation for fraud in regard to these facts on the part of skipper or captain. In modern warfare it is believed that the right of convoy is not a valuable one, because (1) of the growth in freedom of neutral trade and the variety of destinations involved; (2) of the differences in speed, making fleet sailing impracticable.

Before the end of the eighteenth century the attempts to maintain a neutral right to convoy originated among the trading nations of Europe as against Great Britain, and were not successful. But the principle of convoy was one of the features of the second armed neutrality in 1800, by which Russia, Sweden, Denmark, and Prussia agreed to respect convoy as between themselves, and to oblige other powers, notably Great Britain, to concede their right to employ it, if necessary by force. This was so far successful that treaties were made between Great Britain and the three first-mentioned powers providing for a modified sort of convoy instead of search under definite conditions, though eventual joint search might be made. The U. S. maintains the principle of convoy in ten treaties, one with Peru being as recent as 1887. Of these ten treaties only one is with a European power, Italy, under date of 1871.

France has accepted the same principle in six treaties, all with American republics. And Spain, Germany, Italy, Austria, and the Baltic powers accept the right of convoy in their naval instructions. See International Law.

Theodore S. Woolsey.

Convulsions [from Lat. *convul'sio*, convulsion, cramp; *con* + *vel'lere*, *vul'sus*, pluck up, dislocate]: an acute nervous affection, occurring in paroxysms, during which the patient may lose consciousness; the muscles of the body are spasmodically contracted, and the limbs at first stiffened and twisted and then agitated by irregular involuntary movements. The face is distorted, the eyeballs rolled upward, the teeth clenched, frequently biting the tongue, which may protrude at the beginning of the attack. Respiration is arrested by contraction of the chest muscles and by closure of the glottis; in consequence, the color of the face darkens; at the same time the veins of the neck swell, and froth issues from mouth and nostrils. This condition persists for a shorter or longer time; thereupon the muscles again relax, respiration is restored, the agitation of the limbs having ceased; consciousness may be fully restored, or the patient falls into a heavy sleep lasting, perhaps, several hours. The appearance of the patient and the nature of the attack are the same practically in the convulsions of epilepsy, those of women in childbirth, and in many different varieties of convulsions so frequently seen in children. They may result from any cause which first irritates and then suddenly abolishes the functions of the brain and spinal cord; therefore occur in diseases of the nervous centers, in diseases of other organs of the body which transmit irritation to these centers; and finally in morbid conditions of the blood, influencing these centers, either by direct stimulation or by interfering with their nutrition. Under the first head may be mentioned congestion, or anæmia (bloodlessness) of the brain, inflammations, tumors, and premature ossification of the bones of the head, by which the brain becomes subject to abnormal pressure. In other and more obscure cases a congenital susceptibility to irritation, and consequent exhaustion of functions, seems to exist in the brain and cord, so that the most trifling circumstance may occasion a convulsion; to this we ascribe the convulsions of hysteria and of epilepsy. The latter is only distinguished by a constitutional tendency which persists during the intervals between the attacks, and suffices to cause their renewal. The hysterical convulsion, however, offers some peculiarities. During the attack, consciousness, although perverted, is not abolished; interference with respiration is less complete than in the typical varieties, leading to involuntary crying and laughing; there is no lividity of the face; no frothing at the mouth; and the return to consciousness is immediate, without a transition stage of heavy sleep. Neither the irregular convulsive movements, so-called clonic muscular contractions, of chorea or St. Vitus's dance, nor the rigidity or tonic contractions of tetanus, are sufficient to constitute a convulsion proper, in which the two forms of muscular contraction are combined, the last occurring at the beginning, the first at the end, of the attack.

Convulsions dependent on transmitted irritations are common, occurring principally in children; and may be spontaneous, owing to the congenital predisposition mentioned, by which normal physiological processes may become irritating; or they may be excited by inflammation of the gums in dentition (very rarely), by indigestion, by worms, by the invasion of acute diseases, as pneumonia, eruptive fevers, etc., or by some accidents, such as extensive burns, etc.

Women in childbirth are liable to convulsions of a similar character, and this dangerous complication, so-called puerperal eclampsia, is generally associated with an alteration of the blood, which is liable to occur during pregnancy, being due to transient kidney disease. These organs act imperfectly, and allow a retention of urinary elements in the blood which should be excreted by them; these retained elements act as a direct irritant to the brain centers, thus affording a most striking illustration of the morbid influence of altered blood upon the nerve-cells. Part of the albumen of the blood passes off in the urine at the same time. These convulsions are also called albuminuric or uræmic. They also occur in true nephritis or Bright's disease, and in that complicating the second and third stages of scarlet fever.

Various minerals and other poisons introduced into the blood have a similar effect on the brain and cord centers, causing convulsions. Finally, a great diminution in the entire volume of blood, caused by exhausting hæmorrhages or by diarrhœa depriving the blood of its water, has been shown to determine convulsions as certainly as if the blood had been poisoned.

Any convulsion may prove fatal, should the arrest of respiration be sufficiently prolonged, the danger varying greatly according to the cause, the uræmic convulsions of women in childbirth, or the so-called puerperal eclampsia, being by far the most frequently fatal. Hereupon may be successively classed, second, uræmic convulsions in primary nephritis, or that complicating scarlet fever; third, those caused by poisons; fourth, by the anæmia resulting from hæmorrhage or diarrhœa; fifth, by the irritation of morbid dentition, worms, or indigestion in young children; sixth, by diseases of the nervous centers or disorders in their circulation, as congestion, anæmia, etc.; seventh, the convulsions of epilepsy; eighth, those marking the invasion of acute diseases.

The treatment of convulsions may at times be addressed exclusively to the cause, as in the last three classes mentioned, where the danger of the paroxysm itself is known to be small. In the other cases, where life is liable to be endangered by the duration or rapid repetition of the convulsive attacks, relief is urgently demanded. The means are as follows: Compression of the carotids; alcoholic stimulants; venesection; sedative remedies, such as bromides, chloral, chloroform, etc.; anti-hysterical medicines; warm baths or cold applications to the head. Each of these is adapted to a special case. Compression of the carotids has been used principally in cases of idiopathic epilepsy; it is intended to relieve the congestion existing at the base of the brain. Cold applications to the head are used for the same purpose, and may be combined with other methods of treatment. Stimulants are only used where the convulsion results from hæmorrhage or inanition. Venesection is seldom resorted to, but may be required in cases of intense venous congestion of the brain, as indicated by an extreme lividity of the face and distension of the veins of the neck; its principal efficacy has been noted in puerperal convulsions. Large doses of chloral are especially useful in infantile convulsions, or for those of scarlet fever, or during the interval between the attacks to prevent their renewal. The sedative action of chloral is analogous to that of inhaled chloroform. The latter, however, is much more powerful, and may be used in more severe cases or where the patient is unable to swallow. Veratrum viride, when used with extreme care, is a powerful agent to lower the pulse, and may be used in the same cases as venesection, to dissipate the stagnation of blood in the veins. A warm bath, with or without mustard, may be of service in many cases, excepting in puerperal convulsions, where it is contra-indicated by the danger of moving the patient. The facility of its use with young children frequently makes it especially applicable to them. Hysterical convulsions are treated with nerve stimulants, such as assafœtida, valerian, ether internally, etc.; during the interval between the attacks galvanism should be applied to the spine. Apart from special indications, therefore, treat the average convulsion as follows: Loosen the clothing so that it may not interfere with respiration; see that the tongue is protected, to prevent injury by biting, and avoid in a general way any injury the unconscious patient may be liable to. A warm bath with cold applications to the head, or the latter alone, may be of service. When the paroxysm abates, large doses of chloral hydrate may aid greatly in preventing a repetition. When the paroxysms are very severe and frequently repeated, especially as seen in the puerperal cases, the administration of chloroform by inhalation is indicated. When there is intense venous congestion, and suffocation be imminent, venesection may be indicated and of service.

A. Jacobi,
F. E. Sondern.

Convulsionists: a party which arose among the Jansenists about 1730, and continued flourishing till the middle of the century. The position of the Jansenists was rather difficult at that moment. Supported by Cardinal Fleury and Archbishop de Noäilles, of Paris, the Jesuits had gained the ascendency. Then it was suddenly rumored that miracles were wrought on the grave of Dean François, of Paris, who died in 1727 and was buried in the cemetery of St.-Médard. He had been one of the most conspicuous Jansenists, and by his extraordinary charity and his ascetic life he had brought Jansenism in favor among the lower classes. People now crowded in great numbers to the cemetery, and when they reached the grave they were generally seized by convulsions, in which state of mind they then began to prophesy and to testify in favor of Jansenism. The Government ordered the cemetery closed and the fanatics imprisoned (1733), but earth from the grave proved to have the same effect as the grave itself. The enthusiasm, with

its convulsions and its alleged miraculous cures, continued for nearly twenty years. See P. F. Mathieu, *Histoire des miraculés et des convulsionnaires de St.-Médard* (Paris, 1864).

Conway, or **Aberconway**: a small seaport-town of Carnarvonshire, Wales; on the estuary of the river Conway, here crossed by a suspension bridge 327 feet long; 13 miles E. N. E. of Bangor (see map of England, ref. 8–E). Here is Conway Castle, a grand feudal structure with eight vast towers, on a steep rock, built by Edward I. in 1283. It is on the Chester and Holyhead Railway. Pop. (1891) 3,467.

Conway: town; capital of Faulkner co., Ark. (for location of county, see map of Arkansas, ref. 3–D); on St. L., Ir. Mt. and So. R. R.; 30 miles N. of Little Rock. Conway is the seat of a college for boys (Methodist) and a college for girls (Baptist), and has churches of five denominations, public schools, three lumber-mills, a cotton-oil mill, and has a large cotton-trade. Pop. (1880) 1,028; (1890) 1,207; (1900) 2,003. EDITOR OF "LOG CABIN."

Conway, HENRY SEYMOUR: an English general and field-marshal; second son of the first Lord Conway; b. in 1720. He had a high command in Germany in 1761, and was Secretary of State in the Whig cabinet in 1765–68. In 1782 he was appointed commander-in-chief of the army, and made in Parliament a motion to terminate hostilities against the U. S. D. July 10, 1795.

Conway, MONCURE DANIEL: writer; b. in Stafford co., Va., Mar. 17, 1832; graduated at Dickinson College, Carlisle, Pa., 1849, and after preaching as a Methodist for a short time attended the Harvard Theological School; after his graduation preached in Unitarian churches in Washington and Cincinnati. His first publication was a volume of sermons, *Tracts for To-day*. In Cincinnati he edited a magazine, *The Dial*, in which he endeavored to revive the spirit of *The Dial* of Emerson and Margaret Fuller. During the civil war his *Rejected Stone* was pronounced by Charles Sumner the most useful book of the time for hastening the emancipation of the slaves. In *The Golden Hour* he pushed the advantage he had won. He went to Virginia and brought off the slaves from his own home, and wrote an interesting account of the adventure. In 1863 he went to England to advocate the Union cause, and remained there many years preaching in the South Place chapel, London, in which William J. Fox, a famous Liberal, had preceded him. At the same time he was a diligent newspaper correspondent and a writer for the magazines. The following is a partial list of his books: *The Earthward Pilgrimage* (1870); *Sacred Anthology* (1874); *Idols and Ideals* (1877); *Demonology and Devil Lore* (1879); *Emerson at Home and Abroad* (1882); *George Washington and Mt. Vernon: Washington's Unpublished Agricultural Letters* (1889); *Life of Nathaniel Hawthorne* (1890); *Omitted Chapters of History Disclosed in the Life and Letters of Edmund Randolph* (1888); *Thomas Carlyle* (1881); *The Wandering Jew* (1881); *Pine and Palm*, a novel (1887); *Prisms of Air*, a novel (1891); *Life of Thomas Paine* (2 vols., 1892). Mr. Conway returned to his London pulpit in 1892, but settled finally in New York in 1900. JOHN W. CHADWICK.

Conway, ROBERT SEYMOUR: b. at Stoke Newington, London, England, Sept. 20, 1864; educated at City of London School; scholar of Cambridge and London; fellow of Gonville and Caius College, Cambridge; lecturer at Newnham College and in the University of Cambridge. He is author of *Verner's Law in Italy* (1887); *The Italic Dialects, with Text, Grammar, and Lexicon* (1882); the translator of vol. ii. of Brugmann's *Grundriss der Vergl. Gramm.*, and contributor to various journals.

Conway, THOMAS, Count de: general; b. in Ireland, Feb. 27, 1733. He was educated in France, where he entered the army and attained the rank of colonel. In 1777 he emigrated to the U. S. at the suggestion of Silas Deane; offered his services to Congress; was appointed brigadier-general, and in December of that year was made inspector-general with rank of major-general, in spite of Washington's protests. He became so prominent in the plot to deprive Washington of the command of the army that the associated conspirators were known as "Conway's cabal." In Mar., 1778, he offered, conditionally, his resignation, which Congress gladly accepted without conditions. Conway returned to France, and in 1784 was appointed governor of Pondicherry and the French settlements in Hindustan. In 1792 he returned to France to command the royalist forces in the south, but on the breaking out of the revolution was forced to flee the country. D. about 1800.

Co'ny: the name employed in the English Bible for the animal called in Hebrew *shaphen*, and now believed to be the Syrian hyrax, *Hyrax syriacus*. See HYRAX.

Conybeare, kŭn'i-bār, WILLIAM JOHN: Anglican clergyman; son of Rev. William Daniel Conybeare, the eminent geologist and divine; b. in England, Aug. 1, 1815; graduated at Cambridge 1837; was principal of the Liverpool Collegiate Institute 1842–48; d. at Weybridge, 1857. His fame rests upon his joint authorship with the late Dean Howson of the *Life and Epistles of St. Paul* (London, 1851), in which he contributed the translations of St. Paul's letters and speeches. SAMUEL M. JACKSON.

Conyers: town; capital of Rockdale co., Ga. (for location of county, see map of Georgia, ref. 3–G); on Georgia R. R., 30 miles E. by S. from Atlanta. The chief industries are cotton raising and milling. Pop. (1890) 1,349; (1900) 1,605.

Conyngham, MARQUESSES OF (1816): Earls Conyngham (1797), Earls of Mount Charles (1816), Viscounts Mount Charles (1797), Viscounts Conyngham (1789), Viscounts Slane (1816), Barons Conyngham (Ireland, 1789), and Barons Minster (United Kingdom, 1821).—FRANCIS NATHANIEL CONYNGHAM, second marquess, K. P., G. C. H., P. C., lieutenant-general, b. June 11, 1799, succeeded his father, Henry Conyngham, third baron, Dec. 28, 1832; d. July, 1876; succeeded by his eldest son, GEORGE HENRY, b. in 1825, who died in 1882, and was succeeded by his son, HENRY FRANCIS CONYNGHAM (d. Aug. 28, 1897).

Cooch Behar: See KUCH BEHAR.

Cook, ALBERT STANBURROUGH, Ph. D., L. H. D.: scholar; b. at Montville, N. J., Mar. 6, 1853; graduated from the Scientific School of Rutgers College 1872; tutor of Mathematics in Rutgers College 1872–73; studied English and allied branches at Göttingen and Leipzig 1877–78; associate in English at Johns Hopkins University 1879–81; studied in London with Henry Sweet, and at Jena with Profs. Sievers and Delbrück 1881–82; Professor of English in the University of California 1882–89; President of the California Teachers' Association 1887–88: Carew lecturer at Hartford Theological Seminary 1890–91; Professor of the English Language and Literature in Yale University 1889. Besides numerous contributions to *Modern Language Notes*, the *American Journal of Philology*, the *Transactions of the American Philological* and *Modern Language Associations*, the London *Academy*, and other periodicals, his chief publications are an edition of Sievers's *Old English Grammar* (1885–87); of *Judith, an Old English Epic Fragment* (1887–89); and of Sidney's *Defense of Poesy* (1890), which have been received with much favor, and accounted standard in Great Britain and Germany, as well as in the U. S.

Cook, CHARLES, D. D.: Wesleyan divine; chief founder of Methodism in France; b. in London, May 31, 1787; entered the Wesleyan ministry in 1817; went to France in 1818; traveled there, founding Methodist societies and aiding in the revival of the Huguenot churches till his death in Lausanne, Feb. 21, 1858. He wrote *L'Amour de Dieu pour tous les Hommes*. His *Life* was written by J. P. Cook (Paris, 1862).

Cook, CLARENCE CHATHAM: journalist and writer; b. at Dorchester, Mass., Sept. 8, 1828; graduated at Harvard in 1849, and studied architecture in the office of A. J. Downing (his brother-in-law) and Calvert Vaux, at Newburg, and afterward pursued for many years the profession of teaching. In 1863 Mr. Cook contributed to the New York *Tribune* a series of articles on American art, based upon the exhibition of pictures at the New York Sanitary Fair of that year. He continued the profession of teacher until 1869, at the same time contributing the art criticisms which appeared in the *Tribune*, besides occasional articles to magazines. In 1869 he went as correspondent of the *Tribune* to Paris, but resigned that position upon the outbreak of the Franco-German war, passed some time in Italy, and on his return to the U. S. resumed his connection with the *Tribune*. He published *The Central Park* (New York, 1868); *The House Beautiful* (New York, 1878); and edited, with copious notes, a new translation of Lübke's *History of Art* (2 vols., New York, 1878). Became editor of *The Studio* in 1884. D. in Fishkill Landing, N. Y., June 2, 1900.

Cook, DUTTON: b. in London in 1832; educated at King's College, and served articles for some time in a solicitor's

office. Afterward he was assistant editor of the *Cornhill Magazine*, dramaic critic to the *Pall Mall Gazette*, and contributor to other periodicals. Besides collections of essays and studies—*Art in England* (1869); *Hours with the Players* (1870); *Nights of the Play* (1883, 2 vols.), etc.—he has published *Paul Foster's Daughter* (1861); *A Prodigal Son* (1862); *The Trials of the Tredgolds* (1864); *Hobson's Choice* (1866), etc. D. Sept. 11, 1883.

Cook, Francis A.: See the Appendix.

Cook, Capt. James: navigator; b. of very poor parents at Marton, in Yorkshire, England, Oct. 27, 1728; entered the navy 1755, and served as master of a sloop at the capture of Quebec in 1759; commanded an expedition sent to the South Pacific Ocean in 1768 to observe the transit of Venus. After he had observed the transit with success on the island of Tahiti, he visited New Zealand and explored the coast of New South Wales. Having made important discoveries in geography, he returned by the Cape of Good Hope, and arrived in England in June, 1771. In 1772 he conducted another exploring expedition in the Resolution and Adventure, in order to discover the *Terra Australis*, a continent supposed to exist in high southern latitudes. He circumnavigated the globe, discovered the island of New Caledonia, and penetrated southward as far as 71° S. lat., but did not find the Terra Australis. He returned to England in July, 1775, having lost only one man by disease during the voyage. He published a well-written journal of his voyage (2 vols., 1777). In July, 1776, he sailed on a third voyage, the object of which was to discover a northwest passage by way of Bering Strait. He discovered the Sandwich islands in 1778, and explored Bering Strait. Having returned to Hawaii to pass the winter, the natives of that island stole one of his boats. Capt. Cook with a few men went on shore to recover it, and was killed by the savages Feb. 14, 1779. See A. Kippis, *Life of Captain James Cook* (1788).

Cook, Joseph: lecturer on religious and social topics; b. at Ticonderoga, N. Y., Jan. 26, 1838; graduated at Harvard in 1865, and at Andover in 1868; remained there as a resident licentiate till 1870. He was pastor of a church in Lynn, Mass., 1870–71, spent one year (1872–73) in Europe, carried on the Monday lecture in Boston 1874–80, in Europe and Asia 1880–82, and resumed the Monday lectureship in Boston in 1883. He published several volumes of the Monday lectures, which have been widely circulated, and in 1888 founded *Our Day*, a monthly periodical devoted to various reforms. D. in Ticonderoga, N. Y., June 25, 1901.

Cooke, Edward, D. D.: clergyman and educator; b. at Bethlehem, N. H., Jan. 19, 1812; graduated with honor at Middletown in 1838. He was teacher of Natural Science in the Amenia Seminary, in Dutchess co., N. Y., and afterward principal of the newly founded seminary at Pennington, N. J., 1840–47, and minister in various Methodist Episcopal churches at Boston and elsewhere until 1853. He took the direction of the institute now known as Lawrence University in Appleton, Wis., the presidency of which in its more prosperous days was again offered him, but declined. Returning to the East in 1861, he was two years pastor of the Harvard Street church in Cambridge, Mass., where he was one of the board of examiners of Harvard College, which conferred upon him the degree of D. D. in 1855. He was principal of the Western Academy at Wilbraham, Mass., 1864–74, and president of Claflin University, Orangeburg, S. C., 1874–84. D. at Newton Centre, Mass., Sept. 18, 1888.

Cooke, George Frederick: actor; b. in Westminster, Apr. 17, 1756. He made his first public appearance in 1776, performed in the largest cities of Great Britain and Ireland, was successful in both tragedy and comedy, and was a rival of John Kemble. In 1810 he visited New York, where he was equally popular, and where he died Sept. 26, 1812. He is buried in St. Paul's Churchyard in that city.

Cooke, George Willis: Unitarian preacher and author; b. in Comstock, Kalamazoo co., Mich., Apr. 23, 1848; educated at Olivet College, Michigan, Jefferson Liberal Institute, Wisconsin, and Meadville Theological School, where he was ordained in 1872; he has held pastoral charges in the Unitarian Church in Wisconsin, Michigan, Indiana, and Massachusetts; lectured before the Concord School of Philosophy, and the Peabody Institute at Baltimore; contributed to *The Critic*, *The Independent*; and published *Ralph Waldo Emerson: his Life, Writings, and Philosophy* (1881); *George Eliot, a Critical Study of her Life, Writings, and Philosophy* (1883); *Poets and Problems* (1886); *The Clapboardtrees Parish, Dedham, Mass., a History* (1887); *A Guide-book to the Poetic and Dramatic Works of Robert Browning* (1891).

Cooke, Jay: financier; b. in Sandusky, O., Aug. 10, 1821; went to Philadelphia in 1838, and became a clerk in the banking-house of E. W. Clark & Co., of which he became a partner at the age of twenty-one. He established the firm of Jay Cooke & Co. in 1861, and became well known as a successful Government agent for the war-loans during the civil war of 1861–65. The firm to which he belonged became agents for the Northern Pacific R. R., and their suspension in 1873 was one of the causes of the financial panic of that year. Mr. Cooke retained his connection with the railroad, and his subsequent operations in business were remarkably successful.

Cooke, John Esten: novelist and lawyer; b. at Winchester, Va., Nov. 3, 1830. He wrote, besides other works, *Leather Stocking and Silk* (1854); *The Virginia Comedians* (1854); a *Life of General Robert E. Lee* (1871); and *History of Virginia*. He served as an officer in the Confederate army in the civil war. D. Sept. 27, 1886.

Cooke, Josiah Parsons, LL. D.: chemist; b. in Boston, Mass., Oct. 12, 1827; educated at Boston Latin School and at Harvard, where he graduated in 1848; tutor in mathematics in Harvard 1849; instructor in chemistry; Erving Professor of Chemistry and Mineralogy from 1851; and director of the chemical laboratory. He received from Harvard the degrees of A. B., A. M., and LL. D., and from Cambridge, England, that of LL. D. He was corresponding secretary and president of the American Academy of Arts and Sciences. His principal publications are *Chemical Problems and Reactions*, to accompany Stockhardt's *Elements of Chemistry* (1853); *Elements of Chemical Physics* (Boston, 1860, several editions); *Principles of Chemical Philosophy* (Boston, several editions); *The New Chemistry* (1871, several editions and translations); *Religion and Chemistry* (New York, 1864); *Scientific Culture and other Essays* (New York, 1881; n. e. 1885); *The Credentials of Science the Warrant of Faith* (1888). D. at Newport, R. I., Sept. 3, 1894.

Cooke, Mordecai Cubitt, M. A., LL. D., A. L. S.: English botanist; b. in Horning, July 12, 1825; editor of *Grevillea* (1872–92); myeologist to the Royal Botanic Gardens, Kew. He has written many botanical works, mainly devoted to the fungi. Among them are *Illustrations of British Fungi*; *Mycographia*; *Handbook of British Fungi*; *Fungi, their Nature, Uses, etc.*; *Rust, Smut, Mildew, and Mould*; *Handbook of Australian Fungi*; *British Freshwater Algæ*; *British Desmids*, etc.

Cooke, Philip St. George: U. S. military officer; b. 1809 in Berkeley co., Va.; graduated at West Point in 1827, and Nov. 12, 1861, brigadier-general U. S. army. He served as infantry officer on the Western frontier 1827–33; in Black Hawk war 1832; engaged in the battle of Bad Axe; and adjutant Sixth Infantry 1832–33. As a dragoon officer he served on frontier duty 1833–46; on expedition to California during the war with Mexico 1846–47 (brevet lieutenant-colonel); as superintendent of cavalry recruiting 1848–52; on frontier duty and scouting 1852–56; engaged in skirmishes against hostile Indians tribes; quelling the Kansas disturbances 1856–57; on Utah expedition, in command of the cavalry 1857–58; preparing cavalry tactics 1859; and in command of Utah 1860–61. In the civil war he was in Virginia Peninsula 1862; engaged at Yorktown, Williamsburg, Gaines's Mill, and Glendale; in command of Baton Rouge district, La., 1863–64; superintendent of recruiting 1864–66; in command of the department of the Platte 1866–67, and afterward of the department of the Lakes; brevet major-general Mar. 13, 1865. He studied law and was admitted to practice, and is the author of *Scenes and Adventures in the Army* (1856) and *The Conquest of New Mexico and California* (1878). Retired from active service Oct. 29, 1873. D. in Detroit, Mich., Mar. 21, 1895.

Cooke, Rose (*Terry*): poet and story-writer; b. at West Hartford, Conn., Feb. 17, 1827; she married in 1873 and removed to Winsted, Conn., and thence to Pittsfield, Mass. A collective edition of her poems was published in 1888. The stories in *Somebody's Neighbors* (1881) and her other prose volumes are faithful studies of life and character in rural New England. D. in Pittsfield, Mass., July 18, 1892.

H. A. B.

Cookery: the art of preparing and dressing food by the agency of fire or heat. In its crudest form this was prac-

ticed by the earliest known human races. For centuries but little advancement was made. We read, it is true, of the magnificent feasts given in Greece and Rome before and early in the Christian era; but in those times any improvement made in the methods of preparing food was for the few, while the masses continued to live in the rudest manner. During the nineteenth century, however, great progress has been made. Scientists have given more attention to the study of nutrition, and in the last quarter of a century much has been done to educate all the people in the best methods of preparing food. Great Britain has taken the lead in this work, introducing cooking into her board and other schools. In the U. S., cooking-schools—private and connected with the public schools—have done much to spread the principles of healthful cookery. Following out the practical application of the theories of nutrition and of food values expounded in recent years by Vait and his followers of the Munich school of physiologists, there have been opened in the U. S. experiment stations for the study of human food and its best preparation scientifically and economically. A beginning only has been made in cookery from a scientific standpoint, but, under the name of the New England Kitchen, Mrs. Ellen H. Richards, of the Massachusetts Institute of Technology, with the assistance of Mrs. Mary H. Abel, has given this important work an impetus which is destined to tell in future work. With all these agencies in operation the twentieth century should show great advance in healthful and economical cookery, and consequently a physical and mental improvement in the people.

Effect of Heat on Food.—Cooking develops flavor and lessens cohesion, thus making our vegetable and animal foods more digestible. The effect of heat on animal foods is to coagulate the albumen, solidify the fibrin, and gelatinize the fibrous, tendinous, and connective tissues. A piece of raw beef will be spongy, tenacious, and tough. Cook it and it becomes firm, comparatively tender, easily torn apart, and of an appetizing flavor, while if it be cooked rare the juices will run freely. Albumen when subjected to a high temperature not only coagulates, but hardens. For example, the white of an egg, which is almost wholly albumen, will, if cooked for ten minutes in water below the boiling-point, coagulate in a soft, creamy mass. If the egg be cooked longer than ten minutes, say twenty or forty, the white will become a little firmer; but no matter how long the cooking may continue at the temperature below the boiling-point the white of the egg will be so soft that it will break into small particles when pressed between the fingers. If, on the other hand, the egg be cooked five or ten minutes in boiling water the white will be transformed into a smooth, hard, leathery substance, most difficult of digestion, because it does not break up readily. In cooking meats the albumen and fibrin are affected by high or low temperature in the same manner as the white of the egg, but the albumen in meats is so closely united with other elements that it is impossible to illustrate the effect of high or low temperature with the same clearness and ease as in the case of the white of the egg. The result of the application of different degrees of heat to albuminous substances is one of the most important principles in cookery. On the proper observance of this principle depends the healthful and economical preparation of a large part of daily food.

General Principles of Cooking Meat.—Some modes are more healthful or more economical than others; but since variety is necessary to both health and appetite, it is wise to secure it, even if in so doing the most desirable methods be not always followed. A piece of fresh meat, when exposed for a short time to a temperature of 212° or more, will become firm and hard on the surface. If the high temperature be continued for a long time not only the surface will become hard, but also the entire piece of meat, being stringy and indigestible as far as the intense heat has had time to penetrate. This is often seen in a steak, a roast of beef, a turkey or chicken, a piece of corned beef, etc. A piece of meat cooked at this high temperature will, when cut, break into tough, stringy pieces, juiceless and unpalatable. If the same piece of meat had been cooked a sufficient length of time in a temperature just below the boiling-point it would have cut into smooth, tender, juicy slices; for such a temperature would soften and gelatinize the tissues. At this temperature the juices of the meat are drawn to the surface and wasted unless precautions have been taken against loss. It is therefore necessary to form a hard crust on the piece through which the juices can not escape. This is done by exposing the outside of the meat to a high temperature until a thin crust is formed through the hardening of the albuminous matter on the surface. As soon as this result is attained the temperature should be reduced below the boiling-point. Meats cooked below or at the boiling-point do not have the appetizing flavor possessed by those cooked at a higher temperature, but the intense heat which is applied at first to harden the surface develops the flavor in roasted and broiled meats. If we wish to draw the juices and nutritive qualities from a piece of meat we cut it into small pieces, put it in cold water, and heat it slowly almost to the boiling-point. It must not boil if we wish to keep the albumen in a soluble form, as it should be kept for beef tea. All animal substances, if kept closely covered for any length of time at a temperature much below the boiling-point, will spoil quickly. This is particularly true of liquids. It is therefore important that the cooking should go on steadily for the appointed time, and then if the food is to be kept for any number of hours it should boil hard for a few minutes and then be taken from the fire and cooled rapidly. In making soups and broths it is advisable to have a slight vent in the cover.

With these few general remarks the special methods of cooking meats may now be considered.

Boiling.—For all except salt meats the water should be boiling rapidly when the meat is first put in. Cover the pot, and when the water begins to boil again, skim carefully. Let the water continue to boil rapidly for about fifteen minutes. In this time a thin, hard coating will be formed on the surface by the albuminous matter. This will keep the juices in the meat. At the end of fifteen or twenty minutes the pot should be drawn back where the water will just bubble at one side, not all over the surface. This temperature should be kept up until the meat is done. The time required for boiling a piece of meat depends upon the size and kind of piece used and the tastes of the family. All red meats should be cooked rare; all white meats, as well as all that have been salted, should be well done. A leg of mutton weighing 10 or 12 lb. will be moderately rare when cooked for two hours. A turkey weighing 10 lb. should be cooked for three hours and a half; if tough, it may take an hour longer. Fowl, when in good condition, will boil in two hours, but when old it sometimes takes four hours to cook them. A piece of corned beef will cook in five hours. It matters not how small or large the piece may be, the time will be about the same, because the fibers require that length of time to soften. Smoked tongues and hams should be well washed, soaked in cold water for twelve hours, then boiled for five hours.

Broiling.—This is probably the earliest known process of cooking meat. Simple and ancient as it is, in many households the broiling is done no better than, if as well as, in the days of semi-civilized man. The secret of good broiling is to have the surface of the article brown, not scorched, and all the rest tender and juicy. If the meat be red it should be rare, as beefsteak and mutton chops; but if white it must be well done. There are to-day so many appliances for this mode of cooking that it may be done over, under, or in front of a bed of coals, or under a sheet of flame in a gas-stove. In the ordinary household the coals may come from wood burned slowly to produce a bright bed, or a charcoal, anthracite, or bituminous coal fire may be employed. Where natural gas is used a bed of fire-brick is made hot and the gas then turned off, the broiling being done over the hot bricks. This is not satisfactory, as the bricks are not hot enough to give the first browning. A gas-broiler is often used. It is made somewhat like the broilers for artificial gas, and the broiling is done under a sheet of flame. This is much better than the heated bricks. The average housekeeper broils over a bed of coals. The coals should be clear and red and all the draughts be opened. Place the piece of meat in a double broiler and hold it close to the fire, turning frequently until the food is browned (about four minutes for a steak, chop, or small bird); then lift the broiler up a few inches and continue turning constantly until the meat is done. A steak or chop cut a little more than an inch thick will take ten minutes to cook; a small bird, like a quail, the same time. White meat will require a longer time, because it must be well done. This meat, however, will not need such constant turning as the rare meats; still, it must be turned frequently.

Roasting.—Perfection in roasting is gained by the use of a spit before an open fire. But so few modern ranges are provided with the proper arrangement for roasting before

the open fire that, as a rule, most folks in this country, and, indeed, in Europe, roast their meats in an oven. The same fixtures that are used in the gas-stove for broiling are used also for roasting. Roasting done in good gas-stoves is almost perfect; that done in the closed oven, while not ideal, may be at least satisfactory. The article to be cooked never should be placed in the bottom of the pan. Iron racks, with legs that raise them 2 or 3 inches, can be bought in any kitchen-furnishing store. Such a rack should be placed in the dripping-pan and the meat laid upon this. Dredge with salt, pepper, and flour, also dredge the bottom of the pan with flour. Place in an oven heated to about 450°. Watch carefully, that the flour in the bottom of the pan shall not burn. When it turns a dark brown, which may be in five or ten minutes, add enough boiling water to cover the bottom of the pan; but do not wet the meat. When the roast is brown on one side, turn it and brown the other. As soon as it is perfectly browned reduce the heat by closing all the draughts, and begin to baste the meat generously with the gravy in the pan and lightly with salt, pepper, and flour. Do this every fifteen minutes until the meat is cooked. The water in the pan must be removed after each basting. Now, the constant basting drives the heat from the surface to the center of the meat; it also tends to make juices. The basting, which was religiously attended to when roasting was done before the fire, furnished half the elements of success in this method of cooking. As it is more trouble to baste in the oven, many housekeepers sadly neglect this duty.

Stewing.—This is a process which admits of the use of the tough cuts of meat. Only enough water to cover the article is used. The cooking is continued for a long time at a low temperature, until the toughest piece of meat is made tender. The liquid which covers the meat never should do more than bubble slightly, and only at one side of the stew-pan. The meat may be cooked in one piece, or may be divided into small parts. The commonest method of preparing food in this manner is to have vegetables and other seasonings added to the meat, which is generally cut into small pieces. The gravy is thickened with flour. Success in making such dishes depends upon the slow cooking. If rapid boiling be permitted, the meat will become hard, tough, and stringy, and the flavor of the stew be ruined. It adds very much to the flavor of the stew if the meat be browned before adding water to it.

Braising.—This mode of cooking is a combination of stewing and baking. Formerly when all the cooking was done at an open fireplace, a braising-pan was made with a deep cover, on which coals were heaped, the pan being then placed over coals mixed with ashes, or hung over the fire. These pans were often used for baking a loaf of bread or anything that required the heat on all sides. The necessity for this kind of pan passed away with the introduction of ranges or stoves with ovens. Any deep pan, with a close-fitting cover, will answer for a braising-pan. In braising, only enough water to make a gravy is used. Herbs, vegetables and spice are frequently employed to add flavor to the piece of meat, but a seasoning of salt and pepper satisfies simple tastes. The meat is placed in the pan, and, if it have no fat itself, a little pork or some other kind of fat is placed on the bottom of the pan. The meat is dredged generously with salt, pepper, and flour; then the pan is covered and placed in a moderately hot oven. At the end of half an hour the cover is removed and about a pint of hot water added. The pan is then covered and returned to the oven, the heat reduced, and the meat cooked slowly for five hours, being basted every half-hour with the gravy in the pan, and salt, pepper, and flour; the water being renewed whenever necessary. At the end of five hours the gravy is thickened with flour. To have this dish in perfection, the cooking must be slow after the first half hour. At no time should the oven be hot enough to cause the water in the pan to bubble. Braising is one of the most economical methods of cooking, for there is no waste, and the toughest piece of meat can be made tender and savory in this manner. People with weak digestion can not always eat meats that are stewed or braised. It may be that all these dishes would be more healthful if the covers of the pans were so placed that there would be an outlet for any gases that may form in the long, slow process of cooking.

Frying.—This mode of cooking is the least healthful, and in the ordinary household is generally followed in an unscientific manner. To fry properly there must be enough fat to cover the article that is to be cooked. The fat must be so hot as to harden the surface of any article of food the moment it is immersed, making it impervious to the fat or the juices contained in the article itself. The albumen of an egg hardens so quickly that cooks take advantage of this quality to protect articles that lack albuminous matter enough on the surface to form a coating for the food. The egg does not brown quickly, nor does it take a fine color; so bread or cracker crumbs are used with the egg to give the surface color and crispness. Sometimes an article is lightly coated with dry flour or meal, as in the case of some kinds of fish. It is necessary to have perfectly sweet fat, free from foreign substances, such as water, crumbs, etc. This must be heated slowly to 350° or 400° F., depending, of course, upon the kind of article that is to be fried. When blue smoke rises from the center of the liquid, it indicates a temperature of about 350°. All articles that require three or more minutes' cooking, and such as are prepared with flour, eggs, sugar, butter, etc.—for example, fritters, doughnuts, muffins—should be dropped into fat at this temperature; but oysters, croquettes, whitebait, and anything else that requires but little cooking, should have the fat at 400° when immersed. The heat may be tested by a piece of stale bread; if this becomes a rich brown in one minute the fat is at about 350°, but if it browns in half a minute the heat is about 400°. Successful frying depends upon what the French term the *surprise*, meaning the almost instantaneous coagulation of the surface of the article. After this has taken place the temperature may be reduced a little, but never lower than 350°. If too many cold articles be immersed at once, the temperature will be lowered too much and the food absorb grease. The presence of water is always indicated by the fat's bubbling when heated. Pure fat has no motion, unless heated to a temperature that will fill the room with smoke and instantly burn anything that is dropped into it. An article of food properly fried should be so dry and free from grease when brought to the table that it would not soil a sheet of white paper. Frying in deep fat, compared with what is called frying in a shallow pan, is economy of time, materials, and work of the digestive organs.

Fish is subject to nearly the same treatment as meat, in boiling, broiling, baking, etc. The principle of applying intense heat at first, to coagulate the albuminous matter on the surface and develop flavor, is quite as essential in the one case as the other.

Soups and Broths.—In preparing these dishes the great end is to extract from the flesh and bones of the animal all the nutritious properties possible. For this reason the process is the reverse of that of boiling. The meat is cut into fine pieces and the bones are well cracked. All is put in cold water, that the soluble matter may be softened and extracted. The mass is then heated to a degree near the boiling-point, and cooked in this manner for six or eight hours. If it is never allowed to boil, the soluble albumen is left floating in the broth in a digestible form, as always should be the case in making beef tea for the sick. But if the soup be allowed to boil, this albuminous matter will harden into a dark, stringy substance, which is finally strained from the clear broth. Soups or broths cooked at this low temperature always will be liquid, no matter how rich they may be in meat extracts, because the temperature is not high enough to dissolve the gelatin in the bones and meat. To accomplish this, it is necessary to boil the soup gently for a great many hours. When the strained liquid becomes cold, it forms a jelly. The flavor, too, is different from that of a soup cooked below the boiling-point. If a still richer flavor be desired, the meat is first browned in its own juices, and then the cold water is added. Vegetables should not be cooked in a soup more than an hour and a half. Long cooking gives them a rank flavor, which they impart to the soup; and they also absorb the meat flavors.

Vegetables.—The effect of cooking upon vegetables is to soften the fibers and cause the starch granules to swell and burst, thus making the vegetable palatable and easy of digestion. All vegetables, except dried seeds, should first be put in boiling water long enough to soften the tissues and cook the starch—no longer. Over-cooking produces a dark, strong-flavored, indigestible dish. Vegetables of strong flavor, like cabbage, cauliflower, turnips, carrots, onions, etc., should be cooked in a generous amount of water, while the delicately flavored kinds, such as peas, asparagus, potatoes, etc., should be only covered with water. Nearly all vegetables are better for gentle boiling, but a cabbage should be cut into several parts and cooked rapidly in a large kettle of boiling water. The cover must not be put on the

kettle while the cabbage is in it. From thirty to forty-five minutes will suffice to cook a head. Cauliflower should be put, head down, into a kettle of boiling salted water and cooked for half an hour, boiling gently all the while. Green peas should boil gently with the cover of the saucepan drawn a little to one side. Although a potato will be hard and indigestible if underdone, it is only a step from this condition to over-cooking. If a potato be baked, boiled, or steamed too long, it will deteriorate from the moment the over-cooking begins. Potatoes, placed in a kettle on the fire and covered with boiling water, will cook in just thirty minutes. In a moderate oven a potato of medium size will bake in forty-five minutes. If potatoes must be kept warm for any length of time after cooking, they should be covered with a coarse towel through which the steam can escape. They never should be closely covered.

Bread.—All the grains, and even nuts and tuberous roots, are brought into requisition in making this staff of the human family's life. Owing to the large amount of gluten in wheat, that grain is particularly well adapted to bread-making. The perfect loaf of bread is the highest form of vegetable food. The amount of labor which a loaf represents is almost incredible. From the selection of the seed to put into the ground until the bread is taken from the oven the physical and chemical changes are many. Upon the quality of the wheat and the milling depends largely the quality of the bread. Flour made from wheat grown in a wet season, or that which has been wet and not properly dried, or which was grown in too highly fertilized soil, will not make perfect bread. The gluten of such wheat will have a tendency to soften when mixed in the dough. Freshly ground flour, even from the best wheat and the finest milling, will exhibit nearly all the characteristics of flour made from poor wheat, that is, it will soften in the dough; but the bread will have a particularly sweet, nutty flavor. The wheat should be perfectly dry before being ground, and the flour should have a month or more to season before being used. New flour and that made from grains grown in a wet season are improved by being dried in a warm place for a few hours before being used. Good flour will have a pleasant odor and a yellowish tinge, but if made from damp wheat it will exhale a musty, unpleasant odor. If a small quantity of flour be mixed with cold water and formed into dough and then be kneaded for a few minutes, it will show the quality of gluten in the flour. If the dough become smooth and elastic it will be evident that the gluten is sound, and that there will be no difficulty in making good bread. Flour and meals should be kept in a pure, dry atmosphere.

In the earliest ages the grain was pounded and rubbed between stones, or in a sort of mortar. Later two mill-stones were used, the power being either animal, or wind, or water. Since then the improvements in milling have been wonderful. The best mills have machinery that separates each part of the grain and finally reduces the most desirable to flour. By this new process a larger proportion of the inner coats of the grain is made into flour than by the old process with stones; therefore the bread is richer in gluten and phosphates. A whole-wheat flour also is made in which a still larger proportion of the nutritive qualities is retained than in fine white flour. The flavor of bread made from this flour is sweet and nutty; the loaf is brown. This is the kind of bread which should be given to children, because it has so large an amount of the elements necessary to make teeth and bones. Whole-wheat meal, commonly called graham, is the unbolted meal. Aside from the coarse bran, which is irritating to some digestive organs, it is very desirable in the form of bread.

In commerce flour is known as "new process" and "old process." By the old process the flour is ground between stones; in the new process the grinding is done on corrugated cylinders. Flour made by the new method is granular to the touch, and packs more closely than that made in the old way. Measure for measure, the new process flour will weigh one-eighth more than the old. The housekeeper should remember this when following the old cookery receipts which call for flour by measure. If weight be used the rule need not be changed.

Methods of Making Bread.—Man must have known bread first in an unleavened form, but in some way he learned that fermentation produced a more porous, and therefore a more digestible, kind of bread. The leaven was a mixture of flour and water, which was allowed to ferment; or a piece of the risen dough was kept from one baking to another. These two substances are still used a great deal, but this mode of making bread light is open to many objections. Unless the dough be watched carefully, lactic acid is formed, and often the stage of putrefaction is reached. Scientific men have sought for some other method of making bread light. Aërated bread was made by mixing, under pressure, water, flour, and carbonic acid. Various acids and alkalies were tried, and as a result of all the experiments we have many kinds of baking-powders. These answer for breads when baked in small cakes, but nothing has been found which can take the place of the yeast plant for the large, sweet, porous loaf. About 1850 Adolph Ignaz Mautner, of Vienna, produced the press-yeast, or what is known in the U. S. as compressed yeast. This ferment is perhaps the best of anything yet known for bread.

There are many methods of making bread, but they all aim at the same thing: a light, porous, digestible mass. Bread made in Great Britain and the U. S. has a larger proportion of crumb than crust, whereas the reverse is the case on the continent of Europe. The more crust bread has the sweeter and more wholesome will it be. The elements of success in bread-making are good yeast and flour, a thorough beating or kneading, the right temperature, the proper degree of fermentation, and careful baking. The dough is made in the following manner. Suitable proportions of water, flour, salt, and yeast are mixed together. The dough is allowed to stand in a warm place until it has changed into a light, spongy mass, a little more than twice the original bulk. This dough is kneaded again, and then shaped into loaves and rolls, after which time is allowed for a second rising. It is then baked. Simple as this process reads, it involves conditions and chemical changes which must be watched carefully, else the bread will not be perfect. The water which is added to the flour dissolves the sugar and albumen, softens the gluten, and hydrates the starch. If the temperature be right, active fermentation begins at once, although it is not perceptible for several hours. Some of the starch is converted into sugar; this and the sugar of the flour are converted into alcohol and carbonic acid. This gas is diffused through the mass. The minute bubbles, being retained by the tenacious gluten, cause the dough to expand. As long as the fermentation produces only alcohol and carbonic acid, it may go on until the dough has risen sufficiently; if, however, fermentation be allowed to go too far, acetic acid will be formed and the dough become sour. On the other hand, if fermentation has not gone far enough, heavy, indigestible bread will be the result. Fermentation is most rapid at about blood-heat, 98°. The water with which the flour is mixed should be at about 100° in cold weather, and at about 80° in very hot weather. If the flour be kept in a cold place in winter, it should be placed in a warmer room for several hours before being made into dough. If compressed yeast be used, it should be thoroughly dissolved in the water, that it may be evenly incorporated in the bread. The beating or kneading of the bread also must be thorough, that the particles of yeast shall reach every point in the mass of dough. Great care must be taken that the dough is not chilled while being kneaded or in the first period of rising. It is impossible to make good bread with dough that has been chilled in the early part of the fermentation. Dough that has risen to a perfect sponge, and then been kneaded and chilled, will, if made into rolls (which must rise in a warm atmosphere to more than double their size before the baking), give a finer, whiter, and tenderer texture than if the rolls be made with the freshly risen sponge. One hundred degrees is the proper temperature in which to start the fermentation. After a few hours the heat should be lowered to about 70°, and it should be continued at this temperature until the dough is a spongy mass. When it has reached this stage it should be thoroughly kneaded, to break up the gas bubbles and distribute them throughout the bread, thus insuring a loaf filled with small pores. After this kneading the bread must be shaped and raised again to about twice its original size. It is then placed in an oven heated to about 400° F., the temperature being lowered the last half of the baking to about 300°. Fermentation goes on in the interior of the loaf until the temperature is raised to about 212°. It will be seen, then, that the large loaves should not rise as much as the small ones before baking; indeed, it is a pity that there ever should be a large loaf, because the small ones give more crust, and the heat passes to the interior so quickly as to stop fermentation before acetic acid can be formed.

The porosity of the loaf depends upon the elasticity and

tenacity of the gluten in the flour. Gluten exposed to the action of acetic acid will liquefy and lose its tenacity; hence, bread that is sour also is heavy. If too large a proportion of water be used, the texture of the bread will not be so fine and tender, as the pores will be large and unevenly distributed. In baking bread undergoes certain changes. The heat expands the air, moisture, and carbonic acid confined in the dough, and causes the loaf to increase to about double its size; the alcohol is vaporized, and almost entirely driven off in the gaseous form; the starch granules become ruptured, and some of the starch becomes transformed into sugar and dextrin; the vegetable albumen is coagulated and unites with the gluten and starch to increase the strength of the cell-walls, preventing them from giving way under the expansion of gas and vapors. Many chemists advocate using enough yeast to raise the dough to the required lightness in a few hours; but practice has shown that such bread loses its moisture and fine flavor within twenty-four hours, whereas bread in which only a small quantity of yeast is used, requiring many hours to become light, keeps sweet and moist for several days. A small quantity of sugar hastens fermentation by giving the ferment something from which to produce carbonic acid at once. One ounce of sugar to 4 lb. of flour is a good proportion. MARIA PARLOA.

Cook's Inlet: a part of the Pacific Ocean; in Alaska, opposite the island of Kodiak; between lat. 58° and 61° N., and lon. 151° and 154° W. It is 130 miles long.

Cook's or **Hervey Islands**: a group of Pacific islands under British protection; between 18° and 22° S. lat., and 157° and 163° W. lon. Total area, 142 sq. miles. There are six main islands; Raratonga is the largest, and has a population of 3,000; Mangaia has 2,000; Vatui or Atui, 1,200; Aitutaki, 2,000. Total population, 8,900.

Cookson, CHRISTOPHER, M. A.: philologist; b. at Dallington, Northampton, England, Apr., 1861; educated at Clifton College and at Corpus Christi College, Oxford; at present (1893) assistant classical master, St. Paul's School, London. He is the author of *The Principles of Sound and Inflexion as Illustrated in the Greek and Latin Languages* (in cooperation with J. E. King, 1888), and *An Introduction to the Comparative Grammar of Greek and Latin* (1890); and is one of the contributors to *Thirteen Essays on Education* (1891). B. I. W.

Cooley, THOMAS MCINTYRE: jurist; b. at Attica, N. Y., Jan. 6, 1824; removed to Michigan in 1843, and became a lawyer in 1846. He became Professor of Law in Michigan University in 1859, a justice of the Supreme Court of Michigan in 1864, and chief justice in 1867, but retired from the bench in 1885. He was appointed an interstate commerce commissioner by President Cleveland Mar. 22, 1887, and became chairman of the commission, but owing to ill health resigned in Oct., 1891. He published many legal reports, digests, and compilations; *The Constitutional Limitations which rest upon the Legislative Power of the States of the American Union* (1868); *Commentaries on the Constitution of the United States, etc.* (1873); *Law of Taxation* (1876); *Law of Torts* (1879); *General Principle of Constitutional Law in the United States* (1880), etc., and *Michigan* in the American Commonwealth Series (1885). D. in Ann Arbor, Mich., Sept. 12, 1898.

Coolidge, SUSAN: See WOOLSEY, SARAH CHAUNCEY.

Coolidge, THOMAS JEFFERSON: U. S. minister; b. Aug. 26, 1831, in Boston, Mass.: educated in Switzerland, Germany, and at Harvard University, from which he received the degrees A. B. and A. M.: treasurer of Amoskeag Manufacturing Company; president of Atchison, Topeka and Santa Fé R. R. In 1892 he was appointed U. S. minister to France to succeed Whitelaw Reid, but was superseded by ex-Senator James B. Eustis, of Louisiana, in March of the following year.

Coolie, or **Cooly** [Hindustani, *kūlī*, laborer, porter]: in a general sense, an Asiatic laborer not belonging to the artisan class; in a more special sense, a native of China or India emigrating to some foreign country under contract of labor. This coolie emigration began when slavery ceased. As the free Negro could not be induced to engage in field-labor on the tropical plantations, and as the white man proved physically incapable of doing the work, the owner of a great plantation had, indeed, only one chance left—that of importing laborers from India or China. Both countries were overpeopled; both races were acclimatized. Toward the middle of the present century the traffic began. The first to avail themselves of the overstocked labor-market of China were the British colony of Guiana, Peru, and Cuba. In 1847 two vessels went from Amoy to Havana with, respectively, 350 and 629 coolies on board. A few years later on, however, dismal rumors sprang up, denouncing the whole traffic as a new form of slavery more degrading and atrocious than the old one. It was found out that of 4,000 coolies who had been consigned to the guano-pits of Peru not one had survived. Great Britain took effective measures against the evil in 1855, but the result was simply that the whole traffic fell into the hands of the Portuguese, and degenerated still further. The convention of 1866 between France, Great Britain, and China first succeeded in confining the evil within certain limits. At a much earlier date East Indian coolies had begun to emigrate to Ceylon, the Straits Settlements, and Tenasserim; afterward also to Annam, Burma, South Africa, and Mauritius. Between 1834 and 1837 about 700 coolies were shipped from Calcutta alone to Mauritius, and in 1838 it was ascertained that up to that year no less than 25,000 coolies had left India for Mauritius. From 1834 to 1872, 161,539 coolies were exported to Trinidad, Jamaica, etc.

Coomans, JOSEPH: genre and historical painter; b. in Brussels, 1816; studied at Ghent under Hasselaere, and at Antwerp Academy, and traveled in Algiers, Italy, Turkey, Greece, and the Crimea. His *Last Days of Pompeii* (1863) is celebrated. *Defeat of Attila* (1848) is in the city-hall, Brussels. Studio at Boulogne, near Paris.

Coomas'sie: capital of the kingdom of Ashantee, in Western Africa; about 120 miles N. N. W. of Cape Coast Castle; lat. 6° 35′ N., lon. 2° 12′ W. (see map of Africa, ref. 5–B). It was captured by the British in 1874, and again in 1895. Pop. 20,000. See ASHANTEE.

Coombe, WILLIAM: an English humorous and satirical writer; b. at Bristol in 1741. Among his works are a *Tour of Doctor Syntax in Search of the Picturesque* (1812) and *Tour of Doctor Syntax in Search of a Wife*, both in verse. D. Jan. 19, 1823.

Coon'tie, or **Coon'ta** [an Am.-Indian word]: the popular name of the *Zamia integrifolia*, a plant of the natural order *Cycadaceæ*, a native of Southern Florida. Its stem abounds in starch, from which a part of the Florida arrowroot is prepared. Other species of the genus are cultivated in the Bahamas and in Asia for their starch, which, however, is usually classed as SAGO (*q. v.*). Florida formerly produced great quantities of this commodity, of which the quality was often excellent.

Cooper, ANTHONY ASHLEY: See SHAFTESBURY.

Cooper, Sir ASTLEY PASTON, F. R. S., LL. D., D. C. L.: surgeon; b. in Brooke, Norfolk, England, Aug. 23, 1768. He began to study surgery under Mr. Cline in London in 1784. He became Professor of Anatomy at Surgeon's Hall in 1792, and surgeon to Guy's Hospital in 1800. In 1805 he was chosen a fellow of the Royal Society. He gained distinction by a valuable work on hernia (1804–07), and practiced surgery with great success in London. His annual income is said to have amounted to £21,000. He was appointed surgeon to the king in 1828. Among his works are *The Principles and Practice of Surgery* (1836–37); a treatise *On Dislocations and Fractures* (1822), and one on the *Anatomy and Diseases of the Breast* (1829–40). D. Feb. 12, 1841. See B. B. Cooper, *Life of Sir Astley P. Cooper* (1843).

Cooper, GEORGE HENRY: rear-admiral; b. in New York, July 27, 1822; entered the navy as midshipman Aug. 4, 1837; served in boat expeditions against the Seminole Indians in Florida; in the Mexican war he commanded a detachment at Point Isabel; was engaged in attacks on Tobasco, Alvarado, and Tuspan, and remained with the squadron until the capture of the city of Mexico; was employed in the South Atlantic blockading squadron during the civil war, and during the bombardment of Fort Sumter in 1863 was in command of the monitor Sangamon; was commandant of the navy-yard at Norfolk 1872, Pensacola 1875–76, and New York 1878–81; in command of North Atlantic station 1882–84. Retired 1884. D. in Brooklyn, N. Y., Nov. 17, 1891.

Cooper, JAMES: general; b. in Frederick co., Md., May 8, 1810; graduated at Washington College, Pa., in 1831; studied law with Thaddeus Stevens; was a Whig member of Congress from Pennsylvania 1839–43; and was a leading opponent of the repudiation movement in Pennsylvania in 1847.

He was attorney-general of Pennsylvania in 1848, U. S. Senator 1849–55, appointed brigadier-general of Union volunteers in 1861, served in Virginia, and died at Columbus, O., Mar. 28, 1863.

Cooper, James Fenimore: popular novelist; b. at Burlington, N. J., Sept. 15, 1789; was a son of Judge William Cooper. The latter removed to Otsego co., N. Y., about 1790, and founded Cooperstown. Young Cooper entered Yale College in 1803, and became a midshipman in the U. S. navy in 1808. In 1811 he quitted the naval service and married Susan de Lancey, a sister of Bishop de Lancey. He published anonymously, in 1820, *Precaution*, a novel, which was considered a failure. In 1821 he produced the *Spy, a Tale of the Neutral Ground*, which had great success, was republished in various parts of Europe, and translated into several languages. *The Spy* opened a new and fresh field of national and imaginative literature. His next work was the *Pioneers* (1823), in which he gave a graphic description of American scenery and the adventures of life on the frontier of civilization. He published in 1823 *The Pilot*, a tale of the sea, which was very popular. He represented with great success in this work the character of sailors and peculiar phases of maritime life and scenery. In the *Last of the Mohicans* (1826) he gave a vivid picture of the life and character of American savages and trappers. In 1826 he visited Europe, where he remained nearly six years, during which he published *The Prairie* (1827), *The Red Rover* (1828), an admired tale of the sea, and other works. He criticised and satirized the national defects and foibles of Americans in *The Monikins* (1835); *Homeward Bound* (1838); and *Home as Found* (1838). Among his other works are a *History of the Navy of the United States* (1839); *The Pathfinder* (1840); *Wing and Wing* (1842); *Afloat and Ashore* (1844); *The Chainbearer* (1845); and *Oak Openings* (1848). D. at Cooperstown, Sept. 14, 1851. See Lounsbury's *James Fenimore Cooper* (1883) in the American Men of Letters Series.

Cooper, Myles, LL. D., Oxon.: an accomplished scholar; second president of King's College (now called Columbia College), New York city; b. in England in 1735, and educated at Oxford; became a fellow in Queen's College. He removed to America in 1762, as assistant to Dr. Samuel Johnson, first president of King's College, and was made president in May, 1763. In the revolt of the colonies he remained loyal to the crown, and was compelled to flee the country. He became one of the ministers of the English chapel in Edinburgh. D. in Edinburgh, May 1, 1785.

Cooper, Peter, LL. D.: manufacturer, inventor, and philanthropist; b. in New York city Feb. 12, 1791. His early life was one of labor and struggle. He commenced in boyhood to help his father as a manufacturer of hats. He attended school only for half of each day for a single year, and beyond this very humble instruction his acquisitions were all his own. At the age of seventeen he learned the trade of coachmaking.

The foundation of Mr. Cooper's fortune was laid in the invention of an improvement in machines for shearing cloth. This was largely called into use during the war of 1812 with Great Britain, when all importations of cloth from that country were stopped. The machines lost their value, however, on the declaration of peace. Mr. Cooper then turned his shop into the manufacture of cabinet-ware. He afterward went into the grocery business in New York, and finally he engaged in the manufacture of glue and isinglass, which he carried on for more than fifty years. His attention was early called to the great resources of the U. S. for the manufacture of iron. In 1830 he erected works in Canton, near Baltimore. Subsequently he erected a rolling and a wire mill in the city of New York, in which he first successfully applied anthracite to the puddling of iron. In 1845 he removed the machinery to Trenton, N. J., where he erected the largest rolling-mill at that time in the U. S. for the manufacture of railway iron. In these works he was the first to roll wrought-iron beams for fireproof buildings. These works have now grown to be very extensive, including mines, blast furnaces, and water-power.

While in Baltimore Mr. Cooper built, in 1830, after his own designs, the first locomotive engine ever constructed on the American continent. It was successfully operated on the Baltimore and Ohio R. R. Next we find Mr. Cooper taking great interest and investing large capital in the extension of the electric telegraph. He was the first and only president of the New York, Newfoundland, and London Telegraph Company, which continued its operations for eighteen years. He was honorary director of the Atlantic Telegraph Company, president of the American Telegraph Company, and president of the North American Telegraph Association, which at one time represented more than two-thirds of all the lines in the U. S. He took part actively in the first expedition that laid the Atlantic cable in 1854.

Mr. Cooper interested himself early in the New York State canals. Before the water was let into the Erie Canal it was an anxious question what was the best propelling power for the boats to be employed on the canal. Mr. Cooper then made an interesting experiment of propelling a boat by means of an endless chain 2 miles long, supported on posts and rollers, which was driven by the force of elevated water, and might be driven by any other power. By means of this he propelled a boat 2 miles in eleven minutes, carrying with him the Governor, De Witt Clinton, and other distinguished men at that time. Although this method of propulsion was not adopted at that time, it has since been successfully applied in passing boats through the locks of the Delaware and Raritan Canal.

Mr. Cooper served in the New York common council; was a trustee in the Public School Society, first formed to promote public schools in New York, and when that was merged in the board of education he became a school commissioner; but the most cherished object of Mr. Cooper's life, early conceived and faithfully carried out as soon as his means permitted, was the establishment of an institution for the instruction of the industrial classes. Accordingly, in the year 1854, he laid the corner-stone of a large building at the junction of the Third and Fourth Avenues in New York, "to be devoted for ever to the union of art and science in their application to the useful purposes of life." This institution has grown under the fostering care of the trustees appointed by Mr. Cooper and his own unremitting attention till his death. It has a school of art for women, taught in the daytime, in which free instruction is given in all branches of drawing, in painting, wood-engraving, and photography. It has likewise a free school of telegraphy for young women. These schools for the daytime accommodate about 200. The provision made by Mr. Cooper for this woman's art school has since been increased by several bequests from others.

In the evening are opened the free schools of science and art for young men and women. Here mathematics, practical engineering, and practical chemistry are thoroughly taught, and free lectures are given in natural philosophy and the elements of chemistry. In the art department every branch of drawing and painting is taught. During the year 1891–92 instruction was given in the free night school of science to 1,266 male students, and to 1,758 in the art school. Besides these free schools, there is a large free reading-room and library at the disposal of all comers. About 1,500 resort to this daily, where they have free access to 520 periodicals and papers, foreign and domestic, and about 34,000 volumes. Besides this, there is a free course of lectures given every Saturday evening during the winter in the large hall of the Cooper Union, which will seat 2,000.

On May 18, 1876, the Independent party nominated Mr. Cooper for President of the U. S., and at the following election he received nearly 100,000 votes. D. Apr. 4, 1883.

J. C. Zachos.

Cooper, Thomas: Chartist poet; b. in Leicester, England, Mar. 28, 1805; self-educated while working as a shoemaker; became schoolmaster in 1827; led the Leicester Chartists in 1841; for lecturing during the "riots" of Aug., 1842, received two years' imprisonment. During this time he wrote an epic, *The Purgatory of Suicides*, and a series of stories, *Wise Saws and Modern Instances*. In 1847 appeared his *Triumphs of Perseverance* and *Triumphs of Enterprise*. In 1849 he edited a radical journal, the *Plain Speaker*, and in 1850 a skeptical periodical, *Cooper's Journal*; lectured on history, poetry, and literature 1851–52; wrote the novels *Alderman Ralph* (1853) and *The Family Feud* (1854). In 1855 he became converted and lectured much in support of Christianity. D. in Lincoln, England, July 15, 1892. See his *Autobiography* (1872).

Cooper, Thomas Apthorpe: actor; b. in London in 1776; played with much applause in London and the U. S. His daughter married a son of President Tyler, under whom Cooper held various Government offices. His acting was of the school of John Philip Kemble. D. at Bristol, Pa., Apr. 21, 1849.

Revised by B. B. Vallentine.

Cooperage [deriv. of Eng. *coop*, cage, box, tub, vat: O. H. Ger. *chuofa* (> Mod. Germ. *Kufe*): O. Sax. *cōpa*, from Vulg.

Lat. *cōpa* = Lat. *cūpa*, tub]: the art of making rounded vessels by binding together a number of wooden staves with hoops. It is of very ancient origin and was diffused among many nations. Pliny asserts that it was invented by a people who lived at the foot of the Alps. Wet cooperage consists in making casks and barrels for liquids, such as wine, molasses, etc. For flour, fruit, etc., the cooperage is called dry, and the vessels used are of inferior construction. White cooperage is the name given to the making of tubs, churns, etc. The staves, which are mostly cut by machinery, are made broader in the middle, and must be curved precisely, so that when they are placed together and bound by the hoops they must meet accurately at the edges. The best casks and barrels are made of oak of superior quality and thoroughly seasoned.

Co-operation: a method of conducting industry in which the capital is supplied by and the control rests with the operatives when the industry is productive, and the consumers when it is distributive.

Under ordinary circumstances business is controlled by capital. Sometimes a man uses his own capital in amounts sufficient to purchase the materials and supplies, and to hire the laborers or clerks. More often he relies on credit, either commercial or industrial, for a part of the necessary capital. In the largest industries, like factories or railways, the managers represent the associated capital of a number of stockholders. But in all these cases it is the ownership of the capital which gives the ultimate power of saying who shall direct the industrial action. This state of things has many advantages (see POLITICAL ECONOMY), but it has also certain disadvantages. It often produces conflicts between capitalists and laborers; it may sometimes give opportunities of extortion from consumers. To remedy these evils schemes of co-operation have been suggested, whereby industry should be managed either by the producers or by the consumers, instead of by the capitalists. Where the industry is managed by the producers, it is called productive co-operation. Where it is managed by the consumers, it is called distributive co-operation.

The term co-operation is most loosely applied in current use. It is often extended to cover cases of *profit-sharing*, where there is no change in method of management, but only a distribution of profits from time to time among the employees of a business, or, more rarely, among its customers. It is easy to see how this usage arose. A co-operative industry would usually, though not always, divide its profits in this way. This division of profits naturally came to be the prominent feature in the public mind, and any industry which divided profits was called co-operative. But this usage is thoroughly incorrect. Division of profits involves no more change in methods of management than is involved in the substitution of piece-work for day-work. It is merely a different method of payment of the laborers, whereby the employer hopes to obtain an increase in efficiency which will more than counterbalance any extra price which he may have to pay. By substituting the piece-work for day-work, he can increase his gross earnings. By giving the laborers an interest in the profits, he may perhaps increase his net earnings. Experiments in profit-sharing are of great importance, and are discussed in the article PROFIT-SHARING, but they do not involve the change of industrial system which is contemplated by the advocates of co-operation.

Productive Co-operation.—The guilds of the Middle Ages were to all intents and purposes co-operative enterprises. That is to say, they were managed by associations of workmen, each one furnishing a small share of the capital required for the conduct of industry under mediæval methods. But as factories displaced manual labor, capitalists displaced independent workmen, even in those industries where processes were but little changed. It was not until about the middle of the present century that we find organized attempts to establish associations of workmen carrying on business for their own account. A society of co-operative masons was founded in Paris in 1848 which, in spite of the hostility of the Government, worked its way to well-deserved prosperity. In the same year a number of French piano-makers organized an industry of their own, with almost equally marked success. Similar associations have been developed among painters and other trades in France. In Great Britain and the U. S. they have been less successful. There is a record of a Boston tailors' associative union in 1849, but it was in the iron-foundry business, immediately after the civil war, 1861–65, that the first successes in the U. S. were achieved. In woodwork of various kinds the system has become still more widely extended, especially at St. Louis, while co-operative boot and shoe companies have been successfully organized in Massachusetts; though it should be said that the co-operation in this case is often nominal rather than real, the business being in fact managed by joint-stock companies.

By far the most successful experiment in productive co-operation in the U. S. is found among the coopers of Minneapolis. In 1868 a few journeymen coopers, under the leadership of C. W. Curtis, made an attempt to manage industry for themselves. Their work was successful, and was developed in more formal shape in 1874 by the organization of the Co-operative Barrel Company. Other shops of the same sort have since been organized, and with nearly the same success. An impartial investigator, Mr. Albert Shaw, says that the business methods of the co-operative shops are admirable, and their credit high; that the system has developed business capacity in men who were not aware that they possessed it; and that the moral effects of the co-operative movement constitute its highest success. It should be noted, however, that the conditions among the coopers are especially favorable for co-operative enterprise. The amount of capital involved is relatively small, and the workmen are therefore able to furnish it themselves instead of borrowing. The processes are simple, so that there is little or no risk of misdirection of labor and capital. Above all, a large part of the work is done for orders, instead of being thrown on a speculative market, so that the risks which, under ordinary circumstances, a capitalist must bear are conspicuously absent. This possibility of working for orders, instead of for the general market, is usually essential to the success of productive co-operation.

Consumers' co-operation, or *distributive co-operation*, has had a longer continuous history. Under the influence of thinkers like Saint-Simon and Fourier in France and Owen in England many attempts to do away with the capitalist were made by communistic societies. More than three hundred such societies were started in the United Kingdom between 1820 and 1830. But it was not until 1844 that a thoroughly successful co-operative store was established by the "Rochdale Pioneers." In that year there was great depression in the flannel trade at Rochdale, and a number of weavers clubbed together to purchase their supplies more cheaply. Rudely organized as it was, the advantages of the plan proved to be enormous. Twelve years from its first beginning this society possessed a capital of £13,000, and conducted a general supply business of almost every kind, amounting at times to decidedly over £200,000 a year. The co-operative organization spread to all parts of the United Kingdom, the most widely known co-operative stores being those of the army and navy and the civil service. Meantime there had been many such organizations in the U. S. Isolated experiments were made as early as 1830. In 1845 the Workmen's Protective Union of Boston organized a successful store, which was afterward carried on under the name of the New England Protective Union. The war interrupted this development, but after its conclusion it was taken up with renewed vigor. In the West, and afterward in the South, the Patrons of Husbandry encouraged the local granges to form purchasing clubs, employing general agents to buy supplies, often at a great apparent discount. The Sovereigns of Industry, organized in 1874, made co-operative distribution one of their principal objects, and were of great importance in New England, where the grange movement at that time was weakest. But the stores of the Sovereigns of Industry were unsuccessful, and the same thing may be said, with some reservations, of the Patrons of Husbandry also. The purchases were not always judiciously made, and after a brief time the stores found themselves filled with unsold goods. Economy was attempted in the wrong direction. The co-operators thought that the surest way to get their supplies cheap was to hire managers cheap. They found to their cost that cheap management wasted many times more money than it saved. It must not be inferred from this that all the co-operative enterprises were failures. On the contrary, there remain a large number of associations which have done useful work for a long term of years. But it is to be noted that many co-operative stores have been reorganized into joint-stock companies in such a manner as to be co-operative only in name.

There are other forms of distributive co-operation quite

as important as the stores. Chief among these are the societies for furnishing co-operative credit. The most important experiments of this kind in the U. S. have been the numerous BUILDING AND LOAN ASSOCIATIONS (*q. v.*), and they have accomplished a work which can hardly be overestimated. A similar system of co-operative credit enterprises has been undertaken on a wider scale in Germany, under the leadership of Herr Schulze-Delitzsch. These were first established in 1850, and for a long time formed an important element in developing the industry of the country. Mutual insurance forms another important field of co-operative enterprise. In the U. S. it has been most successful among manufacturing industries. About the close of the civil war a number of factories, which had to pay extremely high insurance rates on account of the general prevalence of fire in manufacturing establishments, undertook to insure one another instead of relying on an outside company for their insurance. Not content with adjusting the losses, they undertook to render those losses themselves as slight as possible, and to secure the adoption of rules and methods which should, as far as possible, prevent fires in the associated factories. In this they were extremely successful. Under the leadership of Mr. Edward Atkinson, they reduced the frequency of fires to a very small fraction of what had been previously the rule, and were enabled to do their business at appreciably less cost, on account of the reduction in insurance and the superior methods of construction. We may also note certain forms of distributive co-operation among farmers, of which the establishment in the U. S. of co-operative creameries has been perhaps the most successful. At first sight this seems like productive co-operation, but it is really analogous to the work of the store or the mutual insurance company, since the industry is managed by those for whom the service is rendered. For details with regard to the success or failure of many of these enterprises, see John Hopkins University *History of Co-operation in the United States.*

Socialists believe that co-operation ought to be made more general. Many of them rely on this means for changing the structure of industrial society. The plan of Ferdinand Lassalle contemplated the establishment of a system of government credit, whereby any association of workmen could mortgage the future results of their labor and borrow capital on this security. In this way Lassalle thought that the present monopoly of the capitalists in the control of industry would be done away with. A man who had no capital, but was willing to work, would be on the same level as one who had inherited capital from his father, or saved it from his business. But the history of co-operative enterprises gives little ground to expect much good from a project of this kind. On the contrary, it indicates that the waste of capital under the new system would many times outweigh whatever losses and difficulties there may have been under the old. Its advocates claim the following advantages from the co-operative system: 1. It does away with the conflicts between labor and capital. 2. It avoids the expenses of advertising and certain unnecessary expenses of management, which are incident to the conduct of business to-day. 3. It prevents the exorbitant profits which capitalists have been wont to charge. The weak point in the argument of the co-operators lies in the assumption of the existence of these exorbitant profits. It is a question whether, under the existing methods of industry, the losses from depreciation of capital do not practically wipe out most of the returns received in the form of interest. It is certain that these profits are very much less than is ordinarily supposed, and that the loss due to any slight falling off in efficiency and economy would be a much greater burden on the community than the profits which are now distributed among capitalists as a class. We come back, then, to the question can we expect to have as high a degree of efficiency and economy when business is managed by laborers or consumers as we have under the present system. To this inquiry, at present at any rate, our answer must be in the negative. While capitalistic management does not always put the best men in control, it keeps many classes of incompetent men wholly out of control. It is a system of natural selection, not wholly perfect, but thoroughly good in certain respects. If a man sees what the community wants and supplies it in an efficient manner, he makes money and is able to extend his operations. If he does not see what the community wants, or fails to supply it in an efficient manner, he loses so much money that he is unable to remain in control. Matters do not always work as well as this, but the general operation of the system is what has been here described. On the other hand, if the managers are chosen by the votes of the workmen or the consumers, experience, both of the guilds in the past and of the co-operative societies in the present, shows that we shall not generally have the most efficient men at the head. They will supply goods which the community does not want, or insist on making them by old methods when new ones would be better.

In the cases where co-operation has been most successful, like loan associations or mutual insurance companies, their success has been largely due to their educational character. Sometimes they have taught men to acquire business ability by showing them how the exercise of such ability was an essential means of success. The adoption of a plan like that of Lassalle, which should give every workman the right to control capital simply on account of his willingness to work, without regard to his business ability, would defeat the very end which the best co-operative societies have had in view. Sometimes they have taught men to develop new business methods of sounder character than the old. It may occasionally happen that abuses have introduced themselves into the conduct of a business, and under such circumstances co-operative enterprises may succeed in avoiding precisely those abuses. The case of the co-operative stores in Great Britain is an instance in point. Up to 1864 business there was managed largely under the credit system, and in many lines at least there was quite inadequate provision against bad debts. Such was the conservatism of the people that a store that required cash payment could not secure the necessary custom. But a number of persons, voluntarily associating themselves in a co-operative enterprise, could and did agree to pay cash; and by the substitution of cash for credit they saved money in a multitude of ways, and were able to obtain their supplies much cheaper, just as in the U. S. the mutual insurance companies were able to obtain their insurance much cheaper by voluntarily submitting to a number of rules that they made themselves, and which proved a safeguard against fire. As long as the old-fashioned stores in Great Britain continued to run on the credit system, so long the co-operative stores had a decided advantage. The cash system has now come to prevail in the retail trade of the United Kingdom to nearly the same extent that it does in the U. S. With this change of business habits the co-operative stores have lost their advantage, and the regular joint-stock establishments are now able to make as cheap prices as the co-operative ones and to hold their own with them in every respect. Again, it may readily happen that the workmen in some particular line of industry are not doing justice to their own ability—are habitually working in a slack manner, which involves waste of materials or loss of power, not to say loss of time also. Under such circumstances the stimulus which is given by working for themselves may result in an increase of zeal and efficiency which outweighs any disadvantage in business management. If it has further happened that the capitalist has been subject to the liability of strikes and that the co-operators are free from this danger, this advantage is greatly increased. But the cases where the advantages of productive co-operation have outweighed its advantages seem to have been relatively few—fewer, perhaps, in the U. S. and Great Britain than in France or Germany. Some think that this difference is due to the fact that the labor power of the British or U. S. workmen is under ordinary circumstances far better utilized than that of the Frenchman or German, and that this leaves less margin of possible advantage due to the increased stimulus of co-operation. If a man in the U. S. is working nearly as hard as he can, while the Frenchman or German is only working at half his possible speed, the chance for increased stimulus in the former case is obviously much less than in the latter.

Taking all these things into account we must for the present regard co-operation rather as an occasional means of success and as a useful educator than as a practicable method of conducting ordinary business. It may be that as the community becomes more generally educated in business methods and business habits the field of possible success for co-operation will constantly widen. This is a result that every one must desire to see realized. But such an educational result can only come through gradual progress and voluntary co-operation. The attempt to devise schemes of universal credit which should give the man who had not saved money the same chance to manage business with the one who had would defeat the end in view.

See George Jacob Holyoake's *History of Co-operation* for an account of European experience, and N. P. Gilman's *Profit-sharing between Employer and Employee.*

A. T. Hadley.

Co-operative Banks: See Building and Loan Associations.

Co-operative Insurance Societies: See Fraternal Insurance Societies and Life-insurance.

Co-operative Savings and Loan Associations: See Building and Loan Associations.

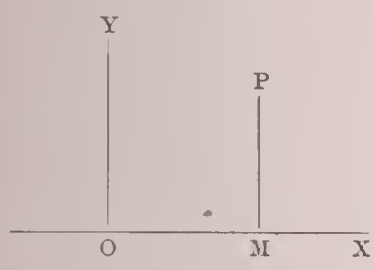
Cooper River: a river of South Carolina; rises in Charleston County, and flowing southeastwardly unites with Ashley river to form Charleston harbor.

Cooper's Creek: a stream in the interior of Australia; formed in Queensland by the junction of the Victoria and Thomson creeks; flows southward, and empties itself into the salt lake Gregory. Cooper's creek has a tragic interest, from the fact of the explorers Burk and Wills having perished in its vicinity.

Cooperstown: village; capital of Otsego co., N. Y. (for location of county, see map of New York, ref. 5–H); pleasantly situated on Cooperstown and Charlotte Valley R. R. and at the south end of Otsego Lake. The lake is 9 miles long, and is traversed by steamboats. Cooperstown has a union school and academy and an orphan asylum. Pop. (1880) 2,199; (1890) 2,657; (1900) 2,368.

Editor of "Freeman's Journal."

Co-ordinates: in mathematics, a system of lines or algebraic quantities by which the position of a point or line is determined. The most common system is called the Cartesian, after Descartes its inventor. Two lines of reference, O X and O Y, are taken, called axes of abscissas and of ordinates respectively. The position of P is then determined by the distances O M, called the abscissa, and M P, called the ordinate, which two distances are called the co-ordinates of the point P. The corresponding co-ordinates of a straight line are the negative reciprocals of the lengths, measured from O, which it cuts off from the respective axes of co-ordinates. In polar co-ordinates an initial axis is assumed (one extremity of which is called the pole), and an initial plane passing through the axis. Various other systems of co-ordinates are employed in analytical geometry.



Coorg: See Curg.

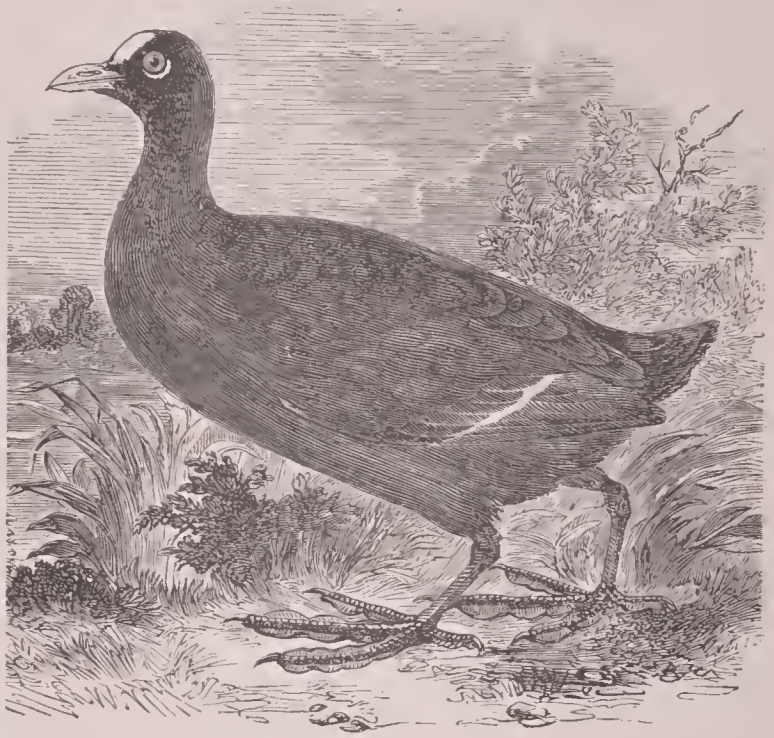
Coornhert: same as Cornhert (*q. v.*).

Co'os (in Gr. Κόως): the New Testament name (Acts xxi. 1) of the island of Cos (*q. v.*); a small island at the eastern entrance of the archipelago, celebrated in ancient times for its light woven fabrics, its excellent wines, and more especially for its famous temple of Æsculapius, which was virtually a museum of anatomy and pathology, from its votive models, and to which was attached a school of physicians. The chief town, of the same name as the island, stood on the northeastern shore, near the promontory of Scandarium, and derived considerable importance from its position as an intermediate station between Miletus and Rhodes. St. Paul passed a night there on his third missionary journey. The history of the island has many interesting points of connection with the Jews. From the edict of Simon Maccabæus (1 Macc. xv. 23) we learn that many Jews were settled in the island, and Josephus (*Antiquities*, 24, 7) tells us that during the Mithridatic war the Jews of Cos were very wealthy.

Coo'sa: a river of the U. S.; formed by the Etowah and Oostenaula, which unite at Rome in Georgia. It crosses the eastern boundary of Alabama, flows southwestward, and then southward, until it unites with the Tallapoosa on the southern border of Elmore co., Ala. The stream thus formed is the Alabama river. The length of the Coosa is estimated at 350 miles.

Coos Bay: the principal harbor of Southern Oregon. Its entrance, just N. E. of Cape Arago (lat. 43° 20′ 38″ N., lon. 124° 22′ 11″ W.), is very good, and its bar has 14 feet of water at high tide. The Coos river flows into it. Four miles from the bar, on the south shore, is Empire City, the capital of Coos County; and 4 miles from the mouth of the river is Marshfield, an important coal-mining center. The bay is important chiefly for its vast quantities of Tertiary lignitic coal, which is found on the south side over a large area. It is by many regarded as the best coal on the Pacific coast, but is inferior to the bituminous coals. The bay is surrounded by an elevated and densely timbered region.

Coot: a name applied in the U. S., and especially on the New England coast, to several ducks of the genus *Oidemia*. The white-winged coot is *Oidemia fusca*, skunk-head coot *Oidemia perspicillata*. In the South the name is given to



Common European coot.

the sora rail (*Ortygometra carolina*). In Great Britain the name is generally applied to the *Fulica atra*, a wading bird allied to the rails. The *Fulica americana*, found in nearly all parts of North America, is the bird to which the name coot should be restricted in the U. S. In its habits the coot very much resembles the water-hen. It lives in lakes or large ponds, or along the quiet banks of calm rivers, feeding upon mollusks, insects, and similar creatures, which it finds either in the water or upon land. It is an excellent swimmer, swift and strong, its toes being fringed with a wide flattened membrane on the edges, which present a broad surface to the water. It walks quickly and not without a certain grace, and when it perches it grasps the branches firmly, owing to the contraction of the foot.

Revised by F. A. Lucas.

Coote, Sir Eyre, K. B.: British general; b. in Ireland in 1726; went to India in 1754; became governor of Calcutta (1757); fought at Plassey in the same year; took Pondicherry in 1761; became commander-in-chief in India (1769), and defeated Hyder Ali in 1781. D. Apr. 26, 1783. His nephew, of the same name, served against the Americans in the Revolutionary war.

Copacabana: See Titicaca.

Copaiba (kō-pay'ba), or **Copaiva** (kō-pay'va), **Balsam of** [*copaiba* is of Brazilian origin]: a stimulant, diuretic, oleo-resinous drug, which has decided value in diseases of the mucous membrane; is obtained chiefly from Pará in Brazil, though the trees which produce it grow extensively in many parts of tropical America. These trees are of many species or varieties, belonging to the genus *Copaifera* and the family *Leguminosæ* and sub-family *Cæsalpinia*.

Copa'is (in Gr. Κωπαΐς): the ancient name of a lake of Bœotia, now called **Topolias**. It receives the river Gavrios, the ancient Cephissus. The extent of the lake varies at different seasons, and in summer it nearly all disappears. It is drained by artificial and natural subterranean channels into the sea. The lake is, indeed, simply formed by the circumstance that the subterranean channels are not always capable of carrying away the volume of water which the Cephissus and its affluents bring down into the basin. It was once famous for its eels.

Co'pal [of Mexican origin]: a name applied to several resins used in preparing varnishes. The copal of commerce is usually a nearly colorless, translucent substance, which is

imported from tropical America, India, and Eastern and Western Africa. The American copal comes from leguminous trees of the genus *Hymenæa* and allied genera. Zanzibar copal is the best. It is from *Trachylobium hornmannianum*.

Copan': a ruined city of Central America: in Honduras; on the Copan river; about 30 miles E. of Chiquimula (see map of Central America, ref. 4–E). It forms a rectangular area 1,600 feet long by 900 broad. It is surrounded by walls, and contains within a temple, a number of obelisks and idols, and blocks on which Maya hieroglyphs are inscribed. See CENTRAL AMERICAN ANTIQUITIES and INDIANS OF CENTRAL AMERICA. See also Stephens, *Central America*.

Copartnership: See PARTNERSHIP.

Cope [a variant of *cape*: Lat. *cappa*, covering for head]: a sacerdotal cloak reaching from the neck to the ankles, and open in front. It appears to have been modeled by Pope Stephen in 286, on the Roman *lacerna*, or hood. It is one of the vestments of the English Church, but is now seldom worn. See VESTMENTS, ECCLESIASTICAL.

Cope, CHARLES WEST: historical and portrait painter; b. in Leeds, England, in 1811. Pupil of his father, Charles Cope, landscape-painter, and of the Royal Academy, London. Royal Academician 1848; celebrated as an etcher. D. Aug. 21, 1890.

Cope, EDWARD DRINKER: naturalist; b. in Philadelphia, Pa., July 28, 1840; grandson of Thomas P. Cope; early distinguished himself in herpetology: Professor of Natural Sciences in Haverford College 1864–67; Professor of Geology in the University of Pennsylvania from 1889 till his death in Philadelphia, Apr. 12, 1897. He was for many years editor-in-chief of the *American Naturalist;* author of numerous contributions to the *Proceedings of the Academy of Natural Sciences of Philadelphia, Transactions of the American Philosophical Society, American Journal of Morphology*, etc. Among his more important works are *Primary Groups of Batrachia Anura* (1865); *Systematic Arrangement of the Lacertilia and Ophidia and of the Class Reptilia* (1854–70); *Systematic Relations of the Fishes* (1871); *The Mechanical Causes of the Origin of the Hard Parts of the Mammalia* (1889); *The Origin of the Fittest*; *The Batrachia of North America*; *The Vertebrata of the Cretaceous of the West*; *The Vertebrate Paleontology of New Mexico*; and the *Tertiary Vertebrata of the West*. Prof. Cope discovered almost 1,000 species of extinct and nearly as many recent species of vertebrata. He was attached as paleontologist to the U. S. geological surveys under Hayden and Wheeler. D. in Philadelphia, Feb. 17, 1897.

Cope, THOMAS PYM: a distinguished merchant of Philadelphia; b. in Lancaster co., Pa., in 1768. He commenced business in Philadelphia in 1790, and in 1821 established the first line of packets between that city and Liverpool. To his energy Philadelphia was chiefly indebted for the supply of water from the Schuylkill and for the establishment of the Mercantile Library. He was a member of the Society of Friends. D. Nov. 22, 1854.

Copec', or **Copeck'**, or **Kopeck'**: a Russian coin; the first ever used in that country as currency. The copecs were originally made of silver, but copper copecs were afterward coined. The copec in use at present is made of bronze. As the ruble equals 100 copecs, the value of the copec varies with that of the ruble.

Copehan Indians [from *kapai*, a Kope word signifying stream or river]: a linguistic family of North American Indians which occupies that portion of Northwestern California bounded on the N. by Mt. Shasta and the country of the Sastean, Qnoratean, and Chimarikan Indians, on the E. by the territory of the Palaihnihan, Yanan, and Pujunan, and on the S. by the bays of San Pablo and Suisun and the lower waters of the Sacramento. The western boundary begins at the northernmost point of San Pablo Bay, trends northwestward in an irregular line to John's Peak, from which point it follows the Coast Range to the upper waters of Cottonwood creek, thence to the W., crossing the head-waters of the Trinity and ending at the southern boundary of the Sastean family. (See map under INDIANS OF NORTH AMERICA.) It embraces two main divisions—the Patwin and Wintu, with their numerous small tribes. The name Patwin signifies man, person. The habitat of this division extends from Stony creek, a western tributary of Sacramento river, southward to the southern boundary of the family. They live beside the watercourses, except during limited periods in winter, when they establish hunting-camps on the plains and along the edge of the tule swamp for the purpose of snaring the numerous wild fowl. Following are the principal Patwin tribes: Chenposel, on lower Cache creek, Yolo County; Kornsi, at Colusa, Colusa County; Liwaito, on Puta creek, near the foothills, Napa County; Lolsel, in Lone valley, E. of Clear Lake, Lake County; Makhelchel, on eastern side of Clear Lake; Malaka, in Lagoon valley, Solano County; Napa, in valley and county of same name; Olelato, on Ulatus creek, Lake County; Suisun, on Suisun bay, Solano County; Topaidisel, at Knight's Landing, Yolo County; Waikosel, in Cortina valley, Colusa County; Wailaksel, on Middle Cache creek, Colusa County; Yodetabi, at Knight's Landing, Yolo County; Yolo (Pop. 45 in 1884), in Yolo County.

The name Wintu signifies Indians, or people, more strictly "the people," and is the name which the tribes comprising this division apply to themselves. Their territory extends from Stony creek northward as far as Mt. Shasta, embracing the upper Sacramento and upper Trinity valleys. Branches of this division were settled in 1876–77 in Yreka and in Inyo County, and a small colony had wandered as far as Huerfano Park, Colorado. The tribes of the Wintu division are Daupom, of Cottonwood valley, Shasta County; Nomlaki, on Stony, Thomas, and Elder creeks, Colusa and Tehama Counties; Normuk, on Hay Fork, Trinity County; Nuimok, on Lower Stony creek, Colusa County; Nummuk, on a tributary of the Cottonwood, in Shasta County; Tien-Tien, on Hay Fork, Trinity County; Waikenmuk, on the upper Trinity, Trinity County. Wailaki is a general term used by the Norbo to designate all the Wintu N. of them.

The general characteristics of the two divisions are nearly the same. Physically, the Patwin have broadly ovoid faces, low, very wide foreheads, large eyes, straight noses, exceedingly depressed at the root, and with prominent nostrils. Their heads are quite small, and covered with a coarse shock of hair, and the skin varies from brassy and hazel almost to black. The young women are of small frame and comely. In youth all of the Patwin are excessively obese, but the aged are hideously wrinkled and repulsive. The Wintu, particularly the mountaineers, are generally larger in stature.

On the plains the Patwin men and all children up to ten or twelve years of age formerly went entirely nude, while the women wore only a narrow slip of deerskin around the waist. In the mountains, however, the Patwin and Wintu women wore short petticoats made of cottonwood bark, which were sometimes fringed and ornamented with pine-nuts and shells. The Wintu women ornament their faces, and sometimes the abdomen and breast, by tattooing. In the plains the Patwin live in dome-shaped houses of branches and earth, the floors of which are about 2 feet below the surrounding surface; but in the mountains, where wood is more abundant, lodges are constructed without the use of earth, two or three families frequently occupying a single lodge. The Wintu lodges differ from those of the Patwin, in that they are sharply conical, and are composed of bark and poles.

All of the Copehan tribes are indifferent hunters, but expert fishermen, salmon forming one of the chief articles of subsistence, although in season wild fowl and other game, clover blossoms, roots, bark, piñon nuts, acorns, berries, and a number of farinaceous seeds (including wild oats and sunflower seeds), and even vermin, contribute largely to their maintenance. For superstitious reasons they do not eat the grizzly bear.

Little is known of the religion of these tribes. They celebrate by dances an abundant harvest of acorns or a plentiful catch of fish. They have other ceremonials, one of which, performed by the Patwin, is for "raising the dead," in early times used for keeping the women in subjection. The Wintu have a number of ceremonials, among which may be mentioned the puberty, gift, and scalp dances. Others of a social nature are also performed.

In war the Patwin employed bows and arrows and flint-pointed spears, and often displayed much bravery. Besides these implements the Wintu use the sling-shot with great skill. Scalps were not taken by the Patwin nor by the Tien-Tien, a Wintu tribe; but, when victors, the former often decapitated a young female captive, the head being held aloft as a target to taunt and exasperate the vanquished. Duels were sometimes fought by men with bows and arrows at long range.

Marriage is generally by purchase. The Wintu are polygamists, and their marital relations are loose and easily sundered.

The healing art is practiced by shamans, sucking and bleeding, combined with various superstitious practices, forming the modes of treatment of patients, from whom large fees are extorted.

Among the Patwin, motherless infants were shaken to death in skins or blankets, and a mother occasionally killed her own babe when deserted by her husband and having no relatives; for, it is said, the sentiment that the men must support the women is very strong among the tribes of this division. Wintu children have been known to be buried alive with their dead mothers.

A widow wears tar on her head and face as long as she is in mourning—sometimes two or three years, sometimes as many weeks. Only when she removes it is it understood she wishes to remarry.

Most of the Patwin tribes bury their dead, but some practice cremation. Among the Wintu a dead person is doubled up, wrapped into a ball with grass ropes, skins, etc., and interred with as many of his former possessions as possible, the remainder being burned. The names of the dead are never mentioned.

Of the present population nothing is known. Prior to the advent of the whites, most of the Copehan tribes were comparatively populous. In 1849 Gen. Bidwell stated that the village of the Kornsi, a Patwin tribe, contained at least 1,000 souls. Whether the other tribes were proportionately numerous is not known. They are now diminished and scattered.

Authorities.—Stephen Powers, *Tribes of Cala, Contributions to N. A. Ethn.*, vol. iii., pp. 218–242 (Washington, 1877); H. H. Bancroft, *History of California*, vols. i.–vii. (San Francisco, 1884–90). See Indians of North America.

F. W. Hodge.

Copenha'gen: the capital and only fortress of Denmark; situated on the east coast of Seeland on the Sound; in lat. 55° 40′ N., lon. 12° 34′ 7″ E. (see map of Europe, ref. 4-E). The narrow strait separating it from the island of Amager forms a splendid harbor. Besides four suburbs, the city consists of three divisions surrounded by fortifications—the old city, lying to the west, the beautiful new city lying to the northwest, and Christianshaven to the south on Amager island. There are within the walls sixteen squares and market-places, of which the most remarkable is the New King's Market, with an equestrian statue of Christian V. Among the most important buildings are the Church of Our Lady, a plain structure in Græco-Roman style, which is, however, adorned with numerous masterpieces by Thorwaldsen; Trinity church, adjoining which is the Round Tower, about 125 feet high, ascended by an interior spiral path of easy grade, up which Peter the Great of Russia once rode on horseback while his wife was drawn up in a four-horse carriage; the Royal Palace of Christiansborg, which also served formerly as a House of Parliament, but was unfortunately destroyed by a conflagration on Oct. 3 and 4, 1884, which left only the bare walls standing; the Amalienborg, four similar palaces surrounding a square, in the midst of which is the equestrian statue of Frederick IV., occupied at present by the royal family and the Minister of Foreign Affairs; the Castle of Rosenborg, surrounded by a beautiful park and royal gardens, a structure of notable architecture; and the Royal theater, on the New King's Market, a stately building erected by the architects Dahlerup and Hansen, adorned at the entrance with bronze statues of the poets Holberg and Oehlenschlaeger. The chief object of interest to travelers is doubtless the Thorwaldsen Museum, a unique structure, not only in its form, but also in the fact that it contains only the works of the artist whose name it bears. The entire building is a regular polygon built in the style of the antique mausoleum about an inner court, in the midst of which is the grave of the great artist. The building contains 80 statues, 130 busts, and 225 works in relief executed by the hand of Thorwaldsen, over 100 of the works being in marble. The Museum of Northern Antiquities, founded in 1807, contains a notable collection of articles of the stone, bronze, and ice periods. The University of Copenhagen, founded in 1479, has a strong faculty, and about 1,000 students and a library of some 250,000 volumes. Copenhagen is the literary, artistic, and intellectual center of Denmark, as well as its industrial and political capital. The theater is in the fullest sense a national theater, and receives state support. Numerous learned societies find their home here. The city presents an active, bustling, attractive appearance, marred only by the somber ruins of the Christiansborg. With the increase of travel to Norway the number of visitors to Copenhagen increases every year. The manufactories of Copenhagen are of considerable importance, but its commerce is its main support. About 12,000 vessels enter and clear the port each year. Copenhagen was constituted a free port Sept. 1, 1894. The position of Copenhagen between two seas gives it great commercial advantages. Regular lines ply from this port to the ports of the Baltic and to Norway, while the Thingvalla line for the U. S. touches here. As early as 800 Copenhagen was a well-known trading-point. Bishop Absalon built a fort here in the twelfth century on the site of the present castle of Christiansborg to protect the place against the pirates. In 1443 King Christopher, the Bavarian, chose Copenhagen for the royal capital. The city has undergone several sieges, most important being those by Charles X. of Sweden, 1658–60, when by its resistance it saved the independence of the Danish monarchy; by the English in 1807 (Sept. 2–5), when a large part of the city was destroyed, and the English, after the surrender, carried away the fleet. In 1801 the great but indecisive battle between Nelson and Olfer Fischer was fought near Copenhagen. Pop. (1890) 312,859; with suburbs, 375,251.

C. H. Thurber.

Copep'oda: a group of entomostracan crustacea of very different appearances, accordingly as they are free swimming or parasitic. All in the young stages pass through a nauplius (see Crustacea) and a cyclops-like stage, and some remain in the latter condition throughout life. In the cyclops condition they have an anterior unsegmented region (cephalothorax) and a jointed abdomen. There is a double eye in front, two pairs of large feelers or antennæ used in locomotion, and four or five pairs of locomotor feet on the cephalothorax. The eggs are carried in a sac on either side of the base of the abdomen. Two tribes are recognized: (1) Gnathostoma, embracing normal forms which are free swimming and which have the mouth parts fitted for biting; (2) Siphonostoma, in which the mouth parts are fitted for piercing and sucking. The Siphonostoma are all parasitic, and in many degeneration has proceeded so far that were the life history unknown one would scarcely think of the adults as being crustaceans, but would rather regard them as worms. Both parasitic and free forms occur in salt and fresh water, and many hundred species are known.

J. S. Kingsley.

Copernican System: that theory of the system of the world which represents the sun to be a fixed body, and the earth one of a system of bodies called planets which move around it. Hence it is known also as the *heliocentric system*. It derives its name from Copernicus (*q. v.*), who attributes it to certain ancient philosophers, especially the disciples of Pythagoras. The subject is not alluded to in the Almagest of Ptolemy, although the motion of the earth on its axis is spoken of as a hypothesis which had been propounded. On the whole, there is no epoch-making theory more completely the work of one man than this. Copernicus probably claimed no credit because in his age it was considered rash to propound a view in opposition to long received theories.

Coper'nicus (the Latinized form of **Kopernigk**), Nicolas: a celebrated astronomer; b. at Thorn, in Poland, Feb. 19 (O. S.), 1473. His father, a Polish merchant from Cracow, died early, leaving his children in the care of Lucas Watzelrode, their maternal uncle, who became Bishop of Ermeland in 1489. Nicolas studied in the high school of his town, and then in the University of Cracow. He applied himself eagerly to mathematics under Albert Brudzevski for four years, and then went to Italy, visiting first Bologna, where Dominico Maria taught astronomy, and afterward Padua, where he became doctor of medicine in 1499. He became intimate with Regiomontanus. Through his uncle he was appointed canon in Frauenburg 1499. He remained in Italy until 1503, and was Professor of Mathematics at Rome in 1501. He then entered upon his office of canon, and is found (1517–19) intrusted with the conduct of the episcopal possessions in Allenstein, and on other occasions ably conducting the cathedral's concerns. He never refused the poor his advice and care as physician. His great discovery, that the planets move around the sun, he spent many years in observations and calculations in order to verify. It was Copernicus's idea by a comparative study of the various astronomical systems of the ancients to develop a new system containing all the truth of the others, but

none of their errors. The Egyptians held that Mercury and Venus revolved around the sun, but they also held that the sun, with Mars, Jupiter, and Saturn, revolved around the earth. Most of the philosophers, however, of the Pythagorean school held that the sun was the center of the universe, and Heraclides and Nuetas even went so far as to explain the phenomena of the rising and the setting of the stars from a daily rotation of the earth around its own axis. From these various systems Copernicus drew his materials, the careful digestion of which finally led to his great discovery, which he expounded in his work *De Orbium Celestium Revolutionibus*, finished in 1530, but not published until 1543, from a fear of persecution. He dedicated his book to the pope, and cautiously propounded his system as a mere hypothesis. According to tradition, he received the first copy of his book on the day that he died. It was published in Nuremberg (1543), in Basel (1566), and in Amsterdam (1617). His theory was rejected not only by the clergy, but by astronomers. "The whole weight of Aristotle's name," says Hallam, "which in the sixteenth century not only biased the judgment, but engaged the passions, connected as it was with general orthodoxy and preservation of established systems, was thrown into the scale against Copernicus." D. at Frauenburg, 42 miles S. W. of Königsberg, Prussia, May 24, 1543. See *Life of Copernicus* by L. Prowe (2 vols., Berlin, 1883–84).

Copiapó (in full, *San Francisco de la Selva de Copiapó*): a city of Chili; capital of the province of Atacama; on the western base of the Andes, at an elevation of 1,300 feet, and 30 miles from the Pacific (see map of South America, ref. 7–C). It is watered by the little river Copiapó, which dries up before reaching the sea; the surrounding region is a desert, and in the town itself rain hardly ever falls. The average temperature in summer is about 67° F., and in winter 51°. Copiapó was founded in 1707 near some gold mines, taking its name from the Copayapu Indians of the vicinity. It was mainly a military and transport station until 1832, when rich silver mines were discovered in the vicinity; these now yield about $6,000,000 annually. A railroad from Copiapó to the port of Caldera has branches to the mines, and it is proposed to continue it over the Andes. Pop. (1895) 9,301. HERBERT H. SMITH.

Copinger, WALTER ARTHUR: See the Appendix.

Copley, JOHN SINGLETON: portrait and figure painter; b. in Boston, July 3, 1737; d. in London, Sept. 9, 1815. He began to paint early in life, and received some instruction from his stepfather, Peter Pelham, a well-known painter and engraver. He began to paint portraits in Boston about 1751, but his work had little artistic merit. He improved, however, as he went on, and a portrait exhibited in London in 1760 received praise from Benjamin West and other artists. He went abroad in 1774, settled in London in 1776, and was made a Royal Academician in 1779. He continued to paint portraits and pictures of historical subjects, and achieved a wide reputation. His work is very interesting to Americans, from the fact that he painted the portraits of numerous celebrities of the Revolutionary period. One of the best of his works is a family group now owned in Boston, and one of his best portraits is that of Mrs. D. D. Rogers, owned by H. B. Rogers, Boston. A fine portrait, that of Ralph Izard and Mrs. Izard, belongs to Dr. G. E. Manigault, Charleston, S. C. It was painted in Rome in 1774. WILLIAM A. COFFIN.

Coppée, kop'pā', FRANÇOIS ÉDOUARD JOACHIM: poet; b. in Paris, Jan. 12, 1842; began in 1866 to publish poems in the *Parnasse contemporain*. The same year he brought out *Le Reliquaire*, a collection all his own. In 1868 appeared *Intimités*, another collection; in 1869 *Poèmes modernes*. His first great success, however, was the comedy *Le Passant*, acted at the Odéon in 1869. During and after the Franco-German war M. Coppée vehemently espoused the cause of his country, and by poems and plays strove to encourage the French to heroic deeds. He became a member of the Académie Française Feb. 21, 1884. Among Coppée's collections of verse, the following are notable: *Les Humbles* (1872); *Le Cahier Rouge* (1874); *Les Mois* (1876); *Récits et élégies* (1878); *Contes en vers et poésies diverses* (1881); *Poèmes et récits* (1885). Among his plays: *L'Abandonnée* (1871); *Fais ce que dois* (1871); *Les Bijoux de la déliverance* (1872); *Le Luthier de Crémone* (1876); *Madame de Maintenon* (1881); *Severo Torelli* (1883); *Les Jacobites* (1885). Coppée's collected works have been published in six volumes (1883–85). See Jules Claretie, *François Coppée*, in the series Célébrités Contemporaines; M. de Lescure, *F. Coppée, l'homme, la vie, l'œuvre* (1889). A. R. MARSH.

Coppée. HENRY, LL. D.: soldier and author; b. in Savannah, Ga., Oct. 15, 1821; graduated at West Point 1845; was lieutenant of artillery till he resigned, June 30, 1855. He served in the war with Mexico 1846–48; engaged at Vera Cruz, Cerro Gordo, La Hoya, Contreras, and Churubusco (brevet captain). Chapultepec, and the city of Mexico, and as assistant professor at the Military Academy 1848–49, 1850–55. Professor of English Literature and History in the University of Pennsylvania 1855–56; author of *Elements of Logic* (1858) and of *Rhetoric* (1859), of *Grant and his Campaigns* (1866) and of several military works 1858–73; editor of a *Gallery of Famous Poets* (1858), of *Distinguished Poetesses* (1861), and of the *United Service Magazine* (1864–66); contributor to the principal reviews and magazines of the U. S. 1848–73; compiler of *Songs of Praise in the Christian Centuries* (1866); president of Lehigh University, Bethlehem, Pa., 1866–75, resigning the presidency in the latter year, but retaining a chair in the college which he held until his death, Mar. 21, 1895.

Copper (in Lat. *cuprum*): an elementary metallic substance, known at a very early period. Before iron was used it was the principal ingredient in domestic utensils and weapons of war. The Romans obtained the best copper from the island of Cyprus, whence its Latin name, *cuprum*, was derived. Copper is distinguished from all other metals by its peculiar reddish color. It is very ductile and malleable, and requires a temperature somewhat lower than gold, but higher than silver (estimated above 2,000° F.), for its fusion. Next to silver, it is the best-known conductor of electricity, being in the pure state 93·08, while silver is 100. The specific gravity of copper is between 8·91 and 8·95; atomic weight, 63·5; its symbol is Cu. It is very hard, elastic and tough, with a tenacity only less than that of iron. It crystallizes in the regular system, forming cubes, octahedrons, etc. The principal ores of copper, besides the native metal, are the sulphides of copper, either alone or combined with other metals, such as copper glance (Cu_2S), indigo copper (CuS), copper pyrites (Cu_2S,Fe_2S_3), variegated copper ore ($3Cu_2S,Fe_2S_3$); Fahl ores, containing admixtures of sulphides of copper, iron, zinc, silver, mercury, etc.; enargite, containing sulphides of copper and arsenic; oxidized copper ores, such as red copper (Cu_2O) and black oxide of copper; and copper salts, such as malachite (which is carbonate of copper), silicate of copper, dioptase, chloride of copper, atacamite, phosphate of copper, and arseniate of copper. All these ores contain copper; it is found also in small quantities in most soils, in seaweed, and in the animal body. Copper forms two oxides, the protoxide (CuO) and the suboxide (Cu_2O); the former is found native in dark steel-gray crystals, with a specific gravity of 5·9; the latter occurs in red translucent crystals, having a specific gravity of 5·8; prepared artificially, it forms a beautiful crimson powder. Protochloride of copper is brown in the anhydrous state, and green when hydrated; it is very soluble in water. There are several sulphides of copper, the principal being the protosulphide and the disulphide, corresponding in composition to the two oxides. They are both found native, and are worked as copper ores. The carbonate of copper is sold as a pigment under the name of blue verditer, and from the subchloride of copper Brunswick green is obtained. The blue and green verdigris of commerce are made by the action of acetic acid upon oxide of copper. The blue vitriol so extensively used in dyeing and calico-printing is sulphate of copper. The alloys of copper are of great value. Brass is copper alloyed with from 28 to 34 per cent. of zinc; gunmetal consists of 90 parts of copper and 10 of tin; bell and speculum metals contain a large proportion of tin. Bronze is sometimes made of 91 parts of copper, 2 parts of tin, 6 parts of zinc, and 1 part of lead. When exposed to the air bronze becomes covered with a green coating of basic copper carbonate, which protects it from further action. This coating is now generally produced artificially by a variety of methods, as by washing the surface with a solution of salts and acids. Alloys with aluminium containing the constituents in widely different proportions are made. That with 3 per cent. aluminium is whiter than aluminium, the color being more like that of silver. An alloy of copper containing 5 to 10 per cent. aluminium has a color resembling that of gold. This is very hard and elastic, and is known as aluminium bronze. It is now used considerably in the manufacture of ornamental and useful articles. German silver consists

of copper, zinc, and nickel. Metallic copper is of very great value in the arts, being especially valuable for ships' sheathing and bolts, and is also the material used in the manufacture of a great variety of wares. The development of electric lighting and the transmission of power and of speech have led to an enormous increase in the consumption of copper, chiefly in the form of wire.

Copper is found in every quarter of the world. It exists in great quantity on the shores of Lake Superior. The U. S. has reached the position of being the greatest producer of copper in the world, and has become one of the largest contributors to the world's markets. The following table shows the growth of the industry, the unit being the gross ton:

COUNTRIES.	1882.	1889.	1899.
Europe:			
Great Britain	3,464	905	550
Spain and Portugal	38,774	54,270	52,617
Germany	15,088	17,356	23,460
Other European countries	12,475	9,082	14,925
North America:			
United States	40,467	101,239	253,870
Other countries	2,401	9,435	28,766
South America:			
Chili	42,909	24,250	25,000
Other countries	8,199	7,733	7,730
Africa	6,316	7,860	6,490
Asia (Japan)	2,800	16,125	27,560
Australasia	.....	11,582	17,900
Totals	177,853	259,837	458,421

The production of the different States and Territories was as follows, according to the statistics collected by the U. S. Geological Survey, in pounds:

STATES AND TERRITORIES.	1889.	1899.
Michigan	88,175,675	147,400,338
Montana	98,222,444	225,126,855
Arizona	31,586,185	133,054,860
New Mexico	3,686,137	3,935,441
California	151,505	26,221,897
Colorado	1,170,053	11,643,608
Utah	65,467	9,584,746
Wyoming	100,000	3,104,827
Nevada	26,420	556,775
Idaho	156,490	110,000
New England	72,000	4,427,574
Middle States	.....	
Southern States	18,144	
Lead desilverizers	3,345,442	3,500,000
Total domestic	226,775,962	568,666,921
From imported ores	5,190,252	23,800,000

Although copper-mining was carried on in colonial days to a very limited extent in Connecticut, New Jersey, and Pennsylvania, and the existence of native copper in Lake Superior, Mich., was known as early as 1660 to the Jesuits, it was not until 1844 that systematic mining was begun in Michigan. Active work was undertaken in Vermont in 1850, and at Ducktown, Tenn., in the same year, California following closely. From 1867 to 1881 between 80 and 90 per cent. of the copper product of the U. S. came from Lake Superior. Then simultaneously the facilities for transportation offered by the transcontinental routes led to the development of the deposits of Arizona and New Mexico on the one hand, and of Montana on the other. Now the three great districts of the country are that of Lake Superior, Butte, in Montana, and the Bisbee, Clifton, and Globe groups, in Arizona. On Lake Superior copper is found native in three distinct forms of deposit. The "mass" veins, in which metallic copper has been found in masses, often of enormous extent, were the chief reliance of early mining. They are now reduced to a very insignificant position. The largest masses discovered were one of 500 tons at the Minesota mine, and a series of related masses in the Central mine which yielded about 1,200 tons. The second form of deposits are the ashbeds or amygdaloids, and the third the conglomerate beds, the latter being now the greatest producers. The metallic copper occurs in nodules, shot and sheets distributed through the beds, the rock yielding about 4 per cent. of copper in the Calumet and Hecla and as low as 0·75 per cent. in the Atlantic mine. The copper rock is crushed under large steam-stamps of the Ball and Leavitt types, and is washed in jigs and buddles, the concentrated product, called "mineral," carrying from 30 to 90 per cent. of metallic copper, being smelted and refined at one fusion.

The copper veins of Butte, Mon., occur in granite, carrying copper glance, peacock copper, and some copper pyrites. They have yielded enormous quantities of ore containing from 20 to 35 per cent. of copper, but the chief reliance of the producers are the low-grade ores which yield from 5 to 10 per cent. Practically all the ores carry some silver, the yield in some instances being relatively high. The ores must be concentrated by crushing and washing. The concentrates so obtained are roasted (i. e. deprived of the greater part of their sulphur contents), in stalls or Brueckner or O'Hara furnaces. The roasted ore is smelted in reverberatory or shaft furnaces to produce a "matte," a compound of copper, iron, and sulphur, carrying about 50 to 65 per cent. of copper. This "matte," generally argentiferous, is either shipped to Eastern or European smelters and refiners or is worked on the spot. Modern practice is to melt the matte in cupolas, tap it into Bessemer converters, expel the sulphur and arsenic by the Manhès pneumatic process, the product being an argentiferous metallic copper. The latter is cast into flat cakes called "anodes," and is worked by electrolysis, pure copper being deposited by an electric current in acidulated sulphate of copper solution on the cathodes, while silver and gold are gathered as a brown mud. The copper is smelted and refined, while the precious metals are parted in the usual manner. The methods followed at Butte may be regarded as typical of modern processes for the extraction of copper from complex sulphuretted copper ores.

The third important source of supply of copper in the U. S. are the deposits of oxidized ores of Arizona, the metal coming, with insignificant exceptions, from the three districts of Clifton, Bisbee, and Globe. The ore occurs in or adjacent to carboniferous limestones, and carries oxides and carbonates of copper. The bulk of the ore is hand-sorted, and is smelted with coke as a fuel in water-jacketed blast furnaces by a single fusion into bars of 96 per cent. standard, which are refined on the Atlantic seaboard, producing a high grade of copper. The smelting in Arizona is typical of advanced practice in the working of oxidized ores.

The report of the census (1890) showed that the cost of mining 3,322,742 net tons of ore, yielding 220,569,438 lb. of copper, was $12,062,180, including $6,096,025 for wages to 8,721 employees, $4,067,970 for supplies, and $1,442,846 for rent, taxes, etc. The cost of crushing 2,137,653 tons of ore in Lake Superior stamp-mills was $985,595.11, while the cost of concentrating and smelting Montana copper ores, producing 102,188,716 lb. of copper in matte and blister was $6,297,538.59. The outlays for smelting Arizona ore yielding 31,362,685 lb. of copper were $1,257,892.87. In refining, $1,885,261 was spent to produce 159,693,252 lb. of refined copper.

Although it constitutes only a fraction of the copper product in the U. S., the amount of metal obtained from cupriferous pyrites is an important source of supply in other countries, notably Spain and Portugal. The pyrites deposits of the Peninsula, which were worked by the Romans, are enormous bodies carrying from 2 to 3·5 per cent. of copper. The ore is either worked on the spot by roasting in open heaps, leaching with water, and precipitating with scrap iron, or by the more modern Deutsch process, or it is shipped to England and the Continent to be first burnt in calciners. The sulphurous acid from the calciners is utilized in the manufacture of sulphuric acid, largely to serve as a raw material in the older Leblanc process of soda manufacture. The residue, which contains the copper and small amounts of the precious metals, is calcined with an admixture of salt, which renders the copper soluble as chloride, from which solution it is deposited by scrap iron. The residue from the leaching out of the copper salts is an oxide of iron, known in England as "blue billy," which is utilized as a fettling in the puddling of pig iron or as an iron ore in the blast furnace. CHARLES KIRCHHOFF.

Copperas: the commercial name of the hydrated protosulphate of iron, sometimes called "green vitriol." It is composed of 28·9 per cent. of sulphuric acid, 25·7 of protoxide of iron, and 45·4 of water. It is used in medicine, in the dyeing of black, and in the manufacture of ink.

Copperhead: a venomous serpent of the rattlesnake family (*Ancistrodon contortrix*) furnished with loral plates on the head, but without rattles. When full grown it is about 3 feet long, of a light-copper color, with darker transverse bars. It has many local names, is nowhere abundant, but is more common in the Southern than in the Northern States. Its bite is much dreaded and often fatal.

Copperhead: any member of a party in the Northern States of America supposed to favor the secessionists dur-

ing the civil war. The epithet was given because this party was regarded as an insidious and secret foe to the Union.

Coppermine River: See the Appendix.

Copper River (native name *Atna*): a river of Alaska; rises in the mountains S. of the Tanana and empties into the North Pacific Ocean at about lat. 61°, lon. 145°. Its general direction is S., its length about 500 miles. An easy portage leads across the water parting between the Copper and Tanana. About 200 miles above the large delta, the river is joined from the E. by the Chittynia, which sends down copper in solution, from which the river derives its name.

Copper-smelting: See METALLURGY.

Coppinger, JOHN J.: See the Appendix.

Coprolite [from Gr. *κόπρος*, dung + suffix *-ite*]: the fossil excrement of animals. The term was originally applied by Dr. Buckland to certain deposits which he found in the lias, and determined to be the fæcal remains of the gigantic saurians of that period. The true coprolites of the lias are formed like kidney potatoes, of earthy texture, black or ash-gray color, and glassy fracture. They are twisted, showing the mark of the intestine, and frequently contain shells, fish scales and bones, or, more rarely, the bones of reptiles that were eaten by their larger relatives. The term coprolite has been extended in a commercial sense to include deposits of phosphatic rock containing large quantities of water-rolled, fossil bones of fishes and saurians, such as occur at the base of the Red Crag of Suffolk, England. The value of these minerals is derived from the phosphate of lime of which they are partly composed. It is used with great advantage as mineral manure, after having undergone cheap chemical treatment. It is converted into a soluble superphosphate by the action of sulphuric acid. The trade in Great Britain is of great importance, and the production large. Some specimens yield when washed and powdered over 85 per cent. of phosphates. The greensand varieties yield about 60 per cent. of phosphates. The annual yield of England is from 30,000 to 40,000 tons. These coprolites contain from 4 to 5 per cent. of organic matter and a little silica, but from 70 to 80 per cent. of their whole substance is a mixed phosphate and carbonate of lime. Extensive beds of phosphates occur in the Tertiary deposits of the Southern States, notably in South Carolina and Florida, and these contain many true coprolites mixed with other remains of vertebrates, especially of sharks, proboscidians, and cetaceans. The output of the South Carolina phosphate mines for 1889 was not far from 500,000 tons.

Revised by F. A. LUCAS.

Copse [*copse* is a variant of *coppice*, from O. Fr. *copeiz*, newly cut wood, probably connected with *colper*, *coper*, cut, and *colp* (> Mod. Fr. *coup*) < Lat. *colaphus* = Gr. *κόλαφος*, blow with the fist]: a name given in Great Britain to plantations of trees which are occasionally cut down for firewood, charcoal, or other purposes. There is considerable rough and rocky land in that country which yields more profit by devoting it to copse-wood than by any other plan. Hop-poles, hoops, tanner's bark, etc., are among the products of copses.

Coptic Church: the direct continuation of the old Christian Church in Egypt, which dates from the earliest Christian centuries. Egyptians listened to the preaching of Peter on the day of Pentecost. Alexandrians disputed with the martyr Stephen. Eusebius says that Mark, the author of the second Gospel, was the first Bishop of Egypt and had a large following. Since the bishopric of Dioscurus ceased, 452 A. D., monophysitism has been the tenet of the Copts. They have always detested the Council of Chalcedon (451). The Church retains the doctrine of transubstantiation, the practice of mariolatry and the confessional. In Upper Egypt the rite of circumcision has been retained, but in Lower Egypt it has been replaced by infant baptism. At the head of the Church is the patriarch, whose seat is now at Cairo. The names of 100 monks approved by the bishops and high priests are sent to the abbot of the monastery of St. Antony, and after being eliminated to three the patriarch is selected by lot. Under him are thirteen bishops and a high priest, besides priests whose duty it is to read the liturgy, but not to preach. Preaching in Coptic churches is unknown. There are also deacons, subdeacons, an archdeacon, readers, and precentors. Ordination performed by the patriarch and bishops is complete only after the use of the sacred oil, which, through the continued miracle of St. Mark, is never exhausted. They lay no claim to apostolic succession through the laying on of hands. The Coptic Church has been peculiarly exposed to persecution. Emirs vied with each other in the attempt to exterminate Christianity in Egypt. It is also a wonder that they have not become extinct through internal dissensions. Monophysites, Monothelites, Jacobites, Melchites, Phantasiasts, Eutychians, Acephali, Esaianites, Gaianites, Barsanuphians, Anthropomorphites, and Semidalites, now only names which perhaps excite a smile, are the epitaphs of so many wrangling sects that through centuries split the Coptic churches, murdered and drove Copts into deserts, caves, and dens. The Coptic Church is far from being in a state of peace. A party of reform among the laity is demanding that the large income of the Church, from the rents of bequeathed estates, now secretly appropriated by ecclesiastics, be managed on business principles; that Coptic schools be provided for Coptic children; and that steps be taken to secure a better educated ministry, who shall be paid a regular salary. In early times the Copts worshiped in Egyptian temples. Now they have their own churches, but, with exceptions, they are small and dirty. At Sunday services the men sit crosslegged on mats, or stand leaning on canes or crutches. At the close the congregation crowd around the priest, who lays his hand on the head of each in blessing. Their fasts are the "great fast" at Easter, fifty-two days, the fasts of Christmas, Whitsunday, and of the Ascension of Mary. During these only bread, onions, oil, and legumes are eaten. Neither the Coptic service nor the Coptic character is fitted to make any impression on Moslems favorable to Christianity. Efforts have therefore been made to infuse a better spirit among Coptic Christians. Since A. D. 1250 the Romish Church has had its Franciscan missionaries in Egypt. In 1781 Pius IV. established an apostolic vicarship at Cairo. The present vicar reports that he has 5,000 Coptic communicants and thirty-one native priests under him. The Church Missionary Society of England began work in Egypt in 1825, and the United Presbyterian Church of the U. S. in 1854.

Malan, London, 1872); Renaudot's *Liturgiarum Orientalium Collectio*; also, same author, *Historia Patriarcharum Alexandrinorum* (Paris, 1713); Brugsch's *Der Bau des Tempels Salamo's nach der Koptische Bibelversion* (Leipzig, 1877); Révillout's *Apocryphes Coptes du Nouveau Testament* (Paris, 1876); de Lagarde's *Bruchstücke der Koptische Uebersetzung des Alten Testaments* (in his *Orientalia*, 1884); Luettke's *Ægyptens neue Zeit* (Leipzig, 1873); Fuller's *Coptic Church* (in Smith and Wace's *Dictionary of Christian Biography*, Boston, 1877); and Butler's *The Ancient Coptic Churches of Egypt* (Oxford, 1884).

LYSANDER DICKERMANN.

Coptic Language and Literature: Coptic was the language of the Egyptian Christians. It was written with the aid of thirty-one letters—twenty-five in the Greek uncial form, six derived from hieroglyphic or demotic prototypes. The date of its rise can not be given accurately, as it was a development from the ancient language through the demotic. All three forms of the language are consequently of importance in mutually explaining a multitude of words. From a form largely monosyllabic, Coptic developed into a thoroughly agglutinative tongue, expressing its grammatical elements by suffixes, prefixes, and combinations. Forms it scarcely possessed, and variations of meaning were expressed by changes of vocalization, so that phonology must form the basis of the Coptic grammatical system. The language became more flexible, precise, and adaptable than its parent, and its lack of forms was supplied by a wealth of periphrase. The formation of its words and sentences is clear, and its vowel changes are of remarkable uniformity and regularity. Under Christian and Byzantine influence many Greek words, nouns, verbs, and particles were borrowed in a pure or adapted form, and were used side by side with the native synonyms. Latin and Persian words are also found, but none of Arabic origin. Coptic began to die out in the tenth and eleventh centuries, as is evidenced by the beginning of the production of works of a grammatical nature, in which the language is explained in a very imperfect way.

Coptic is known under several dialects, and the existence of others is suspected. The dialect of Upper Egypt was the oldest, usually called the Thebaic (better Sahidic, highland), and was spoken from Minyeh to Syene. The literature in it dates from between the third and seventh centuries,

and consists largely of annals written on parchment or papyrus. A large part of it lies unedited in Turin, Naples, Rome, and Oxford. A younger dialect which spread over the whole Delta region was the Memphitic (better Boheiric), containing a large proportion of all the Coptic literature which has come down to us, none being later than the ninth century. Nearly the whole Bible has been preserved in it. Between these two dialects was that of Middle Egypt (erroneously called the "Bashmuric"), which partook of the features of both. Its home appears to have been in the FAYÛM (*q. v.*). The whole of the Bible appears to have been rendered into this dialect, but only fragments of the translation are now extant. Another dialect was the "Bushmuric," spoken in the region of Lake Menzaleh, but it has left no memorials of itself. A careful comparison of the dialects is necessary in order to explain some forms otherwise unintelligible on account of their departure from the hieroglyphic originals. The dialectic variations are marked by preferences for certain letters, words, and forms, and by differences in vocalization. Though long dead the Boheiric is still used for liturgical purposes in the Coptic churches.

Most of the literature is biblical, theological, or ecclesiastical, comprising Gnostic works, lives of saints, apocryphal books, liturgies, etc. Some of the most noteworthy publications are mentioned below. Zoega's *Catalogus codicum copticorum* (Rome, 1810, fol.), containing biblical and patristic matter in all three dialects, is very valuable. Peyron's *Psalterium*; Woide's *Novum Testamentum* (Oxford, 1799, fol.); George's *Evang. Joannis* (Rome, 1789, 4to); Schwartze's *Pistis Sophia*, the famous Gnostic work (Berlin, 1851, 8vo); and Revillout's *Concile de Nice* (Paris, 1880, 8vo, and his *Papyrus Coptes* (in the *Etudes égyptologiques*, Paris, 1876), are all in Sahidic. Tuki's *Psalterion* (Rome, 1744, 4to: reprinted by the London Bible Society, 1826); Lagarde's *Psalterium* (1875, 4to); Tattam's Coptic and Arabic Gospels (London, 1847, fol.); and Révillout's *Apocryphes coptes du Nouveau Testament* (Paris, 1876), are in Boheiric. Budge's *Martyrdom and Miracles of St. George of Cappadocia* (London, 1888, 8vo) is partly in each dialect. Schmidt's *Gnostiche Schriften in koptischer Sprache aus dem Codex Brucianus* (in Gebhardt and Harnack's *Texte und Untersuchungen*, viii. 1–2) is a very valuable addition to the literature. The only Coptic grammar worthy of mention is that of Stern (*Koptische Grammatik*, Leipzig, 1880, 8vo), but it is essentially a grammar of biblical idiom only. The dictionary of Peyron (*Lexicon linguæ copticæ*, Turin, 1835, 4to) is the only one that is trustworthy; those of Tattam and Parthey are unreliable.

CHARLES R. GILLETT.

Coptos: See EGYPT, ANCIENT; also KOPTOS.

Copts [from Arabic *Ghubt* or *Khoobt*, a corruption of *Ha-Ka-Phtah*, the old Egyptian name of Memphis. The Greek corruption is Αἴγυπτος, whence Eng. *Egypt*]: a Christian people of Egypt, descended from the ancient inhabitants of that country, whose blood, however, is mingled with that of Greeks, Arabs, Nubians, etc. They trace their lineage back to the pyramid-builders, and in their slender limbs, high cheek-bones, thick lips, black eyes, and the absence of *embonpoint*, they do resemble the portraits on the monuments of the ancient Egyptians. Dean Stanley called them "the only living representative of the most venerable nation of antiquity." According to the census published by the Egyptian Government in 1869, the Copts numbered 500,000. Of these, 10,000 were said to live in Cairo. Entire villages in Upper Egypt are occupied by Copts, and their faces are common in the Fayûm. The ruins of Coptic churches thickly dotting the Delta and the Nile valley prove that they were once more numerous than now. By apostacy and marriage with Moslems they have long been decreasing. In customs, manners, language, and spirit, the Copt has become a Moslem from head to foot. He ridicules the Moslem mumbling his prayers with his face toward Mecca, but he repeats his own prayers and psalms in the same way with his face toward Jerusalem. At funerals the ceremonies are outwardly like those of the Arabs. A Coptic marriage consists of two parts: the betrothal and the coronation. These may or may not occur at the same time. At the betrothal two rings are blessed and exchanged. Except under peculiar circumstances, the coronation takes place at the church in the presence of priest and witnesses. The marriage robes are blessed, a white veil is held over the kneeling pair, they are anointed with oil, a crown and a cross are laid on the head of each, and prayers and blessings follow. According to the canon, the Eucharist should conclude the service. Divorce is legal only for adultery on the part of the wife, but, in consequence of the overshadowing influence of Moslem practice, divorces occur for other reasons. They dress like Arabs, except that the turban is grayish black or light brown, and they often wear a black coat or gown over their other dress. Coptic women veil their faces in public, and at home when male visitors are present. The Coptic record for honesty is not all that could be desired. Gibbon calls them "a race of illiterate beggars," but this hardly distinguishes them from the Moslems. Ammianus Marcellinus said: "They are false, faithless, and deceitful, but extremely useful as secretaries and accountants." Cyril said: "They are so sunk in darkness as hardly to know whether they believe or what they believe, but each one of them obstinately clings to his superstitions and errors." See Lane's *Modern Egyptians* (London, 1860); Malan's *History of the Copts* (London, 1872); Luettke's *Ægyptens neue Zeit.* (Leipzig, 1873).

LYSANDER DICKERMANN.

Cop'ula [Lat., bond, link; *co-*, together + root, *ap-* in *apis'ci*, attach itself to, *adipis'ci*, attain, *aptus*, suited]: in logic, that word or part of a statement which expresses a relation between the subject and the predicate. Thus in the sentence "Art is long," *is* is the copula connecting *art*, the subject, with *long*, the predicate.

Copyhold: a tenure of lands existing in Great Britain, founded upon immemorial custom. It is commonly said to have originated in a modification of the ancient villeinage by the commutation of base services into a fixed rent in money or money's worth, but this is not certain. A copyhold estate is a parcel of a manor, and is held according to the custom of that manor. Copyhold estates have been burdened with many inconveniences, such as the uncertainty of the customs on which the estate depends, restrictions on the cutting of timber and the mining of minerals, liability to arbitrary fines, etc., and to remedy these numerous statutes have been passed during the reign of Queen Victoria.

F. STURGES ALLEN.

Copyright: the exclusive right of the owner of an intellectual production to multiply and dispose of copies; literary property. It is a right afforded by the law for the protection of property in literary or artistic productions. The term is employed indifferently to signify the statutory and the common law right of property in such productions. Statutory copyright is sometimes called copyright after publication, while common-law copyright is copyright before publication. There is a difference of opinion as to whether copyright existed among the ancients. There is no mention of any such property in the Pandects, and no case in Roman law of any action having been brought to protect a right in literary property.

Statutory Copyright.—By this term is meant an exclusive right given by statutory law to an author or proprietor to multiply copies of his work and place them on sale, and in the case of a play the additional exclusive right of representation on the stage. Without this statutory protection the act of publication would be regarded by the courts as a dedication of the work to the public, and accordingly destructive of the author's right of property. The policy of the copyright law is to give the author, etc., protection in the sale of his work for a specified period, and then to throw its publication open to all. This theory is marked out in the U. S. Constitution, which gives power to Congress to secure to authors the exclusive right to their works for "limited times." The whole subject is under the control of Congress, and any legislation of a State affecting copyright would be inoperative and void. The result is that if an author does not choose to publish his right to his manuscript is perpetual, and may be vindicated in courts of law on general principles of justice; if he prefers to publish, he brings himself within the purview of the law of Congress, must have his right only for such time as the statute prescribes, and must seek his remedies exclusively in the U. S. courts.

In general, any thing may be copyrighted which is the subject of literary ownership. More specifically, the term "copyright," as used in the existing enactments of Congress, applies to books, maps, charts, dramatic or musical compositions, engravings, cuts, prints, photographs, and their negatives, paintings, drawings, chromos, statues, statuary, and models or designs intended to be perfected as works of the fine arts. The words "engraving," "cut," or "print,"

as here used, are to be applied only to works connected with the fine arts or to pictorial illustrations, and are not to be extended to prints or labels designed to be used for other articles of manufacture. These last may be registered in the Patent Office. In determining whether one of the above-named subjects can in a particular case be copyrighted, it is necessary to consider how far it must be original with the professed author. There are some compositions of such a high and elevated character that the question of originality can not be successfully raised. It is conceded by all mankind. On the other hand, there are other works of a much humbler sort, but still of a highly meritorious and useful nature, in which all the materials are existing in literature, and are well known to intelligent men, and open for resort to any one, and the only original feature is found in the selection, arrangement, or combination of materials. Instances of this kind are works on grammar, arithmetic, or geography, maps, charts, etc. These, so far as they are the result of the work of the compiler or "author," are the subjects of copyright. He has no claim, however, to the materials which he did not originate. Any other person may resort to them and prepare a work from them, but he must not make use of the copyrighted book as a mode of collecting his materials. His correct course is to resort to the original sources of information. An illustration of these principles may be found in the case of a law reporter. He can have no copyright in the opinions of the judges, as of these he is not the *author*, while he might lay claim to a statement of the facts of the case, as well as to an abstract of the decision prepared by himself. A translator of a foreign work not the subject of a copyright here may have a copyright, as he is for practical purposes an "author." Any other person may translate the same work, and have himself a copyright. It was even held under the former law that a person might have a copyright in the translation of a work copyrighted in the U. S., though such translation were made without the author's consent. This rule was applied to an unauthorized translation into German of Mrs. Beecher Stowe's well-known work, *Uncle Tom's Cabin*. This anomaly has been corrected by a change in the law which permits an author in taking out a copyright to reserve the right of translation as well as of dramatization of his own works. So in the case of music, the composition of a new air or melody is sufficiently original, but it must be substantially a new work, and not a copy of a piece already in existence, with only such variations as any skillful composer can make. Under these rules there can be no copyright in a subject, but only in a particular mode of treating it. For example, one can not obtain in this way an exclusive right to make maps of the city of New York, though he might acquire one in the results of his own labors and surveys. Any other person may make a like map from his own independent labors and surveys.

The word "book," as used in this class of laws, has a wide meaning. It is not restricted to volumes, but may include a single sheet. It has even been decided that for this purpose a sheet of paper containing diagrams representing a system of taking measures for and cutting ladies' dresses, with instructions for practical use, is a "book." There can be no copyright in a mere title as unconnected with a book. Where, however, a title is used to designate a work, particularly a periodical, it may become of great value, which will be administered by the courts under the law applicable to the "good-will" of trade in analogy to the rules appertaining to "trade-marks." See TRADE-MARKS.

There is a peculiarity to be noticed in the case of a copyright of a dramatic composition. In this case it is not merely an exclusive right to multiply copies for sale, but also to publicly perform or represent the play upon the stage. The term "dramatic composition," as thus used, includes all the parts which go to make up a scene in a theatrical representation—e. g. gestures, spoken words, etc. A character in a play who, according to the part assigned to him, goes through with a series of events without speaking, making use of motions and gestures, is as much an actor as one who uses his voice, and the one part must be regarded as embraced within the expression "dramatic composition" as well as the other. The only difference in the two parts is that the one addresses the eye and the other the ear of the spectator.

The property in a copyright is of an incorporeal nature. It can not, for example, be seized by a sheriff in the exercise of his common-law powers and sold on an execution. (See EXECUTION.) Should the sheriff, for instance, sell in this way a copperplate on which a copyrighted map was engraved, the purchaser would only acquire a title to the copperplate considered as a corporeal thing, with no right to print maps from it. The incorporeal right to publish maps could only be obtained in such a case through the action of a court of equity.

An applicant for a copyright in the U. S. must before publication deposit in the mail a printed copy of the title of the book, etc., or a description of the painting, drawing, etc., addressed to the librarian of Congress at Washington, and within ten days from the publication must also deposit two copies of the book itself, or in case of a painting, drawing, etc., a photograph of the same. Without these deposits the author or proprietor is not entitled to the copyright. A subsequent section of the law provides under a penalty that two copies of the *best* edition must be supplied, and that when any substantial change is made in a subsequent edition a copy of that must also be deposited. It is made by law the duty of the librarian of Congress, on payment of a fee, to make up and register as prescribed by law a formal statement (termed a "record") of the name of the book and the fact of the required deposit. No action can be maintained by a proprietor against an infringer unless the former has caused to be printed on the title-page or succeeding page of each copy of a book, or on the face of a map or photograph, a statement in a form prescribed by law of the fact of the entry in the librarian's office. The following brief statement may be used as an equivalent: "Copyrighted 18— by A. B." The regulations on this subject were much simplified by an act of Congress in 1870, the former law having required the record to be made in the district court of the U. S. of the district of the author's or proprietor's residence. A single office under the present law takes the place of a large number under the former system.

The term for which the copyright is granted in the first instance is twenty-eight years. If the author be then living, or be dead leaving a widow or children then living, there may be a renewal on complying with certain prescribed rules, for fourteen additional years. A copyright may be assigned by an instrument in writing. The assignment should be recorded within sixty days after its execution, or it will be void as against a subsequent assignee or mortgagee for a valuable consideration without notice. A simple assignment of an existing copyright does not carry with it the right of renewal.

The leading questions in the law of copyright concern infringement. The fact that a copyright is of an exclusive nature necessarily gives the proprietor a cause of action against one who infringes his right by placing copies on sale or reproducing on the stage his "dramatic composition." Infringement is a very plain matter when the copyrighted work is simply reproduced. It becomes a complicated and difficult question when only extracts or quotations are made, or when resort is had to the book to make the public acquainted with its contents or to criticise its style or the substance of its thought. It has long been established that the identity of a literary work consists in its ideas and its language. The thought is so associated with the form in which it is expressed that a copyright does not protect an author against the use of his thoughts in a substantially different form. It is for this reason that by general rules of law the unauthorized translation into another language or the dramatization of a copyrighted work is no infringement. Though the sentiment remains, the form is changed. On similar grounds a true abridgment, though made against the author's consent, is no infringement. This consists in a condensation of the author's language, and is substantially a different work. Where there is no such change it is an abuse of language to call the new work an "abridgment." The law as above stated has recently been modified by the express statutory provision, before referred to, allowing an author, if he see fit, to reserve the right of translation or dramatization. Dismissing these special cases of change of form from further consideration, it remains to inquire how far extracts or quotations may be made. When, for example, such quotations are made for the purpose of a review, the main inquiry is whether the act is a reasonable one as calculated to show the character of the original work. The critic must not go so far as to substantially publish the copyrighted work. The question thus becomes one of the *value* of the extracts made. This must be determined by the facts of each case. It has sometimes been thought that the true inquiry was whether there was an *intent* to infringe or steal. This is not satisfactory. The real point is has the author

sustained substantial injury. The same general rule must be applied to other cases where extracts are made. There is a marked distinction in this branch of the law between a true abridgment and a compilation. In the former, as has been seen, there is a real and substantial condensation of the materials, and this has been made with intellectual labor and judgment. In a compilation there is the act of taking the very words of the author, or with such slight changes as to show servile imitation. The law at most tolerates the condensation, and does not permit the copying of the author's words to such an extent as to do him substantial injury. Compilation is to some extent permitted in dictionaries, gazetteers, cyclopædias, guide-books, etc., where the main design and execution of the work are novel. In works of this class the materials must, to a considerable extent, be the same. Novelty and improvement in them in general consists in abridgment, changes in arrangement, more modern information, the correction of errors, etc. It is scarcely necessary to add that an infringement may take place by publishing but a small portion of a work, if that be a vital part and cause a substantial injury to the proprietor.

In the U. S. the remedies for the violation of a copyright are to be sought in the Federal courts, the circuit court under the acts of Congress having original jurisdiction. The regular remedies are an action for damages or an injunction from a court of equity preventing the continuance of the acts of infringement. As incidental to this relief, the court may direct an account to be taken of the profits realized by the infringer. The courts will not grant relief for an infringement in case the work copyrighted is immoral or libelous. This is expressly provided by the act of Congress, and the same doctrine without such a provision would be administered as a regular branch of equity jurisprudence. Where an infringement consists in making use of part of a copyrighted work in connection with other matter, the injunction will be so granted as to prevent the publication of that portion of the infringer's book which is open to objection, without reference to the fact that the order of the court may make the book, thus shorn of a portion of its contents, valueless. Severe penalties and forfeitures are also imposed by statute law upon persons who knowingly violate the provisions of the copyright acts.

Common-law Copyright.—This is the right of the owner of an intellectual production in his work before publication.

1. It can not be successfully disputed that if a person composes a literary work, and does not choose to publish it, he has as complete an ownership in it as if he had produced a watch or other chattel. Conceding that he has no vested right simply in his ideas, he does have a title to them considered in reference to the outward form in which they are clothed. Accordingly, the regular legal remedies for the violation of rights of property would be applicable, and the usual incidents of property would attach. Still, for special reasons, unpublished writings can not be taken by creditors in payment of debts. (*Bartlett* vs. *Crittenden*, 5 McLean, 32.) A decree of Louis XV. of France of May 21, 1749, in favor of the French tragic poet Crébillon (the produce of whose play while acting at the theater was taken for his debts), declaring that the productions of the mind are not among effects seizable by creditors, is noticed by the elder Disraeli as a high honor to literature. (*Curiosities of Literature*, ii., 192.) An owner of this kind of property can sell it or dispose of it by will, or it may pass to his representatives at his death in the ordinary course of succession. The effect of the act of addressing a letter by an author to a correspondent has been frequently considered by courts of justice. The result of the discussions is that while the author parts with the paper on which the letter is written, he still retains an ownership in the sentiments and expressions. By this divided ownership the receiver is entitled to the letter considered as an autograph, while if he publishes the contents he may be pursued by an action in court. The ownership of the receiver is corporeal, that of the author is incorporeal. The same result would happen if one should address in writing a poem or other literary work to a friend. A distinction between the ownership of the paper and of the poem would immediately spring up. Some jurists have confined the applicability of this rule to letters having a literary character. It is, however, believed that this distinction is not maintainable, and that in general a letter can not be published by its receiver or any other person without the consent of the author, unless it may be to vindicate the receiver's character or to subserve the ends of public justice.

One of the most important instances, in the practical administration of justice, of this form of literary property is an unpublished play. A composer of such a work may keep it absolutely to himself, and make it as completely his own as any other species of property. So he may by appropriate acts cause it to become common property and wholly abandon ownership. In such a case he is said to "dedicate" it to the public. The act of dedication must be distinct and unequivocal, and can not be presumed from the fact that he permits it to be exhibited on the stage in the ordinary manner. The most that can be claimed from such an exhibition is that any person having the right to attend upon it may carry away with him as much as he is able from his unassisted memory, and may thus by means of his memory reproduce the play upon the stage. As to the last branch of this proposition, even, there would seem to be some doubt, since it may be plausibly maintained that all that the author intends to concede to the hearer is the right to the personal enjoyment or instruction of the occasion. However this may be, it is clear that there is no implied license to the audience to take notes, and by this means obtain sufficient knowledge of the play to represent it. If an actor becomes himself the author of a play, his performance of it in public, or that of a theatrical company, with his consent, for a compensation, can not be regarded as any evidence of his abandonment of the manuscript to the public or to the profession of actors. Such a special use of an unpublished work for the author's benefit is perfectly consistent with the continuance of an ownership in it.

Rights of this kind appertain to aliens as well as citizens, having nothing to do with the statutes of copyright, and are accordingly of great consequence to foreign and non-resident authors, who, being unable to acquire a statutory copyright in their works, may still, by virtue of their ownership of an unpublished play, maintain an exclusive right to represent it upon the stage. Similar suggestions may be made as to lectures, whether written or oral. The act of delivering them before an audience confers no right upon the hearers to put copies of them on sale without the author's consent. Property in lectures is protected in Great Britain by a special statute (5 and 6 Will. IV., c. 65). The author in the U. S. must rely upon general principles of law, and may resort to an injunction or action for damages. So the exhibition of a statue or a picture gives no license to a spectator to multiply copies and place them upon sale. These rules do not admit of evasion by the unauthorized production of abridgments of manuscripts or copies of works of art reduced in size.

Notwithstanding what has been said it is clear that an author of a manuscript, etc., may absolutely lose all proprietary right in it by unequivocal acts of dedication to the public; as e. g. by placing printed copies of it on sale without obtaining copyright, or by obtaining a copyright in a foreign country and selling the work there.

Literary property may, in the stage of ownership now under consideration, be assigned, so that a distinction will spring up between an author and a mere proprietor. The sale of a manuscript will in general give the purchaser all the rights which the author of it, considered as an owner of an unpublished work, would possess. Whether he could take out a copyright or not could not be determined as a mere matter of reasoning, but would depend on the special provisions of the copyright statutes.

A question of some difficulty has arisen as to the point whether any legal protection can be given to a literary unpublished work which is unsound on the score of morality or contains doctrines subversive of public policy. This question must not be confounded with one which may arise under copyright statutes, as the considerations in the two cases are quite different. In the latter case there is sometimes a distinct provision that the copyright shall not protect an immoral or libelous publication. As to the case of a manuscript, it would appear that the following distinction should be made: no protection should be given to the author by the courts which would enable him to make his immoral work the source of gain or profit. On the other hand, if he simply desires to retain his right of property—e. g. to prevent others from publishing it altogether, as well as to refrain himself—every consideration of justice and expediency requires that he should be permitted to do so. Suppose that a person while in the immaturity of his powers composes a work extravagant or immoral in its views of the rights of society or of individuals, but that in later life his opinions are changed, and he comes to view with abhorrence doctrines

that he once warmly approved, and he finds that some person against his consent has obtained possession of his manuscript and is about to publish it, shall he be prevented by law from suppressing such a publication? Great jurists have answered this question in the affirmative, on the theory that there *can be no property* whatever in such a manuscript. Their reasoning is unsatisfactory and inconclusive, and the true view would seem to be that the author is still the owner of the work, considered merely as an item of property, but can not invoke the aid of the courts to enable him to make profit from that which is inherently vile and base.

In the U. S. the remedies for the violation of the proprietary rights of an author, being given by the common law, may be sought in the State courts, notwithstanding a U. S. statute allows an action against a person who publishes a manuscript without the consent of the author or proprietor, such author, etc., being a citizen of the U. S. or a resident therein. It will be observed that the terms of this statute are not so comprehensive as the rule of the common law, as it confines the remedy to a "citizen or resident," and it appears to have been enacted for the benefit of those persons only who are entitled to the statutory copyright. Remedies, so far as this act extends, are cumulative, and may be sought either in the U. S. or State courts.

International Copyright.—This is an arrangement by which an author residing in one country may secure in such other countries as are parties to the arrangement the exclusive right of multiplying copies of his intellectual productions, and selling the same. In Great Britain international copyright was first granted by the 1 and 2 Vict., c. 59. This act permitted the Queen, in council, to grant to the authors of original foreign works such term of copyright in the British dominions as she pleased, provided the same did not exceed the term allowed for similar works in the United Kingdom. Further legislation on the subject was had in the 7 and 8 Vict., c. 12, and again in 15 Vict., c. 12. By the latter act the Queen, in council, may grant a copyright of five years for an authorized translation of foreign works, and also may prohibit for a similar period, the representation of an unauthorized translation of a foreign dramatic piece. Prussia, however, first set the example of granting international copyright by a law, passed in 1837, which provided that every country might secure copyright for its authors in Prussia by granting reciprocity. In 1852 France passed a law forbidding the piracy of books and works of art published abroad, without requiring reciprocity. Prior to 1891 an author was not entitled to a copyright in the U. S. unless he was a citizen or a resident of the same. And in order to be a resident within the meaning of the law, the foreign author must have formed an intention, at the time of recording the title of his work in the foreign office, of making the U. S. his permanent home. But in 1891 the Government of the U. S. abandoned the policy which it had hitherto pursued, and enacted a law which conferred on foreigners the privilege of copyright. The law, however, only applies to a citizen of a foreign state or nation when such foreign state or nation permits to citizens of the U. S. the benefit of copyright on substantially the same basis as its own citizens; or when such foreign state or nation permits to citizens of the U. S. copyright privileges substantially similar to those provided for in U. S. law; or when such foreign state or nation is a party to an international agreement which provides for reciprocity in the grant of copyright, by the terms of which agreement the U. S. may at its pleasure become a party to such agreement.

Revised by HENRY WADE ROGERS.

Coqua'go: the main branch of the Delaware river; rises in the Catskill Mountains in New York. It flows first southwestward, and then southeastward, until it unites with the Popacton at Hancock, on the line between New York and Pennsylvania. Length, nearly 100 miles.

Coquelin, kok'lăñ', BENOIT CONSTANT: b. at Boulogne, France, Jan. 23, 1841; entered the Conservatory in Paris 1859; studied under Regnier, and made his *début* in the Théâtre Français Dec. 7, 1860; in 1863 he became a *sociétaire*. Scagnavel, Scapin, Don Juan, and Figaro in the classical comedy, and in the modern drama Pierre Gringoire, Marcel in *Les Ouvriers*, the Duke in *L'Étrangère*, and Leopold in *Les Fourchambault* are among his most brilliant creations. During the siege of Paris in 1870 Coquelin continued to play, that the public courage might be kept up. In the summer of 1879 the whole company of the Théâtre Français was given permission to go to London. Coquelin was well received in the British metropolis. In 1888 Coquelin visited the U. S., appearing with Jane Hading, and again in 1900, with Mme. Bernhardt. A second engagement in London in 1892 was unsuccessful.—His brother, ERNEST ALEXANDRE HONORÉ COQUELIN, generally known as Coquelin cadet, is also a celebrated actor, and a *sociétaire* of the Théâtre Français since 1876. B. B. VALLENTINE.

Coquerel, kok'rel', ATHANASE LAURENT CHARLES: a Protestant minister; b. in Paris, Aug. 27, 1795. He was pastor of the French church at Amsterdam from 1818 to 1830, when he removed to Paris, where he gained distinction as a pulpit orator. In 1848 he was a moderate republican member of the Constituent Assembly. Among his works is *Modern Orthodoxy* (1842) and many volumes of sermons. He was liberal in theology. D. Jan. 20, 1868.—His son, ATHANASE JOSUÉ LAURENT, became an eminent Protestant pulpit orator, and the leader of the liberal party that seceded when a schism occurred in the Protestant synod in June, 1872. D. July 25, 1875.

Coquil'la-nuts [Span., dimin. of *coco*, cocoa-tree, cocoa-nut]: the seeds of *Attalea funifera*, a South American palm. The shells of the seeds or nuts are hard, have a close texture, and are susceptible of a fine polish. This shell is much used in turnery for the heads or handles of umbrellas, for toys, and ornamental articles.

Coquimbo, kō-keem'bō: a province of Chili; bounded N. by Atacama and S. by Aconcagua, and extending from the Pacific to the summits of the Andes; area, 12,905 sq. miles. Capital, La Serena. The surface is much broken, but the valleys are very fertile; the mines, especially of copper, are among the richest in Chili. Pop. (1895) 160,898.

H. H. S.

Coquimbo: the principal seaport-town of Coquimbo province (see map of South America, ref. 11–C). The harbor is good and the town is well built. Two railroads connect it with the agricultural and mining regions of the province, and the import and export trades are important. Pop. (1891) about 10,000. Coquimbo is now essentially united to La Serena, the capital of the province, just N. of it at the mouth of the Coquimbo river. Serena was founded by Valdivia in 1544, and named, it is said, after his native village in Spain. Pop. about 20,000. H. H. S.

Coquimbo Owl: See BURROWING OWL.

Coquina: See LIMESTONE.

Co'ra: an ancient city of Italy, in Latium, about 36 miles S. E. of Rome (see map of Italy, ref. 6–E). Livy mentions it as being a *colonia Latina* in 503 B. C. Few cities of Latium have more considerable remains of antiquity than Cora. Here are relics of ancient walls built of massive polygonal blocks. The site is now occupied by the town of *Cori*.

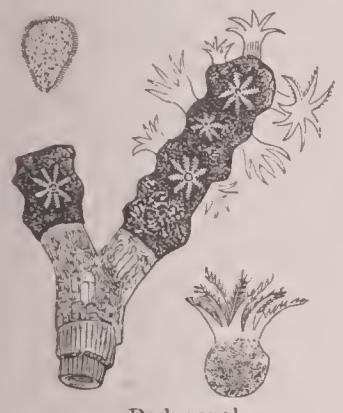
Cor'acoid Bone [*coracoid* is from Gr. κορακοειδής, raven-like; κόραξ, raven + εἶδος, appearance]: a bone of the shoulder-girdle, existing in man and the higher vertebrates as the *coracoid process*, a projection from the lower anterior border of the scapula. In the Monotremes, echidna, and ornithorhynchus, the coracoid connects the scapula with the sternum, and forms a part of the glenoid fossa. In birds the coracoid is always present, and is the most important bone of the shoulder-girdle, articulating with the front of the sternum and forming the main support of the wing. It is large in turtles, forms a part of the glenoid fossa, runs from carapace to plastron (the lower part probably being precoracoid), forming the truss by which the weight of the body is supported on the fore limbs. In other reptiles when fore limbs are present the coracoid forms part of the glenoid fossa, and intervenes between scapula and sternum. It is present in various degrees of development in *Batrachia*, but, as a rule, is well developed in the *Anoura*, while in the tailed batrachians it is cartilaginous, and forms the greater part of the shoulder-girdle. Anatomists differ as to the homologue of the coracoid in fishes. According to Cope, it is the lower of the two bones situated at the base of the pectoral fin, the upper being the scapula; these are named by Gill respectively hypocoracoid and hypercoracoid. In transcendental anatomy it has been considered as the hæmapophysis of the fourth (occipital) cephalic vertebra.

F. A. LUCAS.

Coracoid Process: See CORACOID BONE.

Cora Indians: See PIMAN INDIANS.

Coral [from Gr. κοράλλιον, coral]: the hard skeleton secreted* by certain CŒLENTERATA (*q. v.*) of both the Hydrozoan and Scyphozoan divisions. It is composed of calcic carbonate plus a varying amount of animal matter, and is a secretion of the external layer (ectoderm) or skin of the body. A few species of coral polyps, like the mushroom coral (*Fungia*) live separate, and in such the coral corresponds to the individual; but in most cases the coral-producing animals are colonial, and in such instances the mass of coral is the product of the whole colony, the positions of its various members being more or less clearly seen in the pits on the surface of the coral. Most of the coral-producing animals belong to the Actinozoan division of the *Scyphozoa*, the only exceptions being the Hydrozoan stagshorn coral (*Millepora alcicornis*) and its allies, in which the pits occupied by the polyps are divided by horizontal partitions (whence the group, together with other non-related forms, was formerly called *Tabulatæ*). Of the coral-producing Actinozoa (see POLYP) there are two divisions, the *Octocoralla*, where the parts of the animal are eight-radiate, and the *Hexacoralla*, where they are in multiples of six. To the former belong the sea-fans and sea-whips (*Gorgonia* and *Muricea*) of the southern coast of the U. S., and the precious coral of the Mediterranean. The valuable red coral (*Corallium rubrum*) has a tree-like form, and sometimes reaches a foot in length. The most important coral-fisheries are on the coasts of Algiers, Tunis, and Morocco, but coral is also obtained near Naples, Leghorn, Sardinia, and Corsica, and Naples is the center of the coral-trade. The annual collection of a fishing-boat varies from 400 to 900 lb. In 1873 the Algerian fisheries produced about $500,000 worth of the rare coral. The price varies according to color, large pieces of the finest rose pink being valued at from $400 to $500 per oz., but small bits of the poorer colors, such as are used for children's necklaces, are worth $1 to $1.50 per oz. Of the *Hexacoralla*, *Antipathes* of the tropics produces the valuable black coral. The brain corals (*Diploria*, *Manicina*), star-corals (*Astræa*), etc., are massive. The Madrepores, Oculinas, etc., are branching, while *Agaricia*, etc., form incrusting masses. None of these have any commercial or economic value, except as a source of lime; they are, however, very important in nature's economy, in that they all aid in the building up of coral reefs and islands. No true reef-building corals can live where the water falls below 60° F., but some of the Alcyonoid forms occur even in the Arctic seas.



Red coral.

J. S. KINGSLEY.

Coral Islands and Coral Reefs are among the most characteristic features of the tropical seas. They occur in several different relations; fringing reefs, barrier reefs, and atolls. Fringing reefs lie close along the shore of some island or land mass, not of coral formation. Barrier reefs are separated from the adjacent island or mainland by a lagoon of relatively shallow water, varying from a mile or two to many miles in width (Fig. 1). The Society islands of the mid-Pacific are generally surrounded by more or less continuous barrier reefs, with lagoons a mile or more wide. The great Australian barrier reef, 1,200 miles long, and lying 50 to 300 miles off the N. E. coast of Australia, with which it is roughly parallel, is the largest reef of this kind. Atolls are roughly oval reefs, inclosing a shallow lagoon, seldom over 200 or 300 feet deep, and unbroken by any central island.

FIG. 1.—Bolabola, with barrier, reef, lagoon, and coral islands.

* It is hardly necessary to say that the coral-making animals are not "insects" and that coral is not the "house" which they "build."

These are seen to the number of eighty in the Paumotu or Low Archipelago; to a somewhat greater number in the Caroline-Marshall Archipelago and elsewhere in the Pacific. The term *atoll* is adopted as a general name for such islands from its local use in the Maldive Archipelago, S. W. of India.

Conditions of Coral Growth.—Coral reefs are formed by the growth of various species of corals, or small polyps, living in communities. Each individual may be compared in form to a minute sea-anemone; it secretes carbonate of lime from solution in sea water, and thus forms a stony skeleton, growing slowly to a considerable mass. The destructive action of the waves, as well as of various boring mollusks, breaks up this limestone framework; the finer particles are washed out into deep water, and the coarser sand is thrown back on the older part of the reef. The surface of coral reefs and atolls is built a few feet above the level of the sea by the heaping of coral sand from the beach by waves and winds. The breadth of the strip of land thus formed may reach half a mile or more. The reef is more or less interrupted by transverse channels, connecting the lagoon with the ocean, held open by tidal or wind currents, and frequently giving entrance to protected harbors. Hence an atoll may consist of many small linear islands, slightly disconnected. Reef-building corals thrive only in water whose lowest monthly temperature does not fall below 68° F.; hence they are excluded from the eastern equatorial Pacific, where the cool Peruvian current flows north from far southern latitudes; even directly under the equator the water about the Galapagos islands is too cold for reef-building. The central and western equatorial Pacific, together with the torrid Indian Ocean, where the surface water is warmer from a longer residence in the torrid zone, are the regions of most numerous coral reefs and islands. They are relatively uncommon in the Atlantic; although the Bermudas, Bahamas, and Florida Keys are coral built; and many reefs occur around Cuba and other West Indian islands. Reef-building corals are also limited by depth, none growing more than 120 feet from the surface; although the sand and mud from the wasting of the reef are spread to much greater depths.

Theories of Reef Formation.—The origin of the various forms of coral reefs, particularly of atolls, which occur amid great depths of the open ocean has naturally given rise to many theories. Those now current may be outlined as follows: In 1835 Darwin, while on the British exploring vessel Beagle, conceived that the various forms of coral reefs might be explained as the result of slow submergence of a fringing reef. Recognizing that a shallow foundation is necessary for the beginning of a reef, Darwin believed that the fringing reef is the primitive form of all reefs, thus implying the presence of some pre-existent land, such as a volcanic island, on whose shoal waters the young floating forms of the coral polyp colonized from some other source. A fringing reef thus formed is shown in Fig. 2.

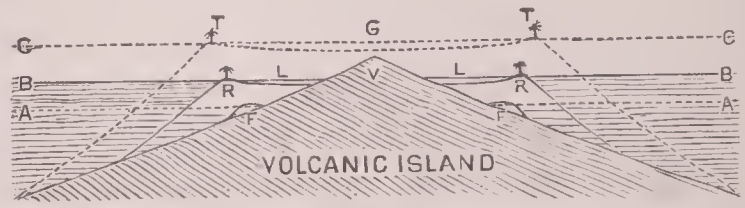


FIG. 2.—Diagram illustrating Darwin's theory of atolls, by submergence, with upward growth of reefs: A A, inferred level of the sea when the present barrier reef was first formed as a fringing reef; F F, on the shore of a new volcanic island; B B, existing level of the sea after inferred slow submergence of the island, with upward and outward growth of corals transforming the fringing reef into a barrier reef, B B, with shallow lagoon, L L, inclosed; C C, future level of the sea, the original volcanic cone, V, being entirely submerged, and the barrier reef having grown upward, forming an *atoll*, T T, with uninterrupted lagoon, G.

F F, the close to sea-level, A A. As the volcanic island is gradually submerged, the reef grows upward on its outer side, where it is well fed by the waves; it also grows slowly outward, leaving a widening lagoon, L L, between its rim, R R, and the diminishing island, V, when the sea-level rises to B B. The lagoon is kept shallow by the washing in of fine coral mud from the face of the reef. Finally, the volcanic summit may be entirely submerged, and when the sea-level stands at C C there is only a roughly circular reef, T T, inclosing a broad lagoon, G. This stage illustrates the perfected atoll. It is manifest that as the original base of the reef sinks, the thickness of the upgrowing reef greatly in-

creases. The size of the final atoll will depend not only on the measure of the initial fringing reef, but also on the rate of submergence; a rapid submergence presumably causing a diminution of the diameter of the reef, a slow submergence allowing an increase of diameter. Darwin's theory was independently invented by Dana, naturalist of the U. S. exploring expedition under Wilkes in 1838–42. It gained a wide acceptance.

Semper in 1863 first cast serious doubt on the assumed necessity of submergence; and since then Semper's theory has been vigorously advocated by Murray, of the British Challenger expedition. Assuming that the level of the sea remains constant, these observers maintain that the foundation on which the initial reef is formed may be either a dwindling volcano, wasting under the attack of weather and waves, or a submarine bank, rising by accumulation of marine deposits. The coral reef once begun, it extends outward, always growing most rapidly in the ocean surf. Its waste is washed down the steep outer slopes, and forms a platform on which further outward growth may extend; and at the same time the solvent action of sea water on the decaying coral sand consumes the inner margin where the coral growth is slower; thus the lagoon is kept open behind the advancing reef front, as illustrated in Fig. 3. Barrier

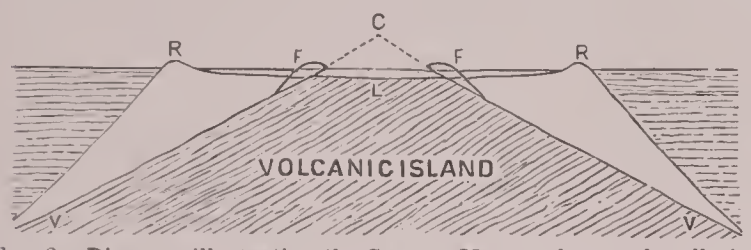

Fig. 3.—Diagram illustrating the Semper-Murray theory of atolls, by outward growth of reef with constant level of the sea: V C V, original outline of volcanic island reduced by rain and waves to V L V, a submarine platform; F F, original site of reefs on margin of volcanic platform, V; R R, later form of reefs, due to outward growth on ocean side and selection on inner or lagoon side.

reefs might thus be formed even during an uplift of the sea bottom, if the coral growth were active and the uplift relatively slow.

It is manifest that these two theories are not contradictory. Indeed, Darwin clearly recognized the power of fringing reefs to grow outward on the banks of their own formation, thus converting themselves into barrier reefs; but he did not emphasize this process as has since been done, because it would not easily account for atolls. The Semper-Murray theory of outward growth is a valuable extension of the Darwin-Dana theory of upward growth; but the new theory does not supplant the older one. It is now recognized that wide barrier reefs may be formed without submergence, and that the supposed demonstration of submergence given by such reefs is weakened; but many facts prove that submergence can not be neglected. The chief of these are the known occurrence of changes of sea-level on many Coasts (*q. v.*); the general association of signs of elevation of the land with fringing reefs and elevated reefs; the irregular outline of the central islands within barrier reefs, like those in the Fiji group, as if partly submerged; the great number of island groups in which atolls alone occur—it would be difficult indeed to account for these without submergence; the comparatively regular distribution of the various forms of reefs in great belts, as if broadly influenced by some widely acting control, such as a general depression of the ocean floor; the occurrence of drowned atolls, as in the Chagos banks, Indian Ocean, as if submergence had here advanced at a faster rate than the upward growth of the corals.

Completed coral islands or atolls afford very imperfect support for man. The form of the islands is low and monotonous; the arable portion is but a small part of the whole, and even this may be overwhelmed by storm or earthquake waves; the variety of plant and animal life is very small, the cocoanut palm being almost the only useful plant. There is only one kind of rock and no metal. The lower forms of marine life flourish in great variety and beauty on the outer reef and in the quiet waters of the lagoon, but the native human population of such islands is degraded. Famine is not infrequent, engendering infanticide, war, and cannibalism. W. M. Davis.

Cor'allines [so called from their resemblance to the corals, to which they were formerly referred]: certain plants classed with the red algæ (*Ftorideæ*) and referred to the family *Corallinaceæ*. They constitute the genus *Corallina*, and several other genera. These plants are peculiar in being of a rigid, stony character, and from the presence (in most species) of a large proportion of carbonate of lime. They are not abundant on the Atlantic coast of the U. S., but are of much more frequent occurrence in the Pacific. From their highly differentiated organs of fructification "the species of *Corallinaceæ* are now placed at the head of the *Florideæ*." They occur abundantly as fossils. The *Corallina officinalis* is common on the northern shores of Europe, and also occurs on the Atlantic coast of British America and the U. S. The name coralline is often given to various marine polyps, but should be restricted to coral-like plants.

Coral Reefs: See Coral Islands and Coral Reefs.

Coral Snakes: various serpents marked with conspicuous red bands which suggest polished red coral. Some of these snakes, like *Elaps fulvius* of the U. S. and *E. corallina*, are venomous, while others, which resemble them very closely, are harmless. Among these latter are various species of *Ophibolus, Oxyrhopus*, and *Erythrolampris*.

F. A. Lucas.

Coranach: See Coronach.

Corato, kō-raa'tō: a town of Italy, province of Bari: 24 miles W. of Bari (*q. v.*). Near here in 1503 a combat took place between thirteen Italian and thirteen French knights, led by Colonna and Bayard, respectively. Pop. 33,258.

Coray, or **Koray**, Diamant; Greek philologist and patriot; b. at Smyrna, Apr. 7, 1748. He studied medicine at Montpellier, in France, and became a resident of Paris in 1788. To promote the regeneration of Greece and the revival of the Greek nationality, he published editions of ancient Greek authors and wrote several political tracts. D. Apr. 6, 1833.

Cor'bel [viâ Fr. from Lat. *corbis*, basket]: in architecture, a projecting bracket, often sculptured like a modillion, sometimes in the form of a basket, for the purpose of supporting a superincumbent object or for receiving the springing of an arch. A corbel-table is a projecting battlement, parapet, or cornice resting on a series of corbels.

Corbet, Richard: English bishop and poet; b. at Ewell, Surrey, 1582. He was educated at Oxford, and was successively dean of Christ Church College (1620); Bishop of Oxford (1624); and Bishop of Norwich (1632). His poems, which are sprightly and humorous, include a *Journey into France* (1613) and *Poetica Stromata* (1648). His best-known verses are his *Farewell to the Fairies*. D. in Norwich, July 28, 1635. See the memoir by Octavius Gilchrist prefixed to his edition of Corbet's poems (London, 1807; reprinted, 1810).

Corbett, Julian Stafford: See the Appendix.

Corbould, Edward Henry: historical painter; b. in London, Dec. 5, 1815. Won two gold medals of the Society of Arts; member of the Institute of Painters in Water-colors; teacher of drawing and painting to the children of Queen Victoria 1851–72. Among his works are *Fall of Phaëthon* (1834); *St. George and the Dragon* (1835); *Marriage of Nigel Bruce and Agnes of Buchan* (1870); *Queen Victoria* (1871); *Canterbury Pilgrims* (1874); *Iris* (1878).

Cor'bulo, Cnæus Domitius: Roman general who flourished under Claudius and Nero. He commanded the Roman army in a war against the Parthians, whom he defeated. Nero, who was jealous of him, ordered him to be put to death; when Corbulo heard this he fell on his sword, 66 A. D. A memoir by him of his experiences in Asia is mentioned by the elder Pliny, but is not extant.

Cor'coran, Michael: brigadier-general of U. S. volunteers; b. in Carrowkeel, Ireland, Sept. 21, 1827; d. Dec. 22, 1863. He emigrated to the U. S. in 1849, and settled in New York city. At the commencement of the civil war he departed for Washington with his regiment, the Sixty-ninth New York, and participated in the first battle of Bull Run, where he was taken prisoner and confined at Richmond, Va., and Charleston, S. C., nearly a year. On being exchanged he organized the Corcoran Legion, and was made a brigadier-general of volunteers, to date from the day of his capture, July 21, 1861. He was thrown from his horse near Fairfax Court-house, Va., Dec. 22, 1863, and fatally injured.

Corcoran, William Wilson, LL. D.: banker; b. at Georgetown, D. C., Dec. 27, 1798; studied at Georgetown College; began banking at Washington in 1837; amassed great wealth; was famous for his magnificent charities and

splendid gifts to the public. In 1847 he presented the Oak Hill Cemetery to Georgetown, and in 1857 the Temple of Art—generally called the Corcoran Gallery—to the city of Washington, where he also founded, in 1870, the Louise Home for Indigent Women. D. Feb. 24, 1888.

Corcy'ra (in Gr. Κόρκυρα): the ancient name of an island in the Ionian Sea, now Corfù (*q. v.*). It was colonized by the Corinthians in 734 B. C., and soon became one of the chief maritime powers of Greece.

Corday d'Armans, kōr'dā'daăr'maăn', Marie Anne Charlotte: revolutionist; b. at St.-Saturnin, Normandy, July 28, 1768; placed by her father, a poor Norman nobleman of literary tastes, in a convent at Caen; removed after the convent was closed by the Revolution to the house of her aunt, where she led a lonely life and read the works of Voltaire and Plutarch. Her lover, a young cavalry officer of republican tendencies, was assassinated by a mob. After the fall of the Girondists, May 31, 1793, many of them fled to Caen, and with them Charlotte became acquainted. She had obtained a passport, apparently with the thought of going to Paris, in April. On July 9 she suddenly left her aunt's on pretext of going to England; on the 11th she was in Paris; on the 13th, after several attempts, she finally obtained an audience with Marat, on the pretext of revealing the Girondists' plots. He was in his bath, and, according to Charlotte's confession, she told him what was passing at Caen; he took down the names of the men mentioned, and said that they should be guillotined in a few days; but as he spoke she drew from her bosom a knife and plunged it into his side. He cried out for help, but sank back dead. She was tried on the morning of July 17, sentenced to death, and guillotined the same day. She preserved her calmness and courage to the last, and her remarkable beauty and lofty bearing stirred even the hearts of her executioners. At her own desire her portrait, now in the Museum of Versailles, was painted by Hauer while she was in prison. So little is really known of her life that an estimate of her character is difficult. She was doubtless strongly impressed by classic ideals of heroism. Lamartine says: "In beholding her act of assassination history dares not applaud, nor yet, while contemplating her sublime self-devotion, can it stigmatize or condemn." He further calls her the "angel of assassination." Adam Lux, a deputy from Mentz, who witnessed her execution, was himself guillotined for proposing a statue to her memory. See Huard's *Mémoires sur Charlotte Corday* (1866); *Œuvres politiques de Charlotte Corday* (1863); Lamartine, *Histoire des Girondins*. C. H. Thurber.

Cordeliers [deriv. of O. Fr. *cordel* (> Mod. Fr. *cordeau*), cord; dimin. of *corde*: Ital. *corda* < Lat. *chorda* = Gr. χορδή]: a political club formed in Paris in 1790, which received its name from the fact of its meeting in the chapel of the convent of the Franciscan friars of that name. The organization was composed of the most extreme republicans and agitators, led by Danton, Marat, Hébert, and Camille Desmoulins, the latter of whom edited the famous revolutionary paper, *Le vieux Cordelier*. The club was first allied with, but afterward in violent opposition to, the Jacobins. It was overthrown in Mar., 1794, by Robespierre, and formally ended by the law of the 6th Fructidor (Aug. 23, 1795), which closed all the political clubs of France. C. H. T.

Cordeliers, or **Cord-wearers** [from O. Fr. *cordel*, a cord or rope; so called from their girdles of knotted cord]: a branch of the order of Franciscans. Soon after the death of St. Francis (1226) a long controversy as to the rules of the order arose, which ended in the division of the order into two great branches, Conventuals and Observantines. Of the Observantines there are three branches: the *Reformed*, established in 1419, the *Recollects*, established in 1500, the *Alcantarines*, established in 1555. In France the *Alcantarines* were called *Cordeliers* on account of their girdle. J. J. Keane.

Corder, Frederick: musician; b. in London, Jan. 26, 1852; at first intended for business, but, being strongly devoted to music, entered the Royal Academy of Music in 1874, and, being elected to the Mendelssohn scholarship, was sent to Cologne, where he studied four years under Ferdinand Hiller. Returning to England, he was appointed conductor at the Brighton Aquarium, and has since devoted his life to teaching and composition. His principal works are *In the Black Forest*, an orchestral suite, 1876; *Evening on the Seashore*, orchestral idyl, 1876; *Morte d'Arthur*, opera, 1877; *Philomel*, operetta, 1880; *The Storm in a Teacup*, operetta, 1880; *The Cyclops*, cantata, 1881; *Ossian*, overture for the Philharmonic Society, 1882; *Dreamland*, ode for chorus and orchestra, 1883; two operettas 1883 and 1885; *Prospero*, concert overture, 1885; *Scenes from the Tempest*, 1886; *The Bridal of Triermain*, cantata for the Wolverhampton festival, 1886; *Nordisa*, opera for the Carl Rosa Company, Jan. 26, 1887; *The Minstrel's Curse*, ballad with orchestral accompaniment, 1888, besides many smaller works. D. E. Hervey.

Cordille'ra (Span. pron. kōr-dĕel-yā'răă), or **Cordilleras** [Spanish, a chain of mountains]: the mountainous tract in Western North America. This name, originally used in a somewhat similar sense by Alexander von Humboldt, has been applied by J. D. Whitney and various other writers on physical geography to the mountains of Central America and Mexico, and to all those of the U. S. and British America lying W. of the Great Plains, but has not passed into popular use. See Mountain and Rocky Mountains.

Cordillera: in South America; one of the great longitudinal or north and south mountain chains of the Andean system. Where there is only one chain the word Andes is commonly used, but where there are two or three parallel ones one of them only is known, in common language, as the Andes, and the others are called Cordilleras. Local custom varies in the use of the two terms, and this has given rise to much confusion. In Colombia the three principal ranges are called respectively the Western, Central, and Eastern Cordilleras. In Ecuador and Northern Peru the easternmost range, abutting on the Amazonian lowlands, is called the Andes *par excellence*, and the parallel western chains are Cordilleras, with various local names. Farther S., on the contrary, the Andes are the western chain, separating Bolivia and the Argentine from Chili; the mountains farther E., some of them still higher, form the Cordillera Real, Cordillera Oriental, and so on. The term Cordillera is also used at times, loosely, for the cross chains or knots so frequent in the Andean system. Herbert H. Smith.

Cór'doba: a province of Argentina; bounded N. by Catamarca and Santiago del Estero, E. by Santa Fé, S. by the territory of Pampa, and W. by San Luis and Rioja. Area, 54,000 sq. miles. The western part is traversed by the Sierra de Córdoba; the eastern part belongs to the great pampean plain through which the rivers Tercero, Cuarto, and others flow to the Paraná. There are numerous small lakes and swamps. The province is celebrated for its rich pastures, and corn, wheat, and lucerne are cultivated. Pop. (1895) 353,000. Capital, Córdoba. H. H. Smith.

Córdoba: capital and principal city of the Argentine province of the same name; on the Rio Primero, at the crossing of the Central Argentine R. R.; 387 miles from Buenos Ayres (see map of South America, ref. 8–D). It was founded in 1573, and is celebrated for its old cathedral, churches, monasteries, etc., and for its university, which is the second in age in America. The national observatory and meteorological station are located here. The Alameda, or public promenade, is one of the finest in South America. Córdoba has an important trade in hides and wool. Pop. (1895) including the suburbs, 54,400. Herbert H. Smith.

Cordova: a province of Spain; bounded N. by Badajos and Ciudad Real, E. by Jaen, S. by Malaga, and S. W. and W. by Seville. It is intersected by the Guadalquivir. The surface in some parts is mountainous. Area, 5,189 sq. miles. Capital, Cordova. Pop. (1887) 420,714.

Cordova, kōr'dō-*v*a [Span. *Cordoba*, or *Cordova*; anc. *Colonia Patricia*]: a city of Spain; capital of province of same name; situated in a plain on the river Guadalquivir; 71 miles N. E. of Seville, with which it is connected by a railway (see map of Spain, ref. 18–E). The river is here crossed by a noble stone bridge of sixteen arches built by the Moors in the eighth century, and defended by a Saracenic castle. The cathedral, originally a beautiful Mohammedan mosque, founded in 786 A. D., presents in the interior a forest of columns of many orders and materials, brought from various ancient temples. Cordova contains a bishop's palace, three colleges, a city-hall, and numerous hospitals. It was formerly noted for the preparation of goat leather, called *cordovan*. Here are manufactures of silk fabrics, paper, silverware, hats, etc. The ancient *Corduba*, sometimes called *Patricia*, built 152 B. C. by the Romans, was second only to Gades among the cities of Hispania, and the birthplace of the two Senecas, of the poet Lucan, and of the Arabic physician Averroës. This place, was captured

by the Moors in 672 A. D., after which it was for several centuries the splendid capital of the Western caliphs. In the tenth century it contained nearly a million inhabitants and 300 mosques. In 1236 it was taken and almost destroyed by Ferdinand III. of Castile. Pop. (1887) 55,614.

Cordova, Diego Fernandez, de: See Fernandez de Cordova.

Córdova, José Maria: South American general; b. at Rio Negro, in the province of Antioquia, New Granada, 1800. He joined the revolutionary army when a boy; served under Bolivar in Venezuela and New Granada, and became general for his services under Sucre in the Quito campaign (1822). At the battle of Ayacucho, in Peru, he led the decisive charge (Dec. 9, 1824). Returning to Colombia he remained devoted to Bolivar until 1829, when he revolted, believing that a monarchy was contemplated. Gen. O'Leary, sent against him, defeated his small force at Remolino, Córdova being killed in the battle (Oct. 17, 1829).

Herbert H. Smith.

Cordova, Francisco Hernandez, de: Spanish soldier; b. about 1475. He went to the Isthmus of Panama with Pedrarias in 1514, and served in various raids. In 1524 he was sent to settle Nicaragua, which had just been explored by Gil Gonzales Davila (1522–23), but which Pedrarias claimed as a part of his territory. Cordova sailed from Panama, landed on the Pacific side of Nicaragua, founded Granada, Leon, and other towns, and explored the lake, discovering its outlet. On hearing of the arrival of Gil Gonzalez in Honduras, he sent his lieutenant, Hernando de Soto, against him; Soto was defeated and captured; Gil Gonzalez himself was captured by Olid, who had been sent there by Hernando Cortés. Olid rebelled and was killed, and finally Cortés himself went to Honduras to settle affairs. Cordova, who had remained in Nicaragua, sent a message to Cortés (1525), offering to transfer his allegiance to him, thus abandoning Pedrarias. Cortés encouraged him, but soon after was obliged to return to Mexico, and Cordova then resolved to create an independent government in Nicaragua for himself. He was resisted by Soto and a few others; they carried word of the defection to Pedrarias, who hurried to Nicaragua with a considerable force, seized his lieutenant at Leon, and had him beheaded (Mar., 1526). Herbert H. Smith.

Cordova, or **Cordoba**, Francisco Hernandez: a Spanish soldier, of whose early life nothing is known. In 1511 he accompanied Velasquez in the conquest of Cuba, received a grant of land and Indians near Santi Espiritu, and in 1517 had become one of the wealthiest men in the island. In that year he was induced by some adventurers from Panama to join as captain in a voyage of exploration westward in the hope of obtaining gold and Indian slaves. Probably Cordova bore the greater part of the expenses of the expedition, which was purely a speculation. Leaving Cuba with three vessels and 110 men, Feb. 12, 1517, they discovered the east coast of Yucatan a few days later, and followed it around to Campeche and beyond. At Champotan they had a fight with the Indians, in which Cordova was severely wounded. They obtained little gold and only two slaves, but found signs of a civilization higher than any that had yet been seen among the natives of America. From near Campeche Cordova passed over to Florida, and thence to Cuba, where he died of his wounds soon after (May or June, 1517).

Herbert H. Smith.

Cordova, Jorge: Bolivian revolutionist; b. in La Paz, 1822. He was an uneducated soldier, but acquired some social standing by his marriage with a daughter of President Belzu. When Belzu was driven out by the revolution of 1855, Gen. Cordova was proclaimed in his place. As a ruler he showed little energy, either for good or evil, but was at least humane in his treatment of political offenders. In 1858 he was deposed by another outbreak. He was shot in the "massacre of Loreto," at La Paz, Oct. 23, 1861.

H. H. S.

Cordova, Pedro, de: Spanish Dominican missionary; b. in 1483. He was vicar of twelve or fifteen Dominicans who went to Hispaniola in 1510, and one of the first of their order to reach the New World. Soon after arriving, Cordova and his companions began to preach against the enslavement of the Indians. Getting nothing but opposition from the colonists, they sent one of their number, Antonio Montesinos, to represent the evil to the king, and in 1512 Cordova himself went to Spain. He was influential in obtaining new laws in favor of the Indians, though these proved ineffectual, and he obtained permission to plant a missionary colony on the American continent. Returning to Hispaniola with a new force of monks, he sent three of them to form his colony on the coast of Venezuela, near Cumaná. This was the first European settlement in that part of America. The Indians received the missionaries well; but the cruelties of some Spanish slave-dealers soon provoked them against the whites, and, though the missionaries were guiltless, they were killed in 1515. Cordova then visited Venezuela himself, and left another mission colony there, which was broken up somewhat later. He was a friend of Las Casas, and did all he could to forward his humane schemes. D. at San Domingo, May, 1521.

Herbert H. Smith.

Cordova y Figueroa, Pedro, de: Chilian historian; b. at Concepcion, 1692. He became a soldier in 1725, served in Araucania, was promoted to *sarjento mayor*, founded Los Angeles in 1739, and was afterward *alcalde* of Concepcion, where he probably died about 1775. His *Historia de Chile* was written between 1740 and 1745, and includes the conquest and history of the country to 1717. It was the best and most complete work on the subject up to that date. The manuscript was long preserved in the National Library at Madrid. A copy was at length made for the Chilian Government, and it was published in the great *Colección de Historiadores de Chile*. Herbert H. Smith.

Corea: See Korea.

Coreal, Francisco: the name, probably fictitious, appended to a book of travels first published in France as *Voyage aux Indes Occidentales* (1727). The author claimed to have been born in Cartagena in 1648, and to have traveled from 1666 to 1679 through Florida, Mexico, and a great part of South America. The work is probably a compilation by some European author, and it is full of errors.

H. H. S.

Corean Language: See Korean Language.

Corel'li, Arcangelo: Italian musician and composer; b. near Imola, Feb., 1653; most of his life was passed in Rome. He produced, besides other works, *Concerti Grossi* (1712). D. Jan. 18, 1713.

Corentyn': river of Guiana, forming the boundary between the English and Dutch colonies. It rises near the Brazilian frontier, has a general northerly course, and reaches the Atlantic, with a length along the main curves of about 400 miles. The lower portion is very tortuous, and is generally lined with forests; it is navigable for about 150 miles for vessels drawing 7 feet. The middle Corentyn has a series of rapids and falls of great beauty.

Herbert H. Smith.

Coreop'sis [from Gr. κόρις, bug + ὄψις, appearance]: a genus of herbaceous plants of the family *Compositæ*, named with reference to the form of the fruit. Plants of this genus have neutral ray florets and a double involucre. Many species of this genus are natives of the U. S., and are popularly called tickseed. The *Coreopsis tinctoria* grows wild in the plains beyond the Mississippi, and is commonly cultivated in gardens for the beauty of its flowers, which are yellow with a brown-purple center.

Corfù, or **Korkyra**: one of the sixteen nomarchies into which the kingdom of Greece is divided. It embraces the island of Corfù, Paxo, Leucadia, and several smaller islands. Area, 431 sq. miles. Pop. (1889) 114,535; (1896) 124,578.

Corfù [an Italian corruption of Gr. Κορυφώ, the Byzantine name for the island, from the two "peaks" (κορυφαί) on which the citadel stands; modern Gr. Κορφοί; anc. Lat. *Corcyra*]: one of the Ionian islands; belonging since Mar. 29, 1864, to the kingdom of Greece. It is separated from Albania by a channel which varies in breadth from 2 to 12 miles. It is 38 miles long, and has an area of 227 sq. miles. The surface is hilly and picturesque, the highest points being about 3,000 feet above the sea. The soil is very fertile. Olive oil is the chief article of export. Pop. (1889) 84,492. Capital, Corfù. The people of ancient Corcyra waged war against Corinth. A naval battle which occurred between these powers in 665 B. C. is mentioned by Thucydides as the first sea-fight on record. Corcyra was in alliance with the Athenians in the Peloponnesian war.

Corfù: a fortified seaport-town; capital of the island of the same name; on the east coast; 10 miles S. W. of Butrinto; lat. 39° 37′ N., lon. 20° 6′ 2″ E. (see map of Greece, ref.

15–H). It has a safe and convenient harbor, and is defended by a citadel and two castles. It has a university, founded in 1823, a cathedral, and numerous Greek and Roman Catholic churches, and a lighthouse. An archbishop of the Greek Church resides here. Corfù stands near the site of the ancient town of *Corcyra*. Pop. (1896) 17,918.

Corin'na (in Gr. **Κόριννα**): celebrated Greek lyric poetess of Tanagra in Bœotia; flourished about 500 B. C. It is said that she overcame Pindar in a poetical contest, but the story is discredited. Scant fragments may be found in Bergk's *Poetæ Lyrici Græci* (3d ed., vol. iii., pp. 543–553).

Cor'inth (Lat. *Corinthus*; Gr. **Κόρινθος**): an ancient and celebrated city of Greece; on the Isthmus of Corinth and near the *Sinus Corinthiacus* (Gulf of Lepanto); about 50 miles W. by S. from Athens (see map of Greece, ref. 16–K). The isthmus is a sterile plain inclosed on several sides by mountains. It is subject to frequent earthquakes. Corinth commanded all the passes between the Peloponnesus and Northern Greece. It had a very favorable position for commerce, and seemed to be destined by nature to be a great maritime power. In consequence of its position it formed the most direct communication between the two principal Grecian seas—the Ionian and the Ægean—and became the emporium of the trade between the East and the West. It was one of the most populous cities of Greece. Its early history is obscure and mixed with fabulous legends. The family of the Bacchiadæ ruled here from 747 to 657 B. C. The Corinthians founded the colonies of Corcyra and Syracuse in 734 B. C. Periander, one of the Seven Wise Men of Greece, became tyrant (prince) of Corinth about 625 B. C., and reigned forty-four years. Soon after his death Corinth became an ally of Sparta, and was ruled by an oligarchy. The Corinthians were defeated by the Athenian general Myronides in 457 B. C. As the ally of Sparta, Corinth fought against Athens throughout the long Peloponnesian war (431–404 B. C.). In 395 B. C. Corinth united with other Greek states in a war against the Spartans, who defeated the allies in several battles. This war, called the Corinthian war, was ended by the peace of Antalcidas in 387 B. C., and Corinth then returned to the alliance with Sparta. Timophanes attempted to make himself tyrant of Corinth, but he was killed by his brother Timoleon in 344 B. C. The battle of Chæronea (338 B. C.) rendered Philip of Macedon master of Corinth, which was subject to his successors, until it was annexed to the Achæan League in 243. At this period Corinth was the richest and most luxurious city of Greece, and abounded in statues, paintings, and other works of art. The patron goddess of Corinth was Aphrodite (Venus), who had a splendid temple on the Acrocorinthus. The numerous fine temples which the wealth of the Corinthians enabled them to erect gave an impulse to architecture, and the most elaborate order of ancient architecture derived its name from Corinth, which was one of the principal seats of Grecian art, but produced no eminent poets or orators.

Having been captured by the Roman consul Mummius, in 146 B. C., Corinth was pillaged by his army, and nearly destroyed by fire. The most valuable works of art were carried to Rome. It remained in ruins for a century, and was rebuilt in the year 46 by Julius Cæsar, who planted there a colony of his veterans and freedmen. It soon rose again to be a populous and prosperous city, which was called *Colonia Julia Corinthus*. St. Paul preached here, and founded a Christian church, to which two of his epistles were addressed. Pausanias, who visited it between 150 and 200 A. D., says that it contained many things worthy of notice, some being the relics of the ancient city, but the greater part executed in the flourishing period after it was rebuilt by Cæsar. The principal monument of antiquity now remaining here is the citadel, built on a hill called Acrocorinthus, which rises 1,886 feet above the level of the sea, and is abrupt and isolated. The view from its summit is singularly magnificent, and comprehends a greater number of celebrated objects than any other in Greece. The Parthenon of Athens is distinctly seen at a distance of nearly 50 English miles. Among the few relics of the Greek city are seven Doric columns of a temple standing on the western outskirts of the modern town. These are 5 ft. 10 in. in diameter. The site of Corinth was occupied by the small town Gortho, destroyed by earthquake (Feb., 1858), and New Corinth was then built 5 miles from the ancient site, on the shore of the gulf, about 1½ miles W. of the entrance to the ship-canal, which has given it much importance. It is now a flourishing city. See SHIP-CANALS. Pop. 41,000.

Revised by C. C. ADAMS.

Corinth: city; capital of Alcorn co., Miss. (for location, see map of Mississippi, ref. 3–H); situated at the junction of the E. Tenn., Va. and Ga., and Mobile and Ohio R. Rs.; 93 miles E. by S. of Memphis, Tenn. It has large iron-works. Pop. (1880) 2,275; (1890) 2,111; (1900) 3,661.

After the battle of Shiloh, Apr. 6–7, 1862, the Confederate army retreated to Corinth. The national army being reorganized and strongly re-enforced, Halleck, who had arrived and taken command, slowly advanced on Corinth by regular approaches, arriving May 21 to within 3 miles of the place, expecting to meet with an obstinate resistance; but Beauregard, deeming it impossible for him to successfully resist, commenced (May 26) secretly evacuating, and by the 29th had removed or destroyed everything of value, retreating with his army southward to Tupelo. Halleck occupied Corinth May 30, and pursuit was given to the Confederates, but without overtaking them.

After his defeat at Iuka, the Confederate general Price retreated to Ripley, Miss., where he was joined by Gen. Van Dorn, raising his force to about 30,000, Van Dorn assuming command, and an attempt to take Corinth by surprise or force was determined upon. This movement began Oct. 2.

Gen. Rosecrans was now in command at Corinth with 20,000 men. To the former extensive line of defenses inner lines had been added. Grant's headquarters were at Jackson, Tenn., Ord's division was at Bolivar.

Van Dorn moved northward to Pocahontas on the Memphis R. R., thence down to Chewalla. Rosecrans, apprised of this advance, deemed it a feint on Corinth, and that the real object was to attack Grant or Ord, but to meet any emergency threw his forces well out to the west, in and beyond the outer line of fortifications.

On the morning of Oct. 3 the Confederate advance struck these troops, who offered sufficient resistance to develop the full strength of the attacking force.

No doubt now existing as to the design of the Confederates, Rosecrans prepared to resist. He had barely withdrawn and rearranged his line when a furious attack on the center forced Davies back a short distance, darkness closing the engagement.

On the morning of the 4th the attack was renewed with great vigor, and although the troops were subjected to a most severe direct and cross fire, it was pushed until Fort Richardson and even Rosecrans's headquarters were taken; but by bringing up the reserves the fort was retaken, the Confederates driven back in confusion, and the line re-established.

At the same time desperate attacks were made upon the Union left center in the vicinity of batteries Williams and Robinett, the last of which was led by Col. Rogers, Second Texas, who fell just outside the ditch of Battery Robinett. These attacks were all repulsed with heavy losses, and by counter charges the Confederates were driven back to the edge of the woods. By noon the battle was ended. The heroic bravery here displayed called forth the admiration of all. The remains of the gallant Col. Rogers, who fell at the ditch, were carefully buried in a separate grave by his foe.

The national loss in this sanguinary conflict was 355 killed, 1,841 wounded, and 324 captured and missing; total 2,520 out of a force of 20,000 engaged. Neither the strength nor losses of the Confederates is exactly known. The official records show Van Dorn to have had about 22,000 men, and to have lost on Oct. 3, 4, and 5, about 4,900 in killed, wounded, and missing, or nearly double the Union loss.

Revised by JAMES MERCUR.

Corinth, Gulf of, or **Gulf of Lepanto** (anc. *Corinthiacus Sinus*): an inlet of the Mediterranean, extending between Hellas proper, or Northern Greece, and the Peloponnesus (Morea). This gulf resembles a large inland lake. In beauty of scenery it equals or surpasses the most picturesque lakes of Northern Italy. "Its coasts," says Leake, "broken into an infinite variety of outline by the ever-changing mixture of bold promontory, gentle slope, and cultivated level, are crowned on every side by lofty mountains of the most majestic forms." It extends E. and W. nearly 80 miles, without including the part called the Gulf of Patras, which is connected with the other portion by a strait less than 2 miles wide, sometimes called the Little Dardanelles. See also LEPANTO, GULF OF.

Corinth, Isthmus of: a neck of land connecting Attica with the Morea, and separating the Gulf of Corinth from that of Ægina. Its width varies from 4 to 8 miles. This isthmus was the scene of the celebrated Isthmian games and the site of a famous temple of Neptune. (See ISTHMIAN GAMES.) A ship-canal has been constructed through the isthmus. See SHIP-CANALS.

Corinthian Order: in architecture, a form of column and entablature invented in Greece but perfected by the Romans. Its origin is uncertain, the Vitruvian legend of Callimachus and the basket encircled by acanthus leaves having been wholly discredited by modern archæology. It was not generally used in Greece before the age of Alexander (330 B. C.), and the few remaining examples differ widely from each other. In Greek hands it was treated as a variant of the Ionic, having no distinctive form of base or entablature, but characterized mainly by its slender shaft and tall, bell-shaped capital encircled by rows of acanthus leaves. In the order of the Tower of the Winds there is but one row of these leaves, and the upper part of the bell is nearly plain; in that of the Choragic monument of Lysicrates there are two rows of leaves, above which appear coupled scrolls under the corners of the abacus, with honeysuckles in the middle. The Romans greatly affected the Corinthian order, and developed it into a distinctive order by giving it a special form of base and modifying the entablature, to the cornice of which they added modillions or brackets. The Roman Corinthian capital is somewhat over one shaft-diameter in height; it consists of an abacus with concave sides surmounting a bell-shaped core, around which are sixteen acanthus leaves in two tiers. From between these spring eight stalks (*caulicoli*), out of which grow branching leaves and scrolls, which meet under the corners of the abacus, with smaller scrolls and a rosette in the middle of each side. The shaft is either fluted, as in the temple of Castor and Pollux (miscalled "Jupiter Stator") at Rome, or a smooth and polished monolith, as in the porch of the Pantheon. The whole column varies from 9⅛ to 10¼ diameters in height, and carries an entablature whose architrave is usually profiled in three unequal bands, though sometimes there are but two. The frieze is usually richly sculptured, and is surmounted by a highly ornate cornice, decorated with carved moldings, dentils, and modillions faced on the under side with acanthus leaves. Among the principal antique examples of the order are the Pantheon, the temples of Mars Ultor, Vespasian, and Castor and Pollux at Rome; the temple of Zeus at Athens, and the Maison Carrée at Nîmes, the last two being doubtless executed by Greek hands. The Corinthian order was frequently used by the architects of the Renaissance. The Capitol at Washington is a good modern example of the order. See ARCHITECTURE and ORDERS OF ARCHITECTURE.

A. D. F. HAMLIN.

Corinthians, THE FIRST AND SECOND EPISTLES OF ST. PAUL TO THE: canonical books of the New Testament. *First Corinthians* was written from Ephesus in the spring of the year 57, to rebuke the Church at Corinth for party spirit, disrespect to the apostle's authority, licentiousness, impropriety at public meetings (especially at the Holy Communion), vanity, and self-seeking. The apostle also settles some cases of conscience as to eating idol-sacrifices, and a point of doctrine as to the resurrection. *Second Corinthians.*—The first Epistle had been sent by Titus probably, whose report greatly comforted the apostle (2 Cor. vii. 4–16), so he sends him back with this second letter, which is a sober and conciliatory but earnest statement of the apostle's true and just authority. From no other source do we learn so much regarding the personality of the apostle. When he wrote he had reached Macedonia on his way to Achaia; was probably in Thessalonica. The time was the summer of 57. The best commentaries in English are by C. Hodge (New York, 1857); A. P. Stanley (London, 1855); J. A. Bett (1882); F. Godet (1885); J. J. Lias (1886–92, 2 vols.); M. Dods. *Expositor's Bible* (1889–93, 2 vols.); on First Epistle alone, by T. C. Edwards (London, 1885); C. J. Ellicott (1888). See PAULINE EPISTLES.

TWO APOCRYPHAL EPISTLES (OF THE CORINTHIANS TO ST. PAUL, AND OF ST. PAUL TO THE CORINTHIANS), existing in the Armenian, are worthless productions. English translations are to be seen in Whiston's *Authentic Records*, and Latin in J. A. Giles's *Codex Apocryphus, N. T.*, pp. 509, 510.

THE EPISTLE OF CLEMENT OF ROME TO THE CORINTHIANS has been regarded as spurious by some, but without sufficient reason, and its genuineness is now conceded. It is translated in vol. i., pp. 5–21, of the *Ante-Nicene Fathers* (New York). The so-called Second Epistle of Clement to the Corinthians is doubtless a part of the pseudo-Clementine homilies, to which it is now generally referred. See CLEMENT OF ROME.

Corinto: a port of Northwestern Nicaragua; in the department of Chinandega; on a bay of the Pacific Ocean (see map of Central America, ref. 6–H). It is connected by rail with Managua, Masaya, and Granada, and the Pacific mail-steamers touch there regularly. The trade is important, the railroad having made this the principal port of the republic. Besides the custom-house and warehouses, the town is composed mainly of adobe or straw huts. Pop. probably less than 2,000. H. H. S.

Coriola'nus, CAIUS MARCIUS: Roman hero, who, according to tradition, received the surname *Coriolanus* because he defeated the Volsci at Corioli about 490 B. C. During a famine he advised that grain should not be distributed gratis among the plebeians unless they abandoned the right or privilege of electing tribunes of the people. For this offense he was banished. Having obtained command of the Volscian army, he marched against Rome, the citizens of which were unable to resist him. He was at length appeased by a deputation of Roman matrons, led by his mother Veturia, and his wife Volumnia. The story of Coriolanus forms the subject of one of Shakspeare's dramas. See Arnold, *History of Rome.*

Corip'pus, FLAVIUS CRESCONIUS: a literary man (*grammaticus*), who was born in Africa and flourished probably in the sixth century; known as the author of an extravagant panegyric upon Justin the Younger, who was Byzantine emperor from 565 to 578 A. D., and of a poem called *Johannis*, celebrating the exploits of Johannes, a proconsul in Africa in Justinian's time. It is believed by some, but without full evidence, that he was the same Cresconius who wrote large and important collections of the canon law, and who was an African bishop of uncertain age. Corippus was a writer of ability, and those parts of his work which are now perfect are highly prized. Much mystery formerly existed with regard to the authorship of his writings, but the discovery of a fairly preserved MS. in 1814 cleared away most of the difficulties which had beset this vexed question. The above works have been often reprinted. See especially the editions by I. Partsch (Berlin, 1879) and by Mr. Petschenig (Berlin, 1886).

Cork [from Span. *corcho*, cork, *corche*, cork-shoe < Lat. *cor'tex, -icis*, bark]: the bark of the *Quercus suber*, a species of oak growing in Spain, Italy, and the south of France. The bark may be removed annually without injuring the tree. Cork is extensively used in the form of stoppers for glass bottles, and in the construction of life-preservers and life-boats. When rasped cork is digested in water and alcohol, it leaves about 75 per cent. of insoluble matter, called *suberine*. The cork-tree has been introduced successfully in the Southern U. S.

Cork: the most southern county of Ireland; bordering on the Atlantic Ocean. Area, 2,890 sq. miles. It is drained by the rivers Blackwater, Lee, and Bandon. The surface is diversified, and presents picturesque scenery. The coast is deeply indented with several bays and inlets, which form excellent harbors. Among these are Bantry Bay and the harbors of Cork and Kinsale. The predominant rocks are old red sandstone and mountain limestone. Here are mines of copper and coal. Capital, Cork. Pop. (1891) 436,641.

Cork: city; river-port and third city of Ireland; capital of Cork county; on the river Lee, 11 miles from the sea, and 136 miles S. W. of Dublin by rail (see map of Ireland, ref. 14–E). It is built partly on an island of the river, which is here crossed by nine modern bridges. Many of the houses are of stone and brick, and the main streets are wide and well-paved, but the suburbs are mean. Among the principal edifices are the court-house, mansion-house, the exchange, a custom-house, a lunatic asylum, and an episcopal palace. It contains a Protestant and a Catholic cathedral and two large Roman Catholic churches, Queen's College, the Cork Library, a medical school, two or three theaters, a fever hospital, and several convents. The chief manufactures are glass, paper, gingham, iron, gloves, etc. Cork has a large, safe, and landlocked harbor, formed by an estuary of the river Lee. The entrance, which is a mile wide, is 11 miles from the city. Queenstown is on an island

in this harbor. Cork derives much of its prosperity from commerce. It is connected by railway with Dublin and other cities. Steam-packets ply between this port and Dublin, Liverpool, Bristol, etc. Cork returns two members to Parliament. It is supposed to have been founded in the sixth century. Pop. (1891) 75,070.

Cork, Earls of (1620): Earls of Orrery (1660), Barons Boyle of Youghal (1616), Barons Broghill, Viscounts Kinalmealy, and Barons of Bandon Bridge (Ireland, 1628), Barons Boyle of Marston, Somerset (Great Britain, 1711).—Richard Boyle, ninth earl, K. P., P. C., master of the buckhounds, b. Apr. 19, 1829; succeeded his grandfather June 29, 1856.

Cork, Richard Boyle, First Earl of: a British statesman; b. at Canterbury, Oct. 3, 1566. He was made privy councilor for Ireland in 1612, raised to the peerage in 1616, became Earl of Cork in 1620, lord justice of Ireland in 1629, and lord treasurer in 1631. D. Sept. 15, 1643. He is known as "the great Earl of Cork," and was father of Robert Boyle, the philosopher.

Cormenin, kōrm'năñ', Louis Marie de la Haye, Vicomte de: French political writer; b. in Paris, Jan. 6, 1788. He became in 1828 a liberal member of the Chamber of Deputies, and under the pseudonym of *Timon* wrote political pamphlets which were successful. He was president of the committee which formed a new constitution in 1848. Among his works *Droit Administratif* (1831; 5th ed. 1840) is the most important. After the *coup d'état* of Dec., 1851, he was a member of the council of state. In 1855 he was admitted into the Institute. D. May 6, 1868.

Cormon, kōr'mōñ', Fernand: painter of historical and archæological subjects and of portraits; b. in Paris, Dec. 22, 1845. Pupil of Fromentin, Cabanel, and Portaels; medals of honor Salon of 1887 and Paris Exposition 1889; officer Legion of Honor 1889. Two large compositions are in the Luxembourg Gallery, Paris, *Cain* (1880) and *The Victors of Salamis* (1887). *The Stone Age*, exhibited at the Salon of 1884, is also a vast canvas, and all of these works are painted with great science and technical strength. It must be said, however, that the chief interest in them lies in the fact that they are reconstructions or representations of the life of other days, for which there are not many authentic documents, and the painter relies on so presenting his subjects on canvas as to give them an air of truth. In the *Cain*, which is the best of the three, there is fine composition, great breadth of handling, and strong draughtsmanship. Cormon's work is not in any sense remarkable for color. He is a figure of considerable importance in contemporary art, one of the best instructors in Paris, and as a portrait-painter is notably successful in the rendering of character. Studio in Paris. William A. Coffin.

Cormontaigne, kōr'mōñ'tăñ', Louis, de: French military engineer; b. in 1696. He made improvements in the art of fortification, on which he wrote several treatises. He planned the fortifications which were constructed at Metz and Thionville in the reign of Louis XV. D. Oct. 20, 1752.

Cormorant: any one of a family of aquatic birds (*Phalacrocoracidæ*) related to the pelicans. They are characterized by a long neck, compressed bill with a hook at the tip, wings of moderate length, and rather long, stiff tail. The feet are totipalmate, that is, all the toes, including the first, are connected by a web, and there are no external nostrils. The conspicuous pouch of the pelican is represented by a patch of bare, often highly colored, skin beneath the bill, and extending to the upper part of the throat. Cormorants occur along the seacoast almost throughout the world, except in the coldest parts, and many are found on inland waters. They usually nest in large colonies, choosing the rocky shelves of some precipitous coast, or, in warmer latitudes, the tangled shrubbery of some island. The young are blind, naked, and helpless, and do not attain their growth for some time. Cormorants live chiefly upon fish which they capture by diving, and in China and Japan these birds are trained to fish for their owners. The double-crested cormorant, *Phalacrocorax dilophus*, the common species of the U. S., is found on both coasts of North America and in the interior. Its general color is glossy, greenish black. The European cormorant, *P. carbo*, shown in the cut, also occurs sparingly on our eastern coast. Pallas's cormorant, *P. perspicillatus*, once found on the Commander islands, is extinct, and but four specimens are known to be in existence. See the Appendix. F. A. Lucas.

Cormorant.

Corn [O. Eng. *corn*, Germ. *Korn*; cf. Lat. *grā'num*]: a general name given to various seeds, especially to cereal and farinaceous grains which grow in ears and are used for food, as wheat, barley, rye, and maize. In Great Britain the term is generally applied to wheat, rye, oats, and barley, and means simply "grain." In Scotland and Ireland, however, it is commonly restricted to "oats." In the U. S. the term is restricted to maize or Indian corn. See Maize.

Corn [from Lat. *cornu*, a horn]: a horny accumulation of epidermic cells upon the surface of the human foot, produced by the pressure of the boot or shoe. Corns may be softened by hot water or poultices, and the horny part can be carefully removed with the knife. When painful, they may be generally much relieved by the occasional application of a solution of nitrate of silver. Various surgical appliances have been devised for the relief of corns, which when neglected may give rise to serious trouble.

Cor'narists: See Cornhert, Diedrik.

Cornaro, Caterina: Queen of Cyprus; b. in Venice, 1454; married James de Lusignan, King of Cyprus, and on his death in 1473 succeeded him on the throne; abdicated in favor of the Venetians in 1489. Her portrait was painted by Titian. D. 1510.

Cornaro, kōr-naa'rō, Luigi: Venetian nobleman; b. 1467; d. 1566; lived very freely up to his fortieth year, when he adopted an almost ascetic mode of life, and put himself on a diet of 12 oz. of solid meat and 14 oz. of wine a day. In his eighty-third year he wrote his *Sure Method of Attaining a Long Life*, the English translation of which has run through more than thirty editions.

Corn'bury, Edward Hyde, Lord: the grandson of Edward Hyde, first Earl of Clarendon. He deserted the service of James II. in 1688, and became an adherent of the Prince of Orange (William III.), who appointed him Governor of New York in 1702. He was censured for rapacity and tyrannical conduct, and was removed in 1708, and soon after returned to England to succeed his father as third earl. D. Apr. 1, 1723.

Corn-crake, or **Land-rail**: the *Crex pratensis*, a European bird, a rare visitant of the U. S. It is a wader, 7

Corn-crake, or land-rail.

inches long, of a brown-gray color, haunting corn and grass lands and osier-beds. It is a game bird, quite hard to flush, as it runs rapidly away from a dog.

Cor'nea [Lat. femin. of adjec. *cor'neus*, horny; deriv. of *cornu*, horn]: the transparent horny membrane which forms the anterior part of the eyeball. In vertebrates it is simple; in insects it is divided into numerous hexagonal segments. See EYE.

Corneille, kōr'nāl' or kōr'nāl', PIERRE: French dramatic author; b. at Rouen, June 6, 1606; is called the founder of the French drama. He was educated by the Jesuits, and studied law, which he practiced for several years without success. In 1629 he produced *Mélite*, a comedy, which was performed with applause. Between 1629 and 1635 he wrote several comedies which are inferior to his later works. His *Médée* (1635), a tragedy, although somewhat bombastic, contains eloquent passages, and reveals the dawning of his genius. His reputation was greatly increased by the tragedy of the *Cid* (1636), an imitation of the Spanish drama of the same name. The *Cid* was performed with great applause, and surpassed everything that had appeared on the French stage. He produced in 1639 *Les Horaces* and *Cinna*, which are excellent in invention and style. *Cinna* and *Polyeucte* (1640) are considered by some critics as his masterpieces. He was admitted into the French Academy in 1647. Among his other works are *Le Menteur* (1642), a comedy of character and intrigue, and an opera, *La Toison d'Or* (1661). He died in Paris, Oct. 1, 1684, and left several children. He was an uncle of Fontenelle. The French call him the "grand Corneille," partly to distinguish him from his brother Thomas. In the opinion of many critics he excelled other French dramatists in impressive declamation, sublime thoughts, and a condensed and noble style. See Fontenelle, *Éloge de Corneille*; Guizot, *Corneille et son Temps* (1852); Taschereau, *Histoire de la Vie et des Ouvrages de Corneille* (1829); Bouquet, *Points obscurs de la Vie de Corneille* (1888); Picot, *Bibliographie Cornélienne* (1875). Among the editions of his works is one by Marty-Laveaux (12 vols., 1862–67).

Corneille, THOMAS: French dramatist; a brother of the preceding; b. at Rouen, Aug. 20, 1625. His first work was a comedy entitled *Engagements du Hasard* (1647). He produced *Timocrate*, *Ariane*, and other tragedies, and several encyclopædic works. D. Dec. 17, 1709.

Cor'nel: a shrubby plant bearing the name of dogwood, belonging to the genus *Cornus*, which includes about twenty-five species, mostly of the northern hemisphere. The small flowers have four petals, four stamens, and an inferior two to three celled ovary, producing a fleshy fruit. The common dogwood, *Cornus florida*, of the Eastern U. S. is a small tree yielding a hard wood resembling boxwood. The dwarf cornel, or bunch-berry, *C. canadensis*, is a low herb growing in cold, damp woods in the North. There are, all told, eighteen species in North America. CHARLES E. BESSEY.

Corne'lia, mother of the Gracchi: See GRACCHUS.

Cornelian, or **Carnelian**: See CHALCEDONY.

Corne'lius, ELIAS, D. D.: clergyman; b. at Somers, Westchester co., N. Y., July 31, 1794. Graduated at Yale College 1813; he became missionary to the Cherokee and Chickasaw Indians, and greatly helped the cause by his book *The Little Osage Captive* [Lydia Carter], *an Authentic Narrative* (New York, 1821; 3d ed. Boston, 1837). In 1819 he became colleague of Rev. Samuel Worcester, at Salem, Mass. In 1826 he became secretary of the American Education Society, in which capacity he gave a notable impulse to the work of training men for the Christian ministry. D. at Hartford, Conn., Feb. 12, 1832. A few weeks before his death he succeeded Jeremiah Evarts as one of the secretaries of the A. B. C. F. M. His life was written by B. B. Edwards (Boston, 1833; 2d ed. 1834; rep. Edinburgh, 1834).

Cornelius, PETER, von: historical painter; b. at Düsseldorf, Sept. 23, 1783; d. in Berlin, Mar. 6, 1867; pupil of Düsseldorf Academy; director of the Academy; executed the Iliad frescoes in the Glyptothek, Munich, 1822–30; from 1841–61 executed a series of frescoes for the cemetery in Berlin. Important works besides these are *The Last Judgment*, Ludwigs Kirche, Munich; *Hagen Sinking the Niebelungen Hoard*, National Gallery, Berlin; Dante frescoes in the Villa Massimi, Rome. W. A. C.

Cornelius Nepos: See NEPOS.

Cornell, ALONZO B.: b. at Ithaca, N. Y., Jan. 22, 1832; son of Hon. Ezra Cornell, founder of Cornell University; educated at the academy in Ithaca; telegraph operator for some time; manager of Cleveland telegraph office 1848, and 1855–59 of principal telegraph office in New York city; 1864–69 cashier and vice-president of First National Bank of Ithaca; afterward first vice-president of Western Union Telegraph Company; chairman of Republican county committee 1859–66; in 1868 Republican candidate for Lieutenant-Governor of New York; surveyor of port of New York 1869–72; in 1870 was first elected chairman of Republican State committee; speaker of Assembly in 1873, 1875–76 and 1878; naval officer of New York in 1876; Governor of New York 1880–83.

Cornell, EZRA: founder of Cornell University; b. at Westchester Landing, N. Y., Jan. 11, 1807. Soon after the invention of the telegraph he devoted his attention to that enterprise, and in its development acquired a large fortune. He served in the New York State Senate, and in 1865 founded the CORNELL UNIVERSITY (*q. v.*). D. Dec. 9, 1874, at Ithaca, N. Y. His *Life*, by Alonzo B. Cornell, was published for private circulation in 1884.

Cornell, JOHN HENRY: organist, composer, and teacher; b. in New York city, May 8, 1828; received his musical education partly at home and partly in Germany. He was for many years the organist and choir-director of St. Paul's chapel, New York. After resigning that position he devoted himself exclusively to teaching and the writing of books of an educational character. His *Primer of Modern Tonality* (1876) attained considerable popularity, and his *Musical Form* is a very valuable treatise. His compositions are not many and are entirely sacred. D. in New York, Mar. 1, 1894. D. E. HERVEY.

Cornell College (Mt. Vernon, Ia.): an institution under the direction of the Upper Iowa and the Northwest Iowa Conferences of the Methodist Episcopal Church. The history of the school began in 1852, Miss A. C. Fortner being the first teacher. At the more formal organization as a seminary, Rev. Samuel M. Fellows, M. A., afterward president of the college, became the first principal. The school was founded and sustained during the earlier years of its existence by the self-sacrifice and earnest effort of the pioneer settlers of Mt. Vernon and vicinity under the leadership of Rev. George B. Bowman, D. D. A college organization was effected in 1857. The art hall, science hall, Bowman hall, and the main college building are of brick. The chapel is of stone, two stories high, built in the modern Gothic style of architecture. Besides the four regular college courses, classical, philosophical, scientific, and civil engineering, there are preparatory, normal, art, and musical departments. The president, Rev. W. F. King, D. D., LL. D., has been at the head of the institution since 1863. The faculty consists of 36 professors and teachers, and the enrollment of students in 1900 was 689. For sixteen years the general Government has detailed an army officer to give military instruction to the students. In addition to the general endowment, three chairs have been endowed by gifts of the late Bishop L. L. Hamline, the Hon. D. N. Cooley, and the alumni. The history of the institution has been marked on account of its high intellectual and religious standards. HAMLINE H. FREER.

Cornell University: a collegiate institution at Ithaca, Tompkins co., N. Y. In July, 1862, Congress granted to each State 30,000 acres of public land for every Senator and Representative it was entitled to, the income to be applied for ever to colleges "where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, . . . in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life." One-tenth of this may be used for experimental farms, but no portion for buildings. New York's share was 990,000 acres. By charter of 1865 and 1867 the Legislature of the State established the Cornell University with a foundation of $500,000, given it by Hon. Ezra Cornell, of Ithaca, and secured to it the entire income of the land-grant. During several years after the establishment of the university the price of land scrip was so low that very little could be realized from the Federal endowment. At length, however, Mr. Cornell secured the passage of a law by the Legislature of the State of New York authorizing him to purchase the scrip at the current market price, on condition that all the profits accruing from the location and sale of the lands represented by such scrip should be turned over to the university as a part of the Cornell Endowment Fund. The lands located by Mr. Cornell under this authority were very largely pine-lands in Wisconsin, and were held until

1881, when, in consequence of the great increase in the value of timber, the university was able to realize a large profit. In the course of the next ten years the sales amounted to about $5,000,000. In addition to the sum thus realized the university has received large amounts from private benefactors. Mr. John McGraw erected the McGraw Hall at an expense of $140,000; Mr. Hiram Sibley founded Sibley College; Mr. Henry W. Sage gave $250,000 for Sage College for women, $30,000 for Sage Chapel, $260,000 for the Sage School of Philosophy, and $560,000 for the General Library Building and its endowment; Mr. A. S. Barnes gave $45,000 for the erection of a building for the Students' Christian Association; and President Andrew D. White gave his library of history and political science, valued at $100,000, besides nearly or quite $100,000 more in miscellaneous gifts.

The university was opened in the autumn of 1868. Though the number of students from the very first was large, it was not until after the material equipment was greatly increased by the sales following 1881 that the growth of the university became remarkable. In 1882 the number of students was 382; in 1900 it was 2,776. Andrew D. White, LL. D., was president from 1865 to 1885; Charles K. Adams, LL. D., from 1885 to 1892; Jacob G. Schurman since 1892. The university includes the College of Agriculture, the Sibley College of Mechanical and Electrical Engineering, the College of Civil Engineering, the School of Law, the Course in Architecture, the Course in Arts, the Course in Philosophy, the Course in Science, and the Course in Letters. In many of the departments the equipment is very extensive. Since 1872 both sexes have been admitted on equal terms. The university bestows thirteen fellowships of $400 each, two of $500 each, and twelve scholarships of $200 each. The grounds of the university consist of 270 acres, picturesquely situated about 450 feet above Cayuga lake.

C. K. Adams.

Cor'net [from Fr. *cornette*, dimin. from Lat. *cor'nu*, horn]: a musical instrument usually of brass, and originally of a curved, horn-like shape. Cornets are of various kinds, but the best form is that known as the *cornet-à-pistons* (a French term signifying a "cornet with pistons," because modifications of sound are produced by small pistons moved by the player's fingers).

Cor'net [Ital. *cornetta*, a small flag]: a commissioned officer of cavalry, corresponding in rank with the ensign of infantry. The standard was formerly carried by the cornet, hence the name. There are no cornets in the U. S. army.

Corn-flower, or **Bluebottle** (*Centaurea cyaneus*): a composite weed common in European grain-fields and cultivated in gardens in the U. S.; admired for the rich blue color of the outer barren florets.

Corn'hert, or **Koornhert**, Diedrik: Dutch author and reformer; b. at Amsterdam in 1522. He efficiently promoted the Protestant Reformation, but opposed Calvinism; wrote a *Treatise against the Capital Punishment of Heretics*. He gave valuable assistance to the Prince of Orange in his contest against Spain, and became secretary of state in Holland in 1572. D. Oct. 20, 1590. His followers, who were called Cornarists, disappeared from history after the rise of the Arminian party in the Dutch Church.

Cornice: the upper and projecting or crowning portion of a wall. It is often made very ornamental by means of rich moldings, carving, inlay of colored material, or by all these means. In Greek and Græco-Roman architecture, and in all the styles derived from these, it forms the upper part of an entablature and consists of a bed-mold, corona, and cymatium or gutter, and sometimes other members, as dentils or modillions. See Entablature.

A. D. F. Hamlin.

Corniferous Limestone [*corniferous* is from Lat. *cornu*, a horn + *ferre*, bear]: a formation of the Devonian period occurring in New York, Pennsylvania, Ohio, and Canada. It is characterized by a large invertebrate fauna, and contains remains of fish. Certain layers are extensively quarried for lime and for building material, but the greater portion of the formation is rendered unfit for these uses by the abundance of the chert, or hornstone, whence its name is derived.

G. K. G.

Cornifi'cius: a writer on rhetoric, mentioned several times by Quintilian. The treatise commonly cited under the title of *Auctor ad Herennium*, and formerly attributed to Cicero, with whose works it is usually printed, is now commonly ascribed to Cornificius. The work, in four books, is the most admirable Roman manual upon rhetoric extant, and must have been composed about 84 B. C., as it was used by Cicero in his youthful treatise *De Inventione*. See editions by C. L. Kayser (Leipzig, 1854); G. Friedrich (part i., vol. i., of the Teubner Cicero, Leipzig, 1884), and F. Marx, who denies the authorship of Cornificius and has published the text under the title *Incerti Auctoris de ratione dicendi and C. Herennium libri IV.* (Leipzig, 1893). M. Warren.

Corning: town (founded in 1869); capital of Adams co., Ia. (for location of county, see map of Iowa, ref. 7–E); situated on Ch., Bur. and Q. R. R., and on East Nodoway river; 80 miles E. S. E. from Council Bluffs. The town has 6 churches, an academy, 2 public schools, 4 canning-factories, cheese-factory, 2 butter-factories, fruit-drying establishment, 3 stone-quarries, flour-mills, and tile and brick works. Pop. (1880) 1,526; (1890) 1,682; (1900) 2,145.

Editor of "Adams County Gazette."

Corning: city (incorporated in 1890); one of the capitals of Steuben co., N. Y. (for location, see map of New York, ref. 6–E); on the Chemung river, and the Del., Lack. and W., the Erie, and the Fall Brook railways; 20 miles W. of Elmira. It has gas and electric light plants, brick and stone pavements, efficient sewerage, and water-works owned by the city. There are 7 churches, 4 public-school buildings, city-hall that cost $50,000, public library, St. Mary's Orphan Asylum, 2 banks, 2 daily newspapers, and manufactures of railway cars, flint and cut glass, building and paving brick, terra-cotta work, marble and granite monuments, flour, lumber, stoves, furnaces, cigars, wagons, and sash and blinds. The tobacco-crop of the Chemung and neighboring valleys is largely handled here. Pop. (1880) 4,802; (1890) 8,550; (1900) 11,061.

B. W. Wellington.

Corning, Erastus: capitalist; b. at Norwich, Conn., Dec. 14, 1794; became a wealthy iron-merchant of Albany, N. Y., and was a member of Congress from the last-named State 1857–63 and 1865–67. He was one of the leading railroad capitalists of the U. S., was one of the regents of the University of the State of New York, and was greatly interested in the cause of popular education. D. Apr. 9, 1872.

Cornish Language: a branch of the Keltic family of languages, and nearest related to the Bretonic and the Welsh. It was spoken in Cornwall down into the eighteenth century, but has been so completely displaced by English that in recent years there remained but a few old people who could recall some scattered Cornish words. The literary records date, with the exception of two older vocabularies, from the end of the Middle Ages or the beginning of modern times. They consist of a series of religious dramas, the so-called mysteries, and a poem on the passion of Christ. Their titles are all enumerated by H. Jenner in the *Transactions of the Philological Society* (London, 1873–74). The word-material of Cornish is collected in R. Williams's *Lexicon Cornu-Britannicum* (1865). The best grammar is contained in the *Grammatica Celtica*, revised by Ebel (1871).

R. Thurneysen.

Corn-laws: laws regulating the trade in grain; specifically the laws enacted by the British Parliament controlling the exportation or importation of grain. In feudal times the legislation of European countries was directed to lowering the price of food products, and to this end the exportation of grain was prohibited, but in England this policy was found to press heavily upon the agricultural classes, and in 1436 Parliament passed a law permitting exportation when the price of grain fell below a certain limit. Heavy duties, however, were still imposed. In William and Mary's reign these duties were abolished and bounties were granted to exporters. In the meanwhile the Government had sought to keep up the price by prohibiting or taxing imports. A law passed in 1463 prohibited importation, and subsequent statutes held it in restraint by high duties. All through the eighteenth century these two methods of keeping up the price—the granting of bounties and the heavy taxation of imports—marked Great Britain's policy in dealing with the grain trade, but in 1814 bounties were abolished. In 1815 a law was passed making 80*s.* a quarter the price at which importation might begin. In 1822 this law was amended so as to permit importation when the price reached 70*s.* a quarter. The price did not rise to this point, and a further change was made in 1828. When the price was 59*s.* to 60*s.* a quarter foreign grain was admitted with a duty of 27*s.*; when the price rose above 73*s.* the duty fell to 1*s.*, and be-

tween these two extremes of price the duty varied. This was the principle of the sliding scale, more fully applied in this than in any previous statute.

After the Reform Bill of 1832 secured for the manufacturing classes and the great towns representation in Parliament, opposition to this protection of the landed interests began to make itself felt, and in 1834 a motion was offered to impose a fixed duty instead of the sliding scale. It was lost, and a motion for repeal introduced in 1837 met with the same fate. Henceforth the chief opposition to the corn-laws came from outside of Parliament. At Manchester in 1838 (or, as some say, in Jan., 1839) was formed an anti-corn-law association, which later, under the name of the Anti-Corn-law League, entered upon a campaign of agitation for repeal. Its leader was Richard Cobden and its most eloquent spokesman John Bright. Representing that cheap food would follow the remission of duties and that the corn-laws were solely in the interest of the landowners, the league constantly won new adherents both in and out of Parliament. In 1842 Peel caused a further modification of the corn-law, improving the operation of the sliding scale, but this did not placate the foes of protection. The potato blight in Ireland in 1845, followed by the failure of the corn crop in England, caused one of the worst famines of modern times. The high price of corn in the midst of the general distress gave the league its opportunity. Its agitation became more vigorous; Peel, then Prime Minister, was converted to its doctrines, and in Jan., 1846, declared himself in favor of repeal. An act providing for the gradual abolition of duties was passed June 25, 1846, and Great Britain has never since returned to the policy of protecting corn. The effect of the repeal measure is a matter of controversy between free-traders and protectionists. The latter point to the depression of agriculture in recent years as a consequence of the change of policy. F. M. Colby.

Cornplanter [Iroquois, *Garianwachia*, the planter]: a half-breed Seneca Indian and chief of the Six Nations; b. about 1732; the son of John Abeel or O'Bail, a white trader. He aided the French against the English, and was a deadly foe to the colonists during the Revolutionary war, but afterward became the steady friend of the white people. He was a man of great intelligence, dignity, and moral worth. D. in Warren co., Pa., Feb. 18, 1836. A monument was erected in his honor by the State of Pennsylvania in 1867. See Snowden, *Historical Sketch of Cornplanter* (1867).

Corn-snake: the *Coluber guttatus*, a colubrine, non-venomous serpent of the Southern U. S., of a brown color, and often 5 feet long. It is generally not seen except mornings and evenings. It enters houses, devours young chickens and other small animals, but is of gentle and familiar disposition.

Cornu, Julius: Professor of Romance Philology in the University of Prague; b. at Basel, Feb. 24, 1849. He is one of the collaborators in Gröber's *Grundriss der romanischen Philologie*, and has published important studies, especially upon Spanish and Portuguese subjects; e. g. *Glanures phonologiques* (1873); *Études sur le poème du Cid* (1881; 1890). A. R. M.

Cornucopia [for Lat. *cor'nu co'piae*, horn of plenty]: in the fine arts, an ornament representing a horn, from which issue flowers, fruits, and leaves. The fable accounting for the origin of this emblem of plenty is that Amalthæa, when one of her goats had broken off a horn, presented it to the infant Jupiter wreathed with flowers and filled with fruit.

Cornu'tus, L. Annaeus: a Stoic philosopher of Leptis, in Africa, who lived in Rome under Nero, and was the teacher and friend of Persius, whose satires he edited. He was banished by Nero together with Musonius Rufus. Of his works we have only a manual in Greek, known as *De Natura Deorum*, compiled for studious youth from the etymologizing and allegorizing mythologies of the earlier Stoics. Edited by Osann (1844) and C. Lang (1881). B. L. G.

Cornwall: a county forming the S.W. extremity of England; bounded by the ocean on all sides except the E. It constitutes a duchy, which is the appanage of the Prince of Wales. Area of the county, 1,350 sq. miles, but the duchy is larger, and includes a part of Devonshire. The surface is partly occupied by rugged hills, with some fertile valleys. The river Tamar forms the eastern boundary of Cornwall, which it separates from Devonshire. The extreme western point of the county is a promontory called Land's End. Cornwall is rich in metals, especially tin and copper. The mining of kaolin and felspar is also important. Silver, lead, zinc, antimony, cobalt, bismuth, and iron are found here. The mines of Cornwall are deteriorating, however, both with respect to the quantity and with respect to the quality of their yield. The pilchard, herring, and mackerel fisheries are extensive. The chief towns are Falmouth, Penzance, Bodmin, and Truro. There are in Cornwall many dolmens and other prehistoric remains. The ancient language of Cornwall, called the Cornish language, ceased to be spoken about the end of the eighteenth century. (See Cornish Language.) Capitals, Bodmin and Launceston. Pop. (1901) 322,857.

Cornwall: a port of entry; capital of Stormont co., Ontario, Canada (see map of Ontario, ref. 2–I); on the north side of the St. Lawrence river, at the foot of the Long Sault Rapids and Canal, 67 miles above Montreal, and on the Grand Trunk Railway. It has 8 churches, 6 schools, great water-power, and manufactures of cotton and woolen goods, paper, flour, etc. Pop. (1891) 6,805; (1893) estimated with suburbs, 9,000. Editor of "Freeholder."

Cornwall, Barry: See Procter, Bryan W.

Cornwallis, Charles, Marquess of: a British general; b. Dec. 31, 1738; eldest son of the first earl, whose title and estate he inherited in 1762. He became a favorite aide-de-camp of the king, but he opposed the measures that provoked the war of 1775–81 with the American colonies. He was ordered to North America in 1775, and with the rank of major-general took part in the battles of Brandywine and Germantown in 1777. Having obtained the command of an army in South Carolina, he defeated Gen. Gates at Camden Aug. 16, 1780. Mar. 15, 1781, he gained some advantage over Gen. Greene at Guilford Court-house, and invaded Virginia. He occupied Yorktown, which he intrenched, and remained on the defensive. Gen. Washington besieged Yorktown, and compelled Lord Cornwallis to surrender his army of about 8,000 men Oct. 19, 1781. He is regarded as the ablest of the British generals who commanded in this war. In 1786 he was appointed governor-general of Bengal and commander-in-chief of the army in India. He waged war against Tippoo Sahib, whom he defeated at Seringapatam in 1792. Having returned to England in 1793, he was raised to the rank of marquess. He became in 1798 Lord-Lieutenant of Ireland, which was then the scene of a rebellion, and he pacified the Irish by moderate measures. He negotiated the treaty of Amiens in 1802, and was appointed Governor-General of India in 1805. He died at Ghazipur in India in the same year, Oct. 5. See his *Correspondence*, edited by Ross (3 vols.; 2d ed. 1859); also Johnston's *The Yorktown Campaign* (New York, 1881).

Cornwall on the Hudson: village; Orange co., N. Y. (for location of county, see map of New York, ref. 7–J); situated on the N. Y., Ont. and West. and the West Shore railways, and on Hudson river; 5 miles S. of Newburg. It has a public library, brick-yards, and several factories, and is a place of summer resort. Pop. (1890) 760; (1900) 1,966.

Co'ro: a former province of Venezuela; now the north-eastern part of the state of Falcon.

Coro: city of Venezuela; capital of the state of Falcon; on low land near the coast (see map of South America, ref. 1–C). It has a considerable export trade in coffee, cacao, tobacco, and goat-skins, known as Curaçoa kid-skins. The climate is hot and unhealthy. Coro was founded in 1527, and until 1576 was the capital of the province of Venezuela. Pop. (1891) 9,000. H. H. S.

Corœ'bus (in Gr. Κόροιβος): one of the half-mythical characters of early Greek history; an Elean chiefly noted for his victory in the foot-race at the Olympian games in 776 B. C. From this victory the Olympiads were reckoned. He slew the monster Pœne, whom Apollo sent to afflict the Argives.—Another Corœbus was a Phrygian hero of the Trojan war, and a suitor of Cassandra.—In Pericles's time there was a famous architect named Corœbus.

Corol'la [Lat., a little crown, dimin. of *coro'na*, crown]: in botany, the inner floral envelope of a plant. It is usually more richly colored than the calyx. Theoretically considered, the corolla is composed of modified leaves (called petals). Corollas are divisible into two classes, monopetalous and polypetalous, the latter of which have several distinct petals. The monopetalous corolla has only one petal, formed by the union of several modified leaves. The corolla is much employed by botanists in their systematic arrangements, and by the French school has been taken as the means of forming fundamental characters of the sub-classes in the grand division of exogenous plants.

Cor'ollary [from Lat. *corolla'rium*, a chaplet, a present given to actors, etc., a fee, gratuity, i. e. something additional; deriv. of *corol'la*, dimin. of *coro'na*, crown]: in mathematics, denotes something in addition to the demonstration —viz., an inference or consequence immediately deducible from the demonstration of a proposition. All the corollaries in modern editions of Euclid have been inserted by editors; they may be said to constitute so many new propositions, differing from the original ones merely in the fact that the demonstrations have been omitted.

Coroman'del Coast: the greater portion of the eastern coast of Madras, India; extending from Point Calymere to the mouth of the river Kistnah. It has no good harbor, and is heavily surf-beaten. The cities of Madras, Tranquebar, and Pondicherry are on this coast.

Coromandel Gooseberry: See CARAMBOLA.

Coro'na [Lat., crown]: a halo or crown of light of great beauty encircling the dark body of the moon during a solar eclipse. In a total eclipse the body of the sun is completely hidden by the interposition of the moon. Although so conspicuous on these rare occasions, the actual light of the corona is so faint as to be drowned out by the brightness of the earth's atmosphere on every other occasion except that of a total eclipse. It was for some time an open question whether this light belonged to the sun, or whether it was caused by the reflection of sunlight from a very rare atmosphere or other matter around the sun. It is not uniform in texture, but consists very largely of lines, filaments, and rays, the former sometimes extending out to a distance of two or three degrees, or several millions of miles. Probably it shines mostly by reflected sunlight, as its light has been found to be polarized. It also shines in part by its own incandescence. It is sometimes called a solar atmosphere; this expression, however, is rather misleading, since an atmosphere in the ordinary sense could not exist at so great an elevation above the surface of the sun. Besides, comets have passed through the region of the corona with a velocity of several hundred miles a second, without suffering any retardation, which would have been impossible had they encountered an atmosphere. It appears to consist of minute isolated particles, thrown out by the sun, and either falling back again or held in suspension by forces of which we have otherwise little knowledge.

Observations upon the corona have been conducted by the human eye, the photographic plate, the spectroscope, and the polariscope. To the eye and the camera the corona appears to have a shape and a structure which is quite definite and indicates a peculiar type of force acting therein. It may be divided into three parts: (1) two polar regions, around the sun's north and south poles respectively of the axis of rotation; (2) the four quadrantal eminences in the neighborhood of the parallels 40° from the poles, which gives a quadrilateral figure to the whole; (3) the equatorial extensions which are nearly parallel to the plane of the ecliptic. A close examination of the pictures shows that the polar regions are traversed by sharply defined straight and curved lines, at the poles being nearly radial, but curving more sharply away from the radii extended, in proportion to the angular distance of the radii from the pole. These lines are associated into separate rays, some being distinct from the others. The quadrantal and the equatorial extensions are nebulous structureless masses, which are sometimes crossed by true radiating lines. The writer has worked out a theory which seems to explain many of the phenomena that have been described. See *The American Journal of Science* (Nov., 1890, and July, 1891) and *The Publications of the Astronomical Society of the Pacific* (No. 16, 1891). Without specifying the physical origin of the force, it is assumed to be in accordance with the Newtonian potential in the case of repulsion, represented by the formula $N = \frac{8\pi}{3} \cdot \frac{\sin^2\theta}{r}$, where N is a constant and $r.\theta.$ the polar co-ordinates of a point on a ray. It leads to the following conclusions: The coronal rays are similar to the lines of force surrounding a spherical magnet, the poles of the axis of magnetization being about $4\frac{1}{2}°$ from the poles of the axis of rotation, the south coronal pole preceding the north by about 100° of solar longitude. The visible lines of force, instead of belonging indifferently to all parts of the surface of the sun, appear to be confined to two belts, one in each hemisphere, say 12° wide, the middle parallel of the belt located at a polar distance of 34°. The rays spring up from these belts and curve over toward the equator like immense rockets, forming from their size and length the most magnificent streamers in the solar system. They may be said to be the prototype of the terrestrial auroras; in fact, the solar and the terrestrial systems have several points of resemblance, and they no doubt are also connected with each other through the intervening space, as is suggested by actions known to occur almost simultaneously on the sun and the earth. These rays are seen by the observer as projected on the background of the sky, those in front centrally forming the polar separated streamers, the curves depending on the lines of projection; those toward the sides of the belt as it passes around the edge of the sun overlapping, and making the nebulous quadrilateral eminences. The action of the originating force tends to transport fine material from the poles of the sun toward the equator, and this may have gradually accumulated the equatorial extensions, and perhaps the matter of the zodiacal light through which the radiant sunlight is seen streaming in straight lines. The coronal poles in all probability rotate with the sun, implying some kind of a nucleus within its photosphere, and the synodic period of rotation from three eclipses has been computed to be 26·677 sidereal days at solar latitude ± 85·5°. This result will need further study in future eclipses.

This solution of the problem agrees with the facts derived from other sources. The spectroscope shows that the corona consists of fine solid particles like dust, and incandescent gases, as indicated by certain lines, namely, the green line 1474 (coronium), C. F. H. K. of hydrogen, an unmatched line (helium), and traces of some of the metallic lines. It is also rich in the ultra violet actinic rays suitable to photography. The polariscope indicates that there comes to us reflected light which is polarized in planes radiating from the center of the sun, these planes being somewhat disturbed in the coronal belt region, as also is the case with the number of the solar prominences which show a falling off at the same latitudes. The evidence is very good that the force chiefly concerned in distributing matter about the sun is of the same general nature as electric and magnetic forces, if not identical with them.

While much has been done to clear up its mystery from an astronomical point of view, the real nature or the physics of the subject yet remain to be elucidated.

FRANK H. BIGELOW.

Corona: in architecture, the flat, square, massive member of a classical cornice, often called the drift or larmier; situated between the cymatium and the bed-molding. Its use is to carry the water, drop by drop, from the building.

Corona, Coronet, or Crown: a botanical term applied to an appendage in the interior of the corolla of some flowers. In some cases the corona has the form of a cup, as in the narcissus. Formerly the corona was regarded as composed of modified stamens, or supernumerary petals; the tendency now is to regard it as composed of united petaline stipules. The five hooded bodies seated on the tube of the stamens of the asclepias are called the *crown*.

Corona: village; now a part of the Borough of Queens, New York City; on Long Island R. R.; 2 miles W. of Flushing; has manufactories of door-knobs, portable houses, etc. Pop. (1880) 750; (1890) 2,362.

Corona Austra'lis, or Southern Crown: a constellation of the southern hemisphere; about the knee of Sagittarius; scarcely visible in the northern temperate zone.

Corona Borea'lis, or Northern Crown: a small but very beautiful constellation between Hercules and Boötes; formed of a semicircle of stars which may be seen near the zenith from May till July.

Coronach, kor'ō-năk, [Gael. *coranach*, a crying, dirge; *comh*, with + *ran*, shriek]: a funeral dirge or lament, mingled with the shrieks and wailings of women; formerly heard in Scotland, especially in the Highlands. The funeral dirge, which is still used at wakes in remote parts of Ireland, is commonly known as the *keen*. Traces of the same practice are found among many primitive peoples.

Coronado: See VASQUEZ.

Coronation [from Lat. *corona'tio*, the crowning; deriv. of *corona're*, to crown]: the act of crowning a monarch; the ceremony of placing the crown upon the head, commonly performed at the time of or soon after the accession of a sovereign to the throne. In some countries of Europe it is customary for a bishop to place the crown on the head of the sovereign. In others, as in Prussia, the crown is sometimes placed upon the head by the monarch himself. The cere-

mony of coronation is a very ancient one, at least as old as King Solomon's time. Anointing often accompanies the coronation, and in Great Britain the sovereign also takes an oath to support the laws, customs, and statutes, the laws of God, the Protestant Reformed religion, the Church of England, etc.; security for the Church of Scotland being promised in the oath of accession, which in some instances long precedes the coronation. For example, George IV.'s accession was Jan. 29, 1820, but his coronation was deferred nearly eighteen months—till July 19, 1821. The ceremony of coronation is not necessary to the authority of a monarch. Revised by C. K. Adams.

Coroner, anciently **Crowner** [literally, an officer of the crown; Lat. *coro'na*]: formerly an officer of high dignity, who served as a deputy of the crown and as chief justice of the king's bench in England. At present, in England and most of the U. S., a coroner is an officer who in case of sudden or mysterious death summons a jury, which sits in sight of the body, to determine the cause and manner of death. Coroners may commit persons suspected of homicide after inquest, without warrant, for trial, and are empowered, in the U. S., to take ante-mortem statements. They also hold inquests in regard to salvage from shipwrecks. They had anciently powers much greater than at present.

Coronet [dimin. of O. Fr. *corone* < Lat. *coro'na*, crown]: in heraldry, an inferior crown belonging to the nobility. The monument of John of Eltham (second son of Edward II.), who died in 1334, is said to afford the earliest English representation of this ornament.

Coronium: See the Appendix.

Corot, kō′rō′, Jean Baptiste Camille: landscape-painter; b. in Paris, July 20, 1796. Pupil of Michallon and Victor Bertin; second-class medal, Salon, 1833; first-class medals, Salon, 1848, and Paris Exposition, 1855; second-class medal, Paris Exposition, 1867; officer Legion of Honor 1867. His father, a native of Rouen, marrying a milliner, took up her business, and in a shop in the rue de Bac in Paris accumulated a competence. Corot as a boy was sent to school at Rouen, remaining there seven years. From school he went to a clothmaker's shop in Paris, and there spent eight years. In his holiday walks along the borders of the Seine at Rouen, and at the lovely Paris suburb Ville d'Avray, where his parents had a little summer home, he grew to love nature, before long set up an easel in his bedroom, and meeting Michallon, a young painter, and getting an insight of what art really meant, resolved to devote himself to it. His father, finding his son's purpose inflexible, guaranteed him a pension of 1,500 francs a year, and on this modest pension Corot lived for thirty years, working early and late. His first instructor was Michallon, who counseled him to put himself face to face with nature, and try to paint what he saw. When Michallon died, soon after he began to work with him, Corot went to Bertin, who had been Michallon's master, but who was himself a severe classicist of the Poussin school. His influence did little to take away the truth to nature that Corot's temperament and work up to that time had made so strong in his studies, and he learned from Bertin to draw accurately and to pay attention to composition and style. In 1825 he went to Rome and Naples, returning to Paris in 1827. He sent his first picture to the Salon in 1827, and exhibited there regularly every year until he died. He visited Italy again in 1834 and in 1842, and in his later years traveled in France, Switzerland, the Low Countries, and went once to England. He never married, and lived chiefly at Ville d'Avray, where he painted many of his pictures. He always had a studio in Paris, and went into almost no other society than that of his fellow-artists, who loved him deeply and erected a monument to his memory at Ville d'Avray in 1880. As a landscape-painter he stands as the greatest and most poetical painter in the movement, begun by Delacroix and Géricault, that discarded classicalism and conventional forms, and turned the attention of artists to nature itself for their inspiration. Less naturalistic than Daubigny, who must be considered his greatest rival, his work is always founded on truth, and is pre-eminently true to nature in its great facts. He is a type of the synthesist in painting, suppressing detail to obtain unity of effect, and making the most of the great things in nature as they present themselves to the eye in mass. He is a fine, though not a profuse, colorist, and the tone of his best landscapes is indescribably beautiful and tender. Corot painted figures sometimes, and some single figures of peasant women are fine in color and general aspect. He painted the nude occasionally, but with varying success. There are several works by Corot in the Louvre; a number, including *The Evening Star* and *Biblis*, a landscape with a little figure of the nymph, probably his chief masterpiece, are in private galleries in the U. S., and his *Dante and Vergil* is in the Boston Museum of Fine Arts. D. in Paris, Feb. 23, 1875. William A. Coffin.

Corpan'cho, Manuel Nicolas: Peruvian poet; b. in Lima, Dec. 5, 1830. In 1851 he made his *début* in literature with a drama, *El Poeta cruzado*, which received warm commendation in Peru and Chili. The same year he finished his medical studies, and was sent to Europe by the Government to study and travel. In 1853 he returned to Peru, and many lyrics by him appeared in the *Lira Patriótica*, a publication in honor of the anniversary of the battle of Ayacucho. In 1854 a volume of poems by Corpancho was published in Paris, entitled *Ensayos poéticos*. In 1855 appeared the drama *El Templario*. Besides these, a variety of shorter productions came from his pen. D. Sept. 13, 1863. A. R. Marsh.

Corporal [a corruption of Ital. *caporale*, deriv. of *capo*, head, chief; Lat. *caput*]: a non-commissioned military officer; next in rank below a sergeant. He is distinguished by two chevrons worn on the arm. A "lance corporal" is a private soldier who is allowed to wear one chevron as a mark of distinction. He may or may not perform the duties of a corporal, but he has no increase of rank or pay.

Corporal [from Lat. *corpora'lis*, belonging to the body (*cor'pus*)]: in the Greek and Roman Catholic churches the altar-cloth upon which the Eucharistic species and the vessels containing them are placed. A "corporal oath" is an oath sworn upon the corporal. The name is retained by the ritualistic party of the Anglican Church.

Corporal Punishment: See the Appendix, also Bastinado, Flogging, Knout, and Whipping-post.

Corpora Quadrigemina: See Brain.

Corporation [from Lat. *corpora'tio*, embodiment, body; deriv. of *corpus*, body]: in law, an artificial person, consisting of one or more individuals, having certain legal capacities, such as succession of members, powers to sue or to be sued, and to act, no matter how numerous its membership may be, as a single individual. This new person is to be thought of without reference to the members of which it is composed. It must be carefully distinguished from a partnership, in which there is merely a collection of persons, no artificial person being constituted. A contract made with the corporation is not made with the members, nor do they, in a legal point of view, own its property, though they may have an interest in its management on the theory of a trust. Corporations may be considered under the following divisions: I. Their various kinds; II. Their mode of creation; III. Their powers; IV. Visitation; V. Dissolution.

I. They may be variously classified, as regard is had to the number of members, their objects, and the fullness of their powers. When considered as to numbers, they are either aggregate (more than one) or sole. When regarded as to the objects to be accomplished, they are ecclesiastical or lay, while lay corporations are either civil or eleemosynary. It can scarcely be said that there are any "ecclesiastical" corporations in the U. S., in the proper sense of the term. They rather belong to the English law under the rules of an established Church. Corporations in the U. S. may be said to be lay. The term "eleemosynary" is substantially equivalent to "charitable," and embraces all that large class of corporate institutions established to promote religion or learning, to relieve the sick or the poor, and in general to accomplish meritorious public objects. Another division of corporations is public and private. A public corporation is designed for governmental purposes, as a city or a village. Others are private. The importance of this distinction lies in the fact that a public corporation, being a mere instrument of government, can be created or dissolved by the law-making power at will, while a private corporation only comes into existence by *the conjunction* of the will of the sovereign power and that of the corporators. Its charter is in the nature of a contract, and it can only be dissolved by an observance of the rules governing the dissolution or impairment of the obligation of contracts. When a corporation is regarded as to the completeness of its powers, it may be either one of full powers or imperfect in its character. In the last case it is termed a *quasi* corporation. Towns in the New England States are true corporations; in New York

they are political divisions with certain specified powers, being *quasi* corporations.

II. A corporation may be created either by prescription, royal charter (see CHARTER), or by legislative act. It is said to be created by prescription when it has exercised corporate powers for an indefinite period without interference on the part of the sovereign power. By a fiction of law it is then presumed to have had a charter. The method of creating corporations by royal charter was formerly in use in the U. S. as a branch of the English law. Of course the leading mode of creation is an act of the Legislature. It is not necessary that each institution should receive a distinct and separate organization. There may be a general formula provided by the Legislature with which any particular body of men desiring to become a corporation may comply, and thus become incorporated. In other words, corporations may be created under general laws as well as organized under special acts. It may be added that the Legislature may act indirectly as well as directly. It may confer upon some intermediate authority the power to incorporate. In this way in New York an organization known as "The Regents of the University, etc.," has the power under certain conditions to incorporate colleges and academies. To the existence of a private corporation the consent of the members is necessary. This consent may be shown either by an express act of acceptance, or by implication from the exercise of powers under the charter, technically called "user." It should have a name whereby to act or to contract, which may be from time to time changed either by special legislative act or by general law.

III. A corporation, being by fiction of law a person, may have the power to make contracts and to do most other acts possessed by natural persons. In general, however, it has capacity to do such acts as are necessary and convenient to carry forward the special ends for which it was created. At the present time it is usually formed to accomplish a definite object, and it is reasonable that it should have the authority necessary to achieve it. A corporation, like a natural person, may transgress the rules prescribed by law for its action. This fact has caused many perplexing questions to arise as to the effect of an unauthorized act. This subject is known as the doctrine of *ultra vires*—transgression of power. In such a case the better opinion would seem to be that the corporate act, considered as a contract, would be void, though the corporation might be liable to an individual injured by its negligent mode of performing an act which it had no legal authority to undertake. The ordinary powers of a corporation are to make such contracts as are necessary to the accomplishment of its purposes, to hold and acquire property, both personal and real, to have a common seal, to make by-laws for the government of its members or of others, and to elect new members or officers in the place of such as may resign, die, or be removed. The act of removing a member is termed *disfranchisement*; the same act exercised toward an officer is called *amotion*. From early times in Great Britain there have been statutes termed "mortmain acts" (see MORTMAIN) to restrain corporations from acquiring lands without license from the king. Such statutes do not, in general, exist in the U. S. The common practice is to limit in the specific act of incorporation the value of the land which may be acquired. If this restriction be exceeded, the title is still valid, unless the State intervenes and institutes proceedings for a forfeiture. It is a general rule that a corporation can not acquire land by will except for charitable purposes. It is not uncommon, even in that case, for a State statute to limit the amount which a testator may bestow, or to require that the will shall be made a certain time before his death. A corporation may, like a natural person, act through agents beyond the limits of the State where it is organized, unless restrained by law. It should be added that a corporation may commit a wrong for which it will be liable in damages, such as an act of negligence, publication of a libel, etc. It can not, in general, commit a crime, except as resulting from a failure to perform a duty prescribed by law. In order to enforce its rights and to subject itself to its legal duties it may sue and be sued at home or abroad, although a proceeding *against* a non-resident corporation would in general be confined to the property within the jurisdiction. Corporations sometimes are made trustees for estates, guardians for minors, etc. In such a case they would be held accountable in a court of equity in the same way as other trustees or guardians.

IV. By "visitation" is meant the power of superintending the corporation and controlling its action. The subject is peculiarly applicable to the management of charitable corporations. The common law distinguishes between a founder of such a corporation, who supplies the funds for its practical working, and the sovereign power which gives it legal existence. The founder in the first sense is allowed to provide rules for the government and discipline of the college or other institution which he has established, and to designate some person or persons (visitors) who shall see that the rules are properly observed. The exercise of this power of visitation is summary, and without review by the courts of justice, except in extreme cases. This power in the U. S. is rarely lodged in a single person, as it frequently is in England, but boards of trustees are intrusted with it. This doctrine does not prevent a court of equity from controlling the funds on the theory of a trust, so as to prevent waste, mismanagement, or perversion from the purposes intended by the donors. In this aspect a corporation is to be regarded as a trustee. The attorney-general, representing the State, may apply to the court to correct abuses in the management of funds which are in the eye of the law directed to public uses. When the case is sufficiently grave the charter of the corporation may be forfeited.

V. A corporation may be dissolved either by compulsory legislation, by surrender of its franchises, coupled with acceptance of it by the state, and by judicial decree. In England an act of Parliament is boundless in its operation, and a corporation may be arbitrarily dissolved by law. In the U. S. a distinction has been taken between private and public corporations. As has been already seen, a charter of a private corporation is a contract, and as under the U. S. Constitution no State can pass a law impairing the obligation of contracts, the power of the State Legislature can not be exercised so as to materially change the provisions of the charter without the consent of the corporators. (*Dartmouth College* vs. *Woodward*, 4 Wheaton.) The effect of this decision is evaded in a number of the States by the insertion of a clause, either in the charter or some general law, or even in the State constitution, providing that corporate charters are to be held subject to alteration or repeal. This clause is of course valid as to all charters granted subsequently. The most common mode of dissolving a corporation is by judicial decree. Every franchise is accepted on the implied condition that it shall be properly exercised. If there be abuse or neglect to make use of corporate powers, a proceeding may be instituted in behalf of the State to forfeit the charter. The abuse or neglect does not *of itself* destroy the charter, nor can the cause of forfeiture be presented to a court in an indirect manner. For example, it could not be urged by a debtor as creating an incapacity to sue, or by an heir as an incapacity to take an estate by will. A proceeding must be resorted to for the very purpose of forfeiting the charter. State laws sometimes provide dissolution as a mode of enforcing the collection of debts, the property being regarded as a trust fund for that purpose, and a court of equity will administer it for the benefit of creditors. The U. S. statutes of bankruptcy are extended to business corporations. It was an old rule of the common law that a dissolution of the corporation extinguished its debts. Its claims could be no longer collected. Its personal property passed to the State, and its land reverted to the grantor. At present there is little room for the application of these rules. A court of equity would, in general, fasten a trust upon the property in favor of creditors, and in all business corporations for the stockholders. Charitable funds would be administered by other trustees.

For further information consult the works of Grant, Angell, Ames, Abbott, Kyd, Dillon Kent, Merewether and Stephens, and Redfield; also the articles MUNICIPAL CORPORATIONS, etc.

T. W. DWIGHT.

Corps d'Armée (Fr., pronounced kōr'daăr'mā'), or **Army-corps**: one of the primary subdivisions of an army, consisting of two or more "divisions," and containing usually between 20,000 and 30,000 men when on a full war footing. In most European armies the corps is made up of two divisions of infantry and a varying force of cavalry and artillery.

The typical organization of a German corps, from which, however, marked variations exist, is

Two divisions of infantry.....	24,000 men.
Two regiments of cavalry.....	1,200 "
Eight batteries of divisional artillery....	48 guns.
Six batteries of corps artillery.....	36 "

Two companies of pioneers, ambulances, and train.

Some divisions contain no infantry, but are composed entirely of cavalry and horse artillery.

The corps of the Army of the Potomac consisted of four or five divisions of infantry, varying amounts of artillery, and usually enough cavalry for scouting duty only.

The "cavalry corps" was made up of three divisions of cavalry containing thirty-two regiments, to which was attached a brigade of horse artillery of eight batteries. See ARMY, WAR, etc. JAMES MERCUR.

Corps Législatif, kōr'lā'zhĕs'la-teef' (or *legislative body*): the name of the lower house of the French legislature during the second empire. It was established in 1852, and abolished in 1870. The deputies were elected by universal suffrage for a term of six years.

Corpulency: See OBESITY.

Cor'pus Catholico'rum and **Cor'pus Evangelico'rum**: names given after the peace of Westphalia to the Catholic and Protestant divisions of the German empire. The Elector of Mayence was the head of the Catholics, while the lead of the Protestant confederacy belonged successively to the rulers of Saxony, the elector palatine, and Sweden, and was restored to Saxony by the Diet of 1653. Both bodies were dissolved at the separation of the German empire in 1806.

Cor'pus Chris'ti [Lat., body of Christ]: a festival of the Roman Catholic Church celebrated in honor of the Holy Eucharist (which is held by that Church to be really, truly, and substantially the body and blood of Christ). It was first established by a bull of Urban IV. in 1264, and is observed on the Thursday after Trinity Sunday. J. J. K.

Corpus Christi: city; capital of Nueces co., Tex. (for location of county, see map of Texas, ref. 7–H); situated on a bay of same name and on railway, 8 miles below the mouth of the Nueces river; about 200 miles S. W. from Galveston. It has a fine harbor, and in commercial importance it ranks among the first cities in the State. Pop. (1880) 3,257; (1890) 4,387; (1900) 4,703.

Corpus Christi College: See CAMBRIDGE UNIVERSITY and OXFORD UNIVERSITY.

Corpuscular Philosophy: a name sometimes given to the atomic philosophy of DEMOCRITUS (*q. v.*).

Corpuscular Theory: See LIGHT.

Cor'pus Doctri'næ: certain collections of theological writings which have had especial authority in the German Protestant churches. The chief collection was *Corpus Philippicum* (1560, fol.), containing the Apostolic, Nicean, and Athanasian Creeds, the Confession of Augsburg, Melanchthon's Loci Communes, etc. The strict Lutherans rejected it as leaning toward Crypto-Calvinism; the Elector of Saxony pursued with rigorous measures those who refused to teach it. This, with many other Corpora Doctrinæ, was superseded by the *Formula Concordiæ*. See CONCORD, FORMULA OF.

Cor'pus Ju'ris Canon'ici [Lat., the body of canon law]: a comprehensive name for the original collections of the CANON LAW (*q. v.*), including the *Decretum Gratiani* (1151), the *Decretalia* of Gregory IX. (1234), the *Liber Sextus* (1298), the *Clementine Decretals* (1313), etc. The best edition is that of Richter, Leipzig, 1833–39.

Cor'pus Ju'ris Civi'lis [Lat., body of civil justice]: the body of the Roman or civil law as set forth in the great compilations made by order of JUSTINIAN (*q. v.*), consisting of the Institutes, Code, Pandects, and Novels. The term corpus juris civilis is of comparatively late origin, but was in common use as early as the beginning of the seventeenth century. One of the best editions is that of the Kriegel brothers (Leipzig, 1833–40). Revised by F. STURGES ALLEN.

Corral, POINCIANO: Central American general; b. in Costa Rica about 1810. He went to Nicaragua when a youth, married a relation of President Chamorro, who made him Minister of State (1853), and afterward commander of the forces against Castellon. After Chamorro's death he supported the legitimist government, commanding the army at Managua, and repelling Walker's first raid (June, 1855). In October he submitted to Rivas and Walker, and was appointed Minister of War, but was soon after accused by Walker of corresponding with legitimist leaders for the purpose of arranging an attack on Granada. Corral was tried, found guilty, and by order of Walker was shot at Granada, Nov. 8, 1855. HERBERT H. SMITH.

Correa de Serra, kōr-rā'ăă-dā-ser'răă, JOSÉ FRANCISCO, LL. D.: a Portuguese botanist; b. at Serpa in 1750. He visited the U. S. in 1813, and became Portuguese minister at Washington in 1816. He wrote several treatises on vegetable physiology, but his principal claim to literary fame is his *Colecção de Livros ineditos da Historia Portugueza* (1790–1816, 4 vols.). D. Sept. 11, 1823.

Correggio, kōr-red'jō, ANTONIO ALLEGRI: Italian painter; b. at Correggio, 20 miles E. of Parma, in 1494. He was of the most individual character and had very great technical power, but there is little else in his work than that to command our admiration. He can hardly be attributed to any one of the local Italian schools, but was rather the result of all the strong talent of his time, which was the height of the Italian Renaissance, acting on an imitative nature, gifted with great executive ability. He seems to have had a very early success, and the story of his having died from the fatigue of carrying home a load of copper coin in which he was paid for his work has not the slightest foundation in history. He died young, but before his death had lived in a comparative retirement for several years, and, so far as is known, no longer in the practice of his art. The distinguishing quality in his painting is his large, rapid, and extraordinary brush-work, and his impasto is not surpassed in masterly precision and largeness by that of Titian or Tintoretto. Sir F. W. Burton, keeper of the National Gallery of London, one of the most competent technical critics of our time, says of him: "Taking this great genius by himself, it is difficult to overestimate his powers. But the influence he exercised on later art was more baneful than otherwise." His most important works are the great paintings at Parma, where the dome of the cathedral and that of the Church of St. John the Evangelist were covered with his work, in the one case the ascension of the Madonna, in the other a vision of St. John. In the convent of St. Lodovico, in the same city, is a large work of his youth, covering the vaulting of a large room. His best known and most admired easel pictures are perhaps the *Marriage of Saint Catharine* and the *Jupiter and Antiope*, in the Louvre; the *Nativity of Christ* (called *The Night*), and the small picture of the *Magdalen*, at Dresden; the *Leda*, at Berlin; and the *Venus and Cupid with Mercury*, in the National Gallery in London. D. in Correggio, Mar. 5, 1534. W. J. STILLMAN.

Correlation of Forces, or **Transmutation of Force or Energy**: See ENERGY; DISSIPATION OF ENERGY.

Corrèze, kōr'rez': a department of France near its center; a part of the former province of Limousin. Area, 2,265 sq. miles. It is drained by the rivers Dordogne, Vezère, and Corrèze. The surface is hilly; the soil is mostly poor. The staple productions are grain, timber, coal, copper, lead, iron, and chestnuts. Capital, Tulle. Pop. (1891) 328,119; (1896) 322,393.

Corrien'tes: a province of Argentina; bounded N. by Paraguay, E. by the river Uruguay, separating it from Missiones, Brazil, and Urnguay, S. by the province of Entre Rios, and W. by the river Paraná, separating it from the province of Santa Fé and the territory of Chaco. Area, 48,357 sq. miles. The extreme southeastern portion is hilly; the remainder is a plain, with numerous lakes and swamps. The Laguna Ibera, in the northern part, is a swamp covering about 4,000 sq. miles and flooded annually. The land is generally open and adapted for pasturage, but there are extensive tracts of forest. The climate is semi-tropical. Grazing is the principal industry; oranges are extensively raised for the markets of Buenos Ayres and Montevideo. Capital, Corrientes. Pop. (1895) 239,344. H. H. SMITH.

Corrientes, or **Siete Corrientes**: capital of the province of the same name; on the right bank of the Paraná river, here more than a mile broad, just below the confluence of the Paraguay (see map of South America, ref. 7–E). Corrientes was founded in 1588. The exports are mainly dried meat, hides, and tallow. Pop. (1895) 14,000, and rapidly increasing. H. H. S.

Corrigan, MICHAEL AUGUSTINE, D. D.: Roman Catholic archbishop of the diocese of New York; b. in Newark, N. J., Aug. 13, 1839; educated at St. Mary's College, Wilmington, Del., and at Mt. St. Mary's, Emmetsburg, Md., graduating from the latter institution 1859; ordained to the priesthood at Rome 1863; received the degree of D. D. 1864; president of Seton Hall College, Orange, N. J., 1868–73; appointed by Pius IX. to the see of Newark 1873; made coadjutor to Cardinal McCloskey, Archbishop of New

York, under the title of Archbishop of Petra 1880; on Cardinal McCloskey's death he became metropolitan of the diocese of New York 1885. C. H. THURBER.

Corrodentia: an order of insects. See PSOCIDÆ.

Corrosive Sublimate: See MERCURY.

Corrugated Iron [from Lat. *corruga're*, make wrinkled; *con* + *ru'ga*, wrinkle]: a name applied to iron in thin plates or sheets which are passed between rollers, producing grooves and ridges in the iron. In this manner the strength of the material is greatly increased, while the square surface of the iron is of course reduced. Corrugated iron is of great value in the construction of buildings, especially for roofs, where lightness and strength are to be combined. It is much used for covering the walls of frame buildings, both within and without. It is frequently "galvanized"—i. e. covered with a thin layer of zinc by dipping it in a bath of the fused metal.

Corruption of Blood: See ATTAINDER.

Corrupt Practices Act: See BALLOT REFORM.

Corry: city and railway center; Erie co., Pa. (for location of county, see map of Pennsylvania, ref. 1–A); 37 miles S. E. of Erie; it has churches of eight denominations, a conservatory of music, good schools, numerous large factories making boring-machines, mechanical toys, bedsprings, upholsterings, mattresses, locomotives and cars for lumber companies, oil-well supplies, boilers, electrical plant, boxes, tables, patent medicines, brooms, sashes and blinds; here are also barrels, brushes, stationary engines, etc., blast furnaces, tanneries, brick-works, flour and feed mills, artesian well, electric lights, water-works, and fuel gas-works. The city has a public park; its growth dates from 1860. Pop. (1890) 5,677; (1900) 5,369. EDITOR OF "LEADER."

Cor'sica (anc. *Cyrnos*, afterward *Corsica*; Fr. *La Corse*): island in the Mediterranean; situated between lat. 41° 20′ and 43° N., and lon. 8° 30′ and 9° 30′ E.; 55 miles from Italy and 110 from France. It is separated from Sardinia by the Strait of Bonifacio, 9 miles wide. It is 110 miles long N. and S., and is 53 miles wide at the broadest part. Area, 3,377 sq. miles. The west coast is deeply indented by the Gulfs of Calvi, Porto, Ajaccio, and Valinco. The interior is traversed by a mountain-chain, the highest peaks of which are Monte Cinto (8,889 feet), Rotundo (8,609 feet), Pagli-Orba (8,284 feet), Padro (7,846 feet), and D'Oro (7,841 feet). To the W. and S. this mountain-chain sends forth a great number of rugged spurs, which fall off abruptly toward the sea. They are covered with immense forests of oak, beech, pine, cork, and chestnut trees, from which in olden times the Romans derived most of the timber for their fleets. But the indolence of the present population has left this source of wealth comparatively neglected. To the E. broad plains open between the mountains and the sea, and here are found large plantations of orange, fig, almond, olive, and lemon, and extensive vineyards. But agriculture is in a backward state, and most of the wine produced in Corsica is sent to France in a raw state to be used for liqueurs. The principal industry is the rearing of cattle, horses, asses, and mules. A peculiar breed of black sheep called *mufflons* is raised on the mountain-pastures. The fisheries of tunny and pilchard are extensive. Among the minerals of Corsica are iron, copper, antimony, lead, granite, porphyry, marble, and limestone. The chief towns are Ajaccio, Bastia, and Calvi. There are a few railways on the island. Corsica was first colonized by the Phœnicians, who called it *Cyrnos*, was conquered by the Carthaginians, and by the Romans soon after 237 B. C. The Genoese became masters of it in 1481. It was ceded by the Genoese to France in 1768. Pop. (1896) 290,168. See Boswell, *Account of Corsica* (1768); Merimée, *Colomba* (1841); Borde, *En Corse* (1887); and Bonaparte, *Une Excursion en Corse* (1891).

Corsica'na: city and railway center; capital of Navarro co., Tex. (for location of county, see map of Texas, ref. 3–I). It has State Orphan Asylum, Widows' and Orphans' Home, convent, high school, large cotton compress, roller flour-mill, grain-elevator, machine and repair shops, cotton-gin, bottling and ice factories, brick-yards, two oil-mills, foundry, street railway, and fine system of water-works. Pop. (1870) 80; (1880) 3,373; (1890) 6,285; (1900) 9,313.
EDITOR OF "COURIER."

Cor'so [Ital., race-course: Fr. *cours* < Lat. *cursus*, running, course, deriv. of *cur'rere*, run]: in Italy, a principal street of a large town. The Corso of Rome is famous as the scene of the diversions of the carnival.

Cor'son, HIRAM: scholar; b. in Philadelphia in 1828; became a teacher, and was (1849–53) connected with the Library of Congress and that of the Smithsonian Institution. He was Professor of History and Rhetoric in Girard College 1865–66, and in St. John's College, Annapolis, Md., 1866–70, when he became Professor of English Language and Literature, etc., in Cornell University. He published Chaucer's *Legende of Goode Women*; *Handbook of Anglo-Saxon and Early English*; *Introduction to the Study of Browning*; *Primer of English Verse*, etc., and prepared a *Thesaurus of Early English*.

Cors'sen, WILLIAM PAUL: German philologist and antiquary; b. in Bremen, Jan. 20, 1820; for several years professor at the gymnasium at Stettin, and subsequently at the Landesschule at Pforta until 1866, when he resigned on account of his health. Author of a learned and once highly esteemed work on *The Pronunciation, Vocalism, and Accentuation of the Latin Language* (2 vols., 1858–59; 2d ed. 1867–69), still valuable as a collection of material. He also published a once famous work on the *Etruscans*, now quite antiquated. D. June 18, 1875. Revised by ALFRED GUDEMAN.

Cort, CORNELIUS: engraver; b. in Horn, Holland, in 1536; a disciple of Jerome Cock. He wished to interpret in engraving the color of paintings, and with this aim went to Italy, sojourning at Venice for some time. Titian received him in his house, and he in recognition of this favor engraved many of Titian's works, especially landscapes. Cort then went to Rome. His finest works are *The Martyrdom of S. Laurence* of Tintoret and *The Transfiguration* of Raphael. D. in Rome in 1578.

Cor'tes [plu. of Sp. *corte*, a court]: the national assembly or legislature of Spain; also that of Portugal. See LEGISLATURES.

Cortés, HERNANDO, HERNAN, or FERNANDO: conqueror of Mexico; b. at Medellin, in Estremadura, Spain, in 1485. He studied law at the University of Salamanca, and sailed to the New World to seek his fortune in 1504. He served with distinction under Velasquez in the conquest of Cuba in 1511, after which he married Catalina Juarez, and became the owner of an estate in Cuba. In 1518 he was appointed by Velasquez to conduct an expedition against Mexico, which had recently been discovered. He sailed from Cuba with eleven vessels and about 700 men in Feb., 1519; defeated an army of the natives at Tabasco, and landed on the site of Vera Cruz, where he destroyed his ships, to induce his men to fight with more desperate courage when they knew that it was impossible to save themselves by retreat. He learned that he had entered the extensive empire of Montezuma, who reigned over Anahuac and possessed immense treasures of gold and silver. In Aug., 1519, he left the seacoast and marched against Mexico or Tenochtitlan, the capital of Anahuac. Passing through the independent state of Tlascala he was resisted by the natives, whom he defeated in several battles; continuing his way, he entered Mexico without resistance in Nov., 1519, and was received with friendly demonstrations by Montezuma. The audacious Spaniard seized Montezuma in his own palace, kept him as a prisoner, and extorted from him a large quantity of gold. The captive prince was persuaded or forced to swear allegiance to Charles V., but he refused to adopt the religion of the Spaniards. Meanwhile, Velasquez discovered that Cortés had thrown off his authority; he therefore sent Narvaez with about 1,000 men to supersede him, or operate against him in case he should not submit. Leaving a part of his force at Mexico, Cortés marched with 250 men to encounter Narvaez, whom he defeated and took prisoner at Zempoalla in 1520. Having persuaded the soldiers of Narvaez to enlist in his service, he returned to Mexico, the people of which had revolted against the Spaniards during his absence. In the fight, which continued several days, Montezuma was killed by his own subjects, and the Spaniards were driven out of the city. Cortés gained a victory at Otumba in July, 1520, and took Mexico after a memorable siege, in 1521. In 1522 the King of Spain appointed him governor and captain-general of the conquered country, called New Spain. Cortés went to Spain in 1528, in order to vindicate himself against accusations made by his enemies, and was received with favor at court. He returned to Mexico in 1530, but he retained only the command of the army, the civil administration having been placed in the hands of a viceroy. This division of power gave rise to much haggling and jealousy. Cortés felt himself hampered in his activity, and in 1540 he once more returned to Spain.

But this time he was coldly received by Charles V. He accompanied the emperor in the unlucky campaign in Algeria, spent the rest of his life in obscurity, and died near Seville, Dec. 2, 1547. Five letters which he addressed to the emperor on the subject of his conquest are still extant. They have been printed in *Historia de Nueva España*, by Lorenzana (Mexico, 1770), and have been translated into English by George Folsom (New York, 1843). See Prescott, *Conquest of Mexico*; Helps, *Life of Cortez* (1871); and Bancroft, *History of the Pacific States* (*Mexico*), vols. i. and ii.

Revised by H. H. Smith.

Cortés, José Domingo: Chilian author; b. about 1830. He was variously employed as a journalist, as *attaché* of the Chilian legation at Brussels, and in Bolivia as director-general of libraries. He published a large number of biographical and historical works, among them the *Diccionario biografico Americano*, *Historia de Bolivia*, *Estadistica bibliografica de Bolivia*, *Los Revolucionarios de la independencia de Chile*, *Poetas Americanos*, and *República de Mejico*. He also edited a general collection of the works of Latin-American authors. D. in 1884. H. H. S.

Cortés, Martin: illegitimate son of the conqueror by the Indian Marina; b. in Mexico about 1521. He was taken to Spain in 1528, was legally recognized by his father, made a knight of Santiago, and served as a soldier in Algiers and Germany. He returned to Mexico with his brother and namesake, the Marques del Valle, in 1562; was arrested in July, 1566, on suspicion of being concerned in the alleged plot of the Avilas, and during eighteen days was subjected to torture, but continued to declare his innocence. In the end he was sentenced to be exiled for life and to pay a fine. It is believed that this sentence was never carried out, for in 1568 he was still living in Mexico, where he probably remained until his death. Herbert H. Smith.

Cortés, Martin: legitimate son of Hernando Cortés; b. in Mexico in 1532. His father took him to Spain in 1540; he received a liberal education, and inherited the title of Marques del Valle. A great portion of the Mexican estates would have been lost to him by a decision of the Council of the Indies, but they were restored by Philip II., with whom he seems to have been a favorite. He accompanied that monarch to Flanders and to England at the time of the marriage with Mary; served with distinction in the army, and was at the battle of St.-Quentin; and, on his return from the Flanders campaign, married Doña Ana Ramirez de Arellano, his niece. In 1562 he went to Mexico, where he lived in great splendor, and had much influence, though not directly concerned in the government. Owing to discontent respecting the new laws of *encomiendas*, the brothers Avila, Aguilar, and others are said to have formed a plan to murder the judges of the audience and make the Marques del Valle sovereign of Mexico. It does not appear that this plot was ever definitely decided upon, and it seems certain that the marquis never treated it seriously; but on July 16, 1566, he was arrested, as were Alonzo de Avila and his brother. The latter were executed, and the marquis was sent to Spain, his estates being sequestered. After several years they were restored to him. D. in Spain, Aug. 13, 1589. The direct line of Cortés ended with the fourth marquis, Pedro, in 1628. The title eventually passed to the Dukes of Terranovo and Monteleone, one of the proudest families of Italy. The estates have passed through many vicissitudes, and have several times been sequestered; but a large portion is now in the possession of the heirs of Cortés.

Herbert H. Smith.

Corthell, Elmer Lawrence: civil engineer; b. at South Abington, Mass., in 1840; educated at Brown University, Providence, R. I.; served in artillery in Union army during civil war, becoming captain of a light battery; studied engineering; from 1868–74 in charge of important work in the Western U. S., including railways in Illinois and Missouri, bridges over the Mississippi at Hannibal and Louisiana, Mo., and the Sny island levee in Illinois; associated with James B. Eads in constructing jetties at mouth of Mississippi river. He accompanied Eads to Mexico, and made surveys for a ship-railway across the isthmus at Tehuantepec; from 1881 to 1885 chief engineer constructing the New York, West Shore and Buffalo R. R.; at same time chief engineer of the ship-railway in Mexico, conducting surveys and plans of the work; after the death of Eads he removed to Chicago, opening an office there and also in New York; constructed large bridges in different parts of the U. S., including that at Cairo, Ill., the longest steel structure in the world, and the Merchants bridge at St. Louis; in 1889 chief engineer of jetties at mouth of Brazos river, Texas, also at Tampico, Mexico, of Tehuantepec ship-railway and the Ontario ship-railway. In 1888 he was vice-president of the American Society of Civil Engineers; in 1889 president of the Western Society of Engineers; chairman of the general committee which organized and conducted the International Engineering Congress, Chicago, 1893. Author of *A History of the Jetties at the Mouth of the Mississippi River* (New York, 1880).

Cortland: village and railway junction; capital of Cortland co., N. Y. (for location of county, see map of New York, ref. 5–G); on the Tioughnioga river; 36 miles S. of Syracuse. It has a State normal school, electric lights, waterworks, and street railway. Pop. (1880) 4,050; (1890) 8,590; (1900) 9,014. Editor of "Standard."

Cortona, Pietro, di: painter; b. Nov. 1, 1596; went to Rome in poor circumstances. The Marchese Sacchetti, seeing him painting in the shop of a gilder, undertook his maintenance and placed him in the art-school of Baccio Carpi. He acquired his drawing from ancient bas-reliefs and the art of grouping figures from Lanfranco. *The Rape of the Sabines* and *The Battle of Alexander* were the first works which made him noticeable. On the strength of their success Urban VIII. chose him to paint a chapel at Bibiana. A little after he decorated the great reception-room for the Barberinis; this is one of his finest works. He spent some years in Florence, painting for Ferdinand II. several rooms in the Pitti Palace. His great success in the execution of this work attracted the envy of many of his imitators. He was accused of having sold to the grand duke, as originals, certain copies after Titian; this brought him into disfavor, and he left Florence in dudgeon, never to return there. He then lived in Rome, where he continued to paint remarkable works. When unable to mount on a scaffold, being much afflicted by gout in his later years, he painted easel pictures, which are rare. D. in Rome, May 16, 1669. W. J. Stillman.

Corumbá: city of the state of Matto Grosso, Brazil, on the west side of the river Paraguay, in 18° 59′ 38″ S. lat. It was a mere hamlet until the opening of the Paraguay to steam navigation in 1856; it then became the port of entry for Matto Grosso, the entire commerce of this vast region passing through it. Pop. about 5,000. From July 3, 1865, to June 13, 1867, it was held by the Paraguayans. Besides its river trade, Corumbá has a considerable commerce with Bolivia. Three miles below the city, at Ladario, is one of the principal marine arsenals of Brazil, with a strong fort.

Herbert H. Smith.

Corun'dum: a mineral consisting, when pure, of native oxide of aluminium, which is, however, almost invariably mixed with magnetic oxide of iron. It occurs crystallized, massive, granular, in impalpable powder, and in layers. Mineralogically, corundum is divided into three varieties: (1) Sapphire, which includes the purer kinds, as sapphire, ruby, Oriental topaz, salamstone, Oriental amethyst, etc.; (2) corundum proper, the duller kinds crystallized or semi-crystalline, including adamantine spar; and (3) emery, the darker and coarser kinds.

The specific gravity of corundum is about 4, while in hardness it is next to the diamond. It becomes strongly electrical by friction. Its crystalline form is rhombohedral. The ruby or red sapphire is valued next to the diamond, and beyond a certain size (3½ carats) as equal to it in value. Its color is supposed to be due to chromic acid, but the amount of coloring-matter is so small that it eludes the ordinary tests. The crystals are seldom above half an inch in length. Two crystals an inch in diameter and about 2 inches long are said to have been in the possession of the former King Thebaw of Burma. The largest ruby known came from China, and, after having been in the possession of Prince Mentzikoff, was finally made one of the jewels of the Russian crown. The largest rubies come from the Capelan Mountains, Ava. Smaller ones are found in Saxony and Bohemia, and occasionally in other localities in Europe; also in the U. S. The blue sapphire occurs much larger, crystals 3 inches in length being sometimes found. The crystals sometimes exhibit a radiated interior with a play of colors, when it is known as asteria or asteriated sapphire. Sapphires are obtained in Ceylon, India, and China, principally in the first-named country. Fine specimens are often found in the beds of streams, whither they have been carried after the decomposition of the rock originally inclosing them. The light-blue sapphires are often exposed to fire by lapidaries to ren-

der them more brilliant. With those from Epailly in France heating deepens the color. White sapphires are sometimes cut and passed for diamonds, which they much resemble. The Brazil sapphire is a blue tournaline.

The Greek *σάπφειρος*, from which the name was derived, was, according to Dana, not what at the present day is called sapphire, but the stone now known as lapis-lazuli. Rubies and sapphires contain about 1 per cent. of magnetic oxide of iron.

Adamantine spar occurs in brownish crystals. It was used by the ancients as a polishing material, and continues to be used for fine work. The chief supplies are brought from China and the Ural Mountains. Salaustone occurs in pale reddish or bluish transparent crystals. Corundum is found abundantly in Chester co., Pa. See EMERY.

Revised by C. KIRCHHOFF.

Corun'na: a province of Northwestern Spain, forming the N. W. part of Galicia, having the ocean W. and N., Lugo E., and Pontavedra S. It has fine forests and pastures and arable lands, besides iron mines. Area, 3,079 sq. miles. Capital, Corunna. Pop. (1887) 613,792.

Corunna (anc. *Adrobicum*; Sp. *Coruña*): fortified city and seaport of Spain; capital of the province of same name; on the Atlantic Ocean; 320 miles N. W. of Madrid; lat. 43° 22′ N., lon. 8° 24′ W. (see map of Spain, ref. 12–B). It has a safe harbor defended by two forts, and a lighthouse, which is called the Tower of Hercules, and is 92 feet high. It has a citadel, court-house, custom-house, arsenal, theater, and the palace of the captain-general. Here are manufactures of linen and hats, cordage, canvas, and cigars. On Jan. 16, 1809, a battle occurred here between the French marshal Soult and the British general Sir John Moore, who was killed. Pop. (1887) 36,200.

Corunna: city; capital of Shiawassee co., Mich. (for location of county, see map of Michigan, ref. 7–J); on railroad and on the Shiawassee river; 75 miles N. W. of Detroit; has churches, public school, flouring-mill, woolen-mill, bituminous coal mine, inexhaustible supply of sandstone, women's library. Pop. (1880) 1,501; (1890) 1,382; (1900) 1,510.

EDITOR OF "INDEPENDENT."

Corval'lis: city; on railway; capital of Benton co., Ore. (for location of county, see map of Oregon, ref. 3–B); situated on Willamette river; 100 miles S. of Portland; contains the State Agricultural College, a handsome county court-house, city-hall, 2 public schools, 3 large saw and planing mills, 2 flour-mills, a carriage factory, and the general office of the Oregon Pacific R. R.; is surrounded by a rich agricultural country, which is very healthful. Steamboats visit the town during two-thirds of the year. The principal export is wheat. Pop. (1888) 1,128; (1890) 1,527; (1900) 1,819.

EDITOR OF "CORVALLIS TIMES."

Corvée: in feudal law, the obligation of the inhabitants of a district to perform certain services for the sovereign or feudal lord, such as the repair of the highways. Some of these services were performed gratis, others for wages below the value of the labor.

Revised by F. STURGES ALLEN.

Corvette, kōr-vet' [Fr., cogn. with Span. *corbeta*: Portug. *corveta* < Lat. *corbi'ta*, a transport ship, deriv. of *cor'bis*, basket]: a small vessel of war having three masts, flush decks, and one tier of guns on the upper deck. The masts are square-rigged.

Corvey: a Benedictine abbey on the Weser, about 30 miles N. by E. of Paderborn, Westphalia, Prussia; a colony from the monastery of Corbie, in the diocese of Amiens, France, founded in 822 by Adalhard, the abbot of Corbie. The first place selected for the colony was at Hethi, in the Solinger Forest, near the present city of Uslar; proved unfavorable, and after seven years of labor lost the colony had to be removed to Huxori, near the present Höxter. But there it prospered so well that ere long it completely outshone the mother institution. After Adalhard's death it obtained its own abbot and became independent of Corbie, and during the latter part of the ninth century large endowments poured in upon it. In 836 the remains of St. Vitus was transferred thither from the abbey of St. Denis, and the relics greatly increased the fame of the monastery. During the earliest period of its history it was the center of the Saxon and Scandinavian missions; Ansgar, Rimbert, Autbert, Nithard, etc., issued from its cells. Later on it became the center of learning in Germany. It had an excellent library, in which in 1514 the lost first five books of the *Annals of Tacitus* were discovered. It maintained at one time twenty-four professors. Not only was theology taught in its schools, but also the sciences. During the Thirty Years' war (in 1632) the monastery was plundered and burnt, and its valuable books and other treasures were hopelessly destroyed or scattered. Its landed property was also confiscated, and little was restored at the Peace of Westphalia. Its princely rank was taken from it, and its prince-abbot became bishop of the little diocese made out of the abbey lands (1792). In 1821 the diocese was joined to that of Paderborn. So all trace of the ancient foundation has well-nigh been lost. At present the building belongs to the Duke of Ratibor, who is also Prince of Corvey. See Paul Wigand's *Geschichte Corveys* (Höxter, 1819); is unfinished, only extends to 1146, and unreliable because derived from the corrupted *Annales Corbeienses*.

Revised by S. M. JACKSON.

Corvi'nus (MATTHIAS) **I.**: King of Hungary; a son of John Huniades; b. at Klausenburg in 1443. He was elected king in 1458. He waged war against the Emperor Ferdinand III., the Turkish sultan, and the King of Poland. In 1485 he captured Vienna. He had superior military talents and was an able ruler. D. Apr. 7, 1490. See Wenzel, *Matthias Corvinus* (1810).

Cor'vus, M. VALERIUS: a famous Roman general; b. about 370 B. C.; was elected consul in 348. He defeated the Samnites in 343, and was chosen dictator in 342 and in 301 B. C. In the year 299 he was elected consul for the sixth time. D. about 270 B. C.

Corwin, EDWARD TANJORE, D. D.: clergyman; b. in New York city, July 12, 1834; graduated at the College of the City of New York, 1853, and at the Theological Seminary at New Brunswick, 1856. He was pastor in Paramus, N. J., 1857–63, and in Millstone 1863–88, at which date he became rector of Hertzog Hall, New Brunswick. He has published *Manual and Record of Church of Paramus, N. J.* (1858); *Manual of Reformed Protestant Dutch Church* (1859); *Centennial of Reformed Dutch Church, Millstone, N. J.* (1866); *Manual of Reformed Church in America* (1869; enlarged edition 1879); *Corwin Genealogy* (1872). Besides these, he has published sermons and articles, and was editor in part of the *Centennial Discourses* (1876; second edition 1877); and of the centennial volume of the New Brunswick Seminary, published in 1884.

WILLIS J. BEECHER.

Corwin, THOMAS: statesman and orator; b. in Bourbon co., Ky., July 29, 1794; removed to Ohio in early youth, and studied law, which he practiced with distinction. He was elected a member of Congress in 1830, joined the Whig party, and advocated the election of Gen. Harrison in 1840 by effective public speeches. In the same year he was chosen Governor of Ohio. He was elected to the Senate of the U. S. in 1845, and was appointed Secretary of the Treasury by President Fillmore in July, 1850. In 1858 he was chosen a member of Congress, and in 1860 was re-elected. He was sent as minister to Mexico in 1861, returned home in 1864, and died Dec. 18, 1865. See the *Life and Speeches*, edited by Strohn (Dayton, O., 1859).

Coryat, THOMAS: English traveler and humorist; b. in 1577. He went on foot over a great part of Europe, and gave an amusing account of his peregrinations in his very eccentric book, *Coryat's Crudities* (1611). He wrote several other narratives of travel, and died at Surat in 1617 after rambles through Greece, Asia, Egypt, and India.

H. A. B.

Coryban'tes [Gr. *Κορύβαντες*, the plural of *Κορύβας*]: Phrygian priests of Cybele or Rhea. They were distinct from the Galli, who were Roman eunuchs and priests of the same goddess. They celebrated the festivals of Cybele with orgiastic dances and loud cries, beating on timbrels, and cutting their flesh with knives.

Corydon: capital of Harrison co., Ind. (for location of county, see map of Indiana, ref. 11–E); on railroad and Indian creek; 115 miles S. of Indianapolis; has a furniture-factory, two flour-mills, and an academy. It is a handsome place, has a sulphur spring, and is a summer resort. It was the capital of the State until 1824. Pop. (1880) 763; (1890) 880; (1900) 1610.

Corydon: capital of Wayne co., Ia. (for location of county, see map of Iowa, ref. 7–G); situated on railroad; about 65 miles S. by E. from Des Moines. Pop. (1880) 801; (1890) 962; (1900) 1,477.

Cor'ylus: See HAZLENUT.

Cor'ymb [from Gr. *κόρυμβος*, uppermost point, head; cf. *κόρυς*, helm]: in botany, a form of inflorescence consisting of a central axis and lateral pedicels, of which the lower are longer than the upper, and the lengths of the pedicels are so graduated that the flowers are all on the same level, as in the *Spiræ*, *Kalmia*, and *Cratægus* (hawthorn).

Cor'ypha [Gr. *κορυφή*, tip, summit]: a genus of tropical fan-leaved palms, one of which, the *Corypha umbraculifera*, or talipot palm, grows in Ceylon to the height of 60 or 70 feet, and bears circular leaves often 12 feet in diameter.

Coryphæ'us, or **Corypheus** (in Gr. *κορυφαῖος*): the leader of the chorus in ancient classical dramas, by whom the dialogue between the chorus and the other actors of the drama was carried on, and who led in the choric song. The name is metaphorically applied to any great leader: thus Dr. Samuel Johnson is sometimes called "the coryphæus of English literature."

Coryph'odon [from Gr. *κορυφή*, tip, summit + *ὀδούς*, *-όντος*, tooth]: an extinct genus of ungulate mammals from the lowest Eocene of Europe and America. The skull in this genus presents many perissodactyl features. It is elongated in the facial region, and the nasal opening is large. The dental formula is—incisors, $\frac{3}{3}$; canines, $\frac{1}{1}$; premolars, $\frac{4}{4}$; molars, $\frac{3}{3} \times 2 = 44$. The brain cavity is quite small, as in all Eocene mammals, and indicates that the brain itself was of a very inferior type. Its most striking features were the small size of the hemispheres and the large expanded cerebellum. The limbs were short, and the femur had a third trochanter. The feet are especially interesting, as they present a primitive or generalized type, having five toes both before and behind. The first known species was described by Prof. Owen under the name *C. eocenus*, and was from the London clay. *C. oweni* is from the lowest Eocene of France. *C. hamatus*, the best-known American species, is from the base of the Eocene in Wyoming, and other species occur in the lowest Eocene of Utah and New Mexico. The genus is thus of great importance, as indicating the parallelism of European and American strata. The animals were about the size of the tapir. O. C. Marsh.

Coryza: See Catarrh.

Cos, or **Kos** (Gr. Κῶς), called also **Stan'chio**, stăn'kĕe-ō: an island of Asiatic Turkey; in the Mediterranean; separated from the coast of ancient Caria by a channel about 3 miles wide. It was called *Lango* in the time of the Knights of Rhodes. It is nearly 22 miles long and 5 miles wide. Area, 85 sq. miles. The surface is partly hilly, the soil is fertile, and the climate delightful. Among the products are cotton, silk, wine, and fruits. In ancient times it contained a celebrated temple of Æsculapius, and was the native place of Hippocrates, Apelles the great painter, and Ariston the philosopher. Pop. 20,000, mostly Greeks. Cos is also the name of a seaport-town on this island. Its port is visited by many merchant-vessels. Pop. about 8,000. See also Coos.

Cosa, Juan, de la: Spanish navigator; b. about 1460. He accompanied Columbus in 1493 to Hispaniola and Cuba. In 1496 he was living at Santona, and had acquired a great reputation as a pilot and chart-maker. He next appears as pilot in the expedition of Ojeda to the Pearl coast, May, 1499, to June, 1500. In Oct., 1501, he sailed again with Bastidas, exploring the northern coast of South America from Venezuela to the Isthmus of Panama. On his return in 1502 he reported that Portuguese ships had been seen on those coasts. He was sent on a mission of remonstrance to Lisbon, where he was imprisoned until Aug., 1504. He subsequently made two successful voyages to the northern coast of South America in command of small fleets (1504–06 and 1507–08). In the latter year he was appointed *alguazil mayor* of Uruba, and in that capacity he accompanied the expedition of Ojeda, destined to settle there. Ojeda, contrary to his advice, landed at the bay of Cartagena with part of his force, including La Cosa. Attacked by Indians, all were slain except Ojeda (Nov., 1509). Two or three of La Cosa's charts have come down to us. His map of the New World is the earliest known, having been made in 1500. It is on vellum and beautifully illuminated. Humboldt found it in 1832 in the library of Baron Walckenaer, and in 1853 it was bought by the Spanish Government.
Herbert H. Smith.

Cosegüina, kō-sā-goo-ee'-nă, or **Cosigüina**: a volcano of Nicaragua; occupying a peninsula at the extreme northwest corner of the republic, between the Pacific and the Gulf of Fonseca. It is 3,835 feet high, and appears simply as a barren cone, much less prominent than many other Central American mountains; but it is notable for one of the greatest volcanic outbursts on record. Early in January, 1835, it gave signs of activity, and on the 20th of that month an enormous mass of ashes burst from its summit; the eruption continued for three days, accompanied by explosions which were heard as far as Oajaca, Mexico; the country for 100 miles around was darkened by the cloud, the obscurity in many places being like that of the thickest night; ashes fell thickly over a large part of Central America, and were carried by the wind to Jamaica and Mexico. Cosegüina at present is quiescent or extinct. H. H. Smith.

Cosen'za: a province of Italy; bounded N. by Basilicata, S. by Catanzaro, and E. and W. by the sea. It is mountainous, and produces rice, saffron, honey, oil, and wine. Its fisheries are still important, though they are not utilized with the same energy as in former days. Capital, Cosenza. It was formerly named Calabria Citeriore. Area, 2,840 sq. miles. Pop. (1890) 463,181.

Cosenza (anc. *Consentia*): a city of Italy; capital of the province of Cosenza; at the confluence of the rivers Crati and Busento; 12 miles E. of the Mediterranean and 262 S. E. of Naples by rail (see map of Italy, ref. 8–G). It is the seat of an archbishop, and contains a fine court-house, a cathedral, a royal college, a theater, several convents, and an old castle which has been converted into barracks. It has manufactures of cutlery and earthenware, and an active trade in silk, oil, wine, manna, rice, etc. Consentia was the ancient capital of the *Brutii*. Pop. 12,590.

Coshoc'ton: village and railway junction; capital of Coshocton co., O. (for location of county, see map of Ohio, ref. 4–G); on the Muskingum river just below the junction of the Tuscarawas and Walhonding; on the Ohio Canal; 69 miles E. N. E. of Columbus. A bridge across the river connects it with Roscoe. Coshocton has 6 churches, 4 schools, steel-works for axles, a paper-mill, and 2 large novelty-advertising concerns. Pop. (1880) 3,044; (1890) 3,672; (1900) 6,473. Editor of "Age."

Cosin, John: English prelate; b. in Norwich, Nov. 30, 1594; educated at Cambridge; by command of Charles I. prepared a manual of *Private Devotions* (1627); became master of St. Peter's College, Cambridge, in 1634; and in 1640 Dean of Peterborough and vice-chancellor of the university; after holding services in Paris during the Commonwealth was made Bishop of Durham in 1660. Author of *Scholastical History of the Canon of Holy Scripture* (1657); *History of Popish Transubstantiation* (1675). D. Jan. 15, 1672. C. H. T.

Cosmati, kos-maa'tĕe, **The** (Lorenzo and his sons, Luca and Jacopo Cosma): architects and mosaic-workers of high distinction in the first half of the thirteenth century, whose work at Civita Castellana, Falleri, and at the Villa Mattei, Rome, shows that the arts were not lost even there when Cimabue flourished. They form a link between the Roman art of the tenth and eleventh centuries and the general Renaissance in Italy. W. J. Stillman.

Cosmic Dust: See Dust.

Cosmo de' Medici: See Medici.

Cosmogony [from Gr. *κοσμογονία*, origin or development of the universe, a word constructed on the type of *θεογονία*, theogony; *κόσμος*, universe + *-γονία*, deriv. of root *gen-*, become, in *γονή*, etc.]: the science or theory which treats of the origin of the cosmos or universe. If we except the cosmogony of the East Indians, the earliest extant is that of Hesiod, which is delivered in hexameter verse. The first prose cosmogonies were those of the early Ionic philosophers, of whom Thales, Anaximenes, Anaximander, and Anaxagoras are the most celebrated. In modern times a *Theory of the World* has been produced by Burnet. The different theories of the origin of the world may be comprehended under three classes: 1. Those which suppose the world to have existed from eternity under its actual form. Aristotle held this doctrine, and, conceiving the universe to be the eternal effect of an eternal cause, maintained that not only the heavens and the earth, but all animate and inanimate beings, are without beginning. 2. Those which consider the matter of the universe eternal, but not its form. This was the system of Epicurus and most of the ancient philosophers and poets, who imagined the world either to be produced by the fortuitous concourse of atoms existing from all eternity, or to have sprung out of the chaotic form which preceded its present state. 3. Those which ascribe

both its matter and its form to the direct agency of a spiritual cause.

The account given in Genesis of the creation is obviously not a scientific cosmogony, which would not only have been out of place in a divine revelation intended specially to impart religious truth, but would, if given in a scientific form (since science is constantly progressing and therefore changing), have been adapted to a single age or period only. Or, supposing the highest and *ultimate* facts of science had been given, it would have been so far in advance of all scientific thought yet reached, or that will be reached perhaps for fifty thousand years to come, that it would be wholly unintelligible, and would in all probability appear utterly absurd even to the most advanced intellects. Therefore those few great facts which were necessary to be indicated in order to point out the relation between the Creator and his works have been presented in a popular rather than a scientific form. Nor can it be said that they are any the less true because not presented in scientific phraseology. An excellent exposition of the harmony between the Mosaic and the geological record of creation is given by Prof. Dana at the end of his *Manual of Geology*, to which the reader is referred. See also Tayler Lewis's *Six Days of Creation* (1855).

Cosmos: See Cosmogony.

Cosne, kōn (anc. *Condate*): a town of France; department of Nièvre; on the Loire; 29 miles N. N. W. of Nevers. It has manufactures of hardware, cutlery, and anchors. Pop. (1896) 8,610.

Cosquin, Emmanuel: French author; b. June 25, 1841, in Vitry-le-François, Marne; translated from Fessler, secretary of the Vatican Council, *La Vraie et la Fausse Infallibilité des Papes* (1873) and *Le Concile du Vatican* (1877); has contributed much to periodical literature, especially articles on religious subjects in *Le Français*, and on folk-lore in *Romania*. The latter were collected and published as *Contes Populaires de Lorraine* (2 vols., 1866), forming an important contribution to the science of folk-lore.

Cossa, Francesco: painter; dates of birth and death unknown. He worked at Ferrara and Bologna, and may be considered one of the founders of the Ferrarese school. He was painting in 1456 and also in 1474. His most important existing work is the *Madonna with Saints* in the Bologna Gallery.

Cos'sacks [Russ. *Kozake*, prob. of Tartar origin]: certain Russian tribes first noted in the southern part of European Russia, now generally scattered over the empire. Their physical and political peculiarities have been curiously persistent. They are small, courageous, superstitious, and have many communistic principles. They have been given many political privileges, the most important of which are freedom from taxes and the rights of distilling, brewing, hunting, and fishing. They are now named by their present distribution as the Cossacks of the Don, of the Azof, of the Danube, of the Caucasus, Danube, Ural, Orenburg, Astrakhan, etc. Historically, they fall into two principal sections —the Cossacks of Little Russia, or of the Dnieper, and those of Great Russia, or of the Don.

The Dnieper Cossacks apparently originated in bands of refugees, of mainly Russian blood, which formed on the islands of the Dnieper in the thirteenth and fourteenth centuries. The unhappy condition of this region caused the community to grow, and by the sixteenth century it was strong and prosperous. Their government was democratic—the leader or hetman elective. Their services were lent to their powerful neighbors. Mazeppa was an Attaman (*q. v.*) of this people; he joined his forces to those of Charles XII. of Sweden, which called out the vengeance of Peter the Great, and led to the subjugation of the Dnieper Cossacks by Russia. Early in their history the more ardent adventurers had formed a military fraternity, called Zaporogians, bound by a vow of celibacy. They ultimately retired to the Crimea, then to Kuban, and a small band of them appears in history as late as 1828.

The Don Cossacks form a restless and warlike race, whose subjugation by Russia extended through centuries and left them with many special privileges. Their territory now constitutes a province of European Russia, with an area of 61,886 sq. miles, and a population (1889) of 1,896,113. They serve in the Russian army as light cavalry. Many half-savage tribes are excused, partly on account of their diminutive size and partly from their great aversion to a military life. M. W. Harrington.

Costa, Claudio Manuel, da: Brazilian poet and revolutionist; b. in the *arrial* of Carmo, Minas Geraes, June 6, 1729. He graduated in law at Coimbra, Portugal, traveled in Europe, and after his return lived at Villa Rica (now Ouro Preto), in Minas. He was known as a distinguished lawyer, who was often consulted by the colonial governors, and as a philosopher and poet of some note. About 1778 he joined in the revolutionary attempt known as the conspiracy of Tiradentes. On its discovery he was arrested, with the others, and committed suicide in prison (1789). Some of his sonnets and songs, published long after his death, are greatly admired for their purity and sweetness.

Herbert H. Smith.

Costa, Lorenzo: painter; b. at Ferrara, 1460. He is generally considered the founder of the Ferrarese school, but improperly. Much of his most important work is at Bologna, and during his middle life he was closely associated with Francesco Francia, so that his painting of that time is often confounded with that of the greater painter. For many years he lived and worked in Mantua, but nearly all his paintings there have perished. His chief works are the altarpiece of the Bacciochi chapel in St. Petronio, Bologna, wall-pictures in the same church, and paintings in the oratorio of St. Cecilia in the same city. There are good easel pictures in the Berlin Gallery and the London National Gallery, especially in the latter a *Virgin and Saints*, and in the Louvre a remarkable allegorical picture known as *The Court of Isabella D'Este*. D. in 1536. W. J. Stillman.

Costa, Sir Michael: composer and conductor; b. in Naples, of an old Spanish family, Feb. 4, 1810; studied in the Royal Academy at Naples; at the age of fifteen years composed a cantata, an opera at sixteen, and another at seventeen; also a mass, an oratorio, a *Dixit Dominus*, and three symphonies. In 1828 he was engaged by the manager of the Teatro Nuova to compose an opera, producing *Il Carcere d'Ildegonda*, and the next year his *Malvina* was composed for the San Carlo. In the autumn of 1829 his master, Zingarelli, sent him to England to direct the old master's psalm *Super Flumina*, but he sang in it instead of directing. He remained in England for the rest of his life, composing operas and cantatas, directing various societies and orchestras, and conducting different English festivals—the Birmingham from 1849 till his death, the Bradford in 1853, and the London 1874. He was the conductor of the Sacred Harmonic Society, and of the Händel festivals from 1857 till his death. His oratorios *Eli* (1855) and *Naaman* (1864) were composed for the Birmingham festival. In 1869 he was knighted by the Queen. He also conducted the opera at Her Majesty's theater, and wrote additional accompaniments for many of Händel's oratorios. D. in Brighton, Apr. 29, 1884. D. E. Hervey.

Cos'ta Cabral', Antonio Bernardo, da, Count of Thomar: a Portuguese statesman; b. May 9, 1803; became Minister of State in 1839. He controlled the government, supported by the court, but by oppressive unconstitutional measures—the abolition of the irremovability of judges, the establishment of a rigorous censure, etc.—he brought upon himself the hatred of all parties. He was obliged to retire in 1846 in consequence of a popular insurrection, was recalled in 1849, but was obliged to flee the country in 1851. His brother Silvo led the opposition. Antonio returned to Portugal in 1852, and from 1859 to 1861 acted as ambassador to Brazil. D. Sept. 1, 1889.

Costa Carvalho, José, da: Brazilian statesman; b. at Nossa Senhora da Penha, Bahia, Feb. 7, 1796. He studied law at Coimbra, Portugal, and was an *ouvidor* at São Paulo. Embracing the cause of Brazilian independence, he was a member of the Constituent Assembly of 1822, and deputy to several parliaments. At first he voted with the liberals, but in 1838 joined the conservative party. In 1839 he entered the Senate; was president of São Paulo in 1842, during a period of revolt in that province; and in 1848 he was called to form the Conservative cabinet which suppressed the revolt in Pernambuco and brought the war with Rozas to a successful issue. Costa Carvalho was named Baron of Monte Alegre in 1841, viscount in 1843, and marquis of the same title in 1854. D. in Rio de Janeiro, Sept. 18, 1860.

Herbert H. Smith.

Costan'oan Indians [from the Spanish *costanos*, coastmen]: a linguistic family of North American Indians whose habitat formerly embraced several of the present counties of Western Central California, extending from the Golden Gate

southward to Point El Sur, eastward to Soledad, thence by an irregular line to Gilroy Hot Springs and the upper waters of Conestimba creek, to San Joaquin river as far as its mouth. The northern boundary was formed by Suisun Bay, Carquinez Straits, San Pablo and San Francisco Bays, and the Golden Gate.

Physically considered, the natives comprising this as well as other Californian groups residing mainly on the coast were of low type. They lived in rude thatched huts, and subsisted chiefly upon fish and mollusks, nuts, roots, and seeds.

The activity of the Spanish missionaries was great among the Costanoan Indians, the missions of San Francisco de los Dolores, Santa Clara, San José, Santa Cruz, San Juan Bautista, San Carlos, and Soledad being established in their territory between 1770 and 1797, and to these missions were attached a large number of *visitas*.

Strict sedentary life, arduous tasks, and disease decimated these tribes, and now only about thirty individuals survive. Most of these, constituting the remnants of the Rumsen tribe, are to be found near Santa Cruz and Monterey. Only the older individuals speak the native tongue.

Following were the principal Costanoan divisions: Ahwaste and Altahmo, on San Francisco Bay; Aulintac, named from their village, under Santa Cruz Mission; Carquin, south of Carquinez Straits and eastward to the mouth of the San Joaquin; Mutsun, in and about San Juan Bautista Mission, San Benito County; Olhone and Romonan, on San Francisco Bay; Rumsen, on coast from Pajaro river to Point El Sur; Thamien, between the Almaden mines and Alviso Landing, Santa Clara County, also in Santa Clara valley; Tulumo, on San Francisco Bay.

Henshaw, *Missions and Mission Indians of California*, in *Popular Science Monthly* (Aug., 1890); Powell, in *Cont. N. A. Ethn.*, iii. (Washington, 1877). Consult also works cited therein. See INDIANS OF NORTH AMERICA. F. W. HODGE.

Costa Rica, kōs'tăă-ree'kăă (i. e. rich coast): the southernmost country in Central America; connecting Colombia with Nicaragua, with the Caribbean Sea on the N. E. and the Pacific Ocean on the S. W., and lying between the parallels 8° and 11° 16′ N. and the meridians 81° 40′ and 85° 45′ W. Area, 20,873 sq. miles. The northern boundary is formed by the river San Juan and the southern shore of Lake Nicaragua; the southern is unsettled, both Costa Rica and Colombia claiming the vicinity of the Bay of Chiriqui. The total area is 23,233 sq. miles. The Caribbean coast-line is 180 miles long, and the Pacific about twice as great. The cordillera which forms the backbone of the country is fairly well defined in the N. W. and S. E., but much broken up in the center. The highest point is Pico Blanco (11,800 feet). There are six volcanoes, only two of which (Irazú and Barba) have given signs of activity in late years; the first is the highest volcanic peak (11,600 feet). There are many small rivers, the drainage usually being N. E. or S. W., and the fall great. The climate is hot along the coasts and inland to an elevation of about 3,000 feet. The temperature is, however, lowered by the trade-winds and sea breezes, the mean varying from 72° F. to 82° F., the latter on the Pacific side. The region of the hot climate comprises about one-third of the republic, and is adapted to the cultivation of the banana, cocoa, vanilla-bean, sugar-cane, and other tropical plants. A temperate region is found on the mountains from 3,000 to 7,500 feet above the sea. The lower slopes are the populous portions of the state, have a very salubrious climate, are well watered and very fertile, and are largely devoted to coffee-growing. The higher slopes gradually pass into the cold region of the higher mountain-tops, the mean temperatures running from 68° F. to 57° F. The dry season generally begins in November and ends in April, and is called the *verano* or summer. The rainy season extends from May to October, and is called the *invierno* (winter). The Meteorological Institute of San José is making elaborate studies of the climate.

Productions.—The mineral wealth of the country is great, and has been known from the time of Columbus. Gold is the principal metal mined, and is found both in the rock and in placers. Silver, lead, and copper are also found. The forests are extensive, and yield mahogany, cedar, rosewood, lignum-vitæ, granadillo, and Brazil-wood. Annotto is also abundant, and a superior quality of indigo is grown. Among medicinal plants the castor-bean, croton, cassia, sarsaparilla, ipecacuanha, ginger, rhubarb, tamarind, and licorice may be mentioned. India-rubber is produced in considerable quantities. Coffee was first planted here in 1796, and its production has long been the principal industry of the country. Banana exportation began in 1880, and has now reached considerable proportions. Sugar, cocoa, tobacco, maize, cotton, and indigo are produced, and cattle raising is an important industry.

Government.—The state is a republic with a president and one legislative chamber of twenty-six members, elected for four years. The army consists of 600 men, and the militia of about 34,000. The revenue for 1899 was 8,413,199 pesos, and the expenditures 8,069,748 pesos, of which 5,232,168 pesos were expended for government, and 1,377,525 for debt. The peso is worth about 46 cents. The revenue is derived mainly from customs and the monopoly of spirits and tobacco. The total internal debt in 1899 was 2,922,221 pesos; foreign debt, approximately, £90,000. The territory is divided politically into five provinces and two sparsely settled comarcas. The most densely populated province is San José, nearly central on the Pacific coast, and containing the capital San José. The others, in order of population, are Alajuela (N. of San José), Cartago (S.), Heridia (E.), and Guanacaste (on the Pacific coast, N. of the Gulf of Nicoya). The comarcas are Puntarenas (on the Pacific coast, S. of San José) and Limon, which occupies the entire Carribean coast.

The imports in 1898 were valued at 4,258,896 pesos, the exports 5,659,219 pesos, of which coffee composed nine-tenths. About one-fifth of this coffee goes to the U. S. The imports from the U. S. amounted to 3,078,258 pesos, larger than from any other country. There are 131 miles of railway, 917 miles of telegraph lines, and 200 miles of telephone lines.

Population.—A census taken in Nov., 1883, gave a population of 182,073, with an estimated addition of 18,207 unenumerated and 3,500 aborigines (Guatusos, Talamancas, and Chirripos), making a total of 203,780. According to the census of Feb. 18, 1892, the population, as far as enumerated, was 243,205. In 1889 there were 1,228 marriages, 9,151 births (nearly 20 per cent. illegitimate), and 5,238 deaths. This gives a death-rate of 22 per thousand, which is high for a rural population, and is probably due to careless treatment of the young. Since 1894 the immigration has been about 1,000 annually. The people of Spanish descent dwell in or near the larger towns. Immigration is encouraged, and there are many small settlements of English, French, Germans, and Italians. Education is compulsory and free. In 1898 there were 327 public schools with 15,000 pupils, and 90 private schools with 2,500 pupils.

History.—Honduras was discovered by Columbus in 1502, and was called *Costa Rica* because some gold was obtained and rich mines were supposed to exist. It remained in colonial times a province of Guatemala, was proclaimed independent in 1821, and in 1824 became a state in the United Provinces of Central America. Since the dissolution of that confederacy in 1848 it has remained an independent republic. The population is more homogeneous and progressive than in most other Central American states. For information as to its antiquities, see CENTRAL AMERICAN ANTIQUITIES.

Costel'lo, LOUISA STUART: English author; b. in 1799. She wrote a number of semi-historical novels and books of travel, which were very popular in their day. In her early years she was a painter of miniatures. D. Apr. 24, 1870.

Cos'ter, or **Koster**, LAURENS JANSZOON: mentioned by Adrian Junius in *Batavia* (an historical work published at Leyden in 1588, but supposed to have been written twenty years earlier), as the original inventor of movable types between the years 1420 and 1440. The story is that he first cut letters out of wood, and printed from them the Dutch *Hailspiegel*, and that afterward he made his letters from lead and tin, and called in assistants, whom he swore to secrecy. One of these assistants, named Faustus, made away with his master's tools and type, and settled at Mentz, where about 1442 he brought out the *Doctrinale* of Alexander Gellus with the very type which Coster had made at Haar-

lem. This story has always been upheld by the Dutch, but in 1870 one of their countrymen, Dr. Antonius van der Linde, made a vigorous assault upon Coster's claims. Meerman was the first writer of note to investigate the story of Junius and furnish corroborative details, and so general is the belief in Coster's claims that a statue, erected to him in Haarlem, bears the inscription "Inventor of the art of printing with movable letters cast of metal." Another statue is in the public gardens in the same town. It is not known when or where he died, though he was alive in 1483. See Hessels, *Haarlem, the Birthplace of Printing* (1888); also *American Dictionary of Printing and Bookmaking* (New York, 1892).

Cos'tigan, John: Canadian cabinet minister; b. at St. Nicholas, Levis co., P. Q., Feb. 1, 1835, and educated at St. Ann's College. He was a member of the New Brunswick Assembly 1861–66; entered the Dominion Parliament in 1867, and has been re-elected at each subsequent general election up to and including that of 1891. He became Minister of Inland Revenue in 1882, a portfolio which he now (1893) holds. He has been a judge of the inferior court of common pleas of New Brunswick. He attained some notoriety in 1882 as the mover in Parliament of an address to the Queen praying that she would grant home rule to Ireland.

Neil Macdonald.

Costiveness: See Constipation.

Costume [from Fr. *costume*, an Ital. loan-word; cf. Fr. *coutume*; both from Vulg. Lat. forms of *consuetu'do, -inis*, usage]: dress and the ornaments of the person, taken in a general sense, and especially a national or provincial or local style of dress, prevailing for a length of time and free from sudden modifications. Thus in recent times the Japanese have to some extent given up their national costume and adopted European dress, while the Chinese have retained their national costume, although the Chinamen in the U. S. wear some garments which are not a part of that costume. We do not say that the Japanese have adopted European costume, however, for there is no such thing, except in the general sense that European men wear trousers and coats of woolen fabric, shirts of cotton and linen, and boots of leather, while the women wear gowns fitted closely to the body from the waist up, and flowing loosely below the waist down to the ankles or lower. These conditions are too general to constitute a costume, and the special shapes, colors, and materials change too often and too capriciously, and too much as a matter of deliberate choice, to allow a costume to exist. But the gown and wig of an English barrister constitute a costume; so does the dress of the Bedouins of the desert, for it has not changed for ages in any important feature; so does the dress of this and that valley of Southern Bavaria or Tyrol; so does the blouse of the French mechanic, and the smock-frock of the English country laborer. These are all traditional, they survive from old times, and continue in use merely because the people who wear them do not feel inclined to change.

If the people of the U. S. were to take up the blouse for their summer wear, it would be not a costume but a fashion. If we can imagine their continuing to wear it for a century it would have something of the nature of a costume. So the suit of white linen which "Mark Twain" gives to Col. Grangerford in *Huckleberry Finn* was in one sense a costume, because all the men of his class wore it and had worn it for years without thought of change; but it was not quite a costume, because it was a part of the modern European and American dress, and was therefore not peculiar in cut or fashion.

The history of costume can not be fully written as yet, because the monuments of art upon which it must depend have not been compared and analyzed with any thoroughness. Even the costumes of the Romans and Greeks in classical times are only half understood, and very many questions regarding both still remain unsettled and disputed. Greek authors mention garments by names of which we do not know the meaning; in Greek statues and vase-paintings are shown garments of which we know neither the names, nor the real shape and make, nor the utility. We do not know for certain what garments a Roman woman wore under her large and loose *palla*, if, indeed, it is the palla. In the crust of ashes at Pompeii there are cavities which formerly contained the bodies of persons smothered at the time of the city's destruction. These bodies crumbling away have left hard, shell-like molds. A plaster cast of one of them has revealed to us a woman's garment whose existence in Roman imperial times had never been suspected by modern students. And the very numerous men's garments which were introduced during the time of the empire, as we are told by contemporary writers, we are generally not able to identify. This uncertainty is yet greater in respect to less known peoples.

The earliest sculptures found in Mesopotamia, dating perhaps 3,000 years before Christ, show in common use a garment made of a large oblong piece of stuff carried over the left shoulder and under the right arm, the two edges overlapping along the left side of the body and left leg. The same garment appears in Egypt at about the same date; it is common in Assyrian sculpture and in the monuments of the great Persian empire of the sixth century B. C. to the second, and we know it as the Grecian *peplos*. Its edges are often ornamented with fringes and with borders which are sometimes of very rich embroidery. It appears often as the only garment of either sex. But the Egyptian women are shown with this single garment drawn very closely around body and limbs, so that all the form is distinctly seen, while the Greek vase-paintings of all epochs show it as much more loosely worn, the forms wholly concealed except where it flies open at the left side. Men who wear this garment are always of some rather elevated social position; the workmen in the fields, mechanics, merchants, and even superintendents and officials are commonly shown in the Egyptian and Asiatic monuments with no garment except a piece of stuff hanging from the waist-belt, and arranged so as to cover the thigh to the knee. In the hot lands of the Eastern Mediterranean this was the dress of most men in antiquity; the thick woolen cloak used by the modern inhabitant of these same regions very seldom appears in the ancient monuments, and we are left equally unable to understand how the men of old time protected themselves from the heat of the noonday sun, and how the Greeks and others who had a winter to face kept themselves warm in cold weather. The Assyrian princes and nobles are shown as entirely covered with clothing, and they have, what is remarkable, sleeves, though short ones. But it seems generally the shirt or inner tunic which has sleeves, and the whole dress may be taken as consisting of this shirt with the above-described wrapping garment, or a larger and fuller one worn over it.

Fig. 1.—Greek vase-painting: Warrior wearing the *chlaina* or *pharos* and a crested helmet, leading a female captive wearing the *chiton* and the *kaluptra* or long veil.

During what we may call the classical age, from about 500 B. C. to 300 A. D., it is noticeable that the non-Greek peoples of Western Asia and Egypt are more inclined to

cover and conceal the person than the Greeks. Even the women are much less heavily draped among the Greeks than in Asia. The *chiton* or shift of the Greek women (see Fig. 1) was made of one piece of stuff just as it left the loom, but with the opposite edges sewn together so as to make a straight case or tube of stuff open at both ends. This could be folded over at top, forming a kind of cape. Whether so

Fig. 2.—Greek vase-painting: Bacchus, wearing the chiton and chlamys, is overthrowing a giant wearing a chiton and a crested helmet, and carrying a large round shield and a sword of unusual form.

arranged or not, the top edge passed under both arms and was then brought up to meet at the top of each shoulder, and held there by a brooch or clasp, the arms left free, and loose folds of stuff formed under each arm. Sleeves for the upper arms could then be made by pinning the top edges of the garment together at several points. When a waist-belt was worn, the long shift could be pulled up so that the feet and ankles and a part of the legs were left free; the loose fold of the stuff then fell outward over the belt, hiding it, and this feature has often been mistaken for another garment. The men's shirt was not unlike this, but generally much shorter (see Fig. 2). Either sex would wear the peplos over the chiton (see Fig. 4). But men are more often represented wearing a very loose cloak, which we know from Greek authors as the *chlaina*, the *himation*, the *chlamys*, and by other names between which it is very difficult to distinguish. In these cloaks there was probably no sewing at all, unless in the case of the ornamenting of the edges, and not often then. These cloaks are continually represented as the only garment of the younger men (see Fig. 1), and it is one of the puzzles of this subject how far we are to take this as the common custom of Greek life, and how far it is the result of the interest which Greek sculptors took in the nude body.

Fig. 3.—Greek vase-painting: King or chief with a long *chiton* and a *chlaina* over it.

The Roman costume was not very unlike that of the Greeks, for in earlier times the dress of all the Italians seems to have been akin to that of more Eastern peoples, and afterward the Romans drew most of their ideas of life from Grecian sources. But one peculiar garment they had, the *toga* (see Fig. 5), a very large and loose cloak which was worn by all citizens when out of their homes and in the city, but thrown off indoors, and little

Fig. 4.—The peplos worn over the chiton.

worn in the country. The statues indeed show it to have been extremely cumbrous. Its shape has been much disputed, but it seems to have approximated to a half circle of from 10 to 12 feet diameter. Many modern archæologists have experimented upon this and other shapes by draping them actually upon living men. One high authority has pronounced for a sort of crescent of an elliptical rather than a circular curve, with another smaller ellipse of stuff sewed into the inner and concave curve of the large crescent. When not wearing the toga, the shirt and the cloak constitute the chief dress of the Roman man; his armor was put on over the shirt, and the cloak worn over the armor again. The shirt was called *tunica*, and the under one when two were worn was the *subucula*; the cloak was called *sagum*, *pallium*, and *paludamentum* (see Fig. 6). Besides these names, Greek, Oriental, and even Gaulish or German names were given to various modifications of the familiar gar-

Fig. 5.—Roman statue of an orator or scholar wearing a full *toga*.

ments, for Rome became at a relatively early time the head of a cosmopolitan community and state, and all customs and all costumes had their day and their admirers.

One marked distinction there was between the people of the Græco-Roman world and their preeursors, on the one hand, and the nations whom they called barbarians and who half surrounded them on the E., N. E., and N., on the other hand: these latter wore trousers. It is a most curious subject for inquiry, this general use of what the Romans called *bracae*, among so many and so different peoples, inhabiting such different climates, as Gauls, Germans, Scythians, Persians, and Parthians; or the people of modern Northern France, Belgium, Holland, Northern Germany, Hungary, Russia, Tartary, Persia, Afghanistan (see Fig. 6). It may be assumed, however, that these garments originated in cold climates, and were only kept in use by those who had often to visit cold regions; thus the Parthian and Persian princes are represented wearing *bracae* in the hot lands of Mesopotamia, but those prinees had come from the high lands of the interior, where the winters were severe. Moreover, the Romans adopted the *bracae* in their campaigns, and apparently in peaceful life as well, when to the N. of the Alps, but abandoned them at once when they re-entered Italy. The people of the peninsula of India have never adopted trousers in eommon life; the Chinese seem not to have used them before the establishment of the Tartar dynasty. The Japanese have never included them in their native costume; except always that, among these various peoples, as also among the Scotch Highlanders, trousers of some sort have often been worn by individuals, sometimes as a mark of social dignity and high official or hereditary position.

Fig. 6.—Roman statue of a northerner wearing the *bracae*, a girdled *tunica*, and the *sagum* or *abolla* fastened with a brooch.

Fig. 7.—Lady's dress of 1280: Loose mantle, with band to hold it across the breast, like a cope, worn over a *bliaut* or other gown; wimple and long veil.

A kindred garment, the stocking, appears first in the early Middle Ages. Quicherat, an excellent authority, assumes that stockings or socks began to be used only when the classical traditions of personal cleanliness and eonstant bathing had been lost, at the beginning of that long epoch of uncleanliness which has not closed yet for the people of the greater part of Europe and the European settlements. In the eighth and ninth centuries of our era in Europe there is visible a constant struggle between classical traditions and new conditions: in the miniatures some of the highest personages are represented with bare legs, some with trousers, and some with long stockings and short skirts, like a Highlander of the sixteenth century, while the most eommon style of dress seems to have ineluded cloaks so long and full that when they were worn all other details of costume are concealed. The long cloak is indeed almost a badge of dignity, being as it is incompatible with active and toilsome occupation. As late as the fifteenth century the dress of a courtier was essentially a robe reaching to the feet. It is not until the reigns of Louis XI. in France and Edward IV. in England that the effigies and miniatures at last show noblemen and princes in short cloaks and doublets, when not engaged in the chase or in active sports; and at a much later time still the dress is not considered complete until the long robe is superadded.

What the nobles wore the citizens always adopted so far as they dared brave or disregard the laws of the time against extravagance and the confusion of classes. In proportion as a man is "in doublet and hose," as a later phrase expressed it, he is either (1) of lower condition or (2) engaged in the chase, in traveling or (3) is in undress in his own apartments, although in the last case a long furred gown is, till the seventeenth century, the winter wear of sedentary men. It is to be noticed that throughout the thirteenth, fourteenth, and fifteenth centuries there is complete confusion between stockings and trousers. Sometimes the same garment covers the feet and reaches to the waist; sometimes the long stockings come only half-way up the thighs, and are secured in some way not made clear; sometimes they are parted at or near the knee; and these distinctions obtain among nobles, citizens, and field-laborers alike. Hence the terms *haut-de-chausses* and *bas-de-chausses* (the upper hose and lower hose), from which comes the modern French word *bas* for stockings. Corresponding English words were trunk-hose (the hose of the trunk or body) and nether-stocks.

Fig. 8.—Lady's dress of about 1450: The sleeves tight, with upper hanging sleeves purely ornamental, covered with fur in small pieces; hawking glove on left hand.

During the Middle Ages the costume of women was more nearly constant than that of men because the principal garment was always a gown, more or less closely fitted from the hips upward, and very loose and full in the skirts. It is only in the statues earlier than the thirteenth century that any resemblance to the ancient girdled shift is to be seen, and this seems to be always a piece of ceremonial court dress, probably a survival of classical times. Otherwise the gown always has sleeves, and is close around the neck and shoulders, and fitted to the waist in such a way as to require much cutting and sewing, and the great fullness of the skirts combined with the snug fit at the waist and hips points to the free use of gores (see Fig. 8). Within this general limit of style many differences existed: in the thirteenth century an overdress without sleeves and with a skirt reaching to the knees showed the longer skirt and the sleeves of another gown beneath; in the fourteenth century the overdress swept the ground, and was eonstantly held up or looped up to show the underskirt—it had short sleeves, too, showing the sleeves of the undergown to the wrist; in the fifteenth century the undergown had its bodice eut low in the neck, and its skirt reaching the ground, while the

Fig. 9.—Dress of young man of good family, about 1490. Fur-lined short cloak, worn over a loose *cotte* or tunic.

overdress was open in front, but came higher on the shoulders, and its skirt was carried out to a long train for ladies of wealth and their imitators, while a broad belt kept all the complicated attire in place. In the fourteenth century, too, was worn that jacket which is so commonly taken by modern artists as a general dress for their mediæval ladies, the curious garment with an edging of fur sweeping down from the shoulder to the hips on each side, a fashion which prevailed so long that a heraldic bearing was derived from it. Varied as were the styles of dress, and far removed from classic simplicity of make for both men and women, it must be said that the shape and the movements of the body were studied, and that they controlled the style of garments throughout the Middle Ages. The whims of fashion were rather shown in the hoods and hats, the caps and veils of the time, for which see HEAD-DRESS.

The end of the Middle Ages is marked at once by the change in architecture from a natural to a deliberately copied style, the almost complete abandonment of body-armor except by the richest men, who could pay for the costly bullet-proof corselets and taslets of the day, and who, moreover, were mounted in battle and on the march, and finally a general abandonment of simplicity and reasonableness in dress, and the introduction of the most fantastic tailoring and trimming for both sexes. Splendid stuffs, such as silks brocaded with flowers, satin of rich design and color, velvet both plain and figured, and cloth of gold and of silver, became common among the nobles of the courts of Europe. The display at a tournament or other court function must have been in every way more splendid than we can now imagine, for men vied with women in the splendor of their material, and the strangeness of cut and shape of their garments, when embroidery was freely lavished upon cloaks, horse-housings, banners, and hangings, and heraldic display gave an excuse for the most positive colors in bold contrast; when, too, rich men and women did not leave to their servants the use of color and gold, of badges and significant devices, but themselves wore garments of unrestrained magnificence and enormous cost.

But the general fashion of men's dress in the middle of the sixteenth century, Henry II. reigning in France and Edward VI. in England, is not so unnatural; it may be described as follows: A gentleman wore a doublet or pourpoint with long sleeves, fitting the body and arms easily, girded at the waist, having short skirts below the belt but not reaching much below the hips; trunk-hose made very large and full, stuffed out with hair or wool or held in place with some elastic material, so that the skirts of the doublet had to be cut with a decided shape to allow of them; the stockings fitting tight to the thigh and leg, a fashion helped by the introduction at this time of *tricot*, or what we call now "Jersey" or stocking-stuff, the elastic material of our modern underclothes; over the doublet would be worn a full cloak, resting on both shoulders or on one and capable of being drawn around the body, but very short, scarcely reaching the hips. All this might be plain enough, though of some delicate choice of color and of braiding or trimming, but these garments could also be made very showy with plaits which, seeming to be in one rich material, showed as they open another even more splendid within, with gold and silver lace, or rather passementerie (real lace in the modern sense did not exist), with buttons of precious material mounted in gold, with embroidery and the use of pearls and precious stones in the embroidery itself. The dress of women had changed less from the mediæval type; it was not irrational in shape and make.

The greatest extravagances of dress came in with the last years of the sixteenth century. Those were the days of excessive stuffing, or *bombasting*, as it was called afterward. The trunk-hose were stuffed out so enormously that it was with great difficulty that the sword could be worn. And this was followed by the stuffing of the doublet into that extraordinary shape which is perpetuated for us in the protruding abdomen of Punch. The Louvre portrait of Henry II. shows the funnel-shaped termination of the body of the doublet reaching far below the waist. The habit of using thick stuffing of this sort had been gained in warfare, for very much of the armor of the time was made up of garments *gambisés* or bombasted; thus the hugest trunk-hose known to us are shown in engravings of the time as a part of the war dress of 1563, and the gambeson for the body in many forms had been worn for at least three centuries. At this time, about 1580, starch was introduced, and was immediately put to use in stiffening the neck-ruff, which, beginning with a diameter of perhaps a foot, soon attained a breadth equal to that of the shoulders, and was worn by both sexes for forty years together. While the men wore the bombasted doublet, the women pinched their waists as much as nature could bear; a surgical work of the time describes the effects of this with the ribs forced to overlap one another; and these slender waists were prolonged downward by the immensely long and pointed stomacher, from which the skirt puffed out behind and at the hips to a circumference of 10 feet or more, which size it retained to the floor. A court lady of the reign of Henry III. of France should be contrasted with a Greek lady of 390 B. C., as seen in the bas-reliefs of the time, for a full understanding of the natural and the sophisticated in matters of costume.

From A. D. 1600 to the time of the French Revolution whimsical extravagance of taste governed fashionable dress, a pretense at simplicity in the dress of one sex being accompanied by wild vagaries in that of the other, and followed by equally strange ones of its own. It is difficult for us to realize the fantastic unreason of the outfit of a *mousquetaire* of Louis XIII.; or to conceive how the simple head-dress with curls which we associate with Madame de Sevigné could be followed by the "tower" of lace on the head of a lady of 1690, and that by the structure of gauze, lace, flowers, and feathers which, combined with the puffed and cushioned hair, rose above the head of a lady of Marie Antoinette's court. The only parallel to these is in the gown of the same lady, 18 feet in circumference at the floor, very nearly as great at the hips, decorated with festoons and bouquets in a way which can not be described here, or else in the men's wigs of an earlier epoch.

With 1750 the waistcoat and coat had been evolved from the doublet and cloak, the waistcoat having still the long flaps which were left from the skirts of the doublet. Knee-breeches and long stockings were the nearly unchanged hose of the Middle Ages. Pantaloons followed knee-breeches, and were worn for a very short time; they fitted the leg snugly, and were buttoned or tied at the ankle. Trousers followed these; the flaps of the waistcoat disappeared, and the costumes of the past were all merged into the uniformity of the last eight decades. What costumes still remain in existence are to be found where modern progress toward uniformity and modern disregard of individuality of design and of style have not penetrated. Women indeed retain the taste for novelty and for brilliancy of attire, but have lost the power of regulating it; costume has been lost in fashion. For bibliography, see DRESS. RUSSELL STURGIS.

Cosway, RICHARD, R. A.: English miniature-painter; b. in 1740. He studied in London under Hudson, and in 1771 became a member of the Royal Academy. He painted figure-pieces in oil, but devoted himself chiefly to the production of miniatures which have become almost classical in his school. D. July 4, 1821.

Cot, kōt, PIERRE AUGUSTE: figure and portrait painter; b. in Bédarieux, Hérault, France, Feb. 17, 1838; pupil of Léon Cogniet, Cabanel, and Bouguereau. His pictures are attractive in composition, but not of extraordinary technical merit. *Mireille* (1882) is in the Luxembourg Gallery, Paris. D. in Paris, Aug. 18, 1883. W. A. C.

Cotabanamá, or **Cotubanamá**: Indian cacique of Higuey, the eastern province of Haiti, at the time of the conquest. He is described as of great stature and immense strength. In 1502 some of his tribe attacked a Spanish boat and massacred the crew in revenge for injuries which they had received. The governor, Ovando, sent Juan de Esquivel to punish them. Cotabanamá resisted, was subdued, and for a time was on friendly terms with the whites; but when he was required to cultivate land for the Spaniards and carry the produce to San Domingo he again rebelled (1504). Esquivel again defeated him, and he took refuge in a cave on the island of Saona. He was soon discovered, taken to San Domingo, and hanged by order of Ovando (1504). HERBERT H. SMITH.

Côte-d'Or, kōt'dōr' (i. e. region of gold, named in allusion to the wealth of its vineyards): department in the eastern part of France, formed of a portion of the old province of Burgundy. Area, 3,383 sq. miles. The surface is diversified by hills and valleys, and partly traversed by a chain of low mountains called Côte-d'Or. It is drained by the rivers Seine, Aube, and Saône. Among its minerals are coal, iron, marble, and gypsum. A large part of this department is covered with forests. The soil is mostly fertile, producing 18,500,000 gal. of wine annually. Here are raised

the celebrated Burgundy wines. Capital, Dijon. Pop. (1891) 376,866; (1896) 368,168.

Cotelerius, Jean Baptiste: scholar; b. in Nîmes in Dec., 1627. He studied theology and philosophy in Paris, but declined ordination. In 1649 he became a lay member of the Sorbonne; in 1654 counselor of the Archbishop of Embrun; in 1659 returned to Paris; was in 1667 appointed assistant librarian in the royal library, and earned great literary reputation by his edition of the apostolic fathers (Barnabas, Clement, Hermas, Ignatius, and Polycarp, Paris, 1672, 2 vols.). Most of the copies of the original edition were destroyed by a conflagration, but new editions appeared in 1698 and 1724. In 1676 he became Professor of Greek in the Royal College at Paris. D. in Paris, Aug. 12, 1686.

Cotes, Roger: English clergyman; b. in Burbage, July 10, 1682; fellow of Trinity College, Cambridge. He became Plumian Professor of Astronomy in 1706, and published the second edition of Newton's *Principia*, with a learned preface (1713). He wrote *Harmonia Mensurarum* (1722). D. June 5, 1716. Newton had so high an opinion of his abilities that he exclaimed, "Had Cotes lived, we might have known something."

Côtes-du-Nord, kōt'dü'nōr' (i. e. northern coasts): maritime department of France; formed of part of the old province of Bretagne. It is bounded on the N. by the English Channel, on the E. by Ille-et-Vilaine, on the S. by Morbihan, and on the W. by Finistère. Area, 2,659 sq. miles. The surface is partly mountainous; the soil is mostly fertile. Many horses and cattle are reared here. Large quantities of grain and linen goods are exported. Among the minerals are iron, lead, and granite. Capital, St.-Brieuc. Pop. (1891) 618,652; (1896) 616,074.

Cotgrave, Randle: lexicographer; b. in Cheshire, England; admitted as scholar at St. John's College, Cambridge, Nov. 10, 1587; later became secretary to William Cecil, Lord Burghley; published in 1611 an excellent French-English dictionary, of which there appeared in 1632 a second edition, together with Robert Sherwood's English-French dictionary; and in 1650, 1660, and 1673 editions revised and enlarged by James Howell. The work is of great value to philology. The year of Cotgrave's death is given as 1634 in Cooper's *Memorials of Cambridge*. C. H. T.

Cöthen: See Köthen.

Co-tidal Lines: a system of lines drawn upon a map, terrestrial globe, or chart, to illustrate the course of the tidal wave. Each of these lines passes through the places which have high water at the same hour, thus tracing the crest of the wave, and enabling the eye to follow its course with all the modifications that it experiences in each ocean. See Tides, Ocean, and Gulf Stream.

Cotin'ga: any one of several South American birds of brilliant plumage, belonging to the family *Cotingidæ*. The best known is *Cotinga cayana*, a bird a little smaller than the North American robin; of a brilliant azure blue with a purple throat. Other notable members of the family are the Bell-bird and Umbrella-bird (*qq. v.*). F. A. L.

Cotocachi, kō-tō-kaăt'-chee: a mountain of Ecuador; in the western Cordillera, about 60 miles N. of Quito. It is of volcanic formation, but no crater has been found on its summit, nor are there records of eruption. The lake, Cui-cocha, at its southeastern base occupies an old crater of explosion, and shows two cones rising from the water. The sides of Cotocachi are steep and broken by deep fissures, said to be the result of earthquakes. These and the icy summit make the ascent extremely difficult. Whymper, who reached the top in the year 1879, found it 16,453 feet high.

Herbert H. Smith.

Cotopax'i: a volcano of Ecuador; in the eastern Cordillera of the Andes; 40 miles S. of the equator and about the same distance S. S. E. of Quito. It is the highest active volcano in the world, recent and very careful observations by Whymper giving 19,614 feet above the sea, or 10,000 feet above the valley of Quito; of this about 4,600 feet is covered with snow. The form is almost perfectly conical. The eruption of 1534, ascribed to this mountain, was probably from Pichincha, but there have been many recorded outbreaks since 1742; some of them have sent out clouds of ashes which darkened the air for many miles around and fell on ships far out at sea; in others it is said that flames shot up several thousand feet. During the eruption of 1803 Humboldt heard the explosions at Guayaquil, 135 miles distant. In 1877 an outburst of cinders was followed by a deluge of water, mud, and stones, which in a single day reached the sea, over 200 miles distant. The top of Cotopaxi was first reached by Dr. W. Reiss in 1872; Whymper spent a night on the brink of the crater, which is 1,300 feet deep. See Whymper, *The Great Andes of the Equator*; Orton, *The Andes and the Amazon*. Herbert H. Smith.

Cotswold Hills: a range of oölitic limestone hills running through Gloucestershire, England, parallel to the Avon and Severn. They are 54 miles long and average 600 feet high, Cleeve Hill, the highest point, having an altitude of 1,134 feet.

Cotta, Bernhard, von: German geologist; b. in Kleinen-Zillah, in the Thüringerwald, Oct. 24, 1808. His father was director of the academy at Tharand, and he was from early youth made familiar with natural history, especially mineralogy and geology. He afterward studied in the mining-school at Freiberg and at Heidelberg, and was in 1842 appointed professor in the former place. Among his important works are a geognostic map of Saxony in twelve sections, published conjointly with Naumann; *Geognostische Wanderungen* (2 vols., 1836–38); *Anleitung zum Studium der Geognosie und Geologie* (3d ed. 1849); *Geologische Bilder* (4th ed. 1861); *Deutschlands Boden* (2d ed. 1858); *Geologie der Gegenwart* (3d ed. 1871). D. at Freiberg, Sept. 14, 1879.

Cotta, Johann Friedrich, Baron von Cottendorf: publisher; b. in Stuttgart, Apr. 27, 1764; conceived at Tübingen in 1794, with Schiller, the plan of the *Allgemeine Zeitung*, an able daily journal, afterward published at Augsburg and now at Munich. He was a friend and liberal patron of Goethe and Schiller, whose works he published. He established a steam press at Augsburg in 1824. He was for many years a member of the Würtemberg Diet, and in 1824 was elected vice-president of the second chamber. D. Dec. 29, 1832. See *Briefwechsel zwischen Schiller und Cotta* (Stuttgart, 1876). Revised by Julius Goebel.

Cotta, L. Aurelius: Roman senator; became prætor in 70 B. C. He was consul for the third time in the year 65, and co-operated with Cicero against Catiline in 63 B. C. He was an adherent of Cæsar in the civil war which began in 49 B. C.

Cottabus: a game of skill often spoken of by Greek writers (Anacreon, Æschylus, Euripides, Antiphanes, Aristophanes) and depicted on Greek vases. It consisted in throwing a portion of wine left in the drinking-cup in such a way that it passed through the air without its bulk being broken and fell with a certain noise into another drinking-cup. The performance of this feat required no small amount of dexterity, as the thrower was expected to retain the recumbent position usual while eating and drinking, and excellence in the game was admired as much as excellence in throwing the javelin. The excitement of the game was often still further increased by bets and by the ominous character ascribed to it.

Cottage City: originally a noted camp-meeting ground and now a popular watering-place (incorporated in 1879); on the northeast shore of Martha's Vineyard, Dukes co., Mass. (for location of county, see map of Massachusetts, ref. 6–J); 22 miles S. E. of New Bedford, 60 miles from Boston. Pop. (1880) 672; (1890) 1,080; (1900) 1,100.

Editor of "Martha's Vineyard Herald."

Cottar: See Crofters.

Cott'bus, or **Kottbus**: a town of Prussia; in Brandenburg; on the river Spree; 67 miles S. S. E. of Berlin, with which it is connected by a railway (see map of German Empire, ref. 4–G). It is inclosed by walls, and has a royal palace and a gymnasium; also manufactures of woolen cloths, linen goods, hosiery, tobacco, etc. Pop. (1890) 34,909.

Cottereau, Jean: See Chouans.

Cot'tidæ [from Cottus (*q. v.*), the typical genus + the patronymic ending idæ]: a family of spiny-rayed fishes characterized by the bony cheeks, short first dorsal, and more or less spiny head. It contains the "miller's thumb," sea-bullhead, sculpin, fatherlasher, and other fishes, most of which are of rather repulsive appearance. The species are very numerous, and are confined to the rivers and seas of the north. They are not much valued as food.

Revised by F. A. Lucas.

Cotting, John Ruggles, M. D., LL. D.: Congregational minister; b. in Acton, Mass., in 1787; educated at Amherst,

Dartmouth, and Cambridge. Dr. Cotting acquired reputation by his publications in chemistry and geology, and by an agricultural survey in Georgia. He was the author of an *Introduction to Chemistry* (1822) and a *Synopsis of Lectures on Geology* (1825). He held professorships in Amherst College and at Pittsfield Medical School. D. Oct. 13, 1867, near Milledgeville, Ga., where he had spent the last thirty years of his life. Revised by GEORGE P. FISHER.

Cotton: a soft, downy fiber which surrounds the seeds in the capsules or bolls of plants of the genus *Gossypium* and order *Malvaceæ*. The species are numerous, but only three are important, viz.: *Gossypium herbaceum*, or *Gossypium album*, called also short-staple upland, woolly-seeded, and green-seeded. This is the species generally cultivated. Varieties of it have been multiplied by selection and by special cultivation, and by hybridizing with *Gossypium barbadense* or *G. nigrum*, known also as sea-island, long staple, or black-seeded cotton. The cultivation of the latter is confined principally to soils bathed in a salt atmosphere. It reaches its highest perfection along the coast of South Carolina, Georgia, Florida, and in Egypt. Both these species are annuals. *Gossypium arboreum*, or tree-cotton, a perennial species, grows in South America and Africa. It is inferior to the annuals both in yield and quality of fiber. All the species of the cotton-plant originated in the tropics, a fact which the cultivator must constantly bear in mind. Like the sunflower, it turns its leaves to the morning and evening sun. Though a tropical plant, it is most successfully cultivated in the temperate zone. The climatic conditions favorable to its best development are six months' exemption from frost, a well-distributed, moderate rainfall during the period of growth, with little rain and abundant sunshine while maturing. These are best supplied in the southern tier of the North American States, which have no competitor except Egypt in the quantity or quality of fiber produced.

Cotton-plant.

While the cotton-plant is cultivated chiefly for the fiber, which grows upon the seed, the seed itself has become commercially valuable, and the fiber from the inner bark, little inferior to and resembling that of jute, also has possibilities of commercial importance.

The flower of *G. barbadense* is of a rich cream color; that of *G. herbaceum* a pure white when first open, changing to red the second day. The flower is bisexual and produces a capsule known as the "boll," which reaches maturity in six to seven weeks, when the surface contracting exposes the lint-covered seed ready for picking. This is done almost entirely by hand. A "harvester" recently invented attained partial success in 1891, a dry autumn. This gathers leaves, bolls, and small stems, from which the lint is afterward separated by machinery made for the purpose. Originally, the cotton-gin was an apparatus in which the cotton was passed between two rollers revolving in opposite directions. This, the "roller-gin," is still used for ginning sea-island or black-seeded cotton, which is quite easily freed from its seeds. But green-seeded, upland, or short-staple cotton, the species most generally grown, can not be ginned by such simple means. The lint of the woolly seeded varieties is separated from the seed by means of the saw-gin, invented in 1793 by Eli Whitney, a native of Massachusetts. This consists essentially of a cylinder composed of fifty to eighty steel disks, the edges of which are sharply serrated. These saws *cut* the lint from the seed while revolving with great velocity. The lint is taken from the saw-teeth by another cylinder called the "brush," and conveyed to the "condenser." The lint is then packed into bales weighing 450 to 500 lb. each. Formerly the bales weighed only 300 lb., and were long and round and packed by hand, as wool and the sea-island cotton are still packed. Sea-island cotton is separated from the seed, to which it adheres but feebly, by the roller-gin, which pulls rather than cuts the lint from the seed. In this species the lint separates readily and entirely from the seeds, leaving them sleek and black. A part of the lint adheres to the seed of the upland cotton. These are reginned, before extracting the oil, and yield about 35 lb. of short lint to the ton of seed. This is used for wadding, batting, and other purposes for which inferior grades of cotton are used. The seed is then decorticated, the hulls constituting by weight one-half of the seed; the meats, or kernels, are then steamed, sacked, and the oil expressed, yielding 30 to 35 gal. of crude oil to the ton of seed. The cake is dried and ground, yielding about 700 lb. of meal per ton of seed.

The refined oil is used in a great many ways, such as in the manufacture of substitutes for butter and standard lard; for oiling machinery, dressing morocco, mixing with other oils for the preparation of paints, and after a voyage to Europe returns as fancy brands of "olive" oil. See COTTONSEED OIL.

The meal is extensively employed as a source of nitrogen in the preparation of commercial fertilizers. It is also used directly as a fertilizer, and for feeding stock. Large quantities are shipped to the Northern U. S. and to Europe as food for cattle. The meal and hulls are fed to cattle without other provender with satisfactory results, both as regards "economy" and as regards the production of flesh and fat.

The cotton-plant is subject to the attack of injurious insects and fungi. The larva of *Aletia*, the cotton caterpillar, is no longer dreaded as formerly, since the means of destroying this pest with "Paris-green" is within the reach of the most humble planter. Means of destroying the "boll-worm," which is very destructive in some seasons, by puncturing the young bolls or capsules, have not yet been devised. No satisfactory preventives of the attack of several very destructive fungi have been discovered.

The experiments conducted at the experiment stations in the cotton States have materially improved the methods of cultivation and contributed to economy in fertilization.

The introduction of commercial fertilizers has extended the area of profitable cotton-culture about 50 miles farther north than formerly, in consequence of their effects in hastening the maturity of the plant. Their use has also improved the quality of the lint, by giving it greater length and strength, and by hastening maturity has enabled the planter to harvest the crop at less cost and in better condition.

The early history both of the culture and the manufacture of cotton is obscure. It seems to be generally admitted that India took the initiative in both, and attained a skill in the latter which was never equaled elsewhere previous to the invention of machinery for its manufacture. Early in the sixteenth century—about 1521—the cotton-plant was cultivated for its flowers in Talbot co., Md. Small patches were grown in Virginia and adjacent States prior to and after the war of the Revolution, the lint being picked from the seed by hand, the thread spun, and the cloth for domestic use woven on the farms.

The saw-gin, even in its earliest history, had a capacity equal to that of 3,000 pairs of hands in separating the lint from the seed.

The Southern U. S., British India, Egypt, and Brazil produce practically the cotton-supply of the world. India ranks next to the U. S. in quantity produced, but in quality of lint her product is inferior. Not only are the soil and

climatic conditions of the Southern U. S. superior to those in any other part of the globe, but the plant has received more intelligent cultivation there than elsewhere. The yield in these States ranges from one-fourth of a bale of 500 lb. to two bales per acre. To produce two bales would require a yield of 3,000 lb. of seed-cotton, one-third of which would be lint—1,000 lb. of lint and 2,000 lb. of seed.

If the lint only is removed from the land, cotton is the least exhausting of the crops cultivated in the U. S. An average crop removes in the lint only 2·75 lb. of nitrogen, phosphoric acid, potash, lime, and magnesia per acre, while a crop of 10 bush. of wheat per acre removes 32·36 lb. of the same elements of plant-food. See COTTON MANUFACTURES.

J. S. NEWMAN.

Cotton, CHARLES: English poet; b. Apr. 28, 1630. His poems were chiefly parodies and humorous pieces, and include travesties of Vergil and Lucian, and a local description —*The Wonders of the Peak* (1681). He translated Montaigne's essays, and contributed a treatise on trout-fishing to the *Complete Angler* of Izaak Walton. D. in 1687.

H. A. B.

Cotton, JOHN: Puritan minister; b. at Derby, England, Dec. 4, 1585; educated at Cambridge; preached over twenty years at Boston in England, but, incurring Laud's displeasure, fled to Massachusetts in 1633; was pastor of the First church in Boston (organized in 1630), and acquired such influence that he was called the patriarch of New England. He opposed Anne Hutchinson and Roger Williams. He wrote nearly fifty books, all of which were published in London. D. Dec. 23, 1652.

Cotton, Sir ROBERT BRUCE: English antiquary; b. in Denton, Huntingdonshire, Jan. 22, 1571; educated at Westminster School and at Jesus College, Cambridge (B. A. 1585); formed valuable collections of books, manuscripts, coins, etc.; was knighted 1603; created baronet 1611. D. May 6, 1631. The Cottonian library was bestowed on the nation by his great-grandson, Sir John; was first removed to Ashburnham House, Westminster, in 1730, and, after suffering from fire in 1731, was finally placed in the British Museum in 1753.

Cotton-gin: a machine for freeing cotton from its seeds, which adhere to the fiber with considerable tenacity. See COTTON and COTTON MANUFACTURES.

Cotton Manufactures: textile fabrics composed of cotton and the processes by which they are produced. The fiber of the cotton-plant is well adapted for the production of yarn or thread, and thus for employment in the fabrication of woven cloth. Each fiber if left to itself acquires a twist which adds to its tensile strength; and it is by twisting many fibers of cotton around one another that the strength necessary to its usefulness as the material of a textile fabric is imparted to it. The spinning of cotton yarn and the manufacture of coarse cotton cloth have been practiced in many parts of the world from a period of remote antiquity. The arts were established in Egypt, India, and China centuries before the Christian era. They are found to be practiced by some tribes of Central Africa who have only lately been brought in contact with modern civilization. They were known to the nations of Mexico, Yucatan, and Peru long before the Spanish conquests in the sixteenth century. But the application of machinery to the preparation, the spinning, and the weaving of cotton dates back little more than a hundred years. In the homes of its origin the manufacture has remained to a certain extent what it has always been—a handicraft in which human labor availed itself of none but the rudest implements. The enterprise of modern commerce carries the cheap product of modern machinery to ever more remote corners of the earth, and will soon render extinct the hand-spun and clumsily woven cloth of the native. The development of the cotton manufacture began with the last process in the making of cloth, and the cycle of fundamental improvements was completed by the invention of a device for removing the seed from the raw material as it comes from the field. The fly-shuttle was invented about 1750. By means of this improvement the efficiency of the hand-loom was much increased. About ten years later James Hargreaves, an illiterate Lancashire weaver, made an invention for the carding of cotton, which was quickly improved by another unknown inventor, and thus the principle of the carding-machine of to-day was introduced. In 1767 Hargreaves invented the spinning jenny, by which he was enabled to produce eight threads at once. In this machine we find partially developed the principles which are fully exemplified in the mule. Richard Arkwright patented in 1769 a spinning frame, or "throstle," called at first a "water-frame," the chief and most useful novelty in which was a device for spinning with rollers. The "roving," or slightly twisted material, passing between two pairs of rollers, the forward pair revolving at a much higher speed than those behind, draw out the roving, and make it finer and more regular before it receives the final twist which converts it into yarn. Arkwright adopted in this machine the principle now known as the flyer, by which the yarn is twisted and wound upon the bobbin at the same time. Samuel Crompton in 1779 combined the ideas of Hargreaves and Arkwright in the mule jenny. In 1785 Dr. Edward Cartwright, a clergyman, invented the power-loom. Two things remained to render possible the gigantic expansion of the cotton industry which this century has witnessed —a quick and inexpensive method of separating the fiber from the seed, which up to that time had been a slow and laborious process, and a new mechanical force to drive machinery at a high speed. The cotton-gin of Eli Whitney supplied the first, and the steam-engine the second, taking them in the order here mentioned; but the first steam-engine set up in a cotton-mill, in 1785, antedated by seven years the great invention which made possible the production on a large scale of cotton in a condition fit for manufacture. The progress made in machinery during the nineteenth century has been rapid, and has resulted both in an enormous saving of labor and in a most wonderful increase in the product resulting from a given expenditure of power. For example, the speed of the spindles used on Arkwright's "water-frame," so called because it was usually driven by water-power, was but 3,000 or 4,000 turns a minute, whereas the speed of a modern spindle is fully 9,000 turns. In no other industry does the keenness of competition require so extensive and so frequent changes of machinery to keep a factory up to the requirements of the times. Improvements are made constantly, and old machinery must be replaced with new long before it has worn out. The chief processes in spinning are directed to the following objects: (*a*) opening and cleaning; (*b*) laying the fibers straight and parallel; (*c*) making the continuous bundle of fibers which is to form the yarn exactly even in size and strength; (*d*) drawing the "sliver"—the bundle of fibers just mentioned—down to the required size, when it is known as roving; (*e*) giving the roving the necessary twist and winding it upon the bobbin. The first machine is the opener, or picker. Loose cotton from the bale is fed into this machine evenly, and is subjected to the action of a beater. This machine separates dust and other impurities from the cotton, which is delivered at the end of the machine in a uniform layer, called a lap. A lapping-machine comes next. It is fed with three laps at once, and the three layers are drawn out to the thickness of one. The object is to neutralize the irregularities of each lap by averaging them with the irregularities of two others. It may be remarked that this principle of doubling and drawing for the purpose of reducing irregularities is followed at every step of the process down to the spindle. After the lapping-machine the cotton goes to the card, by which the fibers are first laid exactly parallel to each other, in a thin, gauzy film, upon teeth covering a cylinder, and then stripped off by a vibrating comb, and drawn together in what may be called a flat, untwisted rope. The strands are next doubled and drawn in a drawing frame. In the manufacture of sewing cotton, however, and in the production of fine yarns for weaving, there is an intermediate process, the combing, by which the short staple is removed; and in the manufacture of all fine yarns the "sliver," as the product of the carding and combing machines is called, passes several times through the drawing frame. There are next three machines, known as the "slubbing frame," the "intermediate frame," and the "roving frame," through each of which the sliver passes, being in each drawn out and slightly twisted. It has now become "roving," a soft, light twisted cord, and it passes to the last process, the spinning. The improvements in spinning during recent years have been numerous and important. The superiority of the modern automatic mule over the flyer frame for spinning fine yarns was so great that it superseded frame-spinning to a large extent, particularly in England, where a large part of the yarn produced is yarn of high counts, which is ultimately to be loaded with "sizing," and thus increased in weight but not in strength. But the invention of the "ring frame," in which the work formerly done by the "flyer" is performed by passing the yarn through a bit of curved wire, known as a "traveler,"

which moves around the spindle on a ring, has revolutionized spinning. The spindle itself has been meanwhile greatly improved. Inasmuch as the production of yarn is substantially in proportion to the speed of the spindle, it follows that the new spindles are much more economical as well as more efficient. For the modern spindles make 9,000 turns a minute—as against a maximum of 7,500 turns only so lately as 1870—and they run so much more easily that the same power moves 25 per cent. more of them at the higher speed than of the old ring spindles at the lower speed. All the fundamental improvements of the ring frame and of the ring spindle are of U. S. origin, and the reintroduction of frame-spinning has made much greater progress in the U. S. than it has elsewhere. By far the largest part of the yarn spun is woven into plain cotton cloth; but considerable amounts are sold for use as warps in woolen and worsted goods, or for knitting into underwear; and a large part of the produce of sea-island cotton, after being spun into yarn, is converted, by doubling and twisting, into sewing thread. In the U. S. the whole manufacture, from raw cotton to woven cloth, or to sewing thread, and sometimes from raw cotton and wool to the condition of woven mixed textiles, is ordinarily carried on by one and the same establishment. In Great Britain and on the continent of Europe spinning and weaving are almost universally separated. See Loom and Weaving.

Cotton manufacture has its chief seat in Great Britain. In 1787 the total importation of raw cotton into Great Britain was 22,800,000 lb. In 1890 the amount consumed in the mills of the United Kingdom was 1,656,000,000 lb., and the value of cotton goods exported reached the enormous amount of £74,400,000. Of late years the expansion of the cotton industry on the continent of Europe and in India has been much more rapid than it has been in Great Britain. The number of spindles in operation in 1875 and in 1890 is shown by the following:

COUNTRIES.	1875.	1890.
Great Britain	39,000,000	43,750,000
Continent of Europe	19,440,000	24,575,000
India	1,100,000	3,270,000
United States	9,500,000	14,188,103

The first successful cotton-factory in the U. S. was that of Samuel Slater, established at Pawtucket, R. I., in 1790. For many years the progress was slow. In 1810 the whole consumption of cotton in the country was no more than 10,000 bales. The consumption reached 90,000 bales in 1815, the war of 1812 having cut off foreign manufactures and compelled the production of goods at home. Under the stimulus of favoring legislation the increase was rapid. But the greatest development has been in the last half of the nineteenth century. The total value of all products of the cotton manufacture, according to the census, beginning with 1840, has been as follows:

1840	$46,350,453	1870	$177,489,739
1850	61,869,184	1880	210,950,383
1860	115,137,926	1890	267,981,724

Inasmuch as this increase in gross value has been accompanied by a steady and a very great reduction in the average price of yarns and cloth, the actual growth of the industry has been vastly larger than is indicated by the figures above given. The magnitude of the manufacture is fully exhibited by the following facts obtained by the census of 1890:

Number of spindles	14,188,103
Number of looms	324,866
Bales of cotton consumed	2,228,347
Pounds of cotton consumed	1,193,584,641
Square yards of woven goods produced	3,002,761,037
Total value of product	$267,981,724
Capital employed in the industry	$354,020,843

NUMBER OF PERSONS EMPLOYED AND AMOUNT OF WAGES PAID.

Men	88,837	Wages	$33,797,517
Women	106,607	"	29,165,086
Children	23,432	"	3,061,935
Officers and clerks	2,709	"	3,464,734
Total	221,585	Total	$69,489,272

The chief seat of cotton manufacturing in the U. S. is New England, which according to the census of 1890 contained 76 per cent. of all the spindles in the country—a ratio which has remained nearly constant during the whole history of the manufacture. Among the States of New England, Massachusetts is very far in the lead. In 1890 it had 41 per cent. of all the spindles in the U. S. The greatest concentration of the manufacture is in the city of Fall River, Mass. The two adjoining counties of Bristol, in Massachusetts (in which Fall River is situated), and Providence, in Rhode Island, contain 30 per cent. of all the spindles in the U. S. The decade from 1880 to 1890 witnessed an extraordinary growth of the cotton manufacture in the Southern States, particularly in North Carolina, South Carolina, and Georgia. The number of spindles in the Southern States increased threefold during the ten years.

Edward Stanwood.

Cottonseed Oil: an oil obtained from the cotton-plant, *Gossypium barbadense*, *herbaceum*, and allied species. The bolls of the plant contain cotton fiber and seed in the proportion of 1 of fiber to 2½ or 3 parts by weight of seed. The average percentage of oil is put at 15 to 20, while 25 per cent. is regarded as high.

Although the cotton-plant has been cultivated for over a thousand years, no use has been made of its products, except the cotton-fiber, until comparatively recently. It has been found that the fiber of the plant-stalk can be made into a coarse bagging, that the root is susceptible of use in dyeing and pharmacy, and that the seeds will yield as a principal product the oil, besides several valuable by-products. In 1861 it was asserted by Mr. Edward Atkinson that the cotton-plant would be a valuable plant for cultivation, even if it produced no cotton. In the preparation of the oil two difficulties presented themselves; the "lint," or short fiber surrounding the seed, retained much of the oil when the seed was crushed and pressed, and the oil, after expression, had a strong color. In 1785 the Society for Encouragement of Arts and Commerce offered a prize for the manufacture of cottonseed oil on a commercial scale. At the British Exhibition of 1851, Burn, of Edinburgh, and De Géminy, of Marseilles, exhibited specimens of cottonseed oil and cake, for which prizes were awarded. In 1852 cottonseed oil was exported from Egypt to France. The first attempts in the U. S. to extract the oil as a merchantable product were made at Natchez, Miss., in 1834, but both those experiments and others made in 1847 at New Orleans, La., were unsuccessful. In 1855 the decorticating machine of L. Klapp was introduced, by which the hulls were separated from the kernels; and since that time the industry has grown rapidly.

Manufacture of Cottonseed Oil.—The "lint" is usually removed by one or more additional ginnings. The clean seed is passed through a hulling or decorticating machine. The kernels are then crushed between iron rollers, when they are ready for pressing. Hydraulic pressure is used, the intensity being 250 to 500 lb. per square inch. Fifteen to 20 per cent. of "crude" cottonseed oil is thus obtained. This product is thick and turbid, has a deep brown-red color, and deposits a slimy sediment on standing. The oil is refined by agitation with dilute alkaline lye (containing 3 to 4 per cent. of potash or soda), heating, and allowing it to stand, when the lye, carrying the impurities, settles to the bottom, constituting what is known as "cotton-oil soap stock," while the clear golden-yellow oil is drawn off from the top. In some cases this treatment is repeated, a lye still more dilute being used. Processes involving heating with milk of lime or with oil of vitriol, either alone or with bichromate of potash, or simply steaming, have also been used in clarifying the oil, while some have recommended or used bleaching-powder or nitric acid and chlorate of potash to improve the color of the oil. By these processes of refining the oil loses about 10 to 15 per cent. of its weight.

The grades of oil found in U. S. markets are crude oil, summer yellow and summer white oil, winter yellow and winter white oil. By cooling the summer oils to the freezing-point the palmitin (called by the manufacturers "stearin") crystallizes out, and the oil separated by pressing the solidified material constitutes the "winter oils."

Properties.—Cottonseed oil (Mod. Lat. *Oleum gossypii*, Fr. *huile de coton*, Germ. *Baumwollensamenöl*, *Baumwollensaatöl*) consists chiefly of palmitin and olein. It contains about 1·85 per cent. of a non-saponifiable hydrocarbon. The winter oils consist almost entirely of olein. The elementary composition is given as—

Carbon	76·4 per cent.
Hydrogen	11·4 "
Oxygen	12·2 "
Specific gravity at 60° F.	0·922 to 0·930 "

It solidifies at about 32° F. or a little above. The removal of the palmitin in the preparation of the winter oils slightly

reduces the gravity and materially lowers the solidifying point. The refined oil is almost odorless and has a slight nutty flavor. The fluidity of the crude oil is 28 to 30 times less than that of water; of the refined oil, about 17 times less (Adriani). The oil is insoluble in alcohol, but very soluble in ether, chloroform, etc. With nitric acid and copper-turnings (elaïdin test) the oil assumes a reddish or brownish yellow color, and, after standing for some time (twelve to twenty-four hours), becomes very thick and viscid. With strong sulphuric acid a dark-colored mixture forms, which, after heating, is soluble in water. With potash or soda lye the oil does not readily or rapidly saponify, but after saponification the mass assumes a bluish tint on exposure to the air. By treating the saponified mass with sulphuric acid a blue-black compound may be obtained, which can be used as a dye, "cottonseed blue" ($C_{17}H_{24}O_4$). Nitrate of silver is but slightly reduced by the oil. Heated with chloride of zinc it turns brown.

Cottonseed oil stands midway between the drying and the non-drying oils. By some it is classified with the one; by others with the other. It has some drying properties, but in this respect is far inferior to linseed oil.

Uses.—Cottonseed oil is used as an adulterant or as a substitute for various oils, such as linseed, sperm, lard, olive, and almond oil, etc. It is extensively used in cooking as a substitute for butter or lard in the U. S. and it appears to be growing in favor. It also finds application in treating leather, in dressing wool, and as a lubricator and an illuminant, as well as in soap-making. Its use in pharmacy has been strongly recommended (Weatherby). It has been stated that nine-tenths of all of the "salad oil" consumed in the U. S. consists of cottonseed oil. In 1881–82 the Italian Government put a high import duty upon cottonseed oil, evidently with the intention of thereby preventing the adulteration of olive oil. It is, however, asserted that this action of the Government has failed of its purpose, since the adulteration is still practiced, oils from other seeds and from nuts being used. Some division of opinion exists as to the advantages derivable from an admixture of cottonseed oil with linseed in paints. Some assert that it affords a more elastic coat, which will not crack; others, that the drying properties are very feeble, and that it is admissible only in the inferior grades of paints and varnishes.

By-products in the manufacture of cottonseed oil:

One hundred lb. of cotton seed will afford—

Lint and hulls	40 to 46 lb.
Cottonseed cake	37 to 38 "
Crude oil	14 to 16 "

Next to the oil, the cake is the most important product. Frequent examinations have been made of the cake, with a view to its utilization. The percentage composition has been found to be about as follows:

COMPONENT PARTS.	From whole seed.	From hulled seed.
Moisture	12	9
Albuminoids	21	43
Oil	7	15
Crude fiber	23	4
Other organic constituents	29	22
Mineral matter (ash)	8	7
Totals	100	100

Phosphoric acid constitutes about one-third of the mineral matter present. The composition is somewhat variable, depending on the quality of seed used, the perfection of the machinery used in extracting the oil, etc.; so that for nearly all the constituents the variation may be 2 to 3 per cent. above or below the figures here given. In Marseilles the cake is extracted with bisulphide of carbon, the oil thus obtained affording, when saponified, a greenish soap which is highly prized. A large proportion of the cottonseed cake produced is, however, used as fodder for cattle, while a not inconsiderable proportion is used as a fertilizer. Experiments with the ground cake ("cottonseed meal") as a packing for the axle-boxes of railway cars, etc., have proved it to be an efficient and economical substitute for cotton-waste saturated with oil for such purposes.

As a fodder, it has been found that 74 per cent. of the albuminoids, 91 per cent. of the fat and oil, and 46 per cent. of the non-nitrogenous material are digestible. Cows fed with the meal show an improvement in the quantity and quality of their milk, while the beef from such cattle is excellent in quality. The droppings from stock fed with it constitute a valuable manure. It is, however, claimed that the effect of feeding pregnant cows with cottonseed meal is to produce miscarriage or abortion.

With regard to the other by-products of the cotton-seed oil manufacture, the lint is used in the manufacture of paper of excellent quality; the hulls are used for fuel, or are ground in with the meal for fodder (some stock-raisers prefer a fair proportion of hulls in the feed for their stock); the residues from the clarifying of the oil ("cotton-oil soap stock"), palmitin, etc., are used in the manufacture of soap.

The average yield of seed is 2 lb. to each pound of lint or merchantable cotton. In the U. S. in 1893, 1,100,000 tons of cottonseed were crushed by the cottonseed-oil mills, yielding 45,000,000 gal. of crude cottonseed-oil, of which 11,131,560 gal. were exported. In 1900, 46,902,390 gal. were exported, valued at $14, 127,538.

Assuming that the average total production of American cotton for several years past was 8,000,000 bales, of 475 lb. each, this would indicate a total annual yield of 7,600,000,000 lb., or 3,800,000 tons of seed. About one-fourth of these would be required for planting seed, leaving 2,850,000 tons for other purposes. This surplus amount of seed would divide into valuable products as follows:

Crude oil, gallons	116,850,000 =	$23,370,000
Cake, in tons	997,500 =	19,950,000
"Linters," in tons	35,625 =	2,137,500
Hulls, in tons	1,102,500 =	5,512,500
Total values		$50,970,000

These figures represent the value of the surplus cottonseed—a product hardly considered of commercial importance until within the last quarter of a century.

Revised by IRA REMSEN.

Cotton States and International Exposition: See EXPOSITION, COTTON STATES, etc., in the Appendix to Vol. IV.

Cot'tonwood-tree: the *Populus monilifera*, a species of poplar which grows on the margins of streams of the Western U. S. to the height of 80 to 100 feet or more. The timber is soft and not very valuable. Several other Western species of *Populus* are commonly called cottonwood.

Cotton-worm: the caterpillar of an owlet moth, *Aletia xylina* (Say); in some years very destructive to the cotton crop of the U. S. and of Central and South America. It is an inch and a half long, green, with light-yellow stripes and black dots along the back; has sixteen legs, and is a semi-looper. It hatches in from one to two weeks from eggs deposited on the under side of the leaf of the cotton-plant. The moth is of buff color, and about an inch long.

Cot'tus [from Gr. κόττος, a kind of fish]: a genus of fresh-water fishes of the family *Cottidæ*, containing the "miller's thumb," blob, or bullhead, numerous species of which abound in the cold rivers of northern regions. They lie on the bottom among rocks, darting suddenly when frightened or in pursuit of prey, and are very destructive to the eggs of trout.

Cotyle'don [from Gr. κοτυληδών, cup-shaped hollow, from κοτύλη, anything hollow]: the first leaf of a little plant as it emerges from the seed. The first formed leaves are simpler and cruder structures than those which follow, and the early botanists, who, ignorant of their nature, did not regard them as leaves, gave them this special name, which is still retained. In some plants even the first leaves are alternate upon the stem, so that there is a single leaf at the beginning, or as we say there is but one cotyledon, and the plant is monocotyledonous; in other cases the earlier leaves are in pairs, and the plant is dicotyledonous.

It happens that these distinctions are accompanied by others which are more profound, and hence we have two

A, young bean with its two cotyledons (*c*); B, young squash with its two cotyledons (*c*); C, oat grain germinating, the single cotyledon at *c*; D, a monocotyledonous embryo with very large cotyledon (*c*); E, same in section.

groups of the higher flowering plants bearing the names Monocotyledons and Dicotyledons (*qq. v.*).

Charles E. Bessey.

Couch, Darius Nash: U. S. military officer; b. July 23, 1822, in Putnam co., N. Y.; graduated at West Point in 1846; served in the war with Mexico 1847–48; and in Florida hostilities 1849–50; resigned Apr. 30, 1855; entered the civil war as colonel of the Seventh Massachusetts Volunteers; and July 4, 1862, became major-general U. S. volunteers: in command of the department of the Susquehanna 1863–64, engaged in defense of Chambersburg, which was evacuated; and in command of a division of the Twenty-third Corps 1864–65, engaged in the battle of Nashville, and operations in North Carolina. Resigned May 26, 1865, from volunteer service. He was the Democratic candidate for Governor of Massachusetts in 1865; U. S. collector for port of Boston 1866–67; quartermaster-general of Connecticut 1877–78, and adjutant-general 1883–84. D. Feb. 12, 1897.

Couchant [pres. ptc. of Fr. *coucher*, lay down, lie down < O. Fr. *colchier*: Ital. *collocare* < Lat. *colloca're*]: in heraldry, lying down, with head raised; distinguished from *dormant*, where the head is down.

Coudert, Frederick R.: See the Appendix.

Cou'dersport: borough; capital of Potter co., Pa. (for location of county, see map of Pennsylvania, ref. 2–E); on Coudersport and Port All. R. R., 17 miles from Port Allegheny; has a tannery, a foundry, several mills, a public library, and graded schools. Pop. (1890) 1,530; (1900) 3,217.

Coues, Elliott, M. D.: naturalist; b. in Portsmouth, N. H., Sept. 9, 1842; graduated from Columbian University, Washington, D. C., in 1861, and subsequently received the degrees of A. M., M. D., and Ph. D. (honorary) from the same institution. He entered the U. S. army as a medical cadet in 1862; from 1863–81 was assistant surgeon, and during that period was brevcted captain for services during the civil war. In 1866 he was post-surgeon at Columbia, S. C.; in 1869 became Professor of Zoölogy and Comparative Anatomy at Norwich University, Vt.; from 1873–76 was surgeon and naturalist to the U. S. northern boundary commission, serving also in 1875 as collaborator at the Smithsonian Institution: from 1877–83 Professor of Anatomy in the medical department of Columbian University; appointed Professor of Biology in the Virginia Agricultural and Mechanical College; is now connected with the Smithsonian Institution. His publications on scientific subjects, especially in the departments of ornithology and mammalogy, are very numerous, and include *Key to North American Birds* (Boston, 1872); *New Key to North American Birds* (1884; 3d ed. 1892); *Field Ornithology* (Salem, 1874); *Birds of the Northwest* (Boston, 1874); *Fur-bearing Animals* (1877); *Monographs of North American Rodentia*, with J. A. Allen (Washington, 1877); *Birds of the Colorado Valley* (1878); *Ornithological Bibliography* (1878–80); *New England Bird Life*, with R. E. C. Stearns (1881); *Check-list and Dictionary of North American Birds* (Boston, 1882); *Air-Fauna Columbiana*, with D. W. Prentiss (1883); *Our Native Birds* (1885). Among other works are *Biogen, a Speculation on the Origin and Nature of Life* (Boston, 1884); *The Dæmon of Darwin* (1884); *A Woman in the Case*, an address (Washington, 1887). Dr. Coues was associate editor of *The American Naturalist*, *The Auk*, and other periodicals, and editor of the departments of general zoölogy, biology, and comparative anatomy of the *Century Dictionary*. He was a member of many scientific societies in the U. S. and Europe, and was one of the founders of the American Ornithologists' Union. He was actively interested in the theosophist movement in the U. S., and was president of the American board of control of the Theosophical Society of India. D. in Baltimore, Dec. 25, 1899.

Cougar: See Puma.

Cough: a sudden inspiration, followed by closure of the glottis, and a sudden expiration, causing a strong current of air to sweep through the air-passages and out of the mouth. Cough may be due to irritation of foreign particles or gases, or of diseased secretions in the larynx, trachea, or bronchi, and tends to remove these. The act is more or less reflex and involuntary, and may become excessive if the mucous surfaces are abnormally sensitive, or if the general nervous system of the patient be excitable. Disease of the bronchial tubes—bronchitis—is the most frequent cause, and in many other diseased conditions of the lungs the associated bronchitis is the real cause of the cough. Certain diseases quite distant from the lungs, however, may cause this symptom, especially in children, as inflammations in the nose, with swelling of its mucous membrane, enlargements of the tonsils and irritation elsewhere in the pharynx, and occasionally abdominal diseases. A persistent cough is always regarded with dread, and may indeed be the only symptom of consumption for long periods of time. Of especial significance is persistent slight cough in one of pronounced phthisical habit or hereditary tendency.

The *treatment* of cough varies largely with the cause. It is by no means necessary in every case to attempt to reduce its severity, since in many the act is conservative in tending to remove an irritant. When, however, the secretions are dry and tenacious, the cough is apt to become excessive without accomplishing any result in the way of removal of the irritant. In such cases mucilaginous drinks and sedatives, especially opium, do much good by reducing the cough. For the rest the treatment is directed entirely to the general disease and condition. Febrifuges for fever, expectorants, such as ammonium chloride, ipecac, and squill, to loosen the secretions and hasten their discharge, and tonics to increase the general strength, may all come into play.

William Pepper.

Coulomb, koo'lōn': in electricity, the practical unit of quantity. It is the quantity of electricity transferred per second by one ampère. The coulomb is $\frac{1}{10}$ of the absolute (C. G. S.) unit of quantity. It is named after Charles Augustine Coulomb (*q. v.*).

Coulomb, Charles Augustine: engineer and savant; b. in Angoulême, France, June 14, 1736. Coulomb was lieutenant of the corps of engineers, in which capacity he served for several years in the West Indies. He was a member of the French Academy and inspector-general of the university. He published many memoirs in the *Transactions of the Paris Academy of Sciences*. His most im-

portant works were in the domain of electricity and magnetism. D. in Paris, Aug. 23, 1806. See TORSION BALANCE.
E. L. NICHOLS.

Coulter, JOHN MERLE, Ph. D., LL. D.: American botanist; b. in Ningpo, China, Nov. 20, 1851; educated in Hanover College, Indiana, and Harvard University; botanist to Hayden Survey 1872–73; Professor of Natural Sciences, Hanover College 1874–79: Professor of Biology, Wabash College 1879–91; president Indiana State University 1891–93. His principal publications are *Synopsis of the Flora of Colorado*, with Thomas C. Porter (1874); *Manual of Rocky Mountain Botany* (1885); *Handbook of Plant Dissection*, with J. C. Arthur and C. R. Barnes (1886); *Manual of Texan Botany* (1892–93); and revisions of the families *Hypericaceæ*, *Umbelliferæ*, *Cornaceæ*, and *Cactaceæ*. Editor of *Botanical Gazette* (1875—). CHARLES E. BESSEY.

Council Bluffs: city; capital of Pottawattamie co., Ia. (for location of county, see map of Iowa, ref. 6–D); an important railway center, and the metropolis of Western Iowa. The city is built principally upon a plain at the base of the high bluffs where the councils of the Indian tribes were held, but not a few of the finest residences are to be found in the numerous "glens" which intersect the bluffs in every direction. The city is connected with Omaha by two iron railway and wagon bridges almost a mile in length, over which electric street cars and regular passenger and freight trains pass. Among the public buildings worthy of mention are the institution for the deaf and dumb, a large court-house, a U. S. post-office, and imposing school buildings. An electric railway connects the eastern, western, and southern extremes of Council Bluffs. Owing to its superior shipping facilities, it has become an important manufacturing center, and one of the chief distributing points for farming implements in the U. S. It is the center of a large fruit and gardening industry, and also has a large trade in horses. Steam-engines in large numbers, milling and mining machinery, planing-mills, agricultural implements of all kinds, cigars, cigar-boxes, and brooms are made here. In 1890 there were 128 establishments, and the value of products was $2,527,388. There are 1 daily and 2 weekly newspapers. Pop. (1880) 18,063; (1890) 21,474; (1900) 25,802.
EDITOR OF "NONPAREIL."

Council Grove: city; capital of Morris co., Kan. (for location of county, see map of Kansas, ref. 6–H); on Mo. Pac. and M., K. and T. R. Rs., on end of division of Mo. Pac., and both sides of the Neosho river; 25 miles from Emporia, in one of the most fertile valleys of the State. It was named by Kit Carson from the grove where councils for protection against the Indians were held, and is one of the oldest towns in the State. It has 7 churches and 6 schools; ships large quantities of grain, cattle, and hogs, and manufactures lime. Pop. (1880) 1,042; (1890), 2,211; (1900) 2,265.
EDITOR OF "REPUBLICAN."

Councilman, WILLIAM THOMAS, M. D.: b. Jan. 2, 1854, in Pikesville, Md.; educated at St. John's College and University of Maryland; assistant professor in Johns Hopkins University; at present (1901) Professor of Pathological Anatomy in Harvard Medical School. Author of *A Contribution to the Study of Inflammation* (1879); *Ueber fibrose Tuberkel* (1881); *Zur Ætiologie der Eiterung* (1883); *Neuere Untersuchungen über Lavaran's Organismus der Malaria* (1887); *On the Ætiology of Malaria* (1884); *On Arterio Sclerosis* (1890); *Syphilis of the Lungs* (1890); *Amœbic Dysentery* (together with D. H. A. Lafleur); articles on tumors in Buck's *Reference Handbook* (1886).

Councils, Œcumenical [from Gr. *οἰκουμένη* (*γῆ*), i. e. the habitable (world); because the whole Christian world is, in theory, assembled], otherwise called **General**, or **Universal, Councils**: certain great ecclesiastical assemblies, so called in distinction from diocesan, provincial, and national councils, which are more limited meetings of the same kind. The Greek and Latin Churches acknowledge seven councils—viz: (1) the first Council of Nice, 325 A. D.; (2) the first of Constantinople, 381 A. D.; (3) the first of Ephesus, 431 A. D.; (4) that of Chalcedon, 451 A. D.; (5) the second of Constantinople, 553 A. D.; (6) the third of Constantinople, 681 A. D.; (7) the second of Nicc, 787 A. D. To these the Roman Catholics add the following: (8) the fourth of Constantinople, 869 A. D.; (9) the first of Lateran, 1123; (10) the second of Lateran, 1139; (11) the third of Lateran, 1179; (12) the fourth of Lateran, 1215; (13) the first of Lyons, 1245: (14) the second of Lyons, 1274; (15) that of Vienne, in France, 1311; (16) that of Constance, 1414–18 (in part); (17) that of Basel, 1431–38; (18) the fifth Lateran, 1512–17; (19) that of Trent, 1545–63; and (20) that of the Vatican, 1869–70. The most important of these are noticed under their alphabetical heads. The great collection of documents upon these councils is that of G. D. Mansi, Florence and Venice, 1759–98, 31 vols.; the great history is by C. J. Hefele, Freiburg, 1855–90, 9 vols. (down to Trent).

Council of Seville, or **Casa de Contratación**: a board originally established in 1503 at Seville for the purpose of dispatching fleets to the Spanish colonies, of receiving vessels from the colonies, attending to the customs taxes and the royal treasure, and disposing of the results of trade or exploration. It also had authority to grant licenses for private exploration and traffic. Bishop Fonseca was at first at the head of it, and like the council of the Indies it may be said to have had its germs in the board of 1493, appointed to assist Columbus. Later the Casa de Contratación was subject to the council of the Indies, attending to its commercial business, and especially charged to maintain a strict monopoly of trade with the Indies for Spanish merchants.
HERBERT H. SMITH.

Council of the Indies: a Spanish tribunal; created by King Ferdinand in 1511 for the regulation of colonial affairs. When Columbus was preparing for his second voyage, in 1493, Juan Rodriguez de Fonseca was appointed to assist him, and to arrange any matters concerning the new discoveries. This man, afterward known as Bishop Fonseca, came to have great power in American affairs, and he was assisted by others, forming a kind of colonial board. Eventually it was merged into the council of the Indies. As its powers were enlarged by Charles V., this became a body of immense importance. "Its jurisdiction," says Bancroft, "extended to every department, civil, ecclesiastical, and commercial, with particular attention to the welfare of the Indians, and with the existing laws of Spain for guidance in framing *cedulas*, which together with royal decrees formed the laws for America. . . . By it viceroys and governors were made and unmade, also patriarchs and bishops, and even the pope had to submit for approval his bulls and briefs concerning the Indies." It was, besides, the supreme judicial court of Spanish America and the East Indies. The audiences were appointed by it, and appeals from them lay only to the council itself, and all the laws and ordinances of viceroys and governors were submitted to it for approval. It was subject only to the sovereign, who conferred with his ministers and with the council of Castile. The position of councilor of the Indies was a coveted distinction, and was frequently given to those who had served as viceroys.
HERBERT H. SMITH.

Council of War: a conference of military or naval officers, called by the commander-in-chief to advise him in relation to some important business or movement. The commandant of a garrison often solicits the opinion of a council of war before surrendering to the enemy. But in the end the military code leaves these matters to the discretion of the commander.

Counselor, or **Counsel**: in law, a person retained by a client to plead his case in a court of justice, or for legal advice or assistance. In Great Britain this term is applied specifically to those who have been admitted to plead to the bar (also called barristers and advocates), as distinguished from attorneys at law and solicitors. A counselor in Great Britain can maintain no action for his fees, the amount of which is optional with his client; all fees are expected to be paid when the briefs are delivered. He is not, however, liable to an action for negligence or lack of reasonable skill in his profession, as in the U. S. It is customary for a counselor to take instructions only through a solicitor; this is only a rule of etiquette and not a matter of law. See ATTORNEY, BARRISTER, and SOLICITOR. F. STURGES ALLEN.

Count [from O. Fr. *comte*: Ital. *conte* < Lat. *comes*, *comitis*, companion. In Germ. *Graf*]: a nobleman of an order of nobility inferior to dukes and marquises, but superior to viscounts and barons. Counts had anciently territorial jurisdiction, but at present they are simply noblemen having this hereditary title. The use of the word *comes* in this sense dates from the reign of the Roman emperor Augustus, who conferred it upon the senators who immediately surrounded him, and was afterward commonly applied to their companions by other Roman emperors. It was used in Spain about 650 A. D., and for a long period seems to have been of

equal dignity with that of duke, no distinction being made till 1297. In the British empire the title of earl is always used instead of count.

COUNTS-PALATINE were originally "officers of the imperial palace" in Germany, who possessed high judicial functions. The term was afterward applied to feudatories who had palatine jurisdiction (see PALATINE) over outlying territories, where they maintained a palace and the other machinery of a court. The term came still later to be applied as a title of honor by several princes, but is now obsolete.

Counterfeit [from O. Fr. *contrefait* < Lat. *contra*, opposite + *factus*, made]: that which is made in imitation of something else without legal authority and with a fraudulent intent, applied chiefly to spurious coin or bank-notes, or other factitious currency. The uttering of such coins or notes is a felony punishable by imprisonment, or even by death in some countries. To guard against counterfeiting, bank-notes are engraved with designs which can not be reproduced except at great expense. There are also secret marks and combinations of letters and figures known only to the proper authorities. A peculiar ink and paper are used, the manufacture or unlawful possession of which is made a criminal offense. Pamphlets called "detectors" are printed with lists and descriptions of counterfeit notes and coins. See FORGERY. Revised by F. STURGES ALLEN.

Counterfort (Fr. *contrefort*): in architecture, a buttress or pier built against or at right angles to a wall, to strengthen it and enable it to resist a particular thrust. In fortification a mass of stone or brickwork added to the revetment of a rampart in such a way as to form a buttress.

Counter-guard: an outwork designed to defend the two faces of a bastion or ravelin from a direct fire, so as to retard a breach being made. The counter-guard consists of two lines of rampart parallel to the faces of the bastion or ravelin, and separated from them by a narrow ditch.

Counter-irritants: a group of substances which are used for the purpose of producing local inflammation, generally upon the external surface of the body, in order that they may influence deep-seated inflammation or congestion. The *rationale* of their action consists in the reflex influence which may be exercised on central organs when irritation is applied to the surface of the body, causing contraction of congested or hyperæmic vessels in internal organs. Counter-irritants may be divided into several classes, namely: rubefacients, or substances which produce reddening of the skin, which exercise a fleeting influence; epispastics, which are so severe in their irritating powers as to produce blisters; and caustics, which actually destroy the tissues with which they come in contact, so that the irritation produced by them lasts for a very considerable period of time. The mild counter-irritant or rubefacient is the one which should be applied in cases where the congestion or inflammation of the internal organ is not marked, and where it is likely to last for a short time. The other measures are to be employed when the diseased condition is severe and where continued action is required. Thus no one would apply a caustic in the case of pain in the abdomen due to inflammation produced by eating bad food.

In the application of counter-irritants, they should never be applied to the area which is actually inflamed, but at some distance away from this area. Thus in cases of inflammation in the knee-joint the plaster should not be applied over the joint where the skin is reddened, but upon the healthy skin, either above or below the joint. It has also been learned by practical experience that where we desire to influence the eye by counter-irritation, the counter-irritant should be placed back of the ear or on the temple. Among the class of mild counter-irritants or rubefacients may be considered mustard, red pepper, and the spice plaster. The chief of the epispastics is cantharides, and of the caustics, which are at the present time very rarely used, caustic potash, caustic soda, and acid nitrate of mercury. H. A. HARE.

Counter-mark: in numismatics, a stamp often seen on ancient coins or medals; generally a figure or inscription. Some antiquaries suppose this mark was struck on money taken from an enemy.

Counterpart: a correspondent part, a copy, a duplicate. In law, when the parts of an indenture are interchangeably executed by the several parties, that part which is executed by the grantor is termed the *original*, and the others are *counterparts*. A counterpart is primary evidence against the party executing it. Revised by F. STURGES ALLEN.

Counterpoint (Fr. *contrepoint*: Ital. *contrapunto*): the art of writing music in several distinct parts. The name is derived from the circumstance of the notes being placed one against or over the other in the score. See MUSIC.

Counterpoise [Fr. *contrepoids*, i. e. that which "weighs against" something else]: a weight sufficient to balance another in the opposite scale; equal force or weight acting in opposition to something. In mechanics, a mass of metal connected with an instrument or machine, either for the purpose of giving steadiness or diminishing the pressure on some particular point.

Counter-proof: a print taken from print which has been taken from an engraved plate, and which is still fresh; the ink not yet dry. As this counter-proof is reversed from the first proof and corresponds with the engraving on the metal, it is a useful guide in retouching the latter.

Counterscarp: in fortification, the side of the ditch opposite the scarp. A *revetted* counterscarp is constituted usually by a wall of masonry called a counterscarp-wall; an *unrevetted* counterscarp is of earth at its natural slope.

Countersign: a watchword given daily by the commander of an army, in order that friends may be distinguished from enemies by their knowledge of it. Sentinels require every person who approaches their posts by night to give the countersign.

COUNTERSIGN is also the signature of a public officer or secretary to the charter of a king, or to any writing signed by the principal or superior, as a certificate that the charter or instrument is authentic.

County (Fr. *comté*): originally the territory of a count or earl. In modern usage it denotes a division of a state or kingdom. In England or Scotland the term is equivalent to shire. The term shire in England is not applied to those counties which were originally distinct sovereignties, such as Kent, Essex, Norfolk, Cumberland, and Sussex. Lancaster, Chester, and Durham are called counties palatine. (See PALATINE.) The primary divisions of the provinces of Ireland are called counties. Each State of the U. S., except Louisiana, is divided into counties, each of which contains a capital or county-town, in which the court-house is located. In Louisiana the divisions are called parishes, but are similar to counties.

Coup d'état, koo'dā'taa' [Fr., lit., a stroke of state]: a violent and illegal exercise of power on the part of a government for the purpose of establishing, increasing, or retaining authority. A *coup d'état* differs from a revolution in this important respect, that, whereas a revolution has for its purpose the overthrow or modification of the methods of a regularly organized and recognized government, a *coup d'état*, on the other hand, aims at a firmer establishment or increase of the authority already established. A revolution is the result of political action taken by large numbers of men for a common but often a somewhat indefinite purpose; while a *coup d'état* is the work of a single man who has a definite end in view, and who strikes quickly for the accomplishment of his purpose. Revolution is often protracted; but a *coup d'état* invariably results in immediate success or failure. Some of the most remarkable instances of violence of this kind are the following: In the early history of Rome during the conspiracy against the elder Tarquinius, Servius Tullius appealed to the plebeians and succeeded in getting himself named king by the assembly of the curies. At a later period the Gracchi, who had come to have so great influence with the popular party as to threaten the legally constituted authorities, were assailed and put to death by direction of the government. Of a similar nature was the death of Julius Cæsar at the hands of the republican leaders. Cicero caused the coadjutors of Catiline to be put to death without the form of a trial. The bloody proscriptions of Sylla were a gross violation of legal forms; and the fall of Sejanus was also accomplished by illegal means of the same kind. In modern times the massacre of St. Bartholomew in 1572 was a celebrated instance. Though several good illustrations of this method of accomplishing political ends occurred in the reigns of Louis XIII. and Louis XIV., it was not till the Revolution of 1789 that *coups d'état* became a common method of accomplishing desired results. It was in this way that the Montagnards overthrew the Girondists, and the Thermidorians in turn proscribed the Montagnards. Robespierre, after having put to death Hébert and Danton, was himself sacrificed by the *coup d'état* of the 9th Thermidor. The Directory, which succeeded in proscribing two of its

own members and fifty-three deputies on the 18th Fructidor, was itself overthrown by means of a violent *coup d'état* on the 18th Brumaire under the direction of Bonaparte. Still more celebrated was the *coup d'état* of Louis Napoleon, by which, on Dec. 2, 1851, he renounced the title of president and assumed the title and powers of an emperor. At about the same period numerous examples of this method of perpetuating power occurred in Germany. During the revolution of 1848 many of the German sovereigns promised charters to their people as the price of submission. As soon as peace was restored, these promises were repudiated. Whenever the representatives of the people clamored for a charter the rulers dissolved the diets. The year 1849 was marked by numerous instances of the *coup d'état* in Germany and Italy. In European countries since the middle of the century they have been common only in Spain. The history of South America and of Mexico has been disfigured by *coups d'état* too numerous to mention.

C. K. Adams.

Couple of Forces (commonly called simply a "couple"): a combination of forces which tends to make a body rotate about some axis, without moving or exerting any pressure upon the axis. It is equivalent to two equal and parallel forces acting in opposite directions, but not in the same straight line. For example, if a body is acted on at one point by a force toward the north, and at another point by a force toward the south, the two points not being in the line of the forces, a tendency to rotation is produced around a vertical axis. The properties of couples were first investigated by Poinsot, who introduced the term. See Composition of Forces.

S. Newcomb.

Courbet, koor'bā'. Gustave: genre, landscape, and portrait painter: b. at Ornans, Doubs, France, June 10, 1819; pupil of David d'Angers. He received medals at the Salons of 1849, 1857, and 1861. Since his death his pictures have greatly increased in value, and he is now considered one of the most important figures in modern art. He first attracted attention by his exhibition at the Salons of 1849 of his pictures *After Dinner at Ornans* and *Burial at Ornans*. But at the Salon of 1851, where he exhibited *The Stonebreakers*, he gave the signal, so to speak, for a battle with then existing traditions in art that has been fought by artists ever since. In *The Stonebreakers* and other works by Courbet, painted in succeeding years, there is a direct hardy process of painting from nature without choosing or elimination, centering the interest in the work solely on effect of light and air. *The Stonebreakers* was more or less of a tentative work, and afterward in such pictures as *The Haunt of the Deer* and the portrait called *The Man with the Leather Belt*, both of which are in the Louvre, he showed his extraordinary power as a realistic painter. The *Haunt of the Deer* is his most complete and satisfactory work in many respects, and nothing could be more frankly and hardily painted than this nook in the forest with the deer nibbling at the foliage and reposing, half hidden by the ferns on the banks of a shallow brook that bubbles among the rocks. It is strikingly like nature itself, and is a real *tour de force* in technique. Some of Courbet's works are in the U. S.; among others, *Woman with a Parrot*, *The Quarry*, *Young Women of the Seine*, and *Doe Run Down in the Snow*, in the Boston Museum of Fine Arts. Courbet was a prominent communist, and it was by his order that the Vendôme Column in Paris was pulled down in 1871. He was sentenced after the Government forces entered the city to six months' imprisonment and to pay for the cost of re-erecting it. He left Paris after his release and passed the rest of his life in Switzerland. D. at Vevay, Jan. 1, 1878. William A. Coffin.

Courbevoie, koor'be-vwăă': a town of France; department of Seine; on the left bank of the river Seine; 1½ miles N. W. of the fortifications of Paris (see map of France, ref. 3–F). It is well built and has large barracks and a carriage-factory. Pop. (1896) 20,105.

Courg: a province of British India. See Curg.

Courier [from Fr. *courir*, run]: literally, a runner, a messenger or bearer of dispatches, usually on public business. According to Xenophon, couriers were first employed by Cyrus the Great. Herodotus speaks of the Persian *cassids* or foot-messengers, who traveled with great rapidity. They were stationed, one man and one horse, for each day's journey; and by these messengers Xerxes sent the news of his defeat to Persia (480 B. C.). Gibbon bears testimony to the rapidity with which communication was carried on in the Roman empire by the regular institution of posts. The Mexican couriers, according to Prescott, traveled with incredible swiftness. The Peruvian *chasquis* or runners carried dispatches at the rate of 150 miles a day.

Courier, or **Courier de Méré**, koo'ri-ā'de-mā'rā', Paul Louis: French scholar and writer; b. in Paris, Jan. 4, 1772. He entered the army in 1792, and served with distinction. In 1809 he resigned his commission. He translated several Greek classics into French, and produced a good edition and version of Longus (1810). He was liberal in politics, and acquired a high reputation as a political writer. Among his writings, which display wit, eloquence, masculine sense, and genial attire, is the *Pamphlet des Pamphlets* (1824). The most complete collection of his writings is *Mémoires, correspondance et opuscules* (1828). He was assassinated on his estate in Touraine Apr. 10, 1825.

Cour'lan: either of two large, rail-like birds of the genus *Aramus*; intermediate between the rails and cranes. Externally they resemble rails, structurally the cranes. *Aramus scolopaceus* is from Eastern South America; *Aramus pictus*, the limpkin or crying bird, from the West Indies, Central America, and Florida. It is about 2 feet long, chocolate brown, with a slight gloss, paler on the throat and head, and marked with numerous streaks of white. The bill near the tip is slightly bent to one side, an almost unique feature.

F. A. Lucas.

Cour'land, or **Kurland**: a Baltic province; incorporated with Russia by the third partition of Poland in 1795. It is bounded on the N. by the Gulf of Riga and on the W. by the Baltic, and lies between lat. 56° and 58° N. and lon. 21° and 27° E. Area, 10,535 sq. miles. The chief river is the Duna, which flows along the northeastern border. The soil is in some parts very fertile, but there are many forests, lakes, and swamps. The greater part is occupied by Germans. Courland was originally an independent duchy, but in 1561 acknowledged the feudal sovereignty of Poland and later that of Russia. Capital, Mitau. Pop. (1897) 672,539.

Court [from O. Fr. *cort* (Mod. Fr. *cour*): Ital. *corte* < Lat. *cōrs* (*cohors*), *cōr'tis*, court-yard]: originally an inclosure or yard; the residence of a sovereign; a royal or princely household. In England and some other countries the term usually denotes the family and attendants of the sovereign, regarded in a public capacity. Also a judicial tribunal, whether composed of one or more judges; sometimes the hall or room in which judges sit and try causes. The term "court circle" is applied in Great Britain to the nobles, bishops, ministers of state, and other persons who are in the habit of approaching the sovereign and of associating with the other members of the royal family. See Courts.

Court, koor, Antoine: French Protestant preacher; b. at Villeneuve de Berg, in the department of Ardèche, May 17, 1696; began his activity as a traveling preacher under great dangers in 1714; formed congregations in Languedoc, Dauphiné, Provence; organized the first synod of the "Church of the Desert" (1715), and retired in 1729 to Lausanne, where he founded a school for the education of Reformed ministers. D. at Lausanne, June 15, 1760. See his life in Hughes's *Histoire de la restauration du protestantisme en France* (Paris, 1872).

Courtat, koor'taa', Louis: figure-painter; b. in Paris, Sept. 6, 1847. Pupil of Cabanel; first-class medal, Salon, 1875. His *Leda*, a finely painted nude female figure, beautiful in color and firmly modeled, is in the Luxembourg Gallery, Paris. Studio in Paris.

W. A. C.

Court de Gébelin, koor'de-zhā'blăñ', Antoine: scholar and author; b. at Nîmes in 1725; son of Antoine Court (*q. v.*). He devoted much attention to mythology and the affinity of languages. Among his works is *The Primitive World Analyzed and Compared with the Modern* (9 vols., 1773–84). He assisted Benjamin Franklin in editing a periodical entitled *The Affairs of England and America* (15 vols., Paris, 1776, *et seq.*). D. in Paris, May 10, 1784.

Courtenay, kŭrt'ni, Edward Henry, LL. D.: military officer and educator; b. in 1803 in Maryland; graduated at West Point in 1821. He served, while lieutenant of engineers, as assistant professor at the Military Academy 1821–24; in construction of Fort Adams, R. I., 1824–26; as assistant to chief engineer 1826–28: and as acting Professor of Natural and Experimental Philosophy at the Military Academy 1828–29; appointed full professor Feb. 16, 1829, on the resignation of his lieutenancy, and with great credit to the Military Academy and profit to his pupils held the chair of

Philosophy till Dec. 31, 1834, when he accepted the professorship of Mathematics in the University of Pennsylvania, continuing in it till 1836; civil engineer New York and Erie R. R. 1836–37; at Fort Independence, Mass., 1837–41; and construction of dry-dock, Brooklyn Navy-yard, 1841–42. He resumed his former vocation, for which he was admirably fitted, as Professor of Mathematics in the University of Virginia 1842–53; translator and editor of Boucharlat's *Mechanics* (1833), and was author of a *Treatise on Differential and Integral Calculus, and Calculus of Variations*. D. at Charlottesville, Va., Dec. 21, 1853.

Courtesy (or **Curtesy**) **of England**: the tenure by which, at common law, a man upon the death of his wife holds a life estate in the lands or tenements of which she was seized in possession in fee simple or in tail during the marriage where they have had lawful issue, born alive, and capable of inheriting the estate. This tenure exists in England, and also in its original or in a modified form in many States of the U. S. An estate by courtesy is a freehold estate for life. See ESTATES. F. STURGES ALLEN.
