Courtesy Titles: titles assumed by individuals, given by custom, but to which they have no legal claim. Such titles are common in countries where there are different orders of nobility, in which cases it is customary to give to the sons and daughters of a peer having several titles one of his inferior titles. A courtesy title has no effect upon the legal status of the person to whom it is given, and does not raise him above the rank of the commoner. For example, the eldest son of the Duke of Bedford has the title of Marquis of Tavistock, and the eldest son of the Duke of Buccleuch has the title of Earl of Dalkeith. The younger sons of dukes and marquises take the title of "lord." The daughters of dukes, marquises, and earls have the courtesy title of "lady." A woman marrying a person with a title inferior to hers, or with no title, retains her own title as a courtesy title. In Scotland the eldest son of a viscount or baron has the title of "master." F. STURGES ALLEN.

Court Martial: in the army, navy, and marines, a tribunal for the examination and punishment of offenders against martial law or against good order and military or naval discipline. The subjects of courts martial are usually officers or men in actual service, but when martial law prevails courts martial sometimes punish offenses committed by persons not in the service.

Courts martial are called "general," "garrison," and "regimental." Summary and informal courts held in the field are sometimes called "drumhead courts martial." The officers of military and naval courts are a president, a JUDGE-ADVOCATE (*q. v.*), and a clerk, all commissioned officers. The sentences passed by these courts are usually subject to the approval of department commanders or other high officers, or even to that of the President of the U. S. See S. V. Benét on *United States Military Law* (1862); Clode, *Military and Martial Law* (1872); Simmons, *On the Constitution and Practice of Courts-martial* (1878).

Courtney, LEONARD HENRY, M. P., P. C.: British statesman; b. at Penzance, July 6, 1832; educated there and at St. John's College, Cambridge (B. A. as second wrangler and first Smith's prizeman 1855); elected fellow at St. John's 1856; called to the bar 1858; Professor of Political Economy at University College, London, 1872–75. Returned to Parliament from Liskeard in 1876, he became Under Secretary of State for the Home Department in Dec., 1880; for the Colonies in Aug., 1881; Financial Secretary to the Treasury in May, 1882; privy councilor 1889. He is an advocate of proportional representation and a more extended system of local government; has contributed to the *Times*, *Fortnightly Review*, *Nineteenth Century*, and *International Review*; and is author of a pamphlet on *Direct Taxation* (1860), and a paper on the *Finances of the United States 1861–67* in the *Journal of the Statistical Society* (1868).
C. H. THURBER.

Court of Private Land Claims: a court of the U. S., consisting of a chief justice and four associate justices (to be appointed by the President by and with the advice and consent of the Senate), three of whom constitute a quorum. It has jurisdiction over claims by any person or corporation to lands within limits of the territory derived by the U. S. from the republic of Mexico, by virtue of any such Spanish or Mexican grant, concession, warrant, or survey, as the U. S. are bound to recognize and confirm by virtue of the treaties of session. Cases are instituted by a petition, and the effect of a confirmation of title has no further effect than to release all claim of title by the U. S. An appeal lies for either party to the Supreme Court. F. STURGES ALLEN.

Courtois, koor'twäă', GUSTAVE: figure and portrait painter; b. in Pusey, Haute-Saône, France, 1852; pupil of Gérôme. *Bayadere* (1882) is a single figure of a young woman in gauzy black drapery that contains the cleverest possible painting, but his work in general falls short of a high level on account of a somewhat flippant air that is given by what can only be termed false cleverness. His *Dante and Vergil in Hell* (1880) is a powerful conception, and seriously painted. First-class medal, Paris Exposition, 1889; Legion of Honor 1889. Studio in Paris. W. A. C.

Courtrai, or **Courtray** (anc. *Cortoriacum*: Flem. *Kortryk*): a town of Belgium; on the river Lys; 26 miles S. W. of Ghent (see map of Holland and Belgium, ref. 10–B). It is well built and clean, has a castle, a fine old bridge, a noble town-hall, and a beautiful Gothic church founded in 1238. Here are manufactures of damasks and other linen fabrics, hosiery, lace, paper, cotton goods, soap, etc. This place was taken in 880 A. D. by the Normans, who fortified it. In July, 1302, the Flemings here defeated the French in the famous "Battle of the Spurs," so called from the great number of spurs taken from the fallen knights. Pop. (1896) 32,517.

Courts (in law): public tribunals established for the administration of justice and the interpretation and enforcement of the law. The protection of private rights, the punishment of criminal offenses, the regulation of conflicting interests of individuals and states, the exposition and application of legislative enactments, and, in some nations, even of constitutional provisions, are the various important functions which are generally deputed to such judicial organizations. It can not be said, however, that all tribunals which have been designated courts in various countries and at different epochs have enjoyed all these prerogatives, or have exercised them so exclusively as is understood to be the appropriate province of courts at the present day among civilized communities. In a primitive form of society the powers of the judiciary are usually much restricted, and subjected, to a greater or less degree, to executive and legislative interference. This remark applies also to despotic governments, even though a high degree of civilization be attained, as the history of France and Germany bears ample witness. In modern times, however, it has been recognized as a necessity to confer upon the courts the powers above enumerated, and to render their independence of the other departments of government as complete as possible. They are generally composed of distinct bodies of officials holding their positions during stated terms, and are under no supervisory control for decisions rendered or other legal acts performed but that of superior or appellate organizations of a similar nature. In the exercise of their powers courts do not attempt to ferret out and redress every evil and form of injustice that may exist within society, and determine the law of their own motion by the direct establishment of legal principles, but are confined to the decision of controverted questions presented to them by injured parties, and thus evolve the law indirectly and mediately. Criminal cases are presented by the government, while those of a civil nature are brought either by states or individuals affected therein, at their own option.

But while there is a general agreement among civilized nations at the present day in regard to the objects to be attained by the creation of courts, the modes by which the same results are sought are notably and strikingly diverse. The courts upon the continent of Europe and in Scotland administer a system of jurisprudence derived from the civil or Roman law, while in England and the U. S. they apply a system which they themselves have originated, called, by way of distinction, the "common law." In the latter the rule of precedent holds sway, in accordance with which principles determined in previous decisions are, in general, to be deemed authoritative in subsequent causes involving similar circumstances. In this system, moreover, the mode of trial by jury was developed as a safeguard against oppressive action by the courts, and has been sedulously maintained as far as its application is reasonably practicable. The judge does not examine witnesses nor decide any questions but points of law, so that every inducement may be removed which would lead him to act as advocate instead of arbiter, and awaken his personal interest in the cause.

A broad distinction is also drawn between actions which are termed legal and suits which are called equitable, the latter dispensing with a jury, administering a more adequate relief in many instances, and in various ways supplementing the deficiencies of the proceedings applicable to the former. In the European courts, on the other hand, which proceed upon the doctrines of the civil law, the force of precedent is not recognized as a controlling principle. Jury trials have only been introduced as a foreign system, are employed in a comparatively small class of instances, and are looked upon with so little favor that any extension of their application is generally thought undesirable. The judges, moreover, may engage directly in the examination of witnesses and prisoners, and not infrequently, particularly in criminal trials, appear to become so strongly biased in consequence as seriously to impair one's belief in the impartial administration of justice. And lastly, no distinction of causes and remedies as legal or equitable is attempted. In fact, the English practice in this respect has even excited the derision of continental lawyers, who charge that it presumes two different kinds of justice.

Besides these fundamental points of difference between the two systems, there are great diversities between the several countries in the number, the character, and the functions of the various courts which have been established, and their relations with each other, which will require an investigation into the judicial system of each of the more important modern nations specifically. England, Scotland, France, and the U. S. will be selected for this purpose, and reference made to their most important tribunals in detail.

I. The Courts of England.—By the common-law system of England and the U. S. courts are distinguished as those *of record* and those *not of record*. A court of the former class is provided with a clerk and a seal, and receives its name from the fact that its proceedings are required to be preserved in accurate *records*; courts of the latter class are inferior tribunals without clerk or seal, and their acts are not formally enrolled. Courts are said to have *original* jurisdiction before which causes are brought in the first instance; *appellate* jurisdiction when decisions rendered in inferior tribunals are transferred to them for review. Civil causes heard before a single judge, with a jury, are said to be heard at *nisi prius* or at circuit; when several judges sit to review causes on appeal they are said to sit *in banc*. Courts are also distinguished as civil or criminal, superior or inferior, as courts of law, of equity, of admiralty, etc.—distinctions which require no explanation. In the following synopsis of the English courts an account will be given (1) of the superior common-law courts of record; (2) of the superior courts of equity; (3) of the ecclesiastical courts; (4) of the courts of probate, divorce, and admiralty; (5) of the criminal courts; (6) of the appellate courts as they existed for very many years, and until the reform legislation beginning in 1873, which is hereafter considered.

(1) *The Superior Common-law Courts of Record.*—These were the Court of Common Pleas, the King's (or Queen's) Bench, and the Court of Exchequer. These several tribunals are considered to have been derived originally from a single organization, the *Aula Regis* (or King's Council), which was the only superior court in the realm during the early history of the Roman kings. This had both civil and criminal jurisdiction, and was ambulatory, or attendant upon the person of the king, holding its sessions in such different parts of the kingdom as he entered in the course of his journeyings. The courts were, when first created, nothing more than subordinate branches or committees of the council, established for the more speedy transaction of business. The exchequer branch entertained questions relating to the royal revenue; that of the common pleas, civil suits between individuals except for forcible injuries; while there was left to the *Aula Regis* proper, jurisdiction in criminal causes and in civil actions for injury by violence, and a general controlling power over inferior tribunals.

In the reign of Edward I. (1272) the three bodies were constituted separate courts, were all fixed at Westminster, and their powers, as distinct tribunals, determined. Each retained, however, its previous particular jurisdiction. But in the course of time, by a gradual process of encroachment, justified by ingenious legal fictions, each court trenched upon the appropriate province of the others, assuming thereby similar powers, so that finally they all entertained co-ordinate jurisdiction in nearly all civil causes. The Court of King's (or Queen's) Bench, however, retained to the last exclusive cognizance of criminal matters and the sole superintendence over inferior courts and civil corporations; the Court of Common Pleas alone had the right to entertain real actions—i. e. actions for the specific recovery of real property (actions now rarely brought); while the Court of Exchequer continued to exercise entire control over strict questions of revenue. In other cases the parties to the action could select any one of the courts they might prefer. As regards the organization of these common-law courts, the King's (or Queen's) Bench and Common Pleas consisted each of a chief justice and five puisne justices; the Exchequer, of a chief baron and five puisne barons. These judges held office during good behavior, but could be retired on a pension after fifteen years' service. An appeal lay from any one of these courts to the Exchequer Chamber, which, when hearing a cause sent from one of them, was composed of the judges of the other two. A second appeal could also be taken to the House of Lords.

To remedy the inconvenience to suitors arising from the fixed establishment of these courts at Westminster, provision was made at an early period for the hearing of jury trials in every county one or more times during each year. The tribunals for this purpose were and still are called *courts of assize and nisi prius*, and are held, now as formerly, by royal commission, either (*a*) general—now issued twice a year to the judges of the High Court of Justice, two judges usually being assigned to each Circuit (*q. v.*), or (*b*) special—issued to certain judges to try certain causes or crimes. Appeals from them, however, can only be heard at Westminster.

(2) *The Superior Courts of Equity.*—It was found at an early period that the common-law tribunals, determining causes as they did only through the instrumentality of juries in the first instance, and in all cases, where no demand was made for specific property, giving only pecuniary damages as relief, were totally inadequate to administer exact justice in a large variety of cases, and the separate system of equity jurisprudence was established to repair the deficiencies of the strict legal methods. These courts were likewise governed by the rule of precedent, but their modes of procedure were less technical, their forms of remedy more diverse, and they employed no juries, though a practice existed of referring special questions to courts of law to be tried by a jury, whose verdict was reported to the equity judge to aid his future action. The equity judges consisted of three vice-chancellors, a master of the rolls, two lords justices, and the lord chancellor. The vice-chancellors and the master of the rolls held each separate courts at which causes were heard in the first instance; so that there were four equity tribunals of original jurisdiction. Appeals could be taken from either of them to the Court of Appeal in Chancery or to the lord chancellor.

The Court of Appeal in Chancery was composed nominally of the two lords justices and the lord chancellor, but almost invariably it is held by the lords justices alone. Any two of these three judges, however, were sufficient for holding the court, or even the lord chancellor alone. Moreover, each of the justices could, under certain restrictions, sit alone. The chancellor could, in addition, exercise an independent jurisdiction, without acting as a member of the court of appeals. This jurisdiction was ordinary when according to common-law methods: extraordinary, when equitable in its nature. An appeal could be taken to the House of Lords. The term of office of these judges was the same as that of the common-law judiciary, except in the case of the chancellor, who could be deprived of his position at the pleasure of the crown.

(3) *The Ecclesiastical Courts.*—These courts derived their authority and powers from the immemorial usage of the Church, and administered justice according to the principles of the civil and canon laws. At one time these courts had a large share in the administration of justice, and their jurisdiction was by no means restricted to spiritual interests. In England the clergy always had the right to exclude the laity from the judgment of spiritual causes, and in the time of the Conqueror a law was promulgated making mandatory the trial of ecclesiastical causes in the ecclesiastical courts. These courts had jurisdiction of offenses committed by the clergy upon the clergy; but if one of the clergy committed an offense upon a layman, the clerical offender might be punished in the secular courts, provided the ecclesiastical court had previously found him guilty, deprived him of his order, and turned him over to the temporal courts. If the ecclesiastical court refused to try the offender, or found him not guilty, and declined to turn him over to the temporal courts, he was free from all outside interference.

These courts had jurisdiction over cases arising from the withholding of tithes, the non-payment of ecclesiastical dues to the clergy, the spoliation of a benefice, ecclesiastical waste, and the neglect of reparations of the church, churchyard, and the like. They also had jurisdiction over matrimonial and testamentary causes. In 1857 the ecclesiastical courts were deprived of their jurisdiction over testamentary and matrimonial causes. In 1876 the question was raised whether an ecclesiastical court had jurisdiction in a criminal suit against a layman for false swearing. In holding that the jurisdiction did not exist, the judge declared that while such jurisdiction had not been expressly taken away by statute, yet it had inferentially, as the statute gave jurisdiction over cases of false swearing to the temporal courts, citing a maxim from Coke that "where the common or statute law giveth remedy in *foro seculari* (whether the matter be temporal or spiritual), the conusans of that cause belongeth to the king's temporal courts only, unless the jurisdiction of the ecclesiastical court be saved or allowed by the same statute to proceed according to the ecclesiastical law." The judge writing the opinion said: "It cannot, I think, be doubted that a recurrence to the punishment of the laity for the good of their souls, by ecclesiastical courts, would not be in harmony with modern ideas, or the position which ecclesiastical authority occupies in the country, nor do I think that the enforcement of such powers where they still exist, if they do exist, is likely to benefit the community." (*Phillimore* vs. *Machon*, 1 P. D., 488.) Practically the civil jurisdiction of the ecclesiastical courts over the laity has ceased to exist, except in matters relating to the fabric and ornaments of the church, the churchyard, and churchwardens. They are now about on a level with courts martial, exercising jurisdiction over the clergy of the Established Church in their professional character, as the military courts deal with soldiers and sailors. (Wilson's *Modern English Law*, p. 248.) The common-law courts restrain, by a writ of prohibition, the ecclesiastical courts from exceeding their jurisdiction, and can compel them to exercise their jurisdiction by a writ of mandamus. The right to practice in the ecclesiastical courts, formerly confined to proctors, has been extended to solicitors, and in the taking of evidence oral has been substituted for written testimony. In the U. S., ecclesiastical courts have never existed in the sense in which they have existed in England.

(4) *The Courts of Probate, Divorce, and Admiralty.*—The Court of Probate and that of Divorce were established in 1857 to supersede the former ecclesiastical courts, and received more extended powers. Their names sufficiently define the nature of their jurisdiction. The judges of either of these tribunals could try questions of fact with a jury, or could order an issue to be tried by a court of law. Appeals could be taken to the House of Lords. The Court of Probate had only a single judge, who could, however, associate with himself a common-law judge or judges. The appropriate labor of this tribunal was facilitated by the establishment of district registries throughout the realm. These were forty in number, besides the principal registry in London, all having power to grant probate and administration.

The Court of Divorce consisted of the judge of probate, the lord chancellor, and the judges of the superior common-law courts. The probate judge was made judge ordinary, and could act alone or with the other judges. The power to grant divorce, which was conferred upon this court, was exercised till 1857 only by Parliament. Actions for criminal conversation could also be maintained in this court.

The High Court of Admiralty had cognizance of causes of action arising from the navigation of the seas, as e. g. claims for repairs of foreign vessels and for supplies furnished them, actions for pilotage fees, for seamen's wages, for personal injuries inflicted at sea or injuries by collision, seizure, and the like; also to determine matters of prize in time of war, and decree the forfeiture of vessels of the enemy or of neutrals in proper cases. This court was held by a single judge, who was appointed by the crown. He could be the same person as the judge of probate.

(5) *The Criminal Courts.*—These were divided into the inferior and the superior, the former including the general and quarter sessions of the peace, while the latter embraced the assizes, the admiralty sessions, the Court of King's (or Queen's) Bench (now a part of the High Court of Justice), and the Central Criminal Court, which is retained in the present system of courts. The assizes were and still are held by royal commission twice a year in nearly all the counties. The judges act by virtue of various commissions, the most important of which are those of "oyer and terminer," by which they are empowered to try treasons, felonies, and trespasses, and "general jail delivery," empowering them to try every prisoner in a specified jail, for whatever offense committed, so as to clear the prisons.

The King's or Queen's Bench was the highest court of criminal jurisdiction. This prerogative, as has been seen, it enjoyed to the exclusion of the other superior common-law courts.

The Central Criminal Court was erected in 1834 for the trial of treasons, felonies, and misdemeanors committed within the city of London and county of Middlesex, and certain parts of other counties.

The other criminal courts require no particular mention.

(6) *Appellate Courts.*—(*a*) The Exchequer Chamber, to which appeals were first taken from the King's Bench, the Common Pleas, and the Exchequer, was composed, as already explained, of the judges of the two courts in which the action was not heard originally.

(*b*) The Judicial Committee of the Privy Council is a tribunal of privy councilors, established to try appeals to the sovereign in council from colonial and ecclesiastical courts, from the Court of Admiralty, and from certain orders in lunacy. It is a court of record, and is composed of a lord president, all the equity judges, the three chief judges of the common-law courts, and certain other officials to the number of twenty or more. Only four, however, are required to constitute a quorum. Of the whole number of members (except two retired East Indian judges) only four receive a salary as such, are required to attend the sittings, and retain their positions during good behavior. The members of the Council generally hold office during the pleasure of the crown. There is no appeal to the House of Lords, and there is, consequently, danger of a conflict of authority between these tribunals of last resort. The jurisdiction of this court in appeals from the High Court of Admiralty and from orders in lunacy was taken away by the Judicature Act, 1873, s. 18.

(*c*) The House of Lords. Though, in theory, this entire body constitutes the appellate tribunal, and any of the lords might, if so disposed, assume to act as judges, yet the judicial functions are, in reality, entirely delegated to a few members of the legal profession, known as the "law lords." The services of the others are only available when they are needed to make up a quorum, for which three members are required. The organization of this court has several objectionable features, since the sittings are only held while Parliament is in session; there is no regularity of attendance required on the part of members; and a judge may sometimes sit in review of his own decisions. The decisions rendered, however, enjoy generally a great reputation from the eminence of those who usually act as judges.

The system of courts above described has been remodeled in recent years by a series of acts known as the Judicature Acts, beginning in 1873, and known as 36 and 37 Vict., c. 66; 37 and 38 Vict., c. 83; 38 and 39 Vict., c. 77; 39 and 40 Vict., c. 59; 40 and 41 Vict., c. 9. By this legislation all the higher courts of law and equity were merged in a Supreme Court of Judicature, consisting of a High Court of Justice and a Court of Appeal. The High Court of Justice never sits as a whole, but is divided into five departments, four bearing the names of the four great courts which preceded them, viz.: the Chancery Division, the King's (or Queen's) Bench Division, the Common Pleas Division, and the Exchequer Division. The other department is known as the Probate, Divorce, and Admiralty Division. Each of these divisions possesses very much the same jurisdiction as did the courts of the same name which they displaced, and which have been previously described, though with some important differences of authority. The lord high chancellor presides over the Chancery Division, and the lord chief justice over the Queen's Bench Division. The Court of Appeal is composed of six judges, and sits in two divisions, one for law and the other for equity, although any judge may sit on either side. The judges hold office for life, though they may be removed by the crown on the address of Parliament. Their salary is £5,000. The salary of the lord chancellor is £10,000, and that of the lord chief justice is £8,000. A uniform system of pleading and procedure has been established, and it has been provided that in every civil cause or matter entertained in the Supreme Court of Judicature law and equity shall be concurrently administered, and that equitable rules shall supersede those of the law when any conflict arises. It is still true, however, that causes of action which in themselves have been hitherto

considered distinctively equitable are to be brought before the Chancery Division, which took the place of the four chancery courts of original jurisdiction.

In a large number of questions several divisions have co-ordinate jurisdiction. It is accordingly provided that any person commencing a cause may assign it to any proper division he may think fit by marking his documents with its name. If a wrong assignment be made, a transfer may be had, on proper application, by direction of the court or by a judge of the division in which the matter is brought, or the cause may even be retained if a transfer would be inexpedient.

Every appeal to the Court of Appeal is heard either by the whole court or by a divisional court consisting of any number, not less than three, of the judges thereof. Appeals may also be reargued before decision, or be reheard before final judgment, before a greater number of judges, if the Court of Appeal so direct. But no judge shall hear a case on appeal which he himself decided, or helped to decide, originally.

The House of Lords still has appellate jurisdiction from the Court of Appeal, although its functions in this respect are really exercised by a committee composed of such peers as are holding or have held high judicial office, and three lords of appeal in ordinary. The House of Lords has been recognized as a court of appeal from the days of Queen Elizabeth. From the time when O'Connell's case came before the House on appeal, in 1844, no attempt has ever been made by the lay peers to exercise judicial functions. So strong was the feeling against O'Connell that a number of the lay peers, who could not bear to see the Irish agitator escape punishment for sedition on a purely technical point, expressed an intention of voting on the appeal. It was, however, so strongly urged on them that by custom, though not by strict law, the judicial functions of the House had not been exercised by lay peers, and that it was only by the observance of this custom that the decisions of the House could command respect, that they finally withdrew and left the matter to the law lords alone. No disposition has since been manifested to infringe this principle.

II. The Courts of Scotland.—Although both England and Scotland belong to one united kingdom and have but a single legislative body, the Houses of Parliament, their judicial organization is almost entirely diverse. There is one tribunal of supreme appellate jurisdiction, the House of Lords, which is common to both countries, but this is the only element of correspondence in the two systems. Scotland administers the civil law instead of the common. The courts of chief importance are the Court of the Sheriff, or sheriff-substitute, and the Court of Session. The Scottish sheriff differs from the English in not being confined to the performance of merely ministerial duties. He acts also as the chief local judge of the county to which he belongs. The jurisdiction he exercises is both civil and criminal, and is quite extensive in its scope. In civil causes it extends to all actions on contract and for damages, no matter how large the amount involved. In matters, however, relating to landed property his authority is much restricted. He has also a summary jurisdiction, conferred by statute, in small-debt cases, where the sum involved is not above £12. In most cases of this kind there is no appeal from his decisions. The sheriff also takes cognizance of bankruptcy, insolvency, and admiralty questions. His criminal jurisdiction extends to all cases which do not infer death or banishment. No jury is employed in the trial of civil causes, but only in those of a criminal nature. Though, however, these various powers are described as appertaining to the sheriff himself, yet in practice, so far as the capacity of hearing causes originally is concerned, they are delegated to a subordinate officer, appointed by the sheriff, and styled a sheriff-substitute. If it is desired to secure the review of a decision rendered by the substitute in the first instance, then the sheriff himself acts in the capacity of an appellate judge. From him also, in proper cases, an appeal may be taken to the Court of Session, and thence to the House of Lords.

The Court of Session is the highest civil tribunal in Scotland. It takes cognizance of all questions of a civil nature, whether legal, equitable, admiralty, or probate, and exercises both original and appellate jurisdiction. It was established in 1532, and, as originally constituted, consisted of fifteen judges, all of whom sat in a body to hear appeals. This arrangement occasioned great dilatoriness of procedure, but continued nevertheless for nearly three centuries, despite this and other commonly recognized inconveniences. The present organization is much different. The number of members has been reduced to thirteen. Five of these are called "lords ordinary," exercise severally original jurisdiction, and constitute collectively what is known as the "Outer House." The eight remaining judges form the "Inner House," and have, as a general rule, only appellate jurisdiction. They are divided into two divisions of four each, either of which possesses the same authority, and may be selected by any party appealing, at his own option. One division is presided over by the lord justice clerk, the other by the lord president. In some few instances the Inner House may exercise original jurisdiction, and in cases of exceptional difficulty the whole body of thirteen judges may consider a question upon appeal; but such cases are very rare. In the trial of civil causes in the first instance before a lord ordinary juries have been employed since 1815, but by no means to so great an extent as in the English practice. The jury system was introduced as an exotic, and does not thrive very vigorously under the unfavorable conditions of a common prejudice against it on the part of clients and hostile criticism by able members of the bar. Juries may be dispensed with, in general, in the discretion of the court or by consent of parties; and, as might be supposed, a resort to these expedients is not infrequent. The constitution of the appellate branches of the Inner House in this system is evidently faulty. There may be an equal division of the judges in either body, so as to render the determination of any question impossible, or the decisions of one branch may directly contradict those of the other, so as to make the law fluctuating and uncertain. The first evil is remedied by calling in a lord ordinary or three judges of the other house to attend a rehearing of the cause, by which means the whole number of judges is made uneven and a majority rendered certain. In the second case the opinions of the whole court may be taken, but this mode of reference is discretionary, and therefore inadequate to meet the difficulty. The final appeal, which may be taken from the Court of Session to the House of Lords, has this peculiar consequence—that it refers questions arising under the civil-law procedure to jurists trained only in common-law methods as a general rule. It can not be said, however, that any practical evils have resulted from this co-operation of systems.

There are several other courts in Scotland composed of members of the Court of Session. Only one, however, deserves mention—viz., the High Court of Justiciary, a tribunal exercising an important criminal jurisdiction. The other courts are of inferior importance.

III. The Courts of France.—The most important courts are the Tribunals of the First Instance, the Courts of Appeal, the Courts of Assize, and the Court of Cassation. The Tribunals of the First Instance, as their name implies, entertain causes originally, and they exercise both civil and criminal jurisdiction. One of them is established in each of the arrondissements into which the whole country is divided. Each of these courts consists of from three to twelve judges, the number varying with the population of the districts. When their number is seven or more, they are formed into two chambers—one for the hearing of civil and the other of criminal causes. When there are twelve judges, three chambers are formed, two civil and one criminal. The tribunal at Paris is so large as to be divided into ten chambers. In civil cases three judges must concur in order to pronounce a decision, while in criminal actions the agreement of five is necessary. Appeals may be taken to the Courts of Appeal.

The Courts of Appeal are twenty-seven in number, and each of them is named from the city or place in which it is situated. They consist severally of at least twenty-four judges, who are generally divided into three chambers—one of civil jurisdiction, another of criminal, while the third hears appeals in police matters. Seven judges must concur in the determination of civil causes, five in criminal accusations. The Court of Appeal in Paris has six chambers and fifty-nine judges. Each chamber in all these courts has its own president. When momentous state questions or causes of exceptional complexity are to be decided, two chambers may be united. This is called "the solemn hearing," and the concurrence of fourteen judges is required in order that a decision may be given. Appeals lie from these courts to the Court of Cassation.

The Courts of Assize are composed of judges of the Courts of Appeal, and exercise only criminal jurisdiction. One of these tribunals is established in each of the departments into which France is divided (about eighty in number), and their

institution is peculiar, as compared with French courts in general, in that it exhibits the employment of the English jury system. The jurors, however, are not required to be unanimous in their verdict, a majority sufficing. The number of judges in each court is three, and sessions are held every three months. The amount of business in Paris, however, requires two sessions a month. Appeals may be taken to the Court of Cassation.

The Court of Cassation (i. e. court having power of annulling) is the highest permanent court of appeal in France. It is composed of a first president, three presidents of chambers, and forty-five other judges called counselors. It is divided into three chambers—one for the hearing of appeals in civil causes, another in those of a criminal character, while the third is termed the Chamber of Requests, and takes cognizance of petitions, determines whether appeals are admissible, etc. Appeals must be brought within three months after the previous decision was rendered. The judges, as in all the higher courts of France, hold office for life. The constitution and functions of the Court of Cassation differ quite essentially from those which are conferred upon appellate tribunals in England and generally in other countries, and even upon the subordinate French courts of appeal; for it possesses no power to affirm the judgment of the court below, but only, as its name indicates, to reverse a decision, and transfer the cause for another hearing to some tribunal having co-ordinate jurisdiction with the one in which judgment was first rendered. Moreover, notwithstanding the pre-eminent position of this court, its determination of the law is not considered authoritative upon inferior tribunals, but only as presumably correct and open to contradiction. Instances in which its views are disregarded, however, are of course very rare.

Other French courts of limited jurisdiction but great usefulness are the Tribunals of Commerce, established in all the commercial cities and towns, and the Courts of Prudhommes, existing in Paris and a few of the larger cities. The former consist largely of men experienced in mercantile pursuits, and take cognizance of questions arising in commercial transactions. The latter are mechanics' courts, consisting of manufacturers and artisans, and take charge of matters arising from the relations of employer and employed. They relieve the ordinary courts of much labor.

IV. The Courts of the United States.—In accordance with the provision of the Constitution establishing a Supreme Court and conferring upon Congress the power to create inferior tribunals, a regular system of courts has been formed throughout the Union. The most important are the District Courts, the Circuit Courts, Circuit Courts of Appeals, and the Court of Claims. Final appeals are taken to the Supreme Court at Washington. All these tribunals exercise both law and equity jurisdiction, and the judicial authority given by the Constitution is variously apportioned among them.

The District Courts are now (1893) sixty-six in number. Each State generally constitutes a single district, though some of the larger ones, as New York, Pennsylvania, Illinois, and a few others, are divided into two or three. New districts are formed by Congress as the population increases or new States are admitted, so that the number is subject to constant variation. Each court consists of a single judge, who must reside in the district for which he is appointed. Original jurisdiction is exercised in civil, criminal, and admiralty causes. The classes of questions of which these courts take cognizance are determined entirely by congressional enactment, and are variously modified at different times. They entertain exclusively questions of admiralty or maritime jurisdiction in the first instance, including all seizures upon navigable waters under laws of imposts, navigation, or trade of the U. S., actions for injuries committed upon the high seas, suits to recover upon maritime contracts, actions for salvage, for injuries by collision, and matters of prize. They also have sole original cognizance of questions arising from seizures upon land, and of all suits for penalties and forfeitures under the U. S. laws, and also of actions against consuls or vice-consuls. In addition, they have original jurisdiction in all causes under the bankrupt laws. They exercise concurrent jurisdiction with the Circuit Courts of all crimes and offenses against the U. S. the punishment of which is not capital, of patent and copyright cases, and of all causes, civil or criminal, affecting persons who are denied in the State courts their rights of citizenship under the U. S. laws. They also have concurrent jurisdiction with the Circuit Courts or with the State Courts of all causes where an alien sues for a tort in violation of the law of nations or a treaty of the U. S., and of all suits at common law where suit is brought by the U. S. or any officer thereof. The trial of issues of fact in the District Courts, except in civil causes of a maritime character, is by jury. No person can be arrested in one district for trial in another.

The Circuit Courts are nine in number, and each circuit in which one of these courts is established consists of several States. The nine justices of the Supreme Court are allotted, by their own selection, each to a particular circuit, and each is required to attend at least one term of such court to which he is appointed in each district of his circuit during every period of two years. There is also appointed a special circuit judge in each circuit, within whose limits he must reside. A Circuit Court is held by the Supreme Court justice thereto allotted, or by the regular circuit judge, or by the district judge of the district sitting alone, or by the Supreme Court justice and circuit judge sitting together and the former presiding, or, in the absence of either of these, by the other (who then presides) and the district judge. Such courts may be held at the same time in the different districts of the same circuit. Two sessions of each court are held annually within each district of the circuit. The Circuit Courts have no appellate jurisdiction. Their original jurisdiction extends, concurrently with that of the State courts, to civil suits in law or equity for more than $500 when the U. S. are plaintiffs, or an alien is a party, or the suit is between a citizen of the State where the suit is brought and a citizen of another State. They also entertain causes arising under the revenue laws and some questions of a particular nature in bankruptcy procedure. Their important concurrent jurisdiction with the District Courts has already been mentioned. Provision is made, moreover, for the removal of certain causes—such as actions against revenue officers, suits on titles to land derived from other States, etc.—from the State courts to the Circuit Courts, on proper petition by the defendant and the entering of security.

Circuit Courts of Appeals were established by an act passed Mar. 3, 1891. This act creates in each of the nine circuits, already referred to, a Circuit Court of Appeals, consisting of three judges, of whom two constitute a quorum. The act provides for the appointment in each circuit of an additional circuit judge, and then declares that the chief justice of the Supreme Court of the U. S. and the associate justices of that court assigned to each circuit, and the several district judges within each circuit, shall be competent to sit as judges of the Circuit Court of Appeals within their respective circuits. But no justice or judge before whom a cause or question may have been tried or heard in a district court, or existing court, can sit on the trial or hearing of such cause or question in the Circuit Court of Appeals. A term is to be held annually by the Circuit Court of Appeals in the several judicial circuits at the following places: In the first circuit, in the city of Boston; in the second circuit, in the city of New York; in the third circuit, in the city of Philadelphia; in the fourth circuit, in the city of Richmond; in the fifth circuit, in the city of New Orleans; in the sixth circuit, in the city of Cincinnati; in the seventh circuit, in the city of Chicago; in the eighth circuit, in the city of St. Louis; in the ninth circuit, in the city of San Francisco. Since the passage of this law no appeals, by writ of error or otherwise, can be taken from any District Court to a Circuit Court, and all appeals from the District Courts are subject to review only in the Supreme Court or in the Circuit Courts of Appeals. Appeals or writs of error may be taken from the District Courts or from the Circuit Courts direct to the Supreme Court in the following cases: In any case in which the jurisdiction of the court is in issue; from final sentences and decrees in prize causes: in cases of conviction of a capital or otherwise infamous crime; in any case involving the construction or application of the Constitution of the U. S.; in any case in which the constitutionality of any law of the U. S., or the validity or construction of any treaty made under its authority, is drawn in question; and in any case in which the constitution or law of a State is claimed to be in contravention of the Constitution of the U. S. The Circuit Courts of Appeals exercise appellate jurisdiction over final decisions in the District Courts and the Circuit Courts in all cases other than those mentioned above, unless otherwise provided by law. The judgments or decrees of the Circuit Courts of Appeals are final in all cases in which jurisdiction is dependent entirely upon the opposite parties to the suit or controversy, being aliens and citizens of the U. S., or citizens of different States; also in all cases arising under the patent laws, under the revenue laws, and under the criminal laws and in admiralty cases.

But a Circuit Court of Appeals may, in every subject within its appellate jurisdiction, certify to the Supreme Court of the U. S. any questions or propositions of law concerning which it desires the instruction of that court for its proper decision. And in cases made final in the Circuit Courts of Appeals it is made competent for the Supreme Court to require the case to be certified to it for its review and determination with the same power and authority in the case as if it had been carried by appeal or writ of error to the Supreme Court.

The Court of Claims is a tribunal established at Washington, consisting of five judges, of whom one is appointed chief justice. It has jurisdiction to determine all claims founded upon any law of Congress, or upon any regulation of an executive department, or upon any contract with the Government of the U. S., which are presented to it by petition. All petitions in regard to such claims introduced into Congress are required, unless that body otherwise orders, to be transmitted to this court. So the cabinet officers may refer certain claims made upon their departments. Demands which are adjudged valid are payable from the national treasury. The Court of Claims has a single annual session. Appeals are taken to the Supreme Court.

The Supreme Court is the highest tribunal of the U. S. It consists of a chief justice and eight associate justices, and holds one term annually at Washington. Six justices are required to constitute a quorum. The jurisdiction exercised is both original and appellate, but chiefly, in practice, the latter. The original jurisdiction extends to all cases affecting ambassadors, other public ministers and consuls, and those in which a State is a party, except that in the latter case no suit can be prosecuted against any State by the citizens of another State. In actions *against* ambassadors or other public ministers, and in many controversies where a State is a party, its jurisdiction is not only original, but exclusive. Its other original authority is shared with the inferior tribunals. In the exercise of its appellate powers the Supreme Court reviews the judgments or decrees of the Circuit Courts, of District Courts, of the Circuit Courts of Appeals, of the Court of Claims, and of some tribunals established in the Territories. Moreover, the decisions of the highest State tribunals which are repugnant to the Constitution, treaties, or laws of the U. S. may be re-examined by the Supreme Court, and reversed or modified as may be necessary. It has power to review both the law and the fact in any cause of which it takes cognizance on appeal.

The Federal tribunals in this way possess exclusive jurisdiction over subjects of such manifest national importance as patents, copyrights, admiralty causes, and questions of revenue, and have power to determine controversies between States, and to declare void all laws, whether of Congress or of a State legislature, which are in contravention of the provisions of the U. S. Constitution.

The salaries of the justices of the Supreme Court are fixed by act of 1873 at $10,000, and that of the chief justice at $10,500. Originally the salaries were fixed at the sum of $3,500 for associate justices, and so remained from 1789 to 1819, when they were increased to $4,000, and so continued until 1855, when they were raised to $6,000. In 1871 they were raised to $8,000, and remained at that amount until the law now in force was passed. The salaries of circuit judges are fixed at the sum of $6,000. The salaries of the district judges were originally fixed at from $800 to $1,800. But at present their salaries range from $3,500 to $5,000. Federal judges are allowed to retire after ten years of service and after reaching the age of seventy years, upon the salary they have been receiving, and to draw it as long as they live.

V. The judicial systems of the various States of the Union are so diverse that to give any account of them would be impracticable. They all agree in having a number of tribunals, some of original and others of appellate jurisdiction, and the determination of the law by the courts of each State, subject to the review of the Supreme Court of the U. S. in constitutional matters, is conclusive within its own boundaries. Reference must be made to the constitutions and statutes of the States severally for further details.

Revised by Henry Wade Rogers.

Couscous: same as Cuscus (*q. v.*).

Cousin, Jean: b. at Soucy, near Sens, about 1520. He began by painting on glass, and became known from an early age to the Italian artists who had been brought to France by the king, such as Il Rosso, Bagnacavallo, and especially to Primaticcio, whose style he imitated. He is the first remarkable historic painter of France. He was an excellent draughtsman and a good anatomist. His taste was rather Florentine than French. He drew and painted chiefly on glass, and worked but little in oil. His chief work in oil is the *Last Judgment*, which is now in the Louvre. Although suspected of being a Protestant, he lived without molestation through the reigns of Francis I., Henry II., Francis II., Charles IX., and Henry III., working for all these monarchs. He was the first to apply the rules of geometry to perspective, and wrote several works on both these sciences; also a pamphlet on the proportions of the human figure, illustrated by wood-cuts, and now accepted as a classic. He was also a remarkable sculptor, deserving the title of the French Phidias with better right than Goujon. Perhaps his most important work in sculpture is the sepulchral monument of Admiral de Chabot, formerly in the Celestins, Paris, now in the Louvre. D. in 1589. W. J. Stillman.

Cousin, koo'zăñ', Victor: French philosopher; b. Nov. 28, 1792; was the son of a watchmaker of Paris. After brilliant academic studies, though he had a strong inclination to music, his mind was directed toward philosophy under Laromiguière, Royer-Collard, and Maine de Biran. In 1815 he succeeded Royer-Collard as professor at the Sorbonne, and continued the teaching of the Scotch philosophy initiated by him, and promoted the reaction against the sensualism of Condillac and the thinkers of the eighteenth century. In a journey to Germany he became indoctrinated with the idealistic philosophy. In 1820 he was suspended on political grounds. He published editions of Proclus (6 vols. 8vo, 1820–27) and Descartes (11 vols. 8vo, 1827), and his celebrated translation of Plato (13 vols. 8vo, 1825–40). In 1827 he was replaced in his chair at the Sorbonne, and shared with Guizot and Villemain a popularity and power in the community unexampled in university annals. He was, under Thiers (1840), minister of public instruction for eight months, and delivered in the Chamber of Peers his *Défense de l'Université et de la Philosophie* (8vo, 1844). The revolution of 1848 called forth, in refutation of socialism, *Justice et Charité. Du Vrai, du Beau, et du Bien* appeared in 1853. Of his numerous works have appeared in this country his *Course of Modern Philosophy* (1855) and *Lectures on the True, the Beautiful, and the Good* (1857), translated by O. B. Wight. But his chief work is his *Fragments Philosophiques* (1826). His philosophy was eclecticism. (See Sir William Hamilton's criticism in *Edinburgh Review* for 1829). He was more critical than systematical. He formed no school, but he exercised a very great influence, leading new and fertile streams of philosophical ideas into French civilization. On primary education he also exercised a decided influence. (See his celebrated *Rapport sur l'État de l'Instruction Publique*, translated into English by Mrs. Austin, 1834.) Of great importance was also his edition of Abelard's works, accompanied with new, and in many respects exhaustive, researches of that period of scholasticism. D. at Cannes, Jan. 13, 1867.

Cousins, Samuel, R. A.: mezzotint engraver; b. at Exeter, England, May 9, 1801; apprenticed to S. W. Reynolds in 1814; aided him in many of his plates; began to engrave on his own account in 1826; associate engraver of the Royal Academy 1835; Royal Academician engraver 1855, retiring in 1880. He produced plates after Landseer, Lawrence, Sir Joshua Reynolds, Leighton, Millais, and other painters. Especially noted are *Master Lambton* and *Mrs. Peel*, after Lawrence; *Bolton Abbey in the Olden Time* (Landseer); *The Strawberry Girl* and *Penelope Boothby* (Reynolds); *Pomona* (Millais); and *Marie Antoinette in the Temple* (E. M. Ward). He gave £15,000 in trust to the Royal Academy for relieving artists in sickness and old age. D. May 7, 1887.

Coutances, koo'taans' (anc. *Constantia*): a town of France; department of Manche (see map of France, ref 3–C). It was formerly fortified. It is the seat of a bishop, and has a handsome old cathedral, a public library, a theater, and manufactures of druggets, worsted stuffs, hardware, etc. Pop. (1896) 7,403.

Couture, koo'tür', Thomas: historical and genre painter; b. at Senlis, Oise, France, Dec. 15, 1815; d. at Villiers-le-Bel, Seine-et-Oise, Mar. 31, 1879. Pupil of Baron Gros and Delaroche; second Prix de Rome 1837; first-class medals, Salon 1847 and Paris Exposition 1855; Legion of Honor 1848. Couture, who was already known as a painter of ability, created a great sensation in the art world by the exhibition at the Salon of 1847 of his great picture *The Decadence*

of the Romans, which is now in the Louvre. It is a work of wonderful power, and fine in composition and drawing. In color it may be reproached with a tendency to too great warmth in the shadows, but it is harmonious in tone and complete in ensemble. He had many pupils, but his influence was not always good on young painters, many of whom adopted his peculiarities of method without attaining to the results achieved by the master. The modern school in France has now completely outgrown the once marked influence of his style. A canvas by him, a study for *The Volunteers of 1793*, is in the Boston Museum of Fine Arts.

WILLIAM A. COFFIN.

Covenant [O. Fr. *convenant*, ptc. of *convenir* < Lat. *convenīre*, meet together]: in theology, the promises recorded in the Scriptures, made by God on certain conditions of obedience, faith, etc., on the part of man. The old dispensation (or Old Testament) is called in Greek ἡ παλαιὰ διαθήκη, i. e. the old covenant; and the new dispensation (or Testament), ἡ καινὴ διαθήκη, the new covenant.

The so called "Theology of the Covenants" or "Federal System" was elaborated by Cocceius (1603–69), who taught: 1, the covenant of works before the fall; 2, the covenant of grace after the fall. And under this second covenant three economics: 1, prior to the law; 2, under the law; 3, under the gospel. This system is the theology of the Westminster Standards.

Covenant: in law, a promise under seal. There are several words appropriated to sealed instruments or promises contained in them, as bond, covenant, deed, and obligation. The first, third, and fourth words are used to express the entire instrument, while "covenant" is commonly employed to designate a particular clause in a sealed instrument. Thus there may be many covenants in a deed. The subject is fruitful in distinctions, covenants being treated in the law-books as to their form, their nature, their relation to other covenants, their assignability, and the like. One of the most important of these is that which classifies covenants into those which "run with the land" and those which do not. To explain this subject it is necessary to state that in ordinary conveyances of land there are found certain clauses which affirm in substance that the grantor is owner in possession, actual or constructive (or seized), and has a good right to convey; that there are no incumbrances on the land; that the purchaser shall quietly enjoy the land without being evicted by any person having a superior title; that the grantor will warrant and defend the title; and that he will make such further deeds or conveyances as he may be called on to make to perfect the title. In brief terms and in technical language these are covenants of seizin, good right to convey, against incumbrances, of quiet enjoyment, of warranty, and of further assurance. The first three of these, it will be observed, affirm an existing fact; the last three concern the future, and are promissory in their nature. The first three do not run with the land; the last three do. The reason of the distinction is technical. The first three, if untrue at all, are so at the very moment when the deed was delivered, and accordingly then conferred a right of action. This immediate right to sue is in the nature of personal property, and closely resembles ordinary rights of action, such as a claim on a promissory note already due. Accordingly, if the grantee in the deed should convey the land, he would not by that act alone transfer these rights of action; they would not, in technical language, "run with the land." On the other hand, as to the three covenants in the future tense, it is clear that no action can be brought upon them until the event against which they are designed to guard happens, or, in other words, until the covenant is broken—that is, until the quiet enjoyment ceases or the grantee is evicted. Until that occurs the covenant will "run with the land," by which expression is meant that the mere conveyance to the second grantee transfers these covenants, as it would the houses, trees, and other additions to land. The distinction thus pointed out also applies to the case of landlord and tenant, and there are abstruse distinctions here to be noted which can not properly be stated within the brief compass of this article. Some of the common covenants in a lease which run with the land are the agreement of the tenant to pay rent, or to make repairs, or to keep houses insured. It should be added that the rule respecting the assignabilty of covenants in leases applies to covenants binding either on the tenant or the landlord. There is a growing practice in conveyances of land in towns and cities to insert clauses binding the purchaser to use the land in a particular manner, as to build dwelling-houses upon it. Although these clauses do not strictly fall within the technical doctrines of covenants running with the land, yet they are binding in equity law on a subsequent purchaser with notice. The covenant may be enforced through the medium of an injunction or other appropriate equitable remedy.

T. W. DWIGHT.

Covenant in Restraint of Trade: See TRADE, COVENANT IN RESTRAINT OF, in the Appendix.

Covenant, National (of Scotland): an agreement to protect the Reformed religion in the Church of Scotland from the attempt of the English Government to enforce the Episcopal form of worship; drawn up and published by the Four Tables in Edinburgh Mar. 1, 1638. It professed to be based upon a document which James VI. had signed in 1580. The Four Tables, as they were called, consisted of—1, nobility; 2, gentry; 3, ministers; and 4, burgesses; and in their hands the whole authority of the kingdom was vested. They elected a general assembly which met at Glasgow in Nov., 1638, and abolished episcopacy; ordering that every person should sign the Covenant on pain of excommunication. The Covenanters prepared for war, and though a treaty of peace was concluded in June, 1639, they entered England in Aug., 1640. An agreement was signed at Ripon Oct., 1640, by which commissioners were to be appointed, to whom the points in dispute were referred. A settlement of the matter was reached, which, under the name of the Solemn League and Covenant, was received by the English Parliament of the Assembly of Divines Sept., 1643. It differed essentially from the Covenant of 1638, and, according to Hallam, "consisted in an oath to be subscribed by all sorts of persons in both kingdoms, whereby they bound themselves to preserve the Reformed religion in the Church of Scotland, in doctrine, worship, discipline, and government, according to the word of God and practice of the best Reformed churches; and to endeavor to bring the Churches of God in the three kingdoms to the nearest conjunction and uniformity in religion, confession of faith, form of church government, directory for worship, and catechising; to endeavor, without respect of persons, the extirpation of popery, prelacy (that is, church government by archbishops and other ecclesiastical officers), and whatsoever should be found contrary to sound doctrine and the power of godliness; to preserve the rights and privileges of the Parliaments, the liberties of the kingdoms, and the king's person and authority in the preservation and defense of the true religion and liberties of the kingdoms; to endeavor the discovery of incendiaries and malignants who hinder the reformation of religion and divide the king from his people, that they may be brought to punishment; finally, to assist and defend all such as should enter into this Covenant and not suffer themselves to be withdrawn from it, whether to revolt to the opposite party or to give in to a detestable indifference or neutrality." This document was signed by members of both houses and by civil and military officers. A large number of the beneficed clergy who refused to subscribe were ejected. Charles II. signed it very reluctantly at Spey in June, 1650, in the hope of recovering the English throne. After the Restoration a majority in the House of Commons ordered it to be burned by the common hangman in May, 1661. In the same year the Scottish Parliament renounced the Covenant and declared the king supreme. The Covenanters became "Protesters" against these wrongs. Ejected from the churches they became "Conventiclers," and, later, "Hamiltonians." Under all these names they were subjected to a fierce and cruel persecution, in which neither age nor sex was spared. After the accession of William in 1688 Presbyterian government was restored in Scotland, but in the form in which it existed in 1592, thus avoiding all mention of the Covenant.

Revised by WILLIS J. BEECHER.

Covenanters: (1) the signers of the Covenant in Scotland and those who after the Restoration adhered to the Covenant. (See COVENANT.) More specifically (2), the religious body founded by Richard Cameron about 1680 (see CAMERON and CAMERONIANS), and represented by the Reformed Presbyterian churches now in existence. They claim that it is in the standards of the Covenanters that we have to look for a true embodiment of the tenets held by the great body of English and Scottish Presbyterians of 1643. Others gave in to the Revolution settlement, and afterward found cause to secede. The Covenanters never

gave in, and of course never seceded. Although in point of fact an elder sister of the existing Church of Scotland and all its secessions, the Cameronian body did not assume a regular form till after the Revolution; and it was with some difficulty that it organized a communion with ordained ministers. The steadfastness of members was put to a severe trial by the defection of their ministers, and for a time the people were as sheep without a shepherd. After sixteen years they were joined by the Rev. John McMillan, from the Established Church, in 1706. In 1743 they constituted a presbytery at Braehead, under the name of the Reformed Presbytery. Holding strictly to the Covenants, the political position of the Covenanters is very peculiar, as they refuse to recognize any laws or institutions which they conceive to be inimical to those of the kingdom of Christ. See REFORMED PRESBYTERIANS and PRESBYTERIAN CHURCH.

Revised by WILLIS J. BEECHER.

Cov'ent Garden [a corruption of convent garden, so called because it was once the garden of Westminster Abbey]: a square in the west central district of London, well known for its market for vegetables, fruits, and flowers. The square was formed in 1632 from the design of Inigo Jones, and it was first used as a market in 1656. The market consisted of an unsightly array of sheds until 1828, when the present building was erected by the Duke of Bedford, who holds under a charter granted by Charles II. It is considered one of the sights of London for a visitor, and should be seen about four o'clock on a summer's morning.

Cov'entry (Lat. *Coventria*): a city and parliamentary and municipal borough of Warwickshire, England; on the Sherbourne; 10 miles N. N. E. of Warwick; on the London and Northwestern Railway (see map of England, ref. 10–H). The modern part of it is well built. Among the remarkable buildings are St. Michael's church, founded in 1313, which is a masterpiece of the lighter Gothic style, has a spire 300 feet high, and is said to be the largest parish church in England; Trinity church; Christ church, with a handsome ancient spire, belonging to the old Gray Friars' convent from which the town has its name; and St. Mary's Hall, built about 1450, an admirable specimen of ornamental architecture. The ancient cathedral was destroyed by Henry VIII. Among modern buildings are a technical school, art school, free public library, a hospital, and a dispensary. Coventry returns one member to Parliament. It has manufactures of fringes, watches, cotton and woolen goods, and art-metal goods; is noted for its output of bicycles and tricycles, and is the greatest emporium for ribbons in England. It was formerly famous for the manufacture of broadcloth, caps, and blue thread. An annual fair, lasting five days, is held here. Coventry is a place of great antiquity, and its name appears in the *Doomsday Book* as *Couentrev*, meaning in the old British tongue "town on the Couen." In 1043 Earl Leofric and his wife, the celebrated Lady Godiva, founded here a magnificent Benedictine abbey. In the fifteenth century religious mysteries were often acted here before the king. With the exception of the period 1842–88 Coventry has enjoyed the privileges of a county since 1451. Pop. (1881) 46,563; (1891) 58,503; (1901) 69,877.

Coventry, EARLS OF: Viscounts Deershurst (England, 1689).—GEORGE WILLIAM COVENTRY, ninth earl, b. May 9, 1838; succeeded his grandfather in 1843; privy councilor; lord-lieutenant of Worcestershire, and formerly master of the buckhounds and captain of the corps of gentlemen-at-arms.

Cov'erdale, MILES: English bishop and Reformer; b. probably at Cover-dale, in Yorkshire, in 1488; was educated at Cambridge, and became an Augustine monk in 1514. He was one of the first Englishmen who adopted the doctrines of the Reformed Church of England (1526). He left the convent and became an evangelist, and then went to the Continent. In 1535 he published an English translation of the Bible, which was reissued in 1537 with the royal sanction. The version of the Psalms is that of the present Prayer-book. This was the first entire Bible ever published in English. It is not a direct translation from the original text, but only a rendering from the German and Latin versions. It has, nevertheless, great merits, and its influence on the Authorized Version, especially in rhythm and style, is easily recognized. (See BIBLE.) He edited the "Great Bible," or Cranmer's Bible (1540). In 1551 he was appointed Bishop of Exeter. On the accession of Mary in 1553 he was deprived of his office and imprisoned for a year. He was then permitted to take refuge on the Continent, whence he returned in 1558. He died in London and was buried Feb. 19, 1568. He also translated from the works of Luther, Calvin, Bullinger, and other Reformers. See his *Writings and Translations*, edited for the Parker Society (2 vols., Cambridge, 1844–46).

Covilhão, kō-vēēl-yow': a town of Portugal; province of Beira; situated among the mountains; 48 miles E. of Coimbra, and is perched like a collection of swallows' nests on the southeastern slope of Serra de Estrella, at an altitude of 2,186 feet above the level of the sea (see map of Spain, ref. 15–B). It has thermal springs, and manufactures of a woolen cloth called saragoca. Pop. (1890) 17,562.

Coville, FREDERICK V.: See the Appendix.

Covington: town; capital of Newton co., Ga. (for location of county, see map of Georgia, ref. 3–H); on railway; 41 miles E. by S. from Atlanta; is the seat of the Southern Masonic Female College. Pop. (1890) 1,823; (1900) 2,062.

Covington: city and railway junction; capital of Fountain co., Ind. (for location of county, see map of Indiana, ref. 6–B); on the Wabash river and Wabash and Erie Canal; 71 miles W. N. W. of Indianapolis; has a high school, foundry, and coal companies. Pop. (1880) 1,920; (1890) 1,891; (1900) 2,213.

Covington: city; Kenton co., Ky.: situated on Chesapeake and Ohio and the Louisville and Nashville R. Rs., and on the Ohio river opposite Cincinnati and just below the mouth of the Licking river, which separates it from Newport (for location, see map of Kentucky, ref. 2–H). The city is connected with Cincinnati by a suspension bridge and two bridges for railway and passenger traffic, and with Newport by two bridges across the Licking river. It is connected with Newport, Cincinnati, and the surrounding Kentucky territory by an electric street railway. Covington is the seat of a Roman Catholic bishopric; has numerous churches, a fine public school system, orphan asylum, hospital, rolling-mills, railroad-iron mill, manufactures of stoves, tobacco, etc., water-works, gas-works, electric light system, and numerous streets paved with asphalt. Pop. (1880) 29,720; (1890) 37,371; (1900) 42,938.

O. J. WIGGINS.

Covington: village; on railway; Miami co., O. (for location of county, see map of Ohio, ref. 5–C); 79 miles W. of Columbus. Pop. (1880) 1,458; (1890) 1,778; (1900) 1,791.

Covington: town; on railway; capital of Tipton co., Tenn. (for location of county, see map of Tennessee, ref. 7–A); situated on Big Hatchie river, 200 miles W. by S. from Nashville. It has cotton compress, fertilizer works, and saw-mills. Pop. (1880) 799; (1890) 1,067; (1900) 2,787.

Cow: See CATTLE.

Cowansville: town of Missisquoi co., Quebec, Canada; on the Yamaska river and Canadian Pacific Railway; 55 miles S. E. of Montreal. It has several mills. Pop. 1,000.

Cow Bay: a port and post-village of Cape Breton County and island; 22 miles from Sydney; has mines of bituminous coal, and a breakwater for the protection of shipping. Pop. 3,000.

Cowbird, or **Cow-bunting**: the *Molothrus ater*, a bird of the U. S. belonging to the blackbird family. The male is glossy black with a brown head, the female grayish brown. It takes its name from the fact that it associates with cattle in pastures, probably for the purpose of catching the insects which are aroused by the cattle. Like the European cuckoo, it builds no nest, but deposits its eggs in the nests of other and usually smaller birds, such as warblers and finches. As a rule but one egg is placed in a nest. The summer yellowbird is frequently victimized, but now and then outwits the cowbird by raising its nest and building over the egg of the intruder.

F. A. LUCAS.

Cowboys: marauders, mostly consisting of Tory refugees, who during the Revolution adhered to the British interests and infested the neutral ground in Westchester co., N. Y., between the American and British lines, plundering the Whigs or those who adhered to the interests of the Continental Congress. They received the name of cowboys because they stole many cattle. In the U. S. the name is now applied to men who take care of large herds of cattle in the West and Southwest.

Cowell, EDWARD BYLES, M. A.: Sanskrit scholar; b. in Ipswich, England, Jan. 23, 1826; educated at Oxford; fellow of Corpus Christi College, Cambridge; formerly principal of the Sanskrit College, Calcutta; since 1867 Professor of San-

skrit in the University of Cambridge. He is the author or editor of *The Prákrit Grammar Vararuci in Sanskrit and English* (London, 1854); *The Black Yajur Veda*, books i.–ii. (conjointly with Dr. Roer, Calcutta, 1856–64); *The Kusumánjula, or Hindu Proof of the Existence of a Supreme Being, in Sanskrit and English* (Calcutta, 1864); *The Aphorisms of Sándilya, Translated from the Sanskrit* (Calcutta, 1878); *The Sarva-darsána-samgrahá, Translated from the Sanskrit* (conjointly with Prof. Gough, London, 1882); *The Divyávandána* (conjointly with R. A. Neil, Cambridge, 1886); *The Buddha-caritá by Aśvaghosha, in Sanskrit and English* (Oxford, 1892); *The Kaushítaki Upanishad, in Sanskrit and English* (Calcutta, 1861); *The Maitri Upanishad, in Sanskrit and English* (Calcutta, 1863 and 1870). BENJ. IDE WHEELER.

Cowen, FREDERIC HYMEN: musician; b. Jan. 29, 1852, at Kingston, on the island of Jamaica, West Indies; was taken to London when very young; studied under Benedict and Goss, and then at the Leipzig and Berlin Conservatories, returning to England in 1868. Since then he has followed the profession of a composer and conductor, refusing to teach. His principal works are an operetta, *Garibaldi*; cantatas, *The Rose Maiden* (1870); *The Deluge*, *The Corsair* (1876), for the Birmingham festival; *St. Ursula* (1881), for the Norwich festival; *The Sleeping Beauty* (1885) for the Birmingham festival; the oratorio *Ruth* (1887) for the Worcester festival; the cantata *St. John's Eve* for a festival at Melbourne, Australia; the operas *Pauline* (Nov. 22, 1876), another, based on Ouida's novel *Signa*, and *Thorgrim* (Apr., 1890) for the Carl Rosa Company; five symphonies, some other orchestral pieces, and many songs and part songs. In 1888 he was appointed conductor of the London Philharmonic Society, which post he resigned about three years later. Cowen's music is exceedingly graceful and melodious, and is everywhere very popular. In 1888 he visited Melbourne, and while there produced his cantata *A Song of Thanksgiving*. D. E. HERVEY.

Cowes, West: a seaport and watering-place of England, on the Isle of Wight; at the mouth of the river Medina; 10½ miles S. S. E. of Southampton (see map of England, ref. 14–I). It is built on a steep slope, presenting a fine appearance from the sea; contains many elegant villas and hotels, has an active coasting trade, and is a general rendezvous for yachtsmen in the yachting season. It is the chief port of the island. Pop. (1891) 10,648.

Cowhage (sometimes called **Mucuna**): a drug which consists of the hairs of the pods of *Mucuna pruriens* (of the family *Leguminosæ*), a long twining plant with large trifoliate leaves and dark-purple or dark-greenish flowers, and largely cultivated in both the East and the West Indies. The hairs are about one-eighth of an inch long, and of a glossy-brown color. They easily penetrate the skin and produce an intolerable itching, which instead of being relieved by washing or rubbing is greatly increased. Very little is known of the chemical composition of the drug. It was originally employed as a vermifuge, but is now very little used. At one time it was made into an ointment and used as a counter-irritant to the skin of limbs which were suffering from paralysis, but this treatment can not only be of no value, it may be distinctly harmful by irritating the surface of limbs which are already in a condition of bad nutrition. H. A. H.

Cowl [O. E. *cuhle*, from Lat. *cucullus*, hood]: originally simply the hood which the monk draws over the head in order to prevent the eyes from glancing either right or left, and thus shut himself up in solitude even while among the multitude; but, as the cowl is the most characteristic part of a monk's dress, the word came in course of time and by an easy transition to mean the whole monastic garment.

Cow'ley, ABRAHAM, M. D.: English poet; b. in London in 1618; entered Trinity College, Cambridge, in 1637. His love for poetry was aroused by reading *The Faery Queen*, and he began to write at an early age, publishing a volume of poems called *Poetic Blossoms* when fifteen years old. He was ejected from college as a royalist in 1643, and removed to Oxford, where he continued his studies. In 1646 he went to Paris with the queen, and remained ten years. He published in 1647 *The Mistress*, a series of poems which abound in frigid conceits. In 1656 he returned to England, was imprisoned as a royalist, but was released through interest, and obtained the usufruct of one of the queen's estates, £300 yearly. From 1658 to 1660 he again lived in Paris. He studied natural history, and issued *Liber Plantarum* (1662–78). The epic *Davideis*, commenced in college, was never finished. His essays, as well as his anacreontics, evidence sensibility and refinement of thought, a facile imagination, a brilliant wit, and cultured mind, but are marred with the prevailing trivial love for glittering ingenuity of style. The most admired poet of his day, he is called on his tombstone "Anglorum Pindarus, Flaccus et Maro." His works were published by Sprat (1680), by Aikin (3 vols., 1802), and by Grosart (1881). D. in London, July 28, 1667. He was buried in Westminster Abbey, beside the remains of Chaucer and Spenser, where the Duke of Buckingham erected a monument in 1675. Cowley holds a high position as a prose-writer and an essayist.

Cow-parsnip: a large herbaceous plant of the genus *Heraeleum* of the family *Umbelliferæ*, or UMBELWORTS (*q. v.*), natives of the northern hemisphere and chiefly of the temperate regions of the Old World. The plants of this genus are characterized by their strongly flattened fruits, conspicuous white flowers in broad umbels, borne upon tall branching large-leaved stems, the leaves ternately compound. About fifty species are recognized by botanists. *Heraeleum lanatum* is the only North American representative. It occurs from Newfoundland and Labrador to British Columbia and Alaska southward to North Carolina, Kentucky, Texas, and California, and its fruit is said to be eaten by some of the native tribes. In the Old World it occurs in Japan and Siberia. It is a tall-growing woolly plant from 4 to 8 feet high, with a grooved stem and broad irregularly cut toothed leaflets. It is said to possess poisonous qualities. C. E. B.

Cowpen-bird: same as COWBIRD (*q. v.*).

Cow'pens: a village of Spartanburg co., S. C.; about 100 miles N. N. W. of Columbia. Pop. (1900) 692. Here Gen. Morgan defeated a British force under Col. Tarleton, Jan. 17, 1781. The British lost 300 killed and wounded; the Revolutionary force took 500 prisoners, 2 cannons, 800 muskets, and 2 standards, and had 12 killed and 60 wounded.

Cowper (properly pronounced "Cooper"), EARLS: Viscounts Fordwich (Great Britain, 1718), Barons Cowper (England, 1706), Barons Butler of Moore Park (England, 1679), Barons Dingwall (Scotland, 1607), and baronets (1642).—FRANCIS THOMAS DE GREY COWPER, seventh earl, a prince of the Holy Roman Empire, captain of the corps of gentlemen-at-arms; b. June 11, 1834; succeeded his father Apr. 15, 1856; from 1880–82 Lord-Lieutenant of Ireland.

Cowper, WILLIAM, Earl: English judge and orator; b. in 1664. He was called to the bar in 1688, and elected to Parliament in 1695. He became an excellent debater and the leader of the Whig party in the House of Commons. In 1705 he was appointed Lord Chancellor. He resigned the great seal when the Tories obtained power in 1710, but was reappointed in 1714. Having resigned office in 1718, he was then created an earl. D. Oct. 10, 1723.

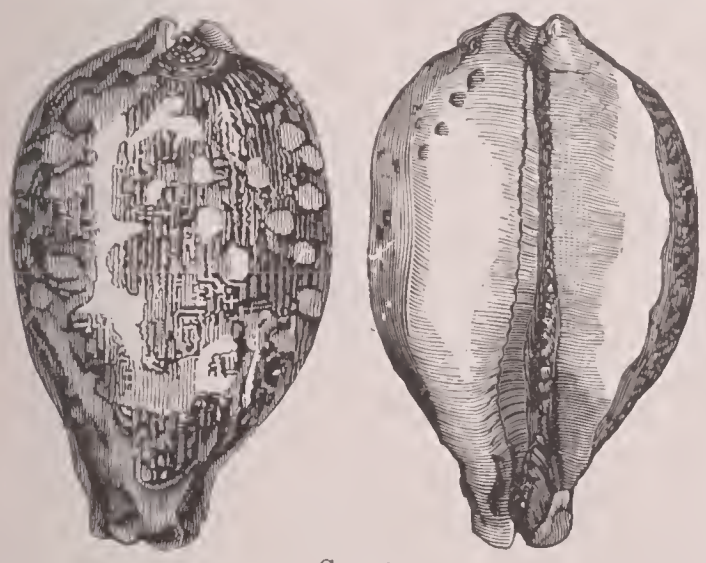
Cowper, WILLIAM: English poet; b. at Great Berkhampstead, Hertfordshire, Nov. 15, 1731; the son of the rector, John Cowper, chaplain of George II., and nephew of Earl Cowper. Deprived of his mother at the age of six, he was a tender, shrinking child, and a sensitive, melancholy boy at Dr. Pitman's school, made more so by the rough fagging at Westminster School, where he advanced in classical studies. First articled to an attorney, living in the Temple in 1752, and called to the bar in 1754, he never practiced. Appointed clerk of the journals in the House of Lords (1763), he could not bring himself to appear for nervousness. He determined on suicide, but wanted courage. Morbidly dejected, he was taken in Dec., 1763, to the private asylum of Dr. Nathaniel Colton at St. Albans, where he spent a couple of years, and then went to Huntingdon, where he came to know Mrs. Unwin, "Mary" in his poems. The acquaintance grew into a tender friendship, and ultimately to an engagement of marriage, her husband dying in 1767. Residing with the Unwins amid gentle and religious influences, where his spirit found repose and ease, he came to be intimate with their friend, Rev. Mr. Newton, whose employment of him as a kind of lay curate may have had the effect to bring back his mental malady. In 1773 he became insane again, and so all thought of marriage with Mrs. Unwin had to be abandoned. Tended by Mrs. Unwin through a long illness, in his convalescence he translated the hymns of Madame Guyon, and diverted himself with taming hares. Mrs. Unwin suggested a poem on the *Progress of Error* in Dec., 1780, and in three months he wrote *Truth*, *Table-talk*,

Progress of Error, and *Expostulation*, published in 1781. Lady Austen, whom he met in 1781, inspired him to write *The Task* (1783), and to translate Homer (1791), and first told him the story of John Gilpin (1782). *The Task* met with great success. In his later life Cowper became more and more the prey of dejection and remorse, which sometimes deepened into insanity. His *Private Correspondence* (2 vols., 1824) is gentle, thoughtful, and pervaded with playful humor. Cowper gave to English taste a simpler and more earnest cast. D. at East Dereham, Norfolk, Apr. 25, 1800. The best edition of his works is Southey's (15 vols., 1837–38), reprinted in Bohn's Library. See the *Lives* in Southey's edition, that of Hayley, and especially by Thomas Wright (London, 1892). Revised by S. M. Jackson.

Cowper's Glands: two small and rather lobulated yellowish glands which in the male of the human species are found between the layers of the deep perinæal fascia, under the anterior part of the membranous portion of the urethra. They secrete a mucus which flows into the bulbous portion of the urethra by a duct an inch long. The vulvo-vaginal glands (glands of Bartholine) are the analogues in the female.

Cowpox Inoculation: a species of inoculation, as a security against the smallpox; introduced by Dr. Jenner. It became general in 1799. The genuine cowpox appears in the form of vesicles on the teats of the cow. It was first brought into use by Jenner, who first vaccinated from arm to arm in 1796. He had been studying and experimenting about it for a number of years before. See Inoculation and Vaccination.

Cowry [sometimes *Courie*, representing *kaurī*, the Hindustani name]: a common name for the shells of the genus *Cypræa*, a group of ctenobranchiate mollusks, often termed porcelain shells from their smooth, polished appearance. The shells are spiral and convoluted, but the spire is concealed in the adult by the great development of the body whorl, so that the shell has a more or less oval outline, notched at either end. Moreover, the outer lip is bent inward, and the lips toothed. The foot is broad, the mantle expanded, and turned up over the shell where it secretes the enamel. Many



Cowry.

of the cowries are beautifully marked with rich colors, others are quite plain. There are something like 200 species, the majority being from the Indian and Pacific Oceans. They keep near shore and are most abundant about low-water mark. One small species, *Cypræa moneta*, is still used as a medium of exchange in parts of Africa, and it was formerly employed in such vast numbers that in one year no less than 300 tons were brought to Liverpool for the African trade. In Bengal it required over 5,000 cowries to equal one rupee (a silver coin which has varied in value from fifty cents down to twenty-eight or thirty cents), and yet the annual importation was in the vicinity of $100,000. Cowries are believed to have been used by the Assyrians, as specimens were found at Nineveh by Layard, but whether for ornamentation or as money is not known.

F. A. Lucas.

Cowslip: the common name in Great Britain of a variety of the native primrose (*Primula officinalis*), a low-growing herbaceous perennial, with ovate or oblong, slightly toothed radical leaves, which form a rosette or cluster at the ground. The flower-stalk rises from the leaf cluster and bears a few-flowered umbel of small yellow flowers. The species is separated into three races as follows: (1) flower-stalk one-flowered, *Primrose*; (2) flower-stalk bearing several umbelled small flowers, *Cowslip*; (3) flower-stalk bearing several umbelled large flowers, *Oxlip*. In the U. S. the *Dodecatheon meadia* is the American cowslip, and the name is applied also to Caltha (*q. v.*). C. E. B.

Cow-trees: trees of the tropics whose milky juice (*latex*) is used as human food. They are found in separated families, and have in some cases no close relationship with one another. In all cases, however, the milky product is derived from certain cells or tissues found in the stems, and is not, as is popularly supposed, the proper juice of the plant. These milk-vessels, or as they are known in botany, the *laticiferous* vessels, are described in the article Histology, Vegetable (*q. v.*). It is necessary here only to say that the laticiferous vessels of plants are generally continuous tubes lying in the midst of other tissues, and that they contain a white, red, yellow, or almost transparent fluid in which starch granules and various alkaloids are usually present. In the Poppy (*q. v.*) the latex contains opium, while in some figs and related trees it contains caoutchouc. In many cases the alkaloids are harmful or even virulently poisonous, but in the cow-trees the latex is wholesome, and is much used by the natives of the regions where the trees abound. The best known of these trees is the *Brosimum galactodendron*, a near relative of the bread-fruit tree of the family *Urticaceæ*, a tree 80 to 100 feet in height, of the forests of Guiana. The latex flows copiously from incisions made in the trunks, and is used in the place of cow's milk by both natives and Europeans. C. E. B.

Cox, David: English landscape-painter; b. at Deritend, a suburb of Manchester, Apr. 29, 1793; son of a blacksmith; studied drawing, and became a scene-painter; in 1804 removed to London, where he studied under John Varley; in 1813 became a member of the Society of Painters in Water Colors; for several years taught drawing in Hereford and elsewhere; from 1827 to 1841 resided in London; then made Harborne, near Manchester, his home, and died there June 15, 1859. He left above 100 paintings in oil-colors, but is best known as a water-color painter, and as such is one of the most noted in the history of English art. His works in water-colors are very numerous, and are characterized by simplicity, pure and brilliant color, and faithfulness to nature, especially her atmospheric effects. Among them are the oil-paintings *Peace and War* (1846) and *The Church of Bettws-y-Coed*, and the water-colors *Ulverston Sands* (1835) and *Bolton Abbey* (1849). He wrote a *Treatise on Landscape-painting and Effect in Water-colors* (1814).—His son, David Cox (1809–85), was a water-color painter of some note.

Cox, Sir George William, Bart., M. A.: Greek scholar; b. 1827; educated at Rugby and at Trinity College, Oxford; since 1881 rector of Scrayingham, Yorkshire. Author of many works on history and mythology, especially of Greece, including *Tales of the Gods and Heroes* (1862); *Tales of Ancient Greece* (1868); *Latin and Teutonic Christendom* (1870); *The Mythology of the Aryan Nations* (2 vols., 1870); *Introduction to the Science of Comparative Mythology and Folklore* (1881); *Lives of Greek Statesmen* (2 vols., 1886). Author also of *Poems, Legendary and Historical* (1850); *Life of John William Colenso* (1888); *The Church of England and the Teaching of Bishop Colenso* (1888). He contributed many articles to the ninth edition of the *Encyclopædia Britannica*. In 1891 he was chosen to the see of Natal by the followers of the deposed Bishop Colenso, but refused consecration by the Archbishop of Canterbury and the English bishops. William Stevens Perry.

Cox, Jacob Dolson, LL. D.: statesman; b. in Montreal, Canada, Oct. 27, 1828. His parents were natives of the U. S. The family removed to Ohio, where he studied at Oberlin College, and was admitted to the bar. In 1859–61 he was a member of the State Senate. He became a major-general of Union volunteers in the autumn of 1862, and served under Gen. Sherman in Georgia in 1864. In December of that year he commanded a division at the battles of Franklin and Nashville. He was elected Governor of Ohio by the Republicans in Oct., 1865, held that office two years, and was appointed Secretary of the Interior in Mar., 1869. He resigned in Nov., 1870; was representative in Congress 1877–79. He became dean of the law school of Cincinnati University in 1881, and president of that university in 1885. D. Aug. 4, 1900.

Cox, Kenyon: figure-painter; b. at Warren, Ohio, Oct. 27, 1856; son of Jacob D. Cox; pupil of Gérôme and Carolus-Duran, Paris; second Hallgarten prize, National Academy, New York, 1889; two third-class medals, Paris Exposition, 1889; Temple silver medal, Pennsylvania Academy, Philadelphia, 1891; member of the Society of American Artists (1882); honorary member and instructor Art Students League; member Architectural League, New York. He began his art studies in Cincinnati; worked after that for a time in Philadelphia, and went to Paris in 1877. He is one of the best of American draughtsmen, and frequently paints pictures of the nude figure. His portraits are notable for simple arrangement and fine technical qualities. Some of his best works are *Jacob Wrestling with the Angel*; *Portrait of Augustus St. Gaudens*; *Vision of Moonrise*; *Blonde*; *Flying Shadows* (a landscape); and *Painting and Poetry*, a large decorative composition. He is a prolific and talented illustrator. His designs for *The Blessed Damozel*, by Dante Gabriel Rossetti, are justly ranked with the best illustrative work of the day. His drawing of the human figure is generally marked by simplicity, and he has a strong feeling for style; more distinguished as a draughtsman than as a colorist, his work is by no means deficient in the latter quality, and in some of his pictures the chief charm lies in the color scheme and the artistic harmony with which it is expressed. He is a vigorous and able writer of criticisms and reviews. Studio in New York. William A. Coffin.

Cox, Melville Beveridge: the first Methodist Episcopal foreign missionary; b. at Hallowell, Me., in 1799; entered the ministry in 1822, and sailed as missionary to Liberia Nov. 3, 1832. Here he labored with great zeal and success for some months. He died of "African fever" July 21, 1833.

Cox, Palmer: See the Appendix.

Cox, Richard: Bishop of Ely; b. in 1499; was the tutor of King Edward VI. He translated for the Bishop's Bible the four Gospels, the Acts, and the Epistle to the Romans. D. July 22, 1581.

Cox, Samuel, D. D.: General Baptist; b. in London, England, Apr. 19, 1826; graduated at the Stepney Baptist Theological College, London, 1851; was pastor in Nottingham from 1863 till his death at Hastings, Mar. 27, 1893. He founded *The Expositor* in 1875, and edited it till 1884 with marked ability, but his advocacy of Restorationism compelled his resignation. He was the greatest of modern English Bible expositors, as distinguished from exegetes. His principal publications are *The Quest of the Chief Good*, a commentary upon Ecclesiastes (London, 1865; 2d ed. 1890); *The Private Letters of St. Paul and St. John* (1867); *The Pilgrim Psalms* (1874); *Ruth* (1875); *Salvator Mundi* (defense of Restorationism) (1877; 11th ed. 1888); *Job* (1880; 2d ed. 1885); *The Larger Hope, a Sequel to Salvator Mundi* (1883); *Balaam* (1884).

Cox, Samuel Hanson, D. D., LL. D.: Presbyterian author and divine of Quaker parentage; b. in Rahway, N. J., Aug. 25, 1793; was ordained July 1, 1817. He was pastor of the Spring Street church, New York (1820–33), Professor of Sacred Rhetoric at Auburn Theological Seminary (1834–37), and pastor of the First Presbyterian church, Brooklyn, N. Y. (1837–54). He was an early and eminent advocate of temperance, anti-slavery, and other reforms. He wrote *Quakerism not Christianity* (New York, 1833). D. Oct. 2, 1880.

Cox, Samuel Sullivan, LL. D.: b. at Zanesville, O., Sept. 30, 1824; graduated at Brown University in 1846; was a Democratic member of Congress from Ohio 1857–65, and from New York city 1869–85. He was a well-known lecturer, and in addition devoted much time to literature. He published *Eight Years in Congress* (1865); *Why We Laugh* (1876); *Three Decades of Federal Legislation* (1885); *The Diversions of a Diplomat in Turkey* (1887), etc. Became U. S. minister to Turkey in 1885; resigned 1886; re-elected member of Congress from New York in 1886 for unexpired term of J. Pulitzer, and for 1887–89; re-elected Nov. 6, 1888. D. Sept. 10, 1889.

Cox, William Van Zandt: See the Appendix.

Coxal'gia [Lat. *coxa*, hip + Gr. ἄλγος, pain], or **Coxi'tis** (technically known as *Morbus coxarius*, or hip-joint disease): an inflammation of the hip-joint, sometimes very rapid, more often slow and insidious, which may begin either in the head of the thigh-bone or the socket of the hip-bone, or else in the membrane (*synovial*) that lines its cavity, but which finally extends to all its tissues, cartilages, ligaments, and surrounding soft parts. Inflammation of the bones (*osteitis*), by far the most common origin of the disease in children, is usually chronic and insidious in its development, and is favored by the incomplete ossification and active nutrition of the bones in childhood. Inflammation of the lining membrane (*synovitis*) is a not infrequent form of hip disease in adolescence and adult age. Chronic infantile coxitis principally affects children between one and five years of age, and is often awakened by a fall or blow, especially when such accident occurs to children of a tuberculous or scrofulous constitution. The first symptom is lameness, followed by pain, first felt in the knee, afterward excited in the joint itself by direct pressure, by motion of the limb, or by the weight of the body resting upon it. To lessen this weight the patient rests on the ball of his foot, and drags the leg in walking, stiffly extending it. At this stage it is turned a little outward by spasmodic contraction of the muscles on the outer side of the joint. But very soon, in order to still further lessen the weight, the body bends over on the thigh, and the arm and lame part of the back, with the abdomen, are carried forward. When the patient lies down, therefore, a space is left between the body and the bed, and if the spinal column be forcibly straightened out and the curve flattened, the thigh in turn is bent on the body by contraction of the muscle that runs from the spinal column to the neck of the thigh-bone (*psoas*). Still, for the purpose of lessening weight, the hips are tilted toward the painful side, and appear oblique, while the leg is thus apparently lengthened. Behind, the nates are flattened. It soon becomes impossible to move the head of the thigh-bone in its socket; the whole hip moves with every motion communicated to the leg. This sign is most characteristic of the confirmed disease; it is due at first to the spasmodic rigidity of muscles—later to inflammatory adhesions.

In the second stage the amount of serous fluid in the joint cavity is increased, the thigh is more strongly bent on the body (flexed), and drawn inward (adducted), so that the foot crosses the opposite leg. The affected limb is therefore apparently shortened. Swelling may appear in the groin and at the outer aspect of the thigh; the pain becomes severe; standing and walking are difficult.

In the third stage the cavity fills with matter or "pus," the ligaments of the joint are relaxed, abscesses form in the neighborhood, and all the soft parts are swollen by inflammatory exudations. Dislocation occasionally, though rarely, occurs. Sometimes the head of the thigh-bone separates from its shaft, and adheres to the socket of the joint, while the socket itself is enlarged. The patient's strength is severely undermined, hectic fever sets in, the emaciation is extreme, and death may occur gradually from exhaustion, or more rapidly from acute absorption of poisons produced by pus.

The diagnosis of *morbus coxarius* is only difficult in the first stage. The lameness may simulate that of muscular paralysis, from which it is distinguished by the freedom with which the head of the thigh-bone may be moved; or the pain in the knee may fix suspicion on the wrong joint; or the thigh may exactly imitate hysterical muscular contraction; but in this affection the limb relaxes completely under chloroform.

The prognosis for spontaneous cure is always very unfavorable. After suppuration death may be caused by pyæmia, by exhaustion, by general tuberculosis, or by amyloid disease. Appropriate treatment of the first and second stages offers about 50 per cent. of recoveries; operative treatment of the third stage has so far cured about one-half of the cases submitted to it. In a large number of cases, although the inflammation is arrested, and hence life is saved, the joint becomes permanently immobilized (ankylosis) by fibrous bands within and around its cavity, that hold the articular surfaces firmly together (false ankylosis). This result is to a certain extent favored by the treatment adopted for the cure of inflammations; it is important therefore that the stiffened limb be left in the most favorable position for use—namely, extension.

The treatment varies according to the stage of the disease. During the primary osteitis that so often precedes inflammation of the joint, and is indicated by the one symptom of lameness, constitutional treatment is to be adopted—cod-liver oil, iron, cinchona, nourishing food, fresh air, and salt-water bathing. As soon as the movements of the joint are compromised, local treatment becomes of primary importance. It aims—1, to immobilize the joint, so as to prevent friction of the inflamed parts; 2, to extend the limb, so as to overcome the tension of the spasmodically contracted and shortened muscles, and to separate as much as possible the

folds of the lining membrane, to reduce to a minimum size the cavity of the joint, and thus favor the reabsorption of fluids; finally, to leave the limb in the best position for use should it become permanently stiffened. The limb can only be maintained in extension by a force sufficient to overcome these spasmodic muscular contractions. Many apparatuses are devised for this purpose, in which the limb is straightened out and fastened to an inflexible plane, and forcibly retained in this position by means either of a weight attached to the foot or a sliding screw at the knee. The simplest form of apparatus is made by swathing the limb in bandages stiffened by plaster-of-Paris or dextrin. These are only adapted to the earliest stage, or when cure is already progressing. It enables the patient to walk about. This facility is also afforded by steel apparatus that supports the limb at the waist and foot, and gradually extends it by continued traction at the knee. In other cases the patient is kept in bed, the leg fastened to a simple long splint, with a cross-piece under the foot, to which is attached a weight. A large double gutter, in which were laid the entire pelvis and both lower extremities of the patient, was formerly famous, but is now seldom used. Other methods, as by external application of blisters or ointments, or repeated blisterings, or by the use of the cautery, formerly much in vogue, are now generally condemned.

When suppuration has occurred within the joint, or even when there is any thickening of the upper end of the femur, or of the joint structures, and especially when pus has discharged externally by one or more fistulæ, it is necessary to amputate (resect) the head of the thigh-bone. Very extensive destruction of the hip-bone and certain general diseases, amyloid disease or general tuberculosis, with incoercible diarrhœa, contra-indicate the operation. After it, death may result from such complications or from surgical fever (pyæmia, septicæmia). When successful, however, the patient is rescued from an otherwise certain death, and the joint recovers a certain degree of function, with some shortening of the limb, nevertheless with very great usefulness; ankylosis being much less frequent than after treatment by immobilizing apparatus.

MARY C. PUTNAM JACOBI.
Revised by ROSWELL PARK.

Coxe, ARTHUR CLEVELAND, D. D., LL. D.: clergyman and author; son of Dr. Samuel H. Cox; b. at Mendham, N. J., May 10, 1818; graduated at University of New York in 1838, and at the General Theological Seminary of the Protestant Episcopal Church; took holy orders in 1841. He wrote, besides other works, *Christian Ballads* (1840); *Athanasian and Other Poems* (1842); *Saul, a Mystery, and Other Poems* (1845); *Thoughts on the Services*; *Impressions of England* (1856), etc. He became rector of Calvary church New York in 1859, and Bishop of Western New York in 1865. D. at Clifton Springs, N. Y., July 20, 1896.

Coxe, REGINALD CLEVELAND: son of Bishop A. C. Coxe; marine painter; b. in Baltimore, July 21, 1855. Pupil of Bonnat, Paris; member of Society of American Artists (1888) and Architectural League, New York. His pictures of the sea are fresh in their impression of nature. He is also an etcher of ability. Studio in New York. W. A. C.

Coxe, TENCH: political economist; b. in Philadelphia, Pa., May 22, 1755; during the Revolution was at first a royalist, but later turned Whig; member of the Continental Congress in 1788. He labored in behalf of manufactures in the U. S., and was especially prominent in urging the introduction of the cotton industry in the South. Among his works are *An Inquiry into the Principles of a Commercial System for the United States* (1787); *View of the United States* (1787–94); and *On the Navigation Act* (1809). D. in Philadelphia, July 17, 1824.

Coxe, WILLIAM: an English historian; b. in London, Mar. 7, 1747. He was appointed curate of Denham in 1771. He published, besides other works, *Travels in Russia, Poland, Sweden, and Denmark* (1784); a *History of the House of Austria* (1792); *Memoirs of Sir Robert Walpole* (3 vols., 1798); and *Memoirs of the Kings of Spain of the House of Bourbon, 1700–88* (1813). He became Archdeacon of Wilts in 1805. D. at Bemerton, June 16, 1828.

Coxsackie, kŏŏk-saw'kĕ: village; Green co., N. Y. (for location of county, see map of New York, ref. 6–J); on West Shore and N. Y. C. and H. R. railways; 21 miles S. of Albany; has a public school, large valve-factory, fire-hydrant factories, shirt-factory, brick-works, and large ice-houses. Pop. (1880) 1,661; (1890) 1,611; (1900) 2,735.

EDITOR OF "NEWS."

Coyo'te (native Mexican *coyotl*): the small barking or prairie wolf, *Canis latrans*, abundant in the Western and Southwestern U. S. and parts of Mexico. See WOLF.

Coypel, NATALIS, or NÖEL: painter; b. in Paris, Dec. 25, 1628. He studied in Orleans under Poncet. At the age of fourteen he returned to Paris, studying with Guillerie, and then with C. Errard, who presented him to the king. At eighteen he was commissioned with the decorations for *Orpheus*, and from that time was always employed by royal patrons. In 1655 he painted in the Louvre the oratory and the king's apartment, also that of Cardinal Mazarin. He painted the ceilings of the queen's room for the marriage of Louis XIV., also the magnificent saloon of machinery in the Tuileries, besides many works at Fontainebleau. He married, at thirty-one, Magdalen, daughter of Kirault, and was received into the Royal Academy of Painting in 1663. In 1660 Coypel decorated the king's apartment at the Tuileries. He was afterward sent to Rome as director of the French Academy, and spent four years there, during which time he produced his pictures of *Solon*, *Trajan*, *Alexander Severus*, and *Ptolemy Philadelphus*. He was recalled to Paris to succeed Mignard as first painter to the king and permanent director of the Academy. Here he remained till his death. D. Dec. 24, 1707.

W. J. STILLMAN.

Coy'pu: a large South American rodent (*Myopotamus coypus*) of the family *Octodontidæ*, resembling in its appearance a huge house-rat. It attains a length of over 3 feet. The fur is long, under fur thick and soft; upper parts dusky, penciled with brownish yellow; sides and under parts brownish yellow in general hue; tip of muzzle and chin white. The coypu is the only species of the genus. It is found from Eastern Brazil southward, occurring on both sides of the Andes. Ordinarily it is a resident of streams and rivers, but in some localities dwells on the coast, making its burrows in the woods a short distance from the shore. It was formerly exported in large quantities for fur, known in the U. S. as *nutria*, the Spanish name for otter. F. A. L.

Coypu.

Cozumel' (in Maya, *Coyumil*): island off the east coast of Yucatan; separated from the mainland by a deep channel 9 miles wide. Length from N. to S., 24 miles; width, 7 miles. It is low and flat, and bordered by reefs; the surface is covered with low trees and bushes, and is partly marshy. Cozumel was discovered by Grijalva, May, 1518, and visited by Cortés in 1519. It was then inhabited by Maya Indians, and remains of their temples and houses still exist (see CENTRAL AMERICAN ANTIQUITIES). It has a small village or pueblo at the northwest angle, called San Miguel, but the most of the island belongs to the hacienda of San Marin, and is devoted to cattle-raising. The island is surrounded by a dangerous coral reef, and has no port.

HERBERT H. SMITH.

Coz'zens, FREDERICK SWARTWOUT: writer; b. in New York, Mar. 5, 1818; was a wine-merchant. He contributed to the *Knickerbocker Magazine* and *Putnam's Magazine*, and for many years published a periodical connected with his business and called the *Wine Press*, in which he wrote interesting articles on grape cultivation and wine-making. Among his works are *Prismatics* (1853); *Sparrowgrass Papers* (1856); *Acadia: or a Sojourn among the Bluenoses* (1858); and *Stone House on the Susquehanna*. D. Dec. 23, 1869.

Crab: the common name of various arthropodous animals, most of which belong to the brachyurous DECAPODA (*q. v.*). Over 1,000 kinds of true crabs are known, most of which have no common names. The following are the best known:

Fiddler Crab.—Species of the genus *Gelasimus*, characterized by having a rhomboid body, and in the male one pincer enormously developed so that it is likened to a violin. Fiddler crabs are amphibious, and live in large colonies in holes in the seashore in the warmer parts of the world. Some forty or fifty species are known.

Hermit Crab.—Anomurous decapods of the family *Paguridæ*, genera *Pagurus*, *Diogenes*, etc., in which the abdomen is not hardened, and hence is exposed to injury. To protect itself the crab inserts its hinder body into the cavity of some cast-off snail-shell, which, held in position by the modified legs of this region, is carried about by the crab.

At the approach of danger the crab retracts itself entirely into the shell, closing the opening by the hard pinching

Hermit crab (in shell).

Hermit crab (without shell).

claws. Hermit crabs occur in all the seas of the world, some living on the shore, others in deep water.

The *Lady Crab* is the *Platyonichus ocellatus* of science. It has a circular body, with flattened feet, and is ornamented by small circles of darker color.

There are several species of *land crabs* in the tropics, mostly belonging to the genera *Uca* and *Gecarcinus*. They have heart-shaped bodies and long legs. They live mostly in the forests, only going to the sea to lay their eggs. When abundant they can cause considerable damage to fields of sugar-cane and the like, as they are largely vegetarians in their diet.

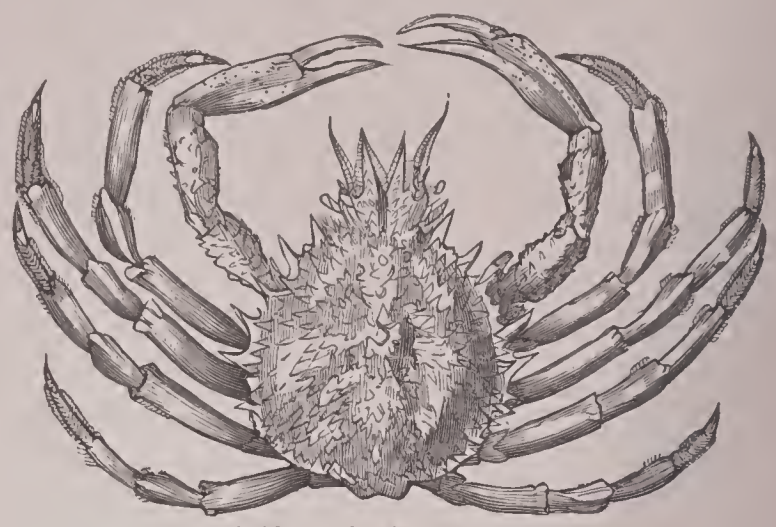
The *Oyster Crab* (*Pinnotheres ostreum*) is a small round crab with thin shell and weak legs, the female of which spends its life inside the shell of the oyster, while the male is but rarely found in such places. The name *Pinnotheres* (pinna = guardian) was given to another similar crab which lives in the pinna-shell, under the belief that it lived here as a guardian to the mollusk, warning it of the approach of danger and telling it when to close the shell. It is hardly necessary to say that its choice of a home is made for protection.

The *Palm Crab* (*Birgus latro*) of the East Indies is a near relative of the hermit crabs, but unlike them it never protects its abdomen with a shell. It is a large form, weighing

Palm crab: *Birgus latro.*

sometimes 20 lb. It lives in holes in the ground which it lines with the fiber of the cocoanut. It is said by some to climb the palm-trees for the cocoanuts on which it feeds; others say it eats only the nuts which fall to the ground. These it opens by boring into the "eyes" and then breaking the shell with its stout claws. Especial interest centers in the palm crab from the fact that it has developed, as a result of its terrestrial life, a spongy organ distinct from the gills which functions as a lung, although, of course, it has no homology with the lungs of the vertebrates.

The *Porcelain Crabs* (*Porcellana*) are small tropical crabs with very hard, brightly colored, and highly polished shells, resembling porcelain.



Spider crab: *Maia squinado.*

The *Rock Crabs* (*Cancer*, etc.) live among the rocks, and are usually large and strong forms, the common rock crab

Spider crab: *Parthenope horrida.*

of California (*Cancer magister*) measuring 2 feet across. All have elliptical shells, the edges being frequently toothed and the body brightly colored.

The swimming crab.

The *soft-shelled* crabs of the markets are members of the group of swimming crabs (*Portunidæ*), in which the body is produced on either side into a long sharp spine, while the hinder feet are flattened into an oar. Like all crabs, these swimmers periodically cast the old shell, and, when taken before the new shell is hardened, they form the soft-shelled crabs of the table. Thus it is evident that it is not so much a species as a condition which constitutes the soft shell; still on the east coast of America *Neptunus hastatus* is the crab most usually employed. When the shell has become hardened the species is commonly known as the *blue crab*.

Many hundred species of small-bodied, long-legged crabs (*Maioidea*) are known as spider crabs. Some of these occur in Arctic seas, but the majority are tropical. As a group they are of considerable interest, especially from the way in which they attach seaweed and sedentary animals to the shell as a means of concealment. To this group belongs the largest crab known, the *Macrocheira* of Japan, which will sometimes measure across the outspread legs as much as 12 feet.

Most crabs act as scavengers, eating up decaying animal and vegetable matter which they find in the sea. In turn, all of them which are large enough are valuable as food, although, excepting the soft-shelled forms, they are largely neglected as a food supply. See CRAB-FISHING.

J. S. KINGSLEY.

Crab-apple (*Pyrus coronaria*): a small tree growing wild in the U. S., bearing rose-colored fragrant blossoms and fragrant greenish fruit, which is prized for preserves. Another wild crab-apple, the *Pyrus angustifolia*, also grows in the Southern States. The cultivated crab-apple is the *Pyrus baccata*, a native of Siberia. (See APPLE.) The term is commonly used to denote any small and sour hard apple which is fit only for culinary purposes.

Crabbe, GEORGE: poet; b. in Aldborough, Suffolk, England, Dec. 24, 1754. He learned the profession of surgeon, which he soon renounced. He went to London in 1780, and soon produced *The Candidate*, an unsuccessful poem, and was reduced to extreme poverty, from which he was relieved by the generosity of Edmund Burke, who received him as an inmate in his own house, and secured the publication of *The Library* by Dodsley (1781). Having taken holy orders in 1782, he became chaplain to the Duke of Rutland at Belvoir Castle, and married Miss Sarah Elmy. His reputation was increased by *The Village*, a poem (1783). He became curate of Strathern in 1785, and obtained the living of Trowbridge, in Wiltshire, in 1813. Among his works are *The Parish Register* (1807), *The Borough* (1810), and *Tales in the Hall* (1819). He was distinguished for his vigor and the "Chinese accuracy" of his observation. D. Feb. 8, 1832. See *Life of George Crabbe*, by his son (1838); also Kebbel, *Crabbe* (1888).

Crab-fishing: crabs are extensively used for food, and among the many edible species may be mentioned the great crab of Europe (*Cancer pagurus*), the closely related *Cancer magister* of the Pacific coast of the U. S., the European stone crab (*Carcinus mœnas*), the West Indian land crab (*Gecarcinus ruricola*), and pre-eminently the blue crab (*Callinectes hastatus*) of the Atlantic coast of the U. S. Crabs are caught in shallow water with dip nets, or in some instances by poking them gently with a pole, which they seize with their strong front claws, and allow themselves to be drawn sufficiently near the surface to be dipped up. Many, especially those dwelling at moderate depths, are taken in crab-pots, wicker or network traps baited with fish or offal, while others are caught in shallow hoop-nets, these being coarse-meshed nets, something like a deep pudding-dish in shape. A boat carries a dozen of these nets, which have the bait tied to the center, and are lowered to the bottom, so as to lie quite flat. When there is reason to suppose that there are crabs in a net, it is pulled so swiftly and steadily to the surface that the occupant can not escape. On the Atlantic coast the blue crab is captured on hand-lines baited with meat, fish, or the refuse of dressed fowls. The crabs cling to the bait until it is near the surface, when they are promptly scooped up with coarse-meshed dip-nets. Trawls, or trot-lines, are sometimes used, these being lines from 200 to 1,200 feet long, having shorter lines bearing bait suspended from them at short intervals. These lines are either anchored or, as in Louisiana or Texas, where the longest lines are used, set from the shore. In the former case the fisherman "under-runs" the line at frequent intervals from one end to the other, dipping up such crabs as may be attached to the baits; in the latter the drop-lines are longer, and are simply hauled inshore and cast out again. In suitable places crabs are caught in small seines, and many are taken in seining fish, often proving an annoyance to the fishermen from the manner in which they become entangled in the meshes of the net. Soft-shell crabs, or shedders, as those are termed which have just cast their shells, are on the U. S. Atlantic coast much more highly prized than the ordinary hard-shelled individuals, and are usually taken with dip-nets, as they will not take bait. Crabs are kept for market in floating pens or cars, and shipped in boxes packed with wet grass or seaweed, the soft-shelled crabs being packed very carefully, inclined at such an angle as to preserve the moisture in the gills. Crabs are canned and, where abundant, often used as manure. They are also largely used for bait, the shedder crabs being a favorite bait for tautog, while on the English coast the hermit crab is a favorite.

The following table shows the magnitude of the crab-fisheries of the U. S. Maryland leads in the number of crabs taken, but the catch of New York is the most valuable, while, owing to the size of the principal edible crab of the Pacific coast, the catch of California is worth almost as much as that of Maryland:

STATISTICS OF CRAB-FISHERIES FOR 1888.

DIVISIONS.	Pounds.	Value.
New England and Middle States	2,596,233	$65,226
Southern States	3,791,430	64,869
Gulf States	1,081,539	24,392
Pacific coast	231,875	37,770
Totals of hard crabs	7,701,077	$192,257
Soft crabs	2,752,909	219,614
Totals	10,453,986	$411,871

The king crab, or horseshoe crab (*Limulus polyphemus*), is of considerable local importance in the manufacture of fertilizer, and is used to a limited extent for feeding pigs and chickens, and baiting eel-pots. In the months of May and June the king crabs seek the shore to spawn, crawling out on sandy beaches in almost incredible numbers. They are usually picked up with a pitchfork or improvised spear and tossed into carts, but at some places pound-nets are used for their capture. The king-crab industry is practically confined to New Jersey, the total catch of that State, New York, and Delaware in 1888 being 3,841,000 lb., worth $8,436.

F. A. LUCAS.

Cra'bro [Lat., hornet]: a genus of hymenopterous insects; belonging to the section Aculeata, or stingbearers, and to the sub-section Fossores (burrowers). The hornet (*Crabro vulgaris*) is the type of this genus, which is now raised to the rank of a family named *Crabronidæ*. Some insects of this family excavate their nests or retreats in woods. In the U. S. they build in fences, trees, etc.

Cracow, or **Krakau**, kraa'kow: a city in Austrian Poland; on the left bank of the Vistula; 158 miles S. S. W. of Warsaw. It is connected by a railway with Vienna, Berlin, and Warsaw (see map of Russia, ref. 8–A). It is the seat of a Roman Catholic bishopric, has a castle founded about 700 A. D., a magnificent cathedral, 36 churches (formerly 76), 7 Jewish synagogues, a university (begun in 1343, chartered in 1364, finished in 1401, and reorganized in 1817), a library of 300,000 volumes, a botanic garden, and many monasteries. In 1893 the university had 126 teachers and 1,210 students. Cracow, founded about 700 A. D., was the capital of Poland from 1320 to 1609, when the court was removed to Warsaw. The Kings of Poland, however, were crowned here until 1764. On the third partition of Poland, in 1795, it was annexed to Austria. It belonged to the duchy of Warsaw from 1809 to 1812. The Congress of Vienna (1815) formed it, with a small territory, into a free state, under the protectorate of Russia, Austria, and Prussia. In 1846 it was again annexed to Austria. Pop. (1890) 76,025.

Crafts, JAMES MASON: See the Appendix.

Crafts, WILBUR FISK, B. D.: writer and lecturer; b. in Fryeburg, Me., Jan. 12, 1850; graduated at the Wesleyan University, Conn. (1869), and the School of Theology of the Boston University (1872). He served Methodist churches 1872–80; the Lee Avenue Congregational church, Brooklyn, 1880–83; the First Union Presbyterian church of New York city 1883–89; then became secretary of the American Sabbath Union, and later editor of the *Christian Statesman*,

Pittsburg, Pa. He is prominent in the National Temperance Society, the International Law and Order League, Sunday-school work, and the like. Jointly with his wife he has published *Through the Eye to the Heart* (New York, 1873); *The Coming Man is the Present Child* (Chicago, 1879); *Pocket Lesson Notes* (New York, 1886). Jointly with Prof. H. F. Fisk he published *Rhetoric Made Racy* (1884). He has also published *The Bible and the Sunday-school* (1876); *The Rescue of Child Soul* (London, 1880); *Plain Uses of the Blackboard* (New York, 1880); *Teacher's Edition of the Revised New Testament* (1881); *Talks to Boys and Girls about Jesus* (1881); *Must the Old Testament Go?* (Boston, 1883); *Successful Men of To-day* (New York, 1883); *What the Temperance Century has Made Certain* (1885); *The Sabbath for Man* (1885; revised and enlarged edition in 1892). WILLIS J. BEECHER.

Craig, JOHN: Scottish Reformer; b. in 1512. Educated at St. Andrews, he entered the Dominican order, and had charge of the novices at Bologna. Converted to the doctrines of the Reformed Church by reading a chance copy of Calvin's *Institutes*, he was tried and condemned to be burned by the Inquisition, but was saved by a mob, which, on the death of the pope in 1559, broke open the prison. He returned to Scotland 1560, and became a colleague of John Knox in the church of Edinburgh 1563. He was appointed chaplain to James VI. in 1579, and took part in the composition of the National Covenant in 1580. D. in Edinburgh, Dec. 12, 1600.

Craig, JOHN NEWTON, D. D.: secretary of Home Missions of the Presbyterian Church (South); b. in Rockingham co., Va., May 14, 1831. He was educated at Washington and Lee College, the University of Virginia, Union Theological Seminary, Virginia, and Columbia Theological Seminary, South Carolina. He has been pastor at Lancaster Courthouse, S. C., chaplain in the Confederate army, and pastor at Holly Springs, Miss. He edits the home mission paper of his church, published at Atlanta, Ga.

Craig, OSCAR JOHN: See the Appendix.

Craig, Sir THOMAS: Scottish lawyer; b. in 1538; was appointed a judge (justice depute) in 1564; knighted in 1603. He wrote, besides Latin poems, a celebrated *Treatise on Feudal Law* (*Jus Feudale*, 1608; 3d ed. 1732). D. Feb. 26, 1608.

Craig, WILLIS GREEN, D. D., LL. D.: Presbyterian theologian; b. in Lincoln co., Ky., Sept. 27, 1834, and educated at Centre College, Danville, Ky., and the Danville Theological Seminary, Kentucky. In 1862 he became pastor of the Westminster Presbyterian church of Keokuk, Ia. From 1882 he was Professor of Biblical and Ecclesiastical History in McCormick Theological Seminary, Chicago, till 1891, when he was transferred to the chair of Didactic and Polemic Theology. In 1893 he was elected moderator of the General Assembly. WILLIS J. BEECHER.

Craik, DINAH MARIA, better known as **Miss Mulock**: English novelist; b. at Stoke-upon-Trent in 1826. Her first novel, *The Ogilvies*, was published in 1849, and *John Halifax, Gentleman*, in 1857. In 1865 she married George Lillie Craik, a nephew of Prof. George Lillie Craik, the author. Besides novels and other works, she published a volume of poems. D. Oct. 12, 1887.

Craik, GEORGE LILLIE: Scottish author; b. in Fifeshire, Scotland, in 1799. In 1830 he published an interesting compilation of biographical anecdote, *The Pursuit of Knowledge under Difficulties*, in one volume. This was originally issued by the Society for the Diffusion of Useful Knowledge, but has since been many times reprinted. He wrote several of the books published by the above-named society in their well-known series, and he also rendered much valuable help in the preparation of Knight's *Pictorial History of England*, and wrote many of the historical and biographical articles in the *Penny Cyclopædia*. In 1836 appeared in the Useful Knowledge Series *Paris and its Historical Scenes*; in 1844–45 *Sketches of the History of Literature and Learning in England*. This excellent work of permanent value was rewritten from chapters on the subject in the *Pictorial History of England*. A new and enlarged edition, *Manual of English Literature and the English Language*, was published in 1862. In 1845 Craik published *Spenser and his Poetry* (3 vols.), and in 1846–47 *Bacon, his Philosophy and Writings* (3 vols.). Each of these books was reprinted in 1859–60 in one small volume. The *Bacon* is a remarkable piece of condensation, completeness, and accuracy. In 1848 appeared another book of anecdote, which has had a wide popularity, *The Romance of the Peerage*. In 1849 Craik was made Professor of History and of English Literature in Queen's College, Belfast. In 1851 he published *Outlines of the History of the English Language*, and in 1857, the first of many books of its kind, *The English of Shakespeare Illustrated by a Philological Commentary on his Julius Cæsar*. D. June 25, 1866.

Craik, ROBERT: See the Appendix.

Crajova: See KRAJOVA.

Crake (Crex): See CORN-CRAKE.

Cramer, MICHAEL JOHN, D. D.: author and minister of the Methodist Episcopal Church; b. at Schaffhausen, Switzerland, Feb. 6, 1835; graduated at Ohio Wesleyan University, Delaware, O., 1860; chaplain U. S. army 1864–67; U. S. consul at Leipzig 1867–70; U. S. minister to Denmark 1870–81; U. S. minister to Switzerland 1881–85; Professor of Systematic Theology, Boston University, 1885–87, resigning on account of ill-health. He became associate editor of the *Theological Quarterly Review* in 1889, and contributed largely to the *Methodist Review*, the *German Theological Review*, and other periodicals. After filling the chair of Church History at Drew Theological Seminary for a year, he became, in 1897, Professor of Philosophy in Dickinson College. D. at Carlisle, Pa., Jan. 25, 1898.

Cramp: a spasmodic, involuntary contraction of voluntary muscles, often painful in character. The name cramp is popularly applied especially to the form attacking swimmers, which very often leads to drowning. It may similarly result from chilling of the body, certain persons being more liable to this, as to all other forms of cramp. Localized muscular spasms not infrequently result from placing the parts, most frequently the feet, in strained positions, and in some people a spasm invariably results from some such posture. Similar localized cramps of the legs are a common and distressing symptom of cholera, and more diffused spasms may be met with in various diseases, especially in children. "Writer's cramp" is the name of the most common of the so-called "professional neuroses," conditions in which spasms affect certain groups of muscles which are used excessively in the occupation of the person. Thus in "writer's cramp" the effort to write or even take a pen in hand is sufficient to provoke a painful spasm of the muscles of the hand and forearm. Curiously the muscles may often be used in any other way excepting in that sequence or combination in which they have been overtaxed. In other words, the finely co-ordinated movements displayed in the work of the patient can not be performed without spasm. In many cases localized palsies instead of cramps are seen. Similar affections are seen in telegraphers, metal-workers, dancers, and others. TETANUS (*q. v.*) is a disease in which spasms of certain, and finally of all, muscles constitute the characteristic feature of the disease. Strychnia-poisoning may present an almost identical picture.
WILLIAM PEPPER.

Cramp, JOHN MOCKETT, D. D.: clergyman; b. at St. Peter's, Isle of Thanet, Kent, England, July 25, 1796: educated at Stepney College; ordained May 7, 1818. In 1844 he became president of the Baptist College, Montreal, Canada, and president of Acadia College, Nova Scotia, in 1851; the principal of the theological department 1853–60; was reappointed president in 1860, and retired in 1869. In 1831, in Dublin (3d ed. London, 1851), he published *A Text-book of Popery*; in 1833 *The Reformation in Europe* (issued by the Religious Tract Society, London); in 1844 *Lectures for these Times*; in 1868 *Baptist History*; in 1871 *The Lamb of God*; in 1873 *Paul and Christ: a Portraiture and an Argument*. D. in Wolfville, Nova Scotia, Dec. 6, 1881.

Cramp'ton's Gap: a pass in the South Mountains, near Burkittsville, Frederick co., Md. The left wing of Gen. McClellan's army, under command of Gen. W. B. Franklin, approached this pass about noon Sept. 14, 1862, to find it defended by a portion of the Confederate general McLaw's division of Lee's army, under command of Gen. Howell Cobb. After a stubborn fight of four or five hours the Confederates were forced out of the gap, having suffered severe loss in killed and wounded, besides losing 400 prisoners and many small-arms.

Cra'nach, or **Kranach**, krăn'ak, Germ. pron. kraa'năăkh, LUCAS; called THE ELDER: German painter and engraver; b. at Kronach, a town near Bamberg, Oct. 4, 1472. His family name is generally said to have been SUNDER. He became court-painter to Frederick, the Elector of Saxony, in 1504,

and worked for many years at Wittenberg, where he was much respected and was made burgomaster. He continued to hold the office of court-painter under the two successors of Frederick, John the Constant and John Frederick the Magnanimous, and when, after the battle of Muhlberg in 1547, John Frederick was taken prisoner, Cranach shared his five years' captivity. They were both released in 1552. He was also an intimate friend of Luther and Melanchthon, whose portraits he both painted and engraved. His works consist of oil-paintings, engravings on copper, and woodcuts. His most important picture is at Weimar. It is an altar-piece representing the crucifixion. He was so rapid and prolific a worker that he was called *pictor celeberrimus*, and it is not surprising that his pictures are found in every considerable collection in Europe. There are two good specimens of his work in the Bryan Gallery, New York Historical Society, a *Venus and Cupid* and a *Portrait*, and one in the New York Metropolitan Museum, a portrait of John Frederick the Magnanimous. D. at Wittenberg, Oct. 16, 1553. All collectors and students of prints know his numerous works, engravings on copper and especially on wood. A set of the *Passion of Christ*, a *Temptation of St. Anthony* and a *St. Jerome in the Desert*, are as well known as any. See Heller, *Das Leben und die Werke Lucas Cranach's* (2d ed. Bamberg, 1844); the latest and best authority, however, is Schuchardt, *Lucas Cranach des Aelteren Leben und Werke* (Leipzig, 3 vols., 1851–71).

Cranach, Lucas, von: portrait painter; b. in 1515; a son of the preceding; was burgomaster of Wittenberg. A good specimen of his work is in the Metropolitan Museum, New York, entitled *Portrait of a German Lady*. D. in 1586.

Cranberry [for *crane-berry*]: the fruit of several species of a sub-genus, *Oxycoccus*, of small, mostly prostrate evergreen shrubs of the natural family *Ericaceæ*, belonging to the genus *Vaccinium*, but differing from the rest of the genus in having a wheel-shaped corolla, with its four petals decidedly revolute. The species are few, natives of the colder regions of the northern hemisphere. The fruit is acid, and is in great request for making sauces, jellies, etc. *Vaccinium oxycoccus* is a native of the northern parts of Europe, Asia, and America. It grows in marshy grounds in the Northern U. S., and is a wiry, creeping shrub, with small oval leaves strongly revolute at the margin. The blossoms are small, but beautiful, and of a deep rose-color. The berries are often kept for a long time in water. They are an excellent antiscorbutic, and valuable in sea-stores. A sort of wine is made from them in Siberia and Russia. The berries of the cowberry (*Vaccinium vitis-idæa*) are sold under the name of cranberries in Scotland, and used in the same way. In Norway the fruits are esteemed. They also grow in New England and northward, where they are often collected for culinary purposes. The "high-bush cranberry" is the *Viburnum opulus* of the U. S. and Europe. Its fruit has little value, although it is sometimes eaten. The name mountain cranberry is often given to the *Arctostaphylos uva ursi* of the U. S. and Europe, a plant whose leaves are of value as a diuretic.

The cranberry of U. S. markets is *Vaccinium macrocarpum*. It is a larger plant than the European species, with larger berries and leaves with less revolute edges. It is gathered extensively from wild bogs. Early in the nineteenth century efforts were made to cultivate it, and now the annual yield from the cultivated bogs of the U. S. is about 800,000 bushels. The largest areas of cultivated cranberries occur respectively in the Cape Cod region, in New Jersey, Wisconsin, Long Island, and perhaps Michigan. Natural swamps or bogs are drained by means of open ditches, the turf is removed, and the whole area is covered 4 to 6 inches deep with sand, in which the cuttings are set at intervals of 14 or 18 inches. The bog is provided with a dam and gates at the outlet of the main ditch, so that it is possible to flood the area for winter protection, or to escape frosts, or to destroy insect or fungous injuries. For this purpose a water-head is indispensable, as a pond, lake, or diverted stream.

Cranborne, Viscount: See Salisbury, Gascoyne-Cecil.

Cranbrook, Gathorne-Hardy, Earl: English statesman; b. at Bradford, England, Oct. 1, 1814; third son of Mr. John Hardy; educated at Oriel College, Oxford; called to the bar 1840; entered the House of Commons 1856; defeated Mr. Gladstone in the contest for the seat in Parliament for Oxford 1865; Secretary of State for the Home Department 1868; Secretary of State for War in Mr. Disraeli's administration 1874; created Viscount Cranbrook 1878; succeeded Marquis of Salisbury as Secretary of State for India 1878; Lord President of the Council in Salisbury's cabinet 1885–86; created earl and baron Sept. 4, 1892.

Cranch, Christopher Pearse: artist and poet; b. at Alexandria, Va., Mar. 8, 1813; graduated at Columbian College, Washington, in 1831; studied divinity, but became a landscape-painter and author, residing in Europe from 1846–63, and subsequently at Cambridge, Mass., and in New York city. He published a volume of poems (1844), and two stories for children, *The Last of the Huggermuggers* (1856) and *Koboltozo* (1857); also a translation of Vergil's *Æneid* (1872). Many of his finest poems appeared in the *Dial*. D. Jan. 20, 1892.

Cranch, William, LL. D.: jurist; b. at Weymouth, Mass., July 17, 1769; graduated at Harvard in 1787. He was appointed chief justice of the U. S. circuit court for the District of Columbia in 1805. He held this position for fifty years, during which, it is said, only two of his decisions were overruled by the Supreme Court of the U. S. As reporter of the decisions of the Supreme Court he prepared nine volumes of reports (1801–15). His legal learning was very profound. Judge Cranch was first cousin to President John Quincy Adams. D. Sept. 1, 1855.

Crane [O. Eng. *cran*, cf. Germ. *Kranich*; related are Gr. *γέρανος*, Lat. *grus*]: any one of various birds of the order *Grallæ* or *Alectorides*, and belonging to the family *Gruidæ*, of which the genus *Grus* alone occurs in the U. S. They are nearly all large birds, with long necks, long legs, and powerful wings. Their wings are not elongated, but rounded. The cranes are often popularly confused with the herons, but structurally the two groups are quite distinct, while externally the cranes differ from the herons in having a compact plumage, toes of moderate length, hind toe short and elevated, and part of head usually bare and rough in the adult. The common European crane, *Grus cinerea*, stands about 4 feet high, is ashen gray in color, with face and neck nearly black. It breeds in marshes in northern Europe and Asia, migrating to warmer climes on the approach of winter. It formerly bred in England, but long ago it ceased to be more than an accidental visitor. Cranes migrate in large flocks, flying at a great height and like geese in a V-shaped body. The whooping crane (*Grus americana*) is larger than the common crane, which it resembles, except that its adult plumage is pure white, the wings tipped with black. It frequents the southern parts of the U. S. in winter; in summer it migrates northward. This crane is remarkable for the extent to which the windpipe is concealed in the breastbone, and for the complicated turns taken by the concealed portion. The U. S. have also the sand-hill crane (*Grus canadensis*) and the little crane (*Grus fraterculus*). To this family belongs also the demoiselle or Numidian crane (*Anthropoides virgo*), with which, rather than with the true crane, the Balearic cranes (*Balearica*) are ranked. Cranes use their bills as a weapon of defense, attacking the eyes of an assailant. The blue heron (*Ardea herodias*) is sometimes, though erroneously, called the blue crane. F. A. Lucas.

Crane: a machine employed to raise heavy weights and to deposit them at some distance from their former position. It has two kinds of motion, namely, a lifting motion and a horizontal one. The latter may be circular or along a radius or a combination of both kinds. The simplest form of crane has an upright post, moving round a vertical axis, a swinging arm jointed to the post at its lower end and fastened to the post by means of a pulley at its outer end, and a winch or other hoisting tackle.

Crane, Bruce: landscape-painter; b. in New York, 1857; pupil of A. H. Wyant, New York. First exhibited National Academy 1879. His pictures are generally painted from American motives, and are fresh in color and frankly painted. Member Society of American Artists (1881) and of American Water-color Society. Studio in New York.

Crane, Stephen: See the Appendix.

Crane, Thomas Frederick: scholar; b. in New York city, July 12, 1844; educated at the public school and academy of Ithaca, N. Y., and the College of New Jersey, Princeton (A. B., 1864; A. M., 1867; Ph. D., *causa honoris*, 1874); assistant Professor of Modern Languages, Cornell University, 1868; Professor of Spanish and Italian there in 1872; Professor of the Romance Languages 1881. Prof. Crane has devoted himself especially to the literary history of the

Romance languages during the Middle Ages, and to that branch of folk-lore relating to the diffusion of popular tales, and has published a large number of articles on these and kindred subjects in the *North American Review*, *International Review*, *Harper's Magazine*, *Lippincott's Magazine*, and *The Nation*. He was also one of the founders of the American Folk-lore Society in 1888, and has been a frequent contributor to its journal. In this line of work he has published *Italian Popular Tales* (Boston, 1885), and *The Exempla or Illustrative Stories from the Sermones Vulgares of Jacques de Vitry* (London, 1890, English Folk-lore Society). Prof. Crane has also published *Tableaux de la Révolution Française* (6th edition 1892); *Le Romantisme Français* (3d edition 1890); *La Société Française au Dix-Septième Siècle* (1889); and *Chansons Populaires de la France* (1891). C. H. Thurber.

Crane, Walter: genre and decorative painter; b. in Liverpool, 1845. Pupil of his father, Thomas Crane, portrait-painter, and of W. J. Linton. Well known as an illustrator of children's books; third-class medal for water colors, Paris Exposition, 1889. Studio in London.
W. A. C.

Crane, William H.: actor; b. in Leicester, Mass., in 1845; educated at the Boston common schools. He became a clerk in a dry-goods store in Boston, and was a member of an amateur minstrel company. He made his first appearance on the professional stage July 13, 1863, at Mechanics' Hall, Utica, N. Y., taking the part of the notary in *The Child of the Regiment*. He joined the Holman Theatrical Company, and remained with this organization for seven years, when he found an engagement with the Oates Opera Company as leading comedian. He afterward appeared in the burlesque of *Evangeline* at Niblo's Garden, New York, where he created the part of Le Blanc. He played for a season in a Chicago stock company in legitimate comedy, and then went to California, where he met with success. In 1876 he entered into partnership with Stuart Robson, the comedian, and on Jan. 29, 1877, they produced at the Park theater, New York, Leonard Grover's farce *Our Boarding House*. They subsequently appeared together in *Forbidden Fruit*, *Our Bachelors*, *Sharps and Flats*, *Comedy of Errors*, and *Merry Wives of Windsor*. Their conspicuous success in Bronson Howard's *The Henrietta* ended after two years in a dissolution of the partnership. Crane began his first starring tour alone in *The Senator* in 1889, and added much to his reputation by his artistic personation of Senator Hannibal Rivers. In 1900 he played with great success the part of *David Harum*.

Cranesbill: See Geranium.

Cra'ney Island: at the mouth of Elizabeth river in Norfolk co., Va.; has a lighthouse 50 feet high, standing in shallow water on iron screw-piles; lat. 36° 53′ 28″ N., lon. 76° 20′ W. During the civil war (1861–65) the Confederates erected batteries here.

Cranganore: a maritime town of Southern India; on the Malabar coast; about 18 miles N. of Cochin (see map of S. India, ref. 7–D). A Christian church has existed here since the fifth century at least. This place was taken from the Portuguese by the Dutch in 1663, and now belongs to the British.

Craniology: See Skull.

Cranium: See Skull.

Cranmer, Thomas: English archbishop and Reformer; b. in Aslacton, Nottinghamshire, July 2, 1489, of an ancient Norman family. He studied at Jesus College, Cambridge, of which he became a fellow, and was well versed in Greek, Hebrew, and theology. In 1523 he was appointed lecturer on theology. He gained the favor of Henry VIII. in 1529 by advising that the question of the king's divorce should be tried by the word of God and referred to the universities. He was appointed a chaplain to the king, who sent him to Rome on a special mission. He married, at Nuremburg, a niece of the reformer Osiander in 1532. He was appointed Archbishop of Canterbury in 1532 by the king, of whom he soon became the favorite minister and adviser. In 1538 he opposed the law of the *Six Articles* or the *Bloody Statutes*, which, however, was carried through by the king's influence. One of the statutes forbade marriage to the clergy. Cranmer himself was obliged to dismiss his wife. Cranmer promoted the translation and circulation of the Bible. On the death of Henry VIII., Jan. 28, 1547, Cranmer, in accordance with the royal will, was appointed one of the regents of the kingdom. He was the head of a commission which composed the Liturgy of the Anglican Church in 1548, and efficiently supported the Reformed cause during the reign of Edward VI. In 1548 he secured the legalization from Parliament of the marriage of the clergy, and then his wife returned to him from Germany. On the accession of Queen Mary, in 1553, he was placed in the tower on a charge of treason. He was also accused of heresy, and was induced by the hope of saving his life to recant, and to subscribe to the doctrines of papal supremacy and the Romish view of the real presence; but his enemies were determined not to spare his life. He was burned at the stake in Oxford, Mar. 21, 1556, and met his death with great fortitude, thrusting his right hand into the flames before his body began to burn. His works were published at Oxford, 1833, 4 vols. Recent investigations prove him to have been an eminent scholar, and possessed of a large liturgical library whence he drew the special features of the English Book of Common Prayer. See his *Life*, by H. J. Todd (1831); Dean Hook (in his lives of the archbishops); Strype's *Annals*, etc.; see also Tennyson's *Queen Mary* for a kindly view of the archbishop's character. Revised by W. S. Perry.

Crannog, krăn'ŭg, or **Crannoge**: a fortified island, such as are found in the lakes of Ireland and Scotland, and which were used as dwellings and places of refuge by the ancient Celtic inhabitants. The area of a small isle in some cases was enlarged by wooden piles or heaps of stones. Crannoges are mentioned in Irish annals as early as the ninth century. See Lake Dwellings.

Cran'tor (in Gr. Κράντωρ): Greek Academic philosopher; b. in Soli, Cilicia; lived about 300 B. C. He was a pupil of Xenocrates at Athens, and wrote, besides other works, a *Treatise on Affliction*, which was highly esteemed. He is mentioned by Horace as an eminent moralist.

Cran'worth, Robert Monsey Rolfe, Baron: an English judge; b. in Cranworth, Norfolk, Dec. 18, 1790. He was elected to Parliament as a Liberal in 1832; became Solicitor-General in 1834, and a baron of the exchequer in 1839. In 1852 he was appointed Lord Chancellor by Lord Aberdeen. Having resigned in 1858, he was again Lord Chancellor from July, 1865, to June, 1866. D. July 26, 1868.

Crape [Fr. *crêpe* < O. Fr. *cresp(e)*, curled, frizzled: Ital. *crespo* < Lat. *cris'pus*, curly]: a light, transparent fabric, made of raw silk deprived of its gloss. Crapes are crisped or smooth, according to the degree of twist in weaving. They are manufactured in Italy, England, and France, and are extensively used for mourning-dresses.

Crary, Benjamin Franklin, D. D.: minister of the M. E. Church; b. in Jennings co., Ind., Dec. 12, 1821; educated at Belmont College, Ohio; pastor and presiding elder 1845–57; president of Hamline University 1857–61; superintendent of public instruction of Minnesota 1861; chaplain in the army 1862–63; editor of *Central Christian Advocate* 1864–72; presiding elder in Colorado 1872–80; editor *California Christian Advocate* 1880. D. Mar. 16, 1895. C. H. T.

Cra'shaw, Richard: poet; b. in London about 1613; a clergyman's son. He was educated at the Charterhouse and at Cambridge; became a fellow of Peterhouse 1636. In 1644 he was ejected from his fellowship for refusing to sign the Covenant. Going to France, he became a Catholic, and, through the influence of Queen Henrietta Maria, became attendant to Cardinal Palotta, and afterward a sub-canon at Loretto, where he died in 1649. His works, marked with fertility of imagination and devout fervor, are in two parts, the sacred poems are entitled *Steps to the Temple* (London, 1646), the secular *The Delights of the Muses*; 3d ed. of the sacred poems entitled *Carmen Deo Nostro* (Paris, 1652). Fullest edition is by A. B. Grosart, privately published 1872. It was he who wrote the immortal line on the miracle at Cana, *Lympha pudica deum vidit et erubuit* (the modest water saw its God and blushed).

Cras'sus, Marcus Licinius: a Roman triumvir; b. about 108 B. C.; in his youth a partisan of Sulla. He was elected prætor in 71 B. C., and defeated Spartacus, the leader of a servile revolt. In the year 70 he was chosen consul as the colleague of Pompey. He amassed an immense fortune by speculation, mining, dealing in slaves, and other methods. Avarice is said to have been his ruling passion, but for the sake of political success he gave large gifts to the people. About 60 B. C. he united with Cæsar and Pompey in a coalition called the first triumvirate. Crassus and Pompey hav-

ing been chosen consuls in 56 B. C., the former obtained command of Syria for five years. He invaded Parthia in the year 54, in order to enrich himself by plunder. In 53 B. C. he was defeated with great loss by the Parthian general Surena, near Carrhæ (the Haran of the Bible). He was treacherously killed at a conference with Surena soon after that battle (53 B. C.). See Plutarch, *Life of Crassus*.

Cratæ'gus [Gr. κραταιγός, a thorn-bush]: a genus of trees and shrubs of the family *Rosaceæ*, nearly related to the apple and pear. About sixty-five species have been described, but it is the opinion of botanists that many of these are synonyms. They are almost entirely confined to the northern hemisphere of both continents, and are most numerous in North America. They are characterized by their spiny branches, adnate calyx-tube which surrounds and grows over the carpels, two-ovuled carpels which become bony at maturity, persistent calyx-lobes, and deciduous leaves. The flowers resemble those of the apple, but they are usually white, and are often ill-scented. The best-known species is the hawthorn, *C. oxyacantha*, a small tree, native of Europe and portions of Asia. It is abundant in Great Britain, and is often planted in the U. S. It bears small, dark-green three- to five-lobed leaves, sweet-scented white or pink flowers, and small, globular or ovoid, red fruits. It is extensively grown for hedges, for which it is admirably adapted, its sharp thorns forming an effectual barrier to any passage. By long cultivation it has given rise to twenty or more well-marked varieties, varying from apetalous forms to those with a multitude of petals, and from white to pink, rose, and orange flowers, with leaves from almost entire to laciniate, and from green to golden margined. The fourteen North American species are: *C. douglasii* of the Pacific coast; *C. brachyacantha* of Louisiana and Texas; *C. crus-galli*, *C. coccinea*, *C. mollis*, *C. tomentosa*, and *C. punctata*, generally from the Rocky Mountains eastward; *C. spathulata*, *C. flava*, *C. cordata*, *C. viridis*, *C. apiifolia*, *C. uniflora*, and *C. æstivalis* of the Southern U. S. C. E. B.

Crater: See VOLCANOES.

Crater Lake: in the western part of Klamath co., Ore. It is oval in form, with diameters of 6 miles and 5 miles, and is 2,000 feet deep. Its surface lies at an altitude of 6,240 feet. From its margin on every side rise cliffs, the peaks of which are from 1,500 to 2,000 feet above the water. From the crest line of the cliffs there is everywhere a descent away from the lake, so that its catchment basin is little larger than its surface. It is fed by springs and has no visible outlet. As its name implies, it occupies the crater of an extinct volcano, and this volcano was at one time several thousand feet taller than the surviving cliffs, having probably lost its apex through the refusion of the underlying core and the consequent falling in of the higher parts. The rock is andesitic, but a cone of basalt stands within the crater near its western side, projecting from the lake as an island. G. K. G.

Crat'erus (in Gr. Κρατερός): Macedonian general; one of the successors of Alexander the Great. He served under that prince in Asia, and was one of his favorite generals. After the death of Alexander (323 B. C.) he was associated with Antipater in the government of Macedonia. He was defeated by Eumenes, and killed in battle in Cappadocia in 321 B. C.

Cra'tes of Athens: Greek comic poet; flourished about 450 B. C. He was also an actor, and performed parts in the plays of Cratinus. According to Aristotle, Crates is memorable for having widened comedy from a personal satire to a universal work of art. Only small fragments of his comedies are extant, in Meineke's and Kock's collections.

Crates of Mallus in Cilicia: Greek grammarian of the second century B. C.: founder of the Pergamene school; commentator on Homer and determined opponent of Aristarchus. Sent by Attalus, about 167 B. C., to Rome as an ambassador, he broke his leg, and, being thus detained, delivered the first lectures on grammar ever delivered in Rome. See C. Wachsmuth, *De Cratete Mallota* (1860). B. L. G.

Crates of Thebes: Cynic philosopher who lived about 320 B. C., and was a disciple of Diogenes at Athens. He had a high reputation for probity, wisdom, and self-control. He was rich in his youth, but set an example of voluntary poverty. He wrote poems and other works, which are all lost.

Crati'nus (in Gr. Κρατῖνος): one of the leaders of the old Attic comedy; b. in 519. The Archilochus of comedy, he wielded personal satire and invective without reserve, and attacked Pericles unmercifully. In the *Knights* (424) Aristophanes undertook to pity him. His reply the next year was a brilliant victory over the *Clouds* with his *Wine-flask*, in which he represented Comedy as his lawful wife and the wine-flask as the charmer who had won him from his allegiance. It was he who opened the field of mythological travesty. D. 422 B. C., though a later date has been advocated. Fragments in Meineke's and Kock's collections.

Cratip'pus (in Gr. Κράτιππος): a Greek Peripatetic philosopher; b. in Mytilene about 75 B. C. He was the most eminent philosopher of that age in the estimation of Cicero, who was his pupil and friend. Pompey, after his defeat at Pharsalia, had an interview with Cratippus, who conversed with him on the justice of Providence. Brutus attended his lectures at Athens in 44 B. C. The only work attributed to him is one entitled *On Divination by Dreams*.

Crato: a city in the southern part of the state of Ceará, Brazil; near the borders of Piauhy and Pernambuco, and 325 miles from the coast at Fortaleza (see map of South America, ref. 4–H). It is in a fertile valley, watered by the little river Grangeiro, one of the few perennial streams of Ceará. During the dry season, when most of the neighboring tableland is like a desert, the valley of the Grangeiro remains green and affords good pasturage; it thus serves as a refuge for the herds, and has become a principal center of the grazing industry. Crato appears to have been settled by explorers from Pernambuco, about 1610. Since 1820 it has been the scene of frequent political disorders. Pop. about 10,000. HERBERT H. SMITH.

Craven, EARLS OF (1801): Viscounts Uffington, Barons Craven (England, 1665).—GEORGE GRIMSTON CRAVEN, third earl, b. Mar. 16, 1841; succeeded his father, WILLIAM CRAVEN (b. July 18, 1809) Aug. 25, 1866. D. Dec. 7, 1883, and was succeeded by WILLIAM GEORGE ROBERT, b. Dec. 16, 1868.

Craven, ALFRED WINGATE: civil engineer; b. in Washington, D. C., Oct 20, 1810; graduated with honors at Columbia College, New York, and studied engineering, rapidly rising to the first rank in his profession; in 1849 became prominently connected with the Croton aqueduct, New York; shortly after its completion was appointed engineer-in-chief to take charge of it; was afterward chosen commissioner in connection with the aqueduct, and subsequently filled both positions, engineer-in-chief and commissioner, and took complete charge of all the public works. He planned and carried into operation the system of sewerage which is now in use in New York city. He was one of the projectors and the first president of the American Society of Civil Engineers. D. in Chiswick, England, Mar. 29, 1879.

Craven, ELIJAH RICHARDSON, D. D., LL. D.: secretary of the Presbyterian Board of Publication and Sunday-school Work; b. in Washington, D. C., Mar. 28, 1824; graduated at Princeton College 1842, and Princeton Theological Seminary in 1848. Before entering upon his present work he was pastor of the Reformed (Dutch) church of Somerville, N. J., 1850–54, and of the Third Presbyterian church of Newark 1854–1887. He was moderator of the General Assembly in 1885. Besides many articles published, he edited the American edition of the volume on *Revelation* in the Lange Series 1874. WILLIS J. BEECHER.

Craven, THOMAS T.: naval officer; b. in Portsmouth, N. H., Dec. 30, 1808; entered the navy as a midshipman May 1, 1822. During the summer of 1861 he commanded the Potomac flotilla. He served with distinction in the civil war 1861–65. In 1862 he was made commodore; in 1866 rear-admiral; in 1866–68 commanded navy-yard at Mare island, Cal.; in 1869 retired. D. in Boston, Mass., Aug 23, 1887.

Craven, TUNIS A. M.: See the Appendix.

Crawfish, or **Crayfish**: several long-tailed decapodous crustaceans, those of Europe and the Pacific States of the American Union belonging to the genus *Astacus*, while those of the Eastern States and the Mississippi valley belong to the genus *Cambarus*. They inhabit fresh water, and dig long burrows in the earth. They feed upon insects, mollusks, dead animals, etc. By some they are esteemed for the table. Crawfishes do immense damage by opening passages for water through the levees of the Mississippi, which in some cases have caused extensive crevasses. In New England they are quite rare. Certain salt-water crustaceans

are popularly called crawfishes, especially the spiny lobsters, of the genus *Palinurus*.

Crawford, Earls of (1398): Earls of Balcarres (1650); Barons Lindsay (previous to 1443); Barons Lindsay of Balcarres (1633); Lords Lindsay and Barneil (Scotland, 1650); Barons Wigan (United Kingdom, 1826).—Alexander William Crawford Lindsay, twenty-fifth earl, M. A.; b. Oct. 16, 1812; author of *Letters on Christian Art*, *Lives of the Lindsays*, *Progression by Antagonism*, etc.; succeeded his father, James (b. Apr. 24, 1783), Dec. 15, 1869. D. Dec. 13, 1880, and was succeeded by James Ludovic Lindsay (b. July 28, 1847) as twenty-sixth earl.

Crawford, Francis Marion: American novelist; son of Thomas Crawford, the sculptor. He was born at the baths of Lucca, Italy, Aug. 2, 1854; studied at Cambridge (England), Heidelberg, and Harvard Universities; and traveled in India, where he edited a newspaper at Allahabad. This experience furnished the material for his first fiction, *Mr. Isaacs* (1882). He has written many other novels, including *Saracinesca* (1887); *Pietro Ghisleri* (1893); *Katherine Lauderdale* (1894); *Casa Braccio* (1895); *Taquisara* (1896); *Corleone* (1897); *Via Crucis* (1899); *In the Palace of the King* (1900).

Crawford, George Washington: lawyer; b. in Columbia co., Ga., Dec. 22, 1798; graduated at Princeton in 1820; admitted to practice law in Georgia in 1822; attorney-general of Georgia 1827–31; a member of Congress in 1843; Governor of Georgia 1843–47; and Secretary of War under President Taylor 1849–50. D. July 22, 1872.

Crawford, Martin Jenkins: lawyer; b. in Jasper co., Ga., Mar. 17, 1820; educated at Mercer University; rose to distinction at the bar; elected to the State Legislature 1845; elevated to the bench in 1853; in the House of Representatives 1856–61; withdrew on the secession of Georgia; a member of the Congress of the Southern States which met at Montgomery Feb. 4, 1861; one of the three commissioners appointed by that body to treat with the authorities at Washington for a peaceful separation of the States; after the war resumed the practice of his profession; at the time of his death, July 22, 1883, was associate justice of the Supreme Court of Georgia.

Crawford, Samuel Wylie: U. S. military officer; b. in Franklin co., Pa., Nov. 8, 1829; graduated at the University of Pennsylvania 1847; appointed assistant surgeon U. S. army 1851; served in Texas and New Mexico and through the civil war, becoming brevet major-general. At Antietam, in 1862, he took command of Mansfield's division after the latter's death, and was severely wounded. Retired on account of wounds Feb. 19, 1873. D. in Philadelphia, Nov. 3, 1892.

Crawford, Thomas: sculptor; b. in New York, of Irish parentage, Mar. 22, 1814; studied under Frazer and Launitz, workers in marble, in New York; went to Italy in 1834 and was a pupil of Thorwaldsen at Rome, where he worked for many years. He was employed in 1849 by the State of Virginia to execute a colossal equestrian statue of Washington, which is at Richmond. Among his works are a statue of *Orpheus* and a colossal statue of the Genius of America, which is on the dome of the Capitol at Washington. D. in London, Oct. 16, 1857.

Crawford, William Harris: U. S. statesman; b. in Amherst co., Va., Feb. 24, 1772; removed to Georgia in his early youth; admitted to the bar 1798; settled at Lexington, Ga.; elected U. S. Senator 1807 by the Democrats; minister to France in 1813; Secretary of War in 1815; Secretary of the Treasury 1816–25. In 1824 he was nominated for the presidency of the U. S. by a Congressional caucus, and received forty-one electoral votes, the other candidates being Andrew Jackson, John Quincy Adams, and Henry Clay. (See Caucus.) D. Sept. 15, 1834.

Crawfordsville: city and railway center; capital of Montgomery co., Ind. (for location of county, see map of Indiana, ref. 6–C). It is the seat of Wabash College, founded 1832, and has fine public schools; its leading industries are manufactures of buggies, nails, spokes, hubs, barbed wire, and coffins; it also has 3 foundries, 3 planing-mills, 4 elevators, 2 flour-mills, electric light, water-works, gas, natural and artificial. Pop. (1880) 5,251; (1890) 6,089; (1900) 6,649.
Editor of "Argus News."

Crayer, krăă'i-ay', Gaspar, de: Flemish painter; imitator of Rubens and of Van Dyck, with whose works Crayer's are sometimes confounded; b. at Antwerp in 1582, and to be studied to the greatest advantage in the museums of Ghent, where are in the museum a *Judgment of Solomon*, and in the church of St. Michael a fine *St. Catherine*, and his native city, especially a picture of *Elijah in the Desert*. D. 1669. W. J. S.

Crayfish: See Crawfish.

Crayon [Fr. deriv. of *craie*, chalk: Ital. *creta* < Lat. *cre'ta*, chalk; so named from island of Crete; cf. Germ. *Kreide*]: a pencil used for drawing and made of chalk or a hardened paste of any finely powdered material, so as to make black, colored, or even white marks on paper or other surface; but not including ordinary lead-pencils, nor, in general, the slips of charred willow-wood used for charcoal drawings.

Creameries: See Butter.

Cream of Tartar (*acid potassium tartrate*, *bitartrate of potash*), or **Potassæ Bitartras** [pharm.]: a compound contained in grape-juice and deposited from it in the process of fermentation, as it is less soluble in alcohol than in water. The crystalline crusts deposited are called *crude tartar*, or *argol*. When this crude tartar is purified it yields *cream of tartar*, which is the acid tartrate of potassium, $KH_5C_4O_6$. This salt is difficultly soluble in water, and insoluble in strong alcohol.

It is frequently adulterated with sawdust, clay, gypsum, flour, chalk, alum, and sulphate of potash. Samples purchased from several grocers in New York were found to contain considerable proportions of gypsum, or sulphate of lime, in one case 70 per cent. Cream of tartar is extensively used, in connection with bicarbonate of soda, as a substitute for yeast and leaven for raising bread. (See Bread.) Cream of tartar is often used as a mordant in dyeing wool. In medicine it is used for its cathartic, diuretic, and refrigerant properties. It is frequently prescribed in combination with senna, sulphur, or jalap. It is also used for the preparation of soluble tartar (neutral tartrate of potash), Rochelle or Seignette salts (tartrate of potash and soda), tartar emetic (tartrate of potash and antimony), tartarized iron (tartrate of potash and iron), white and black flux, etc. Salt of tartar is the carbonate of potassa, prepared by the incineration of cream of tartar. Revised by Ira Remsen.

Crease: See Cricket (the game).

Creasote: See Creosote.

Crea'sy, Sir Edward Shepherd: English historian and lawyer; b. in Bexley, Kent, in 1812; educated on the foundation at Eton, where he obtained the Newcastle scholarship in 1831; elected scholar of King's College, Cambridge, in 1832, and fellow of the same college in 1834; called to the bar at Lincoln's Inn in 1837; became Professor of History in University College, London, in 1840; and was appointed chief justice of Ceylon in 1860. Among his works were *Fifteen Decisive Battles of the World* (1851) and a *History of England* (1869–70). D. Jan. 27, 1878.

Cre'atine [from Gr. κρέας, flesh]: a compound discovered in 1835 by Chevreul in raw muscular flesh, and afterward carefully studied by Liebig and others. Anhydrous creatine has the formula $C_4H_9N_3O_2$. Creatine is found in the flesh of many if not all vertebrate animals, but is now generally considered to be one of the products of the normal destruction of the tissues. It occurs in the urine.

Creat'inine: a powerful organic base or alkaloid ($C_4H_7N_3O$); existing in small quantities in the juice of animal flesh and in urine as one of the products of the physiological destruction of tissues. When creatine is subjected to the action of strong acids it is changed to creatinine, which crystallizes in colorless prisms.

Crébillon, krā'beĕ'yōn', Prosper Jolyot, de: French dramatic poet; b. at Dijon, Jan. 13, 1674. He produced in 1705 *Idoménée*; in 1707, *Atrée*; in 1709, *Électre*; *Rhadamiste et Zénobie* in 1711; and *Pyrrhus* in 1726, after which he wrote nothing for twenty years. He was admitted into the French Academy in 1731. His genius was hampered by poverty. Among his later works is *Catilina* (1749). He is ranked among French dramatists of the first order. D. June 17, 1762. (See D'Alembert, *Éloge de Crébillon*.)—His son, Claude Prosper Jolyot de Crébillon, *fils*, romancist (1707–77), is known as one of the most libertine writers of a most dissolute age.

Crécy, krā'see': small town of France; department of Somme; about 12 miles N. of Abbeville (see map of France, ref. 2–E). It was the scene of a signal victory gained by Edward III. with 40,000 English soldiers over a French

army of 100,000 on Aug. 26, 1346. It is stated that nearly 30,000 of the French were killed in this action. Pop. (1896) 1,592.

Credentials [from Late Lat. *credentia*, credence, deriv. of *cre'dere*, believe]: papers or letters given to an ambassador or other diplomatic agent, in order to enable him to claim the confidence of the court to which he is sent. There are two sorts of credentials—the one sealed, drawn up and countersigned by the Minister of Foreign Affairs; the other open, and signed only by the king.

Credi, Lorenzo, di: Florentine painter: b. 1459; pupil of Verocchio and fellow-pupil of Leonardo, and one of the most fertile and highly reputed of the school to which he belonged. His sacred subjects are characterized by qualities of noble expression and severe drawing, and his portraits are of admirable fidelity and character. D. Jan. 12, 1537. An important picture is the altar-piece in the cathedral of Pistoia, and there is a fine *Nativity* in the academy at Florence, besides easel pictures in most of the museums of Europe. W. J. Stillman.

Credit [Fr. *crédit*: Ital. *credito* < Lat. *cre'ditum*, loan, what is intrusted, ptc. of *cre'dere*, trust]: in bookkeeping, abbreviated as *Cr.*, the reverse of *debit*, denoting in personal accounts those items or values received from the party named at the head of the account. The term credit or creditor is also applied to the side of an account-book on which are entered all moneys, goods, etc., received by the party that keeps the book. In political economy, credit means the power of borrowing money on other property, whether by nation or by individuals. In a majority of cases loans are made by persons who wish to retire from business, or who have more capital than they can advantageously employ, to parties entering into business or who wish to increase their business. "Public credit" means the general confidence placed in the solvency of a state, and in its fidelity as well as its ability to pay its debts, or at least the interest on the same. Revised by A. T. Hadley.

Crédit Agricole: See Commercial Crises.

Crédit Foncier, krā'dĕĕ' fōn'sĕĕ-ā' [i. e. landed credit, from *fond*, bottom or ground]: in France, a plan of borrowing money by mortgaging land (for a sum not exceeding half its value), and repaying the borrowed money and interest in small and regular installments. The Crédit Foncier was established Feb. 28, 1852. See Commercial Crises.

Credit, Letters of: See Letters of Credit.

Crédit Mobilier, krā'dĕĕ' mō'bĕĕ'lĕĕ-ā' (i. e. credit on movable or personal property): a gigantic scheme or joint-stock company which originated in France in 1852, and was sanctioned by the Government, with a capital of 60,000,000 francs. The objects of it are: 1. To initiate trading enterprises of all kinds on the principle of limited liability; 2. To supersede or buy up trading companies—e. g. railway companies—and to substitute scrip and shares of its own for the shares and bonds of the company; and 3. To carry on the business of a bank or bankers on the principle of limited liability. See Aycard, *Histoire de Crédit Mobilier* (1867).

The Credit Mobilier of America is the title of an organization chartered in Pennsylvania in 1859 as a corporation for a general loan and contract business, and reorganized in 1864 with the intention, it would appear, of enabling the shareholders of the Union Pacific Railway and others associated with them to reap enormous profits in case of success. The honesty of its management having been impeached, the affairs of the Credit Mobilier received (1872–73) an investigation from Congress, certain members of which were charged with having unlawfully profited by the enterprise. There has been no institution of this kind in Great Britain. Revised by A. T. Hadley.

Creed [from Lat. *crē'do*, I believe, the first word in the Latin versions of the creeds of the Church]: a term originally signifying "belief," but commonly applied to a statement or profession of fundamental points of belief (Lat. *symbolum*: Fr. *symbole* or *profession de foi*; Germ. *Glaubensbekentniss*), especially applied to summaries of Christian doctrine. The Protestant Churches agree in considering creeds mere standards of belief, the Bible alone affording authoritative rules of faith and practice, but they differ in their estimate of the importance of symbols. Among the more important creeds are the following:

The Apostles' Creed, a summary of the Christian faith which most Christian Churches accept. Many ancient writers assert that this was composed by the apostles themselves, before they separated after our Lord's ascension; but this tradition is now almost universally rejected. The substance of it is no doubt very ancient, but in its present form it dates from the fourth century.

The Athanasian Creed, once supposed to be the work of Athanasius, was certainly composed by some other hand. It probably originated in Gaul, not far from the middle of the fifth century, but its author is not known. It is now omitted from the services of the Protestant Episcopal Church in America, but it is still read in the Church of England.

The Niceno-Constantinopolitan (or Nicene) Creed was first adopted at the Council of Nice 325 A. D. This creed sets forth the faith of the Church in respect to the errors of Arianism. It is admitted by many Protestant Churches, and is held as authority in the Roman and Greek Churches. The form in which the Nicene Creed now appears in the Anglican prayer-books is essentially identical with the modified form of this creed adopted by the second œcumenical council of Constantinople, 381 A. D., with the addition of "and of the Son," made at Toledo in 589. The above formulas are known as the three catholic or general creeds, because they are received by the Greek and Roman Churches, as well as by several Protestant bodies.

The Creed of Chalcedon was an exposition of faith declared by the fourth œcumenical council, held A. D. 451 at Chalcedon. It embraced the Niceno-Constantinopolitan Creed, followed by a statement of the doctrine of Christ's Person.

The so-called Creed of Pope Pius IV. is a statement of the doctrines of the Roman Catholic Church, as established by the Council of Trent. It was issued in 1564 by Pius IV. as a bull. It is slightly altered from the Nicene Creed in the first part, but is much more complicated, and especially enforces the doctrine of transubstantiation. It is sometimes called the *Tridentine Profession*.

The Greek Church has no symbolical books, strictly speaking, but approves the *Answers of the Patriarch Jeremiah to the Lutherans* (1576–80), the *Orthodox Confession of Peter Mogila* (1643), and the *Eighteen Articles of the Synod of Bethlehem* (or Jerusalem) (1672).

The Russian Church, in addition to its use of the above-mentioned documents, has of its own: (1) the *Primer for Children* (1720); (2, 3) the *Shorter* and *Longer Catechisms* (1839); (4) the *Treatise on the Duty of Parish Priests* (1776).

The Lutheran Church has had many creeds and confessions. Besides the Apostles', Nicene, and Athanasian Creeds, may be mentioned the Augsburg Confession (1530), the Articles of Schmalcald (1537), the Catechisms of Luther (1529), the Confession of Lower Saxony (1571), the Suabian-Saxon Formula (1575), the Torgau Formula (1576), and the *Formula Concordiæ* (1577).

The Calvinistic Confessions of Basel (1534), the Tetrapolitan Confession (1530), those of the Helvetic churches (1536–66), the Heidelberg Catechism (1563), the *Expositio Simplex* (1566), the *Formula Consensus* (1675), the Gallican Confession (1559), the Belgic Confession (1559–61), the Scottish Confession of 1560, and especially the great Westminster Confession (1646), and Catechisms (Shorter, 1647; Larger, 1648), the standards of the Presbyterian churches, are among the most important Protestant symbols. The articles held by the Congregationalists and Baptists are based upon the Westminster Confession.

The Church of England receives the three catholic creeds and the *Thirty-nine Articles*, which, however, are not regarded in the light of a "creed" by either the Church of England or the Protestant Episcopal Church in the U. S., which receives a modification of them. (See the article Thirty-nine Articles.) The *Articles* of the Methodist Episcopal Church are also based upon the *Thirty-nine Articles* of the Anglican Church. The best book on the general subject is by Philip Schaff, *Creeds of Christendom* (New York, 6th ed. 1890, 3 vols.; history, with texts, of the Confessions). Revised by S. M. Jackson.

Creede: mining-town; capital of Mineral co., Col. (for location, see map of Colorado, ref. 5–C); situated in a narrow ravine on Willow creek, a small tributary of the Rio Grande; 320 miles by rail S. W. of Denver; the terminus of a branch railway, 10 miles long, connecting with the Denver and Rio Grande R. R. at Wagon Wheel Gap. It has very rich silver mines, extensive lumber-yards, electric lights, etc. The town is of recent growth, increasing from a small cluster of cabins

in 1891 to a town of over 5,000 inhabitants (including environs) in 1893. It is named from N. C. Creede (b. at Fort Wayne, Ind., in 1843), who staked out the first mine there in 1889. The business part of the town was almost entirely destroyed by fire June 5, 1892, the loss aggregating $1,000,000. Pop. (1900) 938.

Creed'moor: village; Queens co., N. Y. (for location of county, see map of New York, ref. 8–K); on Long Island and on railway; 13½ miles E. of New York city; has the largest and most complete rifle-range in the U. S., belonging to the National Rifle Association, and is much frequented for target-practice. The range was established in 1871, chiefly at the expense of the State and the cities of New York and Brooklyn. It now belongs to the State of New York.

Creeks: See MUSKHOGEAN INDIANS.

Creeper [named from the movements of the bird]: a popular name for several passerine birds of the genus *Certhia* and other allied genera of the family *Certhiidæ*. The com-

Creeper.

mon creeper of North America, *Certhia familiaris americana*, may be at once recognized among little perchers by its slender, curved bill and rigid tail, much like that of a woodpecker. It is quick and restless in its movements, and scrambles about the trunks of trees, searching among the crevices of the bark for insects and their eggs. Unlike the nuthatches, it never hangs head downward. F. A. LUCAS.

Creeping of Rails: the remarkable phenomena of the motion of the rails of a railway-track in the direction of the traffic, which occurs on elastic road-beds, on grades, and particularly on bridges. For instance, on the western division of the Canadian Pacific Railway the line crosses a bog which yields about 6 inches under a train, so that the track is thrown into a series of waves. Under an ordinary train the rails creep a distance of about 12 inches in a length of 1¼ miles, and with a heavy consolidation engine, hauling thirty-five cars, the amount of creeping is 20 inches. On the eastern approach of the St. Louis bridge and on the bridge itself, a distance of 4,100 feet, the amount of creeping averaged, before 1885, about a foot per day, so that men were constantly employed in putting in short pieces of rails at one end and taking them out at the other. Spikes, bolts, and the strongest kind of joints have proved ineffectual in preventing creeping, these either being broken under the powerful stresses or the rails themselves twisted out of place.

The reason for the creeping of rails was not understood until 1885, when the subject was investigated by Prof. J. B. Johnson, of Washington University, St. Louis, who also pointed out an effectual remedy. The cause is the wave-motion of the rail, and the consequent elongation of the lower flange, under the passage of the traffic. The rear end of a line of rails being held down by the weight of a car or a train, the front end of the lower flange moves slightly forward by virtue of that elongation, and the train in passing on holds it firmly down in turn in the new position. The remedy is to support the rail under the head instead of under the lower flange, and when this can be done the tendency is to creep backward. See *Journal of the Association of Engineering Societies* (Nov., 1884). MANSFIELD MERRIMAN.

Crees: See ALGONQUIAN INDIANS.

Crefeld, krā'felt: a manufacturing town of Rhenish Prussia; 13 miles N. W. of Düsseldorf, on the railway to Cologne (see map of German Empire, ref. 4–C). It is well built, and has more extensive manufactures of silk than any other town in Prussia. Here are also manufactures of cotton, linen, and woolen fabrics, lace, earthenware, etc. Pop. (1880) 73,872; (1895) 107,245.

Creighton, JAMES EDWARD: See the Appendix.

Creighton, MANDELL, LL. D.: Bishop of London; b. at Carlisle, 1843; educated at Durham Grammar School and at Oxford; ordained deacon 1870; priest 1873; after holding various preferments he became, in 1885, canon of Worcester Cathedral; in 1884 he was elected Professor of Ecclesiastical History in Cambridge; appointed Bishop of Peterborough 1891, and Bishop of London 1896. Author of a *History of the Papacy during the Period of the Reformation* (1882–87; his most important work); *Primer of Roman History* (1875); *The Age of Elizabeth* (1876); *The Life of Simon De Montford* (1877); *Primer of English History* (1877); *Cardinal Wolsey* (1888); *Carlisle* (1889). Editor of the *English Historical Review* from Jan., 1886. He represented Emmanuel College at the 250th anniversary of Harvard College in 1886, when he received the degree of LL. D. D. Jan. 14, 1901.

Cremation [from Lat. *crema'tio*, deriv. of *crema're*, to burn]: the act or custom of burning the dead, especially as a substitute for earth-burial. The custom, which is one of great antiquity, prevailed in Eastern Asia and Western Europe, and was observed by not a few North and South American Indian tribes. The few instances of cremation given in the Old Testament narratives seem to indicate that the Jews resorted to it rarely. The Phrygians are believed to have introduced the practice into Greece, where, as the poems of Homer show, it was common at the time of the Trojan war, although it did not supplant earth-burial; and the Romans borrowed it from the Greeks, or perhaps from the Etruscans. Among the Romans it was generally practiced during the last years of the republic and under the empire, but was abandoned toward the end of the fourth century A. D. It was at one time the favorite method of disposing of the bodies of the dead among the Chinese, and Marco Polo, who traveled in China toward the end of the thirteenth century, found a crematory in every town he visited; but the custom is no longer observed in that country, although universal in Japan, into which it was introduced by the Buddhists. Cæsar relates that the Gauls burned their dead, and the relics and urns found in burial-mounds of Germany, Denmark, Scandinavia, and Great Britain, testify to the prevalence of cremation in Northern Europe in the "bronze age," if not at a later period. The ancient practice was to burn the dead upon a funeral pyre of wood, upon which oil, incense, and spices, and sometimes food and clothing, were placed (a practice similar to that prevalent among savages of burying food and weapons with the dead, and of sacrificing horses, dogs, or even slaves, for the service of the departed). Finally, the embers were quenched with wine, and the ashes, placed in a CINERARY URN (*q. v.*), were deposited in a sepulcher (*columbarium*) or subterranean cell, or in some cases buried in the earth at the spot where the cremation took place. Cremation was unknown among the early Christians, chiefly because those who had come out of Judaism had inherited the custom of entombing the dead, and that method was hallowed by the burial of their Lord; with the spread of Christianity, the custom was perpetuated, and cremation came to be looked upon with abhorrence, largely because it seemed inconsistent with a belief in the resurrection of the dead. The burning of the body of the poet Shelley and that of his friend Edward Williams, in 1822, and one which occurred in South Carolina earlier in the nineteenth century, are among the few instances of the occurrence of cremation in Christian lands before the year 1869.

At the present day, in India and other Eastern countries, as well as in Japan, the dead are usually burned, and in India, until 1847, it was a common practice for a wife to burn herself in a funeral pile along with the body of her husband. (See SUTTEE.) Some native tribes of Northwestern British America still dispose of dead bodies by cremation. During the French Revolution it was proposed to reintroduce the practice of cremation, but no decided steps were taken. In 1856 Prof. H. C. Richter contributed an article to the *Gartenlaube* of Leipzig, in which a crematory furnace was described. The subject was discussed by scientists in Italy in 1866; in 1869 Prof. Brunetti, of Padua, cremated the body of a woman; and in 1873, at the Vienna Exposition, he exhibited a model

furnace, together with some results of his experiments. In 1874, when a closed receptacle was used for the first time, the body of a woman was cremated at Breslau and another at Dresden. One of these was the wife of Sir Charles Dilke. In 1874, largely through the efforts of Sir Henry Thompson, a society for the promotion of cremation was formed in London, and in 1878 a crematory was built at Woking, in Surrey; but the first cremation in England did not take place until 1882, and even then was performed privately. In 1884 the act was declared legal in Great Britain, under certain conditions. In June, 1876, a congress of societies for the promotion of cremation met in Dresden, and the published reports of their proceedings did much to remove popular prejudice. In 1876, also, Dr. Francis J. Le Moyne erected a crematory near Washington, Pa., and in December the body of Baron de Palm, who had died in New York, was burned. In that same year a body, that of Henry Berry, of Marion, S. C., was burned on a funeral pile. Cremation is now very general in Italy, where it was legalized in 1877. Paris, Gotha, and other continental cities have crematories, and societies advocating the measure exist in countries where it is still prohibited. In some places, as at Gotha, columbaria are attached to the crematory temple. In the U. S. crematories have been built in a number of places, including Washington, Lancaster, Philadelphia, Pa., Fresh Pond, L. I., Buffalo, N. Y., Detroit, Mich., St. Louis, Mo., Los Angeles, Cal., and Davenport, Ia.

There are two distinct classes of arguments—hygienic and sentimental—in favor of cremation. The sanitarian urges the danger to the living of placing beneath the surface of the earth great numbers of the dead near large cities, gradually to decompose, thus contaminating the water and poisoning the air by the liberated gases, the overloaded soil being able to do its work of disinfection only to a limited extent. The fear of being buried alive is very general, and is a powerful cause acting in favor of cremation. It simplifies very much the funeral rite, and hence from its economy commends itself to a large class. The objections to cremation, on religious grounds, are met by those who favor it with the statement that it makes the words of commitment, "ashes to ashes, dust to dust," literally true, and that to deny the possibility of resurrection in such case is to deny the omnipotence of the Creator. Furthermore, it permits the use of the same religious ceremonies as before; and generally a chapel for services is attached to a crematory. The most important objection raised against such total and rapid destruction of the body is medico-legal, as it is claimed that evidences of poisoning and violence would be destroyed. This is met by the statement that necessarily there would be a more careful examination of bodies before burning, and probably a more general detection of crime. In all cases, the most decided measures are taken to prevent any irregular use of the process.

Cremation Furnaces.—The Siemens cremation furnace, which is used in Germany, consists of, first, a furnace, in which the body is placed for cremation; and, secondly, a regenerator, in which the gas and air used for combustion are heated before entering the cremation-chamber. The gas for combustion is prepared at a distance from the furnace, and led to it through underground flues. For general description of these furnaces, see FURNACE (Siemens iron). The regenerators consist of fire-brick chambers filled with fire-brick laid loosely, having regular spaces between them through which the air and gas can pass. The gas and air are admitted at the bottom of the regenerators through separate valves, and pass upward through the loosely laid fire-brick, to become heated by contact with them—in what way will be shown presently. The heated gas and air unite at the entrance to the cremation-chamber, where combustion ensues, producing an intense heat and flame that reach to the door at the farther end of the furnace. The burnt gases, after circulating through the furnace, pass back again to the end of the furnace at which they entered—the entrance and exit passages being separated vertically by a thin diaphragm of fire-brick—and downward through the regenerators, heating the loosely laid fire-brick in their descent, and passing out at the bottom of the regenerators, comparatively cold, through the valves to a high chimney-stack, whence they escape into the air. At stated intervals the butterflies in the valves are reversed, by which the currents of air and gas are changed, so that they pass upward through the regenerators, become heated in their passage through them, and after combustion in the furnace pass downward through the regenerators, which absorb their surplus heat. This reversing the currents is done every half hour. The furnace is raised to a strong heat before the body is introduced, and after the body is in the furnace and the door closed, the amount of gas supplied to the furnace is gradually diminished, as the gases coming from the body are sufficient to support combustion. In this way no foul vapor can escape into the air, every particle being oxidized; and when the process is completed—which takes about half an hour—nothing is left in the furnace but a small quantity of white ash, which is carefully collected and placed at the disposal of the friends.

The Gorini furnace, used in Great Britain, Italy, and elsewhere on the continent of Europe, consists of a furnace, a chimney, and a flat-bottomed receiver, connecting with both. Any products escaping from the receiver are consumed by a second fire, of coke, kept burning in the base of the chimney; hence there is no smoke or offensive odor. The time required for the combustion of an adult varies from one and a quarter to one and three-quarter hours, and the ashes weigh from 5 to 7 lb. The Venini furnace, used in some crematories in the U. S., reduces a body in about one hour and a half. The literature of the subject, all of comparatively recent date, is abundant. See H. Thompson, *Treatment of the Body after Death* (London, 1874), and *Modern Cremation* (London, 1889); Ullersperger, *Urne oder Grab* (1874); Leach, *Cremation* (London, 1884); Erichsen, *The Cremation of the Dead* (1887); Cameron, *The Modern Cremation Movement* (Paisley and London, 1888).

SAMUEL SEXTON.

Cremer, AUGUST HERMANN, D. D.: German theologian; b. in Unna, Westphalia, Oct. 18, 1834; educated at Halle and Tübingen; from 1859–70 pastor at Salst; since 1870 Professor of Theology in the University of Greifswald; author of the *Biblico-Theological Lexicon of N. T. Greek*, of which the seventh edition appeared (Gotha, 1892) in the German original and the third in the English translation (Edinburgh, 1886). HENRY E. JACOBS.

Crémieux, krā'mi-ö', ISAAC ADOLPHE: French advocate and republican; b. of Jewish parents at Nîmes, Apr. 30, 1796. He practiced as an advocate in the court of cassation in Paris. In 1842 he was elected a member of the Chamber of Deputies, in which he acted with the radical party. He was minister of justice in the provincial government (1848), and retired from office in June. He was a member of the National Assembly in 1849–50. In Sept., 1870, he became minister of justice after the deposition of Napoleon III. As president of the Universal Israelite Alliance of Paris, he displayed a remarkable activity in behalf of the Jews all over the world. D. at Passy, Feb. 10, 1880.

Cremnitz: same as KREMNITZ (*q. v.*).

Cremo'na: a province of Italy; bounded N. by the provinces of Bergamo and Brescia, W. by Milan, S. by Piacenza, Parma, and Reggio, and E. by Venetia. Area, 632 sq. miles. The soil is fruitful, producing grain, maize, rice, flax, wine, olives, etc. Capital, Cremona. Pop. (1881) 302,064; (1890) 305,214.

Cremona: a city of Italy; capital of the province of same name; in Lombardy; on the Po; here crossed by a bridge; 47 miles S. E. of Milan (see map of Italy, ref. 3–C). It is surrounded by walls, is well built, with wide streets, and has handsome palaces and a cathedral. Connected with the cathedral is a belfry called il Torazzo or the great tower, 372 feet high, completed in 1284, and one of the most beautiful towers in Italy. Cremona is a bishop's see, and has a city-hall, two theaters, a lyceum, a public library, and several hospitals. Here are manufactures of silk and cotton fabrics, porcelain, and chemical products. It was formerly celebrated for the violins of the Amatis (1590–1620), of the Guarneris, and of Stradivari (1670–1728). Cremona was a populous town during the ancient Roman empire. Pop. 37,400.

Crenelle', or **Crenel**: a battlement, or an embrasure in a battlement. The word *crenellated* is employed to signify that a building is supplied with crenelles. In its French form (*crenelé*, crenellated, embattled) the word is also used in heraldry and signifies broken into battlements, or square projections; thus a fesse *crenelé* has one edge so embattled.

Creole [Fr. *créole*: from Span. *criollo*, a deriv. of *criar*, create, nurse, bring up, educate]: a native of the West Indies or South America who is descended from Europeans. The term is sometimes applied erroneously, and *not* in the West Indies, to those whose ancestors were partly white, and have in their veins some blood of the Indians or Negroes. The word is used adjectively, and applies to other things than man; thus creole chickens are those from a recently imported European or other stock. R. STURGIS.

Cre'osote, or **Creasote** [from Gr. κρεο-, the combining form of κρέας, flesh + σώζειν, save]: a sirupy liquid obtained for commercial purposes chiefly from wood-tar and coal-tar, especially from the latter. Both varieties of creosote are very complex mixtures of compounds related to phenol or carbolic acid, and of various hydrocarbons (see HYDROCARBONS), as naphthalene, phenanthrene, anthracene, etc. Wood-tar creosote has a strong, penetrating odor resembling that of wood-smoke. It is a good antiseptic, and has become a valued remedy in tuberculosis of the lungs. Coal-tar creosote is very extensively employed for preserving timber, for softening hard pitch, as a fuel, as an antiseptic, and as a cattle wash for the purpose of destroying animal parasites. It is generally adulterated in commerce with a large percentage of phenol (see CARBOLIC ACID), which can with difficulty be detected. It is also employed in toothache, in obstinate vomiting, and as an outward application in cancer. In an overdose it is an irritant poison, for which any soluble sulphate (as magnesium sulphate) is an antidote. Revised by IRA REMSEN.

Creosoting: See PRESERVATION OF TIMBER.

Crescen'do [Ital., increasing]: in music, a gradual increasing of sound, or changing from piano to forte and fortissimo. It is marked thus <, or with the abbreviation *cresc.*

Cres'cent [from Lat. *cres'cere*, grow, increase]: the figure of the new moon. The standard of the Turkish army bears the figure of a crescent; the word "crescent" itself is often used figuratively for the Turkish military power. It had also been the emblem of the Greeks before the conquest of the Eastern empire by the Turks, and was used by Genghiz Khan's Tartars and other nations of Central Asia.

Crescent, Order of the: an order instituted at Angers in 1464 by René, Duke of Anjou, brother and heir-apparent of the Neapolitan king, Louis III. The badge was a crescent of gold, on which the words "Loz en Croissant" ("Praise to that which increases") were enameled in red letters. Its aims were those common to all military and religious orders—defense of the Church and of the innocent suffering, deference to ladies, and to all divinely appointed authorities, etc. The order is not known, however, to have survived its founder. The Turkish decoration of the Crescent, sometimes called an order, was instituted by Selim III. after the battle of Abukir, 1799, and was designed to be given only to Christians who in some way or other had aided the sultan. The first to receive it was the British admiral Nelson.

Cres'co: city; capital of Howard co., Ia. (for location of county, see map of Iowa, ref. 2–I); on the C., M. and St. P. R. R.; 60 miles W. of the Mississippi river. It has seven churches, a high school, a parochial school, foundries, brick and tile works, flour-mills, creameries, etc.; it is the center of large dairy, poultry, hog, and cattle interests. Pop. (1880) 1,875; (1890) 2,018; (1900) 2,806.

EDITOR OF "HOWARD COUNTY TIMES."

Cre'sol [from *creo*sote + alcoh*ol*; called also **Cresyl'ic Ae'id** and **Cres'yl Al'cohol**]: a compound (C_7H_8O) derived from coal-tar or from wood-tar by fractional distillation. Most of the CARBOLIC ACID (*q. v.*) of commerce contains a large percentage of cresol. It combines with alkalies, like its analogue phenol, and hence is by some called an acid; it is isomeric with benzyl alcohol, and is itself properly one of the alcohols. It refracts light strongly, and boils at 397° F. It is not identical with carbolic acid, but is used in its place as a disinfectant.

Cresses: plants having a pungent taste and diaphoretic and other medicinal qualities; belonging chiefly to the natural order *Cruciferæ*, and found in the temperate and northern parts of the earth. Many are used as articles of food. The common cress, *Lepidum sativum*, an annual and a native of Asia, has been introduced into other countries. In the U. S. it is usually sown out of doors in the autumn or very early in spring. It is used as an antiscorbutic during Arctic voyages. The Virginia cress (*L. virginicum*) is cultivated as a salad in North America, the West Indies, and Great Britain. The bitter cress (*Cardamine amara*), the lady's smock, or cuckoo flower, as it is called in England (*C. pratensis*), and the hairy cress (*C. hirsuta*) are found both in Europe and North America. Water-cress (*Nasturtium officinale*) is a perennial, aquatic plant, used as a spring salad, and is a native of almost all parts of the world. The leaves have a pungent taste, to which is added a little bitterness and saltness. They are very refreshing, however. It grows best in shallow running water with a bottom of sand. It is often cultivated and brought to market in North America and Europe. See NASTURTIUM.

Cres'son: railroad junction; Cambria co., Pa. (for location of county, see map of Pennsylvania, ref. 5–D.); 252 miles W. by N. from Philadelphia and 102 miles E. of Pittsburg. It is beautifully situated on the summit of the Alleghany Mountains, about 3,000 feet above the level of the sea. It is a fashionable place of summer resort. Pop. of township (1900) 1,572.

Cressy, in France: See CRÉCY.

Crest: something worn on the helmet in ancient warfare. Among the Greeks it was often of horsehair, forming a stiff ridge along the top, but falling in a long soft appendage behind the nape of the neck. Among the Romans it was sometimes of stiff upright feathers, but was not in general use as an ornament. In the Middle Ages, as the helmet often covered and concealed the face, the crest became a means of knowing the wearer. It was often very elaborate, made of thin metal or of boiled leather, and painted in rich colors.

In heraldry, an appendage to the escutcheon, usual though not necessary in a man's *achievement*, or general display of armorial bearings, but not in place in the achievement of a woman. It is carried upon a so-called *wreath*, which is sometimes put above a helmet, and sometimes directly above the escutcheon.

Crested Butte: city; Gunnison co., Col. (for location of county, see map of Colorado, ref. 4–C); on branch of Denver and Rio Grande R. R.; 18 miles N. of Gunnison. It is engaged in mining gold, silver, and coal, and in manufacturing coke. Pop. (1890) 857; (1900) 988.

Crestline: city and railway junction (founded in 1850): Crawford co., O. (for location of county, see map of Ohio, ref. 3–F); 63 miles N. by E. from Columbus. Here are 6 churches, 2 schools, extensive shops of the Penn. R. R., lockworks, a furnace, and artesian water-works. Pop. (1880) 2,848; (1890) 2,911; (1900) 3,282. EDITOR OF "ADVOCATE."

Creston: city and railway junction; capital of Union co., Ia. (for location of county, see map of Iowa, ref. 7–F); 190 miles W. of Burlington. It has several banks, a graded school, wagon-factories, and large machine-shops and car-works. Pop. (1880) 5,081; (1890) 7,200; (1900) 7,752.

EDITOR OF "ADVERTISER."

Creswell, JOHN A. J.: lawyer; b. at Port Deposit, Md., Nov. 18, 1828; educated at Dickinson College, Carlisle, Pa.; became a prominent lawyer; allied himself with the Whigs, the Democrats, and finally with the Republicans. He was appointed adjutant-general of Maryland in 1862; in the same year was chosen a Republican member of Congress, and in 1865 was elected a Senator of the U. S. for a short term. He was a member of the convention which renominated Lincoln, and of that which nominated Grant. In Mar., 1869, he was appointed Postmaster-General of the U. S. He resigned in Mar., 1873, and was then reappointed, serving until July 3, 1874. D. at Elkton, Md., Dec. 23, 1891.

Cresylie Alcohol, or **Cresylic Acid**: See CRESOL.

Cre'ta [Lat., chalk, originally Cretan earth]: a pharmaceutical name for chalk (native carbonate of lime) and for the precipitated carbonate of lime. The former is more generally used. The chalk is powdered, washed, and dried, and is then known as *creta præparata* (prepared chalk), an excellent antacid remedy. *Creta præcipitata* (the chemically prepared chalk) is more finely divided. See CHALK.

Cretaceous Period: the division of geologic time following the Jura-Trias and preceding the Eocene. In England and France, where the name cretaceous was first used, the principal formation representing the period is of chalk, and chalk-beds are also found in Texas and Arkansas, but in other regions the name is not descriptive of lithologic character. The life of the period is profusely represented by fossils; among the more characteristic are the *Rudistes*, an aberrant family of lamellibranchs; ammonitids with shells partly uncoiled; and birds with teeth. Cretaceous rocks have a great development in North America. They occupy a belt on the Atlantic coastal plain from New Jersey to Texas; cover an immense area on the Great Plains from Texas to Athabasca; reappear frequently among the mountain-ranges of Wyoming, Colorado, Utah, Arizona, and New Mexico; are greatly developed in the mountains of Northeastern Mexico; and appear at many points on the

Pacific coast from California to British Columbia. W. of the 100th meridian they contain an important store of coal, a store that when fully explored may be found to exceed that of the Carboniferous rocks of the Mississippi basin and Appalachian region. A compendious treatise on the North American Cretaceous, by Dr. Charles A. White, is contained in Bulletin No. 82 of the U. S. Geological Survey. See DAKOTA FORMATION, FOSSIL INVERTEBRATES, FOSSIL PLANTS, FOSSIL VERTEBRATES, GEOLOGY, HISTORIC; and LARAMIE.

G. K. G.

Crete, or **Can'dia** (Gr. Κρήτη; Turk. *Kiridi*): a large and famous island of the Mediterranean; between lat. 34° 57′ and 35° 41′ N., and lon. 23° 29′ and 26° 20′ E. It is 150 miles long, and from 6 to 35 miles wide. Area, 2,949 sq. miles. The surface is mountainous. Mt. Ida rises near the middle of the island to the height of 7,674 feet. Numerous caverns occur here, and an extensive one near Mt. Ida is fabled to have been that which was anciently the retreat of the Minotaur. Among the minerals are limestone and slate. The chief products of Crete are cotton, tobacco, olive oil, grapes, oranges, lemons, wine, silk, and wool. The population in ancient times is believed to have amounted to 1,200,000, and at the time when it was acquired by the Venetians to 500,000; it was estimated in 1885 at 294,192, of whom about 50,000 are Mohammedans, nearly all the others being Christians belonging to the Greek Church, which has eight bishops in the island. Most of the Mohammedans, however, are Greek by descent, and Greek is the only language spoken in the island.

History.—Crete is by some historians considered the cradle of the civilization brought to Europe by the Phœnicians and Egyptians. According to tradition, Minos, a celebrated legislator, reigned over this island before the beginning of the historical period. In the time of Homer, Crete had a dense population of the Hellenic race, and contained a great number of flourishing cities. Crete was visited by the apostle Paul, who planted a church in it. The Venetians became masters of this island in 1204. The Turks conquered it from the Venetians in 1669. In 1866 the Christian inhabitants revolted against the Turks, and demanded annexation to the kingdom of Greece. This war excited much sympathy among Christian nations, but the Cretans were subdued in 1869. They obtained, however, a kind of constitution, but bad government has caused insurrections, especially in the spring of 1897, resulting in evacuation by the Turks in 1898.

Crete: city and railway junction; Saline co., Neb. (for location of county, see map of Nebraska, ref. 11–G); 20 miles from Lincoln. It has several manufactories, and is the seat of Doane College. Pop. (1880) 1,870; (1900) 2,310; (1900) 2,199.

Crétineau-Joly, krā'tēē'nō' *zhō* lee', JACQUES: French author; b. in Fontenay, Sept. 23, 1803; studied theology in Paris, and wrote a number of works in defense of the interests of royalty and the Catholic Church. He is best known by his *History of the Jesuits* (6 vols., Paris, 1844–46; 4th ed. 1856), an elaborate work in defense of that order and at their request. Among his other works are *Histoire de la Vendée Militaire* (4 vols.; 5th ed. 1864); *Histoire de Louis Philippe* (2 vols., 1861–63; 2d ed. 1867); *Le Pape Clément XIV.* (1853). D. in Vincennes, Jan. 1, 1875.

Cret'inism (in Fr. *crétinisme*): a form of congenital disease in which mental and physical deformities are prominent. It has been found especially in certain parts of Switzerland and Central Europe, in the Himalayas and in other parts of Asia, and to a slight extent in America. The inhabitants of the valleys between mountain chains are especially prone to be affected, and it has been suggested that the prevalence of the disease was due to lime salts or other constituents in the waters used by the people of the affected localities. It is probable that the character of the water is of less significance than has been believed, and the special frequency of cretinism in regions abounding with magnesian limestone may depend upon other causes. Not rarely there is distinct evidence of hereditary transmission, and in some situations a large part of the population may be more or less affected. Cretinism is recognized to be dependent upon disease of the thyroid gland, or at all events some of the prominent symptoms depend upon such disease. The cretin is imbecilic or idiotic, and may be completely devoid of capability for intellectual development.

Physically the disease is highly characteristic. The body remains dwarfed, and perhaps distorted by disease and deformity of the bones. The head may be small, with retreating forehead and broad top, or it may be unusually large; the nose is flat, the mouth large, and the tongue broad, thick, and protruding. The eyes are small and frequently deep-set, being covered by thick brows and lids. The hair of the head may be scanty, and the body is generally completely hairless. The skin is dry and harsh, often ashen or yellowish in color, and the subcutaneous tissues may be thickened, causing the skin to hang in folds in various parts. The cretin is usually dirty, and has a voracious appetite.

The treatment of cretinism has received a notable addition within recent years in the administration of thyroid gland or extracts of the thyroid gland of animals, or in the implantation of the thyroid gland of animals into the cretin's body. Decided improvement, and sometimes almost cure results.

WILLIAM PEPPER.

Creuse, kröz: a department near the center of France; area, 2,151 sq. miles. The surface is mostly mountainous. The principal mineral productions are coal and salt. Capital, Guéret. Pop. (1881) 278,782; (1896) 279,366.

Creusot, Le, or **Le Creuzot**, *le*-krö'zō': town of France; department of Saône-et-Loire; 12 miles S. S. E. of Autun (see map of France, ref. 5–G); in the midst of rich mines of coal and iron. It has extensive blast furnaces, foundries, machine-shops, and glass-works. Pop. (1896) 32,034.

Creuzer, kroit'ser, GEORGE FRIEDRICH: German philologist and antiquary; b. at Marburg, Mar. 10, 1771; became Professor of Philology and Ancient History at Heidelberg in 1804, and retained that position for forty-four years. His principal work is the *Symbolism and Mythology of Ancient Peoples, especially the Greeks* (4 vols. 8vo, 1810–12). He ascribed to the pagan myths a mystical significance and a supernatural origin, a theory which was fiercely attacked, especially in Voss's *Antisymbolik*. He also edited the Oxford *Plotinus* (3 vols., 1835). His numerous German treatises have been collected in 4 vols. (Leipzig, 1848). D. in Heidelberg, Feb. 15, 1858. See his autobiography (1847); B. Stark, *Fr. C. sein Bildungsgang und seine bleibende Bedeutung* (Heidelberg, 1875); Bursian, *Geschichte der Philologie in Deutschland* (Munich, 1883).

ALFRED GUDEMAN.

Crevaux, JULES: See the Appendix.

Crew: the body of men employed in a vessel of any kind as distinct from the officers. The commander of a U. S. man-of-war is required to send to the Navy Department upon commissioning, and quarterly thereafter, a muster-roll of the crew, which includes petty officers, seamen, and marines. Prior to clearance, the master of a merchant vessel is required to deliver to the collector of customs his crew list. By the U. S. Postal Subsidy Act of 1890 one-fourth during the first two years of the contract, one-third during the three succeeding years, and one-half thereafter of the crew of a subsidized vessel shall be citizens of the U. S.

Crewe: town of Cheshire, England; 34 miles S. E. of Liverpool (see map of England, ref. 8–G). It has one of the largest railway stations in England, works for the construction of railway carriages and locomotives, and a park of 40 acres. Pop. (1891) 28,761.

Crib: See FOUNDATIONS.

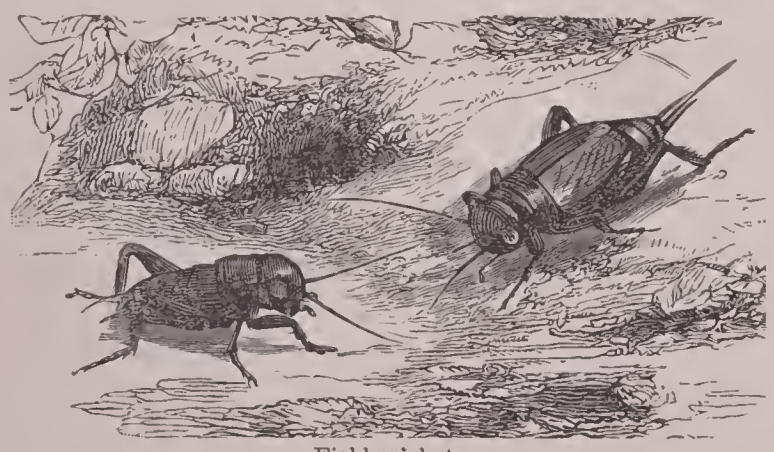
Cribbage [from *crib*, as used in the game]: a game at cards, usually played by two persons. The game is sixty-one points, which are scored with pegs on a board called a cribbage-board having sixty-one holes on each side. In the U. S. the game, when two or four play, is decided by the winning of two out of three *legs*. Where three play, the first out in a double circuit of the board is the winner. When cribbage is played by three persons a three-cornered board is used. In this case each player receives five cards, and an extra card is dealt, which is added to the crib. When four persons play each has a partner, and each receives five cards, of which he discards one to form the crib. When only two persons play, six cards are dealt to each player, and each discards two, to form what is called the *crib*, which belongs to the dealer. The pack is then cut, and the dealer turns up a card, called the *turn-up*, which is reckoned in scoring as belonging to all the hands and the crib. The cards held in the hands are then played alternately, counting the pips or spots (face cards counting ten) up to thirty-one, for which two is scored to the person playing the card that makes it, and scoring in the same way for every combination made according to any of the following rules: Any combination of cards the united spots of which make up fifteen scores two points. A sequence

in rank (without regard to suit) of three or more cards scores one for each card. Two similar cards of different suits (as two fives or two knaves) form a *pair*, and score two; three form a *pair-royal*, and four a *double pair-royal*, scoring respectively six and twelve. When the cards are all played each hand is counted by itself, according to the same rules. For example, a hand containing two sevens, an eight, and a nine, with an eight turned up, would score twenty-four; four fifteens (produced by the different combinations of eight and seven) = 8; four sequences of three each = 12; two pairs = 4. If the cards in either hand, or the cards in the crib and turn-up, are all of the same suit, it is called a *flush*, and one is scored for each card. If a knave of the same suit as the turn-up be in either hand or in the crib, the holder scores one; when the turn-up is a knave the dealer scores two. During the play, when it is found impossible to count to thirty-one without passing that limit, it is called a *go*, and the last player scores one.

Crichton, krī'tŭn, James: called The Admirable Crichton; b. in Perthshire, Scotland, Aug. 19, 1560; a son of Robert, lord-advocate of Scotland. Educated at St. Andrews, before he was twenty he had run through the entire circle of sciences. He could speak in ten languages, and was adroit in all manly accomplishments. He journeyed through Europe about 1580, challenging all scholars to a learned disputation in any of twelve tongues. He vanquished all the doctors of all the universities; moreover, he disarmed the most famous swordsman of the time in fencing, and by his grace and manly beauty his amorous triumphs were not less distinguished. He found his death between 1585 and 1591, at the hands of Vincentio, son of Gonzago, the Duke of Mantua, a dissolute youth whom he had roughly jostled in a carnival encounter. "He was," says Scaliger, "a man of very wonderful genius, more worthy of admiration than esteem." The stories of his accomplishments are no doubt exaggerated. He published Latin verses and prose essays of no great value. See P. F. Tytler, *Admirable Crichton* (1823), and the article in the *Dictionary of National Biography*.

Crichton-Brown, Sir James, M. D., LL. D., F. R. S.: English physician; b. in Edinburgh, 1840; educated at Trinity College, University of Edinburgh, and the medical schools of London and Paris; is vice-president and treasurer of the Royal Institution of Great Britain, and member of many learned societies; author of a large number of monographs on physiology and pathology of the nervous system. As head of the West Riding Asylum, he made it famous, not only for good management, but also as a center of successful research.

Cricket: the popular name of certain orthopterous insects, nearly allied to locusts and grasshoppers, the type of the family *Gryllidæ*. The wings, being horizontally folded, form a slender point beyond the wing-covers. In virtue

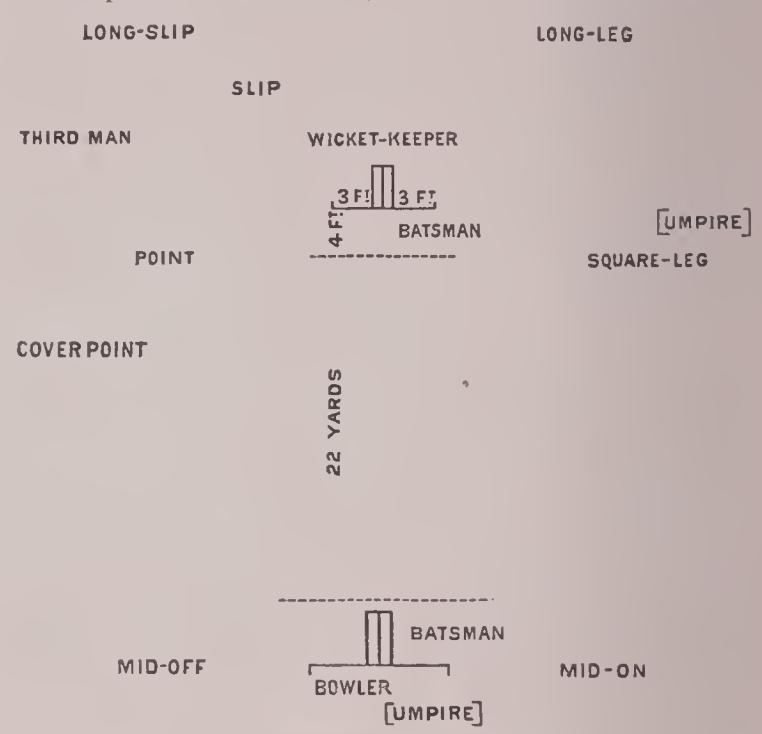


Field-cricket.

of a peculiar formation of the wing-covers, and by their friction, the males produce that stridulous sound by which these insects are so well known. Of the typical genus *Gryllus*, the U. S. have several species, including the common black crickets, *Gryllus abbreviatus* and *Gryllus neglectus*, this last being the most abundant cricket in the New England and Northern Middle States. The house-cricket of Europe, *Gryllus domesticus*, has become naturalized in the Eastern U. S., where it is frequently met. The common mole-cricket of the Northern U. S., *Gryllotalpa borealis*, has wings shorter than the mole-crickets of Europe. The mole-crickets construct chambers for their eggs beneath the surface of the earth, and the passages leading to these cells are long and tortuous, like those of the mole. The climbing crickets (*Œcanthus*) are represented in the U. S. by several species. They are often found upon weeds and shrubs.

Revised by F. A. Lucas.

Cricket: a game played by two sides, of eleven men each, on a smooth field, of which the smoothest and fairly central portion is called the "crease," a strip of ground 22 yards long, at each extremity of which is pitched a "wicket." This wicket, 27 inches high and 8 inches wide, consists of three "stumps," or upright sticks, of sufficient thickness to prevent the ball from passing between two of them, and supports in shallow grooves two "bails" or cross-pieces, placed end to end, which rest so lightly on the stumps that a slight touch of the ball knocks them off. A space marked by a white-wash line, extending 3 feet on each side of the wicket, and a parallel line of indefinite length, at a distance of 4 feet toward the opposite wicket, is the "popping-crease," or batsman's position. Two batsmen represent the eleven at bat ("in"); the other eleven take the "field," in the following normal positions, which may be varied with the character



Arrangement of the players.

of the bowling. If the bowler hits the wicket at which he is bowling with his ball, the batsman is "out," and yields his place to another of the same side. If, on the contrary, the batsman strikes the ball with his bat, and so defends his wicket, and if the ball so hit is neither caught nor stopped by fielders, he may make a "run," i. e. exchange his own popping-crease (see cut) for that of his companion at the other wicket, who makes a corresponding exchange; and if he knocks the ball far enough, may make two, three, sometimes as many as six runs, which are credited to his account in the "score-book." If he fails to touch the ball and it misses the wicket, he may also run ("a bye)," which counts for his side, but not in his individual score; and this holds good of the "leg-bye," where the ball glances off from his person (the hands excepted); of the "wide," where the ball is bowled out of the batsman's reach; and of the "no ball," where the bowler in delivering the ball fails to keep one foot behind the line of the stump, called the bowling-crease, or else "throws or jerks" instead of bowling; but "wide" and "no ball" count in the score without any necessity of running on the part of the two batsmen. Each side has two "innings"; whichever secures the greater aggregate of runs wins the match. A batsman is "out" (1) if his wicket is "bowled"; (2) if he stops with his leg a ball that would otherwise hit the wicket; (3) if he knocks down his own wicket; (4) if he picks up the ball, or (5) obstructs a fielder, or (6) hits a ball twice; (7) if he hits a ball which is then caught by a fielder before it touches the ground; (8) if, in playing at the ball, he goes out of his "popping-crease," and the wicket-keeper can then, with the ball, knock off the bails ("stumped out"); (9) if, in attempting to run, the same thing happens ("run out"). Judgment whether or not a player is out is business of two umpires, one of whom stands by the bowler, the other not far from square-leg. Four (in the U. S. mostly six) balls are bowled in succession from one wicket (an "over"), when fielders change positions, and

another man bowls an "over" from the opposite end; this alternation is kept up through the entire game.

The Implements.—These are expensive, and are made in Great Britain. The ball weighs 5½ oz.; the bat, with a maximum length of 38 inches, has a "blade" of English willow 2 feet long, and not over 4¼ inches wide, flat on the face and convex on the back, and a spliced elastic cane-handle, about a foot in length, carefully wrapped with thread. "Pads" or guards are used for the batsman's legs, and he often adds gloves for his hands. The wicket-keeper is similarly protected.

Science of the Game.—Cricket is practically a duel between bowler and batsman, though the latter is alone and the former has ten men to help him. Recent progress has consisted in finer skill and greater daring on the batsman's part; and on the bowler's part in greater freedom as regards the delivery of the ball (a process analogous to the course of "pitching" in baseball), in greater skill in the control of it, and in a closer co-ordination of the bowling and the fielding. Once confined to "underhand" delivery, then restricted to the "round arm," where the hand was not raised above the shoulder, he may now deliver as he pleases, but must not *jerk or throw*. Slow overhand bowling is a modern art. The "headwork" of bowling is now its main feature. Every ball should be delivered with a purpose, with this or that "break" (spin or twist) and "pitch" (that spot where the ball hits the ground in front of the batsman), and often with deliberate intent to let the batsman hit it ("bowling for catches"). Hence the necessity for changing fielders' positions to suit the bowling. This improvement in bowling has hardly kept pace with the better science of modern batsmen, and scores are growing larger every season. Early cricket knew little but hard hitting; with fast bowling came an era of "blocking" (stopping the ball); nowadays the free hitter is at the front—such a man as the "champion," W. G. Grace, of England, who, in 1876, made 344 runs in one inning. Briefly, the object of batting is to hit the ball, (1) along the ground, and (2) hard enough to make runs. A quick and accurate eye, combined with rapid judgment, makes the player. Theory counts for little compared with practice; but every cricketer must remember to keep his right foot firmly in place, to play mainly forward, with the left shoulder and elbow well in front, the bat perpendicular, and to take the ball at its pitch. The chief hits are the drive, forward to mid-off or mid-on, and the cut, at right angles to the batsman or behind him, toward cover-point or the slips; the former is done chiefly by shoulders and arms, the latter by the wrists. "Slips" and "snicks" are useful with fast bowling, and a good hit to leg is always welcome, though modern bowlers seldom give the opportunity.

History of the Game.—The origin of cricket (as regards both the name and the game) is obscure. "Cricket" may be a diminution of *crice*, the old word for "staff," or, as Mr. Lang suggests, it may have stood, as it does now, for a stool, and the game may have been developed out of "stool-ball." In 1611 Cotgrave's *Dictionary* translates French *crosse*, "a cricket staffe, or the crooked staffe wherewith boies play at cricket." In Queen Elizabeth's reign, by documentary evidence, the boys of the free school at Guildford played cricket; and this is the earliest direct mention of the game. By the eighteenth century it is mentioned on all sides. Laws were drawn up for the game in 1744; and contemporary pictures show us a small wicket (two stumps and one bail), with a bat combining the characteristics of a base-ball bat and a modern shinny-stick. Toward the end of the century all this was materially changed, bat and wicket; round-arm bowling began, and at last (in 1827) Lillywhite raised his hand above the shoulder, and so, not without great controversies, began the era of modern bowling. About 1787 the Marylebone Club was organized; its rules are recognized as supreme authority in cricket. In Great Britain a sharp line is drawn between "professionals" or "players" and the "gentlemen"; but in the U. S. professionals are few, and are mainly employed as bowlers and coaches by local clubs. The university, school, and county matches in England are of national importance, and since 1846 the All-England Eleven has repeatedly played international games, the most noteworthy being those with Australia.

In the U. S. cricket had been played as a provincial rather than national game by British residents and a few others, until the independent interest of natives infused vigor into its career and put it upon its present basis. The center of this movement was Philadelphia, which, indeed, still holds the best and largest clubs of the country. Representative English elevens crossed the ocean and played matches with All America or All Philadelphia, the native side often counting twenty-two men; under this pressure cricket in the U. S. made rapid strides in improvement, so that nowadays an international match of the first class is confined to eleven on each side, is a matter of yearly occurrence, and is often won by the U. S. eleven. The championship of the U. S. is at present held by the Germantown Club of Philadelphia, which has defeated its national rivals as well as the best elevens of Canada. In New England, and even in the West, cricket is spreading rapidly. It does not rival base-ball in popularity, but it has a large and increasing body of adherents.

Books on Cricket.—Many books have been written about the game, but we need mention only Pycroft's *The Cricket Field* and the recent standard work of the Badminton Library, *Cricket*, by Steele and Lyttelton. This contains a mine of information, antiquarian as well as practical, and should be in the hands of every cricketer. Journals of cricket are published, giving the scores of important matches and current gossip of the same. F. B. Gummere.

Crillon, krĕĕ′yōn′, Louis des Balbes de Berton, de: French warrior; b. in Provence in 1541. He served at the siege of Calais in 1558, and fought against the Huguenots in the civil wars. He distinguished himself at Jarnac and Moncontour, and at the naval battle of Lepanto (1571). During the reign of Henry III. he fought for that king against the Catholic League. In 1589 he entered the service of Henry IV., who styled him "the bravest of the brave." He contributed to the victory at Ivry (1590), but after the peace of Savoy retired from public life. D. Dec. 2, 1615. See Serviez, *Histoire du brave Crillon* (1844); Abbé de Crillon, *Vie de L. des Balbes de Berton de Crillon* (3 vols., 1826.)—A descendant of "the brave" Crillon, Louis (1718–96), was a distinguished general of the Thirty Years' war, and in the service of Spain became Duke of Mahon, and commanded at the futile investment of Gibraltar in 1782.—His grandson, Duc de Mahon (1775–1832), a Spanish general, was viceregent of Navarre under Joseph Bonaparte.

Crime [viâ Fr. from Lat. *crimen*, judicial decision, charge, connected with *cer'nere*, discriminate, note, determine]: any act done in violation of those duties which an individual owes to a community, and for a breach of which the law has provided that the offender shall make satisfaction to the public. The ascertainment of these duties, which society imposes upon its members for the general welfare, is derived either from the common concurrence of the moral sentiments of any community or from the enactment of specific laws defining and enforcing particular obligations. Offenses against the one variety of duties are said to be *mala in se* (wrongful in themselves), while those against the other are designated *mala prohibita* (wrongful because prohibited by statute). As a general practice, however, legislative prohibition is also extended to the case of crimes which are strictly *mala in se*, both to provide against uncertainty and fluctuation of opinion and to create additional sanctions; so that the precise original distinction between the two classes is no longer preserved. The laws of England recognize a larger variety of crimes not depending upon statute than is generally the case in the U. S. But even in the U. S., as a rule, there are still some offenses for which the common law alone makes provision.

By the common law crimes are divided into two great classes—felonies and misdemeanors. The distinction is based upon the relative enormity of various offenses. Thus the term "felony" includes those which are of greatest magnitude, while "misdemeanor" is reserved for the residue. But nevertheless an understanding of the exact extent of meaning of these two designations can only be attained by an indirect mode of definition—viz., by showing the diversity of punishment in the respective cases. A felony was originally any crime for which the penalty might be a forfeiture of lands or goods; a misdemeanor was one which entailed a milder punishment. In some of the U. S. the punishments distinguishing felonies have been changed, and are now either death or imprisonment in a State prison. In others, while the common-law distinction has been discarded, no different one has been adopted to supply its place, so that the two terms are used without precision or definiteness of meaning.

In order that a person may be guilty of a crime there

must be a concurrence of capacity, intent, and wrongful act. The questions of capacity and intent are, in fact, closely related, since the law adjudges a person incapable of a criminal offense only because it presumes him incompetent to form a criminal purpose. The principal causes of incapacity are infancy and the want of mental soundness. Infancy exempts from responsibility only when children are so young as to have no acquaintance with the nature of a criminal offense. At the common law a child under seven years of age is conclusively presumed to be unable to commit a crime; between seven and fourteen, his liability depends upon his actual discretion, which must be determined in each particular instance by special proof; after fourteen he is considered presumptively capable. The want of proper mental capacity to form a criminal intention exists in the case of idiots, lunatics, and all persons who are either permanently of unsound mind, or so deranged at the time of the commission of any wrongful act as not to be aware of its guilty character. Exactly what degree of mental alienation should be sufficient to exempt from responsibility is a matter difficult to determine. The only criterion that can generally be adopted is the wrongdoer's power of appreciation of the wrongful nature of the particular act which he committed. (See INSANITY.) Voluntary drunkenness, however, though it may confuse and disorder the moral perceptions, and produce a kind of temporary insanity as pernicious in its effects as natural aberration, affords, in general, no defense for the criminal offender. Only where a specific intent is an essential element to constitute a crime can a person intoxicated be excused for that particular offense. As a rule, the intent to drink is sufficiently culpable to make the resulting act punishable. If, however, true insanity or delirium tremens should be produced as a consequence of intoxication, and the victim of it should commit an act which if he were sane would be a crime, he will be excused. The law in that case only regards the fact of insanity, without reference to the means by which it has been occasioned. Besides these natural incapacities which exempt from penalty, there exist certain other causes for exoneration, such as duress and coverture. Whenever an offense is not perpetrated voluntarily, but under the compulsion of force or fear, there is wanting that willing pursuit of crime which is alone a just reason for condemnation. In like manner, the stress of overwhelming necessity relieves from guilt the involuntary wrong-doer. Coverture also, or the condition of a married woman, exempts from liability in some instances, because her action is considered to have been occasioned by constraint exerted by her husband. Thus all crimes committed by a wife in the presence of her husband, except some of a graver class, as treason, murder, robbery, and the like, are presumed to be done by coercion. This presumption is not a conclusive one, but relieves a married woman from any consequence of her action until rebutted by direct evidence that the crime was exclusively of her own commission. This mode of justification by alleging constraint only applies to married women. Servants and children are not excused, though acting under the command of masters or parents.

The necessity for the existence of a criminal intent in order to make a person responsible for his wrongful acts forms an important distinction between criminal and civil liability, for in civil cases intent need not generally be proved. It has always been a well-recognized maxim in criminal jurisprudence that "the act does not make a man guilty unless his purpose also be guilty." But the intention need not necessarily contemplate the commission of the particular consequence which results. In most instances, of course, the act done will be the specific act intended. But yet, if there be a purpose to perpetrate one crime, and the means used for its accomplishment unexpectedly result in a different offense or affect a person against whom they were not directed, there is still a sufficient connection of intent and act to warrant a holding to accountability. Thus if a man intends to shoot A and his act results in the death of B, whom he did not intend to injure, he is nevertheless responsible, as though he had actually intended to kill B. This principle, however, is not in all its rigor applicable when the crime committed is strictly in the class of *mala prohibita*, for the original purpose is not then deemed sufficiently reprehensible. A still different case arises where the preconceived intention had reference to the specific act performed, but did not include knowledge of its criminality, as where a person shoots game at a certain season when it is prohibited, without being aware that he is violating the law. In this class of instances it is likewise true that all the necessary elements of a crime are sufficiently present to justify punishment. The principle is that ignorance of the law must afford no excuse. If such were not the rule, all laws would be ineffective, for would-be offenders would be likely to abstain from examining their provisions, and thereby secure impunity. The accompaniment of intent and act, therefore, which will constitute criminal transgression, may occur in three different forms: First, the intent may be wrongful, and contemplate the very offense committed; second, the intent may be wrongful, but contemplate another offense than the one committed; third, the intent may be really innocent, but contemplate an offense which happens to be prohibited by law, and so criminal.

There are some cases in which, though no actual criminal intent is conceived, yet the law presumes its existence. When acts are characterized by such a degree of negligence or carelessness as to evince a culpable indifference whether wrong is done or not, the wanton disregard of commonly recognized duties is essentially criminal of itself. But if an unlawful act is committed, through mere accident or misfortune, in the prosecution of some legitimate undertaking, the unwitting offender is excused. In like manner, though ignorance of law affords no justification, ignorance of fact, where no reasonable opportunity is granted for acquiring correct information, is a valid excuse. The law may always be known when the facts can not be ascertained. "The guilt of the accused," it has been said as to these matters of fact, "must depend on the circumstances as they appear to him."

The necessity that an act must concur with the intent depends upon the principle that no mere mental conception or fancy, no matter how reprehensible morally, can ever be taken cognizance of at law without some overt expression of it in an objective result.

The parties engaged in the commission of crimes are distinguished either as principals or accessories. A principal in the first degree is one who is the actual, direct perpetrator of the offense. A principal in the second degree is one who is present, aiding and abetting the act to be done. An accessory is a participant in the wrong-doing in some more remote manner, either by procuration or assistance before the act, or after its occurrence by sharing in the profits acquired or shielding the immediate offenders from justice. In the one case he is called an accessory before the fact; in the other, an accessory after the fact. This distinction between principals and accessories is maintained only with reference to felonies, and even among these an exception is made of the crime of treason. There is no accessory before the fact in the common-law crime of manslaughter, for in it there is no preconceived intent to kill. In treason and in misdemeanors all the participants are deemed principals; in the one case, from the enormity, and in the other from the comparative triviality, of the offense. Where the distinction is preserved there is no reason for diversity of punishment as between principals and accessories before the fact. Accessories after the fact are not so severely punished, as their offense consists in an attack on the administration of justice. A wife is excused for thus shielding her husband. It was formerly the rule that the accessory could not be brought to trial before the principal, but this doctrine has been quite generally changed by statute.

The various crimes which may be committed are classified by legal writers in different ways. Blackstone in his *Commentaries* treats them as either offenses against morals and religion or the law of nations, or as against the existence of the government or state, such as treason, or against public order under the respective titles of public justice, public peace, public trade, public health or economy, and finally, against individuals. These last are subdivided into those which are committed against the person, against habitations, and against property. This classification is incomplete, and no place can be found in it for certain well-established crimes, particularly those which have been created by statute. The most satisfactory treatment of the subject is that adopted by Mr. Bishop, who discusses the general principles of law governing crimes, and then considers specifically each crime known to the law under an alphabetical arrangement. It should be noticed that the criminal law of the Federal Government is wholly created by statute, Congress having enacted so-called "Crime Acts." Under the State Governments the common law of crimes exists unless changed by statute. It will be impossible in this brief

notice to do more than to refer to some of the leading crimes, which are considered under their respective titles: Arson, Bribery, Burglary, Champerty, Cheating, Embezzlement, False Pretenses, Forgery, Gaming, Larceny, Libel, Mayhem, Perjury, Piracy, Polygamy, Rape, Riot, Robbery, Treason, Usury. For punishment of crimes, see Punishment.

In this brief account only the common-law doctrine of crimes could be considered. Upon this may be further consulted Blackstone, *Commentaries*, book iv.; Bishop, *On Criminal Law*; Bishop, *On Criminal Procedure*; Wharton, *American Criminal Law*; Russell, *On Crimes*; Hale, *Pleas of the Crown*; Hawkins, *Pleas of the Crown*; East, *Pleas of the Crown*; and Foster, *Crown Law*. The statutes of the States severally should also be referred to. Upon the general subject of criminal offenses, see Ortolan, *Droit Penal*; Beccaria, *On Crimes*; Mittermaier, *On Capital Punishment*, etc. See also the article Anthropology, Criminal.

T. W. Dwight.

Crime'a (in Russ. *Krim*; anc. *Taurica Chersonesus*): peninsula of Southern Russia; forming part of the government of Taurida, and nearly surrounded by the Black Sea and the Sea of Azof. It is connected with the mainland by the Isthmus of Perekop, 5 miles broad. Its length E. and W. is nearly 200 miles, and its area 9,850 sq. miles. The northwestern part of the Crimea is a treeless plain, the soil of which is impregnated with salt and fit only for pasturage. The southeastern part is occupied by wooded mountains and fertile valleys, but they are ill cultivated. The highest peak of these mountains is 5,450 feet above the level of the sea. Among the products are grain, grapes, olives, silk, honey, and wine. Many horses and cattle are reared here, and salt is exported. Marbles, porphyries, and coal are found. The chief towns are Simferopol, Sevastopol, and Baktshi-Serai, the old Tartar capital. It was conquered in the thirteenth century by the Tartars, who converted it into the khanate of Krim-Tartary. It was annexed to Russia in 1783. Pop. about 250,000, including Tartars (80,000), Jews, Gypsies, Greeks, Armenians, Russians, and Germans.

Crimean War: so called because it was chiefly waged in the Russian peninsula of the Crimea. It was carried on by France, Great Britain, Turkey, and Sardinia, against Russia. The aim of the allies was to check the growing power and encroachments of Russia, and to prop up the tottering throne of the Turkish sultan. One cause of the war was the claim of Russia to be the protector of the Greek Church in Turkey. After ineffectual negotiations between Russia and the Ottoman Porte, the Russian army entered the principalities in July, 1853, and war was declared by the sultan in October of that year. Early in Jan., 1854, the French and English fleets entered the Black Sea, and these allied powers announced to the Czar Nicholas that their combined fleets must have command of that sea. A treaty of alliance between France, England, and the Porte having been signed Mar. 12, the former two powers declared war Mar. 27 and 28. The French and English fleets bombarded Odessa Apr. 22. Lord Raglan took command of the British army, and Marshal Saint-Arnaud of the French. The allied armies landed at Varna May 29, and there suffered severely from cholera. The allies moved their armies to the Crimea early in September, and defeated the Russians at the river Alma on the 20th of that month. Prince Mentchikof commanded the Russian army. The allies commenced the bombardment of Sevastopol Oct. 17, fought a battle at Balaklava Oct. 25, and gained a victory at Inkerman Nov. 5. The British troops, being ill supplied with food and clothing, suffered great privations and hardships in the ensuing winter, and large numbers of them perished. The King of Sardinia joined the allies in Jan., 1855. In May Gen. Pélissier became commander-in-chief of the French army. On June 18 the allies attacked the important fortresses known as the Malakoff and the Redan, but were repulsed. The French took the Malakoff by storm Sept. 8, 1855, and the Russians evacuated Sevastopol about the 9th of that month. An armistice was concluded Feb. 26, 1856, and a treaty of peace was signed in Paris Mar. 30, 1856. See Kinglake, *The Invasion of the Crimea* (8 vols., 1863–87). See Sevastopol.

Criminal Law: See Law and Crime.

Criminology: See the Appendix.

Crimmitschau, krim'mit-show: a town of Saxony; on the Pleisse and on the railway from Altenburg to Zwickau; 10 miles N. W. of the latter (see map of German Empire, ref. 5–F). It has manufactures of woolens and a number of machine-works and breweries. Pop. (1895) 23,553.

Crinoi'dea [from Gr. *κρίνον*, lily + *εἶδος*, appearance]: a class of *Echinodermata*, characterized by having a spherical or cup-shaped body, from which radiate five (often branching) arms, which in turn may bear small processes or pinnulæ. The central body is attached to some submarine object either directly or by the intervention of a long, many-jointed stalk. In most genera this attachment continues throughout life, but in the genus *Comatula* the body soon separates from the stalk, and afterward pursues a free existence. The mouth is in the center of the surface opposite the stalk, and the vent is at one side. In the typical forms ciliated grooves radiate from the mouth and extend along the arms. The cilia in these grooves create currents in the water which bring food to the mouth. The body externally is enveloped in calcareous plates, the arrangement of which is of value in classification, and the stalk is made up of a series of calcareous disks like button molds movably united one with another. The joints of the stem are extremely abundant as fossils, and in England have the common name of "St. Cuthbert's beads." The Crinoids are divided into three groups—the Crinoids proper, the Blastoidea, and the Cystidea. The Crinoids proper range from the Silurian rocks to the present time. In the Carboniferous age they were extremely abundant, and beautiful collections have been made at Crawfordsville, Ind., and Burlington, Ia. Of the recent forms the species of Comatula are numerous, but the other forms are rare, and until the last twenty-five years only one species was known, *Pentacrinus caput-medusæ* from the West Indies. Now a number of species are known. The Blastoids and Cystideans are all extinct; they appear in the Silurian and die out in the Carboniferous rocks. The Blastoids are acorn-shaped and lack arms; the Cystideans have weak arms, and are attached either directly or by the intervention of a short stalk.

J. S. Kingsley.

Crinoline [Fr., hair-cloth; deriv. of *crin*, horse-hair < Lat. *crinis*, hair]: literally, *hair-cloth*; in general, any very stiff textile material intended to stiffen articles of dress or parts of them by being put in as a lining or interlining. Especially, such a stuff when used as an underskirt in women's dress, as in the styles from 1840 to 1865. By extension, a stiff underskirt of any material, even the skeleton of wire and flat steel springs, more properly called a hoop-skirt; and also such skirts in general, as in the phrase "Crinoline is in fashion." The material seems to have been known by this name as early as 1830, but the skirt expanded to great size by its use is not earlier than 1848.

Cripple Creek: mining town; El Paso co., Col. (for location of county, see map of Colorado, ref. 4–E); situated among the hills at the base of Pike's Peak; 30 miles W. by S. of Colorado Springs; connected with the Colorado Midland R. R. by a branch railway 24 miles in length. The town owes its existence to the discovery of gold here in 1891. Pop. (1893) with adjacent mining camps about 3,000; (1900) 10,147. In Apr., 1896, the town was almost wiped out by incendiary fires.

Crisafulli, Henri: French dramatist; b. at Naples in 1827, but educated in Paris. In collaboration with Édouard Devicque he wrote several dramas, including *Cæsar Borgia* (1855) and *Giroflé-Girofla* (1858), and a comedy, *Ernest Ramel* (1861). These were followed by a great number of works written singly or in collaboration with others, among which are *Monsieur et Madame Fernel* (1864); *The Wolves and the Lambs* (1868); *The Postillions of Fougerolles* (1873); *Lord Harrington* (1879). In connection with Gustave Aimard he published a series of romances entitled *Les Invisibles de Paris* (5 vols., 1866–67).

Cri'sis [Gr. *κρίσις*, decision; deriv. of *κρίνειν*, decide]: in medicine, the sudden termination of disease. Certain diseases are prone to terminate by sudden improvement after a course of definite duration. This is notably true of pneumonia, typhus fever, relapsing fever, and a number of others. Among the older physicians "critical days" were regarded as significant of the alteration or elimination of the material cause of disease, and such days were looked forward to with apprehension or hopefulness, according to the progress of the patient's condition. Critical days in this sense did not necessarily imply termination of the disease, but rather days of profound change toward recovery. The crisis of disease is often preceded by aggravation of the morbid symptoms, while the crisis itself is attended with rapid subsidence of

the symptoms. On the other hand, because of this very suddenness, exhaustion, or collapse, and profuse discharges, as of sweat (critical discharges), are frequently observed.

Crisis, Commercial: See COMMERCIAL CRISES.

Crisp, CHARLES FREDERICK: U. S. politician; b. in Sheffield, England, Jan. 29, 1845. His parents, who were actors, brought him to the U. S. when he was a child; he received a common-school education in Savannah and Macon, Ga.; served during the civil war in the Confederate army, becoming a lieutenant in a Virginia regiment, and, in consequence of capture by Union forces, being confined as a prisoner of war in Fort Delaware; admitted to the bar in Americus, Ga., 1866; solicitor-general for the southern judicial district of Georgia; judge of the superior court 1877–82; elected as a Democrat to Congress 1882, and successively re-elected; elected Speaker of the Fifty-second Congress 1891, and of the Fifty-third 1893–95. D. Oct. 23, 1896.

Cris'pi, FRANCESCO: Italian statesman; b. Oct. 4, 1819, at Ribera, Sicily; became a lawyer in Naples; was in 1848 one of the leaders of the insurrection in Palermo, and for two years prominent among the Sicilians in their resistance to Ferdinand I. In 1859 and 1860 he was again at the head of the new revolution of Sicily, and co-operated with Garibaldi in the expulsion of the Bourbons, which brought about the annexation of Naples and Sicily to the kingdom of Italy. Elected member of the Parliament in 1861, he became leader of the Constitutional Left; president of the Chamber of Deputies 1876: 1877–78, and again in 1887, Minister of the Interior; president of the Council 1887–91, and again in 1894–96. He was a firm supporter of the triple alliance of Italy, Germany, and Austria. Revised by C. K. ADAMS.

Cris'pin, SAINT: a native of Rome; worked at the trade of a shoemaker in Gaul. In 287 A. D. he and his brother Crispian suffered martyrdom, and both are commemorated on St. Crispin's Day, Oct. 25. St. Crispin is the patron saint of shoemakers.

Cri'tias (in Gr. Κριτίας): Athenian orator and statesman; a pupil of Socrates. Banished from Athens about 406 B. C., he returned with Lysander in 404 and became one of the so-called Thirty Tyrants. He caused the death of Theramenes, and not long after perished himself in a battle with the men of Thrasybulus 404 B. C. He wrote political pamphlets, dramas, elegies. The few fragments of the elegies that remain are characteristic of his carping temper. See Bergk's *Poetæ Lyrici Græci*, ii., pp. 279–284 (3d ed.).

Critical Philosophy: See KANT.

Criticism: the act or the art of criticising. In the latter signification it has been defined as "the art of judging with propriety concerning any object or combination of objects." In a more limited meaning its province is confined to literature, philology, and the fine arts, and to subjects of antiquarian, scientific, and historical investigation. The elements of criticism depend on the two principles of beauty and truth, one of which is the final end or object of study in every one of its pursuits—beauty in letters and the arts, truth in history and the sciences. Thus historical criticism teaches us to distinguish the true from the false or the probable from the improbable in historical works; scientific criticism has the same object with respect to the different branches of science; while literary criticism, in a general sense, has for its principal employment the investigation of the merits and demerits of design, style, or diction, according to the general principles of composition and to the received standard of excellence in every language. In poetry and the arts, criticism develops the principles of that more refined and exquisite sense of beauty which forms the ideal model of perfection in each.

Of all the critics of antiquity, the greatest beyond comparison was undoubtedly Aristotle. Aristarchus, who is often styled "the prince of critics," was more properly a grammarian and commentator than a critic, in the wider modern acceptation of this term. Among the Romans Quintilian was especially distinguished as a critic, but the poet Horace was a critic of a higher and rarer order.

In modern times the greatest names in general criticism among the English are those of Dryden, Pope, Dr. Johnson, S. T. Coleridge, Hazlitt, Mackintosh, and Hallam; to which may be added those of Lords Jeffrey, Brougham, and Macaulay; and, lastly, that of Carlyle, who, if too often extravagant and wayward, is perhaps, when not biased by pique or prejudice, not surpassed by any in breadth of comprehension or truth of insight. In the U. S. Ralph Waldo Emerson, James Russell Lowell, George Ripley, Edwin Percy Whipple, Henry James, Jr., and others, have distinguished themselves in this branch of literature. Among the French the most celebrated names are those of Boileau, Voltaire, Villemain, Sainte-Beuve, and Taine. The literature of Germany is rich in illustrious critics. Among the greatest of these, in the department of general criticism, are Lessing, Goethe, and the two Schlegels. It is proper to observe that the Germans have studied the great principles which lie at the base of all sound criticism—i. e. the art or science of judging—more philosophically and more thoroughly than the critics of other nations. But it is perhaps in particular criticism that the Germans are most distinguished. Among the most remarkable examples of this kind we may cite Kant in the department of philosophy, Winckelmann in art, and Niebuhr in history, besides a host of other less distinguished names.

Criticism, the Higher (biblical): See HIGHER CRITICISM.

Cri'to, or **Cri'ton** (in Gr. Κρίτων): Greek philosopher; a citizen of Athens, and a friend and disciple of Socrates, whom he attended in his last hours. He wrote seventeen dialogues on philosophy, which are not extant. Plato gave the name of "Crito" to one of his books.

Critola'us (in Gr. Κριτόλαος): Greek philosopher; b. at Phaselis, in Lycia. He was the head of the Peripatetic school in Athens, and was eminent as an orator as well as a philosopher. He was sent to Rome on an important embassy with Carneades about 155 B. C.

Crittenden, GEORGE BIBB: general; son of John Jordan Crittenden; b. at Russellville, Ky., Mar. 20, 1814; graduated at West Point 1832; began to practice law in Kentucky in 1835; served with distinction in the Mexican war; resigned his commission of lieutenant-colonel in the U. S. army in 1861, and joined the Confederate army. He became a major-general: defeated at Mill Spring, Ky., Jan. 19, 1862; was censured for his conduct on that occasion and was kept in arrest by the Confederates till Nov., 1863, and soon after resigned, but continued to serve in the army as a volunteer. D. at Frankfort, Ky., Nov. 27, 1880.

Crittenden, JOHN JORDAN: statesman; b. in Woodford co., Ky., Sept. 10, 1787. He graduated at William and Mary College in 1807, and studied law; removed to Tennessee; in 1809 was appointed attorney-general of the Territory of Illinois; served as a volunteer in the war of 1812; returned to the practice of the law, attaining distinction; and was elected to the Senate of the U. S. for a short term in 1816. In 1819 he removed to Frankfort, Ky.; from 1827 to 1829 was U. S. district attorney, and in 1835 was re-elected to the national Senate by the Whigs for a term of six years. He was a personal and political friend of Henry Clay. In Mar., 1841, he was appointed Attorney-General of the U. S., but he resigned in September of that year. He was again elected a Senator of the U. S. in 1843, and was chosen Governor of Kentucky in 1848. He was Attorney-General in the cabinet of President Fillmore from July, 1850, to Mar., 1853, soon after which he joined the Native American party. In 1855 he again became a U. S. Senator. He opposed the secession movement in 1860–61, and, performing the part of a mediator, offered in the Senate a series of resolutions called the "Crittenden Compromise," which were not adopted. On the other hand, he opposed the employment of slaves as soldiers, and denounced the conscription bill. He was noted for his eloquence. D. near Frankfort, Ky., July 26, 1863.

Crittenden, THOMAS LEONIDAS: general; a son of John Jordan Crittenden; b. at Russellville, Ky., May 15, 1815; State attorney in Kentucky 1842. He served with honor in the Mexican war. He commanded a division of the Union army at Shiloh, Apr., 1862, and obtained the rank of major-general of volunteers in the summer of that year. He commanded a corps at the battle of Stone River in 1863. Colonel of infantry 1864. Retired May, 1881. D. Oct. 23, 1893.

Crivelli, CARLO: painter; b. in Venice about 1435; studied under Antonio and Bartolommeo da Murano. When he became famous he was commissioned to work in different parts of Italy, so that few of his paintings remain in Venice. He lived chiefly in the Marches, where his works may be seen in great numbers, as at Massa, Ascoli, and Ancona. Nothing is known of him after 1493.

Croa'tia: a province of the Austro-Hungarian monarchy; is bounded on the N. W. by Carniola and Styria, on the W. by the Adriatic Sea, on the N. E. by Hungary, and on the S. by Bosnia, Servia, and Dalmatia. Various out-

runners of the Alps, generally comprised under the common name of "the Julian Alps," traverse the country in its whole length, and divide it into two distinct sections, one belonging to the basin of the Danube, watered by the Save and the Drave, and the other forming part of the highlands of the Adriatic coast. About 16 per cent. of the whole country is completely unproductive. In the eastern districts large tracts afford only pastures. But generally the mountains are covered with dense forests of oak, beech, pine, and chestnut trees, and the coast region, 88 miles long, as well as the valleys of the Save and the Drave, is very fertile. The coast regions are exposed to a violent wind, the so-called *bora*, and in the mountains the weather is subject to sudden changes. But in the valleys the climate is generally equable and mild. Large crops of wheat, oats, rye, potatoes, flax, and hemp are raised; tobacco is extensively cultivated, and an excellent wine is produced, though the national beverage, like that of Hungary, is made from the plum. Horses, swine (feeding in the forests), and bees are kept in great numbers. The manufacturing industry of the country is very small. A few silk-spinning factories, glass-works, and distilleries—that is about all. Grain, wine, chestnuts, honey, and horses are exported. Capital, Agram. Of the inhabitants, about 90 per cent. are Croats and Servians, the remainder are Germans, Magyars, Israelites, Italians, and Albanians. Croats and Servians are two Slavic tribes which speak the same language, though the former use the Latin and the latter the Cyrillic alphabet. About 71 per cent. of the population are Roman Catholics, 20 per cent. belong to the Oriental Greek Church; the remainder are Protestants and Jews. This region was anciently inhabited by the Pannonians, who were conquered by the Romans in the reign of Augustus. In 640 A. D. the Croatians or Horvats migrated from the Carpathian Mountains to this country, and gave it the name of Croatia. For several centuries Croatia was an independent kingdom, until in 1097 it was conquered by the King of Hungary. This province, with Slavonia and their former "military frontier," now forms a division of the Hungarian kingdom (*Transleithania*). Their united area is 16,772 sq. miles, of which 5,246 is Croatian. Pop. (1890) with Slavonia, 2,200,977.

Crockery: See POTTERY AND PORCELAIN.

Crockett: town: capital of Houston co., Tex. (for location of county, see map of Texas, ref. 3–J); situated on railway; 100 miles N. of Houston; has two large seminaries, public schools, and mercantile and agricultural industries. Pop. (1880) 599; (1890) 1,445; (1900) 2,612. EDITOR OF "COURIER."

Crockett, DAVID: hunter and humorist; b. at Limestone, Tenn., Aug. 17, 1786. He was elected a member of Congress in 1826, 1828, and 1832, and was a political friend of Gen. Jackson. His habits were eccentric. He enlisted in the Texan army in revolt against Mexico, was taken prisoner at Fort Alamo, and massacred Mar. 6, 1836. His *Autobiography* was published in Philadelphia (1834); also *Tour to the North and Down East* (1835); *Sketches and Eccentricities* (1847); *Exploits in Texas*, and *Life of Van Buren* (1835).

Crockett, Rev. SAMUEL R.: clergyman and author; b. at Duchrae, New Galloway, Scotland, in 1859; educated at the Free Church Institution at Castle Douglas, and at Edinburgh University; became minister of Penicuik 1887. Has published *The Stickit Minister* (1893); *The Raiders*; *Mad Sir Ughtred of the Hills*; *The Lilac Sunbonnet*; *The Men of the Moss Hags*; *Cleg Kelly*, etc.

Crocodile [from Gr. κροκόδειλος, etymol. unknown]: a reptile of the genus *Crocodilus*, which comprises the *true* crocodiles as distinguished from the alligators, caymans, and gavials. *Crocodilus* is the typical genus of the order *Crocodilia*, a group of reptiles characterized by an elongated body, short, stout limbs, and massive skull. The teeth are conical, implanted in sockets, and are replaced as fast as they wear out by others developed at their bases. The jaw is extended backward some distance beyond its articulation with the skull, so that the cranium appears to move on the jaw. The arrangement is such that by elevating the muzzle crocodiles can readily open their mouths while lying flat upon the sand. Cartilaginous processes are attached to the hinder margin of the ribs similar to the bony uncinate processes so characteristic of birds, and a series of splint-like bones is found along the under side of the abdomen from the breast bone to the pelvis. The ears, eyes, and nostrils are closed by flaps or valves, and the disposition of these organs is such that the animals of this order can see, hear, and smell without exposing more than the tip of the nose and that part of the skull immediately about the eye. The heart has four complete divisions, but the aortic arches communicate so that venous and arterial blood are mingled in the circulation. The back and neck always, and the under side in some genera, are protected by bony dermal plates. The tongue is attached all around to the mouth, and the nostrils open at the back of the mouth behind a flap (formed by a modification of the hyoid) which prevents water from entering the throat when the mouth is opened under water. Crocodiles deposit their eggs in the sand or mud, to be hatched by the heat of the sun, or bury them in a heap of decaying vegetation. In the latter case the female jealously guards the nest, not only from outside intruders but from the male, who would otherwise devour the young. The crocodilia are found in fresh or brackish waters throughout the greater portion of the warmer parts of the globe. In localities where the winter temperature is cool these reptiles bury themselves in the mud and hibernate; in tropical countries, where a dry season prevails, they bury themselves and æstivate.

Living *Crocodilia* are divided into three families: (1) GAVIALIDÆ, containing the gavial of India and tomistoma of Borneo, distinguished by a long, narrow muzzle, the two halves of the lower jaw being in contact for upward of half their length, and teeth of nearly equal size interlocking with one another. (2) CROCODILIDÆ, the true crocodiles, with rather long muzzle, but the halves of the jaw only meeting for a short distance at the front end. Teeth of various sizes, interlocking, the first lower tooth fitting into a pit in the upper jaw, the fourth in a notch. Hind legs deeply fringed, toes much webbed, no bony bar between the nostrils. Widely distributed. (3) ALLIGATORIDÆ, alligators and caymans, characterized by a broad muzzle, lower teeth fitting within the upper, fourth lower tooth in a pit, not showing in closed mouth. A bony bar between the nostrils. Toes slightly webbed, no fringe on hind legs. One species of alligator is confined to North America, a second occurs in China. The caymans are confined to Central and South America. The true crocodiles have their habitat in Southern Asia, and have a preference for slow-running or still waters, where they feed upon fish and the partly decomposed bodies of animals they may capture or find dead. Their seeming preference for putrid flesh is largely a matter of necessity, for the broad jaws and conical teeth of these reptiles are ill adapted for cutting flesh, while their ability to swallow is limited by the unyielding articulations of the jaws and tough hide upon the throat. Consequently, prey above a given size must be kept until soft enough to be torn. Crocodiles swim well, the chief organ of propulsion being the powerful tail, the fore legs being tucked up beside the body. On land they ordinarily walk with the body almost touching the ground, but on rare occasions, when at bay or in a great hurry, they stand almost upright, supported by the hind legs and tail. In spite of their size and ugly appearance, crocodiles, with exceptions to be noted hereafter, do not often attack men. Probably, like other animals, they differ in disposition in different localities, something depending on the abundance of food. Their size is usually greatly overestimated, for they rarely exceed a length of 12 feet, although now and then one is taken 18 or even 20 feet long. Out of 266 specimens of the salt-water crocodile taken in Sarawak, Borneo, in one year, only three exceeded a length of 13 feet, the largest being 13 ft. 10 in. The crocodile of the Nile, *Crocodilus*

Nilotic crocodile.

niloticus, revered by the ancient Egyptians and mummied when dead, is now so persecuted by tourists that it has almost disappeared below the First Cataract, and has in other places become exceedingly wary. It is, however, still widely distributed in Africa, and in some localities is so dangerous that the natives are obliged to build inclosures of stout posts, reaching into the rivers, in order to draw water with safety. Other African crocodiles are *Crocodilus cataphractus*, with a long, thin muzzle, and the black crocodile, *C. niger*, with a short head, both from the western part of the continent. The muggar, or marsh crocodile (*Crocodilus palustris*), is abundant in various parts of Southern Asia, and in some localities of India is still held in some reverence, and fed and protected by its fakir friends. It ranges from the hot swamps of the seacoast to the snow-fed streams of the Himalayan valleys. The salt-water crocodile (*Crocodilus porosus*) occurs from India to Northeast Australia, being especially abundant in some portions of the Malay Peninsula and Borneo. It is partial to the estuaries of rivers, and not infrequently ventures out to sea for a mile or so. This animal has an exceedingly massive head, reaches a great size, and is so much dreaded from its man-eating propensities that in some places a price of so much per foot is paid for its capture.

Three species of crocodiles occur in the West Indies and South America, one of which, *Crocodilus americanus*, is found sparingly in Southern Florida. See Alligator, Cayman, and Gavial. F. A. Lucas.

Crocodile Bird or **Crocodile Watcher**: a small species of plover (*Pluvianus ægyptius*); found in Northern and Western Africa, and rarely on the northern shores of the Mediterranean. So named from its habit of feeding around or upon the crocodiles as they bask in the sun. It even ventures to pick the leeches (*Bdella nilotica*) from the very mouths of these huge reptiles, a fact noted by Herodotus and confirmed by Brehm. It is called zic-zac, from its note. F. A. Lucas.

Crocodilopolis: a city of Ancient Egypt (*q. v.*).

Crocus [Gr. *κρόκος*, crocus, saffron]: a large genus of iridaceous plants (herbs) natives of Asia and Europe. The *Crocus vernus* and other species are well known as affording many varieties of very early spring flowers, which are common in cultivation. *Crocus sativus* and other species blossom in autumn. The autumn crocuses are rarely cultivated in the U. S. Their orange-red stigmas, when dried, constitute the drug known as "true" Saffron (*q. v.*).

Crocus of Mars: the finely divided red oxide of iron used in medicine and in the arts. The "crocus of antimony" of the old chemists was a mixture of the tersulphide and teroxide of antimony. The "crocuses" received their name from their saffron color.

Croes, John James Robertson: See Appendix.

Croes, John, S. T. D.: first bishop of the P. E. Church in New Jersey; b. at Elizabethtown, N. J., July 1, 1762; served in the Continental army from 1778 to the close of the war for independence; ordained by Bishop White, Feb. 28, 1790, taking charge of Trinity church, Swedesborough, N. J.; became rector of Christ church, New Brunswick, N. J., in May, 1801, where the rest of his life was spent. At the request of the trustees of Queen's College, then practically defunct, he opened a classical school in the college building, which soon became widely known, and prospered under his direction for several years. In 1825 this school became Rutgers College. The honorary degree of S. T. D. was conferred upon him by Columbia College in 1811. In June, 1815, Dr. Croes was elected Bishop of Connecticut, to succeed Bishop Jarvis. The diocese of New Jersey, to retain his services, on Aug. 15, 1815, elected him its bishop. He accepted the latter position, and was consecrated by Bishop White, assisted by Bishops Hobart and Kemp, on Nov. 19, 1815. D. in New Brunswick, N. J., July 30, 1832.

Cræ'sus (in Gr. Κροῖσος): a king of Lydia proverbial for his riches; was born about 590 B. C. He succeeded his father, Alyattes, in 560, and soon extended his dominions by the conquest of the Æolians, Ionians, and other peoples of Asia Minor. Sardis was the capital of his kingdom. He is said to have enriched himself by the golden sand of Pactolus. In 546 B. C. he was defeated in battle and taken prisoner by Cyrus of Persia, who devoted him, together with fourteen Lydian youths, to the flames as a thanksgiving sacrifice to the god whom the Persians worshiped under the aspect of the fire. Crœsus was saved, however, in a curious way, and afterward lived in honor at the court of Cyrus as his trusted friend. See Herodotus's beautiful narrative.

Croffut, William Augustus, Ph. D.: editor and author; b. in Redding, Conn., Jan. 29, 1836. He received an academic education; taught a public school for a time; served in the civil war as soldier and correspondent, and afterward had editorial charge successively of the New Haven (Conn.) *Palladium*, Rochester (N. Y.) *Democrat*, St. Paul (Minn.) *Times*, Minneapolis *Tribune*, Chicago *Evening Post*, and Washington *Post*, and was an editorial writer on the New York *Graphic*, New York *Tribune*, and New York *World*. He has thrice visited Europe, and has also traveled through Mexico, Yucatan, Cuba, Nova Scotia, the Bermudas, Egypt, Arabia, and Palestine, and has been a voluminous writer of syndicate letters to newspapers. He was executive officer of the U. S. geological survey from 1888 to 1891, when he took charge of the editorial division of that bureau. He is the author of *The War History of Connecticut* (New York, 1867); *A Helping Hand* (Cincinnati, 1868); *Bourbon Ballads* (New York, 1880); *Deseret*, an opera, music by Dudley Buck (1881); *A Midsummer Lark* (1882); *The Vanderbilts* (1886); *Folks Next Door* (1892); *The Prophecy and other Poems*, a second volume of poems (1893); also of a poem read at the opening of the Columbian Exposition at Chicago (May 1, 1893). He has received the degree of Ph. D. from Union College.—His wife, Bessie B. Croffut, has published several stories and contributed extensively to encyclopædias.

Croft, William: composer of cathedral music; b. in Warwickshire in 1677. He was appointed composer to the chapel-royal and organist of Westminster Abbey in 1708. He composed *Divine Harmony* (1712) and *Musica Sacra* (1724). D. Aug. 14, 1727.

Crofters: in Scotland, tenants who reside on holdings the annual rent of each of which does not exceed £30. The term commonly designates a small tenant of land who lives mainly by farming or the raising of live stock. There are two classes: First, those who occupy land in separate tenancy only; and second, those who occupy tillable land in separate tenancy and hold mountain pastures in joint tenancy. The first class are sometimes called "independent" crofters and the second "township" crofters. The latter are so much the more numerous that the joint tenancy of pasture is the characteristic feature of the crofting life. They are found in the lower parts of the Western Highlands and islands, Sutherland, Caithness, Orkney, Shetland, and in parts of Ross-shire and Inverness-shire, and less frequently on the eastern seaboard. In their local government and in the possession of common rights and common obligations they preserve many features of the primitive community. The system is a partial survival of the custom of land tenure that was once common in all Scotland and in many other countries. The crofters generally derive a part of their support from employment outside of the labor on the land. The cottars are closely related to the crofters in origin and pursuits, but they are lower in the economic scale, being frequently mere squatters. The cottars are found mingled with their more fortunate neighbors, the crofters, throughout the crofting country. Both of these classes have had special grievances, which led to the appointment by the House of Commons in 1883 of a royal commission to investigate their condition. It was not, however, until 1886 that the Crofters' Holdings Act received the sanction of Parliament and the crown. The numerous wise provisions of this act have not resulted in much improvement, owing to unfavorable conditions. The crofter and cottar population is computed in round numbers at about 200,000.

C. H. Thurber.

Crofts, Ernest: English genre and military painter; b. in Leeds, Sept. 15, 1847; pupil of A. B. Clay, London, and Hunten, Düsseldorf; associate Royal Academy, London; third-class medal, Paris Exposition, 1889, for his picture, *Marlborough—after the Battle of Ramillies*. Studio in London. W. A. C.

Croghan, George: an inspector-general of the U. S. army; b. near Louisville, Ky., Nov. 15, 1791; served as volunteer aide in the battle of Tippecanoe 1811; appointed captain in the Seventeenth Infantry 1812; major 1813; lieutenant-colonel 1814; and inspector-general, with the rank of colonel, 1825. He distinguished himself at the defense of Fort Meigs and sortie May 15, 1813, and for his gallant conduct in the defense of Fort Stephenson, against a greatly superior force of British and Indians, he was presented by

Congress with a gold medal with suitable emblems and devices. D. in New Orleans, Jan. 8, 1849.

Croix, Carlos Francisco, Marques de: Spanish general and administrator; b. at Lille, in Flanders, 1699. He served for fifty years in the army, attaining the rank of captain-general (1770); was a knight commander of Calatrava, successively commandant at Ceuta and Puerto de Santa Maria, and captain-general of Galicia. He was Viceroy of New Spain (Mexico) from Aug. 25, 1766, to Sept. 22, 1771. His administration was one of the best that Mexico ever had, and he was greatly esteemed as a pure and upright man and an excellent soldier. After his return to Spain he was viceroy and captain-general of Valencia until his death in 1786.
Herbert H. Smith.

Croix, Teodoro, de: Spanish knight; b. at Lille, in Flanders, about 1730. He accompanied his brother, the Viceroy Carlos Francisco de Croix, to Mexico in 1766, and was commandant of the interior provinces and of Sonora. From Apr., 1784, until Mar., 1790, he was Viceroy of Peru. He instituted numerous reforms in the treatment of the Indians, and his rule throughout was tranquil and prosperous. He returned to Spain by way of Cape Horn. D. in Madrid, Apr. 8, 1791. Herbert H. Smith.

Cro'ker, John Wilson: writer and politician; b. in Galway, Ireland, Dec. 20, 1780. He was elected a Tory member of Parliament in 1807; and was secretary of the Admiralty from 1809 to 1830. He co-operated with Scott and others in founding the *Quarterly Review*, to which he contributed 260 articles, including many roughly satirical reviews. In Parliament he obstinately opposed the Reform Bill, and on its passage refused to re-enter Parliament. Among his works, which number seventeen, are *Songs of Trafalgar* and an edition of Boswell's *Life of Johnson* (1831). He is the "Rigby" of Disraeli's *Coningsby*. D. Aug. 10, 1857. See his *Memoirs* (1884).

Croker, Richard: U. S. politician; b. in Black Rock, Ireland, Nov. 24, 1843. His grandfather, Maj. Henry Croker, was inspector-general in the British army, one of his uncles was a member of Parliament, and another was a captain in the British army and a governor of Bermuda. He accompanied his father to the U. S. when three years of age, and has since resided in New York city. He served in Gen. Sickles's brigade during the civil war, and also in the Tenth New York Engineers; elected in 1867 alderman of New York; re-elected in 1869; again elected alderman in 1883; the same year (Nov. 16) was appointed fire commissioner; in 1889–90 was city chamberlain. He early attracted the attention of John Kelly, was prominent in opposition to the Tweed ring, and rapidly advanced in power in the Tammany Hall organization, of which he has been for some years the head. C. H. T.

Croker, Thomas Crofton: Irish writer; b. at Cork, Jan. 15, 1798. He obtained a clerkship in the Admiralty at the age of twenty-one, and retained that position until 1850. He published *Researches in the South of Ireland*; *Fairy Legends and Traditions* (6th ed. 1882); *Legends of the Lakes*, etc. D. Aug. 8, 1854.

Croll, James, LL. D., F. R. S.: geologist and philosopher; b. in Whitefield, Perthshire, Scotland, 1821; for many years connected with the official geological survey of Scotland. His first contribution to literature was in the domain of philosophy, and shortly before his death he published a work on *The Philosophic Basis of Evolution*; but the energies of his life were chiefly devoted to studies in geologic physics, which were embodied in many essays and gathered in three treatises: *On the Physical Characters of the Change of Climate during the Glacial Epoch* (1864); *Climate and Time in their Geological Relations* (1875); *Climate and Cosmology* (1886). The first of these works embodied an elaborate theory of Pleistocene changes of climate, ascribing them to variations in the distribution of solar heat upon the earth occasioned by the precession of the equinoxes and secular changes in the eccentricity of the earth's orbit. This theory immediately received great attention, and has been the subject in subsequent years of much discussion, pro and con. It has had a profound influence upon geologic thought and investigation, and is probably more widely used as a working hypothesis than any rival theory. D. at Perth, Scotland, Dec. 15, 1890. G. K. G.

Cro'ly, David Goodman: journalist; b. in New York city, Nov. 3, 1829; learned the trade of silversmith; was for a time a student in New York University; taught phonography; was employed on the *Evening Post* and New York *Herald* from 1854 to 1858; was editor and proprietor of the Rockford *Daily News*; was the first city editor on the New York *World*, and subsequently its managing editor; resigned in 1871, and from 1872 to 1878 was managing editor of the *Graphic*, an illustrated newspaper. He wrote a *Life* of Horatio Seymour, a *History of Reconstruction* (1868), and was the author of a brochure entitled *The Positivist's Primer* (1876); issued two numbers of the *Modern Thinker*; was the first to introduce the subject of minority representation to the American public in the *Galaxy* in 1866; wrote on journalism in the magazines. In 1856 married the lady now known as "Jennie June." D. Apr. 29, 1889.

Croly, George: a poet, prose-writer, and pulpit orator; b. in Dublin, Ireland, in Aug., 1780. He took orders in the Anglican Church; in 1810 settled in London to devote himself to literary work; became, in 1835, rector of St. Stephen's, Wallbrook, London. Among his works are *Salathiel, a Story of the Past, Present, and Future* (1827); *History of George IV.* (1830); *Poetical Works* (2 vols. 1830); *Catiline, a Tragedy*; a *Life of Edmund Burke* (1840); and *Marston*, a novel. D. Nov. 24, 1860.

Croly, Jane (*Cunningham*): better known as "Jennie June"; b. in Market Harborough, Leicestershire, England, Dec. 19, 1831; at an early age accompanied her parents to the U. S., and in 1856 married David G. Croly, of New York. She began her literary career as a contributor to daily, weekly, and monthly periodicals, her first published article appearing in the New York *Tribune*. She was a regular contributor to the New York *World* for thirteen years, to the New York daily *Times*, Noah's *Sunday Times* and the *Messenger* for ten years, and the weekly correspondent of the New Orleans *Detta*, Baltimore *American*, and other papers. She has besides published several books, *For Better or Worse*, *Talks on Women's Topics*, a cookery book, *Thrown on Her Own Resources*, three manuals, and a *History of Sorosis*. She inaugurated the system of duplicate correspondence, and was connected editorially with Demorest's *Illustrated Monthly* from its start, in 1860, for twenty-seven years. Mrs. Croly called the first woman's congress in New York, 1856, and also the second, 1869, and in 1868 inaugurated the Sorosis (see Clubs for Women). She founded the *Cycle*, a club organ and literary review, and became editor of the *Cycle* and also of the *Home-Maker* magazine. In 1892 she received the degree of Doctor of Literature from Rutgers Women's College, and was appointed to a new chair of journalism and literature in that institution. She has been since its start the president of the New York Women's Press Club, which she founded in 1889.

Crom'arty: county of Scotland politically connected with Ross (*q. v.*), comprising ten detached districts within the limits of that county. Area, 369 sq. miles.

Cromarty: town and seaport of Scotland; in the united counties of Ross and Cromarty; finely situated at the entrance of Cromarty Firth: 18 miles N. N. E. of Inverness (see map of Scotland, ref. 6–G). It has a good harbor, which will admit vessels of 400 tons; also manufactures of ropes, sailcloth, and sacking. Hugh Miller was born here. Pop. 1,300.

Cromarty Firth: one of the finest harbors on the east coast of Scotland. It communicates with Moray Firth, and is adjacent to the counties of Ross and Cromarty. It is sheltered at its entrance, which is 1½ miles wide, by two rocky hills called the Soutars. Its length is 18 miles, and its breadth varies from 3 to 5 miles.

Cro'mer: small seaport and watering-place of England, in Norfolk; on the North Sea; 21 miles N. of Norwich (see map of England, ref. 8–L). It stands on the top of a high cliff. It has a fine church in the Tudor style and a public library. All attempts to form a harbor for large craft here have been baffled by the heavy sea, which is continually encroaching on the land.

Cromlech, krom'lek: a circle of upright stones, erected by some forgotten race, such as are found in Brittany, Great Britain (see Stonehenge), Ireland, and Scandinavia. Formerly this name was applied by British archæologists to equally ancient structures consisting of two or more unhewn stones fixed vertically in the ground and supporting a large flat stone. These now bear the separate name of Dolmen (*q. v.*), and are believed to be uncovered chambered cairns. See Cairn.

Cromp'ton, Samuel: inventor of the spinning-mule; b. near Bolton, Lancashire, England, Dec. 3, 1753. Farming and weaving were the employments of his boyhood. For his invention, which was perfected in 1779, he received, in subscriptions from the manufacturers, only £67 6*s*. 6*d*. His means were so limited that he could not go to the expense of taking out a patent, and he was consequently glad to make private arrangements with the manufacturers for the use of his invention, many of whom, however, did not scruple to evade their obligation. Meanwhile, the mule spread so rapidly, and its influence was so palpable, that in 1812 he drew up a petition to Parliament for a public reward. Parliament voted him £5,000. He was a shy, sensitive, studious man, fond of mathematics and of music. But his business talent was very limited; he once more failed, and a new petition to Parliament was refused. D. at Bolton, June 26, 1827. See French, *Life of Crompton* (1860).

Cromwell, Henry: a younger son of Oliver; b. in Huntingdon Jan. 20, 1628. He served as colonel under his father in Ireland in 1649, became a member of Parliament in 1653, and lord deputy of Ireland in 1657. His administration was moderate and popular. After 1659 he lived as a private citizen. D. Mar. 23, 1673.

Cromwell, Oliver: Lord Protector of England; b. in Huntingdon, Huntingdonshire, Apr. 25, 1599. In 1616 he entered Sidney Sussex College, Cambridge, which he quitted on the death of his father in June, 1617. He married Elizabeth Bourchier in 1620, and settled on his estate at Huntingdon. In the Short Parliament of 1628 he made but one speech, and during the eleven years' prorogation he devoted his time to the cultivation of his farms. He represented Cambridge in the Short Parliament, which met in Apr., 1640, and in the Long Parliament, which met the same year. He was then a zealous member of the Country party, and took an active part in the business of the House. Having raised two companies of volunteers, he entered the army of Parliament in 1642 as a captain of cavalry, and distinguished himself by his strict discipline. He was soon promoted to be colonel. On July 2, 1644, he commanded the victorious left wing at Marston Moor. The Parliamentarians were divided into two parties, Presbyterian and Independent, of which latter Cromwell was the master-spirit. He was excepted from the "Self-Denying Ordinance," which excluded from military command members of Parliament. When the army was reorganized, and Fairfax appointed general-in-chief, Cromwell was promoted to the rank of lieutenant-general. In command of the right wing at Naseby, June, 1645, he greatly contributed to that decisive victory. In May, 1646, the king surrendered himself to the Scottish army, which transferred him to the custody of the English Parliament, in which the Presbyterians had a majority. In June, 1647, the king was seized by one of Cromwell's officers, and removed from the custody of Parliament into that of the army, which the Independents controlled. Charles hoped to profit by the dissensions between the Presbyterians and the Independents, and intrigued with both. Cromwell defeated the Duke of Hamilton, who commanded an army of Scottish royalists, at the battle of Preston, Aug., 1648. In December of that year forty-one Presbyterian royalists were ejected from Parliament by what was called "Pride's Purge." Cromwell was a member of the court which tried the king and condemned him to death in Jan., 1649. Cromwell was now the most powerful man in the country, and became a member of the new council of state. In 1649 he went to Ireland as lord-lieutenant with an army, and subdued the rebellious Irish royalists with extreme severity. The Scotch proclaimed Charles II. as their king, and raised an army for the invasion of England and the promotion of the royal cause. Cromwell, who had returned to England in May, 1650, was then appointed commander-in-chief. He signally defeated the Scottish army at Dunbar on Sept. 3, 1650, and took about 10,000 prisoners. Charles II., having been reenforced, marched into England, and was pursued by Cromwell, who gained a decisive victory at Worcester Sept. 3, 1651. In this great crisis he displayed eminent vigor and sagacity. Clarendon observes that "his parts seemed to be raised, as if he had concealed his faculties until he had occasion to use them." In Apr., 1653, he dissolved the remnant of the Long Parliament, which was called the Rump, and he soon summoned a new Parliament. He assumed the title of Lord Protector of the Commonwealth in 1653. His domestic policy was favorable to religious liberty and conducive to the prosperity of the country. His foreign policy was dignified and enlightened, and secured for England a more commanding position than she had previously occupied. The title of king was offered to him by Parliament, but he declined it. He was stigmatized as an usurper by the royalists, and also by the republicans. He died on Sept. 3, 1658, and was succeeded by his son Richard.

It was long the fashion for historians to represent Cromwell as a fanatic, a hypocrite, and a man of cruel temper and mediocre talents. His character was vindicated from these calumnies by Carlyle and other writers, and it is now generally admitted that as a statesman and commander he displayed abilities of the highest order. "Never," says Macaulay, "was any ruler so conspicuously born for sovereignty. The cup which has intoxicated almost all others sobered him. His spirit, restless from its buoyancy in a lower sphere, reposed in majestic placidity as soon as it had reached the level congenial to it. Rapidly as his fortunes grew, his mind expanded more rapidly still. Insignificant as a private citizen, he was a great general; he was a still greater prince."

Authorities.—Carlyle, *Letters and Speeches of Cromwell*; John Forster, *Life of Cromwell*, in his Statesmen of the Commonwealth of England (7 vols., 1840); Villemain, *Histoire de Cromwell* (1819); Guizot, *Life of Cromwell* (2 vols., 1851); Gardiner, *The Great Civil War* (3 vols., 1887–91).

Revised by C. K. Adams.

Cromwell, Richard: son of Oliver Cromwell; b. at Huntingdon, Oct. 4, 1626. He entered Lincoln's Inn as a student of law in 1647, and married Dorothy Major in 1649. He was a man of moderate capacity, virtuous and unambitious. After Oliver became Protector, Richard was elected to Parliament, and was a member of the Privy Council. He succeeded his father as Protector in Sept., 1658, but the army was disaffected, and he was not earnestly supported by the people. He resigned his power in Apr., 1659, and passed the rest of his life in obscurity and peace, spending about twenty years on the Continent. D. at Cheshunt, England, July 12, 1712.

Cromwell, Thomas: Earl of Essex; an English courtier and minister of state; b. at Putney about 1485, and bred to the law. His early life was spent on the Continent, where he successively served as a soldier, a merchant's clerk, and as a trader on his own account. He returned to England about 1513, and acquired wealth as a wool-stapler and scrivener. He became an agent of Cardinal Wolsey, who employed him in important business. Soon after the fall of Wolsey he entered the civil service of Henry VIII., whose favor he gained. He promoted the Reformation by his strenuous efforts to destroy the supremacy of the pope, and co-operated with his friend Cranmer in establishing a new ecclesiastical polity. In 1534 he was appointed principal secretary of state, and in 1535 vicar-general with power to suppress monasteries. He was for several years the most powerful subject in England, and was created Earl of Essex in 1540. He was a man of superior talents, but is said to have been unscrupulous and rapacious. Froude, however, defends him against these imputations, and gives him a high character. He promoted the marriage of Henry VIII. with Anne of Cleves, because she favored the Lutheran doctrines. His agency in this affair was conducive to his own ruin, for the capricious king regarded her with disgust. Cromwell was tried for treason, and was beheaded July 28, 1540. See Michael Drayton, *Historie of the Life and Death of Lord Cromwell* (1609); Froude, *History of England*, chaps. vi.-xvii.

Cronje, Piet: See Appendix.

Cro'nos (in Gr. Κρόνος): a god of the Greek mythology; was said to be a son of Uranus, and the father of Jupiter, Neptune, Juno, and Ceres. He is commonly identified with the Roman Saturn.

Cron'stadt [Germ., lit., crown city]: a fortified seaport-town of Russia; on the flat and arid island of Kotlin, in the Gulf of Finland; about 20 miles W. of St. Petersburg, and opposite the mouth of the river Neva (see map of Russia, ref. 5–C). It is an important commercial town, and the greatest naval station of Russia. It is stated that two-thirds of the foreign commerce of Russia passes through Cronstadt, which has three harbors. The outer harbor, which is intended for ships of war, is capable of containing thirty-five ships of the line. The inner harbor is used for merchant-vessels, and has a capacity for 1,000 vessels. The place is very strongly fortified. Pop. (1897) 59,539. Ice renders this port inaccessible for nearly five months in the year. See Ship-canals.

Cronstadt, in Transylvania: See KRONSTADT.

Crook, GEORGE: U. S. military officer; b. Sept. 8, 1828, near Dayton, O.; graduated at West Point in 1852; July 28, 1866, became lieutenant-colonel Twenty-third Infantry. He served on frontier 1852–61, in Rogue river expedition 1856, and in command of Pitt river expedition 1857; engaged in several actions, in one of which he was wounded with an arrow. In the civil war he became colonel Thirty-sixth Ohio Volunteers, and was promoted Oct. 21, 1864, to be major general U. S. volunteers, serving in West Virginia operations 1861–62, engaged at Lewisburg (wounded and brevet major); in Northern Virginia campaign 1862; in Maryland campaign 1862, engaged at South Mountain and Antietam (brevet lieutenant-colonel); in operations in West Virginia 1862–63; in Tennessee campaign 1863, engaged at Tullahoma, Hoover's Gap, Chickamauga, and pursuit of Wheeler, with constant skirmishes (brevet colonel); in Northern Virginia 1864, making constant raids and in numerous actions (brevet brigadier-general U. S. army and brevet major-general U. S. volunteers); in Sheridan's Shenandoah campaign 1864, engaged at Berryville, Fisher's Hill (brevet major-general U. S. army), Strasburg, Opequan, and Cedar Creek; in command of cavalry of Army of the Potomac 1865, engaged at Dinwiddie Court-house, Jettersville, Sailor's Creek, Farmville, and Appomattox Court-house; and in command of the district of Wilmington, N. C., 1865–66. In command of districts in Idaho 1866–68; of Department of Columbia 1868–70; of Department of Arizona 1871–75, and again in 1882; of Department of the Platte 1875–82. In 1873 was promoted to be a brigadier-general U. S. army; was major-general in 1888. D. Mar. 21, 1890.

Crooked Island: one of the Bahamas; area, 160 sq. miles (see map of West Indies, ref. 3–F). Exports salt.

Crooked (or Keuka) Lake: in the western part of New York; extends from Penn Yan southwestward into Steuben County, and is about 18 miles long. The greatest width is 1½ miles. The surface is 718 feet above the level of the sea.

Crookes, WILLIAM, F. R. S.: chemist and physicist; b. in London, 1832; educated in the Royal College of Chemistry; founded the *Chemical News* in 1859; editor of the *Journal of Science*, 1864; discovered thallium in 1861; has made numerous important discoveries in chemistry and physics; awarded a special gold medal by the Academy of Science in Paris, 1880; author of several handbooks and numerous contributions to scientific journals. In 1883 Crookes discovered some remarkable phenomena obtained by sending the electric discharge through glass tubes in which a very high vacuum had been produced. Hertz subsequently showed that certain of the rays emanating from such tubes were capable of penetrating metals and other opaque bodies. In 1896 RÖNTGEN (*q. v.*) utilized the property in photographing hidden objects. See GEISSLER'S TUBES.

Crookes Tubes: See GEISSLER'S TUBES.

Crooks, GEORGE RICHARD, D. D., LL. D.: Methodist divine and journalist; b. in Philadelphia, Feb. 3, 1822; graduated in 1840 at Dickinson College; joined the Methodist ministry in 1841; traveled and preached extensively in Illinois; was appointed classical and mathematical tutor in Dickinson College in 1842; principal of the Collegiate Grammar School in 1843; and adjunct Professor of Ancient Languages in 1846. In 1848 he resumed the ministry, occupying important pulpits in Philadelphia, Wilmington, New York, and Brooklyn. In conjunction with Prof. McClintock he prepared *A First Book in Latin* (1846) and *A First Book in Greek*, which have been successful text-books. He also published Butler's *Analogy* (1852), with an elaborate analysis of the work, notes, index, and life of Butler. His most important production is a *Latin-English Lexicon* for schools and colleges, the preparation of which was shared by Prof. Schem (Philadelphia, 1858). His eminent journalistic career began in 1860, when he was elected first editor of the *Methodist*, a weekly newspaper established in New York city by a company of Methodist laymen who were favorable to independent or unofficial journalism in their Church, and he was its editor till 1875. He was Professor of Historical Theology in Drew Theological Seminary from 1880 till his death. He published the *Life of Rev. Prof. Dr. John McClintock* (1876) and of *Bishop Matthew Simpson* (1890); *Sermons of Bishop Matthew Simpson, Edited from Shorthand Reports* (1885); and was joint editor of Crooks and Hurst's *Theological Encyclopædia and Methodology* (1884; n. e. 1893). D. at Madison, N. J., Feb. 20, 1897. Revised by J. F. HURST.

Crookston: city; capital of Polk co., Minn. (for location of county, see map of Minnesota, ref. 3–A); on Red Lake river; is a railway, commercial, and manufacturing center. It has central school building, costing $60,000, water-power, roller-mills, foundry, creamery, etc. Pop. (1880) 1,227; (1890) 3,457; (1900) 5,359. EDITOR OF "CHRONICLE."

Cropsey, JASPER FRANCIS: landscape-painter; b. in Rossville, N. Y., Feb. 18, 1823. He studied architecture for five years, and began to paint under Edward Maury, going to Europe in 1847; National Academician, 1851; member American Water-color Society. He exhibited frequently at the Royal Academy, London, and his style is somewhat like that of some English painters. His pictures are violently colored, but painted with a certain cleverness. Studio at Hastings, N. Y. D. June 22, 1900. W. A. C.

Croquet, krō-kā': an outdoor game much resembling that of pall-mall, which was popular in various parts of Europe in the sixteenth and seventeenth centuries. The game of croquet proper is comparatively modern. When first introduced into the U. S. it was considered a simple game, almost devoid of opportunities for the display of skill. With the development of the game, however, opportunities for accurate and scientific playing have been introduced, and the materials improved, until, as played by experts, the game is now claimed to be as scientific as billiards. The following description and rules apply to the game adopted by the National American Croquet Association (organized Oct. 4, 1882), which meets on the third Tuesday of August in each year at Norwich, Conn.

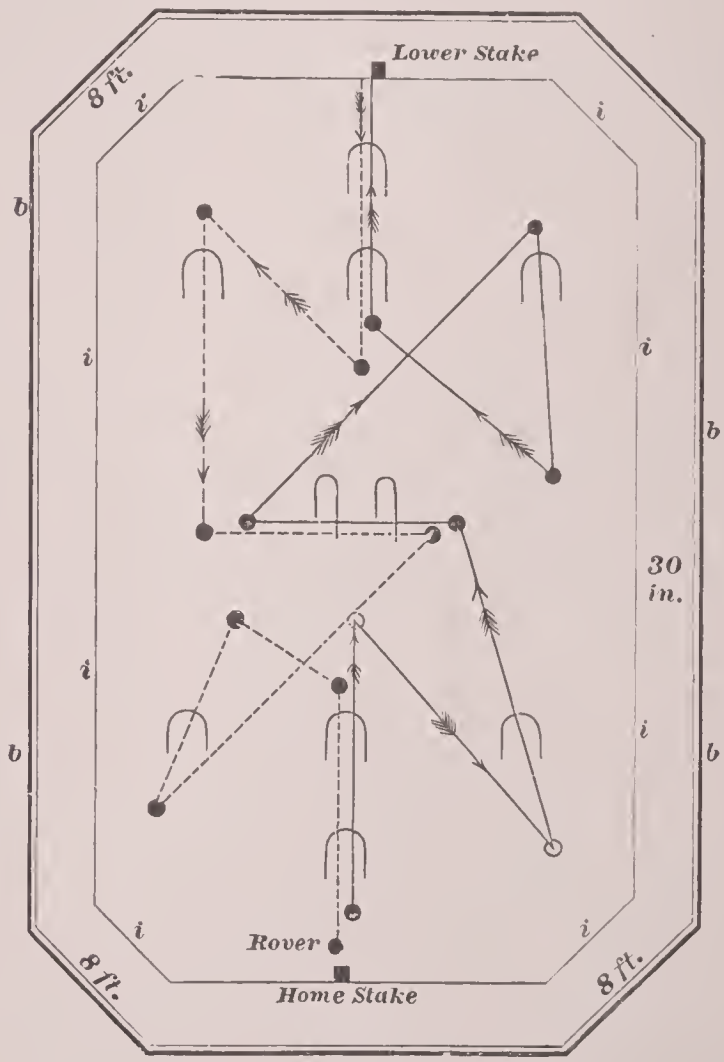


FIG. 1.

Grounds.—The ground when full-sized should measure 36 by 72 feet, and be raised 2 inches at the border, the slope extending 30 inches into the field as far as i i i, imaginary lines denoting the boundary of the field. (See Fig. 1.) The stakes or posts to be 1 inch in diameter and 1½ inches high, situated at the base of the rise at the center of the width of the field. The first wicket to be 7 feet from the stake; the second, 7 feet from the first, on a line extending through the middle of the field; the side arches to be 5 feet from the foot of the rise, on a line with the second arch from each stake; the cage or double wicket in the center to be 18 inches long and 3⅜ inches between the wires, and set at right angles with a line drawn from stake to stake. The border, b b b, at the top of the slope, to be made of maple or other hard

wood, about 4 by 6 inches, laid flat to serve as a cushion whence caroms can be made; the corner pieces to be of same material and 8 feet long, inside measurement. All arches, except the center arch, to be 3½ inches in the clear. The course of balls is indicated in the diagram. Many clubs still adhere to the old rectangular form, without any slope inside the border to bring the balls into the field, and with the wickets all made in the direction in which the player is going. In less scientific games the cage in the center is replaced by a single arch, which is made the same as the other arches. In the ordinary croquet set the wickets are very much wider than stated above. The game was originally and is still commonly played as a lawn game. Much more scientific play can, however, be made upon a ground of well-rolled dirt, lightly sanded to hold the balls. All national match games must be played on dirt ground. The mallets should be of boxwood, 7 or 7½ inches long by 2¼ to 2½ in diameter, and the handle from 8 to 30 inches long, to suit the player. The best balls are of hard rubber, 3¼ inches in diameter. Balls of boxwood and other hard wood are commonly used.

Terms.—Some of the commoner terms are: *Roquet*—to hit another ball with one's own ball; *croquet*—to place player's ball against roqueted ball and strike player's ball, moving both—called *loose croquet* or *roquet-croquet*, as distinguished from *tight croquet*, where the player's ball is held with the hand or foot, allowing only the roqueted ball to move; *carom*—rebounding from arch, stake, or border; *dead ball*—ball on which player has played since making a point; *set up*—same as in billiards, that is, leaving balls favorable for next shot; *wiring*—leaving balls so that following player has wire or stake between his ball and ball to be played upon; *object ball*—one at which player aims; *jump shot*—striking a ball with force on top just back of center so as to make it jump over any obstacle between it and ob-

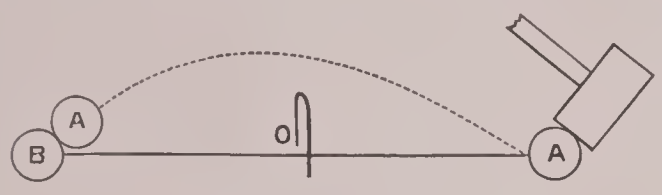

FIG. 2.—"Jump" shot.

ject aimed at; *guilty* or *danger* ball—one next played by adversary; *innocent* ball—ball last played by adversary; *rover* ball—ball that has made all the points except hitting the finishing stake.

The Game.—The game is played by from two to eight players. It needs no special dress, does not demand vigorous exertion, furnishes moderate exercise, and is not fatiguing even when long prolonged. The elements of the game are essentially the same however the wickets may be arranged, and whatever the ground. The object is to make the player's ball pass in succession through all the wickets, striking the lower or turning stake and the home stake, all in the order and direction indicated in the diagram. (Fig. 1.) In this journey, however, the player's ball may be aided by friends or retarded by enemies. The chief points of excellency are: 1, accuracy in *roqueting*, for which an accurate eye and trained hand are indispensable; 2, ability to secure *position* in front of arches; 3, skill in *wiring* an adversary's ball; 4, good *generalship*. Position in striking varies according to the player. It is well not to be too long in aiming; a quick stroke after getting the line between two balls is apt to be most accurate; but after the line of aim is secured, the eye should be kept fixed on the player's own ball. Important points to be observed are keeping your own balls *together* and *separating* those of your adversary; keeping the *innocent* ball of your adversary with you or your partner, and the *guilty* adversary ball wired; giving your partner a *set up* when you can make no further run; and, in making a run, providing for points ahead and leaving no balls behind.

Rules.—Following is a summary of the most important rules; some of the popular variations from them are also noted. The player must always strike his ball with the face of the mallet, the stroke being considered to have been "delivered" whenever the ball is moved by the touch of the mallet, however slight. The player must never strike his ball twice, and must not push or follow it with his mallet except in croqueting. The first play with each ball is made after placing it midway between the home stake and the first arch. The players play in regular order, partners alternating with opponents, and a player's turn continues so long as he makes a point or roquets a ball not dead, or until he violates some rule of the game. A point consists in running an arch or striking a stake in proper order of play. Roquet gives the player the privilege of roquet-croquet only, and in taking it he must move the croqueted ball or end his play. (In the popular game the player is not thus limited, and may besides take tight croquet instead; in either case he has also a second stroke.) If the player roquets two or more balls at the same stroke, he croquets only the first. A player, in each turn of play, may roquet any ball once only before making a point. Roqueting a dead ball by direct stroke ends the play, and the dead ball should be replaced. If a roqueted ball is beyond an arch, and the playing ball rests through it, the arch is held to be first made. A ball is not through an arch when it is touched by a straight-edge laid across the two wires on the side from which the ball came. A ball is not in position to run an arch when it has been placed under it in croquet, or when it rests under it, having been shot from the wrong direction. If a ball first roquets another, and afterward at the same stroke makes a point, the point is not allowed. A ball making two or more points at the same stroke gains no greater privilege than for making one only. (A popular exception is to allow an extra stroke the first turn if the player makes the first two arches at the same stroke.) If a ball not rover be driven through its arch or against its stake by croquet or concussion, it is a point for that ball. A ball shot over the boundary must be returned at right angles from where it stops before play can proceed. A rover has the right of roquet and of consequent croquet on every ball once each turn of play, and is also subject to roquet and croquet. Rovers must be continued in the game until partners become rovers and win the game by successively making the last point, i. e. striking the home stake.

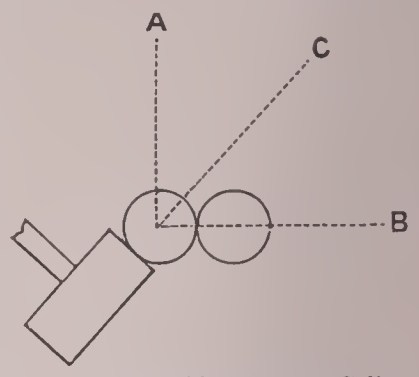

FIG. 3.—A possible croquet: C, line of aim; A, course of player's ball; B, course of croqueted ball.

Crosby, ALPHEUS: educator; b. at Sandwich, N. H., Oct. 13, 1810; graduated at Dartmouth in 1827; was tutor and Professor of Ancient Languages in his alma mater (1829–57), and principal of the normal school at Salem, Mass. (1857–65). He edited Xenophon's *Anabasis*, and published a Greek grammar and other works, which have been extensively used. D. in Salem, Mass., Apr. 17, 1874.

Crosby, HOWARD, D. D., LL. D.: b. in New York city, Feb. 27, 1826; graduated at the University of New York in 1844; became Professor of Greek in the same in 1851; Professor of Greek in Rutgers College, N. J., in 1859; pastor of First Presbyterian church in New Brunswick in 1861; resigned his pastorate in 1862, and his professorship in 1863, when he became pastor of the Fourth Avenue Presbyterian church in New York city. He was chancellor of the University of New York 1870–81, and one of the revisers of the New Testament. Of bold, ardent, and energetic temper, fearless in the defense of his opinions, wise and broad in his judgments, tireless in his energy, he was for years a synonym for every Christian virtue and a leader in every practicable reform. By his personality, and not by his pulpit gifts or scholarship, he filled so large a place in the city's philanthropies. His scholarship was put to popular use. Besides other works, he published *Lands of the Moslem* (New York, 1850); *Œdipus Tyrannus* (1851); *Notes on the New Testament* (1863); *Bible Manual* (1870); *Life of Jesus* (1871); *Book of Joshua* (1875); *The Christian Preacher* (Yale lectures on preaching, 1880); *Commentary on the New Testament* (1885); *Bible View of the Jewish Church* (1888); *The Seven Churches of Asia; or, Worldliness in the Church* (1890); *Sermons* (1891). D. in New York city, Mar. 29, 1891.

Crosby, JOHN SCHUYLER: soldier; b. in Albany, N. Y., Sept. 19, 1839; educated at University of New York; entered the regular army as second lieutenant of artillery in 1861; served with his battery under McClellan in the Army of the Potomac; was brevetted major and lieutenant-colonel after the battles of Pleasant Hill and Sabine Cross-Roads; was in 1864 promoted to the staff of Maj.-Gen. Canby as assistant adjutant-general, and shortly afterward transferred to the staff of Maj.-Gen. Sheridan in the same capac-

ity. He resigned his position in the army in 1872, and was in 1876 appointed U. S. consul at Florence, Italy; became Governor of Montana Aug. 4, 1882, and first assistant Postmaster-General Nov., 1884; resigned Mar. 4, 1886.

Crosby, Peirce: rear-admiral U. S. navy; b. near Chester, Pa., Jan. 16, 1824; entered the navy as a midshipman in 1838. He served on the east coast of Mexico during the Mexican war, and in 1861 was employed with the Union army, and rendered most important service in Chesapeake Bay and in the sounds of North Carolina, particularly at the capture of Forts Hatteras and Clarke. He commanded the Pinola at the passage of Forts St. Philip and Jackson and capture of New Orleans, Apr. 24, 1862, and at the passages up and down the Mississippi past the Vicksburg batteries, June 30 and July 15, 1862. He did good service during the years 1863–64 in command of the Florida and Keystone State, North Atlantic blockading squadron, and in 1865 commanded the steamer Metacomet during the operations which led to the fall of Mobile, superintending the removal of over 150 torpedoes. He was made rear-admiral in 1882, and retired in 1883. D. June 15, 1899.

Crosier, or **Crozier** [from O. Fr. *croce*, bishop's staff (Mod. Fr. *crosse*): Ital. *cruccia*: Span. *croza* < Vulg. Lat. **croccea* (*-us*), hook-shaped, adjec. to **croccum*, hook, a word of Germ. origin]: a staff curved at the top in imitation of a shepherd's crook (and pointed at the lower end), given to a Roman Catholic bishop at his consecration, and used by him as the symbol of the authority with which he rules his flock. It is also used by cardinals, by some canons of cathedral churches, and by abbots. J. J. Keane.

Cross [M. Eng. *crois*, *cros*, from O. Fr. *crois* (Mod. Fr. *croix*): Ital. *croce* < Lat. *crux*]: an instrument anciently used for inflicting the punishment of death, especially upon slaves and the vilest malefactors, and after the crucifixion of Christ the principal Christian symbol. As an instrument of death the cross occurred in the ancient world under a double form—either as a plain vertical stake, to which the convict was nailed with the hands above the head, or as a vertical stake provided with a cross-bar at the top, to which the convict was fastened in the same way, only with the arms outstretched. Death usually came after prolonged and frightful suffering. With respect to the cross on which Christ suffered death, the New Testament gives no indication of its form; only it is evident from John xix. 29 that it had a considerable height. But it seems almost impossible that the tradition which formed on this point, and which unanimously refers to the Roman cross—the vertical stake with the cross-bar—should not be correct. As a symbol the cross occurs under many different forms: the *crux immissa* or *crux ordinaria* (†), the Latin cross or cross of the Romans, on which Christ suffered; the *crux decussata* (X), the Burgundian cross, also called the cross of St. Andrew, because the apostle Andrew is said to have suffered martyrdom on it; the *crux commissa* (T), the Greek cross, on which the apostle Philip is said to have suffered death, also called St. Anthony's cross or the Egyptian cross, because by that St. Anthony is said to have destroyed the idols of Egypt; finally, the double cross (‡) and the triple cross, of which the first is used by the pope, the second by the Raskolniks, or the Russian sectaries. See H. Fulda, *Das Kreuz und die Kreuzigung* (Breslau, 1878); W. W. Blake, *The Cross: Ancient and Modern* (New York, 1888).

Cross in Heraldry.—(1) an ordinary composed of a pale crossing a fesse, and therefore occupying one-half at least of the field; but this size is only retained when the cross is *charged*—that is, has bearings upon it. In other cases the width of the arms is less. (2) A bearing or charge of which there are many forms, as the cross patty, the cross annulate, the cross crosslet. R. S.

Cross, Mary Ann: See Eliot, George.

Cross, Richard Assheton, Viscount: statesman; b. in Red Scar, England, May 30, 1823; educated at Rugby under Dr. Arnold, Trinity College, Cambridge; called to the bar 1849; elected to Parliament, Mar., 1867; Home Secretary in Mr. Disraeli's administration 1874; Home Secretary in Lord Salisbury's administration 1885; made viscount in 1886, and Secretary of State for India; Treasurer of the Inner Temple and Lord Privy Seal, 1895.

Crossbill: any one of several birds of the genus *Loxia*, whose members are characterized by having the points of the bill crossing one another obliquely. This feature, which is not found in any other birds, looks like a malformation, but is really peculiarly adapted for extracting seeds from fir-cones. The crossbills belong to the family of sparrows

American crossbill.

(*Fringillidæ*), and are found in Europe, Asia, and North America, especially in the northern parts, and usually in small flocks.

The common crossbill of the U. S., *Loxia curvirostra americana*, is a variety or sub-species, distinguished chiefly by smaller bill and brighter plumage, of the bird inhabiting Europe and Asia. It is about the size of an English sparrow; the female and young are of a dull greenish olive, mixed with gray, brightest on the head and rump; the adult male is bricky red, with blackish wings and tail. It is a very hardy bird, nesting in Maine in late winter or early spring, while the ground is still covered with snow. Its range varies with the severity of the season and abundance of cone-bearing trees, but it has been taken as far south as Washington, D. C.

The white-winged crossbill, *Loxia leucoptera*, is a larger, brighter colored species, and is furthermore distinguished by two white bars on the wings. This and the preceding species are often found together. A similar but larger species, *Loxia tænioptera*, occurs in Europe. The bright color of the males fades after death, or if the birds are kept in captivity, changing to a dull orange, or more rarely to a golden yellow. The largest member of the genus is the parrot crossbill, *Loxia pityopsittaca*, from Northern Europe, and a straggler in Great Britain. F. A. Lucas.

Crossbow: See Bow and Arrow.

Crosse, Andrew: electrician; b. in Somersetshire, England, June 17, 1784; and educated at Oxford. He commenced in 1807 experiments with a view to form artificial crystals by a voltaic battery, in which he was successful. In the course of many years spent in this pursuit he obtained not less than twenty-four mineral crystals similar in form to those produced by nature. These discoveries were not published until he explained them before the British Association for the Advancement of Science in 1836. Some excitement was produced in the same year by the apparent generation of insects of the genus *Acarus* during his experiments with a voltaic battery. (See Generation, Spontaneous.) D. July 6, 1855.

Crossed Check: a check across the face of which two transverse lines are drawn, and between which the words "& Co." are written by the drawer. The check is then said to be crossed "generally," and can be used only by paying it into some bank or to some banker. When the name of a bank or banker precedes the words "& Co.," the check is said to be crossed "specially," and can be used only by paying it into that particular bank or to that particular banker. The practice of using crossed checks is very common in Great Britain, and is resorted to for the purpose of security in case the check is lost. The effect of crossing a check upon its negotiability is regulated by statute.

F. Sturges Allen.

Cros'sen: town of Prussia; province of Brandenburg; at the confluence of the Bober with the Oder; 32 miles

S. E. of Frankfort (see map of German Empire, ref. 4–H). It has vineyards and manufactures of woolen cloth and hosiery. Pop. (1890) 6,657.

Cross-examination: in the law of evidence, the examination of a witness by a party against whom he is called to testify, and thus distinguished from a direct examination, which is had by the party calling the witness. The range of a cross-examination is much wider than that of a direct examination, the party examining being allowed to impeach the credit of the witness, and to show the inconsistency of his statements, his bias, his want of memory, and other matters tending to reduce the value of his testimony. The course of the examination, depending on the circumstances of the case, must be largely left to the discretion of the presiding judge. For these reasons leading questions are regularly allowed, though they are in general excluded on the direct examination, as tending to make the answers of the witness mere echoes of the questions asked. It is, however, a rule that if a merely collateral question be asked and answered, the cross-examining counsel will not be allowed to call witnesses to disprove the truth of the answer. This rule would not extend to a question as to the point whether the witness had not previously given a different version of the facts from that to which he testifies. If such a question is properly put to him as to time, place, and circumstances, and he answers in the negative, he can be contradicted by other witnesses. The same remark may be made as to a question put to him as to expressions used by him showing hostility toward the party against whom he is called. A witness on cross-examination can not be required to answer whether he has committed a crime the commission of which would subject him to punishment, or has done any act which would subject him to a forfeiture of his estate; though this rule does not extend to an answer which would merely expose him to a civil liability. So he may, to a certain extent, be compelled to answer questions tending to discredit and degrade him. Thus, according to the better opinion, he may be asked whether he has not been confined in the State prison, as the object of the question is not to exclude him from testifying, but to affect the credit due to his statements. He could be shown to be *incompetent* to testify only by the production of the record of his conviction. The true theory of a cross-examination is to qualify the direct testimony, and accordingly the witness should not at this stage of the case be called on by the cross-examining counsel to give independent testimony sustaining his part of the issue, though this rule is not always adhered to in practice. See EVIDENCE. T. W. DWIGHT.

Cross Keys: a post-office of Rockingham co., Va. (for location of county, see map of Virginia, ref. 5–F). An indecisive action took place here on June 8, 1862, between the armies under command of Gens. Fremont and Jackson, in which Fremont was held in check during the day, and Jackson withdrew his forces at night.

Revised by J. MERCUR.

Cross, Orders and Congregations of the: in the Roman Catholic Church, are numerous. Of greatest interest are (1) the spiritual order founded by Theodore of Celles in 1211. It spread through Belgium, France, Holland, Germany, and England, and still exists. (2) The Regular Clerks of the Holy Cross, founded in 1834 in France by Abbé Moreau, and represented in the U. S. (3) A congregation of Daughters of the Holy Cross, founded in 1625 in France, and spread to Quebec, Canada. It is principally engaged in teaching. A second congregation of the same name was founded in 1833 in Belgium. In 1890 it had some 800 members.

Cross Remainders: remainders in two or more persons so created that the survivor or survivors take the whole on the death of the others. Cross remainders may arise by implication in a will, but can arise only by express limitation in a deed. F. STURGES ALLEN.

Cross, The Southern: a noted constellation of the southern hemisphere, some of the principal stars of which form a cross. Being near the south pole, it is not visible far north of the equator. As it is not conspicuous in proportion to its celebrity, the first sight of it is apt to be disappointing.

Crotala'ria [from Gr. *κρόταλον*, rattle, in allusion to the inflated pods whose seeds rattle]: a genus of mostly tropical, herbaceous, or sub-shrubby plants of the Bean family (*Papilionaceæ*), bearing mostly yellow flowers, and simple or palmately compound leaves. Some 200 species have been described, but these probably must be reduced to about 120. Nine species are natives of North America, of which the best known is *C. sagittalis*, the common rattlebox of moist lands, once thought to be the cause of a "loco disease" in horses and cattle, but probably harmless. C. E. B.

Crotalus: See RATTLESNAKE.

Crotch, WILLIAM: musical critic; b. in Norwich, England, July 5, 1775. He showed when an infant so precocious a talent for music that Dr. Charles Burney gave an account of the prodigy in the *Philosophical Transactions of the Royal Society* (1779). In 1797 he was appointed Professor of Music at the University of Oxford, and in 1822 principal of the Royal Academy of Music in London. As a composer he did not fulfill the great expectations he had awakened, though he published many vocal and instrumental compositions, but as a critic and historian his works are still of interest: *Elements of Musical Composition and Thorough-bass* (1812); *Styles of Music of All Ages* (1813). D. at Taunton, Dec. 29, 1847.

Crotchet [Fr. *crochet*, a little hook: dimin. of *croc*]: in music, one of the notes or characters of time, equal to half a minim.

Cro'ton [Gr. *κρότων*, a tick, in allusion to the appearance of the seeds]: a genus of about 500 species of trees, shrubs, and herbs of the SPURGEWORTS (*q. v.*), nearly all of which are natives of the tropical countries of both hemispheres. They are stellate-downy, scurfy or glandular-hairy, and bear alternate or rarely opposite, mostly entire, simple leaves. The flowers are monœcious or rarely dicœcious, and usually bear petals. The ovary is three-celled, and contains one ovule in each cell. Over twenty-five species occur in the Southern U. S., four of which extend into the Northern States. *C. tiglium*, a small tree native of China, produces seeds about one-half inch in diameter, which are known as croton seeds, and are extensively used in medicine. From them a drastic purgative oil is obtained. C. E. B.

Croto'na, or **Cro'ton**: an ancient Greek city of Italy; on the Bruttian peninsula and on the Mediterranean Sea. It was founded 710 B. C., and became a populous and important city. The Crotonians worshiped Hercules as their tutelary divinity, and, led by the famous athlete Milo, they in 510 B. C. conquered Sybaris and leveled it with the ground. The decline of Crotona began with the arrival of Pythagoras. The city was originally governed by a council of 1,000—men who descended from its Achæan founders—but 300 adherents or disciples of Pythagoras once succeeded in overawing the council and seizing the supreme authority. They were soon expelled by the people and a democratic form of government established, but from that time the stability of the government was lost, and the effects of the loss soon became visible. During the war between Pyrrhus and the Romans the city suffered still more; one-third of the space within the walls was unoccupied. During the latter years of the second Punic war Hannibal took up his headquarters at Crotona during three successive winters, which seems to have completed the ruin of the city. It is mentioned again in the wars of Narses and Belisarius. Its site is now occupied by Cotrone. In the days of its prosperity its territory was extensive, stretching from sea to sea, and it was noted for its salubrity. To this circumstance—the healthfulness of the situation—was ascribed the great personal beauty of the youths and maidens of the city, though the Crotonian method of training and education was also celebrated.

Croton Aqueduct: See AQUEDUCT.

Croton Bug: See COCKROACH.

Croton Chloral: See CHLORAL.

Croton Oil (*Oleum tiglii*): the expressed oil of the seeds of *Croton tiglium*, a small tree which grows in Hindustan, Ceylon, and other parts of Asia. In taste it is hot and acrid, varies from a pale yellow to a reddish-brown color, has a faint, peculiar smell, and is miscible with alcohol, ether, and oil of turpentine. It is a powerful purgative, valuable because it can be employed with good effect in very minute portions. Great care must be used in its administration. It is applied externally as a counter-irritant in neuralgia, epilepsy, and pulmonary diseases. The pale oil comes directly from India; that of a darker color is expressed after importation.

Croton River: in New York State; rises in Dutchess County; flows S. and southwestward through Putnam and Westchester Counties. It enters the Hudson river about 35 miles above New York city, which derives from the Croton its chief supply of water. Its length is estimated at nearly 60 miles.

Crouch, Frederick William Nicholls: musician; b. in London, July 31, 1808; son of a violoncello player; in early life sang in several traveling opera and concert companies; instructed in music by his mother and William Watts, secretary of the London Philharmonic Society; played the violoncello in the orchestra of Drury Lane theater; became pupil of Hawes, Attwood, Crevelli, and the Royal Academy of music; set to music Mrs. Crawford's *Kathleen Mavourneen*, when a boy; played in the orchestra at the performance of *Clari, the Maid of Milan*, Bishop's opera and John Howard Payne's libretto, containing the song *Home, Sweet Home*; removed to the U. S. in 1849, giving concerts in various cities with success; was in Richmond when the civil war began, and joined the Confederate army; after the war married a Virginia lady and soon after removed to Baltimore. He composed many songs and some church music, but his fame rests almost entirely on his *Kathleen Mavourneen*. D. at Portland, Me., Aug. 18, 1896. D. E. Hervey.

Croup: an inflammation of the lining membrane of the larynx, causing a greater or less amount of obstruction to breathing by virtue of swelling, development of false membrane, or spasm. Two varieties are distinguished—catarrhal or spasmodic laryngitis, or false croup; and diphtheritic or croupous laryngitis, or membranous croup.

1. *False croup* is usually a mild disease, most frequently seen during the second year of life, males being particularly liable. A marked tendency to it seems to exist in some individuals and families. Among the exciting causes may be mentioned exposure to cold and wet, gastric disturbances, bad hygiene, etc., usually most frequent during the wet winter months. The lining membrane of the larynx is reddened and swollen, its lumen therefore decreased and the passage of air impeded, which condition is aggravated by a spasmodic action of its muscular apparatus. The secretion of mucus is at first diminished, then increased, assuming a tenacious character. The onset of the attack is sudden or it is preceded by a nasal or bronchial catarrh, and usually occurs at night after the child has been asleep for several hours. It wakes up about midnight with a barking cough, loud and laborious respiration, small and frequent pulse, with more or less fever. In the more severe cases the veins of the neck and face are distended, the face looks leaden, and suffocation appears imminent. The attack may last from half an hour to six hours, terminating in perspiration, looser cough, and hoarse voice. Such attacks may repeat themselves on the following two nights. In this affection there is no development of false membrane and there are no swollen glands. A very severe attack requires the use of an emetic, such as ipecac, sulphate of zinc, or turpeth mineral, relieving the dyspnœa; milder attacks require very little or no treatment. The inhalation of moist warm air is of service. Let the child drink a little hot milk at short intervals. It should not sleep longer than an hour at a time, and drink on waking. A mustard plaster or cold water applied externally may be of service. When the breathing is very spasmodic, half a teaspoonful of paregoric (one dose) or a grain of Dover's powder is indicated. For the following general catarrh keep the child in a uniform warm but not hot room for a few days, the air being kept moist by steam; at the same time frequent small doses of ipecac, antimonial preparations, or muriate of ammonia may be given. All the cases do well. Good general hygienic habits do much to prevent attacks.

2. *Membranous croup*, or diphtheritic laryngitis, an exceedingly contagious affection, with its frequent complicating conditions, is the most dangerous disease seen in children. Under ordinary circumstances with an exclusively medical treatment a large majority of the patients die. Of late years operative measures relieving the laryngeal obstruction have more frequently been employed, and they tend to decrease the high mortality of the disease; the complications, however, continue to keep the death rate very high. It consists of an inflammation of the lining membrane of the larynx, swelling and formation of a white, gray, or through admixture with a little blood, darker "false," "croupous," or "diphtheritic" membrane on it, tending to diminish the lumen of the organ. This condition seldom originates in the larynx, but most frequently descends from the throat, where it is found covering one or more small areas or over a larger surface, also at times covering the inner surface of the nose. Micro-organisms described by Klebs-Löffler are now recognized as the causative factor. Their chemical products probably also play a part, especially in regard to the general systemic disturbances. The described deposits in the throat may be known to exist for days; the infection may then descend to the larynx. The voice becomes hoarse, resulting at times in complete loss of it (aphonia); the respiration is slow, labored, and loud, and in the efforts at breathing the muscles of the neck and chest are exerted to the utmost, the insertion of the diaphragm is drawn in with every inspiration—at the same time deep grooves are observed above and below the clavicle—the child is exceedingly restless, tosses about, and supports itself on its knees, throwing the head backward. The lips begin to assume a bluish hue. This symptom (cyanosis) increases in proportion to the difficulty experienced in breathing, and is due to an insufficient supply of oxygen to the blood—as it increases we observe general paleness, even a leaden color; blue tint of the lips and under the finger-nails. This condition may soon be followed by apathy in place of the restlessness, gasping respiratory attempts, and, unless the obstruction be relieved, convulsive twitchings, a loss of consciousness, and death by suffocation. Unfortunately, the loss of consciousness is not constant, many children dying with undisturbed intellect. At the same time there is great prostration, sometimes fever, and weakened heart's action, shown by a rapid, irregular pulse, cool surface, and cold extremities. When the obstruction to breathing is not so severe, or has been relieved by one of the various methods described below, an extension of the disease downward throughout the bronchial tubes, a bronchitis, a pneumonia, or poisoning of the whole system by the septic infection, very frequently cause death.

Medical treatment of this disease is very unsatisfactory, and there is no condition seen in childhood which appears more cruel. As to the medical treatment at the present day the best results seem to follow the use of rather large doses of corrosive sublimate at frequent intervals. Tincture of chloride of iron and chlorate of potash in proper doses are also of value. At the same time an abundance of fresh air, proper nourishment, alcohol and other heart stimulants, ice pills, external cold applications, moist air by means of steam spray, with perhaps a mild antiseptic added. When the temperatures are high, cautious use of antipyretics. The mouth and nose may be protected from infection by frequent cleansing with mild antiseptics. When the obstruction to breathing is severe an emetic may be of service when the membranes are loosened, or where there is a large quantity of mucus in addition. If used at all it should be with caution, as emetics tend to depress the general condition. Most cases resist treatment, and surgical interference is the only means to prevent suffocation. Tracheotomy saves 25 per cent. or more of the cases. It is an operation consisting in the artificial opening of the windpipe below the obstructed larynx. This is kept open by means of a silver or hard rubber tube inserted into it until the disease has disappeared. Intubation, or the introduction of a specially devised tube into the larynx through the mouth without a cutting operation, has largely taken the place of the former procedure. It was invented by Dr. J. O'Dwyer, of New York. It seems to present more encouraging results; the percentage of recoveries is the same as in tracheotomy.

The relief following the one or the other operation is surprising, and, although the mortality is still very great, death is almost always easier, resulting rather from the complicating conditions than from suffocation. A. Jacobi,
F. E. Sondern.

Crow: a name popularly applied to several birds of the genus *Corvus*, which includes also the ravens, the rooks, the daws, and some other birds. They are characterized by a comparatively short tail, long wings, strong, rather conical beak, and generally uniform glossy black plumage. Crows are distinguished from ravens by their smaller size, and by the feathers of the neck blending with those of the body, while in the ravens the neck feathers are pointed and distinct. Although the crow family is widely distributed, the crows, as popularly understood, are mainly inhabitants of the north temperate zone and no true crow is found in South America. They are intelligent, wary birds (when persecuted), and are practically omnivorous, feeding upon

fish, flesh and fowl, eggs, snakes, frogs, crabs, shell-fish, grubs, fruits, seeds, and berries. The common crow of North America is particularly abundant in the Eastern U. S., and is generally looked upon as the inveterate foe of the farmer from the amount of injury it inflicts on growing

Hooded crow of Europe.

crops, and especially upon corn. There is, it is true, a credit side to the account in the destruction of grubs, but as the crow is a great destroyer of the eggs and young of other and beneficial birds, it must, on the whole, be regarded as harmful. The crow can also be charged with disseminating the seeds of the poison sumach (*Rhus venenata*), which form a considerable portion of its food in fall and winter. At these seasons of the year crows assemble by thousands in great roosts, or rookeries; one of these roosts, on the Potomac, above Washington, has been estimated to contain 40,000 crows, while others are still larger. In the gray of the morning the birds leave in clamorous crowds for their feeding-grounds, often many miles away, and in the afternoon they may be seen winging their way homeward in long lines, high above the earth in fair weather, low down in foul. The Eastern fish crow (*Corvus ossifragus*), frequently found in company with the preceding, is a smaller bird, and can readily be distinguished by its hoarse caw. The carrion crow of Europe and Asia (*Corvus corone*) closely resembles the North American crow in form, size, and habits, but is perhaps a little more destructive, attacking and killing lambs, or even weakly sheep. The hooded crow (*Corvus cornix*), found in Northern and Eastern Europe and in many parts of Asia, is gray, with black head, throat, wings, and tail. These two species interbreed, and hybrids between them are common. The gray-necked crow of India (*Corvus splendens*) is a small but bold and mischievous species, stealing the very food from the table. On the other hand, it does much good as a scavenger, forming an able adjunct to the vultures in this respect. See Chough, Raven, and Rook. F. A. L.

Crowe, Catherine (*Stevens*): author; b. in Kent, England, in 1800; married Lieut.-Col. Crowe in 1822, and spent much of her after-life in Edinburgh. In 1838 she published a tragedy entitled *Aristodemus*, which was followed by novels and other works, some of which, like her *Night Side of Nature* (1848), dealt with the supernatural. D. in 1876.

Crowe, Joseph Archer, C. B., K. C. M. G.: journalist and art-writer; b. in London, Oct. 25, 1825; foreign editor of the *Daily News*; correspondent of *Illustrated London News* during Crimean war, and of the *Times* during the Indian mutiny and during the Franco-Prussian war; from 1857 to 1859 director of the Art School at Bombay; in 1860 appointed consul-general at Leipzig, and in 1878 at Düsseldorf; in 1882 became commercial *attaché* at Paris; secretary and protocolist to the Danube conference in London, 1883; British plenipotentiary to the Samoan conference in Berlin, 1889; member of Niger delimitation commission, 1892; editor of editions of Burckhardt's *Cicerone* and Waagen's *Handbook of Italian Painting*, and author, with G. B. Cavalcaselle (*q. v.*), of several works of art. D. Sept. 8, 1896.

Crowe, Winfield Scott, D. D.: preacher and editor; b. in Indiana, Nov. 15, 1850; educated at Stockwell College (A. B. 1871), and Northwestern University; pastor of Second Universalist church, Chicago, and of First Universalist church, Newark, N. J.; editor of the *Universalist Monthly*, an organ of the progressive party in the Universalist denomination; author of *The Man of Evolution*; *The God of Evolution*; *The Lordship of Jesus*; and *Phases of Religion in America* (1892).

C. H. Thurber.

Crowfoot: any plant of the family *Ranunculaceæ*. Plants of this family are characterized by having all parts of their flowers separate, and usually numerous. The flower is thus but a slightly altered shoot, and may be regarded as the typical or primitive flower of the dicotyledons. C. E. B.

Diagrammatic section of the flower of a crowfoot.

Crown: a decorative wreath, ring, or cap, intended to be worn on the head, and used either for ornament at times of festivity, or as an honorary badge, or as a mark and symbol of high rank—especially, in modern times, the mark of sovereignty. The fillet or diadem of the ancient Oriental nations and adopted by the Greeks can hardly be called a crown, nor should the Persian tiara be called so, and the tiara of the pope is really a cap adorned by three crowns which surround it. Crowns of olive, laurel, etc., and wreaths of various flowers were used by the Greeks very freely at feasts and ceremonies, and as prizes in athletic and other contests, each plant when so used having its especial significance; and similar wreaths and garlands were made of gold and other metals in imitation of natural foliage. Such crowns, made of leaves of thin gold, are found in tombs and are common in modern museums. The Romans imitated the Greeks in their use of such wreaths. One such was granted to a general who had caused the siege of a town to be raised; it was made of plants which grew within the place. In like manner the *civic crown* was given to one who had saved the life of a citizen, and the *naval crown* (called *corona rostrata* because it was adorned with figures of beaks of ships) was granted to a victor in naval warfare. A corpse was crowned on the occasion of funeral rites, and both bride and groom at a marriage ceremony.

The metal crown, with sharp upward-pointing rays, is probably of Oriental origin, and when originally used in the West denoted deification. In this sense it is added to portraits of Roman emperors made after death, beginning with Augustus, although it is probable that no kind of crown was assumed by any emperor during his lifetime before the time of Constantine, more than three centuries later. In the Middle Ages crowns were of many forms. It came gradually to be considered that a mere ring around the head, even if adorned with spikes or flowerlike ornaments on the top, was of lower dignity, and that the crown of a sovereign prince should be closed at top, or should have arches over the head from side to side. The crown of the Kings of France had eight half arches meeting in the middle and carrying a kind of finial. The modern crown of the sovereigns of England has four half arches. Each of these crowns has a velvet cap within the arches and covering the head. Crowns of nobles not sovereign princes are generally called coronets. Russell Sturgis.

Crown and **Bridge Work** in dentistry: See Dentistry.

Crown and **Half Crown**: originally English gold coins issued by Henry VIII. in 1527. The first commission for coining them of silver was signed by Edward VI., Oct. 1, 1551. The crown is a silver coin worth five shillings sterling, or about $1.25 in U. S. money.

Crown Glass: the glass usually employed for windows. It is made of a mixture of 100 parts of sand, 35 of soda-ash or potash, and 35 of chalk. It is essentially a silicate of soda (or potash) and lime.

Crown Imperial: See Fritillary.

Crowninshield, Caspar: See the Appendix.

Crowninshield, Frederic: decorative painter; b. in Boston, Nov. 27, 1845. Began to study art in 1867 in London under Rowbotham; later studied in Rome under Benouville, and in Paris with Cabanel; worked also under Couture at Villiers-le-Bel. He first exhibited at the Paris Salon in 1878. He has great facility in painting in oil and water

colors, and is a competent draughtsman. Member Architectural League, New York. Studio in New York.
W. A. C.

Crown Point: town; capital of Lake co., Ind. (for location of county, see map of Indiana, ref. 2–B); on Ch. and Erie and the Panhandle railways, 40 miles from Chicago; has nine churches, graded and parochial schools, machine-shops, steel-mill manufactory, wagon, buggy, and broom factories, elevators, and electric lights. Pop. (1880) 1,780: (1890) 1,907; (1900) 2,336. BARTLETT WOODS.

Crown Point: a post-village, railway junction, and township of Essex co., N. Y. (for location of county, see map of New York, ref. 2–J). The township was first settled by the French, who in 1731 built Fort St. Frederick (the "Crown Point" of history) on a long cape projecting into Lake Champlain, which became the seat of thriving settlements, which were destroyed in 1759, and again in 1777, by the British troops. In 1775 it was surprised and taken by the provincial forces. The British fort at Crown Point, which cost with its outworks nearly $10,000,000, is now in a ruinous condition; but it was never of any great importance as a military post. Crown Point has extensive beds of rich iron ore and mineral phosphate of lime. Iron, lumber, and wooden wares are manufactured on an extensive scale. It has a lighthouse. Pop. of township (1880) 4,287; (1890) 3,135; (1900) 2,112.

Crown Prince (in Germ. *Kron Prinz*): in Prussia, Sweden, and some other European countries, is the title of the heir-apparent to the throne.

Crown, Treaty of the: a treaty made at Vienna, Nov. 16, 1700, in which the Emperor Leopold recognized the elector Frederick III. as King of Prussia. Frederick engaged to furnish 10,000 men to support Austria in the Diet, and to vote as elector for the descendants of the emperor's son, Joseph, King of the Romans.

Crows: See SIOUAN INDIANS.

Crowther, SAMUEL ADJAI, D. D.: Anglican Bishop of the Niger District, West Africa; b. in Ochugu, to the E. of the kingdom of Dahomey, 1812. Captured as a slave in 1819, he came ultimately upon a British man-of-war and was landed at Fourah Bay, Sierra Leone, in 1822. He was educated in Bathurst, West Africa; professed Christianity in 1825; became a missionary; hon. D. D., Oxford 1864, and Durham 1888; ordained deacon and priest 1843; consecrated missionary bishop in Canterbury Cathedral, St. Peter's Day, June 29, 1864. Accompanied the first Niger expedition (1841); missionary at Freetown, Sierra Leone, 1843; Abeokuta 1844–56; Lagos 1856–57; Niger 1857–64. Author *Yoruba Grammar and Vocabulary*; *Dictionary English and Yoruba and Yoruba and English*; *Elements of Nupe Grammar*. Translator of *Portion of the Old and New Testaments into Yoruba*; *Book of Common Prayer into Yoruba*; *Portion of St. Matthew in the Nupe Language*. D. in Africa, Dec. 31, 1891.

Croy'don: parliamentary borough of England; county of Surrey; 10½ miles S. of London bridge (see map of England, ref. 12–J). A hospital and a grammar school, founded by Archbishop Whitgift, and a Gothic church are among the principal buildings. There are thirteen railway stations. There are manufactures of church clocks and carillons. Owing to its nearness to London, of which it is practically a suburb, Croydon is the residence of large numbers of persons doing business in the metropolis. The Archbishops of Canterbury had a palace here until 1757. Since 1807 they have made Addington Park, 3½ miles distant, their summer seat. Pop. (1881) 78,953; (1891) 102,695; (1901) 133,885.

Crozer Theological Seminary (Baptist): located at Upland, Pa., 14 miles from Philadelphia. It was founded and endowed through the liberality of the members of the Crozer family, residents of Upland and Philadelphia, in 1868. In 1900 it had 7 professors, 102 students, an endowment of $462,500, and a seminary building, library building, gymnasium, Anniversary Hall, six professors' houses, and grounds 20 acres in extent.

Crozet Islands: in the Indian Ocean; 1,400 miles S. of Madagascar; in lat. 46° to 47° S. and lon. 52° E. There are five islands, called Inaccessible, Possession, East, Apostle, and Pig islands. They were discovered in 1772 by Capt. Marion, in 1840 by Sir James Ross, and in 1873 by the Challenger expedition. Though they are high, volcanic islands, they are seldom visible on account of the fog that prevails most of the year, and are therefore dangerous to navigation. British war-vessels occasionally visit them to rescue shipwrecked men. They have an area of 200 sq. miles, but no permanent inhabitants. M. W. H.

Crucible [from Late Lat. *cruci'bulum*, popularly connected with *crux*, cross, but really derived from Fr. *cruche* = Teutonic *krūka*, jug, dish; cf. Germ. *Krug*]: a vessel used by chemists in melting minerals, metals, etc. They are made of clay, porcelain, and other substances, and prepared so as to be capable of resisting extreme heat. Platinum crucibles are especially useful in chemical analyses.

Cru'cifers [Lat. *crux*, cross + *ferre*, bear]: the mustard family (*Cruciferæ*); one of the families of the dicotyledonous plants, including about 1,200 species, nearly all herbaceous, a few only being shrubby. They inhabit all countries, and are especially abundant in Southern Europe and Asia Minor. The parts of the flowers are all separate, except the two carpels which have united into a compound pistil. There are normally four sepals, four petals, six stamens, but some of these are often fewer or even wanting. The name crucifer alludes to the cross-like form of the flower when its four petals are expanded.

Many species possess a pungent volatile oil which is especially well developed in the mustard. A few species yield food, as the turnip (*Brassica rapa*), cabbage, cauliflower, etc. (*Brassica oleracea*), radish (*Raphanus sativus*), etc. Some species are ornamental, and a number are troublesome weeds throughout the world.
CHARLES E. BESSEY.

Crucifix: a cross with an image of Christ upon it, either carved or painted; found in use in all branches of the Church Catholic, except Calvinistic Protestantism; made in all sizes from the tiny pendant worn upon the breast to the towering life-size cross upon the wayside. It has come to be the commonest of symbols, and has directed untold millions in the path of religion. Yet it is far from being primitive. No crucifix has been found in the catacombs; nor is there any unmistakable allusion to one prior to the fifth century. The modern crucifix is in each detail an evolution. Drawings or sculptures of the naked cross came first; then the cross with a lamb, the affecting symbol of Christ, at its foot. The next step was to represent the lamb as bleeding beneath the cross, which was followed by the lamb upon the cross. No representation of Christ upon the cross appears till the fifth century. The earliest was in the form of a mere bust. In the middle of the fifth century the first mention of a crucifix appears (Gregory of Tours, *De Gloria martyrum*, 1, 2, 3). So rapid after their introduction was their spread that the Trullan synod of 692 decreed in its eighty-second canon that for the future the figure of the lamb on the cross should be supplanted by that of Christ. On the earliest crucifixes Christ was represented as alive and clothed, with his hands extended in prayer, and with a painless expression. In the tenth century the Greek artists first begun to represent him as dead. This gave great offense to the Latins, and widened the breach between the two Churches, but ultimately the Greek representation prevailed. So also the naked Christ, save for the loin-cloth, came to take the place of the more primitive clothed Christ, as it was more nearly correct. In the first crucifixes four nails were portrayed, the feet were put side by side; but from the thirteenth century only three nails are used, as the feet are crossed and pierced by a single nail.
SAMUEL MACAULEY JACKSON.

Crucifixion [from Lat. *crucifi'xio*, deriv. of *crucifi'gere*, crucify; *crux*, cross + *fi'gere*, fasten]: literally, "fastening on the cross," a form of capital punishment common among almost all ancient nations, except the Jews, who in their later history probably borrowed it from the Romans. The hanging on a tree spoken of in Deuteronomy xxi. 22 has reference to crucifixion *after death*. Tradition ascribes its invention to Semiramis. It consisted in nailing or binding the criminal, perfectly nude, to a cross piece (it was this rather than the upright which the criminal was required to carry) and then raising him, thus hanging, from the ground a foot or two and fastening the cross piece upon the upright stake, where he was left until dead from hunger or exhaustion. It was not general to nail the feet. The legs were frequently broken to hasten death; sometimes, however, a fire was lighted under the cross for the same purpose, or wild beasts were let loose upon those crucified. The body was usually left on the cross till destroyed by the action of the elements. Crucifixion was abolished by Con-

stantine the Great, probably in the year 315 (*Sozomen* i., 8).

This inhuman form of punishment was visited upon Christ by the Jews, in accordance with the unwilling sentence of Pontius Pilate. In addition to the scourging, which seems to have been a legal part of the punishment, he was forced to wear the crown of thorns, and subjected to other indignities by the brutality of the soldiers and populace. See the accounts given in the four Gospels, which give all the necessary details.

Revised by SAMUEL MACAULEY JACKSON.

Cru'den, ALEXANDER: author of the *Biblical Concordance*; b. in Aberdeen, Scotland, May 31, 1700. He was graduated at Marischal College, Aberdeen, and educated for the ministry of the kirk, but never preached, a disappointment in love, it is said, having brought on an attack of insanity, to which he had always had a tendency, and he was put under restraint. On his release in 1722 he removed to London, and taught the classics, and tried to teach French without knowing how it was pronounced. In 1729 he went to the Isle of Man. In 1732 he returned to London and opened a bookstore. In 1735 he became "bookseller" to Queen Caroline, wife of George II. In 1737 he published his *Complete Concordance of the Old and New Testaments*, which is still the best in the English language. He was several times an inmate of lunatic asylums, and during all the latter part of his life was flighty and extravagant. He set up as a reformer, calling himself "Alexander the Corrector." He died suddenly, while praying, at Islington, Nov. 1, 1770.

Cruikshank, GEORGE: illustrator and caricaturist; b. in London, Sept. 27, 1792. He worked with his father, Isaac, and his elder brother, Robert, and began to publish his work when only twelve years old, some very tolerable designs having been issued when he was fifteen. From this time until he was nearly eighty he produced etchings and wood-cuts incessantly. During his early life his most important work was in the way of large political and social caricatures, often colored, and often of extraordinary boldness. His attacks upon the prince regent, afterward King George IV., and equally upon the queen, who was the opposite party in a scandalous discussion and trial from 1815 to 1821, were unmeasured and ferocious. From about 1823 on his more important work was book illustration: *Points of Humor*, in 1823; Grimm's *German Popular Stories*, in 1823–27, with perhaps his most famous etchings; *Greenwich Hospital*, in 1825; *The Novelists' Library* in 1831, with illustrations to *Tom Jones*, *Humphrey Clinker*, *Roderick Random*, *The Vicar of Wakefield*, etc. *The Comic Almanack*, from 1835 to 1853, with twelve full-page etchings in each of the volumes but one or two; *Oliver Twist*, which began in *Bentley's Miscellany* in 1837, and was the only one of Dickens's novels illustrated by Cruikshank; *Rookwood*, *Jack Shepard*, *The Tower of London*, and other novels of William Harrison Ainsworth, some of which appeared first in *Bentley's Miscellany*; *The Ingoldsby Legends*, also from *Bentley*; *Frank Fairlegh*, *George Cruikshank's Fairy Library*, in which some of the old fairy-tales are told anew in the interest of total abstinence from alcohol, and are illustrated with charming etchings—all were published before he was sixty years old. After that time his work was less abundant and less vigorous, but had still great merit. One of the best things of his later work is the *Life of Sir John Falstaff* in large etchings, published in 1858. D. Feb. 1, 1878.

RUSSELL STURGIS.

Cruikshank, WILLIAM, F. R. S. L.: anatomist; b. in Edinburgh, Scotland, in 1746. He became a resident of London, and a partner of Dr. William Hunter. He published, besides other works, *Anatomy of the Absorbent Vessels* (1786). D. June 27, 1800.

Cruillas, MARQUIS OF: See MONSERRAT, JOAQUIN.

Crummell, ALEXANDER, D. D.: colored scholar and divine of the Protestant Episcopal Church in the U. S.; b. in New York city, Mar. 3, 1819; educated (1835) at Canaan, N. H. (where Dr. Highland Garnet was one of his companions), until the school was broken up by a mob of whites, and then (1836) at Oneida Institute, New York. Became a candidate for orders in 1839 under the direction of the Rev. Peter Williams, rector of St. Philip's church, New York; refused admission to the General Theological Seminary on account of his color. He was ordained deacon May 30, 1832, by Bishop Griswold. After studying with Rev. Dr. A. H. Vinton in Providence, R. I., he was admitted to the priesthood in Philadelphia by Bishop Lee, of Delaware. Unable to secure the education he desired in the U. S., he entered the University of Cambridge, England, and graduated with the degree of B. A. Removing to Liberia, West Africa, he was for a time professor in the Liberian College, and rector of a church as well. Returning to America, he became the rector of St. Luke's church, Washington, D. C. He received the degree of D. D. from Lincoln University, Pennsylvania. He wrote *The Future of Africa* (1862); *Greatness of Christ and other Sermons* (1882); *Africa and America* (1891); articles in *The African Repository*, etc. D. at Point Pleasant, N. J., Sept. 13, 1898. W. S. PERRY.

Crusade [probably from Provençal *crosada*, marked with a cross: Fr. *croisade*: Ital. *crociata* < Lat. type **crucia'ta*, deriv. of *crux*]: a war waged for the defense or advancement of the cross; specifically one of the religious wars carried on by the Christians of the Middle Ages for the recovery of Palestine from the Mohammedans. From a very early period the Christians were in the habit of making pilgrimages to Jerusalem and other parts of Palestine rendered sacred by events connected with the Saviour's life and death. These pilgrimages continued with but little opposition till the year 1065, when Palestine, then governed by the Egyptian caliphs, was overrun and conquered by hordes of Seljook Turks. The accounts (doubtless often exaggerated) of the indignities inflicted on the Christian residents and pilgrims by these barbarians produced a deep and powerful impression in all parts of Christendom. At length, Peter the Hermit, a monk and native of Amiens in France, having visited Palestine and witnessed the cruelty of the Turks, reported what he had seen to Urban II., by whom encouraged he traveled through Italy and France, and by his zeal and eloquence excited an extraordinary religious enthusiasm among all classes. In 1095, at a council held at Clermont, a crusade was resolved on. On this occasion the pope himself addressed the multitude. Previous to the setting out of the true crusade, four armies, consisting of disorderly multitudes of the very dregs of Christendom, had departed for Palestine. The first consisted of 20,000 foot, commanded by Walter the Penniless. It marched through Hungary, but was almost entirely destroyed by the natives of Bulgaria, a few only escaping to Constantinople. It was followed by a second, consisting of 40,000 men, women, and children, under Peter the Hermit. The two united at Constantinople, crossed the Bosphorus, and encountered the Turks at Nice. They were utterly routed. Another unorganized band of 15,000 Germans was cut to pieces in Hungary, and its fate was shortly shared by an immense mob of 200,000 persons from England, France, Flanders, and Lorraine. It was only now that the true crusaders entered upon the scene. Six armies, embracing all the chivalry of Europe, and led respectively by Godfrey of Bouillon, Hugh the Great (Count of Vermandois), Robert Curthose, Count Robert of Flanders, Prince Bohemond of Tarentum (under whom was Tancred), and Count Raymond of Toulouse, set forth for Constantinople. Having united their forces and spent some time at this place, they crossed into Asia Minor. Here their first step was the capture of Nice, June 24, 1097. They also defeated the Sultan Soliman at Dorylæum, and took the principality of Edessa. They then marched into Syria, and laid siege to Antioch. After seven months' siege, during which the crusaders suffered terribly from famine and disease, the city surrendered June 3, 1098. The inhabitants were massacred by their captors, who were besieged in their turn by an army of 200,000 Mussulmans. On June 28, 1098, the Mohammedans were put to rout, and the way opened to Jerusalem. In the summer of 1099 40,000 crusaders, the remnant of a vast host which had comprised not less than 600,000 warriors, laid siege to Jerusalem. The city was taken on July 15, after a siege of somewhat more than five weeks. Eight days later Godfrey of Bouillon was elected King of Jerusalem.

The three Latin principalities of the East (Edessa, Antioch, and Jerusalem) maintained themselves against the attacks of the Mohammedans till the year 1144, when the Emir of Mosul conquered Edessa and massacred its Christian inhabitants. His son, Noor-ed-Deen, marched upon Syria and Palestine. A second crusade was preached by St. Bernard, Abbot of Clairvaux, and in 1147 two armies, numbering together 1,200,000 men, set out for Jerusalem. They were commanded by Louis VII., King of France, and

Conrad III., Emperor of Germany. This expedition utterly failed through the treachery of the Greek emperor, Manuel Comnenus, and neither army ever saw the Holy Land.

In 1187 Salah-ed-Deen (or Saladin), Sultan of Egypt, invaded Palestine, and in October of that year took Jerusalem. This event gave rise to a third crusade, under the leadership of Frederick Barbarossa, Emperor of Germany, Philippe Auguste, King of France, and Richard Cœur-de-Lion, King of England. Barbarossa died of fever on the way. The crusaders gained some important victories, but they were not united among themselves, and the crusade was closed by a treaty in which Saladin agreed to impose no taxes on Christian pilgrims to Jerusalem. In 1195 Henry VI. of Germany, undertook a crusade (sometimes called the fourth), but the death of the emperor caused the project to be abandoned. A fourth crusade, instituted by Pope Innocent III. in 1203, turned from its course to take possession of the Byzantine empire, and never reached Palestine at all.

The Children's Crusade in 1212 (of which an excellent account has been written by the Rev. George Zabriskie Gray, New York, 1870) is one of the strangest episodes in history. An army of unarmed French children, 30,000 strong, headed by a boy named Stephen, set out for the Holy Land by way of Marseilles. A similar army of German children, 20,000 strong, led by a boy named Nicholas, crossed the Alps at Mont Cenis. A second army of German children, numbering nearly 20,000, the name of whose leader is not known, crossed the Alps by a more easterly route, touching the sea at Brindisi. Their idea was that the Mediterranean would open a path for them to Palestine, and that the Holy Land would be recovered and the Moslems converted by miracles. Some of the children got discouraged and returned to their homes; many stopped by the way; but most of them either perished on the march, were lost at sea, or were sold into slavery.

In 1228 Frederick II. of Germany commanded a fifth crusade, by which he became master of Palestine, and was crowned King of Jerusalem.

In 1239 the Turks having again seized upon Jerusalem, a sixth crusade was undertaken, under Thibaud, Count of Champagne. A nominal surrender of the Holy Land was the result.

In 1244 Jerusalem was burned and pillaged by a new race of Turks. A seventh crusade, headed by Louis IX. (St. Louis) of France, set out in 1249. It was badly defeated by the Sultan of Egypt, who also made a prisoner of the king. Louis obtained his freedom by the payment of a large ransom.

The eighth and last crusade was also undertaken by St. Louis in 1270. The king died at Carthage of the plague, and Prince Edward, afterward Edward I. of England, assumed the command of the army. The expedition accomplished nothing of importance, and in July, 1272, Edward returned to England with the last of the crusaders. The chief result of the crusades was a better acquaintance of the people of Western Europe with two civilizations more advanced than their own—the Greek and the Saracenic. Thus a powerful impulse was given both to the literature and the commerce of Europe. See besides Gibbon, Hallam, Milman, the special histories by F. Wilken (Leipzig, 1807–26, 7 vols.); J. F. Michaud (Paris, 1825; 9th ed. 1856, 4 vols.; Eng. trans., n. e. New York, 1881, 3 vols.); B. Kugler (Berlin, 1880; 2d ed. 1891) and for very brief treatment see G. G. Perry (London, 1865; 31st ed. 1872) and G. W. Cox (London and New York, 1875); for documents, Wilken's *Geschichte der Kreuzzüge*.

Revised by Samuel Macauley Jackson.

Cru'sé, Christian Frederic: scholar; b. in Philadelphia, Pa., June 27, 1794; in 1815 graduated with honor at the University of Pennsylvania, having been the first moderator of the Philomathean Society of that college; after several years as Lutheran minister, ordained in the Episcopal Church by Bishop White (1822); was assistant professor in the university in which he had been educated (1831–33); was rector of churches in several places; became librarian of the General Theological Seminary of the Episcopal Church, New York, 1853. D. in New York city, Oct. 5, 1864. He translated the *Ecclesiastical History of Eusebius Pamphilus* (Philadelphia, 1833) and the whole of Eschenburg's *Classical Manual*, only the part relating to Roman literature being incorporated in N. W. Fiske's translation (Philadelphia, 1836). W. A. Muhlenberg.

Cru'senstolpe, Magnus Jakob: Swedish author, journalist, and politician; b. in Jönköping, Mar. 11, 1795. His attacks on the Government in the early issues of his *Ställningar och Förhållanden* (Positions and Relations) caused his imprisonment 1838–41. Of more importance than his political tracts are his historical romances, e. g. *Morianen* (The Moor), 1840–44; *Carl Johan och Svenskarne* (Carl Johan and the Swedes), 1845–46; *Carl XIII.*, 1861, all of which, however, are written from the politician's rather than the historian's point of view. D. in Stockholm, Jan. 18, 1865.

G. L. Kittredge.

Crushing Machinery: See Grinding and Crushing Machinery.

Crustacea [Lat., shelly, adj., deriv. of *crusta*, shell]: a group of arthropodous animals, of which crabs, lobsters, shrimps, sow-bugs, beach-fleas, barnacles, etc., are familiar examples. They are like all Arthropods in having a jointed body with external skeleton, each joint bearing a pair of jointed appendages. Each joint or segment of the body is like its fellows in its broader features, but the segments are variously modified in the different regions of the body, being enormously enlarged at times, greatly reduced at others. Thus the two anterior segments are always very small, and the appendages are modified into "feelers" or antennæ. Behind these come several appendages adapted for eating, and still further back are the true limbs for locomotion. The mouth is below, just behind the antennæ; the "stomach" is frequently modified for chewing the food (the "lady" in the lobster); just behind the stomach the "liver" (more like a pancreas) pours in its secretions, the intestine is straight, the vent nearly terminal. The nervous system consists of a brain in front of the mouth, and a chain of secondary nervous centers, frequently considerably consolidated, lying along the floor of the body. The heart is on the back, and may be either a long tube or a short sac. Arteries and veins are developed, but there is no capillary system, the blood flowing during a portion of its course in the spaces (lacunæ) between the muscles. Breathing is effected, in the smaller forms, by the general surface of the body, in the larger by gills which occur on some or all of the legs. In the palm crab of the tropics an apparatus simulating a lung has been developed for breathing air. In all excepting the barnacles the sexes are separate, and the genital ducts open near the middle of the body. Of structural features, the existence of two pairs of antennæ in front of the mouth, the character of the respiration, and the position of the genital ducts alone can be used to distinguish the Crustacea from spiders, insects, etc.

The Crustacea usually carry the eggs about with them until the time of hatching. The eggs are usually filled with yolk, and in all cases pass through a stage with a single eye, without body segments and with but three pairs of appendages. This is called the *nauplius* stage, and with most Entomostraca free life now begins. From the persistence of a nauplius stage in all Crustacea it was formerly thought that the Crustacea were derived from a nauplius-like ancestor, but this idea is now given up, the nauplius being regarded as a feature introduced by "acceleration of development." (See Evolution.) Most Malacostraca pass the nauplius stage in the egg, and many Decapoda hatch from the egg in a *zœa* stage, characterized by the possession of less than the full number of legs, a longer body, and frequently enormous protective spines.

The Crustacea are divided into Malacostraca (containing Decapoda (see also Crab), Tetradecapoda, and Entomostraca (*q. v.*), containing Phyllopoda, Ostracoda, Copepods, and Cirripedia. About 10,000 species of Crustacea have been described, most of them from the sea, a few from fresh water, still fewer being terrestrial. Phyllopods occur in rocks of Cambrian age: the Decapoda first appear in the Carboniferous. J. S. Kingsley.

Crutched Friars: appeared in England in the thirteenth century, and had monasteries in London, Oxford, and Reigate. From the staff which they carried in their hand, on the top of which was a cross, they received the name *croisiers*, which soon was corrupted into "crouched" or "crutched" friars. A street in London bears this name.

Cruveilhier, krü'vā'li-ā', Jean: a French anatomist; b. in Limoges, Feb. 9, 1791. He obtained in 1835 the chair of Pathological Anatomy created in Paris by Dupuytren. He published an important work on *The Pathological Anatomy of the Human Body* (2 vols., gr. fol., with 233 plates, 1829–40), and other works. D. at Jussac, near Limoges, Mar. 6, 1874.

Cruz, José Maria, de la: Chilian general; b. at Concepcion, Apr. 21, 1801. In 1811 he joined the revolutionary army as a cadet, served through the following campaign, retreated with Carrera to Mendoza after the defeat of Roncagua, and returned with the army of San Martin in 1818. From these youthful beginnings he rapidly rose in rank, and was trusted with important commands. In 1831 he was minister of war; in 1838 chief of staff of the army which invaded Peru, and became general of division in 1839; was again minister of war and marine in 1841, and the same year governor of Valparaiso and commandant-general of marine. In 1851 he was the liberal candidate for president, but was defeated by Gen. Montt; he then headed a revolt in the southern provinces, during which, it is said, 4,000 soldiers were killed. He was finally defeated at the bloody battle of Longamilla Dec. 8, 1851; amnesty being proclaimed, he retired to a farm, where he died Nov. 23, 1873. Herbert H. Smith.

Cruz y Goyeneche, Luis. de la: Chilian general; b. at Concepcion, Aug. 25, 1768. During the colonial period he held various civil offices, principally at Concepcion. In 1806 he made an important exploration over the Andes, discovering one of the most practicable passes; his report of this was published at Buenos Ayres by Angelis in 1835. He joined the revolutionists in 1810, was a member of the *junta* of Concepcion, and commanded a division in the patriot army, but was captured by Spanish guerrillas and long imprisoned in Peru and on Juan Fernandez. Released by the victories of 1817, he was named commandant-general of Tolca, and was acting president of Chili during the temporary absence of O'Higgins; went with San Martin's army to Peru 1820, where he was director-general of marine, and was made grand marshal in the Peruvian army; returning to Chili at the end of the war, he was a deputy to the Constituent Congress of 1826, and afterward Minister of Marine. D. Oct. 14, 1828. Herbert H. Smith.

Cry'olite [from Gr. *κρύος*, frost + *λίθος*, stone; so named because it melts in the flame of a candle]: a double fluoride of aluminium and sodium. It is snow-white when pure. It occurs in a large bed in gneiss at Evigtok, West Greenland, whence it is shipped to Pennsylvania for use in the manufacture of soda. The finely divided mineral is mixed with chalk and is fused. By lixiviation, sodium aluminate dissolves, calcium fluoride remains. By passing a current of carbonic acid through the solution, alumina is precipitated, a solution of carbonate of soda being thus obtained.

Cryoph'orus [from Gr. *κρύος*, frost + *φέρειν*, bear]: an instrument invented by Wollaston to freeze water by the absorption of heat arising from its own evaporation. It consists of a glass tube with a bulb at each end. One bulb contains water. A vacuum is produced in the tube and opposite bulb, and the empty bulb being placed in a freezing mixture, the vapor arising from the water is condensed, so that the water soon congeals in the other bulb, though the intervening tube be 2 or 3 feet long.

Crypt [from Gr. *κρυπτός*, hidden]: a vault under a church used either for sepulture or, in rare instances, as a chapel. Crypts generally do not extend beyond the limits of the choir or chancel, and some are of smaller dimensions. They were not common after the early Romanesque or Norman period, and where they exist under churches of a later date they are usually much older than the church. They seem to have been designed to receive the bodies of saints, martyrs, and Church dignitaries, and are in many cases beautifully though simply finished structures. One of the finest examples is that under Glasgow Cathedral; others are found under the cathedrals of Chartres, Canterbury, Hereford, and Gloucester, and under the churches of St. Mark at Venice and St. Eutrope at Saintes. There is a vast crypt under St. Peter's at Rome. Revised by A. D. F. Hamlin.

Crypto-Calvinists: a name applied in the last half of the sixteenth century to the followers of Melanchthon (called also Philippists), who earnestly desired the union of the Lutherans and Calvinists, and were charged with leaning too strongly toward the Calvinistic doctrine of the Lord's Supper. Also applied to the Missouri Lutherans, because they defend the doctrine of unconditional election as taught in the *Formula of Concord*.

Cryptog'amous Plants, or **Crypt'ogams** [from Gr. *κρυπτός*, hidden + *γάμος*, marriage]: all plants below the Phanerogams, or flowering-plants. The names were first used by Linnæus, who may have thus indicated his conviction that all plants possess sexuality. (They do not.) For a long time the vegetable kingdom was divided into two groups, as follows:

1. *Phanerogamia*, with stamens, ovules, seeds, and embryos.

2. *Cryptogamia*, without stamens, ovules, seeds, and embryos, and with spores. These distinctions, although long since acknowledged to be unscientific, are still maintained, especially in popular usage. The Cryptogams, instead of being a single group co-ordinate with the Phanerogams, include several such groups—e. g.: I. Water-slimes (*Protophytes*); II. Spore-tangles (*Phycophytes*); III. Fruit-tangles (*Carpophytes*); IV. Mossworts (*Bryophytes*); V. Fernworts (*Pteridophytes*). More commonly, instead of II. and III. as given above, we have II. *Algæ*, and III. *Fungi*, based upon physiological instead of structural characters.

Charles E. Bessey.

Cryptog'raphy [from Gr. *κρυπτός*, hidden + *γράφειν*, write]: the art of writing or telegraphing in cipher, or in such a way that the matter written can not be read by any one not in possession of the necessary key. Many plans have been devised for this purpose, but almost any person who has taste for the solution of puzzles or enigmas can readily understand most writing of this kind; and it is probable that no kind of cipher could be invented which would be proof against systematic and ingenious decipherers. Military and naval signals resemble cryptographic writing in this respect.

Cryptoproc'ta [from Gr. *κρυπτός*, hidden + *πρωκτός*, vent]: a carnivorous mammal, peculiar to Madagascar, related to the cats and civets; placed by Flower with the civets (*Viverridæ*), by Gill in a separate family (*Cryptoproctidæ*), of which it is the sole member. The skull and teeth somewhat resemble those of a cat, but the cranium is longer and narrower, the latter more numerous. The cryptoprocta, locally known as foussa, is about 5 feet long, including the tail, being the largest carnivore found in Madagascar; it is clothed with short, pale-brown fur; the soles of the feet are naked. The animal is plantigrade, climbs trees, is nocturnal, and savage when wounded. It is sufficiently powerful to carry away kids. F. A. Lucas.

Crypturi [from Gr. *κρυπτός*, hidden + *οὐρά*, tail]: an order of birds, so named because the tail feathers are very short and sometimes wholly concealed by the tail coverts. It contains only the Tinamidæ (*q. v.*).

Crystal: See Crystallography.

Crystalline Lens: See Eye.

Crystalline Schists: in geology, a generic term employed to designate more or less perfectly crystalline rocks which possess a distinct foliation or parallel structure. Such rocks are more abundantly developed in the earth's crust than any others. In some cases they can be proved to be metamorphosed or recrystallized sediments. In other cases they are igneous rocks which have been rendered schistose by shearing and pressure. Other causes of a foliated or parallel structure are the movement in a partly consolidated and viscous mass (flow structure), and the injection of cleaved rocks, whether igneous or sedimentary, by later eruptive material (injection gneiss). By far the most common of the crystalline schists is Gneiss (*q. v.*), which always contains feldspar. Others are hornblende, mica, sericite, quartz, chlorite, and ottrelite schists, crystaline limestone, and quartzite.

Many banded and foliated gneisses have the same chemical and mineralogical composition as well-known igneous rocks. The origin of crystalline schists may in certain cases be clearly made out, but in many others it will probably always remain problematical. No general theory of their origin can be relied on to explain all occurrences. See Gneiss, Metamorphism, and Rocks. G. H. Williams.

Crystallog'raphy [from Gr. *κρύσταλλος*, clear-ice (cf. *κρύος*, frost), crystal + *γράφειν*, write]: the science of crystals. A crystal is a natural or artificial solid, bounded by plane surfaces, which are symmetrically arranged around certain imaginary lines called *axes*. *Κρύσταλλος* originally meant "ice"; it was afterward applied to the transparent variety of quartz, because it was thought that rock-crystal was water turned into stone, and this idea was not challenged until the commencement of the seventeenth century; it was subsequently applied indifferently to any solid which assumed a geometrical shape by natural laws.

All crystals may be referred to seven systems, six of which

are referred to three axes, and one of them to four. These systems are divided into two classes, according as the axes are or not at right angles. Those which are at right angles are called the *orthometric*, and those which are not are called *clinometric* systems. In each one of them there are three varieties. When all the axes are equal and at right angles, the system is called *isometric*. When only two are equal, but all at right angles, it is called the *tetragonal*. When none of the axes are equal, but all are at right angles, it is called the *orthorhombic*. The *clinometric* systems are called, respectively, the *monoclinic*, the *diclinic*, and the *triclinic*, according as the axes have different inclinations. The single system of four axes is called the *hexagonal*.

In all of these systems one axis is placed upright, and is called the vertical axis. In the isometric, tetragonal, and hexagonal systems the other axes are simply called the basal axes, while in each of the other systems each axis has its own name. The axes always terminate in homologous parts, whether these parts are edges or angles.

The axes form a system of co-ordinates by which the position of any face may be determined. Taking the most general case of three unequal axes, the vertical axis is usually designated by c; the one from left to right, b; and the one from front to behind, a; c is always written last. Starting from the origin, the half-axes are determined as + or − (Figs. 43, 44); when all the axes are equal they are all designated by a. The distances on these half-axes, cut off by any crystal face, are called parameters. One of them can always be made equal to unity, so that $ma:nb:c$, with their signs, will always give the position of any crystal face with reference to a given variety of axes. When a face is parallel to an axis, it is said to cut it at a distance equal to infinity, and its coefficient for that axis will be so written, as $\infty a:\infty b:c$. Every face of a crystal which does not cut all the axes must either cut two or be parallel to two of them. According to Weiss, the symbol of *any* face will be $ma:nb:c$. Naumann simplifies it by using two letters, or their numerical values, and writing between them the capital letter which represents the type of the system—O for octahedron, P for pyramid, and R for rhombohedron. The two letters are always written in the same order: m is always equal to, greater or less than unity, and always greater than n, $m \gtreqless 1$, $m > n$; m therefore varies between zero and infinity, while n varies between one and infinity. The coefficient 1 is never written.

Dana's symbols are simply a contraction of Naumann's, in which the letters for the primitive form of the system are left out, and ∞ is written i. Thus, mOn becomes mn, and $\infty O\infty$ becomes ii. Miller's system consists in writing the reciprocals of the parameters in the order of the axis a, b, c; c being always the vertical axis. Thus $\infty P\infty$ becomes 010. They are always written in the same order, without any designation of the crystalline system. The letters hkl written in brackets $\{hkl\}$ indicate a complete form; written simply hkl, they indicate a form in which all the plus axes are cut; written $hk\bar{l}$, it indicates that the plane cuts a negative axis at the distance k.

In every crystalline system a single form is taken as the base of the system. Any form belonging to the system *may* be taken for this base, but it is generally conceded to adopt pyramids. From this form all the others are derived by three very simple laws: (1) All the similar parts of a crystal may be similarly and simultaneously modified. This gives rise to *holohedral* forms. (2) Half the similar parts may be similarly and simultaneously modified. This gives rise to *hemihedral* forms, which in some of the systems are known as *inclined*, *parallel*, or *gyroidal* forms. (3) One quarter of the similar parts may be similarly and simultaneously modified, giving rise to *tetartohedral* forms.

In the isometric system the modifications may be composed of one, two, three, or six planes; in the tetragonal and hexagonal, of one and two; in the orthorhombic, monoclinic, diclinic, and triclinic, of only one plane at a time.

ORTHOMETRIC SYSTEMS.

Isometric System.—1. *Holohedral Forms.*

Three axes, a, a, a (Fig. 1), all equal and at right angles. The base of the system is the octahedron.

Octahedron, O.—When the axes a cut in the relation $a:a:a$, the solid is made up of eight faces, which are equilateral triangles (Fig. 2). There can be but one octahedron.

Hexahedron, $\infty O\infty$.—When the solid angles of the octahedron are modified by planes which are parallel to two of the axes, and cut one at a distance equal to unity, the resulting solid will be a cube, and will have the symbol $a:\infty a:\infty a$ (Fig. 3).

Rhombic Dodecahedron, ∞O.—When the edges of the octahedron are modified in such a way that two of the axes are cut at a distance equal to unity, while the plane is parallel to the third, the symbol will be $a:a:\infty a$ (Fig. 4). There can be but one rhombic dodecahedron.

Tetrahexahedron, ∞On.—When the edges of the octahedron are modified, so that one of the axes is cut at unity, one at infinity, and one at n, the formula will be $\infty a:a:na$ (Fig. 5). As there is nothing to limit the inclination of the planes, there may be an infinite variety of tetrahexahedra (Figs. 5, 6, 7), the limit being ∞O on the one hand when $n = 1$, and $\infty O\infty$ on the other when $n = \infty$.

Trigonal Trisoctahedron, mO.—When the edges of the octahedron are replaced, so that two of the axes are cut at unity and the third at m, the formula is $ma:a:a$. Each plane of the octahedron becomes replaced by three triangular planes; hence the name trisoctahedron. As there is nothing to limit the inclination of the planes, there may be an infinite variety of trigonal trisoctahedra (Figs. 8, 9, 10). Their limit will be O on the one hand when $m = 1$, and ∞O on the other when $m = \infty$.

Tetragonal Trisoctahedron, mOm.—When the solid angles of the octahedron are modified so that two of the axes are cut at a distance m and the third at unity, the symbol will be $ma:a:ma$. The faces of the octahedron will be replaced by three tetragonal planes. As there is nothing to limit the inclination, there may be an infinite number of tetragonal trisoctahedra (Figs. 11, 12, 13). Their limit will be O on the one hand when $m = 1$, and $\infty O\infty$ on the other when $m = \infty$.

Hexoctahedron, mOn.—When the angles of the octahedron are modified so that each axis is cut at a different distance, the symbol will be $ma:na:a$. Each plane of the octahedron will be replaced by six triangular planes. As there is nothing to limit the inclination of the planes, there may be an infinite number of hexoctahedra (Figs. 14, 15, 16). This solid is the most interesting of all the solids of the system, for by successively changing the values of m and n all the other forms of the system may be derived from it. They can all be seen upon it in outline.

2. *Hemihedral Forms.*

In the isometric system there are three kinds of hemihedry: (1) *inclined*, (2) *parallel*, and (3) *gyroidal*. (1) The forms are said to be *tetrahedral* or *inclined* when the faces are not parallel. This is produced when all of the modifications are carried out on alternate homologous parts. (2) They are *dodecahedral* or *parallel* when alternate modifications are carried out in the same order on all the homologous parts. (3) *Gyroidal* forms are produced when alternate modifications are carried out alternately on all the homologous parts. The hexoctahedron is the only solid which allows of hemihedral forms according to all of the three laws.

(1) *Inclined or Tetrahedral Forms.*

Tetrahedron, $\pm \frac{O}{2}$.—When alternate faces of the octahedron are produced to the exclusion of the others (Fig. 17), a tetrahedron (Fig. 18) is formed. There can be but two tetrahedra, which are distinguished as + and −.

Hemi-Trigonal Trisoctahedron, $\pm \frac{mO}{2}$.—When mO is modified by this law, a tetrahedron is produced, each of whose faces is replaced by three tetragonal planes (Figs. 19, 20, 21, 22).

Hemi-Tetragonal Trisoctahedron, $\pm \frac{mOm}{2}$.—When mOm is modified by the same law, a tetrahedron is produced, each one of whose planes is replaced by three triangular planes (Figs. 23, 24, 25, 26).

Hemi-Hexoctahedron Inclined, $\pm \frac{mOn}{2}$.—When mOn is modified by the same law, a tetrahedron is produced, each one of whose faces is replaced by six triangular planes (Figs. 27, 28). The other forms, $\infty O\infty$, ∞O, and ∞On, do not admit of inclined hemihedry.

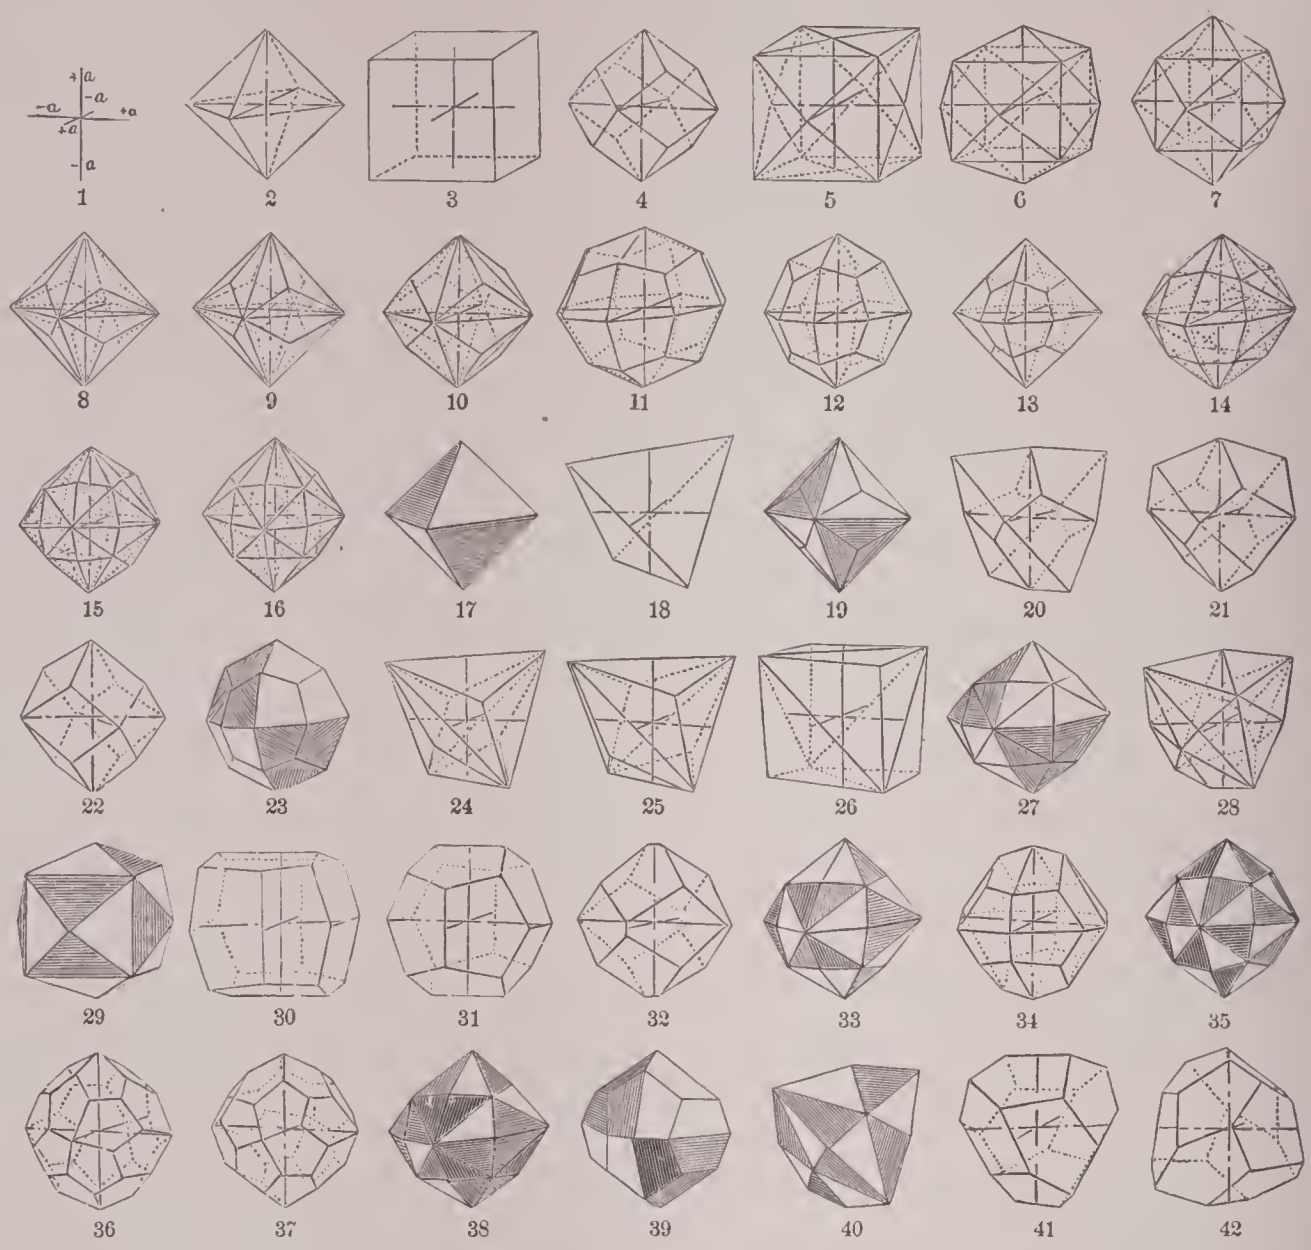
(2) *Parallel or Dodecahedral Forms.*

Hemi-Tetrahexahedron, ∞On.—When ∞On (Fig. 29) is modified, so that every alternate face is produced, a solid is

formed (Figs. 30, 31, 32), which is often called the *pentagonal dodecahedron.*

Hemi-Hexoctahedron Parallel, $\pm \left[\frac{mOn}{2}\right]$.—When mOn is modified so that every other plane is taken in the same order on each face (Fig. 33), a solid (Fig. 34) is produced, which is often called the *diploid.*

edges terminal angles and planes. The general formula for these pyramids is $a:a:mc$, for which the symbol is mP, in which $m \gtreqless 1$; but in that protopyramid P which is selected for the base of the system the value of m is taken for unity. As m may have any value, there may be any number of pyramids. They are called acute or obtuse according as the terminal angle is acute or obtuse.



Isometric system.

3. *Gyroidal Form.*

Gyroid, $\pm \left(\frac{mOn}{2}\right)$.—When mOn is modified in such a way that the faces are taken alternately above and below (Fig. 35), a solid having twenty-four pentagonal faces is produced (Figs. 36, 37). This solid has not been found in nature.

(3) *Tetartohedral Form.*

Tetartoid, $\pm rl \frac{mOn}{4}$.—mOn is the only form which allows of the carrying out of this law. When the hexoctahedron, the diploid, or the hemi-hexoctahedron inclined, is modified as shown in Figs. 38, 39, and 40, Figs. 41 and 42 are produced, and as there are two pairs of these, which are right and left forms, they are distinguished as + and − r and l.

TETRAGONAL SYSTEM.

The axes of this system (Fig. 43) are of two kinds: a, the vertical, being longer or shorter than b, b, which are both equal.

Holohedral Forms.—Closed Forms.

Tetragonal Pyramid of the First Order, P.—When the axes are cut in the relation $a:a:c$, the pyramid of the first order or protopyramid (Figs. 44, 45) is produced. The plane which includes the axes b is a square, and is called the basal plane, and its angles and edges are called basal angles and edges. The planes which include the axes a, b are rhombs, and are called the terminal planes, and their angles and

Pyramid of the Second Order, mP∞.—When the terminal edges of the protopyramid are modified by one plane in the relation $ma:\infty b:b$, a solid exactly similar in all respects to the protopyramid is produced, but turned 90°, so that the basal axes terminate in the center of the basal edges (Figs. 46, 47). As m may be $\lesseqgtr 1$, there may be an infinite number of deuteropyramids. The two forms, P∞ and 2P∞, occur where $m = 1$ in the first case, and $m = 2$ in the second.

Ditetragonal Pyramid, mPn.—When the terminal edges of the protopyramid are modified in the relation $a:na:mc$, a solid is produced in which each plane of the protopyramid is replaced by two planes (Figs. 48, 49). This solid $m \gtreqless 1$, $n > 1 < \infty$; hence there may be any number of ditetragonal pyramids. This solid bears the same relation to this system that the hexoctahedron does to the isometric system.

Open Forms.

Tetragonal Prism of the First Order, ∞P.—When the basal edges of P are modified by one plane, the axes will be cut in the relation $a:a:\infty c$, which produces simply four vertical planes (Fig. 50), these, as they are not closed, produce an open form, which is the protoprism.

Tetragonal Prism of the Second Order, ∞P∞.—When the basal angles of the protopyramid are modified by one plane in the relation $a:\infty a:\infty c$, a prism (Fig. 51) is produced similar to the protoprism, but turned 90°.

Ditetragonal Prism, ∞Pn.—When the basal angles of the protopyramid are modified by two planes in the relation

$a:na:\infty c$, a prism (Fig. 52), made up of eight faces, which are parallelograms, is produced.

Basal Pinacoid, oP.—When the axes are cut by planes in the relation $\infty a:\infty a:c$, we have simply a pair of planes parallel to the basal axes.

Pyramidal Hemihedral Forms.

The pyramidal hemihedral forms of the tetragonal system are called (1) *scalenohedral* or *sphenoidal*, (2) *trapezoidal*, (3) *pyramidal*.

(1) *Scalenohedral.*

Sphenoid of the First Order, $\pm \frac{P}{2}$.—When alternate planes of P are produced, a solid resembling a tetrahedron is formed, in which the faces are isosceles triangles (Figs. 53, 54). There will be two of these sphenoids. This solid is named after the mineral *sphene* (*litanite*), in which it frequently occurs.

Sphenoid of the Second Order, $\pm \frac{mP\infty}{2}$.—When mP∞ is treated by this law, another sphenoid is produced, similar in every respect to the sphenoid of the first order, but turned 90° (Figs. 55 and 56).

the second order, except that the basal axes terminate to one side of the center of the faces of the prism (Fig. 67).

Tetartohedral Forms.—Sphenoidal.

Tetarto-Sphenoid, $\pm \frac{r}{l}\frac{mPn}{4}$.—When mPn is modified as shown in Fig. 68, it produces a sphenoid (Fig. 69), called the sphenoid of the third order.

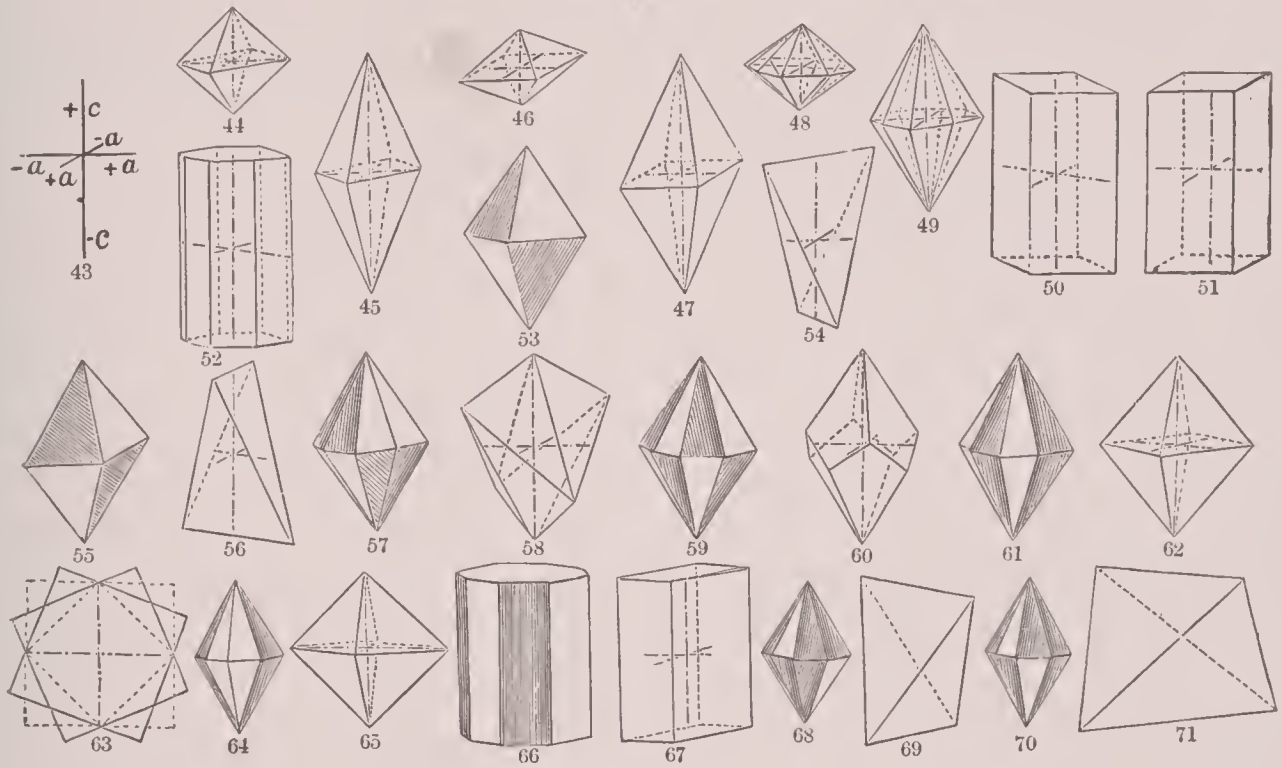
Plagio-Sphenoid.—When mPn is modified as in Fig. 70, it produces a sphenoid (Fig. 71), called the sphenoid of the fourth order. It has not been found in nature.

ORTHORHOMBIC SYSTEM.

The axes of this system (Fig. 72), a, b, c, all unequal, but all at right angles.

Holohedral Forms.—Closed Forms.

Rhombic or Protopyramid, P.—When the axes are cut in the relation $a:b:c$, the solid produced is a pyramid, whose faces are scalene triangles (Fig. 73). The planes ab, ac, and bc are rhombs of different values. As the basal axes form the diagonals of the rhombs bc, they are called, b the *macro* or *longer*, and c the *brachy* or *shorter* axis or diagonal. In each species a value of a is selected for unity, and this value is represented in P, the base of the system. The general formula will, however, be $a:b:mc$, or mP, in which $m \gtrless 1$.



Tetragonal system.

Tetragonal Scalenohedron, $\pm \frac{mPn}{2}$.—When two faces together, taken alternately above and below, of mPn are taken (Fig. 57), the solid resulting is a sphenoid, each of whose faces is replaced by two planes (Fig. 58).

(2) *Trapezoidal.*

Tetragonal Trapezohedron, r or $l\ \frac{mPn}{2}$.—When mPn is modified by taking one plane alternately above and below (Fig. 59), a solid (Fig. 60) is produced; to distinguish them from the other hemihedral forms of mPn, they are called right, r, and left, l.

(3) *Pyramidal.*

Tetragonal Pyramid of the Third Order, $\frac{r}{l}$ and $\frac{l}{r}\ \frac{mPn}{2}$.—When mPn is modified, by taking one alternate plane, but the same plane above and below (Fig. 61), a pyramid is formed which resembles the other pyramids of this system (Fig. 62). It is, however, turned to one side more or less, depending on the angle of mPn. The relations of the pyramids and prisms of the three orders are illustrated by Fig. 63. Another pyramid which is purely theoretical is formed as shown in Figs. 64 and 65.

Prismatic Hemihedral Forms.

Tetragonal Prism of the Third Order, $\frac{r}{l}$ or $\frac{l}{r}\ \frac{\infty Pn}{2}$.—When ∞Pn is modified so that only every other plane is taken (Fig. 66), a prism is produced resembling the prism of

Macropyramid, $m\breve{P}n$.—This solid (Fig. 74) resembles the protopyramid, but the symbol is $a:nb:mc$, in which $m \gtrless 1$. The macro axis has for its coefficient $n > 1$. The planes, therefore, cut the macro axis extended. The long mark ‾ through the P symbolizes this fact.

Brachypyramid, $m\breve{P}n$.—In this form (Fig. 75) the symbol is $a:nb:mc$, in which $m \gtrless 1$ and $n > 1$. The planes, therefore, cut the brachy axis extended, which is expressed by the curve ⌣ drawn through the P.

Open Forms.

Rhombic or Protoprism, ∞P.—When the basal edges of P are modified by one plane, which is parallel to the vertical axis a, according to the law $a:b:\infty c$, the resulting form is composed of vertical parallelograms (Fig. 76).

Macroprism, $\infty\breve{P}n$.—When the basal edges of $m\breve{P}n$ are modified by planes passed according to the law $a:nb:\infty c$, in which $n > 1$, the macro axis extended will be cut. The form consists of four vertical parallelograms (Fig. 77).

Brachyprism, $\infty\breve{P}n$.—When the basal edges of $m\breve{P}n$ are modified according to the law $na:b:\infty c$, in which $n > 1$ (Fig. 78), the resulting form is a prism, in which the brachy axis extended is cut.

Basal Pinacoid, oP.—When the axes are cut in the relation $\infty a:\infty b:c$, we have simply two pairs of planes.

Macrodome, $m\breve{P}\infty$.—When the terminal edges of P are

modified according to the law $a : \infty b : mc$, in which $m \gtrless 1$, the form is roof-shaped, and is called a *dome*, from *domus*, a house. The dome is always over the axis, from which it takes its name.

Brachydome, $m\breve{P}\infty$.—When the terminal edges are modified according to the law $\infty a : b : mc$, in which $m \gtrless 1$, a dome over the brachy axis is formed.

Basal Pinacoid, oP.—When the axes are cut in the relation $\infty a : \infty b : c$, planes parallel to the basal axes are produced.

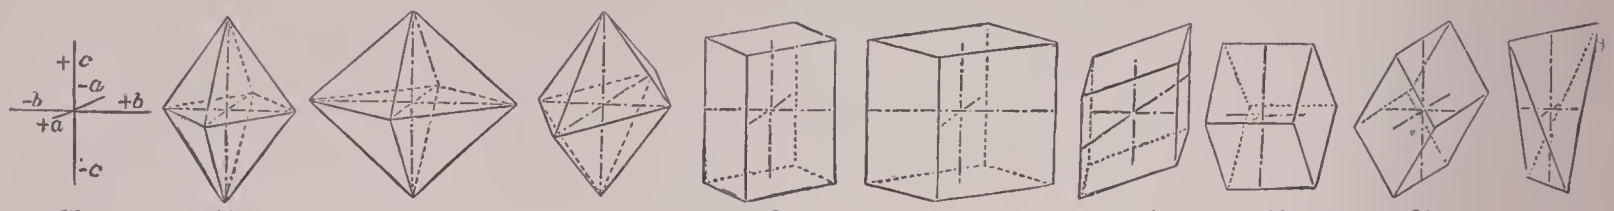
Macropinacoid, $\infty\breve{P}\infty$.—When the axes are cut according to the law $a : \infty b : \infty c$, planes parallel to the axis b are produced.

be formed by these and the other pair of planes behind above and in front below. The pyramid itself will be $\pm$ P (Fig. 83). The two planes, above in front and below behind, are by convention called $-$ P, and the others $+$ P. When m is not equal to 1, the symbol becomes $\pm m$P.

Orthopyramid, $\pm m\breve{P}n$.—When the axes are cut in the relation $na : b : mc$, the two forms produce the orthopyramid (Fig. 84).

Clinopyramid, $\pm m\breve{P}n$.—When the axes are cut in the relation $a : nb : mc$, the two forms produce the clinopyramid (Fig. 85).

Protoprism, ∞P.—When the basal edges of the protopyramid are modified, the axes are cut in the relation $a : b : \infty c$. A monoclinic prism (Fig. 86) results.



72 73 74 75 76 77 78 79 80 81

Orthorhombic system.

Brachypinacoid, $\infty\breve{P}\infty$.—When the axes are cut according to the law $\infty a : b : \infty c$, planes parallel to the axis c are produced.

Hemihedral Forms.

The hemihedral forms of this system consist of one solid, the rhombic sphenoid, and pairs of planes or single planes.

Rhombic-Sphenoid, $\pm \frac{m\text{P}}{2}$.—When alternate planes of the protopyramid are taken, a sphenoid is formed whose faces are scalene triangles (Fig. 81).

Hemimorphic Forms.

According to the law of symmetry, when a crystal is terminated by modifications at one extremity of an axis, the same planes should be repeated at the other. In this and the hexagonal system there occur crystals where this law does not hold good, and these exceptions are called *hemimorphic* forms.

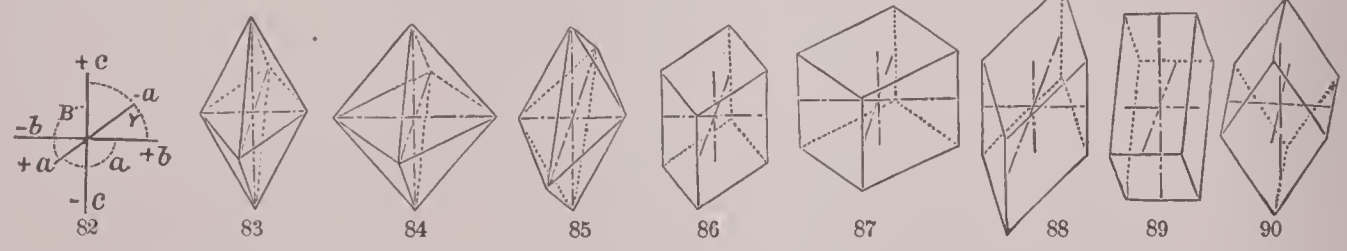
Limit Forms.

When the protoprism is accompanied by the macro and brachy pinacoids, the prism has a hexagonal section. When the angle of the prism is near 120°, forms are produced which are so similar to hexagonal combinations that it is frequently difficult, without a determination of the optical properties of the mineral, to make the distinction.

CLINOMETRIC SYSTEMS.

Monoclinic System.

The axes of this system (Fig. 82) are of three kinds, and have only a single inclination. The angle γ of the plane $ac = 90°$, the angle α of the plane $bc = 90°$, the angle β of the plane $ab \gtrless 90°$. a is called the *vertical*, b the *clino*, and c the *ortho* axis or diagonal. The plane of the basal axes is thus inclined to the vertical axis, while the ortho and clino axes are at right angles to each other.



82 83 84 85 86 87 88 89 90

Monoclinic system.

Holohedral Forms.—Open Forms.

Monoclinic Pyramid, $\pm$ P.—As the axes a and b are of unequal length, and the plane which contains them makes two angles with the vertical axis, the one in front being an obtuse and the one behind making an acute angle, the relation $a : b : c$ will produce only a hemipyramid or a pair of planes, above in front or behind below. The pyramid will

Orthoprism, $\infty\breve{P}n$.—When the basal edges of the protopyramid are modified by one plane in such a way that the ortho axis extended is cut at a distance n, the relation is $na : b : \infty c$ (Fig. 87).

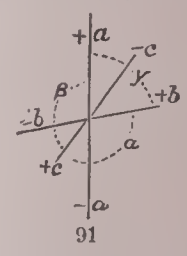
Clinoprism, $\infty\breve{P}n$.—When the orthopyramid is modified so that the clino axis extended is cut at a distance n, the relation is $a : nb : \infty c$ (Fig. 88).

Orthodome, $\pm m\breve{P}\infty$.—As the edges which join the axes a, b are of two kinds, only parallel planes will be produced by a single modification, $\infty a : b : mc$. The orthodome (Fig. 89) will therefore be made up of two hemi-orthodomes. The same convention for the signs $+$ and $-$ is made as for the pyramid.

Clinodome, $m\breve{P}\infty$.—As the edges which join the axes a, c are alike, a dome results from the relation $a : \infty b : mc$ (Fig 90).

Diclinic System.

The axes (Fig. 91) of this system are of three kinds, and have two inclinations. The angle γ of the planes $ab \gtrless 90°$, the angle α of the planes $bc = 90°$, the angle β of the planes $ac \gtrless 90°$. The basal axes are thus at right angles to each other, but the plane which contains them has two inclinations to the vertical axis.



91

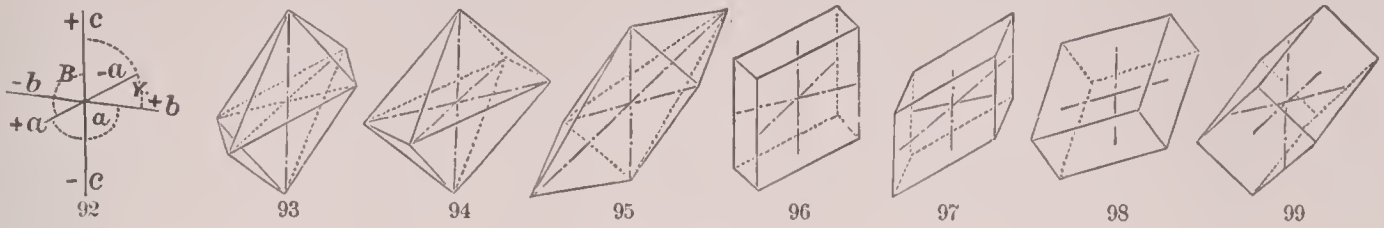
Diclinic system.

Diclinic Pyramid, $'\text{P}'$.—As the faces of the pyramid are equal only in pairs, the pyramid is made up of four tetarto pyramids. This system admits of only hemi forms and tetarto forms. a is called the vertical, b the macro, and c the brachy axis. It admits of tetarto, macro, and brachy pyramids and prisms, and tetarto, macro, and brachy domes and the pinacoids. Mitscherlich announced that he had discovered this system in a crystal of hyposulphite of lime, but subsequent crystallographic and optical researches proved that this salt was triclinic; in consequence of which the system was abandoned by most crystallographers. It has, however, the same theoretical basis as any of the other systems, and there does not seem to be any good reason why it should not be preserved.

Triclinic System.

The axes of this system (Fig. 92) are of three kinds and have three inclinations, the angles α, γ, β, are $\gtrless 90°$. The axis c is called the vertical, b the macro, and a the brachy axis.

Triclinic Pyramid, ¦P¦.—When the axes (Fig. 92) are cut in the relation $a : b : c$, a pair of planes are produced. The pyramid is made up of four tetarto-pyramids, which are distinguished by accents. P' signifies the planes right above, dihexagonal pyramid are modified by one plane, so that the axes are cut in the relation $\mu b : b : \frac{\mu}{\mu - 1} b : \infty c$, a dihexagonal prism (Fig. 106) is produced.



92 93 94 95 96 97 98 99

Triclinic system.

'P the planes left above, P¦ the planes right below, and ¦P the planes left below, with their diagonally opposite planes. The pyramid is ¦P¦. The protopyramid (Fig. 93) will always be m¦P¦, except when m equals one, the maeropyramid (Fig. 94) is m¦P¦n, and the brachypyramid (Fig. 95) m¦P¦n.

Triclinic Prism, ∞'P'.—When the relation $\infty a : b : c$ is carried out, it produces a single pair of planes, whose symbol is ∞P' or ∞'P, according as the planes are to the right or the left. Each prism is made up of two hemiprisms. The whole form (Fig. 96) is ∞'P'. The brachyprism (Fig. 97) is ∞'P', and the macro prism ∞'P'n.

Triclinic Domes.—The domes are single pairs of planes, and each dome is made up of two hemidomes. The macrodomes are made up of m'P'∞ and m¦P¦∞ (Fig. 98), and the brachydomes of m¦P'∞ and m'P¦∞ (Fig. 99).

The only other planes are the basal pinacoid, oP, the macropinacoid, ∞P∞, and the brachypinacoid, ∞P∞.

SYSTEM WITH FOUR AXES.

Hexagonal System.

The hexagonal system is referred to four axes. One of these c (Fig. 100) is vertical. It is at right angles to the plane of the basal axes b, which are inclined to each other at an angle of 60°. The vertical is the optical axis, and is consequently the line of greatest physical as well as mathematical importance.

Holohedral Forms.—Closed Forms.

Hexagonal Pyramid, P.—When the axes (Fig. 100) are cut in the relation $\infty b : b : b : c$, the pyramid of the first order (Fig. 101), or protopyramid, is produced. In the form chosen for the base of the system the vertical axis is cut at a distance equal to unity, but it may be cut at other distances, $m \gtreqless 1$, so that the general symbol is mP. The pyramids are said to be acute or obtuse according as the terminal angle is acute or obtuse.

Hexagonal Pyramid of the Second Order, mP2.—When the terminal edges of the protoprism are replaced by one plane, so that the axes are cut in the relation $2b : b : 2b : mc$, another pyramid called the deuteropyramid (Fig. 102), which is similar in all respects to the protopyramid, except that it is turned 30° from it, is produced.

Dihexagonal Pyramid, mPn.—When the terminal edges of the protopyramid are replaced by two planes, all three of the axes b will be cut at unequal distances. If the shortest parameter is called unity or b, and the longest μb, the third parameter will have a value of $\frac{\mu}{\mu - 1} b$, and its length will be between 1 and 2. The axes will be in the relation $\mu b : b : \frac{\mu}{\mu - 1} b : mc$, or $\mu b : b : nb : mc$, in which $m \gtreqless 1$, $\mu \geqq 2$, and $n = \frac{\mu}{\mu - 1}$ (Fig. 103).

Open Forms.

Hexagonal Prism, ∞P.—When the basal edges of the protopyramid are modified by one plane which is parallel to the vertical axes, they are cut in the relation $\infty b : b : b : \infty c$, and the protoprism (Fig. 104) is produced.

Hexagonal Prism of the Second Order, ∞P2.—When the basal edges of the deuteropyramid are modified by one plane parallel to the vertical axis, a deuteroprism is produced (Fig. 105). The axes are cut in the relation $\infty a : 2b : b : 2b$. This prism is in every respect similar to the protoprism, but it is turned 30°.

Dihexagonal Prism, ∞Pn.—When the basal edges of the

Basal Pinacoid, oP.—When the axes are cut in the relation $\infty b : \infty b : \infty b : c$, the basal pinacoid is produced.

Pyramidal Hemihedral Forms.

This system admits of four different kinds of hemihedral forms, derived from its pyramids, which are called (1) *scalenohedral*, (2) *trapezoidal*, (3) *pyramidal*, and (4) *trigonal hemihedry*.

(1) *Scalenohedral.*

Rhombohedron of the First Order, $\pm \frac{m\text{P}}{2}$.—When mP is modified by producing every alternate plane (Fig. 107), the rhombohedron (Fig. 108) is produced. As there are two of them, they are designated by the signs + and −.

Rhombohedron of the Second Order, $\pm \frac{\infty\text{P2}}{2}$. — When ∞P2 is modified by the same law (Fig. 109), other rhombohedra (Fig. 110) are produced, similar to those of the first order, but turned 30°. As there is no limit to the angles of the pyramids from which they are produced, there are an infinite variety of rhombohedra. They are called acute or obtuse according as the terminal angle is acute or obtuse.

Hexagonal Scalenohedron, $\pm \frac{m\text{P}n}{2}$.—When the dihexagonal pyramid is modified, so that every two alternate faces above and below are taken (Fig. 111), the scalenohedron (Fig. 112) is produced. There are four of these scalenohedra. In order to get a clear idea of them, we have only to suppose that the terminal or basal edges of the rhombohedra were modified by two or the terminal angles by six planes.

(2) *Trapezoidal Hemihedry.*

Hexagonal Trapezohedron, r or l $\frac{m\text{P}n}{2}$.—When the dihexagonal pyramid is modified by the extension of every alternate plane above and below (Fig. 113), the hexagonal trapezohedron (Fig. 114) is produced. They are distinguished as right and left.

(3) *Pyramidal Hemihedry.*

Hexagonal Pyramid of the Third Order, $\frac{r}{l}$ or $\frac{l}{r}$ $\frac{m\text{P}n}{2}$.—When mPn is modified as in Fig. 115, a hexagonal pyramid, in which the basal axes terminate to one side of the center of the basal edges, is produced (Fig. 116), which, to distinguish it, is called the pyramid of the third order.

(4) *Trigonal Hemihedry.*

Ditrigonal Pyramid, r or l $\left[\frac{m\text{P}n}{2}\right]$.—When mPn is modified so that every alternate pair of planes, but the same planes above and below, are taken (Fig. 117), a ditrigonal pyramid (Fig. 118) is produced; to distinguish the symbol it is written in brackets.

Trigonal Pyramid of the First Order, r or l $\frac{m\text{P}}{2}$.—When mP (Fig. 119) is modified by extending every other plane, but the same plane above and below, a trigonal pyramid of the first order (Fig. 120) is produced.

Trigonal Pyramid of the Second Order, r or l $\frac{m\text{P2}}{2}$.—When mP2 (Fig. 121) is modified by the same law, a trigonal pyramid is produced.

Prismatic Hemihedral Forms.

Hexagonal Prism of the Third Order, $\frac{r}{l}$ or $\frac{l}{r}\ \frac{\infty Pn}{2}$.—When ∞Pn is modified by the extension of every alternate plane (Fig. 123), a hexagonal prism of the third order is produced.

Ditrigonal Prism, r or $l\left(\frac{\infty Pn}{2}\right)$.—When ∞Pn is modified by extending pairs of alternate planes (Fig. 125), a ditrigonal prism (Fig. 126) is produced.

Trigonal Prism of the First Order, $\pm\ \frac{\infty P}{2}$.—When ∞P is modified by the extension of every other plane (Fig. 127), a trigonal prism of the first order (Fig. 128) is produced.

Trigonal Prism of the Second Order, $\pm\ \frac{\infty P2}{2}$.—When $\infty P2$ (Fig. 129) is modified by the same law, an obtuse trigonal prism is produced (Fig. 130).

The relation of all these forms to each other is made plain by Figs. 131 and 132. Fig. 131 shows the relative positions of the hexagonal pyramids and prisms of the first, second, and third orders, and the dihexagonal pyramid and prism (Fig. 132) shows the relations of the first, second, and third orders, the scalenohedron, the trigonal and ditrigonal pyramids and prisms.

Pyramidal Tetartohedral Forms.

There are two kinds of pyramidal tetartohedry in the hexagonal system, *rhombohedral* and *trapezoidal*.

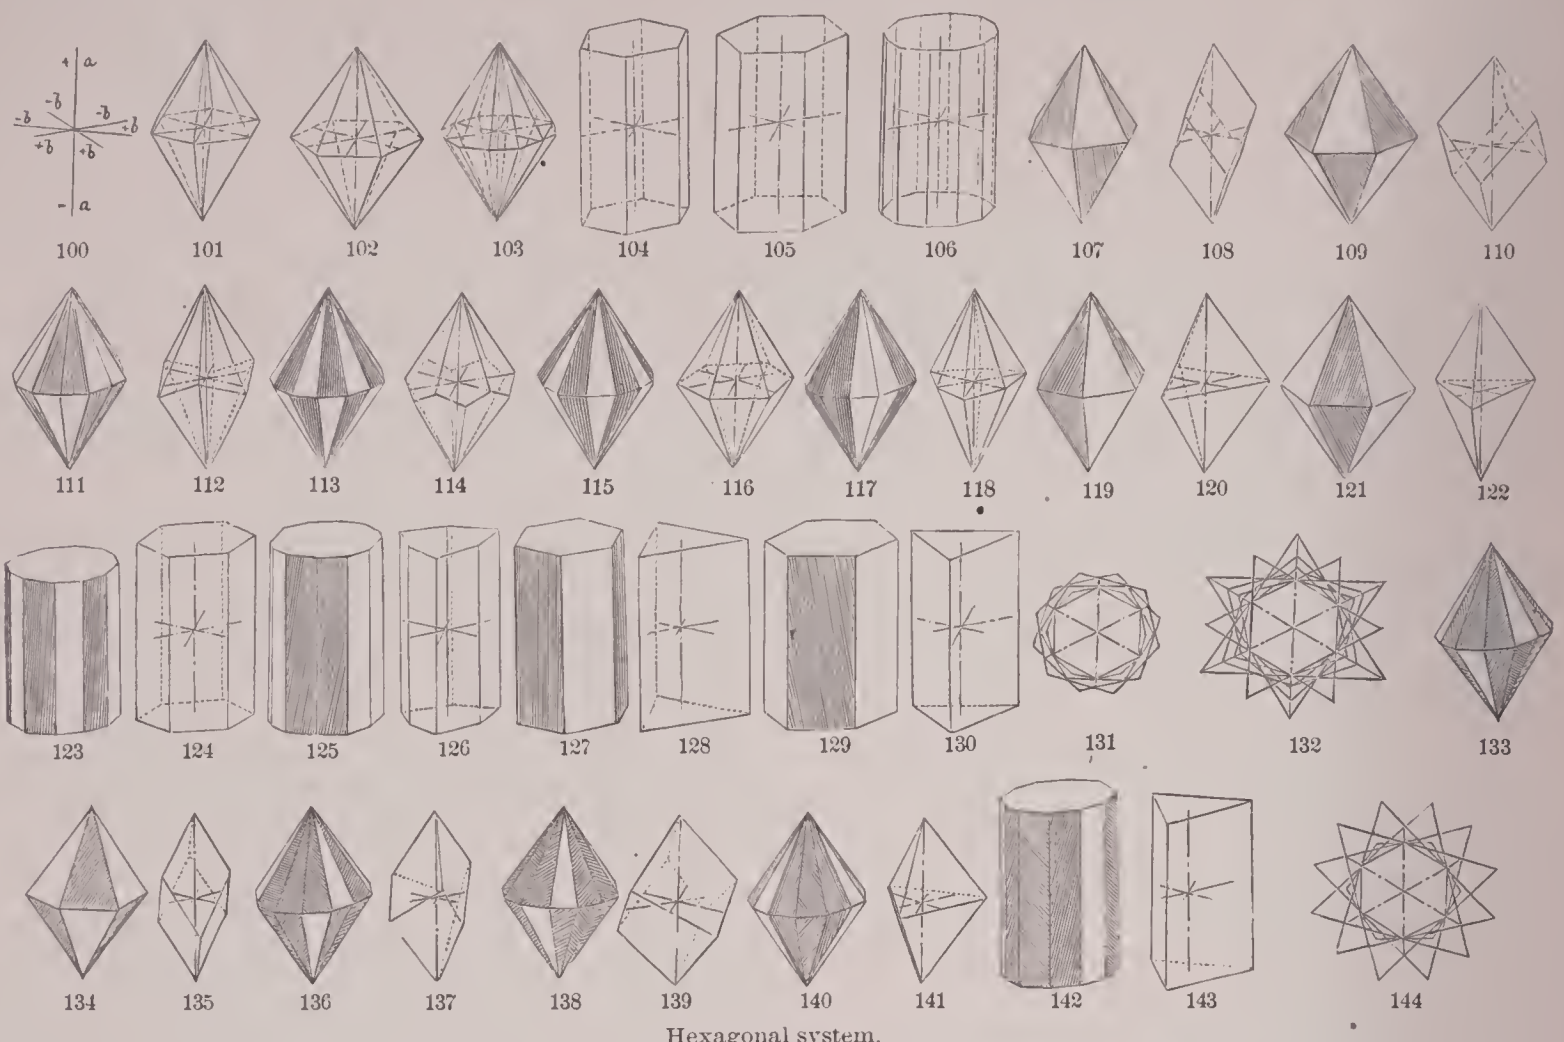
Rhombohedral Hemihedry.

Rhombohedron of the Third Order, $\pm\ \frac{r}{l}$ or $\frac{l}{r}\ \frac{mPn}{4}$.—When the dihexagonal pyramid or the hexagonal pyramid of the third order is modified as shown in Figs. 133 and 134, a rhombohedron of the third order (Fig. 135) is produced.

Trapezoidal Hemihedry.

Trigonal Trapezohedron, $\pm\ r$ or $l\ \frac{mPn}{4}$.—When mPn is modified as shown in Figs. 136 and 138, the solids (Figs. 137 and 139) are produced. These solids were formerly called plagihedra. They vary in form according as the terminal angle is acute or obtuse.

Trigonal Pyramid of the Third Order, $\pm\ r$ or $l\left[\frac{mPn}{4}\right]$.—When mPn is modified as shown in Fig. 140, a trigonal pyramid (Fig. 141) is produced.



Hexagonal system.

Prismatic Tetartohedral Form.

Trigonal Prism of the Third Order, $\pm\ r$ or $l\ \frac{\infty Pn}{4}$.—When ∞Pn is modified as shown in Fig. 142, a trigonal prism is produced (Fig. 143). The position of these tetartohedral forms is illustrated in the diagram Fig. 144, which shows the relative position of the hexagonal pyramids of the first and second orders, the dihexagonal pyramid and prism, and the trigonal pyramids and prisms of the third order.

THOMAS EGLESTON.

Crystal Palace: a structure composed mainly of iron and glass, especially that at Sydenham, near London. The first crystal palace was erected in London in 1851 from designs by Sir Joseph Paxton, and was used for the world's fair of that year. It was constructed wholly of iron and glass, except the floors, which were of wood; was 1,851 feet long, and covered 21 acres. It was taken down after the exhibition. Two years later a world's fair was held in New York in a crystal palace designed by Carstenson and Gildemeister. This was burned in 1858. The present edifice at Sydenham was built in 1854, and contains an extensive museum of art and science, besides a permanent fair, concert-halls, etc. Many similar structures have since been erected in Europe and the U. S., but the name of "crystal palace" has passed out of use except for the three historic edifices above mentioned. Revised by A. D. F. HAMLIN.

Csaba, chŏ'bŏ: a market-town of Hungary; 7 miles by rail S. S. W. of Bekes (see map of Austria-Hungary, ref. 7–J). It has a considerable trade in wine, hemp, grain, flour, and cattle. Previous to 1840 it was but a village. Pop. (1890) 34,608.

Csanad, chŏ-naad': a county of Hungary; bounded N. by Bekes, E. by Arad, S. by Torontal, and W. by Csongrad. Area, 640 sq. miles. It consists of a plain, which is very fertile, but the climate is unhealthful and the water bad. The chief products are wheat, wine, tobacco, and fruit. Chief town, Mako. Pop. (1890) 130,609.

Csongrad, chōn-graad′: a county of Hungary; bounded N. by Szolnok, E. by Bekes and Csanad, S. by Torontal, and W. by Pesth. Area, 1,280 sq. miles. The soil and products are similar to those of Csanad. It is traversed by the Theiss. Chief town, Szegedin. Pop. (1890) 262,774.

Ctenoid Fishes, tee′noid [*ctenoid* is from Gr. κτενοειδής, comb-shaped; κτείς, κτενός, comb + suffix *-oid*, based on Gr. εἶδος, appearance]: the *Ctenoidei*, an order of fishes established by L. Agassiz for those species in which the free portion of the scales bears one row, or several rows, of tooth-like points, that is, are ctenoid or pectinate. The order was the third of four in Agassiz's early classification, the others being the cycloid, the ganoid, and the placoid fishes, but it has become obsolete since the group was shown to be composed of or to contain unrelated species. The word is, however, used to describe such toothed scales. The perch, bass, and flounder are typical ctenoid fishes. F. A. L.

Ctenoph′ora [Gr. κτείς, κτενός, a comb + φέρειν, to bear]: a group of free-swimming marine animals with radiate structure, formerly included in the Radiata and more lately in the Cœlenterates. They differ from these last in many particulars which seem to warrant their separation as a distinct branch. The typical Ctenophore consists of an oval body with terminal mouth and eight-rayed stomach. Upon each of these gastric canals is placed a row of vibratile ciliated plates (the combs from which the name is derived), used in locomotion. The sexes are united in the same individual, and the reproduction is exclusively by eggs, budding being unknown. The body is transparent, and usually colorless. The shape is frequently modified by the outgrowth of ear-like lobes, and in the "Venus's girdle" (*Cestum veneris*) of the Mediterranean the body is drawn out into a ribbon some 2 or 3 feet long. Most of the species are, however, much smaller, and all are exceedingly voracious, living upon small animals which they catch by peculiar adhesive cells or by the widely open mouths. Two groups, Tentaculata and Nuda, are recognized, characterized respectively by the presence or absence of a pair of lateral tentacles. Usually the Ctenophores are included under the common name jellyfish. J. S. Kingsley.

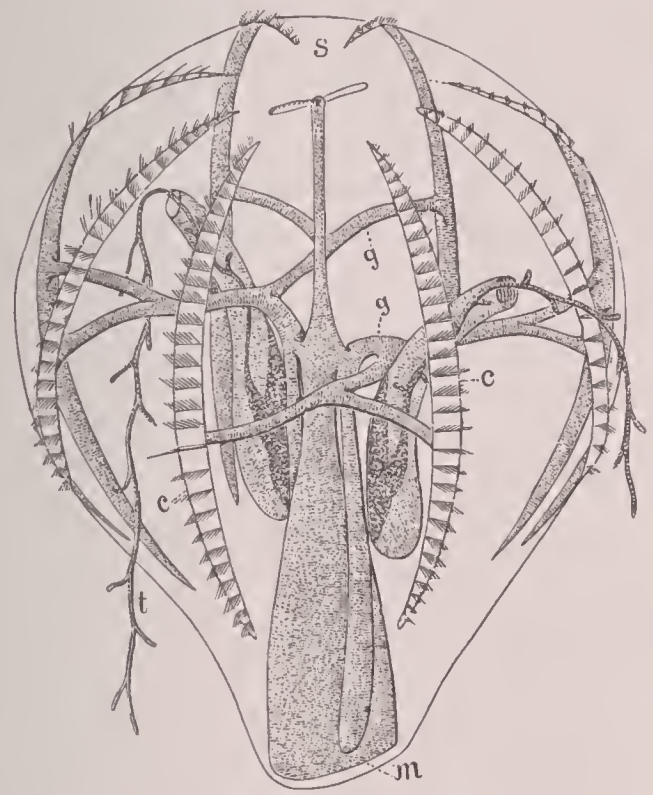

Diagram of a Ctenophore, based on Pleurobrachia; *c*, combs; *g*, divisions of stomach; *m*, mouth; *t*, tentacles; *s*, seuse organ.

Ctesias, tec′si-as (in Gr. Κτησίας): Greek historian and physician of Cnidus; spent seventeen years in the medical service of the Persian court, from 415 B. C. on. At the battle of Cunaxa he treated the wound received by Artaxerxes Mnemon. He was afterward employed in a diplomatic capacity, and returned home about 398. The results of his personal observation and his study of the native records were given in his *Persian History* (twenty-three books), composed in the Ionic dialect. An abridgment of this work, as also of his *History of India*, has been preserved by Photius, and fragments are found elsewhere. Ctesias took especial pleasure in correcting Herodotus. In antiquity he himself had a poor reputation for truthfulness, but some modern scholars have taken him more seriously. Fragments edited by C. Müller in the Didot *Herodotus* (Paris, 1844) and by Gilmore in 1891. B. L. G.

Ctesibius, tĕc-sib′i-ŭs (in Gr. Κτησίβιος): a famous Greek mechanician who flourished at Alexandria about 130 B. C. He invented a clepsydra, a pump, and other machines. He is said to have been the first who applied the elastic force of air as a motive-power.

Ctesiphon, tes′i-phŏn: an ancient city of Assyria; on the east bank of the Tigris; 20 miles S. E. of Bagdad; was the capital of the Kings of Parthia. Its ruins still attest its former magnificence. The site is now occupied by a village called Modain.

Ctesiphon (in Gr. Κτησιφῶν): an Athenian who proposed that a crown of gold should be given to Demosthenes for his public services. For this act he was prosecuted by Æschines, and defended with success by Demosthenes in his famous oration *On the Crown*, 330 B. C.

Cuanza, kwaan′zaă, or **Quanza**: the largest river of Angola and one of the most important of the secondary rivers of West Africa. Rising in Lake Mussombo, on a plateau 5,500 feet above the sea, it flows for 750 miles to the Atlantic, dropping from the highlands by a series of falls and rapids. It is navigable by steamboats from the ocean to Dondo, about 120 miles, though the bar at its mouth, where the river is 2,000 feet wide, is difficult to cross. C. C. Adams.

Cuauhtemoc′: See Guatemotzin.

Cuautla, kwaa′oot-laă, **Cuautla de Amilpas**, or **Ciudad Morelos**: principal city of the state of Morelos, Mexico; on the Morelos Railway; 85½ miles from Mexico city (see map of Mexico, ref. 8–H). It lies in a beautiful valley containing many rich sugar-plantations. The city is well laid out and clean, but there are few handsome buildings. Cuautla was an ancient Indian town. In 1812 the revolutionist Morelos abandoned it after a memorable siege. It was created a city in 1829. Pop. (1886) 14,000. H. H. S.

Cu′ba: the largest island of the Antilles, and for many years the chief colony of Spain; lying between the Caribbean Sea on the S. and the Gulf of Mexico and Bahama Channel on the N.: 130 miles S. of Florida and about equidistant from Yucatan on the W. and Haiti and Jamaica on the E. and S. E. Lat. 19° 50′ to 23° 9′ N., lon. 74° 8′ to 84° 58′ W. It is 780 miles long from E. to W., and from 25 to 130 miles wide. Its area, with adjacent small islands and Isle of Pines, is 43,220 sq. miles.

Topography and Surface.—Cuba probably had its origin in volcanic action, as demonstrated by the mountain-chain (the Copper Mountains) which traverses its whole length, Pico Turquinos, its highest summit, being about 7,750 feet. From the bases of this chain N. and S. the country expands into broad meadows, with frequent lagoons and swamps. The rivers are all small, and none of them navigable. There are good harbors with deep water at Havana, Matanzas, Puerto Principe, Santiago de Cuba, etc. Elsewhere the coasts are shallow and rocky.

Climate.—In the hills, healthful and agreeable; in the lowlands, sickly and generally hot; maximum temperature does not often exceed 88° F., but the heat is protracted, the mean of the year in the lowlands being 78°. It is a moist climate, the average annual rainfall in Havana being about 90 inches, yet some places in the interior require irrigation. There are some hurricanes and occasional earthquakes.

Resources.—Copper, with some gold, silver, iron, coal, marble, etc. There are productive copper mines in the mountains. The mountains are covered with forests of mahogany, ebony, granadilla, rosewood, cedar, live-oak, fustic, palms, and plantains. The cultivated districts yield large crops of maize, rice, yams, bananas, sugar, coffee, tobacco, cotton, and all tropical fruits, sugar and tobacco being the leading products, while immense herds of cattle are reared on the grazing lands. In 1894, a normal year before the late war, 1,054,214 tons of sugar were produced, besides a large quantity of molasses; in 1899, 335,668 tons were produced; and in 1900, 283,651 tons. The production of tobacco in 1900 was 460,000 bales. In 1899 the exports were valued as follows: Sugar, $19,337,771; tobacco and cigars, $21,082,670; fruits and nuts, $355,579; all other exports, $5,525,909; total, $46,301,929. In 1900 they were: Sugar, $16,944,811; tobacco and cigars, $26,098,688; fruits and

nuts, $729,869; all others, $6,225,903; total, $49,902,271. Of these $25,408,828 in 1899, and $31,371,704 in 1900, were destined for the U. S. The total value of the imports in 1899 was $75,303,612; in 1900, $70,644,439. In 1899 $36,773,657 were from the U. S., and in 1900 $32,269,033.

Industries.—Manufactures of sugar, molasses, rum, and cigars, preparation of coffee for market, preserving fruit, bleaching wax, and minor industries. There are 1,135 miles of railway, and 2,301 miles of telegraph line.

Government.—See CUBA in the Appendix.

Finances.—The revenue of 1899 was estimated at $26,359,650, the expenditures at $26,356,731. The approximate amount of the funded debt when the Spaniards left Cuba was $253,800,000, none of which was assumed as a charge on the Cuban people, who were released also from the additional debt of about $100,000,000 incurred by Spain in attempting to suppress the last insurrection.

Church and Education.—Roman Catholic only established religion; education was made obligatory in 1880. By the census of 1899 85,009 pupils were enrolled as attending school, with an average attendance of 54,298. There were 755 public schools, besides schools of secondary education in the towns, and a university in Havana.

History.—Island discovered Oct., 1492, by Columbus; colonized by Spaniards 1511; Indians cruelly treated by Hernando, Spanish governor, and in 1553 the entire Indian population became extinct. In 1534 and in 1554 Havana destroyed by French, but speedily rebuilt and strongly fortified in 1584; in 1624 taken by Dutch, but soon restored to Spain; from 1650 to 1700 often ravaged by filibusters; Puerto Principe plundered and destroyed by them in 1688. After 1700 Cuba prospered greatly. Tobacco monopoly established 1717, and not abolished till 1816. In 1762 Havana taken by English, but exchanged in 1763; its commercial importance rapidly increased, but it became the center of the slave-trade for Spanish America. During the prevalence of the slave-trade, 1789–1845, it is said that over 550,000 slaves were brought into Cuba. There were Negro insurrections in 1844 and 1848; more than 10,000 Negroes perished in the latter. For a great many years there was a strong pressure upon the U. S. Government, mainly from the South, to obtain possession of Cuba; President Polk offered $100,000,000 for it in 1848; in 1854 the Ostend Manifesto, signed by Buchanan, Soulé, and Mason, claimed the right to take and annex it if Spain should refuse to sell. Meantime, in 1849–51, there were insurrections, led by American adventurers. The Spanish revolution of 1868 led to an effort for Cuban independence, which continued with varying fortunes for twelve years; the war was a severe one on both sides; Cespedes was the insurgent president. A law for gradual abolition of slavery in Cuba was passed by the Cortes in 1879; in 1886 slavery was abolished absolutely. See CUBA in the Appendix.

Population and Political Divisions.—The census of 1899, taken by the U. S. War Department, shows 1,572,797 inhabitants—910,299 native whites, 142,098 foreign-born whites, and 520,400 Negroes. Cuba is divided into six provinces. The largest cities are Havana (capital), population 235,981; Santiago de Cuba, 43,090; Matanzas, 36,374; Cienfuegos, 30,038; Puerto Principe, 25,102; and Cardenas, 21,940.

Revised by MARK W. HARRINGTON.

Cubagua, ISLAND OF: See MARGARITA.

Cubas, BRAZ: Portuguese cavalier; b. about 1495. In 1536 he received from the *donotario* Martin Affonso de Souza a grant of lands in the captaincy of São Vicente, and soon after he founded a settlement there; in 1543 he endowed a small hospital in the place, calling it the Hospital de Santos; gradually this name spread to the settlement itself, now the important port and city of Santos. In 1545 Braz Cubas was named Capitão-mor, or governor of São Vicente, acting for Martin Affonso. D. at Santos in 1592.

HERBERT H. SMITH.

Cu'bature: the measurement of the volume of a solid body. If the equation to the surface inclosing the body be given in rectangular co-ordinates, its volume is expressed by the triple integral $\iiint dx\,dy\,dz$, where the integration is to be extended to all points of the solid.

Cube [from Gr. *κύβος*, cube, die]: in geometry, a solid body contained by six equal squares. It is also called a regular hexahedron, and is one of the five regular solids. It is a form which often occurs in nature, especially among crystals. In arithmetic the cube of a number is its third power, or the product obtained by multiplying that number by its square. The duplication of the cube—that is to say, the finding of a cube having double the volume of a given cube—is one of those problems which admit of no solution by the geometry of the right line and circle. On this, as on the quadrature of the circle and the trisection of an angle, a vast amount of ingenuity has been vainly expended since the dawn of mathematical science. The solid contents of a cube are equal to the third power of the number which expresses the length of one of its sides.

Cubeb [Fr. *cubebe*, Span. *cubeba*, from Arab. *kabābah*, an aromatic berry]: the dried, unripe fruit of the *Cubeba officinalis* (and probably of other species), climbing woody plants belonging to the order *Piperaceæ*. The cubeb vine resembles that which produces the ordinary black pepper. Cubebs are brought chiefly from Java, Penang, etc., and are used as an aromatic and stimulant diuretic. Their active properties depend on the volatile oil which they contain. They also have a crystallizable principle called "cubebin," and a balsamic resin. The oil, tincture, and extract are used in medicine.

Cube Root: See ROOT.

Cubic Equation: an equation which involves the cube of the unknown quantity. A *pure* cubic equation contains only two terms; as e. g. $x^3 = 27$; all others are said to be adfected; as e. g. $x^3 - 5x^2 + 4x + 7 = 1$.

Cubic Niter: See SALTPETER, CHILI.

Cubit [from Lat. *cubitus*, elbow, ell > Fr. *coude*: Ital. *cubito*]: a linear measure of the ancients, equal to the length of a man's arm from the elbow to the tip of the middle finger. It is generally stated to be 18 English inches. The ancient Egyptian cubit, or "cubit of Memphis," was about 20·7 British inches. The mean of Sir Isaac Newton's determinations, from the careful measurements of the great pyramid by Prof. John Greaves (published in 1737), made it 20·672. The mean of still more careful measurements by Prof. C. Piazzi Smyth in 1865 made it 20·73. According to Newton, the cubit of Babylon was very nearly 24 British inches; the royal cubit of Persia, 21·195 inches; the cubit of the Romans, 17·406 inches; the cubit of the Greeks, 18·1308 inches; the Egyptian cubit in use in 1737, 21·888 inches; the sacred cubit of Moses he calculates to have been not greater than 24·9389 inches, nor less than 24·7262, and its probable value to have been 24·7552 inches. Prof. Piazzi Smyth thinks that he has proved that the unit of measure employed by the builders of the Great Pyramid in laying out the ground-plan of their work was identical with the sacred cubit of Moses, and that its value was 25·025 British inches; which is, according to the most recent determinations, almost exactly the 10,000,000th part of the earth's polar radius. He supposes, therefore, that this unit of measure, which was divinely given, was made by divine intention to be in this exact decimal relation to the invariable line around which the earth revolves. If the British inch be increased by $\frac{1}{1000}$th part, it becomes what Prof. Smyth calls a "pyramid-inch"; and a pyramid-cubit, or sacred cubit, is 25 pyramid-inches, or $\frac{1}{10000000}$th part of the earth's polar radius. Prof. Smyth maintains his hypothesis with much ingenuity, but it has not been generally received with favor.

The value of the biblical "cubit of a man" is extremely uncertain. Dr. William Smith, in his *Dictionary of the Bible*, has discussed the question pretty fully, and inclines to regard it as having had a value, deduced by Thenius (*Theologische Studien und Kritiken* for 1846) from the Egyptian cubit measure preserved in the Turin Museum, of 23 digits, each digit being 0·7938 British inch = 18·257 British inches.

Cuchan Indians: See YUMAN INDIANS.

Cuckoo: a bird of the genus *Cuculus*, and allied genera, belonging to the family *Cuculidæ*. The family is represented in temperate and tropical regions throughout the world, and comprises birds of great diversity of size and plumage. Aside from certain anatomical characters, they agree in having the fourth outer toe turned backward like the parrots, although they are not climbers. Many of the species have the habit of making no nest, depositing their eggs in the nests of other and smaller birds. The most noted among them is the European cuckoo (*Cuculus canorus*), which breeds throughout Europe and a great part of Asia, retreating south in winter, the European birds migrating to Africa. It is a little over a foot in length; the greater part of the plumage is ashy gray, but the under side is grayish

with black bars; the wings and tail are black, the latter with white spots. The cuckoo frequently places her eggs in nests so situated that she can not sit upon them, accomplishing this by depositing the egg upon the ground and transferring it to the nest with her mouth. The young cuckoo either crowds, or deliberately throws out, the eggs or young of its foster parents, and thus secures their individual care.

The European cuckoo.

The coucals, or ground cuckoos, of the genus *Centropus*, are large species, characterized by a long, straight claw on the inner toe. They are found from Africa, eastward to Australia, are poor flyers, but run well, frequenting thick underbrush and feeding upon small reptiles, insects, eggs, etc. They nest upon the ground and raise their own young. The golden cuckoos, *Chrysococcyx*, are small birds whose plumage, like that of humming-birds, glows with metallic greens and coppery red. They inhabit the warmer portions of Africa, Asia, and Australia, one species regularly migrating from Australia to New Zealand and back. The giant of the family is the Australian channel-bill (*Scythrops novæ-hollandiæ*), a bird 2 feet in length, with a large bill, and plumage rather resembling that of its European relative, whom it is also said to resemble in depending upon other birds to raise its young. The common cuckoos of the U. S. are the yellow-billed (*Coccyzus americanus*) and black-billed (*Coccyzus erythrophthalamus*), both found from the Rocky Mountains eastward, the first also occurring on the Pacific coast. They are both satiny, olive gray above, white below, with long tails tipped with white. Aside from the difference in the color of the bills, the black-billed cuckoo is slightly the larger of the two, has less cinnamon color in its wings and less white in the tail. They build flimsy nests of twigs, and lay four or five pale greenish-blue eggs.

The road-runner, or chapparal cock (*Geococcyx californianus*) is a large cuckoo found in Southern California, New Mexico, and the adjacent region. It is so named from the rapidity with which it runs, its speed on foot being some compensation for feeble powers of flight. Like many other cuckoos, this one deposits its eggs at considerable intervals, so that by the time the last is hatched the first born is half the size of the parents. Lastly, there are a few American cuckoos of the genus *Crotophaga*, known as anis, characterized by dark plumage and deep, sharply ridged bill, which either build a separate nest or club together in parties of four or five and build a common nest, in which as many as twenty eggs may be deposited. They inhabit the warmer parts of America, from Texas and Florida southward.

F. A. Lucas.

Cucumber [M. Eng. *cucumer*, from Lat. *cu'cumis, -eris*]: *Cucumis sativus*, one of the *Cucurbitaceæ*; cultivated from the earliest times, and supposed to have come from India. It is closely allied to the musk-melon, and it is commonly supposed that the two species will cross or mix, but this notion is unfounded. The so-called snake cucumber belongs to *Cucumis melo*, the musk-melon species. There are about seventy varieties of cucumbers offered by American seedsmen. The so-called English or forcing varieties differ from the common kinds chiefly in their greater length—often reaching 30 inches—larger leaves and flowers, and the readiness with which they grow in glass houses. These are much prized in England, and deserve a greater popularity here. The cucumber demands a rich warm soil. It is quickly injured by frost, and should not be planted in the field until all danger of cold is past. Small cucumbers are extensively used as pickles, the smallest varieties being called gherkins. The term gherkin is often applied to the species *Cucumis anguria*, the burr or West Indian cucumber. This is a very different plant from the common cucumber, producing a small prickly short-oblong fruit. It is not generally grown.

L. H. Bailey.

Cucumber Family, the *Cucurbitaceæ*: See Gourd Family.

Cucumber-tree, or **Mountain Magnolia**: a fine North American tree (*Magnolia acuminata*), attaining a height of 60 to 90 feet, with a stout trunk, 3 to 4 feet in diameter, covered with furrowed, dark-brown, scaly bark. The leaves are deciduous, ovate or nearly so, and are from 7 to 10 inches long and from 4 to 6 inches broad; when young they are downy, but when mature they are smooth and deep green. The pale-yellow flowers are about as large as a tulip and of nearly the same shape. They have three acute membranaceous sepals and six obovate pointed petals in two rows, the outer broadest. The short stamens are very many, arranged in many ranks upon the lower part of the receptacle. The very numerous simple pistils cover the elongated receptacle, and form a fleshy mass which bears some resemblance to a small cucumber, which has suggested the common name of the tree. At maturity the ripened pistils split open along their dorsal sutures, and permit the solitary, bright-red seeds to drop out, where they remain suspended for some time by a slender thread consisting of the unrolled spiral vessels of the seed stalk. The wood of this tree has been used for making water-pipes, troughs, etc. C. E. B.

Cucur'bita: See Pumpkin.

Cucuta, or **San José de Cucuta**, saan'*kh*ō-sā'dā-koo'kootaă: a town of Santander, Colombia; second in order of size; situated in lat. 7° 50′ N.; close to the Venezuelan border; about 1,200 feet above the sea. It is connected by rail with the Zulia river, a distance of 35 miles northward. Pop. 10,000.

Cudbear [corruption of *Cuthbert*, from Dr. Cuthbert Gordon, who, about 1777, introduced the manufacture at Leith]: one of the forms in which the dye archil comes into the market. It forms a reddish powder. It is obtained indirectly from a number of lichens that are found on the coasts of the Azores, the Canary and Cape Verd islands, and elsewhere. The substances actually obtained from the lichens are colorless acids known as erythric and lecanoric acids. These can be transformed in a compound called orcinol, which when subjected to the action of the air and ammonia is changed to a purple compound called orceïn. Litmus is obtained from the same lichens by a somewhat different process.

Cud'dalore: a maritime town of Hindustan; in Arcot, and on the Coromandel coast; 86 miles S. of Madras. It is one of the most populous towns in the south of India (see map of S. India, ref. 6–F). It has a custom-house, and a port from which cotton goods are exported. It was taken from the British by the French in 1758, but finally ceded to them in 1785. Pop. (1891) 47,355.

Cud'dapah, or **Kadapa**: division and town of Madras, British India. The division is an irregular parallelogram, lying between the parallels 13° 12′ and 16° 19′ N., and the meridians 77° 52′ and 79° 48′ E. lon. It is divided into two nearly equal parts by the eastern ghats, the eastern part being a low-lying plain, the western a table-land 1,500 to 2,500 feet above sea-level. The drainage is through the Penaur river, which fluctuates greatly with the season. The total area is 8,745 sq. miles. Pop. 1,150,000, nearly all Hindus. The capital is Cuddapah, a station on the railroad from Madras, near the Penaur river (see map of S. India, ref. 5–E). Pop. about 20,000, two-thirds Hindus.

M. W. H.

Cudweed: any plant of *Gnaphalium*, *Antennaria*, and *Filago*, belonging to the family *Compositæ*. They are covered with a woolly down; have sessile or decurrent leaves and tubular flowers. The childing cudweed, *Gnaphalium germanicum*, throws out shoots from its base like a family of children. Some cudweeds are used as diaphoretics in domestic medicine.

Cudworth, Ralph, D. D.: philosopher and divine; b. at Aller, in Somersetshire, in 1617; son of Ralph Cudworth, chaplain to James I. He graduated at Emmanuel College, Cambridge, and became fellow and tutor 1639; master of Clare Hall in 1644; and Professor of Hebrew in 1645. In 1654 he was chosen master of Christ's College, and in 1678 was appointed prebendary of Gloucester. In theology he was a "latitudinarian." His great work *The True Intellectual System of the Universe* (1678) displays great learning, liberality, and independence of mind. He favored the Platonic philosophy, although in physics he adopted the corpuscular theory. D. at Cambridge, June 26, 1688, leaving a *Treatise Concerning Eternal and Immutable Morality*, published in 1731. A number of his unpublished manuscripts are in the British Museum. His daughter became Lady Masham and a friend of John Locke. See J. Tulloch, *Rational Theology*; J. Martineau, *Types of Ethical Theory*, vol. ii.; and his *Life* by T. Birch in the edition of his *Works* (1820, 4 vols.). Revised by S. M. Jackson.

Cuenca, kwen'kăă: province of Spain; in New Castile; drained by the rivers Tagus and Jucar. Area, 6,726 sq. miles. The surface is partly mountainous; coal, copper, iron, and silver are found here. Pop. (1887) 242,024.

Cuenca: city of Spain; capital of province of same name; on a hill nearly 3,000 feet high, rising from the Jucar; about 85 miles E. S. E. of Madrid (see map of Spain, ref. 16–G). It has a richly adorned cathedral and several convents. It was once noted for its silver manufactures. It suffered much during the Peninsular war, and was sacked by the Carlists in 1874. Pop. (1887) 9,747.

Cuenca: city of South America; in Ecuador; capital of the province of Cuenca; on table-land 8,640 feet above the level of the sea; 189 miles S. of Quito, after which it is the most populous city of Ecuador (see map of South America, ref. 3–B). It has a cathedral and a university; also several sugar-refineries, woolen-mills, and potteries. Pop. 25,000 to 30,000.

Cuernavaca, kwār-năă-vaa'kăă: an attractive city of Mexico; capital of Morelos; about 25 miles W. of Popocatepetl; elevation 5,380 feet, according to Humboldt (see map of Mexico, ref. 8–H). It was captured by the Spaniards in 1521, and was a favorite winter resort for both Cortés and Maximilian. Cortés's palace is now a court-house, and Maximilian's villa a school-house. About 6 miles S. are extensive sugar-mills. The town is connected by rail with the city of Mexico. Pop. 8,500.

Cuero, kwā'rō: town; on railway; capital of Dewitt co., Tex. (for location of county, see map of Texas, ref. 6–I); situated 2 miles from Guadalupe river; has public schools, three cotton-gins, cotton-seed oil mills, etc. Pop. (1880) 1,333; (1890) 2,442; (1900) 3,422.

Editor of "Bulletin."

Cuervo, kwār'vō, Rufino José: Spanish-American scholar; b. in Bogotá, Colombia, Sept. 19, 1844. For some years he has lived mainly in Paris. He published in 1872 *Apuntaciones críticas sobre el lenguage Bogotano*. He has published a critical edition of the *Gramática castellana* of Andrés Bello (1890). At present he is at work upon a dictionary of the Spanish language, after the model of the famous French dictionary of Littré, *Diccionario de construcción y regimen de la lengua castellana* (t. i., 1886). A. R. Marsh.

Cuestrin', or **Kustrin**: a fortified town in Prussia; province of Brandenburg; at the confluence of the Oder and Warthe; 52 miles E. of Berlin (see map of German Empire, ref. 3–G). It consists of the town proper, situated within the fortifications and forming a fortress of first rank, and two suburbs, one on the left bank of the Oder and one on the right bank of the Warthe. It is surrounded by marshes. The Oder is crossed by a bridge 900 feet in length. Pop. (1890) 16,672.

Cueva, Baltazar, de la: Spanish statesman; b. in Madrid, 1626. He was a younger son of the seventh Duke of Albuquerque, and became Count of Castellar and Marquis of Malagon by marriage. He graduated in law at Salamanca, and held important judicial posts; was councilor of state and afterward of the Indies, ambassador to Germany, and in 1673 was named Viceroy of Peru, Tierra Firme, and Chili. He entered Lima Aug. 15, 1674. During the four years of his term he paid especial attention to the finances, and remitted large sums to Spain. Peru at this time was regarded only as a means of enriching Spain, and the viceroys were constantly hampered by demands for money; notwithstanding this drain the Count of Castellar did much for the people, and especially legislated in favor of the Indians. In 1674 he ordered that Araucanian Indians taken in war should no longer be held as slaves. He also tried to relax the severe Spanish monopolies on commerce; but this caused an outcry from the merchants, and in July, 1678, the viceroy was ordered to turn over the government to the Archbishop of Lima, and to reside in Paita until the charges against him were tried. The sentence of the court, given after nearly two years, exonerated the viceroy, but pronounced for the continuance of the monopolies. The Count of Castellar then returned to Spain, and resumed his post as councilor of the Indies, which he held until his death at Seville, 1686. Herbert H. Smith.

Cueva, Francisco Fernandez de la: See Fernandez de la Cueva.

Cuevas de Vera, kwā'văăs-dā-vā'răă: town of Spain; in Granada; on the river Almanzor at its entrance into the Mediterranean; 42 miles N. E. of Almería (see map of Spain, ref. 19–H); has important silver mines. Pop. (1887) 20,027.

Cufic Writing [so named from the town of Cufa or Koofa (Syr. *Akula*) on the Euphrates]: one of the most ancient forms of Arabic writing, supposed to have been introduced into Arabia a short time before the period of Mohammed. It was in common use till the tenth century, and afterward was confined to coins and inscriptions.

Cui, Cesar Antonovitch: See the Appendix.

Cuichunchulli: a plant of the genus *Ionidium*, of the Violet Family (*q. v.*), reputed to have great medicinal value. There is some confusion as to the name of the species, some authorities citing it as *I. marcucci*, others *I. parviflorum*, and still others *I. glutinosum*. It is used as a remedy for elephantiasis, and is also emetic and cathartic. C. E. B.

Cuirass' [from O. Fr. *cuirace*: Ital. *corazza*: Span. *coraza* < Lat. adjec. *coriā'ceus*, *-ā*, leathern, deriv. of *corium*, leather]: armor for the body from waist to neck; made of hammered metal in large pieces, usually one breast-plate and one back-piece secured together by straps, and known as a pair of cuirasses. The breast-plate alone is sometimes called the cuirass. See Armor.

Cuirassiers: heavy cavalry wearing the cuirass and helmet. They are a survival of the troopers of the sixteenth and seventeenth centuries who wore a similar protection. There are in the German army twelve cuirassier regiments, the cuirass being of white metal with brass plate; in the French army twelve regiments wearing steel cuirasses with brass plates; in the Russian army four with iron cuirasses covered with a thin layer of copper. In the British army the Life Guards and the Royal Horse Guards received steel cuirasses in 1821, but do not wear them in active service.

Cuitlahuatzin, or **Citlahuatziu**, kĕĕt-lăă-wăăt-zeen': a younger brother of the Aztec sovereign of Mexico, Montezuma II.; b. about 1470. On the approach of Cortés in 1519 he advised resistance, but was disregarded. After the seizure of Montezuma by Cortés he plotted with Cocama and others to effect his release; but the confederates disagreed among themselves, and for a time Cuitlahuatzin himself was in the power of the Spaniards. At the request of Montezuma, Cortés released him. The Aztecs welcomed him as a liberator, and he consented to lead them, directing the assault on the building where the Spaniards were quartered, and against the causeway during the retreat of the *Noche Triste* (June 30, 1520), Montezuma being now dead. Cuitlahuatzin was elected sovereign, but not without resistance and tumult, in which four princes, brothers and sons of Montezuma, perished. His installation was celebrated with the usual human sacrifices, in which the Spaniards who had been captured on the *Noche Triste* were slain. Less than three months afterward he died in the pestilence which swept over Mexico (about Sept., 1520).

Herbert H. Smith.

Cujas (in Lat. *Cujacius*), Jacques: French jurist; b. at Toulouse in 1522. He learned Greek and Latin without

a teacher, studied law at Toulouse, and became in 1577 Professor of Law at Bourges. His lectures on the *Institutes* attracted students from all the countries of Europe. He developed a reform in modern law inaugurated by Alciat. The Roman law received a thorough interpretation from him, and according to its principles, which had until then been adopted partially as expediency suggested, the doctrine of the law was fundamentally renovated. He had in his library 500 manuscripts of the Justinian laws. His works (1st ed. 1577; complete ed. Fabrot, 1658, 10 vols.) have been often reprinted. D. at Bourges, Oct. 4, 1590. See Papire Masson, *Vie de Cujas*, 1590; Bernardi, *Éloge de Cujas*, 1775; Spangenberg, *J. Cujas und seine Zeitgenossen*, 1822.

Culdees', or **Kildees**: a name first used in the eighth century as the designation of an order of Celtic ecclesiastics chiefly found in Scotland and Ireland. Some historians claim that the Culdees were Celtic missionaries of the sixth and subsequent centuries, who carried the gospel to Scotland and other countries. Some of the Culdees were monks, others were free from monastic discipline. Communities of Culdees existed in Armagh, Ireland, until the time of the Reformation, and were resuscitated in 1627, but had only a brief existence. See Skene, *Celtic Scotland*, vol. ii.

Cul-de-sac [Fr., bottom of the bag; *cul* : Ital. *culo* < Lat. *cū'lus*, anus]: a street or alley open at one end only; sometimes called a blind alley. Also, in natural history, in buildings, in topography, and in military language, the term is used in an analogous sense for a passage with only one outlet.

Culenborg, or **Kuilenborg**, koo'len-bōrkh: town in the province of Gelderland, Holland; 6 miles N. N. W. of Tiel; on the Leck (see map of Holland and Belgium, ref. 6–G). It is surrounded by a wall, and has manufactures of furniture, stoves, etc., and a trade in corn. Pop. (1890) 7,630.

Culiacan': a town of Mexico; capital of Sinaloa; on the river Culiacan; 36 miles from its mouth (see map of Mexico, ref. 4–E). It is a handsome Spanish town with many wealthy inhabitants, and has numerous silver mines in the neighboring sierra. It is connected with its port, Altata, by a railway. The largest building is a mint built by English engineers. Pop. about 10,000.

Culil'awan or **Culilawang Bark**, called also **Clove Bark**: a valuable pungent and aromatic bark; obtained from *Cinnamomum* or *Laurus culilawan*, a tree which grows in the Molucca islands. The decoction is useful in diarrhœa and indigestion.

Cullen, William, M. D.: British physician; b. in Lanarkshire, Scotland, Apr. 15, 1712. He acquired his profession amid great embarrassments. In 1756 he obtained the chair of Chemistry in Edinburgh, where he practiced medicine with success. He published *First Lines of the Practice of Physics* (1777), his chief work, in which novel pathological theories are propounded, and which was translated into all European languages; a *Synopsis of Methodical Nosology* (in Latin, 1785); a *Treatise of the Materia Medica*, in which numberless errors were dispelled (1789); and other works. D. Feb. 5, 1790. See Dr. John Thomson. *Life and Writings of William Cullen* (1832). This biography was completed by Dr. Craigie in a second volume, 1859.

Cullera, kool-yā'raă: seaport-town; province of Valencia, Spain; on the Mediterranean; at the mouth of the Jucar, 24 miles S. S. E. of Valencia (see map of Spain, ref. 17–I). Grain, wine, and fruits are exported, and the fisheries are extensive. Pop. (1887) 11,713.

Cull'man: town (founded 1873); capital of Cullman co., Ala. (for location of county, see map of Alabama, ref. 2–C); on L. and N. R. R., 33 miles S. of Decatur, Ill., and 53 miles N. of Birmingham; has 7 churches, 6 schools, furniture and wagon factories, and other small industries; fruit-growing and the raising of grapes are flourishing industries. Pop. (1880) 426; (1890) 1,017; (1900) 1,255.

Editors of "Tribune."

Cullo'den, also called **Drummos'sie Moor**: a battle-field of Scotland. It is an elevated table-land, now well cultivated, in Inverness-shire, 6 miles E. N. E. of Inverness. Here the royal army, commanded by the Duke of Cumberland, totally defeated the Young Pretender, Apr. 16, 1746.

Cullom, Shelby Moore: lawyer; b. Nov. 22, 1829, in Wayne co., Ky.; taken by his father to Illinois the following year; received an academic education at Rock River Seminary, Mt. Morris, Ill.; went to Springfield, 1853, to study law, and has since resided there; admitted to the bar 1855; member of Illinois Legislature 1856, 1860, 1872, 1874; Speaker of the Illinois house 1861 and 1873; member of Congress from Illinois 1865–71; Governor of Illinois 1876, and re-elected, but resigned in 1883, having been elected to the U. S. Senate; re-elected senator in 1888 and 1894; delegate to National Republican conventions, and nominated Gen. Grant in 1872; candidate for Republican nomination for President 1892. Senator Cullom is the author of the interstate commerce law, and has been chairman of the interstate commerce committee of the Senate for a number of years.

C. H. Thurber.

Cul'lum, George W.: U. S. military officer; b. Feb. 25, 1809, in New York city; graduated at West Point in 1833; colonel of engineers May 7, 1867, and brigadier-general of volunteers Nov. 1, 1861. He superintended the construction of many forts and public works; was instructor of practical military engineering at West Point 1848–55. In the civil war he was A. D. C. (rank of colonel) to Lieut.-Gen. Scott, general-in-chief 1861; chief of staff and of engineers to Maj.-Gen. Halleck while commanding the departments of Missouri and Mississippi, and general-in-chief of the armies of the U. S. 1861–64; engaged in establishing defensive works; organized the defenses of Nashville, Tenn., the great dépôt of supplies for Western armies; superintendent of the U. S. Military Academy 1864–66; brevet colonel, brigadier-general, and major-general Mar. 13, 1865; mustered out of volunteer service Sept. 1, 1866; member of the board of engineers for fortifications 1866. Was author of *Military Bridges with Indiarubber Pontons* (1849); of *Register of the Officers and Graduates of the United States Military Academy* (1850); of *Systems of Military Bridges* (1863); of a *Biographical Register of the Officers and Graduates of the United States Military Academy* (1868 and 1890); translator and editor of Duparcq's *Elements of Military Art and History* (1863). Retired from active service Jan. 13, 1874. D. in New York city, Feb. 28, 1892, leaving a large part of his fortune by will for the erection of a memorial hall at West Point, and for continuing the publication of the *Biographical Register of the Officers and Graduates of the United States Military Academy*.

Revised by James Mercur.

Culm [from Lat. *culmus*, stalk]: in botany, the peculiar cylindrical hollow and jointed stem of the grasses. Culm is also a popular name given in some parts of England to anthracite coal. It is also common throughout the British islands in the sense of "coal-dust," or "slack."

Culmination [from Lat. *culmina're*, reach highest elevation, deriv. of *culmen, cul'minis*, peak]: in astronomy, the passage of a celestial body over the meridian at the upper transit. The sun culminates at noon or midday, and the full moon culminates at midnight, 12 P. M. The term is also applied to the transit of a circumpolar star over the meridian below the pole. It is then called the lower culmination.

Cul'peper: capital of Culpeper co., Va. (for location of county, see map of Virginia, ref. 5–G); on Rich. and Dan. R. R., 69 miles S. W. of Washington, D. C.; has a private school for girls, and industries in gold-mining, stock-raising, and agriculture. Pop. (1880) 1,613; (1890) 1,620; (1900) 1,618.

Editor of "Exponent."

Culpeper, Thomas, second Lord: one of the persons to whom Charles II. granted the territory of Virginia in 1673. He was the Governor of Virginia from 1680 to 1683. D. in 1719. This name in the baronage of England is written Colepeper.

Culross': seaport-town of Perthshire, Scotland; on the north shore of the Firth of Forth, 22 miles N. N. W. of Edinburgh (see map of Scotland, ref. 11–H). The monastery of St. Serf was founded here about the sixth century. Culross, which was successively the seat of the Elgin and Dundonald families, has remains of a Cistercian abbey, founded in 1217. Pop. 380.

Cultivator: an agricultural implement used in the U. S. before planting crops, and for loosening the earth between rows of plants. In Great Britain the general name for such an implement is grubber. Cultivators are usually either triangular or rectangular frames, with handles like those of a plow, a greater or less number of plow-like teeth, and with their center-beams projecting in front for the attachment of wheels and draught clevises. Cultivators are very extensively used and manufactured in the U. S.

Cult Societies: See INDIANS OF NORTH AMERICA.

Culturkampf: See KULTURKAMPF.

Culverin [Fr. *couleuvrin*, adder-like, deriv. of *couleuvre*, adder, O. Fr. *culuevre* : Span. *culebra* : Portug. *cobra* < Lat. *co'lubra*, adder]: a cannon belonging to the earliest days of artillery. In the sixteenth century it was the heaviest gun used, throwing a shot of 15 lb. weight.

Culvert [viâ O. Fr. from a deriv. of Lat. *cola're*, cleanse, > Fr. *couler*]: a channel for carrying water underneath a roadway, embankment, or canal. Where stone is scarce they are made of timber, and are rectangular in section. Masonry culverts of less than 20 sq. feet waterway are also usually rectangular, and are called box culverts. Larger ones are built with the upper surface arched, and are called arch culverts, the largest ones having spans of about 20 feet. Pipes of vitrified clay and of cast iron are now much used for small culverts. In order to avoid injury to the embankments by high water, the ends of the culvert are usually provided with wing walls. A box culvert 3 by 4 feet and 25 feet long costs nearly $200, while an arch culvert of 12 feet span and 25 feet length, with wing walls, costs about $1,200. For full details, see Baker's *Masonry Construction* (1890). MANSFIELD MERRIMAN.

Culverwell, NATHANAEL: Platonist; b. in Middlesex; entered Emmanuel College 1633; B. A. 1636; M. A. 1640; elected fellow 1642. D. before 1651. Author of *Light of Nature*, a work of great power and learning (new ed. 1857).

Cu'mæ: an ancient and famous Greek city of Campania, situated on the Mediterranean, 11 miles W. of Naples. It was founded conjointly by colonists from Chalcis in Eubœa and Cyme in Asia Minor. According to Strabo, it was the most ancient of the Greek colonies in Italy. It became an opulent commercial city, built several harbors or port-towns—among which was Neapolis, the present Naples, which has outlived the mother-town—and for a period of 200 years (700–500 B. C.) it was the most important city of Southern Italy. The people of Cumæ waged war against the Etruscans, who disputed their supremacy as a maritime power, and for a time they were successful. But eventually it proved impossible for the Greek colonies in Italy to maintain themselves against the rising power of the native states. Cumæ was conquered by the Samnites in 417 B. C., and became a Roman *municipium* in 338. In the second Punic war Hannibal tried to capture it, but failed. Cumæ was famous as the residence of the SIBYL (*q. v.*). It was the last stronghold of the Goths in Italy, and held out for a long time against the Byzantine army which captured it from them in 552 A. D. In the ninth century it was completely burned down by the Saracens, and in the thirteenth, having become the rendezvous of a desperate gang of robbers, it was razed to the ground by the inhabitants of Naples. But few remains of Cumæ are now in existence.

Cumaná, koo-mää-naa': seaport-city; state of Bermudez, Venezuela; on the Manzanares river, a mile from the Gulf of Cariaco (see map of South America, ref. 1–D). The climate is hot and unhealthful, and the place is visited by frequent earthquakes. The exports are coffee, cacao, sugar, hides, and tobacco. Ships anchor in the roadstead, as there are no wharves. Cumaná was settled by missionaries in 1512, but soon abandoned; it was refounded by Gonzalez Ocampo in 1520, and is thus the oldest city of European origin on the continent of America. It gave its name to one of the old Spanish provinces. Pop. (1891) 12,057. HERBERT H. SMITH.

Cum'berland: the most northwestern county of England; bounded N. by Scotland and the Solway Firth, E. by Northumberland and Durham, S. by Westmoreland and Lancashire, and W. by the Irish Sea. Area, 1,515 sq. miles. The surface is mountainous and picturesque. The highest points are Sca Fell, 3,210 feet, and Skiddaw, 3,058 feet, above the sea. The chief rivers are the Esk, Eden, and Derwent. The scenery is adorned by numerous beautiful lakes, including Derwentwater and Ulleswater, the latter of which is 9 miles long. The land is divided into small freeholds. The main crops are wheat, oats, and turnips. Nearly three-fourths of the corn crops consist of oats. That variety of oats which is known by the name of the potato oat, and which now is cultivated in every part of the United Kingdom, was first discovered in Cumberland in 1788. Sheep and cattle are reared to some extent. Coal, copper, silver, iron, lead, plumbago, limestone, marble, and Silurian slate are found here. There are manufactures of woolens, cottons, linens, earthenware, and glass. The chief town is Carlisle. This county formed part of the ancient CUMBRIA (*q. v.*). Pop. (1891) 266,549; (1901) 266,504.

Cumberland: city and railway center; capital of Allegany co., Md. (for location of county, see map of Maryland, ref. 1–B); romantically situated on the Potomac. In population and commerce it is the second city in the State. It is the head of navigation of the Chesapeake and Ohio Canal (leading to Georgetown, D. C.) and the shipping-point for the semi-bituminous coal produced in the vicinity which constitutes the principal traffic of that canal. It is 178 miles W. by N. from Baltimore, and 153 miles S. by W. from Pittsburg, Pa. Its manufacturing industries comprise extensive rolling-mills for rails and bars and factories for other railroad iron, a factory for the manufacture of steel, foundries, machine-shops, glass-manufactures, flour and cement mills, railway-car and repair shops, and numerous minor enterprises. Its mercantile interests employ a large capital. An admirable system of water-works (on the Holly plan) furnishes an abundance of water. The steadily developing coal-trade of Cumberland, in connection with its growing iron industries, forms the chief source of its prosperity. Pop. (1880) 10,693; (1890) 12,729; (1900) 17,128. EDITOR OF "TIMES."

Cumberland: city; Barron co., Wis. (for location of county, see map of Wisconsin, ref. 3–B); on railway; 87 miles from Minneapolis, Minn. Its principal industry is lumbering. Pop. (1880) 246; (1890) 1,219; (1900) 1,328.

Cumberland, RICHARD: English dramatist and essayist; a grandson of Richard Bentley; b. at Trinity College, Cambridge, Feb. 19, 1732. As secretary to Lord Halifax, he entered diplomatic life, but was unfortunate in this and retired to the pursuits of literature. Of his many successful comedies, the best known is *The West Indian*. Among his miscellaneous writings, the most important are his *Memoirs* (1806). D. at Tunbridge Wells, May 7, 1811.

Cumberland, WILLIAM AUGUSTUS, Duke of: the third son of George II., King of England; b. Apr. 26, 1721. He commanded the allied army which was defeated by the French at Fontenoy in 1745. He defeated the army of the Pretender at Culloden in Apr., 1746, and was censured for his cruelty in that battle. During the Seven Years' war he commanded an English army, which was defeated at Hastembeck in 1757. D. Oct. 31, 1765.

Cumberland and Teviotdale, DUKE OF (Great Britain, 1799), and Earl of Armagh (Ireland, 1799): titles borne by the ex-King of Hanover, who was a prince of the blood in Great Britain, being first cousin to Queen Victoria. His full name was GEORGE FREDERICK ALEXANDER CHARLES ERNEST AUGUSTUS. He was born at Berlin, May 27, 1819, and was married Feb. 18, 1843, to the Princess Alexandrina Marie of Saxe-Altenburg. He succeeded to the throne of Hanover Nov. 18, 1851, as George V., on the death of his father, Ernest Augustus. He took sides with Austria against Prussia in 1866, and was deprived of his kingdom, which was annexed to Prussia, Sept. 20, 1866. D. June 12, 1878.—His eldest son, the present duke, is PRINCE ERNEST AUGUSTUS; b. Sept. 21, 1845. See HANOVER.

Cumberland Gap: a narrow pass through the Cumberland Mountains, on the line between Kentucky and Tennessee and at the western extremity of Virginia. It was an important strategic point in the civil war (1861–65), and was strongly fortified by the Confederates. It was abandoned by them June 18, 1862, and on the same day was occupied by the national troops under Gen. G. W. Morgan. In Aug., 1862, Gen. E. Kirby Smith outflanked this position by a march through Big Creek Gap, and Gen. G. W. Morgan, in consequence of lack of forage and supplies, was compelled to destroy and evacuate the works, which was successfully done on Sept. 11. He was hotly pursued northward by a force of Confederates under John H. Morgan. On Sept. 9, 1863, Gen. Frazer, who held the gap with a brigade of Buckner's troops, surrendered after a siege of only four days to Gen. Burnside's troops. The gap itself is a cleft 500 feet deep, and in some places is only wide enough for a road. If well provisioned, it might have been held by a small force against any opposing army. Revised by J. MERCUR.

Cumberland Island: peninsula of Baffin Land, North America; forms a portion of that coast of Davis's Strait which lies between Hudson's Strait and Lancaster Sound.

Cumberland Mountains: a range of the Appalachian system, forming part of the boundary between Virginia and Kentucky. The range extends in a generally S. W. direction across Tennessee, dividing East from Middle Tennes-

see. These mountains here form an elevated plateau, seldom over 2,000 feet high, but at some points nearly 50 miles across. The range in Tennessee has been described as capable of furnishing "a highway from Kentucky to the Alabama line along its flat top, along which a traveler may pass without once descending, or even without discovering at any time his elevation." On both sides the plateau breaks off in steep sandstone cliffs, the western side much notched, the eastern quite regular. Its immediate sides are from 800 to 1,000 feet high on either side. Both above and below the sandstone are valuable deposits of coal, and near the foot of the slope on each side outcrops a deposit of iron ore known as the "Clinton" ore-bed.

Cumberland Presbyterian Church: a church originating in the nineteenth century. In 1797 a very remarkable revival of religion began to develop in Southwestern Kentucky. The principal minister connected with its early history was Rev. James McGready. Mr. McGready was a Presbyterian, and was educated in Western Pennsylvania, at what became afterward Jefferson College, but he began his ministry in North Carolina. He was a man of unusual earnestness and power in the pulpit. His earnestness and zeal brought him into collision with the community in which he was laboring. The result was a removal from North Carolina to Kentucky in 1796. He was settled in charge of three congregations—two in Logan co., Ky., Gaspar River and Little Muddy River, and one in Tennessee, Red River, near the dividing line between the two States.

Mr. McGready's great zeal soon began to show itself in his new field of labor, and in order to bring his people into sympathy and co-operation with him, he proposed to them a written covenant, which they were to subscribe as a pledge of their earnest intention to fulfill its conditions. The measure was an incipient effort toward what was felt to be so necessary—a great revival of religion. A copy of this covenant is embodied here, as an illustration of the views and feelings, at the time, of a country pastor and a Christian people, surrounded as they were by a literal and a spiritual wilderness. "When we consider," say the covenanters, "the work and promises of a compassionate God to the poor lost family of Adam, we find the strongest encouragement for Christians to pray in faith—to ask in the name of Jesus for the conversion of their fellow-men. None ever went to Christ, when on earth, with the case of their friends that were denied, and although the days of his humiliation are ended, yet for the encouragement of his people he has left it on record 'that where two or three agree upon earth to ask anything in prayer, believing, it shall be done.' Again, 'Whatsoever ye shall ask the Father in my name, that will I do, that the Father may be glorified in the Son.' With these promises before us we feel encouraged to unite our supplications to a prayer-hearing God for the outpouring of his Spirit, that his people may be quickened and comforted, and that our children, and sinners generally, may be converted. Therefore, we bind ourselves to observe the third Saturday in each month for one year as a day of fasting and prayer for the conversion of sinners in Logan County and throughout the world. We also engage to spend one half hour every Saturday evening, beginning at the setting of the sun, and one half hour every Sabbath morning, beginning at the rising of the sun, in pleading with God to revive his work."

This covenant was evidently not a mere formality. The hearts of the preacher and people were in it. In May of 1797 occurred the first developments of the desired work. In July of 1800 occurred the first camp-meeting that ever was held in Christendom. The plan of the meeting was suggested by the circumstances of the country, and the fact that vast crowds were in the habit of assembling at the sacramental meetings from distances varying from 10 to 100 miles. Great numbers professed religion at the camp-meetings and upon other occasions, and the work spread with wonderful rapidity and power over Southwestern Kentucky and what was called the Cumberland Country—now Middle Tennessee—lying adjacent.

The ministers who co-operated with Mr. McGready were Messrs. William McGee, Samuel McAdoo, William Hodge, John Rankin, Presbyterians, and Mr. John McGee, Methodist. These men were all of Scotch-Irish origin, and had emigrated from North Carolina. It may be mentioned here that when the Cumberland Presbyterian Church came to be fully organized nine-tenths of its ministry, and at least four-fifths of its membership, were of Scotch-Irish descent.

The rapid progress and widespread influence of the revival produced the necessity of organizing a great many new congregations; and this, of course, created a necessity for more ministerial laborers. The Presbyterian Church could not supply them in the ordinary way. There were no schools, and if schools had been abundant the congregations could not wait until young men would be able to go through such a course of literary and theological training as is customarily required in the Presbyterian Church preparatory to licensure and ordination. The patriarch* of Presbyterianism in Kentucky visited the region of the revival, and, seeing the necessities of the congregations, advised the ministers and leading laymen of the Church to select such young men as they thought promised usefulness, and direct their attention to the work of the ministry, although they might not be able to obtain what was considered a full ministerial education. The counsel seemed practical, and three young men at first were encouraged to prepare themselves for the work as well as they could. These young men presented themselves to the Transylvania Presbytery in Oct., 1801. The presbytery hesitated, but at length, in Oct., 1802, they were all licensed as probationers for the holy ministry. At the same presbytery two others were received as candidates for the ministry. Opposition, however, at once developed itself. In Oct., 1802, the Transylvania Presbytery was divided, and the Cumberland Presbytery was formed, embracing the more immediate region of the revival. The Cumberland Presbytery from time to time licensed a few others and ordained two or three. These were all what were called uneducated men; they were all, however, men of promise, and some of them became distinguished in subsequent years. The opposition was continued in the new presbytery.

There was difficulty from another source. The revival ministers were warm-hearted, and controlled less by theological and technical than by practical, and what they regarded as spiritual, considerations. The young men, too, had not learned to split all the metaphysical hairs of theology, and there were some expressions in the Confession of Faith which seemed to them to teach the doctrine of fatality. This they could not receive, and were allowed to except to it in their licensure and ordination.

There were thus two subjects of dissension between the parties; one was educational, the other theological. The revival ministers did not object to education for the ministry, but to the rigid application of the rule in the circumstances surrounding them. The young men did not object to the Confession of Faith, but to those expressions in it which seemed to them to imply the doctrine of fatality. Their warm-hearted and liberal fathers thought proper to indulge them in their skepticism on this subject. They adopted the Confession of Faith with the single exception. The difficulties became serious, and were finally brought before the synod of Kentucky. The synod of 1804 appointed a committee to attend a meeting of the Cumberland Presbytery and inquire into the condition of things. None of the committee fulfilled the appointment except one, and he was notoriously a persecutor of the presbytery, and was regarded as a spy. Nothing good, of course, resulted. The synod at its next meeting, in 1805, appointed a commission consisting of fifteen members to visit the region in which the difficulties existed, to confer with the Cumberland Presbytery, and to endeavor to restore quiet and harmony. The commission met on Dec. 3, 1805, at Gaspar River meeting-house, in Logan co., Ky. The first measure of the commission was to require of the presbytery a surrender of all the young men who had been licensed and ordained in what they regarded a questionable manner, for a re-examination by the commission, with a view to a confirmation or an annulling of the proceedings of the presbytery in each particular case. It is to be borne in mind that several of the men thus required to be surrendered to the commission were themselves members of the presbytery. The presbytery declined compliance, upon the ground that the constitution of the Presbyterian Church gives to the presbytery alone the power "to examine and license candidates for the holy ministry; to ordain, install, remove, and judge ministers"; that it gives no such power to a synod, much less to a commission of synod, nor to any other judicature of the Church. The commission then called upon the young men to submit themselves for re-examination; they also declined, whereupon the commission passed the following resolution: "*Resolved*,

* Rev. David Rice.

That as the above-named persons never had regular authority from the presbytery of Cumberland to preach the gospel, etc., the commission of synod prohibit, and they do solemnly prohibit, the said persons from exhorting, preaching, and administering the ordinances, in consequence of any authority which they have received from the Cumberland Presbytery, until they submit to our jurisdiction and undergo the requisite examination."

The names of the persons thus proscribed are omitted as a convenience. Four of them were ordained ministers and members of the presbytery; the others, eight in number, were either licentiates, candidates for the ministry, or exhorters. The presbytery took the ground in the controversy that the proceedings of the commission were unconstitutional, and, of course, that the proscribing act was unconstitutional and void. Nevertheless, from a general respect to authority, and from an obvious desire to procure a reconciliation and enjoy peace and quietude as far as possible, both the proscribed members, and those who had promoted their induction into the ministry and sympathized with them, constituting a majority of the presbytery, organized themselves into what they called a *council*, determining in this manner to endeavor to carry forward the work of the revival, to keep the congregations together, but to abstain from all proper presbyterial proceedings, and await what they thought would be a redress of their grievances. The synod of Kentucky at its sessions in 1806 dissolved the Cumberland Presbytery, and annexed the members who had not been placed under the ban of the commission to the Transylvania Presbytery.

The council continued their organization from Dec., 1805, to Feb., 1810. By that time they became satisfied that they had nothing to hope either from the synod or the General Assembly. As a last resort, and in order to save what they represent to the General Assembly as "every respectable congregation in Cumberland and the Barrens of Kentucky," two of the proscribed ministers, Finis Ewing and Samuel King, assisted by Samuel McAdam, one of those who had been placed under an interdict by the commission for his participation in what they denominated the irregularities of the presbytery, reorganized the Cumberland Presbytery at the house of Mr. McAdam, in Dickson co., Tenn., on Feb. 4, 1810. It was organized as an independent presbytery. It will be observed that it was a reorganization of a presbytery which had been dissolved, and which had received its name from its locality. The Church which grew up from these beginnings naturally took the name of its first presbytery as a prefix. Hence this Church is called, from the circumstances of its origin, "The Cumberland Presbyterian Church." It extends now from Pennsylvania to the shore of the Pacific, but it originated in what was called, at the time, the "Cumberland Country." The name suggests nothing connected with the denomination except the locality of its origin.

The new presbytery held its first adjourned meeting in March, the month following its organization. There were present four ordained ministers, six licentiates, and seven candidates for the ministry. These men constituted really the fathers and founders of the Cumberland Presbyterian Church. Early in the year 1813 the presbytery had become so large that it divided itself into three presbyteries, and constituted the Cumberland Synod. This synod, at its sessions in 1816, adopted a Confession of Faith, catechism, and system of church order in conformity with the principles avowed upon the organization of the presbytery. The Confession of Faith is really a modification of the Confession of Faith of the Presbyterian Church. It was intended by the framers to exclude only the offensive doctrine which had been a principal cause of all the difficulties. The government is Presbyterian.

In 1826 its first college was organized under the supervision of the Church. It was located at Princeton, Ky. It was a manual-labor school. In 1830 its first paper was published under the patronage of the Church. It was a weekly religious and literary journal, also published at Princeton. In 1828 the Cumberland Synod was divided into three synods, and a General Assembly succeeded. The first meeting of the Assembly was held in May, 1829.

The Church has under its patronage three weekly newspapers, one quarterly, and two monthlies—one devoted to the interest of women. It has also under its patronage three chartered universities and several colleges, both for young men and women. One of the universities has regular collegiate, theological, law, and medical departments.

In 1883 the Cumberland Presbyterian Church adopted a revised Confession of Faith, the changes made being in the line of those made in the revisions in progress in the other Presbyterian Churches. This Church is a recognized member of the Alliance of Presbyterian Churches. It 1891 it numbered 121 presbyteries, 1,875 ministers and licentiates, 2,844 congregations, and 165,472 communicants. Later and fuller statistics will be found in the article on the PRESBYTERIAN CHURCH (*q. v.*).

RICHARD BEARD.
Revised by WILLIS J. BEECHER.

Cumberland River: an affluent of the Ohio, rising among the Cumberland Mountains in Kentucky, near the southeastern boundary of that State. It flows nearly westward, crosses the southern boundary of Kentucky, describes an extensive circuit in Middle Tennessee, passes by Nashville, and returns into Kentucky. It afterward flows northwestward, and enters the Ohio at Smithland. The Cumberland and Tennessee rivers are only about 3 miles apart at a point nearly 20 miles from Smithland. Length, estimated at 650 miles. Steamboats can ascend it to Nashville, about 200 miles from its mouth, and it is navigable above Nashville, at certain seasons, 400 miles.

Cum'bria; an ancient principality of the Cymri in Great Britain; comprised Cumberland in England and part of Scotland, namely, the southwestern portion of the region lying between the Ribble and the Clyde. It was ruled by its own kings until about 950 A. D. Scottish Cumbria then became the kingdom of STRATHCLYDE (*q. v.*).

Cumbrian Mountains: a range or group of mountains in the north of England, occupying parts of Cumberland, Westmoreland, and Lancashire. This region, called the "English Lake District," is remarkable for its picturesque scenery, and is much frequented by tourists. Here are numerous lakes, the largest of which are Windermere and Ulleswater. These mountains are mostly formed of granite and Silurian rocks. The highest point, Sca Fell Pike, rises 3,216 feet above the sea.

Cum'min- (or **Cumin) seed**: the fruit of *Cuminum cyminum*, a plant belonging to the family *Umbelliferæ*. It is the only known species, and is found in Egypt and the adjacent countries. It is an annual with branched stem, thread-like leaves, with umbels of small white or pink flowers. It has been cultivated from remote times for the sake of its seeds, which have an aromatic taste somewhat resembling caraway. In Germany and Holland it is used in cookery. As a medicine it is mostly limited to veterinary practice. It is cultivated in Northern Africa, India, and Southern Europe; but the seeds are mostly imported from Sicily and Malta. Oil of cummin is abundantly obtained from the seed. The oil of cummin consists of a mixture of two distinct oils, one called cymene ($C_{20}H_{14}$); the other regarded as a hydride of cumyl ($C_{20}H_{11}O_2.H$). This oil is of a strong bitter, disagreeable taste, with the general properties of the other essential oils.

Cummin is mentioned both in the Old and the New Testaments (Isa. xxviii. 25–27; Matt. xxiii. 23), and in the works of Hippocrates and Dioscorides. Among the Romans it was taken medicinally, the seeds being ground and mixed with water and wine. It was believed to produce pallor of the face (Horace, *Epist.* 1. 19; Persius, *Satyr.* 5. 55), and Pliny tells us that the followers of the famous rhetorician Porcius Latro commonly used it in order to produce a complexion bespeaking close application to study. In the Middle Ages cummin was one of the most common spices grown in Europe, and much appreciated. It was used as a stimulant also, and the seeds brought in the thirteenth and fourteenth centuries a price of about 1*s.* 4*d.* per pound.

Cumming, JOHN, D. D., F. R. S. E.: Scottish preacher; b. in the parish of Fintray, Aberdeenshire, Nov. 10, 1807; became in 1832 minister to the Scottish Church in Crown Court, Covent Garden, London, and so remained till his resignation in 1879. He published interpretations of the apocalyptic prophecies, *The Great Tribulation*, *The Destiny of Nations*, etc. He was a zealous opponent of the Roman Catholic Church and a defender of the National Church of Scotland. D. in Chiswick, London, July 5, 1881.

Cumming, ROUALEYN GORDON: known as the "lion-hunter"; b. at Altyre, Scotland, Mar. 15, 1820. He was the son of a baronet, was educated at Addiscombe, and entered a cavalry regiment in the East India service, and afterward took a commission in the Cape Mounted Rifles in South Africa. While there he distinguished himself by his exploits in killing lions, elephants, and other wild beasts. Of his surprising adventures he wrote an account in book form, which was highly popular, but after a time fell into

a discredit which it hardly deserved. He afterward lectured in Great Britain upon sporting subjects. D. Mar. 24, 1866.

Cummings, Amos J.: journalist; b. at Conkling, Broome co., N. Y., May 15, 1841; received a common-school education; entered a printing-office at twelve, and has set type in nearly every State in the Union; as a boy served with Walker in the last invasion of Nicaragua; served in the Union army in the civil war; has filled editorial positions on the New York *Tribune* under Horace Greeley, New York *Sun*, and New York *Express*; elected as a Democrat to Fiftieth Congress; elected to Fifty-first Congress to fill the vacancy caused by the death of S. S. Cox; re-elected to the Fifty-second Congress; defeated for Congress 1894, but in Nov., 1895, was elected to Fifty-fourth Congress to fill a vacancy caused by the death of A. J. Campbell; author of *Horace Greeley Campaign Songster* (1872); *Sayings of Uncle Rufus* (1880); and *Ziska Letters*.

Cummings, Joseph, D. D., LL. D.: Methodist Episcopal theologian; b. at Falmouth, Me., Mar. 3, 1817; graduated at Wesleyan University in 1840; entered the ministry in 1841; became Professor of Theology in the biblical institute at Concord, N. H., 1853; president of Genesee College 1854; president of Wesleyan University, Middletown, Conn., 1857; resigned and became professor there 1875; preached 1877–81; became president of Northwestern University, Evanston, Ill., 1881. D. in Evanston, Ill., May 7, 1890.

Cummings, Thomas Seir: See the Appendix.

Cum'mins, Francis, D. D.: preacher; b. near Shippensburg, Pa., in 1752; one of the framers of the Mecklenburg Declaration of Independence (May, 1775); in 1780 licensed to preach by the presbytery of Orange, N. C.; pastor of Presbyterian churches in the Carolinas and Georgia. D. in Greensborough, Ga., Feb. 22, 1832.

Cummins, George David, D. D.: clergyman; b. near Smyrna, Del., Dec. 11, 1822. He was graduated from Dickinson College in 1841, and was a licentiate in the Methodist Episcopal Church for two years. In 1845 he studied for orders in the Protestant Episcopal Church; in October of the same year was ordained a deacon, and in 1847 priest. For six years he was rector of Christ church at Norfolk, Va., and then successively rector of St. James's church, Richmond, Trinity church, Washington, St. Peter's church, Baltimore, and Trinity church, Chicago. In 1866 he was elected assistant Bishop of Kentucky. In Nov., 1873, he resigned his position, withdrew from the Protestant Episcopal Church, and founded the Reformed Episcopal Church, of which he was made presiding bishop Dec. 2, 1873. D. at Lutherville, Md., June 26, 1876. See his *Life* by his wife (New York, 1878). Revised by W. S. Perry.

Cummins, Maria Susanna: novelist; b. at Salem, Mass., Apr. 10, 1827. Her most successful novels were *The Lamplighter* (1853), translated into French and German; *Mabel Vaughan* (1857); *El Fureidis* (1860); and *Haunted Hearts* (1863). She contributed to the *Atlantic Monthly* and other magazines. D. in Dorchester, Mass., Oct. 1, 1866.

Cumulative Voting: See Representation.

Cumulus: See Clouds.

Cunard', Sir Samuel: ship-owner; b. in Halifax, Nova Scotia, Nov. 21, 1787; became the head of the extensive firm of steamship owners, Cunard & Co.; and in 1859 was made a baronet. D. Apr. 28, 1865.

Cunax'a: ancient town of Babylonia; on the east bank of the Euphrates; about 60 miles N. of Babylon. In 401 B. C. a battle occurred here between Artaxerxes Mnemon, King of Persia, and his brother Cyrus (the Younger), in which the latter was defeated and killed.

Cundinamar'ca: a department of Colombia; between the Orinoco and its branches, the Meta and Guaviare; bounded N. by Boyacá and Venezuela, E. by Venezuela, S. by Cauca, and W. by Tolima. Area variously estimated from 79,600 to 92,000 sq. miles. The western part is traversed by the central and eastern Cordilleras of the Andes. The intervening valley has a delightful climate, and most of the towns are situated there. The eastern part belongs to the warm Orinoco plains, mainly grass-lands adapted for grazing but as yet very thinly settled. The most important exports are tobacco and hides. Pop. (1884) 537,658. Capital and chief city, Bogotá. Herbert H. Smith.

Cu'neiform [from Lat. *cu'neus*, wedge + *forma*, shape]: having the form of a wedge; applied to one of the bones of the wrist and to three of the tarsus; also to certain wedge-shaped characters found on ancient monuments, especially in Asia.

Cuneiform Inscriptions: ancient writings in wedge-shaped or arrow-headed characters peculiar to Western Asia. The writings of the Babylonians and Assyrians are usually understood by the term, because these peoples made such large use of the script. But it was by no means confined to these. It was likewise used in Armenia, Elam, Asia Minor, Palestine, Persia, and on the Euphrates in the Hittite country. The use in Palestine and the Hittite land was as early as the fifteenth century B. C., though the fact of such use was unknown in modern times until the great discovery made at El-Amarna in Egypt in 1887. The language in this case is mainly Assyrian, though there are a few specimens in another tongue not yet known. The use of the cuneiform script in Persia does not seem to have antedated Cyrus the Great, sixth century B. C.; at least no specimen of older date has yet been found.

The origin of this method of writing belongs to a prehistoric time. Like all early systems, it developed from picture-writing, in which each character was a representation of an entire object or idea. A few of the cuneiform signs have retained a likeness to the original object, but most of them have changed so greatly as no longer to suggest a picture. Thus the sign for a hand was originally made of five straight lines representing the fingers (). In later times one of the lines was rejected, and the four horizontal wedges may be thought of as representing the fingers, while the perpendicular wedge represents the thumb (). The oldest forms of the writing, like the seal of Sargon of Akkad and the inscriptions found by De Sarrec at Tello, are read from above downward, the columns, however, advancing from right to left. By changing the columns or lines to horizontal, the writing in later times came to read from left to right, as in English. Thus the Assyrian language, like the Ethiopic, came to differ from the other Semitic tongues, which read from right to left. The oldest specimens of Egyptian writing likewise read from above downward, as the Chinese still does, even though it may not be possible to prove a direct connection between the three systems.

Who the inventors of the cuneiform script were will perhaps always remain unknown. Most students of Assyriology give the credit to the non-Semitic people, commonly known as Akkadians, who preceded the Semites in the occupancy of the Babylonian territory. Not only the writing but a large part of the culture of the Babylonian Semites is likewise attributed to these Akkadians, or more strictly to them and to the closely related Sumerians. There are, however, several eminent scholars who call in question this thesis. Chief among them are Josef Halévy, of Paris, and Professor Friedrich Delitzsch, of Leipzig. Both deny that there ever was such a people as the Sumero-Akkadians, Halévy maintaining that the supposed specimens of their writings are but a cryptographic manner of writing Assyrian, while Delitzsch holds them to be only an archaic form of Assyrian. While the question as to the existence of a Sumero-Akkadian people and civilization must thus be called an open one, the great body of specialists affirms such existence. Whatever may be the truth in the case, there are various phenomena in the Babylonian-Assyrian civilization which seem to point to a non-Semitic origin. Such origin for the script in particular seems best to account for the ill success in adapting a considerable number of the signs to the Semitic consonants. Furthermore, many of the syllabic values of the signs are based on words which have no natural Semitic etymology.

In the development of the script from picture-writing many of the signs have gone through numerous changes, depending on the era and the locality. Thus a student might be perfectly familiar with the late Assyrian type and still be unable to read the late Babylonian, or he might know both well and still be powerless in the presence of an archaic text. The differences are greater than between the alphabets of the Greeks, Romans, and Germans. In the later Assyrian and Babylonian times, when men affected the antique, there was a tendency to revert to the older types of the cuneiform writing.

The passage from the pictorial stage of the script, in which both curves and straight lines were used, to the stage

in which only wedges were employed was gradual. The rejection of curves and the development of wedges seem both to have resulted from the use of soft clay as writing material and from the form of the stylus, which was made by three plane surfaces meeting at a point like the angle of a cube. The stylus was pressed into the soft clay, tracing on this material being difficult. There are as many impressions of the stylus as there are wedges in any given character. In the case of building-bricks stamps were at times employed, so that an entire inscription containing name and titles of the royal architect was stamped by a single impression on the clay. This may be compared to printing from plates. The stone seals which were rolled over commercial documents imparted their carvings and inscriptions likewise to the soft clay. The stamps and seals thus described excepted, the writing on clay was a slow and painstaking process, the point of the stylus making the head and the line uniting two planes of the cube making the body or tail of the wedge. When the writing is on stone it is chiseled into likeness with that on clay. The number of wedges in a single character varies from one to fifteen or even more, there being, however, no relation between the number of wedges and the complexity of the idea represented.

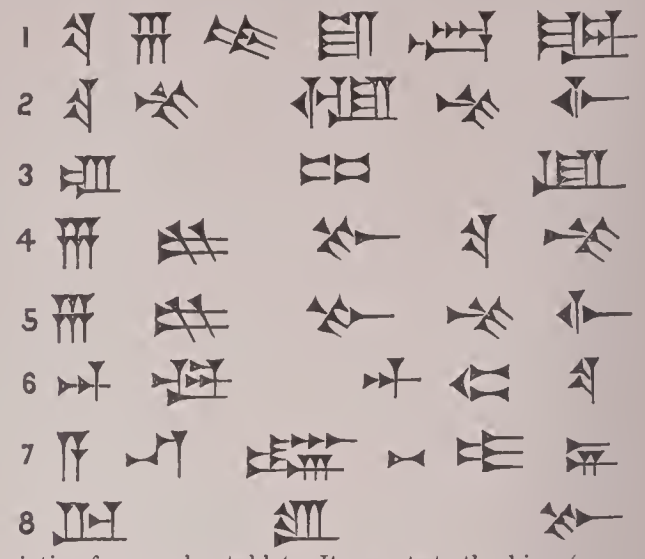
Out of the pictorial use of the script the ancient scribes derived a series of syllables. Their method was to employ a sign not only to represent an object, but also to represent the first syllable of the word expressing that object, and then they could use this syllabic sign in spelling any other word in which such syllable occurs. Thus the Akkadian word for heaven is *ana*, and the sign  representing this word came to be used in spelling any word containing the syllable *an*, like the Semitic word *annu*, this. With the rise of writing by syllables the pictorial, or, as it is called, ideographic, way of writing was not discontinued. Nearly or quite all extant inscriptions contain a mixture of ideograms and of syllabic signs, and the ease of reading depends on the relative proportion of the two systems. As time went on the tendency became more pronounced to use syllabic signs exclusively, save in the case of certain words of very frequent occurrence, for which ideograms were retained. The Japanese writing is likewise syllabic, while the use of many Chinese characters representing objects makes the Japanese writing precisely parallel to the Babylonian-Assyrian method.

The next step, that of deriving an alphabet from the syllabic script, the Babylonians persistently refused to take. They were too conservative and their script too sacred. The step in advance was reserved for the Persians, doubtless under the influence of other nations using a regular alphabetic system. We can see no indication of a tendency on the part of the Babylonians to adopt the improved method of the Persians, nor does the Old Persian cuneiform alphabet of some forty-five or fifty characters seem to have had any successors. Compared with other alphabetic systems, it was indeed too cumbrous. Even the Persians did not use it exclusively. The royal records are also written in the mixed syllabic-ideographic system of the Babylonians. This mixed system maintained itself at Babylon in spite of political changes and the encroachments of alphabets till the first century before our era. It was employed by the scribes even of the Greek kings of Babylon.

The separate signs of the cuneiform script are several hundred in number. Some of these are used only as ideograms, others very largely as syllables, some both as ideograms and as syllables. The context usually shows how a sign is to be understood. Some signs have a variety of values both as ideograms and as syllables, while certain ideas and syllables are represented by a variety of signs. This diversity is often perplexing to the modern student, but becomes less so at every advance in the study.

The wedges of the cuneiform script are arranged horizontally, perpendicularly, or obliquely downward or upward at an angle of about 45°. Complex signs may be composed of wedges arranged in all of these directions. The point of the wedge is toward the bottom or toward the right. There are separate signs for expressing the vowels, but none for the consonants (except in the Persian). Each syllabic sign is composed of one vowel and one or two consonants, never more than two. Thus we have such syllables as *ab*, *ib*, *ub*, *ba*, *bi*, *bu*, or *bab*, *bag*, *bar*, etc. Besides the separate signs for such syllables as *bab*, *bag*, *bar*, it was also possible to write the same sounds *ba-ab*, *ba-ag*, *ba-ar*, pronounced *bab*, *bag*, *bar*.

The decipherment of the cuneiform inscriptions began with the alphabetic variety of the Old Persians. Two men



Inscription from a clay tablet. It reports to the king (presumably Asshurbanipal) the arrival of the vernal equinox. It reads:
1. (On the) day 6th of (the) month Nisan
2. (the) day and (the) night
3. were equal.
4. 6 *kas-bu* (the) day
5. 6 *kas-bu* (the) night.
6. (The) god Nabu (and the) god Marduk
7. unto (the) king my lord
8. may they be gracious.

acting independently of each other were here the pioneers—Georg Friedrich Grotefend in 1802 and Henry Rawlinson about 1835. Though Grotefend has the distinction of being first in point of time, his work was not very fruitful until Christian Lassen, of Bonn, took it up in 1836. At the same time Rawlinson was in Persia copying the inscriptions and deciphering them by the same method which Grotefend had pursued. The success of both Grotefend and Rawlinson was an eminent stroke of genius. Grotefend relates how he began by applying to certain short inscriptions from Persepolis a formula which was contained in some other alphabetic writings from the same region. In this formula the word king frequently occurs. Grotefend noted at once that a particular group of signs always occurred in his inscriptions at intervals corresponding to the word king in the formula. The formula marked out certain other groups as proper names, and Grotefend believed from historical considerations that these must be the kings of ancient Persia. He thus determined the groups for the names of Hystaspes, Darius, Xerxes, and by this means made out several of the Old Persian letters. After the Old Persian was made out by Grotefend, Lassen, Rawlinson, Hincks, and others, it became possible to pass to the decipherment of the Babylonian-Assyrian, because these Old Persian inscriptions from Persepolis, Behistun, and Elwend were accompanied by translations into the Babylonian-Assyrian script and language. The greater complexity of this script, as already described, made the progress of decipherment slow and painful; but, on the other hand, the discoveries at Khorsabad, Nimrud, and Kouyunjik gave a great mass of new material and a new impetus to students. By 1850 the work of deciphering the form of the script as used by the Babylonians and Assyrians may be said to have been practically accomplished.

See Friedrich Delitzsch's *Assyrian Grammar*; Lyon's *Assyrian Manual*; Grotefend's account of decipherment in A. H. L. Heeren's *Ideen über die Politik*, etc. (Göttingen, 1815, vol. i.); Rawlinson's account in *Journal of the Royal Asiatic Society* (1847, vol. x.). D. G. Lyon.

Cuneo, koo-nā'ō: a province of Piedmont, Northern Italy; area, 2,882 miles. One-half of the province is level, the other half hilly. The chief river is the Tanaro. It produces wheat, maize, hemp, rice, and silk. Pop. (1894) 659,101. Capital, Cuneo, or Coni.

Cunha Barboza, koon'yaă-baăr-baw'zaă, Januario, da; Brazilian ecclesiastic and author; b. in Rio de Janeiro, July 10, 1780. He took orders in 1803, was named preacher for the royal chapel in 1808, and gained wide fame as a pulpit orator; was one of the most influential advocates of Brazilian independence; became an object of suspicion to the Government, and was banished in 1823, but exonerated and allowed to return the same year; was several times deputy; editor of the Government journal and of various other

periodicals; director of the national library, and one of the founders of the *Instituto Historico e Geographico Brazileiro*. He published many poems, mainly satirical; of these the best known are *Garimpeiros* and *Victheroy*. D. at Rio de Janeiro, Feb. 22, 1846. HERBERT H. SMITH.

Cunha Mattos, koon'-yăă-măăt'tōs, RAYMUNDO JOSÉ, da: Portuguese-Brazilian soldier and author; b. at Faro, Algarve, Portugal, Nov. 2, 1776. When fourteen years old he entered an artillery regiment, took part in the campaigns under Gen. Forbes 1793–96; from 1798 to 1817 was stationed on the island of São Thomé on the coast of Africa, and in the latter year was called to Brazil, where he was employed in many important positions, principally in organizing the army and the military school, and in preparing fortifications. He was military commandant of Goyaz in 1820, and returned to Rio as deputy from that province. In 1834 he attained the rank of *marechal do campo*. In 1831 and 1832 he traveled in Portugal on leave, and was a witness of the revolutionary struggles there. A man of high scientific attainments and an excellent observer, Gen. Cunha Mattos embodied his varied experiences in a series of valuable historical and geographical works. Among these are *Corographia historica das ilhas de S. Thomé, Principe, Anno Bom e Fernando Pó*; *Itinerario do Rio de Janeiro a Matto Grosso*; *Itinerario do Rio de Janeiro a Pará e Maranhão petas provincias de Minas Geraes e Goiaz*; *Corographia historica da provincia de Minas Geraes*; *Corographia historica de Goyaz*; *Diario dos trabalhos de ataque e defensa da cidade do Porto*; and *Repertorio da legistação militar*. He was one of the founders of the Instituto Historico. D. at Rio de Janeiro, Mar. 2, 1839.
HERBERT H. SMITH.

Cunliffe-Owen, Sir PHILIP: director of the South Kensington Museum; b. June 8, 1828; served for a time in the navy; became, 1857, deputy-general superintendent of the South Kensington Museum; held important positions in the London Exhibition in 1862; in the Paris Exhibition of 1867 (and 1878); in the Vienna Exhibition of 1873; and in the Centennial Exhibition of 1876, in the latter of which he was executive commissioner and organized the British section, and was presented with one of the four silver medals awarded by the Centennial Commission. D. in Lowestoft, England, Mar. 23, 1894.

Cunningham, ALLAN: Scottish author; b. at Blackwood, Dumfriesshire, Dec. 7, 1784; worked as a stone-mason in his youth. He removed to London in 1810, and began to write for the newspapers. He was employed as foreman in Chantrey's studio from 1814 to 1841. His *Traditional Tales of the English and Scottish Peasantry*, *Songs of Scotland*, *Life of Witkie*, and *Lives of British Sculptors, Painters, and Architects* are his best-known productions, besides some favorite songs. D. in London, Oct. 30, 1842.

Cunningham, JOHN, D. D., LL. D.: b. at Paisley, 1819; educated at the Universities of Glasgow and Edinburgh; licensed as preacher 1845, and ordained in the same year in the parish of Crieff, where he remained. His principal work is *The Church History of Scotland*, the standard on this subject. D. Sept. 1, 1892.

Cunningham, WILLIAM, D. D.: theologian; b. at Hamilton, Scotland, Oct. 2, 1805; educated at the University of Edinburgh; appointed pastor of Trinity College church in Edinburgh in 1834, and Professor of Theology in the New College in 1843. Author of *Historical Theology* (1862, 2 vols.); *The Reformers and the Theology of the Reformation* (Edinburgh, 1862); *Discussions on Church Principles* (1863); *Lectures on Evidences*; etc. D. in Edinburgh, Dec. 14, 1861. See his *Life* by R. Rainy (Edinburgh, 1871).

Cupar, or **Cupar-Fife**, koo'per-fīf: capital of Fifeshire, on the Eden; 32 miles N. of Edinburgh (see map of Scotland, ref. 10–I). It has a public library, the Duncan Institute, several newspaper-offices, and manufactures of coarse linens, earthenware, etc. A castle or fortress of the Macduffs, thanes of Fife, formerly stood here. Pop. (1891) 4,729.

Cupel [Fr. *coupelle*, a little cup]: a shallow and porous vessel, somewhat cup-shaped, generally made of bone-earth. It is used in the process of assaying gold and silver, which are fused with lead upon a cupel. The lead is oxidized in the process and sinks into the substance of the cupel, leaving the metal pure.

Cupid (in Lat. *Cupido*): the Roman name of the god of love, corresponding to the Eros (Ἔρως) of the Greek mythology. He was usually represented as the son of Venus, but ancient authorities differ respecting his paternity. He is represented as a beautiful winged boy, bearing a bow and arrows.

Cupids: post-village of Brigus district, on the north side of Conception Bay, Newfoundland, 2 miles from Brigus. Farming and cod and salmon fishing are carried on. Pop. 1,200.

Cupola: nearly synonymous with DOME (*q. v.*), used especially of small domes crowning towers or belfries. It is commonly but erroneously applied to any lantern, observatory, or similar structure rising above the roof of a building. Cupola is also the name of one form of blast furnace for reducing metallic ores. A. D. F. HAMLIN.

Cupping: in surgery, the application to the skin of small cups from which the air is partly expelled. If it be designed to withdraw blood from the patient, the skin is first scarified, a partial vacuum is produced in the cup by direct suction or by the flame of alcohol or of burning paper, and the mouth of the cup is applied to the scarified surface. "Dry cupping" is the same process without scarification. In this case no blood is drawn, the object being to stimulate a diseased surface or to produce derivative action.

Cúra: a town of the state of Guzman Blanco, Venezuela; 60 miles S. W. of Caracas (see map of South America, ref. 1–D); between the valley of Aragua and the plains of Guarico; elevation, 1,703 feet; founded in the seventeenth century. It has broad streets, several small parks, and an excellent library. Pop. 12,198.

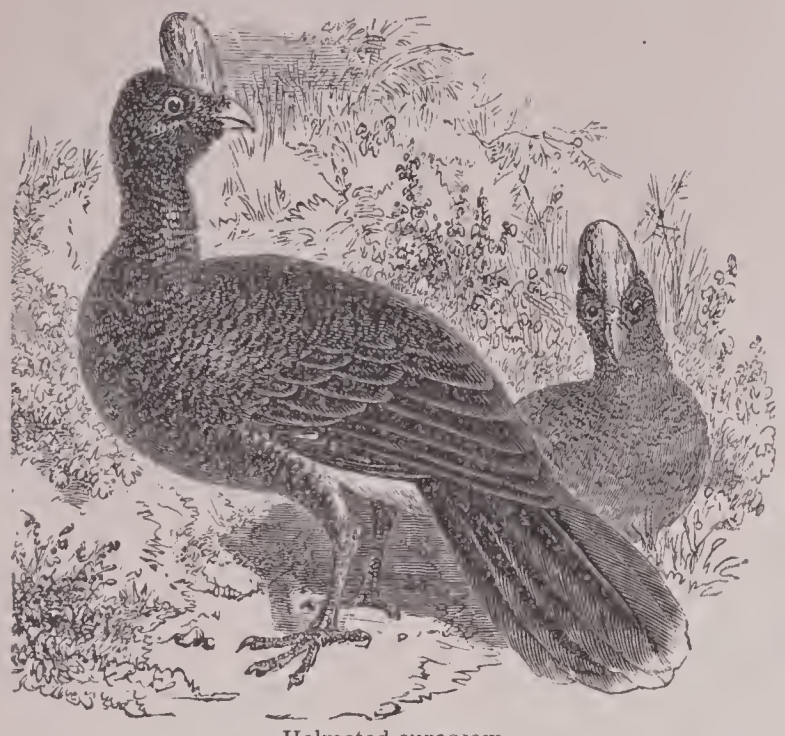
Curaçao, **Curazao**, or **Curaçoa**: one of the Dutch West Indian islands, of the Leeward group; about 50 miles off the coast of Venezuela, in lon. 69° W.; area, 210 sq. miles (see map of West Indies, ref. 9–I). It is long and narrow, partly hilly (the highest point 1,200 feet above the sea), and partly a low coral formation. The island is poorly watered, and most of it is arid; but sugar-cane, tobacco, maize, vegetables, and fruits are raised in the valleys. The climate is hot and often unhealthful. The principal importance of Curaçao is derived from its excellent harbor on the southern side, which is regularly visited by steamers, and has become a center of commerce. The capital and principal town, WILLEMSTAD (*q. v.*), lies at the entrance of this harbor. The Dutch colony of Curaçao embraces besides this island Buen Ayre or Bonaire, to the E. of it, with 95 sq. miles of area and 3,821 inhabitants; Aruba, to the W., 69 sq. miles and 7,743 inhabitants; and the islets of St. Martin, St. Eustache, and Saba in the Windward West Indies, which together have 29 sq. miles of area and 7,353 inhabitants. It is ruled by a governor and council appointed by the King of the Netherlands, and residing at Willemstad. Klein Curaçao, a rock off the east point of Curaçao, yields large quantities of phosphate of lime, and sea-salt is obtained in the archipelago by evaporation. Curaçao was discovered by Ojeda in 1499, and Spanish colonies were established there. It was seized by the Dutch in 1632, and held by them until the wars of the empire, when it was taken by the English. Restored to the Dutch by the peace of 1814, it has since remained under their rule. Pop. (1895) 28,187. HERBERT H. SMITH.

Curaçoa: a liqueur which is made by digesting Curaçao orange peel in diluted spirits along with a little cinnamon, and often a little mace or cloves. The mixture is distilled and then sweetened with sugar.

Cura'ri, sometimes spelled **Cura're**, **Woora'ri**, and **Ura'ri**: a poison probably composed of several poisons derived from various sources, but all of them vegetable in origin; sometimes called India arrow poison. It is obtained chiefly by scraping the young bark of several different trees, adding water to the scrapings, and boiling to a sirupy consistence. It possesses the peculiar properties of being able to paralyze the peripheral ends of the motor nerves, causing total muscular paralysis without materially influencing the circulation, the respiratory center, or the cerebral processes.

Curas'sow: any bird of several species belonging to the order *Gallinæ* and family *Cracidæ*. They have a strong bill, with a cere at the base; much rounded wings, and all four toes on the same level. They inhabit the forests of South America, N. of the Argentine Republic and E. of the Andes, one species only (*Crax globicera*) extending into Mexico. Curassows are mostly large birds, nearly equaling a turkey in size. They assemble in flocks, nest in trees, are readily domesticated, and are very good eating. The crested curassow (*Crax alector*) is the most common species, the helmeted curassow (*Pauxis galeata*) one of the most striking. The bird derives its name from a bony excrescence on top

of the head, nearly as large as a hen's egg, and of a blue color. It is hollow, very light bluish, larger in the male



Helmeted curassow.

than in the female, and is not developed until after the first moult. The plumage of this species is glossy black, white on the belly and tip of tail.

The smaller species of the family *Cracidæ* form another division, and are termed Guans (*q. v.*). F. A. Lucas.

Curate [Mid. Eng. *curat*, from Late Lat. *cura'tus*, p. partic. of *cura're*, care for, heal > Ital. *curato*: Fr. *curé*]: one who has the cure of souls. The term has been variously appropriated to different officers of the Church, but since the close of the sixteenth century in England has been restricted to assistant clergy, deputies, or substitutes. The bishop, or some officer having episcopal authority, appoints the curate's salary and grants his license. There are "temporary" and "perpetual" curates. The temporary or *stipendiary* can be removed at the will of the bishop or vicar. Perpetual curates can not be thus removed. Their salary is paid from tithes established at the foundation of the chapel, and it becomes the duty of the impropriators to support them. The salaries of curates are too often disproportionate to their services, and they are almost destitute of legal rights, being entirely subject to episcopal authority. The word is retained in the Ordinal of the American Episcopal Church, but it is usually supplanted in ordinary speech by the term "assistant minister."

Curcu'lio [Lat., weevil]: a name given to many weevils or coleopterous insects of the family *Curculionidæ*, but perhaps most frequently applied to the *Conotrachelus nenuphar*, a small dark-brown insect, speckled with yellowish white and black. In spring and early summer it attacks the young fruit, such as apples, pears, apricots, etc., but its object of special attack is the plum. The female makes a crescent-shaped puncture in which she deposits her egg. The egg soon hatches, and the maggot feeds upon the young plum, which generally falls to the ground in a short time, and the larva burrows in the earth, becoming a perfect insect in about three weeks. Several generations are said to appear in one season. The destruction caused by this insect upon all kinds of smooth-skinned fruits is a very serious loss. Another destructive curculio is the plum-gouger (*Anthonomus prunicida*), which occurs very abundantly in the Western U. S. It makes a round puncture. It undergoes tranformation inside the kernel of the plum. Another insect of this genus makes numerous holes in the apple; still another lays her eggs in the cranberry, and then cuts off the stem. The grape curculio (*Cœliodes inæqualis*) and other species are very destructive to grapes. Fruit-trees and grapevines should be frequently shaken in summer, when the falling curculios may be caught upon a sheet and burned. Swine and sheep render great service by devouring the fallen fruit with the larvæ contained in it. Nearly 10,000 species of this family have been described. They are arranged in more than 630 genera.

Curculiou'idæ: See Weevil.

Curcuma: See Turmeric.

Curd: See Cheese.

Cures: an ancient and famous city of Italy; the capital of the Sabines; near the Tiber, about 25 miles N. N. E. of Rome. It was celebrated in the early history of Rome as the birthplace of Numa, as well as the city of Tatius. The site is occupied by the modern village of Correse. Cures was colonized by Sulla about 100 B. C. See Quirites.

Curfew Bell, or simply **Curfew** [O. Fr. *covre-feu*; *covrir*, cover + *feu*, fire < Lat. *focus*]: a bell rung at eight in the evening as a signal for extinguishing lights and fires—a practice said to have been introduced into England by William I. in 1068. As the custom existed in France, Spain, and other countries at the same time, it is probable that it was not originated by William I., but the strictness with which he compelled its observance caused it to be attributed to him. The stringency of this law was relaxed by Henry I. in 1103. In the reigns of Edward I. and Edward III. persons were not permitted to be abroad in the city, armed, after curfew. In many parts of England and the U. S. the practice of ringing the bell at eight or nine o'clock still prevails.

Curg, or **Coorg**: a province of Southern India; situated between lat. 11° 56′ and 12° 45′ N., and bounded by Mysore, Malabar, and South Kanara. Area, 1,583 sq. miles; pop., 180,461. The country is high and mountainous; its general elevation is about 3,000 feet above the level of the sea, and its highest peak, Tandiandamol, rises 5,781 feet. It is drained by the Kaveri, which rises on the eastern side of the Western Ghats, and a number of minor streams, which rise in the country itself, and during the rainy season carry great masses of water. Parts of the surface are covered with dense forests—teak, sandalwood, red and white cedar, ebony, etc.—with an undergrowth of cardamom, wild pepper, arums, and ferns. In the fields rice is cultivated and excellent fruit is raised, especially oranges. The fauna comprises the elephant, tiger, tiger-cat, hunting-leopard, wild-dog, elk, several species of deer, wild-boar, the cobra di capello, and the alligator. The inhabitants are of Dravidian origin, and speak a Canarese dialect. They are well formed, bold, and active, but ignorant and unskilled; the only manufacturing industry they have developed is a kind of coarse blankets used as garments. They are also superstitious, having retained the devil-worship of their ancestors. Polyandry and polygamy prevail among them, the wives of the brothers of a family being considered as common property. They were governed by independent rajahs of the Nair caste from 1583 to 1834, when the mismanagement of Viraraja caused Great Britain to interfere and annex the country.

Cu'ria (plu. **Curiæ**): the building in which the senate held its sessions in the cities of ancient Italy. Also a subdivision of the Roman patrician tribes, each of which was divided into ten *curiæ*. These tribes were three in number, the Ramnes, Tities, and Luceres, so that there were thirty curiæ. These curiæ contained only the patricians or *populus* proper, but clients were regarded as passive members of the curia of their superior. In early times the curiæ were of the greatest importance. Each curia had its own name, but only a few of these names have come down to us. In later times the curiæ lost their political importance, but long retained their ancient and mysterious religious rites, which were maintained by the priests called *curio* and *flamen curialis*. In still later times even these old offices were sometimes conferred upon plebeians. The curiæ voting together constituted the *comitia curiata*, once a highly important public body with legislative powers; but before the fall of the republic this body had fallen almost into disuse and oblivion, though it still had a formal existence. In it each of the curiæ had one vote, and in each curia each member had one vote. In the language of modern Europe, *curia* is the Latin word for court or place of justice.

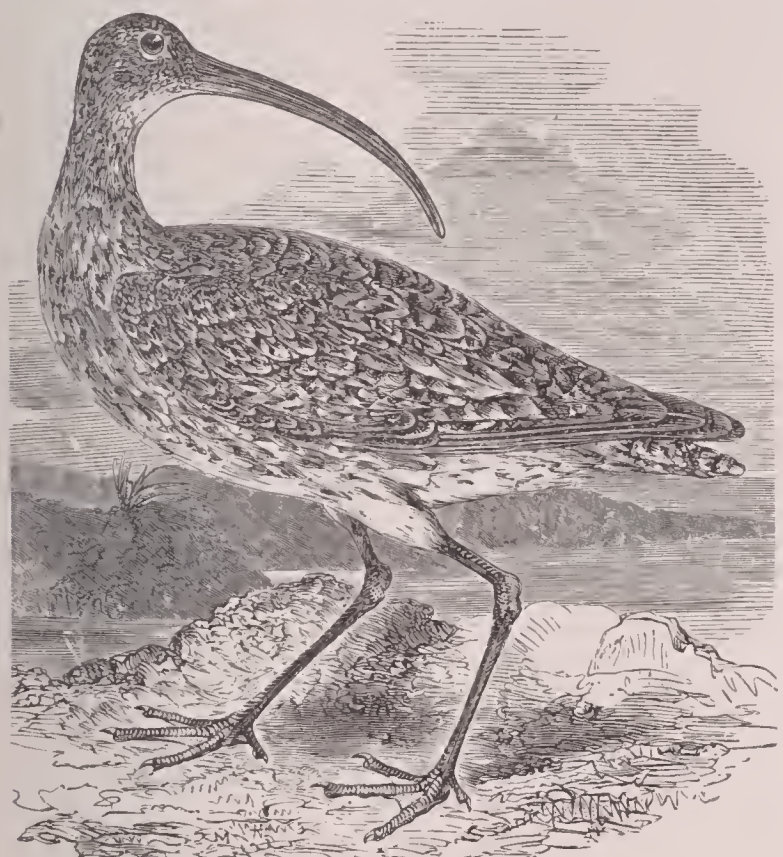
Curicó, koo-rĕē-kō′: a province of Chili; S. of Santiago, between Colchagua on the N. and Talca on the S., and extending from the Pacific to the summits of the Andes; area about 2,913 sq. miles. Capital, Curicó, with 10,110 inhabitants (1885). The western part is crossed by the coast chain, and the eastern is broken by spurs of the Andes. The central portion is a fertile plain, in which Curicó and some smaller towns are situated. Wheat-raising and grazing are the principal industries. The province was created in 1865 by a division of Colchagua. Pop. (1895) 103,242.

Herbert H. Smith.

Curicó: capital of the province of the same name; on the river Mataquito (see map of South America, ref. 8–C); founded in 1742. It is a progressive place, with a college. Pop. (1885) 10,110; (1895) 12,669.

Curitiba, koo-rēē-tee'băă: a city of Parana, Brazil; 80 miles W. of Paranaguá, with which it is connected by rail (see map of South America, ref. 7–F). It has manufactures and a large trade in maté. The German element in the population is large and the place is rapidly growing. Pop. 12,000.

Curlew: a bird of the genus *Numenius*, order *Limicolæ*, natives of Europe and North America. Curlews have long, slender, and curved bills, long legs, and short tails. They frequent the seashore and open moorlands, feeding on



European curlew.

worms, mollusks, insects, etc. The common curlew of England (*Numenius arquatus*) is pursued by sportsmen partly for its flesh, which is delicate and well flavored, and partly because its wild and shy habits render the pursuit exciting. Among the curlews of North America may be mentioned the long-billed curlew (*Numenius longirostris*) of all the temperate parts of North America. It is 25 inches long, the wing measuring about 11 inches. The bill is often 8 inches long. It is of a pale-reddish color, with ashy tints and brown-black marks, and longitudinal lines of black. The short-billed curlew (*Numenius hudsonicus*) of the Eastern and Western coasts is two-thirds the size of the foregoing, with a bill about 4 inches long. The Esquimaux curlew (*Numenius borealis*) is still smaller.

Curling: a game played upon the ice with polished teakettle-shaped stones weighing from 35 to 50 lb., the object being to plant the stone near the "tee," or center of a circle, at a distance of 40 yards or more, and to guard it there, or to drive out the stone of an opponent.

It is the national winter game of Scotland, but is now extensively played in the U. S. and Canada. It has been asserted that the game was introduced into Scotland from Flanders, but there is no evidence that it ever existed on the continent of Europe.

There is a tradition that James IV., who fell at Flodden, was a keen curler, and that Darnley in the severe winter of 1565 enjoyed many a game at Peebles. Be that as it may, it is certain the game has been practiced in Scotland for over three centuries, for a curling-stone bearing the date 1551 was found early in the nineteenth century in a pond which was drained near Dunblane. It was not dressed, but was just as it had been taken from the bed of the river, and had two holes in it where the handles had been. Another stone, with the date 1611, was found near the village of Torpichen, and a third was found at the bottom of Shiels loch with the date 1613 distinctly cut into it. Several stones of great age were found in the mud of a loch near Ardoch, which, although of very primitive appearance, had handles, as may be seen by this sketch of them.

Fig. 1.

Pennecuik, in his *Description* (published in 1715) of the customs of Peeblesshire, says of curling:

> To curl on the ice doth greatly please,
> Being a manly Scottish exercise.
> It clears the brains, stirs up the native heat,
> And gives a gallant appetite for meat;

and James Grahame, in his poem *The Sabbath*, gives an excellent description of the game.

The oldest curling club in existence is the Dudingston Curling Society of Edinburgh, instituted Jan. 17, 1795.

Matches of the most exciting interest take place in Scotland, not only between parishes but even counties, and sometimes the North and South of Scotland play against each other for the curling championship, the Forth being the dividing line. Nearly 2,000 players take part in these matches. The Royal Caledonian Curling Club of Seotland is the "mother" of all the curling clubs, and a recent report shows that some 660 clubs are now associated with it, directly or indirectly.

In 1866 twelve of the curling clubs of the U. S. organized the Grand National Curling Club of the U. S. It increased till some forty clubs became associated with it. As so many of them were in the Northwest it was deemed advisable in 1892 to organize a Northwestern Curling Association, covering all the territory N. W. of Ohio. Many of the clubs in the U. S. and Canada have excellent covered rinks, those of Toronto being especially large and substantial.

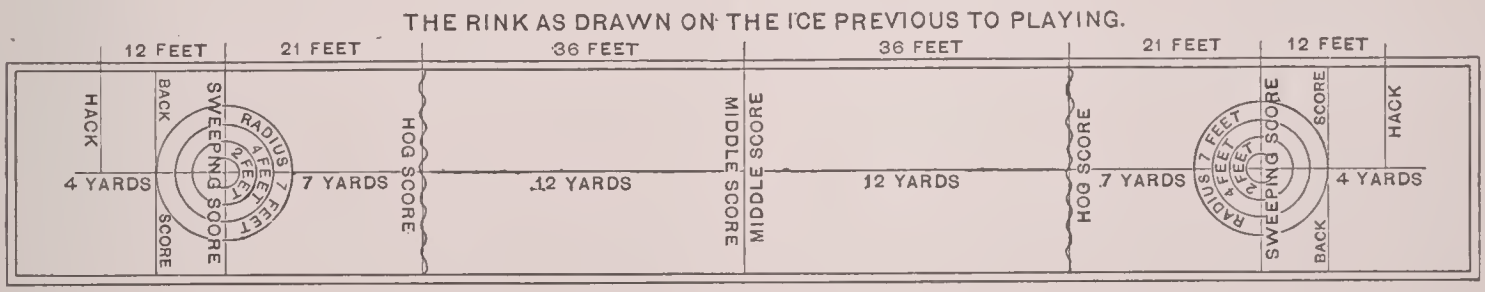


Fig. 2.

Curling is called the "roarin' game," not on account of the noise made by the players, but on account of the roaring sound made by the stones as they speed along the ice. This can be heard at quite a distance on a pond, or where the ice is made on a raised floor. A curling match is called a "bonspiel," a name which is, indeed, applied in Scotland to matches in other games, as in golf.

The game is essentially democratic. The lord of the manor, the clergyman, and the village blacksmith may be found on the same rink, with the smith in command, and implicit obedience to orders is always expected. Curling has always been free from "professionalism," and none of the evils attending so many manly pastimes have ever be-

come attached to this game. It is almost the only game which has an extensive and varied literature of its own. There have been over 300 songs written in its praise, and many sermons have received their most powerful applications from references to its practice.

For a diagram of the rink, see Fig. 2. The center of the rings is called the "tee." The stone may be delivered with an "in" turn or an "out" turn, that is, bringing the elbow in toward the body or out from the body, which gives an "English" to the right or left, and which makes the stone "curl" in or out, and hence perhaps comes the name of the game—"curling." A and B in Fig. 3.

Four on each side make a game, and the captain is called a "skip." In a large tournament the opposing clubs are divided into "fours," who play against each other. When a stone is delivered and is moving too slowly the skip calls on his men to "sweep, sweep" (in Scotch, "soop, soop"). After a rink has been swept many times it may be imagined that sweeping can be of little use, but it is held that a rapid motion of sweeping immediately in front of the running stone creates a vacuum which accelerates the motion of the stone by the air rushing in from behind.

There is no limit to the variety of shots played, and in this it is very different from quoits and is more like billiards. Sometimes the player must "draw" a quiet shot to place the stone on the tee; sometimes he is called on to "guard" or lay a stone in front to protect a winning stone; again, he may be asked to play a swift shot to break the guards off, or run a narrow port; then he may have to inwick or outwick (carom) off a stone at the side, and curl in upon the tee or run a winner out. The game can hardly be made intelligible by a printed description. It has to be seen to be understood.

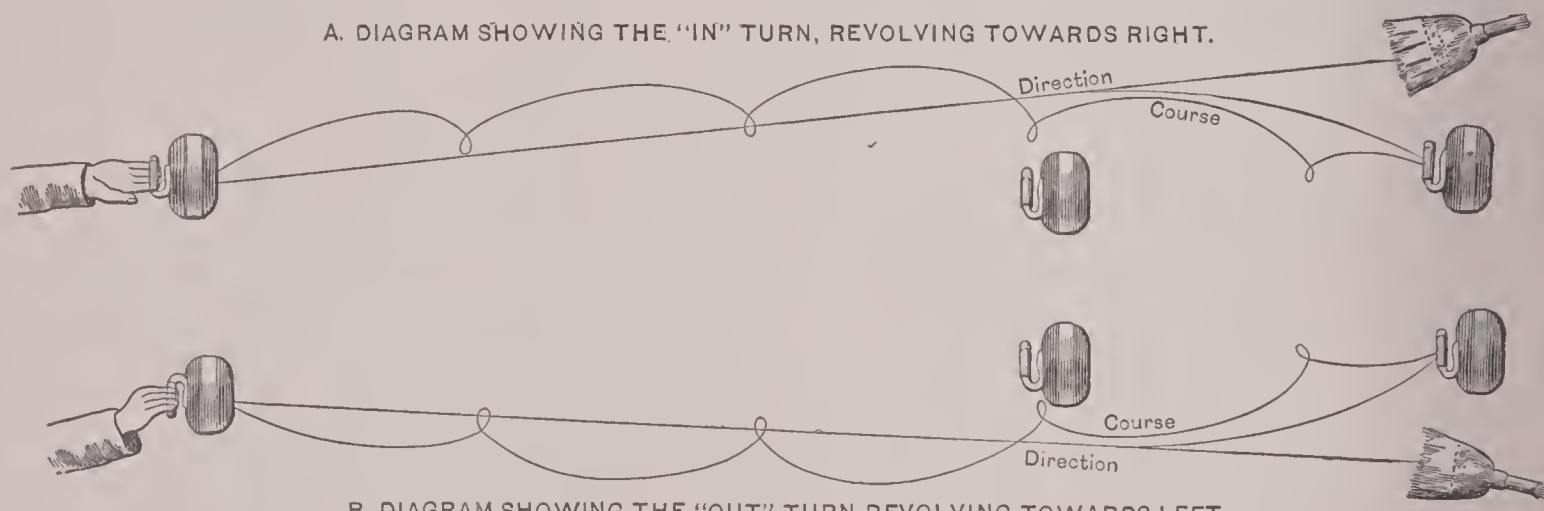

FIG. 3.

The following is a summary of the rules as laid down by the Northwestern Curling Association of America, which do not differ materially from those of the Royal Caledonian and Grand National Curling Clubs:

The standard length of the rink for play is 42 yards from hack to tee. The tees are 38 yards apart, and around each, as a center, is a circle of 7 feet radius, which is called the "home" or "ring." To facilitate measurements, intermediate circles are also described around the tee. Every stone within or resting upon the outer ring is entitled to be counted in the game; no stone is considered without a circle unless it is entirely clear of that circle, nor is a stone considered over a line unless it has crossed and entirely cleared it. This is decided by a square placed upon the ice. From, and in exact alignment with both tees, a line, called the center line, is drawn to a point 4 yards behind each tee; at this point a line is drawn at a right angle to the center line on which the hack is cut. The hack does not exceed 6 inches in length, nor is the inner edge thereof more than 3 inches from the center line, so that all stones are delivered with their center upon the center line. Other lines, called the middle score, the hog score, the sweeping score, and back score, are drawn on the ice at right angles to the center line. The middle score is drawn midway between the two tees, to point out the place at which sweeping may ordinarily be commenced. The hog score is drawn at a distance from each tee of one-sixth of the length from hack to further tee, and indicates the point at which, if a played stone fails to pass, it is counted a hog, and removed from the ice, unless prevented from passing by striking another played stone resting inside the hog score. The sweeping score is drawn across the tees for the guidance of the skips in sweeping. The back score is drawn just outside and behind the 14-foot circle around the tee (the home); all stones that have passed this score are removed. Matches consist of the majority of shots won, after playing a certain number of heads or definite period of time. In the event of both parties being equal at the conclusion of the match play is continued for another head, or for such additional number of heads as may be necessary to decide the match. Every rink is composed of four players a side, each using two stones, and playing one stone alternately with his opponent. The rotation of players observed in the first head is not changed. The two skips opposing each other settle by lot, or in any other way they may agree upon, which party leads in the first head, after which the winning party leads. The skips have the exclusive management of the game for their respective parties, and may play last or in any part of the game they please, but are not entitled to change their places when once fixed. When their turn to play comes they appoint one of their players to act in their places as skips of the game, and take the position of ordinary players until they have played and returned to the tee-head as skips. Players are arranged along the sides, but well off the rink, as their skips may direct; and no party, except when sweeping according to rule, can go upon the middle of the rink. Skips alone stand within the 14-foot circle or home; the skip of the party playing has the choice of place, and must not be obstructed by the other in front of the tee, while behind it, the privilege of both as regards sweeping being equal. Every player must be ready when his turn comes, and must not take more than a reasonable time to play. Should he play a stone belonging to another, any of the players may stop it while running; but if not stopped till at rest, the stone which should have been played may be put in its place to the satisfaction of the opposing skip. If a player plays out of turn, the stone so played may be stopped in its course and returned to the player; should the mistake not be discovered till the stone is at rest, or has struck another, the opposing skip shall add one to the score and have the option of allowing the game to proceed or declaring the end to be null and void. But if another stone be played before the mistake has been noticed, the end must be finished, as if it had been played properly from the beginning. If any player engaged, or belonging to either of the competing clubs, speaks to, taunts, or otherwise interrupts any other player not of his own party, while preparing to play his stone, and so as to disconcert him, one shot is added to the score of the party so interrupted for each interruption. If in sweeping, or otherwise, a *running* stone be marred by any of the party to which it belongs, it is put off the ice and the opposing skip has the option to add one to his score and allow the game to proceed, or to call the end null and void; but if marred by any of the adverse party it is placed wherever the party to which it belongs may direct. If marred by any other means, the player replays the stone. Should any played stone be displaced by any of the players before the head is reckoned, it shall be placed as near as possible where it lay, to the satisfaction of or by the skip opposed to the party displacing it. If displaced by any neutral party, both skips agree upon the

position to which it is to be returned, and if they fail to agree, the umpire decides. The sweeping is under the direction and control of the skips. It is not allowable for the party to whom a running stone belongs to place a broom before it or behind it to screen it from the wind, unless with the consent of both skips. The use of a broom or any other instrument as a fan, either to promote or retard the running of a stone, is strictly forbidden. All stones are circular in shape, and none, including the handle, is of a greater weight than 50 lb., or of a greater circumference than 36 inches, or of a less height than one-eighth of its greatest circumference. No stone or side of a stone can be changed more than once after a match has been begun, unless with the consent of the opposing skip. Should a played stone roll over or stop on its edge or top, it is put off the ice. Should the handle quit the stone in delivery, the player is not entitled to replay the stone unless he retains hold of the handle. No measuring of shots is allowed previous to the termination of the end. Disputed shots are determined by the vice-skips; or, if they disagree, by the umpire; or, if there is no umpire, by some neutral person chosen by the skips. If any of the competing rinks are not ready to begin play at the hour named for a match, one end is counted as played for every ten minutes' delay; and the opposing rink, if ready to play, counts one point in the game for each such period of time it is kept waiting. JOHN JOHNSTON.

Curran, CHARLES COURTNEY: genre-painter; b. at Frankfort, Ky., Feb. 13, 1861. Pupil of Art Students' League, New York, and of Doucet, Lefèbvre, and Benjamin-Constant, Paris; member Society of American Artists 1888; associate of National Academy; third Hallgarten Prize, N. A. D., 1888; honorable mention, Paris Salon, 1890. His pictures are good in drawing and cleverly composed. Represented in the permanent collections of Chicago Art Institute, Columbus (Ohio) Art Gallery, and Vassar College. Studio in New York. WILLIAM A. COFFIN.

Curran, JOHN PHILPOT: an Irish orator; b. at Newmarket, near Cork, July 24, 1750; was educated at Trinity College, Dublin; studied law in the Middle Temple, London; and was called to the Irish bar in 1775. As a barrister he was very successful, and was distinguished for his humor and sarcastic speech. He became in 1783 a member of Parliament, in which he acted with the opposition party, of which Grattan was the leader. In 1806 he was appointed master of the rolls of Ireland. D. in London, Oct. 14, 1817. See Charles Phillips, *Curran and his Contemporaries* (1850); T. Davis, *Life of Curran* (1846).

Currant [Fr. *raisins de Corinthe*, because Corinth was the chief port of exportation]: a kind of small raisin (*Uva passula minor*), the dried berry of a seedless variety of grape which is cultivated in the Levant. Currants are exported from Zante and some of the other Ionian islands, and are used in cookery as an ingredient in cakes and puddings. The staple currants quoted in market reports are these seedless grapes.

Currant: the popular name of the berries of certain species of *Ribes*, low shrubs of the order *Grossulaceæ*, distinguished from the gooseberries by the flowers, which grow in racemes, and by the fact that the currant bush is never thorny. The red currant (*Ribes rubrum*) is a native of Europe, Asia, and North America, is cultivated in gardens for its pleasant acid fruit, and is much used for the table and for jellies, conserves, etc. "Currant wine" is a domestic drink, made of currant juice, sugar, and water, which is allowed to undergo alcoholic fermentation. The black currant (*Ribes nigrum*), a native of Europe and the north of Asia, is also cultivated, and in France large quantities of *liqueur de cassis*, a very agreeable and popular variety of currant wine, are prepared from it. More than sixty species of currants are described, about two-thirds of which are American. Several are highly ornamental in cultivation. Tho varieties of fruit-bearing currants in cultivation are very numerous. They are very readily propagated by cuttings. The most popular market varieties in the U. S. are Victoria, Cherry, La Versailles, Fay, among the reds; White Grape among the whites; and Black Naples among the blacks.

Currency: the circulating medium, or the aggregate of means used for settlement of debts and commercial transactions. The term is a somewhat loose one, modern writers not being agreed whether bank checks or even bank deposits should be regarded as currency. In general, there is a disposition to apply the terms currency and money to the same things, the individual coin or bill being spoken of as money, and the aggregate of such coins or bills constituting the currency. Hence we speak of the value of money, but of the inflation of the currency. Currency in modern states consists of four parts: (1) Metallic money under free coinage, with full legal tender. The gold currency of the U. S. is of this character. (2) Metallic money without free coinage, but with full legal tender. The silver dollars coined in the U. S. are of this sort. (3) Subsidiary coinage or small change, whose bullion value is almost never made equal to its nominal value, and which does not, as a rule, have the legal-tender character. (4) Paper money of various kinds, whether it be certificates of deposit, promises to pay with a legal-tender character, like GREENBACKS (*q. v.*), or promises without such character, like the U. S. national bank-notes. The first and the fourth constitute by far the most important elements.

If a nation attempts to use different forms of currency at the same time, that which has less intrinsic value in the markets of the world will always remain at home, while that which is more valuable will be liable to export. If clipped coin circulates side by side with good coin, the clipped coin will stay at home and the good coin will go abroad. If two different metals are side by side in circulation, free coinage of the less valuable metal will drive the other out wholly, and a restricted coinage of the less valuable metal will drive the other out to some extent. In the U. S. a gold dollar and a silver dollar are at present worth the same amount. For export a gold dollar is worth about 50 per cent. more than a silver dollar. If, therefore, a change in the balance of trade causes the export of money, gold dollars will be exported, and not silver dollars. The fact was first discovered by Sir Thomas Gresham in the reign of Queen Elizabeth, and is known as Gresham's law.

During the early history of the U. S. an attempt was made to employ gold and silver side by side, at a ratio of 15 to 1, the silver dollar having $371\frac{1}{4}$ grains of pure metal and the gold dollar $24\frac{3}{4}$ grains, free coinage of both metals existing at the same time. But $24\frac{3}{4}$ grains of gold was more valuable in the markets of the world than $371\frac{1}{4}$ grains of silver. In consequence of this, people preferred to pay their debts in silver dollars and to use the gold for export. Down to the reform of the currency in 1834, the U. S. used silver only, but, its bulk rendering it inconvenient for large transactions, a change was made by which the ratio of 16 to 1, or, more accurately, 15·98 to 1, was adopted, and the gold dollar reduced to 23·2 grains of pure metal. (See COINAGE.) It happened at this time that the conditions of gold and silver production were such that in the markets of the world the ratio between the two metals was about $15\frac{1}{2}$ to 1. Twenty-three and two-tenths grains of gold was worth less at that time than $371\frac{1}{4}$ grains of silver. The result of this was that people preferred to pay their debts in gold dollars. The silver dollars were exported as bullion, and gold was coined in their place to the necessary amounts. Any business man could make a profit by selling the silver dollar in England as bullion, buying the corresponding amount of gold with it, and having a little less than that amount of gold coined into a dollar, leaving a slight surplus due to the difference between the bullion and the coining value of the metals. The fractional coinage was retained in the U. S. only because it was made of less than the full weight, two halves weighing much less than one dollar. During the period from 1834 to 1873 the coinage both of gold and silver was nominally free, but as the silver was at that time worth more to export than to coin, there was no actual use of silver except for fractional currency. By the act of 1873 the free coinage of silver ceased. See SILVER.

During a large part of this period comparatively little gold or silver was in actual use. Its place was taken in the currency of the U. S. by paper money; sometimes by U. S. bank issues, sometimes by those of State banks. Neither of these experiments was thoroughly successful. The successive U. S. banks fell into discredit, and became the subject of party contentions, culminating in the withdrawal of support by President Jackson in 1833 and the notorious disaster that followed. State bank-notes were worse than U. S. bank-notes, because of the absolute lack of security or proper examination. The currency was inflated by these agencies in times of speculation, and when the disaster followed the notes were worthless and the distress was intensified. (See COMMERCIAL CRISES.) As an antidote for all these evils the national banking system grew up in the years 1863–65.

Meantime, under the war exigencies, the U. S. had been issuing legal-tender notes, or greenbacks, on an enormous scale, completely driving out the gold currency, in accordance with Gresham's law, and then issuing an excess of unnecessary paper money to such a degree as to constitute an inflation. (See below.) In 1863 a paper dollar was worth decidedly less than a gold dollar. In 1864 it was at the lowest point, worth only 43 cents. The restoration of confidence at the close of the war brought the value of a paper dollar up to between 70 and 80 cents, but, the amount of paper money continuing excessive, no gold or silver was used for ordinary purposes of trade for many years afterward. The efforts of Secretary McCulloch to contract the currency in such a way as to bring greenbacks to a par with gold provoked widespread opposition and threats of further inflation. It was not until 1874 that arrangements were made for the resumption of specie payments. Though the law was conceived somewhat at haphazard, a succession of favorable events in the commercial world, combined with the skill of Secretary Sherman, enabled the Treasury to accumulate such a reserve that at the time appointed for resumption of specie payments, Jan. 1, 1879, there was no contraction whatever and no presentation of greenbacks for redemption.

Fractional silver came into use in the place of the fractional currency in 1876. Silver dollars were coined by the act of 1878 at the rate of 2,000,000 a month. By the act of 1890 (repealed in 1893) this was about doubled. (See SILVER.) Much of the silver coinage lies in the Treasury. Certificates of deposit for such coin or silver certificates circulate in their place, while since 1890 notes are in circulation on the basis of uncoined silver lying in the Treasury. There are also gold certificates and legal-tender certificates, representing similar deposits of gold or greenbacks in the Treasury, the sole purpose of the latter being to substitute notes of very large denominations in place of small ones. The currency of the U. S. at various periods has been as follows:

July 1, 1860.—Specie, $235,000,000; State bank-notes, $207,000,000: total, $442,000,000.

July 1, 1865.—Specie (Pacific coast), $25,000,000; State bank-notes, $143,000,000; fractional currency, $25,000,000; U. S. notes, $431,000,000; national bank-notes, $146,000,000: total, $770,000,000 (of which $55,000,000 was in the U. S. Treasury).

July 1, 1870.—Specie (Pacific coast), $25,000,000; State bank-notes, $2,000,000; fractional currency, $40,000,000; U. S. notes, $356,000,000; national bank-notes, $301,000,000: total, $723,000,000 (of which $48,000,000 was in the U. S. Treasury).

July 1, 1875.—Specie (Pacific coast), $25,000,000; State bank-notes, $1,000,000; fractional currency, $42,000,000; U. S. notes, $376,000,000; national bank-notes, $354,000,000: total, $798,000,000 (of which $44,000,000 was in the U. S. Treasury).

The currency of Great Britain consists of gold, subsidiary silver, and Bank of England notes, with a few notes of local banks, not having much importance for the general circulation. Of the Bank of England notes, £15,000,000 are based on securities held by the bank itself, and in this respect are somewhat like national bank-notes. All notes in excess of that amount are secured, pound for pound, by coin in the vaults of the bank, and are, to all intents and purposes, analogous to the gold certificates of the U. S. The Government does not use paper money of its own. The currency of France consists mainly of gold, under a system of free coinage and legal tender, with a good deal of silver having the legal-tender character, but not free coinage. Notes are issued by the Bank of France in very considerable amounts, but without the restrictions as to reserve that govern the Bank of England. The currency of Germany is like that of France, without the legal-tender silver. Russia has a depreciated paper currency. Austria and Italy have a paper currency, but on a much sounder basis than that of Russia. The volume of currency in different states of the world at the end of 1885 was estimated by Haupt to be as follows:

COUNTRIES.	MILLIONS OF DOLLARS.					
	Gold.	Standard silver.	Fractional silver.	Copper and nickel.	Paper in excess of reserve.	Total.
United States	604	211	72	14	302	1,206

China	...	700	...	..	...	700
And for the world as a whole	3,447	3,033	539	92	1,710	8,820

Inflation and Depreciation of the Currency.—Whatever is used as a general medium of exchange naturally serves as a measure of value. A man will not commonly speak of a ton of coal as worth five bushels of wheat, because he does not actually exchange one for the other; but will speak of a ton of coal as worth $5 or a bushel of wheat as worth $1. Money thus becomes the general measure of debts and obligations, and this in civilized states grows to be its most important function. In the older contracts, for instance, in England in the eleventh, twelfth, and thirteenth centuries, and in the feudal obligations of the same time, the services are found measured either in day's labor, bushels of wheat, or provender for horses, and each man's obligations were fixed in this way long after money had come into frequent use. But from the thirteenth to the fifteenth centuries there was a commutation of labor dues or dues in kind, for money payments, so that a man held his land not in virtue of so many days' service per year, but of so many pence or shillings per year. When money became so important a feature in contracts one of its chief uses was to pay interest or principal on debts; and the question whether anything was or was not money came to depend not so much on its acceptability as on the question whether the Government and the courts made it a legal tender for the discharge of such debt. This legal tender might also vary in value from time to time. Sometimes, either by the debasement of the coin itself or by the issue of paper money and other substitutes for the metals, it would depreciate, and the amount of work necessary for the discharge of a debt be less than was at first contemplated; sometimes, though less frequently, money would become scarcer and the quantity of labor necessary to discharge a debt greater.

The value of money, like that of anything else, depends upon supply and demand. (See POLITICAL ECONOMY.) Anything which increases the amount of money while the amount of transactions remains the same will diminish the value of money or increase the value of everything else measured in money. In other words, it will raise prices. Conversely, anything which diminishes the amount of money while the transactions remain the same, or increases the amount of transaction while the supply and the circulation of money are not increased, will tend to lower prices. It should be observed that it is not the quantity of money alone which enters into this calculation, but the quantity of money and the rapidity of circulation. A small amount of money in a country with a good banking system may go further than a much larger amount of money where payments have

to be made from hand to hand by old cumbersome methods; but with this reservation, the relation between quantity of money and quantity of work to be done by that money determines prices. An increase in the number of dollars will make a dollar purchase less goods; or, to put the matter in another way, inflation of the currency raises prices all around.

The danger of "fiat money" or light weight money, or any other money not used by other nations with whom the U. S. deal, lies in the liability to inflation by act of Congress. If the Government takes a certain number of grains out of every dollar and at the same time coins no more dollars than would otherwise have been issued, the value of a dollar may for a long time remain unchanged. Or if the Government substitutes paper dollars which have no intrinsic value for metallic dollars which have a great intrinsic value, prices may remain nearly unchanged as long as the issue is strictly limited to the old amount. Such a case was seen in France during the war of 1870, where the displacement of gold and silver by paper did not have a corresponding effect in prices, nor cause a large gold premium, because the Bank of France restricted its issue to the amount actually needed. Somewhat the same course of events is seen in the U. S. to-day, where the debasement of the silver dollar has not produced a gold premium, because the issue of silver and paper dollars has not as yet been sufficient to drive out the gold currency. But such self-restraint rarely lasts for a long time. A debased currency is demanded, as a rule, from one of two causes: either by the Government officials in some fiscal exigency where they want to issue as many dollars as they can, or by debtors as a class where they wish to have the currency depreciated. Under the operation of these causes excessive issues are almost inevitable when debasement or recourse to irredeemable paper has once begun.

With a gold currency, or a currency composed of gold, silver, and paper together, the fall in the value of a dollar is limited by international trade. If for any cause there is an increased issue of money and it begins to drive prices up a little, the U. S. become a good place to sell in and a bad place to buy in. Persons engaged in foreign trade therefore will send more goods to the U. S. than would otherwise be the case and export fewer goods to pay for them. There will thus be an export of gold and a diminution in the amount of money to counteract the excessive issues. If, on the other hand, owing to the exigencies of moving the crops or any other set of special causes, commercial or fiscal, there becomes a scarcity of money, the U. S. become a good place in which to buy goods and a relatively bad place for selling them. Under such conditions the U. S. export more than they import, and receive gold in partial payment of the difference. The demand for additional quantity thus adjusts itself by international trade, and the U. S. is not subject to variations of value of money and alternate periods of stringency and ease which characterized the years preceding the Resumption Act.

If the gold currency were driven out and silver were alone the medium of exchange, the case would be different. The bullion value of the silver dollar in the markets of the world is less than that of the gold dollar. If, therefore, an increased issue of silver dollars should drive prices up, there would be no demand for exportation of our excess, and the depreciation of the currency or, what is the same thing, the increase of prices might go on until the value of a dollar came down to the limit of the worth of the silver bullion which it contains in the markets of the world. Under silver currency, however, there would be ultimately such a limit, because silver has great utility and considerable cost of production, and the limit of inflation and consequent depreciation of prices would be furnished by the utility and the cost of production of 371 grains of silver, the amount of pure metal in a dollar. With paper there is no such limit. The issue of greenbacks is limited only by the self-restraint of Congress, and how little one can depend on that self-restraint in political exigencies is only too well known. In the time of the civil war issues of greenbacks were crowded to such an excess that a greenback dollar was worth little over a third as much as a gold dollar, with the consequent disturbance of prices and loss to the Government as a purchaser of supplies, which probably more than outweighed any fiscal advantage gained from the issue of paper money. In the Confederate States in the civil war, or in the whole country during the Revolution, the issue of paper money went very much further, so that transactions were often practically reduced to a system of barter, and all industry crippled even more than is inevitable under the stress of a war. The history of nations in general shows that very few, even of the wisest, can be trusted with the dangerous expedient of issuing irredeemable paper money as a legal tender for the payment of debts. It may be thought that the debtors, as a class, gain by such an issue as much as the creditors lose, and that therefore the effect of varying values is not so bad as would appear. This is a mistake. Whatever the debtor may temporarily gain by the scaling down of debts is lost by diminished power of borrowing money in the future. To borrow money for purposes of investment is for the advantage of debtor and creditor alike, but especially of the former, since he is able to take advantage of exceptional natural opportunities which would otherwise be lost to him. Anything which makes the payment of debts more uncertain makes borrowing more difficult, if not absolutely impossible. The creditor will secure protection by the charge of an exorbitant rate of interest, which more than outweighs any possible gain from the depreciation in those cases where loans are made, and in the majority of cases no loans will be made at all, and development of the country will be interfered with.

The foregoing criticisms apply chiefly to the issue of irredeemable paper by the Government. Redeemable paper, especially if not legal tender, is not subject to these dangers. It is more convenient to handle in large sums than gold or silver. It economizes the wear of the coin and prevents, to some extent, the necessity of keeping large masses of coin idle. Such paper may be issued either by the Government or by banks. If the Government issues it, there is perhaps a certain saving of interest to the people, but this advantage is, as a rule, more than counterbalanced by the danger of the abuse of this issuing. If it is in the hands of the banks it is not so liable to abuse. The banks can not declare their notes a legal tender; they can not fail to redeem them without at once having their affairs wound up. More than that, the issue of bank-notes enables the currency of the country to adapt itself, in some measure, to the volume of local business more readily perhaps than would be the case with gold or silver. (See BANKS.) But even under the best banking system there is great danger of the abuse of the issue of paper money. Any gain in economizing the use of coin is more than counterbalanced by danger of undue expansion of the credit system, and of failure of the reserves just when they are most needed by it in a war or in a crisis, for bank-notes ordinarily displace in the use of the nation an almost equivalent amount of metallic currency, and have the effect of making business depend too much upon credit and too little upon cash reserves. There is a large school of writers that believes that paper money should be of the nature of gold or silver certificates; in other words, that every dollar of paper should represent a metallic dollar held actually in reserve somewhere, and that any economy due to the adoption of more moderate reserves is outweighed by the danger which it causes.

See Jevons, *Money and the Mechanism of Exchange*; F. A. Walker, *Political Economy*, for general principles, and for further details the same author's work on *Money*. See also articles on BANKS, COINAGE (for the value of money of different nations), MONEY, and SILVER.

ARTHUR T. HADLEY.

Current: in electricity, a term of convenience to indicate the process by which equalization of electrical potential in conductors takes place. For a description of the phenomena which accompany this process, such as the development of heat in the circuit, electrolysis, the establishment of a magnetic field in the surrounding medium, etc., see ALTERNATE CURRENTS and ELECTRICITY; for means of producing current, see BATTERY and DYNAMO-ELECTRIC MACHINES; and for methods of measuring current, see GALVANOMETERS.

E. L. NICHOLS.

Current-meter: a wheel driven by the motion of the water and which, placed in a stream, records its velocity by means of the number of revolutions of the wheel. The simplest form is a small paddle-wheel, but this can determine only the velocity of the surface. The self-recording instruments devised by Woltmann, Brewster, Saxton, and others are arranged like a windmill, so that the plane of the wheel is perpendicular to the current. The modern forms of these current-meters have electric attachments which communicate with a recording apparatus on shore or in a boat. The current-meter is the most accurate instrument

for determining the mean velocity of a river or canal. To derive the velocity from the number of recorded revolutions per second, the meter must be first rated by pushing it at a known velocity in still water. It is usually found that the number of revolutions is not exactly proportional to the actual velocities of the boat, but the relation being ascertained for different speeds the corrections to be applied in subsequent work are thus known.

MANSFIELD MERRIMAN.

Current River: of Missouri and Arkansas; rises in Texas co., Mo.; flows southeastward into Arkansas, and enters the Black river in Randolph County. Length, estimated at 250 miles. It is a remarkably clear stream, abounding in fish of good quality. It is navigated by flatboats and steamers to some extent. Jack's Fork enters the main stream from the W. in Shannon co., Mo., and steamboats can ascend nearly to the union of the forks in good stages. The river flows through a hilly mineral region.

Currents, MARINE: See OCEAN and GULF STREAM.

Currer Bell: See BRONTÉ, CHARLOTTE.

Currie, JAMES, M. D.: b. at Kirkpatrick Fleming, in Dumfriesshire, Scotland, May 31, 1756. He was destined for mercantile business, and sent out to Virginia while still very young. After the outbreak of the Revolutionary war, however, he returned to Scotland, studied medicine in Glasgow, and settled in 1780 in Liverpool as a physician. His *Medical Reports on the Effects of Water, Cold and Warm, as a Remedy in Fevers and other Diseases*, ran through several editions, but he is best known by his edition of Burns's works (1800). D. in Liverpool, Aug. 31, 1805.

Currie, JOHN, D. D.: theologian; b. in Tatamagouche, Colchester co., Nova Scotia, Dec. 22, 1828; educated at the home grammar school, at Pictou Academy, and in Edinburgh, Scotland. He was a teacher in the public schools of Nova Scotia for eight years, pastor of a Presbyterian church in Maitland, Nova Scotia, for fourteen years, and from 1871 Professor of Hebrew and Exegesis in the Presbyterian Theological College at Halifax. He is a thoughtful and scholarly writer of articles on exegetical subjects and subjects connected with theological study. WILLIS J. BEECHER.

Curry, DANIEL, D. D., LL. D.: Methodist divine and journalist; b. near Peekskill, N. Y., Nov. 26, 1809; graduated at the Wesleyan University, Connecticut, in 1837; was the same year principal of Troy Conference Academy; entered the ministry in Georgia in 1841; and occupied pulpits in Athens, Savannah, and Columbus, S. C. He returned to the North after the division of his denomination through the slavery controversy, and joined the New York Conference; had pastoral charge of important churches in New York and other cities; was three years president of the Indiana Asbury University (1854–57), at Greencastle, Ind.; resumed his labors in the East; contributed largely and ably to the periodical literature of his Church, and in 1864 was appointed editor of its chief official journal, *The Christian Advocate*, New York city, which office he held till 1876. He was editor of the *National Repository* (1876–80), associate editor of the *Methodist Review* (1881–84), and chief from 1884 till his death in 1887. He was author of a *Life of Wycliff* (New York, 1846); *New York, the Metropolitan City of America*, an historical sketch (New York, 1853); *Life Story of Bishop D. W. Clark* (1873); *Fragments, Religious and Theological* (1880); *Platform Papers* (1880); *The Book of Job*, a commentary (1888). He edited Southey's *Life of Wesley* (2 vols., 1852); the works of Rev. Dr. James Floy (2 vols., 1863), and Adam Clarke's *Commentary on the New Testament* (2 vols., 1882–84). D. in New York city, Aug. 17, 1887. Revised by JOHN F. HURST.

Curry, JABEZ LAMAR MONROE, D. D. (1871), LL. D. (1867): statesman, educator, and diplomat; b. in Lincoln co., Ga., June 5, 1825; educated in the University of Georgia and at Dane Law School, Harvard College, graduating at the former in 1843 and at the latter in 1845; member of the lower house in the Legislature of Alabama; member of the electoral college that cast the vote of Alabama for Buchanan and Breckinridge in 1856; member of the U. S. House of Representatives from Alabama, from 1857 to 1861; aide to Gen. Johnston while in command in Georgia; lieutenant-colonel of cavalry; president of Howard College, Alabama (1866–68); president of Alabama Baptist State convention; president of the Foreign Mission Board of Southern Baptist convention; president of the board of trustees of Richmond College; member of the House of Representatives in the Confederate Congress; Professor of English Literature, Philosophy, and of Constitutional and International Law in Richmond College 1868–81; envoy extraordinary and minister plenipotentiary to Spain 1885–88; general agent and honorary trustee of the Peabody education fund 1881–85; trustee and chairman of educational committee of the John F. Slater fund. Dr. Curry's publications include reports of Peabody education and of John F. Slater funds, numerous addresses, *Constitutional Government in Spain* (New York, 1889); and *William Ewart Gladstone, a Study* (Richmond, Va., 1891). W. H. WHITSITT.

Curso'res [Lat., the runners, deriv. of *cur'rere, cursus*, run]: an order of birds comprising the ostrich and allied forms (see BREVIPENNES); also sometimes used for a group containing many of the wading birds. In entomology, cursores is applied to certain spiders which capture their prey by running—the wolf-spiders (*Lycosidæ*). F. A. L.

Curtein, or **Curtana** [Anglo-Fr. *curtein*; Mediæv. Lat. *curtana* < Lat. *curtus*, broken off]: the name originally given to the sword of ROLAND (*q. v.*), the point of which broke off when it was first tested. The name has since been given to the pointless sword carried, as the emblem of mercy, before the sovereigns of England at their coronation.

Curtin, ANDREW GREGG: Governor of Pennsylvania: b. Apr. 22, 1817; son of Roland Curtin, one of the earliest iron manufacturers in Centre County, who removed to the U. S. from Ireland in 1793. He studied law in Dickinson College, canvassed the State in 1844 for Henry Clay, was appointed secretary of the commonwealth in 1854, was elected Governor in 1860, and displayed great energy and promptitude when the first call for troops came at the opening of the civil war. In 1863 he was re-elected by a large majority, and in 1869 was appointed minister to St. Petersburg; was member of constitutional convention of Pennsylvania; joined the Democratic party, and was elected to the 47th, 48th, and 49th Congresses. D. at Bellefonte, Pa., Oct. 7, 1894.

Curtis, BENJAMIN ROBBINS, LL. D.: lawyer; b. in Watertown, Mass., Nov. 4, 1809; graduated at Harvard in 1829, and was admitted to the bar in 1832, after which he practiced law in Boston. He was appointed a judge of the Supreme Court of the U. S. in 1851, but he resigned that office in 1857. He was one of the counsel who defended President Johnson in his trial before the Senate, in Apr., 1868. He was the author of several volumes of legal reports. D. at Newport, R. I., Sept. 15, 1874. See his *Life and Writings*, edited by his son.

Curtis, EDWARD, A. B., M. D.: physician; b. in Providence, R. I., June 4, 1838; was educated in New York; graduated in 1859 at Harvard College; studied medicine at the University of Pennsylvania, where he took his degree in 1861; served in the regular army as a surgeon 1861–70; was appointed Professor of Materia Medica and Therapeutics at Columbia College, New York, in 1872; has devoted himself much to the study of photographing microscopic objects by means of the microscope, and has published various papers on the subject.

Curtis, EDWARD LEWIS, D. D.: theologian; b. at Ann Arbor, Mich., Oct. 13, 1853; graduated at Yale College 1874, and at Union Theological Seminary 1879, winning a fellowship. He studied in Germany, and on his return in 1881 became an instructor, and in 1884 Professor of Hebrew and Old Testament Literature in the McCormick Theological School. In 1891 he became professor in the same department in the Yale Divinity School. He has contributed to the reviews articles relating to biblical subjects. GEORGE P. FISHER.

Curtis, GEORGE HENRY: musician; b. in Troy, N. Y., 1819; attended Trinity School in New York city, under his elder brother, the Rev. John W. Curtis; began studying music against the wish of his parents, but persevered and became a good pianist, organist, and theoretical musician. His first important composition was the cantata *Eleutheria*, the text written by Horatio Stone. This work was produced in Apr., 1849. Mr. Curtis composed a number of songs and choruses to poems by Bryant, and a cantata on the subject of Julian the Apostate in 1878. This was never performed. He is the author of a number of school music books, and in 1884 published his *Prima Donna and Scenes from Real Life*. He was for thirty-four years a class teacher in the New York public schools. D. E. HERVEY.

Curtis, GEORGE TICKNOR: jurist; b. in Watertown, Mass., Nov. 28, 1812; graduated at Harvard in 1832; admitted to the bar in 1836, and practiced law in Boston. His works

include treatises *On the Rights and Duties of Merchant Seamen* (1841); *On the Law of Copyright* (1847); and a *History of the Origin, Formation, and Adoption of the Constitution of the United States* (2 vols., 1855–58); a *Life of Daniel Webster* (2 vols.); a *Life of James Buchanan* (1883); and *Creation or Evolution* (1887). D. in New York, Mar. 28, 1894.

Curtis, George William, LL. D., L. H. D.: author; b. in Providence, R. I., Feb. 24, 1824. After going to school for a time at Jamaica Plain, Mass., he removed with his father to New York, where he remained from 1839 to 1842. From 1842 to 1846 he worked on a farm, a portion of the time as a member of the Brook Farm Community at West Roxbury, where he was greatly influenced by the writings of Emerson. Going to Europe in 1846 he passed about four years in Italy, Germany, Syria, and Egypt. Returning to the U. S. in 1850, he was engaged for a time as one of the editorial staff of the New York *Tribune*. In 1852 he became one of the editors of *Putnam's Monthly*. In 1855 the magazine passed into the hands of a firm to which Mr. Curtis was admitted with pecuniary responsibility, but with no part in its commercial management. In the course of the next two years the house, having undertaken a general publishing business, and having become seriously involved in debt, was obliged to go into liquidation. Mr. Curtis, by means of his meager private fortune and his earnings, undertook the work of saving the creditors from loss. This he was finally able to accomplish, but it was not until he had devoted the efforts of sixteen years to the arduous task. In 1853 he began the remarkable series of papers in *Harper's Monthly* known as the *Easy Chair*. About the same time he entered the lecture field, and at once took rank as one of the most accomplished and popular lecturers of the day. In 1856 he first entered the field as a political speaker, and in the following year he became the leading editorial writer of *Harper's Weekly*, a position which he continued to hold till his death. He was a delegate to the Republican conventions in 1860, 1864, and 1876. In 1867, as delegate at large in the constitutional convention of the State of New York, he was chairman of the committee on education, and framed the constitutional provisions on the subject of education. In 1862 he declined the position of consul-general to Egypt offered him by President Lincoln. President Hayes, desiring to avail himself of Mr. Curtis's accomplishments, asked him, in 1877, to select a foreign mission, and a little later made him the specific offer of the mission to Germany. Both positions, however, were declined on account of the pecuniary sacrifices involved in a residence at one of the prominent European courts. In 1864 Mr. Curtis accepted the office of regent of the University of the State of New York, and in 1890 became chancellor. He was one of the first and most powerful, as well as most consistent, advocates of civil-service reform. Appointed by President Grant chairman of the commission to draw up new rules for appointment in the civil service, he soon resigned on account of differences between himself and the President in regard to the manner of applying the rules that had been adopted. At the organization of the National Civil Service Reform League he was chosen its president, and his annual addresses to the league were justly looked forward to as most important contributions to the literature of the subject. On all the political questions of the day he exerted a powerful influence; and though he was a voluminous writer it may be said he never wrote a line the influence of which was not elevating in its nature. All the products of his pen have a grace and beauty that give them a distinct place in literature. The esteem in which he was held by the most judicious of his contemporaries was well voiced by James Russell Lowell, who wrote:

> Had letters kept you, every wreath were yours;
> Had the world tempted, all its chariest doors
> Had swung on flattered hinges to admit
> Such high-bred manners, such good-natured wit;
> At courts, in senates, who so fit to serve?
> And both invited, but you would not swerve,
> All meaner prizes waiving, that you might
> In civic duty spend your heat and light
> Unpaid, untrammeled, with a sweet disdain
> Refusing posts men grovel to attain.

He died at his home on Staten Island, Aug. 31, 1892. He published *Nile Notes of a Howadji* (New York, 1851); *The Howadji in Syria* (1852); *Lotus Eating* (1852); *Potiphar Papers* (1853); *Prue and I* (1856); *Trumps* (1862); *Eulogy on Wendell Phillips* (1865); *Motley's Correspondence* (1890); *From the Easy Chair* (1892). C. K. Adams.

Curtis, Moses Ashley, D. D: botanist; b. in Stockbridge, Mass., May 11, 1808; educated in Williams College, and in 1835 ordained a clergyman in the Protestant Episcopal Church in North Carolina. He early became interested in botany, and later devoted himself to the study of the fungi. His principal publications are the following: *Enumeration of Plants Growing Spontaneously around Wilmington, N. C.* (1834); *Contributions to Mycology of North America* (1848); *New Fungi Collected by the Wilkes Exploring Expedition* (1851); *Catalogue of the Plants of North Carolina* (1860); *Esculent Fungi* (1866); *Indigenous and Naturalized Plants of North Carolina* (1867); *Edible Fungi of North Carolina* (1869). D. in Hillsborough, N. C., 1872.

Charles E. Bessey.

Curtis, Samuel Ryan: U. S. military officer; b. near Champlain, N. Y., Feb. 3, 1805; graduated at West Point in 1831, served in the Mexican war and in the civil war on the Union side; attained the rank of major-general of volunteers and took command of the Army of the Southwest (1862). He was engaged in driving the enemy from Missouri, and fought in the battle of Pea Ridge and numerous actions on his difficult march of over 1,000 miles to Helena, Ark.; U. S. commissioner to negotiate Indian treaties 1865, and to examine the Union Pacific Railway 1865–66, with which he had been closely identified from the beginning. D. at Council Bluffs, Ia., Dec. 26, 1866.

Curtiss, Samuel Ives, Ph. D., D. D.: theologian; b. at Union, Conn., Feb. 5, 1844; graduated at Amherst College 1867, and at Union Theological Seminary 1870. He was a pastor in New York 1870–72, and of the American chapel in Leipzig 1874–78. He became Professor of Old Testament Literature in the Chicago (Congregational) Seminary in 1878. Besides translations from the German, he has published several theological works; among them *The Levitical Priests* (1877). He has also furnished articles to periodicals and to the yearly publication *Current Discussions on Theology* (1883, *seq.*). He is one of the editors of the *Bibliotheca Sacra*. George P. Fisher.

Curtius, koor'tsi-oos, Ernst: archæologist and historian; b. in Lübeck, Germany, Sept. 2, 1814; educated at Bonn, Göttingen, and Berlin; accompanied O. Müller to Greece, where he spent several years. On his return he became the tutor of the Crown Prince Frederick William, afterward Frederick III. In 1856 Curtius succeeded C. F. Hermann at Göttingen, and was called to Berlin in 1865. He superintended the excavations at Olympia from 1875 to 1880. Among his many contributions to Greek history and archæology the most noteworthy are *Peloponnesos* (2 vols., Gotha, 1851); *History of Greece*, 6th ed. 1889 (transl. by A. W. Ward, 5 vols., 1874); *Alterthum und Gegenwart* (3 vols.); *Die Stadtgeschichte von Athen* (Berlin, 1891). D. at Berlin, July 11, 1896. Alfred Gudeman.

Curtius, Georg: classical scholar; brother of Ernst Curtius; b. in Lübeck, Apr. 16, 1820; became Professor of Comparative Philology at Leipzig in 1862. Author of a *Greek Grammar* (1855); *Das Verbum der griechischen Sprache* (2 vols., Leipzig, 1876); *Grundzüge der griechischen Etymologie* (1862; 1879, 5th ed.); *Philologie und Sprachwissenschaft* (Leipzig, 1862). D. at Hermsdorf, Aug. 12, 1885. See Windisch, *Biographisches Jahrbuch IX.* (1886), pp. 75–128.

Alfred Gudeman.

Cur'tius, Marcus, or Mettus: a patriotic Roman youth, who is said to have sacrificed his life for his country about 362 B. C. According to tradition, a chasm opened in the Forum of Rome, which the soothsayers declared could not be filled except by the sacrifice of the chief wealth or strength of the Roman people. Curtius, completely armed, plunged on horseback into the chasm, which immediately closed up.

Curtius, Quintus: See Quintus Curtius.

Curtius, koor'tsi-oos, Theodor: chemist; b. in Dinsburg, 1857. In 1890 he became Professor of Chemistry in Kiel. He prepared hydrazine, and later discovered azoimide or hydrazoic acid, a strong acid of the formula N_3H, resembling hydrochloric acid in many of its properties. I. R.

Cu'rule Chair (Lat. *sella curu'lis*): among the ancient Romans, a throne or chair of state, one of the emblems of ancient kingly power, which was retained by the magistrates of the republic. Its use was limited to the consuls, prætors, curule ædiles, censors, the flamen dialis, and to the dictator or his deputies. In later times the emperors, as well as many inferior officers, sat upon it. Curule chairs were at first or-

namented with ivory, and later sometimes made of ivory and inlaid with gold.

Curule Magistracies: those of the greatest dignity in ancient Rome; so called because the persons who held them enjoyed the privilege of sitting on curule chairs (*sellæ curules*) when engaged in their public duties.

Curupaity: See HUMAÏTA.

Curve [from Lat. *cur'vus*, bent, crooked]: a line which continually changes its direction, or, to speak with more accuracy, a line no part of which is straight. A plane curve is one all parts of which lie in the same plane; one not plane is called a curve of double curvature, or tortuous curve. In a plane curve we recognize at each point (1) the direction of the curve represented by the tangent line at that point; (2) the degree of curvature of the curve, represented by the rate at which the direction is changing as we pass along the curve, and equal to the curvature of a circle having the closest possible contact with the curve at that point. In the case of a tortuous curve we have at each point (1) a certain direction, as in a plane curve; (2) an osculating plane, which means the plane having the closest possible contact with the curve at the point, or, in mathematical language, the plane containing two consecutive tangents, or three consecutive points of the curve; (3) the principal normal to the curve, being that normal which lies in the osculating plane, and therefore the same as the line in which the osculating plane intersects the plane perpendicular to the curve itself. The binormal is the normal perpendicular both to the osculating plane and the tangent to the curve. The curvature is equal to the curvature of the circle which lies in the osculating plane, and has the closest possible contact with the curve. The angle of torsion is the angle between two consecutive osculating planes.

In modern geometry curves are classified according to the degree of the equation by which they are represented. A straight line is represented by an equation of the first degree between the co-ordinates; a curve by one of a higher degree. To represent a tortuous curve two equations between three co-ordinates are necessary. S. NEWCOMB.

Curwen, JOHN: founder of the Tonic Sol-fa system of music; b. at Heckmondwike, Yorkshire, England, Nov. 14, 1816; educated for the Nonconformist ministry; took up the work which filled the rest of his life in 1841; issued his *Grammar of Vocal Music* in 1843; founded the Tonic Sol-fa Association in 1853 and the Tonic Sol-fa College in 1879. In 1864 he gave up his ministerial work, and devoted himself entirely to teaching the system. He edited and published many works on the system. He died June 26, 1880, and the work has since been continued by his son, John Spencer Curwen. D. E. HERVEY.

Curwensville: borough; Clearfield co., Pa. (for location of county, see map of Pennsylvania, ref. 4–D); situated on railway and on Susquehanna river; 6 miles above Clearfield; in a mining region. It has tanneries. foundries, woolen-mills, etc. Pop. (1890) 1,664; (1900) 1,937.

Curzon, GEORGE NATHANIEL: See the Appendix.

Curzon, kür'zōn', **PAUL ALFRED, de**: landscape and figure painter; b. in Moulinat, France, Sept. 7, 1820. Pupil of Drolling and Cabat; second-class medals, Paris Expositions. 1878 and 1889; Legion of Honor 1865. His *Dominicans Decorating their Chapel* and *Ostia* are in the Luxembourg Gallery, Paris. D. in Paris, July 22, 1895.

Cusa-Amari, SALVATORE: Orientalist; b. in Palermo, Italy, Sept. 20, 1822; since 1875 Professor of Arabic in the University of Palermo. Among his publications are a mediæval Moslem description of Rome (1878) and the *Arabic Cosmography of Haytun the Armenian* (1878).

Cusack, MARY FRANCES: See the Appendix.

Cusack-Smith, Sir BERRY: See the Appendix.

Cusanus, NICHOLAUS, whose true name was **Nicolai Chrypffs**, or **Krebs**, and who is also known under the name **Nicholas de Cusa**: theologian; received his surname from Cues, or Cusa, a village on the Moselle, in the diocese of Treves, where he was born in 1401. He was of poor and humble parentage, and early entered the service of Count Ulrich of Manderscheid; but his great natural gifts soon became apparent, and the count sent him to be educated in the school of the Brethren of Common Life at Deventer. Thence he went to the University of Padua, where he studied law and took his degree as Doctor of Laws 1424. As he lost the first case he pleaded, at Mayence, he at once abandoned the legal career and entered the Church, and was ordained a priest 1430. He soon obtained preferment. His knowledge of mathematics and astronomy, of Hebrew and Greek, of philosophy and theology, gave him a great authority. He was made Archdeacon of Liège, and as such he was sent to the Council of Basel in 1432. While there he wrote his *De catholica concordantia*, in which he attacked the secular power of the pope and the donation of Constantine, and his *De authoritate præsidendi in concilio generali*, in which he defended the supreme authority of the œcumenical council and the independence of the secular princes. Nevertheless, a few years later on, as the intimate friend of Eugenius IV., who sent him as papal legate on many important missions, and of Nicholas V., who made him a cardinal in 1448 and Bishop of Brixen in 1450, he maintained and propagated the very opposite views. This singular change has generally been ascribed to ambition and cowardice, but the simplicity, honesty, and ascetic tendency of his private life forbid such an explanation, while his philosophy seems to proffer another. In his *De docta ignorantia* and *De conjecturis*, his two principal philosophical works, he starts from the proposition that absolute truth is completely incongruous with the human mind, that the human mind can only form opinions, conjectures about absolute truth, etc. But this doctrine, which made him a mystic, and not a skeptic, goes far to explain the above change of views; and it must be added that his mysticism was of a rather obscure and confused description. He carried it along with him also into his scientific studies; though he actually anticipated the improvements of the Julian calendar, introduced by Gregory VII., the Copernican view of the earth's position in the solar system, etc., he also wrote *De quadratura circuli*, in which he asserted that that problem was solved, and *De novissimis diebus*, in which he prophesied that the world would be destroyed in 1734. He was the intellectual parent of Giordano Bruno, and the first to break with Scholasticism. The last years of his life were very much troubled. Archduke Sigismund would not recognize him as Bishop of Brixen. The duke imprisoned the bishop (1457), and only released him on very hard conditions. The pope vigorously aided him, and the case was laid before the emperor. Cusanus died at Todi, 24 miles S. of Perugia, Aug. 11, 1464, before an agreement was reached. The decision given after his death was in his favor. The latest edition of his works is that by Henri Petri (Basel, 1565; trans. of the chief by F. A. Scharpff, Freiburg, 1862). See J. M. Dux, *Der deutsche Kardinal N. von Cusa* (2 vols., Regensburg, 1847); F. A. Scharpff, *Der Kardinal und Bischof N. von Cusa als Reformator in Kirche, Reich und Philosophie* (Tübingen, 1871); Richard Falkenberg, *Philosophie des Nicholaus von Cusa* (Breslau, 1880). Revised by S. M. JACKSON.

Cuscus: the popular as well as the generic name for several of the PHALANGERS (*q. v.*). The cuscuses are stoutly built animals of moderate size, covered with thick woolly fur, with an opposable thumb and prehensile tail. They

Cuscus, or spotted phalanger.

range from Celebes to the Solomon islands, and southward to New Guinea and Northern Queensland. They are noteworthy as being the only Old World marsupials found W. of

Guinea, and the gray cuscus, *Cuscus orientalis*, was the first Australian marsupial seen by a European. The spotted cuscus, *Cuscus maculatus*, is about 3 feet in total length, of a yellowish white, marked with dark-brown blotches. It is found in Amboyna, Waigiou, and New Guinea, and is taken for its fur and flesh. It is slow and dull, growls like a cat when provoked, and fights vigorously. F. A. Lucas.

Cush: in the Old Testament, the name (1) of a person, the first son of Ham (Gen. x. 6, 7, 8; 1 Chr. i. 8, 9, 10); (2) of the country near the Gihon (Gen. ii. 13, marg.); (3) of the Nile, the Nile valley southward of Egypt from Syene to the junction of the Blue and the White Nile (Gen. x. 6), inhabited by the Cushites, or Ethiopians, akin to the Egyptians and distinct from the Negroes. In the Egyptian records the people of Cush are always distinguished from the Negroes in both name and appearance, they being always depicted with Caucasian features and of brown color.

Cushing, Caleb, LL. D.: jurist and scholar; b. in Salisbury, Mass., Jan. 17, 1800. He graduated at Harvard College in 1817; was for two years a tutor in that institution; was admitted to the bar, and settled at Newburyport; elected to State Legislature in 1825; visited Europe in 1829, and published *Reminiscences of Spain*. In 1835 he became a Whig member of Congress, in which he served four consecutive terms. As a political friend of President Tyler he separated from the majority of the Whigs in 1841, and joined the Democratic party. He gained distinction as an eloquent debater. In 1843 he was nominated as Secretary of the Treasury, but was rejected by the Senate. He was appointed commissioner to China in the same year, and negotiated the first treaty between the U. S. and that empire. Having equipped a regiment at his own expense, he served as colonel and finally as brigadier-general in the Mexican war in 1847. He was appointed a justice of the Supreme Court of Massachusetts in 1852, and was Attorney-General of the U. S. in the cabinet of Mr. Pierce from Mar., 1853, to Mar., 1857. He was one of the three lawyers appointed by President Grant to advocate the interests and rights of the Americans before the tribunal of arbitrators who met in Geneva in 1871 for the settlement of the "Alabama claims." Appointed minister to Spain in Dec., 1873, and held that office till Jan. 6, 1877. His publications include *The Practical Principles of Political Economy* (1826); *Growth and Territorial Progress of the United States* (1839); and *The Treaty of Washington* (1873). D. at Newburyport, Mass., Jan. 2, 1879.

Cushing, Frank Hamilton: ethnologist; b. at Northeast, Pa., July 22, 1857; spent his boyhood on a farm in Barry, N. Y., and early became interested in collecting Indian relics in Western New York. When sixteen years old young Cushing excavated many ancient camp sites and fortifications in Central New York, and Prof. Baird commissioned him to make collections and surveys for the National Museum. At the age of eighteen he entered Cornell University as special student of natural science, but he continued his studies and explorations, and was given charge of the modern portion of the National Museum collections at the Centennial Exhibition at Philadelphia in 1876. The next year he was made curator of ethnology, National Museum, and became a member of the Anthropological Society at Washington. After two years more of exploration he was appointed to service in the Bureau of Ethnology under Maj. J. W. Powell, and accompanied Col. James Stevenson on his expedition to the pueblos of New Mexico and Arizona. Here he remained for three years, learning the language of the Zuñis and adopting their costume and habits of life. He was adopted into the clan of the Macaw, appointed assistant head chief of the tribal council, and initiated into the principal cult society of *War and Fate*, the *Priesthood of the Bow*. In 1876 he recorded many Zuñi myths, folk-tales, songs, etc., and the next year took charge of the Hemenway exploring expedition among the ruined pueblos of the Southwest. In the summer of 1888 Mr. Cushing conducted excavations in the ruins of the Seven Cities of Cibola, discovered and identified by him seven years previously. He died in Washington, April 10, 1900.

Among Mr. Cushing's contributions to periodical literature and reports to the Bureau of Ethnology are *Zuñi Fetiches*, *Second Annual Report Bureau of Ethnology* (1881); *The Analogy between the Zuñi Sociologic and Mythic Systems* (in *Popular Science Monthly*, 1882); *The Nation of the Willows*, parts i., ii. (*Atlantic Monthly*, 1882); *My Adventures in Zuñi*, parts i., ii., iii. (*Century Magazine*, 1882–83); *A Study of Pueblo Pottery as Illustrative of Zuñi Culture-growth* (1883); *Discovery of the Seven Lost Cities of Cibola, and their Identification as Zuñi Ruins* (1884); *On Post-mortem Distortion of Skulls and its Relation to Burial and Cranial Classification* (*Science*, 1887); *The Villard-Bandelier Expedition*; and *Manual Concepts, or Hand-made Mind* (1892).

Cushing, Luther Stearns: jurist; b. in Lunenburg, Mass., June 22, 1803. He was reporter to the Supreme Court of that State, and published eight volumes of reports. He also published a *Manual of Parliamentary Practice* (1845), well-known as *Cushing's Manual*, and *The Law and Practice of Legislative Assemblies in the United States* (1855), etc. D. in Boston, June 22, 1856.

Cushing, Thomas, LL. D.: statesman; b. in Boston, Mass., Mar. 24, 1725; graduated at Harvard in 1744. His father, Thomas, was a prominent merchant and public-spirited citizen. The younger Cushing was speaker of the Massachusetts House of Representatives 1762–74, and a member in 1774 of the Provincial and the Philadelphia Congresses. He opposed a declaration of independence, but was regarded in Great Britain as the principal leader of sedition. "One object of the Americans," says Dr. Johnson in *Taxation no Tyranny*, "is said to be to adorn the brows of Mr. Cushing with a diadem." He was occupied throughout the Revolution with the affairs of Massachusetts, where he was a judge, and afterward Lieutenant-Governor. D. in Boston, Feb. 28, 1788.

Cushing, William, LL. D.: jurist; b. at Scituate, Mass., Mar. 1, 1732. He became chief justice of the superior court of Massachusetts in 1777, and associate justice of the Supreme Court of the U. S. in 1789; was nominated chief justice by Washington in 1796, but declined; was one of the founders of the American Academy of Arts and Sciences. D. at Scituate, Sept. 13, 1810.

Cushing, William Barker: commander U. S. navy; b. in Delafield, Wis., Nov. 4, 1843; appointed to the Naval Academy in 1857; resigned in 1858. He entered the service as a volunteer officer in 1861; received a commission as lieutenant in the navy July 16, 1862; became a lieutenant-commander in 1864, commander in 1872. In 1861 Cushing distinguished himself on the Blackwater, in the sounds of North Carolina, and at New River Inlet; in 1863 he added to his fame by his expedition up the Cape Fear and Little rivers and his brilliant operations on the Nansemond; and in 1864 by blowing up the ram Albemarle at Plymouth, N. C. At Smithfield, Wilmington, and in leading the men of the Monticello in the assault upon Fort Fisher, he displayed equal bravery and sound judgment. In 1866–67 he served in the Pacific squadron, and in 1868–69 commanded the Maumee of the Asiatic squadron. D. in Washington, D. C., Dec. 17, 1874.

Cushman, Charles H.: commander U. S. navy; b. in Maine, Dec. 6, 1831; entered the navy as a midshipman Mar. 24, 1849. He served in the Pembina at the battle of Port Royal, Nov. 7, 1861, and in the ironclad Montauk at the first attack on Fort Sumter Apr. 7, 1863, and in the many fights of that vessel with the defenses of Charleston harbor during the summer and fall of 1863. He was at both the Fort Fisher fights, and led one of the storming-parties in the assault on the fort of Jan. 15, 1865, where he was severely wounded. D. Nov. 11, 1883.

Cushman, Charlotte Saunders: actress; b. in Boston, Mass., July 23, 1816; a descendant of Robert Cushman (*q. v.*). The bankruptcy of her father, who had been a merchant, obliged her to support herself, and, having a fine contralto voice, she made her *début* as a singer in 1834. She joined an opera troupe; but, during an engagement in New Orleans, lost her voice, and was advised to become an actress. She appeared in 1835 as Lady Macbeth with great success, and removed to New York, where she played until 1840. In 1844 she accompanied Macready through the Northern U. S., and increased her fame as an impersonator of Shakspearean characters. In 1844 she appeared in London, where she was enthusiastically received, acting with her beautiful and gifted sister Susan. She returned to the U. S. in 1849; acted in Great Britain from 1853–57, spending part of every winter in Rome; in 1858, 1860, and 1871–75 acted and gave dramatic readings in the U. S., and retired as an actress at Boston, May 15, 1875. D. in Boston, Feb. 18, 1876. See *Charlotte Cushman, her Letters and Memories of her Life*, edited by Emma Stebbins (Boston, 1878).

Cushman, Robert: one of the founders of the Plymouth Colony; b. in Kent, England, about 1580. He aided the Pilgrims in escaping to Holland, and joined them in Leyden. He assisted Brewster in procuring a patent from King James, and with Carver chartered the Mayflower. He emigrated to Plymouth with his son Thomas in 1621, and preached Dec. 9 of that year the first sermon ever delivered in New England. He returned to England in 1621 to manage the business of the colonists, and died early in 1625.

Cus'ins, Sir William George: composer and teacher; b. in London, Oct. 14, 1833: a chorister in the chapel royal in his tenth year; entered the Brussels Conservatory in 1844; elected King's scholar in the Royal Academy of Music in 1847; appointed organist to the Queen's private chapel in 1849; assistant professor at the R. A. M. in 1857; conductor of the Philharmonic Society in 1867 (which he resigned in 1883), together with other positions of honor. His compositions are important though not numerous; they include *Royal Wedding Serenata* (1863); *Gideon*, oratorio for the Gloucester festival of 1871; a cantata *Te Deum*; two concert overtures; a pianoforte concerto in A minor; and a few smaller works. He was knighted by the Queen in 1892. D. Aug. 31, 1893. D. E. Hervey.

Cusp [from Lat. *cuspis*, point, tip, lance]: in architecture, a projecting point formed by the meeting of two circular arcs or foils tangent to the intrados of an arch. Cusps are especially common in Gothic tracery, window arches, and panels; they are also not infrequent in Moorish architecture.

Cusp, in astronomy, is a point or horn of the moon or of one of the inferior planets.

Cusp, in geometry, a point at which two tangents to a curve coincide. The two branches of the curve may either lie on the same side of the tangent, in which case the cusp is called *ramphoid*, or on opposite sides, when the cusp is *ceratoid*. The cissoid of Diocles furnishes an example of a cuspidate curve with a ceratoid cusp; the cusps of the new moon are ramphoid.

Cusset, küs'sā'; town of France; department of Allier; a mile E. of Vichy (see map of France, ref. 6–G); noted for its healthful and beautiful surroundings. It has manufactures of cotton and wool, vineyards, and mineral springs. Pop. (1896) 6,441.

Cust, Robert Needham: See the Appendix.

Custard Apple: See Anona.

Custer, Elizabeth Bacon: author; widow of Gen. George Armstrong Custer (*q. v.*), to whom she was married in 1864. Mrs. Custer shared her husband's campaigns against the Indians, and since his death has published *Boots and Saddles* (1885); *Tenting on the Plains* (1887); and *Following the Guidon* (1891). H. A. B.

Custer, George Armstrong: U. S. military officer; b. in New Rumley, O., Dec. 5, 1839; graduated at West Point in 1861; served in the civil war in the Manassas campaign 1861, engaged at Bull Run; in the Virginia Peninsula 1862, engaged at Yorktown, and aide-de-camp to Maj.-Gen. McClellan in the subsequent operations of the campaign; in the Maryland campaign 1862, engaged at South Mountain and Antietam; in the Rappahannock campaign 1863, engaged on "Stoneman's raid" and at Brandy Station; in Pennsylvania campaign 1863, engaged at Gettysburg (brevet major) and various minor actions; brigadier-general of volunteers in 1863; in operations in Central Virginia 1863–64, engaged in numerous skirmishes, etc.; in the Richmond campaign 1864, engaged at Wilderness, Todd's Tavern, Yellow Tavern (brevet lieutenant-colonel), Meadow Bridge, Haw's Shop, Cold Harbor, Trevillian Station, etc.; in the Shenandoah campaign 1864–65, engaged at Opequan (brevet colonel), Cedar Creek; brevet major-general for gallantry at Winchester or Cedar Creek and numerous smaller engagements; in command of the cavalry division in the pursuit of Lee's army 1865, engaged at Dinwiddie Court-house, Five Forks (brevet brigadier-general), Sailor's Creek, and Appomattox (brevet major-general); in command of the cavalry division in the military division of the Southwest and Gulf 1865; as chief of cavalry in the department of Texas 1865–66; major-general U. S. volunteers after Gen. Lee's surrender. After the war he was on Western frontier duty, where he was killed in battle, by the Indians, June 25, 1876.

Custine, küs'teen', Adam Philippe, Count de: French general; b. at Metz, Feb. 4, 1740; served as colonel at Yorktown, Va., in 1781; commanded brilliantly an army on the Rhine in 1792. His popularity and talents excited the jealousy of the Jacobins, and he was guillotined Aug. 28, 1793. See his memoirs by D'Hilliers, 1795.

Custine, Astolph Louis Leonard, Marquis de: grandson of Adam Philippe; b. at Niderwiller, Mar. 18, 1790; traveled through England, Scotland, Switzerland, Italy, Spain (1835), and Russia, and died Sept. 9, 1857. His work *La Russie en 1839* (4 vols., 1843) created at the time of its publication a profound sensation, and the Russian Government deemed it necessary to have an answer to it published.

Cus'tis, George Washington Parke: an adopted son of Gen. Washington; b. at Mount Airy, Md., Apr. 30, 1781. He was a grandson of Mrs. Martha Washington. He produced several plays and orations, and wrote a volume of *Recollections of Washington*, which was published in 1860. D. at Arlington House, Fairfax co., Va., Oct. 10, 1857.

Custody: in law, the care or possession of goods without any special or adverse property therein, as in the case of a servant who is charged with the keeping and care of property subject to the owner's direction. F. Sturges Allen.

Customs, or **Customs Duties**: originally applied to almost any tax or toll other than the general property tax; now practically confined to taxes on imports of foreign merchandise. See Finance, Tariffs, and Taxation.

Cus'tos rotulo'rum [Lat., keeper of the rolls]: in Great Britain, the first justice of the peace in a county, who is also the chief civil officer of the county, and nominally is the keeper of the rolls (writs, indictments, etc.). In practice, however, these are kept by the clerk of the peace, who is appointed by the custos rotulorum.

Revised by F. Sturges Allen.

Custozza, koos-tōd'zaă: Italian village near Verona (see map of Italy, ref. 3–D); scene of two victories by Austrians over Italians; on July 25, 1848, by Radetzky over King Charles Albert; and on June 24, 1866, by Archduke Albert over La Marmora.

Cüstrin: same as Cuestrin (*q. v.*).

Cutch, or **Katch**: a feudatory state of British Bombay, India; lying between the delta of the Indus, the Gulf of Cutch, and the *Runn* or *Ran* of Cutch, the latter an area of 7,000 sq. miles of arid land encrusted with salt. The natives are hardy sailors. The exports are cotton, glue, and oil. The political system is like feudalism, with a sovereign called a *rao* over about 200 chieftains. The best-known town is Bhuj. Area, 6,500 sq. miles. Pop. 512,000.

Revised by M. W. H.

Cutch: See Catechu.

Cutch Gunda'va: the most important province of Baluchistan; between lat. 27° and 29° 50′ N., and lon. 67° 20′ and 69° 15′ E. Area about 10,000 sq. miles. Surrounded by deserts, it is exceedingly fertile, exporting grain, cotton, and indigo. It is the most populous and valuable portion of the possessions of the Khan of Khelat.

Cuthæans, or **Cuthites**: the inhabitants of Samaria; so called in the Talmud and the Chaldee, because Shalmaneser colonized that part of Palestine with people from Cuthah, a district of Asia, and these colonists formed with the few remaining natives a mixed race.

Cuthbert: town and railway junction; capital of Randolph co., Ga. (for location of county, see map of Georgia, ref. 6–F); 118 miles S. W. of Macon. It has a college for boys and a college for girls, six churches, public schools, agricultural and horticultural industries. Pop. (1880) 2,129; (1890) 2,328; (1900) 2,641. Editor of "Liberal Enterprise."

Cuthbert (illustrious for skill), or **Guthbert** (worthy of God): early English saint; b. near Melrose-on-the-Tweed; entered the abbey there in 651, and in 664 became its prior, and shortly afterward prior of Lindisfarne. He retired in 676, and till 685 he led a solitary life on Farne or House island. On Mar. 26, 685, he was consecrated Bishop of Lindisfarne, but in 687 gave up his bishopric and retired to his cell on Farne island, where he died Mar. 20, 687. He had the credit of working miracles. His life was written by Bede.—Cuthbert, Abbot of Jarrow, wrote a moving description of the death of the Venerable Bede 735. (See Twysden, *Decem Scriptores*, 1652).—Cutibert, twelfth Archbishop of Canterbury (741–758), was a friend of Boniface, and sympathized with Pope Zacharias in his efforts to build up the papacy. His letter to St. Boniface describing ecclesiastical abuses is in Hussey's *Bede's Historia Ecclesiastica*. D. in Canterbury, Oct. 26, 758.

Cuthbert Bede: See Bradley, Edward.

Cutler, Elbridge Jefferson: scholar and poet; b. in Holliston, Mass., Dec. 28, 1831. From 1865 till his death, Dec. 27, 1870, he was Professor of Modern Languages at Harvard. He wrote *War Poems* (1867) and *Stella* (1868).

Cutler, John: See the Appendix.

Cutler, Manasseh, LL. D.: Congregational minister: b. in Killingly, Conn., May 3, 1742; graduated at Yale in 1765; was settled over a church in Ipswich, Mass.; served as a chaplain in the army in the Revolutionary war; studied law and was admitted to the bar before he became a minister. He was an accomplished botanist and proficient in other branches of science. He described 350 species of plants indigenous in New England. He was a leader of a party that settled Marietta, O., in 1788, and his services in connection with the settlement and political relations of that whole region were invaluable. He returned to his church in Massachusetts; declined a commission as judge of the Supreme Court of Ohio territory. He was a member of Congress (1801–05). D. at Hamilton, Mass., July 28, 1823. See the *Life of Manasseh Cutler* (2 vols., Cincinnati, 1888).

Revised by George P. Fisher.

Cutler, Timothy, D. D. Oxon.: educator and clergyman; b. in Charlestown, Mass., in 1685. He became president of Yale College in 1719; resigned in 1722; became a convert to episcopacy and in 1723 was ordained in England a member of the Church of England and became rector of a church in Boston. D. in Boston, Aug. 17, 1765.

Cutlery [deriv. of Eng. *cutler*, a maker of knives, from Anglo-Fr. *cotillere* < O. Fr. *cotelier*]: sharp and cutting instruments made of iron or steel. The most primitive cutting instruments were flints, shells, etc., which were succeeded by bronze implements and weapons, and these in turn by iron. In recent years the use of wrought iron for cutlery has been almost entirely superseded by steel, all kinds of steel, such as Bessemer, open-hearth, and crucible, being used for different classes of instruments. For the very finest instruments only the best quality of crucible steel is generally used. Formerly only the cutlery made in Sheffield, England, was considered to be of the highest grade—that is, for the 100 years following Benjamin Huntsman's invention of cast steel, in 1770—but now cutlery of excellent quality is made in many countries in Europe as well as in the U. S. Many centuries ago swords and knives were made in Damascus, and also, during the Middle Ages, in Spain and Italy, of qualities which are equal to the best produced in the present day. Cutlery is made almost exclusively by a forging process, hand-forging for knives and other small pieces, and forging under a power-driven helve-hammer for large pieces. The drop forging-press (introduced about 1860) is now superseding hand-forging. In the production of a fine quality of cutlery two things are most essential: first, the selection of steel of the quality proper for the particular instrument to be made; and second, great skill on the part of the workman in forging at the right heat and in tempering. In modern practice the element of personal skill is rendered less important by the adoption of heating furnaces, whose temperature is carefully regulated by pyrometers, and in tempering and annealing baths and furnaces, whose temperature is also closely regulated. The old method of drawing the temper, in which the extent of drawing is regulated by the workman's judgment of the color formed by a coating of oxide on the brightened surface of the hardened steel, is being superseded by the method of placing the articles in an oven of regulated temperature for a definite period of time. Axes and other cutting instruments which have a heavy thick portion and a cutting edge are commonly made of two kinds of steel, the former of a soft steel of cheap quality, and the latter of the finest crucible steel.

Cuttack, or **Cattack**: city; capital of a district of the same name; on the Mahanadi river; 250 miles S. W. of Calcutta (see map of N. India, ref. 9–H). It has a temple and mosques, chapels, and manufactures of shoes, brass, and salt. Pop. 43,000; of district, 1,800,000; area of district, 3,517 sq. miles.

Cutter: a small vessel with one mast and a bowsprit, built with especial reference to speed. The distinction between a cutter and a sloop is that in a cutter the jib has no stay to support it. The term "revenue cutters" is applied to those which are employed in the pursuit of smugglers. The cutters belonging to ships of war are clincher-built boats about 25 feet long.

Cutter, George Washington: See the Appendix.

Cut-throat Trout: the *Salmo mykiss*; so called from a dash of scarlet or crimson always present between the branches of the lower jaw. The most widely distributed of the American trout, highly variable in its appearance, its range extending from Kamtchatka through all the rivers of Alaska, British Columbia, Washington, Oregon, Montana, and southward in the mountain streams as far as Chihuahua, but only including the northeastern portion of California. This fine trout sometimes reaches a weight of 30 lb. It is spotted with black, and it is best known by its small scales, there being 160 to 180 in a lengthwise series along its sides.

David S. Jordan.

Cutting, Hiram Adolphus: See the Appendix.

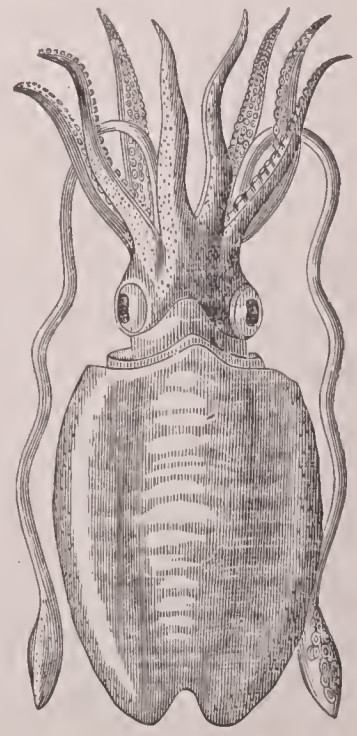
Cutting, James Ambrose: See the Appendix.

Cutting, Sewall Sylvester, D. D.: clergyman; b. at Windsor, Vt., Jan. 19, 1813; graduated at the University of Vermont in 1835; Baptist pastor in West Boylston, Mass., 1836, and in Southbridge, Mass., 1837–45; editor of the *New York Recorder* 1845–50 and 1853–55; editor of the *Christian Review* 1849–52; of the *Watchman and Reflector* in Boston 1851–53; in 1855 founded with Rev. Dr. Edward Bright *The Examiner* in New York; Professor of Rhetoric and History in the University of Rochester 1855–68; secretary of the American Baptist Educational Commission 1868–76; of the American Baptist Home Missionary Society 1876–79. He was author of *Historical Vindications of the Baptists* (1858); *Struggles and Triumphs of Religious Liberty* (1876). D. in Brooklyn, N. Y., Feb. 7, 1882.

Cuttings: in horticulture, living asexual portions of plants which are detached and inserted in soil or water that they may root and form new plants. Cuttings are usually made of stems, although they are sometimes made of leaves, as in certain begonias and in gloxinias; sometimes of roots, as in blackberries and many ornamental plants, and they are sometimes taken from tubers, as in the potato. Stem-cuttings are of two general kinds, soft-wood and hard-wood. Soft-wood cuttings are employed in most common greenhouse plants, as geraniums, coleus, carnations, and the like. These are pieces of the firm growing wood, comprising one or two joints, and inserted in the soil usually not deeper than a fourth or half inch. Hard-wood cuttings are made from mature and dormant wood, as in currants and grapes, and they are most commonly planted out of doors. The best conditions for cuttings are a uniformly moist but not wet soil, which is porous and well drained, comparatively uniform temperature, and a greater or less degree of bottom heat. Full directions for propagation by means of cuttings may be found in *Propagation of Plants*, by A. S. Fuller, and *The Nursery-book*, by L. H. Bailey.

L. H. Bailey.

Cuttlefish: any one of many dibranchiate cephalopodous mollusks, especially one of those of the family *Sepiidæ*, the species of which are numerous and almost world-wide in distribution. The term popularly includes nearly all the dibranchiate cephalopods. They are characterized by the presence of an ink-bag filled with black or brown "sepia," a substance which the animal ejects when pursued, so as to conceal itself from view by coloring the waters around it. This substance was formerly much employed in making sepia or india ink (now made of lampblack, etc.). This coloring-matter is so permanent that it has occasionally been prepared from fossil specimens. "Cuttlebone" (sometimes called *calamary*) is in reality the calcareous internal shell of these animals, especially that of the *Sepia officinalis* of Europe. When powdered it is sold under the name of "pounce," and is used for polishing, for tooth-powder, and in making molds for delicate castings. It was formerly much used in medicine, but is valuable only for its feebly antacid properties. In the tropical seas cuttlefish have been found weighing 2 tons. They are all



Cuttlefish: *Sepia officinalis.*

marine. Many fossil species occur. Several species are found on the Atlantic coast of the U. S. See SQUID.

Cutty-stool [Scottish, *cutty* or *kittie*, a woman of light or worthless character], or **Creepie Chair**: formerly a seat in Scottish churches where offenders against chastity were obliged to sit for three Sundays, and receive a reprimand from the minister.

Cutworms: larvæ, mostly belonging to lepidopterous insects of the family *Noctuælitæ*, and especially to those of the genus *Agrotis*. They cut off Indian corn, cabbage, and other plants just below the surface of the ground; and one species at least (*Agrotis cochrani*) climbs apple and pear trees and destroys the young buds. No effective remedy for their ravages is known.

Cuvier, Fr. pron. kü'vi-ā', GEORGE CHRÉTIEN LÉOPOLD FRÉDÉRIC DAGOBERT, Baron: naturalist; b. at Montbéliard, then in Würtemberg, whither the family had removed from Jura in the sixteenth century upon embracing Protestantism, Aug. 23, 1769. His father was an officer in a French regiment of Swiss mercenaries. He studied political science at the Carolinian academy in Stuttgart, through the interest of the duke. He was an enthusiastic student from boyhood, and his passion for natural history showed itself in his thirteenth year. He became in 1788 tutor to the son of Count d'Héricy, who lived in Normandy, and remained in this situation nearly six years, at the same time pursuing his studies. Early in 1795 he removed to Paris, where he associated with Jussieu and Geoffroy Saint-Hilaire. He became in July, 1795, Professor of Comparative Anatomy in the Museum of Natural History, and began to form his great cabinet of comparative anatomy. In 1796 he was admitted into the Institute, then just founded. He displayed his genius for classification in a work called *Tableau Élémentaire des Animaux* (1798), and succeeded Daubenton as Professor of Natural History in the College of France in 1800. In 1801 he commenced the publication of the important *Leçons d'anatomie comparée* (5 vols., 1801–05; new ed. 1840). He married Madame Duvaucel, the widow of a farmer-general, and was chosen perpetual secretary of the Academy of Sciences in 1802. In 1808 he was appointed councilor to the Imperial University. He displayed a rare faculty of expressing scientific truths in popular and elegant language in his *Discourse on the Revolutions of the Surface of the Globe*, in which he propounds the theory of the correlation of forms in organized beings. He was appointed master of requests by Napoleon in 1813, and councilor of state in 1814. He published in 1817 his celebrated *Animal Kingdom* (*Règne Animal distribué d'après son Organisation*, in four volumes; new edition by his pupils, 11 vols., with 993 plates, 1836–49), in which he proposed the arrangement of animals in four divisions—the Vertebrata, Mollusca, Articulata, and Radiata. Soon after the restoration of the Bourbons he was appointed chancellor of the University of Paris by Louis XVIII. He was elected a member of the French Academy in 1818, and received the title of baron in 1820. He wrote many able notices of scientific men for the *Biographie Universelle*. Among his other works is an excellent *Natural History of Fishes* (1818–30, with the continuation by Valenciennes, 22 vols.), of which eight volumes were finished during his life. As a professor he was distinguished for facility of elocution, clearness of ideas, and the art of fixing the attention in philosophical or historical digressions. He first applied to zöology the natural method, and founded a system on the basis of the invariable characters of anatomical structure. He is regarded as the founder of the science of comparative anatomy, and his knowledge of that science was such that a bone or small fragment of a fossil animal enabled him to determine the order, and even genus, to which it belonged. During the last twelve years of his life he rendered important services as president of the committee of the interior. He was created a peer of France in 1831. D. in Paris, May 13, 1832. He had several children, but none of them survived him. His disposition was amiable, and his moral character unimpeachable. See A. de Candolle, *Notice sur la Vie et les Ouvrages de G. Cuvier*; R. Lee, *Memoir of Baron Cuvier* (1833); L. de Loménie, *G. Cuvier, par un homme de rien* (1841); Flourens, *Cuvier, Histoire de ses Travaux* (1845).—The brother of the naturalist, FRÉDÉRIC CUVIER, b. June 28, 1773, published, with Geoffroy Saint-Hilaire, *Histoire naturelle des mammifères*.

Cuvillier-Fleury, kü'vēe'yā'flö'ree', ALFRED AUGUSTE: author; b. in Paris, Mar. 18, 1802; was educated in Collège Louis-le-Grand, and became in 1819 private secretary to Louis Bonaparte, ex-King of Holland. In 1827 Louis Philippe chose him as tutor for the Duke of Aumale, and in 1834 he entered the staff of the *Journal des Débats*. Of his articles there exist various collections: *Portraits Politiques et révolutionnaires* (1851–52); *Études historiques et littéraires* (1854); *Nouvelles Études* (1855); *Voyages et Voyageurs* (1854); *Dernières études historiques et littéraires* (1859); *Historiens, Poètes et Romanciers* (2 vols., 1863); *Études et Portraits* (1865–68). D. in Paris, Oct. 18, 1887.

Cuxha'ven: seaport-town and watering-place of Germany; on the left bank of the Elbe, at its entrance into the German Ocean, 72 miles by rail W. N. W. of Hamburg, and about 50 from Bremen (see map of German Empire, ref. 2–D). It has long been the port whence Hamburg steamers depart when the Elbe is frozen; recently, however, nearly $2,000,000 have been spent in improving the harbor, which has an area of 60,000 sq. meters, and a depth at low tide of 26½ feet, and is to be used by the largest steamers all the year round. Pop. (1895) 5,300.

Cuyabá, kwĕe-ăa-baa': city of Brazil: capital of the state of Matto Grosso; on the Cuyaba river, an affluent of the São Lourenço and Paraguay (see map of South America, ref. 5–E). It is an episcopal town, and has a large military arsenal and barracks. Cuyabá originated as a mining town in 1718, and for a time the gold-washings were enormously productive; at present they are nearly abandoned, and the exports are unimportant, the surrounding region being very thinly settled. The climate is hot but generally healthful. Pop. (1893) about 20,000. H. H. S.

Cuyahoga, kī-a-hō'ga, **Falls**: town in Summit co., O. (for location of county, see map of Ohio, ref. 2–H); on C. A. and C. and E. and W. R. Rs. (Baltimore and Ohio system), and on Cuyahoga river; 5 miles N. of Akron and 34 miles S. S. E. of Cleveland. The village has 5 churches, 2 schools, manufactures of clay-working machinery, rivets, electrical machinery, bolts, paper, sewer-pipe, tile, turbine water-wheels, wire-machines, tinware, paper bags, flour, etc.; it has abundant water-power, and medicinal waters. Pop. (1880) 2,294; (1890) 2,614; (1900) 3,186.
EDITOR OF "REPORTER AND WESTERN RESERVE FARMER."

Cuyler, THEODORE LEDYARD, D. D.: clergyman; b. at Aurora, N. Y., Jan. 10, 1822; graduated at Princeton College in 1841; at Princeton Seminary in 1846; preached three years at Burlington, N. J.; was first pastor of the Third Presbyterian church at Trenton, N. J.; then pastor of the Market Street Reformed church in New York city; and became pastor of Lafayette Avenue Presbyterian church, Brooklyn, N. Y. The twenty-fifth anniversary of his pastorate was celebrated Apr. 5, 1885. He had then preached there 2,300 sermons, delivered over 1,000 addresses, and received into membership in the church 3,610 persons, 1,566 of them by conversion. He resigned in 1890. He is the author of several works, such as *Cedar Christian* (1863); *The Empty Crib* (1868); *Heart-life* (1871); *From the Nile to Norway* (1881); and *Stirring the Eagle's Nest* (1890). Has also published over 2,700 letters and articles in newspapers and magazines, many of which have been reprinted in Europe.

Cuyo: a portion of Chili which in colonial times extended E. of the Andes. The Spanish Government had fixed the limits of the captain-generalcy of Chili at 100 leagues from the Pacific coast, and not long after the conquest some of the colonists crossed the Andes and founded several towns on the other side. One of these, Cuyo, gave a general name to the region, which eventually extended to about lon. 63° W. and embraced Tucuman, Mendoza, and other flourishing places. The limits with the Platine provinces were never definitely fixed, and the Araucanian wars, barring the best passes of the Andes, made it difficult to maintain communications with the capital of Chili. In 1776 Cuyo was transferred to the new viceroyalty of Buenos Ayres, and the Andes were fixed as the western boundary of Chili. HERBERT H. SMITH.

Cuyp, koip, ALBERT: Dutch painter; b. at Dort, Holland, in 1605; pupil of his father, Jacob Gerritse. Cuyp was one of the most successful painters of effects of sunlight whose works we possess; a tonalist rather than a colorist, and with a happy perception of the picturesque, and as a painter of the golden sunset phenomena he has had many imitators, but few who approached him. He left a large number of pictures. Much of his work is in England: five pictures in the National Gallery, seven or eight in the Bridgewater Gal-

lery, and many in other private collections. Pictures of his are also in the Dresden Gallery, the Amsterdam Gallery, and in many others. D. at Dort in 1691. W. J. Stillman.

Cuyp, Jacob Gerritse: portrait and animal painter; b. at Dort, Holland, in 1575; pupil of Bloemart; with others, founded at Dort in 1642 a guild of St. Luke. D. after 1649.

Cuzco: a southeastern department of Peru; bounded N. by Loreto, E. by Bolivia, S. by Puno and Arequipa, and W. by Apurimac, Ayacucho, and Junin. Area, 27,285 sq. miles. Capital, Cuzco. The southern and more populous portion is an elevated and much-broken region between the lofty chains of the Andes and the central Cordillera; the rivers rising here break through the Andes northward, in deep cañons, uniting beyond to form the Ucayali, the true source of the Amazon. Beyond the Andes the northern and western portions of the department lie in the warm, damp plains of the Amazonian depression, and they are covered with forests which extend far up the mountain sides. The Cuzco basin, by its fertility and delightful climate, is one of the most favored parts of Peru, but owing to the lack of communications its development has been slow. The Mollendo R. R., now in course of construction, will connect it with Lake Titicaca and the Pacific. The mountain regions of Cuzco are rich in minerals. Pop. (1876) 238,445; (1893) probably not much greater. Herbert H. Smith.

Cuzco (Quichua, navel): an interior city of Peru; capital of the department of the same name; on an irregular tableland or terrace, 11,380 feet above the sea. To the N. W. the hill of Sacsahuaman rises high above, and two streams flow down through the city in ancient walled channels—the work of the Incas (see map of South America, ref. 5–B). Cuzco is the most ancient city of Peru, and perhaps of America. It was the birthplace of the Inca power, capital of their empire, which eventually spread over a great part of the Andean region. According to tradition it was founded by Manco Capac in the twelfth or thirteenth century. It is certain, however, that some of the monuments are preincarial, and there can be little doubt that an Indian settlement existed here long before the time of Manco Capac. At the time of the conquest the city proper probably had 50,000 inhabitants, with as many more in the immediate vicinity. The streets were narrow, crossing each other at right angles, and paved with pebbles; near the center there was a large square, and from this radiated four streets to the four great Inca roads. The houses, at least of the better class, were built of stone, and covered with elaborate and handsome thatched roofs. But the glory of Cuzco was the *Ccuri-cancha*, or great temple, commonly called the Temple of the Sun. It was 296 feet long by 52 broad, and was originally built for a palace of the Incas. The interior of the main hall was lined in great part with thin gold. An elliptical gold plate at one end represented the Supreme Deity, and this was flanked by figures of the sun and moon. Its site is occupied by the Cathedral of Cuzco, but portions of the original walls are visible. The *Acclahuasi*, or great house of the virgins of the sun, has been replaced by a convent, but parts of this also can be traced, and portions of old houses and palaces about the city remain almost entire. "The world," says Mr. Squier, "has nothing to show in the way of stone-cutting and fitting to surpass the skill and accuracy displayed in the Inca structures at Cuzco." On the Sacsahuaman hill behind the city is the great fortress of Cuzco, which probably was built before the time of the Incas. It is a fortification 600 feet long, and consisting of three walls, one above the other on successive terraces. They are built of immense stone blocks, some of them 27 feet long by 15 high; and, what is very remarkable, the work is constructed with salient and retiring angles, involving the true principle of modern fortification. Pizarro entered Cuzco Nov. 15, 1533; the city was speedily rifled of its gold, and in 1534 was given a Spanish government. It was besieged in 1536 by the Inca Manco, who set fire to the thatch roofs, burning most of them. For many years after the conquest, and long after Lima was founded, Cuzco remained the chief city, though no longer the capital of Peru, and it is said to have had in the seventeenth century about 50,000 inhabitants. The population in 1893 was about 20,000. About seven-eighths are Indians, and Quichua is the common language. The climate is cool, but seldom cold, and very salubrious. The Yucay and other valleys a few leagues distant yield tropical fruits. With the completion of the Mollendo R. R. to this point, Cuzco will doubtless renew its ancient prosperity, while losing the air of antiquity which is now its great charm. See Markham's *Cuzco and Lima*, and *History of Peru*; Squier's *Peru*; Prescott's *Conquest of Peru*; also Incan Antiquities.

Herbert H. Smith.

Cuzco: See Indians of Central America.

Cyane, sī′ā-nēē (in Gr. Κυανή): a water-nymph of classic mythology, who tried to rescue her playmate Proserpine, and was changed by Pluto into a fountain in Sicily. She is also called the wife of Æolus, god of the winds. The fountain Cyane, near Syracuse, still flows, and gives rise to a considerable river.

Cya′nea [from Gr. κύανος, dark-blue substance]: a genus of jellyfishes belonging to the discomedusan *Scyphozoa*. They have a large jelly-like disk, from the center of which hangs down the proboscis terminating in four greatly fringed lobes. From the margin of the disk numerous long tentacles are developed. The only species in North America, *Cyanea arctica*, reaches an enormous size, the disk being sometimes 7 feet in diameter, the tentacles 200 feet long. The European species is said to sting severely, but *Cyanea arctica* does not affect man except in places, as between the fingers, where the skin is thin. J. S. Kingsley.

Cy′anide [from Gr. κύανος, dark-blue substance]: a salt of hydrocyanic or prussic acid which has the composition HCN, containing the elements hydrogen, carbon, and nitrogen. The cyanide which is manufactured in largest quantity is commonly called *yellow prussiate of potash*, or *potassium ferrocyanide*. (See Potassium.) From this, other cyanides, such as potassium cyanide, KCN, Prussian blue, etc., are prepared. Most cyanides are very poisonous. Some of them are of great importance in the arts, as in gilding, electroplating, photographing. Some are used in medicine.

Ira Remsen.

Cy′anite, or **Kyanite** [Gr. κύανος, a dark-blue substance, dark blue + suffix *-ite* (used of minerals)]: a beautiful mineral (sometimes called *Disthene*), a form of silicate of alumina. It often occurs crystallized, and generally in broad prisms. It is transparent or translucent, sometimes opalescent, and exhibits various shades of blue. Its formula is $Al_2O_3SiO_2$.

Cyanogen [from Gr. κύανος, a dark-blue substance + root *gen-*, produce, in γεννάω, beget, etc.; so named with reference to Prussian blue, one of its compounds]: a gas formed by heating mercuric cyanide. It is colorless, has the odor of peach kernels, and is extremely poisonous. It consists of the elements carbon and hydrogen, and has the chemical formula C_2N_2. All the cyanides are related to cyanogen, as the chlorides are related to chlorine and the iodides to iodine. The group CN enters into chemical compounds as the element, Cl, does, and is said to play the part of an element. Such a group is called a radical. Ira Remsen.

Cyanom′eter [from Gr. κύανος, a dark-blue substance + μέτρον, measure]: an instrument for measuring the blueness of the sky. It consists, essentially, of a disk divided into sectors, the several sectors being colored with tints of blue gradually increasing in intensity. Held between the eye and the sky, some sectors will appear deeper, and some lighter in tint than the heavens. That one where the difference is insensible is the measure of the blueness for the time being.

Cyano′sis [from Gr. κύανος, a dark-blue substance, dark blue + ending *-ωσις*, common to Gr. words denoting a condition of coming to be, or coming to have, as λίθωσις, petrifying (λίθος), ἴσωσις, a making equal (ἴσος), ἰδίωσις, appropriation (ἴδιος), δικαίωσις, justification (δίκαιος), etc., and so used of names of diseases]: a condition of lividity of the skin due to failure of the circulation or respiration. *Congenital cyanosis*, or *cyanopathy*, is an affection in which the skin of the newly born infant shows this appearance. The popular term "blue-baby" is sometimes applied to the child suffering this disease. It is the result of various congenital malformations and conditions of imperfect development. Frequently the pulmonary circulation is defective. In some cases the foramen ovale, a communication between the left and right sides of the heart, remains open as in the fœtal state. The venous and arterial blood are mingled, as is normal before birth. Cyanosis may prove fatal in a few days after birth, but in other cases, with care, life may be prolonged for some years. Growth and normal development in other respects are rarely attained.

Revised by William Pepper.

Cya'thea [from the Gr. *κύαθος*, a cup, alluding to the shape of its indusia]: a genus of beautiful tree-ferns of the family *Polypodiaceæ*, found in the tropical regions of the Old and New World. The species are numerous. *Cyathea arborea*, a native of the West Indies, Mexico, and South America, has bipinnate leaves. *Cyathea medullaris*, a New Zealand species, has edible starchy roots.

Cyathophyl'lum [from Gr. *κύαθος*, cup + *φύλλον*, leaf]: the typical genus of a prominent family of Palæozoic corals (*Cyathophyllidæ*). The Greek name, as well as the English name *cup-corals*, is applied to corals of this genus on account of the cup-shaped corallum of the single polyparies. The cup-corals are either simple or compound, and their septæ are arranged in groups or multiples of four, and they are particularly abundant in the limestones of the Devonian system, although the genus *Cyathophyllum* ranges from the Silurian to the Carboniferous. H. S. Williams.

Cyax'ares (in Gr. Κυαξάρης; Old Persian, *Uvakshatara*, i. e. beautiful-eyed) **I.**: a king of the Medes; began to reign in 633 B. C. He waged war against the Scythians, who invaded his dominions, and against Alyattes, King of Lydia. A total eclipse of the sun which occurred about 610 B. C. induced Cyaxares and Alyattes to make peace. Cyaxares and the King of Babylon took Nineveh in 625. He died in 593 B. C., and was succeeded by his son Astyages, who reigned from 593 to 569 B. C.

Cyaxares II.: a son of Astyages, grandson of Cyaxares I., and uncle of Cyrus the Great. Though not mentioned by Herodotus or Ctesias, he is named by Xenophon as the successor of Astyages in the Median kingdom, and is probably the same as "Darius the Median" spoken of by the prophet Daniel (v. 31). He is supposed to have reigned in Babylon for two years after its conquest by Cyrus in 538 B. C. He came to the throne of Media in 569 B. C.

Cyb'ele (in Gr. Κυβέλη, or Κυβήλη), called also **Cybe'be** (in Gr. Κυβήβη) and **Rhe'a** (in Gr. Ῥεία, Ῥέα, or Ῥείη): a goddess of classic mythology; called in Phrygia and elsewhere in Western Asia "Mother of the Gods" or "Great Mother." She was supposed to be a daughter of Uranus and Terra, the wife of Saturn (Cronos), and the mother of Jupiter. In Phrygia her priests were called Corybantes (*q. v.*). She was sometimes styled the "Berecynthian mother," from the hill Berecynthus, where she had a temple. She is generally represented riding in a chariot drawn by lions, with a diadem of towers upon her head.

Cy'cads [of uncertain origin]: a small family of trees and shrubs (*Cycadeæ*), related to the conifers, with which they agree in being gymnospermous. They have mostly simple stems, with a large pith and large pinnately compound, evergreen leaves, which are clustered toward the summit of the stem. They are of slow growth and are long-lived; the stem elongates by a slowly unfolding terminal bud, much as in the palms, which they resemble so remarkably that they are popularly called "sago palms." The ovules are produced on the margins of slightly modified leaves (in *Cycas*), or on the scales of cones (in other genera). The pollen-bearing flowers constitute cones, roughly resembling the cones of the conifers. Cycads were very numerous in ancient geological periods, but they are now few in number (about eighty species), and are restricted to the warm parts of the world. The living species are disposed in two families as follows: 1. *Cycadaceæ*, including but one genus —*Cycas*—represented by sixteen species, of which *C. revoluta* of China and Japan is common in conservatories. Its pith contains much starch, which is the "sago" of commerce. 2. *Zamiaceæ*, including eight genera, of which *Zamia* (thirty species), *Dioon*, and *Encephalartos* are best known. Two species of *Zamia* are natives of the Southern U. S.

Charles E. Bessey.

Cy'chla, or **Cichla**, sik'lā: a genus of perch-like, fresh-water fishes of the family *Chromidæ*, sometimes placed in a separate family, *Cichlidæ*. There are three or four bright-colored species, found in Brazil, Guiana, and Peru, and used for food.

Cyclades, sik'la-dēēz: a group of islands in the Ægean, numbering twelve in all, according to Strabo, so called because they surrounded the sacred island of Delos (see map of Greece, ref. 17-L). These islands are Syra, Delos, Andros, Tenos, Mykonos, Naxos, Paros, Antiparos, Siphnos, Seriphos, Kythnos, and Keos. The nomarchy of the Cyclades in the modern kingdom of Greece includes, in addition to the above, the following eight islands: Melos, Thera, Kimolos, Pholegandros, Sieynos, Ios, Amorgos, and Anaphe. The surface is mountainous, the soil productive. Pop. of the nomarchy (1896) 134,747. Area, 926 sq. miles. Syra or Hermopolis is the most important city.

Cyclamen, sik'la-men [from Gr. *κυκλάμινος*, *κῦκλαμίς*, a plant-name]: a name given to plants of a genus of the Primrose family. There are two chief species in cultivation, *Cyclamen europæum* and *C. latifolium* (*C. persicum* of florists). The former is the fragrant and the hardier species, and is native to the south of Europe. The latter comes from Persia. The flower is one of the oddest in form, its brilliant petals being strongly reflexed, giving it the appearance of being turned inside out.

Cycle [from Gr. *κύκλος*, wheel, circle]: a period of time which finishes and recommences perpetually. The term has been employed for marking the intervals in which two or more periods of unequal length are each completed in a certain number of times, so that both begin again exactly in the same relations as at first. The cycles used in chronology are three: the cycle of the sun, the cycle of the moon (or Metonic cycle), and the cycle of indiction. The cycle of the sun, or solar cycle, is a period of time after which the same days of the week recur on the same days of the year. If the number of days in the year were always the same, this cycle could only contain seven years; but the order is interrupted by the intercalations. In the Julian calendar, the intercalary day returns every fourth year, and the cycle consequently contains twenty-eight years. This cycle is supposed to have been invented about the time of the first Council of Nice (325 A. D.), but the first year of the first cycle is placed nine years before the commencement of the Christian era. Hence the year of the cycle corresponding to any given year in the Julian calendar is found by the following rule: add nine to the date and divide the sum by twenty-eight; the quotient is the number of cycles elapsed, and the remainder is the year of the cycle. Should there be no remainder, the proposed year is the twenty-eighth, or last of the cycle. In the reformed calendar this rule can only apply from century to century, for the order is interrupted by the omission of the intercalary day every hundredth year. (See Dominical Letter.) The cycle of the moon is a period of nineteen solar years, after which the new and full moons fall on the same days of the year as they did nineteen years before. This cycle was invented by Meton, an Athenian astronomer, and is known as the "Metonic cycle." It contains 8,940 days, which exceeds the true length of the nineteen solar years by nine and a half hours, nearly. On the other hand, it exceeds the length of 235 lunations by seven hours and a half only. The framers of the ecclesiastical calendar, in adopting this period, altered the distribution of the lunar months, in order to accommodate them to the Julian intercalation; and the effect of the alteration was that every three periods of 6,940 days was followed by one of 6,939. The mean length of the cycle was therefore $6{,}939\frac{3}{4}$ days, which agrees exactly with nineteen Julian years. The number of the year in the cycle is called the Golden Number (*q. v.*). The cycle begins with the year in which the new moon falls on Jan. 1. To find the number of any year in the lunar cycle, or the golden number of that year, we have this rule: add one to the date and divide by nineteen; the quotient is the number of cycles elapsed, and the remainder is the year of the cycle. Should there be no remainder, the proposed year is the last or nineteenth of the cycle.

The cycle of indictions, or Roman indiction, is a period of fifteen years, not astronomical, but entirely arbitrary. Its origin and purpose are alike uncertain, but it is conjectured that it was introduced by Constantine the Great about 312 of the common era, and had reference to certain judicial acts that took place at stated intervals of fifteen years. It is considered as having commenced on Jan. 1, 313. By extending it backward to the beginning of the era, it will be found that the first year of the era corresponded with the fourth of the cycle. In order, therefore, to find the number of any year in the cycle of indiction we have this rule: add three to the date, divide the sum by fifteen, and the remainder is the year of indiction.

Cyclic Planes of a Cone: the two planes through one of the axes which are parallel to the planes of circular section of the cone. The perpendiculars to the cyclic planes through the vertex are the focal lines of the reciprocal cone. A sphere around the vertex of the cone is cut by the latter, its cyclic planes, and its focal lines respectively, in a sphero-

conic, its cyclic arcs, and its foci, and thus the reciprocal properties of cyclic planes and focal lines give rise to properties of sphero-conics which are in many respects precisely similar to those of plane conics.

Cycling: the use of the "cycle"—that is, the bicycle or tricycle—by man for self-propulsion from place to place. Cycling is practiced throughout the world for pastime, for health, for business, and for military purposes. (For explanation of the principles governing the balance and motion of cycles, see VELOCIPEDE, which is the original and generic term applied to all forms of "cycle.") That in most common use is the bicycle, a machine consisting of two tandem wheels connected by a frame upon which is a seat. It is propelled by the feet of the rider by means of cranks attached to, or connected with, the driving-wheel, and, in the motor bicycle of the present time, by a gasoline explosion motor. The tricycle is a similar machine with three wheels. Cycling was first practiced in the eighteenth century upon the hobby, or dandy, horse. This was a bicycle with wheels attached to a bar of wood rudely shaped like the body of a horse. The rider sat astride upon it and propelled it with his feet upon the ground. The Baron Drais de Saverbrunn made an improved hobby-horse which was used 1816–19 in the principal European and American cities. It was soon given up, however. In 1840–41 Kirkpatrick McMillan, a Scotchman, made a wooden bicycle with cranks, side levers, connecting rods, and pedals. It was used successfully for years, and to him belongs the honor of making the first bicycle with cranks. McMillan first tried his cranks and side levers on a tricycle in 1835. In 1846, Galvin Dalzell, another Scotchman, who had seen McMillan's machine, made a bicycle remarkably like the safety of to-day. The handle-bar, size of wheels, and rake of front fork were nearly the same. Connecting rods took the place of the present chain. With it Dalzell could outrun a fast coach upon the highway. Michaux, a Parisian carriage-builder, is reported to have built a velocipede in 1855 which was worked with cranks upon the front wheel, but Pierre Lallement made a better one, and patented it in the U. S. in 1866. Edward Gilman took out a similar patent in England a few months earlier. After this the velocipede was developed with rapidity. The first modern bicycle was built in England in 1867. This type is known as the ordinary. Its perfected form is shown in Fig. 1. Iron and steel took the place of wood in the frame and wheels. In 1874 there were in Great Britain twenty manufacturers of bicycles. The tricycle was known as early as 1828, and one is illustrated in the *English Mechanic* for May, 1866. It came into use in 1877. About 1884 the present safety came into use. Fig. 2 shows a safety of 1901 for men. The drop-frame bicycle was invented and made by Herbert S. Owen, of Washington, D. C., in 1887, and is peculiarly adapted for women. Fig. 3 shows a lady's safety of 1901 pattern, equipped as used in America.

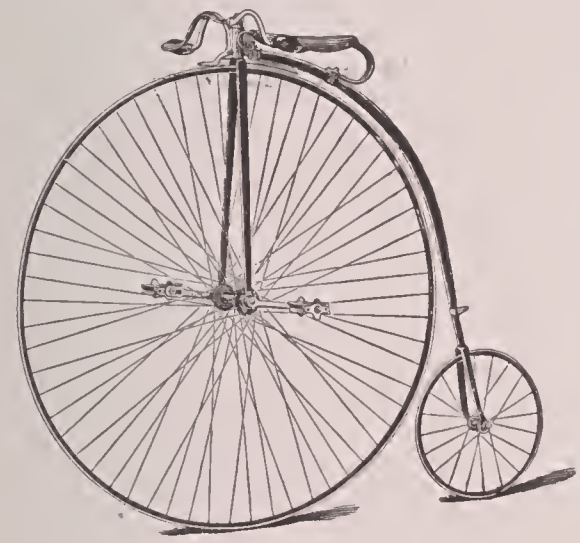


FIG. 1.—Ordinary (bicycle with solid tires).

The adoption of the safety as the permanent form of the bicycle, and of the pneumatic as its only suitable tire equipment, made possible a steady development in the construction of both. Weights were gradually reduced from above 40 lb. to 20 lb. for road, and even less; the ball-bearing principle was introduced at every point of friction; weldless steel tubing of thinner gauge displaced the experimental tubing theretofore used; forgings were substituted for castings; and every part became, as far as possible, easily attachable and detachable. The pneumatic tire was perfected with equal rapidity, and to the pioneer double-tube pattern were added several varieties of single-tube tires (in which the inner tube and its outer cover or "wearing-shoe" are vulcanized together). In 1901 an ordinary injury to either type of tire may be permanently repaired in a few minutes. Heavy suspension saddles and goosenecck posts were displaced by ladies' and gentlemen's saddles of light weight and hygienic construction. Meanwhile to the single safety was added the tandem, "triplet," "quadruplet," "sextuplet," and, in 1896, the decaplet, carrying two, three, four, six, and ten riders respectively, the first mentioned used with nearly the same facility as the single wheel, the others almost exclusively for racing and advertising.

Bicycles with bevel-gear power transmission, in place of the usual chain transmission, were introduced commercially in 1897, and have steadily grown in popularity, because of their neater appearance and the protection of the driving mechanism from mud and dust by inclosing housings. The cushion-frame device and coaster brake were brought out about the same time.

Motor tandem bicycles, for pacing purposes on the race-track, were introduced in France in 1897, and were quickly followed by gasoline motor tricycles for street and road use. American builders began making gasoline and steam tandems for pacing in 1899, and in 1900 brought out the first single bicycles for road use equipped with gasoline power. In the spring of 1901 a score of manufacturers were making such machines. They were equipped with single-cylinder air-cooled explosion motors of from $1\frac{1}{4}$ to $2\frac{3}{4}$ horse power. Motor tricycles and quadricycles are also made for road use.

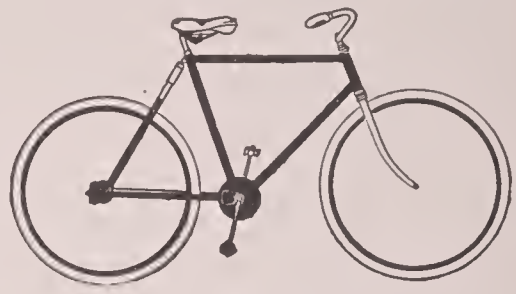

FIG. 2.—Men's chainless-gear cushion-frame safety.

The bicycle-building industry was of British origin, and for several years Great Britain supplied the best machines to all parts of the world. So great was the increase in the American trade from 1892 to 1896, however, that now the products of the factories of the U. S. exceed in value those of any other country, and while a heavy tariff practically prohibits the importation of foreign bicycles and sundries, those of U. S. manufacture are largely exported to England, France, Germany, Denmark, Sweden, Norway, Russia, Finland and other European countries, Australasia, China, Japan, South Africa, India, Argentine Republic and other South American countries.

The annual British output averages probably 500,000 machines, representing a gross value of from $20,000,000 to $25,000,000. About 100,000 more are made in the U. S., in 100 well-equipped factories, the majority being medium and low grades selling at from $35 down. In Great Britain and the U. S. there is a large amount of capital invested in bicycle factories and separate plants devoted to the manufacture of tires, materials, sundries, and fittings.

The bicycle has become a potent factor in awakening people to the necessity of better roads. The strength of half a million cycling voters is felt in the U. S. municipal, State, and national politics; and many States, notably New York, Massachusetts, New Jersey, Connecticut, Maryland, and Minnesota, are now making liberal annual appropriations for permanent highway improvement. Early in 1896 the U. S. Congress established a national bureau of highways, under the direction of the chief of engineers of the army, and the special supervision of the department of road inquiry, whose province it is to have charge of the scientific laying out of all roadways in new territory, and to aid the movement in the various States by the discovery and free testing of building materials. In addition to the impetus given the cause of improved highways by the cyclists of the U. S., thousands of miles of special side-paths for bicyclists are being built by funds raised under special bicycle tax or license laws passed in New

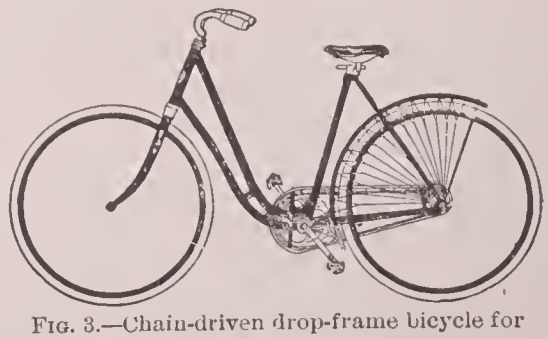

FIG. 3.—Chain-driven drop-frame bicycle for women.

York, Pennsylvania, Ohio, Minnesota, and Oregon. Rochester, Albany, St. Paul, Minneapolis, Seattle, Tacoma, and Portland each have systems comprising more than fifty miles of side-paths.

The safety type of wheel has been the subject of considsiderable experiment by the U. S. War Department, and by nearly every European government. Its usefulness in modern scientific warfare is unquestionable, but its place will

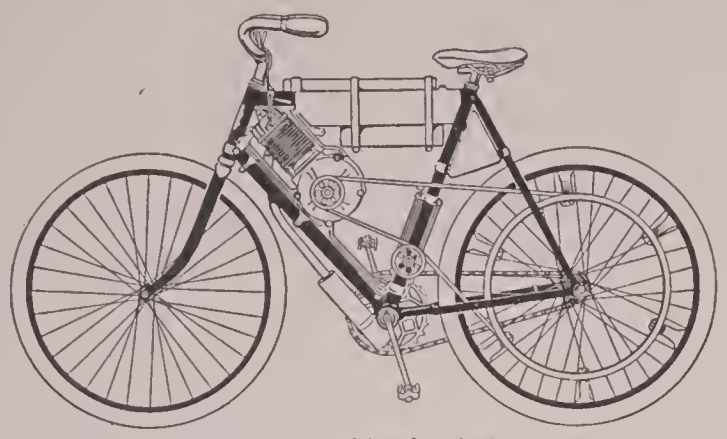

Fig. 4.—Gasoline motor bicycle of 1901 pattern.

not be so much in actual warfare as for the rapid movement of troops, for messenger service, and for skirmishing. Tests of the cycle for the carrying of dispatches over long routes have been made in Europe, but especially in the U. S. under the direction of Lieutenant-General Nelson A. Miles, commander-in-chief of the U. S. army. The national guards of several States have adopted the bicycle in their service.

There are national cycling organizations in the various countries, formed and sustained to promote touring, to advance the good roads movement, to protect the rights of its members as cyclists, and to govern the racing and in some instances the trade interests. The League of American Wheelmen and National Cyclists' Association (U. S.), the National Cyclists' Union and Cyclists' Touring Club (Great Britain), L'Union Vélocipedique and Touring Club of France, the Deutscher Radfahr Bund (Germany), the Canadian Wheelmen's Association, and the League of Victorian Wheelmen (Australia) have a combined active membership exceeding 250,000. Each association has its official organ or regular bulletin. The League of American Wheelmen has 30,000 members.

Cycle racing is a very popular sport, reaching its greatest development in France, Italy, Germany, Australia, and the U. S. In speed trials the bicycle has beaten the best time made by the running horse. International championships are held annually for the purpose of bringing together the speediest racing representatives of the various cycling countries. In 1893 these championships were held at Chicago during the World's Fair; the year following at Antwerp, Belgium; in 1895 at Cologne, Germany; in 1896 at Copenhagen, Denmark; in 1897, Glasgow, Scotland; in 1898, Vienna, Austria; in 1899, at Montreal, Canada; and in 1900 at Paris. Bicycle journals, not including club organs, are published weekly in the U. S., Great Britain, Canada, France, Germany, Italy, Australia, New Zealand, and other countries. France has two daily cycling papers, with immense circulations.

Literature.—*Around the World on a Bicycle*, by Thomas Stevens (New York, 1887); *Across Asia on a Bicycle* (New York, 1894); Lenz's *World Tour Awheel* (*Outing*, Aug., 1892–96); *Cycling for Health and Pleasure*, by Luther H. Porter (New York, 1895); *Two Pilgrims' Progress*, by Joseph and Elizabeth Robins Pennell (Boston, 1886); and *Three Men on Wheels*, by John Kendrick Bangs (Philadelphia, 1900).

C. E. Hawley. Revised by H. W. Perry, Associate editor "The Cycling Gazette."

Cy'cloid [from Gr. *κύκλος*, circle + suffix *-oid*, based on *εἶδος*, appearance; cf. *κυκλοειδής*, circle-like]: a plane curve generated by a point in the plane of a circle when the latter is rolled along a straight line. If the generating point is in the circumference of the rolling circle, a "common cycloid" is generated; if the generating point be outside the circle, it marks a "curtate" cycloid; while if it be a point within the circumference, a "prolate" or "inflected" cycloid is the result. That part of the cycloid which is generated in one revolution of the generating circle is called one "branch" of the cycloid. The branches may be infinite in number. That part of the straight line which is traversed in one revolution of the generating circle is the "base" of one branch. A line bisecting the branch of a cycloid and its base is the "axis." The common cycloid is the "line of quickest descent"—that is, if one point be placed above another, but not in the same vertical line, a falling body will move from the higher point to the lower more quickly along the arc of an inverted common cycloid than by any other course, even if that course be a straight line. If a pendulum be made to vibrate in the arc of a common cycloid, no matter what the length of the arc may be, the time will always be the same. In practice, however, this result has never been attained. Experiments show that cog-wheels with teeth bounded by this curve have their friction reduced to the minimum. See Epicycloid and Hypocycloid.

Cyclones [from Gr. *κύκλος*, circle]: whirling storms of large horizontal dimensions. The whirling character of these storms was not discovered until about the end of the first quarter of the nineteenth century. A cyclone is characterized by a center of low atmospheric pressure toward which there is a spiral inflow of air. The inflow is against the sun (contra-clockwise) in the northern hemisphere, oppositely in the southern. A cyclone is meteorologically a "storm" but it varies through all degrees of gentleness and severity. (See Storm, Storm-area, Hurricane, and Typhoon.) These large storm-areas are often accompanied by smaller ones called "secondaries," and the latter, when severe, have popularly, but erroneously, received the name of cyclones. See Tornado, Thunderstorm, and Hailstorm.

Cyclopædia [abbrev. of *encyclopædia* = Gr. *ἐγκυκλοπαιδεία* for *ἐγκύκλιος παιδεία*, the circle of arts and sciences composing the standard education of a free-born citizen, the liberal curriculum]: properly, a work which takes in the whole circle of learning. The term is often, though incorrectly, applied to a work treating very fully of some one or two important subjects, as a *Cyclopædia of English Literature*, the *Cyclopædia of Anatomy and Physiology*, etc. See Encyclopædia.

Cyclo'pean Walls: huge structures or walls of uncemented stones, the remains of which are found in Greece, Italy, and Asia Minor. These structures were so-called because they were supposed to have been built by the Cyclopes of mythology. The architecture is very different from that of the historic period. Some persons believe that they were erected by the Pelasgi, more than 1,000 years before the Christian era. The Cyclopean walls at Tiryns in the Peloponnesus are formed of unhewn stones from 6 to 9 feet long, and nearly 3 feet thick. At Mycenæ are found massive walls of stones, which are more accurately fitted and are specimens of an architecture less rude than that of Tiryns. A more advanced style of architecture appears in some remains of Etruria. In the Etruscan masonry called Cyclopean the stones are hewn or squared and laid in horizontal courses, but are not cemented.

Cy'clopism: that form of monstrosity or malformation of the fœtus in which only one eye is present, usually on the median line of the head. See Teratology.

Cy'clops [Gr. *Κύκλωψ*, literally, round-eyed; *κύκλος*, circle + *ὤψ*, eye], plu. **Cyclo'pes**: in classic mythology, a race of giants or monsters having each one eye in the middle of the forehead. According to Hesiod, they were the sons of Uranus, and were named Brontes, Arges, and Steropes. Homer represents them as gigantic and lawless shepherds and cannibals who lived in Sicily. The most famous among them was Polyphemus.

Cyclops: a genus of copepodous *Entomostraca*; so called from the fact that its two eyes are united in the middle line. It has a shrimp-like body, the anterior segments being united into a cephalothorax, the posterior forming a jointed abdomen. The species are minute, and are very abundant in fresh water, but none occur in the sea. They form an important element in the food of many fishes. About twenty species are described from the U. S. J. S. K.

Cyclops.

Cyclo'sis: See Protoplasm.

Cyd'nus (in Gr. *Κύδνος*): a river of Cilicia, flowing through the city of Tarsus into the Mediterranean. It was

celebrated for the clearness and coldness of its water. It was anciently navigable up to Tarsus (12 miles), but its mouth is now obstructed by bars. This river was the scene of Cleopatra's celebrated voyage to meet Antony in 41 B. C.

Cydo'nia: an ancient city of Crete; on the northwestern coast of the island. It was noted for the production of the quince (*Cydonia*).

Cyg'nus (the Swan): a constellation of the northern hemisphere in the Milky Way, between Lyra and Cassiopeia; comprises several bright stars, five of which form a cross. The parallax of the binary star 61 Cygni was measured by Bessel, who published in 1839 *Measure of the Distance of the Star 61 in the Constellation of Cygnus.*

Cylinder [from Gr. *κύλινρος*, from *κυλίνδειν*, roll]: in elementary geometry, a solid bounded by two equal and parallel circles or ellipses, forming its bases, and a curve surface generated by the motion of a straight line, called the *generatrix*, which moves around the circumferenee of the bases so as to remain always parallel to itself. If the generatrix is perpendieular to the bases, the cylinder is *right*; if not, it is *oblique*. It is ealled *circular* or *elliptic*, aecording to the figure of the bases. A noteworthy property of this solid is that its contents are to those of the inscribed ellipsoid in the ratio of 3 to 2, a property diseovered by Archimedes in the special case when the cylinder circumseribed a sphere.

Cylle'ne (in Gr. Κυλλήνη): a mountain of Greece; in the northwestern part of Areadia; was supposed to be the birthplace of Mercury (Hermes), who was called *Cyllenius*, and had a temple on its summit. Height above the sea, 7,788 feet. It is now called *Zyria.*

Cy'ma [from Gr. *κύμα*, a wave]: in architecture, a molding having a wave-like profile of double curvature. When the farthest projecting portion of the molding is concave and that nearest to the wall convex, it is called a *cyma recta*; when this succession is reversed, a *cyma reversa.*

Cymbal [from Gr. *κύμβαλον*, from *κύμβος*, hollow]: a brass musical instrument of percussion, circular in form and about 8 inches in diameter. Cymbals are played in pairs by striking one against the other, and produce a loud, harsh sound of no fixed pitch. The best are those made in China and Turkey. Cymbals were employed by the Greeks in the festivals of Baechus and Cybele.

Cyme [from Lat. *cyma*, sprout = Gr. *κῦμα*, fœtus, sprout, deriv. of *κύειν*, become pregnant]: a flat-topped or convex centrifugal infloreseence—viz., one in which the central flower of eaeh cluster or division opens first, that flower terminating the axis. Linnæus restrieted the name to compound infloreseence of this sort, of which the elder (*Sambucus*) and *Viburnum* offer well-marked examples; but modern botanists, making the distinction between flowers from axillary and from terminal buds, employ it as a general term for all forms of inflorescence of the latter kind.

Cymophane: See Chrysoberyl.

Cymric Literature: same as Kymric Literature (*q. v.*).

Cymry: same as Kymry (*q. v.*).

Cynan'chum [from Gr. *κύων*, dog + *ἄγχειν*, choke, i. e. dog-bane]: a genus of plants of the family *Asclepiadaceæ. Cynanchum acutum*, found on the shores of the Mediterranean, produces the Montpellier scammony. Caoutchouc is obtained to some extent from the *Cynanchum ovalifolium*, a native of Penang. Other species have been used in medicine.

Cynewulf, or **Coenewulf**: an Anglo-Saxon religious poet of the eighth century; author of a collection of *ænigmata*, or riddles; of a life of St. Helena (Elene); and a *Christ.* Other poems are more doubtfully attributed to Cynewulf, sueh as lives of St. Guthlae and St. Juliana and a *Vision of the Cross*; also a translation of the *Phœnix*, a Latin poem ascribed to Lactantius. Henry A. Beers.

Cynics [from Gr. *κυνικοί*, dog-like, deriv. of *κύων*, dog; this name, probably first suggested by the name of the place where they taught, Κυνόσαργες, was applied to them on account of their filthy appearance and disagreeable manners]: a sect of philosophers among the Greeks, so called from their dog-like temper and their disregard of the conventional usages of society. It is difficult to give any satisfactory account of the tenets of this sect, as during all the period of its existence it was in a state of constant fluctuation. Its professed aim was to inculcate the love of rigid virtue and a contempt of pleasure. On this point the testimony of Horace —himself a zealous adherent of the school of Aristippus, the very opposite of the cynical sect—even were there no other, must be held conclusive; and according to his opinion the aim of the cynical philosophy was to induce every man to become "the guardian of real virtue." Diogenes belonged to this sect. It was founded in the fifth century B. C. by Antisthenes, a disciple of Socrates, who sought to imitate his master in disregard of outward splendor and contempt of riches, but his indifference to these things soon degenerated into an ostentatious display of singularity.

Cynoceph'alus [from Gr. *κύων*, dog + *κεφαλή*, head]: in Egyptian mythology, a dog-faced baboon. The Egyptians held these animals in great veneration, and professed to discover by their aid the periods of the sun and moon. The name is now applied to a genus of African monkeys. See Baboon.

Cynogale [from Gr. *κύων*, a dog + *γαλῆ*, a weasel]: a singular member of the civet family (*Viverridæ*) found in Borneo, Sumatra, and Malacca, known scientifically as *Cynogale bennetti*, locally in Borneo as the mampalon. It is about 2½ feet long, covered with thick, soft, dark-brown fur. The muzzle is long, much swollen near the end, and the toes are webbed. The animal both swims and climbs well. It feeds upon fish, crabs, small mammals, birds, and fruit.

F. A. Lucas.

Cynosceph'alæ: a locality in Thessaly; was the scene of two important battles. In the first the Thebans defeated the tyrant of Pheræ, in 364 B. C. In the second the Roman general Flamininus defeated Philip of Macedon in 196 B. C.

Cynosu'ra [from Gr. *κυνόσουρα*, name of the constellation; *κυνός*, genit. of *κύων*, dog + *οὐρά*, tail—probably because four stars of Ursa Minor, including the North Star, were fancied to resemble a dog's tail]: a nymph of Ida, said to have been one of the nurses of Jupiter, who translated her into the constellation of Ursa Minor, which includes the North Star. In the language of poetry it signifies a "point of attraction."

Cynthiana, sin-thi-aa'na: city (settled in 1780); capital of Harrison co., Ky. (for location of county, see map of Kentucky, ref. 2–H.); situated on the South Fork of the Licking river, and on the Kentucky Central R. R.; 66 miles S. of Cincinnati, Ohio. It has several churches, a graded free school, a female college, two flouring-mills, and two carriage-factories, and is noted for the manufacture of "Bourbon" whisky. It is in a very fertile agricultural district, and is the site of a famous race-course. A Confederate force numbering 2,200 men, with artillery, under Gen. J. H. Morgan, attacked the city July 17, 1862, garrisoned by 350 Federal soldiers. It was surrendered, but not till the ammunition was exhausted. On June 11, 1864, Morgan with a large force, attacked the place again, and after two days' fighting captured Gen. Hobson with some 1,700 men. On the 14th Gen. Burbridge, with 7,000 men, fell upon Morgan (whose men were out of ammunition and exhausted), and drove him out of Cynthiana with considerable loss. Pop. (1880) 2,101; (1890) 3,016; (1900) 3,257.

Cypera'ceæ: See Sedge Family.

Cype'rus [Lat., from Gr. *κύπειρος*, name of a marsh-plant]: a genus of plants of the family *Cyperaceæ*, distinguished by hermaphrodite flowers and compound spikes of numerous two-rowed glumes, without bristles. It contains numerous species, many of which are natives of the tropics, and others of the U. S. Some of them have tubers or corms which are mucilaginous and nutritious. The *Cyperus esculentus* (rush-nut), a native of Southern Europe, is cultivated in Italy, Spain, and France, and bears farinaceous tubers which are as large as a hazel-nut, and are called *amande de terre* (ground almond) by the French. They are eaten as dessert, and are used in making orgeat. The papyrus plant is often referred to this genus, though separated from it by some botanists.

Cypher: See Cipher.

Cy-pres Doctrine, see'prā-dok'trin: the doctrine or rule of equity that where a testator manifests a general intention, and has adopted a particular mode of carrying his general intention into effect, which, however, is contrary to law, or impossible of fulfillment, then the general intent will be given effect as nearly as may be consistently with the rules of law. The doctrine is more particularly applied to cases of charitable bequests, where the particular form or manner of charitable disposition of the property is or becomes impossible, in which case another mode consistent with the gen-

eral intent will be adapted, so as to substantially give effect to it, if not in the exact mode indicated. It is also applied so as to modify the strictness of the common law in the case of personal legacies upon conditions precedent, in which case it is held sufficient that the condition is complied with as nearly as it practically can be, where a literal compliance is or becomes impossible or contrary to law. The doctrine is derived from the civil law, and rests upon the assumption that it gives effect to the real intention of the testator, who is presumed not to have intended that the impossibility of a literal compliance with his directions should defeat the general object of his bequest. The application of the doctrine has in some cases been carried to an unreasonable extent. The various States of the Union differ in their attitude toward it, some approving of its application, and some repudiating it. All of the New England States, except Connecticut, have approved it. In New York, Indiana, Iowa, and other States, it has been repudiated in whole or in part, and in still other States it has not been decided upon. See INTERPRETATION. F. STURGES ALLEN.

Cypress [from O. Fr. *cypres* < Lat. *cyparis'sus*, *cuparissus*, cypress-tree = Gr. κυπάρισσος, a name of Semitic origin, cf. Heb. *gopher*]: evergreen trees and shrubs of the genus *Cupressus* of the family *Pinaceæ*. (See CONIFERS.) About a dozen species are known, natives of temperate Asia, Southern Europe, Western North America, and Mexico. The genus is characterized by having globose cones, composed of shield-shaped, valvate scales, each with numerous ovules, seeds narrowly winged, embryo with two (rarely three or four) cotyledons, opposite, evergreen awl-shaped and scale-shaped leaves, each usually with a dorsal resin-gland. The best-known species is the cypress of the Old World, *Cupressus sempervirens*, an upright, narrow, tapering tree with erect branches and a dark-green foliage. It is hardy in the Southern U. S. and the south of England. The Monterey cypress, *C. macrocarpa*, of California is a more spreading tree, of rapid growth and much greater hardiness. It is one of the finest of the cypresses. *C. funebris* of China has widely spreading, horizontal, and at length pendulous branches. Cypress wood is very durable, and specimens are known which are said to be several thousand years old. The deciduous or bald cypress, *Taxodium distichum* of the swamps of the Southern U. S., is a tall tree with spreading branches, which bear linear, deciduous leaves. Its wood is soft but durable, and the tree is much planted for timber and ornamental purposes. It commonly sends up from its roots curious, hollow, conical growths ("knees") which rise a yard or more above the ground. Their function is unknown. C. E. B.

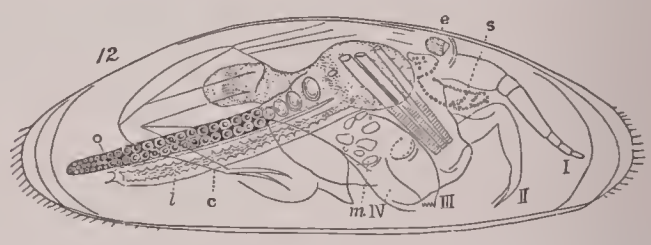
Cyp'rian, SAINT (more fully, **Thas'cius Cæcil'ius Cypria'nus**): a bishop of Carthage and Latin Father of the Church; a native of Africa; b. about 200 A. D. He was a teacher of rhetoric before his conversion, which occurred about the year 246, and he was chosen Bishop of Carthage in 248 A. D. In 250 he retired into the desert to escape from the persecution which was ordered by the Emperor Decius. He returned to Carthage in 251, and then assembled a council on the subject of apostates who had lapsed in consequence of persecution. He judged that these should be treated with moderation and lenity. He emphasized the idea of the Church, insisted upon the three orders of the ministry, and stoutly maintained the parity of bishops against the claims of the Bishop of Rome. He suffered martyrdom under Valerian, by beheading, Sept. 14, 258 A. D. He was eminent for his learning, eloquence, and zeal, wisely tempered with moderation. His works consist of thirteen treatises, the most important of which is his *De Catholicæ Ecclesiæ Unitate*, written in 252, besides eighty-one epistles, including a few addressed to him, all of which have reference to ecclesiastical affairs. See his *Life* by G. A. Poole (Oxford, 1840), and by Peters (Regensburg, 1877); cf. O. Ritschl, *Cyprian und die Verfassung der Kirche* (Göttingen, 1885). Best ed. of his works by W. Hartel (3 vols., Vienna, 1868–71; Eng. trans., *Ante-Nicene Fathers*, v. 263–596).

Cyprin'idæ [from *Cyprinus*, the longest known genus, to which the carp belongs]: the carp family; an enormous group of fresh-water species, about 1,000 species in all, found in the rivers of Europe, Asia, Africa, and North America. They are soft-rayed fishes, with smooth or cycloid scales, and with no teeth in the mouth, the lower pharyngeal bones (modification of the posterior gill arches) being armed each with from four to eight highly specialized teeth. To this family belong the carp, roach, dace, tench, barbel, gudgeon, goldfish, and the great array known as chubs, minnows, shiners, fallfish, and the like. They are tasteless fishes, and full of small bones, hence of little value as food, but useful as food of predatory fishes. Most of the species found in the Eastern U. S. are small, under 4 inches in length, the fallfish, which reaches 18 inches, being the largest. On the Pacific slope these fishes reach a much greater size, one species of *Ptychocheilus* in the Colorado reaching a length of 5 feet, and being the principal food-fish in the river. DAVID S. JORDAN.

Cyprinodon'tidæ [from Gr. κυπρῖνος, carp + ὀδούς, ὀδόντος, tooth]: a family of soft-rayed fishes, superficially resembling the *Cyprinidæ*, but with the jaws provided with teeth and the pharyngeals entirely different. To this family belong the various species known as top-minnows, mummichogs, killifishes, etc., abounding in brackish waters in most parts of the world, and often ascending rivers to the fountain-heads. Many species are viviparous, some are herbivorous, and some are extremely small. DAVID S. JORDAN.

Cypripedium [from Gr. Κύπρις, Venus + Lat. *pes*, *pedis*, foot]: a genus of plants of the family *Orchidaceæ*; remarkable for having two lateral and perfect anthers and another forming a dilated fleshy appendage above the stigma; also for having the lip or labellum large and somewhat pouch or slipper shaped; hence the popular name lady's slipper. About forty species are known, all terrestrial in habit, ranging from the tropics to the colder regions of the northern hemisphere, and often found in bogs or in hilly woods. Eight or nine species are indigenous in the U. S., the most common being *C. acaule*, the moccasin flower. This ranges from the Carolinas into Canada, and has a large purple-pink flower. The largest species, *C. spectabile*, often 2 feet high, has from one to three purple-pink or almost white blossoms.

Cypris [from Gr. Κύπρις, Venus]: a genus of ostracod *Entomostraca*, occurring in both fresh and salt water. The species are minute, have seven pairs of appendages, and are



Animal of Cypris in the shell, after Claus; enlarged: *c*, caudal fork; *e*, eye; *l*, liver; *m*, muscle; *o*, ovary; *s*, shell gland; I, II, III, IV, appendages.

inclosed in a horny bivalve shell. The species are very numerous in both recent waters and in the rocks of almost all formations. J. S. KINGSLEY.

Cy'prus (in Turk. *Kibris*; Gr. Κύπρος): an island of Asia, in the northeast corner of the Mediterranean; 44 miles S. of Cape Anamoor in Anatolia, and about the same distance W. of the coast of Syria. It is about 140 miles long, and 50 miles broad at the widest part. Area, 3,584 sq. miles. The interior is occupied by a range of mountains, the highest points of which rise nearly 7,000 feet above the sea. These mountains are of limestone formation. The soil is generally very fertile, but the island is not liberally supplied with water. The staple products are cotton, wheat, linseed, olives, silk; also grapes and other fruits. Wine of good quality is also made. In ancient times Cyprus was devoted to the worship of Aphrodite or Venus, who was fabled to have here risen from the sea. Her temple was at Old Paphos, now called *Kuklia*. The original occupants of the island were probably the Japhetic Kittim (Gen. x. 4), who left their name in the old capital, Citium. Cyprus, scarcely ever for any great length of time independent, was held by the Phœnicians from about 1100 to 725 B. C.; by the Assyrians from about 700 to 650 B. C.; by the Egyptians from about 550 to 525 B. C.; by the Persians from 525 to 333 B. C.; and then, after 323 B. C., by the Ptolemies till 58 B. C., when it became a Roman province. In 44 A. D. it was visited by Paul in his first missionary tour. The Saracens (from 649 A. D.) took and retook it several times. Wrested from the Saracens by Richard Cœur de Lion in 1191, it was governed by kings of its own from 1192 to 1489, and belonged to Venice from that time till 1573, when it was conquered by the Turks. In 1878 the island was ceded to England in consideration of an annual pay-

ment to the Porte of £92,800. (See BERLIN CONGRESS). In 1882 a constitution, with an elected council, was granted to Cyprus. Perhaps no country on the globe has changed masters so many times, or holds within its bosom the relics of so many civilizations.

For many years Cyprus has been a hunting-ground for archæologists. The *Codex Cyprius*, containing the unmutilated Gospels, was found here in the ninth century, and was carried to Paris in 1673. Pococke saw ruins and tombs; the Abbé Mariti, who visited the island in the latter part of the eighteenth century, describes marbles, medals, idols, and lamps, but the Turks would not permit diggings. Later a number of silver bowls were found, one of which, now in the collection of the Duc de Luynes, closely resembles those found by Layard at Nimroud. In 1845 a bas-relief in black basalt was found at Larnica, upon which is sculptured the figure of Sargon, King of Assyria, father of Sennacherib. This bore the inscription in cuneiform letters, "From the great King Sargon to his vassal friend, the King of Citium." Excavations begun about 1870 by Gen. Louis P. di Cesnola, resulted in the finding of statuettes and other objects, including those comprised in the Cesnola collection in the Metropolitan Museum of Art in New York city. The population was (1891) about 209,300. The inhabitants are orderly and easily ruled. A large portion are Greeks. Capital, Nicosia. See works on Cyprus by Lang, Hepworth Dixon, and Sir Samuel Baker; also vol. iii. of *L'Art et l'Antiquité en Orient*, by Perrot and Chipiez (Eng. trans. 1885).

Cyrena'ica (in Gr. Κυρηναία): the ancient name of a region of Northern Africa, now known as BARCA (*q. v.*). It is also called Pentapolis, from its five cities, Cyrene, Apollonia, Teuchira, Hesperides, Barca; afterward Cyrene, Apollonia, Ptolemaïs, Arsinoë, Berenice. The principal city was Cyrene, from which the name was derived. Cyrenaica was bounded on the W. by Africa Propria, on the E. by Marmarica, and extended southward as far as Libya Inferior. The original inhabitants, now represented by the Berbers, were probably descendants of Phut, the third son of Ham (Gen. x. 6). The Greeks began to colonize this part of Africa about 631 B. C. Till 430 B. C. Cyrenaica was governed by a dynasty of eight kings, four of whom bore the name of Battus, and four the name of Arcesilaus. A democratic republic was then established. In 332 B. C. the people submitted to Alexander. Under the Ptolemies many Jews settled there. In 75 B. C. Cyrenaica became a Roman province, and afterward a part of the Byzantine empire. In 616 A. D. it was conquered by the Persian Chosroes (Khosroo), in 647 was overrun by the Arabs, and now is under the rule of the Turks, whose authority, however, is hardly more than nominal.

Cyre'ne (in Gr. Κυρήνη): the capital of Cyrenaica; situated about 10 miles from the Mediterranean, and 1,800 feet above the level of the sea. It was founded about 631 B. C. by a colony of Spartans. Cyrene carried on an extensive commerce with Egypt and Greece through its port called Apollonia. The site is now occupied by *Grenne* or *Kurin*.

Cyriacus of Ancona: See KYRIACUS.

Cyr'il, or **Cyril'lus**, SAINT: Bishop of Jerusalem; b. probably at Jerusalem in 315 A. D. He was ordained a deacon in 334 or 335, a presbyter in 345, and became Bishop of Jerusalem in 350 or 351. Acacius, Bishop of Cæsarea, who was an Arian and an enemy of Cyril, caused the latter to be deposed by a council in the year 358. He was restored in 359, again deposed in 360, again restored in 362, deposed the third time in 367, and the third time restored in 368. He is said to have predicted the failure of Julian's attempt to rebuild the Jewish temple in 363. D. in Jerusalem, Mar. 18, 386. The best editions of his works are by Milles, Oxford, 1703, and by Touttée (Benedictine), Paris, 1720, reprinted in Migne's *Pat. Gr., XXXIII.* His writings are of especial value for questions of Christian archæology and liturgy. Chief of them is his *Catechetical Lectures*, Eng. trans. in *Nicene and Post-Nicene Fathers*, vol. viii.

Cyril, or **Cyrillus**, SAINT: one of the fathers of the Greek Church; b. at Alexandria, in Egypt. He was the nephew of the famous Patriarch of Alexandria, Theophilus, and succeeded him after some opposition in 412. Doubtless he inherited some of his uncle's severe and uncompromising spirit. The chief authority for his life, the historian Socrates, has been accused of one-sidedness in the narration of the details of Cyril's life, on account of his sympathy for the Novatians (see NOVATIAN). Cyril expelled the Jews from the city (416), but gave as his reason their violent assaults upon the Christians. He is best known for the part he took in the Nestorian controversy. He presided over the Council of Ephesus in 431, which deposed Nestorius. D. in Alexandria, June, 444. His voluminous writings are found in Migne's *Patrologia Græca, LXVIII.-LXXVII.* (reprint of edition of Aubert, Paris, 1638). The confutation of Julian the Apostate, in ten books, written in 433, is especially interesting. Cf. his *Life* by J. Kopallik (Mainz, 1881), and Charles Kingsley's *Hypatia*. There is an English translation of his commentary on Luke (Oxford, 1859), and of his *Five Tomes against Nestorius* (1881). J. J. KEANE.

Cyril, originally called **Constantine**: son of Leon of Thessalonica, and elder brother of Methodius; b. 827 A. D. About 850 Cyril went as a missionary among the Chazars in the Crimea; in 861 Methodius went to Bulgaria; and in 863 the two brothers went together to Moravia. They were the apostles of the Slavic race. Cyril invented the alphabet and translated into the Slavic language the Psalter and all of the New Testament, except the Apocalypse. In 868 he obeyed the pope's summons to Rome to explain their conduct in conducting services in the vernacular and not in the Roman tongue, and won the pope to their side, but retired to a monastery in the city, became a monk, taking the name of Cyril, and there died Feb. 14, 869. See J. A. Ginzel, *Geschichte der Slawenapostel Cyril und Method* (Leitmeritz, 1857; 2d ed. Vienna, 1861).

Cyrillic Alphabet: an alphabet invented about 863 A. D. by St. Cyril, the apostle of the southern Slavi. It was based upon the older Glagolitic alphabet. Some writers, however, make the Glagolitic the invention of Cyril, while the so-called Cyrillic they consider to be the invention of Clement, Bishop of Welitza, who died in 916 A. D. The Cyrillic, with a number of modifications, is the alphabet used in Russia and some other Slavic countries.

Cyril Lucar: Patriarch of Constantinople; b. in Crete, probably in 1572; studied at Venice and Padua, and lived a long time in Switzerland, particularly in Geneva. He was greatly attracted by the Reformed doctrine, and so, although he became a Greek Patriarch of Alexandria in 1602, and was transferred to Constantinople in 1621, he tried to effect a union between the Greek Church and the Protestant doctrines. To this end he published his *Confession* in Latin in 1629, in Greek in 1631, and in both languages at Geneva in 1633. The work is essentially Calvinistic, and his boldness stirred up great opposition. Five times was he deposed and five times reinstated. Finally in 1638 he was accused of high treason, and by order of the sultan he was strangled and his body thrown into the Bosphorus. His doctrines were repeatedly anathematized after his death. It was he who in 1628 sent to Charles I. of England the famous CODEX ALEXANDRINUS (*q. v.*).

Cy'rus the Elder, surnamed THE GREAT: founder of the Persian empire; the fourth in lineal descent from the first King of Ansan (or Elam), the mountainous country E. of Babylonia. In the early part of his reign as King of Ansan, B. C. 549, he was attacked by Astyages, King of Media, but he defeated him and took his capital, Ekbatana (now Hamadan). Within the next three years he obtained possession of Persia, and so styled himself "King of Persia" (546). He then conquered Lydia (540), and ventured against the Babylonians. Nabonidus, the King of Babylonia, lived in Teva, a quarter of Babylon on the western bank of the Euphrates, and sent his son Bil-sana-ut-sur, called Belshazzar (Dan. v.), with the army to Sippara, in Northern Babylonia. In 538 Cyrus advanced into Akkad (Northern Babylonia). Nabonidus went to Sippara, but the city was by treachery delivered into the hands of Cyrus "without fighting" (June 14, 538). Nabonidus fled. On June 16 similar treachery opened the gates of Babylon, and the soldiers of Cyrus "without fighting" entered Babylon. On the 3d of the next month Cyrus entered the city. With the conquest of Babylonia Cyrus was supreme ruler from the Mediterranean Sea to the mountains of Hindustan. In 529 he died upon a military expedition. He left two sons, Cambyses, who succeeded him, and Smerdis, and several daughters.

The above account is based upon cuneiform inscriptions deciphered since 1880, and can doubtless be relied upon. It differs widely from the account given by Herodotus (bk. i.), which briefly is this: The father of Cyrus was Cambyses, a Persian nobleman; his mother was Mandane, a

daughter of Astyages, King of Media. Before her marriage Astyages dreamed that from her a stream of water flowed forth as not only to fill his capital, but to flood the whole of Asia—hence he married her to a man whom he considered much inferior to a Median, thinking thereby to defeat the prophecy. But before her child was born he had another dream. This time he fancied that he saw a vine grow out of his daughter which overshadowed the whole of Asia. He was alarmed lest his daughter's son should cast him down from his throne, and accordingly had his daughter removed to his palace. When her child was born he commanded an officer named Harpagus to kill Cyrus. Harpagus promised to obey the order, but privily committed the infant to the care of a herdsman, who brought him up with his own children. Cyrus, having discovered the secret of his birth, and having inured himself to the hardy habits of the warlike Persians, incited the latter to revolt against the King of Media. He defeated Astyages in battle, and ascended the throne. He conquered Crœsus, King of Lydia, and extended his dominions by the conquest of other states. Among his exploits was the capture of Babylon, by diverting the river Euphrates from its channel while Belshazzar was feasting.

The name of Cyrus occurs in Is. xliv. 28; xlv. 1, or prior to his birth, as those believe who hold to the unity of the book. There is also an allusion to his capture of Babylon, Is. xlv. 1, and as there is no mention of fighting it agrees with the statement quoted above. Similarly the allusion to the capture in Dan. v. 30, 31, looks toward treachery, not a siege as Herodotus relates, confounding probably the siege under Darius with the capture by Cyrus. The inscriptions make it plain that Cyrus was a polytheist and idolater. Yet he was no bigot, but practiced religious toleration. He issued an edict that the Jewish captives who had been deported to Babylon should return to Jerusalem and rebuild their temple (Ezra i. 1–4). Herodotus states that he afterward invaded the country of the Scythian Massagetæ, who were ruled by Queen Tomyris, and that he gained several victories over her, but was drawn into an ambush and killed in 529 B. C. According to Xenophon, Cyrus died a natural death at Pasargadæ. About his name legends and myths have clustered. These are found related in Herodotus and Xenophon, whose *Cyropædia* is a romance which has him for a hero. See the cuneiform inscriptions translated in *Records of the Past*, new series, vol. v. (1892), pp. 144–176.

SAMUEL MACAULEY JACKSON.

Cyrus the Younger: the second son of Darius II. Nothus, King of Persia; b. about 424 B. C. His father made him satrap of Lydia and Phrygia in 407 B. C. Accused of conspiring against his elder brother, Artaxerxes Mnemon, who had succeeded his father as king, he was pardoned and continued in office. As satrap, however, he collected a large native army and hired 13,000 Greek mercenaries, of whom Clearchus, a Spartan, was the leader, and among whom was Xenophon the historian. In the year 401 B. C. Cyrus moved his army from Sardis, but kept his soldiers in ignorance of their destination. He met the army of Artaxerxes at Cunaxa, where, rashly exposing himself in the front, he was killed, about Sept., 401 B. C. His character is praised by Xenophon. The retreat of his Greek mercenaries is immortalized in Xenophon's *Anabasis*.

Cyst [from Gr. *κύστις*, bladder]: a hollow tumor or pathological structure in the form of a bladder. The name is also applied to hollow organs with thin walls, as the gall and urinary bladders. Pathological cysts are frequently transparent and of great tenuity. They are mostly lined by an epithelium, and are either simple or compound.

Cysticer'cus: See HYDATID.

Cystidea: an order of crinoid-like forms of Echinoderms occurring only as fossils in the rocks from the Lower Silurian to the Carboniferous. They were attached, either directly or by the intervention of a stalk, and had an oval or globular body, and frequently weakly developed arms. See CRINOIDEA.

J. S. K.

Cysti'tis [from Gr. *κύστις*, bladder]: inflammation of the bladder. It may be acute or chronic. It is more frequent in men than in women. It may be the result of blows, kicks, bruises, punctured or incised wounds. It also occurs from holding the urine too long, from urine which is irritating—either highly acid or very alkaline—or from the irritation of calculus and gravel in the bladder. In old men it results from enlarged prostate (neck of the bladder), and in women from inflammation and diseases of the uterus and pelvic cellular tissue. The symptoms of an acute case are chilliness, fever, nausea and vomiting, prostration of strength, pain and sense of heat over the bladder, constant desire to urinate, often with inability to do so, and the voiding of urine thick and creamy like pea-soup. The treatment consists in applying, in some cases, ice-packs over the bladder; in others, hot poultices and fomentations sprinkled with laudanum, opiates and chloral by the mouth to allay pain, the free use of alkaline and demulcent drinks, and in withdrawing the urine by the catheter twice daily, washing out the bladder with tepid or cool water, medicated or carbolated.

Czar [Russ. *tsar*, like Germ. *Kaiser*, from Lat. *Cæsar*]: the title of the Emperors of Russia. As early as the twelfth century this title was given by the Russian annalists to the Grand Duke Vladimir and his successors, but it was not officially used till the sixteenth century. The title cesarewitch was introduced in 1799 by Paul I., who bestowed it upon his second son, and the titles of cesarewitch and cesarevna are still applied to the heir-apparent and his wife. In Russia the popular appellation of the sovereign is Gossudar (Hospodar, "lord"). The term white czar is one of great antiquity, and signifies an independent czar.

Czartorys'ki, chaär-tō-ris'kĕe, ADAM GEORGE, Prince: Polish patriot; a son of Prince Adam Casimir, president of the Polish Diet; b. at Warsaw, Jan. 14, 1770; educated at Edinburgh and London. He fought against Russia in 1794, was taken to St. Petersburg as a hostage, and gained the favor of the Grand Duke Alexander, who appointed him assistant minister of foreign affairs in 1802, which position he resigned in 1808. In the revolution of 1830 he supported the Poles against Russia, and was elected president of the new government Jan., 1831, but after the defeat of the Poles in August of that year went into exile, continuing to labor for his country, and refusing an amnesty offered by Alexander II. D. in Paris, July 16, 1861.

Czaslau, chaas'low: a town of Bohemia; 40 miles E. S. E. of Prague (see map of Austria-Hungary, ref. 3–E). It has manufactures of beet-sugar and spirits, and a church with the highest spire in Bohemia (290 feet). At Chotusitz, 2½ miles N. of Czaslau, Frederick the Great defeated the Austrians May 17, 1742. Pop. 8,388.

Czech Language: See SLAVIC LANGUAGES.

Czech Literature: the literature of the Czecho-Slavs, i. e. the Slavic portion of the population of Bohemia, Moravia, and Silesia. To the same stock really belong the Slovaks in Northwestern Hungary; but since the beginning of the nineteenth century they have endeavored to keep themselves distinct from the other Czechs, and now their literature requires separate treatment. (See SLOVAK LITERATURE.) Of the three provinces named above, Bohemia is far the most important, and Czech literature is in the main the literature of Bohemia.

The Czechs entered the circle of the civilized world at the time of their conversion to Christianity by Cyrillus and Methodius, the Greek apostles to the Slavs, in the second half of the ninth century. They had already come into slight contact with Latin Christianity, but their real conversion was due to the Greek Church. Hence their first acquaintance with letters was under Greek influence. They adopted the Cyrillic script, and this survived among them for several centuries. It does not appear, however, that during this period they created what can be called a literature. During the romantic revival of national feeling in the first half of the nineteenth century, to be sure, certain supposed discoveries of ancient manuscripts led many Czechs to believe that their race had had a literature even before it became Christian. Such were the *Königinhofer MSS.* containing fragments of early epic songs; the *Judgment of Libuša* (*Libušin soud*); the Old Czech glosses in the so-called *Mater-Verborum*, a glossary of the thirteenth century; and the *Görlitz Fragments* of a very early translation of the Gospel of John. Suspicious circumstances about the finding of these manuscripts, however, as well as the character of them, led almost at once to a doubt as to their authenticity; and now, after a vehement literary controversy of more than half a century, few Czech scholars still declare their belief in them.

The real literature of the Czechs did not begin until after Greek Christianity had yielded to Latin. This process began as early as the tenth century, and was helped on by two influences—first, the introduction into Bohemia of Roman Catholic Slavs from Bosnia and Dalmatia, bringing

their so-called *glagolitic* (Slavonic *glagol* = word) manner of writing; and second, the political and social Germanization of the Czechs. The first of these influences led to the gradual abandonment of Greek rites and of the Cyrillic script, the visible signs of connection with Byzantine civilization; and by the end of the eleventh century both had disappeared in all but the remote parts of the Czech land. The Germanization of the Czechs was a slower matter; but it went constantly on, owing to the German connections of the ambitious Roman Catholic clergy, and to the fascination for the Czech nobles of the feudal system as they saw it in Germany. By the end of the twelfth century Occidental culture in its German form had everywhere penetrated Bohemia and Moravia, and, furthermore, great numbers of Germans had settled throughout both provinces. Their feudal dependence upon the German emperors had begun almost two centuries earlier. During the thirteenth century everything helped on the change. King Wenzel (Václav) I. (1230–53) made his court as German as possible, surrounded himself with German knights and minnesingers, loved tournaments, the chase, and all chivalric amusements. His son, Přemysl Otokar II. (1253–78), continued in the same course; and the political events which came near making him, instead of Rudolph of Hapsburg, the founder of a new line of emperors were very favorable to the diffusion of German ideas. These conditions continued through the whole of the next century. In 1310 the family of the Přemyslids was succeeded by the pure German family of Luxembourg; and the two most notable kings of this line, Karl I. (1346–78), later as German emperor known as Karl IV., and Wenzel IV. (1378–1419), did not conceal the mainly German character of their interests and designs. It was not until the very end of the fourteenth century that the agitation produced by the Hussite controversy led to a distinct national reaction against this prevailing Germanism.

Under these circumstances it is not surprising to find the first considerable manifestations of Czech literary activity closely connected with those literary movements which appear in Germany in the thirteenth and fourteenth centuries, and which, in fact, had their origin still farther west than Germany, i. e. in France. If the Latin chronicle of Kosmas of Prague (d. 1125) and a few other works of the same kind are omitted, there are no monuments of importance in Bohemia or Moravia until the thirteenth century. Then appear works both religious and profane of the determinate mediæval character just described, which extend on through the whole fourteenth century, and even later. The oldest undoubted religious monument is a poem of the thirteenth century, beginning *Slovo do světa stvořené* (*The Word created in the World*). It is a song based on some Latin original, and the precursor of many. About the same time legends began to be written; and there exist, dating back to the thirteenth century, fragments of legends about the *Virgin*, about the *Passion*, the *Apostles*, the *Holy Ghost*; to the fourteenth century, the legend of *Judas and Pilatus*, that of *St. Alexis*, *St. Dorothea*, *St. Catherine*, *St. Procopius*, *Mary Magdalen*, the *Apostle John*, etc. In the time of Karl IV. these and other legends were collected in a *Passional*, which shows the influence of the *Legenda Aurea* of Jacobus de Voragine (*q. v.*). To this period also belong several religious poems of the allegorical and didactic character so dear to the Middle Ages, e. g. an anecdotical interpretation of the *Ten Commandments*, the *Debate of the Soul and the Body*, the *Rich Man*, the *Transitoriness of the World*, etc. At the same time the translation of the various books of the Bible was slowly going on; and finally, in 1410–16, a collection of these translations was made. The Czech Bible was first printed in Prague in 1488. The religious drama, also, had its rise during the fourteenth century. The earliest fragment of it is the curious serio-comic *Mastičkář* (*Ointment-seller*), from the first years of the century. Several other similar pieces are in existence.

In the meantime profane literature was also being written. The *Alexandreïs*, based upon the Latin poem of Gualtherus ab Insulis, probably dates from the second half of the thirteenth century. To the fourteenth century belong the story of *Tristram*, that of *Tandarias and Floribella* (connected with the cycle of the Round Table), and the apparently indigenous romantic tale *Tkadleček*. The fables and apologues, many of them of Oriental origin, that were so eagerly used all over Europe for didactic or satirical purposes, made their way to the Czechs, as to others. The famous Smil of Pardubic, surnamed Flaška (Jan Smil Flaška z Pardubic a z Rychmburka, d. 1403), employed these for his allegorical didactic works, of which two at least have come down to us, the *Nová Rada* (*New Counsel*, 1394–95) and *Proverbia Flasskonis*, one of the earliest collections of proverbs made in Europe. There have been attributed to the same writer, but with little certainty, several other works of a somewhat similar character, e. g. *Rada otce k synu* (*A Father's Advice to his Son*), *Svár vody s vínem* (*The Debate between Water and Wine*), and *Podkoní a žák* (*The Hostler and the Scholar*). An interesting trait in Smil of Pardubic is his dislike of the Germans; and yet there is little that is essentially Czech to be found in his works.

Another side of literature in this period, the learned side, deserves some words. After the beginning of the fourteenth century a series of chronicles in the Czech tongue made its appearance. The most famous of these are the chronicle attributed to Dalimil of Meseritsch, giving the events of Bohemian history down to 1314 from a strongly nationalistic point of view; and that of the priest Pulkava (Přibyslav, or Přibík, Pulkava z Hradenína, d. 1380), a friend of King Karl IV. Besides chronicles, there are not a few works on jurisprudence of a highly interesting character, e. g. *Kniha starého pána z Rozenberka* (*The Book of the Old Lord of Rosenberg*, d. 1347); *Řád práva zemského* (*Law of the Land*, 1348–55); and *Výklad na právo země české* (*Commentary on the Bohemian Common Law*, about 1400), by Andreas of Duba (Ondřej z Dubé, d. 1412). Finally, we must speak of various translations of learned or quasi learned books into Czech, e. g. the *Anticlaudianus* of Alanus ab Insulis, the *Distiches* of Dionysius Cato, the so-called *Martimianus*, the *Elucidarius*, works of Albertus Magnus, the travels of Maundeville and of Marco Polo.

While such were the prevailing tendencies in Czech literature during the thirteenth and fourteenth centuries, there were not lacking signs of the great religious and national reaction that was to make Bohemia in the fifteenth century one of the most notable countries in Europe. During the fourteenth century, especially, there are constantly increasing indications of discontent with the condition of the Church. In this Bohemia was not peculiar; for as early as the twelfth century the poets and wandering scholars of France and Germany and England are found uttering bitter criticisms of monks and priests, and even popes. In the thirteenth century these criticisms had become a constant stream, and issued from nearly every European people. In Bohemia, however, scoffing or reformatory zeal was made more formidable by additional causes: first by a vague national consciousness, and a very distinct dislike of the influence of the Germans; then by reminiscences of the earlier Greek faith that had been the first form of Christianity known to the Czechs, and was still the form held by other Slavic peoples; and finally by a remarkable extension of intellectual activity, due in the main perhaps to the founding of the University of Prague by Karl I. in 1348. The very clergy began to denounce the iniquities of the Church. Konrad Waldhauser (d. 1369), Jan Milič (d. 1374), Matthew of Janov (Matěj z Janova, d. 1394), and especially Thomas Štítný (Toma, or Tomáš, ze Štítného, b. 1325–26; d. about 1405), in their detestation of ecclesiastical vices, tended more and more to make religion consist, not in allegiance to the Church, but in personal truth to God, as indicated by the interpretation of the Bible according to reason. Štítný, moreover, turned directly to the Czech people, rousing patriotic feeling by utterances like his famous, "I shall write in Czech, because I am a Czech, and the Lord God loves a Czech as well as a Latin." Works like his *Knížky šestery o obecných věcech křesťanských* (*Six Books about Common Christian Things*) and his *Knihy naučení křesťanského* (*Books of Christian Teaching*) profoundly stirred the moral and patriotic enthusiasm of his race.

These tendencies, however, were destined to find expression in a man far greater than any of those just mentioned, indeed, one of the greatest in the religious history of Europe, John Huss (Jan Hus). Born in 1369 at Husinec, Huss received his bachelor's degree at Prague in 1393; became Bachelor of Divinity in 1394, and Master of Arts in 1396. He began to teach at once, both in the faculty of arts and in that of divinity. In 1401–02 he was dean of his own faculty, and about the same time became a priest and preached in the Bethlehem chapel. In 1402–03 he was rector of the university. Early sympathizing with the reformatory movement, he was powerfully affected by the writings of Wycliffe, brought from England about 1398 by his friend,

Jerome of Prague (b. about 1379; d. 1416). As the discussion of the Wycliffite doctrines grew heated in the university, Huss endeavored at first to explain them and to show that they were not heretical. But the question was speedily confused by the race jealousies between the four "nations" into which the university was divided; and when it became clear that the Czech "nation" alone sympathized with the new teachings, Huss threw his fortunes in with his countrymen. He was instrumental in persuading Wenzel IV. to give to the Czech "nation" three votes instead of one (Decree of Kuttenberg, 1409), as a consequence of which all the foreign teachers and students, to the number of nearly 5,000, left Prague, going for the most part to Leipzig. In 1409–10 Huss was again rector of the university. The Church, however, did not submit peacefully. On July 16, 1410, Archbishop Zbyňek ordered all of Wycliffe's writings to be burned, and Huss to be exiled. After vain efforts at conciliation on the part of King Wenzel, Huss, by the king's advice, withdrew from Prague in 1412 and lived quietly in the country until 1414, when he went to the Council of Constance, under promise of protection from Wenzel's brother Sigismund. As is well known, this protection availed him nothing, and on July 6, 1415, he was burned as a heretic in Constance.

For two centuries the intellectual life of the Czechs was mainly determined by the events just described. National and religious feeling were alike aroused by the struggle which Huss inspired by his tragic death. Moreover, he had been a prolific writer, both in Latin and in Czech. His Latin *Tractatus de Ecclesia* (1413) was an epoch-making work for all Europe. What he wrote in Czech was of consequence not only because of its religious import, but also because of the great affection and care he displayed for the national idiom itself. Indeed, it may be said that Huss gave final form to the literary language of the Czechs. His *Postilla*, his *Dcerka, O poznání cěsty pravé k spasení* (*Daughter, or on the Knowledge of the True Way of Salvation*), his *Spiritual Songs*, from which the sacred poetry of the Hussites began, and many similar works, have remained models of literary excellence even to this day.

It is impossible here to do more than indicate briefly the course of the Hussite movement, and the literature it gave rise to. It became almost at the start a national and popular movement, including far the greater part of the Czechs. A friend of Huss, also a voluminous writer, Jacob of Mies (Jakoubek ze Stříbra, d. 1429), introduced the double form of the Eucharist, with bread and with wine, whence the Hussites were known as Utraquists. As time went on the more radical Utraquists threw off entirely the authority of the Church, and were called Taborites (from the town of Tabor, where they were strongest). Other sects of a still more revolutionary character, as the Adamites, also formed themselves. The Church, meantime, undertook to root out the heresy by means of crusades. These were victoriously withstood, however, until 1434, when the Taborites were virtually destroyed in the battle of Lipan. Their ruling ideas, nevertheless, lived on, and, as interpreted by the eloquent and able Peter Chelčický (b. 1390; d. 1460), formed the basis of the famous Union of Bohemian Brethren (*Jednota bratří českých*), which took final shape in the years from 1457–67.

Of names and works from this confused time we can mention only the following: John of Příbram (d. 1448), author of *Lives of Taborite Priests* (*Život kněží Táborských*); John Rokycana (Jan z Rokycan, 1397–1471), author of many Latin and Czech polemical works; Ctibor of Cimburg and Tobitschau (1437–94), a learned writer on Czech jurisprudence and author of the famous *Tobitschau Book* (*Kniha Tovačovská*); Viktorin of Všehrd (1460–1520), also a writer on jurisprudence and author of the *Nine Books of Law and Justice, etc., in Bohemia* (*Knihy devatery o právích, etc.*); Peter Chelčický, already mentioned, author of the *Net of Faith* (*Síť víry*), the *Book of Explanation of Sunday Lessons* (*Postille*), and many other extremely popular works.

Contemporary with the agitations of the Hussite movement, a new intellectual impulse began to make itself felt in Bohemia—that of humanism, or the revived study of the classics, which spread from Italy to the rest of Europe in the fifteenth and sixteenth centuries. And in company with humanism came the new art of printing. In 1462 Gregory of Prague (Castulus or Haštalský, d. 1485) gave lectures in the university on Latin authors. In 1468 the first Czech book, the *Trojan Chronicle* (*Kronika trojanská*), was printed. By the beginning of the sixteenth century humanistic studies had become generally diffused among the Czechs. Men like Bohuslav of Lobkovic (1462–1510), Řehoř Hrubý z Jelení (Gelenius, d. 1514), his son Zikmund Hrubý (1497–1554), Mikuláš Konáč of Hodíšťkov (Finitor, d. 1596), and many others, by their grammatical and lexicographical works, their translations from the classics, etc., greatly enlarged the circle of existing ideas. Scientific studies also began, and by the end of the sixteenth century Bohemia was the favorite resort of scholars like Kepler and Tycho Brahe. The indigenous literature obtained a new largeness. Members of the Bohemian Brotherhood, though still essentially Hussite, showed a new range of interest. Thus Jan Blahoslav (1523–71) labored for the education of his race, and superintended the great translation of the Bible from the Hebrew and Greek known as the *Kralitz Bible* (6 vols., 1579–93), which was published at the expense of the Moravian magnate Jan z Žerotína. Poetry, which had suffered somewhat from overmuch of controversy, revived—both sacred and profane. Hynek Poděbrad (1452–92) wrote his *Májový sen* (*May-dream*) and other sentimental or allegorical pieces. Mikuláš Dačický (1555–1626) produced, besides historical works, his *Prostopravda* (a book of songs), etc. Simon Lomnický, of Budeč (b. 1552; d. after 1622), composed religious, didactic, and satiric poems; e. g. *Cupid's Arrow* (*Kupidova střela*), *A Short Guide for a Young Householder* (*Krátké naučení mademu hospodáři*, 1586), etc. The sacred songs of Martin Michalec, of Leitmeritz (1484–1547), Adam Sturm (1530–65), Jan Augusta (1500–72), Martin Zámrský (or Philadelphus, 1550–92) are worth mentioning. A great quantity of Latin verse was written during this period, and the Czech drama was developed.

Among the Czechs the period we have just been considering, from 1526 to 1620, is known as the golden age of their literature. In it culminated the expression of national impulses and experience, as well as of imported culture. And at its very end came two men, whose names are among the greatest we have to mention, Veleslavín and Comenius, in whom appears the best the Czech literary genius has been capable of. Adam Daniel of Veleslavín (1546–99), though not of striking originality, was a man of universal interests. He wrote school-books, scientific works, histories; translated, edited, revised. His chief production, the *Historical Calendar* (*Kalendář historický*, 1578), was influential both for its method and its style.

The greater part of the life of Jan Amos Komenský (Comenius, 1592–1671) was spent in exile outside of Bohemia. He had hardly attained maturity when the battle on the White Hill (Bíla-Hora, Nov. 8, 1620) destroyed the freedom of Bohemia for nearly two centuries. Catholicism was triumphant over reform; and although the Peace of Westphalia (1648), which ended the Thirty Years' war, left the Lutheran Protestants in enjoyment of their faith, it did nothing for the Hussite Bohemians. Utraquists and Brethren were obliged to flee from their homes, settling as "Exulants" wherever they saw hope of safety. The victorious Catholics proceeded to root out, as far as possible, every trace of Hussitism. Czech books were seized and burned wherever found. Even a century later, Antonin Koniáš (1691–1760), the fanatic inquisitor, could boast that he had himself caused 60,000 Czech books to be burned. The very language was held in suspicion, and its use in the schools was prohibited as late as the reign of Maria Theresa. In spite of these terrible sufferings of his fatherland, however, and in spite of his own exile, Comenius was able to win a European fame. His labors were indeed astonishing. By his works on pedagogy he reformed the educational methods of all Europe. Most noted among these are his *Didaktika* (written 1626–32), his *Informatorium*, and especially his *Janua linguarum reserata aurea* (1631), published also in Czech in 1633. His encyclopædic, philosophical, and religious writings were widely admired—as his *Prodromus pansophiæ* (London, 1639); his *Pansophiæ diatyposis* (London, in English of Collier, 1641; Dantzic, in Latin, 1643); his *Centrum securitatis* (*Hlubina bezpečnosti*, etc., 1625), and many others. And, finally, his poem *Labyrint Světa a Ráj srdce, etc.* (*Labyrinth of the World and Paradise of the Heart*, 1623), has remained one of the chief monuments of all Czech literature.

After Comenius, as has been indicated, Czech literature practically came to an end for nearly a hundred and fifty years. In all that time there is not a name worth recording. It seemed as if the very possibility of revival had passed. When the revival at last came, one of the men most responsible for it, Joseph Dobrovský, supposed himself to be working at a task of merely antiquarian or scientific interest.

Bohemia and Moravia were firmly tied to Austria, and the Austrian Catholics took good care to stamp out every indication of Hussite or national feeling among the Czechs. Things might have gone on thus had not French ideas invaded Austria, and had not an emperor (Joseph II., 1780–90) mounted the throne whose sympathies were with Voltaire and Diderot rather than with the Jesuits. The period of inquisitorial annoyances came to a sudden close in Bohemia; and although Joseph had not the least intention of fostering the independent national feeling of the Czechs, he was not inclined to interfere with scientific or historical investigations, even if these did bring about at times unexpected results. Already in the time of Maria Theresa a few enlightened men had been attracted to the study of Czech history and institutions, and some of them had ventured to show a kind of enthusiasm for the Czech tongue. Among these may be mentioned Gelasius Dobner (1719–90), the first critical student of Czech history; Ignaz Born (1742–91), chief among the founders in 1770 of the private scientific society which in 1784 became the Royal Academy of Sciences; and, above all, František Martin Pelzel (in German, Franz M. Pelzel, 1734–1801), whose works upon Bohemian history (e. g. *Nová kronika česká*, 1791–96), and especially his edition of Balbinus's *Apology for the Czech Language* (1775), produced a deep impression. More important than these men, however, was the already-mentioned Abbé Josef Dobrovský (1753–1829), who may be called at once the founder of Slavic philology and the awakener of Bohemia to a new sense of national life. Himself unaware of the scope of his labors, using, like his predecessors, German and Latin in preference to Czech in his own works, he yet for the first time made clear to the Czechs that they had a language that was a noble member of the great Slavic group of languages, and a history that did not lack in glory. His *Lehrgebäude der böhmischen Sprache* (1809) and his *Geschichte der böhmischen Sprache und ältern Literatur* (1819) may fairly be called epoch-making books for Bohemia; while his *Entwurf zu einem allgemeinen Etymologikon der slavischen Sprachen* (1814) and his great *Institutiones linguæ slavicæ dialecti veteris* (Vienna, 1822) have a similar importance for the whole Slavic race.

The studies of which Dobrovský was the chief representative spread with remarkable rapidity. There was soon an enthusiasm for the publication of the monuments of Slavic history and literature. Pelzel, Voigt (1733–87), Ungar (1743–1807), Durich (1738–1802), Procházka (1749–1809) vied with each other in these labors. Moreover, a desire began to be felt to try the new-found native tongue in fresh literary works. A group of poets appeared who, for lack of original material, strove to imitate the sentimental manner of Bürger, Gleim, and especially Gessner. Among these poets the chief were Vojtěch Nejedlý (1772–1844), Šebastian Hněvkovský (1770–1847), and especially Antonín Jaroslav Puchmayer (1769–1820). Attempts at a Czech drama were made, notably by the brothers Karel Ignác Tham (1763–1816) and the somewhat younger Václav Tham (d. 1812). On the whole, however, all these efforts were poor and slight in their results.

The trouble was a twofold one. In the first place, the Czech tongue in its long disuse had lost much of its literary capacity. Its vocabulary, its grammar, even its orthography had become confused and uncertain. Since the golden age of Veleslavín and Comenius, it had steadily declined. It was a hard question whether the true principle for the new writers was a return to this older idiom, or the adoption and adaptation of the language of the present. A vehement controversy broke out upon this point, and, curiously enough, it centered about a matter of apparently the most trivial kind, i. e. whether after the hard sounds *c*, *s*, and *z* there should be written *y*, as in the older time, or *i*, after the analogy of other Slavic languages. The adherents of *y* came to be known as Upsilonists; those of *i* as Iotists. And gradually Upsilonism grew to mean all conservation of the pure older Czech language and traditions, while Ioticism meant innovation. The second, and more serious, trouble, however, was that the impulses we know as Romantic had not yet crystallized in Bohemia any more than in the rest of Europe. It was only after the Napoleonic wars that this happened. The struggle against France was what brought about the permanent revival of national and racial feeling which has been so marked a feature of the life of the nineteenth century. Among the Czechs this feeling took the form of Panslavism, and led to the production of what is most powerful in their more recent literature. Until Panslavism had defined itself, however, the Czech writers had really nothing to say.

In spite of controversies, however, there was a steady advance toward a true national literature. In 1818 was founded in Prague the Bohemian Museum, which has continued to be the center of the intellectual life of the Czechs. In 1827 first appeared in German and Czech the literary organ of this institution (*Časopis Českého Musea*), which the aged Goethe warmly greeted (*Works*, 1840, xxxii., pp. 380–410), and which has continued to appear in Czech to this day. In 1831 the museum established a publishing department (called *Matice*) for Czech books. Moreover, there began to write a number of young men, who, both as Romantic patriots and as scholars, were destined to give Bohemia a really substantial literature.

Czech critics regard the year 1820 as marking a new epoch in their Renaissance. Indeed, the period from 1820 to 1848 may be regarded as in many ways the most fruitful part of the nineteenth century in Bohemia. Men who were at once scholars, patriots, and poets both re-established the language, and dignified it with serious works. First of all, Josef Jungmann (1773–1847), who in his translation of Milton's *Paradise Lost* (*Miltonův Ztracený ráj*, 1811) had boldly undertaken to use an idiom large enough for modern needs, brought out a scientific and yet patriotic *History of Czech Literature* (1825), and a *Czech-German Dictionary* (5 large vols., 1835–39) that made available all the resources of the language. Then Václav Hanka (1791–1861) undertook the publication of a complete edition of the earlier Czech literary monuments (*Starobylá skládánie*, 1817–26), not without suspicion of having himself had a hand in manufacturing some of the most interesting. Pavel Josef Šafařík, or Schafarik (1795–1861), rendered Panslavism inestimable service by his *Geschichte der slavischen Sprache und Literatur nach allen Mundarten* (1826), his *Slavic Antiquities* (*Slovanské Starožitnosti*, 1837), and his *Slavic Ethnography* (*Slovanský Národopis*, 1842). František Palacký (1798–1876), the "Father of Bohemian History," brought out in 1836 the first volume of his *Bohemian History*, first published in German (*Geschichte von Böhmen*), later in Czech, *Dějiny národu českého v Čechách a v Moravě* (Prague, 1848–76). Finally, Jan Kollár (1793–1852), the most original Bohemian poet of the nineteenth century, wrote his *Slávy Dcera* (*Sláva's Daughter*, published first, 1821, under the title *Básně*, *Poems*; then, 1824, under its present name), full of a kind of mystical Panslavism; and František Ladislav Čelakovský (1799–1852) brought out his *Slavic Popular Songs* (*Slovanské národní písně*, 1821), his *Echo of Russian Songs* (*Ohlas písní ruských*, 1829), and his *Echo of Czech Songs* (*Ohlas písní českých*, 1840), which fed in another way the ever-growing Panslavist passion.

Contemporary with these greater names, we have a crowd of others of more or less celebrity in several departments of literature: In poetry, Jan Erazim Wocel (1803–71), Karel Jaromír Erben (1811–70), Milota Zdirad Polák (1788–1856), Boleslav Jablonský (1813–81), Václav Štule (b. 1814), the satirist Jaromír Rubeš (1814–53), and others; in the drama, Jan Nepomuk Štěpánek (1783–1844), Václav Kliment Klicpera (1792–1859), Josef Kajetán Tyl (1808–56), and Jiří Jan Kolár (b. 1813); in fiction, besides several of the writers already named, Jan Jiřich Marek (pseud. Jan z Hvězdy, 1801–53), Karel Sabina (1814–77), Prokop Chocholoušek (1819–64), and Vojtěch Hlínka (pseud. František Pravda, b. 1817).

In general, the writers just named were essentially Romanticists, but in all Europe the fateful year 1848 saw Romanticism discredited both in politics and in literature, and what happened elsewhere happened also in Bohemia. People grew tired of the perpetual talk about patriotism, and writers began to dream of disinterested science and art—science and art for their own sake. What Romanticism remained was of the disenchanted Byronic rather than of the enthusiastic type. The forerunner of this change in Bohemia was Karel Hynek Mácha (1810–36), whose lyrico-epic poem *Máj* (*May*, 1836) has had more influence upon living Czech poets than almost any other work. The tendencies of Mácha next appear in Karel Havlíček (1811–56), whom the Bohemians compare to Heinrich Heine. What is positive in the new poetry is an effort at cosmopolitanism as contrasted with nationalism, at perfection of statement and form as contrasted with romantic vagueness and exaggeration. Such in the main are the qualities of poets like Vítězslav Hálek (1835–74), Adolf Heyduk (b. 1836), Jan Neruda

(b. 1834), Jaroslav Vrchlický (real name Emil Bohuš Frida, b. 1853), Svatopluk Čech (b. 1846), and the poetess Eliška Krásnohorská (really Henrietta Pech, b. 1847), though the latter in an article (*Časopis*, 1877) has sharply criticised her contemporaries in favor of the older Romantic generation. The tendencies of the time, however, are too strong to be resisted. They appear in every department of literature—in the drama, as written by Emanuel Bozděch (b. 1841), Václav Vlček (b. 1839), and František Jeřábek (b. 1836); in the novels of Neruda, Čech, Vlček, Bohumil Havlasa (1852–79), Jan Jakob Arbes (b. 1840), Žofie Podlipská (b. 1833); in the historical writing of Antonín Gindely (b. 1829), Josef Emler (b. 1836), the Moravian Vincenz Brandl (b. 1834); in literary history and philology as conceived by Alois Vojtěch Šembera (1807–82), Josef Jireček (b. 1825; d. Nov. 25, 1888), Václav Nebeský (b. 1818), Martin Hattala (b. 1821), Jan Gebauer (b. 1838), Leopold Geitler (b. 1847), Josef Konstantín Jireček (b. 1854). Though there are, of course, great differences in detail between these numerous writers, and though in many of them traces of a modified Romanticism appear, yet, on the whole, they clearly belong, as has been said, to a period of would-be disinterested art and science.

A. R. Marsh.

Czech, or **Čech**, Svatopluk: Czech writer; b. at Ostředek, in Bohemia, Feb. 21, 1846. Educated at Leitmeritz and Prague, he early attracted attention by poems published in periodicals and collections of verse. He has become an important personage in the Bohemian literary world, editing various periodicals and reviews—among them the *Lumír* and the *Květy*. He has won distinction as a novelist also. Still he is chiefly remarkable as a poet, being esteemed by his compatriots one of the best living representatives of modern Czech poetry. Among his poems are *The Adamites* (*Adamité*), Prague, 1873; *Dreams* (*Snové*), Prague, 1873; *Poems* (*Básně*), Prague, 1874: *New Collection of Verse* (Prague, 1880); *Songs of the Morning* (1887); *New Songs* (1888). His romantic epic *Dagmar* is regarded by the Czechs as on the whole his *chef d'œuvre*. The following works in prose are worth mentioning: *Stories and Arabesques* (*Povídky, arabesky i humoresky*), 4 vols., Prague, 1878–83; *The Candidate for Immortality* (1884); *Sketches of Travel* (1885); *Reminiscences of the East* (1885): the satiric tales, *M. Brouček's Excursion to the Moon* (1888); and *M. Brouček's Excursion in the Fifteenth Century, etc.* (1889).

A. R. Marsh.

Czechs, cheks: most westerly branch of the Slavonic race; found in Bohemia, Moravia, and Upper Hungary. The total number in the Austrian-Hungarian empire (according to the census of 1890 for Austria and 1880 for Hungary, classifying them by language) was 7,366,000. There are about 60,000 in the Prussian province of Silesia. They are supposed to have migrated from the East into Bohemia about the fifth century. At first divided into numerous small tribes, they finally after centuries established something like a popular and national unity. It seemed at one time as though the national feeling were rapidly dying out under German domination, but within recent years, and with the decline of Austria-Hungary as a Germanic power, there has been a great revival of race enthusiasm among the Czechs. This has led to the formation of what is known as "the young Czech" party, which demands the erection of a kingdom to include Bohemia and Moravia, to be united with the empire as Hungary is. See Austria-Hungary and Bohemia.

Czelakovský, or **Čelakovský**, František Ladislav: Czech poet; b. at Strakonice, Bohemia, Mar. 7, 1799. With Kollár and others he took an eager part in the reawakening of the Czechs to national life and expression. He began to publish as early as 1822 original verses and collections of popular songs. It was not till 1829, however, that his *Echoes of Russian Songs* (*Ohlas písní ruských*) attracted general attention to him. For some years after this he was obliged to live by literary hack-work. In 1835 he was appointed to fill for a time the chair of Czech in the University of Prague. In 1842 he was called as Professor of Slavic Languages and Literatures to Breslau. In 1849 he was recalled to a similar professorship at Prague. In 1840 he had published a second collection of Slavic popular songs, *Echoes of Czech Songs* (*Ohlas písní českých*), and also a poem entitled *Rose with a Hundred Petals* (*Růže stotistá*). D. at Prague, Aug. 5, 1852. In the year of his death appeared his *Philosophy of the Slavic People in its Proverbs* (*Mudrosloví národa slovanského v příslovích*, 1852). This was followed by *Lectures on the Comparative Grammar of the Stavic Languages* (1853); *Lectures on the Beginnings of the History of the Civilization and Literature of the Slavs* (*Čtení o počátcích vzdělanosti a literatury národův stovanských*, 1877); *Czetakovský's Correspondence* (in *Sebrané Listy*), 1865. Very interesting also is his *Correspondence with Bohustava Rajska*, published in the volume called *Years of Awakening* (*Zlet probuzení*) 1872.

Bibliography.—J. Hanuš, *Čelakovský* (Prague, 1862). Čelakovský's works have appeared in six volumes, under the title *Fr. L. Čelakovského spisův básnických knihy šestery* (Prague, 1847); also more recently in Kober's *Národní Knihovna* (Prague).

A. R. Marsh.

Czenstochof, chens-to'khof: a town of Polish Russia; on the river Warthe (see map of Russia, ref. 8–A). Here is a monastery founded in 1382, which has a dark-colored picture of the Virgin, visited by multitudes of pilgrims, and reputed to have miraculous power. Pop. 18,567.

Czermak, cher'maăk, Johann Nepomuk: physiologist; b. at Prague, June 17, 1828; became in 1865 Professor of Physiology at Jena. He published, among other works, *The Laryngoscope, and its Practical Value for Physiotogy and Medicine* (1860), and *Information from a Physiological Study* (1864). His collected works were published in 1879. D. Sept. 16, 1873, while professor at Leipzig.

Czernowitz, cher'nō-vits (i. e. black city): capital of the Austrian duchy of Bukovina; on a hill near the river Pruth; about 160 miles S. S. E. of Lemberg (see map of Austria-Hungary, ref. 5–M). It is the seat of a bishop of the Oriental Greek Church, has a Greek theological seminary, a gymnasium, a Realschule, a school of midwifery, a provincial library, a chamber of commerce, and manufactures of clocks, hardware, silverware, etc. Pop. (1891) 57,403, of whom about 16,000 are Jews.

Czerny (cher'nče) **George**, or **Kara George**, Black George: a Servian chief: b. Dec. 21, 1766; originally a peasant. He became in 1806 the leader of the Servians, who had revolted against Turkey. He defeated the Turks, captured Belgrade in Dec., 1806, and liberated Servia, secretly aided by Russia. When Russia, invaded by Napoleon, could no longer support him, Czerny was driven out by the Turks in 1813. Having returned to Servia, he was murdered in July, 1817, at the instance of Milosch Obrenovitch. —His second son, Alexander Karageorgevitch, was Prince of Servia from 1842 to 1858. D. May, 1885.

D

: the fourth letter of the English alphabet.

Form.—Its form is derived through the Roman alphabet from that of Chalcis in Eubœa, which, together with those of Argos, Corinth, Laconia, and to some extent of Bœotia, Thessaly, Arcadia, and Achaia, used the rounded form (D) in distinction from the triangular form (Δ) which appears in the other Greek alphabets, notably in the Ionian, upon which the standard Greek alphabet is based, and in the Phœnician, probably the common source of all.

Name.—The Greek name of the symbol, *detta*, is a mere transference of the old Semitic name, Heb. *daleth*, door (of tent?), chosen because it combined with the initial use of the sound an indication of the shape.

Sound.—The sound which it indicates in English, and most commonly in other languages, is the dental (lingual) voiced explosive, involving either a complete check of voiced breath by a closure of the tip of the tongue with the roof of the mouth near the front upper teeth or a breaking with voiced breath of such a closure; the former in *lad*, the latter in *dog*. The French *d* differs from the English in two ways: First, the articulation is narrower—i. e. a narrower surface both of the tongue and the roof of the mouth is covered in the articulation; and second, the closure in French is made against the teeth (dental) rather than the gums (alveolar). The North German *d* is intermediate between the English and the French. In connection with *r*, as in *drawn*, the English *d* is cerebral—i. e. the tip of the tongue is bent upward, and makes a contact farther back upon the roof of the mouth. Spanish *d* and the *d* of Irish-English is strongly dental or even interdental. The Sanskrit alphabet provides for both a cerebral (*ḍ*) and a dental (*d*). They differed much as *d* in English *drown* from French *d* in *dans*. In Modern Greek δ indicates the interdental voiced spirant—i. e. the *th* in English *then*.

Source.—The main sources of the English sound *d* are: (1) Indo-Eur. *dh* (> Gr. θ: Lat. *f-*, *-d-*, (with *r*) *-b-*, Skr. *dh-*); *door*, Gr. θύρα, Lat. *fores*; *udder*, Skr. *ūdhar*, Gr. οὖθαρ, Lat. *ūber*. (2) Indo-Eur. *-t-*, in contact with voiced sounds when the accent does not immediately precede; *hund-red*, Skr. *çatám*, Gr. ἑκατόν, Lat. *centum*. (3) Teutonic þ, in contact with *l*; gold, Goth. *gulþs*; *needle*, Goth. *neþla*. (4) Special development out of O. Eng. *n*; *kindred* < O. E. *cynrœden*, *thunder* < O. E. *þunor*.

Value as Symbol.—The following are the chief uses of D (d) as a symbol or abbreviation: (1) As a numeral, Roman D = 500, $\overline{\text{D}}$ = 5,000, Greek δ' = 4, ,δ = 4,000. (2) In names, Roman D = *Decimus*, also *Dirus*, *Dominus*, *Deus*. (3) In other Latin abbreviations, D (in degrees) = Doctor; D. D. = *donum*, *dedit*; D. D. D. = *dat*, *donat*, *dedicat*; D. S. = *de suo*; D (in date of letter) = *dabam*; D. M. = *Diis Manibus*; D. O. M. = *Deo optimo maximo*. (4) In music, the second tone of the scale of C. (5) In chemistry, D = *didymium*. (6) In English money reckoning, *d* (£ *s. d.*) = *pence*, *penny*, an abbreviation of Lat. *denarius*. (7) In mathematics, *d* = differentiation, *D* = derivation, δ = variation, Δ = differencing.

BENJ. IDE WHEELER.

Dab (*Limanda limanda*): a small, flat fish belonging to the *Pleuronectidæ* or flounder family. It is common on the more sandy coasts of Great Britain. The rusty dab (*Limanda ferruginea*) is a similar species taken on the New England coast.

Dabaiba (dăă-bī'bă; also written **Dabaybe**, **Davaive**, **Abibe**, etc., probably derived from the appellation of an Indian chief of the region): the name given by early Spanish colonists to a district vaguely located somewhere S. of the Gulf of Uraba; later it was supposed to be W. of the Atrato river. It was reported that it contained a temple lined with gold, where slaves were sacrificed to fierce idols. In 1512 Vasco Nuñez Balboa led a force of 160 men in search of this wonderful temple. They wandered for a long time in the forests and found many tribes of savage Indians, some of whom had houses built in trees, but the search was unsuccessful. About 1515 Pedrarias sent Balboa and Carrillo on another quest for the golden temple of Dabaiba, and they returned after losing half their men by Indian arrows, disease, and starvation. For a long time this temple was a golden bait to the cupidity of the Spaniards, and many vain attempts were made to reach it. Such were the expeditions of Pedro de Heredia about 1536 and of Francisco César in 1538. Some ancient tombs containing large quantities of gold ornaments were discovered in this region, and it has been surmised that the story of the temple originated with them.

HERBERT H. SMITH.

Dabchick: a common name in Great Britain for the little grebe (*Podiceps minor*). See GREBE.

Dabney, ROBERT LEWIS, D. D., LL. D.: Presbyterian divine; b. in Louisa co., Va., Mar. 5, 1820; educated in Hampden Sidney College, the University of Virginia, and Union Theological Seminary, Virginia; graduated 1846. He was a pastor 1847–53; professor in Union Theological Seminary, Virginia, 1853–83; collegiate pastor of college church 1856–74; Professor of Philosophy, State University, Austin, Tex., from 1883. He was a major in the Confederate army, and in 1862 was chief of staff of the Second Corps. He was moderator of the Presbyterian General Assembly (South) in 1870. He published *Memoirs of T. S. Sampson* (Richmond, 1854); *Review of Theodore Ernest* (1859); *Life of Gen. Thomas J. Jackson* (New York, 1867); *Defense of Virginia and the South* (1868); *Sacred Rhetoric* (Richmond, 1867; 3d ed. 1881); *Sensuatistic Phitosophy of the Nineteenth Century Examined* (New York, 1875; 2d ed. 1888); *Theotogy, Dogmatic and Potemic* (Richmond, 1879; 3d ed. 1885); *Collected Discussions* (4 vols., 1891–92). D. in 1898.

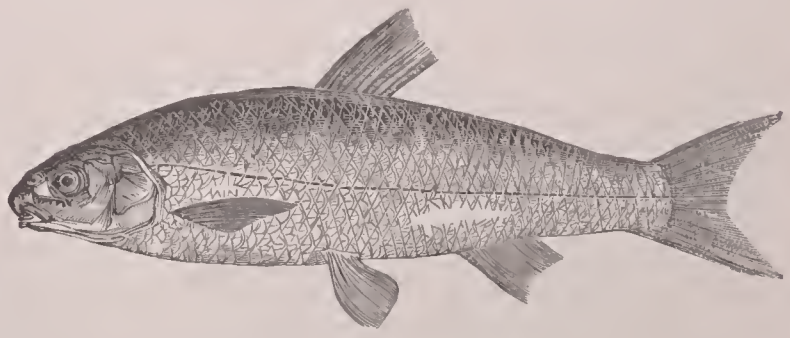
WILLIS J. BEECHER.

Da capo, daa'kaa'pō [Ital., from the beginning; *capo*, head: Fr. *chef* < Vulg. Lat. **capum* for *caput*]: a musical term, abbreviated D. C.; an instruction to the performer in such airs as end with the first strain to return to the beginning and repeat the first part.

Dac'ca: a division of the province of Bengal, British India. Area, 15,000 sq. miles. Pop. about 8,800,000. It is subdivided into five districts, one of which is called Dacca. The district of Dacca forms part of the delta of the Ganges and Brahmaputra. It extends from lat. 23° 12′ to 24° 17′ N., and from lon. 90° 11′ to 90° 58′ E. Area, 2,797 sq. miles. The surface is low and level; the soil is well adapted to the production of rice. Capital, Dacca. Pop. 2,200,000.

Dacca: a city; the capital of the district of Dacca in Bengal; on the Buri'gangá, a navigable stream connected with the Ganges; 127 miles N. E. of Calcutta (see map of North India, ref. 7–J). At the beginning of the nineteenth century it was a thriving and a populous city, but later lost most of its prosperity. Since 1870, however, its trade and manufactures have revived. It contains several ruined palaces, 180 mosques, 119 pagodas or Hindu temples, a government college, several schools, and a large hospital. Dacca has manufactures of fine muslins, cotton cloth, embroidery, pottery, and silver-work. Magnificent ruins of palaces, bridges, etc., are visible here. Pop. (1891) 82,321.

Dace: the *Leuciscus leuciscus*, a small fish of the carp family, common in the streams of Western Europe. It has



Dace.

a stout, round body, covered with good-sized scales. The back is bluish, sides and under parts white, more or less

silvery. It rarely reaches a pound in weight, and is not very good eating, but as it goes in schools, is abundant, and rises to a fly, it is nevertheless popular with local anglers. The dace has numerous relatives in Europe and the U. S., among them the horned dace, *Semotilus corporalis*, of the Middle States. F. A. L.

Dace'lo [transposition of Lat. *alce'do*, kingfisher]: a genus of Australian kingfishers, of which several species have been observed. Of these, the best known is the *Dacelo gigas*, or laughing jackass, a rather large and handsome bird of New South Wales. It takes its popular name from its harsh, dissonant cry, which greatly resembles the so-called laugh of the hyæna, and is not altogether unlike the bray of the ass. This cry is uttered at early dawn. The bird inhabits hollow trees, and feeds upon fish, reptiles, insects, etc.

Dacelo gigas, or laughing jackass.

Dachshund, dăă*k*hs'hoont (Ger. *Dachshund*, badger dog; so-called from being employed in unearthing that animal): a breed of long-bodied, short-legged dogs, with crooked forelegs. The hind quarters should be higher than the fore, the elbow and forefoot should point outward, the wrist inward. The color may be black and tan, dark brown, golden brown, or gray of various shades. Weight, 10 to 28 lb. F. A. Lucas.

Da'ci, also called **Ge'tæ**: an ancient barbarous people who inhabited Dacia. They are supposed to have emigrated from Thrace to Dacia before the time of Alexander the Great.

Da'cia: a former country of Europe; occupied by the Daci, a warlike people. It was bounded on the N. by the Carpathian Mountains, and on the S. by the Danube. The Dacians waged against the Romans a long defensive war which began in 10 B. C., when Augustus sent an army to conquer them. In the reign of Domitian they compelled the Romans to pay tribute. Trajan conquered Dacia, and reduced it to a Roman province in 106 A. D. It was formally relinquished by Hadrian (117–138) on his accession to power, and yet remained under Roman masters till the time of Aurelian (270–275), when the Romans finally withdrew within the Danube, leaving the country to the Goths. This province comprised the eastern part of Hungary, Transylvania, Moldavia, and Wallachia.

Dacier, dăă'si-ā', Anne Lefèvre: classical scholar; b. at Saumur, France, in Mar., 1654. She was instructed in Greek and Latin by her father, the learned Tanneguy Lefèvre, became a resident of Paris in 1672, and was employed by the Duke of Montausier to edit several Latin authors for the use of the dauphin. She was married to André Dacier (1651–1722), librarian of the king, the translator of Plutarch, and editor of the Delphin Horace, etc., in 1683. She published French translations of Anacreon (1681), of Terence, of Homer's *Iliad* (1699), and of the *Odyssey* (1708). As an enthusiastic admirer of Homer and other ancient poets she became engaged in a famous controversy with La Motte, and wrote her *Traité de cause de la corruption du goût*. See Burette, *Éloge de Mme. Dacier*; Rigault, *L'histoire de la querelle des anciens et des modernes* (Paris, 1856), pp. 353–411. D. in Paris, Aug. 17, 1720. Alfred Gudeman.

Da'cite: certain volcanic rocks comprising the quartz-bearing, or most acid members of the andesite series. The term was proposed by von Hauer in 1863 from their occurrence in Southeastern Austria (Roman province of Dacia). They are widespread in many volcanic regions, and were formerly known as quartz-trachytes. See Andesite and Rocks. G. H. Williams.

Dacota, or **Dakota**: See North Dakota and South Dakota.

Dacres, Sir Sydney C.: British admiral; b. at Totnes, Devonshire, England, Jan. 9, 1804; entered the British navy 1817; became captain 1832, rear-admiral 1858, vice-admiral 1865, and admiral 1870; was distinguished as lieutenant in the reduction of the Morea Castle in 1828; as captain in the Crimean war; and as rear-admiral commanded the first ironclad squadron; in 1861, when trouble between Great Britain and the U. S. was imminent on account of the Trent affair, was selected as second in command on the North American and West India station; was senior Lord of the Admiralty 1868–72; governor of Greenwich Hospital 1872–76; in 1874 was placed on the retired list. In 1865 he was created a K. C. B.; was decorated with numerous foreign orders and medals. D. Mar., 1884.

Dactyl [from Gr. δάκτυλος, finger, supposed to be an allusion to the one long and two short joints of the finger]: a metrical foot in Greek and Latin poetry, consisting of a long and two short syllables, as *cārmĭnă*. The term is also applied in the English and in other languages to a foot or measure consisting of one stressed and two unstressed syllables, as *de'sting*. The *light* or *irrational dactyl* has the same representation in syllables, but its value in time is only that of the trochee, so that the three syllables of the one are pronounced in the same time as the two syllables of the other. See Metres.

Dactylology: the science of finger-signs in communicating ideas. See Deaf and Dumb.

Dactylop'terus [from Gr. δάκτυλος, finger + πτερόν, wing]: a genus of spiny-rayed fishes, more correctly known by the earlier name of *Cephalacanthus*, remarkable for its mailed head and for the great development of its pectoral fins. It constitutes a distinct family, *Cephalacanthidæ*. The best-known species is the common flying gurnard, found on both shores of the Atlantic, a brilliantly colored little fish, often seen flying above the surface of the water, and occasionally touching the summits of the highest waves. David S. Jordan.

Flying gurnard.

Dado [Ital., die (plur. dice): Span. *dado*: Fr. *dé* < Lat. *dă'tum*, past ptc. of *dă're*, give; the development of meaning: what is given, result of the throw, the throw, the die]: the cubical portion of a pedestal comprised between its base and cap. Also a broad band of wainscoting, marble, painting, or the like, decorating the lower part of a wall.

Dæd'alus (in Gr. Δαίδαλος): in Greek mythology, an inventor and mechanical genius. He was the reputed inventor of the auger, saw, and other tools. According to tradition, he built the Labyrinth of Crete, and fabricated wings with which he flew from Crete to Sicily. He was the father of Icarus. The inventions ascribed to him are partly artistic, such as the opening of the eyes, which had formerly been closed in statuary, and the extending of the hands, which had formerly been placed down close to the sides; partly mechanical, such as most of the tools employed in carpentry, the mast of the ship, the folding-chair, etc. It seems, however, that when the Greeks ascribed a certain invention to Dædalus they simply meant that it belonged to the period when the arts first sprung up among men.

Dædalus of Sicyon: son and pupil of Patrocles; himself a distinguished artist; flourished about 400 B. C. He made for the Eleans, after their victory over the Lacedæmonians, the trophy which they erected in the grove Altis. Besides this he fashioned statues of several athletes, a Victory, and others enumerated by Pausanias. Henry Drisler.

Daemon: See Demon.

Daffodil [M. Eng. *affodylle*, the prosthetic *d* being probably due to false division in a phrase < O. Fr. *asphodile* < Lat. *aspho'dilus* = Gr. ἀσφοδελός, name of flower]: the name of certain plants of the genus *Narcissus* of the Amaryllis family, particularly of the species *Narcissus pseudo-narcissus* of Europe. The daffodils are among the earliest flowers of spring, and are common everywhere in old gardens. The flowers are yellow, borne singly upon a slender scape a foot high, with a short broad or flaring tube, and a crisped or wavy margin on the cup or corona. Perfectly double forms are also common.

Dagger: a short sword or large knife, the handle of which is usually furnished with a guard and the blade is straight, pointed, and sharpened on two edges. It is carried in a sheath or scabbard. In the sixteenth and seventeenth centuries it was used in connection with the rapier, being held in the left hand to parry the adversary's thrusts. A dagger with a blade from 8 to 16 or more inches long, called a "miserieorde," was carried by the knights of the fourteenth century, and was used to dispatch those who were

overthrown and helpless. A special form of dagger usually called a "dirk" is still carried by the Scotch Highlanders as a part of their equipment. Beside the usual form above described, the blades of daggers have been made of triangular cross section and leaf form, curved, sinuous as the Malay creese, and of many other shapes. JAMES MERCUR.

Daggett, OLIVER ELLSWORTH, D. D.: scholar and divine; son of David Daggett, judge of the Connecticut Supreme Court; b. Jan. 14, 1810, at New Haven, Conn.; graduated at Yale College 1828; studied in the Yale Divinity School 1831–33; ordained pastor of the South church, Hartford, Conn., Apr. 12, 1837; pastor of the First Congregational church, Canandaigua, N. Y., 1845–67; Professor of Divinity in Yale College and pastor of the College church 1867–70; pastor of the Second Congregational church, New London, Conn., 1871–77; resided afterward at Hartford. He was one of the compilers of the *Connecticut Hymn-book*, issued in 1845. D. in Hartford, Conn., Sept. 1, 1880.

Daghestan, dăă-ge-staan′ [Persian *dagh*, mountain + *stan*, country]: a province of Russia; extends along the western coast of the Caspian Sea, from lat. 41° to 43° N., and is mostly between lon. 46° and 50° E. It is bounded S. W. by the Caucasus Mountains, and the surface is generally mountainous. Area, 11,492 sq. miles. Chief town, Derbend. The country belonged to Persia until 1812, when it was ceded to Russia, but the Russian rule was not fully established until the submission of Schamyl in 1859. Pop. (1897) 666,959.

Dagnan-Bouveret, dăăn′yăăn′boo′ve-rā′, PASCAL ADOLPHE JEAN: genre-painter; b. in Paris in 1852. Pupil of Gérôme; second Prix de Rome, 1876; third-class medal, Salon, 1878; first-class 1880; medal of honor 1889; medal of honor, Paris Exposition, 1889; officer Legion of Honor 1892. One of the great artists of the contemporary French school, whose work is admirable technically, fine in color and extremely good in drawing, and wholesome and beautiful in sentiment. He came prominently before the public in 1880 with *The Accident* (collection of W. T. Walters, Baltimore), and followed this success with *The Parental Blessing*, perhaps the finest of all his works (owned in Russia), in 1882, *Vaccination* in 1883, *Le Pain Bénit* (Luxembourg Gallery, Paris) in 1885, *Breton Women at the Pardon* in 1889, and *In the Forest*, 1893. *Horses at the Watering Trough* (1880), an excellent work, is also in the Luxembourg. *The Parental Blessing* is worthy to rank with the best genre-pictures of any school. Dagnan-Bouveret also paints portraits, usually of small size, and his small single figures of Breton peasants are veritable masterpieces. One such is in the collection of Potter Palmer, Chicago. *A Pardon in Brittany* is in the collection of George F. Baker, New York. Studio in Paris.
WILLIAM A. COFFIN.

Dag′obert: the name of several of the Merovingian kings of France.—DAGOBERT I., b. about 602 A. D.; succeeded his father, Clotaire II., in 628. He was one of the most brilliant scions of the Merovingian family. Elected King of Austrasia in 622, he became King of Neustria in 628, after the death of his father, and to these two kingdoms he added that of Aquitaine after the death of his brother, Charibert, in 631. Thus having become sole ruler of the whole Frankish empire, he went to work to curb or restrict the rising power of the double aristocracy of the feudal lords and the prelates. He banished Bishop Arnulph of Metz, and he called Pepin, his "major-domus," to Paris to have him under his immediate control. He ordered a survey to be made of the possessions of all the monasteries, and one-half of the whole mass he confiscated and used for military purposes. One of his greatest feats was his codification of the Frankish laws. Before his death, however, he was compelled to place his son Sigebert on the throne of Austrasia. He died in 638, leaving two sons, Sigebert, King of Austrasia, and Clovis II. of Neustria.

Dagöe, daa′gō-*e*, or **Dago**, daa′gō: an island of Russia; in the Baltic Sea; a part of Esthonia, and separated from the island of Oesel by the narrow Sele-Sund. It is nearly 34 miles long and 15 miles wide. Area, 367 sq. miles. The soil is fertile only along the southern coast. The inhabitants (Esthonian, Swedish, and German) number about 15,000. There are forests upon the island. The exports are fish and cattle of a small and peculiar breed.

Da′gon [from Heb. *dag*, fish]: the national god of the Philistines; human down to the waist, with the tail of a fish; embodying the idea of fertility. Its chief temples were at Gaza (destroyed by Samson, Judg. xvi. 23–30) and at Ashdod, where the idol was miraculously mutilated (1 Sam. v. 2–4), and where the Philistines hung up Saul's head (1 Chron. x. 10).

Daguerre, dăă′ger′, LOUIS JACQUES MANDÉ: the inventor of the daguerreotype; b. at Corneilles, France, in 1789. He became a skillful scene-painter, and was one of the inventors of the diorama. Daguerre and Niepce (1765–1833) began to make experiments in photography conjointly in 1826. After the death of Niepce, Daguerre succeeded in forming indelible images on metallic plates by the chemical action of light, and later improved the process. France pensioned him, and presented his discovery to the world. D. July 12, 1851.

Daguerreotype, dăă-ger′ō-tīp [named from Daguerre, its inventor]: the first successful (now obsolete) form of the photograph. A polished plate of silvered metal was exposed in darkness to the vapor of iodine mixed with bromine, or of iodine alone, until it took a reddish-yellow tint. It was then exposed to the luminous image of the camera and quickly transferred to a dark room. Here the plate (on which no image was visible) was exposed to vapor of mercury, which brought out the figure by blending with that part of the surface which had been affected by the light in the camera. Next the plate was washed in a solution of hyposulphide of soda, which removed the unaltered iodobromide of silver, and left the picture untouched. The principles involved are discussed under PHOTOGRAPHY (*q. v.*).

Dago′ba: a monumental structure containing relics of Buddha or of some Buddhist saint. See PAGODA.

D'Aguesseau, HENRI FRANÇOIS: French jurist. See AGUESSEAU, HENRI FRANÇOIS D'.

Dahl, JOHAN CHRISTIAN CLAUSEN: landscape-painter; b. at Bergen, Norway, Feb. 24, 1778. He early showed decided talent for painting, and studied from 1811 to 1818 at the Academy of Copenhagen. In the latter year he settled in Dresden, where he became professor in the Art Academy and where he spent the rest of his life, making only short excursions to Tyrol, Switzerland, and Italy. His numerous paintings are found in art collections throughout Europe. D. in Dresden, Oct. 14, 1857.

Dahlak Archipelago: a dependency of Italy; in the Red Sea; off the port of Massowa. Area, 420 sq. miles. The largest is the curiously shaped coral island of Dahlak, with a town of the same name. The islands are inhabited by Mohammedans. The pearl-fishery here is important. Pop. 2,000.

Dahlgren, CARL FREDRIK: Swedish poet; b. near Norrköping, June 20, 1791; studied theology and became a preacher in Stockholm, where he died May 2, 1844. His first poems were contributions to a local newspaper. He was associated with Atterbom in *Phosphoros*, and may be regarded as a typical Phosphorist. (See SWEDISH LITERATURE.) In 1829 he gathered his early works into two volumes (*Ungdomskrifter*). His collected writings were edited after his death by A. I. Arvidsson (*Samlade Arbeten*, 5 vols., 1847–52). They comprise poems, lyric and dramatic, comic and romantic tales, and miscellanies. Many of them had first appeared in the poetical annuals, of which he produced several. Dahlgren's lyrical verse has always been popular. His best prose is characterized by luxuriant fancy, which sometimes degenerates into the grotesque, skill in the portrayal of agreeably eccentric characters, warm love of nature, and a delicious playful humor. His faults are the faults of his school. Both his merits and his defects may be seen to good advantage in his comic romance, *Grossörskan Vierdumpels Resa till Kanalfesten år 1832* (Stockholm, 1833). His sketch *Förlofningen* (in *Aftonstjernan: Poetisk Kalender för år 1833*) is an excellent example of his powers in the description of country life.
G. L. KITTREDGE.

Dahlgren, JOHN A.: rear-admiral U. S. navy; b. in Philadelphia, Nov. 13, 1809; entered the navy as a midshipman Feb. 1, 1826. On Apr. 22, 1861, through the abandonment of his trust by Capt. Franklin Buchanan, Dahlgren, then on ordnance duty, became commandant of the U. S. navy-yard, Washington, and to his firmness and sound judgment at that crisis the Government was indebted for the preservation of the yard from falling into the hands of the Confederates. In the fall of 1862 Dahlgren was detached from the navy-yard and appointed chief of the bureau of ordnance, and in June, 1863, became commander-in-chief of the South Atlantic blockading squadron, relieving Rear-Admiral S.

F. Dupont of that command in the harbor of Port Royal, S. C., July 6, 1863. He at once commenced active operations in conjunction with Gen. Gilmore, U. S. army, which speedily resulted in the possession of the greater part of Morris island and the silencing of Fort Sumter, and secured a safe anchorage for the monitors inside the bar of Charleston, thus effectually putting a stop to the blockade-running which had been before so successfully practiced, and reducing Charleston to a place of no importance for the rest of the war. After the fall of Charleston, in 1865, Dahlgren resigned his command, and in 1866 was appointed commander-in-chief of the South Pacific squadron, in the discharge of which duty he remained for two years. In 1868 he was a second time appointed chief of the bureau of ordnance, from which station he was relieved at his own request in 1870, and ordered to the command of the navy-yard at Washington, in which city he died July 12, 1870. He wrote *Exercise and Manœuver for the Boat Howitzer, United States Navy* (1852); *System of Boat Armament, United States Navy* (1852); *Ordnance Memoranda* (1853); *Shells and Shell-guns* (1856); and it is largely to his labors that the navy is indebted for the great improvement in its ordnance since 1840. He invented the DAHLGREN GUN (*q. v.*).

Dahlgren Gun [named from Admiral Dahlgren, its inventor]: an improved form of ordnance used for howitzers, heavy artillery, and especially in naval gunnery. It having been demonstrated that in ordinary cast guns the weight of the metal forward is greater than is needed, and that by far the greatest strain in firing is at the breech, Dahlgren greatly increased the relative size and weight of the breech, with the best results. These guns were chiefly used by the U. S. navy. See ARTILLERY.

Dahlgren, MADELINE VINTON: See the Appendix.

Dah'lia [named after Andrew Dahl, a Swedish botanist]: a genus of plants of the family *Compositæ* and sub-family *Tubuliflorœ*. They are natives of Mexico, and the numerous varieties cultivated are chiefly derived from two species —*Dahlia coccinea* and *Dahlia variabilis*. Dahlias have been very popular, being conspicuous for their varied and exquisite colors and regularity of form, but less attention is paid to them now than formerly, probably. The tuberous roots of these plants, although not agreeable in taste, are used as food in Mexico. A light and moderately rich soil, with plentiful moisture, appears to be best adapted to the cultivation of dahlias.

Dahlmann, daal'maan, FRIEDRICH CHRISTOPH: German historian; b. at Wismar, May 13, 1785. He became in 1813 Professor of History at Kiel, in 1829 Professor of Political Economy in Göttingen, and was deprived of his chair in 1837 on account of his protest against the abolition of the fundamental law by King Ernest Augustus. In 1842 he was appointed Professor of History at Bonn. In 1848 he was one of the leaders of the constitutional party. His chief works are a *History of Denmark* (3 vols., 1840–43); a *History of the English Revolution* (6th ed. 1864); and a *History of the French Revolution* (3d ed. 1864). See *Life* by Springer (1870). D. Dec. 5, 1860.

Dahlone'ga: capital of Lumpkin co., Ga. (for location of county, see map of Georgia, ref. 2–G); on a hill about 66 miles N. N. E. of Atlanta. There are gold mines in the vicinity. Here was before the civil war a branch mint of the U. S.; the building has been converted into the North Georgia Agricultural College. Pop. (1890) 896; (1900) 1,255.

Dahn, JULIUS SOPHUS FELIX: jurist and author; son of the actor Friedrich Dahn; b. Feb. 9, 1834, in Hamburg; Professor of German Jurisprudence in Königsberg 1872, in Breslau since 1888; historical works are *Prokopius von Cäsarea* (1865); *Die Könige der Germanen* (1861–71); *Urgeschichte der german. und roman. Völker* (1881–87); *Geschichte der deutschen Urzeit* (1883–88); poetical works are *Gedichte* (1857); *Harald und Theano* (1856); dramas: *König Roderich*; *Markgraf Rüdeger, Deutsche Treue* (1875); *Sühne* (1879); *Kampfende Herzen, Novellen* (1876); romances: "*Sind Götter?*" (1874); *Ein Kampf um Rom* (1891); *Odhins Trost* (1880); *Kleine Romane aus der Völkerwanderung* (1882–90); *Wettuntergang* (1889); *Odhins Rache* (1891); *Erinnerungen* (1891). C. H. THURBER.

Daho'mey: a French colony (1894) on the Slave coast, West Africa, reaching the Gulf of Guinea at Whydah, but broadening inward and forming a strip between the meridians 130′ E. and 2° 40′ E., which extends northward to about 8° N. lat. It was the hinterland of the French possessions along the coast, and was brought under French dominion as the result of the war with France in 1890–93. Area about 4,000 sq. miles. The surface is generally level, but the northern part is diversified by hills, which are covered with luxuriant forests. The soil is fertile. Maize, cotton, sugar, yams, tobacco, beans, pease, and manioc are cultivated here, and the cocoanut tree and other species of palm flourish. Among the wild animals are lions, tigers, and elephants. The people are fetich-worshipers, their principal fetich being the tiger. The Dahomans are bloodthirsty and cruel, but hospitable and courageous. Human sacrifices and savage religious rites were practiced by them until they were put under the restraint of civilized races. The king, now in exile, was a despot, whose will was law. His wives were numerous, and his chief military officers followed his example. One division of his army consisted of several thousand female warriors. Owing to the peculiar marriage customs of the people and the warfares with other native states, the kingdom, which was once one of the most powerful in Upper Guinea, had become much weakened and reduced. Capital, Abomey. Pop. about 250,000. See Forbes, *Missions to Dahomey* (1851); Burton, *A Mission to Dahomey* (1864); Skertchly, *Dahomey as it Is* (1874); Chaudoin, *Trois Mois de Captivité au Dahomey* (1891).

Daimiel, dī-mĕĕ-āl′: a town of Spain; province of Ciudad Real; 20 miles E. N. E. of the city of Ciudad Real (see map of Spain, ref. 17–F). It has a Gothic church, a town-hall, and a hospital; also manufactures of linen and woolen fabrics and blond lace. Pop. (1887) 11,508.

Daimio, dī'myō′: literally, great name; the title of the feudal barons of Japan before the abolition of the feudal system in 1868–71. These were all vassals of the mikado, but during the Tokugawa shogunate they gradually became subject to the shogun, who compelled them to live in Yedo with their families and a large number of their retainers for at least six months every year, their families being retained as hostages for their good behavior as against the shogun during their absence. When the shogunate was abolished they numbered 255, but their number differed at different times. Each exercised independent authority, and kept in his employment large numbers of samurai or armed retainers, to be placed at the service of the mikado when needed. In 1871 the daimios surrendered their lands and privileges to the mikado, who relieved them of the support of the samurai and granted each a pension proportionate to his former revenue, the highest being 70,000 yen per annum. Some years later these pensions were commuted into interest-bearing bonds, redeemable after five and within thirty years from date of issue. The title has been abolished, and both the feudal or territorial and the kuge or court nobles are styled kwazoku, the samurai being classed as shizoku. The hatamotos or vassals of the shoguns were called shōmio, or "little name." See JAPAN, SHOGUN, and TOKUGAWA. R. L.

Dairy-husbandry: the branch of agriculture which pertains to the breeding, feeding, and management of milch cows, the production of milk, and its conversion into butter, cheese, and the like. Milk has always been an important article of human food, and the making of butter and cheese seems to have been understood and practiced from the remotest periods of history. In earlier times and in some countries, besides the milk of cows, that of asses, goats, and sheep was extensively used; but now the cow is practically the only animal that is kept for its milk. Both in the U. S. and in Europe, dairy operations long formed a part of the household duties of the women of the farm. Under these conditions, while there was wide diversity in the quality of the product, much of it being inferior, certain localities, either because of certain natural advantages or by reason of the skill of the dairy women, became famed for the peculiar qualities of their dairy products. A most striking instance of this is the many characteristic and peculiar varieties of cheese for which France and Switzerland are noted. The introduction of the factory system of manufacture of dairy products marks the era when dairy-husbandry may be said to have become a distinct branch of agriculture. Jesse Williams, of Oneida co., N. Y., established the first cheese-factory in 1860, since which time the principles of modern dairying have been almost wholly developed. Factories for the manufacture of butter soon followed the establishment of cheese-factories, and both rapidly increased in numbers. A primary effect of the factory system was the production of a better and more uniform grade of product: this led to increased consumption, and consequently greatly stimulated

production. Since the introduction of the factory system the two most important influences in the development of the dairy industry have been the invention of the centrifugal machine for the separation of cream from milk, whereby a great economy in the manufacture of butter is secured, and the discovery of methods determining the amount of fat in milk rapidly, easily, cheaply, and accurately, whereby a great aid is given to the selection and improvement of dairy cows. See BUTTER, CHEESE, and MILK. H. H. WING.

Daisy [O. Eng. *dæges ēage*, i. e. day's eye, in allusion to the form of the flower as resembling the sun]: a small perennial plant of the genus *Bellis* and family *Compositæ*. The daisy is a native of Europe, and the species *Bellis perennis* is very common in Great Britain, where its delicate crimson-tipped flower has been immortalized by Burns and other poets. New and very beautiful varieties with variously colored blossoms have been introduced by the florists. Some kinds have the main blossom surrounded by a dozen small flowers formed in the arils of the scales of the involucre. The term daisy is also loosely applied to various composite flowers. The ox-eye daisy, a native of Europe, is *Chrysanthemum leucanthemum*, and is extensively naturalized in the U. S. Revised by L. H. BAILEY.

Dakar: See the Appendix.

Dakoits, or **Dacoits**: armed gangs of robbers who go about in India and Burma plundering travelers and villages. Dakoity, as their practices are called, was formerly very common, but has almost disappeared in British India, owing to active measures of the authorities for its suppression.

Dakota: a former territory of the U. S. See NORTH DAKOTA and SOUTH DAKOTA.

Dakota Formation: in geology, a group of rocks belonging to the American Cretaceous period; first described in territory of the Dakota Indians. Its characteristic beds are of coarse yellowish sandstone, but shales are frequently associated with these. It exhibits a nearly continuous outcrop along the western border of the Great Plains from Texas to Alberta, and appears also at many points in the eastern portion of the plains, being overlaid in the interval by more recent Cretaceous formations. In Texas it rests upon Cretaceous beds of the Comanche series, and in Alberta on the Kootanie formation, also Cretaceous; but in the intervening region it rests in apparent conformity on beds of Jurassic age, as well as unconformably on more ancient formations. West of the plains it reappears in the district of the Colorado plateaus. Fossil shells show that the water body depositing the formation was partly fresh and partly brackish. Abundant remains of plants indicate a luxuriant forest upon its banks. The formation contains a valuable store of coal, and its sandstones constitute the most important reservoir of artesian water in Western North America. The water received along its outcrop at the western or upper edge of the Great Plains has been tapped by the drill at many points further eastward, and affords a series of large fountains, especially valuable in a district sparingly supplied with rain. See CRETACEOUS PERIOD. G. K. G.

Dakota Indians: See SIOUAN INDIANS.

Dakota River, Rivière à Jacques, rĕĕ'vi-ār'ăă-zhăăk', or **James River**: a river of the U. S.; rises in the northeast part of North Dakota. It flows nearly southward, and enters the Missouri river about 8 miles below Yankton. Its whole length is estimated at 600 miles.

Dalberg, daal'bārch, KARL THEODOR ANTON MARIA, von, LL. D.: German statesman and author; b. at Hernsheim, Feb. 8, 1744. He studied law at Göttingen and Heidelberg, entered the Church, and was in 1772 appointed counselor and governor of Erfurt by the Prince-Bishop of Mayence. In this position he revealed an administrative talent of the highest order and supported by nobleness of character and manners. As the friend of Goethe, the Mæcenas of Schiller, the intimate of Joseph II., and author of some spirited pamphlets and essays, he became one of the centers of literary and political life in Germany. In 1802 he was made Archbishop and Elector of Mayence. But Napoleon he could not withstand; alternately threatened and cajoled by him, he became a mere tool in his hands. In 1804 he was present in Paris at the coronation, but even the admonitions of Pius VII. could not prevent him from completely submitting to the dicta of the great conqueror. In 1806 he signed the Confederacy of the Rhine, and was made prince-primate; in 1810 he gave his consent to all the territorial rearrangements which Napoleon demanded, and was made Grand Duke of Frankfort. After the fall of Napoleon his position became untenable; even the many excellent administrative reforms which he had introduced were forgotten or abolished. He made an attempt at explaining his relation to Napoleon, but nobody would listen. He was compelled to resign his sovereignty and retire into private life. D. as archbishop of Regensburg, Feb. 10, 1817. His *Life* was written by B. A. Krämer (Leipzig, 1821) and I. Müller (Würzburg, 1874). See also Beaulieu Marconnay, *Karl von Dalberg und seine Zeit* (Weimar, 1879).

Dalber'gia [named in honor of Nicholas Dalberg, a Swedish botanist]: a genus of trees and shrubs of the family *Leguminosæ*, having pinnate leaves. The fruit is a flat membranous pod containing one to three seeds. All the species are natives of tropical climates, and several of them afford valuable timber. The wood of the sissoo of Bengal, the *Dalbergia sissoo*, is extensively used and highly prized in India. The East Indian rosewood is the timber of *Dalbergia lalifolia*.

D'Albert, EUGENE: musician; b. in Glasgow, Scotland, Apr. 10, 1864; son of Charles d'Albert, an English composer of dance music, of French descent. He received his first musical education from his father. In 1876 he entered the National Training School for Music, of London, gaining a scholarship in competition. Here he studied under Sir Arthur Sullivan, Dr. Stainer, E. Pauer, and E. Prout. He was elected for a Queen's scholarship. He went with Richter to Vienna, where he played at a concert on May 11, 1882. Afterward he became a pupil of Liszt, and has achieved great fame as a pianist. He has written symphonies, overtures, and concertos. D. E. HERVEY.

Dale, JAMES WILKINSON: See the Appendix.

Dale, RICHARD: naval officer; b. near Norfolk, Va., Nov. 6, 1756; entered the merchant service when only twelve years of age, serving until the commencement of the Revolution, when he was made a lieutenant in the marine service of Virginia. He was shortly after captured by an English vessel, and while confined on prison-ship his old companions, who surrounded him, influenced him to take sides with England, and he actually engaged on board a cruiser against his native State; he was wounded at an early day, and during his convalescence realized the error he had committed, and firmly resolved to stand by his own country in the future. He entered the U. S. navy in 1776 as midshipman, was captured in 1777, and confined in prison in London nearly two years, when he made his escape in disguise. He hastened to France, and embarked with Paul Jones, who soon made him a lieutenant of his own ship, and became much attached to him. In the action with the Serapis he greatly distinguished himself, and was wounded. Returning to the U. S. in 1781, he was appointed a lieutenant in the navy, and while serving on the Trumbull he received his third wound, and was captured for the fourth time. In 1794 he was made a captain, and a commodore in 1801. He served in command of a squadron during the Tripolitan war, and on his return to the U. S. resigned in 1802. D. in Philadelphia, Feb. 24, 1826.

Dale, ROBERT WILLIAM, D. D., LL. D.: Congregational divine; b. in London, Dec. 1, 1829; graduated M. A. at the University of London 1853; in that year became colleague pastor with John Angell James in Birmingham, and in 1859 sole pastor. D. Mar. 13, 1895. He delivered the lectures on the Lyman Beecher foundation at the Yale Divinity School in 1877. He was for many years a leader among English Congregationalists, and exerted a wide influence in political as well as ecclesiastical affairs. Among his writings are the *Life and Letters of John Angell James* (London, 1861; 5th ed. 1862); *The Atonement* (1875; 9th ed. 1883); *Lectures on Preaching* (the Yale course, 1877; 6th ed. 1890); *Epistle to the Ephesians, its Doctrine and Ethics* (1882; 6th ed. 1892); *The Living Christ and the Five Gospels* (1890); and *The Fellowship of Christ*, etc. (discourses, 1891). He edited *The English Hymn-book* (1875). He was for a time one of the editors of *The Eclectic Review*, and the editor for seven years of *The Congregationalist*. He was eminent for his versatility and power both as a writer and as a public speaker, whether in the pulpit or in the discussion of political and other topics of public interest. GEORGE P. FISHER.

Dalecar'lia (i. e. the land of the men of the dales), or **Dalarne**: a former province of Sweden, now forming the län or county of Kopparberg. It is famous for its beautiful mountain scenery, its forests of pine, and its mines of

iron and copper. The Dalecarlians are a brave and patriotic people, and as a reward for their fidelity they all have the privilege of taking the hand of the King of Sweden when they meet him. Area, 11,421 sq. miles. Pop. (1890) 197,452.

Dale City: town of Pennsylvania. See MEYERSDALE.

Daleites: a body of Scotch Independents who were Calvinists and followers of David Dale (1739–1806), a benevolent manufacturer, the father-in-law of Robert Owen. The Daleites became affiliated with the Sandemanians for a time, but later were Independents. They never had more than one or two congregations.

D'Alembert, JEAN LE ROND: See ALEMBERT.

Dales, JOHN BLAKELY, D. D., LL. D.: minister of the United Presbyterian Church; b. at Kortright, N. Y., Aug. 6, 1815. He was graduated at Union College, New York, 1835, and at the Associate Reformed Presbyterian Theological Seminary at Newburg, N. Y., 1839. From 1840 till 1893 he was pastor of what is now the Second United Presbyterian church of Philadelphia. During portions of this time he was Professor of Pastoral Theology in the Newburg Seminary (1867–76), and one of the editors of the *Christian Instructor*. He published *Roman Catholicism* (Philadelphia, 1842); *The Dangers and Duties of Young Men* (1851); *Biographical Sketches of Drs. John Mason, John M. Mason, Thomas Clark, and Alexander Proudfit: The Gospel Minister* (1852); *History of the Associate Reformed Church and its Missions*, in the *Church Memorial* (Xenia, 1859); *A Memorial Discourse* (on his fortieth anniversary, Philadelphia, 1880). As secretary of the Board of Foreign Missions of his church, he published its annual reports from 1859 to 1892. D. Aug. 28, 1893. WILLIS J. BEECHER.

Dalhousie, dăăl-hoo'zi: seaport; capital of Restigouche co., New Brunswick; at the mouth of the Restigouche river (see map of Quebec, etc., ref. 2–G). It ships large quantities of salmon, lumber, and lobsters. Pop. 3,000.

Dalhousie, EARLS OF (1633): Barons Ramsay of Dalhousie (1619) and of Kerington (Scotland, 1633), Barons Panmure (United Kingdom, 1831).—FOX MAULE, eleventh earl, was born Apr. 22, 1801. He became a Whig member of Parliament in 1835, and was Secretary at War from July, 1846, to Feb., 1852. In Apr., 1852, he succeeded his father as Lord Panmure. He was Minister of War in the cabinet of Lord Palmerston from 1855 to Feb. 1858. In 1860 he succeeded to the earldom. D. July 1, 1874. His successors, GEORGE, his cousin, twelfth earl (b. Apr. 26, 1806; d. July 20, 1880) and JOHN WILLIAM, thirteenth earl, son of George (b. Jan. 29, 1847; d. Nov. 25, 1887) were in turn succeeded by ARTHUR GEORGE MAULE RAMSAY, fourteenth earl (b. Sept. 4, 1878) the eldest son of John William.

Dalhousie, JAMES ANDREW RAMSAY, Earl and Marquis of: a British statesman; b. near Edinburgh, Apr. 22, 1812; a son of the ninth Earl of Dalhousie. He was returned to Parliament for Haddington by the Conservatives in 1837, and succeeded to the earldom on the death of his father in 1838. In 1845 he was appointed president of the Board of Trade by Sir Robert Peel. He was retained in that office by the Whig Prime Minister who came into power in 1846, and he became Governor-General of India in 1847. His administration was successful, though his somewhat aggressive policy contributed to produce the mutiny of 1857. He annexed Pegu, Oude, the Punjaub, and Berar to the British dominions, and developed the resources of India by canals and other public works. In 1849 he was created Marquis of Dalhousie. He returned to England in 1856, and died, without male issue, Dec. 19, 1860. See Arnold, *History of the Marquis of Dalhousie's Administration of British India* (1863–64).

Dalin, daa'leĕn, OLOF, von: Swedish poet and historian; b. at Winberga, in Holland, Aug. 29, 1708. His weekly paper, *Den svenska Argus* (*The Swedish Argus*), 1733–34, modeled on the *Spectator*, won him popular recognition, and procured him the favor of the Government. In 1737 he was made royal librarian; in 1741 he was commissioned to write a history of Sweden; in 1751 he was ennobled, and shortly before his death, which took place Aug. 12, 1763, he was appointed *hofkansler*. Dalin's elegant prose style, seen to advantage in his *Svea rikes Historia* (*History of Sweden*, to the reign of Carl IX., published 1746–62), had great effect on later Swedish writing. His more serious poetry, composed under the influence of French classicism, has little originality, but is marked by a "correctness" and polish which did much to refine the language and improve versification. In his songs he is simpler and more spontaneous. His tragedy *Brynilda* (1739), his comedy *Den afundsjuke* (*The Envious Man*, 1738), and his epic *Svenska Friheten* (*Swedish Freedom*, 1742) deserve mention. D. in Drottningholm, Aug. 12, 1763. G. L. KITTREDGE.

Dalkeith: a town of Midlothian, Scotland, not far from Edinburgh; has large corn-market, corn-mills, breweries, iron and brass foundries, and tanneries. The chief charm is Dalkeith Palace, the principal seat of the Duke of Buccleuch, built in 1700. It was the temporary residence of Charles I. in 1633, of George IV. in 1822, and of Queen Victoria in 1842. Pop. (1891) 6,952.

Dall, CAROLINE HEALEY: See the Appendix.

Dall, WILLIAM HEALEY: naturalist; son of Caroline (Healey) Dall, reformer and author; b. in Boston, Mass., Aug. 21, 1845; educated in private and public schools in Boston; in 1863 a special pupil of Prof. Louis Agassiz and of Jeffries Wyman and Dr. A. A. Gould; served in Massachusetts militia in riots of July, 1863; held several positions on geological surveys, in 1866 going to Eastern Siberia in charge of the works of the Western Union telegraph expedition for an international line to Europe viâ Bering Strait; has since made several expeditions to Alaska, exploring for the U. S. coast survey; palæontologist to the U. S. geological survey 1884; honorary curator of mollusca in the National Museum; member of many scientific societies at home and abroad; author of numerous scientific papers on brachiopods, mollusks, and the ethnology and general natural history of Alaska, besides *Alaska and its Resources* (1870); *Meteorology and Bibliography of Alaska* (U. S. coast survey, 1879); *Coast Pilot of Alaska* (U. S. coast survey, 1884); *Mollusca of the Southeast Coast of the United States* (U. S. coast survey, 1890); *Reports on the Mollusca of the Blake Expedition* (*Bulletin Museum Comparative Zoölogy, 1880–90*); edited Marquis de Nadaillac's *Prehistoric Man*, with notes.

Dallas: town; on railway; capital of Paulding co., Ga. (for location of county, see map of Georgia, ref. 2–F); 33 miles W. N. W. of Atlanta. Here occurred a battle between Gen. Sherman and Gen. Johnston in May, 1864. Pop. (1880) 169; (1890) 455; (1900) 644.

Dallas: city and railway center (settled in 1841): capital of Dallas co., Tex. (for location of county, see map of Texas, ref. 2–I); on Trinity river, 315 miles N. of Galveston. It has an Episcopal female college, several business colleges, a school of fine arts, a convent and parochial school, merchants' exchange, U. S. court-house, public parks, Texas State fair and Dallas exposition buildings, covering 8 acres, race-course, grain-elevators, planing-mills, Union stock-yards, cotton compresses, 134 manufactories, large and small, cotton mills, 2 meat packing houses, 5 banks, water-works, sewers, suburban electric street railways, asphalt streets, etc. It is the center of extensive wheat and cotton belts. A district 8 miles square, with the court-house as the center, embraces Dallas city proper and five suburbs. Pop. of city (1880) 10,358; (1890) 38,067; (1900) 42,638.
EDITOR OF "NEWS."

Dallas, ALEXANDER JAMES: U. S. statesman; b. in the island of Jamaica, June 21, 1759. He emigrated in 1783 to Philadelphia, where he practiced law, and published in 1790 *Reports of Cases in the Courts of the United States and Pennsylvania* (4 vols.; 3d ed. 1830). In 1801 he was appointed a district attorney of the U. S. He became Secretary of the Treasury in the cabinet of Madison in Oct., 1814, when the national revenue was insufficient and the public credit was impaired. He wrote an able report to Congress recommending the establishment of a national bank, raised money by a loan, and restored the public credit. He resigned office in Nov., 1816. D. in Trenton, N. J., Jan. 16, 1817.

Dallas, GEORGE MIFFLIN, LL. D.: U. S. statesman; a son of Alexander James Dallas; b. in Philadelphia, July 10, 1792. He studied law, and was admitted to the bar in 1813. In 1824 and 1828 he supported Gen. Jackson as a candidate for the office of President. He was elected in 1831 to the Senate of the U. S. for a short term, which expired in Mar., 1833. He was sent as minister to St. Petersburg in 1837, returned in 1839, and was elected Vice-President of the U. S. in 1844, when Mr. Polk was chosen President. In 1846 he gave his casting vote in the Senate for a low tariff bill, in direct violation of his ante-election pledges. In Feb., 1856, he was appointed minister to England, where he remained until 1861. Many of his speeches were published, and a *Series of*

Letters from London appeared after his death. D. in Philadelphia, Dec. 31, 1864.

Dalles of the Columbia: a narrow portion of the Columbia river, 45 miles above the Cascades. The river here rushes violently through a chasm only 58 yards wide, inclosed between steep walls of basaltic rock. *Dalle* is a French word signifying "flag-stone," and also a "spout" for water.

Dalles of the St. Louis, The: a beautiful series of rapids in the St. Louis river, near Duluth, Minn. The river falls 400 feet in 4 miles over a bed of slate.

Dalles, The, or **Dalles City**: city (founded in 1852); capital of Wasco co., Ore. (for location of county, see map of Oregon, ref. 1–E); on Union Pacific R. R., and on the south bank of the Columbia river; 88 miles E. from Portland; has 4 schools, 1 academy, a seminary for girls (Catholic), 7 churches, 1 large flouring-mill, and a machine-shop. The river is obstructed above here by rapids and falls. The Dalles is a great shipping-point for grain, stock, and wool; 5,500,000 lb. of wool are handled here annually. Pop. (1880) 2,232; (1890) 3,029; (1900) 3,542.

EDITOR OF "CHRONICLE."

Dalling, LORD: See BULWER, HENRY LYTTON.

Dallinger, WILLIAM HENRY, LL. D., F. R. S., F. L. S.: scientist; b. at Devonport, England, in 1841; educated privately; entered Wesleyan ministry 1861; minister at Liverpool twelve years, until appointed governor of Wesley College, Sheffield, from which he resigned in 1888 in order to study biology; lecturer at Royal Institution, London; Rede lecturer to University of Cambridge; lecturer at Oxford and on the Gilchrist staff; president of Royal Microscopical Society, 1883. Author of *Minute Forms of Life* (1866); *The Origin of Life* (1878); *Creator and What we may Know of Creation* (1881); and a large number of scientific memoirs and monographs. C. H. THURBER.

Dall' Ongaro, dăl'ōn'gă̆-rō, FRANCESCO: Italian revolutionist and author; b. at Odezzo, near Venice, in 1808; became a priest, but was suspended for his independent preaching. He then renounced the Church, and became a revolutionary journalist in Triest, whence he was expelled in 1847. In 1848 he established a journal at Venice called *Fatti, e non Parole*. He took an active part in the revolutionary movements of that year, and was compelled to leave Italy. He became a contributor to several journals in Paris. In 1859 he returned to Italy, and became Professor of Literature at Florence. He has published tales, dramas, and lyric poems. D. in Naples, Jan. 10, 1873.

Dalma'tia: a portion of the ancient Illyricum, now the southernmost province of Cisleithan Austria; a long, narrow tract bounded on the N. by Croatia, on the N. E. by Herzegovina, and on the S. W. by the Adriatic Sea. It includes a number of islands. Area, 4,940 sq. miles. Pop. (1890) 527,426. With the exception of about 87,000 Greeks and a few Protestants and Jews, the population belongs to the Roman Catholic Church. About 96 per cent. of the population are Slavic and 3 per cent. Italian. The coast is bold and indented with bays, which form good harbors. The surface is diversified with mountains (the Dinaric Alps) of limestone formation, the highest of which, Mt. Orien, rises 6,332 feet above the level of the sea. The soil in some parts is fertile, and produces wheat, oats, potatoes, maize, wine, and olives. Good timber for ship-building is procured on the islands. But only 18 per cent. of the total area is under the plow, 5½ per cent. in vineyards, and 22 per cent. in forests. The climate is warm and healthy, but the country is not well supplied with water. The only streams of importance are the Kerku, the ancient Titius, and the Cettina, the ancient Telurus, both of which rise in the Dinaric Alps. The former of these two streams, which forms the boundary between Croatia and Dalmatia, is famous for the picturesque wildness of its scenery. The chief towns are Zara, Spalato, Ragusa, and Cattaro. Dalmatia was conquered by the Romans in the time of Augustus. In the seventh century it was taken by the Slavonians, who founded in it a kingdom which lasted until 1050. In the Middle Ages it belonged to Hungary. In the fifteenth century it fell under the power of the Venetians, who ceded it to Austria in 1797. In 1805 Napoleon annexed it to the kingdom of Italy, and in 1810 to the kingdom of Illyria. It reverted to Austria in 1814. The district of Cattaro in 1869–70 revolted against Austria, in consequence of changes in their old system of military service. After some concessions to the national pride of the Dalmatians, the revolt was suppressed in the latter year. Revised by C. K. ADAMS.

Dalmat'ica, or **Dalmat'ic** [from real or assumed origin in Dalmatia]: a garment with sleeves, mentioned by Roman authors as in use in the second and third centuries A. D., and named in an edict of Diocetian in the fourth century as worn by both sexes. As an ecclesiastical garment it was afterward adopted by deacons when assisting the priest at the altar. It is still worn by deacons in the Greek and Roman Catholic Churches, though in a different form.

Dalri'ada [a word which appears to have signified the country of the race of Riada, an Irish chieftain]: the ancient name of a region in Ireland now known as the "Route," the northern half of the county of Antrim. Some of the race of Riada are said to have settled in Argyleshire, Scotland, where they founded a petty kingdom called also Dalriada. More than twenty kings of this line in Scotland are mentioned before the Dalriads (or Scots) and the Picts became united under Kenneth McAlpine, who became the first King of Albany. The region S. of the Irish Dalriada was called Dalaradia, probably from another chieftain who governed it.

Dalrymple: See HAILES, LORD, and STAIR, EARLS OF.

Dalrymple, ALEXANDER: hydrographer; younger brother of Lord Hailes; b. at New Hailes, near Edinburgh, July 24, 1737; entered East India Company's service and explored many islands in Eastern Archipelago. He became hydrographer to the East India Company in 1779, and to the Admiralty in 1795. He wrote several geographical works. D. June 19, 1808. His library, very rich in works on geography and natural science, was bought by the Admiralty.

Dalton: city and railway junction; capital of Whitfield co., Ga. (for location of county, see map of Georgia, ref. 1–F); 99 miles N. N. W. of Atlanta and 40 miles S. S. E. of Chattanooga. It was an important strategical position during the last year of the civil war (1861–65); headquarters of Confederate army under Gen. J. E. Johnston in the spring of 1864; several spirited battles occurred near by. Abandoned May 7, at the beginning of Sherman's Atlanta campaign. It has a large trade in cotton, grain, fruit, etc., manufactures of cotton, wood, iron, and leather, and is surrounded by large mineral fields of iron, manganese, and limestone. Pop. (1880) 2,516; (1890) 3,046; (1900) 4,315. EDITOR OF "ARGUS."

Dalton: town: Berkshire co., Mass. (for location of county, see map of Massachusetts, ref. 2–C); on Boston and Albany R. R., 146 miles W. of Boston; has important manufactures of paper, machinery, woolens, and cotton goods. Pop. of township (1880) 2,052; (1890) 2,885; (1900) 3,014.

Dalton, JOHN, F. R. S.: chemist; author of the atomic theory; b. at Eaglesfield, in Cumberland, England, Sept. 6, 1766; son of a Quaker weaver. He taught and gave lectures on physical science, and resided in Manchester. In 1802 he announced his important theory of the constitution of mixed gases. The development of the laws of combining proportions and the atomic theory he explained in the first volume of his *New System of Chemical Philosophy* (3 vols., 1808–27). (See CHEMISTRY.) He wrote a number of scientific treatises, which were inserted in the *Philosophical Transactions*, etc. D. in Manchester, July 27, 1844. See *Life* by Lonsdale (1874).

Dalton, JOHN CALL, M. D., LL. D.: physiologist; b. at Chelmsford, Mass., Feb. 2, 1825; graduated at Harvard 1844; took the degree of M. D. there in 1847. In 1859 he published a *Treatise on Human Physiology*, of which the fourth edition, enlarged, appeared in 1867. Among his other works are *Treatise on Physiology and Hygiene for Schools, Families, and Colleges* (1868); *The Experimental Method of Medicine* (1882); *Topographical Anatomy of the Brain* (1885). He became Professor of Physiology and Hygiene in New York College of Physicians and Surgeons. His original investigations in embryology and other departments of physiology gave him a wide reputation. In 1861–64 he served as surgeon in the U. S. army. D. Feb. 12, 1889.

Dalton-in-Furness: a town of England; in Furness, Lancashire, 18 miles W. N. W. of Lancaster (see map of England, ref. 6–F). Here are iron-works and iron mines. Near Dalton are the ruins of the splendid Furness Abbey, founded in 1127 by Stephen, who was afterward king. Pop. (1891) 13,300.

Daltonism: an inability to distinguish colors; so called because the celebrated John Dalton and his brothers had a

defect in vision, in consequence of which red, blue, and green appeared alike. See COLOR-BLINDNESS.

Daly, CHARLES PATRICK, LL. D.: jurist; b. of Irish parentage in New York city, Oct. 31, 1816; admitted to the bar in 1839; became judge of common pleas in that city in 1845, and was chief judge 1857 to Jan. 1, 1886. He was author of articles in *New American Cyclopædia*, lecturer at Columbia College Law School, published a history of the courts of New York (1855), a memoir of Chancellor Kent, and many papers on banking, law, science, etc. He was, from its foundation, president of the American Geographical and Statistical Society, and was a prominent member of the Ethnological Society. D. Sept. 19, 1899.

Daly, JOHN AUGUSTIN: manager and playwright; b. at Plymouth, N. C., July 20, 1838. His family removed to Norfolk, Va., and after the death of the father came to New York, where Augustin attended the public schools, and was subsequently apprenticed to a house-furnishing firm in Maiden Lane, where he remained until he was about twenty years of age. He began his literary career as dramatic editor of the *Sunday Courier*. He also wrote for the New York *Express*, *Sun*, *Times*, and *Citizen* until 1869. *Under the Gaslight* and *Leah the Forsaken*, the latter an adaptation of Mosenthal's *Deborah*, and *Flash of Lightning* were among his first dramatic ventures. On Aug. 16, 1869, he opened the Fifth Avenue theater in Twenty-fourth Street, the first one so named under his management. It was burnt Jan. 1, 1873. On Dec. 3, 1873, he opened Daly's new Fifth Avenue theater, Twenty-eighth Street and Broadway. In 1878 he abandoned management and went abroad. In 1879 he established Daly's theater in Broadway, New York. Here were produced numerous adaptations from German farces, Shaksperean revivals, plays of Pinero, and standard old comedies. He took the whole of his company to Great Britain, France, and Germany several times, and was the lessee of a theater in London. D. in Paris, June 7, 1899.

Daly, JOSEPH FRANCIS: See the Appendix.

Daly, MALACHY BOWES, Q. C.: lawyer; b. in Marchmont, near Quebec, Feb. 6, 1836: educated at St. Mary's College, Oscott, near Birmingham, England. He represented Halifax in the Dominion Parliament 1878–82, and was appointed lieutenant-governor of Nova Scotia, July 15, 1890.—His father, Sir DOMINIC DALY (b. Feb. 2, 1798; d. Feb. 19, 1868), was for twenty-five years colonial secretary; lieutenant-governor of Tobago and later of Prince Edward Island, and governor-in-chief of South Australia. NEIL MACDONALD.

Daly, THOMAS MAYNE: See the Appendix.

Dam: a bank or mole of earth, or a structure of wood, masonry, or the like, built across a stream of water so as to obstruct its flow and raise its level. Dams are designed for the purpose of creating a reservoir, or of securing a head of water to be converted into power. See RESERVOIR DAM.

Damages: See the Appendix.

Damages, Measure of: in law, a collection of the rules which govern the award of damages in courts of justice. The subject is one which in actual practice runs out into great complexity, and forms the topic of extensive legal treatises. All that can be done in this article is to state a few of the principal rules that are applied by the courts, and to refer the reader to leading text-books and other sources of knowledge for detailed information.

It is necessary in the outset to notice the settled distinction that prevails in the jurisprudence of England and the U. S. between courts of law and equity. (See EQUITY.) It is the principal province of courts of law to award damages as a compensation to an injured party for breach of contract or other invasions of private right. Courts of equity, on the other hand, seek to prevent threatened or apprehended injury, or to compel a party in case of a contract to perform it, instead of causing him to pay damages for its violation. Still, in special cases, the equity courts, as auxiliary to other relief, entertain the matter of damages. It is not necessary in this general survey to consider these special cases, and the residue of the discussion will be confined to the examination of rules concerning damages prevailing in courts of law without referring to special instances recognized in courts of equity. A preliminary remark is that courts of justice do not seek to give an injured party compensation for all the damages that he may, by a strict course of reasoning, be supposed to have sustained. Thus no compensation is given for mental anxiety or suffering, nor is full and adequate indemnity necessarily made for the costs and expenses to which a party is unjustly subjected in the course of a groundless litigation. The courts adopt rules of practical convenience which, while they may not supply the demands of an ideal system of jurisprudence, work out substantial justice. The principal propositions recognized in the law of damages will now be stated in the form of rules.

Rule I. The great general principle governing the law of damages is to give *compensation* for the right violated, and nothing more. If a party to a contract plainly stipulates for a larger sum in case of its breach than compensation, he will not be allowed to recover it. The stipulation will be regarded as a "penalty," and will not be enforced. This is well shown by the case of an ordinary bond for the payment of money. This is so drawn that it would appear that the debtor would forfeit twice the amount of his debt if he did not pay with punctuality on the appointed day. Still, no more can be collected than the actual debt with interest. The great point of inquiry in regard to the fact whether a stipulation is a penalty is whether the amount of damages can be ascertained by a numerical calculation or its equivalent. If so, an agreement to pay more will not be enforced. On the other hand, if the damages are uncertain in amount, and the parties choose to enter into an agreement as to the sum to be paid in case the contract is broken, the courts will not interfere with it.

Rule II. Exemplary or vindictive damages are allowable in certain cases, notwithstanding the general principle that the damages must be compensatory. "Exemplary" or "vindictive" damages mean such as are not in their nature compensatory, but are awarded with a design on the part of the court to punish a wrongdoer. The rule respecting them must be regarded as exceptional in its nature, and founded to a certain extent on theories of public policy. There is a certain class of injuries (mainly wrongs or torts) in which the bad intent of the wrongdoer is allowed to enter as an element in fixing the damages. So the absence of an intent may lead to their reduction, as where the act was accidental or committed by an irresponsible person—e. g. a lunatic. Both of these cases may fall within the rule of compensatory damages, since the presence or absence of an evil intent may increase or diminish the injury sustained. Vindictive damages go still further, having in them no element whatever of compensation, but are strictly punitive. The cases in which such damages, among others, are allowed are aggravated cases of trespass upon property or upon the person, slander, libel, seduction, cases of fraud, etc. The theory adopted, as already suggested, is that over and above all compensatory damages the wrongdoer should be made to pay a sum of money as a punishment for his *quasi* criminal act. This is but a rude and imperfect kind of justice, and not reconcilable with sound principle; for if there is to be an amercement of this kind, reason would dictate that the amount should be paid to the state in the course of some appropriate proceeding, rather than to the injured party. The rule has, however, become too well settled in the practical administration of justice to be shaken. Public convenience is promoted by it, since the law in a number of these cases permits no criminal proceeding, and without the doctrine of vindictive damages the wrongdoer would escape all punishment.

Rule III. In making up an estimate of compensatory damages there are various circumstances to be taken into account, lessening or increasing their amount. Among them are bodily pain caused by a personal wrong. The law distinguishes between bodily pain and mere mental suffering. Damage is assumed to be derived from the former, and not from the latter. In some cases damages enter as an element into the cause of action itself. Some forms of slander are only made actionable by affirmative proof that actual damages of a pecuniary nature have been sustained. Thus a charge of unchastity against a female is not by the common law an actionable slander. It may be made so by proof of consequent loss of employment. So in certain cases of slander actual malice or ill-will on the part of the defendant is proper to be taken into account. The fact that a slander known to be false has been deliberately repeated may be used for the purpose of enhancing the damages in an action simply for the first utterance, as it tends to characterize the intent of the defamer. No damages can be given for the repetition of the slander in that action, since that may be the foundation of a subsequent proceeding, and it would be unjust to award damages twice for the same violation of right.

Rule IV. From a violation of right the law assumes, as

a rule, that damage will follow. If no actual damage is proved, "nominal" damages will be recoverable, such as a farthing or a penny. It has been said by high authority that "every injury imports a damage." It might at first thought be regarded as an idle and foolish thing to bring an action when it must be known in advance, from the circumstances of the case, that only nominal damages are recoverable. Such actions, however, are frequently instituted for the purpose of establishing a right. Thus if inspectors at a public election should willfully and improperly reject a vote, the right to vote might be vindicated by an action for damages, though it may be difficult to say that the elector has sustained any appreciable damage. A judgment in his favor would at least establish his right. So if one should assert a right of way over another's land, the owner might establish the non-existence of the right by bringing an action against the claimant for its exercise, even though the trespass was really nominal. A judgment to this effect might be highly important, since an unmolested exercise of the asserted right for twenty years might give the claimant a way by prescription. (See PRESCRIPTION.) There may perhaps be cases where no possible present or prospective damage would be sustained by an invasion of right, thence called cases of *injuria sine damno* (invasion of a right without damage), and accordingly no recovery even of nominal damages can be had.

Rule V. The damages must not be too remote. This is a rule of great importance, and one in respect to which it is easy for inexperienced persons to err. The damage complained of must have been the natural and reasonable result of the act of the wrongdoer, or, in cases of contract, must have been within the contemplation of the parties. Simple as these statements are, they are found in practice to be quite difficult of application. A wide range of inquiry is open as to the point when the result is natural and reasonable. It is plain that no recovery should be had if the damages are really attributable not to the wrongful act of the defendant, but to some intermediate cause. If A were slightly injured by B, and the medical treatment of the wound thus occasioned were so unskillful as to lead to a dangerous result, the damage is not to be imputed to the act of B, but to the want of skill on the physician's part. On the other hand, if the intermediate act be in no sense a cause, but only an attendant upon the injury, the author of the primary act is liable for all the damage sustained. There is a well-known case in which a squib was unlawfully thrown by one person at another, who warded it off so as to direct it toward a third, and so on until the plaintiff, a remote person in the series, was so injured by it as to lose his eye. It was decided that the true author of the plaintiff's injury was the person who first cast the squib, the intermediate parties not having acted deliberately, but involuntarily and by way of self-defense. There is an important distinction to be observed in certain cases between actions of tort and upon contract. In the former case any one directly or consequentially injured by the act of the wrongdoer may bring his action. In the latter, the plaintiff must be substantially a party to the contract. Thus if a person should lend to another for use a tool or machine which he knew to be dangerous and unfit to be used, and did not give notice of the defect to the borrower, he would be liable to him for resulting damages, but not to a mere stranger who might casually make use of the machine, as he would have no connection with the contract of lending.

One of the most important cases that arises under a contract is whether in an action for its breach profits that might have been realized if it had been fulfilled may be recovered as damages. Sometimes the question concerns the right to a rise of price occurring between the time of the making of the contract and of its fulfillment. At other times it relates to the profits to be gained from the use of an article, such as a steamboat running for hire, or a manufactory. The inquiry is to be solved by determining whether the profits can in a just sense be said to have been within the contemplation of the parties. Thus if a seller had merely contracted to sell a chattel, as, for instance, a steamboat, as a mere article of merchandise, supposing, perhaps, that the purchaser intended himself to sell it again, it could scarcely be claimed that anything more could be recovered for breach of contract than the rise in price of the steamboat. On the other hand, if one contracting to repair such an article for an owner had been informed that it was to be used for a season to carry passengers on a particular line, and that for the use of it a large rent could be obtained, and he failed without cause to perform his contract, it might be just to hold him for loss of *rental value*. It would be necessary to distinguish between profits that are in their nature conjectural and arbitrary, and such a price as that for which the thing in question would rent in the market, since the latter would be reasonably certain. The true line of distinction is between that which is uncertain, fluctuating, and therefore not ascertainable, and that which is capable of being measured and ascertained. The same general line of argument must be adopted as to losses sustained. If a common carrier, to whom had been intrusted by an owner a broken shaft of a mill to have it repaired at a distant point and then returned, should neglect to perform his contract, and the mill should consequently lie idle, loss of rental value could not be charged to the carrier unless when the contract was made he was informed of the relation of the broken shaft to the mill, and thus had the means of knowing the consequences that would naturally result from his want of diligence. Without such information he might suppose himself liable simply for the piece of iron considered as a chattel, and might for that reason fail to exercise the extreme diligence that he would have observed had he known all the facts of the case. Similar questions will arise where one is deprived of his property by wrong. The damages should be the legal, direct, and necessary result of the act. Conjectural profits can no more be recovered than in the case of contract. Thus if one should unlawfully deprive another of the use of a manufactory, compensatory damages (as distinguished from vindictive, already explained) would consist in awarding the rental value to the party injured. In the case of personal injuries, disqualifying a person from labor or diminishing his productive power, the question has arisen whether account can be taken of the personal profits of a business in which the injured party is engaged. This will depend upon the point whether the profits are reasonably certain. Thus it has been decided that the past professional income of a physician can be considered in such a case. The New York court of appeals has recently refused to extend this principle to the past profits of a commercial business (such as importing teas), as being too uncertain. (*Masterton* vs. *Mount Vernon*, 58 New York Reports, 390, 1875.) A good illustration of the general principle is to be found in the case where a sale of goods is made with a warranty of their quality. They turn out to be defective, and loss is sustained. No recovery can be had except for losses directly attributable to the defects within the scope of the warranty. Accordingly, if one should purchase with warranty seeds of grass simply as an article of merchandise, without informing the seller that he intended to sow them in his field, and he should sow them accordingly, and, owing to their want of germinating qualities, should lose the use of his soil for a season, he could only recover the market value of the grass-seed, and not for the loss of the use of the ground. Another conclusion would be reached if the dealer in seeds had been informed that growing seed was wanted for the purchaser's use, to be sown upon his farm. On a like principle, if one should buy a ship's cable under a warranty that it was a good cable, it would appear, notwithstanding a questionable decision to the contrary, that he could not recover for the loss of an anchor which it failed to hold owing to its poor quality, unless he had informed the seller, or that person had reason to know, that it was to be used in and about a ship. It should be added that damages are deemed to be too remote when they are produced or aggravated by the plaintiff's own act or negligence. Under this salutary rule an injured party is not by his own remissness and inattention to allow the damages to become unnecessarily swollen, and then charge them to the wrongdoer. If a trespasser should open the gate to a farm, and the owner become aware of it, the latter should not leave the gate open for cattle to despoil his field, and then hold the trespasser responsible. So, if a servant is hired for a definite period and is wrongfully discharged by his master before the time has elapsed, he is not to lie idle if opportunities to work present themselves and charge his master for an amount equivalent to his wages. He should have accepted an offer to labor in the same business, received such wages as he could obtain, and only have held the master for the deficiency. This rule is one of general application in all branches of business, and dictates that an injured party should use reasonable efforts to confine the damages for a wrongful act within as narrow limits as possible. Damages will also be too remote in a class of cases where the defendant may have set another person in

motion who was the immediate author of the wrong, and yet the loss sustained could not reasonably have been within the defendant's contemplation. Still, if the damages could have been foreseen by the defendant, and were the natural result of his act, the modern view is that he ought to be responsible. It was at one time supposed that if the injured party had an action against the direct author of the wrong, the instigator of it, being more remotely related to the occurrence, was not liable. An illustration of the correct principle will be found in the case where a manager of a theater had induced a singer for a rival theater to break her engagement for the theatrical season. In this case the injured party had an action against the singer for violating her contract, and yet the court, after full discussion, held the manager also liable, as the damage sustained was the natural result of his act. The following may serve as an illustration of a case where no liability would attach: A person defames another, who is a servant, in general conversation. One of the listeners repeats the conversation to the master, who wrongfully discharges the servant, so as to make himself liable to an action. In such a case it is plain that there is no natural connection between the slander and the master's wrongful act. It may be that the slanderer did not even know that the person defamed was a servant, or, if he did, had no expectation that the conversation would be repeated to the master.

Another important question in the law of remoteness is whether the costs of an action growing out of or incident to the claim in respect to which damages are demanded can be recovered. For instance, suppose that A is a surety for B. The latter makes default in payment, and the former is sued, incurs a bill of costs, and finally pays the creditor. Should he be allowed his costs? This will depend upon the point whether his resistance to the action was reasonable or not. Perhaps it was wholly useless and unnecessary. In such a case the costs can not be regarded as derived from the principal's default, but from the surety's own obstinacy or pertinacity. It is a wise course when a surety or other person is sued, who, in case he is made to pay, has a claim over against another, to notify that person to make a defense to the action. If he neglects to attend to this notice, and the party sued acts reasonably and in good faith, he may compel the party notified to repay him such costs and expenses as he was obliged by the rules of law to pay. Even in this case of notification there must have been some reasonable ground of defense, otherwise costs can not be recovered. It has been well said "that no person has a right to inflame his own account against another by incurring additional expense in the unrighteous resistance to an action which he can not defend."

Rule VI. Losses not yet accrued may be included in damages, provided that they are naturally derived from the wrongful act, and do not themselves supply a separate cause of action. If a man were wounded in the skull, and at different times fresh pieces of the skull should come out, he would not have a separate action for each piece, but only one for the whole. Accordingly, whenever he brought his action he should recover damages for the entire injury sustained, both present and prospective. Where an injured party may recover the entire damage in one action, in general he must do so. If he fails to demand the whole amount, the judgment will be a bar to all further proceedings. It is sometimes extremely difficult to determine whether the entire damages can be recovered in one action, and the law upon the subject seems to be in a provisional and unsatisfactory condition. Reference must be made for precise information to the decisions of the courts. The rule now under consideration bears a close relation to the statute of limitations (see LIMITATIONS, STATUTE OF), since, if the damages are all recoverable when the wrongful act is done, that statute will begin to run from the time when the wrong was committed, rather than from the period when substantial loss is actually sustained. Thus if an attorney who was employed to examine a title should do his work in such a negligent manner as to induce his client to pay a price for incumbered land while he only intended to pay for unincumbered, the statute begins to run from the time of the breach of duty, rather than from the foreclosure of the incumbrance.

Rule VII. Interest is frequently to be paid by way of damages. (See INTEREST.) In some cases there is a distinct contract to pay interest; in others, the duty to pay interest has no relation to contract, but it is allowed as a compensation for the detention of property unlawfully withheld, or is imposed upon a wrongdoer as a punishment for his wrongful or fraudulent conduct. It is unnecessary to do more than refer to this topic here as it has been sufficiently considered under the topic of INTEREST.

Rule VIII. An important rule applicable to the subject of pleading must be adverted to. For this purpose a distinction is taken between general and special damages. The former are such as the law implies or presumes to have occurred from the act complained of. Special damages are such as are not necessarily implied by the law, but in the particular case do in fact arise, and are sufficiently proximate to be recognized by the rules of law. In this case the law of pleading requires that such special damages should be set forth in the plaintiff's declaration and as a part of his claim. The particular cases to which this rule applies must be sought in the special treatises upon damages and in works upon pleading. One or two instances may be referred to. In an action for a personal injury damages for an interruption of the plaintiff's occupation must be especially stated. The same remark may be made of a loss of rent in an action for injuries to real estate.

Rule IX. The rules concerning the measure of damages are matters of law, to be decided by the court rather than by the jury. The amount of damages is frequently in the discretion of the jury. This is the case in many actions for wrongs and in personal actions upon contract, such as a breach of promise to marry. Still, over these cases the court exercises a superintending power, and may set aside verdicts for excessive damages, showing, as they frequently do, undue prejudice or passion on the part of the jury. This power is sparingly exercised, and only in extreme cases. In extraordinary cases verdicts may be set aside where the damages are too small. This is mainly the case where no damages are allowed by the jury when some ought to be given.

The cases to which the general rules thus referred to are to be applied are very numerous, and require careful consideration on the part of the courts. Among them may be mentioned actions to recover possession of real property or for wrongful interference with it; actions for the breach of covenants for the conveyance or use of land; also upon bills of exchange or promissory notes, upon policies of insurance, upon the sale of goods, contracts growing out of the carriage of goods, including bills of lading; also between special parties, such as principal and agent or principal and surety. Actions for wrongs involving damages are among others for specific goods wrongfully taken (replevin), for their value (trover), for injuries immediate and direct, to person or property (trespass), for injuries indirect and consequential (trespass on the case). Underlying all these actions will be found the rules already stated. For example, if a principal should bring an action against an agent for violating his instructions in selling merchandise below a fixed price, the measure of damages is the loss sustained, and not the difference between the price received and the instruction price. The former rule supplies complete compensation, since the principal could obtain equivalent goods by means of the sum awarded to him. So, if goods be wrongfully taken or "converted," the general rule of damages is their value at the time of conversion, with interest, though, according to some authorities of inferior weight, a much wider range is allowed, so as to include the highest price down to the time of the trial.

A peculiar rule prevails in most of the U. S., as well as in England, in case of a contract to convey land. In the absence of fraud or of knowledge, or reasonable means of knowledge, on the vendor's part that his title is defective, only nominal damages can be recovered if he fails to make a good title to the property which he has contracted to convey. The principal reason of this rule is that in an ordinary covenant for title in a deed the utmost amount of damages allowed by the law of most of the States is the consideration-money and the interest. If no consideration has been paid, nothing can be recovered, so that rise of price does not enter in as an element in an action upon a covenant for title in a deed. It would not be reasonable that, in a contract to convey, any higher rate of damages should be allowed than would be given in case an actual deed had been delivered and the title had proved defective. The law of damages in real-estate transactions is therefore somewhat anomalous and exceptional, and differs widely from that which prevails in the case of the sale or contract to sell personal property. See the treatises of Sedgwick and Mayne.

T. W. DWIGHT.

Daman: another name for the HYRAX (*q. v*).

Daman, dăă-maan′, or **Damaun**, dăă-mown′ (Port. *Damão*, dăă-mowñ′): a Portuguese district in Western India, E. of the Gulf of Cambay, with a seaport of the same name, in lat. 20° 24′ N., lon. 72° 53′ E. (see map of S. India, ref. 2–C). It is entirely surrounded by British territory. Area, 91 sq. miles. The surrounding country is pleasant and fruitful, but inundated in the wet season. The port has been Portuguese since 1558, and is fortified. Pop. of district, 49,000.

Damanhur, dăă-măăn-hoor′ (anc. *Hermopolis Parva*): a town of Lower Egypt; capital of the province of Bahreh; about 40 miles E. S. E. of Alexandria. It has manufactures of cotton and wool. Pop. 23,353.

Damar, dăă-maar′, **Dhamai**, dăă-mī′, or **Dimar**, dĕĕ-maar′: a town of Arabia, in Yemen; 60 miles S. S. E. of Sana (see map of Persia and Arabia, ref. 10–E). It has a citadel, and is celebrated for its schools and its horses. Pop. 25,000.

Dâmar: See DAMMAR.

Damaraland: the northern part of the German protectorate of Southwest Africa; extending along the coast from the mouth of the Kunene river (lat. 18°) southward to Walfish Bay, and eastward to the meridian of 21° E., except at the northeast angle, where it extends along the northern parallel to the Zambezi river. Area, approximately 200,000 sq. miles. The coast is infertile and desolate, but the inland tracts are richer. It includes Kaokoland and a large part of Ovampoland. All mining and other rights conceded by natives belong to the German West African Society.

The inhabitants form two distinct groups, the Ova-Herero, or Damara of the plains, and the "true Damara," or Damara of the hills. The former, living between 21° and 23° S. lat., number 100,000 (estimated, 1891), and are of pure Bantu stock. Physically they are among the finest races of Africa. Their property consists chiefly of cattle, which supply them with clothing and food. They are warlike and unruly, and prize guns and ammunition almost more than their herds. Their history is one long series of struggles with the hill Damara and Ova-Mbos N. and the Hottentots S. of them. The hill Damara, numbering 35,000 (estimated, 1891), and living at the highest elevation of the Damara plateau, are small and physically inferior, but industrious and devoted chiefly to agriculture. Most of them speak a Hottentot dialect, and ethnologists are not agreed as to their origin. See Galton's *Narrative of an Explorer in Tropical South Africa*; Andersson's *Lake Ngami*; Palgrave's *Report of a Mission to Damaraland and Great Namaqualand in 1876*; Cust's *The Modern Languages of Africa*; and Greswell's *Geography of Africa South of the Zambesi*.

Damasce'nus, JOANNES, also called JOHANNES CHRYSORRHOAS (i. e. streaming with gold), either because of his eloquence simply, or in allusion to his birthplace near the river of that name, the Abana of Scripture, now called the Barada; theologian: b. in Damascus about 680 A. D. His father was in the service of the caliph, and he succeeded him. He was, however, a student of theology, and in 727 wrote the three classical letters in defense of image-worship, and against the edict of Leo the Isaurian. In 730 he retired to the monastery of St. Saba, near Jerusalem, where he devoted his time to the study of philosophy and theology and to the composition of religious works. The principal is *The Fount of Knowledge*, in three parts: I. "Heads of philosophy"; II. "Compendium of heresies"; and III. "An accurate summary of the orthodox faith." The last is the longest and by far the most important part, but it is not so much a well-wrought system of divinity as a digest of the teachings of his predecessors, such as Athanasius, Basil, the Gregories, Chrysostom, and others. He was, indeed, the last of the Greek Fathers, and he is the most authoritative theologian of the Greek Church. As he was the first to employ philosophy in the service of theology, and as, at the same time, he is completely dependent on tradition, he may be considered as a forerunner of scholasticism. D. in the convent of St. Saba, near Jerusalem, between 754 and 787 A. D. He was canonized by the Latin and the Greek Churches. His works are in Migne, *Pat. Gr. XCIV.–XCVI.*; and there is a German translation of part iii. of his *Fount of Knowledge* (Kempner, 1885), and an English one (vol. xiii., *Nicene and Post-Nicene Fathers*, New York). See his *Life*, by Lupton (London, 1882). Revised by S. M. JACKSON.

Damas'cus (in Arab. *Sham el Kebeer* or *es Shereef*, the great or the holy): a celebrated city of Asiatic Turkey, in Syria; situated on a triangular plain at the eastern base of the Anti-Libanus; 58 miles E. S. E. of Beyrut; lat. 33° 27′ N., lon. 36° 25′ E. (see map of Turkey, ref. 7–G). The plain of Damascus, regarded by the Arabs as the fairest of the four earthly paradises, is about 70 miles in circumference, and extremely fertile, irrigated by the river Barada and other streams, and adorned with gardens and orchards. The magnificent appearance of this city from afar has been celebrated by ancient and modern travelers. Numberless cupolas and minarets are seen clustered about the towering mass of the great mosque. Within, the streets are narrow and are badly kept, and many of them have a gloomy and decayed appearance. There are numerous bazaars, where jewelry, gaudy horse-trappings, brilliantly colored shoes, spurious antiques, etc., are sold. The external appearance of the private houses is mean, the walls on the street side being made of mud, but within they display all the Oriental splendor of marble pavements, fountains, fresoed walls, etc. Damascus continues to be Oriental in all its features and characteristics. The city is oval in form, surrounded by a picturesque wall with stately towers and gates, and intersected by the broad street which the Romans called Via Recta. The great mosque, 650 feet in length and 150 in breadth, was built by the Christians in the form of a cross, but has been occupied by the Mussulmans since 705 A. D. Damascus has 248 mosques, many of them with splendid minarets. The huge quadrangular citadel, with massive towers, forms part of the city wall. In 1889 gas and street railways were introduced. Several Protestant denominations have established schools, as well as the London Jews' Society. There are important manufactures of cotton, silk, and woolen fabrics, jewelry, saddlery, ropes, glass, and arms, including imitation "Damascus blades." Large quantities of flour, grain, and fruits, especially apricots, are sent out to Beyrut and other towns in Syria. Damascus has an extensive trade in European manufactures, tobacco, spices, Eastern rugs and carpets, dates, indigo, coffee, sugar, etc., carried on by means of camels and caravans, with Bagdad, Bassorah, Persia, etc. Here is assembled annually a large number of men of different nations, who start on a pilgrimage or Hadj to the Kaaba at Mecca. Three lines of railway from Damascus to the coast have been projected, and that between Damascus and Beyrut has been completed. Damascus was a city in the time of Abraham (see Gen. xiv.), and merits above Rome the title of "the eternal city." During the Hebrew monarchy it was the capital of Syria. It passed afterward successively under the dominion of the Assyrians (740 B. C.), Babylonians (604 B. C.), Persians (540 B. C.), Macedonians (333 B. C.), Romans (65 B. C.), Saracens (634 A. D.), by whom it was made the capital of the caliphate of the Ommyiades (661–750), and it was finally captured by the Turks in 1516. Here the apostle Paul was converted and preached the gospel. Damascus is one of the sacred cities of the Mohammedans, and has long been known for the fanaticism of its inhabitants. In 1860 the Druses entered the city and massacred many Christians. One-fourth of the population, estimated at 180,000, are Christians, chiefly Greeks. The rest are Mohammedans (Turks, Syrians, Arabs, Druses), with a few thousand Jews. See Porter, *Five Years in Damascus*.

Damascus Blades: sword-blades of the highest excellence, formerly made at Damascus in Syria. Since the time of the crusades they have been famous for their beautifully watered and lined appearance, as well as for their exquisite temper, which enabled them, when skillfully handled, to cut, not only bars of iron, but to divide films of gauze floating in the air. It is said that good blades of this kind can be bent into a hoop, and will fly back to their original shape without injury. The secret of their manufacture is unknown, but it is said that the Russians have produced swords which equal the best Damascus blades in beauty and temper.

Damask: certain rich stuffs of silk and linen or silk and wool; first manufactured at Damascus, whence the trade was carried to Venice, Lyons, and Genoa. The cloth was woven with flowers and regular figures, and sometimes gold was introduced. In modern times a fabric often made of worsted or worsted and cotton mixed is called damask, and is used for furniture coverings, curtains, etc. Damask linen tablecloths are said to have been first imported from France into England in 1575. The peculiarity of damask linen or linen damask is that the pattern is white on white, showing only by the play of light on the threads.

Damaskeen'ing [from *Damascus*, where the art was practiced with great success]: the ornamenting of steel or

iron by inlaying with other metals, such as gold or silver. There are several methods of performing it.

Damas'tes: son of Dioxippus, a Greek historian; a native of Sigeum. He is called by Suidas a pupil of Hellanicus, and flourished about 440 B. C. Several works are ascribed to him, as *An Account of Events in Greece*; *On the Ancestors of those who Warred against Troy*, in two books; *A Catalogue of Nations and Cities*; and a treatise *Of Poets and Sophists*. Besides these, he composed a *Periplus*, which is referred to by later geographical writers. Very few fragments remain, collected in Müller's *Fragm. Histor. Grec.*, vol. ii., pp. 64–67.

Dam'asus I.: saint; b. in Spain about 305 A. D.; was elected Bishop of Rome in 366. A rival named Ursinus was at the same time elected by a party, but Damasus was recognized by the Emperor Valentinian. Although elected by the Arian faction, he strenuously opposed Arianism. He employed violent methods, but was a man of learning and taste. We are indebted to his instigation for Jerome's new version of the Latin Bible. He improved the church service by introducing the Psalter. Beside some letters, about forty short poems have been preserved, partly in manuscripts and partly in inscriptions. Most of these are in hexameter, some in elegiacs. Two hymns—one to St. Andrew, the other to St. Agatha—are ascribed to him without sufficient authority. His prosody is very defective, and his cadences frequently rhyme. He is remembered for his care of the relics of the martyrs in the catacombs and in the churches. D. in Rome, Dec., 384, and canonized and his day Dec. 11. His works are in Migne, *Pat. Lat. XIII.* See his *Life* by M. Rade (Freiburg im Br., 1882); cf. A. Couret, *De Damasi carminibus* (Grenoble, 1869).—Damasus II., a German, and probably a Bavarian; Bishop of Brixen; was consecrated pope July 17, 1048, and died Aug. 9 of the same year. See Jaffé, *Regesta Pontificum Romanorum*.

Revised by M. Warren.

Dambulla, dăăm-bool'la: a village of Ceylon; 45 miles N. of Kandy (see map of South India, ref. 8–F). Here is a mass of rock about 550 feet high in which are cave-temples devoted to the worship of Bûddha, and profusely adorned with sculpture and images. Among these is a colossal image of Bûddha, hewn out of the rock. These temples, which are partly artificial, were constructed about 100 B. C.

Dameron, dăă'mā'rŏn', Charles Émile: landscape-painter; b. in Paris; contemporary. Pupil of Pelouse; second-class medal, Salon, 1882; medal Centennial Exhibition, Philadelphia, 1876. His work is sober and forceful. His *Woodman's Cabin—Autumn* is in the Luxembourg Gallery, Paris. Studio in Paris. W. A. C.

Damiani, dăă-mĕĕ-aa'nĕĕ, Pietro, known as St. Peter Damien: an influential Italian prelate: b. at Ravenna in 988 (or 1007) A. D. He was appointed Cardinal-Bishop of Ostia in 1057. He opposed simony and other corrupt practices of the clergy, and was a friend of Pope Gregory VII. He was a voluminous writer, and morally and intellectually one of the first men of his time. He took an active share in the political and religious discussions of that day, lived a very ascetic life, and encouraged the practice of self-flagellation as a meritorious penance for sins committed. He is honored as a doctor of the church. D. in Faenza, Feb. 23, 1072. His works are found in Migne, *Patrologia Latina CXLIV.–CXLV.* They include his *Liber Gomontrianus*, which directly charges the Italian monks with sodomy. See Capecelatro's *Storia di San Pier Damiano e del suo tempo* (2 vols., Florence, 1862); also the lives by F. Neukirch (Göttingen, 1875, unfinished), and J. Kleinermanns (Steyl, 1882). Revised by J. J. Keane.

Da'mianists: a sect originating in the sixth century; the followers of Damianus, a Monophysite Patriarch of Alexandria, who taught that the Trinity are God only in their unity, divinity being divided among them, not that each is God in himself alone. So the godhead of the Father, Son, and Holy Spirit forms one single substance. His adherents were also called Angelites, from their place of meeting in Alexandria, the Angelium.

Damia'nus: a distinguished Sophist and rhetorician of Ephesus, of whom an account is given by his friend Philostratus in his lives of the Sophists. In his youth Damianus had attended the lectures of Adrianus and Ælius Aristides, and he formed himself after the model of these. He taught rhetoric in his native place with great success. He was a man of wealth and great liberality, and erected for his fellow-citizens a beautiful portico. He appears to have left no writings.

Damien de Veuster, dăă'mi-ăăn'de-vös'tā' (Joseph de Veuster), "Father Damien": Roman Catholic missionary, who devoted himself to the lepers of the Hawaiian island of Molokai; b. at Tremeloo, near Louvain, Belgium, Jan. 3, 1840; entered holy orders at the age of nineteen. Having been sent on a mission to Honolulu he learned of the terrible condition of the lepers, in number some 700 or 800, and in 1873 established himself among them. He was physician, magistrate, carpenter, teacher—everything. For twelve years he escaped contagion, but in 1885 the fatal disease seized him. He continued his heroic labors to the last, and died Apr. 15, 1889. C. H. Thurber.

Damiet'ta: a town and river-port of Lower Egypt; on the right bank of the east mouth of the Nile; about 8 miles from the Mediterranean and 110 miles N. by E. from Cairo; lat. 31° 25′ N., lon. 31° 47′ E. (see map of Africa, ref. 2–F). It is irregularly built, but has some good mosques, bazaars, and marble baths. The modern town was founded about 1260 four miles S. of the ancient *Tamiathis*, which in the time of the crusades was a strong fortress of the Saracens. The latter was razed and the river blocked in 1251, so that large vessels have not been able to enter the harbor since. The cloth known as *dimity* was first manufactured in this town, and received from it its name. Pop. (1897) 31,288.

Dam'mar, or **Dâmar** [from Hindustani *dāmar*, resin, pitch]: a resin produced by the dammar pine *Agathis loranthifolia* (formerly called *Dammara orientalis*), one of the curious, broad-leaved evergreen conifers from the Malayan Archipelago. The resin is used for varnishes and in microscopy, and for other purposes. The dammar-pine grows to a great height, and its trunk is often many feet in diameter. Its wood, while valuable for indoor use, is unfit for use where it is exposed to the weather. An allied species is the Kauri pine, *Agathis australis*, of New Zealand, a tree 200 feet in height. Its leaves are linear, about 2 inches long, and from ½ to ¾ of an inch wide. The tall, straight trunks are much valued for masts and spars of ships. This species also yields a resin known as Kauri resin or Kauri gum. A third species, *Agathis vitiensis* of the Fiji islands, yields a valuable resin, and a still more valuable white, durable timber. Other resinous substances are to be found under the name of dammar: thus, Indian dammar is the product of species of *Hopea*, tall trees of the family *Dipterocarpeæ*, while black dammar is obtained from another tree of the genus *Canarium* and family *Burseraceæ*. C. E. B.

Da'mo: daughter of Pythagoras, to whom he left his memoirs (Gr. ὑπομνήματα), with strict injunctions not to allow them to pass out of his family. This injunction she obeyed, though in great poverty and tempted with offers of considerable sums of money. She transmitted them to the care of her daughter Bitale.

Dam'ocles (in Gr. Δαμοκλῆς): a Syracusan parasite and courtier who lived at the court of Dionysius the Elder, and was the subject of an experiment recorded by Cicero. As an antidote to his fond admiration of regal luxury and happiness, the tyrant invited him to a sumptuous banquet, where a sword was suspended by a single hair directly over his head.

Da'mon: a distinguished musician of Athens, celebrated also as a Sophist. Plutarch ascribes to him the invention of one form of the Lydian melody. He taught Pericles music, and was his adviser also in many of his political measures. Plato has spoken highly of the abilities of Damon. Late in life he was banished from Athens, no doubt from the objectionable character of his political opinions.

Da'mon and **Pyth'ias** (or **Phin'tias**): two Syracusans, followers of Pythagoras, noted for the firmness of their friendship. Phintias having been condemned to death by Dionysius I., the tyrant of Syracuse, was at his own request permitted to return to his home to settle his affairs, Damon pledging his own liberty and life for his return. Phintias returned just in time to save Damon from death, and Dionysius, charmed with such fidelity, not only pardoned Phintias, but asked leave to share their friendship.

Damoph'ilus of Bithyn'ia: called by Suidas a philosopher and Sophist; reared by Salvius Julianus, who was consul under Marcus Antoninus. He wrote a number of works, of which Suidas says he found the following in the libraries: *Philobiblus, concerning Books worth Possessing*, and *Concerning the Life of the Ancients*. The notices of Damoph-

ilus are collected by Müller, *Fragm. Hist. Græc.*, vol. iii., p. 656.

Dam'ophon, or **Demophon**: a statuary of Messene, flourished about 370 B. C. He adorned Ægium, Messene, and Megalopolis with his works, which were chiefly statues of Parian marble and of wood. Pausanias mentions among the most important of his works a statue of Lucina, one of Æsculapius, of the Mother of the Gods, of Mercury, and of Venus. He was also employed to repair the Olympian Jupiter of Phidias, the ivory of which had become loosened in many places.

Damoph'yle: one of the large group of Greek lyric female poets who were pupils, companions, and followers of Sappho. She flourished about 610 B. C., and was a Pamphylian by birth, but Pamphylia was largely Greek. Like her mistress Sappho, she instructed other young women. She wrote love-poems, and composed those hymns to Artemis which were sung at Perga. None of her works is now extant, and very few facts with regard to her are known.

Damox'enus: a comic poet of the new Attic comedy, probably reaching back also into the middle period. He is referred to by Athenæus, who with Suidas has preserved the titles of two of his comedies, and has given considerable extracts from one of them. All that remains of his writings has been collected by Meineke, *Fragm. Comic. Græc.*, vol. iv., pp. 529–36.

Dampier, William: freebooter, circumnavigator, and author; b. near Yeovil, Somerset, England, in 1652. He began his seafaring life when ten years old, serving as a common sailor in various voyages. In 1674 he went to Jamaica as assistant manager of a plantation, thence drifted to the logwood-cutters' camps of Campeachy, where for a time he led a wild life. In 1678 he returned to England and married, but presently started off again, leaving his wife; got among his old comrades at Campeachy, and thence joined a party of buccaneers, who, after burning Santa Marta, crossed the isthmus and for two years led the life of pirates on the Pacific coasts, sacking Spanish towns, and capturing vessels. Dampier at length made his way round Cape Horn to the West Indies and Virginia, where, after a year, he joined one Cook, a freebooter, for another voyage. This took him to Sierra Leone, thence to South America, and eventually (1688) across the Pacific to the East Indies. There he was marooned on an island among savages, escaped in a canoe, and, after being nearly drowned in a storm, reached Sumatra; went on trading or pirating expeditions to China, India, etc.; was impressed for a soldier, and, after a few more adventures of a like character, reached England in 1691, twelve years from the time he left it, having meanwhile circumnavigated the globe. About his only possession when he landed was a tattooed islander, whom he proposed to exhibit as an Indian prince, but was soon obliged to sell. Dampier had kept rough notes of his voyages, and in 1697 he published his *Voyage Round the World*, which had an immediate and great success; in 1699 he supplemented it by a second volume on his travels. His writings brought him to the notice of the Government, and he was given command of an expedition (1699), in which he explored the coasts of Brazil, Australia, New Guinea, etc.; was wrecked on his return at Asuncion island, but finally reached England in 1701. In Sept., 1703, he commanded a privateering expedition of two ships to the South Seas, but appears to have accomplished little, and his company was finally broken up. He made his way back to England in 1707, having been a third time round the world. From 1708 to 1711 he was pilot of the Duke privateer, which also made the voyage of circumnavigation, capturing some rich Spanish ships on the way. Dampier died in London, Mar., 1715. Besides his books of travel he wrote a valuable *Discourse on the Winds*, which was long a standard work. Herbert H. Smith.

Dampier Archipelago: a group of islands near the northwest coast of Australia; about lat. 21° S. and lon. 117° E. It comprises Rosemary, Lewis, and other islands. Dampier Island, near the northeast coast of New Guinea, with a volcano over 5,000 feet high, belongs to Germany.

Damps [cognate with Germ. *Dampf*, vapor, smoke]: the noxious exhalations of mines and excavations. The carbureted hydrogen of coal mines is called *fire-damp*, and carbonic acid gas mixed with carbonic oxide is termed *choke-damp*.

Damrosch, dăm'rōsh, Leopold, M. D.: musician; b. in Posen, Prussia, Oct. 22, 1832. While a boy he began to study music, but his parents wished him to be a physician; entered the medical department of the University of Berlin and graduated with high honors, receiving his medical degree, but continued the study of music under Hubert Ries on the violin, and Dehn in composition and counterpoint; practiced medicine till 1854, and in 1855 started on a tour as concert violinist, making everywhere a success. On his return to Posen he was appointed musical director at the Stadt theater, and in 1866 was appointed to a similar post in Breslau. Here he remained till he was called to New York in 1871 to take the leadership of the Arion Society, which he retained till 1884. He established the New York Oratorio Society in 1873, and the Symphony Society in 1878, conducting both till his death. He established the German opera in the Metropolitan Opera-house in New York in the autumn of 1884, but died after a short illness on Feb. 15, 1885. Dr. Damrosch was a fine violinist, an excellent composer, and an able conductor. In 1881 he organized a great music festival in the Seventh Regiment armory, the greatest music festival that had ever been held in New York up to that time. D. E. Hervey.

Damrosch, Walter: musician; son of Dr. Leopold Damrosch; b. in Breslau, Germany, Jan. 30, 1862; accompanied his father to the U. S. in 1871. He was educated in music by his father, whose assistant he was in the New York Oratorio and Symphony Societies. In 1881 he was chosen conductor of the Newark (N. J.) Harmonic Society, and in 1884 organist of Plymouth church, Brooklyn; in 1885 succeeded his father as conductor of the Oratorio and Symphony Societies, and as assistant conductor of the German opera at the Metropolitan Opera-house. On May 17, 1890, he married Miss Margaret Blaine, daughter of Hon. James G. Blaine. He is a good pianist, and has composed a few songs and other smaller works. D. E. Hervey.

Damson [for earlier *dammasin* < M. Eng. *damasyn* < O. Fr. *damaisine* < Lat. *Damasca'num* (sc. *prunum*), i. e. plum of Damascus]: a variety of the common plum. It is a small, oval fruit. In Great Britain it is much used as a confection called *damson cheese*. It is cultivated in the U. S. in several varieties, as Shropshire, Frogmore, and French damsons.

Dam, Tinker's: the wall of dough or chewed bread which a tinker puts around the hole which he is stopping, so as to confine the melted solder to that point. After it is once used it of course loses its value, so that its name is often employed in popular slang as a symbol of utter worthlessness.

Dan [Heb. דָּן]: son of the Hebrew patriarch Jacob and Bilhah, Rachel's maid, and the founder of one of the twelve tribes. Also a part of Palestine occupied by the tribe of Dan, and bounded on the W. by the Mediterranean. It contained seventeen cities, the chief of which was Joppa. Dan (or Laish) was an ancient city in the extreme northern part of the Promised Land, and was laid waste by Benhadad.

Dan: a river of Virginia and North Carolina; rises in the southern part of Virginia, flows in a generally eastward direction, and crosses the boundary between those States five or six times. After a course of about 200 miles it unites with Staunton river at Clarksville, Va. Below this junction the stream is called the Roanoke.

Dana, Charles Anderson: journalist; b. at Hinsdale, N. H., Aug. 8, 1819; studied two years at Harvard College; did not graduate, owing to a disease of the eyes, but afterwards received the degree of A. M. He joined the Brook Farm Association in 1842; edited the *Harbinger*, a journal devoted to the interests of Fourierism; was a contributor to the Boston *Chronotype*; was connected with the New York *Tribune* from 1847–62, when in consequence of a disagreement with Horace Greeley, the editor, arising from Dana's attitude toward the war as revealed in his famous editorial articles *On to Richmond*, he was obliged to resign. He was assistant Secretary of War 1863–64, and afterward edited a new Republican paper in Chicago which was not successful. Returning to New York and participating in the purchase of the New York *Sun*, he was its chief editor from 1868 till his death, near Glen Cove, L. I., Oct. 17, 1897. He edited *The Household Book of Poetry* (1857), and in connection with George Ripley edited *The American Cyclopædia*.

Dana, Charles Louis, M. D.: neurologist; b. at Woodstock, Vt., Mar. 25, 1852; educated at Dartmouth College and New York College of Physicians and Surgeons; has

held the position of Professor of Physiology in the New York Woman's Medical College; Professor of Nervous and Mental Diseases, New York Post-graduate Medical School; Professor of Nervous Diseases in Dartmouth Medical College; president of the Neurological Association; author of *Text-book on Nervous Diseases* (1892), and various monographs. C. H. Thurber.

Dana, Edward Salisbury; mineralogist; b. in New Haven, Conn., Nov. 16, 1849; son of James Dwight Dana (*q. v.*); graduated at Yale College, 1870; assistant Professor of Natural Philosophy at Yale, 1879; Professor of Physics, 1890; associate editor *American Journal of Science*, 1875; member of the National Academy, 1884; member Mineralogical Society of St. Petersburg and Geological Society of London; author of *Text-book of Mineralogy* (1877; rev. ed. 1883); *Text-book of Mechanics* (1881); *Sixth Edition of Mineralogy of James D. Dana* (1892). C. H. Thurber.

Dana, Francis, LL. D.: statesman and jurist; b. at Charlestown, Mass., June 13, 1743; a son of Judge Richard Dana; admitted to the bar, 1767; joined the Sons of Liberty; was chosen a member of council of Massachusetts, at that time the supreme executive power in the State, 1776; delegate to the Congresses of 1777 and 1778. In Nov., 1779, he sailed to Europe as secretary to John Adams, who was sent to negotiate a treaty of peace and commerce with Great Britain; appointed minister to Russia, 1780; appointed a judge of the Supreme Court of Massachusetts, 1785; a delegate to the convention which formed the Constitution of the U. S., but his judicial duties and ill-health prevented his attendance; voted for the Constitution as a member of the State Convention convened to ratify it in 1788; chief justice of Massachusetts 1791–1806. In politics he was a Federalist. D. Apr. 25, 1811. He was the father of the poet Richard H. Dana.

Dana, James, D. D.: Congregational theologian; b. in Cambridge, Mass., May 11, 1735; graduated at Harvard in 1753, and was pastor of the First church in New Haven, Conn., 1789–1805. He published an *Examination of Edwards on the Will* (anonymous, Boston, 1770), and *An Examination of the Same Continued* (New Haven, 1773), in both of which he strongly opposed the doctrine of necessity. He received his degree of D. D. from the University of Edinburgh, 1768. A memorable controversy was caused in the denomination by his settlement in his first charge at Wallingford, Conn. (1758–89), as his liberal principles gave great offense to the consociation, but his patriotism during the Revolution did much to allay prejudice. D. in New Haven, Conn., Aug. 18, 1812.

Dana, James Dwight, Ph. D., LL. D.: mineralogist; b. in Utica, N. Y., Feb. 12, 1813; graduated at Yale College in 1833; was appointed instructor of mathematics to midshipmen in the U. S. navy and sailed to the Mediterranean, returning in 1835; from 1836 to 1838 assistant in chemistry to Prof. Silliman at Yale. He published a *System of Mineralogy* (1837; 5th ed. 1868). In 1838 he became mineralogist, geologist, and zoölogist of the Government exploring expedition under Capt. Charles Wilkes which visited the Southern and Pacific Oceans. The expedition returned in 1842, and Mr. Dana was occupied for several years at Washington and New Haven in preparing for publication reports on the results of the explorations. Among these were *Report on Zoöphytes* (with atlas, 1846); *Report on the Geology of the Pacific* (with atlas, 1849); *Report on Crustacea* (with atlas, 1852–54). The first-named report described 230 new species and the third 658, and nearly all the drawings in the atlases were made by Mr. Dana. In 1855, soon after Prof. Silliman's retirement from active duties, Mr. Dana became Silliman Professor of Natural History and Geology; in 1864 the title of the professorship was changed to that of geology and mineralogy. He retained the chair until May, 1894, when he was elected professor emeritus. About 1850 Prof. Dana became associate editor of the *American Journal of Science and Arts*, which his father-in-law, Prof. Silliman, had founded in 1819, and about 1863 became its senior editor. In 1854 he was elected president of the American Association for the Advancement of Science. In 1872 he received the Wollaston medal from the Geological Society of London, and in 1877 the Copley gold medal from the Royal Society of London. He received the degree of Ph. D. from the University of Munich and that of LL. D. from Harvard University, and is a member of many foreign scientific societies. His principal works in book-form not mentioned above are *Manual of Mineralogy* (New Haven, 1848; 4th ed. New York, 1886); *Coral Reefs and Islands* (New York, 1853); *Manual of Geology* (Philadelphia, 1863; 3d ed. New York, 1880); *Text-book of Geology* (1864; 4th ed. 1883). D. in New Haven, Conn., Apr. 14, 1895.

Dana, Napoleon Jackson Tecumseh: U. S. military officer; b. in Eastport, Me., Apr. 15, 1822; graduated at West Point in 1842, and May 29, 1862, major-general U. S. volunteers; served chiefly at frontier posts (1842–45); in the military occupation of Texas 1845; in the war with Mexico 1846–47, and on quartermaster duty 1848–55. He was a banker at St. Paul, Minn., till the beginning of the civil war, when he became colonel First Minnesota Volunteers, and served throughout the war, rising to the rank of major-general and filling many important stations with distinction. Resigned May 25, 1865, and engaged in mining operations in California and as superintendent, president, etc., of several railroads in Missouri, Illinois, and Montana 1878–85. Revised by J. Mercur.

Dana, Richard Henry: author; b. in Cambridge, Mass., Aug. 15, 1787; son of Chief Justice Francis Dana; educated at Harvard College; studied law, and was admitted to the bar of Boston in 1811. He was one of the editors of the *North American Review* in 1818 and 1819. His first volume of verse, containing his best-known poem, *The Buccaneer*, was published in 1827. He published in 1833 a collection of his poems and prose works, including some essays which originally appeared under the title of *The Idle Man*, in 1821–22. D. in Boston, Feb. 2, 1879.

Dana, Richard Henry, Jr., LL. D.: lawyer and author; b. in Cambridge, Aug. 1, 1815; entered Harvard College in 1832, but in 1834 suspended his studies on account of the weakness of his eyes. He then made as a common sailor a voyage to California, of which he wrote an interesting and popular narrative entitled *Two Years Before the Mast* (1840). Having graduated at Harvard in 1839, he studied law under Judge Story and was admitted to the bar in 1840. He published in 1841 *The Seaman's Friend, containing a Treatise on Practical Seamanship*, and also an edition of Wheaton's *International Law* in 1866; was one of the founders of the Free-soil party in 1848, and an orator of the Republican party in 1856. In 1876 he was nominated minister to England by President Grant, but the nomination was rejected, chiefly on account of opposition made by Gen. Butler. D. in Rome, Italy, Jan. 7, 1882.

Dana, William Parsons: marine and figure painter; b. in Boston, Feb. 18, 1833. Pupil of Picot and Le Poitevin, Paris; third-class medal, Paris Exposition, 1878; National Academician 1863. His *Chase of the Frigate Constitution* is in the collection of Mrs. William Astor, New York. Studio in Paris. W. A. C.

Dan'aë (in Gr. Δανάη): in classical mythology, a daughter of Acrisius, King of Argos, who confined her in a brazen tower because an oracle had predicted that her son would kill her father. She became the mother of Perseus, whose father, Zeus or Jupiter, is said to have obtained access to her in the form of a golden shower.

Danæus, or **Daneau**, Lambert: Calvinistic divine; b. at Beaugency, France, in 1530. He studied first law at Orleans, afterward theology at Geneva, and became pastor of Chien; but was compelled to leave his charge in 1563. After the massacre of the night of St. Bartholomew (1572) he fled from France. For several years he was pastor in Geneva, and afterward pastor and professor at Castres. He was a very prolific writer on various subjects, exegetical, doctrinal, ethical, etc. His *Commentary on the Minor Prophets* was translated into English by Stockwood (London, 1594). A complete list of his works is found in *La France Protestante*, iv., 194. In the history of ethics he has a prominent place, as he was one of the first who treated Christian ethics separately from dogmatics. Down to his time and, indeed, for a long period thereafter, ethics were not treated as a distinct part of the theological system, but simply as the practical side of dogmatics, the practical application of the dogma. D. at Castres, in Navarre, 1595.

Dan'aïd: an ingenious hydraulic machine, consisting essentially of two hollow cylinders, placed one within the other, with a comparatively narrow space between; the inner cylinder closed at bottom, the outer having an aperture at the bottom in the center. Between the two bottoms are partitions radiating from the center to the circumference, but the annular cylindrical space is without partitions. The whole is sustained by a vertical axis, about which it

turns easily. A jet or stream of water being now admitted into the annular space, as nearly tangential horizontally to the cylindrical surface as possible, sets the machine in motion, at first by mere friction, but presently the living force imparted to the water by revolution, acting on the radial partitions of the base, accelerates the velocity and increases the force. Experiments show that this machine utilizes from 70 to 75 per cent. of the power due to the hydraulic head. The name seems to have been suggested by the fable of the DANAÏDES (*q. v.*) pouring water forever into a vessel, from which it continually escapes.

Dana'ïdes (in Gr. *Δαναΐδες*): the fifty daughters of DANAUS (*q. v.*), a mythical King of Egypt, who were married to fifty sons of Ægyptus, their uncle. By order of their father, who had been warned by an oracle that he would be slain by one of his sons-in-law, each of the Danaïdes, except one, Hypermnestra, killed her bridegroom on the wedding-night. Polyxena, another of the sisters, killed Ægyptus, as well as his son, her husband. The Danaïdes were doomed in Tartarus to pour water forever into a vessel perforated with holes.

Danakil, dăă-năă-keel' (sing. *Dankali*): an Abyssinian tribe occupying the area bounded N. E. by the Red Sea and S. W. by a range of mountains. It is about 250 miles long. The climate is very hot; the soil is arid and poor. The inhabitants are ferocious, treacherous, and fanatical Mohammedans. They number about 70,000, and now form a part of the Italian colony of Eritrea.

Dan'aus: in Greek mythology, the son of Belus, King of Egypt, who by some is supposed to be Neptune (Poseidon), and twin-brother of Ægyptus. After the death of Belus, Danaus and Ægyptus ruled over Egypt, but, in consequence of a difference between them, Danaus set sail with his fifty daughters to find a new home. He settled in Argos, whose king, Gelanor, he succeeded in dethroning, and established the dynasty of the Belides. Ægyptus, jealous of his brother's prosperity, followed him to Argos with his fifty sons, who under pretense of friendship sought the hands of their cousins in marriage. (See DANAIDES.) Danaus is said to have died about 1425 B. C., and, according to Pausanias, a monument to his memory was to be seen at Argos.

Danbury: city and railway junction; one of the capitals of Fairfield co., Conn. (for location of county, see map of Connecticut, ref. 11–D); 65 miles N. N. E. of New York. The manufacture of hats, which was established here in 1780, employs twenty-six large factories, and the production of boots, shoes, shirts, and boxes is considerable. It has also a foundry, extensive water-works, public library and a hospital. It was settled in 1684, and burned by the British in Apr., 1777. The losses of private property amounted to about $80,000. Pop. of township (1880) 11,666; (1890) 19,473; (1900) 19,474; of city (1890) 16,552; (1900) 16,537.

Danby, FRANCIS, A. R. A.: landscape-painter; b. near Wexford, Ireland, Nov. 16, 1793. His works are marked by fine light-effects. Among his works are a *Sunset at Sea after a Storm* (1824); *Christ Walking on the Sea* (1827); *The Embarkation of Cleopatra on the Cydnus* (1827); and *Caius Marius among the Ruins of Carthage* (1848). Eleven years of his life were spent on the Continent. D. Feb. 9, 1861.

Danby, THOMAS OSBORNE, Earl of: Marquis of Caermarthen and Duke of Leeds; an English Tory statesman; b. 1631; gained the favor of Charles II.; became lord treasurer 1673, and Earl of Danby 1674; was at heart opposed to the king's policy toward France, but was forced to acquiesce to retain his honors. Though he succeeded in bringing about the marriage of Mary to the Prince of Orange, his supposed intrigue for a secret alliance with France caused his impeachment on the charge of treason (1678), and he was confined in the Tower five years. In 1689 he was appointed president of the council by William III., and in 1694 was created Duke of Leeds. D. July 26, 1712.

Dance of Death (in Mediæval Lat. *chorea Machabæorum*; Fr. *la danse Macabre*, or *la danse des morts*; Germ. *Todtentanz*): an allegorical representation of the power of Death over all classes and conditions of men. The name "Dance of Death" is derived from the mocking activity usually displayed by the skeleton figure of Death as he leads away his victims. As for the name "Macabre" sometimes given to this subject, it has puzzled scholars much, and has produced many absurd etymologies. The only one of these that needs to be noticed is that which connects the word with the story of the seven brothers whose fidelity to the Mosaic law cost them their lives and the life of their mother, as told in 2 Maccabees vii. It is supposed that in the earliest form of the crude drama, in which the Dance of Death was introduced, these brothers figured. But it is much more probable that the name came from the circumstance that the first representation, which took place in Paris in the monastery of the Innocents, was upon their day. Still, as their legend has nothing in it that connects them with this subject, a more reasonable explanation of the origin of the word is that it is derived from the Egyptian anchorite Macarius, one of the most famous of the hermit-saints. His legend connects him directly with warnings of death to the living. Though, as he was a Greek saint, his pictures are rare in the West, yet he is twice represented in the cemetery of Pisa—the Campo Santo—once by Pietro Laurati, and again in the fresco attributed to Orcagna and mentioned below. Vasari expressly tells us that the aged saint who is showing the three dead bodies to the hunting-party was meant for St. Macarius; and it is possible that his name may in time have come to be applied to the subject of which this fresco is a famous illustration.

Traces of the idea which was the foundation of the mediæval acted dramas and pictured or sculptured representations of this subject, so popular in Europe, are to be found in Italo-Greek and Roman antiquity. Douce says that on a sarcophagus found near Cumæ are sculptured three dancing skeletons, and that the same subject is on a Roman lamp and in a Pompeian fresco. On an antique gem in the Royal Gallery at Florence there is engraved an old man piping to a dancing skeleton; and though the introduction of the skeleton is rare, yet it is common enough to find on the Roman sarcophagi such representations of life interrupted by death as will abundantly connect the moralizing of those times with that of the Middle Ages. The earliest of the treatments of this subject in the form of dramatic representations—moralities—were acted in churches and by religious orders in the fourteenth century. It consisted of a dialogue in verse between Death and twenty-four or more followers. Originally, it would seem that the "Dance of Death," which in the fifteenth and sixteenth centuries was made to include a considerable number of people, was restricted to a few. As early as the thirteenth century there appeared a French poem called *Li Trois Mors et li Trois Vis*, that is, *Les Trois Morts et les Trois Vifs*. "This poem relates that three noble youths when hunting in a forest were intercepted by the like number of hideous spectres or images of Death, from whom they received a terrific lecture on the vanity of human grandeur." (*Douce.*) In 1335 Orcagna painted in the Campo Santo at Pisa his *Triumph of Death*, one of the earliest pictures of this subject, where three kings, with their ladies, companions, and servants, returning from hunting, come suddenly upon three open coffins containing the bodies of three persons, one of them a king, in various stages of decay. In his *Pardoner's Tale* Chaucer has also introduced a most powerfully imagined variation of the same theme. In 1425 the various scenes were painted in the monastery of the Innocents in Paris. After 1450 there was no representation of the drama, but the pictures retained their popularity. The best-known and most artistic series is by Holbein, fifteenth century, reproduced in Bohn's Illustrated Library, 1858, and by H. N. Humphrey (London, 1868). For the Lübeck form of the drama, see *Das Dodes Danz* (ed. H. Baethcke, Stuttgart, 1876); for the Basel pictures and verses, see *Der Todten Tantz, wie dieselbe in . . . Basel* (Leipzig, 1870); for the French form, J. Charlier de Gerson, *La Danse Macabre des Saints Innocents de Paris* (Paris, 1874); cf. J. G. Kastner, *Les Danses des Morts* (Paris, 1852).

Revised by SAMUEL MACAULEY JACKSON.

Dancing: a succession of rhythmical movements of the body, often accompanied by music. Dancing is of very early origin. The ancients constituted it a part of their religious observances, and danced before their altars and the images of their gods. The ancient Egyptians ascribed its invention to their god Thoth. All the different passions were expressed in dancing by the Greeks, and the dance of the Eumenides or Furies was so expressive of vengeance that it inspired the beholders with terror. The attitudes of the public dancers were studied by the Greek sculptors in order to delineate the passions. Aristotle ranks dancing with poetry. The Spartans were required to train their children in this art from the age of five. This was publicly done, to

train them for the armed dance, and was accompanied by songs or hymns. In ancient times, dancing in private entertainments was performed by professionals. The Romans counted it disgraceful for a free citizen to dance except as a religious rite.

In Egypt there are dancing and singing girls, who improvise verses and are called *almeh*. In India there are nautch (nâtch) girls, who dance on public occasions. Among savages dancing is still used as a religious rite or as a sort of state ceremony on important occasions. Among civilized nations it is a frequent mode of recreation.

Dancing Mania: an epidemic disorder of the fourteenth, fifteenth, and sixteenth centuries, similar to chorea. It is supposed that much imposture prevailed in many forms of this epidemic, but there were also many cases in which the subject entirely lost control of the will. This disorder is even now known in Abyssinia. Something similar to it in Italy was ascribed to the bite of a spider called the tarantula, but its greatest prevalence was in the cities of Germany during the Middle Ages. At Aix-la-Chapelle, in 1374, there appeared on the streets crowds of dancing men and women, apparently excited thereto by the frantic demonstrations at the festival of St. John. The dancers were said to be unobservant of outward things, but sensible of visions. They appeared to lose all self-control, and would dance till they fell as if dead, and would sometimes beat out their brains upon the ground. The mania extended to the Low Countries, as well as Cologne, Metz, and Strassburg, and caused much demoralization. Exorcism was at first found remedial, and cold water, as applied by Paracelsus in the sixteenth century, was very efficacious. At the beginning of the seventeenth century the St. Vitus's Dance, as the disorder was then called, was abating, and is now almost unknown. The "St. Vitus's Dance" of our day is CHOREA (*q. v.*). The excesses of the French "prophets" of the eighteenth century and the convulsive disorders sometimes seen in the camp-meetings in the U. S. are probably of similar character to the dancing mania. See J. F. C. Hecker, *Epidemics of the Middle Ages* (Eng. trans., 3d ed. 1859).

Dandelion [for earlier *dent-de-lyon* = Fr. *dent de lion*, lion's tooth, probably from the appearance of its leaves; cf. Germ. *Löwenzahn*]: the *Taraxacum officinale*, an herbaceous plant of the family *Compositæ*, with a perennial fusiform root. The leaves spring immediately from the root, are long, feather-shaped, with the divisions toothed, smooth, and of a fine-green color. The plant grows spontaneously in most parts of the globe. The leaves when very young are tender, and are often used as a potherb, and it is cultivated and brought to market in considerable quantities for this use. It is a popular remedy with many medical practitioners in the U. S. and Europe, having gentle tonic powers. The root is sometimes prepared and ground with coffee, the taste of which covers that of the dandelion. The plant called fall dandelion, in New England, is a species of *Leontodon*. See HAWKBIT.

Dandolo: noted Venetian family, extinguished in 1866. The most notable member was ENRICO; b. 1108; became Doge of Venice 1192; participated in the fourth crusade; conquered Constantinople June 17, 1203; established the Latin empire under Baldwin of Flanders, having himself declined the imperial crown. Though blind when elected doge his administration was brilliant. He secured to Venice her full share of the spoils of the conquest, both in provinces and treasure, besides commercial privileges of the greatest importance. The four horses which now adorn the western front of the church of St. Mark were among the booty which was carried to Venice. D. in Constantinople, June 1, 1205. See VENICE. C. K. ADAMS.

Dandruff: a kind of scurf that forms on the skin, especially the scalp. The outer layer of the skin is composed of minute horny plates, which are constantly and imperceptibly being rubbed or washed away. In the deeper layer are numerous oil glands, and these are especially well developed upon the hairy parts of the body. Upon the scalp there is frequently a tendency of the horny cells of the epidermis to be formed in excess, and this abnormal condition causes what is commonly known as the dry form of dandruff. Those suffering from this affection are usually annoyed by fine whitish scales falling upon the shoulders in greater or less quantity whenever the hair is brushed. This bran-like desquamation of the scalp is termed *Pityriasis capitis*. A similar mealy condition of the skin, with slight redness, is sometimes seen upon the face and other portions of the body. There is also a frequent tendency of the oil glands of the scalp to secrete an excessive amount of fatty matter or sebum, which usually dries upon the surface and forms a scurf or thin unctuous crust. To this form of dandruff the term *Seborrhœa capitis* has been applied. If the secretion from the glands is not removed by frequent washing of the scalp, it is apt to accumulate and form a thick greasy crust, accompanied by considerable itching and in time by falling of the hair. In most cases of dandruff there exists in the scurf which forms upon the scalp a mixture of epidermic scales and sebaceous matter.

As dandruff is a frequent precursor of baldness, the importance of treating it at an early stage is quite apparent. When no inflammation of the scalp is present, persistent washing and brushing will often restore the affected part to a normal condition. The practice of digging the scalp with a comb or wire brush and the use of stimulating "hair tonics" can not be too severely condemned.

GEORGE HENRY FOX.

Dandy Fever: See DENGUE.

Dane, NATHAN, LL. D.: jurist; b. in Ipswich, Mass., Dec. 27, 1752; graduated at Harvard in 1778. He was one of the most able lawyers of New England, and a member of the Continental Congress in 1785–88. In 1787 he framed the ordinance for the government and organization of the Northwest Territory, in which he inserted a clause prohibiting slavery; also one prohibiting all laws impairing the obligation of contracts. This, a few months later, was inserted in the U. S. Constitution. He served in the State Senate for several years (1794–98); in 1811 was appointed a commissioner to revise and publish the charters which had been granted in Massachusetts, and in 1812 to make a new publication of the statutes. He published *An Abridgment and Digest of American Law* (9 vols., 1823–29), and an *Appendix* (1830). In 1829–31 he gave $15,000 to Harvard College, to found the Dane professorship of law. D. in Beverly, Mass., Feb. 15, 1835.

Danegelt, or **Danegold** (i. e. Dane-money or Dane-tax): a tribute of one shilling levied on every hide of land by the Anglo-Saxon and early Norman kings originally for the purpose of buying off the Danes. It was subsequently increased to two shillings, and though abolished by Edward the Confessor and again by Henry II. it reappeared for a time as late as the reign of Richard I.

Danelag [for O. Eng. *Dena lagu*, law of the Danes]: name applied under the later Saxon and earlier Norman kings of England to fifteen or more counties of the north and east of England, where the Danes were confined by the wars of Alfred the Great; reduced by Edward the Elder (901–925); rose in revolt in the reign of Eldred, but were forced into submission in 954.

Danenhower, JOHN WILSON: Arctic explorer; b. in Chicago, Ill., Sept. 30, 1849; educated in the public schools of Chicago and Washington; graduated from the U. S. Naval Academy, 1870; commissioned as ensign, 1871; as master, 1873; as lieutenant, 1879; served on a surveying expedition in the North Pacific 1873–74; served on the Vandalia during Gen. Grant's visit to Egypt and the Levant; joined the Arctic steamer Jeannette at Havre, France, making the voyage to San Francisco and into the Arctic Ocean. The expedition left San Francisco July, 1879; the vessel was crushed, and the crew retreated for ninety-five days over the ice. Lieut. Danenhower commanded a boat which landed at Lena Delta, Sept. 17, 1881, and reached the U. S. in June, 1882. Author of *The Narrative of the Jeannette* (1882). D. at Annapolis, Apr. 20, 1887.

Danes: a yellow-haired, blue-eyed people of moderate height, bearing resemblance to the Northern Scandinavians, their kinsmen. The Danish peasant holds his land independently, is a gay, careless person, taking an interest in polities and current events, and fairly educated. The Danish painter represents faithfully all form, but is lacking in vivid coloring and imagination. The Danes delight in music, and boast composers like Hartmann and Gade. See DENMARK.

Danes Island: See the Appendix.

Danforth, MOSELEY ISAAC: See the Appendix.

Daniel (God is Judge, or God will judge): one of the great Hebrew prophets; was a youth when he was carried with many other Jewish captives to Babylon in 605 B. C. Whether he was of royal or only of noble descent can not be determined. He was educated at the court of Nebuchadnezzar, and was eminent for learning and wisdom. His

skill in the interpretation of dreams procured for him the favor of the king, who appointed him governor of the province of Babylon and chief of the magi. He explained the handwriting on the wall at Belshazzar's feast about 538 B. C. After the capture of Babylon by the Medes and Persians, Daniel gained the favor of Darius the Mede, and was the first of three presidents who had authority over the 120 satraps of the empire. He also "prospered in the reign of Cyrus the Persian," and appears to have remained in Babylon when the other Jews returned to Jerusalem. He probably lived at least ninety years.

DANIEL, BOOK OF: an important canonical book of the Old Testament, counted in some Christian traditions as one of the four books of the major prophets, but properly classified among the Hagiographa or *Chetubim*. (See BIBLE.) The book has commonly been divided into two parts, of six chapters each—the first six historical, the last six prophetical. Some recent critics maintain that the first seven chapters treat of the world-power in relation to the kingdom of God; the last five chapters treat of the kingdom of God and its development in relation to the world-power. The book is remarkable both for its miracles and its prophecies. The close general correspondence of these prophecies with the recorded facts of history has led some writers to the belief that the book is not the work of Daniel, as it purports to be, but that it was written by some unknown person at a much later period. This view, which is as old as the time of Porphyry, has been revived and maintained by Collins, Semler, De Wette, Ewald, and others. On the other side, the evidence for the genuineness of the book is satisfactory to the representatives of orthodox theology. Among the points in its favor are the following: 1. The New Testament decidedly affirms its authority in many places. 2. The Maccabean literature and the Septuagint translation show that the book was in existence before the date assigned to it by rationalists (175 B. C.). 3. The book was written partly in Hebrew and partly in the older Chaldee, as might naturally occur at the period when it purports to have been written. This point appears decisive in favor of the genuineness of the work. 4. So far is the book from being a copy of history that even now the historical application of some of its parts is a matter of controversy. 5. It is remarkably free from the characteristic beliefs of the later Judaism. The exegetic and controversial literature upon the book of Daniel is very extensive. The best modern commentaries in English are by E. B. Pusey (London, 1864); P. L. Desprez (1879); J. G. Murphy (1884); R. P. Smith (1886); and A. A. Bevan (1892).

Daniel, dăă'ni-el', ARNAUT: Provençal poet; one of the most famous of the Troubadours; flourished about 1180–1200. Dante (*de Vulg. Elog.* ii. 2) speaks of him as *par excellence* the poet of love; and in another place (*Purgatorio* xxvi. 115, *seq.*) makes Guido Guinicelli call him "the best smith of his mother-tongue." Petrarch also (*Trionfo d'Amore* iv. 40) designates him "*gran maestro d'amor, ch'alla sua terra ancor fa onor col dir polito e bello.*" These citations show clearly the esteem in which he was held. Little, however, is known of his life. We are informed that he was a nobleman of Ribeyrac in Périgord; that he loved and served a distinguished Gascon lady, wife of Guillaume de Bonville; and that he passed his last years in a monastery. Eighteen undisputed poems by him are known to us, and all of them prove the accuracy of Dante's term, "smith of his mother-tongue." They are, in fact, excessively artificial in manner and slight in matter. Arnaut Daniel was the inventor of the poetic form afterward called by the Italians the sextine. See U. Canello, *La vita e le opere del trovatore Arnaut Daniel* (Halle, 1883). A. R. MARSH.

Daniel, HERMANN ADALBERT: divine and geographer; b. at Köthen, Germany, Nov. 18, 1812; studied theology at the pedagogium in Halle, where he afterward became professor. His chief theological works are *Thesaurus Hymnologicus* (5 vols., 1841–56) and *Codex Liturgicus Ecclesiæ Universæ*, etc. (4 vols., 1847–54); his best geographical works are *Leitfaden für den Unterricht in der Geographie* (68th ed. 1872) and *Handbuch der Geographie* (3d ed. 4 vols., 1870–71). D. in Leipzig, Sept. 13, 1871. See *H. A. Daniel, ein Lebensbild* (1872).

Daniel, JOHN MONCURE: See the Appendix.

Daniel, JOHN WARWICK: U. S. Senator; b. at Lynchburg, Va., Sept. 5, 1842; educated at Lynchburg College and Harrison University School; major and adjutant-general on Gen. Early's staff in the Army of North Virginia, in which he served throughout the war; studied law, University of Virginia, 1855–56; elector at large on the Tilden and Hendricks ticket, 1876; member Forty-ninth Congress; entered U. S. Senate as a Democrat to succeed William Mahone Mar. 4, 1887; re-elected 1891 and 1897. C. H. T.

Daniel, SAMUEL: poet; b. at Taunton, England, in 1562; was educated at Oxford. He lived in London, where he associated with Shakspeare and Marlowe, and was employed as tutor to Anne Clifford, who became Countess of Pembroke. In 1603 he was appointed master of the queen's revels. He wrote, besides other poems, *The Tragedy of Cleopatra* (1594); an historical poem *On the Civil Wars of York and Lancaster* (1595); *Poetical Essays* (1599); and among prose works a *Defense of Rhyme* (1602) and a *History of England* (1613–34). D. at Beckington, Oct. 14, 1619. His works were reprinted in 1885–87.

Daniell, JOHN FREDERICK, F. R. S., D. C. L.: scientist; b. in London, Mar. 12, 1790. He published *Meteorological Essays* (1823). In 1831 he became Professor of Chemistry in King's College, London. He was the inventor of the galvanic battery by which it was made possible to maintain a current sensibly constant for a long time, and for this he received the Copley medal in 1837. In 1839 he published an *Introduction to Chemical Philosophy*. His is one of the great names of electrical science, and his *Meteorological Essays* constituted the first attempt to explain the phenomena of the weather by physical science. D. Mar. 13, 1845.

Daniels, WILLIAM HAVEN: See the Appendix.

Dan'ielson: borough; in Killingly, Windham co., Conn.; on the Quinebaug river, and the Norwich and Worcester division of the N. E. Ry.; 26 miles N. N. E. of Norwich (see map of Connecticut, ref. 8–L). It has cotton-mills and shoe-factories. Pop. (1900) 2,823.

Danielsson, daa'ni-el-sŏn, OLOF AUGUST, Ph. D.: philologist; b. in Häradshammar, province of Östergötland, Sweden, Oct. 15, 1852; educated at the Universities of Upsala and Leipzig; from 1879 to 1891 docent in classics, and since 1891 Professor of Greek in the University of Upsala; author of *Grammatiska Anmärkningar* (2 pts., 1881–83); *Grammatische und etymologische Studien* (1888); *Epigraphica* (1890); all published in the *Upsala Universitets Årsskrift*.

B. I. W.

Danish Language: genetically a member of the Scandinavian division of the Teutonic group. Within the Scandinavian division it forms, again, with Swedish the minor group East Norse, in contradistinction to West Norse, composed of Icelandic (Faroese) and Norwegian. Its present territory is the kingdom of Denmark, consisting of the Danish islands and Jutland, together with the adjoining northern part of Schleswig; to which is to be added since the end of the fourteenth century Norway, where it is, with some modifications, not only the literary and official medium, but the spoken language of the cultured classes. See NORWEGIAN LANGUAGE.

The history of the Danish language, as such, begins only after the introduction of Christianity in the eleventh century. During the Viking age (700–1050) and later the name *dønsk tunga*, Danish language, was applied both in Scandinavia and in England to the language of the entire North, but local differences had begun to show themselves even early in this period, and at its end had so far advanced that it is possible to speak of distinct dialects. These differentiations are, nevertheless, in the eastern group not sharply carried out, and Danish and Swedish, with the exception of one of its dialects, Old Gutnic, remain almost identical, even as far down as the development of a Danish literature after the thirteenth century.

The material for this earliest period in the history of Danish consists first of all in Runic inscriptions. It is only, however, when with the end of the thirteenth century a literature begins to appear that an adequate view of the language is presented, and its history can be satisfactorily followed. The language territory in the Old Danish period included not only the islands and Jutland, but the whole of Schleswig and the South Swedish provinces of Skaane, Halland, and Blekinge. Three principal dialectic groups are distinguished: a Skaane group, spoken in South Sweden and in the island of Bornholm; a Zealand group, in the remaining islands; and a Jutish group, in Jutland and Schleswig. The Zealand dialect became the literary language toward the end of the fifteenth century, a result that was in great part due to its use in several of the earliest printed books.

Modern Danish is the direct descendant of the Zealand dialect of Old Danish. Its beginning is approximately coincident with the Reformation, and its earliest literary monument is the Danish translation of the Bible, the so-called Christian III. Bible of 1550. The language as a whole had long before this period assumed a thoroughly characteristic form. The general tendencies toward weaker phonetic conditions and simpler inflections, which had shown themselves dialectically almost from the beginning, had in some cases already been carried out, as, for instance, the specific Danish change during the thirteenth and fourteenth centuries of *k*, *t*, *p*, to *g*, *d*, *b*, after vowels. In the fourteenth and fifteenth centuries falls, too, the first considerable influx of foreign words, Low German forms, namely, that were introduced through commercial connection with the Hanse cities. The influence of German upon the vocabulary, rendered easy at the outset by the contiguity of German territory and the inherent similarity of the adjoining dialects, is one of the most important elements in the external history of Danish. It was further exerted, after the middle of the fifteenth century, under the Oldenburg kings, and in the sixteenth century by the Reformation and the retranslation of Luther's version of the Bible into Danish, and the development, in this and the following century, of a whole literature of translation based upon German originals. Finally, in the eighteenth century, under Christian VI. and VII., German became the official language, and in part the medium of public instruction. The result of this extended influence upon the vocabulary has been to make it in its origin at least half German, although these elements have been thoroughly assimilated and accommodated externally to the formative spirit of the language. Since the latter half of the eighteenth century, when the language may be said to have assumed its present appearance, a reactionary tendency has set in to make it in form more characteristically Scandinavian by means of a purification of the orthography, the exclusion of additional German words, and the reinstatement of Danish forms.

The principal typical characteristics of Danish as a Scandinavian language are the use of the suffixed definite article with substantives, and the formation of a passive voice of verbs by the addition of the reflexive pronoun, in Danish *-s*, to the active form. With Swedish, as contrasted with West Norse, its most prominent agreements are the change of the diphthongs *ei*, *au*, and *ey* to the long vowels *e* and *ø* respectively, and the almost total absence of *u-* umlaut. Unlike Swedish, however, it has throughout weakened the vowel of the inflectional ending (in Swedish still *a* and *o*) to a voiceless *e*. Swedish still further differentiates itself from Danish by the retention of the old *k*, *t*, *p*, after vowels, and has characteristically maintained as a whole a much more ancient condition. In the simplification of grammatical forms Danish occupies an extreme position. The distinction of masculine, feminine, and neuter in substantives and adjectives has been reduced to two, in that masculine and feminine have been united to a common gender; in the declension of substantives but a single case ending, *-s* in genitive singular and plural, has been retained; in the verbal inflection there is throughout no distinction of person.

Within Danish territory itself the spoken dialects have maintained themselves side by side with the literary language in two main groups—the dialects of the islands and of Jutland. The former, out of which the literary language proceeded, naturally most nearly approximates the literary form. In general the dialects have been less conservative than the literary language. This is particularly the case in Jutland, where, for instance, in some localities all distinction of gender is lacking, and even such an inherent Scandinavian characteristic as the suffixed article has wholly disappeared.

Authorities.—Otté, E. C., *A Simplified Grammar of the Danish Language* (London, 1884); Jessen, E., *Dansk Grammatik* (Copenhagen, 1891; in Danish); Rosing, S., *Engelsk-Dansk Ordbog.* (Copenhagen, 1887; English with Danish equivalents); Larsen, A., *A Dictionary of the Dano-Norwegian Languages* (2 vols., Copenhagen, 1888; English-Danish and Danish-English, with Norwegian forms specially indicated); Molbech, Chr., *Dansk Ordbog.* (Copenhagen, 1859; a Danish dictionary of Danish); also by the same author, *Dansk Dialect-Lexicon* (Copenhagen, 1841); Jessen, E., *Dansk Etymologisk Ordbog.* (Copenhagen, 1892–93).

For the pronunciation of the language, see the article by Henry Sweet, *Danish Pronunciation*, in *Transactions of the (English) Philological Society* (1873–74). An exhaustive scientific treatment of older Danish is contained in the chapter by Adolf Noreen, *Geschichte der Nordischen Sprachen*, in Paul's *Grundriss der Germanischen Philologie* (Band i., Strassburg, 1891).

William H. Carpenter.

Danish Literature.—*Pre-Reformation Period.*—The claim of Denmark to share in the glories of the Old Northern literature rests chiefly on inferential grounds. The sagas are an Icelandic development; the skaldic poetry is Icelandic-Norwegian, and the songs of the so-called Elder Edda (see Edda) belong to Iceland and Norway, if not to Iceland alone. (See Icelandic Literature.) It is, however, strongly probable *a priori* that the Danes had their own heroic and mythological lays (or their own versions of lays that were common property in Scandinavia), and some of these are no doubt preserved, though in a much altered form, in the *Historica Danica* of Saxo Grammaticus, finished about 1207. (See Saxo.) Though Saxo has much to say about written sources, it is doubtful if any of the Danish poems which he paraphrased had ever been committed to writing. The prose parts of his work must also be to a considerable extent based on oral tradition, whether song or story. Some of the Danish popular ballads also give echo from heathendom, but none of these are preserved in anything but a comparatively modern form. (See Ballads.) The oldest laws date in part from the heathen age, though not codified till Christian times.

By the middle of the tenth century Christianity had become firmly established in Denmark, but it was some time before the new religion produced any literary activity. Of the Latin historical or biographical works that precede Saxo little need be said. They are brief and feeble, mostly of the ordinary monkish pattern, and show no national or popular spirit, being intended rather to edify than to instruct or inspire. Three of them deal with the king, St. Knut: *Passio S. Kanuti*, *De Martyrizatione S. Kanuti*, and *Historia Ortus Vitæ et Passionis S. Canuti*. These were doubtless all composed between 1095 and 1125 on Danish soil; but the *Historia* is the work of the English monk Ælnoth, and the other two are perhaps also by foreigners. The *Iter Hierosolymitanum Svenonis* and the *Vita Beati Chetilli* also belong to the twelfth century.

Of a somewhat more popular character is a Latin account of the life of St. Knut (Knut Lavard, Duke of Schleswig), written about 1170 and preserved in a MS. of about 1300. A longer *Life* of the same saint, ascribed to a Scotch ecclesiastic, Robertus Elgensis, is unfortunately lost, except for a few fragments. (See Waitz, *Abhandl. der k. Gesellsch. d. Wissensch. in Göttingen, Phil.-hist. Cl.*, viii. 3 ff.) Besides these biographies, we have *Calendaria*, *Necrologia*, *Libri Datici*, which are merely records, and, though important for the historical data they contain, can not be regarded as literature. The earliest *Annals* are of a similar enumerative character, but these gradually become less arid. Among the most interesting is the *Anonymi Roskildensis Chronicon Danicum* (from 826 to 1157), which, however, is partly abstracted from Adam of Bremen. Of a very different sort is the *Compendiosa Regum Daniæ Historia* of Svend Aagesen (Sven Aakessøn), which gives evidence of warm national feeling. Svend was a friend of Saxo, and, like Saxo, based his history on oral tradition, at least in part. Most of the works mentioned in this paragraph may be found in the great collection known as Langebek's *Scriptores Rerum Danicarum Medii Ævi* (Copenhagen, 1772–1878).

The *Historia Danica* of Saxo Grammaticus (finished about 1207) is, though written in Latin, one of the most notable works in the whole course of Danish literature. A storehouse of ancient heroic tradition, its importance in several later periods of literary history, and especially at the time of the Romantic revival, can hardly be rated too high. But its effect on the Latin writers that immediately followed Saxo is hardly perceptible. Annals, chronicles, and accounts of ecclesiastical personages and foundations continued to appear. From the fourteenth century may be mentioned the *Compendium Historiæ Danicæ*, which long went under the name of Thomas Gheysmer (alive in 1431), but which is now known to have been written not far from 1350. This is in part an abstract from Saxo's *Historia*, which it brings down to 1341. It includes some traditional matter, and is marked by some warmth of patriotic sentiment. The system of the schoolmen was made known to Denmark by a contemporary of Saxo—Anders Sunessøn (Archbishop of Lund 1201–22)—whose two Latin poems, the lost *De Septem*

Sacramentis and the *Hexaëmeron*, an account of the Creation with an exposition of Peter Lombard's theology, had of course nothing national about them.

Of *vernacular literature* the oldest monuments are the laws. Of these, the *Skaanske Lov* (Law of Skaane) is referred to the beginning of the thirteenth century, but must be derived from a redaction still more ancient. The two Sealand codes (known conventionally as Valdemar's and Erik's), the *Jydske Lov* (Law of Jutland) and the by-laws of Flensborg, are extant in manuscripts of about 1300. All these laws are essentially of a popular character and appear to be in the main digests of very old customary codes. Most of them are published in the collection of *Nordiske Oldskrifter udgivne af det Nordiske Literatur-Samfund*. Next in age to the laws are the two *Urtebøger* (Plant-books) and the *Stenbog* (Stone-book, chiefly from Marbodus *de Lapidibus*), which go under the name of the physician Henrik Harpestreng (d. 1244). (See *Henrik Harpestrengs Danske Lægebog udgivet af Christian Molbech*, Copenhagen, 1826; cf. L. Pannier, *Les Lapidaires françaises du Moyen Âge*, Paris, 1882, pp. 15 ff.) It is possible, however, that Harpestreng wrote in Latin, and that the Danish version was made forty or fifty years after his death. In a Latin life of St. Niels, written about 1300, a vernacular biography of the same saint is mentioned, but this is lost.

It appears, then, that the conversion of Denmark to Christianity had no appreciable effect in the direction of developing a national literature in the centuries preceding 1300. Nor did the new religion introduce the Danes to any extent to the sort of literature which mediæval Christianity produced or fostered in other countries. The same continues true of the period from 1300 to the Reformation. Neither the Romantic nor the religious literature of the Middle Ages is represented in Denmark, except by a few translations and imitations, mostly of the feeblest kind and often made at second hand. Sweden was much more productive, and Norway was in the twelfth and thirteenth centuries a center of great literary activity. (See Swedish Literature and Norwegian Literature.) It is of course possible that many Danish compositions have been lost, but those which remain are not of a kind to make us greatly regret what may have perished.

Romantic literature is very sparsely represented in mediæval Danish. In this respect the contrast to the activity shown in translating French works into Norwegian is striking. The three *Eufemia-Viser* (Euphemia-songs; so called from the Norwegian queen by whose order the Swedish translation was made)—*Ivan Lejonriddaren* (the *Chevalier au Lion* of Chrétien de Troies), *Hertig Fredrik af Normandie* (Duke Frederick of Normandy), and *Flores og Blanzeflor*—were turned into Danish verse in the fourteenth century. From the fifteenth century we have *Dværgekongen Laurin* (The Dwarf-king Laurin, i. e. *Der kleine Rosengarten*), translated from the German; *Persenober og Konstantinobis* (a version of *Parthonopeus de Blois*), translated rather from a lost Norwegian version than from the *Partolopes Saga* that has survived; and *Den kyske Dronning* (The Chaste Queen). The last (which is dated 1482) and perhaps the second are the work of one Jep Jensen. The story of Charlemagne in a Danish translation (*Karl-Magnus Krønike*), which is from the Norwegian *Karlmagnus Saga*, either directly or through the Swedish, is preserved in a manuscript of 1480. This is accounted the best Danish prose of the century. It was printed in 1501, revised by Christiern Pedersen, and printed again in 1534, and has often been republished as a *votksbuch*. *Olger Dauskes Krønike*, an abridgment of the Old French romance of *Ogier le Danois*, was published by Pedersen in 1534.

In the fourteenth century the Birgittine Order was founded by St. Birgitta (*q. v.*) of Sweden, who was born in 1302 or 1303 and died in 1373. To the impulse given to vernacular composition by this order, the religious literature of Sweden, and to a considerable extent of Denmark, from 1350 to the Reformation, owes its existence. The oldest Danish version of the Bible (Genesis–2 Kings xxiii. 18) comes from a Birgittine monastery. It is preserved in a MS. of about 1480, but is itself older. (See Molbech, *Den ældste danske Bibel-Over-sættelse*, Copenhagen, 1828.) A considerable number of works of edification were translated from Latin or from Swedish under the more or less direct influence of the Birgittine movement. The most important are Bonaventura's *Meditationes Vitæ Christi* (from Swedish, about 1400); Suso the German mystic's *Horologium Æternæ Sapientiæ* (from Latin, about 1450); the *De Imitatione Christi* of Thomas à Kempis (about 1450); and *The Virgin Mary's Rosary* (Iomffrw Marie Rosenkrantz, about 1496), a working-over by the priest Mikael of Odense of the *Psalterium Beatæ Virginis* of Alain de Roche (Alanus de Rupe, b. 1428 (?); d. 1475). Other poems by Mikael are *Om Skabelsen* (On the Creation) and *Om Menneskets Levned* (On the Life of Mankind). In prose legends the poverty of Denmark is in striking contrast to the richness of Sweden. The most important collection is *De Hellige Kvinder* (Holy Women), preserved in a MS. of about 1450, and containing eight biographies, but there are fragments of other cycles. At this point may be mentioned the Danish *Lucidarius* (fifteenth century), a brief popular encyclopædia based on the work of Honorius Augustodunensis. The Danish *Postille* of Christiern Pedersen (printed 1495) may be taken as marking the close of the religious literature of the Catholic or mediæval period. Pedersen afterward became one of the Reformers in Denmark.

The most remarkable vernacular work of the pre-Reformation period is the fifteenth century *Danske Rimkrønike*, a rhymed chronicle of 5,095 verses, in which all the kings of Denmark, mythical and historical, to the death of Christian I. (1481), give an account of themselves in the first person. Much of the work is paraphrased from Saxo, and it is precisely this portion that has had most influence on the life, thought, and ultimately on the literature of the Danes. The lively and popular style of the *Rimkrønike* soon made it a great favorite with the people. It was the first book printed in Danish (1493), and was several times reprinted before 1600. Its effect in keeping alive some feeling for the ancient traditions of the country, and so in preparing a way for that genuinely Danish literature which, however, was not to appear for more than two centuries, may be compared to the effect of the popular ballads. The chronicle was written in the Sealand dialect, and had much to do with the establishment of that dialect as literary or standard Danish. In the composition of rhymed chronicles Sweden anticipated Denmark by more than a century; but it is not certain that this particular work, with its trick of making each king tell his own story, owes anything directly to Swedish. See Rosenberg, *Nordboernes Aandsliv*, ii. 383–394.

The *popular ballads* (*Folkeviser*) are preserved in manuscripts of the sixteenth and eighteenth centuries, or by oral tradition; one fragment is extant in a manuscript of about 1450. It is clear, however, that many of these songs, some of which are of rare excellence, are much older than the oldest of the manuscripts, and some of them doubtless go back to the thirteenth century; a few, as has already been remarked, even give echo from heathendom. Most of the ballad manuscripts are the work of ladies of rank, whence it is inferred that their contents were in favor in the best society of the seventeenth and eighteenth centuries. The earliest printed collection was that of Vedel (1591), enlarged by Peder Syv in 1695, and many separate ballads circulated as broadsides. Thus this important source of literary freshness and inspiration was accessible to all ranks even in the arid "Learned Age," and in the century of Holberg—a fact which should not be forgotten in estimating the causes of the Romantic revival. The standard edition of the ballads is that of Svend Grundtvig, *Danmarks Gamle Folkeviser* (1853 ff., unfinished); see the bibliography at the end of the article Ballad Poetry, and Steenstrup, *Vore Folkeviser fra Middelatderen* (Copenhagen, 1891).

From the Reformation to 1700.—The Lutheran Reformation was legally established in Denmark by the ordinance of 1537. The new period opened auspiciously for the vernacular literature. The unreadable 1524 version of the Scriptures, which goes under the name of Hans Mikkelsen, was soon replaced by *Christian III.'s Bible* (1550), mainly the work of Christiern Pedersen. This remarkable book, for which Luther's German Bible served as a model, not only raised the Sealand dialect at once to the position of the Danish literary language, but substantially fixed the form of that literary language. The necessity of making the new doctrines intelligible to the unlearned produced a multitude of devotional and theological books in Danish, the most important of which is *Liffsens Vey* (The Way of Life, 1570), by Niels Hemmingsen (1513–1600), perhaps the greatest of Danish theologians. The silencing of Hemmingsen for holding Calvinistic opinions was not only a check to the spread of a national literature, but was significant of the coming reaction. With the triumph of Lutheran conformity the literary promise of the early Reformation period came to an end. *A learned age* succeeded, which lasted till

about 1710. The university in a sense severed its connection with the world. Scholars formed an exclusive guild, concerning themselves little with the popular life. Polymathy and its inevitable companions, pedantry and superficiality, flourished. Great names in science and scholarship belong to this period—Tyghe (Tycho) Brahe, the astronomer (1546-1601); Brochmand, the theologian (1585–1652); Ole Worm, the antiquary (1588–1654); Kaspar Bartholin, the physician (1585–1629); Thomas Bartholin (1616–80) and Niels Stensen (1638–86), the anatomists; Ole Rømer (1644–1710), who in 1675 calculated the velocity of light—but none of these men did anything to encourage a national literature, and the condition of the people was one of great intellectual dullness. The court spoke German, scholars spoke and wrote Latin. Yet there were significant exceptions to the general neglect of Danish. The popular ballads, as we have seen, were sung and collected by ladies of rank. A hundred of these songs were edited in 1591 by Vedel (1542–1616), who also did good service by his translation of Saxo (1575). The Norwegian Peder Claussøn Friis (1545–1614) translated Snorri's *Konungasögur*. Peder Syv (1631–1702), the author of the first Danish grammar in the vernacular (1685), re-edited Vedel's ballad-collection, adding a second hundred (1695). Religious lyric reached a high position in the psalms and hymns of Thomas Kingo (1634–1703). The Norwegian Peter Dass (1647–1708) also deserves mention as a hymn-writer, but still more for his descriptive poem *Nordlands Trompet* (begun 1678), which has remained popular as a chapbook. Of a different sort was the influence of Anders Arrebo (1587–1637), who made a partly successful attempt to introduce into Denmark the spirit of the Renaissance. Arrebo is particularly noteworthy for his reformation of Danish meter in accordance, to a considerable extent, with the rules of Martin Opitz. See G. Rode, *Renaissancens tidligste Eftervirkning paa dansk poetisk Literatur* (Copenhagen, 1866).

Though there is abundant evidence that Denmark was not ignored by the mediæval *joculatores*, we have no testimony for a regular drama till the latter half of the fifteenth century. Danish dramatic history begins with three vernacular plays of the pre-Reformation period—the *Comœdia de Sancta Dorothea* (1531) and two other comedies, called by their editor *De utro Hustru* (The Faithless Wife) and *Paris's Dom* (The Judgment of Paris). The *Dorothea* is the work of one Christiern Jensen (or Hansen), who may also be the author of the other two. These plays belong to the school-drama category, and were doubtless performed by grammar-school scholars. They have been edited by S. Birket Smith (*De tre ældeste danske Skuespil*, Copenhagen, 1874). During the sixteenth and seventeenth centuries the school-drama continued to be productive. The plays dealt with both sacred and profane subjects, and were sometimes performed at court. The most important playwrights are Peder Hegelund (1542–1614) and Hieronymus Ranch (1539–1607), both schoolmasters. (See S. Birket Smith's edition of Hegelund's *Susanna og Calumnia*, Copenhagen, 1888–90, and of Ranch's *Skuespil*, Copenhagen, 1876–77.) Though the school-drama served to some extent to foster a taste for dramatic representation, it exercised no such influence on Holberg and his successors as can be traced in the case of the mediæval English plays in their relations to the Elizabethan revival. After Hegelund and Ranch, indeed, there is a distinct decadence, which may be ascribed in part to the discouraging effect of the Learned Age on vernacular literature.

Holberg and his Successors (1710–1800).—The credit of breaking away from the scholasticism of the Learned Age belongs to Ludvig Holberg (1684–1754), whose literary activity lasted from 1711 till the time of his death. A man of culture and learning, well versed in French and English literature, Holberg worked with one clearly defined purpose —to rescue the Danish people from their intellectual stagnation and social provincialism. In his historical writings he aimed to make the results of scholarship accessible in the vernacular; in his satirical poems and his comedies, to amuse while inculcating some moral or social lesson. No part of his work failed of its aim, but it is on his comedies that his fame chiefly depends. These were written for the newly opened Copenhagen theater. They form a long series of brilliant dramatic sketches, modeled on Molière and showing English influence as well, but finding their material in contemporary Danish life and manners. Their inexhaustible humor and good-nature so far deprived their satire of its sting that the author was able to teach his lesson and to delight his audience at the same time. The fun, though not always refined, sinks to positive coarseness surprisingly seldom. Holberg's style is always lively and attractive, but his language shows a greater proportion of French words than it was the lot of Danish finally to assimilate. Holberg was by birth a Norwegian; but there is no separating Norwegian literature from Danish from the time of the Reformation, when the Sealand dialect became the literary language of Norway as well as of Denmark, till the separation of the two countries in 1814. See Danish Language, Norwegian Language, and Norwegian Literature.

Though he left no disciples, Holberg is with much propriety called the father of Danish literature. He successfully asserted the rights of the vernacular; he showed that authorship might be made lucrative, and he created a reading public. The period from his death till the rise of the Romantic school under Oehlenschläger (sometimes called the *Age of Enlightenment*, 1750–1800) was a time of misguided effort in literature rather than of performance. The intellectual turmoil in which the nation was involved by the contest between orthodoxy and free thought was not favorable to creative genius, and there was grave danger that Danish literature would wear itself out in pitiful imitation of second-rate French and German models. For nearly twenty years (1751–70) Klopstock resided at Copenhagen as a sort of literary dictator (see F. Rønning, *Rationalismens Tidsalder, I. Det Klopstockske Tidsrum*, Copenhagen, 1886), exercising an influence from which even so original a genius as Johannes Ewald (1743–81), the great lyric poet, freed himself with difficulty. Ewald's tragedy of *Balder's Død* (Balder's Death, 1773) is important not only as signaling his final emancipation, but as pointing out the path that Danish Romanticism was to follow. (See Rønning, *Rationalismens Tidsalder, II. Det Ewald-Wesselske Tidsrum*, 1770–85, Copenhagen, 1890.) His contemporary, the Norwegian Wessel (1742–85), though his literary opponent, was unconsciously working to the same end when, by his celebrated dramatic parody *Kjærlighed uden Strømper* (Love without Stockings, 1772), he did so much to free the stage from its servitude to French sentimentalism. The great comic poet Jens Baggesen (1764–1826) marks the end of this period, but his unique genius forbids our reckoning him as a member of any school. His *Komiske Fortællinger* (Comic Stories, 1785), which shows Wessel's influence, made him the literary lion of the day, and his prose, seen at its best in his *Labyrinthen* (The Labyrinth, a work of travel, 1792–93), would alone entitle him to a high position as a classic. But his spirit and his life were alike too restless for sustained effort. He understood and partly sympathized with the Romantic movement; but his love of clearness and his sense of form were offended at some of its tendencies. The result was a long literary feud with Oehlenschläger, which is perhaps the most humiliating chapter in the annals of Danish letters. See K. Arentzen, *Baggesen og Oehlenschläger* (8 vols., Copenhagen, 1870–78).

The Romantic Period.—The center of the Romantic movement in Denmark was Adam Oehlenschläger (1779–1850). Introduced to the ideals of German romanticism by Steffens, one of the immediate disciples of Schelling, Oehlenschläger became an ardent devotee of the new school, and never wavered in his allegiance. The robustness of his genius, however, prevented his being a mere imitator, and his fortunate choice of subjects (made under the influence of Ewald's *Balder's Død*) was an additional safeguard against the danger of sentimentalism. In the mythical and heroical song and saga of the North Oehlenschläger found material for a series of noble poems, epic and dramatic, which at once raised Danish literature to an honorable position in European letters. It is largely due to him that Danish Romanticism did not fritter away its strength in whimsical prettiness like that of the Swedish Phosphorists, but became a regenerating force not only in art and letters, but in the whole social and political life of the people. Contemporary with Oehlenschläger, but surviving him more than twenty years, N. F. S. Grundtvig (1783–1872) deserves mention in the same breath as bearing no small share in the restoration of a healthy national life. Grundtvig is often accounted a member of the Romantic school, partly because of the freshness and enthusiasm of his genius, partly because of the nature of the subjects with which his writings deal; but this classification is not quite sound. Grundtvig's aim was not artistic, but practical; he valued literature and scholarship only as a means to the ethical and religious regeneration of the people, and for this he labored with tongue and pen throughout his long life. Though an eminent

scholar, an eloquent preacher, and a great poet, it is, after all, as the religious and educational reformer that his influence will longest endure. Grundtvig's teachings, in insisting on the joyous side of Christianity, are in strong contrast to those of his younger contemporary, the theologian Søren Kierkegaard (1813–55), whose ideals were too austere to be humane; but in one regard both worked to a common end, the substitution of a living, efficient Christianity for the peculiarly deadening form of rationalism that had long held sway in the Danish Church, and it is no accident that their labors coincide in time with the supremacy of Romanticism in literature.

The Romantic revival was prolific of authors, many of whom achieved distinction. A few only can be mentioned. Ingemann (1789–1862), though a poet of much merit, is chiefly important for introducing the historical romance, a kind of writing for which the Danish genius has since shown itself especially adapted. Hauch (1790–1871) wrote poems, dramas, and novels; Winther (1796–1876) was also a poet and a romance writer. Hans Andersen (1805–75) won world-wide reputation as the author of fairy-tales. J. L. Heiberg (1791–1860), though distinctly a Romanticist, was of intellectual kin to Baggesen, and occupies a somewhat peculiar place, from the possession of Romantic tendencies combined with an elegance of mind almost French and the keenest critical powers. His vaudevilles entitle him to be called the reviver of Danish comedy. The dramatists Hertz (1798–1870) and Overskou (1798–1873) were his disciples. His mother, the Baroness Gyllembourg-Ehrensvärd (1773–1856), was a novelist of distinction. Bödtcher (1793–1874) wrote lyrics of marvelous beauty of finish. Paludan-Müller (1809–76) belongs rather to the circle of Heiberg, whose influence is most perceptible in his earlier poems, than to that of Oehlenschläger; but shows in his religious and ethical system a striking affinity to Kierkegaard. (See G. Brandes, *Moderne Geister*, 1882, pp. 339–86.) He is, however, nobody's disciple, and is justly regarded as almost contesting the palm with Oehlenschläger. His great satiric epos *Adam Homo* is remarkable for its realistic spirit, but the rest of his work makes it proper to regard him as belonging to the Romantic school. See also articles on Bergsøe, Bøgh, Brosbøll, H. F. Ewald, Holst, Hostrup, Kaalund, C. K. F. Molbech, von der Recke, Richardt, Rumohr, de Saint-Aubain, and Schack von Staffeldt.

The Latest Period.—The death of Christian VIII. in Jan., 1848, the February Revolution in France, and the revolt of the Schleswig-Holsteiners in March, were for Denmark the beginning of a series of foreign and domestic disturbances which culminated in the humiliation and dismemberment of the kingdom in 1864. The political drift of these years was irresistibly toward liberalism. The temper of the age became unfavorable to the mystical and retrospective in literature. Romanticism had done its work for Danish life and letters, and the rise of a new literary school that should look at the present and the future, and should occupy itself with the religious, social, and political problems that more and more agitate all classes in our day, was only a question of time. Two authors may be said to herald the new movement, even if they do not strictly belong to it: Parmo Carl Ploug (b. 1813), whose patriotic lyrics, chiefly of an occasional character, have given him a high place as a poet, and whose activity as the editor of the journal *Fædrelandet* (The Fatherland) and the untiring advocate of Scandinavian unity make him an important figure in Danish political history; and Meyer Aaron Goldschmidt (b. 1819), an able critic and satirical writer, but chiefly significant as the author of several masterpieces of prose fiction. Both Ploug and Goldschmidt, though representatives of advanced ideas, show clearly the influence of Romanticism in their strictly literary productions.

It was necessary that Denmark should be made acquainted with the latest tendencies in European thought and letters in order to bring the country into sympathy with what is called the modern spirit. This result was largely brought about by the efforts of Georg Brandes (b. 1840), the critic and literary historian, whose intellectual guides had been Hegel, Taine, Renan, and John Stuart Mill. In all respects a radical, possessing an unusual talent for popular exposition, and master of a fluent and eloquent if not always restrained and well-poised style, Brandes by his lectures and books has done more than any one else to turn Danish literature in the realistic direction to which it now seems to be committed. Candid judgment will discover that some of his ideals are flashy, and that the scope of his critical vision is often narrowest when it appears to be most extensive; but of the stimulus which he has given to Scandinavian letters there can be no question. Sweden and Norway felt this stimulus as well as Denmark, and the effect produced on Bjørnson and Ibsen has in turn reacted upon Danish writers. Drachmann, the most distinguished of the younger Danish school, is a writer of astounding fecundity, who, as a lyric poet and a novelist, stands perhaps in the very first rank of Danish literature. A crowd of smaller men, whose place it is too early yet to determine, have been even more subject to the domination of Brandes; among them may be mentioned Sophus Schandorph (b. 1834, a convert from Romanticism), J. P. Jacobsen (1847–87), Asbjørn Skram (b. 1847), Karl Gjellerup (b. 1857, who has revolted from the school of Brandes), Herman Bang (b. 1857), Edvard Brandes (b. 1847), and Gustav Esmann (b. 1860). The Romantic school is still represented among young writers by Ernst von der Recke and Rudolf Schmidt. The literary and scientific activity of Denmark, always remarkable when the small size of the country is taken into consideration, was never more noticeable than to-day. But the feeling of unrest which characterizes the last decades of the nineteenth century is too productive of self-consciousness to be altogether favorable to the development of a great modern school.

Dan'ites, or **Destroying Angels**: a secret society of Mormons, organized in 1838, and originally comprising about 300 men, who are believed to have taken an oath to support the authority and execute the commands of the leaders of their sect at all hazards. Many massacres, robberies, and murders, committed during the early history of Utah, are ascribed to the Danites, but the Mormons themselves assert that these were not countenanced by the "saints." In 1877 John D. Lee, who had belonged to this society, was tried and executed for participation in the massacre of a train of "Gentile" emigrants in 1857.

Dankali: See Danakil.

Danks, Hart Pease: See the Appendix.

Dannat, William T.: figure-painter; b. at Hempstead, L. I., 1853. Pupil of Munich Academy and of Munkacsy, Paris; member of the International Art Jury, Paris Exposition, 1889; member of the Société Nationale des Beaux-Arts, Paris; member of the Society of American Artists, 1881. One of the ablest of American painters; many of his pictures depict scenes of life in Spain. His picture *A Quartette* (1884) is in the Metropolitan Museum, New York. Studio in Paris. William A. Coffin.

Dan'nebrog, or **Danebrog** [from Dan. *Danebrog*; *Dane* + *brog*, cloth]: the ancient battle standard of Denmark, bearing the figures of a cross and crown. It was fabled to have fallen from heaven at the battle of Volmar in Esthonia (1219) during a crusade against the heathens. It was twice taken in battle and twice recaptured. In 1500 a mere fragment remained.—The Order of the Dannebrog is the second of the Danish orders of knighthood. It is said to have been founded in 1219, but fell into decay, and was restored in 1671.

Dan'necker, Johann Heinrich, von: German sculptor; pupil of Pajou in Paris and of Canova (1785–90) in Italy; b. near Stuttgart, Oct. 15, 1758. Having returned to Stuttgart in 1790, he was appointed Professor of Sculpture. He produced busts of Schiller, Lavater, and other men of his time. While surpassed by Canova in creative power, he excelled him in æsthetic perception, and thus stands in the history of sculpture between Canova and Thorwaldsen. Among the best productions of the Canova classicism are his *Ariadne*, of which the original or a replica is in a private collection in Frankfort, the *Sappho* made for the Duke of Würtemberg, and a colossal statue of Christ. D. Dec. 8, 1841.

Dan'nevir'ke (Dane's work): a boundary-wall in Schleswig, built by the Danes against the Franks about 808, from the Baltic to the North Sea. The original line can be traced from the town of Schleswig to Hollingstedt. The line of the Dannevirke was restored in 1748 by a system of strong fortifications known as the "Great" and the "Little Dannevirke." They were evacuated by the Danes Feb. 5, 1864, and destroyed by the allies.

Dannhauer, daan'how-*er*, Konrad: theologian; b. in Breisgau, Baden, 1603. He studied theology at Marburg and Jena, and was appointed professor at Strassburg in 1628. He became known as one of the most ardent champions of Lutheran orthodoxy. Against the Romanists he wrote *Hodomoria Spiritus Papæ* and *Hyæna Friburgica*; against the Calvinists, *Hodomoria Spiritus Calviniani* and *Reformirte Salve*; and against the Syncretists, *Mysterium Syncretismi detecti*. He was the teacher of Spener, but had no influence on him. His *Katechismusmilch* consists of ten volumes in quarto. D. in Strassburg, 1666.

D'Annunzio, Gabriele: See the Appendix.

Dansville: railway junction, and the largest village of Livingston co., N. Y. (for location of county, see map of New York, ref. 5–D); situated at the head of the Genesee valley. It contains a sanatorium, union school, paper and pulp mills, mower and reaper works, chair-factory, woolen-mill, pail-factory, foundry, electric-light works, water-works, extensive nurseries, and vineyards. Pop. (1880) 3,625; (1890) 3,758; (1900) 3,633. Editor of "Advertiser."

Dantan, dăăn'tăăn', Joseph Édouard: genre-painter; b. in Paris, Aug. 26, 1848. Pupil of Pils and Lehmann. Second-class medal, Salon, 1840; first-class, Paris Exposition, 1889; Legion of Honor 1889. His *Corner of a Studio* was much talked of at the Salon of 1880, and is in the Luxembourg Gallery. The still-life in his pictures is remarkably well painted. Studio in Paris. W. A. C.

Dante Alighieri (or **Allighieri**), Ital. pron. daan'tā-ăă-lĕĕ-gĕĕ-ā'rĕĕ: the greatest of Italian poets and author of the *Divine Comedy*, one of the most famous of Italian and of all poems. The subject of Dante's life and works is an intricate one, and the number of treatises upon it already runs into the thousands. The limits of this article preclude the discussion of disputed points, and permit the statement of only what is now reasonably certain. For the sake of clearness it will be well to divide the matter into three portions—the first dealing with Dante's life; the second, with his spiritual history; the third, with his works.

I. Dante's Life.

The poet was born in Florence, in May or June, 1265. His father was Aldighiero (or Alighiero) degli Aldighieri, a lawyer by profession; his mother, Bella, of unknown but probably plebeian origin. The family was almost certainly not noble, and the attempts to connect it with the Frangipani and Elisei, supposably of Roman descent, are more than doubtful, and this in spite of the fact that they were early (perhaps by Dante himself: cf. *Inf.* xv. 70, *seq.*) believed to be well founded. The earliest known ancestor of the poet is his great-great-grandfather, Cacciaguida by name, mentioned by Dante (*Par.* xv. and xvi.). This Cacciaguida married a wife from the valley of the Po, an Aldighieri, probably from Ferrara. Hence came the poet's surname. One of the two sons of this marriage was Aldighiero; he had two sons—one named Bellincione; the latter had among four sons one named Aldighiero, who was the father of Dante. Little is known of the history of the family thus outlined. Dante makes Cacciaguida say that he followed the Emperor Conrad (probably Conrad III.) on his crusade (1147), was knighted by him, and perished by the hands of the infidels. The first Aldighiero is mentioned in a document of 1201, and is placed by Dante in Purgatory because of his pride. In the thirteenth century the family was strongly Guelph, and was twice (1249 and 1260) obliged to go into exile for its opinions. The fact that the latter exile ended only in 1267 has been thought to make doubtful the poet's birth in Florence; but this is clearly established by his own statement that he was "born and nurtured there till the culmination of his life." (*Conv.* i. 3.)

Of the boyhood of Dante we really know very little. There are plenty of fables about it, but they have no foundation in provable fact. An important event in his youth we do know—his love for a young girl of slightly less than his own years, who for centuries (until our own time, in fact) has been believed to be Beatrice, daughter of Folco Portinari. Of this matter, however, it will be better to speak in connection with Dante's spiritual history. Whoever the maiden was, she died young, as Dante himself tells us, June 9, 1290 (*Vita Nuova* xxx.), and this event produced a painful perturbation in his life. Still he had to fulfill his duties to the world in which he lived; and accordingly, after some years (probably toward 1295), he married Gemma, daughter of Manetto Donati. By her he had at least four children—Pietro, Jacopo, Beatrice, and Antonia. Four other names of children ascribed to him (Gabbriello, Aligero, Eliseo, Bernardo) appear; but the existence of these is doubtful. It has been supposed that the marriage was not a happy one, and in proof of this passages from the poet's works unfavorable to women, as well as statements of his early biographer, the novelist and romancer Boccaccio, have been adduced. This, however, is mere conjecture. The indubitable facts are that Dante nowhere speaks of his wife; and that after his exile (1302) she probably remained in Florence, being still alive there in 1332.

Dante was, however, not merely a lover, a husband, and a father. He took an eager part also in public affairs. Writing

about 100 years after Dante's death, his biographer Leonardo Bruni cites a letter of the poet in which he describes himself as having taken part with the Florentines in the battle of Campaldino, June 12, 1289. This letter, however, no longer exists, and Dante's contemporaries and immediate successors say nothing about the matter. A passage in his works (*Inf.* xxii., v. 1–9) has been taken to imply that he took part in the war of the Florentines against the Aretines in 1288; and he clearly informs us that he witnessed the capitulation of Caprona in Aug., 1289 (*Inf.* xxi. 94, *seq.*), though whether as a soldier he does not say. There is more that is certain in regard to Dante's connection with the internal affairs of Florence, though here also many legends have grown up, as, for instance, of the poet's numerous embassies to other states. As has been said, he belonged to a family traditionally Guelph, yet not noble: and as such he can hardly have looked with distaste upon the democratic movement which finally in 1293, by means of the famous Ordinances of Justice, compelled the old Ghibelline (and Guelph) nobility to enroll itself in the *Arti*, or guilds, on pain of loss of civil rights. He himself, probably at the prescribed age of thirty, enrolled in the Art of Physicians and Apothecaries. He at once began to hold public positions. In June, 1296, he was one of the Council of One Hundred, and he was still a member in Mar., 1297. In May, 1299, he was sent on an embassy to the commune of San Gemignano—the only sure one among fourteen reputed embassies. From June 15 to Aug. 15, 1300, he was one of the six priors of the republic. In 1301 he debated in both the aldermanic council (Consiglio delle Capitudini) and the Council of One Hundred. In April of the same year he was given charge of the widening and repairing of a street—the Via di San Procolo.

In the meantime events were shaping themselves, with and without the poet's co-operation, for the great catastrophe that was to affect more than all else his future life,—i. e. his exile. After 1293, despite the Ordinances of Justice, the turbulent nobles of Florence continued to disturb the life of the republic. The Ghibellines, as such, had mainly lost their power; but soon two parties appeared among the Guelphs—the one headed by the haughty Donati, the other by the rich but somewhat plebeian Cerchi. From 1300 these parties bore respectively the names of *Neri* (Blacks) and *Bianchi* (Whites), derived from a similar intestine fend of the neighboring city of Pistoia, in which the Florentines had interfered. The violence of the contest in Florence led the pope, Boniface VIII., to interpose. He took the side of the *Neri*, and intrigued vigorously for their and his own advantage. The *Bianchi*, however, had the upper hand in Florence; and early in 1300 three partisans of the *Neri*, also, it appears, emissaries of the pope, were condemned to heavy fines. This drew from the pope two haughty but vain letters to the Bishop of Florence, demanding the annulling of the decree (Apr. 24 and May 15, 1300). In June of the same year the *Neri* made direct application to the pope for help. He undertook to give it, sending Cardinal Acquasparta to Florence to bring about peace. The mission failed and Florence was excommunicated. Brawls continued to occur, and the priors determined to exile the heads of both parties. According to Dino Compagni (but the authenticity of his chronicle cannot be relied upon), the immediate occasion for this action was an outbreak on June 24, when Dante was one of the priors. From Villani's account, however, it would seem that the date was later, after Dante had given up his office. It is certain, however, that Dante inclined to the side of the *Bianchi*—that is, against the pope. It was not long before Boniface found another way to accomplish his purpose. On the advice of Corso Donati, it is said, he nominated Charles of Valois, brother of Philip the Fair of France, to be pacificator of Florence. Nov. 1, 1301, Charles of Valois, after solemn promises to the Florentines to respect their rights and fortunes, entered the city. Five days later he opened the gates to the Donati, who ravaged the quarters of their adversaries with fire and sword. Thus the *Neri* possessed themselves of the government, and determined upon a proscription of the *Bianchi*. Among the latter Dante was included. Jan. 27, 1302, he and his fellow-priors were accused "on public report" (i. e. the undisputed testimony of two witnesses) of extortion and barratry in office, besides other offenses. Dante was condemned to a fine of 5,000 small florins and other penalties. Forty days later (Mar. 10, 1302), for contumacy in not appearing and paying his fine, he was condemned to be burned, should he ever be found upon Florentine territory.

When and how Dante left Florence we do not know. Relying apparently upon a statement of Boccaccio that Dante was nominated by the *Bianchi* as head of a commission to go to Rome to protest to Boniface against the coming of Charles of Valois, Leonardo Bruni, in his *Life*, declared that Dante was in Rome when sentence was passed upon him, and first heard of the full extent of his misfortune at Siena, on his way home. The best authorities (e. g. Scartazzini and Bartoli) now agree, however, that this embassy is improbable. Dino Compagni, the suspected chronicler, alone of contemporaries mentions it, and many facts are against it. Boccaccio himself merely states that Dante was *nominated* to go to Rome; but declares that when condemned he left Florence secretly with Vieri de' Cerchi. At any rate, the poet went into exile, "to learn how salt is the taste of others' bread, how hard the ascent and descent of others' stairs" (*Parad.* xvii. 58, *seq.*). Whither he went is also in the main dark. He tells us himself that he journeyed, nearly a beggar, almost everywhere the Italian tongue was spoken, "showing against his will the wound of Fortune, which ofttimes is wont to be unjustly imputed to the wounded" (*Conv.* i. 3). The only contemporary statement, beyond his own hints, as to his movements is that of Giovanni Villani (*Cronica* ix. 136): *andossene allo studio a Bologna, e poi a Parigi, e in più parti del mondo.* Legends rapidly grew, and soon various places in Italy claimed the honor of his presence for at least a time. When we study the evidence, however, we find that we get only now and then a sure glimpse of him; then he disappears again from view.

It is worth while, nevertheless, to give briefly the story of his wanderings, in so far as it may be made out with reasonable certainty. From the passage in the *Paradiso* (xvii. 46, *seq.*), in which Cacciaguida is made to predict the sufferings that were to befall his great-great-grandson, it is clear that not long after his banishment the latter sought refuge in Verona, at the court of the Scaligers. This, Cacciaguida declared, should be Dante's *first* refuge and *first* resting-place. In spite of this apparently conclusive statement, however, it is probable that some months at least elapsed between the date of the poet's banishment and his resort to Verona; and that these months were spent by him, along with his fellow-exiles, in vain efforts to effect a return to Florence. His name appears, with the names of seventeen other Florentines, appended to a document drawn up at San Godenzo in the Upper Mugello, almost certainly of the date June 8, 1302. The document is an agreement on the part of the signers to make good any damage incurred by Ugolino Ubaldini, his sons, or others of his house, in an attempt to be made on the castle of Montaceianico, in the interest of the exiled *Bianchi*. The attempt was a success, though valueless as far as the ultimate purpose of the exiles was concerned. How long thereafter Dante remained with the exiles is very uncertain. It is certain, however, that, from whatever cause, he found himself as time went on in a state of growing indignation and rage against his own former friends, and at last he cut himself off from them and from all their projects. In the words of Cacciaguida (*l. c.*), he learned by experience the "course of their bestiality, so that it became well for him to have formed a party by himself." Whether this savage criticism was justified we know not; we know only that the affairs of the exiles went from bad to worse, and in 1304 met irretrievable shipwreck. And it is probable that before this date Dante had gone to Verona, to be kindly received by the "gran Lombardo," who almost certainly was Bartolommeo della Scala.

What the poet did at Verona is unknown, as indeed his means of livelihood through most of the years of his exile are unknown. It has been conjectured by several critics, most recently by Scartazzini (*Dante-Handbuch*, 1892, p. 122, *seq.*), that he made use of his great learning as a teacher. But this is highly uncertain, at any rate in the early years of his exile. Probably he did not long remain in Verona, for his patron there died Mar. 7, 1304, and was succeeded by his brother Alboin, of whom Dante in a well-known passage (*Conv.* iv. 16) speaks depreciatingly. Perhaps his oft-mentioned sojourn in Bologna fell in the years immediately succeeding this date; and perhaps, as Scartazzini has suggested, he was one of the Ghibellines driven out of Bologna by the Guelphs (Mar. 1, 1306), and went with others, notably several professors and scholars of the university, to Padua. He is mentioned in a document of Aug. 27, 1306, as dwelling in Padua. Apparently, however, he did not long abide there, for he appears in a document of Oct. 6,

1306, as intrusted by the Counts of Malaspina in the Lunigiana with the task of procuring peace between them and Antonio, Bishop of Luni, which task he satisfactorily accomplished. And now all certainty fails us for a considerable period. We do not know how long Dante remained in the Lunigiana, nor whither he went when he left it. It has been said on the authority of the fifteenth century writer, Flavio Biondo, that in 1308 he was in Forlì, employed as secretary by Scarpetta degli Ordelaffi. This may or may not be so. About this same year, 1308, the general drift of the evidence, rather than any definite fact, leads most authorities to place the poet's sojourn in Paris. The doubt, however, as to whether this visit ever took place seems ill-founded, seeing that we have the positive statement of Giovanni Villani (*l. c.*), confirmed by the unbroken tradition of the early biographers, from Boccaccio down, as to its reality. About what the poet did in Paris, whether he studied or taught, did or did not take a degree, and so on, we have no sure information. His supposed visit to Oxford, which rests upon a rhetorical passage in Boccaccio's Latin *Carmen in laudem Dantis*, and the statement of the fifteenth century commentator, Johannes de Serravalle, is, on the other hand, very improbable, to say the least.

If Dante was in Paris in 1308 or 1309, when did he return to Italy? Boccaccio says it was when Henry of Luxembourg (Henry VII.), the news of whose expedition had filled Dante with joy, was besieging Brescia. But this was in the summer and fall of 1311, and we have better evidence than Boccaccio's that Dante was already in Italy in the end of 1310. This is the famous letter addressed *Universis et singulis Italiæ regibus et senatoribus almae Urbis, nec non ducibus atque populis, humilis Italus Dantes Alegerii florentinus et exul immeritus orat pacem.* The letter is undated, but its character is such as to make it certain it was written soon after Henry's entrance into Italy (Oct., 1310). It is a pæan, a hymn of congratulation and joy, addressed to all Italy on the coming of its deliverer. It begins: *Ecce nunc tempus acceptabile, quo signa surgunt consolationis et pacis.* It ends: *Hic est quem Petrus, Dei Vicarius, honorificare nos monet; quem Clemens, nunc Petri successor, luce apostolicae benedictionis illuminat; ut ubi radius spiritualis non sufficit, ibi splendor minoris luminaris illustret.* The patriot welcomes the restorer of peace to his fatherland; the Ghibelline, the new representative of the Holy Roman Empire; the idealist in thought, the idealist in practice. On Mar. 31, 1311, the poet wrote to the citizens of Florence, *scelestissimis Florentinis*, a letter full of bitter exultation at the pains they were soon to endure; and he must have been on the borders of Tuscany when he composed it. (*Scriptum prid. Kal. Aprilis in finibus Tusciae sub fontem Sarni, faustissimi cursus Henrici Cæsaris ad Italian anno primo.*) On Apr. 16, 1311, from the same place he directed a third letter to Henry himself (*Sanctissimo Triumphatori et Domino singulari*), in which he urged him to leave for the time the rebellious cities north of the Apennines, and to hasten to the punishment of Florence—*vipera versa in viscera genetricis.* From an expression in this letter it seems clear that Dante had sometime previously seen and done homage to Henry, but when or where we do not know. Nor do we know the fortunes of Dante in the years immediately succeeding. The disappointment of his eager hopes and dreams is of course clear. Henry's death at Buonconvento, Aug. 24, 1313, destroyed them all. No report tells us where Dante was when this catastrophe occurred, nor how he bore it; but of the latter we can judge from the solemn and bitter words of Beatrice, the last she speaks to the poet (*Par.* xxx. 133, *seq.*), as she points out to him in the circle of the celestial rose the great seat already crowned that awaits "the high Henry, who, to set Italy straight, will come ere she is ready." One more point is clear, i. e. that Dante's bitterness against Florence had confirmed his exile. Under pressure of the impending attack of Henry, the city had recalled (Apr. and Sept., 1311) many of her banished sons; but in the list of those excluded from the benefits of Baldo d'Aguglione's *riforma* stands the name of Dante. And this exclusion is again confirmed in a decree of Nov. 6, 1315, but with the addition this time of the poet's sons. It is not probable that this attitude of the city toward her greatest citizen was changed during his life. A passage in Boccaccio's *Life of Dante* (pp. 53–54), to be sure, apparently confirmed by a magnificent letter of Dante to a Florentine friend, has led many to believe that the poet was in 1316 given an opportunity to return on certain humiliating conditions, but refused indignantly to accept the same. The letter, however, exists in but a single and in many ways perplexing manuscript (*Laurent.* xxix. 8), and is in other respects suspicious, so that little confidence can be felt in its authenticity.

The truth is that from Nov. 6, 1315, until the year of Dante's death, we have not a single really certain date. In the statements as to his abiding-places and occupations we are sure there is much that is fabulous, though undoubtedly something that is true. To draw the line with confidence between the two is well-nigh hopeless. Boccaccio tells us that after the death of Henry VII. Dante went across the Apennines into the Romagna, and was received by Guido Novello da Polenta, "at that time lord of Ravenna," and entertained by him for several years. Alas! in 1313–14 Guido Novello was *not* lord of Ravenna, only *podestà* of Cesena. So the whole statement becomes suspicious. Nor is it made less so by the letter in Italian, first published by Anton Francesco Doni in 1547, in which, under date Mar. 30, 1314 (or 1313, for there is trouble over this), Dante purports to write to Guido Novello from Venice an account of an embassy undertaken by him for the latter to the Venetians. It is a strange letter, and there are things in it (e. g. that the Venetians have been unable to understand the Latin of diplomacy) that can only be said to be inexplicable. Perhaps the best thing is to call it outright a forgery. The forger, whoever he was, was very clumsy, for he was trying to connect his falsification with an event the true date of which Giovanni Villani gives us—an embassy of Dante to Venice in 1321.

We can not be sure, then, that immediately after Henry's death Dante went from Tuscany to the Romagna. Guido Novello became lord of Ravenna after the death of his uncle Lamberto, June 22, 1316. It is possible, perhaps even probable, that soon after this date Dante first received the aid and protection of the man who undoubtedly made his life less hard at its very end. It is not likely, however, that the poet resided constantly at Ravenna through all these years. Indeed, we know that now and again (though the precise dates we do not know) he was elsewhere. We need not discuss the long list of uncertain places with which local pride or critical ingenuity has striven to connect the poet's name. Each has its shade of probability or improbability, but it would require a volume to determine it in every case. We shall simply pass over Pisa, Gubbio, Fonte Avellana, Udine, and the rest. In two cities, however, Lucca and Verona, it is practically certain that Dante sometime during these years was, and in both cases the certainty arises from Dante's own words.

In the twenty-fourth book of the *Purgatorio* (v. 34, *seq.*) Dante represents himself as conversing with Bonagiunta, a poet of Lucca, and as being told by him, among other things, that a maiden is already born (by name Gentucca) "who shall make pleasant his city to him, however men may blame it." Clearly when Dante wrote those words he has been in Lucca, and had known the delicate kindness of Gentucca. But when? Troya, basing his argument upon his identification of Dante's Veltro (*Inf.* i. 101), with Uguccione della Faggiuola, tells us that the date must have been later than 1314, for in that year only did Lucca fall into Uguccione's power, having before that been absolutely closed to Ghibelline or *Bianco* (hence to Dante). Here, however, all is conjecture. We can only say that the date as a *terminus a quo* has probability on other grounds also.

And now for Verona. We have already seen that a passage in the *Paradiso* (xvii. 70, *seq.*) proves that Dante was in Verona not long after his exile, and enjoyed the hospitality of Bartolommeo della Scala. The same passage further on proves that at a later date he was in Verona and received the kindly aid of Bartolommeo's younger brother, Can Grande della Scala, who became lord of Verona in 1312. Here again we do not know the date, but it was probably after 1316. Of the intimacy between the poet and Can Grande the best evidence is the famous dedicatory letter to the latter, expounding the true intent of the *Divina Commedia*, which, in spite of all the attacks of the critics, seems still to remain probably authentic. Less fortunate, however, is the attempt to prove that Dante was in Verona in 1320 upon the authority of the treatise *Quaestio de duobus elementis aquae et terrae*; for this treatise is almost certainly a fabrication of a later time.

In the year 1321 (but, let us repeat, how long before that we do not know) Dante was certainly in Ravenna, at the court of Guido Novello da Polenta. In that year

he went on an embassy for the latter to Venice (cf. G. Villani, *Cron.* ix. 136), and upon his return from the same he died, Sept. 14, 1321. "And," says Villani, "in Ravenna, before the door of the greater church (San Pier Maggiore), he was buried with great honor, in the garb of a poet and great philosopher." Yet even in death the weary exile was not to have peace. It would be too long a story to rehearse here the vicissitudes of his mortal remains—the long series of frustrated or but half-fulfilled plans of magnificent preservation and commemoration; the efforts of fanatic churchmen to bring ignominy even upon death; the bickerings of Florence and Ravenna over the possession of the precious relics; the disappearance of these from their sarcophagus just before they were to be given over to Florence (Oct. 20, 1519); their rediscovery, May 27, 1865, by the master mason Pio Feletti, as he was tearing down a wall in the old Franciscan monastery that stands close by San Pier Maggiore; the consequent jubilation of all Italy. The story can be found in every detail in the work by Ricci, mentioned below.

II. Dante's Spiritual History.

Of all poets Dante has most clearly and unmistakably given form and pressure to his own experience, his own ideals, his own aspirations. As we study his works we grow more and more convinced that they are understandable only if we comprehend something of the course of his own inner life. And yet this comprehension is in many ways hard to attain, and the confusion of opinion we have found in regard to his external life prevails even more here. Still it is useful and even necessary to indicate what lines seem in the main to have established themselves. We must speak briefly of his education; of the beginnings of his individual experience; of the phases of thought and belief through which he passed.

We do not know at what schools or under what masters Dante received his early education. Undoubtedly this education took the regular mediæval form of the *trivium* and *quadrivium*, for the poet knows no other scheme of instruction (cf. *Conv.* ii. 14). A tradition, beginning as early as the fourteenth century, represents him as having been taught by Brunetto Latini, and this has been thought to be confirmed by the beautiful words addressed by the poet to the latter (*Inf.* xv. 82, *seq.*):

> Chè in la mente m'è fitta, ed or mi accora
> La cara e buona imagine paterna
> Di voi, quando nel mondo ad ora ad ora
> M'insegnavate come l'uom s'eterna.

These words, however, seem hardly to imply the relation of master to pupil; and on other grounds it is improbable. Brunetto had indeed during his long exile in France become a man of universal learning, as his *Trésor* shows; and he was, in the words of Giovanni Villani (*Cron.* viii. 10), *sommo maestro in rettorica*, as well as *cominciatore e maestro in digrossare i Fiorentini, e fargli scorti in bene parlare, e in sapere guidare e reggere la nostra republica secondo la politica.* But in Florence he was fully occupied till his death (1294) with great public concerns, and certainly can not have given systematic instruction to Florentine youth. Still his influence upon Dante and the group of young men to which Dante belonged is undeniable; and it may well have been under his inspiration that the poet laid the foundation of that learning which subsequently made Villani say of him: *Questi fu grande letterato quasi in ogni scienza, tutto fosse laico.* This learning, as we see it in Dante's works, was naturally the result of the toil of a lifetime, not of youth only. Before his death it embraced practically all that a man of his time and country could know. He was deeply versed in many literatures—Latin (both classical and mediæval), Provençal, Old French, Early Italian—but not in Greek, Hebrew, or Arabic. He was an eager student of philosophy. He was acquainted with most of the mathematical and physical science of his age. He knew something of music and painting. Yet he was never a scholar for the sake of scholarship. All he knew he used for his own purposes, not subordinating himself to it and becoming lost in it.

More important than the history of Dante's learning is that of his imaginative life. It is probable that with him the impulse to imaginative expression and the beginnings of imaginative experience were contemporaneous. The former, perhaps, arose from the example of those poets, somewhat older than himself, who were giving to Italian poetry a meaning independent of the Provençal tradition—the poets of the *dolce stil nuovo.* The change had been begun by the Bolognese Guido Guinicelli, who died while Dante was yet a child (1276), but whose influence the latter recognizes when he calls him (*Purg.* xxvi. 97):

> il padre
> Mio e degli altri miei miglior, che mai
> Rime d'amore usâr dolci e leggiadre.

From Bologna, however, the "sweet new style" had passed over the Apennines into Tuscany; and there in Dante's boyhood it was practiced by a whole group of poets, the most prominent among whom were Lapo Gianni, Dino Frescobaldi, Cino da Pistoia, and Guido Cavalcanti. Side by side with these were poets of the older "Provençalizing" school, such as Dante da Majano, Guittone d'Arezzo, Guido Orlandi, and others. Hence much poetical discussion and some sharp mutual criticism. Whether these poets belonged to the old or the new school, however, their subject was the same—namely, love. This was the theme which the poets of Provence had set, and it was not departed from essentially. Dante himself at first writes about nothing else. To the poets of Provence, however, love was essentially a social function—the service of noble and beautiful women for the sake of knightly perfection and renown. The Italian poets of the "sweet new style" began to identify the service of love with the service of all spiritual ideals, making of the particular woman served rather the incarnation of these ideals than a person to be humanly admired and sought. And this identification was carried by Dante to its utmost point, until in him we find the whole higher life, intellectual, moral, and imaginative, conceived in terms of love and the service of woman.

Early touched by this poetical theorizing, and thoroughly imbued with the doctrine that capacity to love is the one unmistakable mark of the gentle heart, Dante's imaginative preoccupation soon found an object, a center about which to gather itself. This object was the woman whose name is forever consecrated in the poet's works, Beatrice. About her, whoever she was, the whole spiritual life of Dante afterward revolved. To his early love for her his *Vita Nuova* is dedicated; to the history of his later regeneration through and by her his *Divine Comedy* is devoted. And yet, despite the fame she has thus attained, she remains for us remote, uncertain, dim. Putting aside the manifestly romantic account of Boccaccio, we know nothing about her except what the poet tells us; and to him she became more and more simply the incarnation of his own higher nature, so that his words about her are full of difficulties and seeming impossibilities. Indeed, there have been those who have denied that she was a real woman at all; and elaborate theories have been constructed to prove that she was only an ideal creature of Dante's own spirit.

If, however, we take what appears on the face of Dante's words, Beatrice was a Florentine maiden, nearly a year younger than himself, who, toward the end of his ninth year, first attracted his attention and stirred in him the impulse to love. From the time when he first saw her he admired and sought her; and finally, after nine years more, she bestowed upon him a greeting that made him firmly her own. Thenceforward his mind and imagination were absorbed in devotion to her, and he began to compose poems in her honor, which he communicated to other poets, drawing replies from them. For a time he concealed the identity of his real mistress by seeming to serve another lady (*la donna della difesa*); but at last, finding that this was causing comment, and having on one occasion been overcome by his emotions in a company where Beatrice was present, he told his secret to a friend, and soon it had become common property. Though knowing that his suit could yield him nothing but at the most a greeting and the pleasure of speaking and writing about the lady he loved, he yet continued to celebrate her, until on June 9, 1290, she died, leaving him in great pain and grief.

Dante distinctly says (*V. N.* xviii.) that "many persons had learned the secret of his heart." Yet it was reserved for Boccaccio, in his *Life of Dante*, to state who Beatrice was. According to him, she was the daughter of Folco Portinari, a highly esteemed Florentine citizen and a neighbor of Dante's parents. There has been preserved to us the will of this Folco Portinari, dated Jan. 15, 1288; and in it we find it stated that his daughter Beatrice was already at that time wife of a certain Simone dei Bardi. The tradition given by Boccaccio has been generally accepted by Dante's biographers from the fourteenth to the nineteenth century, and very recently an important confirma-

tion of it has been discovered. It is the statement of Dante's own son Pietro that his father's mistress really was Beatrice Portinari. (See Luigi Rocca. *Del Comm. di Pietro di Dante cont. nel Cod. Ashburn.* 841, published in the *Giorn. Stor. della Letter. Ital.* vii. 3.) Yet so strange and unreal is Dante's account of his love in the *Vita Nuova* that, as has already been said, there are those who altogether deny the identification of Boccaccio, and some who refuse to Beatrice real existence at all. As early as the fifteenth century Filelfo declared Beatrice to be only a creature of Dante's imagination; in the eighteenth century Biscioni undertook to prove her a personification of Wisdom (*Sapienza*). In the nineteenth, Gabriel Rossetti has believed her to represent the Holy Roman Empire; Perez, the Active Intelligence; Bartoli, woman in general. Others, the latest perhaps Scartazzini, have admitted her reality, but denied that she was Beatrice Portinari. These theories can not be discussed here, but it may be said briefly that a mere personification could hardly be born in a certain year, go into companies, talk over the poet mockingly with other ladies, live in a street in the middle of the city, and die June 9, 1290. And if Beatrice really lived, no argument that has been yet advanced seems sufficient to overthrow the tradition, beginning with Boccaccio and Pietro di Dante, that she was Beatrice Portinari.

While Beatrice lived she at once engaged Dante's heart and stirred his imagination. By reason of her he wrote various poems that gave him a place among the best poets of his time. When she died he meant still to serve her, and meditated songs in her honor. But there came perturbations in his life. He found it hard to keep true to Beatrice's memory. He swerved in his allegiance, exactly how we do not know, though we are sure of the fact, because in *Purgatorio* xxx.–xxxi. Beatrice sharply reproves him for his faithlessness, and he admits the justice of her words. Moreover, his lapse attracted the attention of his friends. Guido Cavalcanti in particular sent him a sonnet full of bitter blame (*I' vegno 'l giorno a te 'nfinite volte, e trovoti pensar troppo vilmente*, etc.). It is probable that Dante's faults at this time were both moral and intellectual. Boccaccio has left us the hint that the poet had not always control over his passions; and, although this statement has been again and again indignantly denied, it seems to be borne out by certain words of the poet himself (cf. *Purg.* xxiii. 115; xxvii. 46; xxxi. 58; and the sonnets to Forese Donati). But, besides moral aberrations there were also spiritual. This too we know on Dante's own authority. In the *Vita Nuova* itself he has told us how, some time after Beatrice's death, a certain piteous lady (*Donna Pietosa*) came to exercise over him an attraction so great as almost to drive Beatrice from his mind. And in the *Convivio* he tells us who this lady was. She was Philosophy, to whom he turned first for comfort, but whom he soon came to believe a better mistress than any woman could be. Indeed, his powerful imagination, taking a hint, perhaps, from the *De Consolatione Philosophiae* of Boethius (one of the books, as he tells us, from which his passion for philosophy arose), gave form and personality to this new mistress, and he could think of her in truly amorous terms. For several years he tried to live by the service of Philosophy, and there have been some to think that he inclined at this time to the doctrines of those skeptical and worldly thinkers, then somewhat numerous in Florence, whom he himself called Epicureans. This is, however, improbable. There is no evidence in any of Dante's works that he ever ceased to be thoroughly a Catholic Christian, ever doubted the immortality of the soul, or otherwise shared the unbeliefs of his time. What is more probable is that in a self-confident and headstrong way, with too little of humble faith, he strove to penetrate the mysteries of the universe and God. He tells us himself that he was guilty of the sin of pride (*Purg.* xiii. 136, *seq.*); and his contemporary Giovanni Villani says of him (*Cron.* ix. 136): "*Dante per lo suo savere fu alquanto presuntuoso e schifo e isdegnoso, e quasi a guisa di filosofo mal grazioso non sapea conversare co' laici.*" We are led, therefore, by the general drift of Dante's own words of confession to imagine him, after Beatrice's death, in a somewhat reckless and perturbed state of mind, seeking relief in eager studies, and joining with other young men (perhaps Guido Cavalcanti among them), who, though not unbelievers or Epicureans, had not preserved an attitude of humble faith. This was that "school" which Beatrice charged Dante with having followed (*Purg.* xxxiii. 85), adding that "his way had been as far distant from the divine way as is distant from earth the heaven that highest hastes."

Something feverish and uncontrolled, then, there was about these years of Dante's life. And one can not help feeling that this appears in other ways than those already mentioned. For instance, in spite of the great talents that from the start gave him influence and power, no man was ever really less fitted for political life than Dante. Passionate, proud, unwilling to yield or accommodate himself to others, he can have obtained only pain from mingling in public affairs. Yet this very time was when he was beginning to take part in the bitter struggles of Florence. Then, too, it is improbable that Boccaccio's story of Dante's marriage, as arranged by his relatives in order to distract his mind, though manifestly in many respects mere romancing, is totally devoid of foundation in fact. One can not help thinking that here too the poet showed the effects of a disturbed and uncontrolled mind. Fiercely studying, haughtily insisting on his own learning and superior wisdom, hastily mingling in public affairs, recklessly marrying, he appears to us as one going through a phase of experience probably inevitable and also profitable to him, yet such as later to cause him bitter regrets.

It was, however, only a phase. Dante's passionate spirit speedily ran through the alluring assuagements of grief and found them empty. And then his imagination began once more to turn to its old object. Beatrice was dead; but even so she was superior to any living interest, and the service of her was the service of all eternal and spiritual things. Gradually the thought of her became the all-absorbing thought, and the whole higher nature of the man found its ideal object in her. He conceived her as watching over him, even from heaven, and as finally effecting his conversion from error and sin. The story of this conversion is told in the *Divine Comedy*; and there the time of Beatrice's effective interposition in his life is put in the jubilee year 1300, the thirty-fifth year of his own age. In the *Vita Nuova*, however, which was certainly, in greater part at least, composed before 1300, Beatrice is made already to have resumed her sway; and, indeed, that work ends with the expressed hope of the poet "to say of her what was never said of any woman." It must be then that, during the last years of the thirteenth century, Dante was more and more clearly finding out the true meaning of the service of Beatrice; and that from 1300 he fully saw that this was the fulfilling of his own higher nature—the aspiration and the effort for wisdom, for righteousness, for the grace of God.

And this remained to the end Dante's conviction. No other great change came over his spirit. We do not know, of course, the exact history of his inner life during his long exile. We can imagine that he was a weary-souled and sorrowful man. As far as this world goes he probably longed most of all for the end—for peace. This is a favorite word of his, and the story of Fra Ilario * would confirm this view, if we could trust the letter bearing his name. Yet Dante had become a citizen of the eternal world, of the city of God, and in the light of that he viewed the happenings of our lesser sphere. A sad place this seemed to him, but fortunately temporary. At the very end of his life, it may be, he knew some relief from his prevailing melancholy. At the court of Guido Novello at Ravenna he had, at last, respect and quiet; and if we could be sure of the authenticity of the Latin eclogues that purport to have been exchanged between him and Giovanni del Virgilio, we could say positively that he became, before he died, calm, and even at times glad of heart. But there is great uncertainty here, and we can only leave him, as we see him last, a servant of Beatrice and, through her, of God.

III. Dante's Works.

1. The Vita Nuova.—This, the earliest of Dante's works, whose purpose has been already described, consists of a series of sonnets and canzoni, accompanied by a comment in prose. The poems were written before the comment, and the latter serves to bind them together into an account of

* The famous Latin letter purporting to have been written by Frater Hilarius, a monk of Corvo in the Lunigiana, to Uguccione della Faggiuola, was first printed by Mehus in his *Latinae Epistolae et Vita Ambrosii Traversari*, 1759. It is to be found, among other places, in Fraticelli, *Vita di Dante*, 1861, p. 357, *seq.* The story mentioned in the text is the following: *Ecce igitur, quod cum iste homo* [Dante] *ad partes ultramontanas ire intenderet, et per lunensem diœcesim transitum faceret, sive loci devotione, sive alia causa motus, ad loeum monasterii supradicti* [Corvo] *se transtulit. Quem ego eum viderem adhue et mihi et aliis fratribus meis ignotum, interrogavi quid peteret; et eum ipse verbum non redderet, sed loci tamen constructionem inspiceret, iterum interrogavi quid peteret. Tunc ille, circumspectis mecum fratribus, dixit—Paeem.*

the poet's early love. The completed whole, however, is rather imaginative than historic in character—*Dichtung und Wahrheit* in proportions hard to determine. The date of final composition is very uncertain—critics having varied in opinion from 1290 to 1314 (!). Dante's own statement (*Conv.* i. 1) is that he wrote the work *dinanzi all' entrata di mia gioventute*. If the word *gioventute* is here used rigidly, as the poet elsewhere uses it (cf. *Conv.* xxiv.), we should have the date 1290. But the book contains an allusion to the date June 9, 1291 (*V. N.* xxxv.), and to events subsequent to this. Guido Cavalcanti's sonnet, already cited, seems also to imply some delay in the fulfillment of Dante's purpose after Beatrice's death to collect his poems about her into a book. It is safest, therefore, to suppose that Dante, when beginning to recover from the distractions of his period of recent loss, and to return to the thought of Beatrice, carried out a plan earlier conceived, and produced the *Vita Nuova*. This would give us the approximate date 1294 or 1295. One thing is clear, i. e. that the *Vita Nuova* stands in essential connection with the *Convivio* and the *Divina Commedia*. It is, in short, the first member of what Witte has admirably called a *trilogy*.

2. The Convivio, or Convito.—One main purpose of this work (cf. *Conv.* ii. 13, 16; iii. 1) was to set right those persons who, misreading Dante's words about the *Donna Pietosa* in the *Vita Nuova*, had blamed him for changing his love. This piteous lady was no earthly creature, says Dante, but *Philosophy* (*per mia donna intendo sempre quella che nella precedente Canzone è ragionata, cioè la Filosofia, quella luce virtuosissima*, etc., *Conv.* iv. 1). Besides this object, however, Dante had another, namely, to present to ignorant and erring men a rich banquet (*Convivio*) of reason, by partaking of which they should be encouraged to noble virtues, and redeemed from the brutality of the common herd. In order to attain this end Dante thought to publish fourteen of his own canzoni—*sì di amore, come di virtù materiate*—accompanying them with an exposition in prose. For some reason he completed his comment on three poems only; and to the three *Trattati* thus obtained he prefixed a general introduction. The work is therefore only a fragment; but it is very precious to the student of the *Divine Comedy*, because it contains innumerable hints and explanations of Dante's conception of philosophy, of morals, and of art. The date of composition has to be fixed by conjecture from internal evidence; but it seems probable that the three canzoni expounded were written between 1295 and 1299, and that the comment was begun before 1300, but not completed as we have it until 1306–08. The work is essentially an expression of the period in Dante's life when he was giving special attention to philosophy; yet it seems, as one reads, as if, when the finishing touches were given, the exclusive cult of philosophy were only a reminiscence, and the fusion of philosophy with faith, both realized in Beatrice, were already complete. It can not be too much insisted upon that to the end Dante never rejected philosophy; he simply put it by the side of faith, as useless and misehievous without the light of that.

3. The Divina Commedia.—Already when he was writing the *Vita Nuova* Dante had begun to busy his imagination with a great poetical project in honor of Beatrice (cf. *V. N.* xliii.), and this project had probably taken on somewhat the form of the later *Divine Comedy* (*V. N.* xix.). That is, in order the better to show the true character of Beatrice's interposition in his own life, Dante had conceived of an imaginative account of the human soul in its universal and eternal life, as determined, however, by the character of its life on earth. In this wise he could both express his devotion and gratitude toward her, who had come to be the incarnation of his own higher self, and also make clear to his fellow-men the true character of their relation to the universe and God. In form the account should be a vision, similar to many visions that had been written both in the ancient and in the mediæval world (cf A. d'Ancona, *I Precursori di Dante*, Florence, 1874), but described with the immeasurably greater clearness and tangibility that Dante's genius made possible. Thus, by means of a similitude, the inner nature of things should be set forth. Such a scheme permitted not merely a literal description of the unseen world, but all kinds of adumbrations of all kinds of truth. Dante was thoroughly imbued with that theory of the fourfold meaning of all great literary works which the most ardent spirits of the Middle Ages held. He set it forth in his *Convivio* (ii. 1), declaring that what is written must be expounded (1) literally, (2) allegorically, (3) morally or ethically, (4) anagogically, or spiritually. And later, in his letter to Can Grande della Scala, he definitely applied it to his own great poem (*Ep. ad Can Grandem*, vii.). Writing with such a plan and purpose in his mind he naturally filled his work with mystical and difficult meanings. The mere use of numbers illustrates this. To Dante three, nine, and ten had a peculiar significance, and are made to appear everywhere in the structure of the spiritual world. The whole poem has 100 cantos—the *Hell* 33, with an introductory canto, the *Purgatory* and the *Paradise* each 33. And in all manner of other ways the same thing appears. So the student is everywhere met by possibilities of a meaning that does not show itself in the mere words.

It would be too long a task to give a complete account of the form and matter of the *Divine Comedy*. Suffice it to say that Dante represents himself as conducted, to the end that he may be saved from his own life of error and sin (cf. *Purg.* xxx. 136, *seq.*), through the Hell, to which are condemned those who on earth knew not Christ, or, knowing him, persistently refused to live according to his law; through the Purgatory, in which are purified those sinners whose sin was not mortal; and through the Paradise, in which the righteous have the fruition of their earthly endeavors, and enjoy to all eternity the light and the love of God. Through Hell and Purgatory human reason, moved by the grace of God as communicated through Beatrice, suffices as a guide; but human reason as summed up and incarnate in that poet of the ancient world whom Dante most loved and admired—Vergil (cf. D. Comparetti, *Virgilio nel medio evo*, 2 vols., Leghorn, 1872). But human reason does not suffice for Paradise; here faith and divine grace are necessary. And these are for Dante always and everywhere embodied in Beatrice. She guides him through the spheres where the just reside, until at last she delivers him over to that mediæval saint—Bernard—whose devotion to the Virgin had made him the most fit to display to the soul made perfect by the service of what is eternal in woman, the final absorption of the redeemed into the thought of God.

The structure and arrangement of Hell and Purgatory are determined by the scheme of human sins that rose in Dante's mind, as in that of his contemporaries, as needing punishment or purification. There are some apparent contradictions between the Inferno and the Purgatory, which have given rise to almost endless discussions. We can not go into these here. It is enough to say that down through the circles of concave Hell, and up over the ledges of the Mount of Purgation, Dante and his guide pass in review all forms of human misery and guilt. And it is real misery and guilt—that of men whom Dante and every Italian knew or knew about. The poet's inflexible spirit spares none who have deserved ill of God. In no work of the human imagination has the actual world been laid under such large contribution. When, however, we pass from Purgatory to Paradise we find ourselves no longer in a universe of time and space, but rather in the universe as it is the mind of God. That is what salvation is—participation in the life and thought of God. Time and space remain only as appearances. That poetic conception of the universe known as the Ptolemaic astronomy gave Dante the idea of rendering the eternal world, on one side and in one aspect, as formulated in a series of concentric spheres, nine in number, all contained with the highest heaven, the Empyrean. Of these spheres, seven were presided over and named from the seven planets: the eighth was the heaven of the fixed stars; the ninth that crystalline heaven, the *Primum Mobile*, which, by its eternal desire to unite itself with the Empyrean, acquires an inconceivably swift motion, communicating this to the crystalline heaven, and thence to all the heavens and to all things that have life and motion. And in these successive spheres, according as has been the nature and the degree of their merit, the spirits of the redeemed manifest themselves. But not eternally or exclusively so. As redeemed, they all live in the light of God's countenance; and as complete and immortal personalities they have their place in his thought. And this thought of God, in so far as it contains the redeemed, Dante conceived as best described in the form of a mystic rose, whose petals, row upon row, are the seats of the blessed, and whose yellow center is the flame of the love of God. And when Dante has seen this in his vision, and has faced the splendor of the Godhead itself, he begins to feel his own will and desires absorbed into the will of God—at last in harmony with the universe, and revolving, as that revolves, through

L'Amor che muove il sole e l'altre stelle.

The composition of the *Divine Comedy* probably occupied all the last years of Dante's life. If Boccaccio's story of the finding of the first seven cantos of the *Inferno* in Florence after the poet's exile be true, he must have begun to write it before that event took place. But undoubtedly what he wrote then was worked over again before it saw the light. There may be some truth also in Boccaccio's tale about the disappearance and curious rediscovery of the last cantos of the *Paradiso* after the poet's death. The numerous allusions to contemporary persons and events which the poem contains afford a considerable amount of light as to when the various portions of the work were in Dante's hands. But these same allusions are also somewhat confusing at times, and have given rise to great divergences of opinion. One thing is clear, i. e. that immediately after Dante's death his work was received with universal acclamation in Italy. It was not called *Divine* perhaps until early in the sixteenth century, but its pre-eminence over all other Italian poems was long before that fully established.

4. Il Canzoniere.—Besides the poems included in the *Vita Nuova* and the *Convivio*, a number of lyrical poems bearing Dante's name have survived. Some of these are undoubtedly spurious; of some it is hard to determine whether they are genuine or not. The question is made more difficult and also more important by the fact that among them are productions of a character greatly at variance with the larger works of Dante. Such are the coarse sonnets to Forese Donati, which have often been rejected by lovers of Dante, but which many of the best scholars now admit to be genuine.

5. The De Vulgari Eloquentia, or Eloquio.—This Latin treatise, though, like the *Convivio*, only a fragment, has peculiar interest both as containing Dante's maturest views on the subject of his native tongue, and as being the very earliest critical work we have upon the Romance languages. It arose from the eager discussion in the poet's time as to whether a serious writer could venture to use any language but Latin. Dante was naturally deeply interested in the question, because he had written or was to write his greatest works in the vulgar speech. He discussed it in the introduction to the *Convivio*, and there stated (*Conv.* i. 5) his intention of writing a book about it. Just how soon he partially carried this out is uncertain; Boccaccio says it was when he was already near the end of his life, but this is a loose statement. It is more probable that the treatise was undertaken in 1309 or 1310. The work contains some of Dante's noblest words (e. g. *Nos autem cui mundus est patria, velut piscibus æquor*, etc., cap. vi.), and delightfully indicates his final conviction—not that of his earlier years (cf. *V. N.* xxv.; *Conv.* i. 5)—that a man's native speech is, after all, the noblest and best (*Vulg. Eloq.* i. 1).

6. The De Monarchia.—When Dante felt his political convictions to be mature, and his judgment valuable through experience, he undertook to discuss in Latin, and after the most rigid dialectical method of his time, the nature and meaning of the great institution whose incompatibility with the pretensions of the Church gave rise to all the larger political troubles of the Middle Ages; i. e. the Roman empire. And in particular he undertook to answer in three books three questions concerning the empire (*De Mon.* i. 2): 1. *Whether it was necessary for the welfare of the world.* 2. *Whether the Roman people took to itself by right the office of monarchy or empire.* 3. *Whether the authority of monarchy comes from God directly, or only from some other minister or vicar of God.* Evidently the third of these questions was the critical one, considering the period in which Dante lived. His answer to it was that the authority of the empire came directly from God, and not from God through the Church. The two institutions were parallel, neither owing obedience to the other. And yet it behooved the political and temporal power to show respect and deference for the spiritual (*De Mon.* iii. 15). There is difficulty in determining the date of the treatise, some critics (among them Witte) believing that the absence of any mention of Dante's exile proves that it was written before 1302. Others, however, relying on the pronouncedly Ghibelline character of the opinions expressed, believe it to belong to a later time. Thus Scartazzini (*Dante-Handbuch*, p. 340, *seq.*) follows Boccaccio, and connects it with Henry VII.'s expedition into Italy. This seems in all respects the most probable view.

7. The Letters.—The most important of these letters have already been spoken of in connection with Dante's life. Mr. C. S. Latham's *Translation of Dante's Eleven Letters, with Explanatory Notes, etc.* (Boston, 1891), contains full information about them.

8. Doubtful or Spurious Works.—(1) Least doubtful among the works attributed without certainty to Dante are the two *Latin Eclogues* addressed to Giovanni del Virgilio (see above). They are mentioned by Boccaccio and Bruni, and were commented by an anonymous commentator of the fourteenth century. Still, strong objections have been made to them, from which they are not yet altogether redeemed (cf. the article by Paul Meyer, in *Romania*, 1882, p. 325, *seq.*). (2) Almost certainly spurious are the *Sette Salmi penitenziali* and the *Credo* (*trasportati alla volgar poesia da Dante Alighieri*). (3) Spurious also is the so-called *Quæstio de Aqua et Terra* (the full title is much longer). This treatise, which purports to give the substance of a public disputation held by Dante in Verona, Jan. 20, 1320, was first published in Venice in 1508, by a certain Joannes Benedictus Mancettus de Castilione Arretino, as he styles himself. It is not mentioned by a single early biographer or commentator, and there is no early manuscript of it. There is reason for believing Mancetti not to have been a very scrupulous person. Moreover, the work itself, which is devoted to the question whether the water, i. e. the sea, is anywhere, owing to its sphericity, higher than the land, is full of the most extraordinary anticipations of the science of the fifteenth century. Mancetti admitted that he had not given the text as he found it, because it was *plurimis locis adulterinum*, but *castigata, limata, elucubrata*. Who knows how far his corrections may have gone, even if he had an authentic manuscript to start with?

IV. Bibliography.

1. Bibliographical and General Works.—C. de Batines, *Bibliografia dantesca* (2 vols., Prato, 1846); J. Ferrazzi, *Manuale Dantesco* (5 vols., Bassano, 1865–77); W. C. Lane, *The Dante Collections in the Harvard College and the Boston Public Libraries* (Cambridge, 1890), far the most accurate and serviceable, so far as it extends, of the Dante bibliographies; G. A. Scartazzini, *Dante-Handbuch* (Leipzig, 1892); A. Bartoli, *Storia della letteratura italiana* (vols. iv., v., vi., Florence, 1881–89); A. Gaspary, *Geschichte der italienischen Literatur* (vol. i., Berlin, 1885); K. Witte, *Dante-Forschungen* (2 vols., 1869–79); E. Moore, *Textual Criticism of the Divina Commedia* (Cambridge, England, 1889).

2. Works on Dante's Life.—C. Balbo, *Vita di Dante* (2 vols., Turin, 1839); M. Missirini, *Vita di Dante* (4th ed. Milan, 1844); P. Fraticelli, *Vita di Dante* (Florence, 1861); Scherillo, *I primi studi di Dante* (Naples, 1888); I. Del Lungo, *Dell' esilio di Dante* (Florence, 1881); C. Troya, *Del Veltro allegorico di Dante* (Florence, 1826); C. Ricci, *L'ultimo rifugio di Dante Alighieri, etc.* (Milan, 1891). The older lives of Dante, by Boccaccio, Bruni, and Manetti, have been often published; and in Edward Moore, *Dante and his Early Biographers* (London, 1890), may be found a valuable discussion of their character and trustworthiness.

3. Works on Dante's Character and Spiritual History.—J. R. Lowell, *Essay on Dante*, in *Among my Books* (2d series, 1876); R. W. Church, *Dante: An Essay* (1879); Thomas Carlyle, *The Hero as Poet* (in *Heroes and Hero-Worship*); Maria F. Rossetti, *A Shadow of Dante* (1871); Fr. Hettinger, *Dante's Geistesgang* (Cologne, 1888); M. A. F. Ozanam, *Dante et la Philosophie catholique* (Louvain, 1847); F. Perez, *La Beatrice di Dante* (Palermo, 1866); A. d'Ancona, *Beatrice* (Pisa, 1889); G. R. Carpenter, *The Episode of the Donna Pietosa*, in Report of the American Dante Society (Cambridge, Mass., 1889).

4. Dante's Works.—(1) *Vita Nuova*: ed. by Giuliani (3d ed. 1883); d'Ancona (2d ed. 1884); Casini (1885); trans. into English by D. G. Rossetti (1861); T. Martin (1862); C. E. Norton (1867). (2) *Convivio*: ed. by Giuliani (1874–75); trans. very badly into English by Elizabeth P. Sayer (1887), better by Katharine Hillard (New York, 1889). (3) *Divina Commedia*: ed. by Witte (best ed. of text, Berlin, 1862); Scartazzini (large ed. with best general comment, 4 vols., Leipzig, 1874–90); Scartazzini (small ed. with best brief comment, Milan, 1893); Bianchi (1854, and often since); Fraticelli (1852, and often); Lubin (1881); Biase (3 vols., 1886–87); Cornoldi (1887–88); Casini (1889); cf. H. C. Barlow, *Critical, Historical, and Philosophical Contributions to the Study of the Divine Comedy* (London, 1864–65); trans. into English verse by Boyd (1802); Cary (1819); Cayley (1851–55); Dayman (1865); Longfellow (1867); Plumptre (1886–87), and many others; trans. into English prose by J. A. Car-

lyle (*Inferno*, 1849): A. J. Butler (1880–92); C. E. Norton (1892). (4) *Canzoniere*: ed. by Fraticelli (1856): Giuliani (1868); Serafini (1883); English trans. by Lyell (1835); Plumptre (with the *Div. Com.*, 1887). (5) *De Vulgari Eloquentia*: ed. by Giuliani (in his *Opere Latini di Dante Alighieri*, 2 vols., Florence, 1878–82); Eng. trans. by A. G. Ferrers-Howell (1890). (6) *De Monarchia*: ed. by Witte (1874); Giuliani (*op. cit.*); Eng. trans. by F. J. Church (in *Dante*, an essay, by R. W. Church, London, 1879). (7) *Epistolae*: ed. by Giuliani (*op. cit.*); Eng. trans. by C. S. Latham (Boston, 1891). (8) *Ecloghe*, *Salmi*, and *Credo*: ed. by Fraticelli (in *Il Canzoniere di Dante Alighieri*, Florence, 1856). (9) *Quæstio de Aqua et Terra*: ed. by Fraticelli (*Opere Minori di Dante*, 1834–40); Giuliani (*op. cit.*).

Fay, *Concordance of the Divine Comedy* (published by the Dante Society, Cambridge, Mass., 1888); L. Venturi, *Le similitudini dantesche ordinate, illustrate e confrontate* (Florence, 1874).

A. R. Marsh.

Danton, dăn′tōn′, George Jacques: a leader of the first French Revolution; b. at Arcis-sur-Aube, Oct. 28, 1759; of a respectable family in very moderate circumstances; received a good education, and entered on the practice of law in Paris. At the beginning of the revolution he was practicing law with success, happy in his domestic relations and fond of good reading. He was one of the founders and leaders of the club of Cordeliers, which was from the first the center of the extreme popular party in the French Revolution. In the autumn of 1790 he was chosen commander of the battalion of the national guard of his district, and in the beginning of 1791 elected administrator of the department of Paris. As a great revolutionary leader he first won prominence in 1792. In the early months of that year the breach between the Legislative Assembly and the king and queen daily increased. In April war was declared against Austria, and the agitation of the foreign war was thus added to the tumult and confusion of civil affairs. Paris finally broke out in the bloody insurrection of Aug. 10, 1792, which began the Reign of Terror. Danton is generally credited with having instigated this rising. Certain it is that on the day following it he was raised to the post of Minister of Justice. Here he was associated with Roland and others of the Girondists. The success of the enemy on the frontier threw Paris in a panic which presently became murderous. On Sept. 2 Danton delivered a powerful speech in the assembly, closing with the words, "What must we do to conquer and crush them? Dare, dare again, and forever dare!" (*Il nous faut de l'audace, encore de l'audace, et toujours de l'audace.*) The same evening the September massacre took place, when several hundred prisoners were butchered in the prisons. It is not clear that Danton did more than make the best of this terrible action.

He became a member of the Convention; took a foremost part in its deliberations; joined the Mountain, as the most extreme revolutionists were called, on account of the high and remote benches they occupied; voted for the death of the king Jan., 1793; was prominent in the establishment of the Revolutionary tribunal: was a member of the Committee of Public Safety; aided in the overthrow of the Girondists, but did not become a member of the new Committee of Public Safety, although he himself had proposed giving it dictatorial powers. The Terror policy was now thoroughly intrenched. Danton could not approve of the unnecessary excesses, but he was not able to prevent them. Seeming to fall into a sort of apathy, he either thought himself helpless or underrated the strength of his enemies. At last Billaud de Varennes induced Robespierre to move against Danton. On Mar. 30 Danton, Desmoulins, and others of his followers were suddenly arrested and taken before the Revolutionary tribunal, which proceeded to sentence him at once. His vehement bearing led the authorities to fear that he might excite the crowd in his favor. When questioned as to his name and residence he said, "My name is Danton, my dwelling will soon be in annihilation, but my name will live in the pantheon of history." He felt that he left everything in terrible confusion, and predicted that Robespierre would soon follow him to the guillotine, which prediction was verified three months after. Danton, with fourteen others, including Desmoulins, was guillotined Apr. 5, 1794. He exhibited to the last his usual intrepid demeanor. In person Danton was tall, muscular, of ardent temperament, and stentorian voice. "Nature," said he, "has given me the athletic form and harsh expression of liberty." He was a powerful speaker, and, after Mirabeau, probably the greatest orator in a period when great orators were so numerous. He was an able politician, though a vehement one, and personally courageous (in this a striking contrast to Robespierre). He probably understood more clearly than any other man the force and direction of the political currents of those turbulent times. Violent as his measures were, his policy was yet marked by steadfastness and practical judgment. "Nothing," says Lamartine, "was wanting to make Danton a great man except virtue."

C. H. Thurber.

Dant'zic (in Germ. *Danzig*): a fortified city and seaport of West Prussia; on the left bank of the Vistula; 3½ miles from its entrance into the Baltic Sea; lat. 54° 21′ N., lon. 18° 40′ E. (see map of German Empire, ref. 2–I) It is traversed by the rivers Motlau and Radaune, which here enter the Vistula, and is the terminus of a railway from Berlin, 250 miles to the W. S. W. The mouth of the Vistula is obstructed by sand-bars, which prevent the access of vessels drawing more than 9 feet of water. Dantzic is surrounded by walls, and defended by a citadel and outworks. It contains a fine cathedral, begun in 1343 and finished in 1503; numerous Lutheran and Roman Catholic churches, an exchange, a town-hall, two gymnasiums, two grammar schools, hospitals, schools of navigation, midwifery, and commerce, a school of arts and trade, an observatory, a public library, a museum, an arsenal, and a dock-yard. Excellent timber is exported from this place, and great quantities of wheat out of Poland. The granaries on the Speicher island, on which fire is prohibited, are capable of storing 2,000,000 to 3,000,000 bush. Much of this grain comes down the Vistula and Bug on rude floats. The manufactures include beer, spirits, tobacco, sugar, flour, ironware, machinery, and gold and silver ornaments. In 1889 1,379 vessels, of a total tonnage of 420,919 tons, entered the port, and 1,735 vessels, 507,398 tons, left it. The exports amount to $15,000,000 annually. Dantzic was founded in the tenth century or earlier. It was occupied by the Teutonic Knights from 1310 till 1454, when it became a free state under the protection of Poland. It also was for a long time one of the cities of the Hanseatic League. On the partition of Poland in 1793 it was annexed to Prussia. Dantzic has been twice besieged. The first and most famous siege was by the French in the winter and spring of 1807, in which the utmost skill of the French engineer and the science of the French artillerist were successfully illustrated. Marshal Lefebvre, the French commander, was created Duke of Dantzic. The second siege was more properly a blockade made by the allies (Prussians and Russians) in the winter and spring of 1813 after Napoleon's disastrous Russian campaign. Gen. Rapp, commanding the Tenth Corps, held the place, and brilliantly maintained himself until the cessation of hostilities (June 10) under the armistice concluded between Napoleon, Alexander, and the Prussian king. Pop. (1880) 108,549; (1900) 140,539.

Revised by C. H. Thurber.

Dan'ube (anc. *Ister* and *Danubius*; in Germ. *Donau*; Hun. *Duna*): the largest river of Europe next to the Volga. According to the usual view the Danube is supposed to be formed by the union at Donaueschingen of two streams, the Brigach and the Brege, which rise in the Black Forest of Baden, at a height of 2,250 feet above sea-level. It flows through Würtemberg and through Bavaria with a N. E. course. It then turns to the S. E. and crosses the boundary of Germany and Austria at Passau, where it is 230 yards wide. In Bavaria it receives five Alpine rivers, the Lech, Isar, Inn, Altmühl, and Regen. From Lintz to Presburg in Hungary it takes a generally E. course, receiving the Ens and the Morava. It then flows S. E. to its junction with the Raab, and E. to Waitzen, whence it flows S. through the great plain of Hungary, receiving on its course the Waag, the Gran, and the Drave. After meeting the latter it flows S. E., taking in the Theiss and the Temes, and at Belgrade, the Save, where it begins to form the boundary between Hungary and Servia. At Semlin, opposite Belgrade, it is 1,700 yards wide, but farther on it becomes much narrower and very turbulent, being only 129 yards wide at the passage of the Iron Gate below Orsova, where it leaves the dominions of Hungary.

A canal, cut through and around the obstructions at the Iron Gate, completed on Sept. 27, 1896, opened the upper Danube to vessels of considerable size. From Orsova the river flows S. E., N. E., and N. to Galatz, making a loop of

a curve, after which it receives the Pruth and flows E. to the Black Sea. The delta covers an area of 1,000 sq. miles and consists of innumerable lakes and channels. Shipping enters by the Sulina or middle mouth, from which 1,716 vessels of 1,619,703 tons cleared in 1894. Improvements at this mouth (1894–95) raised the depth over the bar to 23½ feet, and cuttings have been made and others nearly completed (1899) with the object of avoiding difficult bends. The total length of the river is about 1,770 miles, and it drains an area of over 300,000 sq. miles.

Danube, Regulation of the: placing the river under the protection of international law in accordance with the terms of the Peace of Paris (1856). Its navigation was made free to the ships of all nations, and a joint commission, composed of representatives from the seven signatory powers and known as the European Commission of the Danube, was appointed to prevent the violation of its neutrality and to promote works of improvement along its lower course. Successive treaties have continued this commission, guaranteeing the permanent neutrality of all improvements that it shall make, and granting it various sovereign powers over the river below Isakcha, such as the collection of taxes to pay for the expenses of the works undertaken. The riparian powers are represented in another commission, also permanent, whose primary object has been to remove obstructions in the Iron Gate, for which purpose they have the right to collect a tax from vessels navigating the river. The Austrian Government changed the course of the Danube opposite Vienna by confining its current to a straight, deep channel along a well-constructed quay. A large area of land was reclaimed for agricultural purposes, and a fine water-front secured. The work was begun in 1869, under a commission, completed in 1881, and cost not less than 32,000,000 gulden, equal to about $16,000,000.

Revised by F. M. Colby.

Danvers: railway junction; Essex co., Mass. (for location of county, see map of Massachusetts, ref. 1–I); 20 miles N. by E. from Boston. It has extensive manufactures of shoes, leather, and brick, lumber and coal wharves at Danvers Port, an iron-foundry, a State insane asylum, public library, and water-works. Danvers formed a part of Salem until 1756. Pop. of township (1880) 6,598; (1890) 7,454; (1900) 8,542.

Editor of "Mirror."

Danville: city and railway center; capital of Vermilion co., Ill. (for location of county, see map of Illinois, ref. 6–G); is situated on the Vermilion river. It has car-shops, numerous factories, several coal mines, three public parks, a free library, a high school, and graded schools. Pop. (1880) 7,733; (1890) 11,491; (1900) 16,354.

Editor of "News."

Danville: town (founded in 1824); capital of Hendricks co., Ind. (for location of county, see map of Indiana, ref. 6–D); on Clev., Cin., Chi. and St. L. R. R.; 19 miles W. of Indianapolis: has 5 churches, 5 graded schools, high school, the Central Normal School, planing-mill, sash-factory, and flouring-mill. Pop. (1880) 1,598; (1890) 1,569; (1900) 1,802.

Editor of "Republican."

Danville: town; capital of Boyle co., Ky. (for location of county, see map of Kentucky, ref. 3–H); on railway, 96 miles S. E. of Louisville. It is the seat of Centre College, the Danville Theological Seminary (North Presbyterian), Caldwell Female College (Presbyterian), Hogsett Academy, Morrison Female Seminary, and a State deaf and dumb institute. It has six churches, good public schools, and manufactures of carriages and dressed lumber. The surrounding region is a rich agricultural and stock-raising district. Pop. (1880) 3,074; (1890) 3,766; (1900) 4,285.

Editor of "Kentucky Advocate."

Danville: borough and railway center; capital of Montour co., Pa. (for location of county, see map of Pennsylvania, ref. 4–G); on the North Branch of the Susquehanna; 50 miles S. W. of Wilkesbarre, and 67 miles N. by E. from Harrisburg. It contains 7 blast furnaces, 6 rolling-mills, and numerous other manufactories. Good iron ore, limestone, and anthracite coal are found in the vicinity. Pop. (1880) 8,346; (1890) 7,998; (1900) 8,042.

Danville: town and railway center; Pittsylvania co., Va. (for location of county, see map of Virginia, ref. 7–F); on the falls of Dan river, 141 miles W. S. W. of Richmond. Its chief industry is the trade in and manufacture of tobacco. The sales of leaf tobacco in 1891 amounted to $40,000,000 lb. The town has 22 tobacco-factories, 104 leaf-handling establishments, 3 cotton-factories, and various other industries. It is the seat of two colleges for women and a military institute. The town of Danville includes Danville city and North Danville. Pop. of town (1880) 8,726; (1890) 14,104; (1900) 16,520.

Editor of "Register."

Daphnæ: See Egypt, Ancient, and Tahpanhes.

Daph'ne (in Gr. Δάφνη): in Greek mythology, a nymph beloved by Apollo. To escape from him she besought the aid of the earth, which opened to receive her, and she was transformed into a laurel-tree.

Daphne: a celebrated grove and sanctuary of Apollo, 5 miles S. W. of Antioch in Syria; frequented by heathen pilgrims and voluptuaries. Here was a temple of Apollo, surrounded by beautiful groves of laurel and cypress trees, gardens, and baths. This place was appropriated to the indulgence of licentious pleasures, and was the scene of an almost perpetual festival of vice.

Daphne [Gr. δάφνη, the laurel-tree]: a genus of dicotyledonous shrubs of the family *Thymelæaceæ*, including about eighty species, all natives of the temperate and sub-tropical portions of the eastern hemisphere. They have entire, often evergreen, leaves, apetalous, clustered flowers, a cylindrical four-lobed corolla-like calyx, bearing eight stamens, and including a sessile, one-celled, one-ovuled ovary, which becomes a one-seeded berry, reputed to be poisonous. Many species are grown in conservatories, and the more hardy sorts are planted in gardens for their beautiful flowers and foliage. *D. mezereum*, with deciduous leaves, and *D. cneorum*, with evergreen leaves, both from Europe, are hardy in most portions of the U. S. C. E. B.

Daphnia [from Gr. Δάφνη, a nymph]: a genus of fresh-water Entomostracans belonging to the order *Cladocera*, and characterized by having a bivalve shell, five pairs of feet, and long swimming antennæ. They form an important element in the diet of many fresh-water fishes. J. S. K.

Daph'nis (in Gr. Δάφνις): in Greek mythology, a beautiful youth of Sicily; the son of Mercury and a nymph of the country. He was reared amid groves of laurel (δάφνη), whence his name, and was taught by Pan to play on the pipe. He became a herdsman, and tended his herds on Mount Ætna, where he won the love of a naiad, who for his supposed unfaithfulness punished him with blindness. He prayed his father for relief, and Mercury transferred him to heaven. The invention of bucolic poetry was ascribed to him. The story of Daphnis forms the subject of the first idyl of Theocritus, and the name frequently occurs as a character in descriptions of pastoral life.

Da Ponte daa-pōn'tā, Lorenzo: poet; b. in Venice, Italy, Mar. 10, 1749. He became Latin secretary to the Emperor Joseph II. in Vienna, where he composed several operas. After he had resided for some years in London, he emigrated to New York in 1805. About 1828 he was appointed Professor of Italian in Columbia College. He wrote the libretto for Mozart's *Don Giovanni* and other works. D. in New York, Aug. 17, 1838.

Darbhan'ga: town of India; capital of district of the same name; on the Baghmati; 78 miles by rail N. E. of Patna. It has considerable trade in salt, timber, grain, oil seeds, indigo, etc. Pop. (1891) 73,561. The district is a very fertile alluvial plain. Manufactures of cloth, saltpeter, pottery, etc., are also carried on. Area, 3,335 sq. miles.

D'Arblay, Madame (originally *Frances Burney*): English novelist; b. at Lynn-Regis, June 13, 1752; a daughter of Charles Burney, the musician. Her father removed to London in 1760, and his house was frequented by Burke, Dr. Johnson, Garrick, and other *literati*, but in these assemblies "Fanny" was a silent and diffident spectator. Her first novel, *Evelina*, published anonymously in 1778, had a great success. In 1782 she produced *Cecilia*. She was second keeper of the robes to Queen Charlotte (1786–91), and wrote an interesting account of court experience in her *Diary and Letters* (7 vols., 1842–46). In 1793 she was married to Count d'Arblay, a French exile. In 1795 she published a tragedy, *Edwy and Elvina*, which was a failure, as was her last novel, *The Wanderer* (1814). Her third novel, *Camilla* (1796), was only a pecuniary success. She lived in France much of the time between 1802 and 1818. D. at Bath, Jan. 6, 1840.

Darboy, dăar'bwăă'. Georges: ecclesiastic; b. at Fayl-Billot, France, Jan. 16, 1813; became in 1839 teacher of philosophy and theology at the seminary of Langres; in 1859 Bishop of Nancy; and in 1863 Archbishop of Paris. At

the Vatican Council he was a decided opponent of papal infallibility, but he recognized it when it was promulgated. On Apr. 5, 1871, he was arrested by the Communists, and when the government troops took the city he was with five others shot at the prison of La Roquette May 24. Among his prominent works are *Les saintes femmes* (1850); *Les femmes de la Bible* (1849, 2 vols.; 5th ed. 1859); *La vie de St. Thomas à Becket* (2 vols., 2d ed. 1860). See his *Life* by J. A. Foulon, Paris, 1889.

Darby: borough; Delaware co., Pa. (for location of county, see map of Pennsylvania, ref. 6–J); situated on railway; 6 miles S. W. of Philadelphia. It has worsted-mills, and contains the residences of many Philadelphia business men. Pop. (1880) 1,779; (1890) 2,972; (1900) 3,429.

Darby, William: geographer and statistician; b. in Pennsylvania in 1775. He was an officer under Jackson, serving in Louisiana, and assisted in the survey of the boundary between the U. S. and Canada. He was the author of numerous works, among which are a *Geographical Description of Louisiana* (1816); *Geography and History of Florida* (1821); a *Geographical Dictionary*; and a number of gazetteers and other works. D. in Washington, D. C., Oct. 9, 1854.

Darbyites: See Plymouth Brethren.

D'Arc, Jeanne: See Joan of Arc.

Darcet, dăr'sā', Jean Pierre Joseph: chemist; b. in Paris, France, Aug. 31, 1777; the son of Jean Darcet (1727–1801), director of the porcelain manufactory at Sèvres, who discovered the combustibility of the diamond. He added several useful discoveries to practical chemistry, important improvements in the manufacture of powder and in the composition of bronze and steel, the production of soda from common salt, etc. D. in Paris, Aug. 2, 1844.

Dardanelle: town; one of the capitals of Yell co., Ark. (for location of county, see map of Arkansas, ref. 3–B); beautifully situated on the south bank of the Arkansas river, about 80 miles above Little Rock. It has machine-shops, cotton-gin, distillery, and planing-mill. Its cotton trade amounts to 15,000 bales annually. Pop. (1880) 748; (1890) 1,456; (1900) 1,602. Editor of "Post."

Dar'danelles (anc. *Hellespontus*), called also the **Strait of Gallip'oli**: a narrow channel connecting the Sea of Mármora with the Ægean Sea and separating the peninsula of Gallipoli from Asia Minor. Its length is about 45 miles and average width between 3 and 4 miles. As it is of great strategic importance, and is considered the key to Constantinople, it is defended by forts at Tchanak-Kalessi on the Asiatic side and at Kilid-Bahr on the European side, and by other forts at the entrance to the Ægean Sea. The first two are mounted with heavy Krupp guns. It was crossed by Xerxes in 480 B. C. by means of floating bridges, and again by Alexander the Great in 334 B. C. The Dardanelles are closed to foreign ships of war by a stipulation of 1878, but an agreement between Turkey and Russia in 1891 has permitted free passage to the volunteer fleet of Russia.

Da'res: a Trojan, companion of Æneas; distinguished for his skill in boxing. At the games in honor of Anchises in Sicily, Dares challenged all competitors, but was defeated and nearly slain by the aged Entellus.

Dares: a priest of Vulcan in Troy, to whom was ascribed an Iliad, written on palm-leaves, before that of Homer. Ælian states that he knew the work as existing in his own day (150 A. D.), but that work, whatever its character, must have been the production of some post-Homeric writer. There is still extant, under the name of Dares Phrygius, a narrative in prose of the destruction of Troy (*De Excidio Troiæ Historia*) in forty-four chapters. A letter prefixed, addressed to the historian Sallust, states that this narrative was translated from the Greek by Cornelius Nepos, who met with the original in Athens. The Latinity shows the production to be of a later age than that of Nepos, and probably as late as the fifth century. It was edited, along with *Dictys Cretensis*, by Madame Dacier, as one of the volumes of the Delphin classics (Paris, 1680); most recently by F. Meister (Leipzig, 1873). See also Dictys.

Revised by M. Warren.

Dar-es-Salaam: the capital of German East Africa, on the coast nearly opposite the southern point of Zanzibar. See German East Africa.

Dar Fertit, daar'fer-teet': the name given by the Arabs to a large area of Negro countries S. of Darfur, between 24° and 27° E. lon. and 6° and 10° N. lat. This region has been the prey of slave-hunters since 1820. One of the oldest domains in Central Africa of the Arab slave-trade, and naturally rich in ivory, rubber, and other resources, it is yet almost an uninhabited wilderness. All places on maps of this region having the prefix "Dem" indicate the zeribas or fortified stations of slave-traders. See Schweinfurth's *Heart of Africa*; Junker's *Travels in Africa* (Keane's translation, London, 1892); and Gessi's *Seven Years in the Sudan* (London, 1892). C. C. Adams.

Darfur, dăar-foor': a country of Central Africa; in the E. part of Sudan; mostly included between lat. 10° and 16° N. and lon. 26° and 29° E. The country is crossed by a range of mountains called Marra. It is fertile in the rainy season, with the exception of the northern part, which is sandy and arid. Grain, tobacco, dates, and watermelons are produced in abundance, and the inhabitants possess large numbers of cattle, camels, horses, and sheep. The people are Mohammedans, a mixture of Arabs and Negroes. Darfur carries on a trade with Egypt by means of caravans, and exports slaves, ivory, copper, hides, and ostrich-feathers. It is ruled by a sultan who has despotic power and resides at Tindelly. The chief commercial town is Kobbe. Darfur was reduced by Ziber Pasha in 1874, bringing it under the control of the Khedive of Egypt, but revolted in 1882. Since the Mahdi's revolt it has resumed its independence. Area, about 200,000 sq. miles. Pop. (estimated) 1,500,000. Darfur is included within the sphere of influence of Great Britain by agreements with Germany (1890) and Italy (1891).

Dar'ic [from Gr. δαρεικός = O. Pers. *darīka*, gold-piece; cf. Avestan *zairi*, golden: Skr. *hari*. The word has no connection with the name *Darius*]: an ancient Persian gold coin, having on the obverse an archer crowned and kneeling, and on the reverse a quadrata incusa or royal palla. In value it was equal to about seven U. S. gold dollars. Several of these coins are preserved in European collections. The daric is essentially the same coin as the Greek *chrysus* (χρυσοῦς) and *stater* (στατήρ) of gold, and also the Roman *aureus* (which, like χρυσοῦς, signifies golden), though the last-named coin appears to have varied more in weight than the Greek stater, averaging about 121 grains. The daric weighed two Attic drachmæ = 133 grains Troy, or in later times considerably less. It was used in Greece as well as in Asia.

Darien (probably from the old name of the Atrato river): the first colony of Europeans on the mainland of America after its discovery in 1499. In 1508 Diego de Nicuesa and Alonzo de Ojeda received grants from King Ferdinand of Spain to settle and govern what was then known as Tierra Firme, or the land on the southwestern side of the Caribbean Sea. Two governments were erected for them. The first, called Nueva Andalucia, was assigned to Ojeda, and corresponded with the present coast of Colombia, from the Gulf of Darien eastward to Cape de la Vela; the second, officially called Castilla del Oro, extended from the Gulf of Darien westward to Cape Gracias á Dios. As usual, only the coast limits were given, the inland extent being undetermined; and it should be remembered that the existence of an isthmus in this region was as yet unknown. At San Domingo, whither they had gone to engage men and vessels, Ojeda and Nicuesa quarreled about the respective limits of their domains; but by the intercession of Juan de la Cosa, Ojeda's pilot, it was agreed that the river Atrato should be the boundary. Martin Fernandez de Enciso, a lawyer of San Domingo, agreed with Ojeda to embark his fortune in the enterprise, and was named *alcalde mayor*. Ojeda sailed from San Domingo Nov. 10, 1509, with two ships, two brigantines, and 400 men, Enciso being left to follow later with re-enforcements. Landing with part of his force at the bay of Cartagena, he was attacked by Indians, his men, including La Cosa, were killed, and Ojeda was wounded, and concealed himself in the swamps for several days, when he was found by a party from the ships. Just then Nicuesa and his fleet touched at Cartagena on the way to Castilla del Oro, and, forgetful of his old quarrel, he aided Ojeda, landed a force which put the Indians to flight, and finally sailed away to his own government. Ojeda then went on to the Gulf of Darien, where, on the eastern side, near the entrance, he built the fort of San Sebastian, intended to be the basis for his capital city. He soon had so much trouble with the natives that he could hardly leave the fort, and the Spaniards died in great numbers from

famine and disease. They obtained some scanty supplies from one Talavera, a piratical cruiser who touched there; and at length Ojeda, who had been severely wounded by the Indians, sailed off on Talavera's ship to seek aid at San Domingo; shipwrecked at Cuba, he returned no more. Francisco Pizarro had been left in charge of the fort, with instructions to wait fifty days for Ojeda, after which he and the garrison were left free to do what they pleased. When the fifty days had passed they found that their number, though now reduced to only seventy men, could not crowd into the small vessels which had been left to them; and they deliberately waited until disease and starvation had reduced them to the capacity of the boats. Then, sailing to Cartagena Bay, their number still further reduced by a shipwreck, they met Enciso, who had at length come with his tardy re-enforcements. Enciso deposed Pizarro and resolved to return to San Sebastian. He found the fort and houses destroyed, and by advice of Balboa, who had come with him and knew these coasts, he crossed the Gulf of Darien, and about Aug., 1510, founded the colony of Santa Maria de la Antigua del Darien. This town prospered. Enciso, who was disliked, was deposed, and Balboa and Zamudio were chosen leaders. Meanwhile Nicuesa's expedition had come to grief, and he was left with a few men in a terrible condition near Nombre de Dios. Hearing of this, and remembering that they were now in the territory assigned to him, the colonists of Darien sent for him. But his overbearing conduct quickly provoked their enmity; he was forced to sail away in an old, leaky ship, and was never again heard of. Balboa remained the leading spirit at Darien until the arrival of Pedrarias in 1514; and from this point he made his celebrated journey across the isthmus, discovering the Pacific. In 1519 Panama was founded and became the capital, and the original town of Darien, being in an unhealthy locality, was abandoned. But at Panama the expeditions parted which eventually led to the conquest of Peru, Chili, Charcas, or Bolivia, and New Granada, and on the other side a large part of Central America. Thus Darien was the nucleus from which sprang all the great states of Spanish America, except the islands which were already colonized, Mexico, Venezuela, and the Rio de la Plata. See Helps, *Spanish Conquest in America*; Bancroft, *Central America*, vol. i.; Oviedo, *Historia general.* HERBERT H. SMITH.

Darien: port of entry and capital of McIntosh co., Ga. (for location of county, see map of Georgia, ref. 6–K); on the Altamaha river; 12 miles from the sea and 60 miles S. S. W. of Savannah. Pine lumber is exported from it. Pop. (1880) 1,543; (1890) 1,491; (1900) 1,739.
EDITOR OF "TIMBER GAZETTE."

Darien, or Urabá, Gulf of: an inlet of the Caribbean Sea in the coast of Colombia; at the extreme northwestern angle of South America, between the continent and the Isthmus of Panama. It is about 30 miles long, averaging 7 miles broad, and the central part is deep, but the shores are lined with shallows, and are in great part low, marshy, and unhealthy. There are two or three small villages on the shores, forming the only ports. The river Atrato enters the gulf by several mouths. HERBERT H. SMITH.

Darien, Isthmus of: as commonly used, the same as THE ISTHMUS OF PANAMA (*q. v.*); in a more restricted sense, that portion of the Isthmus of Panama which forms a narrow neck between the Gulfs of San Miguel and Darien. From the broken nature of the ground and the absence of a good port on the Caribbean side, this part is less favorable to transit than the portion between Panama and Aspinwall.
HERBERT H. SMITH.

Darien Scheme: one of the most disastrous projects in the history of American colonization. In 1695 the Scottish Parliament passed an act for a company trading in Africa and the Indies, which, under the advice of WILLIAM PATERSON (*q. v.*), founder of the Bank of England, determined to establish a colony on the Isthmus of Darien (now Panama) which should be an emporium for the world's commerce. The plan was taken up with national enthusiasm in Scotland, much as the Panama Canal scheme was welcomed in France. July 26, 1698, some 12,000 colonists sailed from Leith and reached Darien Nov. 4. Lack of provisions, sickness, and anarchy worked the ruin of the plan. Spite of successive re-enforcements the whole enterprise went to pieces, somewhat aided in dissolution by Spanish troops, and only a wretched handful of survivors ever returned to their native land. C. H. THURBER.

Darius (in Gr. Δαρεῖος; Old Egyptian, *Ntreioush*; Modern Persian, *Dara*, or *Darab*; Heb. *Daryavesh*; Old Persian (cuneiform), *Daryuhwsh*) **I.**, or **Darius Hystaspes**: King of Persia; son of Hystaspes, a member of the noble family of Achæmenidæ. He was called Gushtâsp in the legends of Persia. He was one of seven noble Persians who conspired against and killed the usurper Smerdis, whom he succeeded in 521 B. C. He married two daughters of Cyrus the Great, and organized the extensive empire which Cyrus and Cambyses had enlarged by conquest. Babylon revolted against him, but was after a long siege reduced to subjection in 516. Soon after this date he conducted a large army against the nomadic Scythians of Europe, whom he was not able to conquer or defeat. He sent a great army to conquer and chastise the Greeks, some of whom had offended him by aiding the Ionians in their revolt against Darius. His army was routed at the great battle of Marathon, 490 B. C. He was preparing to renew the invasion of Greece, when he died in 486 B. C., in the sixty-third year of his age, and was succeeded by his son Xerxes, who reigned from 486 or 485 to 465 B. C. There is little doubt that at first the name Darius was a title rather than a proper name.

Darius II., called **Darius Ochus**, or **Nothus**: King of Persia; a natural son of Artaxerxes Longimanus. He married Parysatis, his aunt, a daughter of Xerxes I. In 424 B. C. he deposed and succeeded the usurper Sogdianus, who had killed Xerxes II., the lawful heir. His reign was ignoble, and disturbed by the rebellions of several satraps. He had two sons of whom the younger, CYRUS (*q. v.*), is famous from the description of his life and character contained in Xenophon's *Anabasis*. His character was weak, and he was the slave of the eunuchs of his court. He died in 405 B. C., and was succeeded by his son Artaxerxes Mnemon.

Darius III., surnamed CODOMANNUS: the last king of the ancient Persian monarchy. A descendant of Darius II., he ascended the throne in 336 B. C., on the death of Arses. In the year 334 his empire was invaded by Alexander the Great of Macedon, who gained a victory at the river Granicus. Darius, commanding in person, was defeated at Issus in 333, and again at Gaugamela, near Arbela, in 331 B. C. He retreated toward Bactriana, pursued by the victorious army, which had nearly overtaken him when he was murdered by Bessus, one of his satraps, in the year 330. The wife and daughters of Darius were captured at the battle of Issus. Alexander married his daughter Statira.

Darjil'ing, or **Darjeel'ing**: a sanitary station of British India; in a district of the same name, belonging to the Rajashahi division of Bengal; at an elevation of over 7,300 feet above the level of the sea; on a narrow ridge rising from the river Runjeet; 308 miles N. of Calcutta. It has a sanatorium and a good water-supply, and is a favorite resort of the Anglo-Indians, especially in October after the cessation of the heavy summer rains. Pop. with cantonment (1891) 14,100.

Dark Ages: the period between the fall of the Roman empire and the revival of letters about the thirteenth century. As this revival occurred earlier in Italy than in Northern Europe, the Dark Ages may justly be said to have been of longer duration in the North than in the South. See MIDDLE AGES.

Dark Day: refers especially to May 19, 1780, which was very dark in Connecticut, New York, and New Jersey, causing great alarm. Similar days have occurred from time to time in other places when, as in the case above, the failure of light is not due to solar eclipses. The darkness is sometimes due to fog—as in London—sometimes to an unusual thickening of the clouds, or an abundance of smoke.
M. W. H.

Darke, WILLIAM: soldier; b. near Philadelphia, Pa., in 1736; removed with his parents to Virginia in 1740; served under Braddock at his defeat in 1755; and served throughout the Revolutionary war, in the latter part of which he held a colonel's commission. He became an influential citizen and a major-general of Virginia militia; served in Ohio and at St. Clair's defeat (Nov. 4, 1791), acting as lieutenant-colonel of the levies, and fighting with desperate valor against the Miamis. He was dangerously wounded, and his youngest son was killed. D. in Jefferson co., Va., Nov. 26, 1801.

Darkhan, dăar-*k*haan', **Mt.**: a high granite mountain range in Mongolia; in lat. 47° 36′ N., lon. 110° 10′ E.; is 140 miles S. E. of Urga. Here is a monument erected to the memory of Genghis Khan, to honor whom the Mongolians assemble here annually.

Darley, Felix Octavius Carr: artist; b. in Philadelphia, Pa., June 23, 1822; son of John Darley, an actor of English birth. Felix Darley devoted himself to art when a youth, and was employed by publishing-houses in Philadelphia; removed to New York in 1848; published outline illustrations of Judd's *Margaret* (1856); Irving's *Legend of Sleepy Hollow*; Hawthorne's *Scarlet Letter* (1879), and other works; illustrated the novels of Cooper, Simms, and Dickens, Lossing's *History of the United States*, and many other publications; member of Academy of Design 1852; an early member of the Society of Painters in Water-colors. Painted a number of pictures depicting scenes in American history; wrote and published *Sketches Abroad with Pen and Pencil* (New York, 1868). D. in Claymont, Del., Mar. 27, 1888.

Darling: a river of Australia; in New South Wales; formed by numerous branches which rise on the western declivity of the Australian Alps. They converge into a central basin of clay, where their channels unite and separate again into branches in a singular manner. Below the union of these branches the Darling flows southwestward through arid plains, and enters the Murray near lat. 34° S. The main stream is about 600 miles long.

Darling, Grace: b. at Bamborough, England, Nov. 24, 1815; a daughter of the keeper of the Longstone lighthouse, on one of the Farne islands. She rescued nine persons from the wreck of the steamer Forfarshire, Sept. 7, 1838. A public subscription of about £700 was raised for her. D. Oct. 20, 1842. See E. Hope, *Grace Darling* (1876).

Darling, Timothy Grenville, D. D.: Presbyterian minister and theologian; b. in Nassau, N. P., Bahamas, Oct. 5, 1842. He received his education at Williston Seminary, Mass., Williams College, and Princeton (1866–68) and Union Theological Seminaries, graduating at Williams in 1864, and at Union in 1869. He was assistant pastor of First Presbyterian church, Baltimore, 1870–73, and pastor of First Presbyterian church, Schenectady, 1873–87. He was acting Professor of Mental Science and Hebrew in Union College 1877; acting Professor of Moral Science 1885; lecturer on Christian Evidences 1886. He became Professor of Sacred Rhetoric and Pastoral Theology in Auburn Theological Seminary in 1887, and was transferred to the chair of Christian Theology in 1890. He has published articles and addresses.

Willis J. Beecher.

Darlington, or **Darnton**: parliamentary and municipal borough in the county of Durham, England; on the Skerne, near its junction with the Tees; 18 miles S. of Durham (see map of England, ref. 5–H). It has a fine church built in the twelfth century, with a tower 180 feet high. The town is well built, and is connected by railway with Stockton and other places. It has manufactures of locomotives, iron and steel, tanned leather, beer, and woolen goods, a grammar school, a high school for girls, a college for female teachers, and a free library. Pop. (1891) 38,060.

Darlington: city (founded in 1855); capital of Lafayette co., Wis. (for location of county, see map of Wisconsin, ref. 7–C); on Mineral Point division of Ch., Mil. and St. P. R. R., and on Pecatonica river; 50 miles S. W. of Madison; has churches of five denominations, high schools, and graded school, large flour-mill, feed-mill, and water-works. It is surrounded by a rich farming country, and is a shipping-point for live stock, grain, butter, cheese, and poultry. Pearls were discovered in the river in 1889, and have been a large source of revenue; there is here a mineral spring noted for its medicinal qualities. Pop. (1880) 1,372; (1890) 1,589; (1900) 1,808.

Editor of "Journal."

Darlington, William, M. D., LL. D.: botanist; b. in Birmingham, Pa., Apr. 28, 1782; practiced medicine at West Chester. He published a valuable work on the plants of Chester County, entitled *Flora Cestrica* (1837); *Agricultural Botany* (1847); *Memorials of John Bartram and Humphry Marshall* (1849), and several other works. He organized societies for the study of natural history and botany in West Chester. The *Darlingtonia californica*, a pitcher-plant of the Pacific States, was named in his honor. D. in West Chester, Pa., Apr. 23, 1863.

Darlington Court-house: town and railway junction; capital of Darlington co., S. C. (for location of county, see map of South Carolina, ref. 5–F); 75 miles E. N. E. of Columbia and 30 miles S. of Cheraw. The town has 7 churches (4 white), 2 schools, and excellent public buildings; it is an important cotton-trading center, shipping annually 20,000 bales; and has a cotton-factory with a capital of $225,000. Pop. (1880) 940; (1890) 2,389; (1900) 3,028.

Editor of "News."

Darlingto'nia [named in honor of Dr. William Darlington]: a genus of herbs of the family *Sarraceniaceæ*, comprising but one known species, the *Darlingtonia californica*, a perennial plant of California. Its leaves are all radical, and resemble somewhat closely those of the Sarracenias (pitcher-plants) of the Atlantic States, but the size of the leaves of the *Darlingtonia* is much the larger, the length in some instances exceeding 2 feet. The leaves are hollow and twisted, the upper part being turned over into a hood-like dome or vault, beneath which is the orifice which opens into the cavity or pitcher of the leaf. On either side of the opening two lobes depend, which may be taken to represent the true leaf, in which case the ascidium or pitcher must be considered as representing the petiole or leaf-stalk. Inside the pitcher the remains of insects are often found, their exit being impeded by long slender hairs within the leaf. The flower-stalk is sometimes 4 feet high, single, and furnished with bracts; the flower regular, nodding, and single, and about 2 inches across; the calyx straw-colored, of five sepals, all pointed; the five petals are pale purple, the stamens twelve to fifteen, nearly hidden by the top-shaped ovary, upon which there is a style with a five-parted stigma. The capsule is five-celled, many-seeded, and an inch long. This plant is the representative of the Sarracenias of the Atlantic States, and with them and the *Heliamphora* of South America constitutes the whole family as far as it is known at present.

Darmesteter, Arsène: French scholar; b. of Jewish parents, Jan. 5, 1846. He was destined by his father to be a rabbi, and received the education customary in such cases. His father, however—a very intelligent man—wished his son to have more than the customary training; to be a doctor of letters, as well as a rabbi. The son, meantime, inclined more and more to the studies this plan implied. Already scientific impulses had been awakened in him. In the Jewish school he had been struck with certain Old French glosses upon Hebrew words, occurring in the commentaries of Raschi, an eleventh-century Talmudist. These *laaz*, as they are called, written in Hebrew characters, had never been deciphered or explained in scientific fashion. Before he had done with them, Arsène Darmesteter had proved them to be our most precious evidence as to the exact form of the French tongue in the eleventh century. In 1867 he became a pupil of Gaston Paris in Old French, and from that time his name is indissolubly connected with the history of Romance philology. With rare sagacity, with creative imagination, with deep enthusiasm, he gave himself up to the study of the real life and history of the French tongue and of French literature. No one in our time has done more to throw light upon both. We can not here follow his researches; we can only give the list of his contributions to science. Suffice it to say that everything he produced abounds in original and profound suggestions, such as only a creative mind is capable of. In 1871 he was associated with M. Hatzfeld in making a new dictionary of the French language, and he labored upon the task for the rest of his life. A series of articles in the *Romania* showed his constant interest in the problems which had early engaged his attention. In 1877 he obtained the Doctor's degree on a highly original thesis touching the history of French epic (Floovent). The same year he published *De la création actuelle de mots nouveaux dans la langue française*, etc. In 1878 he published with M. Hatzfeld a *View of French Literature in the Sixteenth Century*, so excellent as to be now authoritative. In 1886 appeared his little treatise *La vie des mots étudiés dans leur signification*. In 1887 the dictionary was far enough advanced to permit the preparation of its preface. All this time he had been busily engaged in teaching, first in the École des Hautes Études, then in the Sorbonne, and finally in the École normale supérieure des filles at Sèvres. In 1888 he was attacked by an inherited disease, and d. Nov. 7, 1888. See *Reliques scientifiques d'Arsène Darmesteter, recueillies par son frère*, with a charming *Life* of him (Paris, 1890). A. R. Marsh.

Darmesteter, James: Orientalist; b. in Meurthe, France, Mar. 28, 1849; educated in Paris at the Lycée Bonaparte; began Oriental studies, 1872; became secretary of the Société Asiatique de Paris, 1881; and Professor of Iranian Languages and Literature at the College of France, 1885. In 1886 he went to India on a philological mission, and was

made a fellow of Bombay University, 1887. He was the author of *Haurvatât et Ameretât, Essai sur la Mythologie de l'Avesta* (1875); *Ormazd et Ahriman, leurs Origines et leur Histoire* (1877); *The Zend Avesta* (translated 1883); *Études iraniennes* (1883); *Essais orientaux* (1883); *Chants Populaires des Afghans* (1888–90); *Les Prophètes d'Israël* (1892); and various reports to the Société Asiatique de Paris from 1881. D. at Maisons-Lafitte, near Paris, Oct. 19, 1894.

Madame Darmesteter, his wife (*A. Mary F. Robinson*), was born Feb. 27, 1857, at Leamington, England; educated at University College, devoting herself especially to the study of Greek. She is the author of *A Handful of Honeysuckles* (1878); *The Crowned Hippolytus, a Translation of Euripides* (1880); *The New Arcadia and other Poems* (1884); *An Italian Garden* (1886). C. H. T.

Darm'stadt: a town of Germany; capital of the grand duchy of Hesse-Darmstadt; on the river Darm, and on the Frankfort and Mannheim Railway; 15 miles S. of Frankfort-on-the-Main (see map of German Empire, ref. 6–D). It is at the northwestern extremity of the Odenwald. It consists of an old and a new town, both surrounded by walls. The former is ill-built, but the new town has wide and handsome streets. It has five public squares and two ducal palaces, one of which contains a library of 500,000 volumes and a valuable collection of 700 paintings; the other contains Holbein's *Meyer Madonna*. There are manufactures of machinery, chemicals, tobacco, hats, playing-cards, carpets, and beer. Pop. (1885) 43,149; (1895) 63,745.

Darnel: a grass of the genus *Lolium*, well known in Europe, and naturalized in the U. S. The common darnel, *L. perenne*, a pretty good pasture-grass, is found in the Eastern U. S. The seeds of bearded darnel, *L. temulentum*, are reputed poisonous, but recent researches are said to have established their harmlessness. It is often infested by ergot.

Darnell, Henry Faulkner: See the Appendix.

Darnetal, dăr'ne-taal': a town of France; department of Seine-Inférieure; on the Aubette, 2½ miles E. of Rouen (see map of France, ref. 2–E). It has two Gothic churches, and manufactures of flannels and other woolen goods. Pop. (1896) 6,743.

Darnley, Henry Stuart, Lord: b. in England in 1541; a son of the Scottish Earl of Lennox. His mother was a niece of Henry VIII. of England. He had a handsome person, but was profligate and deficient in intellect. In 1565 he married Mary Queen of Scots, whom he soon offended by his insolence and other faults. He also procured the assassination of Rizzio, which aroused her deepest indignation. The isolated house in which he lodged was blown up with gunpowder at the instance, it was suspected, of his wife, and he was killed Feb. 10, 1567. See Mary Stuart.

Darnton: See Darlington.

Dart: a missile weapon, usually 4 to 6 feet long, differing in no essential feature from a javelin; consisting of a pointed head, usually of metal, and a wooden handle, sometimes winged with feathers or their equivalent. It was much used by the ancients, principally by the foot troops, was thrown by hand, and was sometimes provided with a strap which was attached to the wrist of the thrower, and by which it was recovered after being thrown.

James Mercur.

Darter: an aquatic bird related to the cormorants; belonging to the order *Steganopodes* and genus *Plotus*. The darters are lightly built, with a long, slender neck, straight-pointed bill, and long tail. They build a bulky nest in trees or bushes. Unlike the cormorants, the darters are more common in fresh than salt water. There are but three or four species, found in tropical or warm regions. They live upon fish, which they capture by diving, and there is a peculiar arrangement of the neck enabling the head to be extended suddenly, giving to the bill the effect of a spear-thrust. The darters, like the grebes, possess the power of sinking in the water, so that the head and neck are alone visible. The American species is found in North and South America, and occurs along the Gulf coast of the U. S., being common in parts of Florida, where it is commonly known as snake-bird, and occasionally as water-turkey. F. A. Lucas.

Darter: a small fish of the genus *Etheostoma*; abounding in the waters of Eastern North America. The darters belong to the perch family, and are reduced and intensified perches, brilliantly colored, and from 2 to 8 inches in length. They lie on the bottom of swift clear streams, among rocks, quiescent for considerable time, suddenly darting forward on their prey by a sudden movement of the large pectoral fins. About sixty species are known, some of them the most beautiful of all fresh-water fishes. David S. Jordan.

Dartford (Saxon, *Darentford*): a town of England; in Kent; on the river Darent, and on the London and Gravesend Railway; 14 miles by rail E. S. E. of London Bridge (see map of England, ref. 12–J). It lies in a narrow valley between two steep hills. It has cotton and silk printing-works, large powder-mills, manufactures of machinery, iron, paper, and leather, and an important pharmaceutical laboratory. Edward III. held a tournament at Dartford in 1331, and Wat Tyler's insurrection broke out here in 1381. Paper was first manufactured in England here in 1588. Pop. (1891) 11,962.

Dartmoor: a granitic plateau of Devonshire, England, occupying an area of 130,000 acres. It rises in the southern part of the county, and has a mean elevation of 1,200 feet. Hey Tor, one of the granitic crests in the south, is 1,500 feet high, and Yes Tor, in the north, reaches 2,050 feet. Dartmoor is principally moorland covered with heather, and the central part has been a royal forest since a period prior to the Norman conquest. It affords pasturage to numerous cattle, sheep, and ponies. Many rivers rise on Dartmoor. The Dart, the Teign, the Plym, and the Tarry flow S., and the Taw and the Torridge empty in Bideford Bay. Dartmoor is prolific in minerals, the most important being kaolin obtained from the felspar of the granite. At Lee Moor are the largest kaolin-works in England. Dartmoor is full of antiquities. There are numerous barrows, cromlechs, cyclopean bridges, etc., as well as the remains of a prehistoric village at Grimspound. The forest of Dartmoor was granted by Henry III. to his brother Richard, Earl of Cornwall, and since 1337 a part of Dartmoor has belonged to the duchy, though not to the county of Cornwall. Dartmoor is well known as the seat of a convict prison, that was originally built in 1806 for the reception of prisoners of war.

Dartmouth, daart'mŭth: a seaport-town of Devonshire, England; 32 miles S. by W. from Exeter; picturesquely situated on the terraced side of the right bank of the estuary of the Dart, near the ocean (see map of England, ref. 15–E). It has many old houses and an ancient castle. The entrance to the river is defended by a battery. Dartmouth is a quarantine port, and carries on a considerable trade with Newfoundland and the Mediterranean. It is the point of departure for the Castle line of mail-steamers to South Africa. Here Richard Lion-heart assembled the crusading fleet in the spring of 1190. Dartmouth was incorporated by charter of Edward III. in 1342; was attacked by the French in 1404; was taken by Prince Maurice in 1643; and recaptured in Jan., 1645–46, by Fairfax. Pop. (1891) 6,038.

Dartmouth College: the fourth of the New England colleges in chronological order—preceded only by Harvard, Yale, and Brown—and an offshoot of Moore's charity school, an institution for the education of Indian youth, established in Lebanon, Conn., in the year 1754, by the Rev. Eleazar Wheelock, D. D. The school was subsequently removed to Hanover, N. H., a charter for a college, to be connected with it, and yet a distinct institution, having been obtained. This charter was issued Dec. 13, 1769, by John Wentworth, the last of the royal governors of New Hampshire. Dr. Wheelock was its first president, and in view of the interest taken in the school by Lord Dartmouth, an English nobleman, and of his benefactions to it, his name was given to the college. One of the most signal events in the history of the institution is the controversy out of which arose the famous Dartmouth College case. The Legislature of New Hampshire passed an act in 1816, changing the name of the institution to "Dartmouth University," enlarging its board of trustees, and assuming the control of its affairs. To this act the trustees were opposed, and with the design of testing its constitutionality they brought an action before the Supreme Court of the State. By this tribunal the Legislature was sustained, and appeal was taken to the Supreme Court of the U. S., John Marshall being then chief justice. The cause of the college was there argued by Daniel Webster and other able counsel, and fully sustained by the court. The university organization was dissolved, and the old college board of trustees sustained. This great battle was fought by them not for themselves only; the principles concerned were vital to many other institutions. Dartmouth, in comparative poverty, was thus instrumental in vindicating and establishing the sacredness of private trusts.

The college has had nine presidents: Eleazar Wheelock, D. D., inaugurated in 1769; John Wheelock, LL. D., in 1779; Francis Brown, D. D., in 1815; Daniel Dana, D. D., in 1820; Bennet Tyler, D. D., in 1822; Nathan Lord, D. D., in 1828; Asa D. Smith, D. D., LL. D., in 1863; Samuel C. Bartlett, D. D., LL. D., in 1877; William Jewett Tucker, D. D., in 1893. Perhaps the two professions that have drawn most largely upon the institution have been those of teaching and the law. A single class might be named one-fourth of whose members have been either college presidents or professors; and it has been stated that at one time there were residing in Boston, Mass., no less than seven noted sons of the college, including Daniel Webster and Rufus Choate.

While the institution has aimed from the beginning at a high religious tone, it is not sectarian. Most of the trustees and teachers are of the orthodox Congregational connection. As to methods of teaching, while the college has always been conservative, it welcomes all real improvements. It holds to a carefully devised curriculum, but has many electives and options arranged in consecutive courses of study. It retains and honors the ancient classics, but it favors science and the modern languages also. More or less closely connected with Dartmouth College are several associated institutions founded at a later date, and in whole or in part under the same board of trustees—viz., the New Hampshire Medical College, established in 1798; the Chandler Scientific School, in 1851; the Thayer Engineering School, in 1871; the New Hampshire College of Agriculture and the Mechanic Arts, in 1866. The entire number of students in the college and associated institutions, in 1899-1900 was 741, and the entire number of instructors in the same was sixty-one. The library of Dartmouth College contains 85,000 volumes.

Daru, dȧ'rü', Pierre Antoine Noël Bruno, Count: statesman and author; b. at Montpellier, France, Jan. 12, 1767. In the Reign of Terror he was confined in prison, where he translated the odes and epistles of Horace in verse. He became a member of the Tribunate in 1802, a councilor of state in 1805, intendant-general of the imperial household, and commissioner for the execution of the treaties of Tilsit and Vienna. In the campaigns against Prussia and Austria (1806–09) he accompanied Napoleon, whom he served with ability as a diplomatist and financier. He became chief Minister of State in 1811, and opposed the Russian expedition; but when it was undertaken he put forth extraordinary efforts to meet its exigencies. He held office under the restored Bourbon monarchy; but having lost credit with the Government for espousing Napoleon's cause in the Hundred Days, he retired to private life till in 1819 he was called to the Chamber of Peers. In 1815 he was elected president of the French Academy. Among his works are a *History of Venice* (1819) and a translation of Horace. D. at his residence near Meulan, Sept. 5, 1829. See Lamartine, *Éloge du Comte Daru*.

D'Arusmont, dȧ'rüs'mōn', Madame Frances (maiden name, *Fanny Wright*): philanthropist and reformer; b. in Dundee, Scotland, Sept. 6, 1795. Her father was an intimate friend of Adam Smith, Dr. Cullen, and other distinguished men. In her youth she published a defense of the doctrines of Epicurus, entitled *A Few Days in Athens*; was in the U. S. 1818–21; visited France; returned in 1825, and purchased land where Memphis, Tenn., now stands for her famous experiment for the instruction and enlightenment of the colored race. After a number of years of expensive and unsuccessful effort, her people were freed and sent to Haiti. She lectured in many parts of the Union on social, religious, and political questions; she visited France, and in 1838 married M. d'Arusmont. The union was unfortunate, and with her daughter she returned to the U. S. D. in Cincinnati, O., Dec. 14, 1852. Author of *Views on Society and Manners in America*; *Altorf* (1819); *Lectures on Free Inquiry* (1836). See *Lives* by J. Windt (1844) and by A. Gilbert (1855).

Darwin, Charles Robert, F. R. S.: naturalist; a son of Dr. R. W. Darwin, F. R. S., and grandson of Dr. Erasmus Darwin; b. at Shrewsbury, in England, Feb. 12, 1809. He was educated in the grammar school of his native town, at the University of Edinburgh, and at Christ's College, Cambridge, where he took his degree of M. A. in 1831. The same year he sailed with Capt. Fitzroy, of H. M. ship Beagle, as volunteer naturalist in the survey of the coast of South America, etc. His observations, made during this voyage, on the peculiarities shown by the birds of the Galapagos islands may perhaps be deemed the starting-point of the train of thought which culminated in the *Origin of Species*. After his return in 1836 from this voyage, in which he sailed round the globe, Mr. Darwin published a *Journal of Researches into the Geology and Natural History*, etc. (1839; 2d ed. 1854; New York ed. 1846), which has been pronounced the "most entertaining book of genuine travels ever written." In 1839 he married his cousin, Emma Wedgwood, granddaughter of Josiah Wedgwood. Mr. Darwin published (1840–42) the *Zoölogy of the Voyage of the Beagle*; a treatise on *Coral Reefs* (1842); on *Volcanic Islands* (1844); and *Geological Observations* (1846). *A Monograph of the Cirripedia* (1851–53) would have given him a lasting reputation as a philosophic observer had he never written anything else. In 1859 he published his *Origin of Species by Means of Natural Selection*, a work which has gone through many editions at home and abroad, has attracted much attention, and given rise to warm controversy in all civilized countries. It is universally conceded that this treatise displays profound knowledge of the facts of natural science and great powers of generalization. His style is clear and even elegant, his temper is moderate and always courteous, and his statements of fact always accurate. He published a work on the *Fertilization of Orchids* (1862); the *Habits and Movements of Climbing Plants* (1865); *The Variation of Animals and Plants under Domestication* (1868); the *Descent of Man* (1871), which attracted scarcely less attention than the treatise on the *Origin of Species*, and is indeed a continuation of that work. He also published *The Expression of the Emotions in Man and Animals* (1872); *The Effects of Cross and Self Fertilization in the Animal Kingdom* (1876); and *The Formation of Vegetable Mould through the Action of Worms* (1881). Mr. Darwin was a member of many learned societies, and the recipient of numerous medals and other distinctions. He was perhaps equally eminent in geology, zoölogy, and botany. D. Apr. 19, 1882, and was buried in Westminster Abbey. See his *Life and Letters*, by his son Francis Darwin (1887). See Darwinism and Evolution. Revised by David S. Jordan.

Darwin, Erasmus: poet and man of science; grandfather of Charles Darwin: b. near Newark, England, Dec. 12, 1731. He studied at Cambridge, and practiced medicine at Lichfield, from which he removed in 1781 to Derby. He gained distinction as a physiologist, and also as a poet. His *Botanic Garden* (1791), formerly very popular, is a poetical treatise on botany, full of extravagant imagery. Among his works are *Zoönomia, or the Laws of Organic Life* (1793); *Phytologia* (1800); and the *Temple of Nature* (1803). Many of his ideas on physiology contained the germs of important truths. D. near Derby, Apr. 18, 1802.

Darwin, Francis, M. A., F. R. S.: son of Charles Robert Darwin; b. at Down, in Kent, Aug. 16, 1848; educated at Trinity College, Cambridge, and at St. George's Hospital, London; university lecturer in Botany 1884; university reader in Botany 1888; fellow Christ's College 1888; joint author with his father, whose assistant he was 1874–82, of *The Power of Movement in Plants* (1880); author of *Papers on Physiological Botany*; editor of *Life and Letters of Charles Darwin* (1887). C. H. Thurber.

Darwin, George Howard, M. A., F. R. S., LL. D.: scientist; son of Charles Robert Darwin; b. 1845; educated at Trinity College, where he graduated, 1868, as second wrangler; fellow of Trinity College 1868; studied law, but never practiced; contributed to the *Transactions of the Royal Society* a paper *On the Influence of Geological Changes on the Earth's Axis of Rotation* (1876); *On the Remote History of the Earth* (1878); since occupied with physical, mathematical, and astronomical study, with investigations on the pressure of loose sands, on changes in level of the earth's surface and minute earthquakes; assisted Sir William Thompson, 1882, in preparation of new edition of *Thompson and Tait's Natural Philosophy*; elected to the Plumian professorship of Astronomy and Experimental Philosophy at Cambridge, Jan., 1883; member of the council of the meteorological office 1885; frequent contributor to *Nature* and other scientific periodicals.

Darwinism: a term frequently used as synonymous with evolution, but properly more restricted in its meaning. Evolution is the broader term, and implies development by descent wherever it may occur—that law of nature whereby the simple is constantly tending toward the complex, the undifferentiated toward differentiation. The formation of

the solar system from the primordial nebulous matter and the differentiation of the modern Romance languages from the parent Latin are instances of evolution. Darwinism, on the other hand, forms one portion or one aspect of organic evolution. Organic evolution teaches that all living forms have descended by variation from a smaller number of more primitive original forms, while Darwinism is an attempt to explain one part of that process. For a more extended view of Darwinism the reader must refer to the article Evolution, but here it may be briefly summarized as follows: According to Darwin the existence of variation is admitted without much reference to its causes. His great principle is what he has called "natural selection," and what Herbert Spencer has aptly termed the "survival of the fittest." In originating new varieties of plants or new breeds of animals the farmer exercises an *artificial selection*. He takes those individuals which present variations in some desired line, and uses these for reproduction; with the next generation a similar selection is made, and so on until the result is far different from the parent stock. Darwin maintains that a somewhat similar, though not intelligent, selection occurs in nature, those individuals which present some variation which better fits them to their surroundings being more apt to survive than their less favored relatives. That this selection must occur is obvious. The rate of reproduction of any organism is so rapid that were it not checked it would soon completely fill the earth. There is consequently what may be metaphorically called a struggle for existence, not only between individuals of the same species, but between different species as well, and in this struggle it is evident that the fittest must, as a rule, survive. Thus nature exercises a selection and, like the breeder, originates new varieties. The same process carried further produces wider divergences from the parent stock until at last new species and higher groups are differentiated. It must be understood that the initial variations proceed in all directions. One plant may have the advantage through the development of spines; another through the existence of poisonous juices; a third through an inconspicuous habit. So it would follow that these forms must continue their evolution in different directions.

Thus with Darwin (and this is Darwinism) the great idea was that the factors in the origin of species are: animals vary; there is a struggle for existence; nature selects those best fitted for their environment, and these survive. A few years later two other schools arose. Both believe in evolution, but they differ in their ideas as to its methods. Darwin paid little attention to the origin of variation; its existence was enough. He recognized that variation may be spontaneous, i. e. that it may originate in some recondite modification of the germ-cells; and also that it may result from the effects of use and disuse. He regarded the fact of variation as all important, but apparently did not give much consideration to the causes of evolutionary variations. That he saw some of the difficulties connected with the inheritance of acquired characters is shown by his provisional theory of pangenesis. See Heredity.

Under the lead of Prof. August Weismann, of Freiburg (Baden), a third school—sometimes called "Neo-Darwinians"—arose. For a summary of the grounds of their belief the reader is referred to the article Heredity; they believe that those variations which are produced by use and disuse, by environment and by all other than modifications in the germ itself, are incapable of inheritance, and hence can play no part in the evolution of new varieties or higher groups. The variations which can be inherited must arise from and in the germ itself, and hence must be, so far as we can see, largely fortuitous, and by acting upon these, natural selection and heredity produce their results. Opposed to this is the "Neo-Lamarckian" school which believes, with Lamarck, that in evolutionary variation use and disuse and environment are effective causes, and that these "acquired variations" are capable of transmission from one generation to another. (See Lamarckianism.) The struggle between these schools is not over, and it can not be predicted which will prevail. At present the majority of the embryologists are followers of Weismann, while most palæontologists follow Lamarck. For the arguments of those who oppose Darwinism, see Sir J. W. Dawson's article under Evolution.

J. S. Kingsley.

Da'sent, Sir George Webbe, D. C. L.: English scholar and author; b. at St. Vincent, West Indies, in 1820; graduated in 1840 from Magdalen Hall, Oxford; was called to the bar at the Middle Temple in 1852, and appointed civil service commissioner in 1870; was for some years one of the assistant editors of the London *Times*, and became in 1871 editor of *Fraser's Magazine*; translated *The Younger Edda* (1842), and published *The Norsemen in Ireland* (1855); *The Story of Burnt Njal* (1861); *Selection of Norse Tales* (1862), etc.; also edited *An Icelandic-English Dictionary based on the MS. collections of the late Richard Cleasby, enlarged and completed by Gudbrand Vigfusson* (1874). He received the honor of knighthood June 27, 1876, and was an original member of the Royal Commission on Historical Manuscripts. D. June 11, 1896.

Dash'iell, Robert Laurenson, D. D.: clergyman; b. in Salisbury, Md., June 25, 1825; graduated with honor at Dickinson College, 1846; joined the Methodist Baltimore Conference, 1848, and occupied prominent pulpits in the Middle States down to 1868, when he was elected president of Dickinson College, Pa.; resigned in 1872, and same year became corresponding secretary of the Missionary Society of the Methodist Episcopal Church. D. Mar. 8, 1880.

Dash'kof, Ekaterina Romanovna, Princess: a Russian lady eminent for talents and learning; b. of a noble family, Mar. 28, 1743. She became the wife of Prince Dashkof and a friend of the Empress Catharine II. She was one of the chiefs of the conspiracy which dethroned Peter II. Soon after this event she lost the favor of Catharine, and passed several years in a tour through France, Germany, and Italy. Having returned home in 1782, she was appointed president of the Academy of Sciences at St. Petersburg. She was the first president of the Russian Academy, founded in 1784, and superintended the compilation of a great dictionary of the Russian language. D. Jan. 16, 1810. Her autobiography was published in English in 1840.

Dass, daas, Peter: Norwegian poet; b. 1647; parish priest at Alstahoog, in Nordland, from 1689 till his death. His works (*Samlede Skrifter*, edited by A. E. Erichsen, 3 vols., 1874–77) comprise satirical, descriptive, religious, and occasional poems. He was a favorite poet of the Norwegian peasantry throughout the eighteenth century and during the first half of the nineteenth, and his *Nordlands Trompet*, a rhymed description of the whole region included in what is now the bishopric of Tromsø, is still popular. D. Aug., 1708.

G. L. Kittredge.

Da'sya [a mod. quasi-Lat. formation from Gr. δασύς, thick, shaggy]: a genus of red algæ, of the family *Rhodomelaceæ*, nine or ten species of which are found in the U. S., and seven species in the British islands. They have pear-shaped spores, borne in ovate conceptacles upon the smaller branches. The genus includes some very handsome seaweeds.

Dasypodi'dæ [from *Dasypus*, the typical genus; from Gr. δασύς, thick + πούς, ποδός, foot]: a family of edentate mammals comprising the armadillos; characterized by having the back and head protected by bony shields formed of numerous pieces, and the tail encased in bony rings or covered with irregular plates. The teeth are numerous and simple, and, with the exception of *Tatusia*, there is but a single set. The neck vertebræ are short and broad, and the second and third or more are united. The lumbar vertebræ have long processes reaching to the bony shield, the clavicles are well developed, the femur has a third trochanter, and the fore foot has three, four, or five strong claws. By some authorities the genera Chlamydophorus (*q. v.*) and *Tatusia* are made the types of distinct families, leaving the genera *Dasypus*, *Xenurus*, *Priodon*, and *Tolypeutes*. See Armadillo.

F. A. Lucas.

Das'yure [from Gr. δασύς, thick, shaggy, hairy + οὐρά, tail]: the common name for any member of the genus *Dasyurus* and family *Dasyuridæ*; a group of flesh-eating marsupial mammals, which plays much the part among marsupials that the weasels do in the order Carnivora. The dental formula is I. $\frac{4}{3}$, C. $\frac{1}{1}$, Pm. $\frac{3}{2}$, M. $\frac{4}{4} \times 2$, or 42 teeth in all. The dasyures are animals of moderate size, found in Australia, Tasmania, New Guinea, and some of the adjacent islands. Most species are more or less spotted, and, as the name implies, they have bushy tails. The viverrine dasyure (*D. viverrinus*), a typical species, is about 2 feet in total length, gray or brownish-black above, spotted with white on the head and body; light brown or whitish beneath. It is a resident of Tasmania and New South Wales, and is destructive to poultry. See also the articles Tasmanian Devil, Tasmanian Wolf, and Thylacinidæ.

F. A. Lucas.

Dasyuridæ [New Lat., from *Dasyurus*, the typical genus + *idæ*, a zoölogical suffix denoting "family"]: a family of marsupial mammals of Australasia. See THYLACINIDÆ.

Da'ta [things given; neut. plur. of perf. pass. ptc. of Lat. *dare*, give]: things given or admitted; quantities and facts given, known, or admitted, by which to find things or results unknown; in geometry, the quantities or conditions which are assumed to be known in any problem. Thus in the problem, *Given the base, altitude, and area, to construct the triangle*, the data are: 1, that the figure is a triangle; 2, that it has a certain straight line for its base; 3, that its vertex is at a known distance from its base; and 4, that its area has a known magnitude.

Dat'ames: a Persian general and satrap, fourth century B. C.; son of a Carian father and a Scythian mother. His principal fields of action were Asia Minor and Syria. He experienced the fate accorded to many distinguished commanders of antiquity, such as Sertorius, master of Spain eight years in the first century B. C., and Viriathus, second century B. C., and, in modern times, Wallenstein and Guise, when they sought to maintain their independence against despotism, or when they became dangerous to royalty. He is known to modern times only by short notices of Diodorus of Sicily, about 50 B. C., and of Polyen the Macedonian, second century A. D., author of *Strategemata*, and by a very interesting account of him by Cornelius Nepos (first century B. C.). Nepos considers him the most valiant and capable of barbarian generals, with the exception of the two Carthaginians, Hamilcar and Hannibal; as one who owed his success not to the command of great armies, but to an individual ability almost unequaled. The scanty details of his life furnished us justify the belief that in other times he might have proved one of the greatest of military commanders. At first very successful in putting down an extensive confederated revolt, and thereupon invested with the command of the army destined to subject insurgent Egypt, Datames fell into disfavor with the Persian monarch Artaxerxes. Finding himself distrusted and imperiled, he set up for himself, and was victorious over the powerful forces sent against him. Found too great to be conquered, he was betrayed by a friend, and murdered in a conference about 362 B. C. Revised by C. K. ADAMS.

Da'tary [Med. Lat. *data'rius*, deriv. of *datum*, given, the first word in the *date* of papal documents; for example, "Datum Romæ apud Sanctum Petrum," etc., Given at Rome Jan. 1, etc.]: one of the chief officials of the Roman curia. The ordinary graces, *in foro externo*, granted by the pope (benefices, dispensations, etc.) pass through his hands. At present the office is always held by a cardinal, who is entitled pro-datary. It dates in its present form from the thirteenth century. At the death of the pope the activity of the datary's office ceases, all petitions being handed over to the cardinals until the election of a successor. See J. H. Bangen, *Die römische Curie* (Münster, 1854); Bouix, *Tractatus de Curia Romana* (Paris, 1859). J. J. KEANE.

Date [O. Fr. *date* > Mod. Fr. *datte*: Ital. *dattilo* < Lat. *dactylus* = Gr. δάκτυλος, name of the date-fruit; a Semitic loan-word, having originally no connection with the word for finger]: the fruit of one of the palm-trees (*Phœnix dactylifera*) of Southwestern Asia and Northern Africa. It is a tall-growing tree, 100 or more feet in height, with a slender, cylindrical stem, covered with the scars of the fallen leaves, and surmounted by a heavy crown of numerous ascending, spreading, and recurving, pinnately compound leaves. The trees are diœcious, and the flowers are borne in clusters upon long recurving peduncles which arise between the leaves. Each pistillate flower contains three separate pistils, but in ripening only one of the three develops, forming a one-seeded, fleshy fruit, the date of commerce. Dates are highly nutritious, containing 58 per cent. of sugar, besides other digestible substances. They constitute the chief article of food of the inhabitants of the regions where they abound, and immense quantities are annually exported to all parts of the civilized world. In its native region the seeds are ground and used as food for camels and other domestic animals. When roasted the seeds are used as a substitute for coffee under the name of date-coffee. The usefulness of the date-palm is scarcely excelled by any other plant, and we can here do no more than merely mention its most important uses. By pressure the ripe fruits yield a delicious sirup; by distillation of the fermented fruits an alcoholic drink is made; from the sap which exudes upon the removal of the terminal bud "palm wine" is made by fermentation; the succulent terminal bud is edible, and when removed for the purpose of collecting the sap is cooked and eaten; from the fibrous parts of the leaves and stems ropes, baskets, mats, etc., are made; the spongy substance of the trunk contains a starchy and edible substance of which some use is made; and, lastly, the trunk itself is used for posts and beams in the simple structures built by the inhabitants of warm climates. C. E. B.

Date [from Lat. *datum*, given, the first word in the dating phrases, such as *datum Romæ*, etc.]: the exact time when anything is or was or is to be done. The careful observance of dates is of the utmost importance in the writing of history. One of the best works on this subject is *L'Art de vérifier les Dates*, by the Benedictines of St. Maur. See CHRONOLOGY.

Date-line: See CHANGE-OF-DAY LINE in the Appendix.

Date-plum: See DIOSPYROS.

Dath'olite, or **Datolite** [from Gr. δατεῖσθαι, divide + λίθος, stone]: a mineral composed of boro-silicate of calcium with a little water. It occurs in a white opaque massive form and in brilliant crystals, either colorless or of a red, gray, or green tint. It is found in Norway and Italy and in New Jersey and the Lake Superior region.

Datis: a Persian general sent by Darius the First to invade Greece; commanded the army in conjunction with Artaphernes; was defeated at MARATHON (*q. v.*) by Miltiades, and was afterward put to death by the Spartans.

Dative Case: See DECLENSION.

Datiya, da-tee'ya: a town in Bundelkhand, Central India; capital of a feudatory state of the same name; 125 miles S. E. of Agra (see map of N. India, ref. 6–E). It is inclosed by a stone wall 30 feet high. Pop. 30,000.

Datu'ra [from Hindustani *dhāturā*]: a genus of herbs of the family *Solanaceæ*; natives chiefly of warm climates in both hemispheres. *D. stramonium* (thorn-apple, Jamestown or "Jimson" weed of the U. S., where it is naturalized) furnishes the drug STRAMONIUM (*q. v.*). Many species are cultivated in greenhouses for the beauty of their flowers. They all possess narcotic properties similar to those of belladonna.

Daubenton, dō'bäṅ'tōṅ', LOUIS JEAN MARIE, M. D.: naturalist; b. at Montbar, France, May 29, 1716. He studied medicine in Paris, and began in 1742 to collaborate with Buffon upon the first part of his natural history. He was well qualified for this task by his sound judgment, scrupulous accuracy, and patient industry, which enabled him to rectify some of Buffon's errors and hasty theories, and to enrich the work with many new and important facts in the anatomy of animals. In 1745 he was appointed curator and demonstrator of the cabinet of natural history in Paris, of which he had charge for nearly fifty years. He became Professor of Natural History in the College of France in 1778. He contributed many scientific articles to the first *Encyclopédie*, edited by Diderot, and introduced the merino sheep into France. D. in Paris, Jan. 1, 1800. See Cuvier, *Notice sur la Vie de Daubenton*.

Daubento'nia [so named in honor of the French naturalist Daubenton]: the generic name given to the aye-aye (*Chiromys madagascariensis*) by Geoffroy Saint-Hilaire. It has precedence over *Chiromys*, and by the law of priority should be used. F. A. L.

Daubeny, dawb'ni, CHARLES GILES BRIDLE, M. D., F. R. S.: chemist and naturalist; b. at Stratton, England, Feb. 11, 1795. He was for many years Professor of Chemistry, Botany, and Rural Economy in the University of Oxford. He visited the U. S. in 1837. Among his works are a *Description of Active and Extinct Volcanoes, with Remarks on their Origin* (1826); a *Sketch of the Geology of North America*, and *Lectures on Agriculture* (1841). D. Dec. 12, 1867.

Dauber: a name applied to various mud-wasps; hymenopterous insects of the family *Sphegidæ* and the genus *Pelopœus*; natives of various parts of America, some of the species being quite common in the U. S. This name is given on account of the remarkable nest which the mother-insect constructs, bringing lumps of mud in her mouth, which she arranges into cells, inwardly very smooth and regular, but outwardly looking like masses of clay. In these cells she lays her eggs, one in each cell, and with it she seals up a large number of spiders, alive, but paralyzed by her sting. The eggs hatch, the grub feeds on the spiders, goes into the pupa state, and, finally, having burst its cocoon, gnaws through the wall of earth and escapes, a perfect insect.

D'Aubigué, dō'bĕĕn'yā', Jean Henri Merle, D. D.: Swiss divine and historian; b. at Eaux-Vives, near Geneva, Aug. 16, 1794. His father's name was Louis Merle. Having studied theology at Geneva and Berlin (under Neander) he became pastor of the Freneh Protestant ehurch in Hamburg, 1818; court preacher in Brussels, 1823; Professor of Chureh History in the Theologieal Seminary of the Evangelieal Chureh at Geneva, 1831. His principal work is a *History of the Reformation in the Sixteenth Century* (1835), translations of which have obtained extensive eirculation in Great Britain and the U. S. In 1863 he began to publish a *History of the Reformation in Europe in the Time of Calvin*. He also published the *Protector* (*Cromwell*)—*a Vindication* (1848). He is mueh praised for the vivacity of his style, the fervor of his piety, and the pronouneed orthodoxy of his opinions, but he has no standing as an authority. D. in Geneva, Oet. 21, 1872.

D'Aubigué, Théodore Agrippa: See Aubigné, d'.

Daubigny, dō'bĕĕn'yee', Charles François: landscape-painter; b. in Paris, Feb. 15, 1817. Pupil of Edmé Daubigny and of Paul Delaroche; first-class medals, Salons, 1857, 1859, and 1869; offieer Legion of Honor 1874. Daubigny is eommonly associated with the famous Fontainebleau group of painters, just as Corot is sometimes, though neither of them painted in the forest or at Barbizon. They both belong to the same general movement in art as Millet, Rousseau, and Diaz, but Daubigny has gone further in the direetion of absolute truth to nature than any of them. He lived and studied so much out of doors that he has tried in his pietures, more than any of the great landscape-painters of his day, to preserve the actual look of nature. He was not content to use faets for a basis and paint his remembered impressions. Perhaps it was a matter of temperament with him, or possibly he found the results of sueh work as he may have attempted, if he followed the methods of Corot and others who preceded him, less satisfactory than those he achieved when he adhered more closely to his studies from nature. Be that as it may, there is in his work more of the impression of what we fancy we have seen ourselves than there is in the creations of the other great artists, and we are apt to think that Daubigny's landscapes contain more aetual truth than is to be found in any others. But while fidelity to nature's looks is a conspieuous quality in his painting, it by no means overshadows others that are essential in the highest fields of landseape. His work is most highly appreciated by artists, and he is distinetly a "painter's painter." They like his honest direet method, his evident sincerity, and they admire his winning, tender way of depicting Nature, eopying her many moods with a loving hand that fears to add or take away lest her fair beauty be marred. There is no exaggeration, no falsifying in his pictures in one place, or toning down to make them more forceful in another; everything is kept in its just relation to every other thing, and his work seems as absolutely truthful in effect as paint can make it. Onc of the finest of his landscapes is in the collection of John G. Johnson, Philadelphia, representing a view of a town by a riverside; and a small canvas *On the River Oise*, a wonderfully beautiful effect of afternoon sunshine, was in the collection of G. I. Seney (sold in New York, 1891). His pietures are frequently seen in public exhibitions in the U. S., and a large number of excellent canvasses by him are owned in this country. Several works are in the Louvre, and an especially fine one, *A Sluice in the Optevoz Valley*, formerly in the Luxembourg Gallery, is in the Museum at Rouen. Daubigny traveled and studied in Italy when a young man, but painted almost all of his pictures in Franee. He had a studio at Auvers-sur-Oise, another in Paris, and a studio boat in whieh he made leisurely trips along the Seine and the Oise, painting as he traveled. He was an etcher of great talent and left a large number of plates. It may justly be said of him that he never painted a bad picture, and he ranks deservedly among the three or four greatest masters of landseape-painting of his century. An exeellent biographieal sketch of Daubigny was published in the *Century Magazine*, July, 1892. D. in Paris, Feb. 19, 1878.

William A. Coffin.

Daubigny, Charles Pierre (ealled Karl): landscape-painter; son of C. F. Daubigny; b. in Paris, Junc 9, 1846. Pupil of his father; medal, Salon, 1868; third-class medal, Salon, 1874. An excellent painter whose style is individual and whose methods are frank and direet. He painted in eompany with his father in the valleys of the Seine and Oise, and also on the Normandy coasts. One of the best of his works is *The St. Simeon Farm* (1879). D. at Auvers-sur-Oise, May, 1886. W. A. C.

Daubrée, dō'brā', Gabriel Auguste: mining engineer and geologist; member of the Institute; b. at Metz, 1814; from the Polytechnic Sehool and the School of Mines entered the corps of mining engineers in 1834, and was one of the commission to explore Algeria. In 1839 he was Professor of Mineralogy and Geology at the Aeademy of Strassburg and engineer of mines of that residency, and engineer-in-ehief in 1855. In 1861 he was called to Paris as Professor of Geology in the Museum of Natural History; the next year professor in the sehool of mines; in 1867 inspeetor-general of mines; and in 1872 direetor of the sehool of mines. Officer of the Legion of Honor in 1858, he was made grand offieer in 1869. In 1861 Daubrée was eleeted almost unanimously a member of the Institute. He published many memoirs in the *Annales des Mines* and in the *Comptes Rendus* of the Academy. D. in Paris, May 29, 1896. W. R. H.

D'Aubusson, Pierre: See Aubusson, d'.

Daudet, dō'dā', Alphonse: author; b. at Nîmes, Franee, May 13, 1840; settled in Paris in 1857; made his *début* in literature with some poems—*Les Amoureuses* (1858); *La Double Conversion* (1859). In 1864 he became secretary to the Duke of Morny. As a dramatist he aehieved no small suceess—*La dernière idole* (1862); *L'Œillet blanc* (1864); *Le sacrifice* (1869); *Lise Tavernier* (1872), etc. But it is by his prose-writings that he acquired his great fame—*Lettres de mon moulin* (1866); *Lettres à un absent* (1871); *Aventures prodigieuses de Tartarin de Tarascon* (1872); *Contes du lundi* (1873), etc. He is best known by his novels—*Jack* (1876); *Le nabab* (1878); *Les rois en exil* (1880); *Numa Roumestan* (1881); *Sapho* (1884); *Tartarin sur les Alpes* (1885); *La Belle Nivernaise* (1886); *l'Immortel* (1888); *Port-Tarascon; dernières aventures de l'illustre Tartarin* (1890). Several of these books have been dramatized, but without attaining the suceess of the originals. *La Lutte pour la Vie*, amplifying part of the story of *l'Immortel*, has perhaps eome nearest. Daudet was one of the leaders of the naturalistic school in Franee, and in one respect he approached real life nearer than anybody else; several characters in *Le nabab*, *Les rois en exil*, and espeeially in *l'Immortel*, a satiric picture of the Académie Française, are recognized portraits. D. Dee. 16, 1897. See Jules Claretie, *Alphonse Daudet*, in the series Célébrités Contemporaines; also Daudet's own reminiseenees, *Trente ans de Paris, à travers ma vie et mes livres* (1887).

Revised by A. R. Marsh.

Daudet, Louis Marie Ernest: novelist and historian; brother of Alphonse Daudet; b. at Nîmes, Franee, May 31, 1837. He went to Paris in 1857, and, with the exeeption of a year or two of work on journals of the provinees, has lived there ever sinee. From 1860 to 1870 he was a public funetionary, but after 1870 he beeame a reaetionist—now Bonapartist, now Legitimist. He early began to write both novels and historieal works. Among his novels the following are worth mentioning: *Jean le Gueux* (1871); *Les Dames de Ribeaupin* (1872); *Le Roman de Delphine* (1873); *Henriette* (1876); *La Baronne Amalfi* (1877); *Madame Robernier* (1879); *La Carmelite* (1883). Among his historical works are *Le Cardinal Consalvi* (1868); *L'Agonie de la Commune, la France et les Bonapartes* (1871); *Le Ministère de M. de Martignac* (1875); *Le Procès des Ministres* (1877); *Histoire des conspirations royalistes du Midi sous la Révolution* (1881); *Histoire de la Restauration* (1882); *Histoire de l'émigration* (1886, *seq.*); *Les Bourbons et la Russie pendant la Révolution française* (1888). A. R. Marsh.

Daughters of the King: See the Appendix.

Daun, down, Leopold Joseph Maria, Count von: an Austrian general; b. in Vienna, Sept. 25, 1705. He served with distinetion against the Turks, fought in the war of the Austrian suceession, and beeame a field-marshal in 1754. He was eommander-in-chief of the imperial army in the Seven Years' war. On June 18, 1757, he defeated Frederick the Great at Kolin, where the loss of the Prussians was very severe. On Oct. 14, 1758, he gained a victory over Frederick at Hochkirchen, and in the following year, at Maxen, forced Gen. Fink and his whole army to surrender. On Aug. 15, 1760, he was defeated at Liegnitz, and on Nov. 3, 1761, at Torgau. These reverses have been attributed to a eertain dilatoriness in his operations, and a neglect to follow up his successes. He was appointed president of the Aulic eouncil in 1762. D. Feb. 5, 1766.

Daunou, dō′noo′, Pierre Claude François: statesman and author; b. at Boulogne-sur-Mer, France, Aug. 18, 1761. He was elected in 1793 a member of the National Convention, in which he acted with moderation, opposing the execution of Louis XVI. and the proscription of the Girondists. He was the first president of the Council of Five Hundred, and a member of the committee which formed the constitution of the year VIII. (1800). He was editor of the *Journal des Savants* from 1816 to 1838, and became Professor of History in the College of France in 1819. He published an *Essay on the Temporal Power of the Pope* (1810) and a *Course of Historical Studies* (20 vols., 1842, *et seq.*). D. June 20, 1840. See Walckenaer, *Notice sur la Vie de Daunou* (1841).

Dau′phin (Lat. *delphi′nus*): the former title of the eldest son and heir-apparent to the King of France. It was originally the title of the sovereign lords of the province of Dauphiné. In 1349 Humbert, lord of Vienne, dying without issue, bequeathed his possessions to Charles of Valois, on condition that the heir-apparent to the throne of France should bear the title of Dauphin of Vienne. This title was abolished at the revolution of 1830, the last dauphin being the Duke of Angoulême.

Dauphiné, dō′fĕĕ′nā′: a former province in the southeast of France; now comprised in the departments of Drôme, Hautes-Alpes, and Isère; bounded on the E. by Piedmont and Savoy, S. by Provence, and N. and W. by the Rhône; was added to the Roman empire and formed a part successively of the Burgundian kingdom, Carlovingian and German empires. The chief towns were Grenoble, Vienne, Gap, and Valence. Before the end of the twelfth century it was divided into small principalities, of which the Dauphins of Viennois became the most powerful, and extended their authority at the expense of their neighbors. In 1349 it was ceded to the crown of France, and was governed by the king's son as a separate province till 1457 when it was incorporated with the kingdom. Its inhabitants sympathized with the Vaudois and with the Reformers of the sixteenth century, and suffered from persecutions. The province was ravaged in 1692 by the Duke of Savoy and Prince Eugene.

Dauw, or **Burchell's Zebra** [*Equus burchelli*]: a wild ass of Southern Africa, resembling the true zebra, but not so beautiful, its stripes being far less brilliant, and not distributed over the whole body.

Davalos, dăă-vaa′lōs, Gil Ramirez: Spanish soldier; b. at Baeza, in Castile, about 1505. He was a follower of Antonio de Mendoza, who went to Peru as viceroy in 1551; Davalos, accompanying him, was made *corregidor* of Cuzco, and when Giron revolted, in 1553, was seized, deprived of his papers, and expelled from the city. He took part in the campaign which ended in Giron's downfall; was made *justicia mayor* of Quito in 1556; founded Cuenca in 1557, and subdued the Cañares Indians; and in 1558 succeeded his brother, Egidio Ramirez Davalos, as governor of Quijos or the Land of Cinnamon, in the forests about the river Napo. He founded there Baeza, Archidona, and other towns, and formed a flourishing community which was afterward abandoned in great part. In 1561 he retired to Riobamba, near Quito, where, probably, he died.

Herbert H. Smith.

Dav′enant, Sir William: dramatic poet; b. at Oxford, England, in 1605; began to write at an early age, and, after the production of several masques and tragi-comedies, the most famous of which is *The Wits*, he succeeded Ben Jonson as poet-laureate in 1637. He became manager of Drury Lane theater in 1639, but joined the king's side in the civil war and served with distinction throughout the struggle. Taking command of a colonizing expedition to Virginia, he was captured by a government vessel and thrown into prison, where he devoted himself to the composition of his epic *Gondibert*, the best known of his works. His release, due, it is said, to the intercession of the poet Milton, was followed by the production of a number of pieces to which he gave the name of operas, and of which only one, *The Cruelty of the Spaniards in Peru*, had merit enough to survive. After the Restoration his prosperity returned, and he enjoyed the favor of the court until his death in 1668. His writings mark a revulsion from the romanticism of the Elizabethan age without presenting anything desirable in its place, and though *Gondibert* contains many striking and elegant lines it is generally dull and cumbrous in style, while his other poems, especially his plays, are artificial and unsuited to the modern taste. A collection of his plays, with a memoir, edited by Logan and Maidment, was published at Edinburgh (5 vols., 1872–74).

Davenport: city, river-port, and important railway center; capital of Scott co., Ia. (for location of county, see map of Iowa, ref. 5–L): pleasantly situated on the Mississippi at the foot of the Upper Rapids; 330 miles above St. Louis and 184 miles W. by S. from Chicago. It occupies the base and higher parts of a bluff which rises gradually and extends along the river 3 miles, and lies opposite the western terminus of the Hennepin Canal, now being built to connect the Mississippi river with the Great Lakes. A fine iron railway and carriage bridge across the Mississippi river, built by the U. S. Government and the Chicago, Rock Island and Pacific R. R. Company, at a cost of $1,200,000, connects Davenport with Rock Island, containing the great central armory and arsenal of the U. S., and with the city of Rock Island, on the Illinois shore.

Davenport was founded in 1835. It has thirty churches, a public library, Academy of Natural Sciences, founded in 1867, whose proceedings are published regularly, and which possesses a scientific library and a very fine collection of relics of the ancient mound-builders of the Mississippi valley, an imposing Masonic Temple, St. Ambrose College, Kemper Hall, Griswold College, St. Katharine's Hall, College of the Immaculate Conception, two large business colleges, complete system of graded and parochial schools, two fine opera-houses, and new U. S. Government building.

Manufactures.—The census of 1890 shows 463 manufacturing establishments here; capital, $8,283,078; persons employed, 5,060; wages paid, $2,170,510; cost of material used, $5,852,527; value of products, $9,944,709. The flour and grain business is important, and lumber, agricultural machinery, farming tools, woolen goods, glucose, maccaroni, vermicelli, barrels, furniture, cordage, vinegar, paints, watches, canned goods, clothing, pottery, carriages, steam-engines and machinery, cigars, etc., are among the manufactured products.

Water-works, etc.—The city is supplied by an extensive system of water-works, has fire-alarm telegraph, paid fire department, telephone connections, electric street railway lines, and gas-works. Davenport is in the midst of extensive coal-fields, and is the market for a large and highly cultivated farming region. It is the see city of the Episcopal Church in Iowa and of the Davenport diocese of the Roman Catholic Church. Pop. (1870) 20,038; (1880) 21,831; (1890) 26,872; (1900) 35,254. Henry J. Denison.

Davenport, Edward Loomis: actor; b. in Boston, Mass., Nov. 15, 1814; made his first appearance at Providence, R. I., in 1836; became deservedly popular both in the U. S. and in Great Britain, where he acted from 1847 till 1854; from 1873 on acted in New York; married in 1849 Fanny Elizabeth Vining, an English actress. D. in Canton, Pa., Sept. 1, 1877.

Davenport, Fanny Lily Gipsy: actress; b. in London, Apr. 10, 1850; daughter of Edward L. Davenport, the actor. Fanny Davenport made her first appearance at the Howard Athenæum in Boston as the child in *Metamora*; appeared in New York as the King of Spain in *Faint Heart Never Won Fair Lady*, on Feb. 14, 1862, at Niblo's Garden; played in Boston and Philadelphia, and under the management of Augustin Daly at the Fifth Avenue theater, New York, in 1869. She personated a large number of different characters, among them Mabel Renfrew in *Pique*, which ran for 250 nights. She made many starring tours throughout the U. S., and achieved success in *Cleopatra* in Sardou's play of that name. She was married to Edwin H. Price in 1879, but was divorced, and married Melbourne McDowell, an actor of leading *rôles*. D. in Duxbury, Mass., Sept. 26, 1898. B. B. Valentine.

Davenport, Ira: politician; b. at Hornellsville, N. Y., June 28, 1841; educated at Bath, Steuben co., N. Y., and at New Haven, Conn.; elected to New York Senate in 1877, and re-elected in 1879; served during both terms as chairman of committee on commerce and navigation; in 1881 he was elected controller of the State of New York, and in 1884 and 1886 member of Congress. In 1885 he was the Republican candidate for Governor of New York, but was not elected.

Davenport, John, B. D.: Puritan divine and colonist; b. at Coventry, England, in 1597; educated at Oxford; entered the Anglican priesthood and became minister of St.

Stephen's church, London. In consequence of his Puritanical principles and practice he was obliged to leave the Established Church and in 1633 removed to Holland, returning in 1635 to England, where he aided in obtaining the patent of the Massachusetts colony. In 1637 he went to Boston, Massachusetts Bay, and in 1638 became one of the founders of the New Haven colony. In 1639 he became one of the "seven pillars," as the governing body of the settlement was called, and in 1660 he sheltered Goffe and Whalley, the regicides. He opposed the union of the colonies of New Haven and Hartford, and chiefly for this reason accepted a call to the First church of Boston, over which he was installed Dec. 9, 1668. Published *A Discourse about Civil Government in a New Plantation* (1673) and other works. D. of apoplexy Mar. 15, 1670, and was buried in the tomb of his friend John Cotton.

David: chief town of the district of Chiriqui, department of Panama, Colombia; on one of the narrowest parts of the Isthmus of Panama, near the boundary of Costa Rica (see map of Central America, ref. 10–K). It is on a river about 10 miles from the Pacific coast, in a rich alluvial plain, and near the extinct volcano of Chiriqui. A coal field extends nearly across the isthmus in the vicinity of David. It has considerable trade. Pop. about 9,000. M. W. H.

David (in Heb. דוד, beloved; Gr. Δαβίδ, or Δανίδ; Arab. *Dâood*): one of the most remarkable characters in history; a son of Jesse; b. at Bethlehem in Judæa about 1085 B. C., according to the chronology of Ussher. In his youth he followed the occupation of a shepherd, and he acquired great skill as a musician. He was received into the household of Saul, King of Israel, who, we are told, was troubled with an "evil spirit." David, by playing upon the harp, soothed and "refreshed" Saul, and "the evil spirit departed from him." Not long afterward, David slew in single combat a Philistine giant named Goliath, and, as a reward for later exploits, received Michal, Saul's daughter, in marriage. But Saul was offended by the praises which David received for his prowess, and not only regarded his son-in-law with bitter jealousy, but made repeated attempts upon his life. David was obliged to fly for safety to Achish, King of Gath. When David was thirty years old Saul was slain in a battle with the Philistines, and David was made king of the tribe of Judah, reigning at Hebron for seven years and a half, while Ishbosheth, Saul's son, was in power on the east side of the Jordan, and for two years was obeyed by all the tribes except Judah. After the murder of Ishbosheth, David became king of the whole nation. He was victorious in all his wars, and under his sway the kingdom of Israel acquired great prosperity and power. One of his sorest trials was the rebellion and death of his favorite son, Absalom. David died in 1015 B. C., and Solomon, his son, succeeded to the throne. In David all the feelings and passions appear to have been singularly intense and powerful, and by them he was again and again betrayed into great faults and even crimes. Yet his character, on a whole, exhibits a rare magnanimity, as shown in his sparing Saul, his bitterest enemy, when that king was completely in his power. (See 1 Sam. xxiv.) It should be borne in mind that David was not subjected to the powerful restraints which public opinion exercises in some directions on modern European monarchs. His fear of God and his generous feelings were the only checks to his mighty passions and that license which long-continued success and a power all but unlimited in his own dominions tended to foster. If we consider these things, we shall probably find few sovereigns, even in the most civilized times, possessing despotic power, whose characters will bear a favorable comparison with that of David. The Bible account of David, as traditionally interpreted, is perhaps self-contradictory; but it becomes consistent when due attention is paid to such chronological details as those given in 1 Chron. xiii. 5, xxvi. 31; 2 Sam. xv. 7, etc. As a writer of religious poetry, and especially of that kind which comes home to the feelings of all sorely tried hearts, David has no equal among the poets of the human race. His name is in the title of 73 of our 150 Psalms, and yet others are attributed to him by the books of Chronicles and by the New Testament. For an account of the Psalter and of commentaries and others works upon it, see PSALMS.

Revised by WILLIS J. BEECHER.

David I.: King of Scotland; sixth son of Malcolm III.; b. 1084. He married, in 1110, Maud, a great-niece of William the Conqueror. He succeeded his brother, Alexander I., in 1124, and swore to maintain the right of his niece Matilda to the throne of England in case her father, Henry I., left no male issue. Henry died in 1135, and David afterward waged war against Stephen, who disputed her claim to the throne. David invaded England, and was defeated at the "Battle of the Standard" near Northallerton in 1138. He promoted manufactures, education, and civilization. In his reign the feudal system was placed on a firm basis in Scotland, and through his efforts the Celtic and Anglo-Saxon elements of the kingdom were brought into more harmonious relations. As a wise law-giver and zealous patron of the Church he holds a foremost place among the early Scottish kings. Though never formally canonized he has often received the title of saint, and his name figures in the calendar prefixed to Laud's Prayer-book for Scotland (1657). He died in 1153, and left the throne to his grandson, Malcolm IV.

David II., or **David Bruce**: King of Scotland; b. in 1323; a son of Robert Bruce, whom he succeeded in 1329. His kingdom was invaded in 1332 by Edward Baliol, who defeated the army of David in the battle of Dupplin Moor, and in 1333 the Scotch were again routed at Halidon Hill. The king was expelled, and retired to France, but his subjects continued to fight for him, and he recovered the throne in 1342. Having invaded England in 1346, he was defeated at Neville's Cross, captured, and detained until 1357. From that time till his death in 1371 his base subservience to the English throne placed his kingdom in a condition of dependence.

David, daă'veed', FÉLICIEN CÉSAR: composer; b. at Cadenet, Vaucluse, France, Mar. 8, 1810; d. Aug. 29, 1876. He wrote a number of operas, symphonies, etc., but his fame rests chiefly on the symphonic ode entitled *The Desert*, for orchestra and male voices.

David, daa'vit, FERDINAND: violin-player and teacher; b. in Hamburg, Germany, Jan. 19, 1810. He was a pupil of Spohr and an intimate friend of Mendelssohn. He was greatly beloved by his pupils, among whom are a large number of celebrities, the most eminent being Joachim and Wilhelmj. He revived many works of the old Italian, German, and French schools, which he edited with accompaniments, bowings, marks of expressions, etc., and was sought for by publishers to edit all the later critical editions of the violin classics. D. in Leipzig, July 18, 1873.

DUDLEY BUCK.

David, daă'veed', JACQUES LOUIS: historical painter; b. in Paris, Aug. 31, 1748; pupil of Vien; Prix de Rome 1774; commander Legion of Honor. He was the recognized head of the French school during the first empire. His style is classical in the extreme, and he considered truth to nature as of secondary importance compared with the conventional forms of the antique. His principles were combated by Ingres, and the revolt against classicalism was carried on by Delacroix and Géricault, the chiefs of "the men of 1830." A portrait by David of Madame Récamier, in the Louvre, is one of the best works he produced in that branch of art, in which he was highly successful. Several of his most important compositions are in the Versailles Museum, including the *Coronation of Napoleon and Josephine*. D. in Brussels, Dec. 29, 1825. W. A. C.

David, JÉRÔME FRÉDÉRIC PAUL, Baron: French politician; b. in Rome, June 30, 1823; a grandson of Jacques Louis David; in 1859 became a member of the Corps Législatif and a leader of the ultra-Bonapartist party; was in 1867, and again in 1869, vice-president of the Corps Législatif. He was minister of public works in the cabinet of Count Palikao, 1870. He wrote *Réflexions et discours sur la propriété chez les Arabs* (1862). D. at Langon, Gironde, Jan. 28, 1882.

David, LAURENT OLIVIER: See the Appendix.

David, PIERRE JEAN, known as **David d'Angers**: sculptor; b. at Angers, France, Mar. 12, 1789. He gained at Paris the first prize (with a pension) in 1811, and then went to Rome to pursue his studies. He formed a friendship with Canova, returned to France in 1816, and produced a statue of the great Prince of Condé, by which he acquired a high reputation. In 1826 he became a member of the Institute. Soon after the revolution of 1830 he was employed by the government to fill the pediment of the Panthcon with sculptures. Among his works are the statue of the young drummer-boy Barra, busts of Washington, La Fayette, Arago, Goethe, and Lamartine, and statues of Cuvier, Racine, and Jefferson. He also made a large number of portraits in bas-relief, including many of the most celebrated

men and women of his time. These bas-reliefs are among the finest things of their kind produced since the Italian medals of the early Renaissance. He was a republican member of the National Assembly in 1848. D. in Paris, Jan. 5, 1856.

David (Welsh, *Dewi*), Saint: patron saint of Wales. The exact dates of his birth and death are involved in obscurity, though his life can be located in the sixth century. The best historical account states that he was the son of Sandde or Xantus, Prince of Ceretica (Cardiganshire), and was born at Hen-Menen, or Menevia (now St. David's). He founded a monastery in the vale of Rhos, became a very famous theologian, and ultimately founded a see at Menevia. He was canonized by Pope Calixtus I. in the twelfth century. Mar. 1 is celebrated as his festival.

David City: city and railway junction; capital of Butler co., Neb. (for location of county, see map of Nebraska, ref. 10–G); situated in a farming section, 56 miles N. W. of Lincoln, Neb. Pop. (1880) 1,000; (1890) 2,028; (1900) 1,845.

Davidists, David-Georgians, or **Jo'rists**: a sect founded by David George or Joris, otherwise called John of Bruges, who was born at Bruges in Belgium, 1501, settled in Delft as glass-painter 1524; became a Lutheran, and for an attack upon a religious procession was banished for three years 1528; returned in 1536, and established a sect. He pretended to be the Messiah, denied the resurrection, and held various heretical opinions. The sect existed in Holland nearly a century after his death. But he fled to avoid persecution in 1544, and lived quietly in Basel under the pseudonym of John of Bruges, as a member of the Reformed Church, unsuspected by the magistracy of being the notorious sectary. D. in Basel, Aug. 25, 1556. In 1559 the truth came out, whereupon his body was exhumed and burned.

Davidson, Andrew Bruce, D. D., LL. D.: Old Testament scholar of the Free Church of Scotland; b. in Aberdeenshire, Scotland, 1831; educated at Marischal College, Aberdeen, and at the Free Church College, Edinburgh; became Professor of Hebrew and Old Testament Exegesis in New College, Edinburgh, 1863. In the revision of the English Bible he was a member of the Old Testament company of revisers. He published a commentary on Job (1862); *An Introductory Hebrew Grammar* (1874), which has passed through several editions; *The Epistle to the Hebrews* in Clark's *Handbooks for Bible Classes* (1882); *Job* and *Ezekiel* in *Cambridge Bible for Schools* (1884). Willis J. Beecher.

Davidson, Charles, Ph. D.: author and teacher; b. at Streetsboro, O., July 29, 1852; educated at Iowa College (A. B. 1875, A. M. 1877) and Yale University (Ph. D. 1892); principal of Minneapolis Academy 1879–84; master in English, Belmont School, Belmont, Cal., 1888–. He has published *The Phonology of the Stressed Vowels of Béowulf* in *Publications of the Modern Language Association*, vol. vi., No. 283; *The Difference between the Scribes of Béowulf* in *Modern Language Notes*, vol. v., No. 2; *English in the Secondary Schools* in *School and College*, vol. i., No. 10; *Studies in the English Mystery Plays*, published by Yale University.

Davidson, George, A. M., Ph. D.: astronomer; b. in Nottingham, England, May 9, 1825, of Scottish parents; removed to the U. S. in 1832; graduated in 1845 at the Central High School of Philadelphia; entered the U. S. Coast Survey; served in the States bordering the Atlantic and Gulf coasts until 1850, when selected to take charge of a party to the Pacific coast; worked continuously upon the western coast, except during the civil war, when he served on the Atlantic and Gulf coasts; was appointed chief engineer of an expedition for the survey of a ship-canal route across the Isthmus of Darien; in 1867 made a geographical reconnoissance of the coast of Alaska, and reported upon its products, etc., to Congress; in 1868 returned to the Pacific coast, and had charge of the field-work of the parties there; in 1869 brought the San Francisco observatory in telegraphic longitude connection with Greenwich; in 1869 took charge of the expedition to Alaska to observe the total solar eclipse of August; in 1873 determined the 120th meridian; in 1874 conducted the U. S. transit-of-Venus party to Japan; at Nagasaki connected the American and French transit-of-Venus stations by triangulation; visited China, India, Egypt, and Europe for scientific study, the results of which were embodied in a special report to the superintendent of the Coast Survey; returned to the Pacific coast to take charge of the telegraph-longitude work and of the main triangulation and astronomical party carrying the geodetic work across the continent; in 1880 was in charge of the party to observe the transit of Venus in New Mexico; regent of the University of California 1877–84; published works on transit instruments and observations, irrigation, harbor and river improvements, and communications in the *Proceedings* of the California Academy of Sciences, of which he was president 1871–86.

Davidson, James Wood: See the Appendix.

Davidson, Leonidas Heber: See the Appendix.

Davidson, Lucretia Maria: See the Appendix.

Davidson, Margaret Miller: See the Appendix.

Davidson, Robert, D. D.: clergyman; b. in Carlisle, Pa., Feb. 23, 1808; graduated at Dickinson College in 1828, and at Princeton Theological Seminary in 1831; Presbyterian pastor in Lexington, Ky., 1832; president of Transylvania University, Ky., 1840; pastor in New Brunswick, New York, Huntington (L. I.), and Philadelphia. Among his writings are *History of the Presbyterian Church in Kentucky* (1847); *Elijah, a Sacred Drama, and other Poems* (1861); *The Christ of God* (1870). D. Apr. 6, 1876.

Davidson, Samuel, D. D., LL. D.: biblical critic; b. in Kellswater, near Ballymena, Ireland, Sept. 23, 1807; studied at the Royal College of Belfast, where he became Professor of Biblical Criticism and Literature in 1835; became in 1842 Professor of Biblical Literature and Oriental Languages at Lancashire Independent College, but resigned in 1857 and settled in London. Among his works are *Canon of the Bible* (3d ed. 1880); *Introduction to the Old Testament* (1862); *Introduction to the New Testament* (1882); *The Doctrine of Last Things in the New Testament* (1883). D. April 1, 1898.

Davidson, Thomas, LL. D., F. R. S., F. G. S.: palæontologist; b. in Edinburgh, Scotland, May 17, 1817; educated in France and Italy in both science and art; in 1858 became honorary secretary of the Geological Society of London, and in 1865 received from its council the Wollaston gold medal; in 1868 received a Silurian medal for his *Illustrations and History of Silurian Life*; in 1870 was awarded the gold medal of the Royal Society, and in 1871 received a presentation from the Palæontographical Society; twice served as vice-president of section C (British Association), and was a member of the general committee. His chief work was *British Fossil Brachiopoda* (5 vols.). D. Oct. 16, 1885.

Davidson, Thomas, M. A.: scholar; b. Oct. 25, 1840, near Fetterangus, parish of Deer, Aberdeenshire, Scotland; graduated with highest classical honors and the Simpson Greek prize at Aberdeen in 1860; was for several years rector of the Grammar (Latin) School of Old Aberdeen, and subsequently master in several English schools; spent considerable time in France and Germany; went to Canada in 1866 and to the U. S. in 1867, and after spending eight years in St. Louis removed to Cambridge, Mass., in 1875. Mr. Davidson has contributed to various periodicals numerous philological and philosophical articles. After a residence of several years in Italy he published *Rosmini's Philosophical System* (1882), and an English translation of *Rosmini's Psychology*; *The Parthenon Frieze and other Essays* (1882); translation of Seartazzini's *Handbook to Dante* (1887); *Prolegomena to Tennyson's In Memoriam* (1889); *Aristotle and Ancient Educational Ideals* (1892); translation of the eleventh book of *Aristotle's Metaphysics* (*Jour. Spec. Philos.*, 1892). D. in Montreal, Canada, Sept. 14, 1900. Revised by W. T. Harris.

Davidson, William: soldier; b. in Lancaster co., Pa., 1746. He was educated in Charlotte Academy, North Carolina, and served as a major in Washington's army until 1779, when he was sent to re-enforce the army of Lincoln. In an engagement at Calson's Mill he was severely wounded, but was nevertheless able to take the field again a few months later on as brigadier-general. He was detached to follow the movements of Cornwallis, and if possible intercept his progress. On Feb. 1, 1781, Cornwallis proposed to cross the Catawba at Cowan's Ford. To prevent the crossing was impossible, and in the fight Davidson was killed. Davidson College, N. C., was named in his honor.

Davidson College: an institution of learning in Mecklenburg co., N. C.; founded in 1837, on an estate given for the purpose by William Lee Davidson, son of Gen. William Davidson, for whom the college was named. It was further endowed by a munificent gift of $258,000 from Mr. Maxwell Chambers, of Salisbury, N. C. It is under the control of the Presbyterian denomination, all the presbyteries of North Carolina, South Carolina, Georgia, and Florida being repre-

sented on its board of trustees. In 1900 the total number of graduates since organization was 818; number of students, 170; number of instructors, 10; number of volumes in library, 12,000. Rev. J. B. Shearer, D. D., is president.

Davies, Charles, LL. D.: U. S. military officer and mathematician; b. Jan. 22, 1798, in Washington, Conn.; graduated at West Point in 1815. After a year in garrison at New England posts, he resigned Dec. 1, 1816, and was attached to the Military Academy as assistant professor till May 1, 1823, when he was appointed Professor of Mathematics, holding his position till May 31, 1837, when he again resigned for a like position in Trinity College, Hartford, Conn. He was appointed paymaster U. S. army Nov. 17, 1841, holding office till Sept. 30, 1845, and was subsequently Professor of Mathematics and Philosophy in the University of New York 1848–49, and of Higher Mathematics in Columbia College, New York city, 1857–65. After leaving West Point in 1837 he devoted most of his time and talents to the preparation of a complete series of mathematical text-books, adopted largely in public schools. He was a member of several scientific and educational associations. D. at Fishkill Landing, N. Y., Sept. 18, 1876.

Davies, Henry Eugene, Jr.: lawyer and general; b. in New York, July 2, 1836; educated at Harvard, Williams, and Columbia Colleges; studied law, and was admitted to the bar in 1857. In April, 1861, he entered the army as captain Fifth New York Volunteers; was transferred July, 1861, as major to the Second New York Cavalry, of which regiment he subsequently became colonel, remaining in command till Sept., 1863, when he was commissioned a brigadier-general of volunteers, and assigned to a command in the cavalry corps of the Army of the Potomac, serving with distinction till the close of the war (brevet major-general of volunteers Oct., 1864). In June, 1865, he was made a major-general, and assigned to the command of the middle district of Alabama, which he held till Jan. 1, 1866, when he resigned. He was public administrator of the city of New York from Jan., 1866, to Jan., 1869, and assistant district attorney of the southern district of New York from July 20, 1870, to Dec. 31, 1872. D. at Middleboro, Mass., Sept. 6, 1894.

Davies, Sir John: poet and judge; b. in Wiltshire, England, in 1570; educated at Oxford. He was appointed solicitor-general of Ireland in 1603, and published in 1612 *A Discourse of the True Reasons Why Ireland has Never been Entirely Subdued*, an able work. In 1620 he was elected a member of the English Parliament. His chief poem, entitled *Nosce Teipsum* (1599), is a good type of the intellectual or metaphysical style of poetry, and from its clear and condensed expression of abstract thought has been likened to Pope's *Essay on Man*. Its influence can be traced in the writings of Sir William Davenant (*q. v.*) and other writers of philosophic verse. He became lord chief justice in 1626, and died Dec. 7, in the same year.

Davies, Louis Henry: member of Canadian Parliament; b. at Charlottetown, P. E. I., May 4, 1845, and educated at Prince of Wales College. He was admitted to the bar in 1866; has been solicitor-general, premier, and attorney-general of Prince Edward Island; entered the Dominion Parliament in 1882, and has been returned at each subsequent election up to and including that of 1891. He was one of the Canadian counsel before the International Fishery Commission at Halifax in 1877, and is now (1898) president of the Merchants' Bank of Prince Edward Island.

Neil Macdonald.

Davies, Samuel, D. D.: Presbyterian divine of Welsh descent; b. near Summit Ridge, Newcastle co., Del., Nov. 3, 1724. In 1747 he was ordained as an evangelist, and spent some years in missionary work in Hanover co., Va., organizing the first presbytery in Virginia in 1755. He was one of the founders of the College of New Jersey, and succeeded Jonathan Edwards as president of it in 1759. He was noted for his eloquence as a preacher. A collection of his sermons was published in London soon after his death. The last American edition, in three volumes (1851), contains an essay on the life and times of the author by Rev. Albert Barnes. D. in Princeton, N. J., Feb. 4, 1761.

Davies, Thomas: author of the *Life of David Garrick* (1780); b. probably in 1712; studied at Edinburgh, and became an unsuccessful actor in London, where he was also a bookseller and publisher. He was a friend of Dr. Samuel Johnson, who was warmly attached to him. Attacked by Churchill in the *Rosciad*, he was compelled by ridicule to leave the stage. D. in 1785. See Boswell's *Life of Johnson*.

Davila, or **De Avila**, dā-aa′vĕĕ-lăă, Alonzo: a Spanish soldier; b. about 1485. He went to America, and in 1518 was in Cuba, where he joined the expedition of Grijalva to the coast of Mexico, commanding one of his ships. Returning to Cuba (1519) he took service with Hernando Cortés, and during the march to Mexico was one of his most trusted captains. In 1520 he marched with Cortés against Narvaez, and subsequently, it would appear, was employed as an agent to the audience of San Domingo, where he obtained for Cortés authority to conquer and govern all of New Spain. Returning to Mexico, Davila was sent to Spain with the treasure which had been collected, and important dispatches (June, 1522). Near the Azores his ships were captured by French corsairs; all the treasure was lost, and Davila himself was held a prisoner for several years, though he succeeded in sending his dispatches to Spain. In the end he was ransomed, and returning to Spain was appointed *contador* of Yucatan, a province which had not yet been conquered. Montejo, the newly appointed governor of Yucatan, had equipped an expedition to take possession of his domain, and Davila accompanied him as second in command (1527). Soon after they arrived there Montejo sent him to a region on the west coast, in search of gold which had been reported; there his headstrong proceedings provoked conflicts with the Indians, Davila was unable to return, and after terrible sufferings made his way to Truxillo in Honduras. He subsequently rejoined Montejo, and in 1537 took part in another expedition to Yucatan. Of his subsequent career nothing is known.

Herbert H. Smith.

Davila, or **De Avila**, Alonzo: nephew of the soldier; b. in Mexico city about 1540. In 1566 he and his younger brother, Gil Gonzalez Davila, were accused of plotting to overthrow the government, murder the members of the audience, and make Martin Cortés (the Marques del Valle) King of New Spain. It is doubtful if such a scheme was ever seriously contemplated, or that the Davilas were guilty of anything more than discontent and grumbling; but they were tried, condemned, and beheaded at Mexico, Aug. 3, 1566. See Cortés, Martin.

Herbert H. Smith.

Davila, or **De Avila**, Gil Gonzalez: Spanish historian; b. at Avila, 1570. He studied at Rome, subsequently had a minor ecclesiastical office at Salamanca, and in 1612 was made royal chronicler of Castile. Among his works are *Vida del rey Henrique 3°* (1638) and *Teatro eclesiástico de las iglesias de las Indias occidentales* (1645 and 1649). D. at Madrid, 1658.

H. H. S.

Davila, Pedro Arias: See Pedrarias.

Davila y Padilla, Agustin: Mexican historian; b. in the city of Mexico, 1562. He entered the Dominican order in 1579, and was prior of the convent of Puebla de los Angeles in Tlascala; he was also a noted lecturer on philosophy and theology. In 1599 he visited Spain and Rome on business of his order, and was appointed Archbishop of Santo Domingo the same year. D. at Santo Domingo, 1604. His *Historia de la provincia de Santiago de Mejico* was first published at Madrid, 1596. There are later editions, that of Valladolid, 1634, having the title *Varia Historia de la Nueva España y Florida*. The work is primarily a history of the Dominicans in Mexico, but contains much of general interest.

Herbert H. Smith.

Davin, Nicholas Flood: Canadian author; b. at Kilfinane, Ireland, Jan. 13, 1843; educated privately and at Queen's College, Cork. He was admitted to the English bar in 1868, and was correspondent for the London *Standard* during the Franco-German war. He was sent to Washington, D. C., by the Canadian Government in 1879 to inquire into the system of managing Indian industrial schools; a secretary to the royal commission respecting the Pacific Railway 1880–81, and a delegate to Ottawa in 1884 to represent the requirements of the Northwest before the Dominion Government. He was elected to Parliament in 1887 and again in 1891. He established the Regina *Leader* in 1883. Among his works are *The Irishman in Canada*; *Eos: an Epic of the Dawn, and other Poems*; *British versus American Civilization*; *The Earl of Beaconsfield*; *Culture and Practical Power*; and *Ireland and the Empire*.

Davis, Andrew Jackson: See the Appendix.

Davis, Charles H.: landscape-painter; b. at Amesbury, Mass., Jan. 7, 1856. Pupil of Grundman, Boston, and Boulanger and Lefebvre, Paris; member Society of American

Artists 1886; honorable mention, Paris Salon, 1887; second-class medal, Paris Exposition, 1888; Palmer prize for landscape, Chicago Exposition, 1890; prize of $2,000, American Art Association (not a professional organization), 1887. His work is truthful in effect and good in color. His *Late Afternoon* is in the Union League Club, New York. He resided in Normandy for several years and painted there up to 1891, when he returned to the U. S. W. A. C.

Davis, Charles Henry, LL. D.: rear-admiral U. S. navy; b. in Boston, Mass., Jan. 16, 1807; entered the navy as midshipman Aug. 12, 1823. He was superintendent of the American *Nautical Almanac* 1849–56, and again 1859–61. In 1861 he was a member of a board of officers assembled at Washington to inquire into and report upon the condition of the Southern coast, its harbors and inlets, with a view to offensive operations on the part of the Government. This led to the organization of the expedition against Port Royal, in which he bore a conspicuous part as chief of staff. On May 9, 1862, Davis relieved Flag-officer Foote of the command of the Western flotilla off Fort Pillow, and on the following day beat off a squadron of eight ironclads, which had steamed up the Mississippi and attacked him. The vessels with Davis at the time were seven in number. The action was a spirited one, and lasted nearly an hour; three of the hostile gunboats were disabled, but, taking refuge under the guns of Fort Pillow, could not be captured. On June 5 Fort Pillow was abandoned by the Confederates, and on the 8th Davis fell in with their ironclads and rams opposite the city of Memphis. A running fight ensued, resulting in the capture of all the Confederate vessels but one, and the surrender of Memphis. For his services during the civil war Davis received the thanks of Congress, and was made a rear-admiral. On his return from the Mississippi he was appointed chief of the bureau of navigation, and in 1865 superintendent of the Naval Observatory, in which capacity he served for two years. In 1870 he was appointed to the command of the U. S. navy-yard at Norfolk, Va. He was reappointed superintendent of the observatory, and died there Feb. 18, 1877.

Davis, Cushman Kellogg, LL. D.: U. S. Senator; b. at Henderson, N. Y., June 16, 1838; A. B. University of Michigan 1857; studied law; first lieutenant Twenty-eighth Wisconsin Infantry 1862–64; U. S. district attorney for Minnesota 1868–73; Governor of Minnesota 1874–75; took his seat in the U. S. Senate as Republican Mar. 4, 1887; member of the peace commission 1898. D. Nov. 27, 1900.

Davis, David, LL. D.: jurist; b. in Cecil co., Md., Mar. 9, 1815; educated at Kenyon College, O.; studied law with Judge Bishop in Lenox, Mass., and in the Law School at New Haven, Conn. In 1836 he settled in Bloomington, Ill., where he resided many years; he was elected to the lower house of the Illinois Legislature 1844–45; to the constitutional convention which framed a new Constitution for the State 1847; elected judge of the eighth judicial circuit of Illinois in 1848; re-elected in 1855, and again in 1861. While serving this last term he was appointed by President Lincoln an associate justice of the Supreme Court of the U. S. Oct. 8, 1862. He resigned as U. S. judge, and was elected U. S. Senator from Illinois for the full term 1877–83; president *pro tem.* of U. S. Senate Oct. 13, 1881–Mar. 3, 1883. D. in Bloomington, Ill., June 26, 1886.

Davis, Emerson, D. D.: Congregational divine and author; b. at Ware, Mass., July 15, 1798; graduated at Williams College in 1821. He became in 1836 pastor of the First Congregational church in Westfield, where he remained for life. He exerted a wide influence in educational affairs. He was vice-president of Williams College from 1861 to 1868. He published *History of Westfield* (1826); *The Teacher Taught* (Boston, 1839); *The Half Century* (1851), etc. D. at Westfield, Mass., June 8, 1866.

Davis, Col. George R.: director-general of the World's Columbian Exposition; b. at Palmer, Mass., in 1840; educated at Williston Seminary; entered the army in 1862; became captain and afterward major of the Third Rhode Island Cavalry, and commanded the regiment in many important battles until the close of the war; was then transferred to the department of Missouri, and served under Gen. Sheridan and Gen. Custer; resigned from the army in 1871; went to Chicago and became agent of the Hartford Insurance Company; elected to Congress in 1878 as a Republican, and re-elected to the two succeeding Congresses; treasurer of Cook co., Ill., in 1886. D. Nov. 25, 1899.

Davis, Henry, D. D.: Presbyterian divine; b. at East Hampton, N. Y., Sept. 15, 1771. He graduated at Yale 1796; was a tutor in Williams (1796–98) and Yale (1799–1803) Colleges; Professor of Greek at Union College, Schenectady, N. Y., 1806–09; president of Middlebury College, Vt., 1809–17; president of Hamilton College, Clinton, N. Y., 1817–33. He was a preacher of very eminent ability, one of the founders of Auburn Theological Seminary, and an active friend of foreign missions. D. at Clinton, N. Y., Mar. 8, 1852. He wrote *A Narration of the Embarrassments and Decline of Hamilton College* (Clinton, N. Y., 1833).

Davis, Henry William Banks: landscape-painter; b. at Finchley, England, Aug. 26, 1833. Pupil of Royal Academy, London; lived for some time at Boulogne, and painted scenes on the French coast. Royal Academician 1877.

Davis, Henry Winter, LL. D.: statesman; b. at Annapolis, Md., Aug. 16, 1817. He was elected a member of Congress by the voters of Baltimore in 1855 and 1857. He was an eloquent speaker, and acted with the American party. In 1859 he was re-elected. Soon after the civil war began he became a radical Republican. He was chairman of the Committee of Foreign Affairs in the Thirty-eighth Congress (1863–65). D. in Baltimore, Dec. 30, 1865.

Davis, Jefferson, LL. D.: statesman; b. in Christian co., Ky., June 3, 1808; educated at Transvaal College, Ky., and at the West Point Military Academy; served in the army from 1828 to 1835, when he resigned and became a cotton-planter in Mississippi. He began to take an active part in politics in 1843; in 1844 was one of the presidential electors to vote for Polk and Dallas, and in 1845 represented his district in Congress, where he figured prominently in the debates on the Oregon question and the reform of the tariff. At the outbreak of the Mexican war he was placed in command of a regiment of Mississippi volunteers, and served with distinction till July, 1847, being present in the battles of Monterey and Buena Vista. In 1848 he entered the U. S. Senate, where he stood firmly for the maintenance of State rights and of slavery, but resigned in 1851 to become the Democratic candidate for Governor in Mississippi. Though defeated he reduced the majority of the opposition to a small fraction of what it had been in the previous contest. In the election of 1852 he was an active supporter of Franklin Pierce, whose Secretary of War he became. His administration of this office was able, popular, and marked by the introduction of improvements in military tactics, armaments, coast defenses, and means of transportation. Re-elected to the Senate for the term ending Mar. 4, 1863, he opposed the efforts of Douglas in behalf of squatter sovereignty, advocating in place of that measure the extension of the Missouri Compromise line westward to the Pacific. Though unwavering in his devotion to the principle of State sovereignty, he advocated to the last the preservation of the Union. But when Mississippi seceded (Jan., 1861) Davis at once took leave of the Senate, and was unanimously chosen provisional President of the Confederacy by the Congress which met at Montgomery, Ala. In Nov., 1861, he was elected President of the Confederate States, with whose history for the next four years his career is closely identified. (See Confederate States.) His administration has been viewed with widely different opinions. Both in the South and in the North he was accused of faithlessness to his oft-asserted belief in State sovereignty, on account of his alleged intention to coerce any recalcitrant member of the Confederacy, while the reverses of Gettysburg and Vicksburg and the wretched mismanagement of the finances brought upon him the bitterest censure. But it seems to be the prevailing opinion that, however he may have erred in judgment, he was at heart sincerely and thoroughly loyal to the ill-fated Government. At the end of the war he was captured and imprisoned at Fortress Monroe two years. He was indicted May 8, 1866, for treason, but admitted to bail May, 1867, and pardoned in the general amnesty of December, 1868. The attempt in 1876 to except him from the amnesty of that year on the ground of connivance at the atrocities committed against Union prisoners proved unsuccessful. He remained true to his doctrine of State rights, promising its ultimate triumph in spite of its present perils, and in 1881 he published *The Rise and Fall of the Confederate Government*, which contains an exhaustive discussion on the subject and vindicates his policy as President. His death, Dec. 6, 1889, was the occasion of public mourning throughout the South, and the action of the administration in refusing to display the signs of mourning upon the War Department

building gave rise to adverse comment from his friends. His body was removed from New Orleans and interred at Richmond May 31, 1893, with appropriate ceremonies, but without that display of sectional bitterness which has sometimes accompanied events which revived the memories of the lost cause in the South. F. M. Colby.

Davis, Jefferson C.: general; b. in Clarke co., Ind., Mar. 2, 1828; served in the Indiana volunteers in the Mexican war; second lieutenant First Artillery 1848; captain May, 1861; brigadier-general volunteers Dec., 1861, to July, 1866; colonel infantry July, 1866. He was one of the garrison of Fort Sumter when it was bombarded by the insurgents in Apr., 1861. He commanded a division at the battle of Stone River, which ended Jan. 2, 1863, and a corps of the army of Gen. Sherman in the march from Atlanta to the sea, in Nov. and Dec., 1864. D. in Chicago, Ill., Nov. 30, 1879.

Davis, Mrs. Jessie Bartlett: operatic contralto singer: b. in Chicago, Ill., in 1860; was a church singer, and joined the Chicago Church Choir Opera Company to sing in *Pinafore*, in which she won success as Little Buttercup; at fifteen she sang with Caroline Richings in her Old Folks concerts, and in 1882 sang Sicbel to Patti's Marguerite in the Mapleson Company at the New York Academy of Music. She joined the American Opera Company as leading contralto in 1886. Her husband, W. J. Davis, was the manager of the Chicago Church Choir Opera Company. D. E. Hervey.

Davis, John: English navigator of the sixteenth century: b. in Sandridge about 1550; made three voyages to find the northwest passage to the East Indies. On the first he discovered the strait bearing his name, 1585; on the third, 1587, he reached the strait afterward explored by Hudson. D. at sea, near the coast of Malacca, in Dec., 1605. See his *The World's Hydrographical Description* (1595).

Davis, John, LL. D.: U. S. Senator; b. in Northborough, Mass., Jan. 13, 1787; graduated at Yale in 1812. He was elected a member of Congress in 1824, and Governor of Massachusetts 1833–35 and 1840–41. In 1835 he was chosen a Senator of the U. S. for six years by the Whigs, and again elected in 1845. He advocated a protective tariff, opposed the Mexican war, the introduction of slavery into the Territories, and the compromise acts of 1850. He was often called "Honest John Davis." D. in Worcester, Mass., April 19, 1854.

Davis, John Chandler Bancroft, LL. D.: diplomatist; b. at Worcester, Mass., Dec. 29, 1822; educated at Harvard, studied law and followed the practice of his profession. In 1849 he was appointed secretary of legation at London, but returned to the U. S. in 1852, and resumed his profession. He was assistant Secretary of State 1869–71; agent of the U. S. at Geneva during the meeting of the tribunal of arbitration for the settlement of all points of difference between the U. S. and Great Britain 1871–72; assistant Secretary of State 1873–75; U. S. minister at Berlin in 1875, and judge of the U. S. court of claims in 1877; assistant Secretary of State 1881–82; became a reporter of the U. S. Supreme Court 1883.

Davis, Sir John Francis, Bart., K. C. B.: British officer and Orientalist; b. in London in 1795. He first went to China in 1816. He was chief superintendent at Canton, and in 1841–48 governor of Hongkong. Among his works is *The Chinese, a General Description of China and its Inhabitants* (2 vols., 1836). He wrote several works upon Chinese literature. D. Nov. 13, 1890.

Davis, John Lee: rear-admiral U. S. navy; b. at Carlisle, Sullivan co., Ind., Sept. 3, 1825; entered the navy as a midshipman Jan. 9, 1841. He was the executive officer of the Waterwitch in her engagement (Oct. 12, 1861) with the Confederate ram Manassas, and afterward with a squadron off Pilot Town, at the mouth of the Mississippi. He commanded the gunboat Wissahickon 1862–63, and the ironclad Montauk in the summer and fall of 1863, participating in many battles. In command of the Sassacus, he took part in the Fort Fisher fights, and was recommended for promotion by Admiral Porter. D. Mar. 12, 1889.

Davis, Matthew L.: writer; b. in New York in 1766; was an intimate friend of Aaron Burr; under the pen-name of "The Spy in Washington" he wrote letters from Washington to the New York *Courier and Enquirer*, and under that of "The Genevese Traveler" contributed letters to the London *Times*. His chief work is *Memoirs of the Life of Aaron Burr* (2 vols., 1836–37). D. June 21, 1850.

Davis, Rebecca (*Harding*): novelist; b. at Washington, Pa., June 24, 1831. She was married in 1863 to L. Clark Davis, then editor of the Philadelphia *Inquirer*. Among her short stories contributed to the magazines, *Life in the Iron Mills*, originally published in the *Atlantic Monthly*, attracted perhaps the most attention. She has written a number of novels, including *Dallas Galbraith* (1868); *A Law Unto Herself* (1878). H. A. B.

Davis, Richard Harding: author and editor; b. in Philadelphia, Pa., Apr. 18, 1864; son of L. Clark Davis, journalist and author, and Rebecca (*Harding*) Davis, the novelist. He was educated at Lehigh University, Lehigh, Pa., and Johns Hopkins University, Baltimore, Md., paying especial attention to studies adapted to fit him for a journalistic career; was a reporter on the *Press* and other Philadelphia newspapers; in 1888 joined the staff of the New York *Evening Sun*, to which he contributed some of his best short stories; in 1890 was managing editor of *Harper's Weekly*; author of *Gallegher and Other Stories*: *Stories for Boys* (1891); *Van Bibber and Others*; *The West from a Car Window* (1892); *The Princess Aline*; *Soldiers of Fortune* (1897); *The King's Jackal*; *The Cuban and Porto Rican Campaigns* (1898).

Davis, William Morris, M. E.: meteorologist and geographer; b. in Philadelphia, Pa., Feb. 12, 1850; educated at the Lawrence Scientific School and Harvard University. In 1866, at the age of sixteen, he made one of the two observations in the U. S. on the new star *T Coronæ borealis*. From 1870 to 1873 he was assistant in the Argentine National Observatory at Córdoba, and on his return he crossed South America. He was made instructor in Geology in Harvard University in 1876, and Professor of Physical Geography in 1890. He is a director of the New England Meteorological Society and a corresponding member of the German Meteorological Society. He is a prolific writer, having published numerous scientific articles and studies, and his published lectures on *Whirlwinds, Cyclones, and Tornadoes* (1884) are a valuable introduction to meteorology. M. W. Harrington.

Davis's Strait (named in honor of Capt. John Davis, *q. v.*): a strait connecting Baffin's Bay with the Atlantic Ocean; lies between Greenland and British North America. It is about 160 miles wide at the narrowest part. A constant current runs southward through this strait from the circumpolar regions. Davis's Strait is frequented by many whaling ships, and became, after its discovery in 1585, the starting-point for the expeditions to find the northwest passage to India.

Da'vits (plu.): the wooden or iron frame used for hoisting and lowering boats on shipboard. The "fish-davit" is a gaff used in fishing the anchor. Boat-davits have been to some extent superseded by ingenious Boat-lowering Apparatus (*q. v.*).

Davitt, Michael: Irish political leader; b. at Straide, Mayo, Ireland, in 1846. His parents were of the poorer class of Irish peasantry, and when he was five years old his father was evicted. Michael worked in a cotton-factory in Lancashire, where he lost his right arm; then, from the age of fifteen to twenty-two, in a printing-office; joined the revolutionary movement begun by James Stephens in 1866; in 1870 was arrested on indictment of treason-felony and sentenced to fifteen years' penal servitude; released on ticket-of-leave after serving seven years and a half; in 1879 started the land agitation in his native county; Oct., 1879, in conjunction with Mr. Parnell and others, founded the Land League and became its most prominent manager; became superintendent of the organization of the American Land League 1880; arrested Feb. 3, 1881, on account of the state prosecution of the executive of the Land League, and went to Portland prison on the revocation of his ticket-of-leave; again released on ticket-of-leave after fifteen months of imprisonment; has served two other terms of imprisonment; an incessant propagandist of Land League and nationalist principles. While imprisoned in Portland, 1882, was elected member of Parliament, but was disqualified. He was one of those accused in the articles on Parnellism and Crime in *The Times*, and defended himself in a powerful speech (1889). In 1891 he visited the U. S., and in July, 1892, was returned to the House of Commons as member for North Meath. On May 8, 1893, he was declared bankrupt, and accepted the stewardship of the Chiltern Hundreds.

C. H. Thurber.

Da'vors, Jo: author of a work, now rare and valuable, called *The Secrets of Angling* (London, 1613). This work

is quoted by Walton, and the writer's name is doubtless a fictitious one. The authorship has been ascribed to John Donne, John Davisson, John Davies, and other writers of that day.

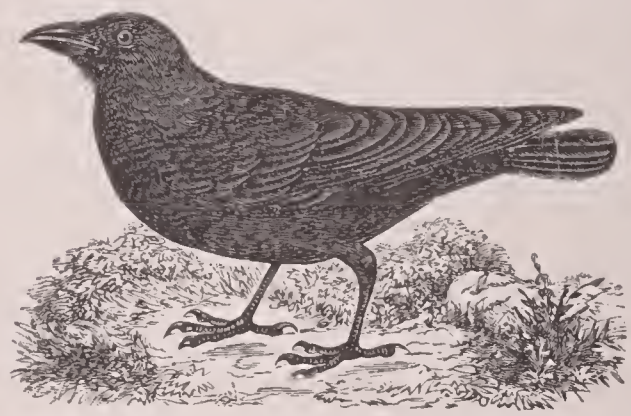
Davout, daă'voo', or **Davoust**, Louis Nicolas, Duke of Auerstadt and Prince of Eekmühl: French marshal; b. near Noyers, Yonne, May 10, 1770. He was a fellow-student of Bonaparte at Brienne, and entered the army in early youth. In 1793 he gained the rank of general of brigade, and in 1798 went with Bonaparte to Egypt. He became a general of division in 1800, and commanded the cavalry of the army of Italy in that year. Having received a marshal's baton in 1804, he led the right wing at Austerlitz in Dec., 1805, and defeated the Prussians at the battle of Auerstadt, Oct. 14, 1806. For his services at Eekmühl he was created Prince of Eekmühl in 1809. He took part in the Russian campaign of 1812, and was wounded at Borodino. He was afterward governor of the Hanse towns, and defended Hamburg for several months against the allies. During the Hundred Days (1815) he was Napoleon's Minister of War. He was commander-in-chief of the French armies in 1815, after the battle of Waterloo, and in 1819 was made a peer of France. D. in Paris, June 1, 1823. See his *Correspondence* (1885); Chénier, *Vie du Maréchal Davout* (1866); and his *Life* by his daughter, the Marquise de Bloequeville (1879–80).

Davy, Sir Humphry, Bart., F. R. S.: chemist; b. Dec. 17, 1778, at Penzance, in Cornwall, England. At an early age he displayed a taste for fiction and poetry, and when eleven years old is said to have composed part of an epic of which the hero was Diomede, son of Tydeus. Even in this work he manifested great powers of imagination and invention. He has left some respectable fugitive poems of a later date. His father died when he was sixteen, and shortly afterward Gregory Watt, son of the inventor James Watt, took lodgings at his mother's house. The young men were congenial in tastes, and a warm intimacy grew up between them, which seems to have played an important part in determining the studies and directing the genius of young Davy. But to Mr. Davies Gilbert the cause of science is still more indebted for the encouragement which he early gave to Davy, and finally for presenting him to the notice of the Royal Institution in London. In 1795 Davy became an apprentice to an apothecary, and in 1798 was taken as an assistant by Dr. Beddoes, of Bristol, who had founded a Pneumatic Institution. The next year appeared his first contribution to science, under the name of *Essays on Heat and Light, with a New Theory of Respiration*, which formed part of a volume published by Dr. Beddoes. In 1800 his *Researches, Chemical and Philosophical, chiefly concerning Nitrous Oxide and its Respiration*, attracted much attention among scientists. These *Researches* made known his discovery of the peculiar intoxicating or exhilarating properties of nitrous oxide gas, and contain, besides, the result of interesting and dangerous experiments on the respiration of nitrogen, hydrogen, carburetted hydrogen, carbonic acid, and nitrous gases. In 1801 he lectured for the first time before the Royal Institution, in which he was made a professor in 1802. He was pre-eminently successful as a lecturer. In 1807 he delivered before the Royal Society his second Bakerian lecture, in which he gave an account of the decomposition by galvanism of the fixed alkalies, his great achievement, by which he proved that these alkalies are merely metallic oxides. It has been justly said that since the time of Sir Isaac Newton no contribution has been made to the *Philosophical Transactions* equal in importance to Davy's account of this great discovery. It is lamentable that one whose intellectual gifts were of so high an order should not have been above the intoxication of fame. Yet it is true that after Davy's rapid rise to fame he was sometimes guilty of an overbearing spirit, especially in his relation to younger seekers for distinction, a circumstance the less justifiable when we consider how much he himself owed to the kindness and generosity of scientific men. He was knighted in 1812, and not long afterward he married a widow (Mrs. Apreece) of accomplishments and fortune. He was made a baronet in 1818. One of the most important of his inventions is the safety-lamp (1815–17). He became president of the Royal Society in 1820, and was elected to that office for seven succeeding years. In 1827 his failing health compelled him to resign. D. at Geneva, May 28, 1829.

The following are a few of his many important works: *Elements of Chemical Philosophy* (1812); *Elements of Agricultural Chemistry* (1813); papers concerning *Firedamp*, etc.; and accounts of his researches relating to *Oxymuriatic Acid* and *Fluoric Compounds*. After his death were published his *Consolations in Travel*, consisting principally of reflections and speculations of a religious nature. Davy appears to have been endowed to the fullest extent with all those gifts necessary to a profound student of the laws of nature. His intellect was at once comprehensive and penetrating, and he possessed, in addition, an inexhaustible invention and fertility in resources, joined to an enthusiasm which no difficulties could discourage. See *Life of Sir Humphry Davy*, by Dr. J. A. Paris (1831); *Memoirs of the Life of Sir Humphry Davy*, by his brother, Dr. John Davy (1836).

Davy, John, M. D.: a brother of Sir Humphry Davy; b. at Penzance, Cornwall, May 24, 1791; received his medical education at Edinburgh, graduating in 1814; entered the British army service, and was on duty chiefly in foreign parts. He published various professional and other works, of which the best known is a *Life* of his illustrious brother. He was himself an able scientific observer. D. Apr. 24, 1868.

Daw, or **Jackdaw**: the *Corvus monedula*; a bird of the crow family, found in Europe, Asia, and Africa; 14 inches long, black, with a smoky-gray neck. Daws are very cun-



Daw, or jackdaw.

ning, social, and active birds, often nesting in church-towers and old castles. They build a nest of sticks, of which they sometimes collect a large quantity. They frequent large towns.

Dawant, Albert Pierre: figure-painter; b. in Paris, Sept. 21, 1852. Pupil of Jean Paul Laurens; second-class medal, Salon, 1885; first-class, Paris Exposition, 1889. His style resembles that of his master. *Bark of St. Julian the Hospitaller* (1885) is one of his principal works. Studio in Paris. W. A. C.

Dawes, Henry Laurens: statesman; b. at Cummington, Mass., Oct. 30, 1816; graduated at Yale College in 1839; taught school, and edited the Greenfield *Gazette* and Adams *Transcript*; studied and practiced law; received the degree of Doctor of Laws from Williams College and Yale College. He was a member of the House of Representatives of Massachusetts in 1848, 1849, and 1852; and of the Senate of Massachusetts in 1850; was a member of the State constitutional convention of Massachusetts in 1853; district attorney for the western district of Massachusetts from 1853 until 1857; elected a representative in the 35th, 36th, 37th, 38th, 39th, 40th, 41st, 42d, and 43d Congresses; declined being a candidate for election to the 44th; was elected to the U. S. Senate as a Republican, to succeed Charles Sumner (whose unexpired term had been filled by William B. Washburn); took his seat Mar. 4, 1875, and was re-elected in 1881 and 1887. His term of service expired Mar. 3, 1893, and he declined re-election. He occupied a prominent position as member of the committees on appropriations, ways and means, civil service, fisheries, etc.; introduced many tariff measures, and bills improving the status of the Indians.

Dawes, Richard: text critic and grammarian; b. in Cambridge, England, in 1708; head master in Newcastle, later in Henworth, where he died in 1766. He was noted for his learning and his ingenuity as a critic. He was a violent opponent of Richard Bentley (see Monk's *Life of R. Bentley*, ii., pp. 367–71). Chief work, *Miscellanea Critica* (London, 1744; 5th ed. 1827). Alfred Gudeman.

Dawison, daa'vče-sōn, Bogumil: German actor; b. at Warsaw, May 18, 1818, of Jewish stock. From 1852 to 1866 he was engaged at the Royal theater in Dresden, where his renderings of Shakspeare's, Goethe's, and Schiller's characters were much admired. D. in Dresden, Feb. 2, 1872.

Dawson: town in Canada. See the Appendix.

Dawson: town; on railway; capital of Terrell co., Ga. (for location of county, see map of Georgia, ref. 6-G). It has a car-factory, and contains the South Georgia Male Institute. Pop. (1880) 1,576; (1890) 2,284; (1900) 2,926.

Dawson, George Mercer, LL. D., F. R. S., etc.: geologist, geographer, and ethnographer; b. in Pictou, Nova Scotia, Aug. 1, 1849; son of John William Dawson (*q. v.*); educated at McGill College and at the London School of Mines; naturalist to H. M. North American boundary commission 1873–75; member of the Geological Survey of Canada from 1875, and is now the director; Bering Sea commissioner on the part of Great Britain 1891–92. As a member of the Geological Survey he has been principally engaged in the exploration and survey of the Northwest Territory and British Columbia, traversing the wilderness with small parties, making maps of regions previously unknown, and gathering data as to the geology, natural history, and aboriginal inhabitants. His official reports are included in the publications of the survey since 1878. His geographic and geologic generalizations have been published in a series of essays in scientific journals. Among these are *On the Superficial Geology of the Central Region of North America* (*Quart. Jour. Geol. Soc.*, vol. xxxi.); *On the Superficial Geology of British Columbia* (*ibid.*, vol. xxxiv.); *Sketch of the Geology of British Columbia* (*Geol. Mag.* Dec. ii., vol. viii.); *On the Later Physiographical Geology of the Rocky Mountain Region of Canada* (*Trans. Royal Soc. Can.*, vol. viii.); he has also published a *Geography of Canada* (Macmillan's Geog. Series, 1892). G. K. G.

Dawson, Henry Barton: See the Appendix.

Dawson, Sir John William, LL. D., F. R. S.: geologist; b. in Pictou, Nova Scotia, Oct. 13, 1820; son of a Scotch immigrant; educated at Pictou College and Edinburgh University; made a special study of the geology and mineralogy of Nova Scotia and New Brunswick; in 1842 accompanied Sir Charles Lyell on a scientific tour through Nova Scotia, and again in 1852; published accounts of his discoveries in geology in the *Proceedings of the Geological Society of London*; in 1846 returned to Edinburgh for further study; in 1850–53 superintendent of education in Nova Scotia; in 1855 became principal of McGill College, Montreal, and Professor of Natural History; subsequently was made vice-chancellor; in 1857 established McGill Normal School, and became its principal, and in 1858 a school of civil engineering. In 1854 he was elected a fellow of the Geological Society of London; in 1862 of the Royal Society; in 1882 was elected president of the American Association for the Advancement of Science and of the Royal Society of Canada; in 1886 president of the British Association. In 1885 he was knighted. The most important of his geological discoveries, that of the *Eozoon canadense* of the Laurentian rocks, believed to be the lowest form of animal life, was made in 1864, and is recorded in *Devonian and Carboniferous Flora of Eastern North America*. He has been from the beginning an opponent of the Darwinian theory of evolution. Among his principal works published are *Handbook of the Geography and Natural History of Nova Scotia* (1848); *Acadian Geology* (1855; enlarged ed. 1868); *Archaia, or Studies of the Cosmogony and Natural History of the Hebrew Scriptures* (1859); a popular treatise on geology, *The Story of the Earth and Man* (1873); *Science and the Bible* (1875); *The Origin of the World* (1877); *Fossil Men and their Modern Representatives* (1880); *Egypt and Syria* (1885); *Modern Science in Bible Lands* (1888); *The Geological History of Plants* (1888); *Modern Ideas of Evolution* (1890). D. Nov. 20, 1899.

Dawson, Simon James: Canadian civil engineer; b. in Scotland in 1824; removed to Canada with his parents when young. He was appointed by the Canadian Government in 1851 to plan and superintend extensive works on the St. Maurice river; in 1857 to explore the country from Lake Superior westward to the Saskatchewan; and in 1868 began the construction of the route to the Red river, since known as the *Dawson Route*. In 1870, under Government instructions, he provided boats and *voyageurs* and conveyed the Red river expeditionary force to the scene of the insurrection. He was one of a joint commission which concluded a treaty with the Salteaux tribe of Indians in 1873, and was a member of the Ontario Legislature 1874–78, and of the Dominion Parliament 1878–91. Neil Macdonald.

Dawson, William James: minister of the Wesleyan (M. E.) Church; b. Nov. 21, 1854, at Towcester, England; educated at Kingswood School, Bath, and Didsbury College, Manchester. Editor of *The Young Man*; author of *A Vision of Souls* (1884); *The Threshold of Manhood* (1889); *The Makers of Modern English*; *A Popular Guide to Modern Poets* (1890); *The Redemption of Edward Straham* (1891); *The Church of To-morrow* (1892). C. H. T.

Dax, daax (anc. *Aquæ Augustæ*): a town of France; department of Landes; pleasantly situated on the Adour; 25 miles N. E. of Bayonne (see map of France, ref. 8-C). It has a cathedral, a bishop's palace, and some manufactures of earthenware, brandy, leather, etc. Here are hot saline springs, which were used for bathing by the ancient Romans, and are still frequented by invalids. Pop. (1896) 10,196.

Day (in Lat. *dies*; Fr. *jour*; Ger. *Tag*): either the interval of time during which the sun is above the horizon, or the time occupied by a complete revolution of the earth with reference to other celestial bodies. In the latter sense it denotes intervals of different duration, according as the body with which the revolution is compared is fixed or movable.

The astronomical or solar day, also designated the apparent day, is the time which elapses between two consecutive returns of the same terrestrial meridian to the center of the sun. Astronomical days are of unequal length for two reasons: 1, the unequal velocity of the earth in its orbit, which results in a greater apparent daily motion of the sun in winter than in summer; 2, the obliquity of the ecliptic, which causes the sun's apparent daily motion in right ascension (or in the plane of the earth's equator) to be less at the equinoxes than at the solstices. The astronomical day is computed from noon to noon.

The civil day, or mean solar day, is the time occupied by the earth in one revolution on its axis as compared with the sun. It is supposed to move at a *mean* rate in its orbit, and to make 365·2425 revolutions in a mean Gregorian year. This mode of measuring time makes the days all of equal length, and any special hour of the civil day sometimes precedes, and sometimes succeeds, the corresponding hour of the astronomical day. Most nations agree in fixing the beginning and end of the civil day at midnight.

The sidereal day is that portion of time which elapses between two successive culminations of the same star. Owing to the great distance of the stars and their apparent fixedness in space, it is not perceptibly affected by the earth's orbital revolution, as is proved by all known astronomical observations. A sidereal day contains twenty-three hours fifty-six minutes four seconds of mean solar time. It is divided into twenty-four sidereal hours, which are subdivided into sidereal minutes and seconds. This is the universal astronomical mode of computing time.

The Jews, who used a lunar calendar, reckoned the day from evening to evening. The day was divided in different manners—in three or in six parts of unequal length. Before the Captivity the night was divided into three watches. When the New Testament mentions four watches the reason is that in the meantime the Græco-Roman division of the night had been adopted. Hours were probably derived from Babylon, as was the dial. At the time of our Lord the division was common, however. The Sabbath was the only day which had a name; the others were simply numbered. See Earth, The.

Day, George Edward, D. D.: theologian; b. at Pittsfield, Mass., Mar. 19, 1815; graduated at Yale 1833, and at the Yale Theological Seminary 1838; assistant instructor in Sacred Literature there 1838–40; was twice settled in the ministry, from 1840–47 in Marlboro, Mass., and from 1848–51 in Northampton, Mass.; from 1851–66 was Professor of Biblical Literature in Lane Theological Seminary, and since 1866 has been Professor of the Hebrew Language and Literature and Biblical Theology in the theological department of Yale College. He has taken great interest in the instruction of the deaf and dumb, and has published (1845–61) two reports on the subject. From 1863 he edited the *Theological Eclectic* until 1871, when it was united with the *Bibliotheca Sacra*. He translated and edited Van Oosterzee's *Titus* in Lange's *Commentary*, and also translated (1871) Van Oosterzee's *Biblical Theology of the New Testament*. He was one of the contributors to Smith's *Bible Dictionary*, and has

published articles in several reviews. He edited the American edition of Oehler's *Biblical Theology of the Old Testament* (New York, 1883). Revised by GEORGE P. FISHER.

Day, HENRY NOBLE, D. D., LL. D.: author and educator; b. at New Preston, Conn., Aug. 4, 1808; graduated at Yale in 1828, and in Yale Divinity School 1834; ordained to the Congregational ministry at Waterbury, Conn., in 1836; Professor of Sacred Rhetoric at Western Reserve College, O., 1840–48. He was a railroad president for many years, and president of the Ohio Female College 1858–64. Among his numerous educational works are *The Art of Elocution* (New Haven, 1844); *Elements of Logic* (New York, 1867); *The Science of Æsthetics* (1872); *Science of Thought* (1886); *Elements of Mental Science* (1889). D. Jan. 12, 1890.

Day, JAMES ROSCOE: See the Appendix.

Day, JEREMIAH, D. D., LL. D.: educator; b. in New Preston, Conn., Aug. 3, 1773; graduated at Yale College in 1795; ordained to the ministry in 1796; became in 1801 Professor of Mathematics and Natural Philosophy in Yale College, and was president of the same (1822–46). Included in his series of mathematical text-books are an *Introduction to Algebra* (1814) and *Navigation and Surveying* (1817). He wrote, also, *An Inquiry Respecting the Self-determining Power of the Will* (1838) and *An Examination of President Edwards on the Will* (1841). D. in New Haven, Conn., Aug. 22, 1867.
Revised by GEORGE P. FISHER.

Day, JOHN: a dramatist of the Elizabethan age, of whose life nothing is known. Six dramas of his have come down to us, of which the most remarkable is *The Parliament of Bees*, a unique production, as singular as it is charming. *The Isle of Gulls*, founded upon Sir Philip Sidney's *Arcadia*, was printed in 1606.

Day, THOMAS: English author; b. in London, June 22, 1748; became heir to an ample fortune. He sympathized with the American patriots, and wrote two poems, entitled *The Devoted Legions* (1776) and *The Desolation of America* (1777). He selected from a foundling hospital two girls, whom he educated according to the system of Rousseau, with an intention to marry one of them; but he was disappointed by the ill success of his experiment, and married Miss Esther Milnes in 1778. He was a consistent though eccentric philosopher, "too deeply in earnest to submit to the ordinary compromises of society" (Leslie Stephen). His chief work is *Sandford and Merton* (1783–89, 3 vols.), a popular juvenile tale of great merit. He was killed by being thrown by an unbroken colt, Sept. 28, 1789. See his *Life* by James Keir (London, 1791) and by J. Blackman (1862).

Day, WILLIAM R.: See the Appendix.

Day-lily: a perennial lily-like plant of the genus *Hemerocallis*. Day-lilies have fleshy fibrous roots and long and linear-keeled leaves, two-ranked at the base of the scapes, which have at the top several large yellow flowers. The latter collapse and decay after expanding for a single day. Several varieties are cultivated in gardens.

Daysman: an archaic or obsolete term for mediator, arbiter, or umpire found in English literature from the fifteenth century onward, and said to be dialectal still in the north of England. In the 1551 version of the Bible it is found in 1 Sam. ii. 25, and in Coverdale's version (1535) it occurs in Job ix. 33: "Neither is there eny dayes man to reproue both the partes, or to lay his honde betwixte us," and this rendering of the Hebrew מוֹכִיחַ has been retained in the Authorized Version.

Dayton: city; Campbell co., Ky. (for location of county, see map of Kentucky, ref. 2–I); situated on the Ohio river, 2 miles from Cincinnati, O. Pop. (1890) 4,264; (1900) 6,104.

Dayton: a handsome city and important railway center; capital of Montgomery co., O. (for location of county, see map of Ohio, ref. 6–C); on the E. bank of the Great Miami, at the mouth of the Mad river; 60 miles N. N. E. of Cincinnati, and 67 miles W. by S. of Columbus; lat. 39° 44′ N., lon. 84° 11′ W. The Miami Canal passes through it, connecting the Ohio with Lake Erie. There are 52 churches, among which the First and Second Presbyterian and Grace (M. E.), built of Dayton marble, are fine specimens of architecture. The city has a fine marble court-house, 15 public schools, a high school, the St. Mary's (Catholic) Institute for boys, and Deavor's College, a preparatory academy for boys. It has a public library of 9,680 volumes (not including over 3,000 pamphlets), 7 national banks, 4 local insurance companies, 5 daily, 3 weekly, 1 tri-weekly and 2 weekly (German), and 3 weekly religious papers; also 3 semi-monthly and 5 monthly publications. It has a large water-power, and is lighted with electricity and gas. Natural gas is supplied from Mercer co., O., 48 miles distant, and the Indiana field. Ten railways enter the city, with 152 passenger trains daily.

Manufactures.—The U. S. census for 1890 shows 920 manufacturing establishments, with a capital of $12,805,231, giving employment to 11,779 persons, at an annual wage of $5,772,371; cost of materials, $11,478,411; value of product, $22,049,906. The assessed valuation of property is given as $43,741,840, and the municipal debt as $3,077,500. A very extensive manufactory of railway cars, a number of large agricultural-implement works, with about 10,000 hands, seven large breweries, factories for the manufacture of stoves, paper, cotton, and woolens, and extensive limestone quarries aid in making Dayton a place of great industrial activity. The National Cash Register Co. employs about 2,000 people and covers nearly two blocks with its buildings.

Dayton is the center of a very extensive system of interurban electric railways—five now completed and three more under active construction—making a network to surrounding cities from 10 to 30 miles distant.

Here is the National Soldiers' Home for disabled volunteer soldiers, on whose roll are the names of 7,500 veterans. It has an admirable hospital, a library of 5,000 volumes, and extensive grounds—700 acres. The streets of Dayton, 22 miles paved with brick and asphalt, some of them 133 feet wide, cross each other at right angles, and twenty-six macadamized pikes radiate from the city. The city is in the heart of the Miami valley, a beautiful and productive region. Pop. (1870) 30,473; (1880) 38,678; (1890) 61,220; (1900) 85,333.
EDITOR OF "HERALD."

Dayton: city; capital of Rhea co., Tenn. (for location of county, see map of Tennessee, ref. 7–H); on railway, 38 miles N. of Chattanooga; in a coal-mining region. It has smelting furnaces, brick-yards, flouring-mills, machine-shops, etc. Pop. (1890) 2,719; (1900) 2,004.

Dayton: city; capital of Columbia co., Wash. (for location of county, see map of Washington, ref. 6–J); on Union Pacific and Wash. and Col. Riv. R. Rs.; 35 miles from Walla Walla; has water-works and electric lights. It is situated in the heart of a rich agricultural country, 9 miles from Blue Mountains, which afford a fine summer resort. Pop. (1880) 996; (1890) 1,880; (1900) 2,216.
EDITOR OF "COLUMBIA CHRONICLE."

Dayton, JONATHAN, LL. D.: statesman; b. at Elizabethtown, N. J., Oct. 16, 1760. He served with distinction in the Revolutionary war, and was a delegate from New Jersey to the convention which framed the Federal Constitution in 1787. In 1791 he was elected a member of Congress, in which he acted with the Federal party. He was Speaker of the House of Representatives for two terms (1793–97), and was chosen a Senator of the U. S. in 1799. D. at Elizabethtown, N. J., Oct. 9, 1824.

Dayton, WILLIAM LEWIS, LL. D.: statesman; b. in Somerset co., N. J., Feb. 17, 1807. He studied law, was admitted to the bar in 1830, and practiced at Trenton. In 1842 he was appointed a Senator of the U. S. to fill a vacancy, and in 1845 he was elected for the full term. He voted with the Whigs, opposed the extension of slavery, spoke against the annexation of Texas, and disapproved of the fugitive slave law. In 1856 he was nominated as the Republican candidate for Vice-President, but was not elected. He was appointed minister to France in 1861. D. in Paris, Dec. 1, 1864.

Daza, daa′zăă, HILARION: Bolivian soldier; b. at Sucre about 1838. His father's name was Grossolí, but he dropped it for unknown reasons; joined a revolutionary party in 1858, took part in various disturbances, and was a major under President Melgarejo. He was accused of murdering the poet Galindo, who had taken part in the rebellion of Flores in 1865. At another time, when a revolt occurred at Sucre, he carried the news to La Paz, riding, by change of horses, 50 leagues a day. This promptness caused the failure of the revolution and won him the grade of colonel. In 1870 he betrayed Melgarejo, joining Morales. Daza was proclaimed President of Bolivia May 4, 1876. On Mar. 1, 1879, he declared war on Chili, owing to the seizure of Atacama; joined the Peruvian forces at Arica and Tacna in April, but showed himself incompetent to command. Urged by the Peruvian president, Prado, he at last set out with 3,000 men for the relief of Tarapaca Nov. 11, but turned back on the 16th,

On Dec. 27 his soldiers mutinied, and Daza fled to Arequipa, intending to return to Bolivia, but on learning that his government had been overturned at La Paz and Campero declared president he retired to France. Later he went to Peru, then to Bolivia, where he was assassinated Feb. 28, 1894.

H. H. S.

De: a Latin particle, commonly signifying down or from. It is often *intensive*, and sometimes *privative* or *negative*, having occasionally nearly the force of the English particle *un*. Examples of its use are the Latin *descendere* (from *scandere*, climb), literally, to climb down; *decoquere*, boil down, boil thoroughly; and the English *deform* (from Lat. *forma*, form, beauty, grace), to mar in form, to deprive of grace or beauty; *decompose*, to *un*-compound. *De* is also a Latin preposition signifying concerning, also from or down from.

Deacon [O. Eng. *deācon*, from Lat. *dia'conus* = Gr. *διάκονος*, minister, servant]: in early times an officer of a church, whose duty it was to collect and dispense alms. The Roman Catholic Church maintains that their ministry was from the beginning both corporal and spiritual, but according to an opinion generally prevailing among Protestants the office was at first secular, although it is evident that deacons frequently exercised spiritual functions. The office grew, like that of the bishop, out of the apostolate, which at first embraced all ministerial functions and duties, but which afterward naturally and necessarily split into many offices, according to time and circumstances. The church at Jerusalem first chose seven deacons, who taught and baptized, as is shown by the example of Philip the deacon. In the second and third centuries the duties of deacons were increased, and it subsequently became expedient to divide their functions among the archdeacons, deacons, and sub-deacons. The offices of archdeacon and deacon were counted among the higher clerical orders (*ordines majores*); and after the twelfth century that of sub-deacon was so reckoned. In the Greek, Roman Catholic, Anglican, and Methodist Episcopal Churches, deacons are clergymen inferior in rank to ministers or priests, and are usually probationers for the latter office. For a long time the deacons continued to be what they had been in the Apostolic Church —the dispensers of the charitable funds of the congregation; Jerome calls them "ministers of the tables and of widows." Their duty was to visit the old and the sick, the widows and the afflicted, the prisoners, etc., and to administer relief under the direction of the bishop. But in course of time, as the sick were gathered into hospitals, the poor into almshouses, the orphans and widows into asylums, and as each of these institutions received a special officer for its proper management, the principal duty of the deacon became to assist in the public worship, more especially in the administration of the sacraments—to arrange the altar, to distribute the consecrated cup, etc. In the Roman Catholic Church the peculiar robes of a deacon are the dalmatica and the stole. Of the Roman cardinals fourteen are styled cardinal deacons: but the term deacon, as thus used, merely denotes rank in the sacred college without reference to hierarchical order, many of the cardinal deacons having the episcopal character. In Protestant Churches the position of deacons is various. The Baptists and Congregationalists have deacons as superintendents of the temporal affairs of the church, and also as assistants in the administration of the sacraments. Among Presbyterians their place is often supplied by the ruling elders, but in the Free Church of Scotland and in some other Presbyterian bodies there are regularly ordained deacons.

Deaconess [in Gr. *ἡ διάκονος*; Lat. *ancilla*, *ministra*, *diaconissa*]: a female officer in the Christian Church. In the Apostolic and early Christian Church deaconesses assisted in the care of the poor, especially of their own sex, gave instruction to the younger catechumens, arranged the agapæ or love-feasts, and took care of the sick. Until the fourth century the deaconess was required to be a maiden, or widow but once married, and sixty years of age, but the age was fixed at forty by the Council of Chalcedon (451 A. D.). She was assisted by the sub-deaconess. The office gradually died out, but sooner in the Latin than in the Greek Church. Several Western councils in the fifth and sixth centuries forbade the consecration of deaconesses, although the office appears not to have been wholly extinct till the tenth century or the eleventh. At Constantinople there were deaconesses as late as the beginning of the thirteenth century, with no trace of them anywhere else in the East. In monasteries, nuns who take charge of the altar are called deaconesses. The Sisters of Charity and other like organizations perform a work analogous to that of ancient deaconesses. The office has been revived in the Church of England, and a diocesan deaconess institution was established in 1861. In the Protestant Episcopal Church in the U. S. training-schools for deaconesses have been established in Philadelphia and New York, the latter in connection with Grace church and under the favoring care of Rev. Dr. W. R. Huntington. The admission, conduct, etc., of deaconesses are regulated by a canon of the church. A deaconess is not under life-long vows. She can lay aside her vocation and, in certain circumstances, take it up again. The Church of Scotland adopted the office of deaconess in 1887–88. Some of the English Separatist churches of the seventeenth century had deaconesses, and many of the Congregational churches of the U. S. statedly elect deaconesses with their other officers. Among the German Protestants the experiment has been successfully tried, and there are now more than sixty such institutions in different parts of the world. A large and excellent Protestant school for deaconesses was established in 1836 at Kaiserswerth, Prussia.

Dead, Book of the: See RITUAL OF THE DEAD.

Dead-letter or **Returned-letter Office**: a division of a post-office to which all mail matter that remains undelivered at the end of a specified time, or is of such a nature that it can not be transmitted, is sent for disposition. Letters addressed to persons "not found," and packages containing articles of a perishable or injurious character, constitute a large proportion of the matter dealt with. See POSTAL SERVICE.

Deadly Nightshade: See BELLADONNA.

Dead-nettle: a herbaceous, annual, or perennial herb of the MINT FAMILY (*q. v.*) and the genus *Lamium*. It has a tubular bell-shaped, five-toothed calyx, labiate corolla, four stamens, and a four-lobed ovary which develops into four sharply three-angled nutlets. There are about forty species, all native of the eastern hemisphere N. of the equator. Four species, *L. purpureum*, *L. amplexicaule* (both annuals), *L. album*, and *L. maculatum* (both perennials), have become naturalized in the Eastern U. S.

C. E. B.

Dead Oil: See PHENOL.

Dead Reckoning: in navigation, the calculation of a ship's place at sea without taking observation of the heavenly bodies. It is derived from the distance which the ship has run and from the courses steered after departure from a place whose latitude and longitude are known. The distance is obtained from the rate of sailing as shown by the log and the time elapsed, and the direction of the course is obtained from the compass. The data are liable to errors and uncertainties, in consequence of currents, changes in the course and intensity of the winds, fluctuations in the declination of the compass, and other causes of disturbance. See NAVIGATION.

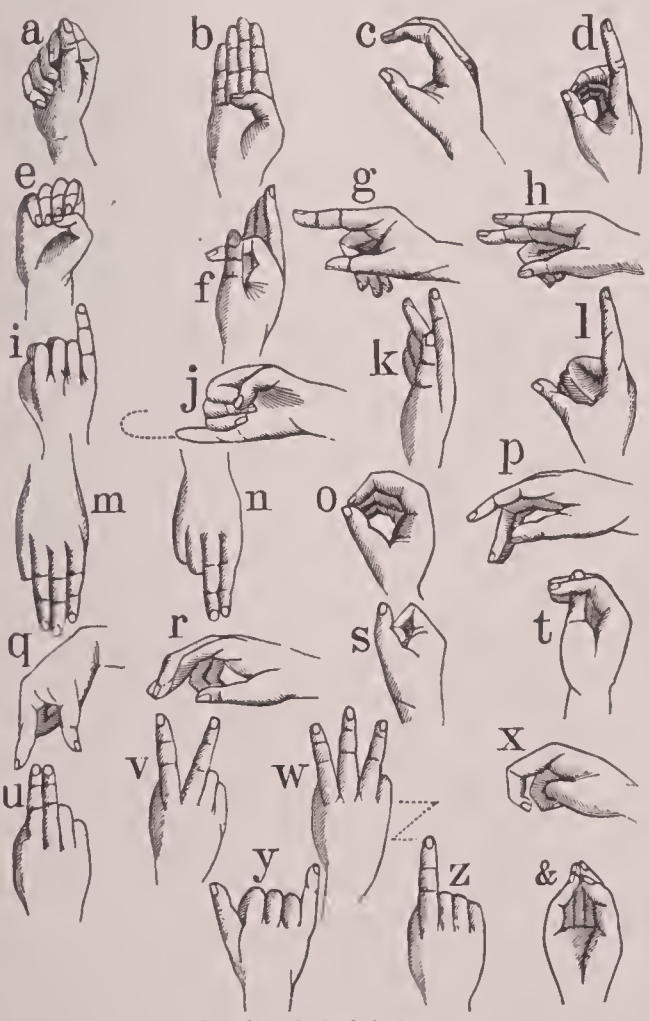
Dead Sea, or **Sea of Sodom** [in Arab. *Bahr Loot*, Sea of Lot; anc. *Lacus Asphaltites*], called in Scripture the **Salt Sea**, **Sea of the Plain**, or **East Sea**: a celebrated lake in the southern part of Palestine. Its northern end is about 20 miles E. of Jerusalem. Its length, as determined by Lieut. Lynch in 1848, is 40 geographical miles, and its breadth from 5 to 9¾ geographical miles. The greatest depth, which is found in the northern portion, according to Lieut. Dale (1848) is 1,308 feet; according to Lieut. Symonds (1841), 1,350 feet. Its depression below the Mediterranean, as measured by Lieut. Dale, is 1,316·7 feet, and its bed is accordingly by far the deepest known fissure on the surface of the earth. The Dead Sea is fed by the Jordan and other streams, but has no apparent outlet, and the surplus water is carried off by evaporation. It is inclosed between naked cliffs of limestone, which on the eastern side rise 2,500 feet above the water. The shores present a scene of desolation and solitude encompassed with deserts and dreary salt-hills. On the southern shore is a remarkable mass of rock-salt called *Usdum* (Sodom), which by some has been supposed to indicate the site of the ancient city of Sodom. Large quantities of asphaltum were thrown up to the surface of the lake by the earthquakes of 1834 and 1837. The water of this lake is remarkable for its great specific gravity (which is 1·25, or one-fourth greater than pure water) and its intense saltness, nearly seven times that of the sea, but varying considerably at different seasons. About 25 per cent. is the average proportion of saline matter by weight. The chlorides of sodium, magnesium, and

calcium are the most abundant salts dissolved in it. Ducks have been seen swimming on its surface. The bed occupied by this lake is part of a long and narrow depression or fissure which extends from the Lake of Galilee southward, and is nearly 200 miles in length. The adjacent table-land is more than 3,000 feet above the Mediterranean, so that the fissure is nearly 6,000 feet deep. See Lieut. Lynch, *Narrative of United States Expedition to the River Jordan and the Dead Sea* (1849); and Prof. Hall, *Survey of Western Palestine* (1886).

Deadwood: city; capital of Lawrence co., S. Dak. (for location, see map of South Dakota, ref. 6–A); on railroad, in the western part of the State; the mercantile, financial, and mining center of the Black Hills. It has two daily papers, good public schools, a private academy, electric light, waterworks, flouring-mills, saw-mills, planing-mills, and manufactures of lumber, flour, brick, lime, etc. Its principal streets are macadamized. Pop. (1880) 3,777; (1890) 2,366; (1900) 3,498. EDITOR OF "BLACK HILLS PIONEER."

Deaf-mutes: those who are both deaf and dumb. Those born deaf are dumb, because they can not learn to speak without the guidance of the sense of hearing, which enables them to imitate sounds. The same is true of those made deaf by disease or accident in early infancy. After learning to speak, the occurrence of deafness does not greatly impair the speech, although persons becoming deaf during childhood sometimes retain throughout life the childish tone which they have learned.

Congenital deafness is reasonably believed to be caused by imperfection of development under influences which lower the grade of nutrition in the embryo during gestation, or which affect, through the constitution of one or both of the parents, the immediate result of conception. Among these influences the most marked appear to be intemperance, marriages between those nearly related, syphilis, and scrofula. Boudin asserts that in France nearly 25 per cent. of deaf-mutes are the offspring of marriages of consanguinity; and somewhat similar estimates have been obtained by Dr. Howe and Dr. Bemiss in their statistical inquiries upon the effects of such marriages in the U. S.



One-handed alphabet.

On account of the comparative helplessness of deaf-mutes they were placed, in the code of Justinian, among persons incapable of the legal management of their affairs. During the Middle Ages they were deprived of the right of feudal succession. Yet in all times they have occasionally shown considerable capacity for culture. Pliny mentions Quintus Pedius, a deaf-mute related to the Emperor Augustus, as a successful painter at Rome; and in later times the uncle of one of the Kings of Sardinia, notwithstanding the same defect, acquired a good education. The earliest account of a

Two-handed alphabet.

deaf-mute being taught to speak is ascribed to Bede, about 700 A. D. Rodolph Agricola, of Groningen, who died in 1485, first mentioned an instructed deaf-mute. Jerome Cardan, half a century later, wrote philosophically on the principles involved in such instruction. Ponce de Leon, a Spanish monk, who died in 1584, and Pasch, a clergyman of Brandenburg, were the first teachers of whom we have any account. Juan Pablo Bonet published at Madrid the earliest known treatise on deaf-mute instruction. He gave a manual alphabet quite different from those which Bede has preserved as used by the ancients. About 1660 to 1700 Dr. John Wallis, of Oxford, and John Conrad Amman, of Holland, published remarkable treatises on this art.

In England the first manual alphabet was published by George Dalgarno, by birth a Scotchman, but residing for a long time at Oxford. He died in 1687. The first school for deaf-mutes in Great Britain was established in Edinburgh in 1760 by Thomas Braidwood. Some years afterward it was removed to the neighborhood of London, and thus no doubt suggested the origination of an asylum in London in 1792, of which Dr. Joseph Watson was the first principal. The first public establishment in the world for the instruction of deaf-mutes was founded at Leipzig in 1778 by the Elector of Saxony, under the directorship of Samuel Heinecke.

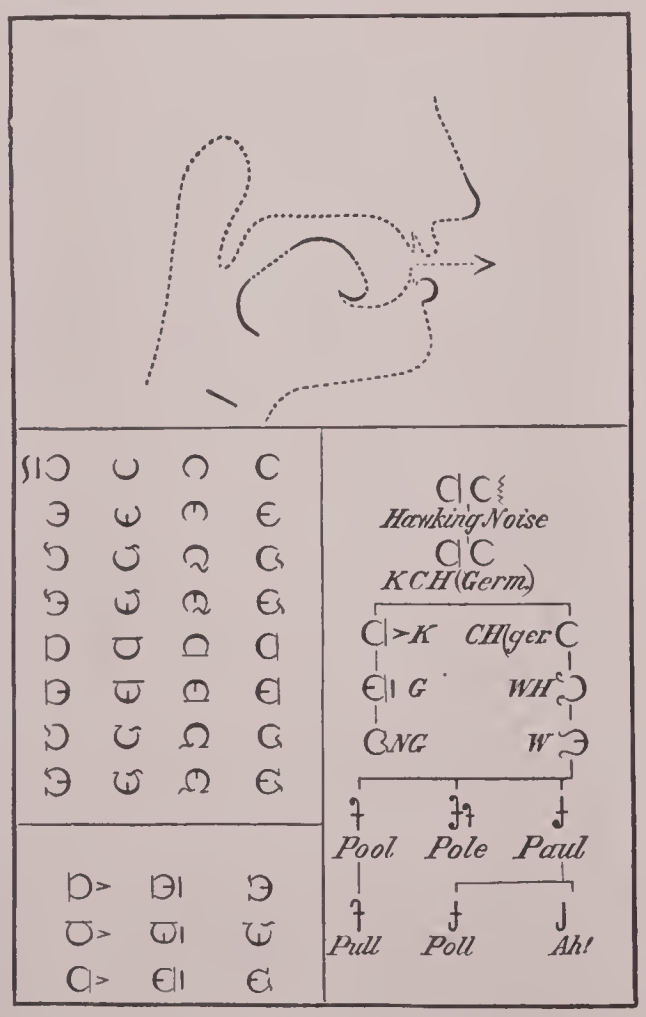
The credit of systematizing the instruction of the deaf and dumb in France is ascribed "to the Abbé Charles Michel de l'Épée, of Paris," but greater success was in some individual cases attained by a Spaniard, Jacob Rodriguez Pereira, whose school was conducted at Bordeaux. These men undoubtedly both contributed to the work; as did also Sicard, the successor of the Abbé de l'Épée, and Itard. In the U. S. the system matured by the experience of the French was brought over in the year 1816 by Dr. Thomas H. Gallaudet, with the personal aid of Laurent Clerc, an educated deaf-mute. Other names especially associated with useful labors on behalf of the same class are those of Dr. F. A. P. Barnard, Lewis Weld, and William W. Turner, of the Hartford Institution; Harvey P. Peet, LL. D., of New

York; Abraham B. Walton, of Philadelphia; John A. Jacobs, of Kentucky; the two sons of Thomas H. Gallaudet (Thomas and Edward M.), and Dr. Samuel G. Howe, of Boston.

The most remarkable instance on record, perhaps, is that of the instruction, under the care of Dr. Howe, of LAURA BRIDGMAN (*q. v.*). By attracting her attention through the sense of touch, it was found possible to develop to a considerable degree her intelligence and capacity for communication with others. Similar examples are Julia Brace in the American Asylum, at Hartford, Conn., while under the charge of the Rev. Thomas H. Gallaudet, and the present interesting case of Helen Keller.

The two principal modes of conveying instruction to the deaf and dumb are by the manual *sign-language*, and by the pupils watching the lips of the teacher during articulation. Real objects and models, pictures, etc., can, of course, also be used. The sign-language is much the most easily and rapidly acquired, and is more generally employed in Europe, as well as in this country. It is largely in use among the American Indians, and by means of it natives of the most distant portions of the continent can understand each other. It is said that a party of Indians present in London at an exhibition of performances by deaf-mutes were delighted to find themselves able to converse with the latter by signs.

The method of teaching by *articulation*, the pupil learning to recognize words (and, in time, to utter them) by closely watching the motions of the lips and tongue in speech, is not favored by all experienced instructors. Except in very few cases it has not been adopted in the Hartford Asylum. The argument urged against it is that the great length of time required for its acquisition can be better employed in obtaining knowledge according to the sign-method. Yet it has sometimes proved very successful, as in the private school of Miss Rogers at Chelmsford, Mass. In Christiania, Norway, in 1872, a deaf-mute was, by instruction in this way, prepared creditably to enter the university as a student. Some have supposed that by means of lip-teaching intelligent deaf-mutes might become pupils



Bell's visible speech.

in the common schools. Itard and his successor, Blanchet, in France, and the Abbé Carton, founder of an institution for the deaf and dumb in Bruges, Belgium, are among those who have especially labored on behalf of the method of teaching by articulation. This method was at first employed at Northampton, Mass., but has now given place to the Bell system. See VISIBLE SPEECH.

A new method of teaching articulation by what is called *visible speech* has been introduced. It was invented in 1848 by A. Melville Bell, a professor in Edinburgh of vocal physiology. It consists of a species of phonetic writing, based not upon sounds, but on the action of the vocal organs in producing them. The characters of this universal alphabet, as matured in 1864, reveal to the eye the position of those organs in the formation of any sound which the human mouth can utter. In 1869 the first attempt was made in Great Britain to apply this alphabet in the instruction of deaf-mutes; and in 1872 it was introduced by A. Graham Bell, the son of the inventor, into the Clarke Institution at Northampton, where it has superseded the old method of imitation, and is the only method of teaching articulation used. Revised by EDWARD M. GALLAUDET.

Deafness: loss or imperfection of hearing; may be congenital or acquired, permanent or temporary, complete or incomplete. It may be (1) "nervous"—that is, caused by organic or functional disease of the auditory nerve or of the brain itself. Deafness of this kind is sometimes curable, but frequently it is permanent. It may be (2) the result of local disease or accident. Disease of the structures of the ear frequently follows scarlet fever, and is often of a scrofulous character. When such disease leads to organic changes, even if they be slight, permanent, and perhaps complete, deafness may result. (3) Cerumen (ear-wax) frequently fills the passage of the ear. In such cases oil should be dropped into the ear, and a gentle flow of warm water from a syringe will generally remove the obstruction. (4) When the *membrana tympani* (ear-drum) is accidentally perforated, much good is often done by the use of Toynbee's artificial ear-drum. (5) The Eustachian tube may be the seat of mucous inflammation, and may require surgical treatment. Counter-irritation behind the ears, the use of general tonics, etc., may be beneficial; and this is more especially true of the deafness of aged people. See Toynbee on *Diseases of the Ear* (1860); Roosa, *On Diseases of the Ear* (new ed. 1874). Since the year 1844, when the attention of physicians was first called to the subject, the growth of minute fungi (*Aspergillus*, etc.) in the ear has been reported to be a common cause of disease of that part. The meatus and tympanum are sometimes covered with the growth, in the form of white or yellow mould on their surfaces. Tinnitus, inflammation, and the accumulation of wax are attendant symptoms, and the treatment consists in the application of a solution of carbolic acid, 5 grains to the ounce of water. The fungi are perhaps the effects of disease rather than the cause.

Deák, dā'ăk, FRANCIS: Hungarian statesman and orator; b. at Kehida in the county of Zala (Szalad), Oct. 17, 1803. He studied law, which he practiced in his youth, was elected to the National Diet in 1832, and became the leader of the liberal party. Soon after the revolution of Mar., 1848, he became Minister of Justice, and projected important reforms in that department. He resigned office when Kossuth obtained power in Sept., 1848. On the defeat of the Hungarian patriots in battle, in 1849, he quitted public life and retired to his estate. Having been elected to the Diet in 1861, he became the leader of the moderate party and the most popular man in Hungary. He was the author of the address sent by the Diet to the emperor requesting the restoration of the constitution of 1848, and of the protest against the imperial rescript in 1861. Deák is regarded as the master-spirit of the movement by which the constitutional autonomy of Hungary was restored in 1867, and large concessions to civil and religious liberty were extorted from the emperor. From that time he remained the recognized leader of the liberal party, commonly called after him, the "Deákist," and which had without interruption a majority of the Hungarian Diet. He refused all offers of a place in the ministry, but no change in the ministry was made without his consent. D. in Pesth, Jan. 29, 1876.

Deal [from Dutch *dēle* (Mod. *deel*): O. H. Germ. *dili*, *dilla*, Mod. Germ. *Diele*, plank, cogn. with Engl. *thill*. The word in Eng. often confused with *deal*, part, cogn. with Germ. *Theil*]: a commercial name for boards exceeding 6 feet in length and 7 inches wide. When 7 inches or less wide they are called battens. Deals are generally 3 inches in thickness and 9 inches in width; when thinner they are usually called planks, but thin boards are often called deals. The word deal is commonly used in Great Britain and rarely in the U. S.

Deal: a maritime town and bathing-place of Kent, England; on an open beach of the North Sea, near the southern extremity of the Downs; 8 miles N. N. E. of Dover, and 89 miles by rail from London (see map of England, ref. 13–M). It has been one of the Cinque Ports since the early part of the thirteenth century. A good anchorage extends between Deal and Goodwin Sands, 8 miles distant; the principal activity of the town is in boat-building and its trade in provisions and naval stores. It is also much frequented for the excellent bathing it affords. Here, in 1539, Henry VIII. built three castles, Deal, Sandown, and Walmer, in the last of which the Duke of Wellington died in 1852. Cæsar landed near Deal in 55. Pop. (1891) 8,898.

Dealfish [so called because to the resemblance of its body to a *deal*, or narrow board]: the *Trachypterus arcticus*, a species of the family *Trachypteridæ*, 4 to 6 feet long, found in northern latitudes in Europe. An allied species occurs on the west coast of the U. S.

Dean (from Lat. *decanus*, from *decem*, ten, because the dean anciently presided over ten canons): an ecclesiastical title applied to officers of several different kinds. In some of the Anglican churches deans are dignitaries next in rank to the bishops. They preside over the chapters of canons and prebendaries, and in the old dioceses nominally elect the bishops. In England they are attached to each diocese. Rural deans are inspectors of parishes, who make report of their visitations to the bishop. In the Roman Catholic Church in the U. S. every diocese possesses, according to the third Plenary Council of Baltimore, a number of deans appointed by the bishop and charged with a certain supervision of their ecclesiastical district. Deans of college faculties were originally the presiding or executive officers; now the faculty is generally presided over by the head of the university. The dean in English colleges presides in chapel, and has charge of the discipline. Few universities in the U. S. have deans, but in these their duties are similar to those of deans in English colleges. The head of a distinct department of instruction is often called dean of that college; there may be besides a dean of the university. The title dean is also given to the oldest member in length of service of an organized body, as dean of the diplomatic corps. Revised by C. K. Adams.

Dean, Amos, LL. D.: lawyer; b. at Barnard, Vt., Jan. 16, 1803; graduated at Union College in 1822; became an eminent lawyer, and was a Professor of Medical Jurisprudence in the medical school and of law in the law school at Albany, N. Y. He was the author of many valuable law treatises, and also published *Philosophy of Human Life* (1839), *Medical Jurisprudence* (1854), and other works. His *History of Civilization* (7 vols. 8vo) was published in 1868–69. D. Jan. 26, 1868.

Dean, Forest of: a picturesque hilly tract, having an area of 22,000 acres, in Gloucestershire, England, between the Severn and the Wye. It is mostly the property of the crown, and nearly half of it is inclosed for the growth of timber for the navy. Here are forests of oak, beech, and other trees, coal and iron mines, and stone-quarries. It was once a royal forest, but was disafforested by Charles I. In the reign of Charles II., however, it was completely reafforested by act of Parliament. The inhabitants, who number between 10,000 and 12,000, formerly enjoyed many privileges acquired partly by birth and partly by working a year and a day in the forest. Many of these privileges have been defined by acts and commissioners' awards, and now have full legal force. The forest is under the control of the commissioners of woods and forests, who have as subordinates in the regulation of the forest a gaveler, a deputy surveyor, four verderers, etc.

Dean of the Chapel Royal: a title in the Presbyterian Church of Scotland; a misnomer, inasmuch as this Church has no deans. The title is held by three clergymen of the Established Church, and is a mere remnant of episcopacy. The duties of the office are merely nominal, consisting in an occasional sermon before the Queen when she visits Scotland, but the revenues are considerable. The occupants are appointed by the crown, and recent appointments have been conferred in connection with chairs in the University of Edinburgh not otherwise endowed.

Dearborn, Henry: general; b. in North Hampton, N. H., Feb. 23, 1751; served as captain at the battle of Bunker Hill 1775, and as major in the campaign against Burgoyne in 1777. In 1778 he fought with distinction at Monmouth. He was a member of Congress from Massachusetts 1793–97, and Secretary of War under Jefferson 1801–09. Having obtained the rank of major-general, he captured York (now Toronto) in Canada Apr. 27, 1813. He was U. S. minister to Portugal 1822–24. D. in Roxbury, Mass., June 6, 1829.

Dearth, Henry Golden: landscape-painter; b. in Bristol, R. I., 1863. Pupil of Hebert and Aimé Morot, Paris; member Society of American Artists 1889. His pictures are marked by fine qualities of color, and show much truth of observation. His subjects are chiefly drawn from the scenery on Long Island and in Connecticut. Studios in New York and East Hampton, L. I. W. A. C.

Deasy, Rickard, LL. D.: an Irish Roman Catholic statesman and jurist; b. 1812, and educated at the University of Dublin (Trinity College); called to the bar in 1835; became queen's counsel in 1849, a serjeant-at-law in 1858, solicitor-general for Ireland in 1859, attorney-general in 1860, and a baron of the Irish exchequer in 1861. He was M. P. 1855–61, belonging to the "moderate Catholic" party, and representing the county of Cork; judge of court of appeals after 1878. D. May 6, 1883.

Death (in Gr. *θάνατος*; Lat. *mors, mortis*; Fr. *mort*; Germ. *Tod*): the cessation of vital functions in animals and plants. The active phenomena observed after death, such as material decay and loss of heat, are merely continuations of processes which have been going on through life. The corresponding operations of repair having ceased, the destructive processes become manifest. In a short time, however, in ordinary conditions, new and much more rapid destructive changes are induced.

Local or partial death of an animal is called mortification, gangrene, or sphacelus; if in a bone it is necrosis. Molecular death of animal tissue is called ulceration, except in bony tissues, when it has the name of caries. Systemic death is said by Bichat to be either—1, by syncope or fainting, when the heart's action fails from lack of its usual stimulus; 2, by asphyxia, when suffocation occurs or the lungs cease to act; or, 3, by coma, when death begins at the brain. Other authorities add to these forms death by (4) changes in the character of the blood, as some forms of death by poisons from without or developed in the body in disease. It would be difficult to assign some instances (such as instantaneous death from an injury) to any one of these categories. Sudden death is perhaps most frequently due to heart disease, but heart disease kills by slow death much more frequently. It is asserted by many careful observers that death is usually painless, and that the apparent agony or struggle so often observed is automatic. Cases are on record of burial after apparent death, but few of these are reliable. There is very little danger of such an occurrence when ordinary precautions are taken. A number of "signs" of death have been offered, and it is by the presence of all of them that certainty is reached. Among these the method of testing for breathing by a feather or cold mirror, or by a glass filled to the brim with water placed on the chest, the absence of heart-beats or sounds, the staring of the eyes, etc., are well known. W. P.

Death Adder: See Acanthophis.

Death-bed Declarations: See Dying Declarations.

Death, Brothers of: a name sometimes given to the monks of the order of St. Paul the Hermit, which was suppressed by Pope Urban VIII. about 1630. They always carried with them a skull, to remind them continually of death.

Death, Dance of: See Dance of Death.

Death, Punishment of: See Capital Punishment.

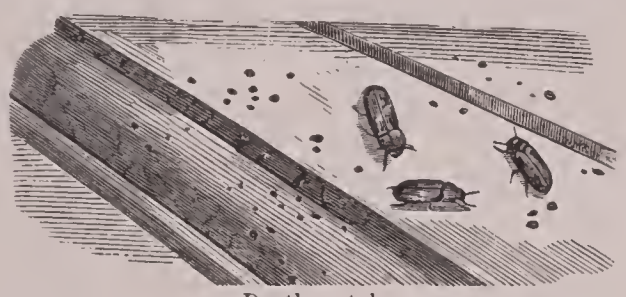
Death-rate: See Vital Statistics.

Death's-head Moth: See Acherontia.

Death Valley (so called because a party of emigrants perished there from thirst and starvation in 1849): a narrow valley of California, 130 miles in length, trending nearly northwest and southeast, and walled at the sides by the Panamint and Funeral Mountains. The middle and lowest portion of the valley bottom is a plain covered by a layer of glittering white salt. This plain lies between 300 and 400 feet below sea-level. Toward the N. W. the surface rises to the foot of Mt. Magruder, which stands at the head of the valley; toward the S. E. there is a more gradual rise to the end of the Funeral Mountains, where the valley coalesces with arms of the Amargosa des-

ert of Nevada and the Mohave desert of Southern California. The so-called Amargosa river, a long and broad channel, usually dry through the greater part of its length, drains a large desert tract in Southern Nevada, and crossing the Amargosa desert with a southward course curves about the south end of the Funeral Mountains and enters Death Valley. It is probable that the channel carries water only at rare intervals, but the volume of its torrent must occasionally be great. Whatever water it brings to Death Valley must gather as a lake in the bottom of the valley until evaporated by the sun, and the salt accumulated in the valley has unquestionably been brought by such torrents from the surrounding deserts. In connection with a scientific expedition sent to the valley in 1891 by the Department of Agriculture, the U. S. Weather Bureau maintained a meteorological station for five months at the base of the Funeral range. During the month of July the mean temperature was 102° F.; the highest temperature was 122°; the mean of the highest temperatures observed on the several days was 115·6°, and the mean of the lowest temperatures observed on the several days was 86·8°. The relative humidity for the same period was ·20. This record, although not made in the lowest part of the valley, indicates that the locality is the hottest and driest in the U. S., and it is not surpassed in these respects by any other place at which a record has been kept. G. K. G.

Death-watch: a small beetle inhabiting human dwellings, and producing a sound like the ticking of a watch. This sound being more readily heard in the stillness attending sickness, it has given rise to the superstitious belief that it prognostieates death; hence the name "death-watch." The noise is produced by the insect beating its head against the wood in which it is concealed. It is supposed to be the call of the male to its mate. The common death-watch (*Anobium notatum*) is a species of borer. It is about a quarter of an inch in length, and of a dusky-brown color. A number of species are found both in Europe and the U. S. The *Atropos pulsatorius*, a very different insect, is called in England by the same popular name, and for the same reason.



Death-watch.

Debatable Land: a tract of country at the head of the Solway Firth on the western border of Scotland and England; lying between the Esk and Sark. It was for a long time a cause of contention between the two countries, and even after its division by royal commissioners in 1542 continued to be a refuge for outlaws. It was divided by a line drawn from E. to W. between the rivers, the southern part being adjudged to England and the northern half to Scotland.

Débat-Ponsan, dā'baa'pōṅ'saaṅ', Édouard Bernard: figure and portrait painter; b. at Toulouse, Apr. 25, 1847; pupil of Cabanel; second Prix de Rome 1872; second-class medal, Salon, 1874; Legion of Honor 1881; third-class medal, Paris Exposition, 1889. His portraits are excellent, vigorously painted, and good in character. *A Doorway of the Louvre*, *Massacre of St. Bartholomew*, is in the museum at Clermont. Studio in Paris. William A. Coffin.

Debenture [from Lat. *deben'tur*, 3d plur. pres. indic. of *debe're*, owe;—acknowledgments of debt formerly began with the words *debentur mihi*, there are owing to me]: a document or writing acknowledging a debt. The term is particularly applied to (*a*) custom-house certificates that an exporter is entitled to a bounty or Drawback (*q. v.*). (*b*) One of a series of instruments, usually under seal, in which the party issuing them covenants to pay the sum therein declared to be owing to the holder at a certain time with interest. Usually this debt is made a charge upon a fund or subject of property specified or referred to. Public companies, especially railroad companies, have frequently resorted to these to raise special loans. The terminability and fixity in amount of debentures being often objectionable to lenders, debenture stock in many cases has been issued. This is frequently irredeemable, and may be transferred in any amount. The holder is entitled to a preferred rate of interest, which is a charge upon the assets of the company next to mortgages.

Revised by F. Sturges Allen.

De'bir [Heb., in the rear]: a city of the tribe of Judah several times mentioned in the Bible; situated W. of Hebron in the hill-country, and in a dry and arid place. It was captured by Joshua, and subsequently by Othniel; was inhabited by the Anakim, and had a Canaanitish king. It was afterward given to the priests of the Hebrews. It was also called Kirjath-sepher (town of the book) and Kirjath-sannah (town of the law), names seeming to indicate that a school or an oracle was situated there. Its site is not at present accurately known. There was also a place of this name near Jericho, and probably another belonging to the tribe of Gad, E. of the river Jordan.

Déblai, dā'blā' [Fr., excavation, clearing, connected with *déblayer*, clear of rubbish, etc.; O. Fr. *blef* (Mod. Fr. *blé*, grain): Ital. *biado* < Lat. *abla'tum*, ptc. of *aufer're*, i. e. what is borne away, as grain from the field]: in fortification, the mass of earth taken from an excavation in the ground in order to form a parapet. The earth used to form the entire rampart or parapet is called the remblai.

Deb'orah: a Hebrew prophetess and judge; the wife of Lapidoth; gained celebrity by her successful efforts to liberate the Israelites from Jabin, King of Canaan. (See Judges iv.) She is supposed to have composed the spirited lyric which forms the fifth chapter of Judges, a pæan over the victory, describing the battle in the most vivid colors.

De Bow, James D. B.: See the Appendix.

Debreczin, dā-bret'sin: a royal free town of Hungary; capital of the county of Bihar; on an extensive sandy plain 116 miles E. of Budapest (see map of Austria-Hungary, ref. 6–J). The houses are mostly only one story high; the streets are unpaved and dirty. It contains a handsome town-hall, several hospitals, and a Protestant college with twenty-four professors, over 1,000 students, and a valuable library. It has manufactures of flour, saltpeter, earthenware, soap, hams, sausages, and tobacco-pipes. Here are extensive markets for cattle and swine. A large majority of the inhabitants are Protestants and Magyars. It is connected with Pesth by a railway. Pop. (1890) 58,952.

De Bry, or **De Brie**, Théodore: goldsmith, engraver, and printer; b. at Liége, 1528. About 1570 he removed to Frankfort-on-the-Main, where he established a printing and engraving house, his two sons, Jean Théodore and Jean Israel, taking part in the engraving work. They made many plates of great excellence for that period, which were published in various works; but the name is best known in connection with the great collection of travels first published in 1590 with the title *Collectiones Perigrinationum in Indiam orientalem et occidentalem.* The designs for this work, as in most of those of the sixteenth century, are more or less fanciful. The volumes were republished in German and Latin with various changes, and it is now nearly or quite impossible to unite specimens of all the editions. It is said that the most complete collection in the world is that of the Lenox Library, New York. De Bry died at Frankfort in 1598. Herbert H. Smith.

Debt: in law, a sum of money due which is certain in amount or capable of being reduced to certainty. Such an indebtedness may arise either as the result of a judgment of a court of justice, or on a sealed instrument (specialty), or on an unsealed instrument, or on a mere oral contract. Debts are thus distinguished into such as are of record, or of special contract or simple contract. They may arise either on an express or implied promise. Debts may be collected by an action of debt, or in some instances by an action of covenant. The last action is resorted to when the duty to pay is derived from a contract under seal. The form of action called *indebitatus assumpsit* (being indebted, he promised) may also be used where the indebtedness is incurred by reason of a simple contract. A debt may be discharged in various ways, as by Accord and Satisfaction, Release, Payment, Novation (*qq. v.*), etc. The statute of limitations will be a bar to an action. The time within which the action must be brought under such a statute varies in the different States. See Limitations, Statute of.

Action of Debt is a common-law action brought to collect a debt. It is also used to collect a penalty given by statute. When an action of debt is brought on a written instrument the defendant may deny its existence. If he as-

serts that there is no such record as the plaintiff alleges his plea is called *nul tiel record*; if he claims that a sealed instrument which is set up as the foundation of an indebtedness was never executed his plea is *non est factum*. These pleas merely deny the *existence* of the judgment or specialty. If he has any other defense he should disclose it by specially setting it forth. So he may deny the existence of a simple contract debt, or may set up in his pleadings any special facts which, while they admit the existence of the debt, show that the plaintiff has no right to recover. A judgment in the action for the recovery of a debt itself constitutes a new debt, on which another action may be brought, and so on, unless there be some statutory restriction of the right to bring an action upon a judgment, as there is in some of the American States. Under the codes of procedure of some of the States the technical action of debt no longer exists, as there is but one civil action. The same remedy may be had in substance under a complaint setting forth the facts constituting the cause of action. T. W. DWIGHT.

Debt, Public: The bulletin of the U. S. census for 1890, published in 1897, shows the aggregate debt of different nations in 1880 and 1890 to have been as follows:

NATURE OF DEBT.	TOTAL DEBT LESS SINKING FUND.		PER CAPITA.	
	1890.	1880.	1890.	1880.
National debt of foreign countries.	$26,621,222,135	$25,484,492,879	$32 88	$35 62
National debt of U. S.	891,960,104	1,922,517,364	14 24	38 33
State and local debt of U. S.	1,135,210,442	1,123,278,647	18 13	22 40

These figures show that the national debts of the world have increased somewhat, but that population has increased faster; that the local debt of the U. S. has remained nearly stationary, while population has increased nearly one-fourth; and that in spite of this last fact the national debt of the U. S. has been reduced one-half. "The average annual decrease in the national debt of the U. S. during the decade exceeded $100,000,000; the decrease per capita of combined national, State, and local debt during the same period was from $60.73 to $32.37, while other statistics show that the value of property assessed for taxation increased meanwhile from $17,000,000,000 to $25,500,000,000, or 50 per cent., indicating a reduction of public debt and an increase of wealth for the country unprecedented, at least in modern times."

The national debt of various foreign countries in 1890 was as follows:

NATIONS.	Total.	Per capita.
France	* $4,446,793,398	116
Russia	3,491,018,074	31
Great Britain	3,350,719,563	88
Austria-Hungary	2,866,339,539	71
Italy	2,324,826,329	76
Spain	1,251,423,696	74
Prussia	1,109,384,127	37
Netherlands	430,589,858	96
Belgium	380,504,099	63
Bavaria	335,503,105	60
India	881,003,592	3
Egypt	517,278,200	76
Japan	305,727,819	8
New South Wales	233,289,245	215
Brazil	585,345,927	42
Peru	† 382,175,655	146
Argentine Republic	284,867,069	70
Canada	237,533,212	48

The debt of Turkey was not given in the census list, but it amounts to some $600,000,000, or about $22 per capita. No other country is reported with a debt as high as $200,000,000, though some of the Australasian colonies come very near it. The per capita debt of New Zealand is conspicuously large ($298). These large Australasian loans, being issued for public works, do not burden the country as much as they otherwise would.

Strictly speaking, the debt of Prussia, Bavaria, and other German states is local; but the national debt of the German empire as a whole is only $77,000,000. With this exception the local debt of foreign nations is not reported. That of various States of the Union is as given in the table in the next column.

* Not including terminable annuities capitalized at $2,000,000,000.
† Not including irredeemable paper outstanding.

DEBT OF STATES OF THE UNION.

The United States	$1,135,210,442	$1,123,278,647	$18 13	$22 40

The different kinds of debt going to make up this total were as follows:

NATURE OF DEBT.	1890.	1880.
State	$228,997,389	$297,244,095
County	145,048,045	124,105,027
Municipal	724,463,060	684,348,843
School districts	36,701,948	17,580,682

The principles involved in the creation of public debts are discussed under FINANCE (*q. v.*). The purposes for which the local debts of the U. S. were created are reported as follows in the census of 1880. No returns are available for 1890:

Bridges	$24,853,388
Cemeteries	283,816
Fire department	2,514,082
Funding floating debt	153,949,095
River and harbor improvement	36,224,548
Parks and public places	40,612,536
Public buildings	48,493,952
Railroad and other aid	185,638,948
Refunding old debt	138,743,730
Schools and libraries	26,509,457
Sewers	21,370,536
Streets	86,674,860
Miscellaneous	130,138,633
War expenses	75,154,400
Water-works	146,423,565
Total	$1,117,585,546

The size of the "refunding" and "miscellaneous" items deprives the foregoing table of much of the value which it would otherwise possess.

With the exception of some important government railway loans (Prussia, India, Australia), national debts have generally been created for war purposes. Thus if the figures of the English national debt at successive dates are taken, the following results are obtained:

DATE.	Amount.	Concurrent events.
1689	£664,263	
1702	16,394,702	War of Spanish succession.
1714	54.145,363	
1763	138,865,430	End of Seven Years' war.
1786	249,851,628	After American war.
1793	244,440,306	French revolutionary war.
1802	571,000,000	
1817	848,282,477	After Napoleonic wars. Maximum of debt. English and Irish exchequers consolidated.
1830	840,184,022	Years of peace.
1840	789.578,720	
1850	787.029,162	
1854	775,041,277	Crimean war.
1856	807,981,788	
1860	802,190,300	
1870	*748,276,181	
1880	*737,821,259	
1890	*618,212,157	
1900	639,165,265	Transvaal war.

The following table shows the progress of the French debt:

DATE.	Nominal capital, millions of francs.	Concurrent events.
1800	724	End of First Republic.
1815	1,272	" First Empire.
1830	4,426	" Bourbons.
1848	5,913	" Orleans family.
1852	5,516	" Second Republic.
1871	12,454	" Second Empire.
1887	23,728	Third Republic.
1891	About 31,000	
1900	30,055	

The earlier U. S. debts were of the same character. The national debt on Jan. 1, 1791, was $75,000,000, and remained almost unchanged for the next fifteen years. At the beginning of 1812 it had fallen to $45,000,000, but rose rapidly in the war with Great Britain, and stood at $127,000,000 at the beginning of 1816. This debt was gradually paid off at maturity, and at the beginning of 1835 had been practically reduced to zero. In the years following a new debt grew up gradually, though somewhat unsteadily, amounting to $65,000,000 on July 1, 1860, the public credit at this time being very poor, owing to the dread of impending secession. The present debt is to all practical purposes a war debt. The war loans began with that authorized by the act of Feb. 8, 1861, of $25,000,000 at 6 per cent. for twenty years, of which $18,415,000 were issued, nominally at par, but really costing about $1\frac{1}{4}$ per cent. in negotiation. Next, on Mar. 2, 1861, treasury notes bearing 6 per cent. interest were authorized, of which $35,364,450 were issued. This was a most important act for the relief of the Government, the notes being received for customs, and being redeemable within two years. On July 17, 1861, $250,000,000 of 7-per-cent. bonds, to run twenty years, were authorized, with authority to issue any part of this amount in the form of treasury notes, running three years, at $7\frac{3}{10}$ per cent. interest (subsequently known as seven-thirties), or notes not bearing interest payable on demand, or treasury notes for one year at $3\frac{65}{100}$ per cent. interest, exchangeable for the seven-thirties: but the whole amount of demand notes not at interest shall not exceed $50,000,000. An act of Aug. 5, 1861, authorized the issue of bonds at 6 per cent. interest, running twenty years, to exchange for the one-year and three-year notes before authorized, with accumulated interest, at any time before or at their maturity; and the demand notes were declared receivable for all public dues. These acts were most wisely designed and signally successful; the demand notes, though at first rejected by the banks, before the close of the year were at a premium; and the interest-bearing notes became very acceptable, and were readily converted, with their accumulated interest, into the permanent 6-per-cent. bonds. The current of public preference was then changed in favor of the Government issues, which at first were received with aversion, particularly by the banks. A very large issue of these notes took place, the seven-thirty notes reaching $140,094,750, and the $3\frac{65}{100}$ per cent. one-year notes a large sum, with the full $50,000,000 of demand notes. Of the 6-per cent. twenty-year bonds issued in redemption of the one and three year notes, there were $189,321,200. On Feb. 12, 1862, $10,000,000 more of demand notes were issued.

The preceding very successful issues laid the basis for the first great popular loan, authorized Feb. 25, 1862, of $500,000,000 of 6-per-cent. bonds, redeemable after five and payable after twenty years—commonly called five-twenties. A large subscription was at once made, and the full $500,000,000 were issued. The acts of Mar. 3, 1864, and Jan. 28, 1865, added $15,000,000 more to the authorization. By this act of Feb. 25, 1862, $150,000,000 of circulating notes were authorized and made a legal tender; $50,000,000 to be in place of the demand notes of July 17, 1861. On July 11, 1862, $150,000,000 more were authorized, and on Mar. 3, 1863, $150,000,000 more—$450,000,000 in all. The whole amount was issued, and formed the great volume of currency known as *greenbacks*. Of this issue $400,000,000 was made permanent, but contractions in 1868 and 1869 reduced the amount to $346,681,016. The act of Feb. 25, 1862, also authorized the acceptance of $25,000,000 of deposits at 5 per cent. interest; this authorization was increased to $50,000,000 on Mar. 17, 1862, and to $100,000,000 on July 11, 1862. On June 30, 1864, a further sum of $50,000,000 was added, this to pay 6 per cent. interest; all this, described as temporary loan, was to be repaid on ten days' notice, and was so repaid in 1865 and 1866, except $78,560 unclaimed.

The act of Mar. 1, 1862, authorized the issue of certificates of indebtedness to public creditors in adjustment of any claims, such certificates to bear 6 per cent. interest, and to run one year. The sum of $561,753,241 of such certificates was issued, all except $4,000 of which were redeemed in 1863, 1864, and 1865. The act of July 17, 1862, authorized the issue of postage-stamps as currency, and made them receivable in payments to the U. S. in sums less than five dollars. An act of Mar. 3, 1863, authorized the use of fractional notes (parts of a dollar) in place of postal currency, limiting the amount to $50,000,000, which authorization was confirmed by the act of June 30, 1864. This issue was promptly called for to the extent of $30,000,000, and it was varied from that sum to the large amount of $45,722,061, outstanding Jan. 1, 1873. In the years beginning with 1875 it was rapidly withdrawn, and fractional silver substituted through the avails of 5-per-cent. bonds sold under the acts of 1870–71.

By act of Mar. 3, 1863, a loan of $900,000,000 was authorized at 6 per cent. for ten or forty years, principal and interest payable in coin, of which $75,000,000 only was issued, and taken at a premium of $3\frac{1}{2}$ to 4 per cent., preference being given because of a possible distinction existing adverse to the payment of the principal of the 5·20s in coin. This act was repealed June 30, 1864. The same act, Mar. 3, 1863, also authorized $400,000,000 of one, two, and three year treasury notes, at not over 6 per cent. interest, to be a legal tender for their face-value, principal and interest payable in lawful money. Of these there were:

One-year notes, issued	$44,520,000, at 5	per cent.	$39,865 out.
Two-year notes, "	166,480,000, at 4	"	30,600
Three-year notes (compound)	266,595,440, at 6	"	208,670

This act authorized the exchange of new treasury notes for any of these issues outstanding at any time, and provided for $150,000,000 more of currency, not at interest, to facilitate such exchange. In all, $477,595,440 of these treasury notes of 1863 were issued, practically all of which were canceled or exchanged before May 15, 1868. It will be seen that but a small amount of permanent loans was created in 1863, treasury notes being largely used.

An issue of $200,000,000 was authorized Mar. 2, 1864, at 5 or 6 per cent., payable in coin; $196,117,300 was issued at 5 per cent., redeemable in ten and payable in forty years in coin—the so-called ten-forties of 1864—and $3,882,500 at 6 per cent. On June 30, 1864, another loan of $400,000,000 was authorized at 6 per cent.—five-twenties of 1864—$125,561,300 being issued. The loans not being fully taken, the act of June 30, 1864, authorized the issue of $200,000,000 of seven-thirty treasury notes, to run three years, which authority was extended by act of Mar. 3, 1865, to embrace $600,000,000 more. Under this authority $829,992,500 of seven-thirty interest-bearing notes were issued, which were duly redeemed or exchanged before July 15, 1868.

* Plus a number of terminable annuities amounting to over £60,000,000 capitalized value in 1900.

The loans of 1865 began with the authorization of $600,000,000 of 6-per-cent. five-twenty bonds by act of Mar. 3, to be applied only to the reimbursement of treasury notes or other outstanding obligations of the Government. Two issues were made—on July 1, 1865, $322,998,950, and on Nov. 1, 1865, $203,327,250. By authority of the same act, as construed by act of Apr. 12, 1866, a further issue was made in July 1867, of $379,616,050, and of $42,539,350 on July 1, 1868, these sums being employed to retire treasury notes and other obligations, but not to increase the public debt.

All these were *funding* operations, whereby a definite obligation was substituted for an indefinite one. The *refunding* issues, whereby bonds at lower rates were substituted for similar bonds bearing higher rates, were inaugurated by the act of 1870. This act provided for the issue of $200,000,000 of 5-per-cent. bonds (increased to $500,000,000 in 1871), $300,000,000 of 4½-per-cents., and $1,000,000,000 of 4-per-cents. By the act of 1875 these issues were made available for use in the resumption of specie payments as well as in the refunding of the debt, and the possible amount considerably increased. The favorable conditions of the foreign trade in the years 1878 and 1879, coupled with the signal success of the resumption of specie payments, caused the 6 and 5 per cent. bonds to be largely retired in advance of maturity; a few were continued for a short time at 3½ per cent. or 3 per cent., under agreements of 1881 and 1882 respectively. All these have been since paid up, while nearly all the 4½-per-cent. bonds, and some of the 4-per-cents., have been purchased in the open market, long in advance of maturity, from the surplus revenues of the Government.

The deficiency in the revenue of the U. S. following 1892 showed itself in an increase in the national debt. The demand for gold coin, as distinct from silver or paper, was so great that the treasury could not safely meet it out of accumulated stocks, and was forced to issue bonds to replenish the gold reserve. The total amount of such bonds issued in Cleveland's administration (1893–97) was $262,315,000.

NATIONAL DEBT OF THE UNITED STATES SINCE 1860.

ARTHUR T. HADLEY.

Decagon [from Gr. *δέκα*, ten + *γωνία*, angle]: a plane geometrical figure having ten sides and ten angles. If the sides and angles are all equal, the figure is a regular decagon, and inscribable in a circle. A regular decagon may be formed from a regular pentagon by describing a circle round the latter, taking the middle points of the intercepted arcs, and drawing lines joining every pair of adjacent angular points to the points of the intermediate section.

Decaisne, *de-kān'*, JOSEPH: botanist; b. in Brussels, Mar. 11, 1809; studied especially vegetable physiology, and was appointed assistant at the Jardin des Plantes in Paris in 1832, and director in 1851. He was for many years one of the directors of the *Annales des Sciences Naturelles*, and published a great number of scientific essays and papers. D. in Paris, Feb. 10, 1882.

Decalcoma'nie [from Fr. *décalquer*, counter-trace + *manie* = Gr. *μανία*, rage, madness]: the art of transferring pictures and designs permanently upon fabrics of various descriptions, china, glass, marble, wood, leather, etc. After carefully washing the article to be decorated, the picture to be applied is coated thinly with prepared cement, and then placed in the position required and pressed tightly with a cloth or rolled over with a heavy roller. Finally, a damp sponge is applied to the upper surface till the paper becomes sufficiently moist, after which it can be easily removed, and the picture will remain firmly on the object.

Decalitre [Fr.]: a measure equal to 10 litres. See LITRE.

Decalogue [Gr. *δεκάλογος*; *δέκα*, ten + *λόγος*, word, being a translation of Heb. עשרת הדברים]: that part of the law of Moses which is contained in Exodus xx. 3–17 and repeated in a hortatory form in Deuteronomy v. 7–21. We are accustomed to speak of it as the *Ten Commandments* and the "moral law," but these terms are not applied to it in the original Scripture; the phrase there is "the ten words." It was originally written, apparently, by Moses in the "book of the covenant," Ex. xxiv. 4, having been given orally from Sinai. Later, for covenant purposes, God gave a copy of it, written by himself, upon two tablets of stone (Ex. xxxi. 18, etc.), which were placed within the ark of the covenant. The text of Ex. xxxiv. 1, 28 appears to fix the number of these "words" at ten, but various opinions exist as to the manner of dividing them. The arrangement recognized by the Greek Church and most Protestants, called the Origenian division, is that which was approved, though not originated, by Origen. It had been approved by Philo and Josephus, and was generally adopted by the Christian Church. But in the West it faded out, and was revived by Leo Judæ (1482–1542) in his catechism, 1534, and by Calvin, 1536. The Roman Catholics, at least in their catechisms, unite into one what most Protestants consider the first and second commandments, and divide the tenth Origenian commandment into two. This was Luther's arrangement, and is generally, though not universally, followed by the Lutheran Church. It is called the first Masoretic arrangement. The modern Jews adopt what is called the Talmudical arrangement, which gives as the first commandment the words contained in Ex. xx. 2, and has for its second commandment the first and second of the Origenian arrangement. The second Masoretic, adopted by English Roman Catholics, differs from the first Masoretic only in inverting the order of the ninth and tenth commandments. The ten commandments, with the exception of the two regarding the Sabbath and reverence to parents, are negative ones, forbidding certain actions, and leaving positive precepts to other laws or to the individual conscience. The Decalogue is generally regarded as a moral code, binding from its own nature, though the Sabbath commandment has a positive as well as a moral element in it. Christ, in common with the Pharisees, regarded the whole law (not the "ten words" merely) as summed up in two precepts.

Revised by W. J. BEECHER.

De Camp, JOHN C.: rear-admiral U. S. navy; b. in New Jersey, Oct. 5, 1812; entered the navy as a midshipman Oct. 1, 1827. He commanded the Iroquois at the passage of Forts St. Philip and Jackson and capture of New Orleans, and, in short, in every action on the Mississippi under Farragut, to and including Vicksburg, in all of which he was conspicuous for gallant bearing. D. in Burlington, N. J., June 24, 1875.

De Camp, JOSEPH RODEFER: figure and landscape painter; b. in Cincinnati, Nov. 5, 1858. Pupil of Frank Duveneck, Munich; member Society of American Artists 1888. His later work, especially in landscape, shows the influence of impressionistic methods, and it is notable for direct realistic treatment. Studio in Boston. W. A. C.

Decamps, *dā'kaṅ'*, ALEXANDRE GABRIEL: genre and landscape painter; b. in Paris, Mar. 3, 1803. Pupil of David and of Ingres. He at first followed the classical traditions

of David, but became with Delacroix and others a leader in the Romantic school of 1830. His pictures are notable for depth and richness of tone. His *Caravan* and *Towing-horses* are in the Louvre; *Night-watch at Smyrna* in the Wolf collection in the Metropolitan Museum, New York; and *The Suicide* in the collection of W. T. Walters, Baltimore. D. at Fontainebleau, Aug. 22, 1860.

WILLIAM A. COFFIN.

De Candolle, de-kăăn'dōl', AUGUSTIN PYRAME, M. D.: botanist of French extraction; b. in Geneva, Feb. 4, 1778. He studied at Geneva and afterward in Paris, where he became a pupil of Desfontaines, and enjoyed the friendship of Cuvier and Humboldt. Lamarck's *Flora of France* (1804–05) was prepared by him. He became in 1808 Professor of Botany at Montpellier, and published in 1813 his *Elementary Theory of Botany*, a profound work, in which he developed his new system of classification according to the natural method. In 1816 he removed to Geneva. He projected a great work which should give a description of all known plants, and published two volumes (1818–21), with the title *Regni Vegetabilis Systema Naturale*, but modified his plan and undertook the well-known *Prodromus Systematis Naturalis Regni Vegetabilis* (17 vols., 1824–73), which he did not live to finish. Among his other works is *Organographie Végétale* (1827). D. in Geneva, Sept. 9, 1841.—His son, ALPHONSE LOUIS PIERRE DE CANDOLLE, b. Oct. 28, 1806, wrote several botanical works; published his father's *Mémoires et Souvenirs* (1862); continued the *Prodromus*, and began the *Monographiæ Phanerogamarum* (1878). D. Apr. 9, 1893.—CASIMIR PYRAMUS DE CANDOLLE (son of Alphonse, b. 1836) has aided in the preparation of the *Prodromus* and the *Monographiæ*.

Decapitation [from Lat. *de*, off + *caput*, head]: a form of CAPITAL PUNISHMENT (*q. v.*) in which the head is severed from the body by an executioner. Under the English Government hanging has taken the place of decapitation, the last instance of the latter having occurred in 1745. This mode of punishment is still used in some of the German states and in France. In France the GUILLOTINE (*q. v.*) is still used. Decapitation is of very ancient origin. It is a frequent punishment among Oriental nations.

Decap'oda [from Gr. δέκα, ten + πούς, ποδός, foot]: a subclass of Crustacea, most of whose members are characterized by having ten walking feet. The limits of the group vary in the estimation of various authors; as here used it is equivalent to *Podophthalmia*, or stalk-eyed Crustacea. The body is divided into two regions, an anterior cephalothorax bearing the organs of sense, of eating, and of locomotion, and a posterior seven-jointed abdomen. The eyes are placed on jointed stalks; the walking legs are ten to fourteen in number. The group contains the largest and best known of the Crustacea. It is divided into the *Cumacea*, the *Stomapoda*, the *Schizopoda*, and the *Decapoda* proper. In the latter there are but ten walking feet, some of which may be armed with pincers; and in the adults these legs have but one principal branch. The true Decapods are divided again into *Macrura* (with a long abdomen like a lobster) and *Brachyura*, with a short abdomen folded under the cephalothorax, as in the crabs. See LOBSTER, SHRIMP, CRAB, etc.

J. S. KINGSLEY.

Decap'olis [Gr. δεκάπολις; δέκα, ten + πόλις, city]: ten cities of Palestine leagued together, like the Hanse towns, and having certain privileges not now known. Decapolis is described by Eusebius in his *Onomasticon* as "the part lying on the other side of the Jordan about Hippos, and Pella, and Gadara." The ancient lists vary. Ptolemy speaks of eighteen cities; Eusebius omits Scythopolis—the only one of the ten that was on the west side of the river; Damascus is sometimes named and sometimes omitted; Pliny's list includes Damascus and omits Capitolias. They were mostly Greek cities, some of which, at least, were settled by the followers of Alexander the Great. They were subdued by the Maccabees (Josephus, *Ant.* xiii. 15, 4). When Pompey conquered the East (63 B. C.), he annexed them to Syria, detaching them from the Judæan government. Surrounded as they were by Jews, these cities then united in a defensive alliance. The original union was probably of these four: Hippos, Pella, Gadara, and Scythopolis (on the west side of the river). Afterward there were added Philadelphia, Gerasa, Dion, Raphana, Capitolias, and Canatha. Of these ten only Scythopolis, Gadara, and Canatha are now inhabited, though all but Raphana have been identified. Hippos has been identified with Fik; Pella with Tubakat Fah'l; Gadara with Um Keis; Philadelphia with Rabbath-ammon; Gerasa with Gerash; Dion with Eidun; Capitolias with Beit er Ras; and Canatha with Kunawat. Scythopolis, the ancient Beth-shean, is now called Beisan. See Selah Merrill, *East of the Jordan* (New York, 1881; 2d ed. 1883).

De Cassagnac, de-kăăs'săăn'yaak', PAUL GRANIER: French journalist, politician, most noted duelist of France, if not of Europe; b. Dec. 2, 1843; son of Adolphe Granier de Cassagnac, a zealous Bonapartist; succeeded his father as editor of *Le Pays*; has been since 1879 a member of the Chamber of Deputies; noted as a fiery Bonapartist and especially for his numerous affairs of honor. Author of *History of the Third Republic*.

C. H. T.

Deca'tur: city and railway junction; capital of Morgan co., Ala. (for location, see map of Alabama, ref. 2–C); on Tennessee river; 87 miles from Birmingham; has numerous churches, saw-mills, planing-mills, and a basket-factory. Pop. (1880) 1,063; (1890) 2,765; (1900) 3,114.

EDITOR OF "NEWS."

Decatur: town; capital of De Kalb co., Ga. (for location of county, see map of Georgia, ref. 3–G); on railway, 6 miles E. N. E. of Atlanta; in an agricultural district. Pop. (1880) 639; (1890) 1,013; (1900) 1,418.

Decatur: city and important railway center; capital of Macon co., Ill. (for location of county, see map of Illinois, ref. 6–E); situated about a mile N. of Sangamon river and 39 miles E. of Springfield. It has numerous manufactures, flouring-mills, large grain elevators, large railway car and repair shops, electric street railways, water-works, and paved streets. There are here two coal shafts. Pop. (1880) 9,547; (1890) 16,841; (1900) 20,754.

EDITOR OF "HERALD-DISPATCH."

Decatur: city and railway center; capital of Adams co., Ind. (for location of county, see map of Indiana, ref. 4–G); on St. Mary's river; 21 miles S. S. E. of Fort Wayne; has 9 churches, 2 public schools, a parochial school; has manufactures of wind-mills and engines, spokes and hubs, mill machinery, salt-glazed tile, and has 3 grist-mills; there are two stone quarries and a limekiln. Pop. (1880) 1,905; (1890) 3,142; (1900) 4,142.

EDITOR OF "DEMOCRAT."

Decatur: village; on M. C. Ry.; Van Buren co., Mich. (for location, see map of Michigan, ref. 8–H); 116 miles E. by N. of Chicago. Pop. (1800) 1,267; (1890) 1,109; (1900) 1,356.

Decatur: town; on railway; capital of Wise co., Tex. (for location of county, see map of Texas, ref. 2–H); beautifully situated 25 miles N. of Fort Worth; has 6 churches, a graded school, a college (Baptist), cottonseed-oil mill, canning-factory, ice-factory, and water-works. Pop. (1880) 579; (1890) 1,746; (1900) 1,562.

EDITOR OF "NEWS."

Decatur, STEPHEN: naval officer; b. in Newport, R. I., in 1751; son of a Huguenot refugee from Rochelle, France, who had served in the French navy as an officer, and who after his emigration married a lady who was a native of Rhode Island. Stephen Decatur removed to Philadelphia, Pa., when a young man, and there obtained command of a merchantman. During the war of the Revolution he commanded the Royal Louis and Fair American, and captured several British vessels. On May 11, 1798, hostilities with France having begun, he was appointed post captain in the U. S. navy, and was placed in command of the Delaware of twenty guns, which, during his cruise along the coast of the U. S. and in the West Indies, captured the privateers Le Croyable and Marsuin. In 1800 he was appointed to the command of a squadron of thirteen sail on the Guadeloupe station. In Oct., 1801, he was discharged from the service under the peace establishment, and engaged in business in Philadelphia. D. at Frankford, near Philadelphia, Nov. 14, 1808. His son, STEPHEN DECATUR (*q. v.*), attained great distinction in the navy.

Decatur, STEPHEN: commodore; b. at Sinnepuxent, Md., Jan. 5, 1779; entered the navy in 1798. In Feb., 1804, he led a small party which burned in the harbor of Tripoli the U. S. frigate Philadelphia after she had been captured by the Tripolitans. For this gallant exploit he was raised to the rank of captain. In the same year he added other deeds of valor to his record in the attacks upon Tripoli by Com. Preble's squadron. Having taken command of the frigate United States, he captured the British frigate Macedonian Oct 25, 1812. A gold medal was voted to him by

Congress for this victory. He was blockaded by a superior force in the harbor of New London in 1813–14. In May, 1815, he was appointed commander of a squadron of three frigates and seven smaller vessels, which was sent to chastise the Algerines. He captured two Algerine vessels of war June 17 of that year, and compelled the Dey of Algiers to sue for peace. He was killed in a duel by Com. James Barron Mar. 22, 1820. He was noted for his resolute spirit and cool intrepidity.

Decazes, dā′kaaz′, Élie, Duc de: French statesman; b. at St.-Martin-du-Laye, Sept. 28, 1780; became the trusted counselor of King Louis of Holland, and afterward secretary to Letitia Bonaparte; went over to the Bourbons in 1814; Minister of Police 1815; Minister of the Interior 1818. He was made Prime Minister in Nov., 1819, and tried to keep the balance between the radical and ultra-royalist parties, but was pleasing to neither. The murder of the Duke of Berry was turned into political capital by the royalists, who charged Decazes with complicity in the crime. He resigned; was created duke by the king, and sent as ambassador to England 1820–21. After the revolution of 1830 he supported Louis Philippe, and in 1834 became grand referendary of the chamber of peers. In 1818 he had been made Duke of Glücksburg by the King of Denmark. In 1846 he was accredited to that country on a special mission, but the latter part of his life was generally free from political concerns, and after 1848 spent in retirement on his estate of Decazeville. D. Oct. 24, 1860.

Decazes, Louis Charles Élie Armanien, Duc de: statesman; b. in Paris, May 29, 1819; eldest son of Élie Decazes. He early entered the diplomatic service, and was minister plenipotentiary to Spain and Portugal in 1848, but retired into private life when the Revolution broke out. In 1871 he was elected a member of the National Assembly. He took his seat in the right center, but, though he generally followed his party, he never openly and formally declared himself a monarchist. In 1873 he was appointed Minister of Foreign Affairs, and he retained that position till 1877, under exceedingly trying circumstances, but with dignity, enjoying the confidence both of the house of representatives and of the foreign cabinets. D. Sept. 17, 1886.

Decazeville, *dā′*kăaz′veel′: a town of France; department of Aveyron; about 20 miles N. E. of Villefranche (see map of France, ref. 8–F). It has extensive blast furnaces and iron-forges. Coal mines are worked in the vicinity. Pop. (1896) 9,634.

Dec′can, or **The Dekkan** [from Sanskrit *dakshiṇa-*, on the right hand, hence in looking east, the south, south country; cf. Gr. δεξιός, Lat. *dexter*, right hand]: a geographical term of historical importance, often applied to the whole of the peninsula of Hindustan S. of the Nerbudda river or Vindhya Mountains, but now often limited to the country between the Nerbudda and the Kistnah. It comprises Aurungâbâd, Bidar, Berar, Bijapur, Candeish, Gundwana, Northern Circars, and Orissa. The Deccan was first invaded by the Mohammedans in 1294, when Diogiri was stormed and pillaged. Over a quarter of a century later on, in 1325, the Mohammedans pushed their conquests still farther, and annexed to the empire of Delhi the whole country as far S. as the Kistnah. The name has been latterly applied to one of the larger political subdivisions of the Presidency of Bombay.

Revised by M. W. Harrington.

December [Fr. *Décembre*, from Lat. *decem*, ten]: the twelfth and last month of the year; so called because in the ancient Roman calendar it was the tenth month of the year. By the Anglo-Saxons it was called *Yule month* and *Mid-winter month*.

Decem′viri (sing. **Decemvir**) [Lat. *decem*, ten + *vir*, man, plur. *viri*]: a name applicable to ten persons appointed for particular purposes, but more especially applied to the ten magistrates elected from the Roman patricians to draw up a code of laws founded on the more approved institutions of Greece; they were also invested with supreme authority to govern the state. The experiment proved entirely successful; their laws were approved by the senate and engraven on ten metal tablets; and their official duties were discharged with so much satisfaction that, at the expiration of their year of office, it was resolved, as their work was not completed, to continue the same form of government. A new commission, invested with the same power, was appointed for the next year, to which the plebeians were admitted, the result of which was two additional tablets, thus completing the famous Twelve Tables which in subsequent times became the foundation of all Roman law. The new decemviri, however, proceeded to the most violent acts of despotism, perpetrating various outrages on the persons and families of the plebeians, which so exasperated the people that an insurrection broke forth; the decemviri were driven from office, and the ordinary magistrates were re-established.

The *decemviri litibus judicandis* (ten men for settling lawsuits) formed a kind of court for trying civil cases, and, later, for matters involving life and death. The *decemviri sacris faciundis* (the ten men for performing sacred duties), first instituted about 367 B. C., were five patricians and five plebeians who had charge of the Sibylline books until the time of Cicero, when they were made fifteen in number. They were considered sacred to Apollo. There were also decemviri for dividing the public lands.

Decennial [from Lat. *decen′nium*, period of ten years; *decem*, ten + *annus*, year]: occurring every ten years. For example, the U. S. census is decennial. The decennial games (*decennia* or *decennalia*) among the later Romans were celebrated in consequence of the fact that the Emperor Augustus pretended to refuse the empire for life, choosing to be elected to it for a period of ten years, at the end of which time he accepted it for ten years more, and so on till the end of his life. The fiction was kept up till the last days of the empire by the observance of the decennial games.

Deciduous Teeth [*deciduous* is from Lat. *deci′duus*, inclined to fall, deriv. of *deci′dere*; *de* + *ca′dere*, fall], called also, in mammals, *temporary* or *milk teeth*: those which appear in infancy and which after a time fall out, and are succeeded by the permanent teeth. In children there are twenty such teeth, ten in each jaw—four molar, two canine, and four incisor teeth. In reptiles and fishes all teeth are deciduous, being continually cast out and renewed.

Deciduous Trees: trees whose leaves fall in the autumn, leaving the branches bare of foliage during the winter. They are contrasted with the Evergreens (*q. v.*), in which the leaves remain upon the branches until after the appearance of the new leaves in the spring. There are many gradations between the two kinds. A tree which is deciduous in a cold climate will be evergreen or nearly so in a warm climate.

Decimal [from Lat. *decimus*, tenth]: a number written in the scale of tens. The name is especially applied to a Decimal Fraction (*q. v.*).

Decimal Fraction: a fraction whose denominator is a decimal number or power of ten. Thus $\frac{1234}{100}$ is a decimal fraction. It may be decomposed into the sum $\frac{1000}{100} + \frac{200}{100} + \frac{30}{100} + \frac{4}{100} = 10 + 2 + \frac{3}{10} + \frac{4}{100}$. By an obvious extension of the method of local values, where each digit has ten times the value of the like digit which immediately follows it, the above decimal fraction may be, and usually is, written thus: 12·34, where the decimal point after the 2 merely serves to indicate which digit represents *units*. In this form a decimal fraction is termed a *decimal*.

For the purpose of indicating the units' place the method of Sir Isaac Newton, of using a point placed for distinction near the top of the figures, is frequently used. The operations of addition, subtraction, multiplication, and division may be applied to decimals in exactly the same manner as to integers. The only additional rules in decimals refer to the position of the decimal point.

In their abbreviated form decimal fractions are now extensively employed in arithmetical calculations. A subdivision of weights and measures on the prineiple of decimal division was introduced into France at the time of the Revolution, and has since been adopted by a large portion of the civilized world under the name of the Metric System (*q. v.*).

Decimal System: See Metric System.

Decimation [from Lat. *decima′tio*, deriv. of *decima′re*, to decimate, to take by lot each tenth man for punishment]: in Roman history, the selection by lot of one man out of every ten, who was put to death in cases of mutiny or other grave offense committed by a body of troops. Decimation has seldom been practiced in modern times. Blücher decimated a body of mutinous troops before the battle of Waterloo, and Mexico occasionally practiced it, as in the case of the citizens of the U. S. captured in the expedition against Mier.

Decimi, dā'chĕe-mĕe [Ital., from Lat. *de'cimus*, tenth]: an Italian term used in music, signifying an interval of ten diatonic degrees, as from small c to the once-marked ē. The harmonic relations of the tenth are so similar to those of the third that in thorough-bass the same figure (3) denotes either. But while, from a harmonic standpoint, the tenth is considered simply as a third, an octave removed from its fundamental in counterpoint (polyphony), relations arise in which the tenth develops peculiarities, which require different treatment from that demanded by the third.

Decius, Caius Messius Quintus Trajanus: Roman general and emperor; b. in Pannonia about 200 A. D. Sent in 249 by the Emperor Philip to appease a sedition, his army revolted and proclaimed him emperor. Philip marched against him, but was killed in the battle which ensued. Decius himself was slain two years later by a shower of darts, and his army defeated while attempting to check the Gothic invasion.

Decius Mus, Publius: a Roman consul and patriot who obtained celebrity by devoting himself to the Dii Manes as a sacrifice. In a battle against the Latins (337 B. C.) he rushed into the midst of the enemy and was killed. His son, P. Decius Mus, imitated his example in 296 B. C., when he commanded against the Gauls.

Decker, or **Dekker**, Thomas: English dramatist; b. in London about 1570; began writing for publication as early as 1597; collaborated with Ben Jonson, Middleton, Webster, and many others; published in 1600 the comedies *The Shoemaker's Holiday, or the Gentle Craft*, and *The Pleasant Comedy of Old Fortunatus*; quarreled with Jonson, who satirized him in *Every Man out of His Humor* and other plays, and was ridiculed in turn in Decker's *Satiromastix, or the Untrussing of the Humorous Poet* (1602); was several times imprisoned for debt; according to his own account, was "three score" in 1637. Among the plays written in conjunction with others were *The Honest Whore, or the Converted Courtesan* (1604; second part, with Middleton, 1630); *The Roaring Girl*, with Middleton (1611); *The Virgin Martyr*, with Massinger (1622). He aided Rowley and Webster in the tragedy *The Witch of Edmonton* (published in 1658). Decker had a sprightly and humorous style, and was a realist in depicting the life of his time. He also wrote a number of pamphlets chiefly satirizing English social life; one of these, *Lanthorn and Candlelight* (1609), was republished as *English Villainies* (1637). These pamphlets were republished in Grosart's *Huth Library*, and a collection of his plays appeared in five volumes in 1873.

Declaration [Lat. *declara'tio*, deriv. of *declara're*, make clear (*clarus*), publish]: an affirmation; the act of declaring; a public announcement; a public expression of facts or opinions; a proclamation. Among the most memorable of all political documents are the Declaration of Independence (*q. v.*), of the British North American colonies, and the "Declaration of Rights" passed by the first Congress of those colonies at Philadelphia on Oct. 14, 1774. The Convention-parliament of England adopted a "Declaration of Rights" on calling William and Mary to the throne in 1689. A "Declaration of the Rights of Man" was adopted by the National Assembly at Paris Aug. 18, 1789. The "Declaration of Thorn" (Lat. *declaratio Thorunensis*) was a confession of faith drawn up at Thorn, in Poland, in 1645, for the use of the Reformed churches, the design being to settle controverted points. Revised by C. K. Adams.

Declaration: in common-law pleading, a specification of a cause of action by a plaintiff against a defendant; the pleading in which a plaintiff sets forth his case against the defendant. It contains certain formal or substantial parts, such as the title, venue, the cause of action, and the conclusion; it answers to the "bill" in equity. The declaration followed after the service of the writ of summons, and unless it was delivered within a certain time the defendant could obtain a judgment of *non pros*. In Great Britain the declaration is no longer in use in actions, being superseded by a "statement of claim" under the Judicature Acts, and in the U. S. the term "complaint" is used in the code States to designate the plaintiff's statement of his cause of action. The term is used in other branches of the law, as in declaration of trust, declaration of uses, declaration in evidence, etc., where it has its general sense of an express or explicit statement, an asseveration or acknowledgment of a fact, purpose, or intent. Revised by F. Sturges Allen.

Declaration of Independence: the act by which the thirteen British colonies of North America asserted their independence of the mother country. The first Congress of the thirteen British colonies, which led to their ultimate union in resistance to the British crown, and their jointly throwing off their allegiance to the same, as well as their ultimate union as the United States of America, met in Philadelphia Sept. 5, 1774. The immediate cause of this assemblage was what was called "the Boston Port Bill"—that is, an act of Parliament by which the port of Boston was closed and the custom-house removed to Salem, because of the destruction of the tea at the former place. This was looked upon by the friends of constitutional liberty in all the colonies as a direct attack by usurpation upon the chartered rights of Massachusetts. If they should silently permit this gross outrage to be perpetrated upon a sister colony they saw no security against similar outrages being perpetrated in turn upon their own chartered or constitutional rights. It was now that the cry of "The cause of Boston is the cause of us all" was raised in Virginia, and extended from the Penobscot to the Altamaha. The result was the call of a general congress of all the colonies, to meet, by deputies, at the time and place stated, for joint consultation and joint action in maintenance of principles essential to the preservation of the rights and liberties of all. The idea of independence or separation was at this time entertained by no one. Upon the assembling of this Congress, Peyton Randolph, of Virginia, was chosen the president of it, and Charles Thompson secretary. In all the deliberations of this body each colony stood upon an equal footing with the others, without regard to population, wealth, or the number of delegates sent. All questions were decided by the colonies present, each having one vote only. They urged several measures upon the consideration of their constituents as proper means for obtaining a general redress of grievances, and also prepared and published a declaration of what they considered the indefeasible rights of all the colonies under the British constitution. They adjourned Oct. 26, 1774, with a recommendation to the colonies to meet in Congress again, by deputies, May 10, 1775.

In speaking of the papers issued by this assemblage, Lord Chatham said in the British Parliament that, though he had studied and admired the free states of antiquity, the master-spirits of the world, yet for solidity of reasoning, force of sagacity, and wisdom of conclusion no body of men could stand in preference to this Congress. All this, however, incensed rather than appeased the ministry. On Apr. 1, 1775, they had 3,000 troops in Boston for the purpose of enforcing their iniquitous measures at the point of the bayonet. Hostilities soon ensued. The battles of Concord and Lexington were fought. Engagements also took place at Ticonderoga, Crown Point, and Skenesborough in New York.

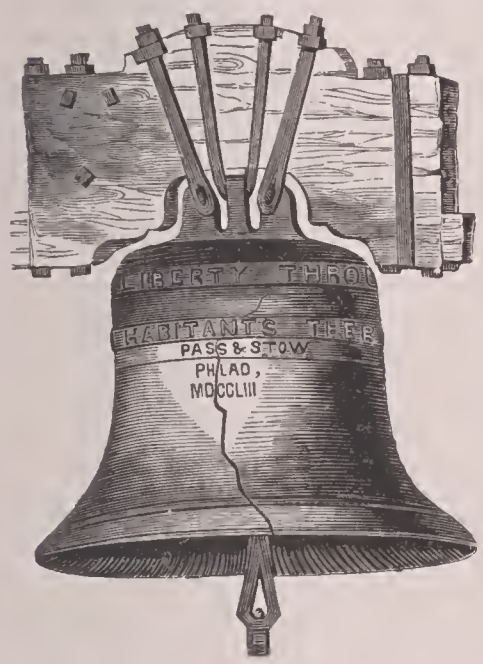
It was in this state of things that the second Congress of the colonies assembled at Philadelphia on May 10, 1775, according to the recommendation of its predecessor. Peyton Randolph, of Virginia, was again chosen president, but soon being called home on urgent business, John Hancock, of Massachusetts, was on May 24 chosen president of the Congress in his stead. The crisis was now becoming not only serious, but alarming. The purpose of Great Britain to reduce the colonies to absolute subjection without any redress of grievances seemed to be evident. The Congress, with firmness and without hesitation, determined to resist force by force. Troops were raised for the purpose. In setting forth the reasons for their action in thus defending themselves and their constituents, they declared that they had "no wish to separate from the mother country, but only to maintain their chartered rights." "In our native land," said they, "and in defense of the freedom which is our birthright, and which we have ever enjoyed till the late violation of it, for the protection of our property, acquired solely by the honest industry of our forefathers and ourselves, against violence actually offered, we have taken up arms. We shall lay them down when hostilities shall cease on the part of the aggressors, and all danger of their being renewed shall be removed, and not before."

On June 14, 1775, at the instance of Massachusetts, George Washington, one of the delegates of Virginia, was unanimously appointed commander-in-chief of all the colonial forces. He was commissioned in the name of the united colonies, the name of each colony present by its deputies being set forth in the commission. This office he accepted on the condition that he should receive no salary except the payment of his actual expenses.

Three days afterward the battle of Bunker Hill was fought. Washington did not reach the vicinity of Boston until July 12, 1775, when he assumed the command of the colonial army assembled there. It was not until the early part of the year 1776 that the public mind throughout the colonies began generally and seriously to consider the question of independence, though a portion of the people of North Carolina had taken this view of the subject almost from the beginning of the troubles. As early as May 20, 1775, their celebrated Mecklenburg convention assembled and announced their famous declaration, severing themselves for ever from all their allegiance to the crown of Great Britain. Though the influence of this act upon the other colonies appears not to have been very great, the historical importance of it was very considerable, as it preceded the general declaration by more than a year, and gave expression to many of the thoughts embodied in the more celebrated document. See MECKLENBURG DECLARATION OF INDEPENDENCE.

In Jan., 1776, Massachusetts instructed her delegates in the Congress of the colonies at Philadelphia to vote for independence. The same thing was done by South Carolina in March, and by Georgia and North Carolina in April. In May, Gen. Washington wrote: "A reconciliation with Great Britain is impossible. . . . When I took command of the army I abhorred the idea of independence; but I am now fully satisfied that nothing else will save us." In the same month Virginia instructed her delegates in Congress to vote for independence. New Hampshire, New Jersey, and Maryland followed early in June. Pennsylvania and New York delayed action, still indulging hopes of an adjustment of the controversy. The general instructions of the colonies to their delegates were to renounce all allegiance to the British crown, and to form a confederation among themselves as independent States. On June 7 Richard Henry Lee, a delegate from Virginia, moved a resolution in Congress that "these united colonies are, and of right ought to be, free and independent States, . . . and that a plan of confederation be prepared and transmitted to the respective colonies for their consideration and approbation." This resolution was adopted on June 11. Two committees were appointed under it—one to prepare a Declaration of Independence and the other to prepare Articles of Union or Confederation. The committee to prepare the Declaration of Independence consisted of Thomas Jefferson, of Virginia, John Adams, of Massachusetts, Benjamin Franklin, of Pennsylvania, Roger Sherman, of Connecticut, and Robert R. Livingston, of New York. They reported on June 28, but action on the report was deferred for some days for the delegates from Pennsylvania and New York to receive their instructions and powers to vote for the Declaration. This celebrated paper was drawn up by Mr. Jefferson, the chairman of the committee, being only slightly modified in some parts, as it now stands, at the suggestion of other members. It came up for final action on July 4, when it received the unanimous vote, not only of all the colonies, but of all their delegates in Congress. It is given in full herewith, with facsimiles of the signatures.

Revised by C. K. ADAMS.



The "Liberty Bell" was first imported from England in 1753. It was cracked at the first ringing after its arrival, and recast in Philadelphia in the same year. Upon the fillets around it were cast (twenty-three years before the Declaration of Independence) the prophetic words, "Proclaim liberty throughout all the land, unto all the inhabitants thereof." After the first reading of the Declaration it was rung for more than two hours, with the firing of cannon and the beating of drums. The bell has been broken for many years, and is to be seen in the hallway of the old State-house, Philadelphia. In 1893 it was taken to Chicago, to be exhibited, with other objects of historic interest, at the Columbian Exposition.

TEXT OF THE DECLARATION.

IN CONGRESS, *July 4, 1776.*

THE UNANIMOUS DECLARATION OF THE THIRTEEN UNITED STATES OF AMERICA.

When, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established, should not be changed for light and transient causes; and accordingly, all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these Colonies, and such is now the necessity which constrains them to alter their former systems of government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having, in direct object, the establishment of an absolute tyranny over these States. To prove this, let facts be submitted to a candid world:

He has refused his assent to laws the most wholesome and necessary for the public good.

He has forbidden his Governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained; and, when so suspended, he has utterly neglected to attend to them.

He has refused to pass other laws for the accommodation of large districts of people, unless those people would relinquish the right of representation in the Legislature; a right inestimable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved representative houses repeatedly, for opposing, with manly firmness, his invasions on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the State remaining, in the meantime, exposed to all the danger of invasion from without, and convulsions within.

He has endeavored to prevent the population of these States; for that purpose, obstructing the laws for the naturalization of foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers.

He has made judges dependent on his will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers to harass our people and eat out their substance.

He has kept among us, in times of peace, standing armies, without the consent of our legislature.

He has affected to render the military independent of, and superior to, the civil power.

He has combined, with others, to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his assent to their acts of pretended legislation.

For quartering large bodies of armed troops among us:

For protecting them, by a mock trial, from punishment, for any murders which they should commit on the inhabitants of these States:

For cutting off our trade with all parts of the world:

For imposing taxes on us without our consent:

For depriving us, in many cases, of the benefits of trial by jury:

For transporting us beyond seas to be tried for pretended offenses:

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these colonies:

For taking away our charters, abolishing our most valuable laws, and altering, fundamentally, the powers of our governments:

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated government here, by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is, at this time, transporting large armies of foreign mercenaries to complete the works of death, desolation, and tyranny, already begun, with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

He has excited domestic insurrections among us, and has endeavored to bring on the inhabitants of our frontiers, the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions, we have petitioned for redress in the most humble terms; our repeated petitions have been answered only by repeated injury. A prince whose character is thus marked by every act which may define a tyrant is unfit to be the ruler of a free people.

Nor have we been wanting in attention to our British brethren. We have warned them, from time to time, of attempts made by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them, by the ties of our common kindred, to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They, too, have been deaf to the voice of justice and consanguinity. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them, as we hold the rest of mankind, enemies in war, in peace friends.

We, therefore, the Representatives of the United States of America, in General Congress assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the name and by the authority of the good people of these Colonies, solemnly publish and declare, That these United Colonies are, and, of right, ought to be, *free and independent States*; that they are absolved from all allegiance to the British crown, and that all political connection between them and the state of Great Britain is, and ought to be, totally dissolved; and that, as *free and independent States*, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which *independent States* may of right do. And, for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other, our lives, our fortunes, and our sacred honor.

Declaration of Independence, The Mecklenburg: See MECKLENBURG DECLARATION OF INDEPENDENCE.

Declaration of Indulgence: a proclamation issued by James II., granting religious toleration to Protestant and Roman Catholic Nonconformists, and ordered to be read in all the churches. It was expected to draw the Dissenters to the side of the king's Catholic policy, since they, in common with the members of the king's faith, were benefited by it, but a storm of opposition arose in all quarters; many of the clergy refused to read it, and at last the seven bishops, headed by Archbishop Sancroft, presented the famous petition for the remission of the requirement that it should be read. Their trial followed on the charge of seditious libel, and amid the most intense excitement resulted in their acquittal. The effect of the declaration was to consolidate the opposition and precipitate the revolution of 1688. F. M. COLBY.

Declaration of Paris: the declaration made by the delegates to the Congress of Paris, 1856, in regard to privateering, blockades, etc. The Crimean war was waged on new and milder principles of naval capture. At its outset the allies announced that they intended to waive their undoubted right to seize enemy's goods on a neutral ship not being contraband of war. Nor would they confiscate neutral property not contraband on an enemy's ship. And they declared that it was not their present intention to issue letters of marque. The sentiments which led to these changes survived the war, and animated the delegates to the Congress of Paris in 1856. After settling various questions growing out of the war and its issue, the plenipotentiaries united in the following declaration:

"Considering that maritime law in time of war has long been the subject of deplorable disputes; that the uncertainty of the law and of the duties in such a matter gives rise to differences of opinion between neutrals and belligerents which may occasion serious difficulties, and even conflicts; that it is consequently advantageous to establish a uniform doctrine on so important a point; and that the plenipotentiaries assembled in congress at Paris can not better respond to the intentions by which their governments are animated than by seeking to introduce into international relations fixed principles in this respect—the above-mentioned plenipotentiaries, being duly authorized, have adopted the following solemn declaration:

"1. Privateering is and remains abolished.

"2. The neutral flag covers enemy's goods, with the exception of contraband of war.

"3. Neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag.

"4. Blockades, in order to be binding, must be effective—that is to say, maintained by a force sufficient really to prevent access to the coast.

. . . . . .

"The present declaration is not and shall not be binding, except between those powers who have acceded or shall accede to it."

This declaration has since been acceded to by all the important maritime states, except the U. S., Mexico, and Spain. The refusal of the U. S. was based upon its dependence upon privateering to supplement its small standing navy in case of maritime war. But Mr. Marey, Secretary of State, offered in return for the exemption of all innocent private property, even an enemy's, from capture, to give up privateering thus become unnecessary, and to accept the other articles. This "Marcy amendment" was declined.

Thus the case rested until the breaking out of the civil war in the U. S. in 1861. Then Mr. Seward made haste to commit his Government to the declaration. Great Britain and France assented, with the proviso that the accession of the U. S. should not be retrospective, for they had both recognized the belligerency of the South, and its right therefore to issue letters of marque, and could not permit the North to limit those rights by acceding to this declaration, and so preventing privateering by neutral subjects. And yet both countries forbade their citizens to accept letters of marque to cruise against a friendly power, as a matter of policy, and this practical refusal of the offer of the U. S. seemed unfriendly. Upon receiving it, the offer to accede was withdrawn.

As regards the rules of the declaration, all but the first are accepted as a part of international law by the U. S., many of whose treaties forbid privateering as between the contracting parties. The U. S. have not (1893) issued letters of marque for sixty years and more. Fast cruisers are now built to do the same work, and the privateer is not needed. What is needed is the right under rules 2 and 3 of the declaration—to carry the goods of a belligerent on U. S. ships. At present, unless in special cases by treaty, the U. S. have no such right, and could not compete with the parties to the declaration on equal terms. If Great Britain and France were at war French cruisers could seize every cargo of U. S. grain or every bale of U. S. goods afloat under the British flag, while if Great Britain and Russia were at war British ships could capture all Russian goods sailing in U. S. bottoms. Neither the produce nor the carrying trade of the U. S. would be safe. So that by acceding to the Declaration of Paris the U. S. would lose little or nothing and gain a great deal. THEODORE S. WOOLSEY.

Declaration of Rights: a state paper presented to the Prince and Princess of Orange (afterward William III. and Mary II.) at the time the crown was tendered to them (Feb. 13, 1689). The declaration had been drawn up by the Convention-parliament, and complained of the following grievances which England had endured during the reign of James II.: The exercise of the dispensing power, the establishment of illegal ecclesiastical tribunals, unlawful taxation, the unlawful maintenance of the army, interference with the courts and the elections, the levying of excessive bail, the infliction of barbarous punishments, and the refusal to hear petitions. The declaration then asserted the rights which had been thus violated, and claimed various privileges for the nation. The substance of this declaration became the BILL OF RIGHTS (*q. v.*), passed in the second session of the first Parliament under William and Mary.

Declaration of War: the formal announcement by one government of its intention to wage war against another. Formerly this proceeding was usually observed among civilized nations. But since the universal use of the telegraph in political correspondence and for conveying the news of the world, the events leading up to a war are so accurately and widely known that a formal declaration is unnecessary, and this with no design of taking an enemy unawares. It is still customary, however, for each belligerent at the outbreak of war to issue manifestoes (1) to its own subjects, to inform them of the impending change and its risks to their property; and (2) to neutrals, to make known the principles and rules of war which will be enforced. In the U. S. an act of Congress, voting to carry on war, is constructive notice of war to all other states. At the beginning of the civil war in 1861 it was held that when the course of justice was interrupted, and courts in the South were closed, there was a state of civil war in existence without necessity for any farther declaration. In the U. S. the declaration of war is a power exercised by Congress alone. During the age of chivalry a herald made declaration of war at the enemy's court, his tabard on his arm. No offense was taken at his defiance, which was frequently rewarded by gifts of money from the party defied. See INTERNATIONAL LAW.
Revised by T. S. WOOLSEY.

Declension [accommodated to analogy of endings like *dimension*, *extension*, etc., from O. Fr. *declinaison* < Lat. *declinatio* (*-nem*), bending aside, inflection]: in grammar, those modifications of form by which nouns, adjectives, and pronouns express the various relations of case. These modifications vary also according to number and gender. The various cases of nouns serve not only to name the objects of thought, but also to denote the relations which these bear in the sentence to the nucleus of the thought or statement—i. e. the verb. In the so-called inflectional languages, like the Indo-European and Semitic, the modification of form is achieved without disturbing the unity of the word, in the agglutinative, like the Turkish, by the addition of elements which preserve a conscious individuality. Those languages in which the relations of the words are commonly left without formal expression are called the isolating. Such are the Chinese and Siamese.

The Indo-European parent-speech was provided with seven different groups of noun-forms for the conventional expression of the most important relations within the sentence. These are the nominative, accusative, genitive, ablative, dative, locative, and instrumental cases. The vocative, which is merely the interjectional form of the noun, is not strictly to be included among the cases. In form it was either the bare stem of the noun, as in Lat. *serve*, Gr. *πάτερ*, or took the form of the nominative. The nominative case indicated the substantive idea in connection with which the action of the sentence as expressed in the verb gained its

expression and received its psychological shape. In form it consisted in the singular of the stem of the noun often with a heavy final syllable, or was indicated by the sign *-s*; in neuters it was like the accusative; cf. Gr. *πατήρ*, *λόγο-ς*. In the plural its prevailing sign was *-es*, which uniting with the final vowel of the *o-* stems produced *-ōs*; cf. Gr. *πόδες*, Goth. *wulfōs*. The endings Gr. *-οι* and Lat. *ī*, etc., had their origin in the pronominal declension. The accusative denoted that toward which the action of the verb was aimed or to which it was directly applied, or, in general, served as the complement of the verb. Its sign was in the singular *-m*, in the plural (masculine and feminine) *-ns*. The neuter plural used a distinct collective form ending in *-ā* (or *ə*). The genitive expressed a relation between noun and noun or a tangency of the action of the verb to a noun. In the singular its sign was *-os* (*-es*, *-s*) or *-si̯o*, in the plural *-ŏm*. The ablative indicated the source of the action of the verb. In the singular its sign was *-d* (preceded by a lengthened vowel), or it was merged with the genitive; in the plural it was merged with the dative. The dative denoted that which the action concerns. Its sign in the singular was *-ai*, in the plural *-bhios* or *-bhos*. The locative denoted the place or sphere within which the action took place. Its sign in the singular was *-i*, in the plural *-su* or *-si*. The instrumental expressed accompaniment or means, and its sign was in the singular *-a* or *-bhi*, in the plural *-bhis*, *mis*, or *-is* (preceded by a long vowel). The number of these cases was generally reduced in the separate languages. A single case-form often assumed the functions of two or more cases. Thus in Latin the so-called ablative case-form combines the meanings of locative, instrumental, and ablative, and in the Greek the so-called dative includes the meanings of locative, instrumental, and dative, and the genitive the meanings of ablative and genitive. Such confusions or syncretisms were generally due to a confusion of the case-functions in use, rather than to a merging of form. As this confusion increased with the development of the various languages, the use of prepositions to supplement the definition of the syntactical relations steadily increased, so that e. g. in English we possess only bare remnants of three case-forms—the nominative, genitive, and accusative—and express the most of the case-relations by the aid of prepositions. The adverbs, prepositions, and infinitives in the various languages are chiefly made up of petrified case-forms; thus the Lat. *modŏ*, *benĕ*, *malĕ* are instrumentals; *rectē*, *optimē*, *pondō* are ablatives; *partim*, *statim* accusatives. The infinitives Gr. *δόμεναι*, Lat. *sequī* are datives, while *δόμεν* and *regĕre* are probably locatives.

BENJ. IDE WHEELER.

Declination [from Lat. *declinatio*, bending aside, down, deriv. of *declina're*]: in astronomy, the angular distance of a celestial body from the celestial equator; measured along a great circle passing through the center of the body and the poles of the heavens; or it may be defined to be the arc of a circle of declination passing through the place of the heavenly body, intercepted between that place and the celestial equator. The place of a star in the heavens is determined by means of its right ascension and declination, which correspond to longitude and latitude on the surface of the earth.

Declination of the Magnetic Needle: the deviation of the axis of a magnetic needle (that is, the straight line which joins its poles) from the astronomical meridian. This declination is sometimes toward the W. and sometimes toward the E. From a table of observations made at Paris it appears that since 1580 the declination has varied more than 31°. In 1663 it vanished. From the date of the first observations till 1820 it advanced progressively westward, but since that time it has assumed a retrograde movement toward the E. The declination of the magnetic needle at London in 1865 was 20° 30′. In 1893 it was scarcely perceptible at Cape Hatteras. To the W. of that point it is easterly, and to the E. the variation is westerly. See MAGNETISM and EARTH.

Declinom'eter [mod. malformation from Lat. *declina're*, decline + Gr. *μέτρον*, measure]: an apparatus for measuring the declination of the magnetic needle, or the force of terrestrial magnetism in the plane of the horizon.

Decomposition [from Lat. *de*, from, un- + *compon'ere*, *compositum*, arrange, construct]: in chemistry, the separation of compound substances into their elementary parts. When compounds are resolved into their elements, or when the chemical constitution of substances is altered, they are said to be decomposed; and when in this operation new products are formed, such products are called the results of decomposition. Thus ammonia is the result of the decomposition of certain animal substances; carbureted hydrogen gas is the result of the decomposition of pit-coal, etc. Chemists use the terms simple and compound, or single and double decomposition, to distinguish between the less and more complicated cases. When a compound of two substances is decomposed by the intervention of a third, which is itself simple or which acts as such, the case is one of simple decomposition; water, for instance, is a compound of oxygen and hydrogen. When the metal potassium, which is a simple body, is thrown into it, it is decomposed; the hydrogen is liberated in the form of gas, and the oxygen combines with the potassium to form potassa. See CHEMISTRY.

De Coninck, PIERRE LOUIS JOSEPH: genre-painter; b. at Méteren, Nord, France, Nov. 22, 1828. Pupil of Léon Cogniet; second Prix de Rome 1855; medals, Salons, 1866 and 1868; second-class medal, Paris Exposition, 1889; Legion of Honor 1889. *At the Fountain*, Wolfe Collection, Metropolitan Museum, New York. Studio in Paris. W. A. C.

Deco'rah; city; capital of Winneshiek co., Ia. (for location of county, see map of Iowa, ref. 2–J); on railway, and on the upper Iowa river. It is the seat of a Norwegian Lutheran college and the Decorah Institute; it has manufactories of paper, flour, windmills, wagons, etc., and a considerable publishing industry. Pop. (1880) 2,951; (1890) 2,801; (1900) 3,246. EDITOR OF "REPUBLICAN."

Decorated Style: a term first employed by Rickman to designate that phase of English Gothic architecture which succeeded the Early English about 1285, and gave way in turn to the Perpendicular about seventy-five years later. Less vigorous than the Early English, it is more ornate, especially in its many-ribbed vaulting and rich window traceries. Its structural forms are more slender and elaborate than in the preceding period, and profusely decorated with naturalistic foliage and other carved enrichments. Sharpe, who counts seven instead of three periods in English mediæval architecture, divides this period according to its changing types of traceries into two, the Geometric, from 1285 to 1320, and the Curvilinear, from 1320 to 1360.

A. D. F. HAMLIN.

Decoration Day: in the U. S., the day set apart to the memory of the soldiers and sailors who fell in the civil war of 1861–65. It was originally called Memorial Day, and is observed by processions and orations in honor of the dead, and especially by decorating with flowers the graves of all who fought in any of the wars of the U. S. The day observed at first differed with the various States, but usage has settled on May 30, which has been made a legal holiday in most of the States. This day is said to have been chosen because it was the date of the discharge of the last soldier of the Union army in the civil war.

Decorations: See ORDERS.

Decorative Art: fine art applied to the ornamentation of objects which exist for other purposes than beauty. Thus the hilt of a sword consists of grip, pummel, guard, etc., and needs no ornament, having indeed a certain beauty of its own from the fitness of its parts and the color of the metal, etc.; but if it receives embossing and chasing, or damaskeening, or even an elaboration of form not required by utility, then the fine art employed in beautifying it in these ways is *decorative art*. By extension the term is used for the various fine arts of less developed and less dignified character; thus a statuette carved in wood and painted, or one made of Dresden porcelain, is often spoken of as a work of decorative art, although the statuette serves no purpose except as a work of art; but a life-size statue would not be called a work of decorative art, nor would even a statuette of bronze or ivory be called so except erroneously, and because it may serve to "decorate" a room. So a painting on canvas is not spoken of as decorative art, but one on a porcelain *plaque* is so spoken of, though it serves no purpose but that of a picture. This extension of the term comes from the employment of those materials or those means of ornamentation which are commonly used for decorative art proper. Thus, in the cases just now given, carved and painted wood is so much used for ornamenting useful things, such as

buildings and parts of buildings, furniture, and the like, and porcelain is so much used for unornamental dishes, bowls, and cups, that these materials and the ornamentation generally applied to them give the character of decorative art to anything in which they are used.

The chief of the decorative arts, or the chief manifestation of decorative art, is what we call architecture—that is, the making a work of fine art of a building which, if purely utilitarian and without any application of fine art to it, would be equally useful as a building. But the kind of fine art used in making a building beautiful by means of the proportion of its parts, its generally graceful form, its picturesqueness or its tranquil majesty, its lightness or its ponderous solidity; and also by means of the leafage, the animal or other forms added to it in relief, inlay, etc., is exactly the same as that used in the sword-hilt, cited above. In times when art was great the same man would design a palace and a bronze medallion and a silver flask for priming-powder; moreover, the same man would paint a sacred picture on a church wall and a coat-of-arms above a mantelpiece. Not that much good decorative art was not produced by artists of secondary rank, for undoubtedly the greater number of ornamental weapons and pieces of furniture were made by men who did not make statues or paint frescoes on church walls; but there was no sharp and generally seen distinction; the statuary was the more skillful carver, the religious painter was the painter of bridal chests and armorial shields grown stronger and more skillful, and now generally recognized as a master.

Decorative art may be divided into classes and groups of classes as to the materials employed or as to the articles and objects adorned. Usually a twofold classification is adopted. Thus in a great collection, which has now (1893) been dispersed, the classification was under thirty-six heads for mediæval or later objects alone. Sometimes the material determines the title, as leather-work or ivory-carvings; sometimes the destination of the objects, as arms and armor, or coins, medals and counters, or church goldsmiths' work. To this list of the classes of European objects for a term of eight or nine centuries only would have to be added the lacquers of Oriental art, the lapidaries' work in very hard and costly stones of both Oriental and Western nations, bookbinding, the mosaics of antiquity and the Middle Ages, the architectural inlays of stones, etc., of different colors, the glazed and other pottery used in architecture, the painted vases of the Greeks and their imitators, the painting of architecture in bright colors used by Egyptians, Greeks, and mediæval artists alike, and the whole immense world of architectural sculpture, in all ages and all lands.

The field is vast, therefore. In fact, all the graphic and plastic arts are *decorative* when used for decoration, and they have been so used far more than in any other way. (See Fine Art.) When savages begin to make simple weapons and simple utensils, the disposition to adorn them in some way shows itself almost from the beginning. And this adorning is partly by adding color or sparkle, as by means of pretty bits of shell or stone or bright feathers, to the weapon or the utensil, and partly by carving it, as by cutting rows of notches, sinking circular pits, engraving wavy and curling lines, and the like. But this coloring and carving is also connected in a curious way with the attempt to represent beasts or birds or men. The inlaid bit of shell is often made to look like an eye; the wooden point of a spear is sometimes worked to look like a tongue projecting from a mouth; even the stiff and rectangular patterns made by weaving together coarse fibers of different colors are forced into some semblance of the human figure or of some beast of chase. All this is decorative art, and this is the only art known to primitive people, because they have not begun yet to make pictures or bas-reliefs in our sense. All the artistic power of the primitive people is given in this ornamenting of spears and paddles and tappa matting and plaited grass; but this ornamenting itself involves a constant attempt to represent the living creatures about the artists—that is to say, the things they care the most about.

Now this is very nearly descriptive also of the condition of fine art in a community of the relatively high civilization of the European Middle Ages. In the thirteenth century in France and England there was still the same turning of all the artistic feeling of the time to ornamentation. No bas-reliefs were made except to fill the tympanum over a door or to adorn the back of a small round mirror or the like; no statues or statuettes except to form a part of the architecture of a church porch, or a *châsse* or shrine for the relics of a saint; no picture of men and their deeds was painted except as an acknowledged and, in a sense, necessary part of the decoration of a building or a piece of furniture. All the fine art of such a time is decorative art; and, as a result, the best artistic thought of the time goes into decoration. The wonderful results of this concentration of thought are seen not only in the decorative work of the time, but long afterward. Thus in the fifteenth century in Italy, although pictures and statues were produced which can not be classed as *decorative art*, the decorative art itself was kept up to a very high ideal. This is the result of tradition; the best artists of the Italian Renaissance had little time to think of jewelry and bookbinding, for their time was taken up with still nobler applications of their power; but the demand for high excellence in decorative art, once established, was slow to cease, and therefore there were still very able men ready to take up these arts and pursue them. At last, however, the demand for such excellence did cease; the high standard was lost. It is a very difficult subject of inquiry why the natural and healthy taste for ornamentation gradually disappeared in Europe, until the French Revolution suddenly destroyed it, and left the European world with no beauty of costume, no natural architecture, no humor for ornamenting. The first half of the nineteenth century went by with but little sign of improvement; but in the second half there has appeared to be a self-conscious and deliberate effort to recover the feeling for decorative art and the power over it which the people of earlier times had held naturally as a part of their intellectual equipment. The predominant commercial spirit of the time has been, however, directly opposed to any such recovery, and the changes of fashion, largely caused by the commercial spirit, have prevented continuous and natural development of any style.

Among people of European civilization, toward the close of the nineteenth century, decorative art is commonly looked at from two very different points of view—the collector's and the constructor's or designer's point of view. All portable objects of art, such as vases of porcelain and of bronze, painted dishes, enamels on metal, stuffs and embroideries, and the like have been for fifty years the subjects of a minute and really scientific study and investigation which has resulted in an historical knowledge of them which no other age of the world has ever possessed. In fact, a large part of the new science of archæology is devoted to these smaller works of decorative art. Immense and costly private collections have been formed, and are perhaps richer in the aggregate than the national museums, especially in containing more of the exceptionally fine and very unusual pieces. Enormous prices are given for such pieces; and this is so far fortunate that it has caused the preservation of many valuable things which would otherwise have been destroyed. Collectors, then, will buy ancient works of art, vases, carvings, bronzes, and the like, rather than modern ones, not only because they are generally finer, but also because they are more easily understood and classified. There are handbooks and dictionaries and also more elaborate treatises to which to refer for ancient art, whereas the work of to-day has to be judged upon its merits, and few persons feel themselves competent to do that. To possess a known and classed ancient work of art, described in the books, or of a kind so described, is more than to have a new piece, however fine. This fact is a serious hindrance to the growth of modern decorative art in portable objects, as there is little encouragement to the maker or the dealer. And here again modern commercialism intervenes to hurt modern art. Any increased respect among buyers and students for modern design is prevented by the disappearance of the art-workmen among a crowd of employees in the shop of a large dealer, and the consequent lack of intercourse between the designer and the employer or paymaster. Moreover, in the organization of a large establishment the designers are separated from the workmen who carry out their designs, and the few instances of fine and original work have generally been obtained by deliberately reversing the ordinary commercial methods.

On the other hand, the decorative art of building—that is to say, the architecture—of the nineteenth century is almost wholly a matter of copying from ancient buildings. Not only is the style of design, in the general mass and in detail, closely followed, but the ornamental details themselves are copied very exactly, far more often than composed anew, or with any degree of originality. An immense number of excellent books on ancient architecture were published be-

tween 1850 and 1890, and photographs have been made in abundance, and are to be bought very cheaply. If a panel of a given shape has to be filled with scroll-work, it is easy to find a photograph of a panel of very nearly the same shape, of fine ancient work of any style that allows of such panels at all. It is far easier and more certain and simple to copy this with such slight modifications as the shape calls for, or as considerations of expense may bid, than to strive for any originality at all. As for the general design of a building, that can not well be copied so closely in most cases, for modern requirements are very different from the ancient ones; but ancient styles are so closely followed, now one style and now another, that no opportunity is afforded for sufficient consideration of the proper form and the obviously natural decoration in any new building, and there is none of that freshness of thought and of inspiration which comes from allowing the design to grow naturally out of the necessities of the case. No style of architecture has ever arisen except when all builders were following the same manner of building and the same fashion of decorating. Slowly, for centuries, an old style, which all the builders and artists of the day were using, as a matter of course, has undergone modifications as the result of new requirements and new ideas, until some unusual opportunity has offered and a new style has developed itself rapidly. Never before in history was a time known like the years from 1840 to 1890, when one designer imitates one style, one another, and only a few exceptions exist of men or associations who are trying to design independently and naturally. This state of things has been almost universal in architecture proper throughout all that long period; not quite so general in stained glass, decorative painting, pottery, furniture, and the like, it is the rule even in these. Nor does it appear that there is sign of improvement. See FASHION.

The above attempt having been made to explain the generally admitted deficiency of the modern European nations in the matter of decorative art, it remains to be shown what there has been done during the latter part of the nineteenth century which is more encouraging; and, first, it must be remarked that the workmen who can design, upon whom Oriental and ancient decorative art has generally depended, exist no longer in Europe or America, and that no designing can be got except from artists of special, deliberate, and costly training. Stained glass for windows is the one branch of decorative art most successfully practiced in America, and the most important part of this is produced by half a dozen painters well known as artists of high rank, and who, if they were not engaged in the stained-glass business, would be producing easel pictures which would bring high prices. Modern wall decoration which is of any value consists of fully realized paintings by artists of just such high rank. Modern architectural sculpture not merely copied from old work is of a wholly different character from that of the past; the foliated capital, the frieze of scroll-work, the conventionalized beast or man of ancient work are replaced, in the few modern buildings that are treated with respect enough to have rich and costly sculpture, by statues of complete scientific excellence, set up in niches or between windows. In all these, representative and expressive art of skilled and highly taught artists, and of technical excellence approaching the highest, has replaced the effective decoration of the artisan working according to tradition. So when a modern manufacture of pottery begins to be artistic, it becomes so by means of painting, as of flowers and leaves, so faithfully studied from nature that it differs from similar work on paper chiefly in the limitation of its coloring. A vase will be ornamented by means of a sprig of chrysanthemum or rose seeming to be laid upon the body and neck, and the painter makes this as like the natural sprig as his means and his ability allow. The vase itself will be very simple in form; indeed, it is very curious how little diversified and how simply modeled are all these richly painted modern vases. The naturalistic sprig or bouquet laid upon it is its only decoration beyond a generally graceful form and a pleasant color and texture of surface.

And evidently it is in this way that modern designers ought to proceed. There is the line of least resistance which all ought to follow. The most accomplished European artists are unable to design in meaningless patterns, scrolls, frets, and zigzags, or in conventionalized and formal hints at animal and vegetable forms, as the humble and unknown artisans of Europe once designed, and as those of the East were still designing until a few years ago. They can not produce shawls like the people of Northern India, nor painted plates and vases like the Chinese, nor varnished boxes like the Japanese, nor rugs like the Persians. Not only is Europe incapable of these beautiful arts, but European influence is destroying them rapidly in the lands where they are native. The only chance for any decorative art is to employ the trained painter and sculptor, and to allow to them this innovation, that great simplicity of form and color shall alternate with fully expressed art of representation and expression, no lower kinds of art being possible to us. RUSSELL STURGIS.

De Costa, BENJAMIN FRANKLIN, D. D.: historical writer; b. 1831 at Charlestown, Mass.; graduated at Biblical Institute, Concord, N. H., 1856; settled in New York, as rector of St. John the Evangelist, in 1863, but many years afterward became a Roman Catholic; has been editor of *The Christian Times*, *Episcopalian*, and *Magazine of American History*. His historical works include *Pre-Columbian Discovery of America by the Northmen*; *Sailing Directions of Henry Hudson*; *Verrazano, the Explorer*.

Decree: See the Appendix.

Decrescen'do: in music, a gradual diminishing of sound, the reverse of CRESCENDO (*q. v.*). It is marked thus >, or abbreviated *decres.*

Decre'tal [from Lat. *decre'tum*, decree, thing determined, ptc. of *decer'nere*]: a letter of the pope determining some point in ecclesiastical law. The canon law (*Corpus Juris Canonici*) consists of the following parts: The *Decretum of Gratian* (1139–59); *The Five Books of the Decretals of Gregory IX.* (1234); *The Liber Sextus of the Decretals of Boniface VIII.* (1298); *The Collection of the Constitutions of Clement V.* (1314–17); *The Extravagantes* (additional decretals) *of John XXII.* (1325); *The Extravagantes Communes* (published 1500, authenticated 1580). The above collections enjoy the official recognition of Gregory XIII., July 1, 1580. To them is to be added the subsequent legislation of popes, councils, and Roman congregations. See Laurin, *Introductio in Corpus Juris Canonici* (Freiburg, Baden, 1889). J. J. KEANE.

Decretals, False (otherwise called the PSEUDO-ISIDORIAN CANONS): a collection of papal letters, canons of councils, etc., both genuine and spurious, made in the course of the ninth century by an unknown author, though in the preface of the work they are ascribed to a certain Isidorus Mercator (Peccator, according to some MSS.). There are about a hundred false decretals under the names of the earlier popes from Clement I. (d. about A. D. 100) to Siricius (384–398). Several of the Pseudo-Isidorian documents were current long before the time of Pseudo-Isidor, and must not be laid to his charge (e. g. the Donation of Constantine, the Letter of Pope Sylvester, etc.). Otgar, Archbishop of Mayence, Benedictus the Levite, of the same city, Pascharius Radbert, Agobard of Lyons, and other ecclesiastics of the middle of the ninth century, have been credited with this remarkable compilation of genuine and forged documents. Modern criticism points to-day toward the city of Le Mans in France, and inclines to fix the date about 850 A. D. The aim of this collection was to free the bishops from the oppression of the metropolitans, themselves under the influence of the Carlovingian kings. Some Protestant writers have maintained that the primacy of the popes is based upon the false decretals. Roman Catholic writers, on the contrary, point to the history of Leo the Great, Gregory the Great, and other popes to show that this position was already acknowledged by the Church. It is true that the popes appealed to them, but it is worth remarking that, as a rule, such appeals took place long after the compilation of the decretals, when they had been accepted by the civil and ecclesiastical world. Their easy acceptance is explained by the fact that they contained much that was genuine and timely, and that the forged documents were, roughly speaking, in harmony with the prevalent temper of European society and the ecclesiastico-political ideas of the time. Petrus Comestor in the thirteenth century, Marsilius of Padua in the fourteenth century, and in the fifteenth century Gobelinus Persona, Heinrich Kalteisen, and Cardinal Cusanus (Nicolaus von Cues) doubted their genuineness. The Magdeburg Centuriators pursued the question with more vigor, and since the refutation of Turrianus by Blondel (1628) no serious author maintains the genuineness of the entire collection. The latest and best edition of the text is that of Prof. P. Hinschius, *Decretales Pseudo-Isidorianæ et Capitula Angilramni* (Leipzig, 1863). There is a partial translation in *The Ante-Nicene Fathers*, viii., 601–644. J. J. KEANE.

Decu'rion [Lat. *decu'rio*, head of a *decu'ria*, a body of (originally) ten]: the leader of a *decuria*, or body of ten men, in the Roman cavalry. Three *decuriæ* constituted a *turma*, or body of thirty men, and the name decurio was afterward given to the commander of the larger body. There were also civil officers called decurions who during the republic constituted the executive authority in the Italian municipalities. Under the empire their functions gradually dwindled to those of mere tax-receivers.

Decussation [Lat. *decussa'tio*, deriv. of *decussa're*, to make in form of a cross (X); cf. *decus'sis*, the number ten (X.), a coin valued at ten *asses*; *decem*, ten + *as*, *assis*, unit of value]: in anatomy, a crossing of nervous filaments, so called from a fancied resemblance to the letter X. The innermost fibers of the anterior pyramids and lateral columns of the *medulla oblongata* decussate freely from side to side; so that disease in one side of the brain frequently leads to paralysis of the opposite side of the body. Another decussation occurs between the optic nerves; this is often called the *chiasma*, also from its resemblance to the letter X (the Greek *chi*). The crossing of rays of light, etc., is also called decussation.

Dedham: town and railway center; capital of Norfolk co., Mass. (for location of county, see map of Massachusetts, ref. 5–I); situated on Charles river, 10 miles S. W. of the State-house in Boston. It has a granite court-house, jail, house of correction, a home for fallen women, town-hall, and large woolen mills. In 1872 part of Dedham township was included in the new township of Norwood. Pop. of township (1880) 6,233; (1890) 7,123; (1900) 7,457. Part taken to form Westwood town since 1890.

Dedication [Lat. *dedica'tio*, deriv. of *dedica're*, publish, set forth, formally transfer, dedicate]: a complimentary address to a particular person, prefixed by an author to his work. This custom was in use at a very early period. Horace, Vergil, Cicero, and Lucretius were among those who practiced it. At the period of the revival of letters in Europe few works were published without dedications. Many of these are remarkable for their elegance and purity of style. But the practice became perverted, and many authors of the succeeding generations employed them chiefly with the view of securing the patronage of the great. Dedications were most abused in France under Louis XIV., and in England from 1670 to the accession of George III. Dryden was a great dedicator, and Johnson wrote dedications for money. Corneille got 1,000 louis d'ors for the dedication of *Cinna*. Some of the most beautiful dedications are those prefixed to the different volumes of the *Spectator* by Addison, and in more recent times those with which each canto of Sir Walter Scott's *Marmion* is prefaced.

Dedication, in law: See HEREDITAMENTS, INCORPOREAL.

Dedication, FEAST OF THE: a Jewish feast commemorating the purification of the Temple after its pollution by Antiochus Epiphanes, B. C. 167, and the rebuilding of the altar of burnt-offerings by Judas Maccabæus, after he had driven the Syrians out of Jerusalem, B. C. 164 (cf. 1 Mac. iv. 42–59). It was kept eight days, and very joyously. It is only once referred to in the New Testament (John x. 22). Josephus calls it "Lights" (*Antiq.* xii. 7, § 7). The use of lights was one of the characteristics of the festival. Jesus probably alludes to this when calling himself the "light of the world" (John ix. 5). SAMUEL MACAULEY JACKSON.

Deduction [from Lat. *dedu'cere*, draw from; *de*, from + *du'cere*, draw]: the mental operation which consists in drawing a particular truth from a general principle already known. It is opposed to *induction*, which consists in rising from particular truths to the determination of a general principle. The syllogism is the form of deduction. Before we can deduce a particular truth we must be in possession of the general truth. The mathematical and metaphysical sciences are founded on deduction; the physical sciences rest on INDUCTION (*q. v.*).

Dee: a river of England, 80 miles long; drains parts of Merioneth, Denbigh, Flint, Salop, and Cheshire, and enters the Irish Sea through a tidal estuary 9 miles long and from 3 to 6 miles broad.

Dee, JOHN: astrologer and mathematician whose life affords a curious example of the superstition of the time; b. in London, 1527; graduated at Trinity College, Cambridge, but was forced to leave England on account of the suspicions aroused by his supposed practice of magic; returned in 1551 and received a pension from Edward VI. In Mary's reign he was imprisoned on the charge of attempting the queen's life by means of enchantments, but from Elizabeth he received favorable notice, being consulted by her in the mysteries of magic, and on the occasion of her illness sent to advise with the astrologers and physicians on the Continent. After his return his suspected intimacy with the devil again aroused the wrath of the mob, who wrecked his house and forced him into exile for the second time. Thenceforth he devoted himself to the study and practice of necromancy, and in company with one Kelly, an apothecary, traveled through Europe displaying his powers as a conjuror. Returning to England he was made chancellor of St. Paul's Cathedral (1594), and warden of Manchester College (1595). D. at Mortlake, 1608. F. M. COLBY.

Deed [O. Eng. *dæd*: Germ. *That*; that which is done, accomplished, executed]: a writing on paper or parchment, sealed and delivered. This is its most general signification. In a restricted sense it means an instrument for the conveyance of real estate. According to Lord Coke, it should possess the following requisites: Writing, parchment or paper, a person able to contract, a sufficient name, a person able to be contracted with, a sufficient name, a thing to be contracted for, apt words required by law, sealing, and delivery. Deeds pursue a regular form—containing the premises, *habendum*, *tenendum*, *reddendum*, conditions, warranty, covenants, and conclusion. The premises express the names of the parties, the consideration to be paid for the conveyance, and a description of the property conveyed. This should be minute and accurate. The "habendum" expresses the interest which the grantee is to have, whether it be an estate in fee, for life, or an inferior estate. The "tenendum" refers to the tenure upon which the land is to be held, and is at present of no practical importance. The "condition," "warranty," and "covenants" are not found in all deeds. They may be inserted whenever required to carry out the intention of the parties. When a condition is resorted to, it may be either precedent or subsequent. (See CONDITION.) The covenants vary with the nature of the conveyance. In a conveyance in fee six convenants may be inserted (see COVENANT); and in such case the instrument is called a deed with full covenants. In some instances the single covenant of warranty is introduced, when it is ordinarily termed a warranty deed. In many cases there are no covenants at all, the object of the transaction being only to convey whatever interest the grantor may have. It is a rule of the common law that some words in a conveyance used by a grantor will imply a covenant. This doctrine tends to mislead grantors who are not familiar with the rules of law, and it has been abrogated in some of the U. S.—e. g. New York. There is, however, an important rule that a promise may be implied on the part of the grantee from his acceptance of an instrument containing words purporting to create a personal liability. Thus if there are words to the effect that the grantee assumes the payment of a certain specified mortage, he becomes liable by his acceptance, though he does not execute the instrument. Whether he is liable upon an implied *covenant*, or only upon a promise, is not clear upon the authorities.

A deed may be either an indenture or a deed poll. The leading distinction between these terms is that an indenture purports to be the act of both parties, a deed poll of only one. An indenture commences with the third person, a deed poll with the first. In an indenture the date is found at the beginning of the instrument, in a deed poll at the end. An instrument in the form of a deed poll may be in substance an indenture if there be acts to be done by both parties. Between a strict deed poll and an indenture there is claimed to be an important difference in the construction of doubtful or ambiguous words. In the former these are interpreted against the grantor; the grantee may take the construction most favorable to himself if the words will reasonably bear it. To an indenture the rule has no application, and is not regarded in any case with as much favor in modern law as formerly. In a country like the U. S. where many men not lawyers undertake to draw their own deeds, questions frequently arise as to the effect of omissions or insertions by mistake, or of alterations or erasions. These occur in many instances through mere inexperience, and without any evil intent. In the case of an omission or insertion of a clause by mutual mistake, an application may be made to a court of equity (see EQUITY) to rectify the conveyance and make it what the parties intended it should be. The case of an alteration by one of the parties creates more

difficulty. One of the most perplexing questions presented is whether the fact of an erasure or other alteration raises any presumption that it was made after execution, or whether the opposite view should be taken, that there can be no presumption which would lead to the conclusion that the grantee has committed a wrong. The better view would seem to be that the attendant circumstances should go to a jury, without any presumption either way, and should be passed upon as a matter of fact. A fraudulent alteration would in general vitiate the instrument, though it would not divest a title to land which had already become the property of the grantee. As to all instruments which did not confer an estate, but only created an easement or conferred a right of action, the alteration would be fatal. Conveyances in the U. S. are in general registered or recorded, their execution for that purpose being attended with prescribed formalities. (See REGISTRATION and RECORDING.) The instrument is in general valid between the parties without registration, its object being to protect subsequent purchases or incumbrances. The requisites and validity of a deed of land in any particular State depend upon the law of the place where the land is situated, though the question concerning them be raised in the courts of another State. See also WARRANTY, QUIT CLAIM, COVENANT, and BARGAIN AND SALE.

T. W. DWIGHT.

Deems, CHARLES FORCE, D. D., LL. D.: clergyman; b. in Baltimore, Md., Dec. 4, 1820; graduated at Dickinson College, Carlisle, Pa., 1839; served in the Methodist ministry of the South; was professor in the University of North Carolina 1842–45, and in Randolph-Macon College 1845–46; and president of Greensboro Female College 1850–55. In 1866 he became the pastor of the Church of the Strangers, New York city. He was an abundant and able contributor to the *Southern Methodist Quarterly Review*, and was the author of a volume of sermons; a *Life of Dr. Adam Clarke* (New York, 1840); *Devotional Melodies* (Raleigh, 1842); *Home Altar* (New York, 1850); *What Now?* (1853); *Weights and Wings* (1872); *Twelve College Sermons* (Philadelphia, 1844); *A Scotch Verdict in re Evolution* (1886); *The Light of the Nations* (1868); *The Gospel of Common Sense as Contained in the Canonical Epistle of James* (1889); *Chips and Chunks for Every Fireside; Wit, Wisdom, and Pathos* (1890); *The Gospel of Spiritual Insight; Studies in the Gospel of John* (1891); a volume of poems entitled *Triumphs of Peace* (New York, 1840). He was president of the American Institute of Christian Philosophy from 1881, and editor of *Christian Thought* from 1883. D. Nov. 18, 1893.

Revised by J. F. HURST.

Deemsters, or **Dempsters**: the two chief judges in the Isle of Man, one of whom presides over the northern division of the island, the other over the southern. Formerly in Scotland a *dempster* or *doomster* was an officer, connected with the high court of justiciary, who pronounced sentence on condemned persons.

Deep Bottom: a point on the north side of James river; in Henrico co., Va.; about 12 miles by land and 20 miles by water below Richmond; opposite the peninsula of Jones's Neck, and between Three and Four Mile creeks, and near the battle-ground of Malvern Hill; an important strategic point during the civil war, 1861–65. It was occupied by part of the troops of Gen. B. F. Butler, June 20, 1864, and a pontoon bridge was thrown across the river. Several important actions were fought near Deep Bottom during Aug. and Sept., 1864, the general result being favorable to the Union forces.

Deep River (Indian, *Sapponah*): a river of North Carolina; flows southeastward through Randolph County, and nearly eastward through Chatham County, until it enters the Cape Fear river at Haywood. Coal abounds on its banks. Length, estimated at 120 miles.

Deep-sea Exploration: the limits of the region known as the "deep sea" have been differently defined at different periods of its exploration. To navigators for over a century the 100-fathom lead-line for sounding has been known as the "deep-sea lead," and the general understanding of the term "deep sea" has been that portion of the sea having a depth of 600 feet or more. Knowledge of thalassography has progressed to a point where a more rational subdivision of oceanic depths has taken the place of arbitrary selection, and at present they are divided and designated as follows: 1. The region to which light can penetrate and, therefore, that in which marine algæ can grow, and animals, subsisting only on marine plants, can live; this extends from the shore seaward to a varying depth in different regions, being dependent on the translucency of the water and the average angle of the sun's rays, but in a rough way the 100-fathom depth corresponds to its extreme seaward margin. This area is known as the littoral region. 2. From the seaward edge of the littoral region the sea-bottom slopes more or less directly to the floor of the ocean, which is found, on an average, at a depth of 2,500 fathoms, where it extends in a gently undulated or level plain over vast areas. The latter is known as the benthal or abyssal region, while the intermediate area, chiefly on the continental slopes between the littoral and abyssal areas, has been named the archibenthal region. The region comprised under the name "deep sea" includes the abyssal and archibenthal areas.

Methods of Investigation.—The exploration of the deep sea includes the collection of facts relative to its depth (see BATHOMETER); the nature of the bottom; the temperature, constitution, specific gravity, and motion of the water; the nature and distribution of the organisms which inhabit it. This exploration has grown from small beginnings, represented by the line of the deep-sea fisherman, which in the middle of the eighteenth century brought up the coralline *Umbellularia* from a depth of 234 fathoms in the Arctic Sea, to a science which employs a great variety of complicated and delicate apparatus, and enlists the most ambitious efforts of the physicist, the chemist, the mechanician, electrician, and biologist. Work was first done on the investigation of the depth of the sea. A weighted line was let down into the sea, and the amount run out determined by tags previously attached to the line at measured distances. This method has been in use by all navigators from an unknown antiquity. In shallow water it is of reasonable accuracy, but for sounding the abysses it is an extremely imperfect method. Friction on the line required for great depths delays the arrival of the weight at the bottom, and renders its recovery slow and difficult; surface and submarine currents carry it out of the vertical, so that it does not measure the actual depth truly; and the storage of immense quantities of rapidly deteriorating line offers a serious problem in the case of a vessel engaged in extended sounding work. To overcome the friction of the line against the water extremely heavy weights were first employed. Capt. Sir James Clark Ross in 1840, off the west coast of Africa, by employing a small line with a weight of some 300 lb., obtained a sounding at the depth of 2,677 fathoms, which was determined by the sudden change in the rate of running out of the line when the weight struck the bottom. This appears to be the first recorded attempt at abyssal sounding which met with success in approximating to the real depth, though Sir John Ross as early as 1818 sounded in Baffin's Bay in 800 to 1,000 fathoms, and even brought up a large *Astrophyton*, or basket-starfish, on the line. The U. S. exploring expedition under Wilkes, which sailed in 1838, was supplied with copper wire for sounding purposes, which, however, proved too weak for successful use. In 1849 Capt. Barnett, R. N., attempted to use an iron wire which broke at 2,000 fathoms; and later in the same year Lieut. J. Walsh, U. S. navy, tried steel wire, which also failed from imperfect splicing. The next step was due to J. M. Brooke, U. S. navy, who invented in 1854 a detaching apparatus by which the weight was thrown off, and only the line with a small sample of the bottom remained to be hauled in. This method in principle is now in general use.

The employment of wire having seemed impracticable, the attention of those interested was directed to the improvement of hempen line, various forms of collectors for bringing up specimens of the bottom, and other accessories. All the surveying of the ocean-bed for submarine telegraph cables, which gave a great impetus to deep-sea exploration, was done with hempen line, and in the important series of voyages (1869–73) carried on by the British Government for this purpose, culminating in the voyage of the Challenger, hempen line alone was made use of for sounding.

In 1872 Sir William Thomson invented a machine for using steel piano-wire for sounding purposes. In this the wire furnished with a heavy weight was paid out directly from a reel, on which, by means of an accessory rim, a friction-line checked by a balance was so applied as to make the friction balance the weight of wire run out. On striking the bottom the reel ceases to revolve, and the number of revolutions multiplied by the circumference of the reel gives the length of wire delivered and the depth of the sounding. The introduction of this invention has revolutionized deep-

sea sounding. Owing to some errors of construction, the reel did not work perfectly at first. To Capt. George E. Belknap, U. S. navy, during the voyage of the U. S. Tuscarora in the North Pacific in 1873, is due the demonstration of the practicability of Sir William Thomson's machine when properly constructed; and to Com. C. D. Sigsbee, U. S. navy, the application to it of elastic appliances called "accumulators," which rendered it possible to use steam in reeling in the line, thus perfecting the modern method of deep-sea sounding.

Numerous appliances for obtaining specimens of the bottom have been invented, beginning with the spoon-like tongs of Sir John Ross and including the "Stellwagen cup," the "Belknap cylinder," a modification of Brooks's apparatus, the "Hydra" and "Bulldog" machines, etc., the essential principle of which is a receptacle closing after striking the bottom. The determination of deep-sea water-temperatures was attempted by Ellis about 1750, who brought up water from a depth of 900 fathoms and tested it at the surface. Later attempts made by sending self-registering thermometers down on the line gave erroneous results, due to the influence of pressure on the thermometer bulb, causing an excessive extension of the fluid in the tube. To avoid this difficulty a form of thermometer was suggested by Prof. Miller and constructed by Casella, which consists of a U-shaped tube forming a maximum and minimum thermometer, in which the large bulb is protected by an outer bulb nearly filled with alcohol, space being left for the compression of the outer bulb by the pressure it must encounter. An objection to this form of instrument is that it registers only the minimum or maximum of the entire column of water through which it passes. To obviate this defect another form of instrument, made by Negretti & Zambra, is commonly used. This holds the thermometer in a reversed position until the line begins to be hauled in, when it is released; by an ingenious arrangement the column of mercury above the bulb is then separated from the supply in the bulb and kept apart from it, so that the height of the column at the lowest depth reached may be determined when the thermometer is drawn up. Another means of continuously registering the temperatures on deck during the passage of the instrument through the water has been invented by Sir William Siemens, on the principle that the electrical resistance of a conductor varies with the temperature. This consists of an insulated coil attached to a cable and lowered with the sounding-line, and connected so as to form one arm of a Wheatstone bridge. The corresponding arm of the bridge is formed by a second exactly similar coil, immersed in a copper vessel filled with water, which is heated or cooled until the bridge is balanced. The temperature of the water in the vessel then corresponds to the temperature of the coil. This instrument under favorable circumstances has given excellent results, but owing to the extreme care needed in its use is not likely to supersede the simpler thermometers above mentioned.

For securing samples of water for analysis and specific gravity determinations various forms of "water-bottles" have been devised by Wille, Sigsbee, and other investigators, on the principle of a metallic receptacle capable of sealing itself automatically at a given depth.

Instruments for determining the direction and force of submarine currents have been devised by several investigators, and usually depend upon the principle of the screw-propeller and the differential motion of surface floats.

The abyssal fauna have been explored mainly by means of the dredge, the beam-trawl, and the "tangles," which are simply large "swabs" made of hempen line picked out into twine. On the fibers of the tangles spiny or rough organisms adhere in great numbers, in places where the roughness of the bottom would render dredging impracticable. The dredge is a slightly modified form of the Stimpson dredge used in shallow water, and the beam-trawl is like that of the fishermen, except that it is double, so that whichever side falls on the bottom it will work effectively. In deep-sea work the handling and hauling of both dredge and trawl are done with steel wire rope by steam-power. For searching the region intermediate between the bottom and the surface various forms of nets or traps have been invented which can be sent down closed, opened when at a certain depth, and closed again before being hauled up, so as to investigate only the stratum at a particular depth desired.

Progress of Exploration.—Excluding isolated experiments or inconclusive instances of the capture of living animals from the abysses, the first systematic exploration of the deep sea was carried on by the Norwegians, led by Prof. O. Sars, in the archibenthal region of the north of Europe. But owing to the fact that the deep-water and shore faunas of Norway are in most respects very similar, and for other reasons, the bearing of these researches was not appreciated, and the old notion entertained by Forbes and other eminent naturalists that the dark, cold oceanic abysses are devoid of organic life except stragglers from the surface, though contested by Keferstein, Lovèn, Sars, Torell, Wallich, Ehrenberg, Alphonse, Milne-Edwards, and others, still held general sway. In 1867, however, the U. S. Coast Survey officers, Pourtalès and Mitchell, began systematic explorations in the Straits of Florida, reaching a depth of 850 fathoms. The animals captured were so profuse in quantity, so interesting, novel, and peculiar in character that the active interest of naturalists of all nations was aroused, and exploration began in various quarters. This work has been carried on more or less continuously ever since. The most important researches of the English are the voyages of the Lightning, Porcupine, Shearwater, and Valorous, by which the Mediterranean and North Atlantic regions were explored under the direction of Wyville Thomson, Carpenter, and Gwyn Jeffreys, 1868–72, and the world-renowned voyage of the Challenger under Nares and Thomson, 1873–76, during which all parts of the ocean were visited and observations made at 360 stations. France, with the Travailleur, 1880–81, and the Talisman, 1883, explored the eastern North Atlantic and part of the Mediterranean. Norway continued her work in the boreal Atlantic in the Voringen, 1876–78, and Italy explored the abysses of the Mediterranean in the Washington. In the U. S. work has been more continuous than elsewhere. The U. S. Coast Survey work of 1867 was continued in 1868 and 1869 in the Bibb, while in the Blake, by the co-operation of Agassiz, Sigsbee, and Bartlett, 1877–80, most important results were obtained. The U. S. Fish Commission Albatross and Fishhawk have been more or less continuously engaged since 1872 in work on both shores of both Americas, under the direction of Baird and his successors; and the navy, as represented by Belknap, Tanner, and others above mentioned, has borne a most important part in the work in both oceans.

Bibliography.—Wyville Thomson, *Depths of the Sea* (1873); Wild, *Thalassa* (1874); *Challenger Reports* (1876–90); Agassiz, *Three Cruises of the Blake* (1888); *Reports United States Fish Commission* (1872–92); *United States Coast Survey Reports* (1855–91); and *Deep-sea Sounding and Dredging*, by Sigsbee (1880).

Deep-sea Sounding: See Deep-sea Exploration.

Deer [O. Eng. *dēor*: Germ. *Thier*: Goth. *dius*, wild animal; not connected with Gr. θήρ, Lat. *fera*, but probably derived from an I.-E. root *dhus-*, breathe; cf. Lat. *animal*]: the common name for the various members of the family Cervidæ (*q. v.*), a group of ruminating mammals characterized by the presence in the males of solid bony horns or antlers, which are shed and renewed annually. Antlers start as soft excrescences on the forehead, grow rapidly, and attain their full size in about three months. In the early stages they are spongy, permeated by blood-vessels, covered with short hair, and are said to be in the velvet. Having attained their growth, the circulation of blood stops, the antlers harden, and the skin is rubbed off against trees. The first antlers of the young deer make their appearance in the second year as short spikes, and become branched in the third or fourth year; but while the number of branches increases with age up to a certain point, they afford no certain indication of the age of the animal. The antlers are carried for four months or so, and are then broken off or fall off near the skull, just below the "burr." Antlers are sometimes borne by the females, as in the reindeer, and are absent in the males of the musk deer. According to Forsyth, antlers are not shed annually in the warmer parts of Asia. The teeth and stomach of deer are of the usual ruminant type; the feet have two main hoofs, and almost always a small hoof on each side of these. A gall bladder is absent, except in the musk deer. Deer are found in North and South America, Europe, and Asia, this last region, with its large outlying islands, containing the greatest number of species. No deer occur in Australia or Madagascar, and none in Africa S. of the Sahara, while the two species found in Northeastern Africa, the fallow deer and stag, are stragglers from the European fauna.

The common deer of the U. S. is the Virginia deer (*Cariacus virginianus*), known in the West as the white-tailed

deer. It is found throughout the U. S., in Northern Mexico, and in parts of Canada and British Columbia. The more northern specimens are much the largest and most powerful, examples from warm southern localities being quite small. The mule deer (*Cariacus macrotis*), readily distinguished from the preceding by its greater size, black-tipped tail, large ears, absence of brow antlers, and forking of the hinder branch, ranges from Minnesota to the Pacific, and from the latitude of Cape St. Lucas to British Columbia. The black-tailed deer, a closely related but smaller species, is confined to the Pacific coast of the U. S. and British Columbia westward of the Sierra Nevadas.

The Mexican deer (*Cariacus mexicanus*) extends from New Mexico southward, and several small deer of the genus *Coassus*, distinguished by small, spike-like antlers, sloping backward, are found in Mexico and the northern part of South America. Several other species occur in South America, S. of the Amazon or on the western slope of the Andes, which have rather simply forked, erect antlers. The largest and finest is the swamp deer (*Blastocerus paludosus*), with very stout, rough, sharp-pointed antlers. See Axis, Caribou, Elk, Fallow Deer, Moose, Muntjak, Reindeer, Roebuck, Stag, and Wapiti. F. A. Lucas.

Deerfield: town; on railway; Franklin co., Mass. (for location of county, see map of Massachusetts, ref. 2–E); on the west bank of the Connecticut river at its junction with Deerfield river; 33 miles N. of Springfield. The township, which contains the important manufacturing village of South Deerfield, was the scene of several contests with the Indians in colonial times. Among these may be mentioned the "Bloody Brook massacre" (1675), and the burning of the village by the French and Indians under De Rouville (1703). Old Deerfield has a beautiful soldiers' monument, and there is at South Deerfield a marble monument commemorative of the Bloody Brook disaster. Deerfield has an academy, and two high schools. Pop. of township (1890) 2,910; (1900) 1,969. Part annexed to Greenfield since 1890.

Deer-grass: popular name of plants of the genus *Rhexia* and family *Melastomaceæ*. Nine species are natives of the U. S. They have brilliant rosy-purple flowers.

Deer Lodge: former cap. of Deer Lodge co., Mon. (for location of county, see map of Montana, ref. 6–E); on Montana and Union Railway, and on Deer Lodge river in Deer Lodge valley; 50 miles W. of Helena. It has a college, St. Mary's Female Academy, public school, churches of five denominations, a hospital (in charge of the Sisters of Mercy), and a State penitentiary. Pop. (1880) 941; (1890) 1,463; (1900) 1,324. Editor of "New Northwest."

Deer-mouse, or Jumping Mouse: a small mouse (*Zapus hudsonius*) belonging to the family *Dipodidæ*. The body is about 4 inches long, the tail somewhat more, and the hind legs are much longer than the fore; the color is yellowish above, white below. This little mouse is very active in its movements, clearing as much as 10 feet at a bound. It is quite generally distributed throughout the woodlands of North America N. of Mexico, although in southern localities it occurs only on elevated ground.

Deer-mouse is also applied to several mice of the genus *Hesperomys* and family *Muridæ*. The best-known species is the white-footed mouse (*Hesperomys leucopus*), which is widely distributed in North America. This mouse is under 4 inches in length, the tail shorter than the body. The color is grayish or yellowish brown above, white below, the feet also white. F. A. Lucas.

De Facto: a Latin legal phrase signifying in fact, in reality; used to denote the facts as they actually exist, in distinction from *de jure*, which is used to denote the legal rights of the parties in question. The person who usurps a throne to which he has no title is a king *de facto*, and the legitimate claimant is king *de jure*, or of right. An officer *de facto* of a corporation is one who, under an appointment or election which is invalid, assumes to act as an officer of the corporation under such circumstances that his acts are binding upon the corporation with respect to the rights of third persons who dealt with him *bona fide*. A public officer *de facto* is one who performs the duties of an office with an apparent right and under claim and color of appointment to such office or under such circumstances as to justify the presumption that he has a right to exercise its duties, but without being actually qualified by law so to do. The official acts of a public officer *de facto* upon principles of policy and justice are held to be valid so far as they affect the rights of the public or of third persons, and his right to exercise the powers of such office can not be investigated in a collateral proceeding. F. Sturges Allen.

Defamation: See Libel.

Default': in law, in a general sense, a failure in the performance of one's legal obligations, as in the case of a breach of contract; the omission of any act which a party ought to perform in order to entitle himself to a legal remedy. Such is, for example, non-appearance in court on a day assigned. If a plaintiff in an action make default, he is non-suited; if a defendant, judgment by default is passed against him. Judgment by default is not necessarily final.
Revised by F. Sturges Allen.

Defaux, de-fō', Alexandre: landscape-painter; b. in Paris, Sept. 27, 1826. Pupil of Corot: second-class medal, Salon, 1875; Legion of Honor 1881. His pictures are soundly painted and he is a clever technician. *Morning at Château Laudon* and *Harbor of Pont-Aven* are in the Luxembourg Gallery, Paris. Studio in Paris. W. A. C.

Defeasance: in law, a collateral deed accompanying another and containing conditions on the performance of which the estate or interest created by such other deed may be defeated and determined. In the case of conveyances of frecholds the defeasance must be made at the same time as the deed to which it relates, and form a part of the same transaction. In the case of chattels or executory interests or of a bond, recognizance or warrant of attorney, it may be made then, or at any time after the execution of the principal deed. F. Sturges Allen.

Defendant [Fr. *défendeur*]: in law, the party against whom a claim is made in an action or suit. In actions *ex contractu* the person who either expressly or implicitly made the contract should be made the defendant; in actions *ex delicto*, the person who either actually committed the injury or aided in committing it.
Revised by F. Sturges Allen.

Deffand, Marie de Vichy-Chamrond, Marquise du: French literary woman; b. in 1697; married in 1718 to the Marquis du Deffand, but soon separated from him. She was beautiful, witty, accomplished, a skeptic and an egotist. Her house in Paris was frequented by many eminent authors and statesmen. She corresponded with Voltaire, Horace Walpole, and D'Alembert, and wrote letters which are commended for style. D. Sept. 23, 1780.

Defiance: city and railway center; capital of Defiance co., O. (for location of county, see map of Ohio, ref. 2–C); on the Maumee river at the mouth of the Auglaize, and on Miami and Erie Canal; 50 miles W. S. W. of Toledo. It is a manufacturing town. Pop. (1880) 5,907; (1890) 7,694; (1900) 7,579. Editor of "Republican and Express."

Deficient Number: in arithmetic, a number which exceeds the sum of its aliquot parts. Thus 8 is a deficient number, since the sum of its aliquot parts, 1, 2, 4, amounts to only 7.

Definite Proportionals, in chemistry: See Chemistry.

Deflection [from Lat. *deflec'tere*; *de*, off + *flec'tere*, bend]: in architecture and engineering, the bending or depression of a horizontal beam caused by its own weight or that extraneously imposed upon it; also the amount of such deviation from its original form. According to Coulomb, (*a*) deflection is in direct proportion to the weight causing it; (*b*) the weight required to produce a given deflection is proportional to the width of the beam and to the cube of its depth, but (*c*) it is inversely proportional to the cube of the length of the beam. Revised by A. D. F. Hamlin.

De Foe, Daniel: English writer; b. in London in 1661; was a son of James Foe, a butcher and Nonconformist. He was educated at a Dissenter's academy and intended to become a minister, but went into business about 1685, and in that year joined the rebellion of the Duke of Monmouth, after whose defeat he returned to business life in the subordinate position of a secretary and accountant. He produced in 1701 *The True-born Englishman*, a satirical poem designed to vindicate King William III., which was very successful. He wrote an ironical pamphlet entitled *The Shortest Way with Dissenters* (1703), for which the House of Commons punished him with the pillory, a fine, and imprisonment; from 1704 till 1713 he conducted a newspaper called *The Review*. He advocated the principles of the Whigs and Dissenters in several political works. In 1706 the ministers employed him as one of the staff of commis-

sioners sent to Scotland to promote the union of the two countries. He published a *History of the Union* (1709). In 1713 he was again fined and imprisoned for one of his political writings. His most popular work is *The Adventures of Robin Crusoe* (1719). He wrote, besides numerous other works, *Memoirs of a Cavalier* and *Captain Singleton* (both in 1720); *The Fortunes and Misfortunes of Moll Flanders*, *The Journal of the Plague Year*, and the *History of Colonel Jack* (all in 1722); *Roxana, or the Fortunate Mistress* (1724), all of which produce a vivid impression of reality. He was a pithy and vigorous writer, distinguished for his versatility of mind and fertility of invention. D. at Moorfields, Apr. 26, 1731. See W. Hazlitt, *Memoirs of De Foe* (1843); Sir Walter Scott, *Life of De Foe*, prefixed to De Foe's works; William Lee, *Life of Daniel Defoe* (3 vols., 1869).

De Forest, John William, A. M.: author; b. in Seymour, Conn., Mar. 31, 1826; served in the civil war 1861–65; was breveted major; made New Haven, Conn., his home; author of *The History of the Indians of Connecticut* (Hartford, 1853); *Oriental Acquaintance* (New York, 1856); *European Acquaintance* (1858); and a number of novels, including *Miss Ravenel's Conversion* (New York, 1867) and *The Oddest of Courtships* (New York, 1881).

Defregger, de-freg'er, Franz, von: genre-painter; b. at Stronach, Tyrol, Apr. 30, 1835; pupil of Munich Academy and of Piloty; third-class medal, Paris Exposition, 1878; member Munich, Vienna, and Berlin Academies. *Return of the Victors* (1876), National Gallery, Berlin; *The Smith of Kochel* (1881), New Pinakothek, Munich. Studio in Munich. W. A. C.

De Freycinet, Charles Louis de Saulces: See Freycinet, Charles Louis de Saulces de.

De Funiak Springs: town; on railway; capital of Walton co., Fla. (for location of county, see map of Florida, ref. 1–D). It is the seat of the State Normal School. Lumber, cotton, wool, rice, and cane are the principal products. Pop. (1890) 672; (1900) 1,661.

De Garmo, Charles: See the Appendix.

Degeneration: a term applied by Dohrn to those cases of Evolution (*q. v.*) where the line of descent takes apparently a backward direction. In most cases which progress far enough to come to our notice the line is from the simple to the complex; the adult is more differentiated than the embryo, the offspring higher than the ancestor. It, however, happens that frequently there is variation in the opposite direction, and then, by favorable circumstances, these retrograde modifications are accumulated in successive generations to such an extent that the degeneration is evident.

As stated in the article Evolution, one of the ascertained laws of the modern theory of descent is, the development of the individual (*ontogeny*) is a recapitulation of the development of the race (*phylogeny*). In other words, if we know the life-history of any animal, we have in it an outline of its ancestry. Thus the gill-slits of the human embryo are a record of a fish-like ancestor; the three-chambered heart of a reptilian forefather. These are instances of an advancing evolution.

On the other hand, we find in many sedentary and especially in parasitic animals cases which are different. Thus in the Tunicata (*q. v.*) the development is progressive until the result is a free-swimming tadpole-like larva with a cartilaginous rod (notochord) between nervous system and alimentary canal, and paired gill-slits in the throat in the same manner as in the young (tadpole) of the common frog. Then the larva settles down, becomes attached and loses its tail and notochord, and becomes twisted into a loop while the gills become converted into a sieve-like sac. The result is an animal totally unlike the early promise of the embryo, but rather one the vertebrate affinities of which would never be suspected from the adult, but which was formerly classed with the mollusca. Interpreting the facts of development, we say that the tunicates have degenerated from a tadpole-like ancestor with many of the characteristics of the true vertebrates. Another example is furnished by the parasitic Entomostraca (*q. v.*), where the larva is a regular nauplius like that of the more regular Crustacea. This soon becomes attached to some other animal, and, needing no longer to struggle for existence, it gradually degenerates into a worm-like organism scarcely more than an apparatus for obtaining food, provided with the means of reproducing its kind. The nauplius stage (see Crustacea) is a record of a normal crustacean ancestor; the adult is a degenerate descendant. The phenomenon also occurs in the root barnacles. See Cirripedia.

Degeneration is to be regarded as the result of removal from the conditions normal to the group and exposure to those entirely different. Thus in the parasitic Crustacea referred to locomotion is no longer necessary, so the legs are lost, while the mouth changes from a chewing organ into one adapted to sucking the mucus or the body fluids of some fish. J. S. Kingsley.

Degeneration (in plants): In the evolution of the vegeable kingdom as it exists to-day there have been modifications in many directions. While the general direction of evolution has apparently been from the lower and simpler to the higher and more complex, there have been many cases of degeneration from higher forms. If we represent the vegetable kingdom by a many-branched tree, in which the branches and branchlets generally grow upward, we must also show some branches and branchlets in which the direction is distinctly downward. Degeneration is most frequently associated with a dependent habit, as in parasites and saprophytes, in which the vegetative organs of the plant-body have suffered atrophy. Thus in the dodder (*Cuscuta*) the leaves are mere colorless bracts of no value, while the stems, no longer called upon to support large leaves, are weak and brittle. Could we restore to this degenerate plant its lost leaves and original vegetative vigor, we should have something very much like a morning-glory. In *Aphyllon*, now nearly as leafless as the dodder, we have a degenerated figwort (*Scrophulariaceæ*), the floral organs being little changed, while the vegetative parts are greatly reduced. Likewise *Monotropa* is a degenerated rhododendron-like plant (*Ericaceæ*), and the coral-root (*Corallorhiza*) a degenerated orchid. The "fungi" afford the more notable examples of degeneration through parasitism and saprophytism. The black moulds (*Mucoraceæ*), the water moulds (*Saprolegniaceæ*), and the downy mildews (*Peronosporaceæ*) are clearly modified, and somewhat degraded pond-scums (*Zygnemaceæ*) and green felts (*Vaucheriaceæ*), and the powdery mildews (*Erysipheæ*) are probably referable to *Coleochæte* (a genus of semi-parasitic fresh-water algæ). In all these cases we observe that the reproductive parts of the plant-body as compared with the vegetative parts are proportionately larger and more prominent than in the green plants to which they are allied. This has doubtless been carried much further in the cup-fungi (*Discomyceteæ*), the puff-balls and toad-stools, in which the reproductive structure is so large as to be commonly mistaken for the plant-body.

Degeneration is, however, not confined to the vegetative organs of plants. In many fungi the sexual organs have become abortive (as in *Erysipheæ*), and in certain great groups (*Hymenomyceteæ* and *Gasteromyceteæ*) it is the opinion of eminent botanists that they have entirely disappeared. In the flowering plants many families show more or less degeneration in their floral organs. In this way most of the so-called "Apetalæ" have probably been derived. The willows, oaks, walnuts, spurges, elms, etc., have attained their present simplicity of floral structure by modifications essentially of the nature of degeneration. So, too, the sedges and grasses are to be regarded as simplified from the Alisma-like monocotyledonous type of floral structure.

Charles E. Bessey.

Deger, dā'ger, Ernst: historical painter; b. at Bockenem, Hanover, Apr. 15, 1809. Pupil of Berlin and Düsseldorf Academies; member Berlin and Munich Academies; decorated the chapel of Stolzenfels Castle near Coblentz. D. at Düsseldorf, Jan. 27, 1885. W. A. C.

De Giers, Nicholas Carlovitch: Russian statesman; b. May 9 (O. S.), 1820; educated at the Imperial Lyceum of Czarskoe Selo; entered the Asiatic Department of Foreign Affairs at the age of eighteen; ambassador to Persia 1863–69; at Berne 1869–72; at Stockholm 1872; became adjunct to the Minister of Foreign Affairs and director of the Asiatic Department, Dec., 1875; several times had charge of the Ministry of Foreign Affairs in the absence or illness of Gortchakoff, whom he succeeded as Minister of Foreign Affairs in Apr., 1882; especially prominent in his policy in connection with the conflict between Russia and Great Britain in Asia. D. Jan. 26, 1895. C. H. Thurber.

De Goeje, de-khoo-ye, Michael Jan: a Dutch Arabist; b. at Dronryp, Aug. 13, 1836, and trained by the eminent Arabist Dozy. He is Professor of Arabic in the University of Ley-

den, editor of the new edition of *Tabari*, and of other texts, and author of many dissertations on Arabic subjects.

C. H. Toy.

Degree [O. Fr. *degre*; Lat. *de + gradus*, step, grade]: one of a series of progressive steps; also one of the unitary divisions of a scale of measurement.

Degree in Algebra: the magnitude of the greatest sum that can be formed by adding together the exponents of the factents or variables which occur in any single term of an equation or expression. The terms *degree* and *order* are frequently used synonymously in algebra, but have distinct meanings when applied to differential equations.

Degree in Trigonometry: a unit of measurement for arcs of circles and for angles subtended by them; the 360th part of the circumference of a circle, or the 90th part of a right angle. A degree is subdivided into sixty minutes, and each minute into sixty seconds. The notation employed for an angle of six degrees fifty-two minutes and sixteen seconds is 6° 52′ 16″. Thus there are 21,600 minutes and 1,296,000 seconds in the entire circle.

A division of the quadrant into 100 parts was proposed by the authors of the metric system at the time of the French Revolution, and is sometimes used. These parts are sometimes called grades; each grade is divided into 100 minutes, and each minute into 100 seconds. These minutes and seconds are called "centesimal," and the signs ' and " are used to distinguish them. Revised by Simon Newcomb.

Degree (in music): one of the lines or spaces of the staff upon which the notes are marked. When notes are on the same line or space, they are on the same degree, even though one of the notes should be raised by a sharp or lowered by a flat.

Degrees: scholastic distinctions. These fall under two classes. First, those which are given as a testimonial of the completion of a certain prescribed course of study; and second, honorary degrees conferred by the faculty and trustees of institutions of learning upon persons of distinction, not only in scholarship but in other lines as well. Originally the degree signified simply that the holder was qualified to teach in a university. The master's degree was the one first employed; at the University of Bologna, in the twelfth century, the degree of doctor apparently was substituted for it. Innocent III., in 1215, promulgated a body of statutes for the University of Paris, which stated that the bachelor should begin by explaining sentences in the school of some doctor for the space of a year; he was then examined by the chancellor of the Cathedral of Paris, and, if successful, became a licentiate until he received the degree of doctor, when he could open a school of his own. The degree of doctor was first given in England under King John about 1207. The mediæval university included the four faculties of arts, law, medicine, and theology. The term master gradually became restricted to the teacher in the first of these, and that of doctor to the other three. The pope, the recognized head of all universities, granted the right to confer degrees during the Middle Ages. He now exercises the privilege of conferring degrees directly upon whom he will. The government in modern states confers this right on institutions by charter. The degree of bachelor is now usually granted at the completion of a four years' course of collegiate study. The degree of master requires a period of graduate study thereafter. The degree of doctor, regarded as the highest academic distinction, is the only degree conferred by German universities, except that of licentiate, which is conferred by theological faculties alone. The title Doctor of Medicine entitles its holder to practice medicine. In a similar way certain other degrees, as that of Civil Engineer, Doctor of Dental Surgery, etc., denote the fitness of the possessor to practice his profession. The degree of Doctor of Philosophy ranks as the highest distinction to be won outside of professional scholarship. The universities of the U. S. have established graduate courses, and grant this degree on substantially the same lines as those followed in the best German universities. There is, however, no uniformity of practice in the matter of conferring degrees, although the condition of affairs in this respect is much better in Europe than in the U. S.; and the tendency seems to be to restore to the degrees the dignity and distinction that originally belonged to them. The original degrees of Bachelor of Arts, Master of Arts, Doctor of Philosophy, Doctor of Theology, Doctor of Medicine, and Doctor of Law have been very greatly increased in number, so that now a person may be bachelor, or master, or doctor of almost anything. In Germany there are twenty-one universities with the right to confer degrees; in Great Britain a much smaller number; while in the U. S. there are at least 300 colleges and universities entitled to exercise this right.

The University of London is a body which examines and grants degrees, but gives no instruction. The University of the State of New York is the only similar institution in the U. S. As a rule, the degrees represent knowledge acquired, in part at least, in the institution conferring them.

See University, Doctor, College, and Compayré, *Abelard and the Origin and Early History of Universities*. The requirements for obtaining degrees from various institutions of learning will frequently be found stated in the descriptions of these institutions. C. H. Thurber.

Degrees of Latitude and Longitude: The distance from the equator to the poles, along a meridian, is called *latitude*, or width; the distance from an assumed prime meridian, along a parallel, in the direction of the earth's rotation, is called *longitude*, or length. These expressions have been handed down to us by the ancients, who used them because the world known to them was really more extensive, or long, from east to west, than wide, from north to south. The degrees of latitude are counted from the equator as zero, both north and south, making ninety degrees each way to the poles. It would be most desirable that all civilized nations should also agree on a prime meridian from which the degrees of longitude should be uniformly counted; but it is not so. The British count 180 degrees east and 180 degrees west from the meridian passing through their national observatory at Greenwich, near London; the French start from the meridian of their observatory at Paris; the Germans often take the meridian of Ferro, the most western of the Canary islands, because it leaves all the lands of the Old World to the east and those of the New World to the west; the Americans often use the meridian of the National Observatory at Washington. Therefore, when the longitude of a place is mentioned, the prime meridian from which it is reckoned must be indicated. The seafaring nations mostly use Greenwich longitude; the nations on the continent of Europe, Paris and Ferro.

The meridians being all great circles, the length of their degrees, or of the degrees of latitude, is about uniform; they only show slight elongation toward the poles, due to the polar compression. But the degrees of the parallels which mark the longitudes are rapidly decreasing with the circumference of the circles from the equator to the poles, as shown in the following table:

LENGTH OF DEGREES OF LONGITUDE IN DIFFERENT LATITUDES, IN ENGLISH MILES.

Degrees of latitude.	Length of degrees.	Circumf. of parallel.	Degrees of latitude.	Length of degrees.	Circumf. of parallel.
Equator	69·16	24,899	50°	45·55	16,037
5°	68·90	24,805	55	39·76	14,314
10	68·12	24,523	60	34·67	12,482
15	66·82	24,056	65	29·31	10,553
20	65·02	23,407	70	23·73	8,542
25	62·72	22,580	75	17·96	6,466
30	59·95	21,581	80	12·05	4,339
35	56·72	20,419	85	6·84	2,464
40	53·06	19,101	90	0·00	Pole.
45	48·99	17,636			

The length of a minute of a degree of the equator is called a *geographical* mile, of which, therefore, there are sixty in one degree. This is the same as the nautical mile, used by all mariners in computing distances at sea. One degree of the equator contains 69·16 English statute miles. See Earth.

De Grey, Earl: See Ripon, Marquis of.

De Haas, de-haas', Maurice Frederick Hendrick: artist; b. in Rotterdam, Holland, in 1832; a pupil of Louis Meyer and other eminent artists. He gave much attention to marine-painting, in which he early acquired distinction. In 1857 he was appointed artist to the Dutch navy. In 1859 he emigrated to New York. His pictures are marked by vigorous and effective drawing, and by fidelity to nature. His *Farragut Passing the Forts* is his best-known American work, D. in New York, Nov. 23, 1895.—His brother, William Frederick De Haas (1830–80), also was a marine-painter, and removed from Rotterdam to New York in 1854.

Dehli: See Delhi.

Deh'ra, or **Dehra Dun**: a district of Meerut, Northwestern Provinces, British India; at the foot of the Himalayas, between the Ganges and Jumna rivers. It comprises the

valley (*dun*) of the Dehra and adjacent hills. Area, 1,193 sq. miles. It is well wooded, undulating, and well watered by natural and artificial channels. Tea cultivation and the rearing of silk-worms are thriving industries. Rice, oil-seeds, millet, potatoes, and peppers are extensively cultivated. The principal town is Dehra, the headquarters of the great trigonometrical survey of India; pop. about 9,000. It is in lon. 78° E., lat. 30° 20′ N. (see map of Northern India, ref. 4–E). The hill station Mussooree is a favorite summer resort with a population which fluctuates with the season. Landaur, near by, is a military dépôt for European convalescents. Total pop. about 150,000.

Deipnosophists: See ATHENÆUS.

Deists [from Lat. *deus*, God]: a loosely defined body of thinkers having their principal development in England from the last part of the sixteenth century to the middle of the eighteenth. With several beliefs in common, they differed widely in regard to a future life and other matters. Their temper was not less believing than that of their orthodox opponents. They rejected revelation because man's natural reason seemed to them perfectly adequate to assure him of the existence of God and the right form of worship, viz., the practice of virtue and enthusiasm for the beneficent order of the world. That their God was a mechanical creator, but, having made the world, he was indifferent to its concerns, is an idea often unwarrantably attributed to them as a class. They rejected the Trinity, the deity of Christ, vicarious atonement, the supernatural or infallible inspiration of the Scriptures. In general, they regarded the Scriptures as made up of higher and lower things, the former a republication of natural religion, the latter the additions of the crafty and the superstitious. Lord Herbert of Cherbury (1581–1648), called the "Father of Deism," expressed the positive aspects of the system, but dealt little in negation. His temper was less purely intellectual and more religious than that of his successors. Blount, the first of these (1654–93), developed Hobbes's objections to the Mosaic authorship of the Pentateuch; argued the inconsistency of the Mosaic cosmology with the Copernican; and by an examination of the alleged miracles of Appolonius of Tyana endeavored to discredit those of Christ. He set the Deistical habit of regarding religious doctrines and practices as the inventions of designing men. Shaftesbury (1671–1713) differed widely from the other Deists, often criticising them. While the most intellectual and powerful writer of them all, his plea was for the emotional origin and character of religion. Toland (1670–1722) argued that true Christianity is not mysterious, and rudely anticipated the Tübingen criticism of Christian origins. Collins (1676–1729) was strongest in his attack on prophecy as an evidence of Christianity; Woolston (1669–1733) against the miracles. Tindal (1657–1733) sought to make out that Christianity is "as old as the creation." Chubb (1679–1764) was one of the least learned and most systematic; Bolingbroke (1678–1751), the most satirical and ironical. Voltaire, the chief of the French Deists, adopted his opinions and his methods; Diderot's position was similar; Rousseau's that of the more religious. Gibbon's famous chapters on Early Christianity are belated Deism, and Paine's *Age of Reason* reproduced its leading ideas, positive and negative. With many shrewd anticipations of the higher criticism of the nineteenth century, Deism was singularly lacking in the historic sense and in any real appreciation of the forces by which religions and their sacred books are developed. See Leslie Stephen's *History of English Thought in the Eighteenth Century* (2 vols. 1876). JOHN W. CHADWICK.

Dejani'ra, or **Deianeira** [in Gr. Δηϊάνειρα, or Δηάνειρα]: in Greek mythology, a daughter of Œneus, King of Ætolia, and the wife of Hercules. She preserved some blood of the centaur Nessus as a love-charm, with which she saturated a tunic of Hercules, who was poisoned by wearing it.

Dejazet, *de-zhaă'zā'*, PAULINE VIRGINIE: actress; b. in Paris, Aug. 30, 1797. She made her *début* on the stage as Fanchon toute seule when she was five years old, and played Bonaparte à Brienne when she was seventy-five. Her best impersonations were those of boys and young men. In 1859 she bought the Théâtre des Folies-Nouvelles, which, after her, is called "Théâtre Dejazet." She left the stage in 1868, and died in Paris, Dec. 1, 1875.

De Jure: See DE FACTO.

DeKalb: city; on railway; DeKalb co., Ill. (for location of county, see map of Illinois, ref. 2–E); 58 miles W. of Chicago; has 9 churches, 3 graded schools, barbed-wire factories, large wire-drawing plant, foundry, agricultural-implement factory, shoe-factory, glove and mitten factory, machine-shop, and various smaller manufactories. The increase in population since 1890 is due to the opening of new industries. Pop. (1880) 1,598; (1890) 2,579; (1900) 5,904.
EDITOR OF "CHRONICLE."

De Kalb, *de-kaalp'*, JOHN, Baron: general; b. in Hüttendorf, Bavaria, July 29, 1721; served first in the French army, and was promoted to the rank of brigadier-general. He removed to the U. S. with La Fayette in 1777, and was appointed a major-general by Congress in the same year. He served under Washington in Pennsylvania and New Jersey until the spring of 1780, and then became the second in command in the army of Gen. Gates. He was mortally wounded at the battle of Camden, S. C., and died Aug. 19, 1780. See Kapp, *Leben des Amerikan. Generals, Joh. Kalb* (1862). A bronze statue of De Kalb was unveiled at Annapolis, Md., Aug. 16, 1886.

DeKay, CHARLES: poet and journalist; b. in Washington, D. C., July 25, 1848; graduated at Yale College, and has been literary editor of the New York *Times* and consul-general at Berlin. Author of *Hesperus* (1880); *The Vision of Nimrod* (1881); *The Love Poems of Louis Barnaval* (1883); *Life of Barye* (1889); and *Bird Gods* (1898).

Dekkan: a geographical designation in India. See DECCAN.

Dekker, THOMAS: dramatist. See DECKER.

De Kov'en, REGINALD: musician; b. in Middletown, Conn., Apr. 3, 1859; graduated B. A. at St. John's College, Oxford University, in 1879; studied music in Stuttgart; received the degree of Mus. Doc. from Racine College 1890. He has composed many songs and several operas, chief of which are *Don Quixote* (1890); *Robin Hood* (1891); *The Fencing Master* (1892); *The Knickerbockers* (1892)—all of which have been successfully performed. He has written musical criticisms for the Chicago *Post*, New York *World*, and *Harper's Weekly*. D. E. HERVEY.

De la Beche, *de-laă'besh'*, Sir HENRY THOMAS, F. R. S.: geologist; b. near London in 1796. He began the geological mapping of Great Britain as an *attaché* to the Ordnance Survey, and afterward secured an independent organization, thus founding the first official geological survey. Among his works are a *Geological Manual* (1832) and the *Geological Observer* (1851). D. in London, Apr. 13, 1855.

Delaborde, *de-laă'bōrd'*, HENRI, Vicomte: historical painter; b. at Rennes, May 2, 1811; pupil of Paul Delaroche; first-class medal, Salon, 1847; officer Legion of Honor 1870; member of the Institute 1868; is a distinguished critic and writer on art. *Knights of St. John of Jerusalem* (1845) is in the Versailles Museum; *Hagar in the Desert* (1836) in the museum at Dijon; *Passion of Christ* (1848) in Amiens Cathedral. W. A. C.

Delacroix, *de-laă'krwaă'*, FERDINAND VICTOR EUGÈNE: figure-painter; b. at Charenton-Saint-Maurice, near Paris, Apr. 26, 1799; pupil of Guérin. He was the leader of the revolt against the bombastic classical style of David, and the chief of the Romantic school of 1830. The revolt was really begun by Géricault, who did not live to carry on the war, and a considerable part of the glory that rightly belongs to him is attributed to Delacroix. Delacroix first came into notice in 1822, when he exhibited his picture of *Dante and Virgil in Charon's Bark* (now in the Louvre). It is one of the best of his works. The battle between the romanticists and the classicists was a very hot one, and is not entirely fought out to this day. How much of the fame of Delacroix belongs to his part in founding a new school in art and how much is due to his merits as an artist it is difficult to determine. It is probable, however, that his ability has been exaggerated, and that time will bring a more modest estimate of his worth and artistic balance as a colorist, while not detracting from his value as the prime factor in the development shown in the art of painting since his advent. He has high reputation as a colorist, and it is certain that he was wonderfully gifted in this respect. In his work he is at times flighty and fiery in the bewildering richness of a multitude of glowing tints; in others, as in the *Battle of Taillebourg* (Versailles Museum), he is almost unintelligible. The *Entry into Constantinople* (Louvre) is perhaps his completest and finest work. In spite of faults and insufficiencies in the matter of form in his work, it is, taken as a whole, of extraordinary brilliancy and power. His influence on the

modern French school was very great, and with him and with Géricault began a transformation in the art of painting that has affected every school of art in the world. D. in Paris, Aug. 13, 1863. WILLIAM A. COFFIN.

De Laet: See LAET.

Del'afield, EDWARD, M. D.: physician; b. in New York city in 1794; graduated at Yale College in 1812 and at the College of Physicians and Surgeons in 1815. Soon after this he went to London, remained abroad about a year, and on his return to New York, in conjunction with Dr. J. Kearny Rodgers, he established the New York Eye and Ear Infirmary in 1820. In 1825 he was appointed a professor in the College of Physicians and Surgeons; in 1834 was appointed physician to the New York Hospital; in 1842 organized the Society for the Relief of the Widows and Orphans of Medical Men, and was its first president; in 1866 was elected president of the medical board of the Women's Hospital; in 1858 was elected president of the College of Physicians and Surgeons; in 1870 became, by virtue of his presidency, one of the governors of the Roosevelt Hospital, and was elected first president of the board of governors. D. Feb. 13, 1875.

Delafield, RICHARD: U. S. military officer: b. Sept. 1, 1798, in New York city; graduated at West Point in 1818; chief of engineers Apr. 22, 1864, with the rank of brigadier-general. He was engaged in many important works of engineering, and when the civil war broke out served on the staff of Gov. Morgan, of New York, to reorganize and equip State forces for the service 1861–63; in command of corps of engineers and in charge of engineer bureau, Washington, D. C., 1864–66; as inspector of Military Academy 1864–66; as member of lighthouse board and of commission for the improvement of Boston harbor 1864–70; and as regent of Smithsonian Institution 1865–70; brevet major-general U. S. army Mar. 13, 1865, for faithful, meritorious, and distinguished service in the engineer department; and retired from active service Aug. 8, 1866. D. in Washington, D. C., Nov. 5, 1873.

Delago'a Bay (i. e. lagoon bay): an inlet of the Indian Ocean; in Southeastern Africa; 55 miles long and about 25 miles wide. It is about lat. 26° S. and lon. 33° E. The surrounding country is very insalubrious, but the bay is commodious and safe. It was discovered by Vasco de Gama in 1498, and shortly after the Portuguese founded the factory of Lourenço Marques. It seemed, however, as if the Portuguese exercised no jurisdiction in the country, and in 1822 Capt. Owen hoisted the British flag and appropriated the territory. But on his return, in 1823, he found the Portuguese governor in possession of the country, and strife began. The question attracted no attention, however, until, in 1868, the Transvaal republic, the Boers having made a settlement there in 1835, incorporated the country. The case was then laid before the president of the French republic for arbitration, and on Apr. 19, 1875, Marshal MacMahon declared in favor of the Portuguese claim. A railway to Pretoria, begun by British and American capital, was confiscated by Portugal in 1889. The question of indemnity was submitted for arbitration to the Swiss Federal Council in 1891. Mar. 29. 1900, Portugal was ordered to indemnify the original concessionaires to the extent of £28,000 plus 15,314,000 francs, with simple interest at 5 per cent. from June 25, 1889, the date of the seizure.

Delambre, de-läN'b'r, JEAN BAPTIST JOSEPH: astronomer; b. at Amiens, France, Sept. 29, 1749; studied under Lalande. He produced *Tables of the Orbit of Uranus* in 1790, and in 1792 *Tables of Jupiter's Satellites.* In the service of the Government Delambre and Méchain spent about seven years (1792–99) in the measurement of the arc of the meridian from Dunkirk to Barcelona. Delambre published the result of this operation in his *Base du Système Métrique Decimal* (1806–10). He was admitted into the Institute in 1795, became perpetual secretary of the Academy of Sciences in 1803, and Professor of Astronomy in the College of France in 1807. Among his numerous works are a *History of Ancient Astronomy* (1817); a *History of Mediœval Astronomy* (1819); and a *History of Modern Astronomy* (1821). D. Aug. 19, 1822. See Fourier, *Éloge de Delambre.*

De Lan'cey, EDWARD FLOYD: See the Appendix.

De Lancey, JAMES: jurist; b. in New York in 1703; the son of a Huguenot from Normandy. He was educated at Cambridge, England; returned to New York in 1729: in the following year formed one of a commission to frame a new charter for the city, and the instrument known as the Montgomery charter was drawn up chiefly by him; became a justice in the supreme court of the province 1731, and in 1733 its chief justice. He was one of the founders of King's (now Columbia) College, and was lieutenant-governor for several years. He was a man of great talents, wealth, and learning, but is said to have been unprincipled and intriguing. Several members of the De Lancey family were prominent and bitter Tories during the Revolutionary war, but they were in general men of remarkable talents. D. in New York, Aug. 2, 1760.

De Lancey, WILLIAM HEATHCOTE, D. D., LL. D., D. C. L. (Oxon.): P. E. bishop; b. at Mamaroneck, N. Y., Oct. 8, 1797; graduated at Yale in 1817; was ordained deacon in 1819, priest in 1822; was provost of the University of Pennsylvania 1827–32, and was consecrated bishop of Western New York in 1839. D. in Geneva, N. Y., Apr. 5, 1865.

Deland: city; capital of Volusia co., Fla. (for location of county, see map of Florida, ref. 4–J); on railway in the center of a great orange belt; has five churches, and is the seat of John B. Stetson University, which has a large endowment and fine buildings. Pop. (1890) 1,113; (1900) 1,449. EDITOR OF "NEWS."

Deland, MARGARETTA WADE (*Campbell*): poet and novelist; b. at Alleghany, Pa., Feb. 23, 1857; educated at New Rochelle, N. Y.; taught industrial drawing in New York city. She was married in 1880 to L. F. Deland, of Boston, where she has since resided. She published a volume of verse, *The Old Garden*, in 1886; *John Ward, Preacher*, a theological novel which has had wide popularity (1888); *Florida Days* (1889); *Sidney* (1889); *The Story of a Child* (1892); *Mr. Tommy Dove and other Stories* (1893); *The Wisdom of Fools* (1895); *Philip and His Wife* (1898).

Delane, JOHN THADEUS: journalist; b. in London, Oct. 11, 1817; educated at King's College, London, and at Oxford; in May, 1841, when not yet twenty-four, he became editor of the *Times*, and held the position for thirty-six years, during which period the paper attained an influence unparalleled in the history of journalism. He resigned the editorship in 1877, and died Nov. 22, 1879. C. H. T.

Delano, COLUMBUS, LL. D.: lawyer; b. in Shoreham, Vt., June 5, 1809; removed in his early youth to Ohio. He practiced law with distinction, and was chosen a member of Congress in 1844. Having joined the Republican party, he was again elected to Congress in 1864. He became commissioner of internal revenue in Mar., 1869, and Secretary of the Interior in the cabinet of President Grant in Oct., 1870. D. Oct. 22, 1896.

Delanoy, de-läN'nwäN', HIPPOLYTE PIERRE: still-life and genre painter; b. in Glasgow, Scotland, of French parents; contemporary. Pupil of Gleyre, Barrias, Bonnat, and Vollon; third-class medals, Salon, 1879, and Paris Exposition, 1889. *At Don Quixote's* is in the Luxembourg Gallery. His work is excellent; highly finished. Studio in Paris.

De la Ramé, de-läN-räN'mā', LOUISA: British novelist of French extraction (known in the literary world as "Ouida"); b. at Bury St. Edmunds in 1840. Her pseudonym was a childish mispronunciation of "Louisa." Her novels, some twenty-five in number, are popular but sensational and high-colored fictions. Some of them are *Strathmore* (1865); *Under Two Flags* (1867); *In a Winter City* (1876); *In Maremma* (1882); *Guilderoy* (1889). She has resided in Florence, Italy, for many years. H. A. BEERS.

Delaroche, de-läN'rōsh', HIPPOLYTE (called *Paul*): historical painter; b. in Paris, July 17, 1797; pupil of Baron Gros; grand gold medal, Salon, 1824; officer Legion of Honor 1834; member of the Institute 1832; professor at the École des Beaux-Arts. He painted the famous *Hemicycle* in the École, 1838–41. *Charlemagne Crossing the Alps* (1847) is in the Versailles Museum, and *The Princes in the Tower*, one of his most famous works, and the *Death of Queen Elizabeth* are in the Louvre. He was a pronounced classicist. D. in Paris, Nov. 4, 1856. W. A. C.

De la Rue, WARREN, Ph. D., F. R. S.: English physicist and inventor; b. in the island of Guernsey, Jan. 18, 1815; educated in Paris; afterward followed his father's employment as wholesale stationer and manufacturer of card paper. He invented processes for photographing the heavenly bodies, improvements in color-printing, in envelope-folding machines, in oil-refining, etc., and published important reports of original observations in chemistry, astronomy, and physics. D. Apr. 19, 1889.

Dela'tor, in the plural **Delatores** [Lat. deriv. of *defer're, dela'tum*, carry off]: a Latin word, literally meaning carrier; applied in course of time to the carriers of evil reports, informers, or public spies. Under the Roman emperors the delatores were a class of men who gained their living by informing against their fellow-citizens. They constantly brought false charges forward to gratify the jealousy or avarice of the different emperors, and were generally paid according to the apparent consequence of the information they gave, although in some cases the law specified the sums which were to be given to informers. Thus if a murder had been committed in a family, and any slaves ran away before inquest (*quæstio*) had been made, whoever apprehended such slaves received for each one so apprehended five pieces of gold from the estate of the deceased, or, if the estate could not pay it, the government gave the reward. At various times attempts were made to regulate the pay of public spies and informers, who at last became so numerous, and gave rise to so much trouble in society, that the emperors were obliged to expel and variously punish great numbers of them.

Delaunay, de-lō'nā', Charles Eugène, F. R. S. L.: mathematician and astronomer; b. near Troyes, France, Apr. 9, 1816; educated at the Polytechnic School, where he graduated in 1836 with the highest honors. He was subsequently appointed principal engineer of mines of the first class, and Professor of Mechanics in the Polytechnic School and in the Faculty of Sciences. He was also an officer of the Legion of Honor, a member of the Institute, and was the recipient of numerous native and foreign honors and distinctions. He became a member of the Academy in 1855, of the bureau of longitude in 1862, and director of the Parisian Observatory in 1870. He wrote, among other works, *Traité de Mécanique Rationelle* (3d ed. 1862); *Théorie de la Lune* (1866); *Rapport sur le Progrès de l'Astronomie* (1867). He was drowned at Cherbourg, Aug. 5, 1872.

Delaunay, Jules Élie: figure and portrait painter; b. at Nantes, France, June 12, 1828; pupil of Flandrin; Grand Prix de Rome 1856; third-class medals, Salon, 1859, and Paris Exposition, 1867; first-class medal, Paris Exposition, 1878; officer Legion of Honor 1878; medal of honor, Paris Exposition, 1889; member of the Institute 1879. His portraits are among the finest in modern art, and his work is distinguished by the most artistic qualities of drawing and composition. His *Death of the Centaur Nessus* is in the museum at Nantes, and *Diana* is in the Luxembourg Gallery, Paris. He has done important decorative work, including several churches and the stairway of the new Hotel de Ville, Paris. D. in Paris, Sept. 5, 1891.

Delaunay, Louis Arsène: French actor; b. Mar. 21, 1826, in Paris; appeared at the Odéon 1845; played the part of the son in *L'univers et la maison* 1846; 1848 appeared in *Le Menteur* at the Théâtre Français, and in *Pythias et Damon*; he has shown particularly as Télémaque and Hernani.

Del'avan: city and railway junction; Tazewell co., Ill. (for location of county, see map of Illinois, ref. 5–D); 157 miles S. W. of Chicago. It has a library, a high school, a park, and various manufactures. Pop. (1880) 1,340; (1890) 1,176; (1900) 1,304.

Delavan: village (settled in 1836); Walworth co., Wis. (for location of county, see map of Wisconsin, ref. 7–E); on railway, and on Turtle Creek; 58 miles S. W. of Milwaukee; has the State institution for the deaf and dumb, a foundry, cheese factories, etc. There are mineral springs here, and the village is a place of summer resort. Pop. (1880) 1,798; (1890) 2,038; (1900) 2,244. Editor of "Republican."

Delavigne, de-laă'veeñ', Jean François Casimir: dramatist; b. in Havre, France, Apr. 4, 1793. After the Restoration he wrote a series of patriotic lyrics called *Messéniennes*, which were received with favor. The dramas *Les Vêpres Siciliennes* (1819), *Les Comédiens* (1820), and *Le Paria* (1821) increased his fame. In 1830 he wrote *La Parisienne* and other revolutionary songs. Delavigne occupies an intermediate position between the Classical and Romantic school. There are more piquancy and realistic sentences in his delineations of characters than in those of Voltaire, but less passion and fire of imagination than in those of Victor Hugo. D. Dec. 11, 1843.—His brother, Germain Delavigne, b. Feb. 1, 1790, wrote with Casimir the words to Halévy's opera of *Charles VI.*, and in collaboration with Scribe *Le Vieux Garçon* and other vaudevilles. D. Nov. 1, 1868.

Delaware (named in honor of Lord Delaware, second Governor of Virginia): a river of the U. S.; rises in New York, and is formed by the Coquago and the Popacton, which unite at Hancock on the boundary between New York and Pennsylvania. It flows southeastward to Port Jervis on the Erie R. R., and reaches the northern extremity of New Jersey. Below this point it forms the boundary between Pennsylvania and New Jersey, and runs southwestward to the Delaware Water Gap, where the river passes through a picturesque gorge in the Kittatinny Mountain. Thence it flows southward to the northern extremity of Bucks County, and southeastward to Trenton, where it meets tide-water. Below Bordentown it flows southwestward until it enters Delaware Bay, about 40 miles below Philadelphia. Its whole length is about 300 miles. It is navigable for steamboats to Trenton, and ships of the largest size can ascend to Philadelphia, where it is nearly a mile wide. It is connected with the Hudson river by the Morris Canal and the Delaware and Hudson Canal. Large numbers of shad are caught in the Delaware.

Delaware: one of the Middle Atlantic States, and one of the original thirteen. It is situated between 38° 28′ and 39° 50′ N. lat. and 75° and 75° 46′ W. lon. It is 96 miles long and from 9 to 37 miles wide. Bounded N. and N. N. W. by Pennsylvania, E. by Delaware river and bay and the Atlantic, S. and W. by Maryland. Area, 2,050 sq. miles.

Topography.—The peninsula bounded by Chesapeake and Delaware Bays and the Atlantic, of which Delaware forms the northeast portion, is generally nearly level and, except on Delaware river and bay, sandy. There are no mountains, but some rolling lands with hills and valleys in the N.; but below New Castle a sandy and somewhat marshy ridge only relieves the eye from gazing on a dead level. This ridge is nowhere above 70 feet in height, runs near the west boundary of Delaware, and forms the backbone of the peninsula. The affluents of the Delaware river in the E. and of the five or six streams falling into Chesapeake Bay have their sources in this low ridge. There are three shallow bays or sounds, landlocked by spits of sand, below Cape Henlopen—viz., Rehoboth Bay, Indian River Bay, and the north portion of St. Martin's Bay. Most of the larger streams and bays are navigable for vessels of light draught, but only the Delaware river and bay and Christiana creek are navigable for large ships and steamers. Rehoboth Bay admits vessels drawing 6 feet of water. Delaware Bay is a fine body of water, with a deep though tortuous channel, having from 35 to 75 feet of water. The only good harbors in the State are those of Wilmington on Christiana Creek, New Castle, and Lewes.

Minerals.—Bog-iron ore, found in all the swamps, shell marl, in the greensand region, and kaolin or porcelain clay are abundant.

Zoölogy.—There are few wild animals in the State, except that many formidable reptiles are to be found in the swamps. The shores of Delaware Bay are frequented by immense flocks of ducks and teal, as well as by wild geese; the other birds of the State are those common to the Middle Atlantic States.

Soil and Vegetation.—In the swamps there are extensive forests of cypress and other evergreen trees and shrubs of a semi-tropical character, as well as bog-oak, huckmatack, etc. Elsewhere in the State there are no extensive forests, the land being almost wholly under cultivation. The soil for eight or ten miles inland from Delaware Bay is for the most part a rich clayey loam, but west of this it is sandy, and requires constant fertilization in order to produce heavy crops. The swamp lands, when reclaimed, are very productive.

Longitude 75°30′ West from Greenwich

The *climate* is mild and favorable for farming; healthful in the north and center; some remittent and intermittent fevers prevail in the swampy regions in the south.

Agricultural Products.—Delaware is eminently a fruit-growing State. Peaches, apples, and small fruits raised here are in demand in the New York and Philadelphia markets, and, in connection with New Jersey and Maryland, she supplies certainly seven-tenths of the entire demand for these products. In 1880 were reported 8,749 farms, of which 6,745—more than three-quarters—were of 50 acres or more; of the whole number 3,708 (about three-sevenths) were rented, and two-thirds of these were rented for pay in kind (generally fruit). Farms occupy about ten-thirteenths of the entire area. In 1900 Delaware produced 5,010,312 bush. of Indian corn, 1,479,139 bush. of wheat, and 332,724 bush. of oats. About 50,000 tons of hay are annually harvested. Potatoes, sweet potatoes, and all garden vegetables are very largely produced. The live stock of the State in 1899 was 31,192 horses, 4,879 mules and asses, 22,305 working oxen and other cattle, 35,730 milch cows, and 12,592 sheep. The peach crop varies in favorable years from 3,300,000 to 4,000,000 baskets or crates. The apples, pears, quinces, and small fruits produced are together worth more than the peaches.

Manufactures.—Delaware has extensive manufactures, Wilmington being the center of some important interests; the principal are iron, mostly rolled, flour and meal, morocco and leather; ship-building, iron and wood; machinery, car-wheels, etc.; railway and horse cars; cotton goods, paper, powder and chemicals, carriages and wagons; canned provisions, vegetables, and fruits; tobacco, cigars, cigarettes, and snuff; woolen goods, boots, shoes, and findings.

Railways.—There were on June 30, 1899, 351.12 miles of railway in operation in Delaware. These lines penetrate each county. Trunk roads to Baltimore, Washington, and the South pass through the northern part of the State.

Finances.—The total debt Jan. 1, 1900, was $819,750; assessed valuation, about $75,000,000. The State annual revenue, as well as that of Wilmington, exceeds expenditure. While the nominal State debt, as given above, was $819,750, the State owns $1,024,452 in bank stocks and railway mortgages, and is practically free from debt. There is no State taxation in Delaware, but the county and municipal taxes raised amount to about $1,000,000 annually.

Commerce.—Though the foreign commerce of Delaware is conducted mostly through Philadelphia and Baltimore, yet the Delaware district, of which Wilmington is the port, had $2,912,772 of exports and $178,633 imports in the seven months ending Feb. 1, 1901. Wilmington has a line of steamers plying regularly to New York, and steam and sailing vessels of lighter draught run to various ports in the State.

Banks, etc.—Delaware had, Sept. 5, 1900, 19 national banks in operation, with a capital of $2,133,985, and $6,252,694.77 individual deposits; the outstanding circulation was $850,383. There were in 1900 6 State banks, savings-banks, and private banking-houses, having an aggregate capital of $1,600,000; deposits, $10,035,837. There were also four local fire insurance companies and twenty-two mutual life insurance companies in the State doing business in Delaware.

Newspapers and Libraries.—There were in 1900 42 newspapers and other periodicals in the State—6 daily, 30 weekly, and 6 monthly. There are also 18 public libraries, having an aggregate of about 65,000 volumes.

Churches and Education.—The number of churches of all denominations is about 300; the Methodists (Episcopal and Protestant) lead, and are followed in their order by Presbyterians, Episcopalians, Baptists, Roman Catholics, Friends, Lutherans, and five or six minor denominations. Delaware had in 1899 48,830 children of school age, of whom 33,174 were enrolled in the public schools; number of school-houses, 497; value of school property, about $904,426. There are 840 teachers (218 men, 622 women); total receipts and expenditure for these schools, about $275,000. The city schools of Wilmington are excellent. There is one normal school with 2 teachers and 25 students; 10 teachers' institutes held. There is one State college at Newark, with scientific and normal departments; a college at Wilmington. There are also 13 academies, seminaries, or high schools, but no professional schools.

Population.—In 1790, 59,096; in 1830, 76,748; in 1870, 125,015; in 1880, 146,608 (white 120,160, colored 26,448); in 1890, 168,493 (white 140,066, colored 28,427, including 37 Chinese and 4 Indians); in 1900, 184,735.

* See map of Delaware.

Principal Towns and Population 1900.—Wilmington, largest city, 76,508; Dover (capital), 3,329; New Castle, 3,380; and Smyrna, 2,168. North Milford, Seaford, Lewes, Laurel, Delaware City, South Milford, Georgetown, and Newark are important towns.

Government.—Under the constitution of 1897, governor and lieutenant-governor are elected for four years, senate (17 members) for four years, house of representatives (35 members) for two years.

History.—Named from the bay and river; first settlement by Dutch under De Vries, 1630, near Lewes; colony destroyed by Indians. In 1637 Swedes and Finns bought the land from Cape Henlopen to Christiana creek, and built a fort at the mouth of the creek, calling the country New Sweden; the Dutch at New Amsterdam built a fort at New Castle, 5 miles below; after some difficulties the Dutch captured New Sweden in 1655, and expelled those who would not swear allegiance to Holland. In 1664, when the New Netherlands were conquered by the English, the Duke of York claimed Delaware as belonging to him; Lord Baltimore also claimed it; William Penn purchased it in 1685, and it was called "the territories," and regarded as a part of Pennsylvania for twenty years. In 1703 it had a distinct legislature, but until 1776 was under the Pennsylvania government, and the Penn family were proprietaries. Became independent in 1776, and in the Revolutionary war, as in previous wars, the "Blue Hen's chickens" (so called from their flag) were as brave and efficient soldiers as any. Constitution adopted Sept. 20, 1776, and others in 1792, 1831, and 1897; ratified the Constitution of the U. S. Dec. 7, 1787. The State has been quiet but prosperous. It held a few slaves till the civil war, and though it sent about 10,000 men into the Union army in the war, there was a large minority who then and afterward did not sympathize with the Union.

Governors of the State.—From 1776 to 1787, two governors of Pennsylvania, John Dickinson and Thomas McKean, were presidents of Delaware, but in 1789 the first Governor of Delaware was elected, and the succession has since been:

Joshua Clayton	1789–96	William Temple	1846
Gunning Bedford	1796–97	William Thorp	1846–51
Daniel Rogers	1797–98	William H. Ross	1851–55
Richard Bassett	1798–1801	Peter F. Causey	1855–59
James Sykes (acting)	1801–02	William Burton	1859–63
David Hall	1802–05	William Cannon	1863–65
Nathaniel Mitchell	1805–08	Gove Saulsbury	1865–69
George Truett	1808–11	James Ponder	1869–75
Joseph Haslett	1811–14	John P. Cochran	1875–79
Daniel Rodney	1814–17	John W. Hall	1879–83
John Clarke	1817–20	Charles C. Stockley	1883–87
Jacob Stout (acting)	1820–21	Benjamin T. Biggs	1887–91
John Collins	1821–22	Robert J. Reynolds	1891–95
Caleb Rodney (acting)	1822–23	Joshua H. Marvil *	1895–95
Joseph Haslett	1823–24	William T. Watson	1895–97
Samuel Paynter	1824–27	Ebe W. Tunnell	1897–1901
George Poindexter	1827–30	John Hunn	1901–
David Hazzard	1830–33		
Caleb P. Bennett	1833–37		
Cornelius P. Comegys	1837–40		
William B. Cooper	1840–44		
Thomas Stockton	1844–46		
Joseph Maul (acting)	1846		

* Died Apr. 8, 1895.

Delaware: city and railway center; capital of Delaware co., O. (for location of county, see map of Ohio, ref. 4–E); on the Olentangy river, 24 miles N. of Columbus. It is the seat of Ohio Wesleyan University and Ohio Wesleyan Female College. It has good schools, large railway repair-shops, 2 foundries, 2 flouring-mills, an oil-mill, a woolen factory, and manufactures of bagging, chairs, iron fences, carriages, lumber, etc. It is handsomely situated and well built. There are valuable medicinal springs here. Pop. (1880) 6,894; (1890) 8,224; (1900) 7,940.

Editor of "Gazette."

Delaware, or, more correctly, **Delawarr**, Thomas West, Lord: the twelfth baron of that title, the second governor and first captain-general of Virginia; a descendant by the female line of an old and noble family which derived its name, according to some authorities, from an estate called

La Warre (or Warwick), in Gloucestershire, England. He took his title in 1602. He was named captain-general of Virginia (which comprehended nearly all the present eastern coast of the U. S.) in a charter dated May 23, 1609. He visited the colony in 1610, established a post at the mouth of the James, built two forts, and returned in the following year to England. He expended large sums of money in establishing the colony of Virginia. He died at sea, "not without suspicion of poison," June 7, 1618, while on his second voyage to America. He appears to have been a noble and philanthropic man.

Delaware Bay: a wide estuary between the mouth of the Delaware river and the Atlantic Ocean, separating the State of Delaware from the southern part of New Jersey. The entrance between Capes May and Henlopen is 13 miles wide; the greatest breadth of the bay is about 25 miles. A safe and capacious harbor has been formed in this bay by the construction of a BREAKWATER (*q. v.*) near Lewes. This structure is in lat. 38° 59′ 07″ N., lon. 75° 6′ 9″ W. The western part of the bay is generally shallow, but it has a deep though not very direct channel for shipping.

Delaware City: a city of New Castle co., Del. (for location of county, see map of Delaware, ref. 2–N); on the Delaware river, about 40 miles below Philadelphia. It is the eastern terminus of the Chesapeake and Delaware Canal. Pop. (1880) 1,085; (1890) 969; (1900) 1,132.

Delawares: See ALGONQUIAN INDIANS.

Delaware Water Gap: a summer resort of Monroe co., Pa.; on the Delaware river, where it passes through the Kittatinny Mountain, and on the Delaware, Lackawanna and Western R. R.; 108 miles N. of Philadelphia and 92 miles W. of New York (for location of county, see map of Pennsylvania, ref. 4–J). The river here flows through a narrow gorge between steep rocky banks, which rise nearly 1,200 feet above the water.

De la Warr, EARLS, and Viscounts Cantalupe (Great Britain, 1761): Barons de la Warr (1209), Barons West (1343), Barons de la Warr (England, 1579, by patent).—CHARLES RICHARD SACKVILLE WEST, sixth earl, major-general, b. Nov. 13, 1815, succeeded his father, GEORGE JOHN, Feb. 23, 1869; d. Apr. 23, 1873; succeeded by his brother REGINALD WINDSOR SACKVILLE, b. Feb. 21, 1817.

Delcommune, ALEXANDRE: See the Appendix.

Del Credere Commission [*del credere* is Ital., and means of faith or belief]: in mercantile law, an additional premium charged by a factor or commission merchant on the price of goods consigned to him when he guarantees the solvency of the purchaser who buys them on credit. The *del credere* factor or agent is a surety, liable only to his principal in case of default on the part of the purchaser.

Delegation: the name formerly given in the Italian states of Lombardy and Venice and in the papal dominions to a province and its governor and his court. There were nine of these governing bodies in Lombardy and eight in Venice, each consisting of a delegate as president, a vice-president, and subordinates. In 1816 there were seventeen delegations established in the states of the Church, but the numbers were several times changed. Here the delegate was always a prelate appointed by the pope; if a cardinal, he was called a legate and his province a legation.

Delescluze *de-lā′klüz′*, LOUIS CHARLES: a French politician; b. in Dreux, Oct. 2, 1809; took part in 1830 in the republican movement; was, after the revolution of 1848, for a short time commissioner-general in the departments Du Nord and Pas-de-Calais; then published several ultra-radical papers in Paris; was in 1857 deported to Cayenne. In 1868 he started a journal, *Reveil*, which advocated the views of the International. During the reign of the Commune, of which he was the leading spirit, he was at the head of the war commission with almost unlimited powers. His fall, on May 28, 1871, on the barricade in the Rue d'Angoulême, ended the resistance of the Commune to the troops of the Government. He was accused unjustly of having issued the incendiary orders. He wrote *De Paris à Cayenne: Journal d'un Transporté* (1867), in which he described his sufferings during his exile.

Delft: a town of the Netherlands, province of South Holland; on the railway from Rotterdam to The Hague; 4 miles S. E. of the latter (see map of Holland and Belgium, ref. 6–E). It is well built of brick, and clean, and is situated amid a network of canals. It has a richly adorned townhall, a Gothic church containing a magnificent monument to William, Prince of Orange, who was assassinated here in 1584: a state arsenal, an East Indian college, a polytechnic, and several hospitals. Delft was formerly noted for glazed earthenware, which throughout Holland came to have the name of delft-ware. The same kind of pottery, now mostly made in England, is still called *delf*. Here are manufactures of carpets, woolen cloths, soap, etc. Pop. (1896) 32,021.

Delfts'haven: the port of Delft; on the river Meuse, 1½ miles S. W. of Rotterdam (see map of Holland and Belgium, ref. 6–E), and connected with the city by canal. It has a handsome church. The inhabitants are partly employed in ship-building, iron-foundries, and distilleries. Here the Pilgrim Fathers embarked for Southampton, July 22, 1620. Pop. 13,138.

Delgada, del-gaa′da, or **Ponta Delgada**: a city of the Azores; on the south side of the island of St. Michael; the capital of that island and of St. Mary; lat. 37° 45′ N., lon. 25° 40′ W. It has considerable trade in fruit, grain, and orchil. There are here a breakwater and docks for shipping. Pop. 17,940.

Delhi, or **Dehli**, dĕl′i: a division and district of the Punjaub, British India. The division forms the southeast angle of the Punjaub, on the west side of the Jumna river, with the Northwest Provinces on the E., and Rajputana on the S. It has an area of 15,530 sq. miles, and a population in 1891 of 4,433,680. The district is one of the subdivisions of the division, and is a strip of territory on the west bank of the Jumna, about 75 miles long and from 15 to 23 broad, lying between lats. 28° 13′ N. and 29° 13′ N., and containing the celebrated city of DELHI (*q. v.*): area, 1,276 sq. miles. It consists of a narrow, low-lying alluvial strip along the river, backed by a country of stony or hard sandy soil, which requires artificial irrigation. The chief products are wheat, barley, sugar-cane, cotton, and building-stone. The Rajputana state railway crosses the district, and the East India railway and the Punjaub railway run trains into Delhi city. Pop. 675,000. M. W. HARRINGTON.

Delhi, or **Dehli** (in Sanskrit, *Indraprastha*): a celebrated city of Hindustan, called by the Mohammedans **Shahjehanâbâd**: on the Jumna, 954 miles N. W. of Calcutta by rail; lat. 28° 40′ N., lon. 77° 18′ E. (see map of N. India, ref. 5–E). It was formerly the capital of the Mogul empire, and was the largest city of Hindustan, having a population of 2,000,000. An extensive tract, covered with the ruins of palaces, pavilions, baths, and mausoleums, marks the dimensions of the ancient metropolis. The modern city, mostly rebuilt by Shah Jehan 1638–58, has a circumference of 7 miles, and is surrounded on three sides by walls of red sandstone 30 feet high. It has ten colossal arched gates, defended by round bulwarks. The streets are mostly narrow, but one of the main avenues is 120 feet wide. The palace of the Great Mogul, built by Shah Jehan, is the most magnificent in India. Its stupendous towers, surmounted by elegant pavilions, its marble domes and gilded minarets, present a very imposing appearance. Among the other remarkable edifices is the Jamma mosque, a splendid structure in the Byzantine style, built of white marble and red sandstone. Delhi has about forty mosques, many of which have lofty minarets and gilded domes. The goldsmiths of Delhi are famous for the beauty of their work. Many Kashmir shawls are here embroidered with silk and gold. Delhi has a large trade in wheat and other produce. The city, which has been frequently captured by hostile armies, was taken by the British general Lord Lake in 1803, and it has continued under British domination ever since that time. In May, 1857, Delhi was occupied by the mutinous Sepoys, who here murdered a number of British residents. A British army commenced the siege of this place in June, and took it by assault, after a severe fight of seven days, in Sept., 1857. Pop. (1891) 192,579.

Delhi: village; capital of Delaware co., N. Y. (for location of county, see map of New York, ref. 6–H); on a branch of the N. Y., Ontario and Western Railway, and the west branch of Delaware river. It is the center of a grazing and butter-producing region, and has a foundry and various manufactories. Pop. (1880) 1,384; (1890) 1,564; (1900) 2,078.

Delibes, CLEMENT PHILLIBERT LEO: opera composer; b. at Saint-Germain-du-Val, France, Feb. 21, 1836; studied at the Paris Conservatory, taking first prize for solfeggio in 1850; accompanist at the Théâtre Lyrique in 1853 and at the Grand Opéra 1863, and second chorus-master under Massé. He was a chevalier of the Legion of Honor and a member

of the Institute. He succeeded Reber as Professor of Composition in the Conservatory. His most famous opera was *Lakmé*, produced in Paris in 1883 with the American singer Marie Van Zandt in the title *rôle*. Other works were *Coppelia*, 1870; *Sylvia*, 1876; *Le Roi l'a dit*, 1873; and *Jean de Nivelle*, 1880. These, and his ballets *La Source* and *Le Pas de Fleurs*, were very successful. D. Jan. 16, 1891. D. E. Hervey.

Delille, de-leel', Jacques, L'Abbé: didactic poet; b. at Aigueperse, Auvergne, France, June 22, 1738. He was educated at a college in Paris, and became Professor of Humanities at Amiens. His reputation was established by a translation of Vergil's *Georgics* (1769). In 1780 he published *Les Jardins*. He translated into French verse Vergil's *Æneid* (1804) and Milton's *Paradise Lost* (1805). His version of the *Æneid* is considered the best in the language. Among his works is a poem entitled *Imagination* (1806), which is highly commended. D. May 1, 1813. See Campenon, *Éloge de Delille*; Sainte-Beuve, *Portraits Littéraires* (vol. ii.).

Delirium [Lat. deriv. of *delira're*, to be beside one's self, liter., to leave the furrow; *de*, off + *lira*, furrow]: a condition in which the ideas of a sick person are in a confused, wild, or wandering state. It differs from insanity in being a symptom of acute disease, like fever, while insanity is an evidence of more chronic disease.

Delirium Tremens [Lat., trembling delirium]: one of the affections produced by chronic alcoholism. It occurs as a result of a protracted debauch in those habitually excessive in the use of alcoholic drink, more rarely as a result of a sudden withdrawal of the accustomed stimulus, or of a temporarily excessive indulgence. It is frequently caused by some severe injury in a drunkard, or by acute disease. Common as this condition now is, and must have been from earliest times, its cause and nature were not pointed out until 1813, when Dr. Sutton distinguished cases of delirium curable by opium, but not by blood-letting, from other forms of delirium, and in 1819 when Rayer showed the true nature and proposed the name *Oino-mania* (Gr. *οἶνος*, wine).

The symptoms of delirium tremens are varied, but the most important are wakefulness, loss of appetite, delirium, trembling, and hallucinations. Inability to sleep, combined with aversion from food and vomiting when such is taken, rapidly reduce the strength of the patient to an extreme degree. The trembling, so characteristic as to form part of the name, is invariable, usually affecting the hands, but in some cases general. The hallucinations generally pertain to sight, the objects seen being grotesque or horrible (only occasionally of a pleasant nature), and usually combined with most dreadful apprehension of impending evil. These symptoms continue and grow in severity until the patient is utterly exhausted, when death may ensue, or after longer or shorter intervals tardy restoration of health. Death occurs in about one-sixth of bad cases.

The treatment consists in supporting the strength of the patient by nourishing soft food, remedies being applied to the stomach to insure its retention; in inducing quiet and sleep by opium or morphia, bromide of potash, chloral, and similar drugs, together with utmost quiet of surroundings, and in attending to proper action of the emunctories. There is a constant craving for alcohol, but in most cases this is to be withheld. When weakness is marked, a little spirits may be allowed. Restraint with manacles and the like is not advisable when they may be dispensed with.

Delirium tremens is but one of the results of chronic alcoholism. An allied form, alcoholic mania or *mania a potu*, is a violent acute mania, and more often follows temporary excess in drink. In other cases, especially in drinkers of absinthe, which contains oil of wormwood, convulsions resembling those of epilepsy occur. But in general long-continued excess in drinking causes degenerative changes in all of the organs of the body, and therefore the symptoms are legion. William Pepper.

Delisle, de-leel', Guillaume: French geographer; b. in Paris, Feb. 28, 1675. He reformed the system of geography, and published in 1700 a map of the world and celestial and terrestrial globes. He wrote several memoirs on geography, and produced maps of ancient and modern countries. D. Jan. 25, 1726.—His brother, Joseph Nicholas Delisle (b. in Paris, Apr. 4, 1868), founded a school of astronomy at St. Petersburg, and wrote an account of the Russian search for a passage from the South Sea to the north of America. In Delisle s thermometer, used in Russia, the boiling-point of water is zero, and the freezing-point is 150°. D. in Paris Sept. 11, 1768.

Delitzsch, dā'litch: a town of Prussian Saxony; capital of a district, on the river Lober, and on the Magdeburg-Zerbst-Leipzig and the Halle-Suten Railways; 15 miles N. of Leipzig (see map of German Empire, ref. 4–F). It has four churches, a castle, and manufactures of woolen hosiery and gloves. Pop. (1890) 8,949.

Delitzsch, Franz: German theologian; b. in Leipzig Feb. 23, 1813. In 1846 he became Professor of Theology at Rostock, in 1850 at Erlangen, and in 1867 at Leipzig. In addition to numerous devotional and theological works, among which are *The House of God* (1848); *History of Jewish Poetry* (1836); *Biblico-Prophetic Theology* (1845); *Biblical Psychology* (1855); *Christian Apologetics* (1869); *A Day in Capernaum* (1871), he wrote valuable commentaries on Genesis, Isaiah, Psalms, Proverbs, Job, Song of Songs, and Hebrews. He moved steadily from a conservative position to an acceptance of the modern view of the composition of the Hexateuch. He prepared also a translation of the New Testament into Hebrew. He was one of the most esteemed and influential expositors of this century. D. in Leipzig, Mar. 4, 1890. Revised by C. H. Toy.

Delitzsch, Friedrich: son of Franz Delitzsch; b. in Erlangen, Sept. 3, 1850; Professor of Assyriology at Leipzig, and a leader in the younger school of German Assyriologists.

Delius, dā'lēe-oos, Nicolaus: German Shakspeare scholar; b. in Bremen, Sept. 19, 1813; studied at Bonn and Berlin; taught at Berlin; removed to Bonn in 1846, where, after holding other subordinate positions in the university, he was made full professor in 1867. His most important work is his *Shakspeare*, a critical text with explanatory notes, which was first published 1854–61, and has run through several editions. Of his other publications the following may be mentioned: *Maistre Wace's St. Nicolas* (1850); *Der Mythus von Wm. Shakspere* (1851); *Ungedruckte provenzalische Lieder* (1853); *Ueber das englische Theaterwesen zu Shakspere's Zeit* (1853); *Pseudo-Shakspere'sche Dramen* (5 parts, 1854–74); *Abhandlungen zu Shakspere* (1878). D. at Bonn, Nov. 18, 1888. G. L. Kittredge.

Del'la Crus'ca [Ital., of the bran, because the chief object of the organization was the purifying or sifting out of the bran from the language. The emblem of the society was a sieve]: the name of a celebrated academy founded at Florence in 1582 for the purpose of establishing a standard of the Italian tongue. This academy published a dictionary, which became an authority in relation to classical purity of language. The Della Cruscan Academy was afterward incorporated with the Florentine Academy (*q. v.*), but was revived early in the nineteenth century. See Academy.

Della Cruscan School: a group of affected English writers, which came into notice toward the end of the eighteenth century, and flourished for a brief period. A number of English residents at Florence published about 1785 a volume entitled *The Florence Miscellany*, and, finding their verses admired, assumed the name of Della Cruscans (see Della Crusca), and began to contribute to newspapers published in England. Their imitators became numerous in England, but William Gifford (*q. v.*) satirized the Della Cruscans so severely in his *Baviad* (1794) and *Mæviad* (1796) that the school was summarily killed. Among its lights were Mrs. Thrale Piozzi, Robert Merry, Bertie Greathead, and William Parsons.

Dello: a Florentine painter; b. 1372. His name seems to have been *Daniello* (or *Dello*) *Delli*. He first aimed at sculpture, but being obliged to make his living he turned his attention to designing and painting furniture. He continued at this for many years, and painted for John of Medicis all the furniture of one room. Donatello also helped him with his work. His fame spreading, he was called to Spain in the service of the king. He became rich and was knighted, after which he wished to return to his country; but envious people attacked him, and he was not allowed by the Signoria to wear the insignia of his knighthood. So he returned to Spain, where he died in 1421. W. J. S.

Delmar, Alexander: a political economist of Spanish extraction; b. in New York city, Aug. 9, 1836. He was editor of the *Social Science Review* 1864–66; organized the U. S. bureau of statistics, 1866, and was its director 1867–68. He has published, besides other works, *Gold Money and Paper Money* (1862); *Essays on Political Economy*

(1865); the *International Almanac* (1866); *What is Free Trade?* (1868); *Letter on the Finances* (1868); and *History of Money in Ancient Countries* (1884).

Delmonte y Tejada, del-mōn'tā-cĕ-tā-*k*haa'dăă, Antonio: Spanish-American author; b. at Santiago de los Caballeros, Santo Domingo, Sept. 29, 1783. He graduated in law at the University of Santo Domingo. In 1801 he fought against Toussaint Louverture. The increasing disturbances in Santo Domingo forced him to emigrate to Cuba, and he finally fixed his residence in Havana, where he occupied various government positions and practiced law. He wrote *Historia de Santo Domingo*, of which the first volume only was published (Havana, 1853). D. at Havana, Nov. 19, 1861.

Herbert H. Smith.

De Long, George Washington: lieutenant-commander U. S. navy; b. in New York, Aug. 22, 1844. He entered the U. S. Naval Academy in 1861, was graduated in 1865, and served in the Juniata on her trip to Greenland in 1873 in search of the Polaris. From that time it became his great desire to be placed at the head of an expedition of Arctic exploration, a duty for which he was well qualified. In Nov., 1873, he explained his views by letter to Mr. James Gordon Bennett, proprietor of the New York *Herald*, who had already considered the feasibility of such an expedition. The result of various conferences was the purchase, by Mr. Bennett, of the English bark-rigged, steam-yacht Pandora, of 420 tons, owned by Sir Allen Young. By special act of Congress she was allowed to sail under American colors, to take the name of Jeannette, and be navigated by officers of the U. S. navy, with all the rights, privileges, etc., of a Government vessel. The command was given to De Long, who sailed in her from San Francisco July 8, 1879, through Bering Strait in search of the north pole. On June 13, 1881, the Jeannette sunk, crushed by the ice, in lat. 77° 15′ N., lon. 155° 50′ E., and De Long, with a number of the party, perished on the banks of the delta of the Lena, in Siberia, in Oct., 1881. See *The Voyage of the Jeannette*, by Mrs. Emma De Long (Boston, 1884, 2 vols.); also *Our Lost Explorers* (Hartford, 1888).

Delorme, Philibert: architect; b. in Lyons, France, about 1500; one of the best French architects; after studying ancient art in Italy he returned to France in 1536 and did his utmost to revive Roman forms in architecture in lieu of Gothic. He worked for Henry II., being introduced at court by the Cardinal du Bellay. He built a part of the royal château at Fontainebleau, designed the châteaux of Anet and Meudon, and restored many royal houses. Catherine de Medici employed him upon the Tuileries, where he displayed all the resources of his genius in its decorations. He published a work entitled *A New Way of Building Well and with Economy*, in which he suggests the use for roof construction of planks of fir-wood, instead of the usual building-wood, to combine tightness, economy, and solidity. He obtained permission of the queen to try this when he erected at Monceaux a most costly edifice for the *jeu de paume*. The experiment was most successful. D. in 1577.

W. J. S.

Delort, de-lōr', Charles Édouard: genre-painter; b. in Nîmes, France, Jan. 4, 1814. Pupil of Gleyre and Gérôme; second-class medal, Salon, 1882; Legion of Honor 1889. His most important work is *Capture of the Dutch Fleet in 1794* (1882). D. Mar. 10, 1895. W. A. C.

De'los (in Gr. Δῆλος), also called **Orty'gia**: a small island in the Ægean Sea, belonging to the group of Cyclades; was celebrated in ancient times as the birthplace of Apollo and Diana. According to tradition, it was originally a floating island, and was rendered immovable by Jupiter, in order that it might be a place of refuge for Latona. It was the site of a famous temple and oracle of Apollo, and was the center of a great periodical festival in honor of him. In 426 B. C. Delos was purified by the Athenians, who removed all the tombs, and enacted a law to prevent it from being polluted by births or deaths. It was reputed one of the holiest places in Hellas. On the formation of the confederacy in 477 B. C., for the purpose of resisting the Persian invaders, Delos was chosen as the common treasury of the Greek allies. After the fall of Corinth (146 B. C.), Delos, which had a good harbor, was the center of an extensive commerce. Here was a town of the same name, which is now a mass of ruins. Shiploads of columns and other remains have been carried away to Venice and Constantinople. The island has an area of 32 sq. miles, consisting for the most part of barren rocks culminating in Mt. Cynthus, and is not inhabited.

Del'phi (in Gr. Δελφοί): an ancient town of Phocis, and one of the most celebrated places in the Hellenic world, on account of its oracle of Apollo. It was situated at the southern base of Mt. Parnassus, in the narrow vale of the Pleistus, amid sublime and beautiful scenery. It occupied the central area of a great natural theater or semicircular recess, partly inclosed by stupendous rocky barriers. The original or proper name of the oracle was *Pytho*. The name Delphi does not occur in the poems of Homer, who mentions that Agamemnon consulted the oracle at Pytho. The Pythian games were celebrated here every four years, the first celebration occurring in 586 B. C. Delphi became an opulent city and independent state, deriving its riches and importance from its oracle, which was the most famous of all the oracles. In the eighth century B. C. its reputation extended not only throughout Hellas, but also among foreign nations. Crœsus, King of Lydia, gave rich presents to the Pythian Apollo. The oracles were uttered by a female called Pythia, who sat on a tripod placed over the mouth of a cavern. She is said to have breathed an intoxicating exhalation of vapor which issued from this cavern or chasm and was supposed to inspire her with the gift of prophecy. The fountain of Castalia, issuing near the base of Parnassus, supplied holy water for the temple of Apollo, which was one of the largest and most beautiful in Greece, and had a front of Parian marble. In 480 B. C. Xerxes sent a detachment of his army to plunder this temple, which contained a large amount of treasure. As the Persians were climbing up the rugged path to the shrine, on a sudden thunder was heard to roll, the war-shout sounded from the temple of Athena, and two huge crags rolled down the mountain, crushing many to death. The surviving Persians were seized with a panic, and retreated without having effected their object. In 357 B. C. the Phocians seized the temple, and thus provoked the Sacred war, during which a portion of the treasures was expended in paying the troops of Phocis. Delphi was attacked in 279 B. C. by Brennus and an army of Gauls, who, it is said, were repulsed by the same supernatural agency as the Persians. The Delphic oracle was finally silenced by the Emperor Theodosius. The site of Delphi is occupied by the modern town of Castri or Kastri.

Delphi: city and railway junction; capital of Carroll co., Ind. (for location of county, see map of Indiana, ref. 4–D); on Wabash river and the Wabash and Eric Canal; has a fine court-house, paper-mills, planing-mills, extensive lime interests, and excellent water-power. Pop. (1880) 2,040; (1890) 1,923; (1900) 2,135. Editor of "Journal."

Del'phin Classics: an edition of the principal Latin classics for the use of the Dauphin of France, son of Louis XIV. (*in usum delphini*), at the suggestion of his tutor, the Duke de Montausier, and under superintendence of Bossuet and Huet, preceptors to the dauphin. The series comprised ultimately forty authors or titles. See Hallam, *Introduction to the History of Europe*, vol. iii., p. 247; Baillet, *Jugements de Savans*, vol. ii., p. 278.

Delphin'idæ [from Lat. *Delphinus*, a dolphin, the typical genus]: a family of toothed whales, having for its principal characters numerous teeth usually present in both jaws, a short symphysis to the mandible, no distinct lachrymals, bony sternal ribs, and a central, transverse, crescent-shaped blow-hole, with the concavity forward. This family contains the greater part of the cetaceans, both in species and individuals. They range in size from the grampus, or killer (*Orca gladiator*), to the porpoise, or puffing-pig (*Phocæna communis*). A few occur in fresh water, but the great majority are marine and inhabitants of the waters of the globe, except the very coldest. See Beluga, Blackfish, Dolphin, Grampus, Narwhal, and Porpoise. F. A. Lucas.

Delphin'ium [from Lat. *delphi'nus*, dolphin; so called from the resemblance of the nectary to the form of the dolphin]: a genus of poisonous herbs of the natural order *Ranunculaceæ*, commonly called larkspurs. The seeds of *Delphinium staphisagria* and *Delphinium consolida* have powerful cathartic properties, and the alkaloid (*delphinia*) is recommended for paralysis and rheumatism. Both the annual and perennial kinds are favorite garden flowers; the double rocket larkspurs are especially rich and varied in color, and resemble hyacinths in their regular clusters. The genus *Delphinium* is closely allied to the aco-

nites. Several species are natives of Europe, the U. S., and Mexico.

Delphi'nus [Lat., a dolphin]: a small but striking constellation visible in the south in September. Four of its stars form a lozenge commonly called Job's coffin.

Delphos: city and railway junction; Allen and Van Wert cos., O. (for location of counties, see map of Ohio, ref. 3–C); on the Miami Extension Canal, 45 miles E. of Fort Wayne. It has good water-power. Pop. (1880) 3,814; (1890) 4,516; (1900) 4,517.

Delpit, Albert: French author; b. in New Orleans, La., Jan. 30, 1849; educated at the College of St. Barbe, and at the Lycée of Bordeaux. In Jan., 1870, he received a prize for an *Éloge de Lamartine*. He served with distinction in the war with Prussia, and received the cross of the Legion of Honor Aug. 5, 1871. His first volume of verse, *l'Invasion* (1872), and a poem entitled *Le Repentir, ou Récit d'un curé de campagne* (1873), won Montyon prizes, and in 1880 the Academy awarded him the Vitet prize. He wrote many novels, e. g. *Les Compagnons du Roi*; *La Vengeresse*; *Jean Nu-Pieds*; *Le Mystère du Bas-Meudon*; *Les Fils de joie*; *Le Dernier Gentilhomme*; *La Famille Cavilié*; *Théresine*; *Disparu*, etc. A collection of his poems in the *Revue de Deux-Mondes* was published under the title *Les Dieux qu'on brise*. D. in Paris, Jan. 4, 1893. Benjamin B. Holmes.

Del Rio: town; capital of Val Verde co., Tex. (for location of county, see map of Texas, ref. 5–E); situated on So. Pac. R. R., 2 miles from Rio Grande river; has a public school, ice-factory, cotton-gins, water-works, electric lights, and graded streets. The town is the center of a system of irrigated farms, the water for which is supplied by a series of springs 2 miles from the town. There are here a medicinal well, and large unworked deposits of mineral paint. Pop. (1880) 50; (1890) 1,980; not returned separately in 1900.

Editor of "Record."

Delsarte, del'saart', François Alexandre Nicolas Chéri: musician and investigator; b. at Solesmes, France, Dec. 19, 1811. He was the son of a physician, but was early orphaned, and became a rag-picker in Paris; at the age of twelve he devised an original method of musical notation which attracted the attention of the musician Bambini, who adopted and educated him; he was admitted to the Conservatoire when fourteen, but owing to pernicious training his voice failed; forced to abandon the lyric stage, he became a teacher and an investigator. For about forty years he studied all phases of human nature and its expression, seeking a natural and scientific basis for all art, especially for oratorical, musical, and dramatic expression. Leading artists, orators, and philosophers sought his instruction. The King of Hanover conferred upon him the Hanoverian medal of arts and sciences, also the cross of a chevalier of the Guelph order. Fearing "unripe publicity," he would not permit the results of his researches to be published; the only records of his work are charts of his formulations and fragmentary writings. Although his philosophy lives mainly in tradition, it has become the acknowledged basis of the highest art-criticism and culture. D. in Paris, July 19, 1871. Emily M. Bishop.

Delsarte System: an analytical, educational, æsthetic study of man and of art based upon François Delsarte's statement: "There is in the world a universal formula, namely, the trinity, that may be applied to all sciences and to all things possible." Man has sensation, mind, and soul, or, a vital, mental, and an emotional nature, each distinct but not separable from the other two. Tones express the vital nature, words the mental, gestures the emotional; the trinity formula is again applied to each. The body whose activity manifests the passions, thoughts, emotions, consists of three great members that correspond with the inner spiritual essence. The limbs are the primary vital agent, the head the mental, the torso the emotional. Each agent is divided and subdivided into three: thus in the torso the abdominal zone is vital in expression, the lung zone mental, the heart zone emotional.

The Formula applied to Motion.—All movements from the center (the body) are eccentric or vital, all toward the center concentric or mental, all around the center centered or normal. The laws of opposition, succession, rhythm, altitude, force, direction, velocity, reaction are the principal ones governing bodily motion and expression.

In the U. S. this system has been popularized and developed into a broad culture, artistic and utilitarian. It has had influence on the plastic, graphic, decorative, literary, and histrionic arts, and been made practical by the application of its fundamental principles to health. Delsarte taught the philosophy of expression, and illustrated by facial and pantomimic series; from his teachings have been developed series of psychophysical exercises governed by the law of correspondence: "Every outward manifestation is the expression of an inner state." They consist of (1) relaxing movements for removing over-nervation and conserving vital energy; (2) energizing movements for directing the nerve-force; (3) æsthetic movements for harmonizing all of man's threefold powers—thus producing health, harmonious development, natural expression.

Emily M. Bishop.

Delta: the name originally applied to the triangular alluvial plain in the mouth of the Nile, from its resemblance to the Greek letter Δ (delta). (See Egypt, *Ancient*.) The name is now applied to any deposit of land-waste laid down by a river or stream at its mouth in a sea or lake. Deltas are stony when rapid streams descend from steep mountains into quiet waters; but the greater deltas of the world are formed by large rivers of gentle slope, whose detritus consists almost entirely of fine silt. Near their mouths such rivers give out distributary streams, diverging on either side, and thus spreading their silt over a deltoid area. On the delta of the Mississippi, such distributaries are called bayous. Deltas are generally very fertile, but their slow drainage and marshy surface often render them malarial, and their occupation is difficult from danger of flooding by overflow of the rivers or by invasion of high storm tides from the sea. The greater deltas of the world are those of the Mississippi, Mackenzie, Nile, Po, Ganges and Brahmaputra, and Hwang-ho. Deltas are wanting in rivers whose lower course has recently been submerged by depression of the land. See Estuary.

Fan deltas are gently sloping alluvial deposits formed where steep streams run from mountain gorges out upon more open valleys or lowlands, as along the foot of the mountains that inclose the desert plain of Great Salt Lake. When a steep side-stream joins a larger river of gentle slope, a fan delta may push the river against the opposite side of its valley, as on the Rhône above Lake Geneva; or occasionally even obstruct the river and form a lake, as in Lake Pepin on the upper Mississippi above the entrance of the Chippewa. Similar fan deltas are rapidly formed in the lower valleys when the upper mountain slopes are deforested, thus throwing much land waste into the streams, as in Savoy. They attain great size in arid regions, as in Southern California. See Rivers, Floods, and Plain.

W. M. Davis.

Delta: a territory of Venezuela; occupying the delta of the Orinoco river and extending southward along the coast to the boundary of English Guiana, claimed by Venezuela to be the Essequibo river. The western boundary N. of the Orinoco is the Cano Vagre or Manomo outlet of that river. S. of this river the western boundary is the Sierra Imataca, about 80 miles inland. England claims the most of the southern portion; area claimed by Venezuela, 25,347 sq. miles. The land is alluvial, generally heavily wooded, subject to overflow and malarial. Population almost exclusively Indian, whose dwellings are often in trees. Capital, Tucupita on the Manomo. M. W. H.

Delue, de-lük', Jean André, F. R. S: a Swiss geologist and natural philosopher; b. in Geneva, Feb. 8, 1727. He invented a portable barometer, and published in 1772 *Researches on the Modifications of the Atmosphere*. In 1773 he removed to England; was chosen a fellow of the Royal Society, and became reader to the queen. He published in 1778 *Letters, Physical and Moral, on the History of the Earth and Man*, in which he defended the cosmogony of the Bible, and ascribed the formation of the present continents to a great and violent revolution which occurred about 4,500 years ago. He wrote several other works in French. He became a professor in Göttingen in 1798, but subsequently returned to England, and died at Windsor, Nov. 7, 1817.

Deluge [O. Fr. *deluge*: Ital. *diluvio* < Lat. *diluvium*, flood; *di-*, apart + *lu'ere*, wash]: an inundation or overflow of land by water, a term especially applied to the flood in the time of Noah, an account of which is given in Genesis vi., vii., and viii. It is often estimated to have occurred B. C. 2516, but its date may have been much earlier. The Jewish narrative seems to have been drawn from a double

source—an Elohistic document extending the duration of the Flood to a whole solar year, and alluding to the legal distinction between clean and unclean, and a Jehovistic—but both sources agree in ascribing the Flood to the depravity of mankind, in the description of the rescue of Noah, and in the promise that a deluge shall never again take place. Traditions of the Flood occur in many countries. Among the more important of these is the Chaldæan account preserved in a fragment of Berosus, and somewhat resembling that given in the Bible. In many of its details it completely coincides with the biblical narrative; thus in the triple letting out of the birds. Otherwise it seems founded on cuneiform sources. Mr. George Smith published (1872), from the cuneiform inscriptions, a very remarkable account of the Flood, corresponding in many particulars with those of Moses and Berosus. It was found in the library of King Asshurbanipal, and dates from about 660 B. C. Sisit (Hasisadra), an old Chaldæan king, takes the place of the Xisuthros of Berosus and the Noah of Genesis. He describes the godlessness of the world, the divine command to build an ark, the coming of the Flood, etc. Bunsen states that no trace of Noah's deluge is found in the Chinese traditions, but missionaries, both Protestant and Roman Catholic, assert that the Chinese have a story remarkably like that contained in the Bible. The Mahâbhârata of the Hindus contains still another tradition of the same event. The ancient Mexicans and many other tribes of American Indians have similar accounts. The same is true of the ancient Phœnicians, Greeks, and many other nations, ancient and modern. The Egyptian monuments appear to have no account of a general flood.

It is now generally held by Christian scholars that the flood recorded in the Bible was local, and not universal. The language of the original account does not necessarily imply more than this.

Delusion: See INSANITY.

De Lutherbourg, PHILIP JAMES: French landscape painter; b. in Strassburg about 1735; d. in London, 1812. He was a pupil of Casanova; elected to the French Academy; removed to London 1771, where he painted decorations for the opera-house, becoming celebrated for mechanical constructions. He excelled in landscapes, battle-pieces, and sea views; he etched his own designs. C. H. T.

Delyannis, THÉODORE: Greek statesman; b. at Kalavryta in 1826; Minister for Foreign Affairs, 1863; associated with the so-called Economical ministry, 1877; represented Greece at the Berlin Congress and was Premier 1885–86, and again in 1890, on the downfall of the Tricoupis ministry; but on Mar. 1, 1892, was overthrown by Tricoupis, chiefly on account of his alleged incompetence in managing the finances. He was again Premier from Apr., 1895, to Apr., 1897.

Dema'des (in Gr. Δημάδης): an Athenian orator and demagogue, who was a violent opponent of Demosthenes. He was witty, eloquent, and profligate, and acquired great political influence. He fought against Philip of Macedon at Chæronea, 338 B. C., but afterward took a bribe from that king, and favored the interest of Philip and his son Alexander. He was put to death by order of Antipater (or Cassander) in 318 B. C.

Demand and Supply: See POLITICAL ECONOMY.

Demantoid: See GARNET.

Demarcation, or **Demarkation**: a line or boundary by which one object is separated or marked off from another; a limit ascertained and marked, or the act of ascertaining and marking a limit; the "dead line" between two armies. The "line of demarkation" is a name given especially to an imaginary north and south line drawn by Pope Alexander VI., 360 miles W. of the Azores, all newly discovered lands to the eastward being granted by him to Portugal and all westward to Spain (1494).

Demarest, DAVID D., D. D.: a minister of the Reformed (Dutch) Church; b. in Oradell, Bergen co., N. J., July 30, 1819. He was a graduate of Rutgers College (1837) and the New Brunswick Theological Seminary (1840). After pastorates in Reformed churches in Flatbush, N. Y., New Brunswick, N. J., and Hudson, N. Y., he became, in 1865, Professor of Pastoral Theology and Sacred Rhetoric in the New Brunswick Seminary, holding in connection with this other positions of trust and usefulness. D. June 21, 1898. He published *The Reformed Church in America* (New York, 1856; 4th ed. 1889); *The Liturgical Spirit and Features of the Reformed Church in America*, in *Centennial Discourses* (1876); *History of the Theological Seminary at New Brunswick* (in the centennial vol. of 1884); *The Huguenots on the Hackensack* (1886). WILLIS J. BEECHER.

Demarest, JOHN TERHUNE, D. D.: a minister of the Reformed (Dutch) Church; b. at Teaneck, N. J., Feb. 20, 1813; graduated at Rutgers College (1834) and New Brunswick Theological Seminary (1837). For more than twenty-five years he was pastor at New Prospect, N. J., and he has been emeritus pastor from 1885. During an interval in this pastorate, 1850–67, he was pastor at Minisink, principal of Harrisburg Academy, and pastor at Pascack. He has published *Exposition of the Efficient Cause of Regeneration* (New Brunswick, 1842); *Exposition of 1 Peter* (New York, 1851); *Commentary on 2 Peter* (1862); *Christocracy*, jointly with Dr. W. R. Gordon (1867; 2d ed. 1878); *Commentary on the Catholic Epistles* (1879).

WILLIS J. BEECHER.

Demavend': the highest mountain of Persia, about 45 miles N. E. of Teherân; is the culmination of the Elburz chain, which separates the low shores of the Caspian Sea from the high table-land of Persia. It has a conical form and a crater-shaped summit, and consists of eruptive rocks and ashes. Its height is 18,600 feet, as determined by a Russian Caspian survey. An Englishman (William T. Thompson) ascended to the top of Demavend in 1837. As it is a conspicuous object from the great trade-route between India and Western Asia, it is connected with the early Persian legends much as Etna is with those of the Greeks. Columns of smoke frequently ascend from its fissures.

Dem'bea, Tzana, or **Tana**: a lake of Abyssinia; in lat. 12° N. and lon. 37° 15′ E.; 40 miles long, and has an average width of 25 miles. It occupies part of a fertile plain, and is 6,108 feet above the level of the sea. The Blue Nile issues from this lake.

Deme, or **De'mos** [Gr. δῆμος, people]: one of the smaller divisions of the ancient Attic tribes. When Clisthenes broke up the four old Attic tribes into ten new ones, Herodotus states that he subdivided these into 100 demes, but as there is no other authority for such statement, and the number of demes was actually 173 or 174, different explanations have been attempted of the passage in Herodotus. The demes were local divisions, in the registers of which the citizens had to enroll their names for political and other purposes. These demes were named sometimes after places, sometimes after persons, and those of the same tribe were not always adjacent, but might be in quite different parts of Attica. They had each its own presiding officer (δήμαρχος), treasurer, and other officers, and its own assembly, in which the business of the deme was transacted. Lists of the names of the demes under their proper tribes are given by K. F. Hermann, *Griech. Alterth.*, Anhang iv.; by Leake, in his *Demes of Attica*; and by Müller, *Hist. Græc. Fragm.*, vol. ii., pp. 357–359.

Demen'tia [Lat. deriv. of *de'mens*, demented; *de*, off + *mens*, mind]: a form of insanity characterized by gradual extinction of all the mental powers. It is one of the most hopeless forms of mental disease. See INSANITY.

Demera'ra: river of British Guiana, rising in the Macarí Mountains and flowing northward to the Caribbean Sea; length about 350 miles. The lower portion is navigable for about 75 miles for large vessels, and above that small vessels ascend some distance farther to the Kaicoutshi rapids. This part of the river was originally lined with forest, but much of it is now under cultivation. The upper river flows through open lands, and is much obstructed. The Demerara has given its name to the most populous county of Guiana, and the term is applied loosely to the whole colony, and in particular to the capital, GEORGETOWN (*q. v.*). HERBERT H. SMITH.

Demesne, dĕe-meen′, or **Demain**: in law, originally that portion of the lands belonging to a lord which was held in his own occupation or reserved for his immediate use. Hence it is sometimes used to denote those parts of a manor which the lord has in his own hands. Copyhold estates are also considered demesnes, because the tenants are held to retain them only at the will of the lord. See DOMAIN.

Deme'ter: See CERES.

Deme'trius (Russian, *Dmitri*): Czar of Russia, usually called the FALSE DEMETRIUS. He pretended to be a son of Ivan IV., who at his death in 1584 left two sons, Feodor and Demetrius. The latter died probably in 1591. The False

Demetrius raised an army of Poles in 1603, invaded Russia, and defeated Boris in battle. He began to reign in Moscow in 1605, but his partiality to the Poles offended the Russians, who revolted and killed him May 28, 1606. He was succeeded by Basil III., or Shuisky. See also DEMETRIUS THE FALSE.

Deme'trius Phale'reus: Grecian orator and philosopher; b. at Phalerum in Attica about 345 B. C. He was a disciple of Theophrastus the philosopher. He was appointed governor of Athens by Cassander in 317 B. C., and held that office ten years. His administration was so prosperous and popular that the Athenians erected to him, it is said, 360 statues. He escaped to Egypt when Athens was taken by Demetrius Poliorcetes in the year 306. He was the author of many historical and philosophical works, which, with the exception of fragments, are not extant. D. in Egypt about 284 B. C. A rhetorical treatise *On Style* (*περὶ ἑρμηνείας*), which bears the name of Demetrius Phalereus, belongs in all probability to the first century B. C. It is to be found in Walz, *Rhetores Græci*, vol. ix., pp. 1–126, and Spengel, *Rhetores Græci*, vol. iii., pp. 259–328.

Revised by B. L. GILDERSLEEVE.

Demetrius Poliorce'tes (in Gr. *Δημήτριος Πολιορκητής*, i. e. Demetrius the besieger of cities): King of Macedon; b. about 338 B. C.; a son of Antigonus, King of Asia. He was surnamed Polioreetes, besieger of cities, on account of his success as a general. He fought for his father against Ptolemy of Egypt in Syria. In 306 B. C. he captured Athens from Cassander, and defeated Ptolemy in a naval battle near Cyprus. His remarkable successes caused him to be treated by the Athenians with disgraceful servility, even to the extent of raising altars to him as a god, and, it is said, of allowing him to dwell in the Parthenon as the guest of Minerva. He gave proof of superior military skill in a long siege of Rhodes, but he failed to take that city. After the death of Antigonus, and his own defeat at the battle of Ipsus in Phrygia (301 B. C.), he lost his possessions in Greece, but subsequently, on forming an alliance with Seleucus, regained them in part. He usurped the throne of Macedon in 294, but was driven out by Pyrrhus and Lysimachus, and finally was forced to surrender to his former ally, Seleueus, by whom he was held a prisoner till his death, about 286 B. C. See Plutarch, *Life of Demetrius*.

Demetrius of Su'nium: Cynic philosopher, who enjoyed a high reputation for correctness of life and firmness of principle. He lived at Rome under the emperors from Caligula to Domitian, and was the friend of Thraseas Pætus and of Seneca. Living with the greatest strictness himself, he did not hesitate to censure even those in high position, for which freedom of speech he was banished. He is probably the same philosopher as the Demetrius of Corinth mentioned by Philostratus, according to Ritter, who gives a summary of his doctrines in his *History of Philosophy*, vol. iv., p. 168, Eng. trans. He left no writings.

HENRY DRISLER.

Deme'trius So'ter (in Gr. *Δημήτριος Σωτήρ*, i. e. Demetrius the preserver; so called by the Babylonians because he freed them from their tyrants): King of Syria; b. about 185 B. C.; a son of Seleucus Philopator. He was a hostage at Rome when his father died in 175 B. C., and his uncle, Antiochus Epiphanes, obtained the throne. Having escaped from Rome in 161 he was proclaimed king by the Syrians. He waged war against the Maccabees. Syria was invaded by Alexander Balas, by whose army Demetrius was defeated and killed in 150 B. C. His son, Demetrius Nicator, eventually became King of Syria.

Demetrius the False: pretender to the throne of Russia; began to urge his claim in 1607. He affirmed that he was Demetrius, the son of Ivan IV., and was supported by many partisans. He was killed by a Tartar chief in 1610. For the first pretender, see DEMETRIUS.

Deme'trius Triclin'ius: Greek scholiast of the fifteenth century. He is known for a recension of the text of Sophocles which long served as a basis of subsequent revisions. He also composed scholia on Sophocles, first published by Turnebus in his edition, and two other works on the same poet, the one on the meters (*περὶ μέτρων*), the other on the figures (*περὶ σχημάτων*), which, however, are of no great value. He compiled scholia also on Hesiod, Pindar, and Aristophanes.

HENRY DRISLER.

Deme'trius Ze'nus: a writer of Zacynthus, who, about 1530 A. D., translated the *Batrachomyomachia* into modern Greek in the so-called *στίχοι πολιτικοί* (popular verses). This is printed in Ilgen's edition of the *Homeric Hymns*, pp. 123–139, with a Latin translation by M. Crusius. The best edition is that of Müllach, Berlin, 1837. He composed a poem in the same measure on Alexander the Great, printed at Venice, 1829.

Demidoff: a Russian noble family, distinguished for the possession of great wealth, and the devotion of it to works of practical benevolence. The founder of the family was NIKITA, b. 1665, who established the first iron-foundry in Siberia, and was ennobled by Peter the Great in 1720. NICOLAI, who fought against the Turks in 1789, raised and fitted out a regiment at his own expense when Napoleon invaded Russia, 1812, and became a count and a privy councilor; added rich gold and silver mines to the family estate. His son, ANATOLI, author and patron of learning, b. 1812, married the daughter of Jerome Bonaparte; wrote, in conjunction with several French authors and artists who accompanied him on his travels, *Voyage dans la Russie méridionale et la Crimée, par la Hongrie, Valachie et Moldavie* (4 vols., Paris, 1839–41). D. in Paris, 1870. F. M. COLBY.

Demi-gods (literally, half-gods): fabulous heroes of the Greek and Roman mythologies. They were sometimes deified heroes, and sometimes the offspring of a divinity and a mortal.

De Mille, JAMES: Canadian author; b. at St. John, N. B., in Aug., 1837, and graduated at Brown University in 1854. He was Professor of Classics at Acadia College 1860–65, and of History and Rhetoric at Dalhousie College 1865–80. Among his works are *Helene's Household* (New York, 1858); *Andy O'Hara* (1860); *The Soldier and the Spy* (1865); *The American Baron* (1870); *An Open Question* (1872); *The Living Link* (1874); *Treatise on Rhetoric* (1878). D. at Halifax, N. S., in 1880.

NEIL MACDONALD.

Demi-lune [Fr. *demi*, half (< Lat. *dimi'dius*) + *lune*, moon < Lat. *luna*; so called because it is somewhat crescent-shaped]: in fortification, an outwork constructed to cover the curtain and the shoulders of the bastions. It is composed of two faces and two flanks, the former being inclined at a salient angle toward the outside.

Deming: town and railway center (founded in 1881); Grant co., New Mexico (for location of county, see map of New Mexico, ref. 14–Q); has four churches, fine public schools, an extensive factory for the reduction of canaigre, or tannin plant, which is indigenous and abundant on the surrounding plain, and sampling-works. Deming is the center of a leading silver-producing region, and is surrounded by an immense cattle-range. Pop. (1890) 1,183; (1900) 1,341.

EDITOR OF "HEADLIGHT."

Demiur'gus, or **Dem'iurge** [Gr. *δημιουργός*, handicraftsman, artisan; a term applied in the Platonic philosophy to the Creator; *δήμιος*, public, pertaining to the people (*δῆμος*) + *ἔργον*, work]: a word originally applied to an artisan or workman; afterward used by Plato, and especially by the Neo-Platonists and the Gnostics, to designate the Creator of the world, who was conceived by the Gnostics to be inferior to the Supreme Deity. In their fantastic elaboration of the doctrine of emanation the demiurge generally denotes the principle which, by entering chaos, produced the world. The name was also given to the highest magistrates in some of the Grecian cities.

Demmin, dem-meen': a town of Prussia; in Pomerania; on the river Peene; about 75 miles W. N. W. of Stettin (see map of German Empire, ref. 2–G). It is very old and was formerly fortified, but its fortifications have been demolished. It has manufactures of machinery, bells, ironware, bricks, lime, hats, woolen and linen fabrics, hosiery, etc. Pop. (1890) 10,852.

Democe'des (in Gr. *Δημοκήδης*): Greek physician of Crotona; b. about 550 B. C. He was taken prisoner by the Persians, and carried to the court of Darius I., to whom he gave medical advice. The Queen Atossa, whose favor Democedes had gained, persuaded Darius to send him to Greece with a small party of Persians on a secret mission. Democedes escaped from them and returned to Crotona.

Democh'ares (in Gr. *Δημοχάρης*): Athenian orator; a nephew of Demosthenes; a leader of the anti-Macedonian party. He was banished about 295 B. C., but returned in 287 or 286, after which he rendered important service as minister of finance. D. after 280 B. C.

Dem'ocles (in Gr. Δημοκλῆς): Attic orator trained in the school of Theophrastus; a contemporary and opponent of DEMOCHARES (*q. v.*). He is believed to have left written orations, since Dionysius of Halicarnassus attributes to him an oration previously ascribed to Dinarchus. Dionysius and Suidas call him Democlides.

Democracy [Gr. δημοκρατία; δῆμος, people + κράτος, power]: government by the people; a state in which the people at large possess the whole sovereignty. There are but three clearly distinguishable methods of government—the monarchical, the aristocratic, and the democratic; that is to say, the rule of one, of a number, or of the whole. The prefixes despotic, hereditary, and elective merely describe varieties of the first; an oligarchy is only a particular kind of the second; and such terms as republic and commonwealth import little that is distinctive as to political structure. Of sovereignty in other forms there has been ample experience, but governments based exclusively upon the democratic principle, without any admixture of other elements, have not been known until a recent period on any considerable scale. But see Thomas Erskine May's *Democracy in Europe.*

Essential Principles of Democracy.—A pure or simple democracy deciding questions of policy by direct vote is perhaps competent to the exercise of supreme power in an independent state of slight extent; opinions concur in denouncing it as impracticable in a large one. The representative form may therefore be regarded as the only practicable method of administering government on the democratic principle. Consistently with it political power may be denied to some members of the state, who are nevertheless entitled to protection and such privileges as are suitable to their condition. Age, sex, or ascertained unfitness may form grounds of exclusion; so in respect to a distinct race very inferior in numbers, as, for instance, the whites of Haiti. The right to exclude criminals after their guilt has been ascertained is indispensable to the preservation of social order—and, practically, it may be aimed against a class, as in the known instance of certain polygamists—but it should never operate otherwise than upon the offending individual as a consequence of his personal delinquency. Even in this case pernicious opinions can not properly be held to impair the citizen-right, though foreigners known to entertain them may be denied naturalization or hospitality in any form. With this qualification it may be broadly asserted that democracy, as a principle, entitles each citizen, in common with every other, to an equal interest in the state. A government based upon it can acknowledge no conflicting interests among the people to be favored or opposed. All its legitimate ends are accomplished when public safety and individual liberty are maintained. Where the voice of the people is actually sovereign this must ever be the fact, for it is an irresistible deduction of reason that the supreme will never can intentionally enact a law which is not required, or, in other words, lay upon its own freedom any needless restraint. Hence the axiom that in a democracy every positive regulation, not actually indispensable to the public and general welfare, which restrains or even indirectly tends to restrain, individual liberty in any degree, however slight, so far violates the spirit of the constitution.

Democracy and Privileged Classes.—The existence of classes is the very essence of monarchy. Their interests are necessarily adverse—a circumstance enforcing upon the rulers a general activity in support of their pre-eminence. In states actually or approximately despotic standing armies and frequent wars are the forces for this purpose; where a nominal place is assigned to the democratic principle permanent political parties might serve in lieu of the soldier to uphold the political machinery, but in general they only supplement him. Thus in great monarchies the so-styled common people have always been oppressed by enormous establishments, military or naval, or both. These are easily justified to unreflecting observers on the score of necessity, for, aggressive wars by monarchs in furtherance of ambitious designs being of constant recurrence, armed organization for defense seems a requisite. War, with its inherent rapine and cruelty, is not, indeed, due to the crimes of any one monarch; but the fact remains patent that it is an evil founded in the principle of monarchy, and inseparable from it. The active and enterprising spirits of every clime and age have found seductive occupation in these war-establishments, and through their agency large portions of society have always been withdrawn from useful employments to feed upon the labor of the rest. (Compare Herbert Spencer's *Political Institutions*, chapters xvii., xviii., on the Militant and Industrial Types of Society.) The annals of government are consequently little else than a recital of the devices by which from the beginning every civil society has been preyed upon by its own official corps. This is easily effected wherever monarchy or aristocracy prevails. Democracy, being based upon absolute equality, admits of no governing class, nor of any interest adverse to the people in those who conduct the public business. But by artifice and irregular methods the latter may become a class, may grasp powers incompatible with the nature of the government, and may involve their country in all the evils incident to hereditary rule. Persecution for moral nonconformity may be from time to time practiced until resistance is provoked and a color afforded for war. To this condition the grandly patriotic spirit engendered by free institutions gives great force and breadth; the entire people at once rush to arms, and public debt is incurred at a pace twentyfold more rapid than would be tolerated under the cautiously regulated corruption of monarchies. These are abuses, and are deviations from the democratic principle.

Democracy in the U. S.—The founders of the U. S. recognized not only the ineptitude of monarchy and aristocracy, but the necessity of repressing in the newly conceived system their most conspicuous abuses. Standing armies were denounced as dangerous to liberty; wars for the extension of territory were regarded as unjust, foreign alliances as inexpedient, and public debt as mischievous; but, strangely enough, no barriers whatever were instituted against any of these practices. On the contrary, powers to introduce and foster the most dangerous of them were expressly delegated, in the name of the people, to their public agents. The natural ill-effects were foreseen; but they were deemed susceptible of being kept within endurable bounds. Monarchy and aristocracy were indeed effectually repudiated for the time. Neither could long exist without hereditary distinctions, nor could these be upheld where commerce in land was free, and inheritances were equally partible by compulsion or from social habit; so primogeniture and the accustomed contrivances for rendering estates permanently inalienable were extirpated. But the founders of the American Union invested the national government with most of the powers by which the few had oppressed the many in all previous times. The State governments were framed in the same way. The powers of government in common use, originally designed by the officeholding aristocracy to create or uphold their own interests against the governed mass, were all sanctioned. Under the vicious and unjust systems previously existing they were no doubt indispensable; they were therefore assumed to be necessary, even in a representative democracy. As the checks and balances of the mixed system existing in England had developed the best administration then known, it was thought that, monarchy and all hereditary distinctions being excluded, complexity would afford adequate preventives of official malversation. The same example induced a reliance upon the free action of political parties as a motive-power to keep the official counterchecks in healthy action. Obvious distinctions between the old and the new governments seem to have been overlooked. In the former permanently antagonistic interests were legalized, and so commingled in the political constitution as to induce and necessitate continual conflict as a duty. Each of the three estates was there obliged to maintain a constant contention with the others, in order to protect its own peculiar and rightful privileges; while in the U. S. there were to be no classes, no separate estates, and no peculiar privileges. Everything was reduced to the dead level of absolute equality; there was nothing fundamental that needed a check or required to be balanced. Oppression by a permanently privileged class had heretofore been the grievance of nations. Such a contradiction in terms, and apparently in fact, as oppression of the people by themselves was not anticipated; to their virtue and intelligence it was therefore committed to carry the experiment to its full fruition, with an admonitory warning that perpetual vigilance was the price of liberty. The extent to which popular vigilance could be kept in beneficial action was then a problem; in some respects it is still so.

The Tendency of Political Parties.—In a great and prosperous state the private interests of business or pleasure afford engrossing employments. Minds fully occupied with such subjects can not be at the same time employed on large conceptions of governmental policy and in devising plans for their execution. The wealthy are regardless of govern-

mental action, unless led to seek aid for their private enterprises through official favoritism. The necessary preoccupation of the citizens in their private affairs, not lack of judgment or intelligence, is the great impediment to wise and just administration in representative democracies. There is much injustice on both sides in the mutual criminations which disfigured the early debates of parties in the U. S. on this topic. It was never a fact that one party distrusted the popular judgment, or that the other relied upon it. All the leaders well knew that, as the political system was arranged, the people could never act directly on public affairs, and those leaders failed to devise an effectual method of securing in permanence the choice of desirable legislators. It is a delusion to suppose that in a representative democracy popular attention can be kept riveted on public affairs by the contentions of party. In mixed governments this may be possible. There antagonistical parties are supposed to be founded on conflicting ideas or principles expressed in intelligible maxims, and the original faith of each party, together with the social and political condition in which it originated, is consequently perpetuated in the same lines from generation to generation. It may thus acquire a fixed place in the mind and heart, and may become an active moral sentiment. In a representative democracy there is no legitimate basis for just and honorable antagonisms of this permanent character. As in the nature of things was inevitable, the so-called political parties have ever since been gradually losing their hold upon distinctive opinions, and tending to a unity of views and purposes in which principles have little part. With such a unity parties can be nothing more than bands of rival leaders, keeping on foot, and employed as their respective forces, bodies of traders in the business or occupation of manipulating the masses, the ballots, or the returns. A government carried on by such agencies must at last attain a worse perfection than any which could exist under monarchical forms. According to these the king and his nobles, as ruling officers, have a permanent interest in the state descendible to their heirs. For the protection of that inheritance and for the benefit of their posterity they will take some care of the state. In a representative democracy the officeholders of the hour are the rulers of the hour; their term is brief, and if corrupt they will, like the similarly situated pashas of Turkey, make haste to grow rich, for their positions are soon to be surrendered to others.

Abuse of Power by the Official Class.—It is not through parties contending for control of the government that the benefits of democracy can be realized. The principle itself must be placed beyond the power of such parties. Permanent barriers, like those devised against monarchy, must be introdueed, which shall absolutely restrain governmental agents—that is to say, the officeholders—from any action not indispensably necessary to the common weal. Public offices and employments must be thus rendered undesirable to the indolent and the avaricious. This safeguard can only be established by a representative democracy. Monarchical principles are directly opposed to such a condition of things, and wholly incompatible with it. Its practicability depends upon the question whether a persistently active and capable supervision of the ruling officeholder can be established among those who neither hold nor expect office—that is to say, among the burden-bearing multitude who support the official corps. In effect, and quite consciously too during advanced stages of political degradation, the organized class of office-seekers will actually become allies of the party in power. Their function is to perpetuate among the people a belief that a conflict concerning principles is ever going on. Through the ordinary revolutions of the political lottery such contestants divide between themselves, and alternately enjoy, all that through the forms of law can be wrung from the multitude. They have been known to concert in perfect harmony before elections the means of accomplishing a prearranged result. On public emergencies the heroic virtues do indeed exhibit themselves in acts of great disinterestedness, but there is very little of this spirit displayed while nations are in their normal condition. In an exceedingly small or greatly impoverished country the vices natural to rulers may, indeed, be without opportunities; but in a great and prosperous state there is no possible safeguard against robbery by those who control the machinery of government, if the machinery be in itself adequate to effect that object when pushed to its utmost capacity. Those who enact the laws and administer them will always promote their private interests at the public cost if vested with sufficient power. Such is human nature, no matter what form or name the government may adopt. Democracy accepts this as an indisputable truth, and, distrusting all rulers, it gives to none of them any power that can safely be withheld. The policy of instituting checks upon power unavoidably granted, though not to be absolutely repudiated, is of little value. Appointing one set of official persons to watch another is a bootless contrivance. The remedy really aggravates the disease; it fosters the primary evil of government—a multiplication of public agents. The watcher and the watched soon learn to co-operate for joint benefit in the work of deluding the mass, whom it is the interest of both to circumvent. The judiciary may form an exception. The ancient practice of assigning reasons for the judgment pronounced still exists, and the duty is regarded as unavoidable. This, with the institution of review on appeal, does afford a protection of some strength. Besides, for the honor of our common nature let it be said, as it is true, that the habitual study of justice tends to create a sincere love of it. The inherent vice of all governments is a tendency among the official rulers to devour the people's substance, and the only remedy is in a strict application of the democratic principle. All powers which can be dispensed with should be withheld from the government, and numerous vicious methods now in the highest favor should be suppressed. Permitting revenue or the means of defraying public expenditures to be drawn from duties, imposts, excises, loans, or any source whatever other than immediate taxation enables those who control the administration to conceal their waste of the people's wealth, and protects them from any effective supervision. Compelling them to procure all revenue from the last named source would obviate these evils.

Safeguards against Official Extravagance in the U. S.—In a democratic State of wide extent it is evident that the whole electoral body can not govern directly. Even were the electors composed only of the most learned and enlightened of the non-officeholders, they could afford neither the time nor leisure to govern directly by their own act, or to watch the machinery of government in its varied details, and by that sort of guardianship prevent abuse. They could not even study, in this extended sphere, the character and capacity of their representatives. To hope for any of these things were idle and visionary. There is only one thing that the mass can do to secure good government. Each citizen can for himself—and if suitably spurred to the duty he will—give attention to preventing levies upon his own private purse, made directly before his eyes by government officials. Because of this tendency of the human mind a supervisory spirit among taxpaying electors may be evoked. In great emergencies patriotic zeal may be relied upon, but the needs of everyday life can be supplied in no other way than by thus appealing to the common and constantly active impulses of mere individual self-interest. The difficulty of inducing the citizen to pay taxes directly must be admitted. The very quality of mind which is relied upon for thus controlling public expenditure, and consequent taxation, creates an aversion to this duty. The evil art of the politician who calls himself a statesman consists in perceiving and acting upon the absurd preference for being robbed extensively through the secret and unfelt instrumentality of duties, excises, and the like, rather than paying directly moderate exactions in the form of taxes. This weakness of the citizen forms the strength of those evil counselors who misgovern the State. It must be corrected or intolerable evils will ensue. In the action of Congress, of the State legislatures, and of the municipalities official extravagance has been fostered to a shocking extent by allowing these unfelt methods of raising revenue, borrowing money for long terms on the public credit being the most prominent. Unless the numerous governments intertwined in the American system can be checked in this career, the system itself must ere long perish. This can not be accomplished otherwise than by absolutely forbidding all methods of obtaining revenue or funds for outlay other than immediate taxation. Simple taxation must always be paid, in the first instance, by those who possess property. A policy which would draw directly at the moment of need, and from the pockets of this class, through the immediate agency of the taxgatherer, the whole supply for public expenditure, would keep its members, from a regard to their own private interests, under the pressure of a constant and potent stimulus to restrain injudicious enterprises in war or peace.

Effect of Public Debt.—The creation of public debt diminishes present drafts upon the people, as duties, excises, and the like expedients conceal them. Both, consequently, facilitate wars and needless public works. If every governmental outlay were immediately defrayed by the taxpayers, very different results would ensue. The most wary and influential of the citizens, instead of being tempted to foster expense, would find in the approach of the unwelcome taxgatherer a potent stimulus to labor for its prevention. The consequent diminution of government jobs would relieve from public employ the multitudes whom corrupt officials now drive to the polls as cattle to the shambles. The favoritism displayed in taxing all others for the means to confer a bounty upon manufacturers would likewise disappear. The obtaining of revenue by secret or unfelt methods, independently of its keeping up a costly and vicious establishment, is in itself a positive evil. A sensibly felt pressure, in the form of taxation, is an indispensable provocative to vigilance among the taxpaying electors.

Proper Limits of Legislation.—By means of general laws admitting of no favoritism or partiality all requisite facilities, through corporate forms or otherwise, should be afforded to individuals for conducting every description of lawful business. This should include banking, insurance, the establishing of roads, canals, docks, fairs, or markets, and the furnishing of supplies of every description. Under this head there is the greatest room for progress in effectively applying the democratic principle, so as to prevent any needless action by the government, or the employment of its officers in any affairs that experience might show could be safely committed to individuals as a business. Regulation by general laws being sufficient, no power should exist to create, repeal, or alter any private corporation. Monopolies and fraudulent or extortionate rivalries in trade should be alike prohibited, as well as all power of enacting private laws. A general structural law for each kind of civil division, say counties, towns, cities, and villages, should be adopted, subject to alteration only by amendments likewise general in their application. This would at once reduce the volume of statute law, simplify its form, conduce to its intelligibility, diminish litigation, and restrain corrupt practices. Under a system of which this affords a specimen, laws might become few, simple, and easily understood. There would not be seen in one single State of the Union a legislative body sitting for four months of each year, surrounded by a hired lobby, and engaged in confounding the courts and the people with 2,000 pages of additional legislation, most of it hurriedly passed during the last week of the session in such confusion and disorder that the clerks, if disposed, can make alterations in bills after their passage and before their formal engrossment or authentication as laws. Little progress has been made in the application of the democratic principle since its adoption. Few of the steps hitherto taken or as yet proposed by parties with that professed object are of a beneficial tendency. A State school system was deemed judicious, and had, in its early stages, a beneficial effect. It dispelled that low grade of ignorance which was the only evil under this head demanding strong measures. But in process of time the trading politician seized upon State education, and rendered it, to a considerable extent, another foster-parent of the jobbery and electioneering abuses incident to a loose administration. It is in some places enormously expensive, a means of official patronage, and a football to be tossed to and fro in factious contentions, involving at times a plain infraction of religious liberty. Religion can exist only as a conviction deeply seated in the individual mind, and it is believed to be essential in forming good citizens; yet from the variety of its forms non-interference with it by government is a fixed democratic dogma. Theoretically, there seems an inconsistency in these propositions, but practically they are found to harmonize. Religious convictions bring into full action the voluntary principle, and divine worship is nowhere more amply provided for than in the U. S. The differences of opinion constituting what is called sectarianism, apart from which religion is unknown, form the precise objection to governmental interference with religious worship hitherto relied upon. The statesman's assumed aid to either if it do not begin in actual obstruction is sure to end there.

Reforms needed in the U. S.—(*a*) *The Civil Service.*—There is room for the introduction of many real reforms. Short terms and frequent elections are no doubt necessary as to the chief executive and the legislative bodies. Due responsibility to the real sovereignty—i. e. the people—can not otherwise be maintained; but as to all other officers removals should be for cause only—that is to say, fault or incapacity. Rotation in respect to public agents of any kind is a mistake in doctrine. Faithful service and proved capacity are singular grounds of disqualification. It must be admitted, however, that no absolute right of the citizen is invaded by introducing certain limits to eligibility, and expediency may require it in respect to one office. Indeed, it can hardly be doubted that a long quarantine should be required between exercising military command and aspiring to the chief magistracy.

(*b*) *The Registration of Voters.*—To guard against fraud, registry laws are expedient in densely peopled districts. A considerable period should elapse between the registry and the vote, without allowing exceptions on account of intermediate changes in residence. The more fixed and permanent the elector's habits, the better his duties will be performed. No public interest is subserved by a multitudinous or floating constituency; it is enough if the electoral body be sufficiently large to secure efficient supervision in the choice of representatives. It would be expedient to exclude from the elective franchise all officers and employees receiving pay from the public, and vast benefits would result if severe penalties were decreed against any who should compel this class to contribute toward the expense of elections.

(*c*) *Conflicting State Laws.*—The Federal Government was designed as an organ of limited powers, yet it has exhibited ample capacity to crush or modify at will not only State institutions, but the States themselves. Practically considered, the latter exist merely by sufferance, holding, as it respects the essentials of political power, no higher relation to the central authority than towns or counties do to the States in which they are situated. As bulwarks of liberty or constitutional rights they are nearly if not entirely powerless. But while thus superannuated and rendered ineffectual for the high purposes of the founders, they exercise a power which tends to serious mischiefs. Through their conflicting legislation, enforced by independent judiciaries, they may ultimately derange the laws concerning trade, contracts, and some other subjects of general concern. By the identity of their language, moral ideas, and social habits, and by their essential proximity effected through railroads and telegraphs, the inhabitants of the U. S. have become commercially and socially one nation. Conflicting laws and a jarring jurisprudence among them should be prevented, if prevention be practicable. A court of ultimate appeal, as well from the State as from the Federal tribunals, composed of judges selected by the States, and neither subject to official interference nor possessing coercive machinery of its own, might preserve this desirable unity of jurisprudence throughout the whole country, and might also defend the autonomy of the States.

The course of reform suggested would eventually mature the democratic system by securing to all citizens the utmost measure of freedom, affording material progress every aid to its most perfect development which an equal and impartial Government can bestow, and terminating official misrule. Its aim is to break the scepter of the trading politician, and thus, at last, to establish liberty on the only reliable basis—a popular censorship on democratic principles, perpetually stimulated to its duty by the simple operation of intelligent self-interest.

The fullest treatment of the questions here outlined is found in Bryce's *American Commonwealth*. Compare De Tocqueville, *Democracy in America*; Stickney, *Democratic Government*; and an anonymous work, *Class Interests* (New York). See also Burgess, *Political Science and Constitutional Law*. Compare articles REPUBLIC, and SOVEREIGNTY.

Revised by A. T. HADLEY.

Democ'rates (in Gr. Δημοκράτης): a supposed Pythagorean philosopher (of whose personal life no notice has come down to us) under whose name a collection of moral sayings called the "Golden Maxims" (γνῶμαι χρυσαῖ) has come down to our time. These are written in the Ionic dialect, and are remarkable for their simple and correct character, which highly recommends them even to a modern reader. The author is otherwise unknown, and the age of the collection is not determined. They are printed along with the collection of DEMOPHILUS (*q. v.*).

Democrates: an Attic orator who lived in the time of Demosthenes, and was an opponent of the Macedonian

party. He is mentioned in the Decrees in the oration of Demosthenes, *De Corona*, as serving with Demosthenes on two embassies—the one to Philip to receive the oaths, the other to the Thebans to enlist them on the side of Athens against Philip.

Democratic Party: one of the two great political parties of the U. S. In studying its history the fact should be borne in mind that no party can be free throughout its career from apparent inconsistencies, in which its original characteristics will be for a time lost, and its genuine significance obscured by its temporary policy.

From the very nature of men opposing parties appear to be a necessity. Roughly speaking, there is a radical difference between those who prefer change, and those who are in favor of the existing order of things. The force which lies in the direction of progress and the conservatism which desires to preserve are always in opposition. By whatever name men choose to designate the voluntary organizations into which they array themselves, it may be laid down as a general proposition that there will always be found those who may be designated as progressive and those who may be called conservative.

Wherever there is any form of freedom political parties will be organized, and the two great divisions will be of those who believe that all powers spring from the people, and those who, in some form or other, believe that powers are inherent in those who are called to rule. These two lines of division—that between the radical and conservative, and that between those who believe in delegated and those who believe in inherent powers—can not always be parallel. The history of a party will be somewhat like the meanderings of a great river. The general direction will always be toward the ocean, but there will be frequent windings, some making very sharp horseshoe bends, so that the casual observer, studying only a particular period, will be wholly unable to understand the drift of the party or to comprehend its current.

The Theory of Government proclaimed in the Declaration of Independence.—The formation of the colonies in America necessarily produced difference of interests between these communities. There were also some differences in blood and religion, so that there never was a time when all the colonies were completely homogeneous, and in the nature of the case it was and always will be impossible that this should be. The climatic influences which have so potent and subtle a power will always create differences of interests between New England and the cotton States; between the wheat-growing States of the Northwest and the mineral regions of our mountain-ranges. There is an occult growth for which we can not entirely account, even under the same general conditions, as is demonstrated by the national peculiarities which can be instantly discovered as one crosses the imaginary lines in European countries. The institution of slavery itself had two distinct influences—one to compact those colonies in which it was profitable, the other to separate the colonies into two divisions. The difference in population and size between the colonies also raised troublesome questions, so that if there had been no division among the American colonies on the grave question of separation from the British empire, and they had attempted simply to form a union, it would have been a difficult and delicate matter; possibly it would not have been feasible except under the great enthusiasm and the eminent leaders which the Revolution produced. To secure national independence our forefathers were obliged to pass over those other questions which might have been impossible of mutual compromise and settlement.

To justify that revolution it was necessary to agree upon some theory of government, and that has never been so well expressed as in the Declaration of Independence. It has always been true that God created men in his own likeness; that from this necessarily resulted the truth that man as man was capable of self-government, and therefore was the equal of every other man, and therefore free; that these men when organized into communities ought to be equal in each community, and that each community ought to be free; that the only reason which justified the organization of society was the protection of its members in those inalienable rights which follow from freedom and equality. All powers, therefore, must be delegated powers, and the only basis upon which government could rest would be the consent of the governed. For the purpose of securing national independence those communities could unite with each other, so as to give to each the power of all and yet to preserve to each its freedom and equality. Upon this theory, proclaimed in the Declaration of Independence, the Continental Congress representing the thirteen colonies necessarily was recognized as having a principal from whom it received its powers, and in whose name it acted. That principal was primarily the thirteen colonies acting separately, but the power exercised in each colony by virtue of which these delegates were chosen was also a delegated power, being given by the people of each colony, and therefore the principal was the peoples of each colony respectively. In that Continental Congress and among those who were conspicuous in the war were men who received these opinions with grave questioning; they doubted whether liberty could be preserved under such institutions; they could not rid themselves of the old conception that in some form governments possessed their powers inherently. When it is remembered that for many centuries kings reigned and parliaments enacted laws by divine right, that for much the larger part of what we call the history of our race men ruled by virtue of authority not derived from those ruled; when we recall the struggle between Church and state, it is not strange that among the ablest of those patriots were men who adhered to these traditional opinions. A "strong" government was held to be necessary to preserve order, and a strong government meant one in which the rulers were practically without limitation, and where the people were without rights, having only privileges. Paternalism as used in the vernacular of to-day is simply another form of stating the old claim made by Church and king, by whatever name they might choose to call it, that the power and right to rule were not derived from the consent of the governed. Under this theory, of course, men were not citizens, but subjects; communities were not free and equal or autonomous; distinctions and privileges were of favor; taxation was a kingly prerogative, its extent, subject, and mode to be determined by kingly discretion; public moneys belonged to the public authorities, who were not trustees for its expenditure. Under this theory splendid empires were possible, and superb monuments of human progress created.

The Formation of Parties.—Even some of those who believed that power rested in the people and was delegated by them doubted the success of free institutions, except in communities comparatively restricted in territory and small in population; that law and order could not be maintained under free institutions over a wide extent of territory. They also believed in what was called the necessity of the homogeneity of peoples—that is, that, under any form of government except that of despotism, peoples of different races or religions could not successfully work out the experiment of freedom.

Out of these various conflicting views and out of the diverse interests of the colonies there necessarily grew the formation of parties, not with strict lines of accurate or logical division, and not with close and compact party organization. This division can be traced in the secret history of the Continental Congress; it appears very strikingly in the contest over the secret treaty offered by Spain and France by which it was proposed that the united colonies should reach only to the top of the Alleghany Mountains, and that all west of the Alleghanies should be divided between France and Spain, France to receive all north of the Ohio river and Spain all south. This was defeated largely by men like Jefferson and Patrick Henry, who believed entirely in the doctrines laid down in the Declaration of Independence and the practical results which would follow from those doctrines, and possibly the division of parties may be found as well at that point as at any subsequent period.

To acquire the western country became the passion of Henry, Jefferson, and that school of thinkers who believed that under a confederation somewhat loosely formed, but based upon the general principles set out above, a republic could be successfully established which would include the entire continent. The opposition of Henry to every step taken toward the formation and adoption of the Federal Constitution can be understood only upon the hypothesis that after 1780 he believed the Eastern States were willing, if not determined, to prevent the expansion of the republic toward the West, and that he was convinced that the success of the American experiment depended upon the acquisition of western territory. This also will explain much of the history of the contest over the Constitution.

The Jeffersonian Party.—The debates in the Constitu-

tional Convention and in the various State conventions called to ratify that Constitution, and in the pamphlets of the period, demonstrate that there was a division upon the general lines indicated herein, and that the Constitution was a compromise between these diverse opinions. Those who believed that it was not wise to form a centralized republic, who secured the ten amendments to the Constitution, and who construed the Constitution to mean only delegated powers, under the lead of Mr. Jefferson gradually formed themselves into a party. Its first platform may be said to be the letter of Mr. Jefferson to President Washington in which he laid down with great clearness the Jeffersonian construction of the Constitution as opposed to the Hamiltonian construction. Without having any compact organization, and therefore not being in the strict sense a party, those who shared these opinions carried their opposition to the administration of Gen. Washington to an extent sufficient to indicate that at his retirement from the presidency there would be an attempt to control the government in the interests of their opinions. Mr. Jefferson, who was a great party leader, accepted the Constitution with the ten amendments as a finality, and so construed it as to give vigor to the Federal Government, preserve the sovereignty and autonomy of the States, and secure the individual liberty of the people. The acts of the Federal party under the lead of John Adams, the passage of the Alien and Sedition laws, the known opposition of its leaders to the acquisition of western territory, gave to Mr. Jefferson and his followers great advantages.

The Resolutions of 1798-99.—Perhaps the first formal platform of any party were the Virginia and Kentucky resolutions of 1798—those in Virginia drawn by Mr. Madison, those passed by Kentucky approved by Mr. Jefferson, and drafted in part by him and in part by John Breckinridge, who offered them and drew up the additional resolutions passed by the Kentucky Legislature in 1799.

These resolutions were at the time, strange as it may seem, Union resolutions. They consolidated the Union. Kentucky had come to the conclusion that the Eastern States under the Federalist construction of the Constitution were inimical to her interests; that under their control Kentucky would never secure the free navigation of the Mississippi river; and that the larger States close to the Federal capital would dominate the republic. The growing sentiment that continued union with the Eastern States was not profitable, further aroused by the election of John Adams and the consequent refusal to annex Louisiana, would in all probability have led to an attempt to dismember the republic at the Alleghany Mountains; but if the construction put upon the Constitution by the resolutions of 1798 and 1799 was received as the proper construction, and the Federal Government should be controled thereby, then Kentucky was urgently desirous to strengthen her ties to the Federal union, and intensely loyal to it. The election of Mr. Jefferson upon this platform obliterated all desire in the West for separation and insured the loyalty of the entire West and Southwest. It created a national party based upon that construction of the Federal Constitution which secured to each State the control of its own affairs, which limited the general Government to Federal matters, and yet gave to the Federal Government the sovereign power of increasing the territory of the republic, and furnished hope of unlimited expansion.

The Louisiana Territory.—The acquisition of Louisiana territory was really the first great act of sovereignty performed by the republic. It practically destroyed the Federal party. It gave to the U. S. the capacity for growth, and was an inspiration of invincible prestige.

Whatever may have been the doubts of Mr. Jefferson as to the constitutionality of acquiring territory in the mode in which Louisiana was acquired, they were forever settled by the action of the republic, and from that day it may be considered as settled that we have the power to acquire territory without a constitutional amendment.

The Republican Party.—The decadence of the Federal party gave to its opponents opportunity to consolidate themselves upon the general principles laid down by Mr. Jefferson in his inaugural address.

If all people were free and equal, and all power rested in them, and the grants called the Constitution were wholly from them, it followed necessarily that those who were chosen to execute those duties were trustees for the people; that all burdens were to be distributed equally; that all benefits were to be impartially given; that no taxes could be imposed except for public purposes; that those who received these taxes were trustees of the people for their expenditure; that no expenditures could be justified except for public purposes. This would require an economical government, a strict account of the expenditure of public funds, constant reference to the Constitution to ascertain the grants and limitations contained therein, and upon any new question which might arise such a party would naturally decide according to these principles.

Under the lead of Mr. Jefferson the Democratic party, then called the Republican party, was organized, and all his and its utterances are precisely in this line—to the general Government a faithful allegiance and a loyal obedience within the limits of the Constitution; the careful and vigilant preservation to the States of their autonomy and independence in all matters not granted to the Federal authority; the equal and impartial rights and privileges of the common people; the careful and economic expenditure of public money; the just imposition of impartial taxation.

The Tendency to Free Trade.—From the beginning of the struggle of the Revolutionary war the tendency of those who afterward became Democrats, under the lead of Mr. Jefferson, was toward free trade. Free commerce with all nations was considered necessary for the growth of the country. In the Republican platform adopted at Philadelphia by the congressional caucus in 1800 the sixth plank was "Free commerce with all nations, political connection with none, and little or no diplomatic establishment." And this represented the almost unanimous opinion of those who called themselves Jeffersonian Republicans. This was not considered incompatible with a system of imposts on imports by which revenue was raised, because the Government had to be maintained by taxation; but it was looked upon as the object to be finally attained, and it grew out of the principles held to be fundamental. There is no right more sacred than that of free labor. It is perhaps the highest form which freedom can assume that a man shall have the right to labor for his daily bread and the support of those dependent upon him as to him shall seem best. Free labor necessarily carries with it free disposition of the product of his labor. It is illogical and absurd to say that a man may labor as he pleases, but he shall not dispose of the product of his labor as he pleases. The dollar earned is the laborer's dollar, to be spent where, how, and as he pleases, save so far as his conduct may injure others. It therefore was almost a necessary tenet of those who held these general views that a laborer may sell and buy in whatever market seems to him best, the limitation being that he should pay out of his labor his share of the public taxes, which might be levied upon that labor in the shape of imports into which it had been transmuted.

But the question of protection and protective tariffs was not made a party issue until long after this period, and did not become a divisive one until after the war of 1812. The right and power of the Government to lay imposts had been asserted for many generations in every part of the world, and it was not strange that it was accepted without much question or consideration by that generation of thinkers and statesmen. It must also be remembered that during the debates on these financial questions from 1815 to 1828 there were no party organizations in the present sense of those words. The destruction of the Federal party had become complete and the election of Mr. Monroe was practically unanimous, so that men of various opinions claimed to belong to the same organization. During this period began those divisions which resulted in the reformation of party lines under Gen. Jackson and Mr. Clay; and it would be a curious inquiry, if there were any mode of making it certain, what would have been the result of party organizations if Mr. Clay had in 1824 elected Gen. Jackson President instead of Mr. Adams, and Clay and Jackson had united in the same organization instead of becoming enemies.

The Election of Mr. Adams.—The election of Mr. Adams gave to Gen. Jackson and his followers a plea that public opinion had been disregarded; and, while that election was entirely legal according to the forms of law, it was held by the subsequent judgment of the American people to be in violation of the spirit of our institutions, and the election of Gen. Jackson was a declaration of the American people that public officers are public servants, to act each in his place within the limitations of the law, but in obedience to the ascertained public will; and that while it may not be illegal to do a certain act, in the lower sense of a violation of statutes, it may be unlawful in the higher sense of dis-

obedience to the ascertained public opinion. Those who would most probably have been intensely Jeffersonian in 1801 became Jacksonian in 1828 because of this plea. Divided as they were upon the financial questions of the day, and disapproving, as no doubt many of them did, the somewhat arbitrary conduct of Gen. Jackson, they yet adhered to him because he represented the conception that public opinion when once ascertained by an appeal to the prescribed forms enacted by law ought to be dominant; that the people as people are sovereign, and that all governmental authorities are agencies and not rulers.

The divisions upon financial questions were nearly parallel with this division upon the election of Mr. Adams. It was not unnatural that those who believed that the defeat of Gen. Jackson by the House of Representatives was an improper act should be restive under any system which gave to a national bank great powers, and which looked to the expenditure by the Federal Government of large sums of money for internal improvements, or which tended in any other way to increase the power of the Federal Government.

The Nullification Contest.—At the same time the contest between Jackson and Calhoun over the nullification resolutions of South Carolina demonstrated that the majority of the Democratic party adhered strongly to the policy of maintaining the Federal Government in all its vigor. South Carolina won that fight as to the practical results. The compromise measures adopted by Congress under the lead of Mr. Clay were practically a surrender to the claim of South Carolina. Morally Gen. Jackson achieved a notable triumph. He both revealed and intensified the sentiment of the country that the union of the States was extremely precious. From the election of Mr. Jefferson to 1832 that sentiment had increased. The war of 1812 had compacted the States, and the glory won by our navy had added to the national pride. The navy is our most national institution, and its triumphs were the common triumphs of the nation, and its victories gave strength to the belief that the union was in and of itself an inestimable blessing. This was also increased by the superb speeches of Daniel Webster in his famous debate with Mr. Hayne and by the fervent appeals of Mr. Clay, so that, while South Carolina obtained such modification of the tariff laws as she could honorably submit to, and her statesmen could claim that they had triumphed in the contest, the result of these debates and of Gen. Jackson's proclamation and action was to give fervor and almost universality to the union sentiment in the country.

Jackson's Leadership.—The leadership of Gen. Jackson secured for the Democratic party the legitimate succession to the Republican party, and gave to it the right to boast that it was the party of Jefferson as well as that of Jackson. He preserved intact the organization, he consolidated its thinkers, he made permanent its discipline. As Jefferson had been the greatest of political leaders in the wisdom of his policy, so Jackson was the greatest in the power of his discipline. Jefferson formed a party, it is true, and made it victorious and led it to the absolute destruction of its enemies, but it was a party of thinkers without much cohesion; Jackson organized it into a great army, a powerful and vigorous machine, made it capable of great victories and of withstanding, without loss of *morale*, equal disasters. Under his leadership every member of it became inspired with the desire not only to enforce policies, but to secure victory. From that day to this the Democratic party has never lost the *morale* of organization nor the power of self-discipline, and has survived defeats which would have destroyed any other organization known to the history of the U. S.

Organization and First Platform.—During Jackson's two administrations the Democratic party needed no platforms. It stood substantially upon his messages. Its principles were enunciated by him or his followers, and were fully understood by the people. It was not considered necessary to formulate party beliefs through party platforms. From 1828 to 1840 it may fairly be said that the Democratic party formulated no creed. Resolutions were passed by various public assemblies of Democrats; statements were made in various state papers, but the party in formal convention did not put out any creed, and yet there was no doubt or uncertainty in the minds of its members as to its principles or its policies; but in 1840 it became necessary for the party as a party to express in some open and formal way what its purposes, its principles, and its policies were, and the Democratic platform adopted at Baltimore on May 6, 1840, gives as clear a statement of its beliefs as has been made from the time of Jefferson, and is as follows:

Resolved, That the Federal Government is one of limited powers, derived solely from the Constitution, and the grants of power shown therein ought to be strictly construed by all the departments and agents of the Government, and that it is inexpedient and dangerous to exercise doubtful constitutional powers.

2. *Resolved*, That the Constitution does not confer upon the general Government the power to commence and carry on a general system of internal improvements.

3. *Resolved*, That the Constitution does not confer authority upon the Federal Government, directly or indirectly, to assume the debts of the several States, contracted for local internal improvements or other State purposes; nor would such assumption be just or expedient.

4. *Resolved*, That justice and sound policy forbid the Federal Government to foster one branch of industry to the detriment of another, or to cherish the interests of one portion to the injury of another portion of our common country; that every citizen and every section of our country has a right to demand and insist upon an equality of rights and privileges, and to complete and ample protection of persons and property from domestic violence or foreign aggression.

5. *Resolved*, That it is the duty of every branch of the Government to enforce and practice the most rigid economy in conducting our public affairs, and that no more revenue ought to be raised than is required to defray the necessary expenses of the Government.

6. *Resolved*, That Congress has no power to charter a U. S. bank; that we believe such an institution one of deadly hostility to the best interests of the country, dangerous to our republican institutions and the liberties of the people, and calculated to place the business of the country within the control of a concentrated money power and above the laws and the will of the people.

7. *Resolved*, That Congress has no power under the Constitution to interfere with or control the domestic institutions of the several States, and that such States are the sole and proper judges of everything pertaining to their own affairs not prohibited by the Constitution; that all efforts by abolitionists or others made to induce Congress to interfere with questions of slavery or to take incipient steps in relation thereto, are calculated to lead to the most alarming and dangerous consequences, and that all such efforts have an inevitable tendency to diminish the happiness of the people and endanger the stability and permanence of the Union, and ought not to be countenanced by any friend to our political institutions.

8. *Resolved*, That the separation of the moneys of the Government from banking institutions is indispensable for the safety of the funds of the Government and the rights of the people.

9. *Resolved*, That the liberal principles embodied by Jefferson in the Declaration of Independence and sanctioned in the Constitution, which makes ours the land of liberty and the asylum of the oppressed of every nation, have ever been cardinal principles in the Democratic faith; and every attempt to abridge the present privilege of becoming citizens and the owners of soil among us ought to be resisted with the same spirit which swept the alien and sedition laws from our statute-book.

Of these, the first, fourth, fifth, and ninth are the enunciation of general and permanent principles, the others relate to the practical issues then before the people for settlement; of these, slavery has been settled by the thirteenth, fourteenth, and fifteenth amendments; the system of internal improvements is too firmly rooted to be overturned; and the question of the national bank has assumed a wholly new and different aspect.

In all party platforms there must be these two elements—fundamental political principles and declarations as to practical living issues. As to the first, we may expect exact and clear statements; as to the latter, there will probably be compromise, concession, and possibly ambiguity.

The Annexation of Texas.—The defeat of Mr. Van Buren, the election of Gen. Harrison and his early death, the repudiation by Mr. Tyler of the policy of the Whig party, the extra session, the resignation of Mr. Clay from the Senate, and the difficulties with Mexico, produced a state of affairs in 1844 which ought to have given to the Whig party a triumph, and which probably would have done so but for the desire of the country to annex further territory. Mr. Clay and the

Whigs made the same mistake in 1844 which Adams and the Federalists made in 1801. There are always local and transitory causes which operate with permanent and deeper motives. Mr. Clay's position on the slavery question, his unfortunate Raleigh letter, the alleged frauds in the Plaquemine precinct of Louisiana, may have contributed to his defeat; but the intense desire of the American people to acquire more territory secured the election of Mr. Polk, which would have been impossible even with all these other causes if it had not been for the position of Mr. Clay and the Whigs upon the Texas question. And looking back upon that controversy, it can be asserted that no one now regrets the decision under which we obtained Texas and acquired the territory extending to the Pacific Ocean. That election was the real deathblow to the Whig party. It did not die at once, even as the Federal party did not disintegrate upon the defeat of Mr. Adams. It was enabled by a division in New York to elect Gen. Taylor in 1848; but the seeds of dissolution had been sown—the death of Gen. Taylor and the accession of Mr. Fillmore revealed that the Whig party was no longer a compact party, and the overwhelming defeat of Gen. Scott in 1852 practically put that party out of the active list of political combatants. Its leaders were as able and perhaps more eloquent, and certainly as patriotic, as the leaders of the Federal party, but like the Federal party it ceased to represent either the nationality of the republic or any great local interest. The South distrusted its loyalty on the slavery question, the North looked upon it with suspicion because of its disposition to compromise, and its failure to recognize the inevitable destiny of the country turned from it the younger generation.

The Walker Tariff.—The Democratic party under the lead of Mr. Polk achieved two notable victories—the successful termination of the war with Mexico and the passage of the Walker tariff bill, which was framed upon the general lines of Democratic policies as laid down in the first platform of 1800. Taxation is always an important public question. In times of peace it becomes the most important public question. It touches everybody; its burdens must be borne, and they may become very heavy; it can be so laid as to give vast advantages to certain interests; it can be the means of wide corruption; it involves every financial problem; it affects all industries; upon it men are forced to differ by reason of climate, product, and interest, who would otherwise agree upon principle. It is not, therefore, strange that at different periods, under different circumstances, with diverse leadership, there should have been inconsistent declarations or legislation which can not always be reconciled. But the Walker tariff may be held to be the practical crystallization of the general views which the Democratic party then held on the subject of raising revenue by imposts on imports, and the experiment was an eminently successful one, as shown by the action of all parties in 1856 and the legislation of 1857. The later claim that under that tariff our industries lagged and disasters occurred was a new discovery made after 1870, and is wholly inconsistent with the facts. The Democratic party in 1846–48 would seem to have entered upon a period of control as long as, and as absolute as, that upon which it entered in 1801. That it did not do so is wholly due to the institution of slavery.

The Slavery Question.—It is impossible to give a history of the institution of slavery in this article, but this much may be said: When the cargo of Africans was landed at Jamestown in 1619, prior to the landing of the Pilgrim Fathers in 1620, slavery was universally considered proper. It became legal in all the colonies. It was a local domestic institution recognized and legalized by each of the colonies. It was also recognized by the Constitution, and, in fact, a compromise was made by which the importation of slaves was made legitimate till 1808, upon the consideration that Congress should have the power to pass navigation laws—a contract effected by a union of certain maritime Northern States and Southern slaveholding States against the protest of the larger slaveholding States. The invention of the cotton-gin by Eli Whitney made slavery highly profitable. It was an institution which interwove itself in the domestic fabric of Southern civilization. The slaves were different in race and color from the masters, and the problem of gradual emancipation was one from which the Southern statesmen shrank. Many of the ablest men of Virginia, Maryland, Kentucky, and Tennessee, and other Southern States urged the adoption of some plan of gradual emancipation, and the majority of slaveholders were probably always in favor of some such system. It was defeated mainly because of the inability of the men of the South to make up their minds as to what could be done with the emancipated negro. They did not see how he could be deported, and they were not willing to make him a partner in their political control or an equal in their social life, and they shrank from the experiment of having so large a body of freemen who were held to be both politically and socially inferiors. Amalgamation was intolerable. And so the conservatism of preserving the existent order of things always prevented the adoption of any system of gradual emancipation. To these motives may be added the enormous value which the slaves represented. The South had bought and paid for them; to make the slaves freemen seemed to be an act of confiscation of the most cruel character, and to inflict the burden of compensation for them upon the non-slaveholding part of the community seemed to be equally cruel. So the slaves increased in number and in value, and the problem grew in danger and in difficulty. There was always a very wide anti-slavery sentiment in the North, and finally the Abolition party was organized, and became a factor in political matters. As a rule, the Democratic party, being in favor of the preservation of the power of the State over domestic institutions, rested upon the principle of Federal non-interference with slavery, and of remitting all questions concerning it to the various States. Mr. Clay, Mr. Calhoun, and others of various shades of opinion, saw that this could be only temporary. To postpone any national interference the policy of keeping the balance of power equal was adopted, so that with the admission of a free State a slave State should also be admitted, and the equality of power in the Senate be thereby maintained. Mr. Calhoun foresaw that the acquisition of territory under the treaty with Mexico would necessarily change the form of this problem and require congressional action, and he was indubitably correct. The compromise known as the Missouri Compromise could not be permanent, for it is in the nature of all compromises that they are only temporary. New and unexpected transactions produce new and unexpected complications, and each generation must solve its own problems for itself.

From 1801 to 1850 this question had entered constantly into political thought, but never in such a manner as to render it difficult of solution, but it constantly increased in gravity. The South became alarmed at the dangers which threatened it; it became sensitive to attack and anxious as to the final result. The mountainous character of so large a part of the South and the cheap prairie lands of the North made migration to the North so large as to render certain the loss of political power in the South. It took no acumen to calculate when the Northern States would greatly outvote the slaveholding States. Every day the disparity was becoming more apparent, and if division had to come, the sooner it could be brought about the more nearly equal the struggle would be. So the South turned readily to that party which stood by the guarantees of the Constitution, which denied any power of the Federal authorities unless granted in that instrument which it regarded as its sole barrier and its only hope. On this issue the Whig party in the South was practically destroyed, but the Democratic party in the North had a difficult if not impossible task to perform. As slavery existed in the District of Columbia, over which the U. S. had absolute control, as under the fugitive-slave law the authorities of the Northern States were often called to act, as there were territories over which Congress legislated, and which had to be organized into and admitted as States, it was impossible for the Federal Government not to concern itself with slavery; and the Northern Democrat had to face the question as to what his action would be concerning these questions, which were not within the domain of State action. He could well agree with his Southern brother that as to the institution in the States Congress could exercise no power, but he gradually ascertained that he could not agree as to what should be done on these other matters. To emancipate the slaves in the District of Columbia and to exclude them from the territories was practically to limit this institution so as to make it the victim of the increasing anti-slavery sentiment. Not to do this was held by the Northern States to require of them to become partners in the maintenance of the institution.

Slavery in the Territories.—When the question of the formation of territorial governments for the new territory acquired from Mexico and of the admission of California came up for decision, a division was inevitable. It was post-

poned by the compromise measures of 1850–51. It was apparently settled by the unprecedented victory of Gen. Pierce over Gen. Scott in 1852, but it is now clear that the division was inevitable. It may have been unwise in Mr. Douglas and those who urged him to do it to repeal, in form, the Missouri Compromise, and thereby to give the occasion for the formation of the anti-slavery party; but if this had not then been done the question would have had to be met in some form, and the same division would have occurred. The convention of 1856 adopted a compromise platform on this question which enabled the party to carry the election of that year; and if it had been wisely and ably led during the administration of Mr. Buchanan, it is probable that the division could have been postponed and some pacific solution of the problem ascertained. The requirement of the Southern Democracy that the territory should be looked upon as a common territory purchased by the joint contribution and acquired by the joint expenditure of blood, and therefore to be held for the joint benefit of all the States and of all the people, with the right of every citizen to carry his property into that common territory, was always a barren claim, and if admitted would never have made a single territory a slave State. The view of Mr. Douglas, known as "squatter sovereignty," however acute, was one which furnished no settlement, and the position of the Republican party that slavery was solely a local institution, and property in slaves purely statutory, and therefore not to be recognized beyond the territorial limits of the sovereignty whose statute created it, put in issue the entire question. The division of the Democratic party at Charleston was inevitable, and its division made the election of Mr. Lincoln certain. The war of secession destroyed slavery, overturned the State governments in eleven States, created a large public debt, and caused the issue of greenbacks.

The New Questions arising out of the War.—The new questions thus arising out of the war had to be met under unusual and peculiar circumstances. The Republican party was in control of every State of the Union except Kentucky, New Jersey, and Connecticut, and the exercise during the war of those powers which, for want of a better name, were called "war powers" had left in the hands of the President enormous power. To meet the expenses of the war had required in the judgment of those in control of Congress the issue of many millions of greenbacks, to which the quality of legal tender had been given, and the creation of a large public debt. The general Government had become necessarily interested in the financial affairs of the people. It had taxed out of existence the circulation of the State banks, and substituted for State banks a system of national banks. The Walker tariff had been repealed and the Morrill tariff enacted. The Democratic party at once, at its convention in 1868, took such position as was consistent with the principles upon which it was founded. As it had always believed in the equality and autonomy of the States, it declared for the "immediate restoration of all the States to their rights in the Union under the Constitution, and of civil government to the American people"; and "amnesty for all past political offenses, and the regulation of the elective franchise in the States by their citizens." Being utterly opposed to centralization in all its forms, it declared in favor of the payment of all the public debt as rapidly as practicable; and that all money drawn from the people by taxation, not requisite for the necessities of the Government economically administered, be honestly applied to such payment. Being committed to the equal distribution of burdens, it declared for equal taxation of every species of property according to its real value, and for one currency for the Government and the people and for every class of citizens. It committed itself to "economy in the administration of the Government; the reduction of the standing army and navy; . . . and a tariff for revenue upon foreign imports, and such equal taxation under the internal revenue laws as will afford incidental protection to domestic manufactures, and as will, without impairing the revenue, impose the least burden upon, and best promote and encourage, the great industrial interests of the country."

From 1865 to 1876 it vigorously and ceaselessly contended for the rehabilitation of the eleven States which had participated in the Confederate movement; for the restoration of every citizen to equal rights; for the removal of the army from those States; for the cessation of military government; for the payment of the public debt; and for a return to the former peaceful modes of government. During these years questions of taxation were not as important as they have since become, because the questions at issue involved the very nature of our institutions and the existence of State governments.

The Conventions of 1872.—In 1872 Greeley and Brown, having been nominated by the Liberal convention, were also nominated by the Democratic convention, not because it agreed with the views of these gentlemen upon the ordinary questions of taxation, but because they represented good government; the limitations of the Constitution in Federal matters; the restoration of the States to their autonomy; the subordination of military power to civil authority; and the equality of citizenship. Perhaps this aided the Democratic party to obtain the control of the House of Representatives in 1874 in the Forty-fourth Congress, and it exercised the power thus given to it by reform of abuses and the reduction of expenditures. Under the lead of Samuel J. Randall the Democratic House secured a reduction of over $30,000,000 of the annual expenditures of the Government, and at once restored to the House of Representatives its power over the public purse.

The Convention of 1876.—In 1876 at St. Louis the Democratic party in substance reaffirmed the platform of 1868, but in addition thereto demanded that all custom-house taxation should be only for revenue, and on that platform it claimed that Samuel J. Tilden and Thomas A. Hendricks were legally elected President and Vice-President of the U. S. The election being disputed, Congress, composed of a Republican Senate and a Democratic House, created the Electoral Commission which declared Mr. Hayes elected President, to which decision the Democratic party submitted. The result of that election at least was to cause the withdrawal of the Federal troops from the Southern States, and to restore to the three States of Louisiana, South Carolina, and Florida their autonomy; to put an end to Federal interference with the local affairs of the Southern States; to have in both branches of Congress a full representation from those States, which was soon followed by having that representation really elected by the people; and to enable the country to take up with more deliberation and less passion the economic questions which are now in process of discussion and settlement.

The Convention of 1880.—In 1880, at Cincinnati, the Democratic party was enabled to take position upon these economic questions with greater hope of union, and in that platform it expressed its general faith in these words:

"*Third.* Home rule, honest money, consisting of gold and silver, and paper convertible into coin on demand; the strict maintenance of public faith, State and national; and a tariff for revenue only; the subordination of the military to the civil power; and a general and thorough reform of the civil service."

The defeat of Gen. Hancock and the election of Mr. Garfield, followed by his untimely death and the unexpected succession of Mr. Arthur, led to the postponement of whatever reforms might otherwise have been possible; and the Republican party coming into possession of both branches of the Forty-seventh Congress, took advantage of having the President and Congress to revise all the tariff laws by the passage of the act of Mar., 1883. In the Forty-eighth Congress the Democratic party, though having control of the House of Representatives, found itself so divided on the question of taxation as to render any action on that question impossible.

The Convention of 1884.—The leader of the House, the Hon. William R. Morrison, chairman of the Ways and Means Committee, found himself overborne by the combination between the Republican party and the minority of the Democrats led by the Hon. Samuel J. Randall. This division of the Democratic party was carried into the convention which nominated Grover Cleveland and Thomas A. Hendricks at Chicago in 1884, and resulted in a compromise platform, the exact meaning of which has been the subject of great dispute, and which prevented the Democratic House of Representatives of the Forty-ninth Congress from passing a tariff bill. In 1887 the President, Mr. Cleveland, sent to the House of Representatives of the Fiftieth Congress his celebrated tariff message, in which he ranged himself with that wing of the party which had attempted legislation in the Forty-eighth and Forty-ninth Congresses, and which, though strong enough to elect its representative, the Hon. John G. Carlisle, of Kentucky, Speaker of both houses, had not been able to pass a tariff bill. After many months of deliberation and discussion, the House did enact a conservative Democratic bill known as the Mills Bill, from the Hon.

Roger Q. Mills, of Texas, leader of the House and chairman of the Ways and Means Committee.

The Convention of 1888.—At St. Louis, in 1888, the convention indorsed the Mills Bill and construed the platform of 1884 as contended for by the revenue Democrats, and nominated Grover Cleveland and Allen G. Thurman upon that platform. The defeat of Mr. Cleveland carried with it the defeat of the Democratic party in the House, and again the Republican party had possession of the presidency and both branches of Congress, and again took advantage of it to revise the tariff by the passage of the McKinley Bill, under the lead of the Hon. William McKinley, Jr., of Ohio, by which act the duties on such articles as were left dutiable were greatly increased; bounties were paid on sugar and other articles, and raw sugar made free. An attempt was made to pass an election bill which has become known to the country as "The Force Bill," and the Speaker, the Hon. Thomas B. Reed, of Maine, reversing the ruling of a hundred years, ruled that a quorum of those present and not voting could be counted for legislative purposes. This Congress also enacted what has become known as the Sherman law, by which it is made the duty of the Secretary of the Treasury to purchase monthly 4,500,000 oz. of silver, to issue therefor treasury notes, and with power to coin only so much of the silver as in the discretion of the Secretary may be necessary for the redemption of these notes. Upon these issues —1, the tariff; 2, the force bill; 3, the currency question; and 4, parliamentary liberty—the Democratic party appealed to the country, and secured the lower house of the Fifty-second Congress by an unprecedented majority, and upon the same issues nominated at Chicago Grover Cleveland for President, and Adlai E. Stevenson, of Illinois, for Vice-President.

The Election of Mr. Cleveland.—The nomination of Mr. Cleveland was, even if no platform had been adopted, equivalent to a pledge by the party that it would repeal the McKinley tariff act and substitute in its place a law imposing imposts upon imports upon the principle of raising revenue only, and that it would repeal the Sherman law and give to the country a sound and stable currency; it also pledged repose to the Southern States, and the repeal of all laws permitting improper Federal interference at the polls. The election of Mr. Cleveland by so large an electoral majority may be taken as a solemn declaration by the people of America that all interference by congressional legislation, or Federal authority, with elections in the States must cease; that from this time forth elections are to be controlled by the people resident within the several States. The battle for the equality and autonomy of the States may be considered as won, and the long contest for equal rights and privileges of the citizens, for the preservation of the power of the local authorities, and the security of home rule, may be considered as ended. This much the Democratic party may claim as its contribution to the peace, repose, and liberty of every State and every section.

The Sherman Law.—The repeal of the Sherman law must also be considered as promised. What shall be put in its place will be a matter of consideration and agreement by the Fifty-third Congress, which in both its branches has become Democratic under the verdict of the American people upon the issues submitted at the election of 1892. For the first time since Mar. 4, 1861, the President and Congress are Democratic; for the first time, therefore, can the Democratic party undertake to enact a statute, and for the first time can it be held responsible for legislation. It will take action upon the question of the currency, and settle it upon the principles announced in these various platforms, and probably never better than in that of 1880 in the words: "Honest money, consisting of gold and silver and paper, convertible into coin on demand." It declared in 1868, "for one currency for the Government and the people, the laborer and the officeholder, the pensioner and the soldier, the producer and the bondholder." These two declarations are equivalent, though in language they seem to be different. They mean that every dollar issued by the Government shall be equal to every other dollar, and shall be the equal of any dollar in any market in the world. This is in accordance with the fundamental principle of Democracy. As the agent of the people it must see to it that no dishonesty is practiced, and it follows that when it issues a dollar it has pledged that it is in fact and value a dollar, equal to every other dollar, and worth exactly what it professes to be worth. How, practically, this is to be carried out is a mere question of detail in statesmanship. There is no doubt that it will be successfully accomplished.

Taxation.—The same general remark can be made as to how the questions of taxation and the revenues of the Government will be met. They will be reduced within the limits of a fair and liberal economy. What are proper governmental expenditures will be answered in the light of the principle that no money shall be taken by taxation from the citizens except for such purposes as are enumerated within the Constitution, and only to such extent as is necessary to carry out those purposes. To meet these expenses revenue must be raised by taxation, and the bulk of this revenue must be raised first, by imposts on imports; second, by internal revenue from spirits and tobacco; third, the deficit, if any, must be made up by some form of internal taxation, either by an income tax or by increasing the subjects of taxation.

In laying imposts on imports the principle that it shall be for the purpose only of raising revenue will be kept steadily in view; but in framing a tariff bill certain practical principles must be observed to which the Democratic party is committed. In the Forty-ninth Congress, under the lead of the Hon. William R. Morrison, the Committee on Ways and Means reported a bill repealing all duties on raw wool. This committed the party to the principle "of free raw material." It may therefore be considered as settled that such material in its raw and crude state as can not be used except for the purpose of manufacture, and upon which further labor must be employed before it can go into consumption, will be admitted either entirely free of duty or with the lowest revenue tax; second, that on all articles only such duties will be laid as will produce a fair revenue, and that they will be laid for the purpose of producing revenue, and not for the purpose of protection; third, that the necessities of life will be admitted free. The principle involved in this is that he who makes a dollar shall have the control of that dollar, and shall purchase in such market as he chooses free from any other limitation than that of equal taxation to support the government which gives him protection.

The Democratic party has always been in its action a conservative party. It has never lacked caution. The reforms which it has pledged itself to accomplish will be done in a spirit of conservatism and caution. It will not destroy any industry which can live under fair and just competition; it will not make sudden changes, but will give fair and reasonable time for such necessary readjustment as modifications of the tax law may require.

The country is so rich, its products so enormous, the value thereof so great, the surplus which must be sold abroad so necessary to the maintenance of prices at home, that under a proper financial system it ought to be able to control the markets of the world. With proper amendments to our navigation laws by which our citizens can buy ships on precisely the same terms as citizens of other countries, we can regain the control of the sea; by removing all unnecessary barriers, taking off all improper burdens, and giving to American industry a fair market, we can control the markets of the world; and under a just and impartial taxation the income of America will be justly distributed among those who produce it.

Under the presidency of any Democrat who is a sincere believer in Democratic principles, and who will see to it that economy is practiced in all the departments, and that the civil service is fairly carried out, the expenditures can be greatly lessened; also under such a President who will require of public servants that they shall execute the duties of their office as if it were a public trust the revenues of the Government can be increased, and therefore the extinction of the public debt without an increase of taxation may be reasonably looked for.

This will divorce the Government from the financial operations of the citizen; it will limit the operations of the Treasury Department to its just functions—the collection and disbursement of the public revenue; it will also divorce the Government from the banking operations of its citizens, and limit the issues of its currency to the constitutional requirements.

With the autonomy of the States entirely recognized, with repose in every State, with equal taxation, with economic expenditure, with honest administration of the Goverment, the future of the republic will surpass the utmost flight of our hopes. WILLIAM C. P. BRECKINRIDGE.

Democ'ritus (in Gr. Δημόκριτος): a celebrated and profound Greek philosopher; b. at Abdera, in Thrace, about

460, or, some say, 469 B. C. He is supposed to have been a disciple of Leucippus, and to have received lessons from some Chaldæan magi. He inherited, it is said, from his father, a fortune of 100 talents. In early life he traveled in pursuit of knowledge in Egypt, Greece, Persia, and India, and continued his travels until he had spent nearly all his patrimony. Having returned to Abdera, he declined political honors and employment, preferring to pass his life in study and retirement. He had a high reputation for virtue as well as learning. He appears to have been versed in geometry, physics, natural history, and ethics, on which subjects he wrote numerous works, but none of them is now extant. According to the later biographers he was called the "laughing philosopher," from his habit of laughing at the follies of mankind. He was a man of noble, pure, and diligent life. It appears that he admitted the existence of law in nature, but not that of design. He died 357 B. C. His system is sometimes called the corpuscular philosophy. He taught that matter is eternal, and that the universe is composed of empty space and indivisible atoms which are infinite in number. To these atoms he attributes a primary motion, which brings them into contact and forms innumerable combinations, the result of which is seen in the multifarious productions and phenomena of nature. He imagined that the soul or thought is produced by the motion of round fiery atoms. Many of his ideas and theories were adopted by Epicurus, and explained by Lucretius in his poem *De Rerum Naturâ*. Of his works only the smallest fragments have been preserved. See Erdmann's *History of Philosophy*; Mullach, *Fragmenta Philos. Græc.*; Zeller's *Pre-Socratic Philos.* (vol. ii.).

Demod'ocus (in Gr. Δημόδοκος): the celebrated bard of the Phæacians; represented in the *Odyssey* as singing at the banquet of Alcinous, when he entertained Ulysses, the battles and the fate of the Greeks who went to Troy, with the conquest and destruction of that city, and also the loves of Mars and Venus. Later writers, who regarded him as an historical personage, represent him as an old and blind musician and poet of Coreyra, who composed a poem on the destruction of Troy (Ἰλίου ἄλωσις), and another on the loves of Mars and Venus.

De Mogeot, de-mō'zhō', Jacques Claude: author; b. in Paris, July 5, 1808; educated in seminary of St. Nicholas of Chardonnet; entered the University of Paris later; lecturer at Beauvais, Bordeaux, and Lyons; appointed to the chair of Rhetoric at the Lycée St. Louis at Paris 1843; author of *Les Lettres et les Hommes de Lettres au XIX^e^ Siècle* (1856); *Histoire de la Littérature française* (1857); *Tableau de la Littérature française au XVII^e^ Siècle* (1859); and *Histoire des Littératures étrangères* (1880). D. Jan. 9, 1894. C. H. Thurber.

Demogor'gon [from Gr. δαίμων, spirit, demon + Γοργώ, Gorgon, deriv. of γοργός, terrible]: a dreadful and mysterious being alluded to by some of the later classical writers, and by Boccaccio, Ariosto, Spenser, Milton, Shelley, and others. In Shelley's *Prometheus Unbound* he is the conqueror of Jupiter. The ancients dreaded the very mention of his name.

Demon, or **Dæmon** [from Gr. δαίμων, spirit, demon]: a term of Greek origin, used in classical writers primarily for the Supreme Divinity, sometimes as a synonym for θεός, a god, and later more especially as a tutelary or guardian divinity which was supposed to attend upon men. Thus Socrates is commonly said to have been attended by a beneficent dæmon. It may well be doubted, however, whether such an idea is justified by the language of Xenophon (see *Memorabilia*, i., 2, *et seq.*) or Plato (*Apol. Socr.*). Socrates appears to have meant simply that a divine influence or intimation of some kind within him, a sign or voice (σημεῖον, φωνή, in Plato), controlled his actions. (See Socrates.) According to Plato, "Every dæmon is a middle being between God and man." "Intercourse between gods and men is carried on by dæmons." He further says: "The poets speak excellently when they say that when good men die . . . they become dæmons." These ideas were greatly amplified by the Neo-Platonists, who divided the dæmons into good and bad. The dread of evil dæmons became so great that in time the word came to be almost always used in a bad sense. In the Greek New Testament evil spirits are often called dæmons (δαιμόνια, commonly translated devils), and Beelzebub is spoken of as the prince of dæmons (ὁ ἄρχων τῶν δαιμονίων). See Demonology.

Demon (in Gr. Δήμων): a Greek writer; author of an *Atthis*, or *History of Attica*; flourished about 280 B. C. His writings were regarded as of no great authority. He is also the author, according to Schneidewin and Müller, of a work on proverbs (περὶ παροιμιῶν). Of both these works some fragments still exist. Those of the proverbs have been inserted in the *Paræmiographi Græci* of Schneidewin and Leutsch, and all the extant remains have been collected by Siebelis, *Phanodemi, Demonis, etc.*, Ἀτθίδων *Fragm.* (Leipzig, 1802), and by Müller, *Hist. Græc. Fragm.*, vol. i., pp. 378–383.

Demo'nax (in Gr. Δημώναξ): Cynic philosopher who lived and taught at Athens in the second century A. D. His claim to distinction, however, is not so much that of a teacher of philosophy as of a model Cynic, and in this character he is depicted in Lucian's treatise called after his name. Though a native of Cyprus, he passed most of his life in Athens, where he was greatly honored while living, and when dead he was buried by the public with great magnificence. An outline of his doctrines will be found in Ritter's *History of Philosophy* (English translation), vol. iv., p. 169, and several of his apothegms are given in Orelli's *Opuscula Græc. vet. Sententiosa*, vol. ii., pp. 144, *seq.*

Demonetization: the removal of the legal-tender quality from money; in a more general sense, the destruction of its character as money. See Money.

Demonology [from Gr. δαίμων, spirit, demon + λόγος, word, reason]: the branch of the science of religion which relates to demons. (See Demon.) Belief in supernatural beings, neither divine nor human, yet affecting directly human beings for their weal or woe, seems to be universal and from the earliest times. Among savage nations evil demons play a prominent part. To them is attributed diseases and other misfortunes and calamities. Fear of them is the curse of heathenism and the exorcist is the great man, the "medicine" man of the savage. Among those a little higher in the scale of civilization the demon is still a dreaded being who can control a man to his loss and compass his death. So also in China, India, Japan, and among the Mohammedans sometimes, the demon plays comparatively harmless pranks, but usually he means mischief. Christian civilization is not entirely emancipated from belief in demons. The allegation of witchcraft among the Puritans of New England proves how persistent it is, for the alleged witches lived in the midst of a Christian civilization in many respects remarkable for its purity. Modern spiritualism is present-day proof of the same thing. It could never hold its place after repeated exposure as a delusion and a fraud if there were not belief in demons.

The question whether the cases of demoniacal possession mentioned in the New Testament are really such or only those which modern physicians would class under hysteria, epilepsy, lunacy, or the like, is frequently discussed. To the theological mind there is no difficulty in supposing that the demons (not "devils," as the Authorized Version calls them) really had permission to vex men in order that their powerlessness before Christ might be manifested, who at his word conquered them. He surely seems to have acted as if demoniacal possession was a fact. In Matt. iv. 24 a distinction is made between those who were possessed with demons and those who were lunatics. In Matt. viii. 32 the demons are declared to be numerous enough to enter into a herd of swine. So in many other passages.

It is not denied that the ancient Jews believed in demons. The law of Moses commanded to kill those who had familiar spirits (Lev. xx. 27), and it is said that Saul "put away those who had familiar spirits and the wizards out of the land" (1 Sam. xxviii. 3). His recourse to a witch proves his own belief in their existence. Much later is the story of the apocryphal book of Tobit with its similar testimony. Belief in demons passed over into the Christian Church. The lives of the saints have many a story of their appearance. They loved to tempt holy men and women. St. Anthony is a classic illustration. It was held as a dogma that every child born into the world was under the power of an evil spirit, and so the early Church used a regular formula of exorcism before the baptismal formula, and so do the present Roman and Greek Churches. The exorcists were one of the minor orders of clergy. They exercised their functions in connection with what are now called nervous diseases. They relied much upon the use of the name of Christ for expelling the evil spirits. The heathen world was by the early Fathers, and by the far later Christian missionaries, con-

sidered to be full of demons, and to their opposition the slow progress of the truth was attributed. Idolatry has frequently been represented as the worship of demons (e. g. 1 Cor. x. 20).

As might be expected there are stories innumerable about demons. Many of them are collected in such books as G. Roskoff's *Geschichte des Teufels* (2 vols., Leipzig, 1869); E. B. Tylor's *Primitive Culture* (2 vols., London, 1871); M. D. Conway's *Demonology and Devil-lore* (2 vols., London and New York, 1879). SAMUEL MACAULEY JACKSON.

Demonstration [from Lat. *demonstra're*, show forth]: an indubitable proof of a proposition; properly, a perfect proof, such as a mathematical one. The term was used by Aristotle and the older writers to signify any manner of showing either the connection of a conclusion with its premises or that of a phenomenon with its asserted cause; but it now signifies in philosophical language only that process by which a result is shown to be a necessary consequence of the premises from which it is asserted to follow. The word demonstration is also applied to an imperfect proof, yet of a nature such that no reasonable doubt is possible, as Kepler's proof that Mars moved in an ellipse.

DEMONSTRATION, in common language or in everyday speech, signifies an exhibition or display, generally of an oppositional character; and very often the word is applied in such a manner as to involve a slight censure or disapprobation.

Demoph'ilus (in Gr. Δημόφιλος): a philosopher of the new Pythagorean school, whose age is not certainly known. He was the author of a work entitled βίου θεραπεία, from which there is still extant a collection of moral precepts entitled γνωμικὰ ὁμοιώματα, which are edited, along with the *Golden Maxims* of Democrates, by Schier (Leipzig, 1754), and which are printed also in Orelli's *Opuscula Græco. vet. Sententiosa*, vol. i., p. 1, *seq.*

Demoph'oön, or **Dem'ophon** (in Gr. Δημοφόων, or Δημοφῶν): in Grecian mythology, a King of Athens; son of Theseus and Phædra, who is said to have accompanied the Greeks on their expedition against Troy, whence he rescued his grandmother Æthra. When Diomed, on his return from Troy with his Argives, ran in by night to the coast of Attica, and began to plunder it, Demophon attacked him and carried off the Palladium, or statue of Pallas. Demophon is said also to have assisted the Heraclidæ against Eurystheus, who was slain in the battle that took place, and to have received Orestes when, after his mother's murder, he sought refuge at Athens.

Demop'olis: city; Marengo co., Ala. (for location of county, see map of Alabama, ref. 5–B); on railway and Tombigbee river just below the mouth of Black Warrior; has a cotton compress, two large lumber-mills, oil-mills, an ice-factory, and an active trade in cotton and coal. Pop. (1880) 1,389; (1890) 1,898; (1900) 2,606.

EDITOR OF "NEWS."

De Mor'gan, AUGUSTUS: English mathematician; b. in Madura, Madras Presidency, in June, 1806; educated at Cambridge. He was for many years Professor of Mathematics in University College, London. He wrote numerous works, among which are *Elements of Algebra* (1835); an *Essay on Probabilities* (1838); and *Formal Logic, or the Calculus of Inference, Necessary and Probable* (1847), and contributed largely to the *Penny Cyclopædia*. D. Mar. 18, 1871.

Demos: See DEME.

Demos'thenes: the most illustrious of Greek orators; the son of Demosthenes, a well-to-do Athenian citizen, proprietor of a cutler's establishment and a chair-factory. Born in 383 (or 384) B. C., he lost his father before he was eight years old, and fell into the hands of unscrupulous guardians, who appropriated a large part of the fourteen talents ($14,000) which should have been husbanded for the heirs. Two years after reaching the legal age of eighteen Demosthenes, who by that time had been trained in law and rhetoric by ISÆUS (*q. v.*), brought suit against his guardians and won his case, which he pleaded in person, but recovered only a part of his property, so that he found himself obliged to mend his fortunes by following the profession of a speech-writer. He soon became a distinguished and successful advocate, and we have a number of speeches prepared by him for use in private suits from the guardian speeches just mentioned down to the year 345. In 359 he began the preparation of speeches to be used in public suits, and in 354 appeared in the case against Leptines and won his right to be considered a master. In 351—the date of the first Philippic—began his long struggle with Philip of Macedon. The first Philippic, in which Demosthenes uttered his call to arms, was followed in 349–8 by the Olynthiacs, three short speeches, which are marvels of condensed vigor. In the same twelvemonth with the Olynthiacs falls the speech against Meidias, who had assaulted Demosthenes while the orator was discharging a public function, but this speech, one of the most famous among the extant orations, was never delivered. In 346 Athens made the peace with Philip known as the peace of Philocrates, and Demosthenes was one of the ambassadors sent first to negotiate and then to ratify the treaty. The conduct of Æschines, who was a prominent member of the embassy, gave occasion to the famous speech "On the Malembassy" (περὶ παραπρεσβείας), with the reply of Æschines (344), both of them in their extant form diligently manipulated by their authors. To this period belong the second Philippic (344) and the third Philippic (341). Open war was declared in 340, and ended in the crushing defeat of Chæronea (338). Demosthenes took part in the battle, and shared the fortunes of the day. The cheap charge of cowardice did not affect either his position or his influence. He was chosen to deliver the funeral oration over the fallen, and was active (by personal superintendence and personal contributions) in furthering the work of repairing the walls of Athens. For this patriotic service Ctesiphon brought in a bill that Demosthenes should be publicly crowned. This proposal was made in 336, shortly before the death of Philip. Legal technicalities were interposed by Æschines, who brought against Ctesiphon a charge of unconstitutional legislation. The case dragged its slow length along, and did not come to trial until 330. Demosthenes triumphed, and Æschines did not receive the fifth part of the votes, and was forced to withdraw from the city. The *Speech on the Crown* is not only the culmination of Demosthenean eloquence, but outranks all speeches known to fame. After this achievement Demosthenes lived to be drawn into the disgraceful affair of HARPALUS (*q. v.*), lived to be banished from Athens in 324 on the charge of receiving bribes. In 323 the death of Alexander brought hope to Demosthenes, brought him restoration to Athens. But the hope was of brief duration. Athens fell into the hands of the Macedonians, and Demosthenes was condemned to death. He made his escape to the island of Calaurea, but was followed into the sanctuary of Poseidon by the emissaries of Antipater, from whom he escaped by taking a quick poison which he carried concealed on his person (322).

Of the sixty orations extant which bear the name of Demosthenes modern criticism has rejected a considerable number, but we have ample material for a study of his art in its higher lines. That art was not easily acquired, and there are many stories as to the painful processes by which Demosthenes won his way to perfect mastery. Nature was against him. He was of delicate constitution, his voice was poor and unmanageable, his articulation so bad that he could not pronounce, it was said, the first letter of the word rhetoric (his own art), and his manner was awkward. To remedy these defects he recited verses with pebbles in his mouth, declaimed while running, while walking uphill, while facing the noise of the waves, and gesticulated before a mirror. Hooted down and laughed down in the assembly, he did not despair. He took lessons of actors, and persevered until his delivery matched his thoughts, and became dramatic and impassioned—too dramatic and impassioned for his critics—so that the professional actor Æschines sneered at the rant of the amateur actor Demosthenes. But Demosthenes was an actor who had "to know his lines"; he had to be "part perfect," and seldom trusted himself to extempore speech, though even there he was brilliantly successful. He was first and last a student, and the story that he transcribed Thucydides eight times in order to steep himself in the style of the historian is of a piece with the current criticism that his speeches smelt of oil. He was a student first and last; and it is only the close student of the original that can appreciate the fineness of the texture. Vocabulary, syntax, order of words in reference to sound as well as to sense, periodology, rhythm—all these things that contribute so much to the total effect, so much to the "action" of oratory, are lost in translation. But the directness of his style, his manly contempt of ornament, "the lightning and the thunder" of his eloquence, illumining, terrifying, transfixing, the rush of a great personality which gives weight and cogency to argument, the inspiration of a

passionate patriotism—these are not all lost in modern renderings; and there is enough to justify the language of Brougham, who called Demosthenes "the first of orators, at the head of all the mighty masters of speech." His nature was austere, it is true; he lacked tenderness, he lacked playfulness; but there was little room for these in his public orations, and with the private speeches criticism has been too busy to allow full justice to the resources of this "Proteus" of orators, as Dionysius calls him.

For the period, see Grote's *History of Greece*, vol. xi., ch. lxxxvii.; Thirlwall's *History of Greece*; the exhaustive work of Arnold Schäfer, *Demosthenes und seine Zeit* (3 vols.; 2d ed. 1885–7). For the style, see Brougham, *Dissertation on the Eloquence of the Ancients* and Blass's *Attische Beredsamkeit*, vol. iii., and for an admirable account in brief compass of both statesman and orator, Butcher's *Demosthenes* (1881). The chief annotated edition of all the orations is that of Dindorf (9 vols., Oxford, 1846–51); critical editions by Bekker (1824), Sauppe (1843), Dindorf-Blass, in the Teubner collection. Among the best editions of single or select orations are those of Blass, Buttmann, Dissen, Rehdantz, Sandys, Shilleto, Vömel, Wayte, Weil, Westermann, Whiston, F. A. Wolf. English transl., by C. R. Kennedy (5 vols.), in the Bohn Library. B. L. GILDERSLEEVE.

Demosthenes: an Athenian general who acted a prominent part in the Peloponnesian war. He and Eurymedon jointly commanded an army sent in 413 B. C. to re-enforce Nicias at Syracuse. After the Athenians had been defeated he surrendered, and was put to death by the victors in 413 B. C.

Demot'ica (anc. *Didymotichos*): a town of European Turkey; in Adrianople province, on the river Maritza, 25 miles S. of Adrianople (see map of Turkey, ref. 4–D). It is defended by a citadel or castle, and has several Greek churches; also manufactures of silk and woolen goods and pottery. Here Charles XII. of Sweden lived in retirement after his defeat in the battle of Pultowa (1709). Pop. about 8,000.

Demotic or **Enchorial Writing**: a cursive or shorthand alphabet used in ancient Egypt. It was an abbreviation of the hieratic writing, which was itself an abridged form of the true hieroglyphics. Its remains are difficult to decipher. It began to come into use about the origin of the twenty-sixth dynasty (672–525 B. C.), and was still used in 200 A. D. It contained forty-two letters and forty-eight syllabic characters. It appears on the Rosetta Stone, and was extensively employed even in public documents. Remnants of this alphabet appear in the Coptic. See EGYPTIAN LANGUAGE AND LITERATURE.

Demurrage: in mercantile law, an allowance made to the master or owners of a ship by the merchant or freighter when he detains the ship in port beyond the time specified in the charter-party. It is usually stipulated in the charter-party or agreement that if delay occurs in loading or unloading the vessel, the merchant who charters and freights her shall pay a certain sum per diem for the extra time. The rule is that during the loading and unloading the merchant runs all the risk of interruptions, even from necessary and accidental causes. But no demurrage can be claimed for a delay caused by the detention of a ship by a public enemy, or for delay caused by the fault of the master, owners, or crew. The word *demurrage* is also employed to mean the delay itself. Revised by F. STURGES ALLEN.

Demurrer: in law, a suspension of action in a cause until the determination of some point by the court; distinguished from an ANSWER (*q. v.*). In a pleading in equity, as well as at law, it raises a question as to the sufficiency in law of the case as stated by the opposite party. There may also be a demurrer to evidence, on the ground that the testimony offered by a party in a cause is insufficient to maintain or overthrow the issue. Revised by F. STURGES ALLEN.

De Murska, de-moorsh'kăă, ILMA: opera-singer; b. in Pesth, Hungary, in 1844; taught singing in Paris and Vienna, and made her *début* in opera in Florence when nineteen years old. Appeared in London in 1865, and in New York in 1874, with great success. Her voice broke and she soon sank into obscurity and poverty, and died in Munich, Jan. 17, 1889. D. E. HERVEY.

Denain, de-năn': a town of France; department of Nord; on the Scheldt, and on a railway; 5 miles W. of Valenciennes (see map of France, ref. 2–G). It is in an extensive coal-field, and has iron-works and manufactures of beet-root sugar and brandy. Pop. (1896) 19,916.

Dena'rius [a Lat. term, from *deni*, ten]: a Roman silver coin; originally equal to ten asses; was first coined 269 B. C. Its weight varied at different periods, and its value was afterward equivalent to sixteen asses, or about sixteen cents of U. S. money. See AUREUS.

Denbigh, den'bē: capital of Denbighshire, Wales; in the Vale of Clwyd; 22 miles W. of Chester (see map of England and Wales, ref. 8–E). It stands on the sides and at the base of a steep limestone hill, crowned by the imposing ruins of a castle built in 1284, and has many handsome antique houses, an old parish church, an ancient chapel, an asylum for lunatics, a home for orphan girls, and manufactures of shoes and leather. Pop. 6,535.

Denbighshire: a county of North Wales; bounded N. by the Irish Sea and W. by the river Conway. Area, 664 sq. miles. The surface is mostly rugged and mountainous, but fertile and beautiful valleys occur. Coal, copper, iron, lead, limestone, and slate are found in this county. The chief towns are Denbigh, Wrexham, Abergele, Llangollen, and Ruthin. Pop. (1891) 118,979; (1901) 131,588.

Den'derah (anc. *Tentyra*, probably taken from *Tei n Athor*, abode of Athor): a town of Upper Egypt, near the left bank of the Nile; in lat. 26° 13′ N., lon. 32° 40′ E., and opposite Keneh. Here are the ruins of a celebrated temple dedicated to Athor, the Egyptian Venus. It is one of the best preserved of the ancient structures of Egypt. It has a portico supported by twenty-four columns. The chambers and passages, as well as the exterior walls, are ornamented with portraits, among which are those of Cleopatra and her son Cæsarion. There are also two other temples—one dedicated to Isis and the other called Typhonium, from the representation of Typhon on its columns. See EGYPT, ANCIENT.

Dendermon'de, or **Termon'de**: a fortified town of Belgium, in East Flanders: at the confluence of the Dender and the Scheldt, and on the railway from Mechlin to Ostend; 16 miles E. of Ghent (see map of Holland and Belgium, ref. 9–D). It has a town-house, and a very old church called Notre Dame; also manufactures of linens, cotton yarn, and beer. Pop. (1890) 9,298.

Dendrite [from Gr. δένδρον, tree + suffix *-ite*, used of minerals]: a peculiar mineral, containing internally, or having its surface covered with, filamentary forms resembling moss, ferns, trees, etc. Moss agate and Mocha stone are examples.

Dendro'bium [from Gr. δένδρον, tree + βίος, life; so called because they live on trees]: a genus of epiphytic orchids, mostly natives of the tropical parts of Asia and Australia. They have flowers of great beauty, sometimes also remarkable for grotesqueness of form or for fragrance.

Den'drolites [from Gr. δένδρον, tree + a corruption of λίθος, stone, under influence of suffix *-ite*]: petrifactions found in Secondary and coal formations. They consist of plants and fragments of trees, having, generally, nothing in common with those now growing in the same regions. They are mostly cycads, tree-ferns, conifers, etc.

Dendrology: See FORESTRY and NURSERY.

Den'drophis [from Gr. δένδρον, tree + ὄφις, serpent]: a genus of tree-snakes (*Dendrophidæ*) found in India and Australia. They are of moderate size, up to 4 feet in length, slender, and either of a green color, harmonizing with the leaves, or brightly marked in a manner suggestive of flowers. They feed on insects, tree-frogs, and birds. F. A. L.

D'Enghien: See ENGHIEN.

Dengler, FRANK: See the Appendix.

Dengue, deng'gā [Span. prudery, fastidiousness, subst. to *denegar*: Ital. *denegare*: Fr. *de'nier* < Lat. *denega're*, refuse; first used by the Span. of the West Indies as a presumed equivalent of Eng. *dandy*]: an epidemic, seldom fatal, disease, which has prevailed at different times in the southern parts of the U. S. and in the East and West Indies. It is called "dandy fever" or "dengue," which is a Spanish perversion of "dandy," from the stiff carriage of those affected. It is also called "break-bone fever." The symptoms are headache, fever, pain and swelling of the smaller joints, an eruption of the skin, and gouty pains which often cause lameness for a considerable time. The disease is certainly infectious, and has many characters which suggest a relation to influenza. It may be the same disease modified by the climates in which dengue occurs.

Revised by WILLIAM PEPPER.

Denham, Sir John: poet; b. in Dublin in 1615. He graduated at Trinity College, Cambridge, in 1634, and studied law. His principal works were *Sophy* (1641), a tragedy, and a poem entitled *Cooper's Hill* (1643). He was a royalist in the civil war, and fled to France in 1648, but returned in 1652 and was appointed surveyor-general of works and Knight of the Bath. D. in 1669, and was buried in Westminster Abbey.

Denina, dā-nee'năă, Giacommaria Carlo: historian; b. at Revello, in Piedmont, Italy, Feb. 28, 1731. He published *The Vicissitudes of Literature* (*Vicende della Letteratura*, 1760). His principal work is a *History of the Revolutions of Italy* (*Istoria delle Rivoluzioni d'Italia*, 3 vols., 1769–70). Having been invited by Frederick the Great, he removed to Berlin in 1782, where he wrote *Revolutions of Germany* (8 vols., Florence, 1804). In 1804 he was appointed by Napoleon imperial librarian at Paris. Among his works is a *History of Western Italy* (1809). D. in Paris, Dec. 5, 1813. See Carlo G. Reina, *Vita di C. Denina* (1820).

Denio, Hiram: See the Appendix.

Denis, de-nee', Jean Ferdinand: author; b. in Paris, Aug. 13, 1798. He traveled extensively in America from 1816 to 1821, and subsequently visited Spain and Portugal with the special object of studying the literature of those countries. In 1838 he was appointed librarian of the ministry of public instruction, a post which he left in 1841 to take that of conservator of the Ste.-Geneviève library; in 1865 he became administrator of the Ste.-Geneviève. He was an officer of the Legion of Honor. Denis wrote several descriptive and historical works on Brazil, Guiana, and the Platine states, and on Portuguese literature, as well as a series of historical novels and numerous articles for the *Nouvelle Biographie générale* and other cyclopædic works. Among his best-known books are *Précis de l'histoire littéraire du Portugal et du Brésil*; *Le Brésil* and *Le Portugal*, in the collection called *L'Univers pittoresque*; *Chroniques chevaleresques de l'Espagne et du Portugal*; and *Scènes de la nature sous le Tropique*. D. in Paris, Aug. 2, 1890.

Herbert H. Smith.

Denis, Saint (Lat. *Dionysius*): the patron saint of France and first Bishop of Paris. According to Gregory of Tours (540–594 A. D.), he was one of seven missionaries sent from Rome about 250 A. D. to preach the gospel to the Gauls, and after he had converted great multitudes suffered martyrdom probably in 272 under Valerian. His festival is on Oct. 9. The identity of St. Denis of Paris and Dionysius the Areopagite, was first maintained by Hilduin, Abbot of St.-Denis (834). Previous to that time all the ancient martyrologies of French origin distinguished them, celebrating the feast of the Areopagite on the 3d and that of the Bishop of Paris on Oct. 11. (See Tillemont, *Memoirs for Church History*, vol. xiv.) Their identity is no longer defended by any serious writer. Revised by J. J. Keane.

Denison: town; capital of Crawford co., Ia. (for location, see map of Iowa, ref. 5 D); situated on Chi. and N. W. R. R., and on Boyer river; 64 miles N. N. E. of Council Bluffs; has six churches, and is the seat of a normal college. Pop. (1880) 1,441; (1890) 1,782; (1900) 2,771.

Denison: city and important railway center; Grayson co., Tex. (for location of county, see map of Texas, ref. 2–I); has St. Xavier convent, a business college, good schools, ice-factory, meat-refrigerator, planing-mill, foundry, railroad machine-shops, water-works, etc. Pop. (1880) 3,975; (1890) 10,958; (1900) 11,807. Editor of "Herald."

Denison, Charles Wheeler: See the Appendix.

Denison, George Taylor: officer; b. in Toronto, Canada, Aug. 31, 1839; educated at Upper Canada College in that city. He was admitted to the bar in 1861; entered the militia, and was promoted to command of Governor-General's Bodyguard in 1866, and commanded outposts on Niagara river during the Fenian raid the same year. In 1872 and again in 1873 he was sent to Great Britain to represent Ontario in emigration matters; and in 1877 was appointed police magistrate of Toronto. His work, *History of Cavalry* (London, 1877), was awarded a prize of 5,000 rubles, offered by the Czar of Russia for the best work on the subject. Among his other works are *Manual of Outpost Duties* (Toronto, 1866) and *Modern Cavalry* (London, 1868).—His brother Frederick Charles, C. M. G., b. in Toronto, Nov. 22, 1846, was educated at Upper Canada College, and admitted to the bar in 1870. He served as orderly to Gen. Wolseley in the Red River expedition of 1870; went to Egypt in command of the Canadian *voyageurs* employed in the campaign for the relief of Gen. Gordon, and was made a C. M. G. for his services. He entered the Dominion Parliament in 1887, and was re-elected in 1891. A fellow of the Royal Society of England, and author of *Historical Record of the Governor-General's Body-guard*.

Denison, Mary Andrews: See the Appendix.

Denison University (formerly known as Granville College): an institution of learning established and located at Granville, Licking co., O., by a vote of the Ohio Baptist Education Society May, 1831. It was at first intended for a manual-labor school, and hence located on a 200-acre farm, 1½ miles W. of the town. As a manual-labor school it was, like most others of the time, a failure. It was incorporated by the Ohio Legislature Feb. 3, 1832, under the name of the Granville Literary and Theological Institution. The name was changed in 1845 to Granville College, and this again under the general law of Ohio was changed, June, 1856, to the name it now bears.

The buildings are four, containing dormitories and study-rooms for 178 students, besides a fine chapel, natural history room, two society halls and libraries, college library (with over 14,000 volumes), lecture-rooms, recitation-rooms, etc. The fourth building is for the library, and is called Doane Hall. It was the gift of W. H. Doane, Esq., of Cincinnati, and was completed in 1879. A fine science hall, costing $40,000, and an academy building, costing $30,000, are in process of erection. These buildings are the gift of E. J. Barney and W. H. Doane, respectively.

Five four-year courses are provided—classical, scientific, Latin philosophical, Greek philosophical, and literary. The preparatory department is called Granville Academy. It has 6 instructors and 122 students.

The board of instruction consists of twenty professors and five instructors. The number of students, including Shepardson College, is about 350. The fixed property of the university, in ground, buildings, etc., is estimated at $160,000; library and apparatus, $40,000; and the productive endowment is $420,000. Shepardson College for women, affiliated with Denison University, established 1887, occupies six buildings, and has an endowment of $100,000.

D. B. Purinton.

Denizen [O. Fr. *deinzein*, one within, as opposed to *forein*, one without; deriv. of *deins*, *dens* > Mod. Fr. *dans* < Lat. *de* + *intus*, from within]: in Great Britain, an alien who had received from the sovereign letters-patent to make him a British subject. He might take lands by purchase and devise, but could not take by inheritance. Since 1870, however, aliens can take and inherit lands the same as natural born subjects. A denizen can not be a member of the privy council or of either House of Parliament, and can not hold any office of trust, civil or military.

Revised by F. Sturges Allen.

Deniz'li, or **Degnizli**: a town of Asia Minor; in Anatolia; 53 miles S. E. of Alashehr (see map of Turkey, ref. 5–E). It is surrounded by mountains or hills, and has a castle and several mosques. Leather is made here. It is stated that 12,000 of its inhabitants were killed by an earthquake in 1715. Pop. about 20,000.

Denman, Herbert: figure-painter; b. in Brooklyn, N. Y., June 20, 1855. Pupil of Art Students League, New York, and Carolus-Duran, Paris; honorable mention, Paris Salon, 1886, and Paris Exposition, 1889; member Society of American Artists 1887. His work, which is sometimes decorative in character, is marked by good qualities of color and drawing. One of the best of his works is *The Trio*, exhibited at the Salon of 1886, and representing three young women with musical instruments. Studio in New York. W. A. C.

Denman, Thomas, First Lord Denman: an English judge; b. in London, Feb. 23, 1779. He was called to the bar in 1806, and elected to Parliament in 1818. In politics he was a Liberal. He became Attorney-General in 1830, and chief justice of the king's bench in 1832. In 1834 he was raised to the peerage. D. Sept. 22, 1854.

Denmark: a kingdom of Northern Europe; consisting of the peninsula of Jutland and several adjacent islands of the Baltic Sea—viz., Seeland, Fünen, Falster, Laaland, Samsöe, Bornholm, Langeland, and Möen, together with the Faroe islands. Area, 15,289 sq. miles. Pop. (1890) 2,185,335. Besides Denmark proper, the Danish monarchy possesses Greenland, Iceland, and the West India islands of

Santa Cruz, St. Thomas, and St. John. Area of the colonies, 75,115 sq. miles. Pop. (1890) 127,184. Jutland is bounded on the N. by the Skager-Rack, on the E. by the Cattegat, and on the W. by the North Sea. Its surface is low and level, the highest elevation, Himmelbjerget (the Mountain of Heaven), being only 565 feet, and was formerly covered by forests of beech, birch, oak, etc. The eastern coasts are indented with numerous bays or *fiords*, while the western are lined with a double row of sand-banks, behind which extensive marshes occur in various parts. Denmark has no considerable river. Seeland is separated from Sweden by the Sound, and from the island of Fünen by a channel called the Great Belt.

Climate, Soil, etc.—The climate is humid, and is modified by the proximity of the sea, so that the winter is milder than that of Northern Germany. The mean annual temperature is about 46° F. The weather is changeable, but the transition from winter to summer is slower than in most other countries. In spring and summer the west wind prevails. The soil is generally productive, either alluvial or sandy. The marshy districts produce good pasture. Denmark is pre-eminently an agricultural country. The staple productions are barley, oats, wheat, rye, buckwheat, potatoes, beans, pease, and flax. The Danish farmers, however, derive a large part of their revenue from cattle, horses, and the products of the dairy. The chief articles of export are cereal grains, butter, horses, hides, and fish. The fiords abound in cod, herring, and other fish. As Denmark has no coal, nor any other mineral resources, its manufacturing industry is comparatively unimportant. There, are, however, in the kingdom numerous iron-foundries, sugar-refineries, paper-mills, and distilleries. and Danish furniture, porcelain, gloves, articles of horn, bone. and ivory, etc., are celebrated.

Commerce, Revenue, etc.—The commerce of Denmark is carried on mainly with Great Britain, Germany, and Sweden. The total value of imports amounted in 1898 to 462,219,000 kroner (137,701,000 kroner from Germany, 97,187,000 kroner from Great Britain); that of the exports amounted to 326,-361,000 kroner (56,401,000 kroner to Germany, 199,922,000 kroner to Great Britain). The principal articles of export to England are butter and live animals. The value of the butter export increased from £767,190 in 1870 to £7,309,831 in 1898. The principal articles of import from England are cotton manufactures, yarn, coal, and iron. The export of horses in 1898 was 15,423 in number; of cattle, 36,066; and of sheep, 2,644. Of food substances the export value was 204,200,000 kroner; of raw materials, 25,400,000 kroner; of articles of personal and household consumption, 6,500,000 kroner; and of seeds, fodder, and fertilizers, 2,400,000 kroner. The revenue for the year ending March 31, 1900, was 72,561,487 kroner; the expenditure, 77,509,052 kroner. The public debt in 1900 was 207,419,912 kroner, of which 138,-512,250 kroner is owed abroad, mostly at 3 per cent. On Jan. 1, 1899, the merchant navy consisted of 3,774 vessels of 394,685 tons, of which 510, of 225,422 tons, were steamers. In 1898 there were 1,568 miles of railway, of which 1,108 miles belonged to the state, and 3,029 miles of Government telegraph lines. The army consisted (1899) of 9,769 regulars (824 officers and 8,945 men) and 51,817 reserves; the navy consists of 10 ironclads, 25 torpedo-boats of various classes, and 5 protected vessels.

Religion and Education.—The established religion is Lutheran, to which 99 per cent. of the population belong, and the king must be a member of the Lutheran Church. Other sects are tolerated. The kingdom has a good system of education, which is generally diffused among the people. All children between the ages of seven and fourteen are compelled to attend school. Education is given gratuitously in the public schools to children whose parents are too poor to pay for it. Of higher schools, Denmark has a good university at Copenhagen, 13 gymnasia, 27 Realschulen, and 5 training colleges for teachers.

Government.—The Government is a hereditary constitutional monarchy. The present constitution is embodied in the charter of June 5, 1849, according to which the executive power belongs to the king, and the legislative power is vested in the king and Diet (*Rigsdag*) jointly. The Rigsdag is composed of two houses, called the Landsthing and the Folkething. The latter, which is the lower house, consists of 102 members, elected by universal suffrage for a term of three years. The Rigsdag must meet every year on the first Monday of October. All money bills must in the first instance be submitted by the Government to the Folkething. Besides its legislative functions the Landsthing has the duty of appointing from its midst the assistant judges of the Rigsret, which forms the tribunal before which parliamentary impeachments are tried.

History.—Denmark is one of the three Scandinavian kingdoms. (See SCANDINAVIA.) On the decline of the Roman empire the Scandinavians, under the name of Northmen or Normans, became a formidable and aggressive race, much addicted to piracy and maritime enterprises. The Danes conquered Normandy in 912, invaded England with success in the ninth century, and completed the conquest of it about 1016, in the reign of Canute or Knud, who was perhaps the most powerful monarch of his time. He reigned over Denmark as well as England, and is said to have introduced Christianity into his dominions. Margaret, Queen of Denmark and Norway, conquered Sweden in 1388, and procured the adoption of the Union of Calmar (1397), by which the three Scandinavian kingdoms were united, and her nephew, Eric, was appointed her heir. At her death (1412) each kingdom chose its separate ruler. In 1448 the Danes elected Christian I., Count of Oldenburg, who was the founder of the royal family that has continued to reign to the present time. The monarchy was elective until 1660, when the clergy and people, impelled by enmity to the nobility, ordained that the power of the king should be hereditary and absolute. As an ally of Napoleon, Denmark was involved in a war against Great Britain and Russia, and suffered great disasters. The British fleet bombarded Copenhagen in Sept., 1807. Denmark was compelled to cede Norway to Sweden in 1814. Christian VIII., by the Open Letter of 1846, declared his intention to extend the law of succession of Denmark proper to the duchies of Schleswig-Holstein, the inhabitants of which are mostly Germans, in order to secure in this way the indivisibility of the Danish monarchy. When Frederic VII. in 1848 ascended the Danish throne a rebellion broke out in Schleswig and Holstein, which was put down in 1850, though it was openly supported by Germany and secretly also by Prussia. In the meanwhile the non-German great powers and Sweden had agreed (June, 1850) to declare the indivisibility of Denmark, and Austria soon after (Aug., 1850) acceded to this declaration. On June 5, 1851, Prince Christian of Glücksburg was designated in the Protocol of Warsaw as heir to the throne, and on May 8, 1852, he was recognized as such by the great powers and Sweden. In 1849 Denmark had obtained an extremely liberal constitution, which secured the most entire civil liberty and universal right of suffrage. This constitution was somewhat modified in 1855, and extended to the duchies, but found no favor with the German population of Holstein, which cared very little for liberty, but was very enthusiastic for its German nationality. In Nov., 1858, the king abolished the joint constitution of the Danish state for Holstein and Lauenburg, and restored absolute monarchy in these countries. By a proclamation of Mar., 1863, a new fundamental law was prepared for Denmark and Schleswig. War with Germany broke out soon afterward, and was terminated by the peace of Vienna (Oct., 1864), and Denmark was compelled to renounce all claim on Schleswig-Holstein. The question as to whether the duchies should be subject to Prussia or whether they should be dependent upon Austria was settled by the war of 1866 in favor of Prussia. See SCHLESWIG-HOLSTEIN. See DENMARK, in the Appendix.

See Allen, *Haandbog i Fædrelandets Histoire* (6th ed. 1863); Dahlmann, *Geschichte von Dänemark* (3 vols., 1840–43). For the language and literature, see DANISH LANGUAGE and DANISH LITERATURE.

Revised by C. K. ADAMS.

Den'ner, BALTHASAR: painter of portraits and genre; b. in Hamburg, Germany, Nov. 15, 1685. He painted with such extreme minuteness that his heads have become synonymous with the most slavish literalism, the pores of the skin, the hairs of the eyebrows, and even the objects reflected in the eyes, being rendered. As curiosities of art his portraits are ranked highly. In spite of this excessive attention to detail of the least importance, Denner showed a great mastery of execution, and his work has not the hardness of the early purists, as it has none of their exaltation. D. in Rostock, Apr. 14, 1747. W. J. S.

Den'newitz: a village of Prussia; province of Brandenburg; 42 miles S. S. W. of Berlin (see map of German Empire, ref. 3–G). Here, on Sept. 6, 1813, an army of 50,000 Prussians, under Bülow, defeated an army of 70,000 French, Saxons, and Poles commanded by Marshal Ney. The French lost about 15,000 killed, wounded, and prisoners.

Dennie, Joseph: author and critic; b. in Boston, Mass., Aug. 10, 1768; graduated at Harvard and studied law, which, however, he did not practice. From 1796 to 1798 he edited *The Farmer's Weekly Museum* at Walpole, N. H. Having removed to Philadelphia in 1799, he founded the *Portfolio*, a literary magazine, which he edited with ability from 1801 till 1812. Among his writings is *The Lay Preacher*. D. in Philadelphia, Pa., Jan. 7, 1812.

Dennis, John: English dramatist and writer of satires and pamphlets; b. in London in 1657. He studied at Cambridge, made the tour of Europe, and after his return was led to devote himself to literature through his acquaintance with Dryden, Wycherly, etc. He had no talent. Nevertheless, his tragedy *Love Asserted* (1704), achieved a success by its anti-French tendency. His temper was quarrelsome, and he provoked the enmity of many persons by his libels. He was lampooned by Swift, and satirized by Pope in the *Dunciad*. D. Jan. 6, 1734.

Dennison: village; Tuscarawas co., O. (for location of county, see map of Ohio, ref. 4–H); situated on railway, 100 miles E. N. E. of Columbus; has railway car-shops and machine-shops. Pop. (1880) 1,518; (1890) 2,925; (1900) 3,763.

Dennison, William: statesman; b. in Cincinnati, O., Nov. 23, 1815; graduated at Miami University in 1835; admitted to the bar in 1840; practiced at Columbus, O., 1840–48; was a member of the Legislature of Ohio 1848–50; president of the Exchange Bank and of the Columbus and Xenia R. R. Co.; delegate to the Pittsburg convention in 1856 which inaugurated the Republican party, and also to the Philadelphia convention; Governor of Ohio 1860–62; Postmaster-General 1864–66. D. in Columbus, June 15, 1882.

Denon, de-nōṅ', Dominique Vivant, Baron: artist and author; b. at Châlons-sur-Saône, France, Jan. 4, 1747. He became *chargé d'affaires* at Naples in 1782 and a member of the Royal Academy in 1787, after which he devoted himself to art, and gained distinction as an art critic. He accompanied Bonaparte to Egypt in 1798, and in 1802 he published an admirably illustrated work entitled *Travels in Upper and Lower Egypt*. D. in Paris, Apr. 27, 1825, leaving an unfinished *History of Art*.

Density [Lat. *den'sitas*, deriv. of *densus*, thick]: in physics, the quantity of matter which a body contains per unit of volume. Density thus defined is called "absolute density." The quantity of matter in any body is called its *mass*, and is measured by the weight of the body, to which it is always proportional. The density of bodies is therefore directly as their mass and inversely as their volume. It is customary to express density in terms of that of some substance selected as a standard. In the case of solids and liquids water at 4° C. is the usual standard. Gases are compared with air or with hydrogen. This is "relative density," a term which is synonymous with specific gravity.

E. L. Nichols.

Density of the Earth: See Earth (*Density*).

Dental Formula: a tabular mode of indicating the kinds and number of teeth possessed by a mammal. The letters *i.*, *c.*, *pm.*, and *m.*, respectively mean *incisor*, *canine*, *premolar*, and *molar*, while figures affixed to these letters denote the number of each kind of tooth. These figures placed above or below a horizontal line indicate that the teeth referred to occur in the upper or lower jaw. The dentition of both sides is often given, but, as the number of teeth on each side is normally the same, it is common to give the formula for one side only. When it is necessary to specify the first, or milk dentition, the letter *d.*, deciduous, or *M.*, milk, is prefixed to the formula. The milk or deciduous molars correspond to the premolars of the adult animal.

The dental formula of an adult man is as follows: $i.\ \frac{2-2}{2-2}$, $c.\ \frac{1-1}{1-1}$, $pm.\ \frac{2-2}{2-2}$, $m.\ \frac{3-3}{3-3}$, or $i.\ \frac{2}{2}$, $c.\ \frac{1}{1}$, $pm.\ \frac{2}{2}$, $m.\ \frac{3}{3}$.

The formula for a child is $M.i.\ \frac{2-2}{2-2}$, $M.c.\ \frac{1-1}{1-1}$, $M.m.\ \frac{2-2}{2-2}$. The terms cutting-teeth and check-teeth are used, especially by English writers, to denote respectively the incisors and canine collectively and the premolars and molars. See also Teeth.

F. A. Lucas.

Denta'lium [Mod. Lat. deriv. of *dens*, tooth, in allusion to the shape of the shell]: a genus of marine *Mollusca* which presents so many points of difference from all other mollusks that it forms a group—class *Scaphopoda*—by itself. The shell, shaped like an elephant's tusk, is open at both ends, and from the larger opening the burrowing foot and the fringe-like gills can be protruded. The body is perfectly bilaterally symmetrical, the nervous system is untwisted, the sexes distinct. With the mouth is connected a lingual ribbon. (See Mollusca.) There is no heart and there are no distinct blood-vessels. The embryos are remarkable for the development of five ciliated rings about the body behind the ring which is characteristic of all mollusean larvæ. About fifty species of *Dentalium* (and the allied genera *Siphono-dentalium*, *Entalium*) are known, all living in the sand in depths of 10 to 100 fathoms in the seas of all parts of the world.

Dentalium elephantinum.

J. S. Kingsley.

Denta'tus, Manius Curius: a Roman plebeian consul noted for his martial exploits, frugality, and integrity; said to have been born with teeth; hence the surname. He defeated the Samnites in 290 B. C., and gained a decisive victory over Pyrrhus near Beneventum in 275. He was consul for the third time in 274, and censor in 272 B. C. During his censorship he constructed an aqueduct which conveyed water from the Anio to Rome. D. in 265 B. C.

Den'tex [New Lat., from Lat. *dentix*, name of a fish, now called in Ital. *dentale*; from Lat. *dens*, *dentis*, tooth]: a genus of marine fishes belonging to the sub-family *Denticinæ* (of which it is the type) and family *Sparidæ*, but resembling perch in shape. They have sealy cheeks, curved canine teeth in each jaw, a single dorsal, and a forked tail. They are found in the Mediterranean and Red Seas, off the coast of South Africa, East Indies, China, and Japan. Some species attain a weight of 30 lb. and are valuable for food.

F. A. L.

Dentifrice [from Lat. *dentifri'cium*, tooth-powder; *dens*, tooth + *frica're*, rub]: a powder or wash of various kinds used for cleaning the teeth. Among the substances employed are charcoal, chalk, common salt, myrrh, catechu, cinchona, phosphate of soda, and cream of tartar.

Den'tils [mod. deriv. of Lat. *dens*, tooth]: in architecture, square blocks or projections in the bed-moldings of the cornices of the Corinthian, Ionic, and composite orders. The term is also applied to ornaments in cornices of rooms which are founded on the same style of decoration.

Dentin, or **Dentine**: See Teeth.

Dentiros'tres [from Lat. *dens*, *dentis*, tooth + *rostrum*, beak]: a term applied by Cuvier to a group of passerine birds whose members have the upper mandible notched on each side near the tip. It included the greater number of insectivorous birds, thrushes, warblers, Old World fly-catchers, shrikes, etc., and was contrasted with Conirostres, Fissirostres, and Tenuirostres (*qq. v.*). The term was used in the same way by G. R. Gray in his *Hand List*, and in a much restricted sense by more recent ornithologists. As groups thus characterized have proved to be more or less unnatural, the use of the word has been practically abandoned.

F. A. Lucas.

Dentistry [deriv. of *dentist*: Fr. *dentiste*: Ital. *dentista*, deriv. of Lat. *dens*, tooth]: that branch of the healing art which has for its province the treatment of diseases and lesions of the human teeth and their replacement by substitution when lost.

While civilized nations consider their teeth most beautiful in their natural form and color, some nations mutilate their teeth by chipping, filing, and altering their form, in some cases also staining them to conform to their peculiar ideas of beauty. Mutilation is practiced by certain wild tribes of Africa, New Guinea, Java, and the Tasmanian coast of Australia, and is prompted by fashion, superstition, or conformity with religious rites. With the Malays filing the teeth is a religious act performed at puberty, while in Indo-China and Japan girls have their teeth stained black at the time of marriage. Filing the front teeth to points is practiced by Abyssinians to increase the savageness of their aspect and terrify their foes.

Early History.—Herodotus, the Greek historian (*Hist.* ii.,

84), tells of the attention given to diseases of the teeth as well as of the eye and ear in Egypt, and Belzoni and other writers claim to have found in Egyptian tombs artificial teeth made from ivory and wood, some of which were mounted upon gold plates. Teeth of mummies at Thebes are said to have been found filled with gold and a white cement, but of this there is no positive evidence. In 1884 Dr. Van Marter, of Florence, discovered in the museum at Corneto, Italy, skulls exhumed from Etruscan tombs in which pure gold wire was wound around natural teeth and the spaces between them where teeth were lacking, in such a way as to indicate plainly that artificial or possibly human teeth had at some time been thus supported in place.

As the Etruscans preceded the Romans in occupying the land now known as Italy, the antiquity of this form of reparative dentistry is well established. As to the extent to which the Greeks or Egyptians practiced dentistry as a specialty before the Christian era, there is no definite information. The only writings of ancient times extant where dentistry is spoken of as an art are those of Galen, who wrote in the second century after Christ. From Galen until Ambrose Paré published his celebrated work on surgery in 1550, but little was added to dental literature. During the sixteenth century probably less than a dozen dissertations on the teeth were published. In the seventeenth century about 50 and in the eighteenth some 150 essays and volumes upon the subject appeared, the result of the labors of such men as Hunter, Jourdain, Lécluze, Blake, etc.

Later History.—During the eighteenth century dentistry became a subject of more critical inquiry and thorough investigation. Men of intelligence and education devoted themselves to it exclusively, and as a result its advancement in both literary and scientific directions during the nineteenth century has been most marked. This is shown by the fact that from 1800 to 1892 there were published in Europe and America some 200 volumes treating exclusively of the care and diseases of the teeth, besides numerous monographs upon the same subject. Among the list of European authors appear the well-known names of Bell, Baume, Delabarre, Laforgue, Fox, Maury, Le Maire, Owen, Nasmyth, Tomes, Wedl, Magitot, and Coles, while in the U. S. the more prominent authors are Gardette, Koecker, Fitch, Spooner, Goddard, Harris, Taft, Richardson, Garretson, Gorgas, Flagg, Litch, Black, and Miller.

Until the latter part of the eighteenth century any advance in dentistry was confined to Europe, but since then its most rapid strides have been taken in the U. S.

Dentistry in the U. S. and Europe.—The first dentist in the U. S. of whom there is any account was one Le Maire, who accompanied the French army which aided the revolutionists of 1775–83. Soon after the arrival of Le Maire an English dentist named Whitlock settled in the U. S. John Greenwood, who began to practice in New York about 1788, is believed to have been the first native dentist. In 1790 and in 1795 he constructed entire dentures for Gen. Washington. These were carved from ivory and retained in the mouth by means of spiral springs. Greenwood was followed by Spence from England, Gardette from France, Hudson from Ireland, and Koecker from London. In 1820 there were about 100 practitioners; in 1892 the number was 18,000. The first dental school in the U. S. was chartered by the legislature of Maryland in 1839, with the title of the Baltimore College of Dental Surgery: the Ohio College of Dental Surgery (at Cincinnati) was chartered and established in 1845; the Pennsylvania College of Dental Surgery (at Philadelphia) was established in 1856, and the Philadelphia Dental College in 1865. In 1892 the number of dental colleges in the U. S. was 38. The number of graduates from the various dental colleges of the U. S. from 1880–92 inclusive was 6,329, while the number of graduates in 1892 alone amounted to 1,483. Among these were many young women. The first diploma granted to a woman was in 1869. The first dental periodical in the U. S. was published at Baltimore in 1839; in 1892 the number of such periodicals was 17. The first dental society in the U. S., the American Society of Dental Surgeons, was organized about 1840; in 1892 there were 130 of different kinds.

In Europe the number of both periodicals and societies is markedly less than in the U. S. To prevent charlatanism, as well as to encourage a high standard of attainment among those seeking to enter upon dental practice, most countries have enacted dental laws, which require in general that the candidate for practice shall be a graduate of a reputable dental school or pass a satisfactory examination before a legally constituted board. Some countries and certain of the United States require both a diploma and an examination before permission to practice is granted.

Professional Advancement.—In former times a dentist performed all dental operations and manipulations. Many of these are now relegated to specialists; for instance, cases of disease of the soft or bony tissues of the mouth, extraction of teeth under the influence of an anæsthetic, and correction of irregularity of position of the teeth are usually referred to specialists in these departments. The making of sets of artificial teeth, as well as what is denominated crown and bridge work, is attended to by practitioners who limit themselves to one or the other of those branches. The carving and baking of porcelain teeth, which was once done by the general practitioner, was more than fifty years ago turned over to manufacturers.

Operative Dentistry.—The operation requiring the least skill is that of scaling or cleansing the teeth. This consists in the mechanical removal of salivary calculus or tartar, which in nearly all mouths accumulates about the teeth near the gum margin. It is almost entirely composed of mineral ingredients, phosphate and carbonate of lime being the chief, and unless removed in time is apt eventually to cause the teeth to become loose and fall out. Its rapid accumulation, even in the mouths of the young, is one reason why it is well to have the teeth examined at least once a year. The use of a brush of medium hardness and tooth-powder of very fine grit will do much to check the accumulation of the accretion. The dentist removes tartar with instruments called scalers, and then completes the process of cleansing with wooden points charged with fine powder. Whatever the condition of the teeth may be, they should be brushed at least twice daily, and a quill toothpick or floss silk should be used after each meal, for decomposing articles of food generate an acid which directly attacks and dissolves the tooth substance.

Filling.—When teeth have once become affected by decay, it is necessary to check its inroads and repair the injury done. This is accomplished by the operation known as filling. The first step after gaining proper access to the cavity is to remove all the decayed matter, shape the cavity so that it will mechanically retain the filling, and dress the margins to the line of strength. After this the cavity is usually swathed with some medicament having antiseptic and germicidal properties, such as carbolic acid or one of the essential oils. After careful drying the cavity is ready for a filling. The number of materials for filling is very great, none of them possessing all of the best qualities. Of the metals, gold is preferred, because of its purity, adaptability, and resistance to both the force of mastication and the action of the fluids of the mouth. Tin foil probably comes next to gold, is worked in a similar manner, requires somewhat less time for its introduction, is almost as durable, and is much less expensive.

Amalgam, which consists of an alloy of two or more metals (principally silver and tin) mixed into a pasty mass by the aid of mercury, is very largely used for the filling of teeth. It is easily prepared and quickly introduced, but the molecular changes occurring in the mass during solidification make it a less perfect stopping than any of the previously named metals, while its discoloration causes it to become quite unsightly. Nevertheless its durability is often remarkable.

Gutta-percha is the only vegetable product in use for filling teeth, and to add to its resisting power it is mixed (after being refined and bleached) with a small proportion of inorganic matter, usually pulverized feldspar or oxide of zinc. It is introduced with heated instruments, and possesses reasonable durability. Its inertness, non-conductivity, and color especially recommend it in certain cases.

There are only two combinations of metallic oxides in common use: *oxychloride of zinc* and *oxyphosphate of zinc*. The former consists of zinc oxide combined with dilute zinc chloride; the latter of zinc oxide with deliquesced phosphoric acid.

The combination in each case is made just before introduction, for the "setting," especially in the case of the phosphate, is very rapid.

The color of these fillings is harmonious with that of the tooth, but each is irritating to the vascular tissue of the tooth, and their durability is so slight that they can be regarded only as temporary fillings.

In the introduction of any of the filling materials mentioned, except gold and tin, the cavity can usually be pro-

tected from the fluids of the mouth and kept dry sufficiently long for the introduction of the filling by the aid of small mouth-napkins, but when either of the two first-named metals is employed a longer time is required for insertion, and a coffer-dam of rubber is used. This is simply a piece of sheet-rubber with a small hole punched through it, which, when stretched and slipped over the tooth, grips it with such tenacity that all moisture is excluded. It was invented by Dr. S. C. Barnum, of New York, in 1864, and is probably the most useful dental appurtenance ever devised.

Gold as prepared for dental use is primarily either in the form of foil or of a loose crystalline mass thrown down from a solution. Foil in being further prepared for use is folded into wide or narrow ribbons, twisted into ropes, or rolled into cylinders of various sizes and density. In whatever form it may be employed, it is always introduced in small portions at a time, and thoroughly condensed, so that the filling when completed shall be as dense and homogeneous as possible in order to exclude all moisture and extraneous matter, and withstand the force of mastication. When introduced, it is most important that the external surface be dressed to conform to the original outline of the tooth and be made absolutely smooth.

The instruments employed in removing the decay and preparing the cavity are usually steel hand instruments of various forms, and technically known as chisels and excavators. Since about 1870, however, hand instruments for these operations have been largely superseded by burs and drills, which, being operated through the medium of a dental engine, do their work more satisfactorily and rapidly than formerly. The engine in its simplest form is a miniature lathe-head connected with a movable or flexible shaft terminating in a mandrel which carries the various burs. The lathe-head is mounted upon a delicate but rigid upright standard with base, the power being communicated to it by means of a cord or belt connected with the driving-wheel, which in turn may be operated by the foot, a water-motor, or an electric-motor. In some cases the head and shaft are mounted upon a swinging bracket, thus doing away with the standard and base.

The condensation of the gold during introduction, which was at one time done entirely by hand-pressure, is now accomplished by the impacting power of a mallet in some form. The hand mallet, made of wood or metal; the automatic mallet, operated by a spiral spring alternately compressed and released: the mechanical mallet, operated by the engine; or the electric mallet, operated by the electric current—all are in use.

The operation of preparing the cavity has been measurably relieved of its most objectionable features by the present methods of desiccating the cavity with warm air, the use of medical pain-obtundents, and the employment of rapidly revolving and keen-edged burs.

Another method of filling is known as porcelain filling, and possesses some advantages over the older methods. It consists in shaping a piece of porcelain to the form of the prepared cavity, and cementing it into place with thinly mixed phosphate of zinc. There are three ways of preparing and shaping the porcelain stopper: 1, by grinding a section from a porcelain tooth of proper shade; 2, by burnishing into the prepared cavity a piece of platinum foil, removing it, and filling the mold thus formed with pulverized silex or "tooth-body," and baking it in a muffle-furnace; 3, by burnishing pure gold or gold and platinum foil into the cavity, as in the previous case, filling the mold with pulverized glass of suitable color, and fusing it in the flame of an alcohol lamp. In both of these latter methods the gold or platinum foil is stripped from the mass before it is cemented into place. The third method produces a filling which is simply fused glass, but for convenience is included under the head of porcelain filling. Fillings of this character have the advantage of being formed out of the mouth, and are highly esteemed because by the judicious admixture of earthy coloring-matter they can be made to approximate the color of the natural tooth more closely than any other; but as the cement which retains them in place is so readily acted upon and dissolved by the fluids of the mouth, their durability is not as great as might be desired.

Probably the most common complication met with in connection with the preparation of cavities is the exposure of that delicate and highly vascular organ of sensation and nutrition, occupying the central portion of the tooth, known as the dental pulp. In the earlier days of dentistry such exposure was deemed sufficient cause for the extraction of the tooth, but later it was found that it might be devitalized by the application of certain medicaments (usually arsenious acid), removed, and its place filled with some inert and insoluble substance, thereby greatly prolonging the usefulness of the tooth. Such continues to be considered good practice, but an advance has been made in that simple exposure of the pulp does not necessarily call for its devitalization. The more conservative method now prevails of capping or covering the exposed portion with some non-irritant substance, and filling over this in the usual way.

When, as a result of long continued decay or other cause, the pulp loses its vitality and is not removed, putrefaction sets in, and an abscess at the end of the root is the result. Relief is usually gained by perforation to allow the gases resulting from putrefaction to escape, after which it is necessary to remove the dead pulp tissue, and inject into the canal formerly occupied by it such medicaments as will sterilize and destroy the microbic agents that were active in the production of the abscess. For this purpose various drugs are employed, such as creosote, carbolic acid, iodoform, eugenol, oil of cassia, etc. Before introducing any of these agents it is necessary to rid the abscess sac of its purulent contents. After each treatment some of the medicament used is allowed to remain in the canal which is hermetically sealed at its outer opening. When a cure has been effected, the entire canal is permanently filled, as in the case when removal of the pulp followed immediately upon its devitalization.

Anæsthetics.—It is said that at least one-third of the teeth extracted in civilized countries are removed under the influence of anæsthetics. Ether and chloroform, alone or combined, were in common use at one time for the purpose, but nitrous oxide has largely supplanted them, its use being comparatively free from danger, and its effects evanescent. In cases where it is desirable slightly to prolong the anæsthetic effect, combinations of the vapor of ether with gas are often used, and with satisfactory results. The reluctance felt by many persons to being placed in an unconscious condition gave rise to the employment of agents that would exercise a benumbing effect only upon the parts to be operated upon. Among these were the galvanic current and the spray of such volatile liquids as sulphuric ether and rhigolene, but all have been superseded by muriate of cocaine. This is employed in the form of a 4-to-10-per-cent. aqueous solution, and is hypodermically injected into the soft tissues surrounding the tooth. In some cases other drugs, such as carbolic acid, chloral hydrate, menthol, etc., are introduced into the solution, but probably the cocaine is alone responsible for the effect produced.

Oral Surgery.—The treatment of all lesions, diseases, and abnormal growths occurring in the soft and hard tissues of the mouth, aside from the teeth themselves, as well as all surgical operations called for in the same region, fall within the province of oral surgery. One novel operation in this department was advocated and performed by Dr. Younger, of San Francisco, in 1881. It is the implantation of a human tooth in an artificially formed socket of the jaw. The operation may be briefly described as follows: A tooth that has been extracted (no matter how long before) is prepared by thoroughly reaming out the contents of the root canal from the root end, and filling it with softened gutta-percha, capped with a minute plug of gold foil. The tooth thus prepared is placed for a time in a sterilizing solution of mercuric bichloride, kept at a temperature of about 110° F. The cavity into which this tooth is to be implanted is formed by making an incision in the soft tissues overlying the jaw-bone at the point desired, drilling into the bony tissue beneath with a spear-shaped drill to a depth corresponding to the length of the root of the tooth to be implanted, reaming this to a proper size, and then, after irrigating the cavity with a sterilizing liquid, placing the tooth in position and ligating it to any adjoining teeth. After the lapse of a week or ten days the ligatures are removed, and the tooth is found to have become firmly fixed in its socket. The tooth must be sound, must have upon the surface of its root a covering of healthy peri-cemental membrane such as existed there at the time of its extraction, and must correspond in size and color with the adjoining teeth. A new bony material forms in the socket surrounding the tooth, holding it firmly in position for a number of years. The percentage of operations of this character that have been successful is large.

Regulating the Teeth.—The teeth of the second or permanent set are liable to be misplaced either during eruption

or afterward, often crowding or overlapping each other. The time at which correction can be most readily and perfectly accomplished is between the twelfth and twentieth years, while the bony process which holds them in position is still pliable. The appliances used in the operation are almost innumerable, and are constructed from a variety of materials varying from a delicate silk ligature to the stiffest gold or steel spring.

After the teeth have been brought into proper position it is necessary to retain them firmly by artificial means until new bony material has been formed about their roots. This requires six months or longer. If released earlier than this they will most likely return to their former positions.

Mechanical Dentistry.—Sets of artificial teeth, or dentures, as they are technically called, consist of porcelain teeth mounted upon and attached to a base-plate covering the whole or a portion of the arch and roof of the mouth. The teeth are called porcelain because they are composed of the same minerals (silex, feldspar, and kaolin) and are baked or burned in the same manner as porcelain ware in general. The making of them is a large industry in itself, there being at least fifty manufactories in the U. S., and probably half as many more in other countries, principally in Great Britain, France, and Germany.

In the making of the teeth the finely pulverized mineral ingredients, in proper proportion, are mixed with water into a putty-like mass, which is then placed in carved molds and subjected to great pressure to consolidate it. After this the molded teeth are removed, thoroughly dried, placed on fire-clay slabs, and vitrified in a large furnace. The platinum pins which are found in teeth, and furnish the means by which they are attached to the tooth-plate, are introduced in the process of molding. The enamel or flux which gives to the tooth its polished appearance and the coloring-matter of the gum portion are also laid on in the mold before the mass of "body" is introduced. The various colors or shades in different teeth are produced by incorporating with the body certain metals or their oxides.

Metal Plates.—Gold is the principal metal now used as a basis for artificial teeth, silver having fallen into disfavor. An impression of the form of the jaw and palate is taken, usually with plaster-of-Paris mixed with water. From the impression a plaster model is made, and from the plaster model, by the process of molding in sand, a duplicate in zinc is produced, from which in turn a reverse or counter-die of lead is made. Between these two a properly shaped piece of gold plate is laid, and by repeated swaging is made to assume the shape of the zinc die. This constitutes the plate proper, and to it the teeth, after being arranged and ground to fit, are attached by means of pieces of heavier gold-plate, which are at the same time soldered to the pins in the teeth and to the plate. During the soldering the teeth and plate are immersed in a mixture of sand or asbestos and plaster, to guard against the breaking of the teeth by sudden change of temperature or the warping of the plate. When cool the piece is carefully smoothed and polished.

Vulcanite plates have vulcanized rubber instead of metal for the base. For their construction the impression and model are made the same as for metal-work, but no swaging or soldering is required. Upon the plaster model a temporary base-plate of wax is formed, having a raised ridge of wax to represent the length and outline of the teeth, and upon this, after being mounted upon an articulator, the teeth are arranged or "set up" as intended, and the whole made smooth and shapely by the addition of melted wax until the exact form of the finished plate is obtained. The whole is then incased in plaster in a parting-flask, and after the plaster has become hard the flask is opened, the wax removed, and its place supplied with pieces of warm vulcanizable rubber. The flask is then again closed and pressure applied to force out the excess of rubber, after which it is placed in the steam vulcanizer and the mass indurated by subjecting it to a high heat for a given time. The completed piece is then trimmed and polished by means of files, scrapers, and graded polishing powders.

Celluloid Plates.—In making plates of this material, which lacks durability, the process is very similar to the one just described. The difference consists principally in the method of molding the plate, for while rubber is packed into the flask in small pieces and in a soft state, the celluloid is introduced in the form of a hard "blank," and after being softened by heat is pressed into form. After being "formed" it is allowed to cool, when it resumes its former hardness. It is then finished in the same manner as a rubber plate. The teeth used for both rubber and celluloid work are usually arranged in blocks of "twos" and "threes," and have the pins headed on the outside to enable them to be retained in place in the material of the plate.

Continuous-gum Plates.—In 1848 Dr. John Allen, of New York, invented an improved method of making a plate of porcelain with a platinum base. The platinum was swaged to the form of the mouth and the teeth soldered to it, very much as in the construction of other metal plates. After this the entire lingual surface of the plate was covered with a thin layer of porcelain *body* and fired in a furnace. A second coating was then put on and fired, after which the final layer of pink gum enamel was applied, and the piece passed through the fire for the third time. It came out of the fire finished and smooth. This style of work found much favor with the profession on account of its cleanliness and great beauty, for, being made of porcelain tinted to the exact shade of the natural gum, its artificiality could scarcely be detected. It is still considered the most artistic work in mechanical dentistry, and the only drawbacks to its more general use are its brittleness, difficulty of repair, and expensiveness.

Crown and Bridge Work.—This is a method of supplying artificial crowns or teeth without the employment of a plate. The attaching of an artificial crown to a natural root which has through accident or decay been deprived of its own crown was practiced in a rude way at least as early as the beginning of the nineteenth century, and as the method was scientific and the results artistic it has been continued to the present time. Originally the crown of an extracted tooth was used for mounting upon the natural root, but as it proved disappointing in durability it was soon superseded by one of porcelain. The porcelain crowns were first made with a round hole in the base into which was fitted a pivot or dowel of tough hickory-wood. The natural hole (or canal) extending through the root, after being closed at its upper end, was reamed out to the size of the wooden dowel and the porcelain crown with its dowel forced into position. Many crowns thus mounted have been worn with satisfaction for many years. Improvements have from time to time been made in the method, such as the employment of a platinum dowel fused into the crown at the time of its construction, placing a gold or platinum ferrule around the exposed edge of the root to guard against splitting, and the making of crowns partly of gold and partly of porcelain, so as to combine the strength of the metal with the beauty of the porcelain. All crowns with metal dowels are cemented into the root either by means of warm gutta-percha or zinc phosphate, which serve the triple purpose of greater security, prevention of decay, and more perfect cleanliness. Single crowns, proving so useful, naturally led to experiment in the way of uniting several crowns together to bridge a space created by the entire loss of some teeth. The results have been so satisfactory that the method has come to be recognized as one of the most useful and artistic in the whole range of dental substitution. In bridge-work it is usually necessary to have two teeth or roots, one at either end of the space, to act as piers or abutments. These terminal teeth or roots have dowel crowns or metal caps made for them, and in the intervening space are arranged a suitable number of gold and porcelain crowns (called "dummies"), after which all are united together with gold solder and properly smoothed and polished. When completed, the dowel crowns or caps are lined on their lower portions with zinc phosphate and the entire piece, or *bridge*, quickly forced into position. If thus properly mounted it becomes a permanent part of the dental masticating apparatus, and answers all required purposes.

A modification of this method consists in having the dummies alone united together and arranged so that they can be fastened to the pier crowns or caps after the latter have been placed in position. This is known as a *removable* bridge, because it can at any time be readily removed for cleansing or repair. A *permanent* bridge is sometimes constructed of porcelain and platinum in one piece, and by some practitioners is thought to possess advantages over the one previously described. In its construction a bar of platinum is made to bridge the space, and is fitted at either end into cavities prepared for it in the pier-teeth. Upon this bar porcelain teeth are arranged and attached by adding porcelain "body" and fusing in a furnace. The piece when completed is placed in position, and secured by plugging the ends of the bar into the prepared cavities in the natural teeth. See TEETH.

S. H. GUILFORD.

Dentition: See TEETH.

Denton: city and railway junction; capital of Denton co., Tex. (for location of county, see map of Texas, ref. 2–H); has numerous churches, a public school, normal college, flouring-mills, two nurseries, cotton and oil mills, water-works, electric lights, and several flowing artesian wells. Pop. (1880) 1,194; (1890) 2,558; (1900) 4,187. ted, 3,500.

EDITOR OF "CHRONICLE."

D'Entrecasteaux, dăn'tr'kăs'tō', **Archipelago**: a part of the British colony of New Guinea; lying N. of the south-eastern extremity of New Guinea and N. W. of the Louisiade islands. The largest island is Fergusson, the next Normanby and Goodenough islands. Area, 1,214 sq. miles. Pop. estimated at 12,400.

Denudation [from Lat. *denuda're*, lay bare, deriv. of *nu'dus*, bare, naked]: in geology, as defined by Lyell, "the removal of solid matter by water in motion, whether of rivers or of the waves and currents of the sea, and the consequent laying bare of some inferior rock. This operation has exerted an influence on the structure of the earth's crust as universal and important as sedimentary deposition itself: for denudation is the necessary antecedent of the production of all new strata of mechanical origin. The formation of every new deposit by the transport of sediment and pebbles necessarily implies that there has been somewhere else a grinding down of rock into rounded fragments, sand, or mud equal in quantity to the new strata." Denudation may be divided into *subaërial*, which is effected by the action of wind, rain, and rivers, and *submarine*, which is caused by tides and currents of the sea. In many instances deep and wide channels or valleys have been excavated in rocky strata by the long-continued action of rivers; and these are called *valleys of denudation*. As the strata exposed on the sides of these valleys correspond to each other, both in composition and order of position, it is evident that they were originally continuous. "The larger part of the valleys of the world," says Dana, "are formed entirely by running water."

Denver: city and important railway center; capital of Colorado and of Arapahoe County (for location of county, see map of Colorado, ref. 2–F): beautifully situated on South Platte river, 15 miles E. of the base of the Rocky Mountains; 5,200 feet above the level of the sea; in lat. 39° 45′ 21·68″ N., lon. 104° 59′ 35·05″ W. It commands a magnificent view of mountain-scenery, including Pike's, Long's, and other noted peaks perpetually covered with snow. The streets are wide and shady, and the residences and public buildings, built largely of brick and yellow stone, are stately, handsome, and attractive. Denver is appropriately called "The Queen City of the Plains."

Public Institutions, etc.—The city has 142 churches, among them St. John's Cathedral (Protestant Episcopal), noted for its stained glass window representing the Crucifixion. The public-school system is excellent. There were in 1900 75 buildings and 700 teachers. There are ten public and private libraries. The city is also the seat of Denver University, Wolfe Hall (a ladies' seminary), three medical colleges, and several private schools. The State capitol is 383 feet long and 313 feet wide. It stands on Capitol Hill, where is obtained the best view of the city. Other prominent buildings are the city-hall, the county court-house, and especially the U. S. court-house and post-office. Denver has 143 miles of electric street railways, and is lighted by gas and electricity. It has an excellent system of water-works; water is brought from the mountains. Seven railways center here, and there is a large and commodious Union depot. All the Eastern trunk lines maintain offices here. Denver has eleven parks, the largest, City Park, containing 340 acres.

State capitol, Denver, Col.

Manufactures and Commerce.—Denver is an important center for mining, agriculture, and stock-raising, the leading industries of the State. It has a branch U. S. mint and many important manufactories. Three smelting-works in 1900 produced gold, silver, lead, and copper bullion to the value of $19,068,777. Semi-official statistics for the year 1901 showed 600 manufacturing establishments: capital about $7,500,000; average number of persons employed, 15,211; wages paid (round numbers), $9,500,000: value of products, about $40,000,000.

There are four national banks, with a capital of $1,250,000.

Population.—Denver was settled as a mining-camp in 1858–59. Its growth has been rapid and steady. Pop. (1870) 4,759; (1880) 35,629; (1890) 106,713; (1900) 133,589.

Denver, Gen. JAMES W.: soldier and frontiersman; b. in Winchester, Va., 1817; moved to Ohio with his father in 1830; studied law; moved to Missouri; raised a company and served in the Mexican war; went to California in 1850, where he became prominent in politics and was elected Secretary of State, and afterward elected to the Thirty-fourth Congress as a Democrat. Before the end of his congressional term he was appointed commissioner of Indian affairs, but left the office to accept the office of Governor of Kansas. He returned to Washington after twelve months of service, leaving the Territory well organized and law-abiding. He returned to California in 1859, but soon after removed to Wilmington, O.; served in the Union army during the civil war until 1863. Gen. Denver suggested the name *Colorado* for the Territory formed out of Kansas, and the city of Denver was named in his honor. D. Aug. 9, 1892.

Denver, University of: See the Appendix.

De'odand [from Lat. *Deo dandus*, to be given to God; *deo*, dative of *deus*, God + *dandus*, fut. pass. ptc. of *dare*, give]: in English law, any personal chattel, animal, or thing which had caused the death of a human being, and for that reason was applied to pious uses, or, as the term implies, given to God. It was, in fact, forfeited to the king, and distributed in alms by his high almoner. The origin of this singular law is very obscure, and the juridical development which in course of time it underwent affords no light. A distinction was made between an animal or a thing in motion and one at rest. If a sailor fell overboard and was drowned while the vessel was in motion, both the hull and the cargo were forfeited; if the vessel was at anchor, only the hull, not the cargo, was deodand. If a man was thrown from a cart and killed while the cart was in motion, the cart and the load were forfeited: if he fell while climbing the wheel, only the wheel, and not the cart, was deodand. But these and other distinctions of similar description seem to be wholly arbitrary. Two hypotheses have been proffered. The Mosaic law demands that "if an ox gore a man that he die, the ox shall be stoned and his flesh shall not be eaten"; and the Athenian law demanded that "whatever was the cause of a man's death by falling upon him should be exterminated or cast out of the dominions of the republic," thereby ascribing a moral effect on the animal or thing to the fact of its having caused the death of a human being. The law was abolished by statute 9 and 10 Victoria, c. 62.

Deodar: See CEDAR.

Deo'datus, or **Deus'dedit**, SAINT: pope; succeeded Boniface IV. in 615; died Nov. 9, 618, and was succeeded by Boniface V. He is regarded as a worker of miracles. His day is Nov. 8.

Deodorizers: See DISINFECTION.

Deoxidation [deriv. of *deoxidate*: *de-*, privative + *oxidate*, a deriv. of *oxygen*]: the chemical process by which oxygen is abstracted from a compound. This term when applied to metals is synonymous with *reduction*. A compound of a metal with oxygen may in many cases be reduced or deoxidized by heating it with carbon or in a stream of hydrogen gas.

Department [Fr. *département*, deriv. of *départir* : Ital. *dispartire* < Lat. *dis-*, apart + *parti're*, divide (*disperti're*)]: literally, a division; a portion: a distinct province; a territorial division; a principal division of executive government. In the U. S. each of the members of the cabinet is the head of a department. These are called the Departments of Agriculture, Interior, Justice, Navy, Post-office, State, Treasury, and War. A department is not defined by the Constitution, but is recognized and mentioned several times in that instrument. It is a division of government business over which the head, by law, exercises exclusive control, subject only to the supervision and direction of the President. The Attorney-General is the head of the Department of Justice, established in 1870. Portions of the duties of several departments are allotted to bureaus, but there are no separate bureaus in the Department of State or that of the Post-office. The term department is also applied to the three principal branches or co-ordinate powers of the republic. "Under the Federal Constitution," says Gillet, "the national Government is composed of three distinct and independent departments—the *legislative*, the *judicial*, and the *executive*." The whole territory of the U. S. is divided into military departments, each under a general officer.

Department, in geography, a primary division of France. In 1790 the old divisions called provinces were abolished, and the country was divided into eighty-three departments, most of which were designated by the names of French rivers or mountains. The old boundary-lines between the provinces, with their toll-gates, custom-houses, military posts, etc., were effaced, and very often districts from two or three different provinces were united to form one department; the object was centralization. During the first empire the number increased to 130, including Belgium, portions of Italy, etc. At the beginning of the German war in 1870 the number of departments was eighty-nine. In 1871 France ceded to the German empire the whole of Bas-Rhin, a large part of Haut-Rhin, nearly all of Moselle, a small part of the department of Vosges, and a part of Meurthe. Each department is divided into arrondissements, and is governed by a prefect. The principal divisions of Bolivia, Peru, and some other South American republics are also called departments.

Departure, in navigation: See Navigation.

De Pauw University: an institution of learning situated in Greencastle, Putnam co., Ind. It was founded by the Indiana Conference of the Methodist Episcopal Church and chartered in 1837. The first class graduated in 1840. The campuses of the university comprise 150 acres. There are eight buildings used for educational purposes. Until 1884 the institution consisted of a college and a preparatory school, and was called the Indiana Asbury University. Hon. W. C. De Pauw, of New Albany, provided by his will for an endowment of about $1,000,000, besides giving during his lifetime large sums for the better equipment of the university. In recognition of these munificent gifts the corporation in 1884 changed the name of the institution to De Pauw University. At the time of this change the institution became a university in fact. Professional schools of theology and law and special schools of music, art, and pedagogics were established, and graduate courses were added in the college of liberal arts. In 1890 the school of pedagogics was discontinued, and at the same time the university adopted new courses of study in harmony with the best tendencies of the age. A very liberal range of electives is permitted. All candidates for an academic degree must pursue a major equal to one-fourth of their entire course, and a minor equal to one-eighth of the same. The major and the minor must be in unlike subjects. A limited number of courses is required in mathematics, history, English, a foreign language, and a laboratory science. The remainder of the course is made up of free electives. The ordinary class distinctions do not exist. Modern methods of instruction are employed throughout all the departments. As the student advances in his course the individual rather than the distinctively class method is approximated. The libraries and laboratories are conducted according to the best modern plans, and seminaria are established in many of the departments. The various post-graduate degrees require examination on work done in residence. The total number of graduates exceeds 2,000. The present faculty numbers 28 professors and instructors, and the number of students in 1900 was 635. The president is Hillary Asbury Gobin, D. D., elected in 1896.

De Pere, de-peer': city, on railway; Brown co., Wis. (for location of county, see map of Wisconsin, ref. 5-F); situated on the right bank of Fox river, and connected with West De Pere, on the opposite bank, by a bridge 1,500 feet in length. It is supplied with water-power, and has smelting-furnaces, iron-works, and manufactories of agricultural implements, paper, tile, bricks, and woodenware, etc. A line of steamers makes regular trips to Chicago, and the Buffalo line takes freight to Buffalo and intermediate ports. Pop. (1880) 3,824; (1890) 3,625; (1900) 4,038.

Depew, Chauncey Mitchell, LL. D.: lawyer; b. at Peekskill, N. Y., Apr. 28, 1834; graduated at Yale College 1856; studied law; member of the New York Assembly 1861–62; Secretary of State of New York 1863–65; minister to Japan for a short period; candidate of the Liberal Republican party for Lieutenant-Governor for New York 1872, but not elected; chosen regent of the State University 1874; appointed capital commissioner 1871; received the degree of LL. D. from Yale 1887; made the speech nominating President Harrison in the Republican national convention in Minneapolis in June, 1892; delivered the oration at the dedicatory exercises of the World's Columbian Exposition at Chicago Oct. 21, 1892. In 1866 he became attorney for the New York and Harlem Railroad Company, and on its consolidation with the New York Central, counsel for the united companies 1869; second vice-president of the New York Central Railroad Company, 1882; president, 1885; also president of the West Shore R. R. He has won distinction as a railway manager and as a political leader, and is one of the most popular orators and after-dinner speakers in the U. S. He was elected U. S. Senator for New York in Jan., 1899.

De Peyster, Abraham: chief justice; b. in New York, July 8, 1658; eldest son of Johannes De Peyster; deputy mayor of New York in 1677; was acting Governor and president of the council in 1700; chief justice 1700–01; colonel commanding the militia of the city and county of New York, and treasurer for many years of the colonies of New York and New Jersey. D. Aug. 10, 1728.

De Peyster, Johannes: merchant; b. in Haarlem, Holland, about 1600; was of French Huguenot extraction; emigrated to New Amsterdam (New York); was schepen in 1656, etc., alderman in 1666, etc., burgomaster in 1673, and then deputy mayor in 1677, refusing the mayoralty because he could not speak English. He displayed his patriotism and firmness in one of the most trying crises of the Dutch colony (1673). D. in New York about 1685.

De Peyster, John Watts: author; b. in New York city, Mar. 9, 1821; a descendant of Johannes De Peyster, deputy mayor of New York in 1677; educated at Columbia College; joined the State militia, and on the military reorganization of the State was assigned to the command of the twenty-second district; in 1855 became adjutant-general; in 1866 breveted major-general; assisted in organizing the present police force of New York. He has published many military and historical works, including *Life of Field-Marshal Torstenson* (1855); *The Dutch at the North Pole* (1857); and *Personal and Military History of General Philip Kearny* (1869).

Depil'atory [from Lat. *depila're*, deprive of hair; *de*, off + *pilus*, hair]: a name given to applications used to remove hair from any part of the body. A thin paste of powdered quicklime and water applied to any part until a burning sensation is produced, and then wiped off with a wet sponge, will generally remove hair.

Deposit: that which is deposited or placed in trust with another, as earnest money paid by the buyer of goods to make the contract of sale binding, or as title-deeds given as security for debt (a practice once common in Great Britain). Specifically: (*a*) In the law of bailments, the placing of personal property in the hands of another to be kept by him gratuitously and returned upon demand. Various classes of deposits were set up by the civilians according to the circumstances under which the deposit was made or the purpose had in view; thus *necessary deposits* are those made upon some sudden emergency; *voluntary deposits* are such as are made by the consent or agreement of the parties. Where a deposit is made by two or more persons having adverse interests in controversy with respect to it it is called a *sequestration*, and is either judicial or voluntary according as to whether it is made with or without an order of court in the course of a judicial proceeding. (*b*) In banking law, the lodging of money, bills, etc., in a bank so that the rela-

tion of debtor and creditor is thereby established between the depositor and the bank. When the identical articles, whether money, plate, jewelry, or the like, is to be returned in specie it is called a *special deposit*, and the bank is a bailee for hire. F. STURGES ALLEN.

Deposit: village; Broome and Delaware cos., N. Y. (for location of counties, see map of New York, ref. 6–G); situated on the Erie R. R. where it crosses the Delaware river; 177 miles N. W. of New York. It has an academy, union free schools, stock-yards, a planing-mill, a flouring-mill, pearl-button factory, hand-sled factory, and iron-foundry. Pop. (1880) 1,419; (1890) 1,530; (1900) 2,051.
EDITOR OF "COURIER."

Deposition [from Lat. *deposi'tio*, deriv. of *depo'nere*, *depo'situs*, lay down, lay off; *de*, off + *po'nere*, place]: in law, a written statement under oath; specifically and usually the testimony of a witness set down in writing in answer to interrogatories legally exhibited. Depositions are taken either by a judge, a commissioner, or other official authorized by law. The questions to which the depositions are answers are usually put by the parties to the suit or their legal representatives, and an opportunity for cross-examination must be given as in any taking of testimony. It is a rule in the law of evidence that a deposition can not be read where the witness himself might be produced, because his oral testimony is the most satisfactory medium of proof. Depositions are frequently taken to perpetuate testimony likely to be material in the future, but otherwise liable to be then unavailable. Revised by F. STURGES ALLEN.

Dep'ping, GEORG BERNARD: historian; b. at Münster, Prussia, May 11, 1784, but removed in early life to Paris. In 1817 he published in Leipzig a *Sammlung der besten alten spanischen histor. Ritter- u. maurischen Romanzen*. In 1826 he published in French *L'Histoire des expéditions maritimes des Normands et de leur établissement en France au X. Siècle*: in 1834, in German, *Die Juden im Mittelalter*; in 1835 *Histoire de Normandie* (a continuation of the work of Licquet). He began a general history of Spain, but was obliged to give it up for political reasons. Other works by him have less repute, though many of them are valuable. D. Sept. 5, 1853. Revised by A. R. MARSH.

Depres, or **Desprès**, JOSQUIN: musical composer; b. at Vermand, in French Flanders, about 1440. He was a pupil of Ockeghem, or Ockenheim, a noted Flemish musician; at the age of twenty-five went to Rome, on invitation of Pope Sixtus IV., to instruct the musicians of Italy, and remained there until the death of his benefactor (1484), when he repaired to the court of Hercules I., Duke of Este. After a time he became chief singer of the royal chapel of Louis XII. of France, but the closing years of his life were spent at Condé, in French Flanders, in the capacity of a canon of the cathedral. He was a prolific writer of sacred music, and was justly considered by his contemporaries to be the greatest composer of his time. D. at Condé, Aug. 27, 1521.

Deprez, dā-prā', MARCEL: French engineer, electrician; b. at Aillant-sur-Milleron, Loiret, Dec. 27, 1843; studied at the Lycée St.-Louis; failed in his examinations at the Polytechnic School, and was not admitted to the School of Mines. His mechanical and electrical inventions rendered him conspicuous, many of them being of great value, and those made for the Bureau of Naval Ordnance of France caused him to be twice nominated as a chevalier of the Legion of Honor. In the Academy of Sciences on Oct. 2, 1882, a dispatch was read from the committee on electricity of the Exposition of Munich announcing the complete success of the attempt of Marcel Deprez to transmit power by means of an ordinary telegraph wire from Munich to Miesbach, a distance of 35 miles. This was the first practical example of the electrical transmission of power to a distance, an application as now perfected of the utmost value to the industrial world. In 1883, a syndicate, headed by M. Rothschild and the great engineering-shops of Creusot and Fives-Lilles, furnished the money for much more extensive experiments, which were made on the line of the Northern Railway of France, the results of which were reported in 1885 to the Academy as a large advance upon previous experiments. The theory and person of Deprez have been the object of bitter criticism as well as of the highest praise. In 1881 he was made chevalier of the Legion of Honor, in 1883 officer of the same, and in 1886 he was elected member of the Academy in the place of Tresca. Since 1890 he has been Professor of Electricity at the Conservatoire des Arts et Métiers, and of Physics at the College of France. W. R. HUTTON.

Deprez Signal: See RECORDING APPARATUS, PSYCHOLOGICAL, in the Appendix.

Deptford: town of England; on the Thames; 4 miles below London bridge, and separated from Greenwich by the Ravensbourne, which here enters the Thames (see map of England, ref. 12–J). It is partly in Kent and partly in Surrey. The famous dockyard in which Peter the Great worked as a ship-builder was closed in 1869. The victualing-yard, from which the navy is supplied with provisions, is the largest establishment of the kind in the kingdom. There are large marine engineering establishments and an extensive electric-light plant. Pop. (1901) 110,513.

Deputy [O. Fr. *depute* : Ital. *deputato* < Mediæv. Lat. *deputa'tus*, partic. of *deputa're*, (class. Lat.) prune down, (Med. Lat.) select, appoint as representative]: a person appointed to act for another as representative, lieutenant, viceroy, or agent; a delegate; a legislator chosen to represent his constituents. One of the legislative bodies of France under the monarchy (1814–48) was called the Chambre des Députés, which term is now applied to the lower house of the French National Assembly. In Italy the lower house is called Camera de' Deputati, Chamber of Deputies. It consists of about 500 deputies, elected by the people who pay taxes.

De Quincey, THOMAS: author; b. in Manchester, England, Aug. 15, 1785. He was a younger son of a wealthy merchant. He once ran away from school and went to London, where he passed nearly two months in extreme want and strange adventures. He entered the University of Oxford in 1803, and there contracted a habit of using opium. In 1808 he quitted the university, became a friend and associate of Coleridge, Southey, and Wordsworth, and began to reside at Grasmere in the lake district. He married in 1816, devoted his time chiefly to literature, made good translations from Lessing and Jean Paul Richter, and contributed articles on biography, philosophy, and other subjects to *Blackwood's Magazine*. When in the prime of life he overcame the habit of the excessive use of opium, and in 1821 he published *Confessions of an English Opium-eater*. He removed to Scotland in 1843, and passed the later years of his life near Edinburgh. He was one of the most brilliant magazine-writers of his time, and wrote on a great variety of subjects, but his works are mostly fragmentary. The first edition of his collected works was published in Boston (18 vols., 1851–58). D. in Edinburgh, Dec. 8, 1859. See Masson, *De Quincey* (1881).

Dera Ghazi Khan, der'a-gaă-zec'kaan': a town of the Punjaub, British India; on the river Indus, and 65 miles N. W. of Bhalpur (see map of N. India, ref. 4–B); in a large but thinly populated district of the same name, lying between the Indus and Suleiman Mountains. It is advantageously situated for trade, and has manufactures of silk and cotton goods and cutlery. Pop. 27,886 (one-half Mohammedan). Silk and woolens are manufactured here.

Derah (Arab. *deraa*): the unit measure of length in Egypt. The subdivisions are the *kadam* = one-half of a derah, the *abdat* = one-sixth of a derah, and the *kerat* = one-twenty-fourth of a derah. Several derahs are in use—viz., the common derah of Egypt = 22·37 British inches; the derah Hendazeh, by which dry goods are sold = 25·5 British inches; the derah Istambouli (Constantinopolitan derah), used for European dry goods = 66·34 British inches; and the ancient derah of the Nile or of Memphis = 20·699 British inches. The first three values above are given on the authority of the *Report of the International Conference on Moneys, Weights, and Measures* (Paris, 1867); and the last on that of Prof. Piazzi Smyth. This measure has some interest in consequence of its connection with discussions concerning the Great Pyramid of Egypt and the purpose of its construction.

Dera Ismail Khan, -ĕĕs-maă-eel'kaan': a town of the Punjaub, British India; in a very large district of the same name; on the Indus; 17 miles N. N. W. of Bukkur (see map of N. India, ref. 4–B). It has an active transit trade with Khorasan and manufactures of cotton cloth. Pop. 24,906.

Derajat, der-a-jaat': a division of British India; comprising the western part of the Punjaub between the Indus river and Afghan Mountains, with an almost equal territory between the Indus and the Jhelum, and including the districts of Dera Ismail Khan, Dera Ghazi Khan, and Bannu. It lies between lat. 28° 27′ N. and 33° 16′ N., and lon. 70°

15′ E. and 72° 3′ E. It is three-quarters uncultivable and largely devoted to grazing. The population is sparse for India, largely nomadic, and very largely Mohammedan. Area, 23,317 sq. miles. Pop. (1891) 1,650,380. M. W. H.

Derayeh, El, el-derī′e: a town of Arabia, in Nedjed; about 430 miles N. E. of Mecca; was formerly the capital of the Wahabees (see map of Persia and Arabia, ref. 6–E). It has a beautiful situation, with gardens and fertile fields in the environs. It was once a populous town, and contained about thirty mosques, but it was taken and partly destroyed by Ibrâhim Pasha in 1818. Pop. about 15,000.

Derbend′, or **Derbent′**: a fortified maritime town of Russia; capital of Daghestan; on the west shore of the Caspian Sea; lat. 42° N., lon. 48° 15′ E. (see map of Russia, ref. 12–H). It is situated at the foot of a mountain, and at the entrance of a defile called by the ancients *Albaniæ Pylæ*, and now the Pass of Derbend. To the south lies the seaward extremity of the great Derbend or Caucasian wall, known to the Turks as Alexander's wall, which originally had a height of 29 feet and a thickness of 10, and was provided with iron gates and watch-towers, forming a valuable defense of the former boundaries. The harbor is very ancient. It is poor and accessible only to small boats. In ancient times Derbend was a very important town. The Arabs established a khanate there in 728, and it was from time to time the dwelling-place of Haroun-al-Rashid, but in the course of succeeding centuries it changed masters many times. Peter the Great of Russia captured it from the Persians, who, however, subsequently regained it, but the siege of 1795 gave it again to Russia, with which it was formally incorporated by the treaty of 1813. Pop. 15,000.

Revised by M. W. Harrington.

Derby: a manufacturing town of England; capital of Derbyshire; on the river Derwent; at the junction of the main branches of the Midland Railway; 119 miles N. N. W. of London and 35 miles N. N. E. of Birmingham (see map of England, ref. 9–H). It is an old town, and during the Heptarchy was called *Northwothing*. Its present name, "Derby," or "Deoraby," was given to it by the Danes. It was incorporated by Henry I. Its charter was granted to it in 1683 by Charles II. Derby returns two members to Parliament. The private houses are built mostly of brick. Here is a free grammar school founded in 1162. Derby has manufactures of silk, cotton, lace, hosiery, porcelain of great beauty, jewelry, and ornaments of fluor-spar; also iron-foundries, rolling-mills, and tanneries. The chief industry is throwing silk. Pop. (1891) 94,146; (1901) 105,785.

Derby: city; New Haven co., Conn.; on both sides of the Naugatuck river, immediately above its junction with the Housatonic; on the N. Y., N. H. and Hart. Railroad; 9 miles W. of New Haven (for location, see map of Connecticut, ref. 11–F). It was formed by act of Legislature, taking effect Jan. 1, 1894, from the borough of Birmingham (*q. v.*) and the village of Derby. Pop. (1900) 7,930.

Derby, Earls of (England, 1485): Barons Stanley (United Kingdom, 1832), and baronets (1627). The Kings of Man were of this line from 1406 till 1505, when they took the title of lords of that island. The lordship of Man passed from the Derby family in 1735.—Edward Henry Smith-Stanley, fifteenth earl, P. C., D. C. L., formerly styled Lord Stanley, was born at Knowsley Park, July 21, 1826; educated at Trinity College, Cambridge, and elected to Parliament in 1848. He was one of the most liberal members of the Conservative party. In Feb., 1858, he entered the cabinet as Secretary for the Colonies, and in the ensuing May he became commissioner for the affairs of India. He retired from office when the Liberals came into power, in June, 1859. On the formation of a Conservative ministry by his father in June, 1866, he was appointed Secretary of Foreign Affairs. He presided over the conference of the European powers which was held in London in May, 1867. He resigned with his colleagues in Dec., 1868, and inherited the title of Earl of Derby in Oct., 1869; became Secretary of Foreign Affairs 1874, and resigned Mar. 28, 1878. He joined the Liberals 1880, and was Secretary for the Colonies 1882–85. He did not follow Gladstone in 1886 as a supporter of Home Rule for Ireland. D. Apr. 21, 1893, and was succeeded by his brother, Lord Stanley of Preston. —Frederick Arthur Stanley, sixteenth earl; b. in London, Jan. 15, 1841; represented Preston in the House of Commons 1862–65; Secretary of State for War 1878; and Secretary of State for the Colonies, and later President of the Board of Trade in Lord Salisbury's government; was Governor-General of Canada 1888–93.

Derby, Edward Geoffrey Smith-Stanley, Fourteenth Earl of: English statesman; b. in Lancashire, Mar. 29, 1799. He was educated at Oxford, was elected to Parliament in 1820, representing successively Stockbridge, Preston, Windsor, and North Lancashire, and became a master of the art of parliamentary debate. In 1825 he married a daughter of Lord Skelmersdale. He became Chief Secretary for Ireland in 1830 and supported the Reform bill, whose principles he had favored from the first. As Irish secretary he succeeded in carrying a coercion bill through the House in spite of the opposition of O'Connell, and brought in the first national education act for Ireland. In 1833 he entered the Whig ministry as Secretary for the Colonies, and while holding that office he used all the weight of his influence and the power of his eloquence in carrying through the measure for the emancipation of the slaves. He resigned office in 1834 because of the Government's position on the question of the Irish Church, whose surplus revenues it proposed to apply to educational purposes, a course which he characterized as plunder. So strong was his feeling on this subject, and so bitter his hostility to his former colleagues, that he abandoned the Whig party. He was Secretary for the Colonies in the cabinet of Sir Robert Peel from 1841 to 1845. Having been created Baron Stanley in 1844, he then passed into the House of Lords. He resigned office in 1845 because he was opposed to the repeal of the corn-laws, and soon after this date began to be regarded as the leader of the Conservatives and protectionist party. He stood in the foremost rank as a parliamentary debater. On the death of his father in 1851, he succeeded him as Earl of Derby. He was Prime Minister from Feb. to Dec., 1852, and was then succeeded by Lord Aberdeen. He was the leader of the opposition during the administration of Lord Palmerston, who resigned in Feb., 1858. Lord Derby then formed a new ministry, in which he was First Lord of the Treasury (Premier). This ministry is noted for the passage of the bill removing the disabilities from the Jews and of that transferring the control of India from the East India Company to the crown. He introduced a bill for electoral reform, but the House adopted an amendment offered by Lord John Russell. Lord Derby therefore dissolved Parliament and appealed to the country, but the Liberals obtained a majority in the new House of Commons which met in June, 1859, and Lord Derby then resigned office. He produced a translation of Homer's *Iliad* into blank verse (1867), which is highly commended. Russell and Gladstone, whose Reform bill had been rejected by the House of Commons, retired from power in June, 1866, and Lord Derby was then requested by the Queen to form a new ministry. He failed in his efforts to draw several Whig or Liberal leaders into a coalition. His principal colleague was Disraeli, who prepared a new Reform bill, passed in 1867, extending the right of suffrage to great numbers of the middle class. Lord Derby resigned in Feb., 1868, and was succeeded by Disraeli. D. Oct. 23, 1869.

Derby, George Horatio: officer and humorist; b. in Dedham, Mass., Apr. 3, 1823; graduated at West Point in 1846; and July 1, 1860, captain of topographical engineers. He served in the war with Mexico 1846–47; engaged at Vera Cruz and Cerro Gordo (severely wounded and brevet first lieutenant); on various surveys and explorations 1846–52; on improvement of San Diego harbor, Cal., 1853–54; on staff of commanding general and in charge of military roads department of the Pacific 1854–56; on coast survey 1856; and lighthouse engineer 1857–59. Under the *nom de plume* of "John Phœnix" he was author of *Phœnixiana* (1855); *Squibob Papers* (1859). D. in New York, May 15, 1861.

Derby, Orville Adelbert: geologist; b. at Kellogsville, N. Y., July 23, 1851. He studied at the State Normal School and subsequently at Cornell University, where he received the degree of M. S. in 1874. In 1870 and 1871 he had made brief trips on the Amazon. He was instructor in geology at Cornell from 1873 to 1875, when he resigned to take a place on the geological commission of Brazil. In 1878 the commission was dissolved, and its chief, Prof. C. F. Hartt, died soon after. Mr. Derby was appointed curator of the geological department of the National Museum, where he was engaged, among other things, in arranging and studying the rich material which had been collected by the geological commission. In 1885 he organized the geo-

graphical and geological commission of São Paulo, of which he is still the chief (1893). He has explored nearly every state of Brazil, and is the highest living authority on the geology and physical geography of that country. He has published several important papers on the geology, paleontology, etc., of Brazil, and has been employed in numerous scientific commissions by the Government. He is a fellow of the London Geological Society, and of numerous other scientific associations. HERBERT H. SMITH.

Derbyshire: an inland county of England; occupies nearly the center of the country, and has an area of 1,029 sq. miles. In the time of the Britons it belonged to the kingdom of the Coribani; under the Roman rule it formed part of *Britannia Prima*; in the period of the Heptarchy it stood under the Kings of Mercia. It is bounded E. by Nottinghamshire and Leicestershire, W. by Staffordshire and Cheshire, N. by Yorkshire and Cheshire, and S. by Leicestershire. Derbyshire is drained by the rivers Trent and Derwent. The county is remarkable for the great variety of its scenery, and is partly occupied by the Penine chain, formed of Carboniferous limestone. The Peak, the highest land in Derbyshire, has a summit, Kinder Scout, 2,082 feet in altitude. This county is rich in minerals—viz., coal, copper, iron, lead, zinc, etc. Here are manufactures of cotton, silk, and worsted goods, metallic wires, and porcelain. It is traversed by several canals and railways. Capital, Derby. Pop. (1891) 527,886; (1901) 604,577.

Derbyshire Spar: FLUOR-SPAR (*q. v.*).

Dercyl'lidas (in Gr. *Δερκυλλίδας*): a Spartan commander sent to aid the Asiatic Greeks in their resistance to the Persian forces under Pharnabazus and Tissaphernes, B. C. 399. He captured a number of cities in Asia Minor, and built a wall to protect the Greeks of the Chersonesus against the Thracians. He was superseded by Agesilaus, B. C. 396.

Der-el-Bahari: See EGYPT, ANCIENT.

Der-el-Medineh: See EGYPT, ANCIENT.

Der'embourg, HARTWIG: French Arabist; b. in Paris, June 17, 1844; since 1885 Professor of Arabic in the Collège de France. He has published the Arabic texts of Jawālīki and Ibn Jānāh, and numerous dissertations on Arabic and Sabean subjects. C. H. TOY.

Derembourg, JOSEPH: father of Hartwig Derembourg; Hebraist and Arabist; b. in Mayence, Germany, in 1811; since 1852 a resident of Paris. He has published editions of Lokman and Hariri, *The History of Palestine from Rabbinical Sources* (1867); two Hebrew versions of Dimna and Kalila, and, in conjunction with his son, *The Sabean and Himyaritic Monuments of the Louvre* (1886). C. H. TOY.

De Reszké, EDOUARD: See the Appendix.

De Reszké, JEAN: See the Appendix.

Derg, Lough (Red Lake): an expansion of the river Shannon, in Ireland; between Tipperary, Galway, and Clare; 24 miles in length and averaging 2 miles in width. The same name is given to a small lake of Ireland between Donegal and Tyrone. It incloses an isle, the reputed entrance to St. Patrick's Purgatory, which is visited annually by many devotees, and was long the most celebrated place of pilgrimage in Ireland.

Derived Function, or **Derivative**: a term first used by Lagrange in his *Calcul des Fonctions* to indicate the coefficient of h in the development of a function $F(x + h)$ according to powers of h. It is itself a function of x, and is usually represented by the symbol $F'(x)$. In a similar manner the derived function of $F'(x)$ is termed the second derived function of $F(x)$, and is denoted by the symbol $F''(x)$.

Dermap'tera (see DERMOPTERA): a name frequently given to the order of insects known as *Euplexoptera*. See FORFICULIDÆ.

Dermatology: the branch of medical science which treats of SKIN DISEASES (*q. v.*).

Dermat'ophytes [from Gr. *δέρμα, δέρματος*, skin + *φυτόν*, plant, growth]: cryptogamic vegetable growths which inhabit the cuticle or epidermis, and give rise to certain skin-diseases, such as favus, ringworm, etc. It is held that the various forms of these plants are in many cases transmutable into each other. For example, the favus plant, the barber's-itch plant (*Achorion*), and the chloasma plant (*Microsporon*) are only forms of the yeast plant (*Torula* or *Cryptococcus cerevisiæ*).

Dermes'tes [from Gr. *δέρμα*, skin + *ἐσθίειν*, eat]: a genus of small dull-colored beetles of the family *Dermestidæ*, whose larvæ feed upon dry animal substances, such as skin, horn, and feathers. *Dermestes lardarius* (the bacon beetle) and *D. maculatus* are among the most active and dangerous of museum pests, attacking all manner of dried animal preparations that have not been poisoned. The larva of a related species, a small steel-blue beetle (*Anthrenus museorum*) is particularly given to destroying the beaks and nails of birds. F. A. LUCAS.

Dermop'tera [from Gr. *δερμόπτερος*, having membranous wings (as a bat); *δέρμα*, skin + *πτερόν*, wing]: a sub-order of insectivorous mammals, distinguished by a fold of skin extending from the wrist to the ankle, and thence to the tip of the tail. See FLYING LEMUR and INSECTIVORA.
F. A. LUCAS.

Dermoskeleton [from Gr. *δέρμα*, skin + *σκελετόν*, skeleton, neut. of *σκελετός*, dried up, withered (sc. *σῶμα*, body); cf. *σκέλλειν*, to parch]: the crustaceous, testaceous, or osseous integument which covers many invertebrate animals, as the beetle and lobster; also some vertebrate animals, as the tortoise. It serves to protect the soft parts of the body, and affords points of attachment for the organs of locomotion.

Der'ne, Der'na, or **Bel'ed-al-Soor** (anc. *Darnis*): a seaport-town of Northern Africa; in Barca; a mile from the Mediterranean; lat. 32° 46′ N., lon. 22° 41′ E. (see map of Africa, ref. 2–E). Its harbor is insecure, and its general prosperity is decreasing. During the hostilities between the U. S. and Tripoli this town was taken in 1805 by the forces under Gen. Eaton. Pop. about 6,000.

De Rosny, *de-rō'nee'*, LÉON: Japanese and Chinese scholar; b. Apr. 5, 1837; professor in the School of Living Oriental Languages at Paris. He has published a history of the yellow race, a Chinese grammar, a Japanese anthology, and many dissertations on the peoples and the civilization of the extreme Orient. C. H. TOY.

Déroulède, *dā'roo'lād'*, PAUL: politician; b. in Paris, Sept. 2, 1846; studied law; a volunteer in the campaign of 1870; was wounded at Sedan, but escaped into Belgium. His *Chants du soldat* (1872) and *Nouveaux chants du soldat* (1875) attracted much attention, especially on account of their intense anti-German spirit, and ran through many editions. His *l'Hetman*, a drama in five acts and in verse, also proved a success (1877). But within the next few years his reputation rested mainly on his political activity, while chief of the Patriotic League, an organization that appealed directly to the patriotic devotion of all citizens. In 1884, when Boulanger became Minister of War, Déroulède, who was his stanch supporter, sought by all the means in his power to further a vigorous foreign policy and excite anti-German feeling. He was conspicuous in the presidential crisis of Dec., 1887, attacking the financial scandals of the Élysée. The power of the league showed itself in the election of Jan. 27, 1889, which gave him an enormous majority as deputy. The Government then suppressed the league. After the condemnation of Boulanger, Déroulède continued to be his defender, and in Sept., 1889, was elected a Boulangist deputy; re-elected in 1898. An extreme revisionist, he is usually a bitter antagonist of the Government, and holds that the President should be elected by popular vote. Other works by him are *De l'Éducation nationale* (1882); *Monsieur le Uhlan et les Trois couleurs* (1884); *Refrains militaires* (1888); and *Histoire d'Amour* (1890).

Derqui, SANTIAGO: politician; b. at Cordova, Argentine Republic, about 1810. In the political struggles which followed the revolution he adhered to the *Unitario* party, the aim of which was to bring the Platine states under one government. In 1842 he was at the battle of Caaguazú, and in 1846 he was banished by Rosas. After the fall of Rosas he was a member of the constitutional congress of the provinces at Santa Fé (1853); subsequently minister under Urquiza, and finally president of the Argentine Confederation (not including Buenos Ayres) after the retirement of Urquiza (1860). The struggle with Buenos Ayres continued, and the army of the confederation was finally beaten by Gen. Mitre at Pavon, near Buenos Ayres, Sept. 17, 1861. The result was the formation of a new constitution, and Derqui retired to Corrientes, where he died soon after.
HERBERT H. SMITH.

Derrick [so named from Derick, originally an abbreviation of Theodoric, or Derrick, a celebrated hangman at Ty-

burn in the seventeenth century]: a kind of crane or apparatus for lifting and transporting to short distances heavy weights, such as stone in a quarry. It usually consists of a tall mast supported on a pin, on which it may revolve, the pin being journaled in a hole in a large stone sunk in the ground, held steady by several guy-ropes or rods, and provided with a boom hinged near the bottom of the mast, which may be raised or lowered by suitable rope-tackle, the blocks of which are fastened respectively near the top of the mast and near the outer end of the boom. A tackle also depends from the outer end of the boom, by which the load is carried. The tackle-ropes are operated by suitable wheel gearing fastened near the bottom of the mast.

Dervishes [from Pers. *derwēsch*, mendicant, beggar]: an order or sect among the Mohammedans, resembling in some respects the monkish orders of the Roman Catholic Church and the mendicant friars, and having in some particulars a resemblance to the Freemasons of mediæval Europe. The name corresponds to the Arabic *fakir*, by which term the order, or at least the inferior portion of it, is known in India and Arabia. The order is also described by the terms *santon* and *sûfi*, which latter term Sir John Malcolm uses in his *History of Persia*.

The dervishes constitute a large part of the population in Western and Central Asia and in Northern and Eastern Africa. The origin of the order is involved in a good deal of obscurity. It is clear that the leading philosophical and religious ideas on which the order is based had been long and widely prevalent before there was any formal organization. They endeavor to trace their origin to the caliph Ali, one of the immediate successors of Mohammed. There is no clear proof of the existence of the sect in definite form earlier than the twelfth century.

This order has both a religious and a philosophical basis. At the center of its philosophy is the idea that the soul is an emanation from God, and that man's highest aim is to seek a total absorption in the Deity. On their surface the tenets of the higher grades of the order appear to be of a pure and exalted character. They partake largely of the mysticism prevalent among the Hindus, and have striking analogies with those of the Pythagoreans.

The dervishes are an ascetic order, and practice very austere rites and ceremonies. But the membership does not involve the giving up of private property or entire seclusion from the world; and many of them are engaged in trade, and some are allowed to marry. The various and, to us, strange rites and ceremonies in vogue among them are only different ways by which they seek for union with and absorption in God. They claim that in these exercises they may in time become endowed with miraculous powers; and their books teem with wonderful stories of feats of mind-reading and mesmerism performed by them in the ecstatic conditions into which they are brought by these exercises. The feats that they perform as a part of their religious service—thrusting swords and knives into their flesh, eating glass, and swallowing fire—seem little less than miraculous. Their chief religious exercise is the performance of the "zikr," which is a repetition in many different ways of the name and attributes of God, accompanied with violent exertion of arms and head and of the whole body, with intense mental strain. This is practiced often and for a long time, until the bodily powers are exhausted, and often a condition of catalepsy induced. The merit of the exercise depends upon its severity and the length of its continuance.

While the dervishes are Moslems, their doctrines differ widely from the faith of Mohammed. The Moslems in general think of religion as having little to do with personal character, it being with them mainly a means of escaping from perdition; the dervish, on the other hand, values religion as an aid in gaining deliverance from the dominion of sin. There are among the dervishes many sects or classes having more or less clearly marked peculiarities. The chief distinction is between those who are definitely organized and settled in convents, where they observe prescribed rites and give themselves to meditation and penance, and those who are unorganized, but still engage more or less in the appointed rites and ceremonies. These convents are endowed with lands which are incapable of alienation, and are otherwise the recipients of large gifts.

It is one of the traditions of the dervishes that at the first there were only two orders among them, and that afterward twelve orders arose, one from each of the twelve imams who succeeded the first caliphs. The best-known and most distinctly marked of the orders in Turkey are the Mevlevi, or whirling dervishes, and the Bedevi, or howling dervishes. Besides these there are a number of other classes, variously stated at thirty to one hundred. This uncertainty as to their number may be taken as proof that they do not exist, or that they are very imperfectly organized.

There are many dervishes who have no connection with any regular organization and no fixed abode. They go from place to place in search of employment, or are simply mendicants; and in their trade they display great skill and effrontery, often demanding aid in such a way that refusal is impossible, or at least dangerous. And so they have come to be both respected and feared.

In the early times the higher orders of the dervishes had chiefly and decidedly a religious character, but for a long period they have wielded a powerful social and political influence, and at times they have been a dangerous power in the state. As they acknowledge no authority but that of their spiritual guides, and do not accept the interpretation which the ordinary tribunals put upon the letter of the Koran, the sultans have always regarded them with jealousy. In 1826 the Sultan Mahmoud II., seeing what they were doing, and apprehending more serious trouble, put to death some of the chiefs, and attempted to destroy the order. There followed, however, a reaction, and the order in a short time regained its influence. See Madden, *The Turkish Empire* (London, 1862); Malcolm, *History of Persia* (London, 1829); Lane, *The Modern Egyptians* (London, 1836); Brown, *The Dervishes* (Philadelphia, 1868); Hughes, *Dictionary of Islam* (London, 1885). JOHN EDMANDS.

Dervish Pacha, dĕr'vish-pā'shaa': Turkish general and diplomatist; b. 1817 at Eyoub, Constantinople; sent to England and France to study engineering by the Government: filled various professional and diplomatic positions; appointed commander of all the military schools of the Turkish empire 1855; director of the administration of mines and forests 1861; defended Batoum against the Russians 1878; suppressed an insurrection of Albanians 1880–81; agent of the sultan to Egypt 1882. C. H. THURBER.

Der'wentwater, also called **Keswick Lake**: a beautiful lake of England; in Cumberland; an expansion of the river Derwent. It extends southward from Keswick; is 3 miles long and 1 mile wide. It is 238 feet above the level of the sea. On this lake is a floating island, covered with vegetation and full of air-bubbles, which render it buoyant. See DERWENTWATER, FLOATING ISLAND OF, in the Appendix.

Derwentwater, JAMES RADCLYFFE, Earl of: an English Roman Catholic and Jacobite; b. in Northumberland, June 28, 1689. He inherited the earldom from his father in 1705. In 1715 he raised a small body of his retainers to fight for the Pretender. He was one of the leaders of the army that was defeated at Preston (Nov. 13), and was taken prisoner. He was convicted of treason, and beheaded Feb. 24, 1716. His estates were given to Greenwich Hospital.

Derzhavin, der-zhaa'vin, written also **Derzavin**, or **Derjavine**, GABRIEL ROMANOVITCH: lyric poet; b. at Kazan, Russia, July 3, 1743. He entered the army in 1762, and was raised to the rank of colonel. Having gained the favor of the Empress Catharine, he was appointed secretary of state in 1791. He became a senator in 1793, imperial treasurer in 1800, and minister of justice in 1802. In 1810 he published four volumes of poems, remarkable for originality, sublimity, and for purity of sentiment. His most popular poem is an *Ode to the Deity* (*Oda Bogu*), which has been translated into English, Chinese, and other languages. His works were published in five volumes in St. Petersburg (1810–15). D. July 6, 1816.

Desaguadero, dā-saă-gwaă-dā'rō: a river of Bolivia. See TITICACA.

Desaguadero: a river of Central America. An old name for the San Juan. See NICARAGUA.

Desaix de Veygoux, de-sā'de-vā'goo', LOUIS CHARLES ANTOINE: general; b. near Riom, Auvergne, France, Aug. 17, 1768. He served with distinction in several campaigns of the army of the Rhine, and was rapidly promoted to the rank of general. In 1798 he took part in the expedition to Egypt. He gained a victory at Sidiman in October of that year, and completed the conquest of Upper Egypt in 1799. He afterward governed that province with such moderation and justice that the natives called him "The Just Sultan." In May, 1800, he returned to France, and hastened to join the army in Italy. The French were about to retreat at

Marengo, when Desaix arrived with a reserve, and converted defeat into a decisive victory, but he was killed in this action, June 14, 1800. See J. Lavallée, *Éloge historique du Général Desaix*; Thiers, *History of the Consulate*.

De Sanctis, Francesco: scholar and statesman; b. in Italy in 1818. He was educated in Naples, and there began his career as teacher or professor. This was always his natural calling, yet it was hard in the troubled days of the fifties for an Italian to avoid the complications of politics. De Sanctis had opinions, and the result was three years' imprisonment (1850–53). After his release, he taught for a time in Turin, then in Zurich, returning to Naples in 1860. Here in 1862 he became professor in the university, founding at the same time the journal *L'Italia*. He will be longest remembered for his *Storia della letteratura italiana* (2 vols., 1870). D. at Naples, Dec. 29, 1883. A. R. Marsh.

De Sanctis, Luigi: a leader of the Protestant movement in Italy; b. in Rome, Dec. 31, 1808; was for some years a priest (1831) and Professor of Theology in Rome; became a Protestant in 1847; was in 1864 appointed Professor of Theology at the Waldensian Seminary in Florence, and established there the Protestant periodical *Eco della Verità*. He wrote a number of treatises against the Roman Catholic Church, which have been translated into several languages. D. in Florence, Dec. 31, 1869. See the anonymous *Life* of him (Florence, 1870).

Desaulniers, dā'sōl'ni-ā', François Severe Lesieur: journalist; b. at Yamachiche, P. Q., Canada, Sept. 19, 1850; educated at Nicolet College, and admitted to the bar in 1879. He has been editor of *Le Constitutionnel*, *Le Canadien*, *Le Foyer Domestique*, *Le Messager de Nicolet*, and *Le Journal des Trois-Rivières*. He was a member of the Legislative Assembly of Quebec 1878–86; entered the Dominion Parliament in 1887, and was re-elected in 1891.

Neil Macdonald.

Desbrosses, dā'brŏs', Jean: landscape-painter; b. in Paris, May 28, 1835. Pupil of Ary Scheffer and Chintreuil; second-class medal, Salon, 1887; third-class, Paris Exposition, 1889. He usually paints sunlight effects on summer landscape motives. Studio in Paris. W. A. C.

Descartes, dā'kaart', René: philosopher and mathematician; b. at La Haye, in Touraine, France, Mar. 31, 1596; educated at the college of La Flèche, where he acquired great proficiency in mathematics and astronomy, and formed an intimate friendship with Mersenne. He left college in 1612, dissatisfied with the method and doctrines which were then in vogue. He resolved to efface from his mind all scholastic dogmas and the prejudices of his education, to reject the authority of books, and to admit only that which was confirmed by reason and experiment. He entered the Dutch army in 1616, and that of the Duke of Bavaria in 1619, but renounced the military profession in 1621. In pursuit of knowledge he traveled for several years in Italy, France, and other countries. He settled in Holland in 1629, in order to devote himself to the study of mathematics, astronomy, metaphysics, etc. He made important discoveries in algebra and geometry, which he announced in his *Discourse on the Method of Reasoning Well and of Investigating Scientific Truth* (*Discours de la Méthode pour bien conduire la Raison*, etc., 1637). This work comprises treatises on metaphysics, dioptries, and geometry. He was the first who introduced exponents or applied the notation of indices to algebraic powers, and he gave a new and ingenious solution of equations of the fourth degree.

He published in 1641 *Meditationes de Prima Philosophia*, which gave a wonderful impulse to philosophical inquiry. He founded the superstructure of all positive knowledge on the basis of self-consciousness, or the relation between consciousness and existence, which he expressed in this phrase: *Cogito, ergo sum*—I think, therefore I exist. He worked a greater change in metaphysical thought than any modern philosopher. The innovations and paradoxes of the Cartesian philosophy excited much hostility among the theologians and the disciples of Aristotle. His book was condemned by the college of cardinals at Rome. Among his other works is *Principles of Philosophy* (*Principia Philosophiæ*, 1644), in which he propounds his theory of the world —that the sun is the center of a *vortex* of an ethereal fluid, whose whirling motion produces the revolution of the planets and other phenomena. The French court granted him a pension of 3,000 livres in 1647. Having been invited to her court by Christina, Queen of Sweden, he went to Stockholm in 1649, where he died, Feb. 11, 1650. Complete editions of his works were published in 1690 and 1824. See *The Method, Meditations, and Selections from the Principles of Descartes*, translated by John Veitch; a translation of the *Meditations*, by W. R. Walker in *Jour. Spec. Philos.*, vol. iv.; Kuno Fischer, *Geschichte der Neueren Philos.*, bd. i.; Adrien Baillet, *Vie de Descartes* (2 vols., 1691); Thomas, *Éloge de Descartes* (1765); G. H. Gaillard, *Éloge de Descartes* (1765); Millet, *Descartes, sa Vie*, etc. (1869).

Descartes's Rule of Signs: a theorem by means of which the maximum number of positive or negative roots of an equation can be ascertained by inspection. The theory reduces itself essentially to this: The number of positive roots of an equation can not exceed the number of variations in the signs of its coefficients, considered in their proper order. As an illustration, take the cubic equation $F(x) = 3x^3 - 7x^2 + 11x + 4 = 0$. Inasmuch as there are but two variations of signs on passing from one extreme term to the other, through the intermediate ones, we conclude that the cubic can not have more than two positive roots. To ascertain the maximum number of negative roots, it is merely necessary to apply the same theorem to the equation which is obtained from the original by changing x into $-x$. Thus the positive roots $F(-x) = -3x^3 - 7x^2 - 11x + 4 = 0$ are negative roots of the original cubic, and by Descartes's rule their number can not exceed one. This rule is a particular case of Fourier's theorem.

Descent: in law, the succession to landed estate after the owner's death, in cases where he has not made previous disposition of the estate. The rule of descent among the ancient Greeks was that the sons shared alike, and the daughters were dependent upon the bounty of their brothers. Among the Hebrews the eldest son had a double portion. With the ancient Romans sons and daughters shared alike. The former English law was very complicated, but has of late received important modifications. The law of primogeniture prevails as to males, while several females of equal degree claim as one heir.

The subject of descent is regulated by positive rules in the U. S., and but few of general application can be stated. The following may be referred to as either of common recognition or having some peculiarity worthy of notice:

1. Title by descent depends upon a rule of law. The person from whom the land descends is termed an ancestor; the one to whom it passes is called an heir, who has no volition in the matter. The estate is cast upon him, at the death of the ancestor, even against his consent.

2. The persons to whom land descends are specifically designated by positive rule, and may be grouped as follows: (1) Lineal descendants. These, if of equal degree, take equally undivided shares or are "tenants in common." If of unequal degree, those who are more remote take the share that would have belonged to their parent if living. Thus if the ancestor had left a son A, and C, D, E, children of a deceased son B, the grandchildren taken together would have the share of B. Those who inherit on equal terms are said to take *per capita*; those who take the shares of deceased persons, as above illustrated, are said to take *per stirpes*. (2) Where there are no descendants, the next claimants would regularly be the parents (the father being frequently preferred to the mother), as they are removed but one degree from the intestate, while the nearest collateral relatives (brothers and sisters), reckoning according to the methods of the civil law (see Consanguinity), are two degrees. Still, if the estate descended to the intestate from maternal relatives, there are cogent reasons for preferring the brothers and sisters to the father, and the same reasons for preferring them to the mother where the land came from paternal relatives. Under these circumstances the law of some of the States gives the land to the father or mother for life only, as the case may be, and the estate itself to the brothers and sisters. (3) If there be no father or mother or descendants, the land will descend to the brothers and sisters equally, with the same distinctions as to taking *per capita* and *per stirpes* as noticed under subdivision (1). (4) The next claimants are either grandparents, or, if these be passed over, as may be the case, uncles and aunts and their descendants. In the instance of uncles, etc., the law of some of the States distinguishes between the case where the intestate acquired the estate by his own act and where he obtained it by inheritance. In the former instance the descent would take place to maternal and paternal uncles and aunts and their descendants, without discrimination;

in the latter, the uncles, etc., belonging to that branch of the family from which the estate was derived would have the preference. More remote claimants need not here be noticed. (5) Distinctions sometimes are recognized between relatives of the whole blood and those of the half blood, so that the latter are excluded from inheriting. An illustration is found in the law of New York, under which, for example, a brother of the half blood on the maternal side (*frater uterinus*) can not inherit land from a brother having a different father, which land such brother had inherited from his father, as the claimant is not in that case of the blood of the immediate ancestor from whom the estate was derived by the brother from whom inheritance is claimed (*Wheeler* vs. *Clutterbuck*, 52 New York Reports 67, 1873). (6) Posthumous children inherit as if they had been born during the life of the ancestor. They must be born alive, and of such a state of development that by the laws of physiology they are capable of living. (7) The English common law will prevail unless abrogated by statute. Thus in New York, where the special cases referred to in the statute of descents do not occur, primogeniture still is recognized.

3. Illegitimate relatives can not in general inherit, though in a number of the States they may under certain qualifications, particularly from the mother and maternal relatives.

4. The law of the State where the land is situate governs descent, without reference to the law prevailing where the owner resides.

5. In general, all interests in and rights to land are governed by the rules of descent. Thus should the intestate have only a right of action, or be the owner of a future estate, or have simply a beneficial ownership, such as an estate held in trust, his rights and qualified estates of this nature will be transmitted under the same general rules as if he were legal owner in possession. This proposition is in some respects in marked contrast with the doctrines of the common law. This system required the ancestor to have been at some time seized or to have an estate of which seizin could be affirmed. (See SEIZIN.) Accordingly, if he had acquired only a right of action, this could not descend from him, nor could in general an estate of which he had acquired the ownership, subject to a life estate in another. Still, if he had once been seized, the unlawful deprivation of his seizin would not prevent the operation of the law of descent.

6. In a number of the States aliens can not inherit. This is a rule of the English common law. In other States it has been abrogated. T. W. DWIGHT.

Deschambault, dā-shăăm-bō′: town of Quebec, Canada; in Port Neuf County, and on the St. Lawrence river. It is a railroad station, 39 miles S. W. of Quebec. See map of Quebec, ref. 4–D. Pop. 1,456.

Deschamps, dā′shăăñ′, ÉMILE: poet and dramatist; b. at Bourges, France, Feb. 20, 1791. He produced in 1818 two successful comedies, entitled *Selmours et Florian* and *Le Tour de Faveur*, and took position in the literary world as one of the most ardent champions of the Romantic movement. In 1828 he published a volume of poems called *Études françaises et étrangères*. He contributed to the journals some prose tales and a great number of critical articles. He also translated *Romeo and Juliet* and *Macbeth*. D. Apr. 23, 1871.

Deschamps, EUSTACHE, entitled *Morel* during his life: poet; b. at Vertus, in Champagne, France, in 1328; has an important place among the artificial versifiers of the end of the fourteenth century. He chiefly produced *ballades*, *rondeaux*, *virelais*, and similar forms of verse. Still we have by him a poem of 13,000 lines, entitled *Miroir de Mariage*, and an *Art of Poetry* (*Traictié de l'art de dicter*), which has much interest for the student of French verse. D. about 1410. The edition of the works edited by the Marquis de Queux de Saint-Hilaire for the Société des Anciens Textes Français is not yet complete (1892). See A. Sarradin, *E. Deschamps, sa vie et ses œuvres* (1880). A. R. MARSH.

Deschanel, dā′shăă′nel′, ÉMILE AUGUSTE ÉTIENNE MARTIN: author; b. in Paris, Nov. 14, 1819; published in 1850 *Catholicisme et Socialisme*, and articles for the republican press which caused his banishment. Returning in 1859, he became an editor of the *Journal des Débats*; in 1881 he was made Professor of Modern French Literature in the Collège de France. He printed *Les Courtisanes de la Grèce* (1854); *Histoire de la Conversation* (1858); *Physiologie des écrivains et des artistes* (1864); *Études sur Aristophane* (1867); *Le Romantisme des classiques* (1882); *Racine* (2 vols., 1884); *Pascal, La Rochefoucauld, Bossuet* (1885); *Le Théâtre de Voltaire* (1886); *Boileau, Charles Perrault* (1888).

Revised by A. R. MARSH.

Descht: a river of Baluchistan; enters the Arabian Sea in lat. 25° 15′ N., lon. 61° 50′ E. It is nearly 900 miles long, but is shallow in all parts of its course.

D'Esclot, Esclot, or **Sclot**, BERNAT: Catalan historian, whose *Chronicle* was first published in the original text by Buchon, together with a translation of Muntaner and other matter in his *Collection* of *Chroniques étrangères relatives aux Expéditions françaises pendant le XIII^e^ Siècle* (Paris, 1841, 8vo). The years of D'Esclot's birth and death are unknown, but his *Cronica del Rey En Pere e dels seus antecessors passats* appears to have been composed in 1285. This work has not the fervor, the "wrath and partiality," of Muntaner's chivalric narrative, but it is not therefore less trustworthy; and it often contains piquant details which Muntaner sacrificed to his rhetoric. D'Esclot's is the oldest historical composition of any moment which remains to us from the early stage of the Catalan language, and it is therefore of great linguistic as well as literary interest.

Descriptive Geometry: See GEOMETRY, DESCRIPTIVE.

Deseada: island of the West Indies. See GUADELOUPE.

Deseret′, University of: a collegiate institution of Salt Lake City, U.; incorporated in 1850 by the assembly of the provisional State of Deseret. In Nov., 1850, it was opened for the reception of students under the supervision of Orson Spencer, A. M. Owing to a lack of patronage the school was discontinued till 1867, when, under David O. Calder, it was started as a commercial college. In 1869, under the presidency of John R. Park, M. D., scientific, classical, and normal departments were added to the commercial, and in 1870 an academical department was established, as well as a model school. A deaf-mute department was established in 1884. Both sexes are admitted to the university.

Deseron'to: town (founded in 1850); Hastings co., Ontario, Canada (for location, see map of Ontario, ref. 3–G). It is connected with the Grand Trunk and Canada Pacific R. R. by a branch line, and is situated on the Bay of Quinte, 130 miles W. of Toronto. Deseronto has four churches, high school, extensive lumber-mills, sash and door factory, terra-cotta works, car and locomotive shops, flour-mills, brick-yard, distilling works, etc. Pop. (1880) 1,670; (1890) 3,388; (1893) estimated, 4,000.

EDITOR OF "TRIBUNE."

Deserts [O. Fr. *desert*: Ital. *deserto*: Span. *desierto* < Lat. *deser′tum*, plur. *deser′ta*, uninhabited land, *deser′tus* pte. of *dese′rere*, abandon]: barren land areas, determined by aridity, cold, or the absence of soil. They are commonly thought of as dry plains, but they may possess great variety of form, including all areas scantily occupied by or free from animal and plant life. The barren rocks and snows of mountain summits, the icy plateau of Greenland, the fresh lava flows of volcanic districts, and the salt-beds of extinct lakes may all be included with arid lands under the general term desert.

The dryness by which arid deserts are produced depends on three things: 1. Mountains inclosing the region from moist winds. Thus the deserts of the western basins of Nevada, Utah, and Arizona are sheltered by the Sierra Nevada from the vapor-bearing winds of the Pacific; the mountains that rise above these deserts may have rain or snow enough to support forest growth at high levels, but the intervening plains are extremely barren. The great interior basins of Asia are inclosed on all sides by mountains which receive rain from the oceans on their outer slopes; streams descend from the mountains to the inclosed basin, supporting small settlements where they emerge from their steeper valleys, and then dwindling away as they advance across the sandy wastes. 2. The occurrence chiefly or exclusively of warming winds; that is, of winds which flow toward the equator, warming as they advance and yielding no rain. Thus the great Sahara lies chiefly under the N. E. trade winds; its northern margin receives light rains in winter, when cyclonic storms pass by from the Atlantic; the southern margin has rain in summer, when the equatorial rain-belt migrates north; but the central area has no rains except where its mountains rise high enough to provoke precipitation. The deserts of Atacama on the west coast of South America and of Lower California are dry

even though near the ocean, because their winds blow equatorward. 3. Distance from the ocean, even though not inclosed by mountains. The deserts and steppes of the Aralo-Caspian region may be reached by Atlantic winds crossing the lowlands of Central Europe, but the overland distance is so great that most of the vapors brought from the sea fall as rain on the way.

The form of arid deserts varies greatly; from unbroken plains, as the beds of extinct lakes or seas in Utah, Nevada (see BONNEVILLE and LAHONTAN), and Australia, to sandy and stony plateaus much diversified by high and low land, as over the greater part of the Sahara. The former action of running water, indicative of a moister climate, is clearly proved by the dried valleys or wadies which traverse the Sahara, where they are often followed as caravan routes; but the present agent of greatest geological change is the wind, by which the finest dust is blown far away, even to the ocean, and the sand is drifted about obliterating rather than forming valleys, carving the rocks, and heaping up dunes several hundred feet high. See ARID REGION, DUNE, OASIS, and SAHARA. W. M. DAVIS.

Desfontaines, dā′fōn′tān′, RENÉ LOUICHE: botanist; b. at Tremblay, Ille-et-Vilaine, France, in Feb., 1750. Among his published works were *Flora Atlantica* (2 vols. 4to, 1798), which treats of the plants of Africa, and *Description of the Trees and Shrubs of France*. D. Nov. 16, 1833.

Desgenettes, dā′zhe-net′, NICOLAS RENÉ DUFRICHE, Baron: physician; b. at Alençon, France, May 23, 1762. He was chief physician of the army of Italy in 1795–96, in Egypt 1798; was physician to the grand army during the empire, and at the battle of Waterloo. He lost his position at the Restoration. He wrote, besides other medical works, *The Medical History of the Army of the East* (1802). D. Feb. 3, 1837.

Desgoffes, dā′gŏf′, BLAISE ALEXANDRE: still-life painter; b. in Paris, Jan. 17, 1830. Pupil of Flandrin; second-class medals, Salons, 1863 and 1878; third-class medal, Paris Exposition, 1889. Many of his paintings represent groups of splendid objects of art, ivories, bronzes, enamels, lapis-lazuli vases, and the like. *Amethyst Vase* and *Crystal Vase and other Objects* are in the Luxembourg Gallery, Paris. Studio in Paris. W. A. C.

Deshnef, SIMEON: See the Appendix.

Des'iccant [from Lat. *desic'cans*, pres. ptc. of *desicca're*, to dry anything up; *de.* off + *siccus*, dry]: in medicine, an application used to check secretion of a membrane or ulcer.

Desiccation: a process of extracting moisture by chemical agency or by the use of air and heat. Fused calcium chloride, quicklime, fused potassium carbonate, and sulphuric acid are used for this purpose.

Desiderio (Da Settignano): See SETTIGNANO.

Designs: See the Appendix.

Desima: a very small artificial island in the Bay of Nagasaki, Japan, shaped like a fan. In the early history of European relations with Japan the Dutch were the only people admitted, and they were confined to this island and subjected to many indignities.

Desire: See the Appendix.

Desjardins, dā′zhaar′dăn′: a sculptor, whose real name was MARTIN VAN DEN BOGAARD; b. in Breda in 1640. In 1670 he went to Paris, and in 1671 presented to the Academy a bas-relief representing Hercules crowned by Glory, and two other works. These caused his election into the Academy. He executed the equestrian statue of Louis XIV. for the city of Lyons, his first and finest work of this size. In the vestibule of the church of the Mazarin College he sculptured the Evangelists and the Fathers of the Church in six groups; these were destroyed in the Revolution; he produced the marble statue of *Evening* for the park of Versailles, and finished Lefevre's *Artemis*. He was commissioned to erect a statue to Louis XIV. on the Place de la Victoire in Paris, for which he was paid a million francs; this was also destroyed in 1792. D. in 1694. W. J. S.

Desjardins, ALPHONSE: member of Canadian Parliament; b. at Terrebonne, P. Q., May 6, 1841, and educated at Masson College. He was admitted to the bar in 1862; in 1868 forsook law for journalism, and has edited *L'Ordre* and *Le Nouveau Monde* newspapers. He was one of the organizers of the Canadian papal zouaves sent to aid the Pope in 1868; one of the authors of the *Programme Catholique* 1871; and was created a knight of the order of Pius IX. in 1872. He entered the Parliament of Canada in 1874, and has been re-elected at every subsequent election up to and including that of 1891. NEIL MACDONALD.

Desman [Swed. *desman-ratta*, musk rat]: the common name for the two species of musk shrews. The Russian desman (*Myogale moschata*) is about 8 inches long, exclusive of the tail, which is as much more. The fur is soft, brown, and glossy, the hind feet long and webbed, the tail naked and vertically flattened. In fact, but for its long, slender nose, the desman, although an insectivore, bears a strong external likeness to a small musk rat. It inhabits the lakes and rivers of Southeastern Russia, and feeds on aquatic insects. The Pyrenean desman (*M. pyrenaïca*), so named from its habitat, is smaller, and has a round tail. See TALPIDÆ. F. A. LUCAS.

Desmids [from Gr. δεσμός, chain + εἶδος, form]: microscopical, single-celled, fresh-water algæ (*Desmidiaceæ*), numbering about 1,100 species. In many ways they remind one of the Diatoms, but they have true chlorophyll, and their walls are not silicified. In shape they vary from fusiform to cylindrical and disk-shaped, and are often much constricted at the middle. In some cases they have the power of movement, somewhat as in Diatoms; but it is not known whether the mechanism is the same or not.

They reproduce by splitting (fission), and by a sexual process (conjugation). In the former the neck joining the two halves elongates, and divides by a partition (Fig. 1), producing two unsymmetrical individuals. By subsequent growth of the smaller lobes the two desmids soon become

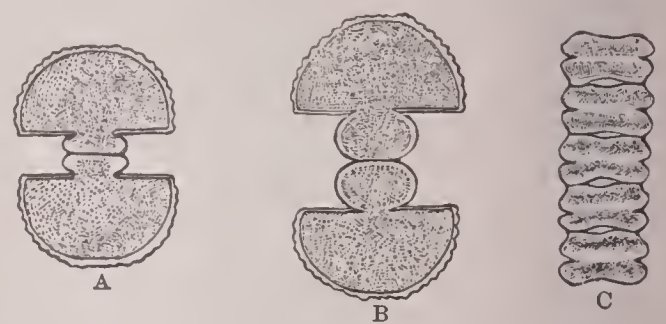

FIG. 1.—A, B, the splitting (fission) of *Cosmarium*; C, the splitting of *Desmidium*, in which the new individuals remain attached.

symmetrical, and usually separate from one another. In some species they remain attached, and thus form long filaments.

In the sexual process two contiguous cells break open, and their contents unite into a single mass which soon surrounds itself with a thick wall, thus becoming a resting-spore (zygospore). In germination these spores separate their contents into two parts, each of which eventually becomes a new desmid.

In the classification of desmids three sub-families are recognized as follows: (1) Cells after division forming a filament (*Eudesmidieæ*), as in *Desmidium* (Fig. 1, C), *Hyalotheca*, *Gonatozygon*, etc. (2) Cells after division free, but connected by a hyaline branching filament (*Cosmocladieæ*), as in the single genus, *Cosmocladium*. (3) Cells after division always free, usually more or less bilobed (*Didymioideæ*), as in *Closterium* (Fig. 2, A), *Cosmarium* (Fig. 2, B), *Euastrum*, *Micrasterias* (Fig. 2, C), etc.

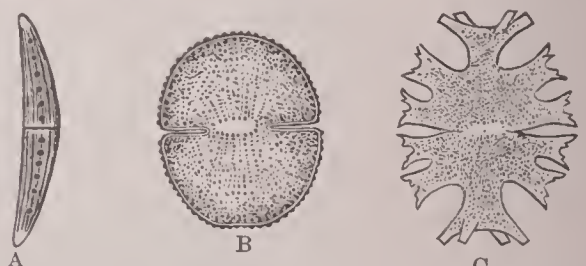

FIG. 2.—A, *Closterium striolatum*; B, *Cosmarium radiosum*; C, *Micrasterias americana*, all highly magnified.

LITERATURE.—*British Desmids*, by M. C. Cooke (1887), with 65 plates; *Desmids of the United States*, by Francis Wolle (1884), with 53 plates; *Sylloge Algarum* (vol. i., pp. 777 to 1236), by J. B. De Toni (1889), including descriptions of all known species. CHARLES E. BESSEY.

Des Moines, de-moin′: river of the U. S., the largest that traverses the State of Iowa; rises in the southwest part of Minnesota. It flows in a S. S. E. direction to the capital city, Des Moines, below which it runs nearly southeast-

ward until it enters the Mississippi river at the southeast extremity of Iowa, about 4 miles below Keokuk. Length estimated at 500 miles. It flows through fertile undulating prairies and a large field of bituminous coal.

Des Moines: city and center of seventeen railways; capital of Iowa and of Polk County (for location of county, see map of Iowa, ref. 5–G); on Des Moines river at the mouth of the Raccoon; 357 miles W. of Chicago, 174 miles W. of Davenport, and 138 miles E. of Omaha. The State capital was removed in 1857 to this city, which was at that time called Fort Des Moines, founded five years earlier. A new State-house has been erected at a cost of $3,000,000.

State capitol, Des Moines, Ia.

The State library contains over 50,000 volumes, and the city maintains a large free library. The State arsenal, a large building, contains, besides military equipments for the State, the tattered flags of all Iowa regiments engaged in the war of 1861–65, and other trophies and articles of interest. The city has 85 churches, 45 public school buildings, and several private schools; 3 high schools, 8 colleges, a museum, an extensive system of electric railways, water-works, 4 daily, 28 weekly, and 15 monthly and semi-monthly periodicals; 14 banks (4 national, 8 savings, 1 State, and 1 private), with an aggregate of nearly $2,000,000 capital and about $1,000,000 surplus; 50 insurance companies; a U. S. court-house and post-office, built of Joliet stone, costing $350,000, and a large county court-house. The city is surrounded with inexhaustible coal lands, and coal is mined so cheaply that the cost of motive-power is trifling.

A military post for cavalry and artillery has been established here, and $200,000 appropriated by Congress for land and buildings.

Manufactures.—The manufacturing interests are large and rapidly increasing, including starch-factories, cotton, woolen, flour, and oatmeal mills, packing-house, linseed-oil mills, and manufactories of paint, soap, boilers, plows, scales, wagons, carriages, brooms, shoes, bricks, boats, confectionery, crackers, excelsior, furniture, woven-wire fence, gloves and mittens, hats, harness, hosiery, iron and brass, proprietary medicines, novelties, pottery, pumps, printing-presses, pianos, suspenders, show-cases, tents, type-writing machines, trunks, windmills, white bronze, yeast, and washing-machines. The U. S. census report for 1890 shows 297 manufacturing establishments, with a capital of $2,792,979, giving employment to 3,149 persons, at an annual wage of $1,660,969. The cost of material used was $2,425,796, and the value of products $5,242,992.

Population.—Des Moines is the most populous city in Iowa. Pop. (1880) 22,408; (1890) 50,093; (1900) 62,139.

SECRETARY OF COMMERCIAL EXCHANGE.

Desmond: a noble family of Ireland, whose founder was MAURICE FITZGERALD, who became Earl of Desmond and one of the three chief governors of Dublin. GARRET, Earl of Desmond, the head of the Southern Fitzgeralds and an all-powerful chief in Munster, refused to submit to the authority of Queen Elizabeth, and was declared a traitor. He then submitted, but revolted in 1574, and again in 1579. Driven from his lands and hunted as an outlaw, he was discovered and slain by the English in 1583. From that time the family ceased to be powerful, and it is now extinct.

Desmoulins, dā′moo′lăn′, LUCIE SIMPLICE CAMILLE BENOIST: political journalist and revolutionist; b. at Guise, Aisne, France, Mar. 2, 1760; studied law in Paris, and embraced the ideas of the Revolution with boundless enthusiasm. Some of his writings had already attracted attention and exerted considerable influence, when he was suddenly lifted into prominence by his passionate address in the garden of the Palais Royal, July 13, 1789, which stirred up the people to the storming of the Bastile on the following day, and may perhaps be considered the beginning of the active manifestations of the Revolution. He became a devoted follower of Danton; edited the *Révolutions de France et de Brabant* with great brilliancy and audacity, reflecting and controlling the tumult and passion of the hour; was a prominent member of the Cordeliers Club, and one of the leaders of the rising of Aug. 10, 1792. In 1792 he became a member of the convention, in which he acted with the Mountain, voted for the death of the king, and aided in the overthrow of the Girondists. Still following Danton's leadership, he joined the latter in an effort to counteract the bloodthirsty excesses into which the *Enragés* plunged the Revolution, and in his paper *Le vieux Cordelier*, which had much fame and possessed admirable literary qualities, he denounced these excesses with courage and often nobility of spirit. Indeed, his wit contributed much to his ruin. He incurred the implacable hatred of Saint-Just by saying that the latter "carried his head like the Holy Sacrament." Robespierre, his schoolmate, who had several times intervened in his favor, and who in his speeches gave some very striking characteristics of his noble enthusiasm and dangerous talent, and of the peculiar tenderness and waywardness of his character, finally deserted him. He was involved in the proscription of Danton, and was executed with him Apr. 5, 1794. At the last his courage failed him, and he was conducted to the guillotine in a state of piteous terror which contrasted strangely with the courage of Danton. Lucile Duplessis, to whom he was married in 1791, and whom he tenderly loved, soon followed him to the guillotine. He was not a great leader like Danton, but rather a brilliant guerrilla. Of all the actors of the Revolution he was the most gifted writer. "No one," says Lamartine (*History of the Girondists*), "could so well personify the populace with its tumultuous movements, its nobility, its inconstancy, and its quick transitions from fury to pity for its victims. A man at once so ardent and so volatile, so trivial and so inspired, so undecided between blood and tears, must have influence over an insurgent people in proportion as his nature is congenial with theirs." See Thiers, *History of the French Revolution*; Carlyle, *French Revolution*; Lamartine, *History of the Girondists*; Claretie, *Œuvres de Camille Desmoulins* (Paris, 1874) and *Camille Desmoulins* (Paris, 1875); Robinet, *Le Procès des Dantonistes d'après les documents, etc.* (Paris, 1879); and the biography by Godart (1889).

C. H. THURBER.

De Soto: city; Jefferson co., Mo. (for location of county, see map of Missouri, ref. 5–J); situated on railway, 43 miles S. W. of St. Louis. It is an important center in a mining district. Pop. (1880) 1,989; (1890) 3,960; (1900) 5,611.

De So'to, HERNANDO: Spanish explorer. See SOTO.

De Spenser, HUGH LE: a favorite of King Edward II., whose rapid rise and arrogant manners provoked the hatred of the barons. Aided by the queen and led by Lancaster, the barons forced De Spenser into exile (1321), but the king's unexpected energy discomfited the malcontents. De Spenser was recalled; Lancaster was defeated and executed with many of his adherents. In 1326 the barons revolted, with the queen again on their side. The king's party was captured, and De Spenser promptly hanged. The king was dethroned and imprisoned (1327). F. M. COLBY.

Despoblado: See PUNA.

Dessalines, des′săă′leen′, JEAN JAQUES: Haitian revolutionist; b. at Grande Rivière, département du Nord, 1758. He was a Negro slave, and for a time belonged to another Negro, one Dessalines, from whom he took his name. Joining the insurrection of 1791, he allied himself to the atrocious bands of Brouckman and Jean François. Later he attracted the attention of Toussaint Louverture, who rapidly promoted him until he became a general of division and second in command. Dessalines was so ignorant that he could hardly write his own name, and he was quite incapable of planning a campaign or even a battle, but his ferocious courage was very effectual in the strife with the mulattoes,

who were generally led by men as ignorant as himself. At Artibonito he distinguished himself against the English, and subsequently he commanded different departments successfully, ruling by brute force and cruelty. When the French expedition of Leclerc arrived Dessalines opposed them bravely in the department of the West; at the fort of Crête à Pierrot he defended himself with only 1,000 men until nearly 2,000 of the assailants were killed or wounded (Mar. 25, 1802). He at length submitted; but after the departure of Toussaint he joined with others in a new revolt, and was recognized as general-in-chief by the blacks. The French army had been decimated by yellow fever; Dessalines, aided by the English, defeated them several times, and they finally evacuated the island (Nov., 1803). On Jan. 1, 1804, the independence of Haiti was declared, and Dessalines was named governor-general for life, with full legislative and military powers, and the right of appointing his successor. He expelled nearly every Frenchman from the eastern end of the island, and attempted, unsuccessfully, to subdue Santo Domingo. Imitating Napoleon, he had himself proclaimed emperor as Jean Jacques I. (June 16, 1805). But his tyranny soon provoked hatred, and he was waylaid and killed near Port au Prince, Oct. 17, 1806. HERBERT H. SMITH.

Dessau, des'sow: a town of Germany; capital of the duchy of Anhalt; on the Mulde near its entrance into the Elbe; 80 miles by railway S. W. of Berlin (see map of German Empire, ref. 4–F). It is well built, and contains a fine ducal palace, a town-hall, a theater, a college, and a normal school. Here are many paintings of the early German masters. It has manufactures of woolen cloth, hosiery, hats, tobacco, etc. It was at the bridge of Dessau that Wallenstein won his victory over Count Mansfeld in the Thirty Years' war, Apr. 25, 1626. Pop. (1895) 42,375.

De Staël-Holstein, ANNE: See STAËL-HOLSTEIN, etc.

Dester'ro, NOSSA SENHORA DO (often called Santa Catharina): capital and principal city of the state of Santa Catharina, Brazil; beautifully situated on the western side of the island of the same name, facing the strait which divides it from the mainland (see map of South America, ref. 1–F). This strait forms an excellent and secure anchorage, with only a slight exposure to south winds. The city is backed by high hills, and is itself built on very irregular ground; the streets are ungraded and almost impassable for carriages. Feather flowers and ornaments are manufactured and exported in considerable quantities. A Portuguese named Monteiro settled here in 1650, and built the chapel from which the place took its name. He was driven out by the Dutch, but the locality was resettled in later years. Pop. about 6,000. H. H. SMITH.

Desty, ROBERT: See the Appendix.

Detaille, de-tăl', JEAN BAPTISTE ÉDOUARD: military painter; b. in Paris, Oct. 5, 1848. Pupil of Meissonier; medals of honor, Salon, 1888, and Paris Exposition, 1889; officer Legion of Honor 1881. A draughtsman of great skill and delicacy, and one of the most popular painters of the day. He seldom paints action in war, but his pictures of soldier life are in every way excellent. His name is usually coupled with that of de Neuville, the two being counted the foremost military painters of the modern French school. Many of his pictures are in U. S. collections; among them *Skirmishing near Paris*, 1870 (Vanderbilt collection, New York); *French Cuirassiers bringing in Bavarian Prisoners* (Corcoran Gallery, Washington). W. A. C.

Determinants: certain symmetrical algebraic functions of n^2 quantities of very frequent recurrence in the theory of equations, and still more in the higher geometry. Thus, if we take the product $a_1b_2c_3...n_n$ of n factors, and permute the subscript indices in every possible way, we shall have 1.2.3....n products. If now we give to each one of these several products a *plus* sign whenever the number of interchanges of indices necessary to produce it from the above product is *even*, and a *minus* sign when the number of interchanges is *odd*, and add the results, we have the *determinant* of the n^2 quantities a_1, b_1, c_1, ...n_1, a_2, b_2, c_2, ...n_2, a_3, b_3, etc.

The determinant is usually written thus:

$$\begin{vmatrix} a_1\ b_1\ c_1 \dots n_1 \\ a_2\ b_2\ c_2 \dots n_2 \\ a_3\ b_3\ c_3 \dots n_3 \\ \dots\dots\dots\dots \\ a_n\ b_n\ c_n \dots n_n \end{vmatrix}$$

but it is also sometimes written $\Sigma\pm\ (a_1b_2c_3...n_n)$, where the product written in the parenthesis is that of the letters along the diagonal of the matrix, beginning at the upper left corner.

Determinants play a most important part in every branch of advanced mathematics. The most extended treatise on them is the German one by Baltzer.

Revised by S. NEWCOMB.

Determinate Problem: a problem in geometry which admits of a limited number of solutions, an indeterminate problem being one which admits of an indefinite number of solutions. Thus the problem, "Given the base, perimeter, and area to construct the triangle," is determinate, there being in general but four solutions. By omitting one of the three data, however, the problem becomes indeterminate. For instance, an infinite number of triangles having the same perimeter can be constructed on a given base. The problem, however, is not *perfectly* indeterminate, for the vertices of all such triangles are restricted to a certain locus —i. e. the ellipse whose foci are the extremities of the given base. In general, the omission of one of the conditions or data which render a problem determinate leads to a local problem.

Determinism: the doctrine that denies the freedom of the will, and refers all acts of seeming volition to a law of necessity. According to Sir William Hamilton's use of the term, it signifies the theory of the necessitarian school of philosophers, who hold that the acts of the will are determined by an inner necessity arising from the controlling force of motives acting upon character. These motives in man are the result of his peculiar and necessary development in accordance with the laws of the universe, of which he is a part. This doctrine is a part of pantheistic systems of philosophy, but belongs as well to other systems, and holds a prominent place in the philosophy of Leibnitz, according to which each monad, substance, or being acts independently of all others, but by a pre-established harmony governing its internal development is prevented from conflicting with the rest of the universe. The theory of determinism has been maintained by the exponents of various systems of philosophy, and approached from widely different standpoints. Schopenhauer, Julius Müller, J. S. Mill, and Buckle have advanced it in one form or another, and among theologians it has given rise to endless discussion. St. Augustine employed the argument of determinism against the Pelagians, and the early Calvinists zealously maintained this doctrine as the necessary consequence of the theory of predestination. See FATE, NECESSITY, and WILL.

Det'inue [O. Fr. *detinu*, past ptc. of *detenir*; Mod. Fr. *détenir*, detain < Lat. *detine're*; *de*, from + *tene're*, hold]: in the common law, an action for the recovery of a personal chattel wrongfully detained, or its value, with damages and costs. The action is for the recovery of a specified article; the chattel therefore must be of such a character that it can be distinguished from others, as a horse. The plaintiff must have an absolute or special property in the article at the time he brings the action. The defendant must have had possession at some time, which should have been acquired in some lawful manner, as by contract or finding. The nature of the possession must also continue. Thus, if a finder should sell the thing found before action, the proper remedy would be an action for conversion, though if he had not sold there might be a case of detinue. In the U. S. this form of action has been largely superseded by the less technical actions of trover or replevin. Revised by F. STURGES ALLEN.

Detmold, det'mōlt: a town of Germany; capital of the principality of Lippe-Detmold; on the Werre; 42 miles S. W. of Hanover (see map of German Empire, ref. 4–D). It has a fine castellated palace, a museum, a theater, a public library, and a celebrated teachers' seminary; also manufactures of linen and woolen goods, tobacco, cards, and carved work in wood and stone. Near this town is the battle-field where Hermann destroyed the Roman army of Varus in 9 A. D. Pop. (1890) 9,735.

Detmold, WILLIAM, M. D.: b. in Hanover, Germany, Dec. 27, 1808; studied medicine in Göttingen; served as surgeon in the Hanoverian army; in 1837 became a resident of New York city; professor in College of Physicians and Surgeons; introduced orthopædic surgery into the U. S.; during the civil war acted as volunteer surgeon in Virginia; invented a knife and fork for one-handed men, known as "Detmold's knife." D. in New York, Dec. 26, 1894.

De Tocqueville, de-tŏk'veel', ALEXIS CHARLES HENRI CLEREL: French publicist. See TOCQUEVILLE, DE.

Detouche, Laurent Didier: painter; b. at Rheims, France, July 29, 1815; was educated for the legal profession, but in 1837 entered the studio of P. Delaroche, and thenceforth devoted himself to art. Among his historical paintings are *Saint Paul ermite*, which he gave to the Cathedral of Rheims in 1840; *Le Supplice de Jeanne d'Arc* (1841), which procured him the gold medal; and *La Disgrâce de Fouquet* (1853). He also did excellent work as a painter of *genre*. D. at Paris, Apr. 28, 1882.

Detours, Hippolyte: lawyer and politician; b. at Moissac, France, Jan. 5, 1799; held office under the restored Bourbons. In 1837 he was admitted to the bar, and practiced law. He was elected to the Assembly after the February revolution, and voted with the extreme left. After the *coup d'état* of 1851 he resumed his practice at Moissac. D. at Limoux, July 2, 1885.

De Trobriand, de-trō'brĕĕ'ăn', Philip Regis: author and officer in U. S. army; b. June 4, 1816, in Tours, France; removed to U. S.; served with distinction on the Union side in the civil war; commanded defenses of New York, May, 1864; attained rank of brevet major-general of volunteers; served in the West after the war; retired Mar. 20, 1879. Author of *Les Gentilshommes de l'Ouest* (Paris, 1841); *Quatre ans de Campagnes à l'armée du Potomac* (1867); editor and publisher of the *Revue du nouveau monde* (New York, 1849–50); editor of the *Courrier des États-Unis* (New York, 1854–61). D. at Bayport, L. I., July 15, 1897.

Detroit' [Fr. *détroit*, the strait]: an important railway and commercial center; the metropolis of Michigan and capital of Wayne County (for location of county, see map of Michigan, ref. 8–K); on the west bank of the Detroit river; 18 miles from Lake Erie and 7 miles from Lake St. Clair; in lat. 42° 19′ 53″ N., lon. 82° 58′ W. The Detroit river, which is the boundary-line between the U. S. and Canada, is of varying width, being half a mile broad opposite the city, and of great depth, forming an excellent harbor.

The site upon which the city is built rises from the edge of the river, the inclination being gradual, at the rate of about 58 feet per mile, affording perfect drainage. Detroit is one of the best-sewered cities in the U. S. The streets are broad and well paved, and the number of handsome private residences and business buildings is large.

The city is abundantly supplied with water, there being 560 miles of pipe laid up to Jan. 1, 1900, at which time the aggregate cost of construction of the water-works amounted to $6,061,110. The water-works have a bonded debt of $1,033,000. The city has a perfectly disciplined paid fire department, with steam apparatus, etc., costing $1,700,000, and also a fire-alarm telegraph. The expense of the department in 1900 was $568,707. The city has a uniformed metropolitan police force, with a central, 7 precinct and 5 sub stations. The expenses of the force for 1900 were $554,850. There are 70 public school buildings, valued at $2,444,295, with 898 teachers and an enrollment of 34,000 pupils. The annual expenses of the schools are $1,085,710. There are, besides Detroit College, an art school, several convents, 30 Roman Catholic parochial schools, 23 German Lutheran schools, and a large number of private institutions, including 4 commercial colleges. The assessed valuation of the real and personal property of the city in 1900 was $244,371,550. The bonded debt of the city July 1, 1900, was $5,074,000—resources in sinking fund, $1,609,809.88; net debt, $3,724,637. The principal work of art adorning the city is the Michigan Soldiers' and Sailors' Monument, designed by Randolph Rogers, and built of bronze and granite at a cost of $75,000. The structure is 55 feet high, surmounted with a colossal bronze allegorical statue of "Michigan." The chief public buildings are the city-hall, situated on the Campus Martius and facing upon four streets, and the county court building opposite, on Cadillac Square. The latter is regarded as one of the finest in the West, and cost $2,250,000. The house of correction, which has attained a national and European reputation, is valued at upward of $400,000, and has a capacity for 600 prisoners. There are 187 miles of electrically equipped street railways in the city, and 297 miles of suburban electric railway tracks. The public library contains 162,511 volumes. There is a bar library with upward of 7,000 volumes. There are 3 medical colleges, 6 public hospitals, 4 orphan asylums, 2 foundling and women's hospitals, an insane asylum, 3 houses of shelter for magdalens, an industrial school, 2 homes for the aged poor, 2 old ladies' homes, and numbers of other benevolent institutions of less prominence. There are 200 churches. Some of these church edifices are noble specimens of architecture. The city contains 6 national banks, 16 State banks, 2 trust companies, and a number of building and loan associations and savings and loan institutions. It is the seat of the U. S. circuit court for the sixth circuit, and the U. S. district court for the eastern district of Michigan, the Wayne County circuit court, the recorder's and the probate court of Wayne County. The U. S. custom-house for the port of Detroit and the internal revenue office are located here, as are also the principal office of the U. S. lake survey and the department in charge of the lake lighthouses. Fort Wayne, designed to be the most extensive American fortification on the northern frontier, is located just below the city, commanding both it and the river. Though in an incomplete state, it includes a series of batteries protected by earthworks, and is garrisoned by a force of infantry. There are nine cemeteries. The three principal—Elmwood, Mt. Elliott, and Woodmere—are upon locations of great natural beauty, and are embellished by skillful landscape-gardening and tasteful monuments. There are twenty public parks, the largest of which, Belle Isle, contains about 700 acres. It was purchased in 1879 at an expense of $200,000, and over $1,250,000 has been expended in its improvement. A bridge connects it with the city proper. Palmer Park, which has an area of 133 acres and is situated in the northern part of the city, is next in size. A boulevard extends from the Belle Isle bridge nearly to the western boundary of the city, surrounding a large portion of it on three sides. The city is lighted by its own plant, established in 1893. The plant complete cost the city to July 1, 1899, less depreciation charges, the sum of $720,620.34, and it is electrically equipped for 2,375 2,000 candle-power arc lamps and 3,000 16 candle-power incandescent lamps. The cash cost for an arc light for the year ending July 1, 1900, was $40.30. The number of street lights operated is 2,002 arcs of 2,000 candle-power each, placed at 1,695 locations.

Manufactures.—There are many foundries, blast furnaces, copper-smelting works, locomotive and car works, ship-yards, dry-docks, iron-bridge works, safe-manufactures, furniture and other establishments using wood as the chief material, pork-packing establishments, and some of the most extensive tobacco and cigar, salt and soda-ash factories in America. The shipping trade of the city in produce and manufactures is very large. The U. S. census report for 1890 shows 1,744 manufacturing establishments, with a capital of $43,275,940, giving employment to 38,281 persons, at an annual wage of $18,911,712. The cost of materials used was $41,225,534, and the value of products $77,039,177. There are 8 daily papers, 2 being in the German language, 34 weeklies, 4 semi-monthlies, 23 monthlies, and 1 quarterly.

History, etc.—The present site of the city was first visited by the French in 1610, and remained under their dominion until 1762. The first legitimate settlement was made in 1701, at which time a fort was erected called Ponchartrain, the first governor being the Sieur de la Motte Cadillac; and from time to time emigrants were sent over by the French Government. In 1763 the British assumed possession, erecting fifteen years later a fort. In 1787 its government was assumed by the U. S., Gen. Arthur St. Clair being the first governor. In 1812 it was surrendered to the British, and was retaken in 1813. In 1824 it was incorporated as a city. The history of Detroit is intimately connected with the history of the whole Northwest. Three different sovereigns have claimed its allegiance, and since the U. S. have held it thrice has its government been transferred. It has twice been besieged by Indians, once captured in war, and once totally consumed by fire. 'Pop. (1870) 79,577; (1880) 116,340; (1890) 205,876; (1900) 285,704.

Editor of "Free Press."

Detroit City: capital of Becker co., Minn. (for location, see map of Minnesota, ref. 5–B); on Detroit Lake and on the Northern Pacific R. R., 206 miles W. of Duluth; is chiefly engaged in agriculture. Pop. (1890) 1,510; (1900) 2,060.

Detroit River: outlet of Lake St. Clair; flows nearly southward, forming part of the boundary between Michigan and Canada, and enters Lake Erie. It is about 24 miles long, and from half a mile to one mile wide, and is navigable for the largest vessels.

Detroyat: de-trwäă'yaa', Pierre Léonce; soldier and writer; b. at Bayonne, France, Sept. 7, 1829; entered the navy in 1845; served in the Crimean war and in the expeditions to China and to Mexico. Accompanying the Empress Charlotte back to Europe, he was by the French Govern-

ment forbidden to return to Mexico on account of the unfavorable report he made on Bazaine, after which he withdrew from the navy and devoted himself to journalism. In 1871 he was for some time commander of the camp at La Rochelle, but resumed, after the war, his journalistic work as editor of *Le Bons Sens*, and afterward of *L'Estafette*. He published *La Cour de Rome et l'empereur Maximilien* (1868); *L'Intervention française en Mexique* (1868); *Possessions françaises dans l'Indo-Chine* (1887), and other works.

Dettingen: Bavarian village; on the Main; noted for an important battle in the war of the Austrian Succession, in which the so-called Pragmatic army, consisting of the Austrians, Hanoverians, and English under George II. defeated a larger French force under Marshal Noailles, June 27, 1743. The French armies fell back into Alsace, and Charles VII. made peace with Maria Theresa. This was the last time an English king took the personal command of an army in battle. Pop. 657.—There is another DETTINGEN, 10 miles E. of Reutlingen, in Würtemberg. Pop. (1890) 3,322.

Deuca'lion (in Gr. Δευκαλίων): in the Greek mythology, a son of Prometheus and the husband of Pyrrha; also the father of Amphictyon and Hellen. According to tradition, he saved himself and his wife from a deluge by building a ship or ark, which, when the water subsided, rested on Mt. Parnassus. As soon as the waters had retired from the surface of the earth, Deucalion and his wife went to consult the oracle of Themis, and were directed to repair the loss of mankind by throwing behind them the bones of their grandmother. This expression meant only the stones of the earth; and, after some hesitation as to the meaning of this obscure oracle, they obeyed. The stones thrown by Deucalion immediately became men, and those thrown by Pyrrha women.

Deus ex machinâ, dee'ŭs-eks-măk'i-na [Lat. translation of Gr. ἀπὸ μηχανῆς θεός, the god appearing from the stage machinery]: a supernatural deliverer; an expression borrowed from the classic stage with reference to the practice of the Greek dramatic poets, in having recourse to the intervention of a god, who descended by stage machinery, and brought about a speedy *dénoûment* of the plot.

Deuteronomy [Gr. δευτερονόμιον (late), duplicate law; δεύτερος, second + νόμος, law]: the last book of the Pentateuch, consisting in part of a restatement of the law, as given in Exodus, Leviticus, and Numbers, and containing also, besides special commands and admonitions not previously given, an account of the death of Moses. The authorship of this book has been traditionally assigned to Moses, but of course the part relating to his death is not supposed to have been written by himself. Much critical labor has been bestowed upon the book, and its Mosaic authorship has been both assailed and defended with great learning and ability. See HEXATEUCH.

Deutsch, doitch, EMANUEL OSCAR MENAHEM: author; b. at Neisse, in Prussian Silesia, Oct. 28, 1829. He studied, in Berlin, Hebrew, especially the Talmud, Aramaic, Chaldee, etc.; visited the East twice, in 1869 and 1873; was in 1855 appointed assistant in the library of the British Museum, and contributed a number of valuable articles to various periodicals and encyclopædias. His brilliant article *The Talmud* in the *Quarterly Review* for Oct., 1867, was translated into several foreign languages. A volume of his *Literary Remains*, edited by Lady Strangford, with a brief sketch of his life, appeared in London and New York (1874). D. in Alexandria, Egypt, May 12, 1873.

Deutsch, SOLOMON: See the Appendix.

Deutz, doits (anc. *Tuitium*): a fortified town of Prussia; on the right bank of the Rhine, opposite COLOGNE (*q. v.*). It is the terminus of a railway extending to Minden (see map of German Empire, ref. 5-C). Pop. 17,773.

Dent'zia [named after *Deutz*, a botanist of Amsterdam]: a genus of shrubs belonging to the order *Saxifragaceæ*, and indigenous in Northern India, China, and Japan. *Deutzia scabra* has leaves very rough, with siliceous hairs, which are used in Japan for polishing wood. *Deutzia gracilis*, a hardy shrub with elegant white flowers, is much cultivated in gardens in the U. S.

Deux Ponts: See ZWEIBRÜCKEN.

Deux Sèvres: See SÈVRES DEUX.

Dev, dāv, or **Dew**: a Persian word, akin to the Sanskrit *devá*, god, but deriving its meaning of evil spirit from the use of the word *daeva* in the Zend Avesta. For the peculiar differentiation of meaning in the word-pair Sanskrit *asura*, *dêva* and Zend *ahuro*, *daeva*, see v. Bradke, *Dyâus Asura*. See ZOROASTER, RELIGION OF.

Dêva, dā'va: Sanskrit word from √*div*, shine, signifying god, and forming a part of many names in Hindu mythology, as Kāmadêva (the god of love), Mahādêva (the great god), a name of SIVA (*q. v.*).

Devaloka: literally, the sphere or abode of a deva or god. The Buddhist system recognizes six devalokas or celestial spheres, situated in tiers above MT. MERU (*q. v.*), and between the Brahmalokas and the Earth. The lowest is the heaven of the "Four Kings" who guard the Earth and the Heavens against the assaults of the Asuras or demons who live beneath the Earth. Each of these kings guards one-quarter of the heavens. The second devaloka is the heaven of Indra, and is called Trayastrinsha, or "the heaven of the thirty-three divinities." The third is that of the Yamas, beings who take no part in the war against the Asuras, and are hence called the "strifeless." The fourth devaloka is the heaven that is called Tushita. It is the home of the Bodhisatvas, or persons who are destined to become Buddhas. Maitreya, the coming Buddha, now lives there and presides over it. The fifth devaloka is that of the Nirmanarati, or devas who delight in transformations, or, according to another interpretation, who constantly enjoy pleasures provided by themselves. The sixth and highest, that of the Paranirmita vasavartin, beings who constantly enjoy pleasures provided by others, or who, while others are transformed, are themselves independent. In the first of these devalokas life lasts 500 years, but one day there is equal to fifty years on earth. In the second life lasts 1,000 years, and the day is equal to 100 earthly years. In the third life lasts 2,000 years, and the day equals 200 earthly years, and so on in geometrical progression up to the highest, where life lasts 16,000 years, and the day is equal to 1,600 years on earth. Above these six heavens are sixteen Brahmalokas rising one above the other. In these there are no sensual enjoyments as in the devalokas, and there is no pain, though bodily form exists. Above all these are four formless or spiritual Brahmalokas, in the highest of which life lasts 80,000 MAHAKALPAS (*q. v.*), during which the inhabitants are not fully conscious and yet not quite unconscious.

According to the PURĀNAS (*q. v.*) there are seven devalokas, the second of which is Indraloka or Swarga, and the seventh Brahmaloka or Satyaloka, "the world of infinite wisdom and truth."

R. LILLEY.

Devanagari: See SANSKRIT LANGUAGE.

Devapraya'ga: town of Northern Hindustan; in Gurwhal; lat. 30° 8′ N., lon. 78° 39′ E.; at the confluence of the Alakanonda and Bhagirathi, which unite to form the Ganges. As the origin of that sacred river, it is considered a holy place by the Hindus, and is visited by multitudes of pilgrims. A flight of steps is hewn out in the rock down to the very edge of the water, and two large basins have been formed for ablution.

Development: See EVOLUTION; also DARWINISM.

Development of the Embyro: See EMBRYOLOGY.

Dev'ens, CHARLES, Jr., LL. D.: jurist; b. in Charlestown, Mass., Apr. 4, 1820; graduated at Harvard in 1838, and admitted to the bar in 1841; practiced in Berkshire County, and in 1847 was sent to the State senate; from 1849 to 1853 U. S. marshal for Massachusetts and prominent on account of his anti-slavery attitude. On the outbreak of the civil war (1861) he entered the service as major of the third battalion of Rifles, Massachusetts Volunteers, and distinguished himself, from the early engagement at Ball's Bluff till the closing scenes at Appomattox Court-house, rising to the rank of brigadier-general (brevet major-general). He was appointed associate justice of the superior court of Massachusetts in 1867, which position he retained until Oct., 1873, when he was appointed associate justice of the Supreme Court of Massachusetts. Appointed Attorney-General by President Hayes Mar. 7, 1877; resumed his position as associate justice of Supreme Court of Massachusetts 1881. He delivered addresses at the centennial celebration of the battle of Bunker Hill; at the dedication of the soldiers' monuments in Boston and in Worcester; on the deaths of Gen. Meade and Gen. Grant; and, as presiding officer, at the two hundred and fiftieth anniversary of Harvard College. D. in Boston, Mass., Jan. 7, 1891.

Dev'enter (Lat. *Daventria*): city of Holland; in the province of Overyssel: on the river Yssel, about 60 miles E. by S. from Amsterdam (see map of Holland and Belgium, ref. 5–H); is surrounded by walls or ramparts, and has a good harbor. It contains a cathedral, five other churches, a large town-house, a court-house, and several hospitals; has iron-foundries and manufactures of carpets, hosiery, etc., and exports butter. Pop. (1896) 25,527.

De Vere: See VERE.

De Vere, CLEMENTINE: See the Appendix.

Devereux: See ESSEX, EARL OF.

Devereux, JOHN HENRY: b. in Boston, Mass., Apr. 5, 1832; educated at Portsmouth, N. H., as a civil engineer, and began to work at once upon the construction of railroads. From 1848 to 1861 he was engaged in the building of railroads in Ohio and Tennessee. He was called to Washington by the Government Mar. 31, 1862, and in April following was appointed superintendent of military railroads. In Mar., 1864, he resigned the charge of Virginia railroads, and became superintendent, and subsequently vice-president, of the Cleveland and Pittsburg R. R.; resigned the latter position in 1868, and became president of the Lake Shore R. R., and afterward became general manager of the consolidated Lake Shore and Michigan Southern R. R. Resigning in June, 1873, he was elected president of the Cleveland, Columbus, Cincinnati and Indianapolis R. R. Company (1873); of the Atlantic and Great Western Railway Company (1874); and of the Indianapolis and St. Louis (1880). In 1877, by his personal courage, he prevented 800 of his men from joining in the railway riots. D. in Cleveland, O., Mar. 17, 1886.

Dêvî (Sanskrit, goddess): See PARVATI.

Deviation of Projectiles: See GUNNERY and GYROSCOPE.

Deviation of the Compass: See SHIP'S MAGNETISM.

Deviation of the Plumb-line: a phenomenon especially observed near mountains, in which case the attraction of the mountain evidently draws the line out of the perpendicular. Maskelyne took advantage of this fact in his experiments to determine the density of the earth. (See EARTH.) The same phenomenon has been observed on plains, and is probably caused either by great caves under ground, or by large masses of matter near the surface greatly surpassing in density the average of the earth near the point of observation. Mr. E. D. Preston, of the U. S. Coast Survey, has observed some striking instances in the Sandwich islands. He found the total deflection at Kaupo to be 29·1″; at Kohala, 30″ to the S.; at Hilo, 15″ to the N. From his measurements he drew the following conclusions:

I. Deflections of the plumb-line are greater on island than on continental mountains, presumably on account of the lighter surrounding sea water.

II. Deflections appear to be greater in the vicinity of extinct volcanoes than near active ones. See *American Journal of Science*, vol. xxxvi., p. 305.

Revised by E. L. NICHOLS.

De Vigny, de-vēēn'yee', ALFRED VICTOR, Comte: French author; one of the most prominent representatives of the Romantic school; b. at the castle Loches, Mar. 27, 1799. In 1828 he published a collection of poems called *Poèmes antiques et modernes*. He also produced (1826) *Cinq-Mars, or a Conspiracy under Louis XIII.*, which was very favorably received; *Stella, or the Blue Devils*, a narrative; and the tragedy of *Chatterton* (1835). D. Sept. 18, 1863.

Devil [O. Eng. *deōfol*: O. Sax. *diubal*: O. H. Germ. *tiufal* (> Mod. Germ. *Teufel*): Goth. *diabōlus*, from Lat. *dia'bolus*, or its source Gr. διάβολος, accuser (Eccles.), devil]: the name among Christians of any evil spirit, but especially of the chief of evil spirits, nearly corresponding in the latter sense to the Hebrew Satan and the Mohammedan Iblis or Shytân. The Greek for devil appears to be derived from the character of Satan as presented in the book of Job—that of a fault-finder or slanderer. In the Middle Ages, and even later, the devil was supposed to possess in perfection every kind of skill and knowledge—a skill and knowledge resembling that of man, indeed, but immeasurably surpassing it in degree. The devil was believed to possess transcendent skill in all the magic arts, and when a man of genius had accomplished some wonderful feat which seemed clearly above the unassisted powers of the human mind, it was commonly supposed (especially if he was not pre-eminently religious) that he had been either assisted by the devil or that the latter had performed for him the entire work; in which case, of course, some promise (such as the final surrender of the soul of the assisted party) or reward had to be given as an equivalent for his services. This idea, once almost universal in Europe, furnished the basis of the legend respecting Dr. Faustus. In the miracle plays of the Middle Ages the devil is the comic character, yet the players and the audience lived in daily fear of him. The doctrine of a personal devil was one of Luther's firmest possessions, and in private and public he had much to say about his agency.

It would seem probable that the prevailing superstitions of the Middle Ages respecting the devil might have been considerably influenced by the notions entertained of the character of Loki, the god of evil in the Norse mythology. As Loki is said to have taken various forms—sometimes of a woman and sometimes of one of the lower animals—in order more successfully to deceive, so the devil was supposed to assume at one time the appearance of a most beautiful woman to mislead and ruin the souls of men, at another time to take the form of a hunted animal to draw the too eager pursuer into danger and death; but all his wiles were of course lost upon those who looked to Heaven for help, and called on the protecting saints. For the consideration of theological connections, see SATAN.

Devil-fish: a popular name for one of the cuttle-fishes, usually *Octopus vulgaris*. In the U. S. applied in the Southern States to a large ray or skate (*Manta birostris*), and on the Pacific coast to the California gray whale (*Rhachianectes glaucus*). F. A. LUCAS.

Deville: See SAINTE-CLAIRE DEVILLE.

Devil's Coach-horse (*Deypus oleus*): a beetle common in Great Britain and on the Continent of Europe; belonging to the family *Staphylinidæ*. See ROVE-BEETLES.

Devil's Darning-needle: See DRAGON-FLY.

Devil's Dust: See SHODDY.

Devil's Island: See the Appendix.

Devil-worshipers, or **Yezidees**: a religious sect living in Armenia, Kurdistan, and Asiatic Turkey. They number more than 200,000. Their faith is a curious mixture of degenerate Christianity, as derived from the Gnostics, and Mohammedanism. Their chief peculiarity is that they treat the devil with great respect, because they believe he will be restored to heaven, where they wish him to be their friend. They hold the Old Testament in great reverence, and pay much less regard to the New Testament and the Koran. They practice both infant baptism and circumcision. They have four orders of priesthood. (See Layard's *Nineveh*.) There are various other sects of devil-worshipers.

De Vinne, THEODORE LOW: printer; b. in Stamford, Conn., Dec. 25, 1828. He learned the printing trade in Newburg, N. Y., and in New York city; became a member of the firm of Francis Hart in 1859. Shortly after the civil war he took a prominent part in forming the New York Typothetæ, was its first secretary, and has since been prominent in its proceedings; was president of the United Typothetæ of America 1887–88. In 1873 his firm began to print the *St. Nicholas* magazine, and later the *Century Magazine*. Upon the latter he was successful, after much experimenting, in printing the illustrated forms on dry paper in lieu of wet, which had been the trade usage, and thus secured a far more brilliant effect with illustrations. He was also the first printer to use coated paper for magazine and fine illustrated book-work. He has written much on trade topics, his chief works being the *Printers' Price List* (1st ed. 1869; 2d ed. 1871) and *The Invention of Printing* (1 vol. 8vo, 1878).

Devi'zes: town of Wiltshire, England; 22 miles N. N. W. of Salisbury (see map of England, ref. 12–G); has manufactures of snuff and malt, and some trade in grain. Here are ruins of the famous castle built by the Bishop of Salisbury (1132), and destroyed by Cromwell (1645). Pop. (1891) 6,426.

Devon: a county of England. See DEVONSHIRE.

Devonian Period: the division of geologic time following the Silurian period and preceding the Carboniferous; so called from Devon, England. As in the case of the Silurian, the most abundant vestiges of its life are invertebrate, and trilobites are among the dominant forms, but fishes, of whose earlier presence but scanty trace has been discovered, were then greatly developed as to variety and size. The earliest traces of trees belong to this period. In the U. S. Devonian

rocks are greatly developed in New York and Pennsylvania, where they have been classed under the terms Oriskany (oldest), Corniferous, Hamilton, Chemung, and Catskill. From this district, which may be regarded as the typical American area, a long and diminishing belt extends S. W. to Alabama, the formations appearing in various ridges of the Appalachian mountain system. In Maine the rocks have been recognized in a metamorphic condition. In the lower peninsula of Michigan they surround the coal basin. In Ohio, Indiana, and Kentucky they surround the Silurian area of the Cincinnati uplift, and they are also developed in Eastern Iowa. Farther westward their occurrence is sporadic, and they are usually of little thickness, but in Nevada they are well developed. In New York and Ohio they include limestones and sandstones, which afford large quantities of excellent building material. Among the upper members are great carbonaceous shales, which yield by natural distillation much of the petroleum and natural gas stored in the sandstones of Pennsylvania and Eastern Ohio, and some of these sandstones also belong to the Devonian series. One of the British formations of the period is a fresh-water deposit called the Old Red sandstone, and was the theme of a classic work by Hugh Miller, entitled *The Old Red Sandstone, or New Walks in an Old Field*. For descriptions of the American rocks and their life, see the official reports on the geology and palæontology of New York and Ohio, and an essay by H. S. Williams on *The Devonian and Carboniferous*, constituting Bulletin No. 80 of the U. S. Geological Survey. See also Fossil Fishes and Building-stone. G. K. G.

Dev'onport (before 1824 called Plymouth Dock): a maritime and fortified town of Devonshire, England; on the east shore of the estuary of the Tamar (called the Hamoaze); 2 miles W. N. W. of Plymouth (see map of England, ref. 15-D). It occupies high ground, and is separated from its suburbs, Stoke and Morice Town, by the glacis of its now dismantled fortifications. It derives its importance from the dockyard and naval arsenal, which is perhaps the largest in Great Britain. The national works occupy about 350 acres, and the dockyard comprises six building-slips for vessels of various rates. Here are also five docks, and manufactures of sails, ropes, anchors, soap, etc. Devonport has a residence for the port-admiral, a military hospital, large barracks, and extensive commercial wharves. It returns two members to Parliament. Pop. (1901) 69,674.

Devonshire (Lat. *Devonia*): a county of England; bounded N. by the Bristol Channel and S. by the English Channel. Area, 2,586 sq. miles. The surface is mostly hilly, and in some parts rocky. The highest point, High Willhayse, on Dartmoor, has an altitude of 2,039 feet. Granite, magnesian limestone, Devonian and Silurian rocks occur here; also copper and tin. It is drained by the rivers Exe, Dart, Tamar, and Torridge, the estuaries of which form good harbors. The climate of the south coast is mild; the soil is generally fertile. This county produces good apples, and is famous for its cider. The Red Devon breed of cattle is highly esteemed. The fisheries are extensive, and the manufactures are very important. Pop. (1901) 436,913.

Devonshire, Dukes (1694): Earls Devonshire (1618), Barons Cavendish (1605).—William Cavendish, K. G., P. C., D. C. L., F. R. S.; seventh duke, lord-lieutenant, and custos rotulorum of the county of Derby, high steward of Cambridge, chancellor of the University of Cambridge, etc.; b. Apr. 27, 1808; succeeded his cousin, William George Spencer Cavendish, in 1858; d. Dec. 21, 1891; succeeded by his eldest son, Spencer-Compton Cavendish, Marquis of Hartington. See Hartington, Marquis of.

Dew [O. Eng. *dēaw*: O. Sax. *dau*: Germ. *Thau*, connected with the Skr. root *dhav-*, flow]: moisture deposited during the night on the surfaces of bodies exposed in the open air. Dew is produced by the condensation of watery vapor from the atmosphere. Its deposition is, however, unaccompanied by the appearance of any visible mist. Such mist appears when the condensation takes place within the body of the air itself, and is then called "fog" in the lower regions of the atmosphere, and "cloud" in the higher. Dew occurs only at the surface of contact with solids, the air above remaining clear. The deposit of dew is caused by the cooling of the bodies bedewed, and this takes place in consequence of the radiation of heat into open space without any equivalent return. Experiments on vaporization have shown that when a liquid is exposed in a confined space to a constant temperature, vapor will be formed from it until the density reaches a certain determinate limit, invariable for the temperature, but greater as the temperature is higher, after which evaporation will cease. This maximum density is called the density of saturation or the density due to the temperature. Air is said to be saturated with vapor when the density of the vapor in it is the density due to its temperature. Should the temperature of a body of air in this condition be in the slightest degree depressed, the air will be supersaturated, and some of the vapor will be condensed, forming a visible cloud. But if, the temperature remaining the same, a body colder than the air be immersed in it, condensation will occur on the surface of that body only, and the air itself will remain clear. If, as is usual in the atmosphere, the air contain vapor without being saturated, it may be brought by cooling to a temperature at which it will be saturated, and then any further cooling will produce precipitation, as in the case before supposed. Or if the temperature of air in this condition remain unchanged, a body colder than the air immersed in it may produce condensation, provided its temperature be as low as the point of saturation, or lower, but not otherwise. This point is called the Dew-point (*q. v.*).

During the day the loss of heat by bodies on the earth, in consequence of radiation, is more than compensated by the amount received directly or indirectly from the sun. After sunset all such bodies begin to cool, but they cool with unequal rapidity, because of their different relations to heat. The atmosphere cools very slowly. Badly conducting solids cool rapidly. Good conductors, if in contact with the earth, cool less rapidly, because the heat they lose by radiation is, to an extent proportioned to their conducting power, restored by conduction from the earth beneath. If of small mass, however, and insulated by bad conductors, their temperature falls more rapidly. So soon as the cooling process has depressed the temperature of any object down to the point of saturation for the vapor present in the air, dew will begin to form upon it. Some bodies are bedewed very soon, others more tardily, and some occasionally escape altogether. Grass, which radiates well and conducts ill, is in the first class; wool and woolen stuffs, cotton, linen, silk, wood, earth, gravel, stone, and metals contract dew with less and less facility, nearly in this order. Polished metallic surfaces often remain untarnished by moisture throughout the night. In clear nights the difference of temperature shown by two thermometers, one lying on the grass and the other suspended in the open air, a few feet above, is often 8° or 10° F., and is sometimes much greater. In one instance, Mr. Glaisher (*Phil. Trans.*, 1847) observed a difference as great as 28½° F., the lower thermometer lying on raw wool.

Clouds check the formation of dew by obstructing radiation, or restoring by counter-radiation some of the heat lost. When the sky is wholly overcast no dew is formed. Neither is any dew formed beneath an open shed or shelter, though the earth around may be so distinctly wet as to leave the form of the roof distinctly marked on the ground. Facts of this kind were long supposed to prove that the dew descends like rain—a belief of which the trace is still preserved in the expression "the falling of the dew." Even a very slight screen, as a sheet of paper or a cambric handkerchief, spread out above an object exposed in the open air, will protect it perfectly against moisture from dew. Wind also prevents the formation of dew, by continually changing the strata of air in contact with the colder solids. The nights most favorable to the deposit of dew are those in which the sky is clear and the air motionless. The profuseness of the deposit will depend, however, upon the hygrometric state of the atmosphere.

Very various and very absurd notions prevailed among the ancients in regard to the dew. By some it was supposed to descend from the stars, and to be possessed of wonderful virtues. The Roman ladies were accustomed to use it as a cosmetic, supposing it superior to all other applications for the improvement of the complexion. The true theory of dew was first clearly set forth by William Charles Wells, a physician of London, in his famous *Essay on Dew*, first published in 1814. This standard authority has been many times reprinted. Revised by M. W. Harrington.

Dewar, James: See the Appendix.

Dewart, Edward Hartley, D. D.: minister; b. in County Cavan, Ireland, Mar. 30, 1828; received his school education at Toronto, Canada; entered the ministry of the Methodist Episcopal Church 1851; became editor of the *Christian Guardian* (published at Toronto, the oldest and chief of

the periodicals of the Canadian Methodist Church) 1869; author of *The Development of Doctrine* (1879); *Jesus the Messiah in Prophecy and Fulfillment*.

Dewberry: a kind of trailing blackberry. Two species are cultivated in the U. S.—*Rubus canadensis* of the Northern States, and *R. trivialis* of the South. The former is the more important. A variety of *Rubus canadensis*, called the Lucretia, is the best known and probably most valuable of the dewberries. This came into cultivation from West Virginia about 1875. Other varieties of this species are Bartel and Windom. The Pacific coast dewberry (*R. vitifolius*) has also been introduced to cultivation.

Dewdney, Edgar: Canadian cabinet minister: b. in Devonshire, England, in 1835, and educated as a civil engineer. He moved to British Columbia in 1859; was a member of the Legislative Assembly of that province 1868–69; of the Dominion Parliament 1872–79; and in the latter year was appointed Indian commissioner. He was Lieutenant-Governor of Northwest Territory from Dec. 3, 1881, to July 3, 1888, and on Aug. 3 of the latter year became Minister of the Interior. In Oct., 1892, he was appointed Lieutenant-Governor of British Columbia.

D'Ewes, Sir Symonds: antiquary; b. in Dorsetshire, England; educated at St. John's College, Cambridge, and called to the bar in 1623, but gave up his practice for the study of numismatics and historical manuscripts. He entered Parliament for Sudbury in 1640, and supported the popular party against the king, but being too moderate in his views to suit the radical element he was one of those driven from the House by Pride's Purge (1648). D. at Stow Langtoft Hall, Apr. 18, 1650. Materials for a history of England, collected but never published by him, have been of great service to subsequent historians. His *Journals of all the Parliaments during the Reign of Queen Elizabeth* were published in 1682. The *Autobiography and Correspondence*, edited by J. I. Halliwell (London, 1845), presents some interesting details of the manners of the time.

De Wet, Christian: soldier; b. in Dewetsdorp, Orange Free State (now Orange River Colony) about 1860. Was a successful farmer and a member of the Volksraad. Though he had had no previous military training, he fought with distinction in the British-Boer war of 1899–1900, attaining the rank of general in the Boer army. After the fall of Pretoria, with a small force, he, for many months, evaded capture and inflicted heavy losses on the British garrisons and patrols.

De Wet'te, Wilhelm Martin Leberecht: German biblical critic; b. at Ulla, near Weimar, Jan. 12, 1780. He studied at Weimar, under Herder, and at Jena, where Paulus was his teacher. In 1807 he was appointed Professor of Theology at Heidelberg, and in 1810 he was called to the newly founded University of Berlin. In 1819 he was dismissed from his chair and banished from the Prussian territories because he had written a letter of consolation to the mother of the Sand who murdered Kotzebue. He removed to Weimar, and was in 1822 called to Basel, where he remained till his death. His contributions to Old Testament criticism (especially in determining the date of Deuteronomy) and to biblical theology (in recognizing the literary independence of each biblical writer) were of great importance in his day. His writings are characterized by freshness and vigor and by an attractive combination of freeness and reverence. Among his works are a *Commentary on the Psalms* (1811); *Jewish Archæology* (1814); *Christian Dogmatics* (1813–16); *Introduction to the Old and New Testaments* (1817–26); *Lectures on Ethics* (1824); together with an exegetical manual to the Old Testament and a translation of the Bible (in conjunction with Augusti). He also wrote two romances, *Theodor* and *Heinrich Melchthal*. D. at Basel, June 16, 1849. See accounts by Schenkel (1849), Hagenbach (1849), Lücke (1850), and Stähelin (1880). C. H. Toy.

Dewey, Chester, D. D., LL. D.: botanist and teacher; b. in Sheffield, Mass., Oct. 25, 1783; graduated at Williams College 1806; became Professor of Mathematics and Natural Philosophy at Williams College, 1810; principal of the Collegiate Institute at Rochester, N. Y., in 1836; and from 1850 till 1860 Professor of Chemistry in the University of Rochester. He wrote many excellent monographs on the Carices of North America, etc. D. Dec. 15, 1867.

Dewey, George, LL. D.: U. S. naval officer; b. at Montpelier, Vt., Dec. 26, 1837; graduated at the Naval Academy in 1858; served with distinction on board the steamer Mississippi at the passage of Forts Jackson and St. Philip and the capture of New Orleans, Apr. 24, 1862, again on the Mississippi when she was lost at Port Hudson, Mar. 14, 1863, and on the Colorado at Fort Fisher, 1864–65. On Aug. 1, 1889, he was appointed chief of bureau of equipment with rank of commodore. He took command of the Pacific squadron on Jan. 1, 1898, and on May 1 destroyed the Spanish fleet in Manila Bay, the Philippines, without himself losing a ship or a man. He also captured Cavite, and later, in conjunction with Gen. Merritt, took Manila itself (Aug. 13). He was made rear-admiral 1898, and admiral 1899.

Dewey, John: See the Appendix.

Dewey, Melvil, M. A.: b. in Jefferson co., N. Y., Dec. 10, 1851; graduated at Amherst College in 1874; acting librarian there 1873–76; removed to Boston, where he founded (1) the American Library Association, of which he was secretary fifteen years, and then president; (2) the *Library Journal*, the monthly official organ of library interests, of which he edited the first five volumes; (3) the metric bureau for introducing decimal weights and measures; (4) Spelling Reform Association for simplifying English orthography—has been from the first secretary of the last two societies. In May, 1883, he became chief librarian of Columbia College; in May, 1884, was made Professor of Library Economy and director of the Columbia College School of Library Economy, proposed by him to be opened in Jan., 1887; in 1889 elected secretary and treasurer of the University of the State of New York, and director of the New York State Library, retaining also the directorship of the library school, which was transferred to the State Library. Perhaps his most important and far-reaching contribution to education is the careful revision and amplification of the laws of New York pertaining to higher education, including libraries, made in 1892 and known as the University Law. The *Decimal Classification and Relative Index*, the peculiar system devised by him in 1873 for increasing the efficiency and reducing the expenses of library administration, first published in 1876, has passed through numerous editions, as has *Rules for Authors and Classed Catalogs*, now published with his rules for other library departments as *Library School Rules*. He has edited, besides the *Library Journal*, *Library Notes*, *Metric Bulletin* and *Metric Advocate*, and is co-editor of *Spelling*, a continuation of the *Spelling-Reform Bulletin*.

Dewey, Orville, D. D., LL. D.: Unitarian minister; b. in Sheffield, Mass., Mar. 28, 1794. Originally a Calvinist, he graduated at Williams College in 1814, and at Andover Theological Seminary in 1819; he then became a Unitarian and preached in the pulpit of Dr. Channing in Boston, as his assistant, for nearly two years. He was pastor at New Bedford 1823–33, and in the city of New York 1835–48. In 1858 he became minister of the New South church in Boston, but retired in 1862 to his farm in Sheffield and devoted himself to religious studies with occasional preaching. He was an original thinker and an impressive pulpit orator. He published several volumes of sermons, a volume of European travels, and, as his chief work, *The Problem of Human Destiny* (n. c. 1864). A complete edition of his works, with a memoir by Miss Mary E. Dewey, his daughter, appeared in 1885 (Boston). Channing's favorite theme was the dignity of human nature and Dewey's the dignity of human life, and in his own person he gave it ample illustration. D. in Sheffield, Mass., Mar. 21, 1882.

Revised by J. W. Chadwick.

Dewing, Thomas Wilmer: figure and portrait painter; b. in Boston, May 4, 1851. Pupil of Boulanger and Lefebvre, Paris; National Academician 1888; member Society of American Artists 1880; Clarke prize, National Academy, New York, 1887; second-class medal, Paris Exposition, 1889. His pictures are refined and delicate in color, and his portraits, notably those of women, are marked by elegance of style and arrangement. He has painted some important decorations, including a ceiling, a composition of three female figures, in the Hotel Imperial, New York. *The Prelude* (1883), one of the best of his works, is in the collection of C. T. Barney, New York; other compositions are *The Days* (1887) and *The Garden* (1884). Studio in New York.

William A. Coffin.

De Winter, Jan Willem: b. at the Texel in 1750; entered the Dutch navy in 1762, but fled to France in 1787, having taken part in the attempts of the revolutionists; served afterward under Dumouriez and Pichegru with the French in the campaigns of 1792 and 1793, rising to the rank of a general of brigade; returned to Holland 1795,

and was by Napoleon placed at the head of the Dutch fleet. In the battle of the Texel he was defeated and captured by the English under Admiral Duncan, but an investigation of his conduct amply vindicated his gallantry and military skill. He became minister-plenipotentiary to France from 1798 to 1802, when he was again placed in command of the Dutch fleet, and he was highly trusted and honored both by Napoleon and the King of Holland. D. in Paris, June 2, 1812.

De Witt: town (founded in 1841); Clinton co., Ia. (for location, see map of Iowa, ref. 5–K); on Chi. and N. W. and Chi., Milwaukee and St. P. R. Rs.; 25 miles N. of Davenport and 20 miles W. of Clinton. The town has six churches, a public park, some manufactories, and a system of waterworks. Its principal industry is agriculture. Pop. (1880) 1,608; (1890) 1,359; (1900) 1,383. Editor of "Observer."

De Witt, Cornelius: Dutch naval officer and statesman; b. at Dort, June 23, 1623; had a high command under De Ruyter in 1666, when he burned the English shipping in the Thames; distinguished himself in the naval battle of Solebay in 1672. In the same year he was falsely accused of complicity in a plot to poison the Prince of Orange. He was imprisoned, tried, and acquitted, but as he was coming out of prison was murdered, by a mob, with his brother John De Witt (*q. v.*), Aug. 20, 1672.

De Witt, John: Dutch statesman; b. at Dort, Sept. 25, 1625. He was a leader of the party which was hostile to the House of Orange, or wished to reduce the power of the Prince of Orange. William II. died in 1650, and De Witt was elected grand pensionary of Holland in 1653, in which position he controlled the policy of the state in the interest of the republicans. In 1654 he negotiated with Cromwell a treaty of peace, in which a secret article stipulated that no member of the Orange family should ever be stadtholder. He was re-elected grand pensionary for a term of five years in 1658, and again in 1663. In 1665 Charles II. of England declared war against the Dutch, whose fleet entered the Thames and burned some shipping at Chatham. De Witt conducted the war with ability, and it was terminated by the peace of Breda, 1667. In the same year a perpetual edict was issued forever abolishing the office of stadtholder, and the policy of the grand pensionary seemed absolutely triumphant. Meanwhile Louis XIV. had invaded the Spanish Netherlands, and De Witt, thoroughly realizing the danger to Holland which would arise from the annexation by France of those provinces, formed the triple alliance between England, Sweden, and Holland, and compelled Louis XIV., at the Peace of Aix-la-Chapelle, to give up his plans. The French king, however, stung to the quick by this humiliation, succeeded, by his crafty diplomacy, in estranging England from Holland and in exciting a number of the minor German princes against the republic. In the meantime a change took place in the position of the grand pensionary. His popularity began to wane. The clergy, his natural enemies, openly attacked him. Finally the king invaded the republic with a great army. De Witt, being unable to repel the enemy, who captured several towns, was blamed for these misfortunes, and naturally became the object of public fury, which was further aroused through the efforts of the Orange party. William of Orange was chosen general-in-chief and stadtholder. De Witt went to prison to visit his brother Cornelius, who had been tried and acquitted. They were both murdered by the populace at the prison Aug. 20, 1672. See Motley, *United Netherlands* (4 vols., 1880); P. Simon, *J. de Witt en Zijn Tijd* (3 vols., 1832–35).

De Witt, John, D. D., LL. D., L. H. D.: biblical scholar of the Reformed (Dutch) Church; b. in Albany, New York, Nov. 29, 1829; graduated at Rutgers College in 1838, and at the Theological Seminary, New Brunswick, in 1842. Between 1842 and 1863 he was pastor of several churches, and then became Professor of Oriental Literature in the New Brunswick Seminary. From 1884 till he retired in 1892 his department was Hellenistic Greek and New Testament Exegesis. He published *The Sure Foundation, and How to Build on it* (New York, 1848; 2d ed. 1860); *The Psalms, a new Translation* (1891), the latter practically displacing his earlier work on the Psalms (1884 and 1885).

Willis J. Beecher.

De Witt, John, D. D., LL. D.: Presbyterian divine; b. in Harrisburg, Pa., Oct. 10, 1842; a graduate of Princeton College (1861); studied theology at Princeton (1864) and Union Theological Seminaries (1864–66). He was pastor of the Presbyterian church of Irvington-on-Hudson 1865–69, of the Central Congregational church, Boston, 1869–76, and of the Tenth Presbyterian church, Philadelphia, 1876–82; Professor of Church History, Lane Theological Seminary, 1882–88, of Apologetics and Missions in McCormick Theological Seminary, Chicago, 1888–92, and since of Church History in the Theological Seminary, Princeton, N. J. He has published about thirty review articles, many other papers and discourses, and *Sermons on the Christian Life* (New York, 1885).

Willis J. Beecher.

Dewlet-Gherai III.: the last khan of the Crimea; succeeded his uncle, Kerim-Gherai, as chief of the Crimean Tartars in 1769. He had more taste for court etiquette and ceremonies than for war, and, though supported by the Turks, he was expelled by the generals of Catharine II. D. in Constantinople about 1780. Three years later the Crimea was incorporated with Russia.

Dew-point: the temperature at which watery vapor in the air begins to be condensed. Its determination is of great importance to the meteorologist, as by comparing it with the actual temperature he can tell the relative humidity of the air. He knows that at the actual temperature the air would be saturated if it contained a certain quantity of moisture; and also that the actual quantity present is only such as would suffice to saturate air at the observed dew-point; the ratio of this last quantity to the former expresses the relation between the actual humidity of the air and the humidity of saturation at the observed temperature. The dew-point in the evening further shows the temperature near which the minimum during the night is likely to be. When the temperature has fallen to the dew-point, the vapor in the air will be condensed, and an amount of heat will be set free which will raise the temperature of the air. The temperature will again sink by radiation somewhat below the dew-point; dew will be formed, and the temperature again be raised. See Dew and Rain.

Revised by M. W. Harrington.

Dewsbury: town of the West Riding of Yorkshire, England; on the river Calder; 8 miles S. S. W. of Leeds (see map of England, ref. 7–H). It is on the Lancashire and Yorkshire Railway, and is connected with London by another railway. It has a grammar school, a chamber of commerce, an infirmary, and a handsome town-hall. It has manufactures of blankets, carpets, and coarse woolen goods made from shoddy (i. e. refuse rags worked over). There are collieries and iron-works in the vicinity. Pop. (1891) 29,847.

Dexip'pus (in Gr. Δέξιππος): Greek philosopher; pupil of Iamblichus; lived about A. D. 355. He wrote commentaries on Plato and Aristotle, and sought to defend the latter against the attacks of Plotinus. There is extant a treatise of his on the *Categories* of Aristotle, but only in a Latin translation, which was printed at Paris (8vo, 1549).

Dexippus, Publius Herennius: Athenian author, rhetorician, and soldier of the third century. He was a man of great learning, and attained the highest honors in his native state. He was also appointed commander of the army against the Goths (Scythians), who had invaded Attica, and defeated them, though not before they had captured Athens. A public statue was erected to his honor, the base of which, with its inscription, still exists. The fragments of the historical works of Dexippus are to be found in Müller, *Fragm. Hist. Græc.* (vol. iii., pp. 666–687).

Dexter: town, on railway; Penobscot co., Me. (for location of county, see map of Maine, ref. 6–E); has 7 churches, 5 woolen-mills, and 2 machine-shops, and is a center of trade for the surrounding country. The increase in population since 1890 is due to the opening of a new woolen-mill. Pop. of township (1890) 2,732; (1900) 2,941.

Dexter, Henry: See the Appendix.

Dexter, Henry Martyn, D. D., LL. D.: minister; b. at Plympton, Mass., Aug. 13, 1821; graduated at Yale in 1840 and at Andover in 1844; pastor in Manchester, N. H. 1844–49; and of the present Berkeley Street Congregational church, Boston 1849–67. From 1859 to 1866 he was one of the editors of the *Congregational Quarterly*, and in 1867 became editor-in-chief of the *Congregationalist*. Dr. Dexter was a voluminous writer, principally on subjects connected with the history and polity of Congregationalism, and with New England history generally. In this field he was a diligent explorer and an authority. One of his most important

works is *The Congregationalism of the Last Three Hundred Years*, etc. (New York, 1880). He left in manuscript an unfinished work on which he had been long engaged, on the *English and Dutch Life of the Plymouth Pilgrims*. He had much influence in the ecclesiastical affairs of the Congregational body. D. in New Bedford, Mass., Nov. 13, 1890. Revised by GEORGE P. FISHER.

Dexter, SAMUEL, LL. D.: jurist and statesman; b. in Boston, Mass., May 14, 1761; graduated at Harvard; studied law in Worcester, Mass., with Levi Lincoln; admitted to the bar in 1784; attached himself to the Federal party, and was elected a Senator of the U. S. in 1798. He was appointed Secretary of War in 1800 by John Adams, and became Secretary of the Treasury early in 1801. When the executive power was transferred to Jefferson in 1801, Dexter retired from the public service and resumed the practice of law in Boston. He had no superior and few equals as an advocate before the Supreme Court in Washington. As a supporter of the war against England, he separated from the Federalist party in 1812. He published *Letter on Freemasonry*, *Progress of Science*, and *Speeches and Political Papers*. D. in Athens, N. Y., May 4, 1816.

Dextrin [from Lat. *dexter*, right hand]: a substance ($C_6H_{10}O_5$) formed by the action of diastase on starch, and by the action of mineral acids on starch. There are several commercial products known as dextrin, British gum, starch gum, which are mixtures containing perhaps some dextrin. These products are used as substitutes for gum-arabic and other gums, in stiffening, sizing, and glazing calicoes, nets, crapes, laces, silks, papers, cards, etc., as mucilage on every office-table, and for the adhesive layer on the back of postage-stamps and on self-sealing envelopes. Some varieties of ink are thickened with them. Pure dextrin is a colorless, glassy body, which may be rubbed down to a white powder. It is practically tasteless, and inodorous. It is converted into maltose and then into dextrose by treatment with mineral acids. Revised by IRA REMSEN.

Dextrogy'rate [from Lat. *dexter*, right hand + *gyra're*, turn]: a term applied in optics to crystals which have the power to rotate a plane of polarization of a plane polarized ray toward the right. It is opposed to *lævogyrate*, which expresses the power to rotate the plane in like manner toward the left.

Dextrose: See SUGAR.

Dey, dā [viâ Fr. from Turk, *day*, maternal uncle, a title of respect]: a Turkish title of dignity given throughout the seventeenth century to the chief officer of the armies of Algiers, and signifying originally elder, since command depended upon seniority; but early in the eighteenth century the dignity of pasha was added to the dey, who thus became the chief civil as well as military officer in Algiers. His authority ended with the French conquest in 1830, but the title of dey is still given to the chief ruler of Tripoli. Tunis was governed by a dey at one period, but this title in the latter country has long been supplanted by that of bey.

Dezful, dez-fool', or **Dezfil**, -feel': town of Persia; province of Khuzistan; on Dezful river, here crossed by a bridge of twenty-two arches; 28 miles W. N. W. of Shuster (see map of Persia and Arabia, ref. 3–F). It is the chief mart of Khuzistan. Ancient ruins and mounds, evidently of Sassanian origin, are found in the vicinity. Pop. about 30,000.

Dhanis, Baron FRANÇOIS: See the Appendix.

Dhar, daar: town of Central Hindustan, in Malwa; the capital of a protected state of the same name, 32 miles W. S. W. of Indore (see map of N. India, ref. 8–D). It has two large mosques of red stone, and a fort with twenty-six towers. Pop. about 15,000.

Dhawalaghiri, da-wăl-a-gee'rē: lofty peak of the Himalaya Mountains, in Nepaul, Northern Hindustan; lat. 28° 42′ N., lon. 82° 32′ E. Its altitude is 26,826 feet, and it was formerly supposed to be the highest mountain of the earth.

Dhegiha Indians: See SIOUAN INDIANS.

Dhole, dōl: a species of wild dog, *Canis, or Cuon, dukkunensis*, found in the Western Ghauts and other mountainous parts of India. It is of a rich bay color, with a sharp muzzle, and large, pointed ears; is somewhat smaller than a wolf, and is remarkable for fierceness and courage, and for hostility to animals of the feline race.

Dhōl'ka: town of British India; presidency of Bombay; 22 miles S. W. of Ahmadâbâd (see map of S. India, ref. 1–C). It is inclosed by a mud wall, and stands in the midst of ruined palaces, mosques, mausoleums, and spacious tanks lined with masonry. Pop. 17,716.

Dholpur, dōl-poor': town of Rajputana, British India; on the Chambal, 34 miles S. of Agra (see map of N. India, ref. 6–E); is the capital of a feudatory state, with an area of 1,156 sq. miles and a population of 279,890. A fair lasting two weeks is held here annually. Pop. 16,000.

Dhun'chee, or **Dhanchi**: plant of the genus *Sesbania* and family *Leguminosæ*, having an extended loment with many seeds. It is an annual plant, cultivated extensively in some parts of India for its fiber, which is used in the manufacture of paper, cordage, canvas, and cloth. The plant has a slender stem about 8 feet high.

Dhyána: a Sanskrit word meaning contemplation or meditation. Its Páli equivalent is *jhána*. It is used in Buddhism to denote (1) a kind of abstract contemplation intended to destroy all attachment to existence in thought or wish, and thus as a means of arriving at Nirvána; and (2) one of four groups of heavens called Brahmalokas, corresponding to the four degrees of stages of this mystic contemplation. (See DEVALOKAS.) In the first stage of Dhyána the mind is so fixed that while the thinking faculties are exercised a state of tranquil joy is attained. Those who arrive at this stage are re-born in one of the three heavens which constitute the first Dhyána or group of Brahmalokas. In the second stage the meditation has been carried on so far that only the tranquil joy remains. This insures re-birth in the second Dhyána or group of heavens. In the third everything but tranquillity is eliminated, and re-birth in one of the third group of Brahmalokas is the result. In the fourth stage the whole being is freed from every fetter which would bind to existence, a condition of indifference is reached, and six kinds of supernatural wisdom as well as ten kinds of supernatural miracle-working power are acquired. Those who attain to this condition are re-born in one of the seven highest heavens in which bodily form still continues. R. L.

Dhyáni-Buddhas: incorporeal beings who exist in "the formless worlds of meditation" (i. e. the four Brahmalokas situated above the sixteen worlds of form), as the spiritual counterparts and representatives of those Buddhas who appear on the earth from time to time to teach men how to attain to Nirvána. The Dhyáni-Buddhas of the present Kalpa or age are five in number, corresponding to the three Buddhas who had preceded Gautama Buddha, to Gautama himself, and to Maitreya the coming Buddha. The Dhyáni-Buddha, corresponding to Gautama, the historical Buddha who appeared in India, is *Amitábha*, the Buddha of "boundless light." He presides over the "Paradise of the West," and among Northern Buddhists is the most popular of all the Buddhas. See TSING-TU and SHINSHIU. R. L.

Diabase: an igneous rock of the trap family, and therefore related to BASALT, GABBRO, etc. (*qq. v.*). The term was first proposed by Brongniart in 1813 (in allusion to its two-fold composition) for the same rock which was more generally known as diorite. The name, therefore, was superfluous until Hausmann revived it in 1842 for eruptive rocks composed of pyroxene and labradorite feldspar. Chemically and mineralogically diabase is about identical with basalt and gabbro. It is distinguished from these by its structure, which is its chief characteristic. Its feldspar is in well-formed, lath-shaped crystals, in the irregular spaces between which lies the younger pyroxene. The rock differs from basalt in being coarser and in containing little or no glass. Its peculiar structure is called *diabase* or *ophitic* structure. All diabase contains iron oxide in the form of magnetite or ilmenite; some diabases also contain olivine as a fourth constituent.

In general appearance diabase is dark, heavy, and compact, and it is the best representative of the rocks popularly known as trap or nigger-head. The rock has not usually cooled at the surface, but occurs either in dikes or intrusive sheets. It disintegrates into irregular or spherical boulders, and gives rise to a deep-red soil. Under the influence of intense pressure in the earth's crust diabase is metamorphosed to a green schist composed mostly of hornblende or chlorite.

Economically, diabase has little value except for making foundations, stone-walls, or roads. It is very abundant in Scandinavia and in other parts of Europe; also in the red sandstone formation (Trias) of the Atlantic border region.

GEORGE H. WILLIAMS.

Diabe'tes [Gr. διαβήτης, diabetes, also compass, siphon; its value as a Gr. medical term is derived directly from its etymology, διά, through + βαίνειν, pass, go]: disease characterized by the excessive excretion of urine; occurs in two forms. *Diabetes insipidus*, now called Polyuria (*q. v.*), is distinguished from the other much more dangerous disease by the fact that the urine is very watery, but otherwise not abnormal. It is neither frequent nor formidable. But *Diabetes mellitus*, "sweet" or "honeyed diabetes" (*Glycosuria*), is often one of the most incurable and serious of diseases. The urine is light colored, but has its specific gravity greatly increased by the presence of diabetic sugar, a substance believed to be identical (in most cases) with liver-sugar, and very closely approaching grape-sugar in its composition and reactions. In some cases it appears to be muscle-sugar (*inosite*). The disease is further characterized by excessive appetite, intense thirst, wasting, and prostration of mind and body. Its causes are obscure and its treatment not well understood. Some cases are greatly benefited by opium, the avoidance of sugars and starchy food, and the use of strictly nitrogenous diet, like gluten bread and skim milk. A milder form of diabetes is not infrequent in the obese and those of gouty habits. After a variable duration the glycosuria may in these cases cease entirely; and there is rarely much disturbance of the general health. Temporary diabetes has been observed after the administration of laughing-gas, chloral, chloroform, woorari poison, and other drugs.

Revised by William Pepper.

Diacaustics: See Caustic.

Diadem [from Gr. διάδημα, fillet, band about the head; διά, through + δεῖν, bind]: the symbol of royalty among several Oriental nations; originally a fillet wound round the forehead and temples. Among the Persians the diadem was a broad light-blue band made of silk, linen, or wool, bound round the tiara or turban, and from them it was borrowed by Alexander the Great. The Ptolemys of Egypt and the Seleucidæ of Syria used plain fillets of gold encircling the head. Mark Antony assumed the diadem, but Diocletian was the first Roman emperor who adopted it. After his time it was embroidered with gold and adorned with pearls or precious stones.

Diagno'sis [Gr. διάγνωσις, discrimination, decision, connected with διαγιγνώσκειν, to discern; διά, apart, through + γιγνώσκειν, know]: the discovery of the nature and seat of disease, one of the most difficult and important branches of medicine and surgery. Diagnosis is based upon "physical signs and rational symptoms"; "signs" being appreciable by the senses, and "symptoms" arrived at by the educated judgment. Both, however, are popularly known as symptoms. Diagnosis is best learned at the bedside, under the guidance of good instructors. The stethoscope, thermometer, laryngoscope, etc., furnish important aid in this branch of medical practice. The term is often used by naturalists for the discrimination of species of animals, plants, or minerals.

Diagom'eter [an irreg. mod. compound from Gr. διάγειν, conduct + μέτρον, measure]: electric instrument for determining the conducting power of fixed oils, invented by M. Rousseau. It consists of a dry pile, by means of which a current is passed through the oil, and the strength of the current determined by a magnetized needle. It is used especially for the detection of the adulteration of olive oil, said to have the lowest conducting power of such oils.

Diagonal [from Gr. διαγώνιος, from angle to angle: διά, through + γωνία, angle]: a straight line drawn through a figure, joining two opposite angles. The term is chiefly used in geometry in speaking of four-sided figures, but it is also properly applied with reference to all polygons of more than three sides. Euclid uses the term *diameter* in the same sense, but modern geometers use diameter only when speaking of curved lines.

Diag'oras (in Gr. Διαγόρας): Greek poet and philosopher; born in the island of Melos; lived about 425 B. C., and is said to have been a disciple of Democritus of Abdera. He was a citizen or resident of Athens. As he rejected or doubted the popular religion and polytheism, he was stigmatized as an atheist. He fled from Athens in 411 B. C., or, as some say, was banished for impiety. He appears to have been a witty and fearless man of good moral character. His works are not extant. He lived at Pallene for a time, and then removed to Corinth, where he died. See Reuthen, *De Atheismo Diagoræ*, 1812.

Dial [from Lat. *dialis*, daily, pertaining to the day, deriv. of *dies*, day]: instrument showing the hour of day by the shadow of a gnomon or style cast by the sun on a gradnated arc; also called Sundial. The invention is of great antiquity, the Grecks having, it is said, learned its use from the Chaldæans. In the construction of a dial the object is to find the sun's distance from the meridian by means of the shadow. When this is known, the hour also is known, provided we suppose the sun's apparent motion to be uniform, and that it moves in a circle parallel to the equator during the whole day. In point of fact, neither of these conditions is fulfilled, but the error arising from this is of small amount. Although dials have many different constructions, the general principles are the same. The style, gnomon, or axis of the dial is either a cylindrical rod or the edge of a thin plate of metal. It must be parallel to the earth's axis, and thus it may be considered, on account of the smallness of the earth's diameter compared with the distance of the sun, as coinciding with the axis of the diurnal rotation: consequently the plane which passes through the center of the sun and the style will coincide with the shadow, and will turn with the sun, as the sun turns round the style, by the effect of the diurnal motion. Dials are horizontal, vertical, or inclined, according to the position of the plane of the dial with respect to the horizon of the place. The essential principle is that the rod shall point to the pole of the heavens.

Dialectic [from Gr. ἡ διαλεκτική (sc. τέχνη, art), the art of discussion, femin. of adjec. διαλεκτικός, pertaining to discussion, conversation, Gr. διάλεκτος]: technical term much used in both Greek and German philosophy, but of a somewhat vague signification. In the Greek philosophy it may be best explained by considering it in its relation to logic. Logic was the science of the forms of thinking, the science of conclusion and evidence; it taught the manner by which to arrive at truth. Dialectic treated of the truths arrived at; it was the science of expressing and setting forth ideas, the science of definition. With an idealistic thinker like Plato, with whom truth is an intuition and the idea an inspiration, dialectic, the science of definition, the art of defining, means the highest function of science—science itself. With a realistic thinker like Aristotle, with whom truth is the result of induction and deduction, and the idea an evidence, dialectic means only a part, and even an inferior one, of logic. Hence the multitude of contradictions which invest this word. In the German philosophy it may be best explained by considering it in its relation to the expression "dogmatical." Dogmatical is applied to a definition when it excludes absolutely the opposite; "dialectical," when it combines the opposites as correlatives. According to the dogmatical definition, everything is either good or bad; and if it is good, it is not bad; if it is bad, it is not good. According to the dialectic definition, anything which is essentially good may have some bad in it, and anything which is essentially bad may have some good in it. According as the object passes under different views, the different constituents of the idea shift place and importance in the definition; relativity is the character of the actual world, relativity must be the character of the world of thought. Both in the Greek and German philosophy the word *dialectic* is sometimes used to signify a mere word-fence.

Dialects [from Gr. ἡ διάλεκτος (sc. γλῶσσα), conversational language, discourse, conversation, deriv. of διαλέγεσθαι, discuss, argue, converse]: various modes of speech regarded as local and divergent forms of a central or standard language, or as closely related descendants from a common original. In the latter, which is the less frequent meaning, the word is used, for instance, of the four traditional forms of the Greek language—the Attic, Ionic, Doric, and Æolic dialects—and it was in this sense and in connection with these that it was first appropriated to grammatical use by the Greek grammarians. The common popular view, that dialects represent a debased or perverted form of the standard language, is in general nearly the reverse of the truth. The standard, sometimes known as the literary language, is generally based historically upon one of a number of sister dialects, but is generally more or less of an artificial structure, including compromises and mixtures with various dialects. It is called into being by the practical necessities of intercommunication in some form of centralizing civilization, and corresponds in its materials and shape, as well as in the extent of its recognition, to the controlling factors and constituency of that civilization. The dialects, so far-

as they survive, represent the continuance of language in its natural growths and according to the natural laws of its development. Hence arises the surpassing importance of the dialects for all study of the life and growth of language, and as the only natural growths they furnish also the only reliable norms for determining the development and testing the materials of the standard language.

The demands of exact scientific grammar have in recent years directed the attention of philologists more particularly to the study of the folk-dialects, and in every province of historical grammar great activity has been shown in the collection and arrangement of dialectal material. For the English dialects a large amount of valuable material has been collected in the publications of the English Dialect Society. Of pre-eminent value is *The Existing Phonology of English Dialects, compared with that of West Saxon Speech*; part v. of *Early English Pronunciation*, by A. J. Ellis (1889). Among a great number of valuable works are also to be mentioned as peculiarly representative of the modern method of scientific language study, J. A. H. Murray, *The Dialect of the Southern Counties of Scotland: its Pronunciation and Historical Relations* (1873); C. C. Robinson, *An Outline Grammar of the Mid-Yorkshire Dialect*; J. Wright, *The Yorkshire Dialect of Windhill, Shipley* (1893). A compendious dictionary of the English dialect is now in preparation under the auspices of the English Dialect Society. A bibliography of the most important existing material in glossaries and grammars is to be found in the article on the *English Dialects* by Joseph Wright in Paul's *Grundriss der german. Philologie*, vol. i., pp. 975 ff. (1891).

The dialects of the U. S. have not as yet been clearly defined and characterized, but collections of material with this in view are now being made by the American Dialect Society, and are published in the *Dialect Notes* (1890–92); five parts have appeared. A sample investigation of a local dialect is O. F. Emerson, *The Ithaca Dialect* (1891). Valuable bibliography will be found in parts i., ii., and v. of the *Dialect Notes*.

For the study of the relation of dialects to each other and to the standard, the history of the German language affords a particularly instructive field; cf. A. Socin, *Schriftsprache und Dialekte im Deutschen nach Zeugnissen alter und neuer Zeit* (1888); Jostes, *Schriftsprache und Volksdialekte*, *Jahrbuch des Vereins für nieder deutsche Sprachforschung*, vol. xi.; F. Kluge, *Von Luther bis Lessing* (2d ed. 1888). Sample investigations of local dialects may be found in J. Winteler, *Die Kerenzer Mundart in ihren Grundzügen dargestellt* (1876); F. Holthausen, *Die Soester Mundart* (1886). Maps of the dialect boundaries are to be found in Peschel und Andree, *Physicalisch-statistische Atlas des deutschen Reiches*, Karte x. (1877); Bernhardi-Stricker, *Sprachkarte von Deutschland* (2d ed. 1849); map accompanying Behaghel's *Geschichte der deutschen Sprache* in Paul's *Grundriss*, vol. i.

For the dialects of France and the abundant literature of the subject, cf. H. Suchier, *Gröber's Grundriss der roman. Philol.*, i., 592 ff.; for the dialects of the other Romance languages, cf. Gröber, *Grundriss*, i., 426 ff. (an enumeration and classification of the entire body of dialects); T. Gartner, *Gröber's Grundriss*, i., 461 ff.; F. D'Ovidio, *Gröber's Grundriss*, i., 548 ff. (*Italian Dialects*).

The best and most recent summaries of the work in the Greek dialects are contained in R. Meister, *Die griechischen Dialekte*, 2 vols., appeared 1882–89; Hoffmann, *Die griechischen Dialekte*, 2 vols., appeared 1891–93.

Benj. Ide Wheeler.

Dialogue [from Gr. διάλογος, conversation, dialogue, deriv. of διαλέγεσθαι, converse; διά, between two, through + λέγειν, speak]: originally a discourse between two or more persons. In literature, a composition in the form of a conversation between two or more individuals. The dialogue was the form most generally adopted by the ancients for the conveyance of instruction, and was considered applicable to the gravest and most philosophical subjects. It was adopted by Plato, Cicero, and Lucian with great success. The philosophical dialogue has also been employed by several eminent modern writers, as Fénelon, Fontenelle, Macchiavelli, Berkeley, Lessing, and Herder. In the drama, dialogue is combined with action, and those dramas which are not written for the stage differ from the dialogue chiefly in having a plot and a *dénoûment*, while the dialogue is more strictly didactic.

Dial'ysis [Gr. διάλυσις, dissolution; διά, in two + λύειν, loose]: the separation of certain substances by means of liquid diffusion. The dialyzer is usually a hoop on a low, broad glass bell-jar, open above as well as below. A piece of wet parchment paper is stretched over the hoop and securely tied in place. The fluid to be dialyzed is poured into the hoop to the depth of half an inch, and the whole is floated on distilled water. Crystallizable bodies, as common salt, nitrate of potassa, etc., and bodies closely allied to them, such as hydrochloric acid and alcohol, pass rapidly through the membrane into the water; while bodies which do not crystallize, but are inclined to assume the gelatinous form, such as silicic acid, hydrated alumina, starch, gum, caramel, tannin, albumen, gelatine, and extractive matters, diffuse with extreme slowness. Such bodies are called *colloid*, from κόλλη, glue. When a mixture of sugar and gum was placed in the dialyzer, three-quarters of the sugar passed through in twenty-four hours, without a trace of the gum. On treating silicate of soda (soluble glass), acidulated with hydrochloric acid, in the same way, seven-eighths of the silicic acid was left in the dialyzer at the end of five days, without a trace of hydrochloric acid or chloride of sodium. Urine dialyzed for twenty-four hours gave a liquid so free from mucous and gelatinous matter that on evaporating to dryness and extracting with alcohol a solution was obtained which gave pure urea in crystalline tufts.

The purification of soluble colloids is best effected by dialysis; they are thus completely freed from crystalloids. A solution of pure hydrated alumina is obtained by dialyzing its solution in the chloride or acetate. In a similar manner may be obtained, *in solution*, hydrated sesquioxide of iron and of chromium; Prussian blue from its solution in oxalatic acid; an aqueous solution of silicic acid from silicate of soda and hydrochloric acid; pure albumen from albumen and acetic acid; pure gummic acid from gum-arabic (gummate of calcium) and hydrochloric acid. Mr. Whitelaw was granted a patent for the application of dialysis to brine from salted and corned meats. The salt and niter pass rapidly through the parchment paper, while the nutritious extractive matters dissolved out of the meats are retained, and may be used for soup. For the application of dialysis to the purification of beet-molasses, see Endosmose.

Dialysis is specially useful in examining animal fluids for poisons where the presence of the colloids interferes with the ordinary tests. Arsenious acid may be readily separated in twenty-four hours from the contents of a stomach in sufficient purity to be immediately recognized by the usual tests. Tartar emetic, morphine, strychnine, and, in fact, almost all soluble poisons, may be thus separated.

Decompositions are also effected by dialysis. Bisulphate of potassa is partially separated into neutral sulphate and hydrated sulphuric acid; alum is partially separated into sulphate of alumina and sulphate of potassa; sulphate of potassa and lime-water yield considerable hydrate of potassa and sulphate of lime. Separations and decompositions of this kind undoubtedly occur in plants and animals, and in the soil; and dialysis is probably one of the most common processes in nature. See Watts's *Dictionary of Chemistry*, under *Liquids, Diffusion of*; also the original papers of Prof. Graham, who minutely investigated this subject, in the *Philosophical Transactions* (1850 and 1862), and in the *Journal Chem. Soc.* (iii., 60, 257; iv., 83; xv., 216).

C. F. Chandler.

Diamagnetic Polarity: the polarity imparted under certain conditions to substances which have been magnetized by means of an electric current. If a bar of iron be placed in a helix or spool of copper wire, through which circulates a current of electricity, the bar will be magnetized, and the end of the bar round which the current passes in the same direction as the motion of the hands of a watch will be a south magnetic pole. When a bar of bismuth replaces the bar of iron, the end above mentioned becomes a north magnetic pole—that is, bismuth has its poles the reverse of iron when it is placed in the same conditions of magnetization. Weber held to the opinion of the reversed polarity of bismuth, but Faraday denied any such condition. Tyndall settled the question by a series of experiments of great delicacy made with an apparatus designed for that purpose by Weber, and proved conclusively the existence of reversed polarity, not only in bismuth, but also in other diamagnetic solids and liquids.

A. M. Mayer.

Diamagnetism: phenomena exhibited by certain substances which under the influence of magnetism place them-

selves with the longer axis at right angles to the magnetic lines of force.

The line joining the two opposite poles of a horseshoe magnet is called the *axial* line, while a line bisecting at right angles this axial line is called the *equatorial* line of the magnet. The space included between the opposite polar surfaces of the magnet is called *the magnetic field*. When small bars of iron, nickel, cobalt, manganese, etc., are suspended between the poles of a magnet, they place their lengths in the axial line. Substances taking the above position are called magnetic substances, or, as Faraday termed them, *paramagnetic* substances. The majority of bodies, however (e. g. bismuth, antimony, phosphorus, heavy glass, wood, water, blood, bread, hydrogen, and ammonia), when delicately suspended in the magnetic field, place their lengths equatorially, and to distinguish them from magnetic substances they were called *diamagnetic* (διά, across, and μάγνης, the magnet) by Faraday, who, in Dec., 1845, gave the discovery of diamagnetism to the world in a paper read before the Royal Society of London.

The difference in the behavior of magnetic and diamagnetic substances in the magnetic field was thus concisely stated by Faraday: Magnetic substances tend to go from weaker to stronger places of magnetic action, while diamagnetic bodies tend to go from stronger to weaker places in the magnetic field.

Faraday found that not only solids, but also liquids and gases, possessed magnetic and diamagnetic properties. In experimenting with these bodies he inclosed them in glass tubes, whose magnetic behavior was determined before they were filled with the liquids or gases to be examined, and the previously determined action of the magnet on the empty tube was deducted from the resultant magnetic effect on both the tube and its contained liquid or gas. Or two tubes of exactly the same size and material were hung opposite each other from the ends of a short piece of light wood, which was then placed across the end of a longer wooden rod, and the latter was suspended by silk fibers or by a fine silver wire. The two tubes hung on opposite sides of the axial line of the magnet, and with their centers equidistant from it. By this ingenious arrangement the actions exerted by the magnet on the glass tubes neutralized each other, and whatever motion he observed was due to the difference in the action of the magnet on the two substances they contained. By filling one of the tubes with water or air, and the other successively with different liquids and gases, he determined *the specific magnetism* of these substances relatively to water or air taken as unity. Further experiments on the action of the magnetic field on water and air inclosed in a vacuum gave the data for reducing all of his measures to what he would have found had all the substances been suspended *in vacuo* between the poles of the magnet. Plücker in Germany and E. Becquerel in France also made extensive researches in this field, and obtained very refined measures of these actions.

In the following table are contained the results of Faraday's measures of the actions of attraction or repulsion of magnetism on various substances, determined by means of a delicate torsion balance. In the comparisons equal volumes of the substance were used, and the action on water taken as the unity of intensity. The sign + indicates that the substance is magnetic, while the sign − shows that it is diamagnetic:

TABLE OF SPECIFIC MAGNETISM.

SUBSTANCES.	Powers.	SUBSTANCES.	Powers.
Iron	*+100,000	Absolute alcohol	−0·815
Protochloride of iron (saturated solution)	+62·0	Essence of citron	−0·828
Protoammoniuret of copper	+1·390	Camphor	−0·855

Protochloride of iron	1·276	+36·07
Protochloride of iron (saturated solution)	1·433	+55·81

The general law of these actions was discovered by Faraday, and Becquerel has formally stated it as follows: If we place in the neighborhood of a magnetic pole a fixed vessel filled with a fluid, the latter will experience no motion. Imagine any portion of the interior of the fluid mass isolated; it is solicited, according as it is magnetic or diamagnetic, by a force f, positive or negative; and as it is not displaced, the medium which surrounds it must necessarily exert on it an equal and contrary pressure equal to $-f$: this is to say, that the principle of Archimedes applies as well to these forces as to gravity. Replace now the mass of the fluid we supposed isolated from the same fluid surrounding it by another which is bounded by the same surface as the former, but of a different magnetic nature; it will receive from the magnet a different action f^1, positive or negative, and from the surrounding fluid the same action as above, f; the resultant action on the new substance will be $f^1 - f$. Consequently, the action which the pole of a magnet exerts on any body whatever, plunged in a fluid medium, is equal to the difference of the actions which it exerts separately on this body and on the fluid in which it is suspended.

From these considerations the following consequences result: When the medium is magnetic, f is positive, and $f^1 - f$ is negative; consequently, any body whatsoever tends to become diamagnetic in a magnetic fluid or medium. Conversely, in a diamagnetic medium f is negative, and $-f$ is positive; and the substance may act as though it were magnetic, even when it really is not when tested in a vacuum, and will become more diamagnetic when it really is diamagnetic when suspended in a vacuum between the poles of the magnet.

Faraday beautifully illustrated the above principle by the following ingenious experiments: He filled glass tubes with solutions of sulphate of iron (a magnetic substance) of different degrees of strength, and suspended them between the poles of his magnet in similar solutions, also of different degrees of strength. When the solution in the tube was stronger, or contained *more* iron, than that in the solution in which it was suspended, it pointed *axially*: when it was weaker, or contained *less* iron, than that in the surrounding liquid it pointed *equatorially*; and when the solution in the tube and outside of the tube were of the same degree of strength the tube was indifferent.

In Sept., 1847, Bancalari, of Italy, discovered that when the flame of a candle was placed between the poles of an electro-magnet it was deflected into the equatorial line the moment the iron of the magnet was magnetized, and the flame returned to its first position when the magnet was demagnetized. Faraday repeated these experiments with the powerful magnet of the Royal Institution, and greatly extended these observations by his discovery of the magnetic character of oxygen, olefiant gas, and nitrogen, when these gases were contained in tubes and placed in a vacuum in the magnetic field; and observed that hydrogen, cyanogen, and ammonia were diamagnetic when placed in similar conditions. Faraday made many important experiments on the effects of the change of temperature and pressure in modifying the magnetic conditions of gases, and found that the action in the magnetic field on these bodies diminished with an elevation of their temperature and a diminution of their density. Thus hot air is shown to be diamagnetic when allowed to ascend through cold air between the poles of the magnet. This and other similar facts he showed by causing the currents of gas in their progress toward the magnetic field to pass over pieces of paper saturated with chlorhydric

acid, while between, around, and above the poles were placed little tubes moistened with ammonia. When the gases entered one of these tubes the fact was known by the formation in it of white fumes of chloride of ammonium. He thus found that the heated air on reaching the magnetic field was repelled from the poles, while a descending current of cold air was attracted toward the poles.

The writer of this article has devised a method of observing these phenomena by passing through the gases, as they ascend or descend or pass between the poles, a strong diverging beam from an electric light. The difference in refracting power of the hot or cold gas currents and the surrounding air causes shadows of the currents to be projected on a screen placed on the side of the magnet opposite the light; and thus can be seen at once all the parts of the phenomena. In these experiments the powerful electro-magnet of the Stevens Institute of Technology was used. With this magnet the experiments of Bancalari are very remarkable. On bringing the flame of a candle slowly upward between the poles of the magnet the top of the flame is first depressed and spread out equatorially in the magnetic field; as the flame is elevated it spreads out yet more, and often takes the form of an oval-shaped vase flattened equatorially, with an anterior depression extending down nearly to the base of the wick. A larger flame becomes compressed into a flattened elliptical dish, with two curved arms or handles projected upward.*

After Faraday had discovered the magnetic properties of oxygen, he experimentally determined that one cubic meter of this gas equaled in magnetic effect 54 centigrammes of iron, and hence that the whole atmosphere acted as would a layer of iron which enveloped the earth and had a thickness of $\frac{1}{10}$ mm. Parts of this gaseous magnetic shell are successively heated—and therefore weakened in magnetic intensity—by the sun in his apparent daily and yearly changes of position; and hence Faraday reasoned that here was certainly a true, and probably a sufficient, cause of the diurnal variation of the needle. (*Phil. Trans. R. S.*, Nov., 1850.)

The results of Faraday's experiments on the action of the magnetic field on gases are given in the following table. A gas which is magnetic in the circumstances stated in the top line of the table has + before it. If it is diamagnetic it has — before it.

GASES.	In air.	In carbonic acid.	In hydrogen.	In coal gas.
Air	O	+	+weak	+
Nitrogen	—	—	—strong	—
Oxygen	+	+	+strong	.....

Becquerel (*Comptes Rendus*, 1881) has found that ozone is more magnetic than oxygen.

Faraday, in the course of his experiments on bars of bismuth, met with the following anomalous actions. He found that some cast bars of bismuth pointed axially, others equatorially, while yet other bars took intermediate positions of rest. These extraordinary phenomena both he and Plücker, of Germany, endeavored to explain, and they both observed that there was some relation between the positions of crystals in the magnetic field and their crystalline forms. The phenomena received their full explanation at the hands of Tyndall.

Tyndall's discoveries can best be made clear by quoting from his paper *On Diamagnetism and Magne-crystallic Action* (*L., E., and D. Phil. Mag.*, July, 1850) the following experiments, and giving in his own words the law which embraces their characteristic phenomena: "If we take a slice of apple about the same size as a penny, but somewhat thicker, and pierce it through with short bits of iron wire in a direction perpendicular to its flat surface, such a disk, suspended in the magnetic field, will, on the evolution of the magnetic force, recede from the poles and set its horizontal diameter strongly equatorial; *not* by repulsion, but by the attraction of the iron wires passing through it. If, instead of iron, we use bismuth wire, the disk, on exciting the magnet, will turn into the axial position; *not* by attraction, but by the repulsion of the bismuth wires passing through it.

"If we suppose the slice of apple to be replaced by a little cake made of a mixture of flour and iron filings, the bits of wire running through this will assert their predominance as before; for, though the whole is strongly magnetic, the superior energy of action along the wire will determine the position of the mass. If the bismuth wire, instead of piercing the apple, pierce a little cake made of flour and bismuth filings, the cake will stand between the poles as the apple stood; for though the whole is diamagnetic, the stronger action along the wire will be the ruling energy as regards position.

"Is it not possible to conceive an arrangement among the particles of a magnetic or diamagnetic crystal capable of producing a visible result similar to that here described? If, in a magnetic or diamagnetic mass, two directions exist, in one of which the contact of the particles is closer than in the other, may we not fairly conclude that the strongest exhibition of force will be in the former line, which therefore will signalize itself between the poles in a manner similar to the bismuth or iron wire? . . .

"If analogic proof be of any value, we have it here of the very strongest description. For example: bismuth is a brittle metal, and can readily be reduced to a fine powder in a mortar. Let a teaspoonful of the powdered metal be wetted with gum-water, kneaded into a paste, and made into a little roll, say an inch long and a quarter of an inch across. Hung between the excited poles, it will set itself like a little bar of bismuth—equatorial. Place the roll, protected by bits of pasteboard, within the jaws of a vice, squeeze it flat, and suspend the plate thus formed between the poles. On exciting the magnet the plate will turn, with the energy of a magnetic substance, into the axial position, though its length may be ten times its breadth.

"Pound a piece of carbonate of iron into fine powder, and form it into a roll in the manner described. Hung between the excited poles, it will stand as an ordinary magnetic substance—axial. Squeeze it in the vise and suspend it edgeways, its position will be immediately reversed. On the development of the magnetic force the plate thus formed will recoil from the poles *as if violently repelled*, and take up the equatorial position.

"We have here 'approach' and 'recession,' but the cause is evident. The line of closest contact is perpendicular in each case to the surface of the plate—a consequence of the pressure which the particles have undergone in this direction; and this perpendicular stands axial or equatorial according as the plate is magnetic or diamagnetic."

Prof. Tyndall thus sums up the law which rules all of these actions: "If the arrangement of the component particles of any body be such as to present different degrees of proximity in different directions, then the line of closest proximity, other circumstances being equal, will be that chosen by the respective forces for the exhibition of their greatest energy. If the mass be magnetic, this line will stand axial; if diamagnetic, equatorial."

The above law explains clearly the anomalous actions Faraday observed in his bars of bismuth. Bismuth is a crystallized body, and the lines of greatest proximity of its particles are in the direction of its cleavage planes. Therefore this line of greatest condensation will always place itself equatorially in the magnetic field. In other words, the planes of cleavage will take an equatorial direction. But in casting bars of bismuth, these planes may, on the solidification of the bismuth, take various positions in reference to the length of the bars; hence the anomalous actions which are sometimes observed in these bars.

When the crystal cleaves equally easy in two planes, the lines of greatest compression will be parallel to both of these planes, and therefore the intersections of these planes

* It is not necessary to use the intense field of a powerful electro-magnet to obtain the phenomena of diamagnetism. The writer has successfully used the magnetic field of a steel horseshoe magnet made by Van Wetteren, of Haarlem, Holland. This magnet is formed of five plates. The legs are 26 cm. long, with a cross section of 4 by 3 cm. In the field of this magnet bismuth shows itself strongly diamagnetic, and even a parallelopiped cut out of a banana points equatorially.

will determine the position the crystal takes in the magnetic field. This is confirmed by experiment.

If there are three cleavage planes, perpendicular to each other, as in rock-salt, or if there are none, as in quartz, there will be no line of elective polarity, and the body will act as though it were not crystallized.

Finally, when three planes of cleavage are not perpendicular, there is generally one direction of greatest compression, which is found—for example, in calc-spar—parallel to the axis of crystallization; this line will place itself axially if the crystal is magnetic, and equatorially if it is diamagnetic. This deduction has been confirmed by experiment.

Villari (Pogg. *Ann.*, 1879) has made experiments to find *the time necessary to produce the maximum diamagnetization.* A disk of flint-glass was rotated in a magnetic field with the axis of rotation of the disk perpendicular to the polar axis of the magnet, so that the diameter of the disk was in the direction of the lines of force of the magnetic field. A beam of polarized light was passed through the disk in the direction of its diameter. When the disk was stationary the flint-glass disk caused a rotation of the plane of polarization equal to 19 divisions. Velocities of rotation of the disk of 110, 121, 143, and 180 turns per second reduced the rotation of the plane of polarization by 2, 5, 10, and 17 divisions, respectively. Villari concluded from these experiments that $\frac{1}{800}$ second is required to produce a diamagnetization sufficient to be detected by the rotation of the plane of polarization, that $\frac{1}{4\,1\,4}$ second is required to develop the maximum diamagnetization of flint-glass, and that its diamagnetism lasts $\frac{1}{5\,5\,5\,5}$ second after the magnetic inducing force has disappeared. ALFRED M. MAYER.

Diamantina, dĕĕ-ăă-măăn-tee′năă (formerly TEJUCO): a city of Brazil in the northern part of the state of Minas Geraes; near the eastern base of the principal chain of the Serra do Espinhaco, about 4,000 feet above the sea (see map of South America, ref. 6–G). It is built partly on the steep sides of a hill and partly on level ground above, presenting a curious appearance when seen from a distance. The surrounding country is watered by numerous streams, affluents of the Jequitinhonha. Diamantina owed its first importance, as well as its name, to the rich diamond washings of the vicinity; these are by no means exhausted, but since the discovery of the South African diamond-fields they have been in great part abandoned. The city retains its position as a center for the trade of Northern Minas. It is the seat of a bishop, and has numerous churches. Pop. about 10,000. HERBERT H. SMITH.

Diamantino: city of Brazil; province of Matto Grosso; on a small tributary of the Paraguay. It was founded in 1730, and was a very flourishing place for a time after the discovery of diamonds in 1746, but now numbers less than 2,000 inhabitants, mostly Indians. The chief products are ipecacuanha and vanilla.

Diameter [from Gr. *ἡ διάμετρος* (sc. *γραμμή*, line), the line measuring the distance across; *διά*, across + *μέτρον*, measure]: a right line drawn through the center of a circle, and terminated in both directions by the circumference. In architecture diameter is the measure across the lower part of a classic shaft or column, and is used as a convenient scale of relative dimension for the various parts of an order. Some writers, following the Italian tradition, arbitrarily divide the diameter into two *modules* and twenty-four to sixty *parts* or *minutes*, according to the order. In astronomy the apparent diameter of a celestial body is the angle which the latter subtends at the eye, and is measured by the micrometer. The distance of the body in question from the earth, when multiplied by the sine of this angle, gives the real diameter of the body. In elementary geometry diameter is any right line through the center of a figure. In conics a diameter always bisects a system of parallel chords. Newton showed that the centers of mean distances upon a system of parallel lines, of the n intersections of each with a curve of any order, always lie on a right line, which may be called a diameter. A diameter of any curve is simply the polar line with respect to the curve of an infinitely distant point. The rth diameter is the rth polar of an infinitely distant point, and consequently a curve of the $(n-r)^{\text{th}}$ order. The $(n-2)^{\text{th}}$ diameter is called the diametral conic, the $(n-3)^{\text{th}}$ the diametral cubic, etc. The same extension is applicable to surfaces. When the primitive surface is of the second order, there is but one diametral surface, and that is the diametral plane which bisects a system of parallel chords. Three diametral planes so situated with respect to each other that each bisects all chords parallel to the intersection of the other two, constitute a system of conjugate diametral planes, and intersect each other in conjugate diameters.

Diamond [M. Eng. and O. Fr. *diamant*: Ital. and Span. *diamante* < Lat. *a′damas, -antis*, with change of *da-* to *dia* under influence of Gr. prefix *dia*. Lat. *adamas*, adamant, is a loan from Gr. *ἀδάμας, -αντος*, unconquerable, a hard metal; *ἀ-*, not + *δαμᾶν*, to subdue]: a mineral which is the hardest known substance, and the only gem that is combustible or that phosphoresces by attrition. Certain blue-white Brazilian diamonds phosphoresce in the dark after exposure to the sunlight. Diamonds can be split by cleaving them on the cleavage parallel to the octahedron, and are cut by rubbing two of them together until they assume the desired form. They are then polished by being ground on a disk of soft steel about a foot in diameter covered with diamond-dust and oil, the wheel or disk making about 3,000 revolutions per minute. They are generally cut in what is known as the brilliant form, having a flat table surrounded with thirty-two facets on the upper side, the small point called the *culet*, and twenty-four facets on the back. Rose diamonds are flat on the back and brought to a point above, the upper or dome-shaped side consisting of triangular facets. Their weight is but one-third that of a brilliant of the same surface.

At present over 98 per cent. of the diamonds of commerce are produced at or near Kimberley, South Africa, where they have been mined since 1870, in what is known as the blue-stuff, which in fact is an altered peridotite (a volcanic rock) inclosing pieces of a shale rich enough in carbon to be ignited with a match. It is believed that when the volcanic intrusion broke through this shale, the diamonds resulted from the distillation of a volatile hydrocarbon. Since 1868 more than $300,000,000 worth of rough diamonds, worth about $750,000,000 after cutting, have been produced here—more than the entire world's yield for two hundred years before the discovery of these mines. (See DIAMOND-FIELDS OF SOUTH AFRICA.) In Brazil, India, and Borneo, diamonds have always been found in an alluvial deposit, but the mines have almost ceased to yield. Diamonds have been found in Virginia, North Carolina, Georgia, Wisconsin, Idaho, and California, but the entire product of all these States could be held in the palm of the hand.

The largest diamond of modern times is the Victoria or Imperial diamond, purchased by the Nizam of Hyderabad for over $1,500,000. It is a perfect blue-white oblong brilliant, weighing 180 carats. The De Beers light-yellow diamond weighs 225 carats, and was bought by an East Indian potentate. The Regent or Pitt diamond, weighing 136 carats, now in the Galerie d'Apollon in the Louvre, is perhaps overestimated at $2,400,000. The Koh-i-nûr at Windsor Castle weighs $102\frac{3}{4}$ carats. (The stone exhibited with the jewels in the Tower of London is only a glass model.) The largest diamond in America is the Tiffany yellow, weighing $125\frac{3}{8}$ carats. More diamonds weighing over 100 carats each have been found since the opening of the African mines than were known before that time. The Hope diamond, privately owned in England, is almost sapphire blue, and weighs $44\frac{1}{4}$ carats. The Dresden Green, at the Green Vaults at Dresden, Saxony, is a rich light green, and weighs $48\frac{1}{2}$ carats. The red diamond of Czar Paul is at St. Petersburg and weighs 10 carats.

Blue, red, and green diamonds are most highly prized, the red even more highly than the ruby, a $\frac{3}{8}$-carat stone being sold for $1,200. Fine shades of brown and yellow command very high prices. Off-colored and imperfect stones have greatly depreciated in price since the opening of the South African mines, and sell for $50 a carat, and often much less, even when of considerable size. The compact amorphous variety of the diamond known as bort or bortz is found in the provinces of Bahia, Brazil, and is of great value in drilling tunnels and rocks, cutting mill-stones, sawing and turning stone, etc. It must not be confounded with *boart*, the imperfect and flawed variety of crystalline diamond. Diamonds are used extensively for forming splints, for writing on glass and stone, and, in the form of powder, for slitting rock-sections, glass, and in engraving glass and hard stones. GEORGE F. KUNZ.

Diamond-beetle: the common name of a Brazilian beetle belonging to the group of WEEVILS (*q. v.*). It is over an inch in length, black in ground color, with a golden-green band

on the prothorax and the wing-covers with numerous rows of metallic green spots. It is the *Entimus imperialis* of

The diamond-beetle.

naturalists, and receives its common name from its brilliancy.

Diamond-bird (*Pardalotus punctatus*): member of the Dicæum family (*Dicæidæ*); found in Southern Australia and Van Diemen's Land; so named from the white markings on its plumage, which is varied with black, brown, red, and yellow. The bird is 3½ inches long, and builds an elaborate nest at the bottom of a burrow 2 or 3 feet deep.

F. A. L.

Diamond-bird.

Diamond-fields of South Africa: the region in South Africa affording the principal supply of diamonds; situated in Griqualand West, Cape Colony. The farmers along the Orange river near Hopetown had observed stones of striking appearance, but that they were diamonds was not discovered until 1867, when a pebble with which a native boy was playing was found to be a rare gem. Miners began to flock to the neighborhood of Hopetown, and in 1869 a native found a gem of 83 carats, the Star of the South, which was sold for about $60,000. The Orange river fields, however, did not prove profitable, and the discovery of diggings at Pniel, on the Vaal river, about 100 miles N. of Hopetown, drew the crowd. The diamonds of the Vaal, associated with agate, quartz, and chalcedony, are of fine quality, and the diggings yielded (1870–86) more than $10,000,000 worth of gems. But these mines were entirely surpassed after 1870 by the discovery of the diamond-bearing mud craters about 25 miles S. E. of Pniel, where the city of Kimberley (*q. v.*) now stands. The most famous are the Bultfontein, Du Toit's Pan, Kimberley, and De Beers. The Kimberley mine proved to be the richest in the world, its annual product averaging more than $4,000,000. To control the output the four great companies were consolidated in 1887, and the absorption of weaker companies steadily progressed till the entire mining interests came practically under one management.

Cyrus C. Adams.

Diamond Necklace: a celebrated necklace containing 500 diamonds, and valued at 1,800,000 livres (about $400,000); made in 1773–75 by order of Louis XV. for Madame du Barry, his mistress. Before it was finished the king died, and Du Barry was exeluded from court. In the years 1783–84 the Prince-Cardinal de Rohan was persuaded by the so-called Countess Jeanne de Lamotte-Valois, an unscrupulous adventurer, that the Queen Marie Antoinette regarded him with interest, which would be increased if he would assist her in buying the diamond necklace by becoming her surety for the payment of its price to the makers of the ornament, MM. Boehmer and Bassanges. The cardinal agreed to stand surety for the payment. The necklace was delivered to him, but it was stolen, broken up, and sold in pieces. The jewelers, not having received their pay, went to court and made complaint. Cagliostro, the cardinal, and others were thrown into the Bastile. The trial in 1785–86 proved the guilt of no one but the Countess Lamotte, who, with her husband, was branded on each shoulder and sentenced to a life imprisonment, from which she shortly afterward escaped to London, where she died Aug. 23, 1791. The details of the affair attracted very general attention, and were so discreditable to the members of the court that they contributed not a little to the popular tumult which almost immediately after resulted in the French Revolution. See Vizetelly, *The Story of the Diamond Necklace* (new ed. 1880).

Dian'a: Italian divinity; worshiped by the ancient Romans as the goddess of the moon. Her name is, indeed, the feminine form of Janus. She was thought to preside over the woods and the lakes, to govern the changes of human character, more especially those of the female sex, and to lead in chase and war. Worshiped by the Sabines, the Æqui, the Hernici, the Latins, etc., she had sanctuaries among all these tribes; but her most celebrated sanctuary was her grove at Aricia, on the Lake of *Nemi*, whence she was called Nemorensis. The principal festival of Diana was celebrated on the Ides of August—that is, the full moon or the hot season—and torchlight was one of the principal features of the celebration. She was identified by the later Romans with the Artemis of the Greeks. She was supposed to be the daughter of Jupiter and Latona, and the sister of Apollo, with whom she shared his attributes of destruction and healing. She was represented as a virgin armed with bow and arrows, and was regarded as the patroness of chastity. As the goddess of the moon she was often called Selene and Phœbe, and was represented as loving to dwell in groves and in the neighborhood of wells.

Diana: the patron goddess of Ephesus, where she had a splendid temple; different from the Diana of the Latins and Greeks, being rather a personification of the reproductive and nutritive powers of nature, and identical with the divinity called Cybele, or Ma, or Anaitis, whose worship existed in Phrygia, Lydia, Cappadocia, Armenia, and Bactria. Paul's preaching at Ephesus had such an effect upon her worship that the makers of the little shrines which were put in her temple as votive offerings stirred up a riot (Acts xix.). See Diana, Temple of.

S. M. Jackson.

Diana Monkey: African monkey (*Cercopithecus diana*); so named from a white mark on the forehead which bears a

Diana monkeys.

fancied resemblance to the silver crescent of the goddess. The general color is greenish gray, the lower part of the

back chestnut, the chest and long hair on sides of face yellowish white. F. A. Lucas.

Diana, Temple of: at Ephesus: one of the Seven Wonders of the World; built at the common charge of all the Asiatic states. The chief architect was Chersiphron; and Pliny says that 220 years were employed in completing this temple, whose riches were immense. It was 425 feet long, 225 broad, and was supported by 127 columns of Parian marble 60 feet high, some of which were peculiar in this—that a belt of figure sculpture in relief surrounded the lower part of the shaft. This was, according to legend, the eighth temple built upon the site. The seventh temple had been set on fire on the night of Alexander's nativity by an obscure individual named Erostratus, who confessed on the rack that the sole motive which had prompted him to destroy so magnificent an edifice was the desire of transmitting his name to future ages (356 B. C.). The famous eighth temple was burned by the Goths in their naval invasion (A. D. 256). See J. T. Wood, *Modern Discoveries on the Site of Ancient Ephesus* (London, 1890).

Diane de Poitiers, dē̆'aan'de-pwăă'ti-ā': beautiful French lady; b. Sept. 3, 1499; married at the age of thirteen to Louis de Brézé. After his death (1531) she became a favorite of the king's son, who in 1547 ascended the throne as Henry II., and created her Duchess of Valentinois in 1548. She had great influence over the king, who permitted her to exercise royal power and control his foreign policy. She maintained her ascendency until the death of Henry in 1559. D. at Anet, Apr. 22, 1566.

Dianthus: See Pink.

Diapa'son [Gr. διὰ πασῶν, through all (the notes) the octave, i. e. ἡ διὰ πασῶν χορδῶν συμφωνία, the concord obtained by passing through all the notes of the scale; cf. ἡ διὰ πέντε, the fifth]: in music, among the ancient Greeks, the interval of an octave; the consonance obtained by going through all the strings of the lyre from first to last. In France it came to mean a tuning-fork and the pitch registered by it. The *diapason normal*, the standard of pitch generally recognized in France, gave 435 vibrations for the A above middle C. In Great Britain the name is given to the most important foundation-stops of the organ. See Organ.

Diapen'sia [from Gr. διὰ πέντε, by five]: small flowering plant, an inch or two high, with a tuft of small leathery leaves and low flower-stalk, which bears a single pentapetalous, greenish flower. It is interesting as occurring in the U. S. only on the summits of mountains in New York and New England, although common from Labrador to Arctic America and Greenland. It occurs also in Norway, Sweden, and Lapland. It probably reached the Eastern U. S. during the glacial period, and has persisted there upon the cold mountain-tops. Charles E. Bessey.

Di'aper [O. Fr. *diaspre*, jasper, a cloth of various colors (cf. Mod. Fr. *diapré*, variegated in color): Ital. *diaspro*: Span. *diaspero*, jasper < Lat. *iaspis* = Gr. ἴασπις, jasper, the precious stone]: textile fabric, such as toweling, in which a small and simple woven pattern is repeated over the whole surface. Also the decorative pattern itself when of a similar character, having one or two simple units constantly repeated, as in some wall-papers, and as often stenciled on walls. These are the more common uses of the term; originally it meant a pattern of the same general color as the ground, relieved either by being of a slightly different tint or by the run of the threads in weaving; and also the fabric itself which was so decorated. Sometimes *diaper* is distinguished from a *sprinkled* or *semé* pattern in that the latter consists of units which do not touch one another and are separated by the field or ground, while the units of the diaper continually grow out of one another, or are formed each by the other; thus a checker-board or a honeycomb is of the simplest possible diaper, whereas a plain ground with round spots is the simplest form of sprinkled pattern. In heraldry, *diaper* or *diapering* is an ornament not made up of true heraldic bearings or charges, but covering any surface, as of the field or a bearing, which is then said to be *diapered*. It is not common.

Diaphore'sis [Gr. διαφόρησις, a carrying off, perspiration (Galen); deriv. of διαφορεῖν, carry off, carry off by perspiration; διά, through + φορεῖν, carry]: the excretion of sweat from the skin without perceptible moisture; insensible perspiration. Medicines promoting this excretion are called diaphoretics, while those producing perceptible wetness of the skin are called sudorifics. But the terms diaphoretic and diaphoresis are frequently applied to both the sensible and insensible perspiration.

Diaphragm, or **Midriff** [*diaphragm* is from Gr. διάφραγμα, barrier, midriff: deriv. of διαφραγνύναι, separate by a barrier; διά, apart + φραγνύναι, fence in; *midriff* is from A.-S. *midhrif*; *midd*, middle + *hrif*, bowels, womb]: the thin musculo-aponeurotic septum which in mammals separates the abdominal cavity from the thorax. Its center in man is occupied by the cordiform tendon or trifolium (trefoil), so called from its shape, which roughly resembles a clover-leaf (Lat. *trifolium*). The diaphragm is attached to the vertebral column by two muscular buttresses or pillars called *crura* (Lat. *crus, cruris*, a leg). It is traversed by the phrenic (internal respiratory) nerves, and, like the other respiratory muscles, is partly involuntary. In forcible inspiration it is drawn down like the piston of an air-pump. It is one of the principal agents in the various expulsive acts, and also in sneezing, coughing, and laughing. Hiccough (Lat. *singultus*) is a clonic spasm of the diaphragm.

Diarbekîr, dē̆'ăăr-be-keer' (in Turkish, *Kara-Amid*): town of Asiatic Turkey; capital of a pashalic of the same name; situated on the right bank of the Tigris, near its source, and about 200 miles N. E. of Aleppo; lat. 37° 55′ N., lon. 39° 52′ E. (see map of Turkey, ref. 5–I). It is inclosed by a high, strong stone wall flanked with towers; is the seat of a Nestorian and a Jacobite patriarch, and of a Catholic and an Armenian bishop, and has numerous handsome mosques, bazaars, and khans. It was formerly a more populous city, and had extensive manufactures of silk and cotton, but these have declined. The manufacture of silk is still carried on. Pop. 40,000.

Diarrhœa [Gr. διάρροια, a flowing through, diarrhœa; διά, through + ῥεῖν, flow]: a disease characterized by frequent soft alvine discharges. The causes of diarrhœa are very numerous, and the condition must be considered as a symptom of many diseases rather than a disease itself. Intestinal irritation and inflammation, acute or chronic, are frequently the causes, and these depend on improper food and drink. The effect of improper drinking water is known to everyone. In the case of children bad milk is the common cause, and especially in summer when fermentative changes are prone to occur from the heat. In many diseases, as cholera, typhoid fever, dysentery, and consumption, diarrhœa occurs as a symptom, in consequence of the inflammation in the bowel. Diarrhœa is occasionally an expression of extreme debility, in wasting diseases like consumption, and occurs from the leaking of the watery elements of the blood into the bowels. This is akin to the profuse perspiration of similar conditions. Sometimes the diarrhœa may be salutary, and an effort on the part of nature to remove poisonous matters, as in certain cases of Bright's disease. It would not be wise to check it suddenly in such cases.

The treatment of diarrhœa requires a close consideration of its cause. If irritating substances, as improper food, have provoked it, a brisk purge like castor oil or, especially in children, aromatic tincture of rhubarb should first be given. The diet must in all cases be regulated, especially in children. Mild astringents like bismuth and prepared chalk are frequently used with good result. The more active, as iron, lead, and vegetable astringents, require more care, and opium should be given with great caution, especially to children, who bear all narcotics poorly. Change of scene, climate, and mode of life, all find their application, more particularly in chronic cases.

Revised by William Pepper.

Dias, Antonio Gonçalves: See Gonçalves Dias.

Di'astase [Gr. διάστασις, separation; διά, apart + στῆναι, stand]: a substance contained in sprouted barley, that has the power to convert starch into dextrin and maltose and dextrose. It is contained also in the leaves of most plants, and many other germinating seeds besides barley, and in the horse-chestnut. Saliva has the same power as diastase, and it is concluded, therefore, that diastase is contained in saliva. Diastase has not yet been prepared in a fine state, but in concentrated form it can be made from low-dried barley malt by grinding, treating with water, filtering by means of a press, and adding alcohol. This precipitates the diastase, which is then washed with alcohol, and afterward dried *in vacuo* over sulphuric acid. Whatever method may be employed in the preparation of diastase, the product is not a pure chemical compound. Diastase is a white solid substance, soluble in water. Its principal property is the

power to convert starch into dextrin and maltose. According to recent researches, when starch is dissolved in a solution of diastase at 63°, one-third is converted into dextrin and two-thirds into maltose. It appears probable that some forms of diastase convert starch into dextrose or glucose. The activity of diastase is greatly influenced by heat, the action stopping at 75° to 76°. The activity is destroyed by the ordinary mineral acids, as well as by oxalic, tartaric, and citric acids, and many other substances. In the preparation of beer diastase changes the starch into sugars, and this change is then followed by fermentation.

IRA REMSEN.

Diather'mancy [from Gr. διαθερμαίνειν, to warm through, deriv. of διά, through + θερμός, warm]: the property of transmitting radiant heat, the property of not transmitting radiant heat being called *adiathermancy*. When a source of radiation, such as a lamp flame or a Leslie cube, sends out energy to a thermopile or thermometer, it is found that the interposition of certain substances, as glass, ice, quartz, calcite, lampblack, vulcanite, etc., fails to impede altogether the passage of the rays. The thermopile still indicates the reception of energy from the source. Such bodies are said to be *diathermanous*. The most remarkable substance in this respect is rock salt. Melloni found a layer 2·6 mm. thick capable of transmitting 92·3 per cent. of the radiation falling upon it. An alum plate of the same thickness transmitted only 9 per cent. (*La Thermochrose*, p. 227; Naples, 1850). The modern method of studying diathermancy consists in measuring the transmitting power of the material under investigation for each wave-length of the spectrum separately. The diathermancy of various vapors, liquids, and solids have thus been determined by Ångstrom (Stockholm Acad. of Sciences, 1890, No. 7), Rubens (Wiedemann's *Annalen*, vol. xlv., p. 258), E. F. Nichols (*Physical Review*, vol. i., p. 1), and others.

So far as the wave-lengths which constitute the visible spectrum are concerned, *diathermancy* and *transparency* are synonymous.

Bodies, however, may be quite transparent and yet of low *total* diathermancy; thus alum ceases to transmit altogether wave-lengths greater than 1·4μ. Others may be opaque through failure to transmit the particular group of waves which affect the eye and may yet possess high total diathermancy, like hard rubber, which for wave-lengths greater than 0·9μ transmits radiation almost as freely as does glass.

E. L. NICHOLS.

Diath'esis [Gr. διάθεσις, arrangement, distribution, disposition, condition: διά, apart + θεῖναι, set. The word is exactly translated by Lat. *dispositio*]: in medicine, a predisposition; a constitution of body tending toward some particular disease. Writers mention the strumous, cancerous, scorbutic, rheumatic, gouty, hæmorrhagic, and other diatheses. These tendencies exercise a most powerful influence upon life and health, and their detection and treatment are matters of great practical importance.

Diatoms [from Gr. διάτομος, cut in twain; deriv. of διατέμνειν: διά, through + τέμνειν, cut]: the lower algæ comprised in the family *Diatomaceæ*, or *Bacillarieæ*. The family is represented by numerous species (about four thousand), numbering countless individuals in nearly all parts of the world. They are microscopic in size, and consist of single cells of peculiar construction. In many ways they are like the DESMIDS (*q. v.*), to which they are probably related; indeed the difference between them lies mainly in the fact that while the desmids have walls of cellulose simply, the diatoms have their walls early infiltrated with silica, making them hard and rigid. On this account provision is made for the increase of the protoplasm by the sliding of one part of the wall upon the other, as a deep box cover slides upon the sides of the box. This is accomplished by the *splitting of the wall* parallel to its surface.

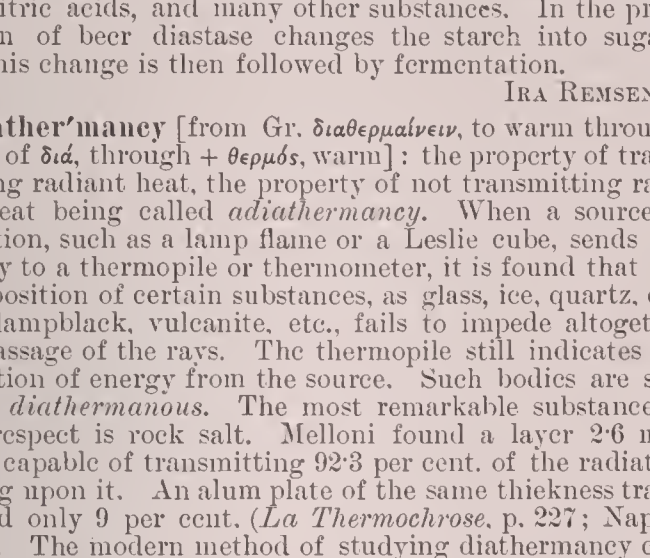

FIG. 1.—Ideal cross-sections of *Navicula*, showing the successive steps in the division of the cell. The deeply shaded portions are the "diatomin" bodies.

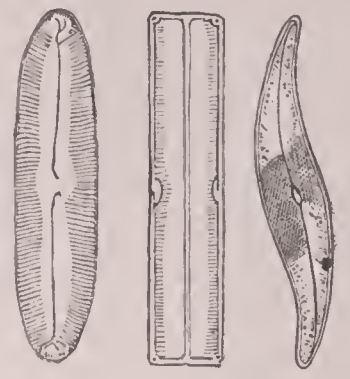

FIG. 2.—A and B, different views of *Navicula viridis*; C, *Pleurosigma angulatum*. All highly magnified.

The coloring-matter of diatoms is diatomin, which differs from chlorophyll in being yellow or brown in color; its spectrum shows some differences also, but there can be little doubt that it is functionally the same, and that chemically it differs but little from chlorophyll, of which it may be considered a marked modification. The siliceous walls constitute veritable shells, and permanently retain their shapes after the death of the cell; as a consequence, they exist in great quantities in a fossil state in the Tertiary and later beds. The walls are often marked with striæ, dots, points, etc., which have long made them objects of interest to the microscopist.

Diatoms reproduce by splitting (fission), one plant in this way giving rise to two, as shown in Fig. 1. Under certain conditions two individuals part their shells sufficiently to allow the protoplasm to escape from each one, when they unite to form a single rounded spore (zygospore), which after a time divides again into two cells, each a new (and larger) diatom. This simple sexual process appears to be for the purpose of invigorating the race, whose individuals become smaller and smaller by the splitting process (fission) described above. It appears that large individuals are produced asexually also by the escape of the protoplasm from a small plant, and this after increasing in size clothes itself with a wall again, thus assuming the proper diatom form.

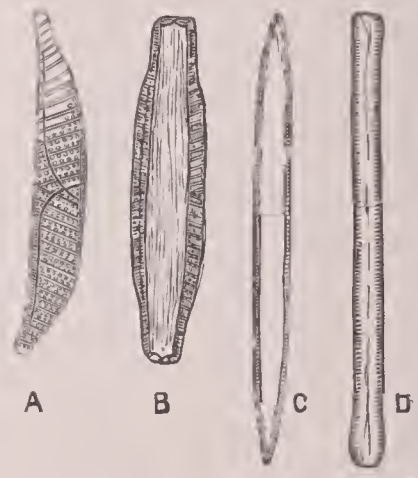

FIG. 3.—A and B, different views of the *Epithemia turgida*; C and D, different views of *Nitzschia linearis*, var. *tenuis*. All highly magnified.

While many diatoms are separate cells, many others remain attached to one another after splitting, thus forming bands or ribbons, as seen in Fig. 4, B. In some cases they secrete a mucilaginous substance upon which they rest, as upon stalks. The free species usually are actively motile and move through the water with a good deal of rapidity. Observers are not yet agreed as to the nature of the mechanism by which they move, but it is probable that it is by means of protoplasmic protrusions through the walls.

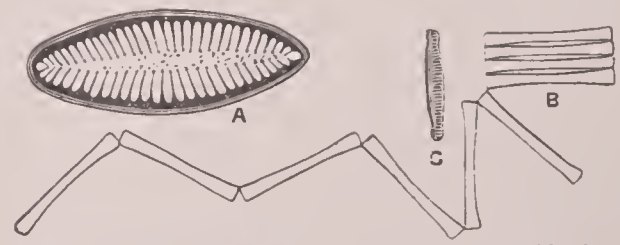

FIG. 4.—A, *Surirella elegans*; B, a number of individuals of *Diatoma vulgare*, var. *ehrenbergii*, more or less united; C, different view of a single individual. All highly magnified.

The regularity and fineness of the markings on the shells of diatoms have made them favorite objects of observation

with microscopists. These markings have been measured as follows:

Pleurosigma balticum..... ·0006 mm. (about $\frac{1}{40000}$ inch).
" *angulatum*.... ·0005 mm. (about $\frac{1}{50000}$ inch).
Amphipleura pellucida..... ·0002 mm. (about $\frac{1}{125000}$ inch).

Diatoms are classified upon the structure of their shells. Three main groups (sub-families) are recognized, viz.: I.

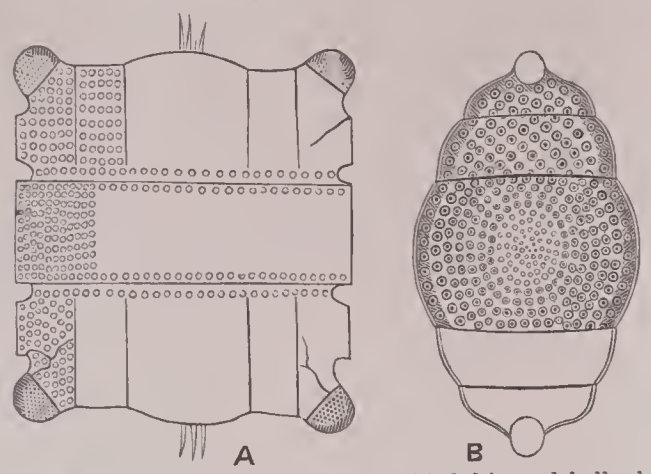

FIG. 5.—A and B, different views of *Biddulphia pulchella*, highly magnified.

Those with a distinct ridge on the principal face of the shell (*Raphidieæ*), as in *Navicula*, *Pleurosigma* (Fig. 2), *Amphipleura*, etc.; II. Those with only an indistinct or false ridge (*Pseudoraphidieæ*, as in *Epithemia*, *Nitzschia* (Fig. 3), *Surirella*, *Diatoma* (Fig. 4), etc.; III. Those with no ridge whatever (*Araphidieæ*, or *Cryptoraphidieæ*), as in *Isthmia*, *Biddulphia* (Fig. 5), *Arachnoidiscus* (Fig. 6), *Coscinodiscus*, etc.

FIG. 6.—*Arachnoidiscus ehrenbergii*, highly magnified.

In the study of the Diatoms the following works may be profitably consulted: *Sylloge Algarum*, by J. B. De Toni (vol ii., *Bacillarieæ*, 1891), contains descriptions of all known Diatoms; *Synopsis des Diatomées de Belgique*, by H. Van Heurck (1885), contains 132 excellent plates; *Diatomaceæ of North America*, by Francis Wolle (1890), contains 112 excellent plates. CHARLES E. BESSEY.

Diatonic Scale of Colors: the spaces occupied by the seven primary colors in the solar spectrum, and supposed by Newton to be exactly proportional to the length of strings that sound the seven notes in the diatonic scale of music. It is now known, however, that this theory is not well founded, although there is an analogy between the pitch of sounds and the color of bodies.

Diaz, dee'ăăz, or dee'ăăs, BARTOLOMEU: Portuguese navigator; commanded an expedition sent in 1486 to explore the western coast of Africa. He sailed or was driven by the wind around the southern extremity of Africa to the mouth of the Great Fish river. Returning homeward, he discovered the cape which he had previously doubled unawares, and called it Tormentoso, which was soon exchanged for the name of Cape of Good Hope (Cabo de Buena Esperanza). He was captain of one of the ships in the fleet of Cabral which sailed for India in 1500, and he perished by shipwreck May 29 of that year.

Diaz, PORFIRIO: Mexican general and statesman; b. in Oaxaca, Sept. 15, 1830. He studied law, but joined the army during the war with the U. S. (1847), and subsequently applied himself to military science. In 1854 he opposed Santa Anna, commanding a battalion in the army of Alvarez, and in 1858 he adhered to Juarez and the liberal party. He was elected deputy in 1861, but soon after took the field, and won a victory over the reactionist forces of Marquez. From the first he strongly opposed the French intervention; took part in the victory of Pueblo May 5, 1862, and in subsequent operations, and was captured at Pueblo May, 1863. Soon after he escaped, and during the supremacy of Maximilian he kept up the resistance in the south until forced to surrender at Oaxaca Feb., 1865. He again escaped in September, and got together a small force in the eastern provinces. After the withdrawal of the French army, recruits flocked rapidly to Diaz; he took Pueblo by assault Apr. 2, 1867, drove Marquez before him into Mexico, besieged the city, and took it June 21, 1867. In the elections of Oct., 1867, Diaz was a candidate for the presidency, but was defeated by Juarez. From that time his life was a continual struggle to overthrow Juarez and his successor, Lerdo—sometimes in congress and through the press, oftener heading revolts. Several times he was forced to take refuge in the U. S., and his adventures and escapes read like romance. In 1876 he was successful, and Lerdo was driven from the country. Gen. Mendez then became president, and was succeeded by Diaz May 5, 1877. Under his administration order was at once restored, and an era of prosperity began. By the Mexican constitution the president was not eligible to immediate re-election, and Diaz was succeeded by his friend Gen. Gonzales, in Dec., 1880. At the end of Gonzales's term (1884) Diaz was again elected, and he has since held the presidential office by successive re-elections, the constitution having been amended to permit this. Though he first reached power by irregular means, he has been decidedly the best ruler that Mexico ever had, and his wisdom and executive ability have opened a bright future for the country. He is very popular with nearly all classes in Mexico. HERBERT H. SMITH.

Diaz de la Peña, -de-lăă-pān'yăă, NARCISO VIRGILIO: landscape and figure painter; b. of Spanish parents at Bordeaux, Aug. 21, 1808; d. at Mentone, Nov. 18, 1876. He was a painter on porcelain, and began to paint pictures without instruction from a master. His figure-pieces are merely excuses for color compositions, and many of them are beautiful in color harmony. He was one of the great landscape-painters of the Fontainebleau group, and in some of his works attains to a very high level. His pictures of the forest of Fontainebleau are those which have made his reputation. He received a first-class medal at the Salon of 1848 and the Legion of Honor in 1851. His pictures are numerous but are often counterfeited. Several are in the Louvre. A fine example of his work is *The Storm*, in the collection of W. T. Walters, Baltimore. W. A. C.

Diaz del Castillo, BERNAL: Spanish soldier and author; b. at Medina del Campo, Valladolid, about 1498. He went to Darien with Pedrarias in 1514 as a common soldier; soon after drifted to Cuba; was with Francisco Hernandez de Córdoba in 1517, when Yucatan was discovered; and with Grijalva during the exploration of the Mexican coasts, 1518. On his return he enlisted with Cortés (1519), and served through the subsequent campaigns and in the siege of Mexico, never rising above subaltern offices. He then marched with Alvarado to Guatemala, where he received an *encomienda* of Indians; was one of the first settlers of Santiago de los Caballeros, and *regidor* of that town. In 1668 he began to write his *Corónica de la Conquista de Nueva España*, a narrative of the events in which he had taken part. It was intended as a refutation of Gomara's history, but it remained unpublished until long after his death, which occurred about 1593. It was first published at Madrid in 1632, and there are later editions, the best being that in the *Biblioteca de Autores Españoles*, vol. xxvi. The *Corónica* is a simple soldier's narrative, embodied in rough language, but full of information and having the impress of truthfulness. It is perhaps the best original authority for the history of the conquest of Mexico. HERBERT H. SMITH.

Diaz de Solis, JUAN: See SOLIS.

Dib'din, CHARLES: musician and writer of songs; b. at Southampton, England, Mar. 15, 1745. He composed over 1,000 sea-songs, among them *Tom Bowling* and other favorites of the British tar. D. July 25, 1814.—His son, THOMAS JOHN DIBDIN, b. in 1771, was an actor and author of innumerable melodramas, farces, etc., of which the best known is *The Cabinet*. D. Sept. 16, 1841.—Another son, CHARLES DIBDIN (1768–1833), wrote songs and dramas.

Dibdin, THOMAS FROGNALL, D. D.: English bibliographer; b. in Calcutta in 1776; a nephew of Charles Dibdin, the writer of sea-songs; took orders as a priest in 1804; published, besides other works, *Bibliomania* (1809); a new edition of Ames's *Typographical Antiquities of Great Britain* (4 vols., 1810–19); *Bibliographical Decameron, or Ten Days' Pleasant Discourse over Illuminated MSS.* (1817); and *Reminiscences of a Literary Life* (2 vols., 1836). D. Nov. 18, 1847.

Dibranchia'ta [from Gr. δι-, twice + βράγχια, gills]: an order of *Cephalopoda*, or cuttlefishes; characterized by having two gills in the mantle cavity. See Cephalopoda and Octopoda.

Dicaear'chus (in Gr. Δικαίαρχος): Greek philosopher and author; disciple of Aristotle. History and geography were his chief studies; his great work, the *Life of Greece* (βίος Ἑλλάδος), or rather *Life of the Greek People*. Dicaearchus is the source of many of the extant Greek biographies. The scant fragments of his writings may be found in Müller's *Fragmenta Historicorum Græcorum*, vol. ii., pp. 225–268, and *Geographi Græci Minores*, vol. i., pp. 97–110.

B. L. Gildersleeve.

Dicæ'um [so named by Cuvier, perhaps from Gr. δίκαιος, just]: a genus of birds belonging to the family *Nectariniдæ*, remarkable for their beauty, their rapid flight, and the sweetness of their long-continued though very soft notes. They are of small size, usually have a slender arched bill, short tarsi, and red conspicuous in the plumage. They inhabit the highest trees, and weave a purse-shaped nest from the down found about the seeds of many plants. Among the best-known species are the Australian dicæum (*Dicæum hirundinaceum*, and the *Dicæum cruentatum* of India.

Australian dicæum.

Di'cast [from Gr. δικαστής, juror, judge, deriv. of δίκη, justice]: a member of a body of Athenian citizens, consisting of 6,000, who were chosen yearly by lot from the body of freemen for the purpose of assisting in the administration of justice. They were divided into ten sections, generally about 500 each, before which causes were tried. The leading points of law and evidence were previously ascertained before a magistrate, and the conflicting issues were reduced to a formal statement called the anakrisis. This was carried for decision before a section of the dicasts, who were supreme judges of the law and the fact. They were kept in ignorance of the cause which was to come before them, and each dicast was sworn to vote according to the law and justice. The analogies of the system to jury trial are obvious, as are also the differences between the two systems.

The word *dicasterion* was used to denote the whole body of the dicasts and the place where their session was held.

Dice, plur. of *die* [the sing. is reconstructed from **dee*, under influence of plur.; O. Fr. *de*, *det*: Ital. *dado* < Lat. *datum*, what is given, hence the result of the throw, the throw, the die itself]: small cubes used in playing certain games of chance. They are made of bone, ivory, or close-grained wood, having their six sides marked with dots or pips, from one up to six. These dots are so arranged that the numbers on two opposite sides taken together always count seven. The dice are shaken in a box called a dice-box, and then thrown on a board or table, and the number of dots on the upper faces decide the game. The invention of dice is very ancient, and is variously ascribed to the Greeks and Egyptians, and by Herodotus to the Lydians. Dice similar to those of our day have been found in Thebes. The Greeks gave the names of their gods and heroes to the different throws. The game of dice was popular among the Romans, and it is said that during the decline of the empire wealthy Romans not unfrequently staked their whole fortunes on a single throw. Gamblers resort to the practice of loading dice by adding lead to them on one side, so that the higher numbers are almost sure to turn up. When this trick is suspected, the thrower should turn down the mouth of the box abruptly, and this will prevent the dice from arranging themselves unjustly. Two cubes, supposed to be Etruscan dice, but marked with words instead of pips, have given ground for Taylor's theory that the Etruscan was a Turanian language, the words being assumed as numerals.

Dicen'tra [from Gr. δίκεντρος, double-spurred; δι-, two + κέντρον, sting, spur; so named in allusion to the shape of the blossom]: a genus of herbaceous perennials belonging to the family *Fumariaceæ*. They are found in moist, rich woodlands, and flower in spring. Among the species native in the U. S. are *Dicentra cucullaria* (commonly called Dutchman's breeches), *Dicentra canadensis* (squirrel corn), and *Dicentra eximia*. *Dicentra chrysantha*, found in California, has large golden-yellow flowers. *Dicentra spectabilis*, introduced from Japan about 1846, grows sometimes to the height of 3 feet, and produces long racemes of rosy blossoms.

Dicey, Albert Venn: See the Appendix.

Dicey, Edward, C. B.: journalist; b. in Leicestershire, England, in May, 1832; educated at Cambridge; became a frequent contributor to the leading periodicals, and after serving on the staff of the *Daily Telegraph*, acted as the special correspondent for that paper in different parts of the Continent. He was for three months editor of the *Daily News* in 1870, and then became the editor of the *Observer*, remaining in the latter position till 1889. Besides his newspaper and magazine articles, he has written *A Memoir of Cavour*; *Rome in 1860*; *The Schleswig-Holstein War*; *The Battle-fields of 1866*; *The Morning Land*; and *Victor Emmanuel* in the New Plutarch Series (1882).

Dichlamyd'eous [from Gr. δι-, two + χλαμύς, cloak]: in botany, having both calyx and corolla. Thus butterenps, roses, beans, etc., are dichlamydeous, while anemones, buckwheat, etc., are monochlamydeous.

Dichotomy: an artificial system for the arrangement of natural objects, based upon principles of binary distinction. In logic, the division of a class into two sub-classes, which are opposed to each other by contradiction. In anthropology, the recognition of two factors, and only two, in man—the physical and the spiritual—contrasted with trichotomy, which recognizes in man three factors—viz., body, soul, and spirit.

Di'chroism [from Gr. δίχροος, two-colored; δι-, two + χροιά, color]: the property possessed by some crystallized bodies of showing two different colors, according to the direction in which rays of light pass through them. The crystals of the double chloride of palladium and potassium, for example, appear deep red along the axis, and vivid green in a transverse direction. Dichroism in physiological opties is a term frequently applied to color-blindness, because the Daltonist or color-blind individual possesses a system of colors based upon only two of the three primaries of the "trichroic" or normal eye. See Color-blindness.

Di'chroite, Cordierite, or **Iolite**: a silicate of magnesia, ferric oxide, and alumina. It is found in prisms belonging to the trimetric system, and is sometimes used as a gem.

Dichromatism [from Gr. δι-, twice + χρῶμα, color]: in ornithology, a color variation found in some birds, a given species exhibiting two distinct phases of coloration not due to sex, nor to changes produced by age or season. One of the best examples of this is shown by the little screech owl (*Megascops asio*), which may be either gray or red, young of each color being found in the same nest. The little blue heron (*Ardea cærulea*) also exhibits dichromatism, and may be either blue or white.

F. A. Lucas.

Dick, Thomas, LL. D.: Scottish author; b. in the Hilltown, Dundee, Nov. 28, 1774; was educated for the ministry in connection with the Secession Church in the University of Edinburgh 1794–1801, but after preaching a while as a licentiate he became a teacher, and had schools at Methven and at Perth. The success of his first book, *The Christian Philosopher* (Glasgow, 1823; 8th ed. 1842), induced him to give up teaching in 1827, and devote himself to literature. He lived at Broughty Ferry, near Dundee, and wrote numerous popular scientific and religious works, among which are *The Philosophy of Religion* (1825); *The Philosophy of a Future State* (1828); *Celestial Scenery* (1838); and the *Sidereal Heavens* (1840). He received a pension from the Government (1847). D. at Broughty Ferry, July 29, 1857. In the *Christian Philosopher* he aimed, as he said, "to illustrate the harmony which subsists between the system of nature and the system of revelation, and to show that the manifestations of God in the material universe ought to be blended with our view of the facts and doctrines recorded in the volume of inspiration." His above-mentioned later works were all supplementary in aim to the *Christian Philosopher*.

Dickens, Charles: novelist; b. at Landport, Portsmouth, England, Feb. 7, 1812. His father was John Dickens, who held a position in the navy pay department, and who afterward became parliamentary reporter for one of the London daily papers. After studying in a college near Rochester, young Dickens was placed in an attorney's office to learn the profession of the law. This pursuit proving

uncongenial to his taste, he left it and obtained a position as reporter on the staff of the *Morning Chronicle*. In this paper appeared the first efforts of his genius, his *Sketches of Life and Character*, which in 1836 were collected and published in two volumes under the title *Sketches by Boz*. The public gave these a favorable reception, and in 1837 they were followed by *The Posthumous Papers of the Pickwick Club*, which first appeared as a serial in monthly parts. The work had an immediate and almost unparalleled success, and raised its author at once to the first rank among the popular writers of the day. In its peculiar vein of humor it has never been equaled in English literature. He was married in 1838 to the daughter of George Hogarth, a music critic, and in the same year appeared *Oliver Twist*, a novel in three volumes. This was followed by *The Life and Adventures of Nicholas Nickleby* (3 vols., 1839); *Master Humphrey's Clock* (1840–41); and *Barnaby Rudge* (1841). In 1841 he visited the U. S., and in the following year appeared his *American Notes for General Circulation*, in which life and character in the U. S. were somewhat severely satirized. The *Notes* were followed in 1843–44 by the *Life and Adventures of Martin Chuzzlewit* (3 vols.), a work which reflected still more on the faults and foibles of the people of the U. S.

In 1844 Mr. Dickens went to Italy, whence he returned in 1845, and toward the end of that year he assumed the chief editorship of the *Daily News*, a Liberal journal then just established. He soon, however, resigned this position. In 1847–48 appeared his *Dombey and Son*, which, in some of its passages at least, is not surpassed by any of his works either in power or pathos. It was followed in 1850 by *The Personal History of David Copperfield*, which is regarded by many as the best of all his novels. Certainly in none other is the interest more intense or better sustained from the beginning to the end. It is commonly understood that in the story of *David Copperfield* the novelist has introduced many of the incidents or circumstances of his own life, without, however, following so closely the real history as in any way to compromise the characters of those with whom he associated. Among his other works may be mentioned *Bleak House* (1852); *Hard Times* (1854); *Little Dorrit* (1857); *A Tale of Two Cities* (1860); *Great Expectations* (1862); *Our Mutual Friend* (1864–65); and *The Mystery of Edwin Drood*, left unfinished at his death. *Household Words*, a weekly periodical originated by him in 1850, had a very extensive circulation. He afterward in 1859 started another weekly journal entitled *All the Year Round*. In 1867 he made a second visit to the U. S., and met everywhere with a cordial and even enthusiastic reception. He gave in the principal cities public readings from his own works, which were attended by crowded audiences. He returned to his native country in the spring of 1868, and died at Gad's Hill, June 9, 1870. He was buried in Westminster Abbey June 14, 1870. See his *Life* by John Forster (3 vols. 8vo, 1871–72–74), and Kent's *Charles Dickens as a Reader*; also Miss Kate Field's *Pen Photographs of Charles Dickens's Readings in America*.

Dickey, Charles Andrews, D. D.: Presbyterian preacher and pastor; b. in Wheeling, West Va., Dec. 25, 1838; educated at Washington and Jefferson College (1858). He was pastor of the United Presbyterian church of Allegheny City, Pa., 1861–69, of the First Presbyterian church of St. Louis 1869–75, and of the Calvary Presbyterian church, Philadelphia, from 1875–93, when he resigned that he might devote his time to the service of the Presbyterian Hospital, Philadelphia, of which institution he has been president since 1883.

Willis J. Beecher.

Dickins, John: Methodist Episcopal preacher; b. in London, Aug. 24, 1747; studied at Eton; and emigrated to America before the Revolutionary war. In 1774 he became a Methodist, and soon began to preach. He was one of the ablest preachers of his day, and contributed much to the foundation of Cokesbury College, near Abingdon, Md., and the Methodist Book Concern. Died of yellow fever in Philadelphia, Pa., Sept. 27, 1798.

Dickinson: town (founded in 1882); Stark co., N. Dak. (for location of county, see map of North Dakota, ref. 3–C); situated on Heart river, and on N. Pac. R. R.; 109 miles W. of the Missouri river; has churches of six denominations, good public school, headquarters of the Mission Division on N. P. R. R., cigar-manufactory, brick-works, and other minor industries. Pop. (1890) 897; (1900) 2,076.

Editor of "Press."

Dickinson, Anna Elizabeth: orator; b. of Quaker parents at Philadelphia, Oct. 28, 1842; was educated in the Friends' free schools. Her first public speech was delivered in Jan., 1860, at a meeting for the discussion of woman's rights, and at once established her reputation. During the civil war she delivered many patriotic and political addresses, and subsequently spoke much upon labor reform, woman's suffrage, etc. In 1875 she entered upon the dramatic profession and produced two plays, *Marie Tudor* and *Anne Boleyn*, in both of which she performed the principal part.

Dickinson, Daniel Stevens, LL. D.: Senator and lawyer; b. in Goshen, Conn., Sept. 11, 1800. He was elected as a Democrat to the Senate of New York in 1836, and became Lieutenant-Governor of that State in 1842. In 1844 he was chosen a Senator of the U. S. for six years. He was distinguished as a debater, and was the leader of the conservative (Hunker) Democrats of New York. After he retired from the Senate he practiced law at Binghamton with success. In 1861 he was elected attorney-general of New York. During the civil war he zealously supported the cause of the Union by public speeches. He was appointed district attorney for the southern district of New York in the spring of 1865. D. in New York city, Apr. 12, 1866. See his *Life and Works* by his brother (2 vols., New York, 1867).

Dickinson, Don M.: lawyer; b. at Port Ontario, N. Y., in 1845, but was taken when a child to Detroit, Mich., where he has since resided; studied law at Michigan University, and began practice in Detroit; was Postmaster-General Jan. 16, 1888, to Mar. 5, 1889.

Dickinson, John, LL. D.: lawyer and statesman; b. in Maryland, Nov. 13, 1732. He received his legal education in London; practiced law with success in Philadelphia, and was a deputy to the first Colonial Congress in 1765. He was a member of the Continental Congress in 1774, and wrote for that body several important state papers, among which was a *Declaration to the Armies*. He was an eloquent and ready debater. In 1776 he spoke against the Declaration of Independence, which he regarded as premature, and he was one of the few members of Congress who did not sign that declaration. He consequently became unpopular, and was defeated in the next election, but he served as a private soldier in the war of Independence. In 1779 he represented Delaware in Congress. He was president of Pennsylvania in 1782–85. He wrote numerous political essays, and had a high reputation for learning. In 1783 he founded and endowed Dickinson College at Carlisle, Pa. D. in Wilmington, Del., Feb. 14, 1808.

Dickinson, Jonathan: Presbyterian theologian; b. at Hatfield, Mass., Apr. 22, 1688; graduated at Yale College in 1706. He preached at Elizabethtown, N. J., from 1709 till his death; became president of the College of New Jersey 1746. He wrote several works on theology. D. in Elizabethtown, N. J., Oct. 7, 1747. His collected writings were published in Edinburgh 1793.

Dickinson College: an institution of learning, situated in Carlisle, Pa. It was founded in 1783, and with the exception of the University of Pennsylvania is the oldest college in the State. In consequence of the valuable gifts and personal interest of Hon. John Dickinson, "president of Pennsylvania," the institution received his name. The first president was Charles Nisbet, D. D., a native of Scotland and minister at Montrose. Later presidents have been Robert Davidson, D. D., elected in 1804; Jeremiah Atwater, D. D., in 1809; John M. Mason, D. D., in 1821; William Neill, D. D., in 1824; Samuel B. How, in 1830; John P. Durbin, D. D., in 1833; Robert Emory, D. D., in 1845; Jesse T. Peck, D. D., in 1848; Charles Collins, D. D., in 1852; Herman M. Johnson, D. D., in 1860; Robert L. Dashiell, D. D., in 1868; James A. McCauley, D. D., LL.D., in 1872; George E. Reed, D. D., in 1889.

The institution is denominational. Until 1833 it was under Presbyterian control, but the division of that Church into the old and new branches brought the college under grave embarrassments. The Old School kept the educational funds; the New School had a majority of the board of trustees, but, being without funds, transferred the college to the Methodist denomination, under whose care it now remains. At the breaking out of the civil war (1861) it had many students from the Southern States; these left, others were called to the battle-field, and the college suf-

fered in its finances until the year of the centenary of Methodism, when its endowment fund was increased $100,000. Since 1882 the endowment has been increased by about $120,000, and buildings and other equipment added at a cost of about $125,000. The new buildings are the Jacob Tome Scientific Building, James W. Bosler Memorial Library Building, and a gymnasium, making six buildings in all. The library contains about 45,000 volumes.

There are three courses of study—(1) the classical course, (2) the Latin-scientific course, and (3) the modern language course. Greek is omitted from the Latin-scientific course, and Greek and Latin from the modern language course. JAMES A. MCCAULEY.

Dickson, Sir COLLINGWOOD: soldier; b. 1817; entered the Royal Artillery as second lieutenant in 1835; became captain in 1846 and colonel in 1866; served during the Eastern campaign of 1854–55 on the staff of Lord Raglan, and was present at the actions of Bulganac and McKenzie's Farm, battles of Alma and Inkerman, capture of Balaklava, expedition to Kertch, and siege of Sebastopol; wounded Feb. 4, 1855; commanded the right siege-train, and was present at the bombardment, gaining the Victoria Cross for gallantry Oct. 17; was breveted lieutenant-colonel and colonel; received medal with four clasps from his own Government, also the Turkish medal, and was appointed aide-de-camp to the Queen, officer of the Legion of Honor, and created a C. B. He is also a knight of the order of Charles III. and of Isabella the Catholic. In 1870 he was appointed inspector-general of artillery, and in 1871 nominated a K. C. B. In 1875 he was made a colonel-commandant of the ninth brigade of Royal Artillery; general 1877.

Dickson, SAMUEL HENRY, M. D., LL. D.: physician; b. of Scottish parentage at Charleston, S. C., Sept. 20, 1798; graduated at Yale in 1814, and received the degree of M. D. at the University of Pennsylvania in 1819. In 1824 he became Professor of the Institutes and Practice of Medicine at Charleston Medical School (S. C.); was Professor of Practice in the University of New York 1847–50, returning then to Charleston. In 1858 he was called to the chair of practice at Jefferson College, Philadelphia. He was the author of *Manual of Pathology and Practice of Medicine*; *Essays on Pathology and Therapeutics*; *Essays on Life, Sleep, Pain, etc.*; *Elements of Medicine*; and numerous pamphlets upon medicine and other subjects. D. in Philadelphia, Pa., Mar. 31, 1872.

Dickson, WILLIAM PURDIE, D. D., LL. D.: Scottish educator and biblical scholar; b. at Pettinain manse, Lanarkshire, Oct. 22, 1823: graduated at the University of St. Andrews 1851. He was minister of Cameron parish, Fife, 1851–63; Professor of Biblical Criticism, University of Glasgow, 1863–73; and from 1873, Professor of Systematic Theology in that university. Under his care as curator the university library has become celebrated for the completeness of its catalogues. He has been a large contributor to books of reference and periodicals. He published a translation of Mommsen's *History of Rome* (4 vols., London, 1862–66; revised ed. 1868; two supplemental volumes, 1887) and a translation of Meyer's *Commentary on the New Testament* (Edinburgh, 1873–80). WILLIS J. BEECHER.

Diclinic System: See CRYSTALLOGRAPHY.

Dicotyle'dons [from Gr. *δι-*, two + *cotyledon*, a seed leaf, a cavity]: a sub-class of higher flowering plants (Angiosperms); characterized by having their first leaves (cotyledons) in pairs, the veins of the later leaves mostly netted, the parts of their flowers commonly in fives, and the woody bundles of their stems arranged concentrically. There are exceptions to every one of the foregoing characters, and it is only by the general agreement of the characters that the sub-class is defined.

Here are included all the trees of northern climates, as well as the greater part of the shrubs and herbs. In woody plants the stems of dicotyledons are easily distinguished from those of the other sub-class (monocotyledons) by having distinct pith, wood, and bark, but this does not serve to separate them from those of the Conifers among the Gymnosperms. In fact the resemblance of the stems of dicotyledons to those of the Conifers led the older botanists to include all Gymnosperms in the dicotyledons, ignoring the profound differences in the ovule, and ovuliferous leaves. The real relation of these groups to one another is more as follows:

ANTHOPHYTA, or PHANEROGAMIA.	Class II. Angiosperms.	Sub-class II. Dicotyledons.
		Sub-class I. Monocotyledons.
	Class I. Gymnosperms.	

The dicotyledons include many orders and a great many families. CHARLES E. BESSEY.

Dictamnus: See DITTANY.

Dicta'tor [Lat., commander, dictator, deriv. of *dicta're*, command]: a magistrate of ancient Rome who was invested with extraordinary authority. He was elected in cases of especial danger to the republic and retained his office for six months, but might be elected again if the state still stood in need of his services. The senate decided when it was necessary to elect a dictator, and made over to one of the consuls the power of nominating a man to the office. The first dictator was chosen during the war with the Latins, 500 B. C. In the exercise of his authority he recognized no superior. He could raise and disband forces; he could proclaim war, and could inflict such punishments as he pleased. During his rule all other magistrates except the tribunes of the people were suspended from their duties. He was preceded by twenty-four lictors with the fasces. When elected he chose a subordinate called *magister equitum*, who at first a mere transmitter of orders, after the second Punic war had almost as much power as the dictator. But the dictator's authority was limited in several ways. He could not pass the borders of Italy; he could not touch the treasury, neither could he ride on horseback on any expedition. The office at first was confined to patricians, and held in great honor, but afterward became odious on account of the usurpations of Sulla and Julius Cæsar, so that on the death of the latter the senate, on the motion of Antony, decreed that no more dictators should be appointed. The last regular dictator held office 202 B. C.

Dictionary: a book whose distinguishing characteristic is the arrangement of its subjects according to some stated principle connected with the form of their names, usually the principle of alphabetic order. In its original and proper use the term was limited to books in which the subjects treated were words or names, but it is now, by restriction of the characteristic to alphabetic arrangement, freely extended to books treating of other subjects. Thus we have dictionaries of biography, antiquities, politics, history, history of special countries, geography, statistics, heraldry, medicine, natural history, philosophy, arts and manufactures, quotations, conversation, the Bible, etc. There are dictionaries of things (Germ. *Realwörterbücher*) as distinguished from word-books or dictionaries proper. The dictionary of things which undertakes to cover all fields of knowledge is called an encyclopædia or cyclopædia. As dictionaries of things will be duly treated under the special topics with which they are connected, the present article restricts itself to the term dictionary in its original and purely linguistic sense.

There are a number of terms partly synonymous with *dictionary*, at least in current usage, and partly indicative of subordinate classifications, which deserve notice in this connection. *Lexicon* is a term most commonly applied to dictionaries of Greek, Latin, and Hebrew, but may be applied to any dictionary of a dead or foreign language. *Thesaurus* (Gr. θησαυρός, treasury) is a term which is sometimes used for the more extensive lexical works involving copious citations and discussions. *Vocabulary* refers in its common use to a word-list with concise definitions accompanying a special text or extract. Thus a *Vocabulary to the First Six Books of the Iliad*. A *glossary* is properly a collection of rare, obscure, dialectal, or antiquated words with no attempt at completeness in any line. *Idioticon* (Gr. ἰδιωτικός, deriv. of ἴδιος, peculiar to one's self) applies to a collection of the words of a single dialect. *Onomasticon* (Gr. ὀνομαστικόν (*sc.* βιβλίον), deriv. of ὄνομα, name) is a collection of names or of the technical terms of a science or art. The classical example is the *Onomasticon* of Julius Pollux (second century A. D.), in which the words of the Greek language are arranged in groups according to their meaning; thus under such headings as the house, parts of the house, doors, locks, ships, nautical terms, parts of the day, etc.

Closely related to the dictionary or word-book is the *concordance*, which arranges the material of an important work or set of works in passages or phrases, classifying them according to prominent words or catch-words, and indicating the book, chapter, verse, or line of their occurrence. Or it may be viewed as an index-list of the prominent words accompanied by the passages in which they occur. Examples are Cruden, A., *A Complete Concordance to the Holy Scriptures*; Bruder, K. H., *Concordantiae omnium vocum Novi Testamenti Græci primum ab E. Schmidt editæ*; Clarke, Mrs. Cowden, *Complete Concordance to Shakespeare*;

Prendergast, G. L., *Concordance to the Iliad of Homer*; Dunbar, H., *Concordance to the Odyssey and Hymns of Homer.*

A list of the words or word-forms in an author or work alphabetically arranged with reference to the passages where they occur is called an *index.* Thus Seber, W., *Iudex vocabulorum in Homeri Iliade atque Odyssea*; Gehring. *Index Homericus*; Whitney, W. D., *Index Verborum to the Publ. Texts of the Atharva-Veda.*

Gazetteer is a name frequently applied to dictionaries of place-names, i. e. geographical dictionaries. This title is said to have had its origin in the name of an early work of the kind, Echard's, *The Gazetteer's or Newsman's Interpreter.* Examples are Lippincott's *Gazetteer of the World, a Complete Pronouncing Gazetteer or Geographical Dictionary*; De Colange, L., *The National Gazetteer, a Geographical Dictionary of the United States.*

Following is a list of dictionaries, selected and arranged, not on an historical, but on a purely practical, basis, as being the most important for general use in connection with the English language, the historical development of the English dictionary being reserved for the article LEXICOGRAPHY (*q. v.*):

Dictionaries of the English Language in English.—A New English Dictionary on Historical Principles, founded mainly on the materials collected by the Philological Society, edited by James A. H. Murray (Oxford, 1888). The letters A, B, and the greater part of C and E had appeared in Jan., 1893. The aim of this work is "to furnish an adequate account of the meaning, origin, and history of English words now in general use, or known to have been in use at any time during the last 700 years." It gives an account of the various forms in which each word appears since the formation of the language in the eleventh century, or since the introduction of the word into the language, and is consequently invaluable for the history of orthography. It discusses these varieties of form in the interest of determining the historical development of their pronunciation. It attempts to arrange all the meanings known to have been attached to each word in the order of their development, and to account for this development. It furthermore seeks to give by application of the comparative method the prehistoric etymology of the word. Its purpose is not to dictate to usage, but to record usage. It promises to be as valuable a classified word-inventory as has ever been made for any language.

The Century Dictionary, an Encyclopædic Lexicon of the English Language, prepared under the superintendence of William Dwight Whitney (6 vols., New York, 1891), addresses itself more directly to the demands of general use than Murray's *Dictionary.* It is far less pretentious in its aims, and is naturally less exhaustive in its treatment of the history of form and meaning, being based upon far smaller collections of material. Its etymologies are generally brief. Free use of excellent illustrations and much explanation of *things* as additional to that of *words* proper cause it to share some of the characteristics of an encyclopædia. Its vocabulary includes more than 200,000 words.

The Imperial Dictionary of the English Language, a Complete Encyclopædic Lexicon, Literary, Scientific, and Technological, by John Ogilvie; new edit. by Charles Annandale (London, 1883). This is the prototype of the *Century Dictionary*, which has followed its general plan and is based to some extent upon its material.

A Standard Dictionary of the English Language, upon Original Plans, prepared under the supervision of Isaac K. Funk, editor-in-chief, and Francis A. March, advisory editor (New York, 1893–95). For this work is claimed the largest vocabulary in any completed dictionary. As it is compressed into one volume (2,318 pages), its treatment of words is very concise. It contains all possible special vocabularies, and is supplemented by an atlas of the world and a condensed cyclopædia. A peculiar and very useful feature is a list of disputed spellings and pronunciations, showing plainly the preferences of eminent specialists.

Webster's International Dictionary of the English Language, being the Authentic Edition of Webster's Unabridged Dictionary, Revised under Supervision of Noah Porter (Springfield, Oct., 1890). This work also includes many special vocabularies—proper names of all kinds, phrases and proverbs from foreign languages, etc.

A Dictionary of the English Language by Rev. James Stormouth, the Pronunciation Revised by Rev. P. H. Phelp (New York, 1885). A dictionary based essentially upon the standard English of England, and as such a particularly valuable book of reference, especially in the matter of pronunciation. It does not seek to present an inventory so much as a norm of usage. A peculiar feature of the book is the arrangement of the word-material in groups according to derivation, or sometimes according to etymology; thus in one group under *music*: *musical*, *musically*, *musicalness*, *musician*, *music-glasses*, etc.

A New Dictionary of the English Language by Ch. Richardson (2 vols., London, 1839). Valuable for its numerous quotations from standard authors, chronologically arranged. Its etymologies are remarkable for their perversity. A new and greatly condensed edition, omitting the useful citations and retaining the baneful etymologies, appeared in 1860.

A Dictionary of the English Language, Founded on that of Dr. Samuel Johnson, with Numerous Additions and Emendations, by R. G. Latham (4 vols., London, 1866); an unsuccessful attempt to adapt the famous dictionary of Dr. Johnson, which first appeared in 1755, to present needs.

A Dictionary of the English Language, by Joseph Emerson Worcester (Boston, 1860, and in many other subsequent editions).

Schmidt's *Shakespeare Lexicon, a Complete Dictionary of all the English Words, Phrases, and Constructions in the Works of the Poet* (2 vols., 1874–75), may be mentioned as a sample of the dictionaries devoted to the explanation of the meanings of words as used by particular authors.

Etymological Dictionaries of English.—Skeat, W. W., *An Etymological Dictionary of the English Language Arranged on an Historical Basis* (Oxford, 1882; 2d edit. 1884; abbrev. of same, *A Concise Etymological Dictionary*, 2d edit. 1885). The best work of its kind, but very defective on the side of scientific phonology. This is particularly noticeable in the treatment of the loan element of the language and in the field of general Indo-European philology.

Mueller, Eduard, *Etymologisches Wörterbuch der englischen Sprache* (2d edit. 2 vols., Cöthen, 1878). Represents the best philological attainment of the date of publication. Needs revision.

Wedgewood, H., *A Dictionary of English Etymology* (2d edit. 1872). Though containing much original and valuable material, its uncritical method and fantastic views of the growth of language render it entirely untrustworthy.

Palmer, A. S., *Folk-etymology, a dictionary of verbal corruptions or words perverted in form or meaning by false derivation or mistaken analogy* (London, 1882). A most valuable and useful collection of material, needing, however, a more critical treatment.

The Stanford Dictionary of Anglicized Words and Phrases, edited by C. A. M. Fennell (1892). This work deals principally with the material imported into English from other languages since the introduction of printing.

Dictionaries of Phrases and Synonyms.—Roget's *Thesaurus of English Words and Phrases, classified and arranged so as to facilitate the expression of ideas and assist in literary composition* (London, 1852, 1879, 1886, 1892). A classified vocabulary of standard English, with a valuable collection of phrases and proverbial expressions.

Smith, Charles John, *Synonyms Discriminated, a dictionary of synonymous words in the English Language, illustrated with quotations from standard writers* (new edition 1882).

Crabb, G., *English Synonyms Explained* (latest edition 1889).

Dictionaries of Quotations, Literary Allusions, Pseudonyms, etc.—Bartlett, J. R., *Familiar Quotations* (1889); Brewer, E. C., *Dictionary of Phrase and Fable* (1880); *The Reader's Handbook* (1888); Wheeler, W. A., *Noted Names in Fiction* (1889); *Familiar Allusions* (1882); Allibone, S. A., *Great Authors of All Ages* (1885); *Dictionary of Authors* (5 vols., 1872–91); Ward, A. L., *Dictionary of Quotations in Prose* (1889); Bent, S. A., *Short Sayings of Great Men* (1882); Frey, A. R., *Sobriquets and Nicknames* (1888); Reddall, H. F., *Fact, Fancy, and Fable* (1889); Barbier, A. A., *Dictionnaire des Ouvrages Anonymes* (4 vols., 1880); Weller, E., *Lexicon Pseudonymorum* (1886); Halkett-Laing, *Dictionary of Anonymous and Pseudonymous Literature of Great Britain* (4 vols., 1888); Cushing, W., *Initials and Pseudonyms* (1885; second series 1888); Cushing, W., *Anonyms* (1890); Franklin, A., *Dictionnaire des Noms, Surnoms, et Pseudonyms Latins de l'Histoire Littéraire du Moyen Âge* (1875); Adams, W. D., *Dictionary of English Literature*: includes in its headings names of authors and *noms de plume*, titles of books, first lines of familiar poems, phrases, etc.

Dictionaries of Names of Persons and Places.—Lippincott's *Gazetteer of the World*, edited by Thomas and Baldwin (1882); Johnston, A. K., *General Dictionary of Geography* (1882); Putnam's *Globe Pronouncing Gazetteer of the World* (1888); Blackie, C., *Dictionary of Place-names, giving their derivations* (1887); *Century Cyclopædia of Names* (1894); Kleinpaul, R., *Menschen- und Völkernamen* (1885); Joyce, P. W., *Irish Names and Places*, 2 series (1883); Lower, M. A., *English Surnames* (2 vols., 1875); *Patronymica Britannica, dictionary of family names* (1860); cf. also Yonge, C. M., *History of Christian Names* (1884).

Dictionaries of English Dialects, etc.—Wright, Thomas, *Dictionary of Obsolete and Provincial English*, containing words from the English writers previous to the nineteenth century which are no longer in use, or are not used in the same sense, and words which are now used only in the provincial dialects (2 vols., 1857; later edition by S. J. Herrtage, 1886); Halliwell-Phillips, J. O., *Dictionary of Archaic and Provincial Words, Phrases, etc.* (2 vols., latest edition 1889).

Britten and Holland, *Dictionary of English Plant Names* (3 parts, 1878–84); Bartlett, J. R., *Dictionary of Americanisms* (1877); Farmer, J. S., *Americanisms, Old and New* (1889).

For special dictionaries to various local dialects of England, see bibliography by J. Wright in Paul's *Grundriss der germ. Philol.* i., 976 ff.

Dictionaries of Middle English.—A Middle-English Dictionary, containing words used by English writers from the twelfth to the fifteenth century, by Francis Stratmann. New edition, rearranged, revised, and enlarged, by Henry Bradley (1891). The earlier edition of this work appeared under the title *Dictionary of the Old English Language.*

Altengtische Sprachproben nebst einem Wörterbuch herausgegeben von Eduard Mätzner. The first volume is made up of selections; the second (1878–91) is the dictionary proper, and has appeared through the letter *L.* The title "Altenglisch" is used to designate what is now, in English, generally called "Middle English."

A Concise Dictionary of Middle English, by A. L. Mayhew and W. W. Skeat (1888, 272 pp.).

Dictionaries of Old English (Anglo-Saxon).—An Anglo-Saxon Dictionary, based on the manuscript collections of Joseph Bosworth, edited and enlarged by Northcote Toller (4 parts, A–Sw complete, 1882–92).

Grein, *Sprachschatz der angelsächsischen Dichter*, 2 vols., 1861–64 (vols. iii. and iv. of the *Bibliothek der angelsächsischen Poesie*). An abbreviated form of same by Grosehopp (1883), and in English form, Harrison and Baskerville, *A Handy Poetical Anglo-Saxon Dictionary* (1885).

Leo, H., *Angelsächsisches Glossar* (1877).

The Most Available Greek Dictionaries.—Liddell and Scott, *Greek-English Lexicon*, 7th edition (1889); also various abridged editions.

Yonge, C. D., *English-Greek Lexicon* (1870); also an abridged edition.

Thayer, J. H., *Greek-English Lexicon of the New Testament*, translated, revised, and enlarged from Grimm's Wilke's *Clavis Novi Testamenti* (1889).

Sophoeles, E. A., *Greek Lexicon of the Roman and Byzantine Periods* (1870); memorial edit. revised by J. H. Thayer (1887).

Contopoulos, N., Λεξικὸν Ἑλληνοαγγλικόν (*Modern Greek-English*), 3d edit. 1889; also a vol. for English-Modern Greek.

Cremer, H., *Biblico-Theological Lexicon of New Testament Greek* (1887).

Pape, W., *Wörterbuch der griechischen Eigennamen* (proper names), 2 vols.

Stephanus, H., *Thesaurus Linguæ græcæ* (Greek-Latin); best edit. edited by Hase, C. B., Dindorf, G., Dindorf, L. (Paris, 1831–65).

The Most Available Latin Dictionaries.—Harper's Latin Dictionary, based on Freund's *Latin-German Lexicon*, edited by E. A. Andrews and revised by C. T. Lewis and C. Short (1886).

White and Riddle, *Latin-English Dictionary* (2 vols., 1880), abridged (1865); *English-Latin Dictionary* (1870).

Forcellini, Aeg., *Totius Latinitatis Lexicon*; 5th edit. revised by V. De Vit (6 vols., 1858–75); *Onomasticon totius Latinitatis*; 5th edit. revised by De Vit (1859–). The most complete of all the Latin lexicons.

Georges, K. E., *Deutsch-Lat. und Lat.-Deutsches Wörterbuch* (4 vols., 1880–85). A very serviceable work, accurate and compact. The best of the Latin dictionaries in German.

Du Cange, C. D., *Glossarium mediæ et infimæ Latinitatis*, edited by Henschel (10 vols., 1882–88).

Best Dictionaries of Modern European Languages (into English).—Flügel, *A Universal English-German and German-English Dictionary* (3 vols.; fourth thoroughly revised edition, 2 vols., appeared 1891). Altogether the best.

Grieb, C. F., *Dictionary of the English and German Languages*, 3 vols. (1885); Lucas, N. J., *Dictionary of the English and German Languages* (4 vols., 1868); Whitney, W. D., *German and Engl. Dict.* (1877); Köhler, F., *German and English Dictionary* (1881); the best of the smaller dictionaries. Eger, *Technological Dictionary in the English and German Languages* (1886).

Calisch, *Complete Dictionary of English and Dutch Languages* (2 vols., 1890); Picard, A., *Pocket Dictionary of English-Dutch and Dutch-English Languages* (1877); Ferrall-Repp-Rosing, *Danish-English and English-Danish Dictionary* (1873); Larsen, A., *Danish-Norwegian-English Dictionary* (1884); Geelmuyden, J., *English-Norwegian Dictionary* (1887); Nilsson-Widmark-Bollin, *English-Swedish Dictionary* (1889); Oman, V. E., *Swedish-English Dictionary* (1889).

Spiers and Surenne, *French and English Pronouncing Dictionary* (1891); Gasc, F. E. A., *English-French and French-English Dictionary* (1889); Hamilton-Legros. *Dictionnaire International Français-Anglais* (1888); Bellows, J., *Pocket Dictionary French-English and English-French* (1877); an ideal pocket dictionary; compact, accurate, and arranged on such a plan that the exact use of the words can usually be easily determined.

Baretti, J., *Italian-English and English-Italian Dictionary* (1877); James and Grassi, *Dictionary of English and Italian Languages* (1884); Millhouse, J., *New English and Italian Pronouncing Dictionary* (2 vols., 1889).

Velasquez, M., *Pronouncing Dictionary of the Spanish and English Languages* (2 vols., 1889), abridged (1889); Neuman and Baretti, *Dictionary of the Spanish and English Languages* (2 vols., 1874); Lopez and Bensley, *New Dictionary of the Spanish and English Languages* (1878); Valdez, J. F., *Portuguese-English and English-Portuguese Pronouncing Dictionary* (2 vols., 1879); de Lacerda, José, *New Dictionary of Portuguese and English Languages* (2 vols., 1871); Elwes, A., *Portuguese-English and English-Portuguese Dictionary* (1888); Contopoulos, N., *Greek-English and English-Greek (Modern Greek) Lexicon* (1889); Alexandrow, A., *Comptete English-Russian Dictionary* (2 vols., 1879); Pawlowsky, J., *Pocket Dictionary of the English and Russian Languages* (1874); Baranowski, J. J., *Anglo-Polish Lexicon* (1884); Redhouse, J. W., *Turkish and English Dictionary* (1887); Bizonfy, F., *English-Hungarian Dictionary* (1878); *Hungarian-English* (1886).

For dictionaries of other languages see under head of special languages.

Etymological Dictionaries.—Those on English have already been mentioned under the special head of English. The following list contains the titles of the most important works of present scientific value:

Fick, A., *Vergleichendes Wörterbuch der indogermanischen Sprachen* (4 vols., 3d edit. 1876); of 4th edit. one vol. appeared (1890). The only etymological dictionary covering the whole field of Indo-European speech which is at all in accord with the present status of science.

Pott, A. F., *Wurzetwörterbuch der indogerm. Sprachen* (6 vols., 1876). Though now entirely antiquated in its scientific point of view, it remains a storehouse of valuable and suggestive material.

Curtius, G., *Grundzüge der griechischen Etymologie* (5th edit. 1879); in Engl. translation by Wilkins and England (2 vols., 1886). This work offers the fullest collection of material available, but in its theories of scientific etymology is already antiquated, and can no longer be quoted as an authority.

Vaniček, A., *Griechisch-Lateinisch etymologisches Wörterbuch* (1877). Absolutely lacking in critical value, but useful for its references to the earlier literature of the subject.

Prellwitz, W., *Etymologisches Wörterbuch der griech. Sprache* (1892). The best available handbook, but it contains no references to the literature of the subject, and is not free from a certain laxity in the application of phonetic laws.

Wharton, E. R., *Etyma Græca* (1882). Contains little independent material.

Pape, W., *Etymologisches Wörterbuch der griech. Sprache* (1836). This is not strictly an etymological dictionary, but

is a collection of the word-material of the language arranged according to endings or suffixes, and is often of great convenience for etymological or grammatical purposes.

Vaniček, A., *Etymologisches Wörterbuch der lateinischen Sprache* (1881); uncritical. Wharton, E. R., *Etyma Latina* (1890); a convenient handbook. Bréal-Bailly, *Dictionnaire Étymologique Latin* (1886); intended especially for school use; words are arranged into convenient groups around their primitives. Postgate and Vince, *Dictionary of Latin Etymology* (in preparation). A Latin etymological dictionary by Prof. Osthoff, of Heidelberg, is also in preparation. There follow two dictionaries of Greek loan-words in Latin which are serviceable for etymological purposes: Weise, F. O., *Die griech. Wörter im Lateinischen* (1882); Saalfeld, G. A., *Tensaurus Italogræcus* (1884).

Diez, F., *Etymologisches Wörterbuch der romanischen Sprachen* (1887). Körting, G., *Lateinisch-Romanisches Wörterbuch* (1892). This is really an etymological dictionary of the Romance languages, having its material arranged according to the form of its sources, i. e. generally under the Latin form; a most valuable book. Brachet, A., *Etymological French Dictionary*, translated from French by G. W. Kitchin (1878). Scheler, A., *Dictionnaire d'Étymologie Française* (1880). The great French dictionary of Littré (4 vols. and suppl., 1874–84) is also invaluable for its etymological material. Coelho, F. A., *Diccionario manuel etymologico da Lingua Portuguesa* (1890). Schade, O., *Altdeutsches Wörterbuch* (2d edit. 1872–82). Kluge, F., *Etymologisches Wörterbuch der deutschen Sprache* (4th edit. 1889). The fourth edition has appeared in English translation. One of the best etymological dictionaries of any language. Weigand, F. L. K., *Deutsches Wörterbuch* (2 vols., 1882). Of first importance for the modern German, especially for the development of signification, is the monumental work begun by the Grimm brothers. Grimm, J. and W., *Deutsches Wörterbuch* (begun in 1852 still (1893) incomplete).

Feist, S., *Grundriss der gotischen Etymologie* (1888).

Balg, G. H., *A Comparative Glossary of the Gothic Language* (1887–90).

Miklosich, F., *Etymologisches Wörterbuch der slavischen Sprachen* (1886).

Meyer, G., *Etymologisches Wörterbuch der albanesichen Sprache* (1891).

Scientific Dictionaries. — Dictionaries explaining the meanings of words peculiar to the arts or sciences or the technical or scientific meanings of words also in general usage have multiplied with great rapidity, keeping close to the development of the arts and sciences themselves. This is rendered necessary by the fact that the vast terminology of the arts and sciences precludes the incorporation of a great portion of their terms in any general dictionary. All the more important technical or scientific dictionaries, as of chemistry, electricity, mechanics, medicine, law, philosophy, theology, etc., are found in most public libraries.

BENJ. IDE WHEELER.

Dic'tyogens [from Gr. δίκτυον, net + root of Gr. γένος, race]: a name proposed by Lindley for a sub-class of plants included by other botanists among monocotyledonous plants. While they agree with the latter in the structure of the embryo, they are distinguished by having net-veined instead of parallel-veined leaves, and the growth of their stems appears to partly resemble that of dicotyledons and partly that of monocotyledons. The most important families referred to this class are *Dioscoreaceæ* and *Smilaceæ*, and among the plants are the different species of yam and sarsaparilla.

Dic'tys Creten'sis: an apocryphal history or journal of the Trojan war (*Ephemeris Belli Trojani*) in six books, purporting to have been written by a certain Dictys, who went with Idomeneus, King of Crete, to Troy. The original, written on bark in Phœnician characters, is said to have been discovered in the thirteenth year of the reign of Nero, who ordered it to be translated into Attic Greek. The work in its present form is probably a compilation of the fourth century. Scholars are still divided as to whether it is or is not a translation of a Greek original. The professed Latin translator, L. Septimius, dedicates his work to Q. Aradius. There are many imitations of Sallust, Vergil, and other Latin writers. Dictys and Dares were very popular in the Middle Ages, and from them many Homeric legends were introduced into Romance. See edition by R. Meister (Leipzig, 1872) and article DARES.

M. WARREN.

Dicyn'odon [from Gr. δι-, two + κυν-, nomin. κύων, dog + ὀδούς, tooth]: a genus of fossil reptiles whose remains have been found in South Africa. Animals of this genus united in their structure the characteristics of different reptiles. The closed orbits and sharp, compressed jaws covered with a horny plate ally it closely to the tortoise, but it also has affinities with the lizard and crocodile. It takes its name from a pair of sharp-pointed tusks growing downward, one from each side of the upper jaw. The articulating surfaces of the vertebræ being hollow, it may be supposed that these reptiles were good swimmers; and if they were inhabitants of the water, the construction of the bony passages of the nostrils proves that they must have come to the surface to breathe air.

Didactic [from Gr. διδακτικός, pertaining to teaching; διδάσκειν, teach]: skilled in teaching, imparting instruction. Didactic poetry aims chiefly to teach some art, science, or system of philosophy. Among the most remarkable examples of ancient didactic poems are Lucretius's *De Rerum Naturâ* (designed to explain and defend the philosophy of Epicurus), which Macaulay pronounces "the finest didactic poem in any language"; Vergil's *Georgics* (a treatise on agriculture); and Horace's *De Arte Poeticâ* (*On the Poetic Art*). Many fine didactic poems have also been written in modern times. Among the principal of these are Vida's *Art of Poetry* (*De Arte Poeticâ*); Boileau's *Art of Poetry* (*L'Art poétique*); Pope's *Essay on Criticism* and *Essay on Man*; Darwin's *Botanic Garden*; and most of Cowper's longer poems.

Didel'phia [from Gr. δι-, twice + δελφύς, womb, in allusion to the double condition of the uterus]: that one of the three sub-classes of mammals containing the marsupials, or pouched mammals, equivalent to the *Metatheria* of Huxley. Contrasted with *Ornithodelphia*, the *Monotremes*, or egg-laying mammals, and the *Monodelphia*, or placental mammals. See MAMMALS and MARSUPIALIA.

F. A. L.

Didelphys: See OPOSSUM.

Diderot, dēē'drō', DENIS: French philosopher; b. at Langres, Oct. 5, 1713; educated by the Jesuits, and destined for the Church and later for the law, but eagerly embraced the study of literature. His father, a prosperous cutler of stern character, withdrew from him all support upon his refusal to pursue his professional studies. Among his first writings were a free translation of Shaftesbury's *Inquiry Concerning Virtue and Merit*, with comments of his own; *Philosophic Thoughts* (1746), soon followed by the essay *On the Sufficiency of Natural Religion*, in both of which he presented the rationalistic objections to revealed religion; and *Lettre sur les Aveugles* (1749), in which he showed the dependence of men's ideas upon the five senses, and foreshadowed the modern theory of variability and the survival of the fittest. He suggested too the possibility, since realized, of teaching the blind to read by the sense of touch. This work established his reputation, but cost him a year's imprisonment. His earlier works were all written under the stress of poverty. His reputation is founded chiefly on the *Encyclopædia* (*Encyclopédie, ou Dictionnaire raisonné des Sciences, des Arts et Métiers*), of which he and D'Alembert were joint editors. He wrote the articles on ancient philosophy, history, and on the arts and trades, and supervised other parts of the work. He expended many years on this arduous labor, for which he was qualified by great quickness of intellect and extent of information. Grimm expressed the opinion that he had perhaps the most encyclopædic head that ever existed. The first volume of this work was published in 1751. The Government suspended the publication because it revealed too progressive a spirit. The ideas which seemed so radical and dangerous to the governing class of France in 1759 sound strangely commonplace to the modern reader of the *Encyclopædia*. It did not advocate atheistic views, nor did it directly attack either the Church or the state; but it took for granted the righteousness of religious tolerance, it exalted scientific knowledge and peaceful industry, and it assumed that the condition of the mass of the people should be the chief object of public concern. The tendency of all this was hostile to the spirit of the old *régime*. In spite of the suspension the work was clandestinely continued, but the greater contributors feared to compromise themselves by writing for an illegal publication, and for seven years Diderot worked almost unaided, finishing several hundred articles, reading proofs and attending to the details of the workshop, in the midst of repeated insults and the frequent interference of the police. It was completed in 1765. In that year Catharine II. of Russia granted him a pension and invited him to St. Petersburg, whither he went in 1773, but he soon returned

to France. Among his works are novels entitled *The Nun* and *Jacques the Fatalist.* He is considered as the chief of the skeptical philosophers called Encyclopædists. D. in Paris, July 30, 1784. His complete works were published by Naigron (15 vols., 1798; new ed. 22 vols., 1821). See Damiron, *Mémoire sur Diderot* (1852); Carlyle, *Essay on Diderot*; Rosenkranz, *Leben und Werke Diderots* (2 vols., 1866); Morley, *Diderot and the Encyclopædists* (2 vols., 1878).

Revised by F. M. Colby.

Didier, dĕĕ′di-ā′, Jules: landscape and animal painter; b. in Paris, May 26, 1831. Pupil of Léon Cogniet and Laurens; Grand Prix de Rome 1857; medals, Salons, 1866 and 1869; third-class medal, Paris Exposition, 1889. One of his best works, *Farm in Roman Campagna*, is in the Luxembourg Gallery, Paris. Studio in Paris. W. A. C.

Did'ius, Salvius Julianus: a Roman emperor; b. at Milan in 133 A. D. He had a high command in the army, and was chosen consul with Pertinax, after whose death, in 193 A. D., the prætorians offered the empire at public auction to the highest bidder. Didius, who was very rich, gave 6,250 drachmas to each soldier, and was proclaimed emperor. After reigning nearly two months he was killed in his palace by his soldiers, June 1, 193. He was succeeded by Severus.

Di'do (i. e. the fugitive), whose real name was **Elissa** or **Elisa**: a daughter of the Tyrian king Belus or Agenor, after whose death she and her younger brother Pygmalion (Pilmelium) were to reign conjointly. But Pygmalion, aided by democratic partisans, usurped the whole authority, and procured the assassination of her husband and uncle (the Sichæus of Vergil). She then fled with many Tyrians by sea, and founded Carthage about 870–860 B. C. Hiarbas, King of Numidia, demanded her hand in marriage, threatening war in case of refusal, and to escape this fate Dido stabbed herself upon a funeral pile. Vergil has been charged with committing an anachronism in representing her as contemporary with Æneas. See Vergil's *Æneid* (i., ii., and iv.).

Didon, dĕĕ′dōṅ′, J. Henri, Père: a French Dominican preacher and writer; b. Mar. 17, 1840; has attracted much attention for his series of eloquent Lenten sermons. Having come into conflict with his superiors because of his views about democracy, he ceased for a time to preach. His leisure was spent in preparing a life of Jesus which should be an antidote to the skeptical *Vie de Jesus* of Renan. The result was his *Jésus-Christ* (2 t., 1891), a book which moved Paris and France deeply. He has also written a book about Germany, *Les Allemands* (1884).

A. R. Marsh.

Didot, dĕĕ′dō′, François: printer; b. in Paris in 1689; founded there a famous house of printers and type-founders. D. Nov. 1, 1757. The business was carried on by his sons, François Ambroise (b. in 1730, d. July 10, 1804), who made improvements in the printing-press and paper manufacture, and Pierre François. Of the sons of the former, Pierre (b. 1760, d. Dec. 31, 1853, leaving as his successor his son Jules) took charge of the printing-house in 1789, and published magnificent folio editions of Vergil, Horace, Racine, and other classical authors; and Firmin (b. 1764, d. Apr. 24, 1836) took charge of the type-foundry, improved the art of stereotyping, and became known also as an author and translator. His business was inherited by his sons, Ambroise Firmin (b. Dec. 20, 1790, d. Feb. 22, 1876) and Hyacinthe Firmin (b. Mar. 11, 1794, d. Aug. 6, 1880).

Didron, dĕĕ′drōṅ′, Adolphe Napoléon: French archæologist; b. at Hautvillers, Marne, Mar. 13, 1806. He began in 1844 to publish *Annales Archéologiques*, devoted to mediæval art and antiquities, which he continued to twenty-seven quarto volumes. This work was completed, long after his death, by the twenty-eighth volume, which included a general index. It is a valuable storehouse of mediæval art and archæology. His chief works are a *Manual of Christian Iconography* translated from an ancient manuscript, and *Christian Iconography* (1843), which forms a history of the representations of the persons of the Trinity in art, their attributes, etc. D. Nov. 13, 1867.

Didym'ium [from Gr. δίδυμος, twofold]: an element separated by Mosander in 1842 from the mineral *cerite.* Its occurrence with lanthanum led to the name didymium, which refers to the twinlike relation between the two metals. According to von Welsbach, the element hitherto called didymium is a mixture of two elements which can be separated by repeated crystallizations of the nitrates. One of these he calls *praseodymium*, the other *neodymium.* When a salt of one is mixed with a salt of the other a salt of didymium is obtained. Crookes, however, did not succeed in separating didymium into two distinct substances. Didymium is more closely allied to bismuth than to any other common element. Its chemical symbol is Di, and its atomic weight about 143. Ira Remsen.

Did'ymus (The Blind): one of the most learned men of his age; b. at Alexandria, A. D. 308; became blind in his fifth year. He was at the head of the theological school in Alexandria from 390 to 395, the year in which he died. His extant works are a treatise upon the *Spirit*, a treatise upon the *Trinity*, the work *On the Canonical Epistles*, and the treatise *Against the Manichæans.*

Didymus of Alexandria: Greek grammarian, surnamed for his industry Chalcenterus (Brazenbowels); b. about 63 B. C.; lived in Rome, and is said to have written more than 3,500 "books," chiefly commentaries on Greek authors. To Didymus and his excerptors we owe much of our knowledge of the learned investigations of the Alexandrian scholars. See M. Schmidt, *Didymi Chalcenteri Fragmenta* (1854).

Basil L. Gildersleeve.

Die: in coinage, the instrument by which impressions are stamped upon coins. The intended device is first engraved by hand upon a plug of forged steel, which is softened for the purpose by heating, and which, when complete, is hardened and is called a *matrix.* From this, coins, medals, or the like could be struck directly, but it is more usual to make dies from it by means of a punch. For this purpose, by means of a powerful fly-press, an impression in *relief* is taken upon another piece of soft steel, which, when duly shaped and hardened, is called the *punch.* From this again impressions upon pieces of steel are taken, which, being shaped in the lathe and tempered, are the *dies*, and which are, of course, exact reproductions of the original die or matrix. A good pair of dies will sometimes yield from 200,000 to 300,000 impressions before they become too much worn for use. The engraving of dies, technically called *die-sinking*, has acquired increased importance on account of the great extension of the process of stamping metal. Many kinds of work formerly made by the hammer and punch are now shaped by a few blows between suitable dies. As examples of these may be mentioned the ornamental work of gas-fittings, buttons, common jewelry, ornamental trays, dishes, boxes, small parts of firearms, etc. For such purposes a pair of dies is required—one in relief, the other in intaglio—and the metal is pressed between them. The astonishing cheapness of many of the metallic wares is mainly due to the use of dies for doing by a single blow the work that formerly required long and tedious manipulation.

Die, in architecture, is that part of a pedestal which lies between its base and its cornice.

Die (plu. Dice): See Dice.

Diebitch, dee′bitch (surnamed Sabalkanski), Hans Karl Friedrich Anton, Count: Russian general; b. in Silesia, May 13, 1785. He served at the battle of Austerlitz 1805, and became a major-general in 1812. Having distinguished himself at the battles of Lützen, Dresden, and Leipzig, he was raised to the rank of lieutenant-general in 1813. He was appointed chief of the imperial staff about 1820. Having obtained command of an army in the war against the Turks, he took Varna in 1828, and became general-in-chief in 1829. He defeated the Turks at Kulevdcha and Silistria and crossed the Balkans, hence his title Sabalkanski (crosser of the Balkans). With an army that had dwindled to 20,000 he penetrated almost to Constantinople, which was expected every moment to fall into his hands, but the jealousy of the great powers brought about an adjustment in the treaty of Adrianople, Sept. 14, 1829. He was raised to the rank of field-marshal, and in Jan., 1831, took command of an army sent to subdue the Polish insurgents. D. of cholera June 10, 1831. See Belmont, *Graf Diebitsch* (1830).

Dieckhoff, deek′hof, August Wilhelm, D. D.: Lutheran theologian; b. in Göttingen, Prussia, Feb. 5, 1823; was resident privat docent and professor extraordinary and ordinary there 1847–60. Since 1860 he has filled the chair of Historical Theology at the University of Rostock, and is a member of the Consistorium of Mecklenburg. He has been a voluminous author on subjects chiefly of a dogmatico-historical character; has been prominent in his attacks

upon the theology of Ritschl and of the Missourians, and in 1891 published a pamphlet on the doctrine of inspiration, in which he dissents from the Lutheran theologians of the seventeenth century. HENRY E. JACOBS.

Diedenhofen, dee'den-hō-fen: the German name for THIONVILLE (*q. v.*).

Diefenbach, LORENZ: philologist; b. at Ostheim, Hesse-Darmstadt, July 29, 1806; was educated at the University of Giessen, and became the pastor and librarian at Solms-Laubach for twelve years. Greatly interested in religious reform he was one of the chiefs of the German Catholic party, and was elected as deputy from Offenbach to the Frankfort parliament of 1848. In 1865 he was appointed second librarian to the city of Frankfort. In 1876 he retired to Darmstadt, where he died Mar. 28, 1883. As a writer he was indefatigable. Poetry and romance, as well as philosophical works of great value, attest his remarkable industry. The most important of his writings are *Celtica* (3 vols., 1839–40); *Vergleichendes Wörterbuch der Gothischen Sprache* (2 vols., Frankfort, 1846–51); *Glossarium Latino-Germanicum Mediæ et Infimæ Ætatis*, a supplement to Ducange's *Glossary* (1857); *Origines Europææ* (1861); *Hoch- und Nieder-Deutscher Wörterbuch* (1874–85).

Dieffenbach, dee'fen-bă*kh*, JOHANN FRIEDRICH: surgeon; b. in Königsberg, Prussia, Feb. 1, 1794. He graduated in 1822, and began to practice in Berlin, where he gained a high reputation; became professor in the university there in 1832; noted for his plastic operations. Author of *Chirurgische Erfahrungen* (4 vols., 1829–35); *Durchschneidung der Sehnen und Muskeln* (1841); *Ueber das Schielen* (1842); and *Operative Chirurgie* (2 vols., 1844–49). D. Nov. 11, 1847. F. M. C.

Diego Garcia Island: See CHAGOS ARCHIPELAGO.

Diego-Suarez, dĕe-ā'gō-swaa'res: town and bay (also Antomboka Bay); on the northeast coast of Madagascar; ceded by the Hova Government with a small surrounding district to France in 1885 (see map of Africa, ref 7–I). The harbor is one of the best in Madagascar. The governments of Nossi-Bé and Ste.-Marie de Madagascar were united with that of Diego-Suarez in 1890. Pop. (1887) 4,007. C. C. ADAMS.

Diegueño: See YUMAN INDIANS.

Diel du Parquet, JACQUES: French soldier and administrator; b. about 1600. He was in the West Indies with his uncle, d'Enambuc, or d'Esnambuc, and succeeded him in 1638 as chief of the infant colony at Martinique. This position was confirmed by the French West Indian Company, who gave him the title of seneschal, with the rank of lieutenant-general. His rule was efficient and generally prosperous, though he had some trouble with a rebellious governor of St. Christopher's (1643) and with the Caribs. In 1650 he went to France and bought for 60,000 livres the proprietorship and government of St. Lucia and Grenada, islands which at that time had not been colonized. The English opposed him at St. Lucia, and gained possession of that island 1654. Diel du Parquet successfully established a French colony at Grenada, but in his absence the Caribs of the island attacked it. A war ensued, in which the greater part of the Grenada Caribs were exterminated, the survivors submitting. The Caribs also attacked Martinique, where Du Parquet only escaped through timely aid received from some Dutch ships. D. at St.-Pierre, Martinique, Jan. 3, 1658. HERBERT H. SMITH.

Dielectric [*di-* (= Gr. δι*ά*, through) + *electric* (see ELECTRICITY)]: any medium within which it is possible to set up an electrostatic field of force; in other words, any substance through which electrostatic induction will take place. Dielectrics are, as a class, insulators rather than conductors of electricity. Solids, liquids, and gases alike possess the dielectric property, although in varying degrees. The dielectric value (specific inductive capacity) of each substance is measured by the ratio of the capacity of a condenser in which it forms the insulator, to the capacity of the same condenser with a vacuum as a dielectric. For a table of dielectric constants thus determined, see INDUCTIVE CAPACITY, SPECIFIC.

On the electro-magnetic theory of light, according to which the medium which transmits radiation is the same as that through which induction takes place, there should be a definite relation between the specific inductive capacity of a substance and its index of refraction, the square root of the former constant being equal to the index of refraction for very long waves. It has been shown by Arons and Rubens (*Wiedemann's Annalen*, xlii., p. 581, and xliv., p. 206, 1891), and by Rubens (*Wiedemann's Annalen*, xlv., p. 257, 1892), that in so far as the two constants have been determined, the above relation holds true. E. L. NICHOLS.

Dielman, deel'măn, FREDERICK: genre-painter; b. in Hanover, Germany, Dec. 25, 1848. Pupil of the Munich Academy; National Academician 1883. Removed to the U. S. when quite a young man, and spent six years in the U. S. engineering department in Virginia. One of the first pictures he exhibited was *A Patrician Lady*, at the National Academy in 1877. He was elected President of the Academy in 1899. Studio in New York.

Diels, deels, HERMANN: classical scholar; b. in Hamburg, Germany, May 18, 1848; graduated at Bonn in 1870; professor at the University of Berlin since 1880, and member of the Berlin Academy. In 1879 appeared his epoch-making work, *Doxographi Græci*, in which the sources of the doctrines of Greek philosophers as handed down by post-Aristotelian scholars are for the first time determined. Other publications are an edition of Simplicius's *Commentary on the Physics of Aristotle*; a celebrated treatise on the *Chronica of Apollodorus* (Rhein. Mus. xxxi., p. 1 ff.); on *Aristotle, Rhet.* bk. iii., *Empedocles* and *Gorgias*, *Seneca* and *Lucan*, *Leucippos* and *Democritos*, *Sibyllinische Blätter* (1891). He is one of the editors of the *Archiv f. Gesch. der Philosophie*, begun in 1887. ALFRED GUDEMAN.

Diemen, dee'men, ANTHONY, van: naval officer; b. at Kuilenburg, Holland, in 1593. He served for many years in the East Indies, and became an admiral. He was appointed governor-general of the Dutch East Indies in 1636, and sent out in 1642 an exploring expedition under Abel Tasman, who discovered Van Diemen's Land. D. at Batavia, Apr. 19, 1645.

Die'penbeck, written also **Diepenbeke**, ABRAHAM, van: historical painter; b. at Bois-le-Duc, Holland, in 1607 or, according to some authorities, in 1596; was a pupil of Rubens, and after a residence in Italy became his assistant. In 1641 he was chosen director of the Academy of Antwerp. He painted with facility on glass, but devoted especial attention to oil-painting and designing; imitated Rubens with great freedom, and gained a high reputation by his skill in composition and coloring. Among his works is a series of fifty-eight designs called *The Temple of the Muses*. D. in Dec., 1675.

Dieppe, dĕe'ep': seaport-town of France: department of Seine-Inférieure; on the English Channel; at the mouth of the river Arques, and at the northern terminus of the Rouen and Dieppe Railway; 33 miles N. of Rouen, and 143 miles by rail N. W. of Paris; lat. 49° 55′ N., lon. 1° 5′ E. (see map of France, ref. 2–E). It stands between two high ranges of chalk cliffs, and is defended by a wall and a castle built on a high cliff. Vessels of 500 tons can enter the harbor at high water, but at low tide the harbor is nearly dry. Dieppe has a college and a school of navigation, a theater, a public library, and manufactures of watches, lace, fine linen, paper, and ivory wares. Ship-building, distilling, and fishing are important industries. In the fifteenth and sixteenth centuries its commercial importance compared favorably with that of the Italian cities. It became a center of Protestantism, and its inhabitants were among the first to support Henry IV. No city of France suffered more severely from the Revocation of the Edict of Nantes (1685). It is one of the most fashionable watering-places of France, and is a favorite landing-place of British tourists visiting France. Its import and export trade is chiefly with England and Norway. Pop. (1896) 22,439.

Di'es I'ræ: a Latin hymn, probably written in the thirteenth century by a Franciscan friar, Thomas da Celano, commencing—

> Dies Iræ, dies illa,
> Solvet sæclum in favilla,
> Teste David cum Sibylla.
>
> Day of Wrath! On that dread day
> In ashes earth shall pass away,
> Attest the King's, the Sibyl's, lay.

The Western Church soon gave it a place in its offices as the "Sequence for the Dead," so called because in the Roman mass it is sung between the Epistle and the Gospel, following immediately after the Gradual Hymn, when that is sung. In an English form it has also been adopted into the hymn-books of the Church of England and others. It is chief among the "seven great hymns of the mediæval

Church." among which are *Jerusalem the Golden*, *Come, Holy Ghost* (*Veni, Sancte Spiritus*), etc. Of all these sacred lyrics none can compare in point of sublimity or touching pathos with the *Dies Iræ*. For centuries it has been the favorite alike of Roman and Protestant Christendom.

The composition is evidently suggested by the words of Zephaniah, in the Vulgate (Zeph. i. 15, 16); in English: "*That Day, a Day of Wrath*, a day of trouble and distress, a day of wasteness and desolation, a day of darkness and gloominess, a day of clouds and thick darkness, a day of the trumpet and alarm against the fenced cities and against the high towers!"

The translations into modern languages are numbered by scores, perhaps by hundreds; but the Latin verse of the Franciscan monk, simple and easy as it appears at the first glance, has in it a secret force which baffles the ingenuity and skill of translators. Among the versions complete or incomplete in English may be mentioned one ascribed to the Earl of Roscommon, the condensed rendering by Sir Walter Scott in the *Lay of the Last Minstrel*, one by W. J. Irons, D. D., that of Gen. John A. Dix while he was in command of Fortress Monroe during the civil war in the U. S., and thirteen versions by Dr. Abraham Coles. The words of the *Dies Iræ* constitute the principal subject of the music of the famous *Requiem* of Mozart.

Revised by E. S. Sheldon.

Di'esis [Gr. δίεσις, a letting through, a semitone; διά, through + ἵέναι, let go]: in music, an interval less than a comma. The harmonical diesis is the difference between the small and the great semitone, as from C to C sharp, and from C to D flat.

Dies non, or, in full, **Dies non juridicus**: a day that is not a court-day; that is, a day upon which courts do not sit, and upon which process can not ordinarily issue, be executed, or returned. Every legal holiday is a *dies non*, as well as such other days as may be fixed by law.

F. Sturges Allen.

Diesterweg, dees'ter-*vāch*, Friedrich Adolph Wilhelm: educator; b. at Siegen, Prussia, Oct. 29, 1790; educated in the Latin School there, and at the Universities of Herborn and Tübingen 1808–11; taught at Mannheim and Worms 1811–13. In 1813 he was called to the Model School in Frankfort, where he became associated with some of Pestalozzi's pupils, and came under the influence of Pestalozzi's ideas. July 3, 1820, he became director of the Teachers' Seminary at Mörs, and director of the City Normal School in Berlin 1832–47. In 1851 he was pensioned by the Government. The remaining years of his life were employed mainly in literary work. He founded the *Pädagogische Jahrbuch*, and in 1859 was elected a member of the Prussian Chamber of Deputies. Among his very numerous educational writings are *Heinrich Pestalozzi* (1846); *Wegweiser zur Bildung deutscher Lehrer*; and *Rheinische Blätter*, of which he was the editor. Diesterweg early determined to devote himself to the building up of the common schools. His great service to education was in the line of the training of teachers. He was the first, in Germany at least, to recognize that a good practice school is indispensable in connection with every institution for the professional education of teachers. D. in Berlin, July 7, 1866.

C. H. Thurber.

Diet [O. Fr. *diete* < Lat. *diæta* = Gr. δίαιτα, manner of living]: See Food and Nutrition.

Diet (Late Lat. *diæta*): the assembly of the German states, probably deriving its origin from the national assemblies of the ancient Teutons. During the Middle Ages it was a feudal body, with no trace of popular representation, and constituted the central authority in the Holy Roman Empire. It was composed of three colleges or divisions, which met and voted separately. The first, that of the electors, consisting of three spiritual and four temporal princes, whose privilege was permanently guaranteed by the Golden Bull of Charles IV. (1356), had the duty of choosing the emperor. The second college was composed of the princes of the realm, who, though not having the electoral privilege, were in all other respects the equals, and in some the superiors, of the electors. The third body, composed of the free cities, was far inferior to the other two in influence, and was not formally recognized until the Peace of Westphalia Oct. 24, 1648. The Diet met at different places, whose names are used to designate the sessions, as Diet of Worms, Diet of Spires, etc., but from 1663 down to the destruction of the Holy Roman Empire in 1806 it was held at Ratisbon. These dates, too, mark its steady decline in power and the failure to secure centralization in the German state. The German confederation (1815–66) vested its central authority in a diet which met at Frankfort, and in which the influence of Austria was generally predominant. The legislative bodies of other countries are sometimes called diets. The Diet of Hungary (*q. v.*) formerly met at Pressburg, and was active in the exciting events of 1848–49. Since 1861 it has met at Pest. The parliament of Japan, though modeled in the main on the British Parliament, is also termed a diet.

F. M. Colby.

Dieterici, dē̆e-te-reet'sē̆e, Karl Friedrich Wilhelm: political economist; b. in Berlin, Prussia, Aug. 23, 1790; became Professor of Political Economy at Berlin in 1834, director of the National Bureau of Statistics in 1844, and member of the Berlin Academy. He published, besides other works, *Public Welfare in the Prussian States* (1846), and *Manual of the Statistics of the Prussian State*, continued by his son (1858–61). D. July 29, 1859.—His son, Friedrich Dieterici, was b. at Berlin, July 6, 1821; became professor at the University of Berlin in 1850; has published a number of works on the Arabic language and literature, among which are *The Logic and Psychology of the Arabs* (1868); *The Science and Natural Philosophy of the Arabs* (1875); *Darwinism in the Tenth and Nineteenth Centuries* (1878).

Dietet'ics [from Gr. διαιτητική (sc. τέχνη, art), art of living healthfully, deriv. of δίαιτα, manner of life]: that branch of medicine which treats of food and drink. In a wider sense it may treat of the recovery or maintenance of health by means of correct habits with regard to eating, drinking, exercise, the wearing of proper clothes, etc. See Hygiene.

Dietrich, dee'trich, Christian William Ernest: painter; b. in Weimar, Oct. 30, 1712. He studied drawing with his father and with the landscape-painter Alexander Thiele. At eighteen Count Bruhl employed him to decorate his various castles. His work was so much admired that the King of Poland invited him to enter his service. After leaving this court, from jealousy of the Italian artists, and having traveled through Holland and visited his own country, he returned to Dresden and worked for the court there in 1742. He was sent to Italy to study the old masters, and painted landscape there. He imitated Rembrandt's manner as to historic painting, adding his own peculiar power in painting landscape backgrounds. Dietrich also was very able as an engraver and etcher. Impressions from two hundred plates are extant, but are very rare, because having made one impression he scraped the plate to use again. D. at Dresden in 1774.

W. J. Stillman.

Dietrichsen, dee'trik-*sen*, Lorentz Henrik Legelcke: art critic; b. in Bergen, Norway, Jan. 1, 1834. His works on art and literature are very numerous, and some of them are of great value.

R. B. A.

Dietrich von Bern: See Theodoric.

Dietz, Feodor: historical and military painter; b. at Neunstetten, Baden, May 29, 1813; pupil of Munich Academy and of Alaux and Horace Vernet, Paris. Among his works are *March to Paris in 1814*, in the National Gallery, Berlin; *Attack of Bavarians on Turks*, *Siege of Vienna*, National Museum, Munich. Died while accompanying the German army in France, at Gray, Haute-Saône, Dec. 18, 1870.

W. A. C.

Dieu et mon Droit, di-ö'ā-mōñ'drwäă' [Fr.]: See Motto.

Dieulafoy, di-ö'läă'fwäă', Marcel Auguste: engineer and archæologist; b. in Toulouse, France, Aug. 3, 1844; is famous for his explorations in the ancient monuments of Persia, described in his *Ancient Art of Persia* (1884–89) and his *Acropolis of Susa* (1890). In his work he has been assisted by his wife, who has for her part published *Persia, Susiana, and Chaldea* (1866), and *At Susa* (1887).

C. H. Toy.

Diez, deets, Friedrich Christian: philologist and founder of the scientific study of Romance philology; b. at Giessen, Germany, Mar. 15, 1794. He served against the French in 1813, and afterward continued his studies at Giessen and Göttingen. As results of his Provençal studies appeared in 1825 *Beiträge zur Kenntniss der romantischen Poesie*; in 1826 *Die Poesie der Troubadours*; and in 1829 *Leben und Werke der Troubadours* (second editions of the last two were published after his death, with additions by Bartsch). He was appointed professor at Bonn in 1830, and held that

position until his death, May 29, 1876. His two greatest works are the *Grammatik der romanischen Sprachen* (1836–43; 3d ed. 1870–72, the last during his life) and *Etymologisches Wörterbuch der romanischen Sprachen* (1853, and several editions since). He applied to the Romance languages the comparative and historical method, following most successfully the example of J. Grimm's work on the Teutonic languages. Among his other works may be mentioned *Altromanische Sprachdenkmale* (1846); *Zwei altromanische Gedichte* (1852); *Ueber die erste portugiesische Kunst- und Hofpoesie* (1863); *Altromanische Glossare* (1865).

E. S. Sheldon.

Diez, Wilhelm: genre and military painter; b. at Baireuth, Germany, Jan. 17, 1839. Pupil of Piloty, Munich; professor at the Munich Academy. His work is minutely finished, even in canvasses of considerable size. *Picnic* is in the National Gallery, Berlin. W. A. C.

Difference Engine: a calculating-machine which operates by the method of differences. Such are the calculating-machines of Babbage and Scheutz. See Calculating-machines.

Differences, Method of: in algebra, a method of finding any distant term of a series, or the sum of a definite number of terms, by means of the differences between the initial terms, the differences of their differences, and so on. *A first order of differences* is found by taking each term of the series from the next term following. Thus if the series be a, b, c, d, etc., the first order of differences is $b - a$, $c - b$, $d - c$, etc.; and the *first* of these ($b - a$) may be indicated by d_1. The *second order of differences* will be found by taking each first difference from the next following first difference, and the *first* of the second differences may be indicated by d_2. In like manner are found d_3, d_4, etc. If the law of the series be expressed by a formula in which the indices of the powers of the variable are integral, or which is capable of being transformed into such an one, the differences of the order denoted by the highest power of the variable will be equal and those of higher orders will be zero. Thus if this highest power be the m^{th}, there will be m orders of differences.

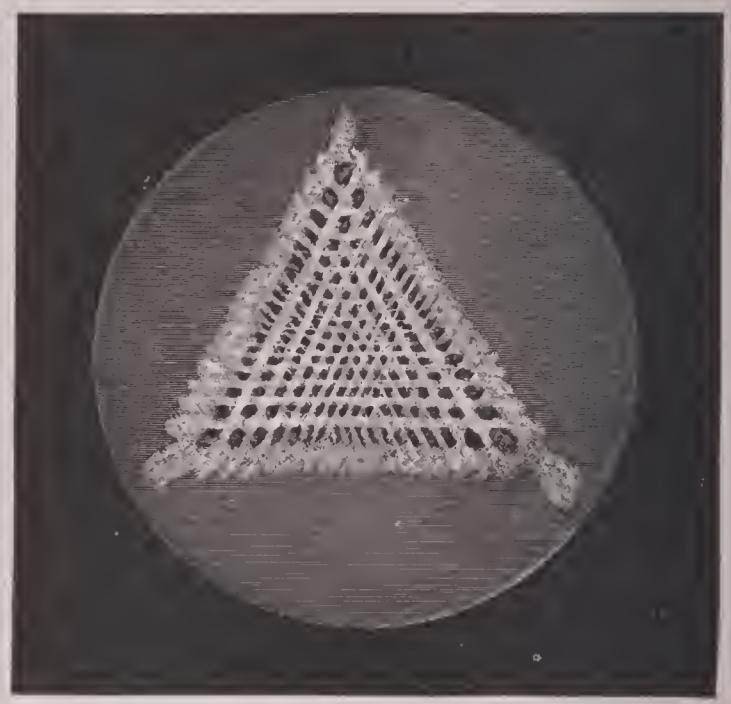
Differential: in mathematics, an infinitesimal difference between two values of a variable quantity. When a variable quantity, as x, is taken in two states indefinitely near to each other, as x and $x + h$, the infinitely small difference, h, is called the differential of the variable, and is written in analysis dx. If the given quantity is not x itself, but a function of x, say $F(x)$, then, when x becomes $x + h$, $F(x)$ becomes $F(x + h)$, and the differential is $F(x + h) - F(x)$, which may be written $F'(x, h)$. The analytic method which is founded on differentials is called the differential calculus. See Calculus.

Differential Calculus: See Calculus.

Differential Thermometer: a thermometer for indicating very slight variations of temperature. The instrument as here described was invented by Sir John Leslie. It consists of two glass bulbs connected by a narrow tube, which is usually bent in the form of a U. The bulbs are uppermost, and are filled with air, while the tube contains a column of mercury or sulphuric acid. The measurement is effected by the expansion of the air in one of the bulbs. This instrument is far more sensitive than mercurial and most other thermometers, owing to the greater expansive power of gases. It is estimated that a change not greater than the 6,000th part of a degree Fahrenheit can be indicated by it. The differential thermometer has been largely superseded for delicate measurements of temperature by the Thermopile (*q. v.*).

Differentiation: the operation in mathematics by which the differential of a function is determined. The allied operation, which leads to the determination of the derived function (or differential coefficient), is usually termed derivation. The partial differentiation of a function of two or more independent variables is the differentiation of that function, on the hypothesis that one only of these variables suffers change. Finite differentiation is the operation by which the difference of a function corresponding to a finite difference of a variable is determined. The term is also used to denote the process of development in plants and animals from simple to complex organizations.

Diffraction [from Lat. *dis-*, apart + *frangere*, *fractum*, break]: in optics, a deviation or deflection which the rays of light undergo in passing very near any opaque body. It had been observed by Grimaldi, but Newton first explained its cause. Let a beam of solar light, reflected horizontally, be admitted into a dark chamber through a small round hole, and received on a white screen. If the hole have a sensible diameter the image of the sun on the screen will suffer no sensible alteration of color; but if we place in the axis of the beam, and at a distance of 5 or 6 feet from the hole through which it is admitted, a metallic plate having a very fine puncture, and intercepting all other light than that which passes through the puncture, the appearance on the wall will be surrounded with several concentric colored rings, covering a space far exceeding in extent that which the solar beam would have occupied if its rays had followed their rectilinear direction. By substituting a very narrow slit for the puncture in the plate, or several punctures or slits close to each other, very beautiful phenomena are produced. See Optics and Color.



Diffraction fringes produced by the passage of monochromatic light through a triangular hole.

The accompanying figure shows the series of diffraction fringes formed when light is allowed to pass through a small triangular aperture and is caught upon a screen. The original photograph of which this is an enlargement (about 10 diameters) was obtained by Prof. B. W. Snow without the use of lenses, the sensitive plate being exposed in the path of a beam of monochromatic light after the passage of the rays through a minute triangular hole.

Revised by E. L. Nichols.

Digamma [Gr. δι-, two, double + γάμμα, name of third letter of Greek alphabet]: a name applied by the Greek grammarians of the Roman period to what was originally the sixth letter of the Greek alphabet as received from the Phœnicians. Its original name was *Vau*. It survived in many of the provincial alphabets, as in those of Laconia, Heraclea, Argos, Corinth, Corcyra, Megara, Crete, Phocis, Locris, Epirus, Thessaly, Bœotia, Elis, Arcadia, but in the historical period had disappeared from the alphabets of Ionia and Attica, as the sound it denoted had disappeared from the dialects of those localities. It passed over into the Roman alphabet as F from the alphabet of Chalcis, of which the Roman was only a continuation. The present standard Greek alphabet of literary use is the Ionic alphabet as used at Athens since the end of the fifth century. Dialectal and rare or obsolete words cited by the grammarians and in the old glossaries, e. g. that of Hesychios, often show the digamma under the guise of B or Γ, or even T. The last two are due to misconception of the form of the letter, the first to an attempt to approximate the sound. Traces of an existence of the sound at the period when the Homeric poems were first taking shape are found in its influence upon the quantity of syllables and its closing of apparent hiatus, though it never appears in written form. Thus in ἀτὰρ εἴπῃσι, the final syllable of the former word may be used as long on account of the *F* which was originally pronounced as initial in the latter. The loss of the sound in Greek may often also be verified by etymologies; thus οἶνος, wine : Lat. *vī'num*; ἰός, poison, Lat. *vī'rus*, etc. The sound of digamma was a

bilabial spirant, probably not unlike the German *w* in *zwei*, or Spanish *b*. Cf. Hartel, *Homerische Studien*; Meyer, G., *Griech. Grammatik*, ² §§ 229 ff.; Brugmann, *Griech. Grammatik*, ² § 13. BENJ. IDE WHEELER.

Digby: seaport-town; capital of Digby co., Nova Scotia; on railway, and on Digby Neck, Bay of Fundy; about 110 miles W. of Halifax (see map of Quebec, etc., ref. 3–A). It has an academy, exports lumber, mackerel, and herrings, and carries on ship-building. Pop. about 2,000.

Digby, GEORGE, Earl of Bristol: an English royalist noted for his instability and inconsistency in politics; b. in Madrid in 1612; was among the champions of privilege in the Long Parliament, and famous for his speech against Stafford, whom he characterized as the great apostate to the commonwealth who "must not expect to be pardoned in this world till he be dispatched to the other." And yet he would not sign the bill of attainder, and almost immediately joined the king's party. He was accused in Parliament of high treason, but went to France, whence he corresponded with the queen and his royalist friends. He returned home in 1660, and rashly impeached Lord Clarendon in 1663. He enjoyed the confidence of the king for a considerable time, however, and was much employed in the negotiations with the Spanish court concerning the Spanish-English marriage. He was the author of *Elvirah*, a comedy. D. Mar. 20, 1677.

Digby, Sir KENELM: English author; a son of Sir Everard (b. in 1581, and executed Jan. 30, 1606, for abetting the Gunpowder Plot); b. at Gayhurst, Buckinghamshire, July 11, 1603. He was a gentleman of the bedchamber at the court of Charles I., and was a royalist in the civil war. In 1636 he was converted to the Roman Catholic Church. He passed much time in France, and was an associate of Descartes. His wife was Venetia Anastasia Stanley, a well-known beauty. He wrote, besides other works, *Observations upon Religio Medici* (London, 1643); a *Treatise on the Nature of Bodies* (Paris, 1644; London, 1658); *The Body and Soul of Man*, a famous treatise on sympathetic cures; *The Cure of Wounds by the Powder of Sympathy, with Instructions how to make the said Powder* (1658); and *Private Memoirs of Sir Kenelm Digby* (first published in 1827). D. in London, June 11, 1665.

Digby, KENELM HENRY: author; b. in Ireland in 1800; educated at Cambridge, and, having become a Roman Catholic, devoted himself to scholastic theology and mediæval antiquities. He published *The Broad Stone of Honor* (1829); *Mores Catholici* (1840); *Compitum* (1851), and other works, which have many warm admirers, and are imbued with the nobler characteristics of Middle Age thought. D. in London, Mar. 22, 1880.

Digest: in legal terminology, a condensation or systematic arrangement of laws, statutes, or decisions. The name is often applied to the Pandects of Justinian. See JUSTINIAN.

Digester, Papin's [named from DENIS PAPIN (*q. v.*), a French savant, who invented it in 1681]: an invention by which bodies may be subjected to the action of high-pressure steam or water raised above its ordinary boiling temperature to 400° F., and sometimes higher. The digester is a strong boiler made of copper or iron with a tightly adjusted cover furnished with a safety-valve. It has the power of dissolving even bones, and has been employed in France to a considerable extent in preparing soup from bones.

Digestion [from Lat. *diges'tio*, arrangement, distribution; *di-*, apart + *ge'rere*, carry]: the function possessed by most animals of converting food into assimilable substances. The nature of the process naturally varies very much with the character of the food, and in certain of the very lowest forms, as also in some entozoic parasites like the tapeworms, there is no digestion at all, the nutritious materials being taken in by endosmosis. These animals form a sort of transition between animals and vegetables, the latter always directly absorbing their nutriment from the soil in which they grow.

In man digestion comprises a number of stages, beginning with the action of the saliva and ending in the intestines. In the mouth the starches of the food are converted into grape-sugar by the action of a powerful ferment, ptyalin, of the saliva. The sugar so produced is absorbed by the blood-vessels of the stomach and any starch not digested acted upon in the intestines by a ferment similar to ptyalin, though much less active. It will appear from this that thorough mixture of the food with the saliva is necessary, and that mastication must be carefully performed. Derangements of the general health, such as fevers, "colds," etc., seem to alter the character of the saliva, preventing healthy action.

In the stomach the albuminous portions of the food are particularly acted upon. The food is thoroughly commingled with the gastric juice by the various churning and rolling movements of the stomach walls. The gastric juice was first demonstrated in 1752 by Réaumur, though its presence and activity had been long before suspected. It is a clear, yellowish fluid of acid reaction, slight odor, and saltish taste. It will keep for a long time without change. The acidity of the gastric juice is due to free hydrochloric acid, and there are contained besides this various mineral ingredients, chief among which is sodium chloride. Of all the constituents the most important is an organic substance called pepsin. There is probably very little secretion of gastric juice when the stomach is at rest, but soon after ingestion of food abundant outpouring occurs. This has been found to result largely from the mere presence of something within the stomach, as it occurs when the mucous membrane is irritated through an artificial fistula leading into the organ. The quantity of gastric juice *per diem* probably varies widely, but has been stated at 14 lb.

The important function of the gastric juice is the conversion of albuminous substances into peptones, and this is accomplished by the ferment pepsin, acting by its presence rather than by itself, entering into the chemical changes. There is little action on starches or fats in the stomach, but milk is curdled by the operation of a special ferment assisted by the acidity of the gastric juice. The name CHYME (*q. v.*) is applied to the stomach contents when digestion is complete. The peptones produced are largely absorbed by the blood-vessels in the walls of the stomach; the remaining matters pass into the intestines. The rapidity of gastric digestion depends upon a great variety of conditions of the stomach, the body in general, and the food. In animals it varies greatly, requiring from twelve to twenty-four hours in a dog, and in rabbits the stomach is never entirely empty of food. There is a great difference in different kinds of food, in the manner of their preparation, and in the thoroughness with which mastication is performed. In disturbances of the general health, and especially in fevers, digestion is apt to be imperfect and retarded. Ingestion of excessive quantities of sugars, of alcohol, or of any other food retards digestion; but, on the other hand, moderate amounts of alcohol stimulate the gastric function, and moderate drinking with the meals is on this account advisable in old people in whom digestion is apt to be sluggish. The drinking of water with the meals has long been regarded as very prejudicial to proper digestion, but experimental observations fail to sustain the view, though excessive drinking, especially of cold water, would appear to be harmful.

The chyme having passed into the duodenum is further acted upon by the pancreatic juice and the bile. The starches not altered in the mouth are converted into sugar and so absorbed; albuminous substances unaffected in the stomach are changed into peptones; and fats not at all affected in mouth or stomach are broken up into a very fine emulsion and carried off in the lacteals. (See LYMPHATICS.) Conditions affecting the gastric digestion favorably or otherwise probably act also on the intestinal digestion, but the processes are here much more complex and less thoroughly worked out. Signs of intestinal indigestion resemble those of derangement of gastric digestion very closely, but are apt to come on a longer time after the taking of food—that is, when the chyme is passing into the duodenum. See STOMACH and DYSPEPSIA. WILLIAM PEPPER.

Digger Indians: See SHOSHONEAN INDIANS.

Digges: an English family, several members of which attained note as scholars and writers.—LEONARD; b. at Barham, Kent; educated at Oxford, and died about 1573. He wrote *Tectonicon: Measuring of Land*, etc. (1556), an arithmetic, and a military treatise entitled *Stratonicos*, which was enlarged by his son THOMAS (d. 1596), who edited his father's works and published *Celestial Orbs*, *Pantometria*, a geometrical work, etc.—Sir DUDLEY; son of Thomas (1583–1639); educated at Oxford; studied law; and was employed as ambassador to Russia and Holland, but afterward lost the favor of the king on account of his independence, and was even imprisoned for a short time. He was the author of *Right and Privileges of the Subject*, a correspondence

between Walsingham, Burleigh, and others concerning the marriage of Elizabeth and the Duke of Anjou (1642), and the *Compleat Ambassador* (1655).—His son DUDLEY published *Unlawfulness of Subjects Taking up Arms against their Sovereign* (1643). D. in 1642.

Dighton Rock, dī'tŭn'rok': a stone bearing a rude and unreadable inscription, attributed by some to the Northmen; stands on Taunton river in the town of Berkley, Bristol co., Mass.

Digit [from Lat. *di'gitus*, finger]: in arithmetic, one of the ten symbols, 0, 1, 2, 3, etc., by which all numbers are expressed. In astronomy the term is used in speaking of eclipses to denote the twelfth part of the diameter of the sun or moon. Thus the eclipse is said to be of ten digits if ten parts of the twelve are concealed. Digit is also a measure of dimension equal to the breadth of a finger, and estimated at about three-fourths of an inch.

Digita'lis [from Lat. *digita'le*, glove, or *digita'lis*, belonging to finger (*di'gitus*), used as translation of *thimble*; Germ. *Fingerhut*]: a genus of plants belonging to the family *Scrophulariaceæ*. With the exception of the common foxglove (*Digitalis purpurea*), which is a native of Great Britain, the species are mostly found in Southern Europe and different parts of Asia. The leaves of *Digitalis purpurea* are largely used in medicine. They are dried and reduced to powder or dissolved as an infusion or tincture. They have a very bitter taste, and are administered in diseases of the heart, to which they act as a powerful stimulant. They contain a crystalline principle called digitalin, and also digitonin, digitoxin, and digitalein. Several of the species are cultivated in gardens.

Digitate [from Lat. *digita'tus*, having fingers, deriv. of *di'gitus*, finger]: a botanical term applied to compound leaves, the leaflets of which are all borne on the apex or tip of the petiole, as the clover and horse-chestnut. Such leaves are also called *palmate*.

Digitigra'da, or **Dig'itigrades** [from Lat. *di'gitus*, finger + *gradi*, walk]: those carnivorous quadrupeds that walk on their toes, as opposed to plantigrades or those that walk on the sole of the foot. As a matter of fact, a large number of quadrupeds walk on their toes, notably the ungulates, but the term is commonly used in speaking of the carnivora. A group of carnivora is so called in the system of Cuvier. Among the digitigrada are included the cat, the dog, the hyæna, weasel, etc.

Digne, deeñ (anc. *Dinia*): town of France; capital of the department of Basses-Alpes; on the river Bléonne, 60 miles N. E. of Marseilles (see map of France, ref. 8–I). It has a cathedral, a public library, several tanneries, and a trade in almonds, prunes, grain, honey, wax, and hemp. It suffered much during the Huguenot wars. Pop. (1896) 7,276.

Dignitary [from Lat. *dig'nitas*, rank, deriv. of *dig'nus*, worthy]: in canon law, originally an ecclesiastic of higher rank than an ordinary priest. To this class exclusively belonged all bishops, deans, and archdeacons, but it now includes also prebendaries and canons. Any officer of high rank may be called a dignitary.

Dignities: See the Appendix.

Dihong, dĕe-hong', also called **Tsanpo**: the upper part of the Brahmaputra river above Assam. (See BRAHMAPUTRA). It rises on the north side of the Himalayas, traverses part of Tibet, and bursts through that mountain-chain near lat. 28° 15′ N.

Dijon, dĕe'zhōñ' (anc. *Dibio*): town of France; capital of the department of Côte-d'Or; situated in a plain on the river Ouche, at its junction with the Suzon; about 175 miles S. E. of Paris, and 120 miles N. of Lyons, with both of which it is connected by railway (see map of France, ref. 5–H). Its environs are remarkably beautiful. Dijon was formerly the capital of Burgundy, and the residence of the Dukes of Burgundy for three centuries. Originally a Roman fortified camp, it passed through many vicissitudes, being burned by the Saracens in the eighth century, sacked by the Normans in the ninth, again destroyed by fire in the twelfth, and besieged by the Swiss in 1513, but saved by the conclusion of a humiliating treaty. Severe fighting took place around it in the Franco-German war, and it was successively captured by the Germans and the French. It is well built, has spacious and clean streets, and is inclosed by ramparts. Among the principal public edifices are the palace of the Princes of Condé; the cathedral, a Gothic structure founded in the thirteenth century; the noble Gothic church of Notre Dame; a theater and town-hall. Dijon has a large public library, a botanic garden, and an *académie universitaire*; also manufactures of beer, brandy, woolen cloth, blankets, hosiery, chemical products, cotton fabrics, and pottery. Its prosperity is largely derived from the trade in Burgundy wines, flowers, and agricultural products. Pop. (1896) 67,736.

Dike, or **Dyke** [O. Eng. *dīc* (whence also with umlaut *ditch*): Germ. *Teich*, pond; Fr. *digue* is borrowed from Low Germ., cf. Dutch *dijk*]: in engineering, an embankment erected on the shore of a sea or river in order to prevent inundation. Such embankments raised along the Mississippi river are called levees. The coasts of Holland are protected against the encroachments of the sea by dikes constructed on a grand scale and in a systematic manner. A large part of that country is so low that it would be overflowed by the sea during high tides if it were not protected, partly by natural sandhills or dunes and partly by artificial dikes. The latter are also raised on the banks of the Rhine, Waal, and other rivers near their mouths. The dikes are broad at the base, and are usually of such magnitude that there is room on the top for a public road. The fabric is strengthened by willows, either growing or interwoven as wicker-work on the sides of the dike, which should present a very gradual slope toward the sea or river. The *Ammophila* and other creeping grasses are carefully cultivated on some of the dykes, and contribute much to their security. The base is often faced with masonry, and protected by vast heaps of stones (usually brought from Norway), and by rows of piles projecting 6 or 7 feet above ground, connected by timber, and filled in with fascines weighted with stones. The most stupendous of these embankments are the dikes of the Helder and of West Kappel, at the western extremity of the island of Walcheren. The term dike, as the equivalent of the Fr. *digue*, is applicable to BREAKWATERS, JETTIES (*qq. v.*), to the dams of Holland constructed for engineering purposes, the most remarkable of which is the work by which the Y is isolated from the Zuyder Zee (see CANAL), and also to that by which one of the outlets of the Maas has been obstructed.

Dike: in geology, a broad and relatively thin plate of igneous rock, originally introduced while molten into a fissure. Dikes are inclined at all angles to the horizon, but the greater number are approximately vertical. When inserted between the layers of a sedimentary formation, they are called intrusive sheets. Rocks traversed by dikes usually show alteration at and near the surface of contact, due to the heat of the injected liquid. As dikes are laid bare by erosion, their material often proves more resistant than the inclosing rock, in which case they project above the general level in wall-like ridges, whence their name. See ROCKS and VOLCANOES. G. K. G.

Dike, SAMUEL WARREN, LL. D.: minister; writer on economic and social questions; b. at Thompson, Conn., Feb. 13, 1839; graduated at Williams College 1863, and at Andover Theological Seminary 1866; held pastorates in the Congregational church 1868–82; corresponding secretary of the National Divorce Reform League 1881; assisted Carroll D. Wright in the preparation of his report on marriage and divorce in the U. S. and Europe; has prominently urged the study of sociology in educational institutions; author of numerous papers upon sociology and the marriage and divorce problem, which have been published in the *Political Science Quarterly*, *Century*, *Arena*, *Atlantic Monthly*, etc. C. H. THURBER.

Dilemma [Gr. δίλημμα, a double assumption, argument from a double assumption; δι-, two + λῆμμα, assumption, deriv. of λαβεῖν, take, assume]: a syllogism with a conditional premiss, used to prove the absurdity or falsity of some assertion. A conditional proposition is assumed, of which the antecedent is the assertion to be disproved, and the consequent is a disjunctive proposition setting forth the supposition on which the assertion can be true. If the supposition be denied, the assertion must also be denied. Thus, if A is B, either C is D or E is F; but C is not D, and E is not F; therefore A is not B. The dilemma was called the *syllogismus cornutus* (horned syllogism), the two members of the consequent being the "horns of the dilemma," on which the adversary is caught. Since there may be more than two horns to the dilemma (giving us a trilemma, tetralemma, or polylemma), Hamilton proposes the term hypothetica-disjunctive.

Dilettan'te [Ital. pres. ptc. of *dilettare* < Lat. *delecta're*, delight]: an Italian term naturalized in English, French, and German; originally synonymous with an *amateur* or lover of the fine arts. It is sometimes applied to a person who pursues an art without serious purpose or for mere amusement, and is often used as a term of reproach for one whose knowledge is superficial and affected. The plural is *dilettanti*. In 1734 the Society of the Dilettanti was established in Great Britain to encourage a taste for the fine arts. It sent an expedition to the East in 1764, and published in 1769 the first part of the *Ionian Antiquities*, the fourth part of which appeared in 1881. Chandler's *Travels in Asia Minor* appeared in 1775, and his *Travels in Greece* in 1776; the *Unedited Antiquities of Attica* in 1817, *Antique Sculpture* in 1835, and *Athenian Architecture* in 1851.

Diligence, dĕĕ'lĕĕ'zhääns' [Fr., with meaning developed through "attention," "speed," "expedition," "dispatch"]: a four-wheeled public vehicle used in Europe. The French diligence is very strongly built, and drawn by four or six horses at the rate of 6 miles an hour. The front, called the *coupé*, holds three persons, the second compartment (the *intérieur*) six, and the *rotonde*, entered from behind, also six. Diligences are also used in Germany, Italy, Spain, and Russia; the German diligence (*Eilwagen* and *Postwagen*) is attached to the post-office. Diligences are much less used than formerly, owing to the facilities of railway travel.

Dilke, Charles Wentworth: English critic and journalist; b. Dec. 8, 1789; educated at Cambridge, and served for twenty years in the navy pay office; edited *Old English Plays* (6 vols., 1814). He purchased in 1830 the *Athenæum*, which he edited with ability and success until 1846. He established the *Daily News*, a Liberal journal, in 1846, and edited it for three years. D. at Alice Holt, Hants, Aug. 10, 1864. See the collection of his contributions to newspapers and periodicals, with biographical sketch, entitled *The Papers of a Critic* (1875).

Dilke, Sir Charles Wentworth: politician; b. in Chelsea, England, Sept. 4, 1843; educated at Cambridge, and called to the bar in 1866. He traveled through the U. S., Australia, and India, and on his return published *Greater Britain, a Record of Travel in English-speaking Countries during 1866–67* (1868), which speedily passed through several editions, and procured the author's election to Parliament for Chelsea. He was re-elected in 1874, though violently opposed because in the meantime he had acknowledged himself a republican. In 1880 he was appointed under-secretary of state for foreign affairs, and in 1882 president of the local government board, with a seat in the cabinet. In 1884 he was appointed chairman of the Royal Commission on the Housing of the Working Classes, the other members being the Prince of Wales, Lord Salisbury, and Cardinal Manning. In 1886 he was defeated for Parliament, doubtless for having been the co-respondent in a divorce suit brought by Capt. Crawford. He was not again in public life until 1892, when, after a contest of much bitterness, he was returned to Parliament as a Liberal by the Forest of Dean, with a heavy majority. Up to his retirement in 1886 he had been regarded as a probable future leader of the Liberal party. He succeeded his father and grandfather as proprietor of the *Athenæum*, is proprietor of *Notes and Queries*, and one of the proprietors of the *Gardeners' Chronicle*. In addition to *Greater Britain*, he is the author of *The Present Position of European Politics* (1887); *The British Army* (1888); *Problems of Greater Britain* (1890); and several minor works, magazine and review articles. Revised by C. H. Thurber.

Dilke, Lady Emilia F. (*Strong*): English author; b. in 1842. She was married in 1862 to the Rev. Mark Pattison, and in 1885 to Sir Charles W. Dilke. She has contributed art criticisms to the *Academy*, and published *The Renaissance of Art in France* (1879); *Claude Lorrain, sa Vie et ses Œuvres* (Paris, 1879); *The Shrine of Death* (1886); and *Art in the Modern State* (1888). H. A. B.

Dill: any plant of the genus *Peucedanum* of the family *Umbelliferæ*. The most important of these is *Peucedanum graveolens* (formerly called *Anethum graveolens*), a weed-like annual plant of Southern Europe and Western Asia. Its oval-oblong flat fruits have a smooth brown surface and a membranous border. These fruits are aromatic, and constitute the dill-seed or dill of commerce, which are of some importance in pharmacy, where they are known under the name of "anethum." Medicinally they are stimulant, carminative, and stomachic. From them a pale-yellow, pungent oil used in making dill-water is obtained. C. E. B.

Dillen, Johann Jakob, M. D.: botanist; b. at Darmstadt, Germany, in 1687. In 1721 he removed to London, where he edited Ray's *Synopsis of Plants* (1724). He obtained in 1728 the chair of botany founded by Sherard at Oxford. He published *Hortus Elthamensis* (1732) and a good *History of Mosses* (1741). D. Apr. 2, 1747.

Dil'lingen: town of Bavaria; in the circle of Suabia; on the Danube, 24 miles N. W. of Augsburg (see map of German Empire, ref. 7–E). It is inclosed by old walls; has a palace, three Catholic churches, a gymnasium, and a Catholic institution for deaf and dumb girls, with which is also connected, since 1869, an institution for cretins. The university, which was established in 1554, and was a chief seat of the Jesuits, was suppressed in 1809. The town has also manufactures of cutlery. Pop. (1890) 5,791.

Dillmann, Christian Friedrich August: theologian and Orientalist; b. at Illingen, Würtemberg, Apr. 25, 1823; became Professor of Exegetical Theology at Tübingen in 1853; of Oriental languages at Kiel in 1854; of Exegetical Theology at Giessen in 1861; and at Berlin in 1869. He has distinguished himself by his works on the Ethiopic language, among the most important of which are *Grammatik der Æthiopischen Sprache* (1857); *Chrestomathia Æthiopica* (1866); *Lexicon linguæ Æthiopicæ* (3 parts, 1862–65); editions of the old Ethiopic version of the Bible (1855–73); of the apocryphal book of Enoch (1851); the book of Adam, the book of Jubilees, and the Ascension of Isaiah. He also wrote valuable commentaries on the Hexateuch, Isaiah, and Job, and was author of the article on the Ethiopic Language in the present work. D. July 4, 1894.
Revised by C. H. Toy.

Dillon: city; on Utah and Northern R. R., capital of Beaver Head co., Mon. (for location of county, see map of Montana, ref. 7–E). It is the seat of the State Normal School, is a trade center for a large stock-raising, agricultural and mining region, is lighted by electric lights, and has a national bank and two weekly newspapers. Pop. (1890) 1,012; (1900) 1,530. Editor of "Tribune."

Dillon, John, M. P.: Irish politician; b. 1851; son of an Irish agitator, John Blake Dillon, who was obliged to flee in 1848 to America; educated at the University of Dublin; studied medicine; elected to Parliament for Tipperary 1880; suspended Feb. 2, 1881, the first of the Parnellite party to be so treated; again elected to Parliament 1885–86–92; several times arrested for political causes; one of the most prominent leaders of the Irish national movement.

Dillon, John F.: See the Appendix.

Dillon, Wentworth: See Roscommon, Earl of.

Dilman, deel-maan': town of Persia; province of Azerbijan; 50 miles N. N. W. of Urumiya (see map of Persia and Arabia, ref. 1–E); about 4 miles E. of an old ruined town of the same name. It is surrounded by gardens and orchards, and is described as a neat and healthful place, with some trade and manufacturing industry. Pop. 6,000.

Dilolo, Lake: See the Appendix.

Dilu'vium: a Latin word signifying deluge; applied by the older geologists to certain gravels and comparatively recent deposits which appear to be the result of a deluge, in order to distinguish them from the fine sand and mud which is washed down by rivers, and is called alluvium. Those deposits are now known to have been formed through the agency of glaciers in the pleistocene period. See Drift.

Di'man, Jeremiah Lewis, D. D.: clergyman; b. at Bristol, R. I., May 1, 1831; graduated at Brown University, 1851, and at Andover Theological Seminary, 1856, spending in the meantime two years in study abroad. He was settled over the First Congregational church in Fall River, Mass., in 1856, and over the Harvard church in Brookline, Mass., in 1860. In 1864 he became Professor of History and Political Economy in Brown University. He published numerous addresses and articles in the leading reviews, and was an accomplished scholar and orator. D. in Providence, R. I., Feb. 3, 1881. Published posthumously *The Theistic Argument* (Boston, 1881); *Orations and Essays* (1881). His *Life* was written by Caroline Hazard (Boston, 1887).
Revised by George P. Fisher.

Dime [O. Fr. *disme* < Lat. *de'cimus*, tenth]: a silver coin of the U. S. equivalent to ten cents or one-tenth of a dollar. It was formerly written *disme*.

Dimension [from Lat. *dimen'sio*, deriv. of *dimeti'ri*, measure off]: in mathematics, the capacity of extension to be measured in some direction. In geometry, a point has no dimensions; a line, whether straight or curved, has one dimension—namely, length; a surface has two—length and breadth; and a solid has three dimensions—length, breadth, and thickness. As the latter is the most general form of extension, space is of three dimensions. Space of four dimensions, an expression used by some mathematicians, is simply an algebraic term.

Diminution [from Lat. *diminu'ere*, make small; *de*, off + *minus*, less]: the act of making or becoming less; decrease; in architecture, the gradual decrease in the diameter of a column from the base to the upper end. In heraldry, the word diminutions is sometimes used for differences, marks of cadency, and brisures indifferently.

Diminutive [from Lat. *diminuti'vus*, deriv. of *diminuere*, lessen, make smaller]: in grammar, a derivative which softens the meaning of its primitive, or expresses a young or a small object of the same kind as its primitive; thus *animalcule* (Lat. *animalculum*) to *animal*. The principal diminutive suffixes in English are: *-et*, *-let*, *-cle*, *-cule*, *-kin*, *-ling*, *-ock*, *-in*, *-y*, *-ie*; cf. *versicle*, *particle*, *islet*, *coronet*, *leaflet*, *lambkin*, *manikin*, *duckling*, *gosling*, *darling*, *bullock*, *hillock*, *hammock*; compare Latin *filiolus*, little son, with *filius*, son, *homunculus*, little man, with *homo*, man, *regulus*, prince, with *rex*, king; so Fr. *maisonette*, little house, with *maison*, house; Germ. *mädchen*, with *magd*, etc.

Dimity [viâ Mediæv. Lat. from Gr. δίμιτος, of double thread; δι-, two + μίτος, thread]: a cotton fabric of thick texture, and generally figured or striped. It was formerly much used for bed-hangings and window-curtains. Originally, dimity was commonly white, or, at least, of one uniform color, but now they are made of different colors. The cloth is made with a woven pattern and a plain band alternating, and a colored pattern is printed on the latter.

Dimorphism [from Gr. δίμορφος, of double form; δι-, two + μορφή, form]: in biology, the occurrence of individuals of the same species under two distinct forms, which, were not the connection known, would be regarded as distinct species or even as distinct genera. In many cases the dimorphism is sexual, the male and female presenting entirely different characters. Thus in the canker-worm moth the male is winged, the female lacks the wings. In other cases differences may be seen among the individuals of the same sex. Thus in a South American Isopod (*Tanais*) there occur two types of males, one stronger and with strong pincers for clasping the female, the other weaker, with a differently shaped pincer, and with abundant smelling hairs. For other instances, see POLYMORPHISM. J. S. K.

Dimorphism: in crystallography, the capacity of a substance to crystallize in two distinct forms. Carbon, sulphur, and calcium carbonate are examples. Sulphur when obtained by evaporation from its solution in carbon bisulphide crystallizes in octahedra, but sulphur melted by heat on cooling forms prismatic crystals. The latter have a tendency to break up into octahedra, but these when heated form smaller prismatic crystals. Carbon, as the diamond, crystallizes in octahedra and allied forms, but as graphite it forms hexagonal crystals.

Dimsdale, THOMAS: physician; b. at Thoydon-Garnon, England, 1712: practiced in Hertford, and became famous for his inoculation for the smallpox. In 1768 he was summoned by Catherine the Great of Russia to inoculate herself and her son, and for his services was rewarded with a title and a pension of £500 per annum. Returning to England he published a treatise on *Inoculation* (1796), and afterward became a member of Parliament for Hertford. D. in Hertford, Dec. 30, 1800.

Dinaburg: same as DÜNABURG (*q. v.*).

Dinajpur, dĕĕ-năăj-poor': district in the northeastern part (Rajshahi division) of Bengal, British India; area, 4,118 sq. miles. The surface is nearly level, and the climate is unhealthful. Rice is the staple product of the soil. The population is chiefly of aboriginal descent. Pop. 1,525,000. The capital of the district is Dinajpur, 221 miles N. of Calcutta, on the Purnabhaba river (see map of N. India, ref. 6–I). It is meanly built, and its trade is inconsiderable. Pop. 12,560.

Dinan, dĕĕ'năăn': an old town of France; department of Côtes-du-Nord; on the river Rance, 30 miles N. W. of Rennes (see map of France, ref. 4–C). It stands on a hill of granite about 250 feet above the river, is inclosed by walls and defended by a castle. It has a handsome cathedral, a public library, a college, and a town-hall. Here are manufactures of linen and cotton fabrics, sailcloth, hats, beet-root sugar, etc. The Rance is navigable from its mouth to Dinan. Pop. (1896) 10,620.

Dinant' [in Fr. pron. dĕĕ'năăn', Lat. *Dinantium*]: town of Belgium; province of Namur: on the river Meuse; 15 miles S. of Namur (see map of Holland and Belgium, ref. 12–F). It is on the declivity of a rocky hill, and is surrounded by picturesque scenery. It has a Gothic cathedral, a town-house, two hospitals, and manufactures of cutlery, paper, woolen goods, hats, and leather. Dinant was founded in the sixth century, was strongly fortified as early as the twelfth century, and has suffered much from sieges. Pop. (1891) 7,048.

Dinapur, dĕĕ-năă-poor': town and important military station of British India; province of Bengal; on the right bank of the Ganges, about 12 miles above Patna (see map of N. India, ref. 6–H). Here are spacious barracks, and about 3,200 houses, mostly of mud.

Dinar'chus (Δείναρχος): one of the ten Attic orators; a native of Corinth who came to Athens about 342 B. C. and took up the profession of a composer of speeches. He rose to influence under Demetrius Phalereus, and fell with him in 307. After spending fifteen years in exile at Chalcis in Euboea, he was allowed to return, but it was only to die in penury and almost total blindness. Though a virulent opponent of Demosthenes, against whom his principal extant oration is directed, he imitated the great orator in a rough way, and hence was called a "barleybread Demosthenes" (κρίθινος Δημοσθένης). This imitation is evident in the three speeches extant, all pertaining to the miserable affair of HARPALUS (*q. v.*). Edited with elaborate commentary by Mätzner (1842); critical edition by Thalheim (1887). See Blass's *Attische Beredsamkeit*, vol. iii. (B), pp. 236–247.

Dinar'ic Alps (in Lat. *Alpes Dinaricæ*): the name given to the range of mountains connecting the Julian Alps with the western ranges of the Balkan. It divides Dalmatia from Bosnia and Herzegovina, and a spur extends into Dalmatia. The highest summits are Mt. Orjen and Mt. Dinara, the former of which rises about 6,225 feet above the sea. The rocks of this range are mostly limestone.

Din'dorf, WILHELM: philologist; b. in Leipzig, Saxony, Jan. 2, 1802; became Professor of History and Literature there in 1828, but resigned in 1833 in order to devote himself to the publication of a new edition of the *Thesaurus* of Stephanus, which his brother Ludwig Dindorf and Hase had begun in Paris. Along with this he prepared critical editions of very many classical authors; among them, an edition of Demosthenes for the University of Oxford (1849), and editions of Æschylus, Sophocles, Euripides, and Aristophanes, to which were added commentaries, and a work on the meters of the same poets; later he compiled a *Lexicon Sophocleum* and a *Lexicon Æschyleum*. D. Aug. 1, 1883. See *Biogr. Jahrbuch*, vi. (1883), pp. 112–121.

Revised by A. GUDEMAN.

Dingdings, The: a part of the Straits Settlement colony (British) on the west coast of the Malay Peninsula. It consists of the island of Pangkor, with a small strip of the coast of Perak. It is about 30 miles S. of Penang.

Ding'elstedt, FRANZ, von: German poet; b. at Halsdorf, in Hesse, Jan. 30, 1814; appointed librarian to the king at Stuttgart in 1843; intendant of the royal theater of Munich in 1850; an intendant of the Weimer theater in 1859; director of the court opera at Vienna in 1867; and director of the Burgtheater of Vienna in 1871. Author of *Lieder eines kosmopolitischen Nachtwächters* (Songs of a Cosmopolitan Nightwatch, 1841); the tragedy *Das Haus der Barneveldt* (The House of Barneveldt, 1850); *Nacht und Morgen* (Night and Morning, a collection of poems, 1850); several novels, mostly humorous, sketches of travel, etc. His translations of Shakspeare's works, especially the historical dramas, became famous on the German stage. D. May 17, 1881.

Dingley, NELSON: See the Appendix.

Dingo (the native Australian name): a species of dog (*Canis dingo*) inhabiting Australia. It is somewhat larger than a shepherd's dog, of a tawny color, with erect ears and a bushy tail. The dingo is extremely fierce, and being very destructive to sheep, its numbers have been greatly lessened by the efforts of the colonists. In its wild state the dingo does not bark, but learns to do so in captivity. It is re-

markable for being the only dog living both in a wild and in a domesticated state, and also from the fact that it is the sole large terrestrial mammal not a marsupial found in Australia. From its striking contrast to the other Australian mammals it would seem that the dingo could scarcely have reached Australia without the aid of man, and yet its remains are found fossil in pliocene tertiary deposits. F. A. Lucas.

Dinich'thys [from Gr. δεινός, terrible + ἰχθύς, fish]: a genus of placoderm fishes, attaining a length of 15 feet and upward, whose remains are found in the lower Carboniferous of Ohio. The cranium was very massive; the anterior part of the body protected by bony plates, the principal dorsal shield sometimes having a diameter of 2 feet. No scales have been found, and the hinder portion of the body was probably covered with rough skin. The mouth was large, the lower jaw of some species being 2 feet in length. There were two large triangular teeth in front, above and below, and back of these a few small pointed teeth. The dentition is remarkable from the fact that these teeth were formed by projections of the jaw-bone. Revised by F. A. Lucas.

Dinka, or **Denka**: a people inhabiting about 60,000 sq. miles W. of the White Nile, and between 6° and 9° N. lat. They belong to the darkest of negro races, are clean in their persons and in what they eat, give all their attention to cattle-raising, and possess immense herds. Their principal weapon is the lance. The men dispense entirely with clothing, but the women are well dressed. Though their tribes fight one another, their union against the Arab slavers has prevented the Khartoum raiders from getting a foothold on their soil. See Schweinfurth's *Heart of Africa*. C. C. Adams.

Dinkelsbühl, ding'kels-bül: a walled town of Bavaria; on the river Wernitz, 44 miles S. W. of Nuremberg; formerly a free city of the empire (see map of German Empire, ref. 6–E). It has a Latin school and various manufactures. Pop. (1890) 4,484.

Dinoceras: See Tinoceras.

Dino Compagni, dee'nō kōm-paan'yee: Italian magistrate, and author of a valuable history of Florence comprising the period 1280 to 1312; became prior and gonfalonier of justice. Though of noble birth, he supported the democratic cause. D. at Florence, Feb. 26, 1323.

Di'nomys [from Gr. δεινός, terrible + μῦς, a mouse]: the only genus of the *Dinomyidæ*, a family of rodents based on a single specimen of a mammal from Peru, named *Dinomys branickii* by Prof. Peters. The body is about 2 feet and the bushy tail 9 inches in length; the hair is harsh, the color grizzly gray marked with two white stripes and numerous white spots on the back and head; there are four toes on each foot. The animal, which bears a strong resemblance to a paca with a bushy tail, combines characters of the agoutis, pacas, and chinchillas. F. A. Lucas.

Dinor'nis [from Gr. δεινός, terrible + ὄρνις, bird]: the typical genus of the family *Dinornithidæ*; a group of extinct birds, known as moas, whose remains occur abundantly in the most recent deposits of New Zealand. By some authors the Moas are regarded as forming an order by themselves, but they are usually considered as a family of the order *Struthiones* and placed near the cassowaries, these birds and the kiwis (*Apteryx*) being their nearest living relatives. Capt. Hutton divides the birds, once united in the single genus *Dinornis*, into seven genera and twenty-six species, ranging in size from a turkey to a bulk exceeding that of an ostrich. The Moas were much more massive in their structure than any existing birds, the leg bones in particular being extremely strong and heavy, *Dinornis elephantopus* taking the lead in this respect, although not the largest species. All were incapable of flight, and in some species not even the rudiments of a wing were present. The head of these birds was small in proportion to their bulk, and indicates them to have been sluggish and stupid. *Dinornis maximus*, one of the best-known members of the group, was about 9 feet high when standing erect, but could easily have reached 2 or 3 feet higher. The tibia of this bird was 34 inches long, the combined length of femur, tibia, and tarsus being nearly 6 feet. Differences of opinion exist as to the date at which these gigantic birds became extinct, but there is good reason to believe that some were in existence within the last 300 years, possibly even at the time of the discovery of New Zealand.

Dinornis (restored).

Their remains occur in caves, in fissures caused by earthquakes and enlarged by the action of water, in swamps, and in some localities bones are plowed up in bringing land under cultivation. The best skeletons have been obtained from narrow fissures, into which birds had fallen and died, the specimens plowed up being always imperfect, and often bearing evidence showing that the missing portions had been cut off by man. The ultimate extinction of the Moas was brought about by man, who feasted on their flesh and eggs, but it is thought that the beginning of their decrease was due to increasing severity of climate.

A most interesting deposit of bones was found in a swamp, or lagoon, fed by springs, in which the Moas are believed to have sought refuge from the cold. No less than 7 tons of bones, representing at least 400 individuals, were taken from this spot, intermixed with a great quantity of quartz pebbles from their crops. Feathers, fragments of skin, and bones with dried tendons attached have been discovered in caves, and a very few eggs have been found, principally in graves. The largest egg measures 10 by 7 inches, not especially large for the bulk of the bird, and far inferior in size to the egg of the extinct *Æpyornis* of Madagascar. A few remains assigned to *Dinornis* and to a nearly related bird, *Dromornis*, have been discovered in Queensland, Australia.
F. A. Lucas.

Dinosau'ria [from Gr. δεινός, terrible + σαῦρος, lizard]: an order of extinct reptiles related to the crocodiles on the one hand and the birds on the other, containing the largest land reptiles and many which often, or habitually, walked on their hind legs. The smallest species were not more than 3 feet long, while the largest attained a length of 60 feet. See Vertebrates, Fossil. F. A. L.

Dinothe'rium [from Gr. δεινός, terrible + θηρίον, wild animal]: a genus of extinct mammals related to the mastodon and elephant, but having no tusks in the upper jaw, and two tusks projecting downward and slightly backward from the lower jaw. The skull is broad and flattened, and there are two premolars and three molars on either side of each jaw. The first molar has three ∧-shaped cross ridges, the other teeth two. Remains of the *Dinotherium* occur in the Middle and Upper Miocene of Germany, France, Greece, Asia Minor, and India. The skull first discovered was not associated with limb bones, and the animal was supposed to have been aquatic and allied to the manatee. Limb bones have since been found, among them a femur nearly 6 feet long, and *Dinotherium* is now regarded as a proboscidean. F. A. L.

Dio, or **Dion** (surnamed Chrysostomus, "Gold Mouth," on account of his eloquence): Greek rhetorician and philosopher; b. at Prusa, in Bithynia, about 50 B. C. Honored by Vespasian, he was banished from Rome by Domitian, but recalled by his patron Nerva, and favored by Trajan. He traveled much after the fashion of the times, and to these travels we owe interesting glimpses of the life of the empire. Dio is not exempt from the unreality of his age, but the thought is deeper, the moral conviction more thorough, than we find in the mere "sophist" or "rhetorician" of the Greek Renaissance, and his orations or, better, "essays" are something more than rhetorical exercises. His style is clear and fluent, he is a good story-teller, and his Atticism, though not the success it was once held to be, is more than respectable. Best ed. by Emperius 1844, text with valuable introduction by L. Dindorf in the Teubner series. See Schmid, *Atticismus*, i., 141 foll., and Hertzberg, *Geschichte Griechenlands unter der Herrschaft der Römer*, vol. ii., pp. 186–188. B. L. Gildersleeve.

Di'o Cas'sius: the most important Greek historian of the imperial period; grandson of Dio Chrysostomus; b. at
