# 1963 cENSUS OF MANUFACTURES 

# Petroleum refining and Lubricating oils and greases 

## preliminary report

SIC Codes 2911 and 2992

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Petroleum Refining Industry (SIC 2911) shipped products valued at $\$ 16,505$ million, an increase of 14 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 18 percent from 1958 and 3 percent from 1962 to a total of 119 thousand employees in 1963. Value added by manufacture amounted to $\$ 2,980$ million in 1963 , an increase of 41 percent over 1958, but approximately the same as 1962.

Manufacturers in the Lubricating Oils and Greases Industry (SIC 2992) shipped products during 1963 valued at $\$ 446$ million, an increase of 59 percent over 1958. Average employment in this industry showed a slight increase over 1958 to a total of 7.6 thousand employees, and value added by manufacture amounted to $\$ 187$ million in 1963 , an increase of 81 percent for the same period.

The Petroleum Refining Industry includes establishments engaged primarily in producing gasoline, kerosene, fuel oils, lubricants, and other products from crude petroleum and its fractionation products either through straight distillation of crude oil, redistillation of unfinished petroleum derivatives, cracking or other processes. Establishments primarily engaged in re-refining or reclaiming used oils (crankcase drainings) by a

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sanpling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
August 1965
distillation process are also included in this industry. Refineries engaged in blending and compounding lubricants are included in Industry 2911 but establishments primarily engaged in blending and compounding lubricants from purchased materials are classified in Industry 2992, Lubricating Oils and Greases. Establishments engaged in producing natural gasoline or cycle condensates from natural gas are classified in Mineral Industries, and petroleum bulk stations or distribution terminals are classified in wholesale trade. Activities relating to pipe-line and other long distance transportation facilities are classified as transportation and were excluded from the 1963 Census of Business, Manufactures, and Mineral Industries.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLTSHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such à separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Petroleum Refining, and Lubricating Oils and Greases Industries consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Petroleum Refining and the Lubricating Oils and Greases Industries amounted to $\$ 16,505$ million, and $\$ 446$ million respectively.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 15,460$ million of petroleum refinery products, and lubricating oils and greases were shipped by all producers of these products.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1A, 1B, and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1A, 1B, and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the-Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in these or associated industries or areas, or (b) because these industries were of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on these industries.)
(D) Withheld to avoid disclosing figures for individual companies.
${ }^{1}$ Less than $\$ 500$ thousand.

Table 3.-QUANTITY AND VALUE OF PETROLEUM REFINING AND LUBRICATING OILS AND GREASES SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: I963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Petroleum Refining, and Lubricating Oils and Greasés Industries but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

[^1]Table 3.-QUANTITY AND VALUE OF PETROLEUM REFINING AND LUBRICATING OIIS AND GREASES SHIPPED BY ALL PRODJCERS IN THE UNITED STATES: 1963 AND 1958-Continued

(NA)
Represents zero.
Not available. (X) e.c. Not elsewhere classified.
(D) Withheld to avoid disclosing figures for individual companies.
${ }^{1}$ Reporting companies were requested to classify items in the same manner as billed by the shipper regardless of how the refinery (or blending and compounding establishments) would otherwise classify them.

3Represents the difference between "Total shipments" (Quantity) and "Receipts" (Quantity).
${ }^{3}$ Product code 2911151 included with code 291111
${ }^{3}$ product code 2911151 included with code 2911111 for 1963.
${ }^{4}$ product code 2911198 included with codes 2911111 and 2911131 for 1958.
${ }^{5}$ Includes all finished gasolines (other than aviation and automotive gasoline), finished base stocks, and blending agents such as alkylate,
polymers (dimer, codimer, etc.), hydropolymers (hydrodimer, hydrocodimer, etc.) cumene, isopetane, isohexane, neohexane, isoheptane, iso-octane, motor benzol (benzene), and other blending agents derived from petroleum (excludes natural gasoline).
${ }_{7}^{6}$ Includes range oils, signal oil, mineral seal oil, mineral colza oil, longtime burning oil, $300^{\circ}$ oil, and insecticide base.
${ }^{7}$ Product code 2911400 included with 2911451 for 1963.
${ }^{8}$ Includes ethane, propane, propene, butane, butene, propane-butane mixtures, pentane, butadiene, and other liquefied hydrocarbon gases. Receipts and shipments exclude liquefied petroleum gases from natural gasoline plants

91963 figures are not directly comparable with those for 1958 because liquefied refinery gases and aromatics for 1963 (formerly defined as Liquefied petroleum gases), product class code 29115, include undetermined amounts previously reported as other finished petroleum products, product class code 29110.
${ }^{10}$ Product code 2911511, included in code 2911598 for 1963.
${ }^{11}$ Detailed product statistics for liquefied gases used as chemical raw material are published by the United States Tariff comnission in the report "Synthetic Organic Chemicals, United States Production and Sales.
${ }^{12}$ Although respondents were requested to report receipts in the same manner as billed by the shipper, the figures indicate that items billed as other oils by the shipper were sometimes reported as receipts of "unfinished oils" or "lubricating oil base stock" for the refinery receiving these oils.
${ }^{13}$ Includes such products as cracking stock, unfinished gasoline, requiring further distillation, naphtha stocks, soaps, wax distillate, and other unfinished petroleum oils. Excludes lubricating oil base stocks, natural gasoline and cycle condensates.
${ }^{5}$ Includes light, medium, neutral, heavy neutral, and residual stocks.
${ }^{15}$ Includes flux for paving, roofing, waterproofing, mastic, and other purposes; cut-back asphalt, emulsified asphalt and fluxes made in petroleum refineries, and other liquid asphaltic products except road oil and fuel oil used for heating purposes.
${ }^{16}$ Includes asphalt for paving, roofing, waterproofing, briquetting, mastic, pipe coating, molding composition, and other heavy asphalt products.
${ }^{17} 1958$ figure, which was previously published in quantities of thousand pounds, has been converted to thousand barrels on the basis of 280 pounds per barrel.
${ }^{18}$ Represents residual asphaltic oil used for surface treatment of road and highways.
${ }^{19}$ Includes petroleum ether, rubber solvent, mineral spirits (petroleum spirits), varnish makers' and painters' naphtha, high-solvency naphtha, benzol diluent, lacquer diluent, cleaners' naphtha, stoddard solvent, extraction solvents, and other petroleum distillates shipped as solvents.
${ }^{20}$ Represents amorphous paraffin of melting point not under $145^{\circ}$.
${ }^{21}$ Includes oils for lubricating purposes and such nonlubrication purposes as transformer oil, hydraulic oil, processing oil, quenching oil, and liquid rust preventative.
${ }^{22}$ Lubricants and similar oils containing animal and vegetable oils made in petroleum refineries, product code 2911651, are included in lubricants and similar oils containing animal and vegetable oils made in other manufacturing industries, code 2992651.
${ }^{23}$ Includes greases for aviation, automotive, industrial, and railroad uses; launching grease, and cutting, drawing, and grinding compounds and paste. Also includes paste rust-preventative comoounds and thread compounds. See also footnote 21. Does not include "Lubricating greases, not specified by kind, made in other manufacturing industries" (product code 2992700).
${ }^{24} 1958$ figure, which was previously published in quantities of thousand pounds, has been converted to thousand barrels on the basis of 315 pounds per barrel.

BUSINESS CYCLE DEVELOPMENTS is published monthly for specialists concerned with the analysis of current business conditions. It summarizes many of the available economic time series in convenient form for short-term evaluation and interpretation and supplements other Department of Commerce reports on the economy. The features of this report are:

- The arrangement of series according to their usual timing relations during the course of the business cycle.
- The inclusion of special analytical measures and historical' cyclical comparisons that help in evaluating the current stage of the business cycle.
- The speed with which the data are collected, assembled, and published. BCD is issued about the 22 d of each month covering data for the preceding month.
About 90 principal indicators and over 300 components are used for the different measures shown. The movements of the series are shown against the background of the expansions and contractions of the general business cycle so that "leads" and "lags" can readily be detected and unusual cyclical developments spotted. Since almost all of the basic data presented in this report are available in other published sources, the value of BCD lies in its analytical arrangement and speed of publication.
The presentation and classification of the time series in the BCD report follows the business indıcators approach. The classification of series and the business cycle turning dates are those designed by the National Bureau of Economic Research which, in recent years, has been a leader in this field of investigation.

For sale by the Government Printing Office, Washington, D.C. 20402. \$6 a year ( $\$ 1.50$ additional for foreign mailing). Single copies, $60 ¢$ each.

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Paving mixtures and blocks

SIC Code 2951

preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Paving Mixtures and Blocks Industry shipped products valued at $\$ 417$ million, an increase of 56 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 25 percent over 1958 to a total of 9.7 thousand employees in 1963. Value added by manufacture amounted to $\$ 163$ million in 1963, an increase of 45 percent over 1958.

The Paving Mixtures and Blocks Industry includes establishments engaged primarily in the manufacture of asphalt and tar paving mixtures, and paving blocks made of asphalt and various compositions of asphalt or tar with other materials. Establishments primarily engaged in manufacturing brick, concrete, and stone paving blocks are classified in Major Group 32. For a more detailed list of primary products of Industry 2951, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

(NA) Not available.
${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and ig47 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ In addition to the data shown, estimates have been derived and generaliy published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the rcsults that would be obtained frum a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can he expected between the estimates and complete canvass totals because of sampling fiuctuations. For this industry, the standard errurs were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965

## U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating ,more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1939 and 1947, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Paving Mixtures and Blocks Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Paving Mixtures and Blocks Industry amounted to $\$ 417$ million. Of this total, $\$ 25$ million were products primary to other industries; and $\$ 37$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 395$ million of paving mixtures and blocks were shipped by all producers of these products. Of this total, $\$ 355$ million, or 90 percent, were shipped by plants classified in Industry 2951, Paving Mixtures and Blocks, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 85 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBITCATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -CENERAL STATISTICS FOR THE PAVING MIXTURES AND BIOCKS INDUSTRY, BY GEOGRAPHIC AREAS: 1963 AND 1958

# 1963 CENSUS OF MANUFACTURZS 

## INDUSTRY SERIES

## Asphalt felts and coatings

## preliminary report

SIC Code 2952

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Asphalt Felts and Coatings Industry shipped products valued at $\$ 527$ million, an increase of 15 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 6 percent from 1958 to a total of 15 thousand employees in 1963. Value added by manufacture amounted to $\$ 190$ million in 1963 , an increase of 22 percent over 1958.

The Asphalt Felts and Coatings Industry includes establishments engaged primarily in the manufacture of asphalt and other saturated roofing felts in roll or shingle form, either smooth or faced with grit, and in manufacturing asphalt and tar cements and coatings.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

Table 1.--GENERAL STATLSTICS FOR THE ASPHALT FELTS AND COATINGS INDUSTRY IN THE UNITED STATES FQR SELECTED YEARS
(SIC code 2952)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipnents$(\$ 1,000)$ | $\begin{aligned} & \text { Capital } \\ & \text { expend- } \\ & \text { itures, } \\ & \text { new } \\ & (\$ 1,000) \end{aligned}$ |

(NA) Not available.
${ }^{2}$ Inclues expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .

In addition to the data show, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishnents. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 , the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1939 and 1947, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unad justed value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Asphalt Felts and Coatings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Asphalt Felts and Coatings Industry amounted to $\$ 527$ million. Of this total, $\$ 39$ million were products primary to other industries; and $\$ 58$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 459$ million of asphalt felts and coatings were shipped by all producers of these products. Of this total, $\$ 430$ million, or 94 percent, were shipped by plants classified in Industry 2952, Asphalt Felts and Coatings, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 92.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other jndustries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also
their activities in the manutacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued.

Fina $\perp$ industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, It was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## INDUSTRY SERIES

## Tires and inner tubes

SIC Code 3011

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Tires and Inner Tubes Industry shipped products valued at $\$ 2,951$ million, an increase of 14 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4.6 percent from 1958 to a total of 85.3 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,321$ million in 1963, an increase of 12 percent from 1958 and 3 percent from 1962.

The Tires and Inner Tubes Industry includes establishments engaged primarily in the manufacture of pnuematic casings, inner tubes, and solid and cushion tires for all types of vehicles, airplanes, farm equipment, and children's vehicles, as well as tire repair, and tire retreading (camelback) materials.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (x) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishnents. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended. nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Tires and Inner Tubes Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Tires and Inner Tubes Industry amounted to $\$ 2,951$ million. Of this total, $\$ 211$ million were products primary to other industries; and $\$ 342$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that \$2,419 million of tires, inner tubes, tread rubber, tire sundries, and repair materials were shipped by all producers of these products. Of this total, $\$ 2,397$ million, or 99 percent, were shipped by plants classified in Industry 3011,Tires and Inner Tubes while the remainder was shipped by plants classified in other industries. The 1958 ratio was also 99 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th Census of manufacturing establishmentsin the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, itwas conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of
the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Rubber footwear

SIC Code 3021

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Rubber Footwear Industry shipped products valued at $\$ 352$ million, an increase of 54 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 41 percent from 1958 to a total of 28.8 thousand employees in 1963. Value added by manufacture amounted to $\$ 216$ million in 1963, an increase of 44 percent from 1958.

The Rubber Footwear Industry includes establishments engaged primarily in the manufacture of all rubber footwear, waterproof fabric upper footwear, and other fabric upper footwear having rubber soles vulcanized to the uppers.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishrnents included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Rubber Footwear Industry consists not only of products described above as primary to the industry, hut also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Rubber Footwear Industry amounted to $\$ 352$ million. Of this total, \$24 million were products primary to other industries; and $\$ 26$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 336$ million of rubber footwear were shipped by all producers of these products. Of this total, $\$ 302$ million, or 90 percent, were shipped by plants classified in Industry 3021, Rubber Footwear while the remainder was shipped by plants classified in other industries.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## Reclaimed rubber

SIC Code 3031

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statis'tics, 1963 Census of Manufactures.

During 1963, manufacturers in the Reclaimed Rubber Industry shipped products valued at $\$ 50$ million, an increase of 27 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 8 percent from 1958 and 2 percent from 1962 to a total of 2.0 thousand employees in 1963. Value added by manufacture amounted to $\$ 28$ million in 1963, an increase of 34 percent from 1958 and 4 percent from 1962.

The Reclaimed Rubber Industry includes establishments engaged primarily in reclaiming rubber from used tires, scrap and miscellaneous waste rubber articles by processes which result in a devulcanized, depolymerized or regenerated, repiasticized product containing added ingredients. This product is sold for use as a raw material in the manufacture of rubber goods with or without a mixture with natural or synthetic rubber.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

BUREAU OF THE CENSUS, Richard M. Scammon, Director

For sale by the Bureau of the Census, Washington, D. C., 20233, and U.S. Department af Cammerce Field Offices. 10 cents.
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENIS

The value of shipments reported by establishments classified in the Reclaimed Rubber Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified intheReclaimed Rubber Industry amounted to $\$ 50$ million. Of this total, $\$ 4$ million were products primary to other industries; and $\$ 3$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 55$ million of reclaimed rubber were shipped by all producers of these products. Of this total, $\$ 43$ million, or 77 percent, were shipped by plants classified in Industry 3031, Reclaimed Rubber while the remainder was shipped by plants classified in other industries. The 1958 ratio was 72 percent.

## GENERAL, STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing
industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, itt was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTUR=S 

## INDUSTRY SERIES

Rubber products, n.e.c.<br>SIC Code 3069

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Fabricated Rubber Products, N.E.C., Industry shipped products valued at $\$ 2,576$ million, an increase of 37 percent over 1958,according to preliminary results obtained from the 1963 census. Average employment in this industry showed anincrease of 10 percent from 1958 and 2 percent from 1962 to a total of 131.6 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,418$ million in 1963, an increase of 42 percent from 1958 and 7 percent from 1962.

The Fabricated Rubber Products, N.E.C., Industry includes establishments engaged primarily in the manufacture of industrial and mechanical rubber goods, rubberized fabrics and vulcanized rubber clothing, and miscellaneous rubber specialties and sundries.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE FABRICATED RUBBER PRODUCTS, N.E.C., INDUSTRY IN THE UNITED STATES FOR SETECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, new ${ }^{1}$ $(\$ 1,000)$ | Standard error of estimate (percent) for number of employees columa ${ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | With 20 or more employees | Number | Payroll $(\$ 1,000)$ | Number | Man-hours $(1,000)$ | Wages $(\$ 1,000)$ |  |  |  |  |  |

[^4]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inc-uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value, of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified inthe Fabricated Rubber Products, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Fabricated Rubber Products, N.E.C., Industry amounted to $\$ 2,576$ million. Of this total, $\$ 325$ million were products primary toother industries; and \$170 million were receipts formiscellaneous activities. The industry shipments of primary products represented 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 2,349 \mathrm{milli}$ on fabricated rubber products, n.e.c., were shipped by all producers of these products. Of this total, $\$ 2,081$ million, or 89 percent, were shipped byplants classified in Industry 3069, Fabricated Rubber Products, N.E.C., while the remainder was shipped by plants classified in other industries. The 1958 ratio was 86 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. Ievel for each 4-digit industry and 2- and 3-digit industrygroup. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral lndustries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures ( 2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4 -digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics
Volume II, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume 111, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics
Volume II, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, cadital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.
U.S. DEPARTMENT OF COMMERCE

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Plastics products, n.e.c. <br> SIC Code 3079

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Plastics Products, N.E.C., Industry shipped products valued at $\$ 3,142$ million, an increase of 68 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 43 percent from 1958 and 8 percent from 1962 to a total of 165.9 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,649$ million in 1963, an increase of 77 percent from 1958 and 12 percent from 1962.

The Plastics Products, N.E.C. Industry includes establishments engaged primarily in molding primary plastics for the trade, in manufacturing film, sheets, sheeting, rods, tubes and other stock shapes from purchased resins, and in fabricating miscellaneous finished plastics products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. -GENERAL STATISTICS FOR THE PLASTICS PRODUCTS, N.E.C., INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The mether of compiling figuzes for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Plastics Products, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Plastics Products, N.E.C., Industry amounted to $\$ 3,142$ million. Of this total, $\$ 157$ million were products primary to other industries; and $\$ 139$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 3,489$ million of plastics products, n.e.c., were shipped by all producers of these products. Of this total, $\$ 2,846$ million, or 82 percent, were shipped by plants classified in Industry 3079, Plastics Products, N.E.C., while the remainder was shipped by plants classified in other industries. The 1958 ratio was 85 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

| 30790 -- | Miscellaneous plastics products, not specified by kind......................... | 135,053 | 79,400 |

n.e.c. Not elsewhere classified. (NA) Not available.
${ }^{1}$ Detailed product figures for the product classes shown below will appear in the final census report. Preliminary 1963 product figures appear in Current Industrial Reports Series M30D(1963)-1, "Shipments of Selected Plastics Products."
${ }^{2}$ Because of changes in classification, 1963 and 1958 product lines are, for the most part, not comparable. In 1958 the only unsupported film, sheet and sheeting separately classified were vinyl and polyethylene; other unsupported film, sheets, sheeting, rods, tubes and other stock shapes made from purchased resins were reported in other classifications.

# 1963 CENSUS OF MANUFACTURFS 

# Leather tanning and finishing 

## preliminary report

SIC Code 3111

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Leather Tanning and Finishing Industry shipped products valued at $\$ 757$ million, an increase of 2 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 15 percent from 1958 and I percent from 1962 to a total of 31.4 thousand employees in 1963. Value added by manufacture amounted to $\$ 272.1$ million in 1963, a
decrease of 1 percent from 1958 and an increase of 3 percent from 1962.

The Leather Tanning and Finishing Industry includes establishments engaged primarily intanning, currying, and finishing hides and skins into leather. This industry also includes leather converters who buy hides and skins and have them processed into leather on a contract basis by others.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

[^6]June 1965
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Leather Tanning and Finishing Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Leather Tanning and Finishing Industry amounted to $\$ 757$ million. Of this total, $\$ 16$ million were products primary to other industries; and $\$ 112$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 100 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 631$ million of tanned, curried, and finished leather were shipped by all producers of these products. Of this total, $\$ 629$ million, or almost 100 percent, were shipped by plants classified in Industry 3111, Leather Tanning and Finishing, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 100 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## n.e.c. Not elsewhere classified. (NA) Not available. (X) Not applicable. Trevised.

${ }^{1}$ For this product, more detailed data were collected for 1958. This information is shown in the 1958 Census of Manufactures report.
${ }^{2}$ Quantity estimated based on the quantity-value relationship reported for other products of the product class.
${ }^{3}$ Contract receipts are not included in the total shown for tanned, curried, and finished leather. For 1963 , contract receipts include all receipts for tanning and finishing done for others on their materials regardless of the industry classification of the establishments. For l958, contract receipts include all receipts for contract work done for others on their materials by establishments classified in Industry 3lll, Leather Tanning and Finishing.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Industrial leather belting 

SIC Code 3121

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Industrial Leather Belting Industry shipped products valued at $\$ 52$ million, a decrease of 23 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 27 percent from 1958 to a total of 2.9 thousand employees in 1963. Value added by manufacture amounted to $\$ 32$ million in 1963, a decrease of 10 percent from 1958.

The Industrial Leather BeIting Industry includes establishments engaged primarily in the manufacture of industrial leather products, such as transmission belting, mechanical packings, and textile leathers.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and 1963 but are not included for 1954 and earlier years.

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final Therefore, the $1959-1962$ data have been withheld from this preliminary report. It is planned, however,
census reports. See annual survey of manufactures volumes for further explanation of the sanfling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries on geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Industrial Leather Belting Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Industrial Leather Belting Industry amounted to $\$ 52$ million. Of this total, $\$ 7$ million were products primary to other industries; and $\$ 5$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 49$ million of industrial leather belting and packing were shipped by all producers of these products. Of this total, $\$ 43$ million, or 87 percent, were shipped by plants classified in Industry 3121, Industrial Leather Belting, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 92 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTUR=S 

## INDUSTRY SERIES

## Footwear cut stock

SIC Code 3131

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Footwear Cut Stock Industry shipped products valued at $\$ 229$ million, a decrease of 11 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 21 percent from 1958 to a total of 14.3 thousand employees in 1963. Value added by manufacture amounted to $\$ 90$ million in 1963, a decrease of 9 percent from 1958.

The Footwear Cut Stock Industry includes establishments engaged primarily in the manufacture of
leather soles, innersoles, and boot and shoe cut stock and findings. This industry also includes finished wood heels. Establishments primarily engaged in manufacturing heels, soling strips, and soles made of rubber, composition, plastics, and fiber are classified in Major Group 30.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and 1963 but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Establishments in this industry were requested to report "value of shipments" in 1963 and "value of production" in prior years. This change was made as a result of a review of the reporting which indicated that the value of shipments data were more generally available from company records and were usually reported in place of value of production. This change does not significantly affect the comparability between 1963 and prior years for the product statistics shown in table 3 or in the industry's value of shipments shown in table 1.

However, it does have a somewhat greater effect on the comparability of the 1963 value added data to the value added information published for prior years since an adjustment in prior years was not made for changes in finsihed products inventories. For 1958, the finished products inventories adjustment would result in a decrease of 100 thousand dollars.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Footwear Cut Stock Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Footwear Cut Stock Industry amounted to $\$ 229$ million. Of this total, $\$ 12$ million were products primary to other industries; and $\$ 12$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 94 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 216$ million of footwear cut stock were shipped by all producers of these products. Of this total, \$204 million, or 94 percent, were shipped by plants classified in Industry 3131, Footwear Cut Stock, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 95.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Shoes, except rubber and House slippers 

## preliminary report

SIC Codes 3141 and 3142

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Shoes, Except Rubber Industry shipped products valued at \$2,246 million, and manufacturers in the House Slippers Industry had shipments of $\$ 124$ million, increases of 10 and 11 percent, respectively, since 1958, according to preliminary results obtained from the 1963 census. Average employment in the Shoes, Except Rubber Industry decreased 6 percent from 1958 to a total of 201.9 thousand employees, while employment in the House Slippers Industry decreased 3
percent to a total of 11.2 thousand in 1963. Value added by manufacture in the Shoes, Except Rubber Industry amounted to $\$ 1,210$ million in 1963, an increase of 11 percent from 1958, while the value added by manufacture for the House Slippers Industry amounted to $\$ 65$ million, an increase of 9 percent from 1958.

The Shoes, Except Rubber Industry includes establishments engaged primarily in the manufacture of boots and shoes designed primarily for street, work, play or sport wear. Establishments primarily engaged in the production of such protective footwear as rubbers, rubber boots, storm shoes, galoshes and other footwear with rubber soles vulcanized to fabric uppers are classified in Industry 3021.

$5_{\text {Less than }} \$ 500$ thousand.
April 1965

The House Slippers Industry includes establishments primarily engaged in manufacturing house slippers of leather or other materials.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1939 and 1947, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value, added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories
between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Establishments in these industries were requested to report "value of shipments" in 1963 and "value of production" in prior years. This change was made as a result of a review of the reporting which indicated that the value of shipments data were more generally available from company records and were usually reported in place of value of production. This change does not significantly affect the comparability between 1963 and prior years for the product statistics shown in table 3 or in the value of shipments or value added data shown in tables IA and 1B.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in either the Shoes, Except Rubber Industry or in the House Slippers Industry consists not only of products described above as primary to .their respective industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Shoes, Except Rubber Industry amounted to $\$ 2,246$ million. Of this total, $\$ 32$ million were products primary to other industries; and $\$ 42$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 99 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 99 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that \$2,196 million of shoes, except rubber were shipped by all producers of these products. Of this total, $\$ 2,171$ million, or 99 percent, were shipped by plants classified in Industry 3141, Shoes, Except Rubber, while the remainder was shipped by plants classified in other industries. The comparable figure for 1958 was also 99 percent.

The total value of shipments and other receipts of establishments classified in the House Slippers Industry amounted to $\$ 124$ million. Of this total,
\$10 million were products primary to other industries; and $\$ 5$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

This differs from the total value of shipments of house slippers which amounted to $\$ 126$ million as shown in table 3. Of this total, $\$ 109$ million, or 87 percent, were shipped by plants classified in Industry 3142, House Slippers, while the remainder was shipped by plants classified in other industries. The comparable figure for 1958 was 85 percent.

## COMPARISON OF CENSUS AND CURRENT SURVEY DATA

Establishments producing shoes and slippers also report their production monthly or annually on Census Forms M31A or MA-31A, "Shoes and Slippers." These reports were matched with the Census of Manufactures reports. Among other discrepancies, this analysis revealed that a significant number of manufacturers had not been included in the current survey. The data for these companies were included in a revision to the M31A data as issued on March 26, 1965.

The data shown in table 3 represent footwear shipments and therefore differ from the production by method of construction data shown in tables 4A and 4 B and also differ from the revised production data issued on March 26, 1965. The production data shown in tables 4 A and 4 B have been ad justed to equal the revised 1963 production figures issued in the M31A series.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1A, 1B, and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary
activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics ítables IA, 1B, and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for these industries will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary sumary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. "Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(X) Not applicable.
${ }^{1}$ Establishnents in this industry were requested to report "Value of shipments" in 1963 and "Value of production" in 1958. This change does not significantly affect the comparability of the data for the two years (see text).
${ }^{2}$ Quantity estimated using the average unit value reported by other shoe producing companies reporting both quantity and value of shipments.

Table 4A.-PRODUCTION OF SHOES AND SLTPPERS, EXCEPT RUBBER, BY TYFE OF CONSTRUCTION: 1963
(1,000 pairs)

NUY'E: The constructions shown in this table relate to the method of outersole attachment. In addition to those specified, companies were asked 'o report two additional categories: Moccasins with outersole attached, and moccasins having no line of demarcation between the sole and upper. An investigation showed that a substantial number of companies producing moccasins with outersole attached had included them with cemented, welt, etc., depending on the method of attachment of the outersole. It was also apparent that moccasins having no line of demarcation between the sole and upper were not completely reported. Figures reported for these two categories, therefore, have been included in the "construction not specified" column,
by type of footwear.

- Represents zero.
(D) Withheld to avoid disclosing figures for individual companies.
${ }^{2}$ Production data on footwear with sole vulcanized to fabric upper, including sneakers, are presented in the 1963 Census of Manufactures preliminary report on rubber footwear, SIC Code 3021.

Note: The constructions listed are those for which separate data are available for 1958. More detailed information for 1963 for the "other constructions"category is shown in Table 4A.

- Represents zero.
$\overline{1}_{\text {For }}$ 1958, includes 1,657 thousand pairs of men's play shoes for which separate data were not collected by type of construction.
${ }^{2}$ For 1958, figures for misses' play shoes are included with those for women's shoes. For 1963, they are included with misses'.
${ }^{3}$ Data by method of construction are not available for 1958.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral lndustries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures ( 2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral lndustries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral lndustries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3-digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral lndustries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics
Volume ll, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume 111, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## preliminary report

## Leather gloves

SIC Code 3151

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Leather Gloves Industry shipped products valued at $\$ 80$ million, an increase of 48 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 24 percent over 1958 to a total of 7.7 thousand employees in 1963. Value added by manufacture amounted to $\$ 33$ million in 1963, an increase of 27 percent over 1958.

The Leather Gloves Industry includes establishments engaged primarily in the manufacture of dress, semidress, and work gloves exclusively of leather. Establishments primarily engaged in manufacturing sporting and athletic gloves are classified in Industry 3949, Sporting and Athletic Goods; knit gloves in Industry 2259, Knitting Mills, N.E.C.; and dress, semidress, and work gloves and mittens of cloth, or cloth and leather combined in Industry 2381, Fabric Dress and Work Gloves.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

[^11]is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel; purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Establishments in this industry were requested to report "Value of shipments" in 1963 and "Value of production" in prior years. This change was
made as a result of a review of the reporting which indicated that the value of shipments data were more generally available from company records and were usually reported in place of value of production. This change does not significantly affect the comparability between 1963 and prior years for the product statistics shown in table 3 or in the industry's value of shipments shown in table 1. However, it does have a somewhat greater effect on the comparability of the 1963 value added data to the value added information published for prior years since an adjustment in prior years was not made for changes in finished products inventories. For 1958, the finished products inventories ad justment would result in a decrease of 1 million dollars, or approximately 4 percent.

While value of shipments data were frequently reported in place of value of production, the companies do differentiate between the quantity produced and the quantity shipped. This resulted in some differences in the quantity data collected in the census of manufactures and in the current survey as indicated in the note to table 3.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Leather Gloves Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Leather Gloves Industry amounted to $\$ 80$ million. Of this total, $\$ 15$ million were products primary to other industries; and $\$ 12$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 79 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 85 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 61$ million of leather gloves were shipped by all producers of these products. Of this total, $\$ 54$ million, or 88 percent were shipped by plants classified in Industry 3151, Ieather Gloves, while the remainder was shipped by plants classified in other industries.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an
industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing
industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: The quantity data reported in the census of manufactures is quantity shipped, while the quantity data reported on Census Annual Form MA-23D, "Gloves and Mittens," is quantity produced. In large part, this accounts for the difference between the data collected in the two surveys.
(NA) Not available. (X) Not applicable. revised.
${ }^{1}$ Establishments in this industry were requested to report "Value of shipments" in 1963 and "Value of production" in 1958. This change does not significantly affect the comparability of the value data for the two years (see text). For 1958, the quantity of production data were obtained from the Current Industrial Report M23D, "Gloves and Mittens."
${ }^{2}$ Includes only all leather "gloves and mittens. Leather-and-fabric combinations are classified in Industry 2381, "Fabric Dress and Work Gloves." ${ }^{3}$ Quantity estimated based on average quantity-value relationship of all other products.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

Luggage
SIC Code 3161

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Luggage Industry shipped products valued at $\$ 205$ million, an increase of 14 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 1 percent from 1958 to a total of 16.1 thousand employees in 1963. Value added by manufacture amounted to $\$ 111$ million in 1963, an increase of 15 percent from 1958.

The Luggage Industry includes establishments engaged primarily in the manufacture of luggage and
related products, such as briefcases, zipper cases, brief bags, school bags, and musical instrument cases. Establishments primarily producing instrument cases other than musical instruments, jewelry boxes and cases, and travel kits are classified in Industry 3172, Small Leather Goods.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and 1963 but are not included for 1954 and earlier years.

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass, totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
July 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

For sole by the Bureou of the Census, Washington, D. C., 20233, and U. S. Department of Commerce Field Offices.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, aand November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Luggage Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Luggage Industry amounted to $\$ 205$ million. Of this total, $\$ 10$ million were products primary to other industries; and $\$ 9$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A,indicates that $\$ 201$ million of luggage were shipped by all producers of these products. Of this total, $\$ 187$ million, or 93 percent, were shipped by plants classified in Industry 3161, Luggage, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 95.

## COMPARISON OF CENSUS AND CURRENT SURVEY DATA

Establishments shipping luggage, travel kits, billfolds, wallets, and French purses also report monthly on Census Form M3IE, Luggage, Briefcases, and Personal Leather Goods. The 1963 data compiled from this survey are shown in table 3A together with the comparable totals reported in the census of manufactures. The M31E survey was initiated in 1960.

The two sets of 1963 data differ primarily because of the different procedures used in deriving the totals. All manufacturing plants are included in the census of manufactures. The monthly M31E data, on the other hand, are estimates based on reports received from a sample of all producers benchmarked to their 1958 Census of Manufactures reports. Over a period of time, most samples, including this one, are subject to increasing errors pending rebenchmarking to a complete universe. It appears that the sample for the luggage and personal leather goods survey did not completely reflect the changes in business activity of the nonsample companies and consequently the estimates differed from the results of the complete census.

In addition, the data available for the benchmark year (1958) were in less detail than that collected in the M31E survey. Therefore, "average" estimating factors were used for some of the detail items. This fact significantly affected the level of some of these estimates.

It is expected that the 1965 monthly data will be rebenchnarked to the 1963 Census of Manufactures within the next few months.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)
${ }^{1}$ Less than $\$ 500$ thousand.

Table 3A, --QUANTITY AND VALUE OF LUGGAGE SHLPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Luggage Industry but also by establishments

Note: The reasons for the differences between the 1963 data collected in the census of manufactures and the current monthly survey MBIE are discussed in the text. The M3IE survey was not conducted in 1958, and all data for that year are from the census of manufactures.
(NA) Not available. (X) Not applicable.
${ }^{1}$ For 1963, data collected in the census of manufactures are not completely comparable to those collected on the census monthly survey M3IE to the extent that vanity cases are included in the monthly survey data but are classified in Industry 3172, Small Leather Coods, in the census of manufactures.
${ }^{2}$ For 1958, separate data were not collected for zippered hand luggage. Figures for this item were included with women's and men's hand luggage, as applicable. Therefore, the data are not comparable to the 1963 information. Detailed figures were collected in 1958 by type of material (leather, plastic, and other) and are published in the census of manufactures report for that year.
${ }^{3}$ For 1958 , figures for attaché cases and catalog cases were not collected separately but were included with "Other luggage."

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Handbags and purses

SIC Code 3171

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Handbags and Purses Industry shipped products valued at \$276 million, an increase of 19 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 9 percent from 1958 to a total 24.1 thousand employees in 1963. Value added by manufacture amounted to $\$ 140 \mathrm{milli}$ in in 1963 , an increase of 26 percent from 1958.

The Handbags and Purses Industry includes establishments engaged primarily in the manufacture of women's handbags and purses of leather or other materials, except precious metals (Industry 3911).

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawail are included for 1958 and 1963 but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTIGS FOR THE HANDBAGS AND PURSES INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3171)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new ${ }^{1}$$(\$ 1,000)$ |

| 1963 ². | 537 | 259 | 24,055 | 87,170 | 21,552 | 40,886 | 69,010 |  | 135,246 |  |  |
| 1958. | 620 | 262 | 21,971 | 68,654 | 19,459 | 37,259 | 54,275 | 111,545 | 119,430 | 231,221 | 1,575 |
| $1954{ }^{3}$ | 714 | 247 | 22,881 | 61,405 | 20,911 | 39,942 | 49,620 | 93,865 | 100,486 | 194,262 | 972 |
| 19473. | 736 | 279 | 20,378 | 45,664 | 18,468 | 38,725 | 36,168 | 77,042 | 86,264 | 163,306 | 799 |
| $1989{ }^{3}$. | 286 | (NA) | 15,700 | 14,777 | 14,048 | (NA) | 11,239 | 22,929 | 32,878 | 55,807 | (NA) |

(NA) Not available.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available for 4-digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained fram a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location"were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954, 1958 and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Handbags and Purses Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Handbags and Purses Industry amounted to $\$ 276$ million. Of this total, $\$ 5$ million were products primary to other industries; and \$13 million were receipts for miscellaneous activities. The industry shipments of primary products represented almost 100 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 96 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should beclearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure appearing in table 3A, indicates that $\$ 267$ million of handbags and purses were shipped by all producers of these products. Of this total, $\$ 263$ million, or 98 percent, were shipped by plants classified in Industry 3171, Handbags and Purses, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 98.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 " and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Small leather goods

SIC Code 3172

## preliminary <br> report

The Small Leather Goods Industry includes establishments engaged primarily in the manufacture of small articles, such as billfolds, key cases, and coin purses of leather or other materials, except precious metals which are classified in Industry 3911, "Jewelry, Precious Metal."

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not appiicable.
I $_{\text {See }}$ text regarding comparability of 1963 data with earlier years.
${ }^{2}$ Includes expenditures for plants under construction but not in operation This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{3}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard errors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling estimate.

4Data for Alaska and Hawaii are not included.
August 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS, A. Ross Eckler, Director

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPL,OYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALJE ADDED BY MANUFACTURE
For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for eardier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Small Leather Goods Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Small Leather Goods Industry amounted to $\$ 154$ million. Of this total, $\$ 6$ million were products primary to other industries; and $\$ 10$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 150$ million of small leather goods were shipped by all producers of these products. Of this total, $\$ 138$ million, or 91 percent, were shipped by plants classified in Industry 3172, Small Leather Goods, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 87.

## COMPARISON OF CENSUS AND CURRENT SURVEY DATA

Establishments shipping luggage, travel kits, billfolds, wallets, and French purses also report monthly on Census Form M31E, Luggage, Briefcases, and Personal Leather Goods. The 1963 data compiled from this survey are shown intable 3, together with the comparable totals reported in the census of manufactures. The M31E survey was initiated in 1960.

The two sets of 1963 data differ primarily because of the different procedures used in deriving the totals. All manufacturing plants reported in the census of manufactures. The monthly M31E data, on the other hand, are estimates based on reports received from asample of all producers benchmarked to their 1958 Census of Manufactures reports. Over a period of time, most samples, including this one, are subject to increasing errors pending rebenchmarking to a complete universe. It appears that the sample for the luggage and personal leather goods survey did not completely reflect the changes in business activity of the non-sample companies and consequently the estimates differed from the results of the complete census.

In addition, the data available for the benchmark year (1958) were in less detail than that collected in the M31E survey. Therefore, "average" estimating factors were used for some of the detail items. This fact significantly affected the level of some of these estimates.

It is expected that the 1965 monthly data will be rebenchmarked to the 1963 Census of Manufactures within the next few months.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBIICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary sumnary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)

See text regarding comparability of 1963 to 1958 data.
${ }^{2}$ Less than $\$ 500$ thousand.

Table 3.-QUANTITY AND VALUE OF SMALI LEATHER GOODS SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Small Ieather Goods Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

(NA) Not available. (X) Not applicable.
${ }^{1}$ See text for a discussion of the reasons for discrepancies between the totals for items reported on both survey M31E and the census of manufactures. ${ }^{2}$ For 1963, quantity data for these items were also collected on Census Form MBlE, Luggage, Briefcases, and Personal Leather Goods. Since this survey was begun in 1960, comparable data are not available for 1958. The 1958 data are as collected in the census of manufactures for that year. ${ }^{3}$ For 1963 , no category was provided to report billfolds, wallets, and French purses of materials other than leather and plastic in either the census of manufactures or survey MBIE. No information is available on where these were reported for 1963.
${ }^{4}$ The data as reported in the census of manufactures are not completely comparable to the data reported on survey MBlE. On survey MBlE, vanity cases are included with "Other women's hand luggage", product code 3161025 , while on the census they are included in product code 3172019 . The quantity of this item is not known.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Leather goods, n. e.c.

SIC Code 3199

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Leather Goods, N.E.C., Industry shipped products valued at $\$ 68$ million, an increase of 13 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 6 percent from 1958 to a total of 5 thousand employees in 1963. Valued added by manufacture amounted to $\$ 33$ million in 1963, an increase of 6 percent from 1958.

The Leather Goods, N.E.C., Industry includes establishments engaged primarily in the manufacture of leather goods, not elsewhere classified, such as saddlery, harness, and whips; embossed leather goods; leather desk sets; and razor strops.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and 1963 but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Leather Goods, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts ofestablishments classified in the Leather Goods, N.E.C., Industry amounted to $\$ 68$ million. Of this total, $\$ 8$ million were products primary to other industries; and $\$ 8$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 98 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 96 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 66$ million of leather goods, n.e.c., were shipped by all producers of these products. Of this total, $\$ 58$ million, or 88 percent, were shipped by plants classified in Industry 3199, Leather Goods, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 84.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

| 3199000 | Leather goods, not specified by kind. | 11,832 | 16,485 |

n.e.c. Not elsewhere classified.
${ }^{1}$ The products of this industry only include leather goods that are not classified in other industries. Separate reports are being issued for the other leather goods industries such as leather tanning and firishing, industrial leather belting and packing, footwear and footwear cut stock, gloves, luggage, handbags, and other personal leather goods.
U.S. DEPARTMENT OF COMMERCE

# 1963 GENSUS OF MANUFAGTURES 

INDUSTRY SERIES

Flat glass
SIC Code 3211

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Flat Glass Industry shipped products valued at $\$ 553$ million, an increase of 44 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 10 percent over 1958 and 4 percent over 1962 to a total of 23 thousand employees in 1963. Value added by manufacture amounted to $\$ 366$ million in 1963, an increase of 38 percent from 1958 and 16 percent over 1962.

The Flat Glass Industry includes establishments engaged primarily in the manufacture of flat glass products such as sheet (window) glass, plate glass, rolled glass, wireglass and laminated glass from glass produced in the same establishment. Establishments primarily engaged in manufacturing laminated glass from flat glass received from other establishments are classified in Industry 3231, Glass Products, Made of Purchased Glass.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

(NA) Not available. ( X ) Not applicable.
Includes expenditures for plants under
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unad justed value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as mate-
rials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Flat Glass Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Flat Glass Industry amounted to $\$ 553$ million. This includes shipments of primary products, shipments of secondary products and miscellaneous receipts.

## INDEXES OF PRODUCTION AND UNIT YALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry. It should also be noted that table 3 includes, laminated glass made in the Products of Purchased Glass Industry to avoid disclosing figures for individual companies. (See footnotes 1 and 4 of table 3A.)

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports
will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, It was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## Glass containers

SIC Code 3221

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Glass Containers Industry shipped products valued at $\$ 1,004$ million, an increase of 16 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 9 percent over 1958, but approximately the same as 1962, to a total of 60 thousand employees in 1963. Value added by manufacture amounted to $\$ 630$ million in 1963, an increase of 18 percent from 1958 and 3 percent over 1962.

The Glass Containers Industry includes establishments engaged primarily in the manufacture of glass containers for commercial packing and bottling, and for home canning. Products of this industry include food containers, carboys, fruit jars, cosmetic jars, medicine bottles and beverage, beer, liquor, wine and milk bottles. For a more detailed list of primary products of Industry 3221, refer to table 3A, product codes 3221011 to 3221037 .

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

(NA) Not available. (X) Not applicable. Revised.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishnents canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Glass Containers Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Glass Containers Industry amounted to $\$ 1,004$ million. Of this total, $\$ 7$ million were products primary to other industries; and $\$ 24 \mathrm{mil}-$ lion were receipts for miscellaneous activities. The industry shipments of primary products represented 99 percent of the total manufactured products shipments, primary and secondary. The 1958 ratio was also 99 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table $3 A$, indicates that $\$ 982$ million of glass containers were shipped by all producers of these products. Of this total, $\$ 974$ million, or 99 percent, were shipped by plants classified in Industry 3221, Glass Containers while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 99.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities
(contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports
will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -GENERAL STATISTICS FOR THE GLASS CONTAINERS INDUSTRY BY REGIONS AND STATES: 1963 AND 1958
(SIC code 3221)

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)

Table 3A, -QUANTITY AND VALUE OF GLASS CONTAINERS SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Glass Containers Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

Note: Comparable monthly quantity data are published in Current Industrial Reports Series M32G, Glass Containers.
lproduction figures include all containers produced whether for domestic or export shipment. Shipments figures include only domestic shipments. Refer to product code 3221062 for export shipments.
${ }^{2}$ Net weight was not reported for shipments totaling 11,509 thousand gross in 1963.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Products of purchased glass

## preliminary report

SIC Code 3231

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Products of Purchased Glass Industry shipped products valued at $\$ 625$ million, an increase of 33 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 8 percent over 1958 to a total of 26 thousand employees in 1963. Value added by manufacture amounted to $\$ 308$ million in 1963, an increase of 27 percent over 1958.

The Products of Purchased Glass Industry includes establishments engaged primarily in the manufacture of glass products from purchased glass including laminated glass; mirrors; stained and leaded glass; glassware etched, ornamented, bent, etc., and tempered, bent or enameled sheet, plate and rolled glass. For a detailed list of the products of Industry 3231 refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

Table 1.--GENERAL STATISTICS FOR THE PRODUCTS OF PURCHASED GTASS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, new ${ }^{1}$ <br> ( $\$ 1,000$ ) |

| $1939{ }^{3}$. | 557 | (NA) | 12,195 | 15,168 | 10,012 | (NA) | 10,615 | 23,432 | 26,454 | 49,886 | (NA) |

(NA) Not available.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
${ }^{4}$ Due to misclassification of small establishments between Industries 3229 and 3231 in the 1954 Census of Manufactures, no separate establishment count is available.

July 1965

## 1963 CENSUS OF MANUFACTURES

(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1963 but are not included for earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Products of Purchased Glass Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Products of Purchased Glass Industry amounted to $\$ 625$ million. Of this total, $\$ 28$ million were products primary to other industries; and $\$ 36$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry. In comparing these statistics it should also be noted that laminated glass has been excluded from the table 3 total. To avoid disclosing figures for individual companies it is necessary to combine laminated glass made in Industry 3211, Flat Glass with the laminated glass made in Industry 3231, Products of Purchased Glass, (see footnotes 1 and 3 of table 3). The laminated glass has been included in the total for Industry 3211.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 GENSUS OF MANUFACTURZS 

## INDUSTRY SERIES

## Pressed and blown glass, n.e.c.

SIC Code 3229

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Pressed and Blown Glass, N.E.C., Industry shipped products valued at $\$ 634$ million, an increase of 42 percent over 1958, according to preliminaxy results obtained from the 1963 census. Average employment in this industry showed an increase of 9 percent over 1958 to a total of 38.2 thousand employees in 1963. Value added by manufacture amounted to $\$ 474$ million in 1963, an increase of 52 percent over 1958.

The Pressed and Blown Glass, N.E.C., Industry includes establishments engaged primarily in the manufacture of glass and glassware not elsewhere classified, pressed, blown, or shaped from glass produced in the same establishment. Establishments primarily engaged in manufacturing textiletype glass fibers are also included in this industry, but establishments primarily engaged in manufacturing glass wool insulation products are classified in Industry 3296. Establishments primarily engaged in the production of pressed lenses for vehicular lighting, beacons, and lantems and moulded lens blanks are also included in this industry, but establishments primarily engaged in the production of optical lenses are classified in Industry 3831. Establishments primarily engaged in manufacturing glass containers are classified in Industry 3221, and complete electric light bulbs in Industry 3641.

Table 1.--GETERAL STATISTICS FOR THE PRESSED AND BLOWI GLASS, N.E.C., INDUSTRY IN THE UIITED STATES FOR SETECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new ${ }^{1}$$(\$ 1,000)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

(iNA) Not available, $r_{\text {Revised. }}$
${ }^{1}$ Incluies expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available Dy 4-digit industry for 1954 .
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standara errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
${ }^{4}$ Due to misclassification of small establishments between Industries 3229 and 3231 in the 1954 Census of Manufactures, no separate establishment count is available.
June 1965

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census: Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March,- May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VAIUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted.value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel,
purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in Pressed and Blown Glass, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Pressed and Blown Glass, N.E.C., Industry amounted to $\$ 634$ million. Of this total, $\$ 20$ million were products primary to other industries; and $\$ 10$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry)should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 620$ million of pressed, blown or otherwise shaped glassware, not elsewhere classified were shipped by all producers of these products. Of this total, $\$ 604$ million, or 97 percent, were shipped by plants classified in Industry 3229, Pressed and Blown Glass, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable 1958 percentage was also 97.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

In 1958, certain lenses, e.g., automotive (including sealed bean) lantern, searchlight, etc., were included with "Other Pressed and Blown Glassware" (32294) the exact amount of which is not available. For 1963 these lenses are classified in Product Class 32292, Lighting and Electronic Classware.
${ }^{3}$ Shipments of railroad, marine and traffic lighting glassware were valued at $\$ 1,957$ thousand in 1958.
4 Data for fibrous glass were collected on Form MA-32J and previously published in Current Industrial Reports Series M32J.
${ }^{5}$ Quantities include normal sizing, but exclude the weight of vinyl, polyester, and other synthetics used in coatings.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Cement, hydraulic

SIC Code 3241

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Cement, Hydraulic, Industry shipped products valued at \$1,176 million, an increase of 9 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 15 percent from 1958 and 2 percent from 1962 to a total of 35 thousand employees in 1963. Value added by manufacture amounted to
$\$ 785$ million in 1963, an increase of 9 percent from 1958 and 2 percent from 1962.

The Cement, Hydraulic, Industry includes establishments engaged primarily in the manufacture of hydraulic cement, including portland, natural, masonry, and pozzolan cements. For a detailed list of products of Industry 3241 refer to table 3A. In its annual report Minerals Yearbook, the U.S. Department of the Interior, Bureau of Mines publishes detailed figures on the products listed in table 3A of this report. The variation between Bureau of Mines summary totals and the data appearing inthis report are due to (1) inclusion of cost of containers and interplant transfers in Census

Table 1.-GENERAL STATISTICS FOR THE CEMENT, HYDRAULIC, INDUSTRY IN THE UNITED STATES FOR SEIECTED YEARS

(NA) Not available. (X) Not applicable. $\mathrm{r}_{\text {Revised. }}$
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not availble by 4 -digit industry for 1954.

The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

Data for Alaska and Hawaii are not included.
March 1965

For sole by the Bureou of the Census, Woshington, D.C., 20233, and U.S. Deportment of Commerce Field Offices. 10 cents.

Bureau figures and (2) differences in the reports submittef to the two agencies by individual companies.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number o.- all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of
finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the zost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Cement, Hydaulic, Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Cement, Hydraulic, Industry amounted to $\$ 1,176$ million. The industry shipments of primary products represent approximately 99 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 99 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 1,161$ million of hydraulic cements were shipped by all producers of these products. Of this total, more than 99 percent, were shipped by plants classified in Industry 3241, Cement, Hydraulic, while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was also more than 99.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Brick and structural tile

SIC Code 3251

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Brick and Structural Tile Industry shipped products valued at $\$ 325$ million, an increase of 13 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 7 percent from 1958 to a total of 29 thousand employees in 1963. Value added by manufacture amounted to $\$ 216$ million in 1963, an increase of 10 percent over 1958.

The Brick and Structural Tile Industry includes establishments engaged primarily in the manufacture of clay building brick, vitrified paving brick and hollow structural tile. Establishments primarily engaged in manufacturing clay firebrick are classified in Industry 3255, Clay Refractories; nonclay firebrick in Industry 3297, Nonclay Refractories; sand lime brick in Industry 3299, Nonmetallic Minerals, N.E.C.; and glass brick in Industry 3229, Pressed and Blown Glass, N.E.C. For a detailed list of products of Industry 3251, refer to table 3A.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

[^14]March 1965
establishments. 'The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel; purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establish_ ments in Brick and Structural Tile Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Brick and Structural Tile Industry amounted to $\$ 325$ million. Of this total, $\$ 6$ million were products primary to other industries; and $\$ 15$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 98 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 96 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 308$ million of brick and structural tile were shipped by all producers of these products. Of this total, $\$ 303$ million, or 98 percent, were shipped by plants classified in Industry 3251, Brick and Structural Tile while the remainder was shipped by plants classified in other industries. The comparable 1958 percentage was also 98.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, puyrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported tor each establishment as a whole. Aggregates of such figures for an
industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing
industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Ceramic wall and floor tile

SIC Code 3253

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Ceramic Wall and Floor Tile Industry shipped products valued at $\$ 165$ million, an increase of 22 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry of 13 thousand for 1963, was approximately the same as 1958. Value added by manufacture amounted to $\$ 111$ million in 1963, an increase of 19 percent from 1958.

The Ceramic Wall and Floor Tile Industry includes establishments engaged primarily in the manufacture of ceramic wall and floor tile and includes glazed wall tile, ceramic mosaic tile and quarry tile. Establishments primarily engaged in manufacturing structural clay tile and facing tile (structural) are classifiedin Industry 3251, Brick and Structural Clay Tile. For a detailed list of products of Industry 3253, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

All employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Ceramic Wall and Floor Tile Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Ceramic Wall and Floor Tile Industry amounted to \$165 million. Of this total, $\$ 7$ million were products primary to other industries; and $\$ 15$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 A , indicates that $\$ 143$ million of ceramic wall and floor tile were shipped by all producers of these products. Of this total, 99 percent were shipped by plants classified in Industry 3253, Ceramic Wall and Floor Tile while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 99.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table $3 A$, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ars industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the

United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manuf acturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Clay refractories

SIC Code 3255

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Clay Refractories Industry shipped products valued at \$192 million, an increase of 17 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 8 percent from 1958 and 4 percent from 1962 to a total of 12 thousand employees in 1963. Value added by manufacture amounted to $\$ 118$ million in 1963, an increase of 12 percent from 1958 and 3 percent from 1962.

The Clay Refractories Industry includes establishments engaged primarily in manufacturing clay firebrick, refractory bonding mortars, and other heat-resisting clay products such as glass-house tank blocks, stoppers, floaters, and rings. Establishments primarily engaged in manufacturing nonclay refractories as well as all graphite refractories whether of carbon bond or ceramic bond, are classified in Industry 3297, Nonclay Refractories. For a detailed list of products of Industry 3255, refer to table 3A, product codes 3255011 to 3255094.

This report doesnot include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manuracturing establishnents cenvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not incluged.
Januery 1965

## U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 , the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unad justed value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in Clay Refractories Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Clay Refractories Industry amounted to $\$ 192$ million. Of this total, $\$ 19$ million were products primary to other industries; and $\$ 9$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in Table 3A, indicates that $\$ 176$ million of clay refractories were shipped by all producers of these products. Of this total, \$163 million, or 93 percent, were shipped by plants classified in Industry 3255, Clay Refractories, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 92.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAI STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment
as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBEICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the corning months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

USCOMM-DC

## U.S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS WASHINGTON, D.C. 20233

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Structural clay products, n.e.c. <br> SIC Code 3259

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Structural Clay Products, N.E.C., Industry shipped products valued at $\$ 160$ million, an increase of 19 percent over 195\%, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 17 percent from 1958 to a total of 12 thousand employees in 1963. Value added by manufacture amounted to $\$ 108$ million in 1963, an increase of 15 percent over 1958.

The Structural Clay Products, N.E.C., Industry includes establishments engaged primarily in the manufacture of clay sewer pipe and structural clay products, not elsewhere classified, such as architectural terra-cotta, roofing tile, conduit, chimney pipe, wall coping, adobe brick, etc. For a detailed list of products of Industry 3259, refer to table 3A.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

[^17]and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Structural Clay Products, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Structural Clay Products, N.E.C., Industry amounted to $\$ 160$ million. Of this total, $\$ 15$ million were products primary to other industries; and $\$ 8$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 140$ million of structural clay products, n.e.c., were shipped by all producers of these products. Of this total, $\$ 136$ million, or 96 percent, were shipped by plants classified in Industry 3259, Structural Clay Products, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 94.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary
products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3 A ) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports
will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Comnerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Vitreous plumbing fixtures

## preliminary report

SIC Code 3261

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Vitreous Plumbing Fixtures Industry shipped products valued at $\$ 156$ million, an increase of 9 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 but an increase of 5 percent from 1962 to a total of 9 thousand employees in 1963. Value added by manufacture amounted to $\$ 102$ million in 1963, an increase of 16 percent over 1958 and 15 percent over 1962.

The Vitreous Plumbing Fixtures Industry includes establishments engaged primarily in the manufacture of china plumbing fixtures and china and earthenware fittings and bathroom accessories. For a detailed list of products of Industry 3261, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table I.-GENERAL STATISTICS FOR TTE VITREOUS PIUNBING FIXTUPES INDUSTFY IN THE UNITED STATES FOR SELECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | VaIue added by manufacture $(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | CapitaI expenditures, new ${ }^{1}$$(\$ 1,000)$ | Standard error of estimate (percent) for number of empioyees column |

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishnients canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing estabiishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Vitreous Plumbing Fixtures Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Vitreous Plumbing Fixtures Industry amounted to $\$ 156$ million. Of this total, $\$ 5$ million were products primary to other industries; and $\$ 12$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 143$ million of vitreous and semivitreous plumbing fixtures and accessories were shipped by all producers of these products. Of this total, $\$ 139$ million, or 97 percent, were shipped by plants classified in Industry 3261, Vitreous Plumbing Fixtures while the remainder was shipped by plants classified in other industries. The percentage in 1958 was also 97.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.-GENERAL STATISTICS FOR THE VITREOUS PLIMBING FIXTURES INDUSTRY, BY REGIONS AND STATES: 1963 AND 1958

Revised. (X) Not applicable.
${ }^{1}$ The source of the quantity data for codes $3261014-3261026$ is Current Industrial Reports Series N34E(63)-5, Plumbing Fixtures. No separate quantity data for vitreous and senivitreous sinks, laundry trays, sink and laundry tray combinations and other plumbing fixtures are available since quantity data for vitreous and semivitreous sinks, laundry trays, sink and laundry tray
${ }^{2}$ Represents vitreous china only. In addition, shipments valued at $\$ 2,398,000$ in 1963 and $\$ 2,236,000$ in 1958 were reported for plumbing fixtures made of earthenware, concrete, and composition.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Vitreous china food utensils

SIC Code 3262

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Vitreous China Food Utensils. Industry shipped products valued at $\$ 51$ million, 'an increase of 6 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 14 percent from 1958 and 5 percent from 1962 to a total of 6 thousand employees in 1963. Value added by manufacture amounted to $\$ 43$ million in 1963, an increase of 8 percent over 1958 but a 2 percent decrease from 1962.

The Vitreous China Food Utensils Industry includes establishments engaged primarily in the manufacture of vitreous china and porcelain table and kitchen articles for use in households and in hotels, restaurants, and other commercial institutions for preparing, serving, or storing food and drink. Establishments primarily engaged in manufacturing fine (semivitreous) type of earthenware table and kitchen articles are classified in Industry 3263. For a detailed list of products of Industry 3262 , refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volunes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Vitreous China Food Utensils Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Vitreous China Food Utensil Industry amounted to $\$ 51$ miliion.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary prod-. ucts of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 47$ million of vitreous china food utensils were shipped by all producers of these products.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 OENSUS OF MANUFACTURES 

## Earthenware food utensils

SIC Code 3263

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Earthenware Food Utensils Industry shipped products valued at $\$ 59$ million, an increase of 18 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 22 percent from 1958 to a total of 7.3 thousand employees in 1963. Value added by manufacture amounted to $\$ 41$ million in 1963, an increase of 14 percent over 1958.

The Earthenware Food Utensils Industry includes establishments engaged primarily in the manufacture
of fine (semivitreous) types of earthenware table and kitchen articles for preparing, serving, or storing food and drink. Establishments primarily engaged in manufacturing vitreous china table and kitchen articles are classified in Industry 3262, Vitreous China Food Utensils. For a detailed list of products of Industry 3263, refer to table 3A.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. $\mathrm{r}_{\text {Revised. }}$
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not availahle hy 4-digit industry for 1954.
${ }^{2}$ In addition to the data shown, estinates have been derived and generally published for 1959-1962 from a representative sample of manufacturing estahlishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be ohtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected hetween the estimates and complete canvass totais heaause of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have heen withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the samnling estimate.
${ }_{3}{ }^{\text {Datata }}$ for Alaska and Hawaii are not included.
March 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establish. ment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VAJUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Earthenware Food Utensils Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Earthenware Food Utensils Industry amounted to $\$ 59$ million. Of this total, $\$ 5$ million were products primary to other industries; and $\$ 2$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 58$ million of earthenware food utensils were shipped by all producers of these products. Of this total, $\$ 53$ million, or 91 percent, were shipped by plants classified in Industry 3263, Earthenware Food Utensils while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 91.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primery products of the industry produced or shipped by all producers, including those in other industries and are shown ir table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBITCATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTUR=S 

## INDUSTRY SERIES

## Porcelain electrical supplies

SIC Code 3264

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Porcelain Electrical Supplies Industry shipped products valued at \$131 million, an increase of 35 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 11 percent from 1958 to a total of 10.1 thousand employees in 1963; approximately the same as the 1962 average employment. Value added by manufacture amounted to $\$ 90$
million in 1963; an increase of 36 percent from 1958 and 7 percent from 1962.

The Porcelain Electrical Supplies Industry includes establishments engaged primarily in the manufacture of porcelain electrical insulators, molded porcelain parts for electrical devices, steatite electrical products and other electrical supplies from clay and other ceramic materials. For a detailed list of products of Industry 3264, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in l939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishnents canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishnents. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965
is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Porcelain Electrical Supplies Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Procelain Electrical Supplies Industry amounted to $\$ 131$ million. Of this total, $\$ 13$ million were products primary to other industries; and $\$ 5$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 120$ million of porcelain electrical supplies were shipped by all producers of these products. Of this total, $\$ 113$ million, or 94 percent, were shipped by plants classified in Industry 3264, Porcelain Electrical Supplies, while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was 93.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the
coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## Pottery products, n.e.c.

SIC Code 3269

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Pottery Products, N.E.C., Industry shipped products valued at $\$ 95$ million, an increase of 20 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry was 9 thousand in 1963; approximately the same as 1958. Value added by manufacture amounted to $\$ 62$ million in 1963, an increase of 15 percent over 1958.

The Pottery Products, N.E.C., Industry includes establishments engaged primarily in firing and decorating white china and earthenware for the trade and manufacturing art and ornamental pottery, industrial and laboratory pottery, stoneware and coarse earthenware table and kitchen articles, unglazed red earthenware florists' articles, and other pottery products,n.e.c. For a detailed list of products of Industry 3269, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

[^19]is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABILSHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954,1958 and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Pottery Products, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Pottery Products, N.E.C., Industry amounted to $\$ 95$ million. Of this total, $\$ 10$ million were products primary to other industries; and $\$ 12$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 88 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 82$ million of Pottery Products, N.E.C., were shipped by all producers of these products. Of this total, $\$ 73$ million, or 89 percent, were shipped by plants classified in Industry 3269, Pottery Products, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was 91.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## preliminary report

# Concrete block and brick 

SIC Code 3271

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Concrete Block and Brick Industry shipped products valued at $\$ 504$ million, an increase of 21 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent over 1958 to a total of 23.7 thousand enployees in 1963. Value added by manufacture amounted to $\$ 245$ million in 1963, an increase of 29 percent over 1958.

The Concrete Block and Brick Industry includes establishments engaged primarily in the manufacture
of concrete building blocks and brick from a combination of cement and aggregate. Contractors engaged in concrete construction work are classified in the construction industries and building materials dealers primarily engaged in mixing and delivering ready-mixed concrete in Industry 3273. For a detailed list of products of Industry 3271, refer to table 3A.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included.

[^20]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 mariufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Concrete Block and Brick Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Concrete Block and Brick Industry amounted to $\$ 504$ million. Of this total,
\$45 million were products primary to other industries; and $\$ 75$ million were receipts for miscelLaneous activities. The industry shipments of primary products represent 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 461$ million of concrete block and brick were shipped by all producers of these products. Of this total, $\$ 385$ million, or 83 percent, were shipped by plants classified in Industry 3277, Concrete Block and Brick, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 83.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing
industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -GENERAL STATISTICS FOR THE CONCRETE BLOCK AND BRICK INDUSTRY, BY GEOGRAPHIC APEAS: 1963 AND 1958

# 1963 CENSUS OF MANUFAGTURES 

## Other concrete products

SIC Code 3272

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Other Concrete Products Industry shipped products valued at $\$ 928$ million, an increase of 29 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 13 percent over 1958 and 6 percent over 1962 to a total of 52 thousand employees in 1963. Value added by manufacture amounted to $\$ 542$ million in 1963, an increase of 39 percent over 1958 and 9 percent over 1962.

The Other Concrete Products Industry includes establishments engaged primarily in the manufacture of concrete products, except block and brick, from a combination of cement and aggregate. Contractors engaged in concrete construction work are classified in the construction industries, and building materials dealers primarily engaged in mixing and delivering ready-mixed concrete in Industry 3273. For a detailed list of products of Industry 3272, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

Table 1.-GENERAL STATISTICS FOR THE OTHER CONCRETE PRODUCTS INDUSTRY IN THE UNITED STATES FOR SEIECIED YEARS
(SIC code 3272)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capitel <br> expend- <br> itures, new ${ }^{1}$ $(\$ 1,000)$ | Standard error of estimate (percent) for number of employees column ${ }^{2}$ |

[^21]edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of menufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Other Concrete Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Other Concrete Products Industry amounted to $\$ 928$ million. Of this total, $\$ 57$ million were products primary to other industries; and $\$ 69$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 93 percent of the total
manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 862$ million of other concrete products, were shipped by all producers of these products. Of this total, $\$ 801$ million, or 93 percent, were shipped by plants classified in Industry 3272, Other Concrete Products, while the remainder was shipped by plants classified in other industries. The comparable ratio for 1958 was 94 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(NA) Not available. (X) Not applicable. ${ }^{\text {r Revised. }}$
Separate data for prestressed pipe were not collected in 1958, therefore, detailed data shown for codes $3272113-3272198$ are not directly comparable between 1958 and 1963.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Ready-mixed concrete

SIC Code 3273

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Ready-Mixed Concrete Industry shipped products valued at $\$ 2,291$ million, an increase of 36 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 15 percent over 1958 to a total of 71 thousand employees in 1963. Value added by manufacture amounted to $\$ 979$ million in 1963, an increase of 44 percent over 1958.

The Ready-Mixed Concrete Industry includes establishments engaged primarily in the manufacture
of Portland cement concrete manufactured and delivered to a purchaser in a plastic and unhardened state. This industry includes production of central mixed concrete, shrink mixed concrete and transit mixed concrete.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years.

[^22]May 1965

## ESTABLISHMENTS

The census of manufactures is conducted $b_{i}$ obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments incıuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipment reported by establishments classified in the Ready-Mixed Concrete Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Ready-Mixed Concrete Industry amounted to $\$ 2,291$ million. Of this total, $\$ 66$ million were products primary to other industries; and $\$ 197$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry)should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 2,076$ million of ready-mixed concrete were shipped by all producers of these products. Of this total, $\$ 2,028$ million, or 98 percent, were shipped by plants classified in Industry 3273, Ready-Mixed Concrete, while the remainder was shipped by plants classified in other industries. The comparable 1958 ratio was 97 percent.

## GENERAL STATISTICS

нue general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th. census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFAGTURFS 

## INDUSTRY SERIES

Lime<br>SIC Code 3274

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Lime Industry shipped products valued at $\$ 167$ million, an increase of 27 percent over 1958, according to preliminary results obtained from the 1963 census. The 1963 average employment in this industry of 7 thousand employees was approximately the same as 1958. Value added by manufacture amounted to $\$ 97$ million in 1963, an increase of 31 percent over 1958 but approximately the same as 1962.

The Lime Industry includes establishments engaged primarily in the manufacture of quicklime, hydrated lime, and dead-burned dolomite produced from limestone, dolomite, shell and other substances. For a detailed list of products of Industry 3274, refer to table 3A.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

 able by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass or all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard errors exceeding lis percent. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaij are not included.
April 1965
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPIOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added'. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Lime Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Lime Industry amounted to $\$ 167$ million. Of this total, $\$ 29$ million were products primary to other industries; and $\$ 8$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 82 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 138$ million of lime was shipped by all producers of lime products. Of this total, $\$ 130$ million, or 94 percent, were shipped by plants classified in Industry 3274, Lime, while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was 95.

In its annual report Minerals Yearbook, the U.S. Department of the Interior, Bureau of Mines publishes detailed figures on the products listed in table 3A of this report. The variations between Bureau of Mines summary totals and the data appearing in this report are due to (1) inclusion of cost of containers and interplant transfers in Census Bureau figures and (2) differences in the reports submitted to the two agencies by individual companies.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (Table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Gypsum products

SIC Code 3275

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Gypsum Products Industry shipped products valued at $\$ 427$ million, an increase of 17 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 9 percent from both 1958 and 1962 to a total of 11.5 thousand employees in 1963. Value added by manufacture amounted to $\$ 261$ million in 1963, an increase of 18 percent over 1958 and 8 percent over 1962.

The Gypsum Products Industry includes establishments engaged primarily in the manufacture of plaster, plasterboard and other products composed wholly or chiefly of plaster. For a detailed list of products of Industry 3275, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under constr
Includes expenditures for plants umder construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.

The data are estimates derived from a representative sample of manufacturing establishnents canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Gypsum Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Gypsum Products Industry amounted to $\$ 427$ million. Of this total, \$16 million were products primary to other industries; and $\$ 17$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e. the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3,indicates that $\$ 403$ million of gypsum products were shipped by all producers of these products. Of this total, $\$ 394$ million, or 98 percent, were shipped by plants classified in Industry 3275, Gypsum Products while the remainder was shipped by plants classified in other industries. The comparable ratio for 1958 was also 98.

The U.S. Department of the Interior, Bureau of Mines, in its annual Minerals Yearbook publishes more detailed data on the production, shipment and consumption of gypsum and gypsum products. The variation between the two sets of data is due primarily to (1) inclusion of cost of containers and interplant transfers in Census Bureau Figures and (2) differences in the reports from individual companies submitted to the two agencies.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports
will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Cut stone and stone products <br> SIC Code 3281

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Cut Stone and Stone Products Industry shipped products valued at $\$ 218$ million, an increase of 6 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 10 percent from 1958 to a total of 18 thousand employees in 1963. Value added by manufacture amounted to $\$ 132$ million in 1963, an increase of 2 percent over 1958.

The Cut Stone and Stone Products Industry includes establishments engaged primarily incutting, shaping and finishing marble, granite, limestone, slate and other stone for building and miscellaneous uses. Establishments primarily engaged in buying or selling partly finished monuments and tombstones, but performing no work on the stones other than lettering, finishing, or shaping to custom order, are classified in trade industries. For a detailed list of products of Industry 3281, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

August $19{ }^{\prime \prime} 5$
is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. The figures for production workers, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Cut Stone and Stone Products Industry consists not only of products described
above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Cut Stone and Stone Products Industry amounted to $\$ 218$ million. Of this total, \$14 million were products primary to other industries; and $\$ 15$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 191$ million of cut stone and stone products were shipped by all producers of these products. Of this total, $\$ 189$ million, or 99 percent, were shipped by plants classified in Industry 3281, Cut Stone and Stone Products, while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was 97.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the.Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to
cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURFS 

## INDUSTRY SERIES

## Abrasive products

SIC Code 3291

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Abrasive Products Industry shipped products valued at \$701 million, an increase of 43 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 18 percent over 1958 to a total of 28 thousand employees in 1963; approximately the same as the 1962 average employment. Value added by manufacture amounted to $\$ 414$ million in 1963, an increase of 49 percent over 1958 and 4 percent over 1962.

The Abrasive Products Industry includes establishments engaged primarily in the manufacture of abrasive grinding wheels of natural or synthetic materials, and other abrasive products. The cutting of grindstones, pulpstones, and whetstones at the quarry is classifiedin mining industries. For adetailed list of products of Industry 3291, refer to table 3, product codes 3291117 to 3291498.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differeaces that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
Jemuary 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHIENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as mate-
rials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Abrasive Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Abrasive Products Industry amounted to $\$ 701$ million. Of this total, $\$ 121$ million were products primary to other industries; and $\$ 41$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 81 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, apnearing in table 3, indicates that $\$ 567$ million of abrasive products were shipped by all producers of these products. Of this total, $\$ 537$ million, or 95 percent, were shipped by plants classified in Industry 3291, Abrasive Products, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1.958 was 96.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the
coming months. Series of preliminary sumnary reports showing U.S. Totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establisnments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

SIC Code 3292

## INDUSTRY SERIES

## Asbestos products

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Asbestos Products Industry shipped products valued at \$509 million, an increase of 12 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 8 percent from 1958 and 11 percent from 1962 to a total of 19.5 thousand employees in 1963. Value added by manufacture amounted to $\$ 269$ million in 1963, an increase of 14 percent over 1958 and approximately the same as 1962.
edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the' payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by, other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Asbestos Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Asbestos Products Industry amounted to $\$ 509$ million. Of this total, \$20 million were products primary to other industries; and $\$ 26$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 89 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 506$ million of asbestos products were shipped by all producers of these products. Of this total, $\$ 463$ million, or 91 percent, were shipped by plants classified in Industry 3292, Asbestos Products while the remainder was shipped by plants classified in other industries. The comparable ratio for 1958 was also 91.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also
their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Gaskets and insulations

SIC Code 3293

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Gaskets and Insulations Industry shipped products valued at $\$ 278$ million, an increase of 47 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 23 percent over 1958 to a total of 17 thousand employees in 1963. Value added by manufacture amounted to $\$ 160$ million in 1963, an increase of 52 percent over 1958.

The Gaskets and Insulations Industry includes establishments engaged primarily inthe manufacture of gaskets (all types), packing for steam, water and other pipe joints, and for engines, air compressors, etc.; and asbestos insulating materials. Establishments primarily engaged in manufacturing leather packing are classified in Industry 3221, rubber packing in Industry 3069 and metal packing in Industry 3599. Establishments primarily engaged in manufacturing mineral wool and insulation products therefrom are classified in Industry 3296. For a detailed list of products of Industry 3293, refer to table 3.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.
${ }^{2}$ In addition to the data show, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the $1959-1962$ data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
Nay 1965
establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Gaskets and Insulations Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Gaskets and Insulations Industry amounted to $\$ 278$ million. Of this total, $\$ 47$ million were products primary to other industries; and $\$ 25$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 81 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 258$ million of gaskets and asbestos insulations and packings were shipped by all producers of these products. Of this total, $\$ 206$ million, or 80 percent, were shipped by plants classified in Industry 3293, Gaskets and Insulations, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 69.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., ?.0233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## Mineral wool

SIC Code 3296

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industr! Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Mineral Wool Industry shipped products valued at $\$ 391$ million, an increase of 55 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 20 percent over 1958 to a total of 15 thousand employees in 1963; approximately the same as 1962. Value added by manufacture amounted tc $\$ 207$ million in 1963, an increase of 51 percent over 1958 but a decrease of 3 percent from 1962.

The Mineral Wool Industry includes establishments engaged primarily in the manufacture of mineral wool and mineral wool insulation products made of rock, slag, or glass, or combinations thereof. Establishments primarily engaged in manufacturing asbestos insulation products are classified in Industries 3292 and 3293; textile type glass fibers in Industry 3229 and exfoliated vermiculite products in Industry 3295. For a detailed list of products of Industry 3296, refer to table 3A, product codes 3296111 to 3296298.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

Table 1. - GENERAL STATISTICS FOR THE MINERAL WOOL INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value <br> added by manufacture $(\$ 1,0 \infty)$ | Cost of materials$(\$ 1, \infty)$ | Value of ahipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, new ${ }^{1}$ <br> ( $\$ 1, \infty 00$ ) | Standard error of estimate (percent) for number of employees columm ${ }^{2}$ |

| $1958{ }^{3}$ [... | 135 | 69 | 12,294 | 61,058 | 9,267 | 19,229 | 43,734 | 137,577 | 114,167 | 251,681 | 10,488 | (X) |

[^25]${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{\text {Erstablishments primarily engaged in producing exfoliated vermiculite were classified in Industry 3296, Mineral Wool and are included in the fig- }}$ ures for the years 1958-1962. For 1963, the classification of these plants was changed to Industry 3295, Minerals and Earths, Ground or Otherwise ures for the years $1958-1962$. for 1963 , the classirication of these plants was changed to Indus
${ }_{4}$ A reviaion in the definition of this industry was introduced in the 1957 Standard Industrial classification so that data for the industry prior to 1958 are not directiy comparable. Details of this revision are described in the 1958 Census of Manufactures Volume II, Industry Statistics.
March 1965
is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. The figures for production workers are based on employment ror the payroll period ended nearest the 15 th of March, May, August, and November.

## LALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Mineral Wool Industry consists not only of products described above as primary to
the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Mineral Wool Industry amounted to $\$ 391$ million. Of this total, $\$ 38$ million were products primary to other industries; and $\$ 13$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value o primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 354$ million of mineral wool were shipped by all producers of these products. Of this total, $\$ 340$ million, or 96 percent, were shipped by plants classified in Industry 3296, Mineral Wool, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 95.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc..). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports
will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary surmary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Comerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.-GENERAL STATISTICS FOR THE MINERAL WOOL INDUSTRY BY GEOCRAPHIC AREAS: 1963 AND 1958

WASHINGTON, D.C. 20233

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Nonclay refractories

SIC Code 3297

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Nonclay Refractories Industry shipped products valued at $\$ 247$ million, an increase of 39 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 6 percent over 1958 to a total of 8 thousand employees in 1963. Value added by manufacture amounted to $\$ 127$ million in 1963, an increase of 24 percent over 1958.

The Nonclay Refractories Industry includes establishments engaged primarily in the manufacture of refractories and crucibles made of materials other than clay. This industry also includes establishments primarily engaged in manufacturing all graphite refractories, whether of carbon bond or ceramic bond. Establishments primarily engaged in manufacturing clay refractories are classified in Industry 3255. For a detailed list of products of Industry 3297, refer to table 3A, product codes 3297012 to 3297098.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments

[^26]January 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing es.tablishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of.compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthiy figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Nonclay Refractories Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Nonclay Refractories Industry amounted to $\$ 247$ million. Of this total, $\$ 6$ million were products primary to other industries; and $\$ 8$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 252$ million of nonclay refractories were shipped by all producers of these products. Of this total, $\$ 232$ million, or 92 percent, were shipped by plants classified in Industry 3297, Nonclay Refractories, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 89.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment
as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## ${ }^{r}$ Revised. (X) Not applicable.

Molten cast brick and shapes are included with "Forsterite, pyrophilite, molten cast and other nonclay brick and shapes.
Molten cast refractories are made by fusing refractory oxides as in an electric furnace and pouring the molten material into molds to form finished shapes.
${ }^{3}$ Fused as applied to bauxite and alumina means complete melting, as in an electric furnace; after cooling, the product is crushed and graded for use in the refractory. Dense-sintered alumina refers to heat treatment (short of melting) to render it relatively volume-stable for use in a refractory.
${ }^{4}$ Represents shipments for direct use as finished refractory products by establishments classified in "manufacturing" industries, and excludes shipments to refractory producers for processing in the manufacture of brick and other refractories.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Blast furnaces and steel mills 

SIC Code 3312

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Blast Furnaces and Steel Mills Industry shipped products valued at $\$ 16,338$ million, an increase of 18 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 2 percent from 1958 and no significant change from 1962 to a total of 501 thousand employees in 1963. Value added by manufacture amounted to $\$ 7,425$ million in 1963, an increase of 18 percent from 1958 and 11 percent from 1962.

The Blast Furnaces and Steel Mills Industry includes establishments engaged primarily in the manufacture of hot metal, pig iron, silvery pig iron, and ferroalloys from iron ore and iron and steel scrap; converting pig iron, scrap iron and scrap steel into steel; and in hot rolling iron and steel into basic shapes such as plates sheets, strips, rods, bars, and tubing. Merchant blast furnaces and byproduct or beehive coke ovens are also included in this industry.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

[^27](SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel; purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENIS

Data on cost of materials and value of shipments of the Blast Furnaces and Steel Mills Industry include extensive duplication resulting from the transfer of products such as coke to establishments producing pig iron; the transfer of pig iron from nonintegrated blast furnaces to steel works; and the fact that considerable quantities of steel ingots, semifinished shapes and finished shapes and forms are transferred from one steel mill to another for further processing. The value of such shipments are duplicated in the total value of shipments. A corresponding duplication enters into the total cost of materials. The data shown for value added by manufacture (value of shipments less cost of materials, etc.) avoid this duplication.

In view of the duplication in value of shipments, the exact "primary product specialization ratio" and the exact "coverage ratio" for this industry have not been computed.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry wil? appear in the final census reports. These report ${ }_{\text {i }}$ will also include a comprehensive discussion ou such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral lndustries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3-digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral lndustries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral lndustries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

Manufactures
Volume 1, Summary Statistics
Volume 11, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume 1ll, Area Statistics

## Mineral lndustries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Electrometallurgical products

SIC Code 3313

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963,manufacturers in the Electrometallurgical Products Industry had total shipments valued at $\$ 399$ million, approximately equal to 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 17 percent from 1958 and 4 percent from 1962 to a total of 10.5 thousand employees in 1963. Value added by manufacture amounted to $\$ 148$ million in 1963, a decrease of 17 percent from 1958 and 8 percent from 1962.

The Electrometallurgical Products Industry includes establishments engaged primarily in the manufacture of ferro and nonferrous additive alloys by electrometallurgical processes, including high percentage ferroalloys and high percentage nonferrous additive alloys.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent

(SIC code 3313)

(NA) Not available. (X) Not applicable.
${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 194 ? and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

Data for Alaska and Hawaii are not included.
May 1965
years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Electrometallurgical Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Electrometallurgical Products Industry amounted to $\$ 399$ million. Of this total, $\$ 58$ million were products primary to other industries; and $\$ 21$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 423$ million of electrometallurgical products were shipped by all producers of these products. Of this total, $\$ 321$ million, or 76 percent, were shipped by plants classified in Industry 3313, Electrometallurgical Products, while the remainder was shipped by plants classified in other industries. The 1958 ratio was also 76 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables I and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROTND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Steel wire drawing, etc.

## SIC Code 3315

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Steel Wire Drawing Industry had total shipments valued at $\$ 582$ million, an increase of 29 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 11 percent from 1958 and 8 percent from 1962 to a total of 21 thousand employees in 1963. Value added by manufacture amounted to $\$ 249$ million in 1963, an increase of 27 percent from 1958 and 11 percent from 1962.

The Steel Wire Drawing Industry includes establishments engaged primarily in drawing wire from purchased iron or steel rods, bars, or wire and which may be engaged in the further manufacture of products made from wire; and those primarily engaged in manufacturing steel nails and spikes from purchased material.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent

(NA) Not available.
(x) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishnents. The percentage standard errors in this colurm indicate the range of differences that can be expected between the estimates and canplete canvass totals because of sampling fluctuations. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification so that comparable data for prior years are not available.
June 1965
years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Steel Wire Drawing Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Steel Wire Drawing Industry amounted to $\$ 582$ million. Of this total, $\$ 33$ million were products primary to other industries; and $\$ 26$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 94 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 88 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,657$ million of steel wire and fabricated ferrous wire products were shippedby all producers of these products. Of this total, $\$ 522$ million, or 32 percent, were shipped by plants classified in Industry 3315, Steel Wire Drawing, while the remainder was shipped by plants classified in other industries, mainly Industries 3312 and 3481. The comparable percentage for 1958 was 26.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as. a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)
${ }^{1}$ Less than $\$ 500$ thousand.

Table 3. -QUANIITY AND VALUE OF STEEL WIRE DRAWING SHTPPED BY AL工 PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishonents classified in the Steel Wire Drawing Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

(NA) Not available. (X) Not applicable.
i Excludes shipments of steel processed on a conversion basis from nonsteel producing companies. Detailed data by shape and grade and net shipments figures appear in Current Industrial Reports, Series M33B "Steel Mill Products" for 1963.
${ }^{2}$ Data reported in the census of manufactures differ from comparable figures reported in armual survey MA-33B chiefly due to companies not included in the annual survey. In addition there were minor differences between figures for a few companies reporting in the two surveys.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Cold finishing of steel shapes

## preliminary report

SIC Code 3316

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturersin the Cold Finishing of Steel Shapes Industry shipped products valued at $\$ 751$ million, an increase of 57 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 25 percent from 1958 and 14 percent from 1962 to a total of 14 thousand employees in 1963. Value added by manufacture amounted to $\$ 223$ million in 1963, an
increase of 58 percent from 1958 and 15 percent from 1962.

The Cold Finishing of Steel Shapes Industry includes establishments engaged primarily in (l) cold rolling steel sheets and strip from purchased hot rolled sheets; (2) cold drawing steel bars and steel shapes from purchased hot rolled steel bars; and (3) producing other cold finished steel. Establishments primarily engaged in the production of steel, including hot rolled steel sheets, and further cold rolling such sheets are included in Industry 3312, Blast Furnaces and Steel Mills.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not availby 4 digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishnents canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishnents. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding in percent. See the anaual survey of manuractures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 1.5 th of March, May, August, and November. Figures for production workers are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Cold Finishing of Steel

Shapes Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Cold Finishing of Steel Shapes Industry amounted to $\$ 751$ million. Of this total, $\$ 69$ million were products primary to other industries; and \$36 million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 3,338$ million of cold finished steel shapes were shipped by all producers of these products. Of this total, $\$ 647$ million, or 19 percent, were shipped by plants classified in Industry 3316, Cold Finishing of Steel Shapes while the remainder was shipped by plants classified in other industries, mainly Industry 3312. The comparable percentage in 1958 was 18 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Steel pipe and tube

SIC Code 3317

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Steel Pipe and Tube Industry shipped products valued at $\$ 771$ million, a decrease of 1 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 9 percent from 1958 to a total of 22 thousand employees in 1963. Value added by manufacture amounted to $\$ 274$ million in 1963, a decrease of 3 percent from 1958.

The Steel Pipe and Tube Industry includes establishments engaged primarily in the manufacture of weldedor seamless steel pipe and tube and heavy riveted steel pipe from purchased materials. Establishments primarily engaged in the manufacture of steel skelp, steel blanks, tube rounds, or pierced billets are classified in Industry 3312. Establishments producing welded or seamless steel pipe and tube and heavy-riveted steel pipe from material produced in the same establishment are also classified in Industry 3312.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 fram a representative sample of manufacturing establishments canvassed in the annual survey of manuractures. These estinates, consequentiy, may differ from the results that would be obtained from a complete canvass of all manuracturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: for 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958 and 1963 value added by manufacture represents adjusted value added; tor earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Steel Pipe and Tube Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries) and miscellaneous receiptsfor contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Steel Pipe and Tube Industry amounted to $\$ 771$ million. Of this total, $\$ 71$ million were products primary to other industries; and $\$ 28$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,868$ million of steel pipe and tube were shipped by all producers of these products. Of this total, $\$ 672$ million, or 36 percent, were shipped by plants classified in Industry 3317, Steel Pipe and Tube while the remainder was shipped by plants classified in other industries, mainly Industry 3312. The comparable percentage for 1958 was 40 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of. preliminary summary reports showing U.S. totals $\overline{\text { IN }}$ or each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^30]
# 1963 CENSUS OF MANUFACTURES 

# Gray iron foundries 

SIC Code 3321

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in Gray Iron Foundries had total shipments valued at \$1,977 million, an increase of 38 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 7 percent from 1958 and 1 percent from 1962 to a total of 120 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,162$ million in 1963, an increase of 43 percent from 1958 and 8 percent from 1962.

The Gray Iron Foundries include establishments engaged primarily in the manufacture of gray iron castings, including cast iron pressure and soil pipe and fittings.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^31]April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figues for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified as Gray Iron Foundries consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified as Gray Iron Foundries amounted to $\$ 1,977$ million. Of this total, $\$ 151$ million were products primary to other industries; and $\$ 56$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary productsof the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 2,017$ million of gray iron castings were shipped by all producers of these products. Of this total, \$1,770 million, or 88 percent, were shipped by plants classified in Industry 3321, Gray Iron Foundries, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 87.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(D) Withheld to avoid disclosing figures for individual companies.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor econoric importance in the State. (Additional publishable detail will appear in the final census report on this industry.)

| - Represents zero. <br> (NA) Not available. <br> (x) Not applicable. <br> ${ }^{1}$ Differs from the figures published in Current Industrial Reports Series M33-1, "Iron and Steel Castings," in that no figures are included above for castings produced by captition departments of plants classified in other industries. As shown in the Current Industrial Reports, captive production ("for own use"), including both interplant transfers and cas and consumed by the same plant for 1963, totaled 5,674 thousand tons. Of this total, only 2,497 thousand tons of transfers to other plants of the same company are included above between tonnages shown above for "shipments to other companies" and the "for sale" figures in Series M33-1 are due to differences in classification in the census and monthly surve such products as machinery parts, etc., and fiscal year reports in the Census. <br> ${ }^{2}$ Figures for transfers to other plants of the same company are included with "shipments to other companies" to avoid disclosing operations of individual companies. |  |  |  |  |  |  |  |  |  |  |  |  |  |

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Malleable iron foundries

# preliminary report 

SIC Code 3322

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Malleable Iron Foundries Industry had total shipments valued at $\$ 321$ million, an increase of 50 percent over 1958, according to preliminary results obtained from the 1963 census and an increase of 5 percent from 1962. Average employment in this industry showed an increase of 12 percent from 1958 to a total of 23 thousand employees in 1963. Value added by manufacture amounted to $\$ 205$ million in 1963, an increase of 61 percent from 1958 and 5 percent from 1962.

The Malleable Iron Foundries Industry includes establishments engaged primarily in the manufacture of malleable iron castings.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and şubsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

Data for Alaska and Hawaii are not included.
June 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuies for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthiy figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly ${ }^{\circ}$ figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Malleable Iron Foundries Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Malleable Iron Foundries Industry amounted to $\$ 321$ million. Of this total, $\$ 53$ million were products primary to other industries; and $\$ 3$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 83 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 312$ million of malleable iron castings were shipped by all producers of these products. Of this total, $\$ 265$ million, or 85 percent, were shipped by plants classified in Industry 3322, Malleable Iron Foundries, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 90 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.
PUBLICATION PROGRAM AND BACKGROUND
More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5
years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

${ }^{-}$Differs from the figures published in Current Industrial Reports Series M33-1 "Iron and Steel Castings" in that no figures are included above for castings produced by captive foundry departments of plants classified in other industries. As shown in the Current Industrial Reports, captive production ("for own use"), including both interplant transfers and castings produced and consumed by the same plant for 1963 , totaled 410 thousand tons. Of this total only 340 thousand tons of transfers to other plants of the same company are included above.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## preliminary report

## Steel foundries

SIC Code 3323

## MC63(P)-33B-3

establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments incluced in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. Production workers are based on employment for the payroll period ended nearest the 15 th of March,May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Steel Foundries Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Steel Foundries Industry amounted to $\$ 861$ million. Of this total, $\$ 118$ million were products primary to other industries; and \$15 million were receipts for miscellaneous activities. The industry shipments of primary products represented 86 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly
distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 822$ million of steel castings were shipped by all producers of these products. Of this total, $\$ 727$ million, or 89 percent, were shipped by plants classified in Industry 3323, Steel Foundries while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 86 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For l963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Primary copper

SIC Code 3331
preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Primary Copper Industry had total shipments valued at $\$ 1,245$ million, an increase of 51 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 3 percent from 1958 and a decrease of 2 percent from 1962 to a total of 15 thousand employees in 1963. Value added by manufacture amounted to $\$ 280$ million in 1963, an increase of 77 percent from 1958 and 14 percent from 1962.

The Primary Copper Industry includes establishments engaged primarily in smelting copper from the ore, and in refining copper by electrolytic or other processes. Establishments primarily engaged in rolling, drawing, or extruding copper are classified in Industry 3351.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--CENERAL STATISTICS FOR THE PRIMARY COPPER INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3331)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture (\$1,000) | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend itures, new ${ }^{1}$ <br> ( $\$ 1,000$ ) | Standard error of estimate (percent) for number of employees columan ${ }^{2}$ |

| 19474... | 27 | 26 | 14,629 | 44,790 | 13,065 | 29,751 | 38,967 | 93,196 | (NA) | (NA) | 4,176 | (X) |

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ The value of shipments and cost of materials for this industry include extensive duplication arising from shipments between establishments in the same industry classification. For further explanation see text "Value of shipments".
${ }^{4}$ Data for Alaska and Hawaii are not included.
May 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payfoll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

Data on cost of materials and value of shipments of the Primary Copper Industry include extensive duplication resulting from the transfer of products such as anode and blister copper to establishments producing refined copper. The value of such shipments are duplicated in the total value of shipments. A corresponding duplication enters into the total cost of materials. The data shown for value added by manufacture (value of shipments less cost of materials, etc.) avoid this duplication.

In view of the duplication in value of shipments, the exact "primary product specialization ratio" and the exact "coverage ratio" for this industry have not been computed.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Primary lead

SIC Code 3332

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Primary Lead Industry shipped products valued at $\$ 265$ million, a decrease of 16 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 28 percent from 1958, but an increase of 3 percent from 1962 to a total of 26 hundred employees in 1963. Value added by manufacture amounted to $\$ 25$ million in 1963, a decrease of 32 percent from 1958 and 22 percent from 1962.

The Primary Lead Industry includes establishments engaged primarily in smelting lead from the ore, and in refining lead by any process. Establishments primarily engaged in rolling, drawing, or extruding lead are classified in Industry 3356.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants umder constiructiom but not in operation. This information was not collected in 1939 and 1947 and is not available wy 4-digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard errors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ The value of shipments and cost of materials for this industry include extensive duplication arising from shipments between establishments in the same industry classification. For further explanation see text "Value of Shipments."

April 1965

## ESTABLISHMENI'S'

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 vaIue added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net. change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VAIUE OF SHTPMENTS

Data on cost of materials and value of shipments of the Primary Lead Industry include extensive duplication resulting from the transfer of products such as lead-base bullion to establishments producing refined lead. The value of such shipments are duplicated in the total value of shipments. A corresponding duplication enters into the total cost of materials. The data shown for value added by manufacture (value of shipments less cost of materials, etc.) avoid this duplication.

In view of the duplication in value of shipments, the exact "primary product specialization ratio" and the exact "coverage ratio" for this industry have not been computed.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment is a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of

Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next
census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^34]U.S. DEPARTMENT OF COMMERCE

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Primary zinc

SIC Code 3333

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Primary Zinc Industry had total shipments valued at $\$ 282$ million, an increase of 35 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 10 percent from 1958 and 5 percent from 1962 to a total of 8.1 thousand employees in 1963. Value added by manufacture amounted to $\$ 99$ million in 1963, an increase of 8 percent from 1958 and 29 percent from 1962.

The Primary Zinc Industry includes establishments engaged primarily in smelting zinc from the ore, and in refining zinc by any process. Establishments primarily engaged in rolling, drawing, or extruding zinc are classified in Industry 3356.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals peccuse of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
Way $=965$

## ESTABLISHEENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Primary Zinc Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Primary Zinc Industry amounted to $\$ 282$ million. Of this total, $\$ 26$ million were products primary to other industries; and $\$ 10$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry)should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 307$ million of smelted and refined zinc were shipped by all producers of these products. Of this total, $\$ 246$ million, or 80 percent, were shipped by plants classified in Industry 3333, Primary Zinc, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 76 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(D) Withheld to avoid disclosing figures for individual companies. (X) Not applicable. - Represents zero.
${ }^{\text {D Data }}$ for toll shipments and quantities produced and consumed in the same plant are excluded but will be included in the final report for this industry.
${ }^{2}$ Includes toll production.
${ }^{3}$ Includes shipments of these products produced on a toll basis by others.
${ }^{4}$ Includes shipments to other smelters and refineries, shipments to consumers, and to some nonmanufacturing companies which sell directly to consumers.
${ }^{5}$ Consists of 210,939 short tons valued at $\$ 13,448$ thousand shipped to other companies and 214,625 short tons valued at $\$ 12,374$ thousand shipped as transfers to other plants of the same company.

1963 total shipments consists of 836,588 short tons valued at $\$ 295,432$ thousand shipped to other companies and 27,983 short tons valued at $\$ 6,572$ thousand shipped as transfers to other plants of the same company. Comparable figures in 1958 were: 752,670 short tons valued at
$\$ 153,639$ thousand shipped to other companies and 23,997 short tons valued at $\$ 5,074$ thousand shipped as transfers to other plants of the same company.
${ }^{7}$ Represents shipments to other companies. None were shipped as transfers to other plants of the same company.
${ }^{8}$ Consists of 129,715 short tons valued at $\$ 40,742$ thousand shipped to other companies and 632 short tons valued at $\$ 166$ thousand shipped as transfers to other plants of the same company.

# 1963 CENSUS OF MANUFACTURES 

## Primary aluminum

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Primary Aluminum Industry shipped products valued at $\$ 1,090$ million, an increase of 35 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 and 5 percent from 1962 to a total of 18 thousand employees in 1963. Value added by manufacture amounted to $\$ 499$ million in 1963, an increase of 30 percent from 1958 and 6 percent from 1962.

The Primary Aluminum Industry includes establishments engaged primarily in producing aluminum from alumina, and in refining aluminum by any process. Establishments primarily engaged in rolling, drawing, or extruding aluminum are classified in Industry 3352.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate
${ }^{3}$ Data for Alaska and Hawaii are not included.
May 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were, required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March.' May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel; purchased electric energy and contract. work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENIS

The value of shipments reported by establishments classified in the Primary Aluminum Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Primary Aluminum Industry amounted to $\$ 1,090$ million. Of this total, $\$ 1$ million were products primary to other industries; and $\$ 17$ million were receipts for miscellaneous activities. The industry shipments of primary products represent almost 100 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 100 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that $\$ 1^{\circ}, 422$ million of aluminum ingot and billet were shipped by all producers of these products. Of this total, $\$ 1,073$ million, or 75 percent, were shipped by plants classified in Industry 3334, Primary Aluminum, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 76.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was witheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)
(D) Withheld to avoid disclosing figures for individual companies.

Table 3. -QUANTITY AND VALUE OF ALUMINUM INGOT AND EXTRUSION BILLET SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Primary Aluminum Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

[^35]${ }^{2}$ Includes shipments of these products produced on a toll basis by others.
${ }^{3}$ Most of the aluminum ingot and billet (alloys) produced by aluminum rolling mills represent duplication of tonnages reported by the primary
aluminum industry in that the metal produced by the rolling mills is made from ingot produced in primary aluminum plants.
${ }^{4}$ Data for toll shipments are excluded but will be included in the final report for this industry.
${ }^{5}$ Excludes ingot and billet produced and consumed in rolling mills.
${ }^{6}$ Includes shipments to other smelters and refiners, shipment to consumers, and to some nonmanufacturing companies which sell direct to consumers.

# 1963 census or MANUFACTURES 

## INDUSTRY SERIES

## Secondary nonferrous metals

SIC Code 3341

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Secondary Nonferrous Metals Industry had total shipments valued at $\$ 1,040$ million, an increase of 44 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 7 percent from 1958 to a total of 15 thousand employees in 1963. Value added by manufacture amounted to $\$ 224$ million in 1963, an increase of 52 percent from 1958.

The Secondary Nonferrous Metals Industry includes establishments engaged primarily in recovering nonferrous metals and alloys from new and used scrap and dross, but which are not engaged in further fabrication. This industry includes establishments engaged in both the recovering and alloying of precious metals. Plants engaged in the recovery of tin through secondary smelting and refining, as well as by chemical processes,are included in this industry. Establishments primarily engaged in assembling, sorting, and breaking up scrap metal, without smelting and refining are classified in trade industries.

This report does not include figures for administrative offices, warehouses, garages, or

Table 1. - gengral statistics for the secondary nonferrous metais industry in the united states for selected years
(SIC code 3341)

[^36]other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISEMENTS

The census of manutactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

I'he method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March,- May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Secondary Nonferrous Metals Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Secondary Nonferrous Metals Industry amounted to $\$ 1,040$ million. Of this total, $\$ 67$ million were products primary to other industries; and $\$ 175$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 3,091$ million of refined nonferrous metals were shipped by all producers of these products. Of this total, $\$ 798$ million, or 26 percent, were shipped by plants classified in Industry 3341, Secondary Nonferrous Metals, while the remainder was shipped by plants classified in other industries.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.-GENERAL STATISTICS FOR THE SECONARY NONFERROUS METALS INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958
(SIC code 3341)

[^37]
# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by moredetailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral lndustries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics
Volume 11, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume 1II, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

# Copper rolling and drawing 

SIC Code 3351

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Copper Rolling and Drawing Industry had total shipment valued at $\$ 1,644$ million, an increase of 36 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 3 percent from 1958 and 6 percent from 1962 to a total of 39 thousand employees in 1963. Value added by manufacture amounted to $\$ 458$ million in 1963 , an increase of 3 percent from 1958 but a decrease of 4 percent from 1962.

The Copper Rolling and Drawing Industry includes establishments engaged primarily in rolling, drawing, and extruding copper, brass, bronze, and other copper base alloy basic shapes, such as plate, sheet, strip, bar, and tubing.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. -GENERAL STATISTICS FOR THE COPPER ROLLING AND DRAWING INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3351)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, <br> new ${ }^{1}$ $(\$ 1, \infty 00)$ | Standard error of estimate (percent) for number of employees colum ${ }^{2}$ |

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and l958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Copper Rolling and Drawing Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Copper Rolling and Drawing Industry amounted to $\$ 1,644$ million. Of this total, $\$ 178$ million were products primary to other industries; and $\$ 92$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 88 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A,indicates that $\$ 1,529$ million of brass mill shapes were shipped by all producers of these products. Of this total, $\$ 1,375$ million, or 90 percent, were shipped by plants classified in Industry 3351, Copper Rolling and Drawing while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was 94.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into
account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 GENSUS OF MANUFACTURZS 

## INDUSTRY SERIES

## Aluminum rolling and drawing

SIC Code 3352

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Aluminum Rolling and Drawing Industry had total shipments valued at $\$ 2,214$ million, an increase of 42 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 18 percent from 1958 to a total of 55 thousand employees in 1963. Value added by manufacture amounted to $\$ 733$ million in 1963, an increase of 36 percent from 1958.

The Aluminum Rolling and Drawing Industry includes establishments engaged primarily in rolling, drawing and extruding aluminum and aluminumbase alloy basic shapes such as plate, sheet, bar, tubing and foil.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^40]June 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuies for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Aluminum Rolling and Drawing Industry consists notonly of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Aluminum Rolling and Drawing Industry amountéd to $\$ 2,214$ million. Of this total, $\$ 297$ million were products primary to other industries; and $\$ 125$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 86 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 3,237$ million of rolled, drawn and extruded aluminum were shipped by all producers of these products. Of this total, $\$ 1,793$ million, or 55 percent, were shipped by plants classified in Industry 3352, Aluminum Rolling and Drawing, while the remainder was shipped by plants classified in other industries, mainly Industries 3334, Primary Aluminum and 3341, Secondary Nonferrous Metals.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.-GENERAL STATISTICS FOR THE ALUMINUM ROTLING AND DRAWING INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

| Geographic area | 1963 |  |  |  |  |  |  |  |  |  |  | 1958 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new$(\$ 1,000)$ | $\begin{gathered} \text { Al1 } \\ \text { employ- } \\ \text { ees, } \\ \text { number } \end{gathered}$ | Value added by manufacture$(\$ 1,000)$ |
|  | Total | With 20 or more employees | Number | $\begin{aligned} & \text { Payroll } \\ & (\$ 1,000) \end{aligned}$ | Number | Man-hours $(1,000)$ | Wages $(\$ 1,000)$ |  |  |  |  |  |  |
| United States, total.......... | 211 | 151 | 55,247 | 383,238 | 43,481 | 92,151 | 282,642 | 732,784 | 1,532,597 | 2,214,273 | 81,680 | 46,879 | 537,086 |

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)
${ }^{1}$ Less than $\$ 500$ thousand.

Table 3.-QUANTITY AND VALUE OF ROIJED, DRAWN AND EXTRUDED ALUMINUM SHIPPED BY ALI PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not oniy by establishments classified in the Aluminum Rolling and Drawing Industry but also by

See footnotes at end of table.

Table 3.-QUANTITY AND VALUE OF ROLLED, DRAWN AND EXTRUTED ALUTHNUM SHIPPED BY ALU PRODUCERS IN THE UNITED STATES: 1963 AND 1958-CONTINUE

- Represents zero. (D) Witheld to avoid disclosing figures for individ
(NA) Not available. (X) Not applicable.
Includes shipments of these products produced on a toll basis by others
In 1963, there were 515,259 short tons of aluminum ingot and 223,469 short tons of aluminum extrusion billet produced and consumed in the same plant. Otherwise, data for receipts, toll shipments and quantities produced and consumed in the same plant are excluded for 1963 but will be included in the final report for this industry. In 1958, data for receipts, and quantities produced and consuned in the sane plant are not available. See footnote 8, for data on toll shipments in 1958.
${ }^{3}$ Data are also shown in Current Industrial Reports Series M33-2, "Alurinum Ingot and Mill Products."
4Data for ACSR. and aluminum cable, bare, are also published monthly in Current Industrial Reports Series M33-2, "Aluminum Ingot and Mill Products" Net quantity of shipments as reported in this series for the year 1963 and 1958 totaled 136,127 short tons and 87,424 short tons, respectively. However, these quantities represent aluminum content only. The 149,100 short tons and 92,608 short tons reported in the Census of Manufactures for 1963 and 1958, respectively, represent gross weight.

Differs from quantity data published in Current Industrial Reports Series M33-2, "Aluminum Ingot and Mill Products," in that no data are included in the plain aluminum foil figures for that quantity of plain foil which is produced and converted in the same establishment. As shown in the Current Industrial Reports, net shipments of aluminum foil totaled 161 thousand short tons in 1963 and 100 thousand short tons in 1958.
${ }^{6}$ Most of the aluminum ingot and billet (alloys) produced by aluminum rolling mills represent duplication of tonnages reported by the primary aluminum indusiry in that the metal produced by the rolling mills is made from ingot produced in primary aluminum plants.
${ }^{7}$ Excludes an unspecified amount of ACSR produced on a toll basis. The tonnage is included in the Current Industrial Reports,
${ }^{8}$ Toll shipments of the products included in product classes $33522,33523,33524,33525$ and 33526 totaled 31,747 short tons in 1958 . Toll shipments data are not available for product class 33521 and product code 3352011.

Quantity figures are shown in terms of metal weight.
${ }^{10}$ Laminated foil made from purchased aluminum foil totaled 8,113 short tons metal content valued at $\$ 17,497$ thousand.
${ }^{13}$ Represents aluminum-base alloys made only by establishments classified in Industry 3352, Aluminum Roiling and Drawing. Comparable shipments for plants classified in Industries 3334, Frimary Aluminum and 3341, Secondary Nonferrous Metals, and other industries are as follows:

|  | Total shipments |  | Other Companies |  | Interplant transfers |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Quantity | Value | Quantity | Value | Quantity | Value |
| Industry 3334. | 508,189 | 260,838 | 156,525 | 82,463 | 351,664 | 178,375 |
| Industry 3341........................... | 311,359 | 140,471 | 302,036 | 135,745 | 9,323 | 4,726 |

## PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES

Results of the 1963 Censuses of Manufactures and Mineral Induseries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral lndustries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics
Volume II, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume III, Area Statistics

## Mineral Industries

Volume I, General Summary and Industry Statistics

Volume II, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 GENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Rolling and drawing, n.e.c.

SIC Code 3356

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Rolling and Drawing, N.E.C., Industry had total shipments valued at $\$ 639$ million, an increase of 31 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 6 percent from 1958 but a decrease of 6 percent from 1962 to a total of 17 thousand employees in 1963. Value added by manufacture amounted to $\$ 246$ million in 1963 , an increase of 41 percent from 1958 and 14 percent from 1962.

The Rolling and Drawing, N.E.C., Industry includes establishments engaged primarily in rolling, drawing, and extruding nonferrous metals other than copper (Industry 3351), and aluminum (Industry 3352). The products of this industry are produced in the form of basic shapes, such as plate, sheet, strip, bar, and tubing. Establishments primarily engaged in recovering nonferrous metals and alloys from scrap or dross are classified in Industry 3341; in manufacturing gold, silver, tin, and other foils except aluminum in Industry 3497; and aluminum foil in Industry 3352.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

[^41]is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures show in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Rolling and Drawing, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Rolling and Drawing, N.E.C., Industry amounted to $\$ 639$ million. Of this total, $\$ 103$ million were products primary to other industries; and $\$ 26$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 83 percent of the total manufactured products shipments, primary and secondary. The 1958 ratio was 77 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that $\$ 624$ million of nonferrous mill shapes, except copper and aluminum were shipped by all producers of these products. Of this total, $\$ 511$ million, or 82 percent, were shipped by plants classified in Industry 3356, Rolling and Drawing, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 82.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Data for toll shiprants and quantities produced and consumed in the same plant are excluded but will be included in the final report for this Data for toll shipments a
industry.
${ }^{2}$ Includes toll production.
${ }^{2}$ Includes toll production.
4Data are also published in Current Industrial Reports Series M33G, "Magnesium Mill Products."
${ }^{5}$ Consists of 5,336 short tons valued at $\$ 10,465$ thousand shipped to other companies and 4,228 short tons valued at $\$ 9,414$ thousand shipped as
transfers to other plants of the same company.
${ }^{6}$ Consists of 34,973 short tons valued at $\$ 15,137$ thousand shipped to other companies and 1,563 short tons valued at $\$ 477$ thousand shipped as transfers to other plants of the same company.
${ }^{7}$ Data are also published in Current Industrial Reports Series BDSAF-263, "Titanium Ingot and Mill Products."
${ }^{8}$ In 1958 data for titanium forging and extrusion billet are included with other titanium mill products.
${ }^{9}$ In 1958 data for precious metal mill shapes are included with other nonferrous metals, code 3356098.
${ }^{10}$ Includes $\$ 20,371$ thousand produced in Industry 3357, Nonferrous Wire Drawing, Etc.

# 1963 cansus or MANUFACTURES 

## INDUSTRY SERIES

## Nonferrous wire drawing, etc.

SIC Code 3357

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Nonferrous Wire Drawing, Etc., Industry had total shipments valued at \$2,071 million, an increase of 41 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 6 percent from 1958 and I percent from 1962 to a total of 55 thousand employees in 1963. Value added by manufacture amounted to $\$ 679$ million in 1963, an increase of 28 percent from 1958 and 5 percent from 1962.

The Nonferrous Wire Drawing, Etc., Industry includes establishments engaged primarily in drawing, drawing and insulating, and insulating wire and cable of nonferrous metals from purchased wire bars, rods, or wire.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable. $r_{\text {Revised. }}$
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for $195^{4}$.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishrents canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.

August 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Nonferrous Wire Drawing, Etc., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Nonferrous Wire Drawing, Etc., Industry amounted to $\$ 2,071$ million. Of this total, $\$ 212$ million were products primary to other industries; and $\$ 48$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that $\$ 2,158$ million of drawn and insulated nonferrous wire were shipped by all producers of these products. Of this total, $\$ 1,811$ million, or 84 percent were shipped by plants classified in Industry 3357, Nonferrous Wire Drawing, Etc., while the remainder was shipped by plants classified in other industries. The 1958 ratio was 83 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of
the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 3. -QUANTITY AND VALUE OF DRAWN AND INSULATED NONFERROUS WIRE SHIPPED BY AJI FRODUCERS IN THE UNITED STATES: 1963 AND I958-CONTInUed

See footnotes at end of table.

Table 3. -QUANTITY AND VALUE OF DRAWN AND INSULATED NONFERROUS WIRE SHIPFED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958 -Continued

- Represents zero. n.e.c. Not elsewhere classified. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable. ${ }^{r}$ Revised.

Includes shipments of these products produced on a toll basis by others
${ }^{2}$ Data for production, receipts and toll shipments are excluded but will be included in the final report for this industry,
${ }^{3}$ Data for ACSR and aluminum cable, bare, are also published monthly in Current Industrial Reports Series M33-2, "Aluminum Ingot and Mill Products, and Magnesium Products." Net quantity of shipments as reported in this series for the year 1963 and 1958 totaled 136,127 short tons and 87,424 short tons respectively. However, these quantities represent aluminum content only. The 149,100 short tons and 92,608 short tons reported in the census of manufactures for 1963 and 1958, respectively, represent gross weight.
${ }^{4}$ Excludes an unspecified amount of ACSR produced on a toll basis. This tonnage is included in the Current Industrial Reports.
${ }^{5}$ Includes $\$ 20,371$ thousand produced in Industry 3357 , Nonferrous Wire Drawing, Etc.
${ }^{6}$ This quantity was valued at $\$ 5,599$ thousand. The remaining $\$ 1,435$ thousand was reported without quantity.
7 of these totals, the following figures represent the value of shipments of insulated wire and cable transferred from plant of a company to another plant of the same compary:

| Product class <br> code | Thousands of <br> dollars |
| :---: | ---: |
| $33574 \ldots \ldots \ldots \ldots \ldots$ | 18,443 |
| $33577 \ldots \ldots \ldots \ldots \ldots$ | 67,149 |
| $33578 . \ldots \ldots \ldots \ldots$ | 5,460 |
| $33579 \ldots \ldots \ldots \ldots$ | 12,261 |

BUSINESS CYCLE DEVELOPMENTS is published monthly for specialists concerned with the analysis of current business conditions. It summarizes many of the available economic time series in convenient form for short-term evaluation and interpretation and supplements other Department of Commerce reports on the economy. The features of this report are:

- The arrangement of series according to their usual timing relations during the course of the business cycle.
- The inclusion of special analytical measures and historical cyclical comparisons that help in evaluating the current stage of the business cycle.
- The speed with which the data are collected, assembled, and published. BCD is issued about the 22 d of each month covering data for the preceding month.
About 90 principal indicators and over 300 components are used for the different measures shown. The movements of the series are shown against the background of the expansions and contractions of the general business cycle so that "leads" and "lags" can readily be detected and unusual cyclical developments spotted. Since almost all of the basic data presented in this report are available in other published sources, the value of BCD lies in its analytical arrangement and speed of publication.
The presentation and classification of the time series in the BCD report follows the business indıcators approach. The classification of series and the business cycle turning dates are those designed by the National Bureau of Economic Research which, in recent years, has been a leader in this field of investigation.

For sale by the Government Printing 0ffice, Washington, D.C. 20402. $\$ 6$ a year ( $\$ 1.50$ additional for foreign mailing). Single copies, $60 \$$ each.

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Aluminum castings

SIC Code 3361

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Aluminum Castings Industry had total shipments valued at $\$ 636$ million, an increase of 51 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 20 percent from 1958 to a total of 36 thousand employees in 1963. Value added by manufacture amounted to $\$ 341$ million in 1963, an increase of 51 percent from 1958.

The Aluminum Castings Industry includes establishments engaged primarily in the manufacture of castings (including die castings) of aluminum.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^43]April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Aluminum Castings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Aluminum Castings Industry amounted to $\$ 636$ million. Of this total, $\$ 124$ million were products primary to other industries; and \$14 million were receipts for miscellaneous activities. The industry shipments of primary products represented 80 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 79 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 606$ million of aluminum castings were shipped by all producers of these products. Of this total, $\$ 498$ million, or 82 percent, were shipped by plants classified in Industry 3361, Aluminum Castings while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 81.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry ref'lect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(Indexes $1954=100$ )

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Brass, bronze, copper castings

SIC Code 3362

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Brass, Bronze, Copper Castings Industry hadtotal shipments valued at $\$ 284$ million, an increase of 29 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 2 percent from 1958 but a decrease of 15 percent from 1962 to a total of 15 thousand employees in 1963. Value added by manufacture amounted to $\$ 142$ million in 1963, an increase of 29 percent from 1958 but a decrease of 8 percent from 1962.

The Brass, Bronze, Copper Castings Industry includes establishments engaged primarily in the manufacture of castings (including die castings) of copper and copper-base alloy.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{2}$ Includes expenditures for plants under construction but not in operation.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manuractures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals ${ }_{3}$ A revision in the definition of this Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
with earlier years. April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Brass, Bronze, Copper Castings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Brass, Bronze, Copper Castings Industry amounted to $\$ 284$ million. Of this total, $\$ 46$ million were products primary to other industries; and $\$ 9$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 83 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 85 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 296$ million of Brass, Bronze, Copper Castings were shipped by all producers of these products. Of this total, \$229 million, or 77 percent, were shipped by plants classified in Industry 3362, Brass, Bronze, Copper Castings while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 81.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Nonferrous castings, n. e.c. <br> SIC Code 3369

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Nonferrous Castings, N.E.C., Industry shipped products valued at $\$ 301$ million, an increase of 28 percent over 1958 , according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 2 percent from 1958 and 12 percent from 1962 to a total of 18 thousand employees in 1963. Value added by manufacture amounted to $\$ 168$ million in 1963, an increase of 24 percent from 1958 and 12 percent from 1962.

The Nonferrous Castings, N.E.C., Industry includes establishments engaged primarily in the manufacture of casting of nonferrous materials except aluminum, copper, and copper base alloys.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE NONFERROUS CASTINCS, N.E.C., INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3369)

| Year | Establishments (number) |  | All employees |  | Production morkers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, new ² $(\$ 1,000)$ | Standard error of estimate (percent) for number of employees column ${ }^{2}$ |

|  | 389 |  |  | 102,547 |  |  |  |  |  |  |  |  |
| $1962^{2}$ | (NA) | (NA) | 15,779 | 90,380 | 13,218 | 27,145 | 69,432 | 149,768 | 110,485 | 259,438 | 6,735 5,780 |  |
| $1961{ }^{2}$. | (NA) | (NA) | 14,574 | 81,744 | 11,953 | 24,226 | 60,862 | 127,825 | 94,058 | 222,190 | $(4,106)$ |  |
| $1960^{2}$. | (NA) | (NA) | 17,079 | 92,640 | 14,221 | 28,718 | 69,036 | 150,157 | 108,993 | 260,157 | 7,830 |  |
| $1959{ }^{2}$. | (NA) | (NA) | 18,309 | 98,083 | 15,477 | 31,343 | 74,685 | 151,623 | 116,862 | 267,699 | 6,655 |  |
| $1958{ }^{3}$. | 345 | 136 | 17,253 | 89,239 | 14,330 | 27,617 | 66,339 | 135,311 | 98,678 | 234,649 | 5,013 | (x) |

(NA) Not available. (X) Not applicable. TRevised.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.

The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent. See the Annual Survey of Manufactures volumes for further discussion of the sarmpling estimate.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.
April 1965

## U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March. May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic
importance of manufacturing industries or geographic areas.

## VALUE OF SHIPMENIS

The value of shipments reported by establishments classified in the Nonferrous Castings, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Nonferrous Castings, N.E.C., Industry amounted to $\$ 301$ million. Of this total, $\$ 70$ million were products primary to other industries; and $\$ 7$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 76 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 78 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 306$ million of nonferrous castings n.e.c., were shipped by all producers of these products. Of this total, $\$ 225$ million, or 73 percent, were shipped by plants classified in Industry 3369, nonferrous castings, n.e.c., while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 77 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary sumnary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

n.e.c. Not elsewhere classified. (NA) Not available. (X) Not applicable.
${ }^{1}$ These data differ from the tonnagc data published in the Current Industrial Reports Series M33E, Nonferrous Castings, in that no data are included for castings produced by captive foundry departments of plants classified in other industries. In addition, certain products are reported as castings in the monthly survey which in the census of manufactures are classified as finished products in other industries.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Iron and steel forgings

SIC Code 3391

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Iron and Steel Forgings Industry shipped products valued at $\$ 834$ million, an increase of 27 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 7 percent from 1958 to a total of 35 thousand employees in 1963. Value added by manufacture amounted to $\$ 368$ million in 1963, an increase of 17 percent from 1958.

The Iron and Steel Forgings Industry includes establishments engaged primarily in the manufacture
of light and heavy board drop, steam hammer, upset, and press iron and steel forgings with or without the use of dies. Rolling mills engaged in the production of iron and steel forgings are classified in Industry 3312, Blast Furnaces and Steel Mills.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^46]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuees for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 194.7, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENIS

The value of shipments reported by establishments classified in the Iron and Steel Forgings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Iron and Steel Forgings Industry amounted to $\$ 834$ million. Of this total, $\$ 70$ million were products primary to other industries; and $\$ 33$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,046$ million of iron and steel forgings were shipped by all producers of these products. Of this total, $\$ 731$ million, or 70 percent, were shipped by plants classified in Industry 3391, Iron and Steel Forgings while the remainder was shipped by plants classified in other industries. The comparable ratio in 1958 was 72 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(NA) Not available. (X) Not applicable.
Includes product class 33129 open die hanmer and press forgings made in blast furnaces and steel mills.
${ }^{2}$ These figures are not strictly comparable with tonnage figures shown in Current Industrial Reports Series M33c, "Commercial Steel Forgings," in that the latter include only forgings "for sale," whereas the 1963 and 1958 Census of Manufacturer also include interplant transfers of forgings. Accordingly, a direct comparison with the monthily Current Industrial Reports series is not possible. Forgings produced and consumed are not included in either the Census or the Current Industrial Reports figures. The anmal totals in the monthly Current Industrial Reports survey for commercial steel forgings were as follows:

| Item | $\begin{gathered} 1963 \\ \text { (short tons) } \end{gathered}$ | $\begin{gathered} 1958 \\ \text { (short tons) } \end{gathered}$ |
| :---: | :---: | :---: |
| Closed die (drop, upset and press) forgings: |  |  |
| Carbon. | 785,267 | 528,716 |
| Alloy, including stainles | 391,346 | 295,141 |
| Open die hammer and press forgings: |  |  |
| Carbon. | 156,074 | 92,096 |
| Alloy, including stainless. | 219,936 | 163,480 |

${ }^{3}$ Figures for 1963 have been revised from data previously published in the preliminary report for Industry 3312 "Blast Furnaces and Steel Mills."
In 1958, product codes 3391921 and 3391941 were combined.
In 1958, product codes 3391922 and 3391942 were combined.
${ }^{6}$ In 1958, product codes 3391923 and 3391943 were combined.

## U.S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS WASHINGTON. D.C. 20233

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Nonferrous forgings

SIC Code 3392

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Nonferrous Forgings Industry had total shipments valued at $\$ 124$ million, an increase of 25 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 5 percent from 1958 to a total of 4.4 thousand employees in 1963. Value added by manufacture amounted to $\$ 53$ million in 1963 , an increase of 43 percent from 1958.

The Nonferrous Forgings Industry includes establishments engaged primarily in manufacturing, with or without the use of dies, forgings of aluminum, copper, titanium, and other nonferrous metals and alloys.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the lyth of March. Figures for production workers are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Nonferrous Forgings Industry consists not only of products described above as primary to the industry, but also to the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Nonferrous Forgings Industry amounted to $\$ 124$ million. Of this total, \$14 million were products primary to other industries; and \$ll million were receipts for miscel-
laneous activities. The industry shipments of primary products represented 88 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 85 percent (revised).

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 197$ million of nonferrous forgings were shipped by all producers of these products. Of this total, $\$ 98$ million, or 50 percent, were shipped by plants classified in Industry 3392, Nonferrous Forgings, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 60 (revised).

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manuracturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963 , it was conducted jointly with censuses of
mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years
ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## USCOMM-DC

U.S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS WASHINGTON, D.C. 20233

OFFICIAL BUSINESS

# 1963 OENSUS OF MANUFACTURES 

# Primary metal industries, n.e.c. 

SIC Code 3399

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Primary Metal Industries, N.E.C., Industry had total shipments valued at $\$ 260$ million, an increase of 84 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 45 percent from 1958 to a total of 14 thousand employees in 1963. Value added by manufacture amounted to $\$ 174$ million in 1963, an increase of 92 percent from 1958.

The Primary Metals Industries, N.E.C., Industry includes establishments engaged primarily in the manufacture of primary metal products, not elsewhere classified, such as nonferrous nails, brads, and spikes; metal powder, flakes and paste; and establishments primarily engaged in heat treating of metal for the trade.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent

years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Primary Metal Industries, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Primary Metal Industries, N.E.C., Industry amounted to $\$ 260$ million. Of this total, $\$ 4$ million were products primary to other industries; and $\$ 7$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 98 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that $\$ 277$ million of primary metal industries products, n.e.c., were shipped by all producers of these products. Of this total, $\$ 249$ million, or 90 percent were shipped by plants classified in Industry 3399, Primary Metal Industries, NoE.C., while the remainder was shipped plants classified in other industries. The 1958 ratio was 87 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Metal cans

SIC Code 3411

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Metal Cans Industry had total shipments valued at \$2,098 million, an increase of 15 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 2 percent from 1958 but an increase of 1 percent from 1962 to a total of 53 thousand employees in 1963. Value added by manufacture amounted to $\$ 815$ million in 1963, an increase of 22 percent from 1958 and 6 percent from 1962.

The Metal Cans Industry includes establishments engaged primarily in the manufacture of metal cans from purchased tinplate, terneplate, blackplate, enameled sheet metal, aluminum sheet or impact extrusions (slugs).

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment

Table 1.-GENERAL STATISTICS FOR THE METAL CANS INDUSTRY IN THE UNTTED STATES FOR SEIECTED YEARS

(IIA) Not available. (X) Not applicable. ${ }^{r}$ Revised.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey or Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because or sampling fluctuations. See the Annual Survey or Manufactures volumes for further discussion of the sampling estimate.
excludes data for Alaska and Hewaii. Number of "All employees" in these two States was between 250 and 499.
${ }^{4}$ Data for Alaska and Hawaii are not included.
April 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the MetalCans Industry consists not only of products described above as primary to the industry, but also of the value of secondary
products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Metal Cans Industry amounted to $\$ 2,098$ million. Of this total, $\$ 61$ million were products primary to other industries; and $\$ 53$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that \$2,028 million of metal cans were shipped by all producers of these products. Of this total, \$1,984 million, or 98 percent, were shipped by plants classified in Industry 3411, Metal Cans, while the remainder was shipped by plants classifiedin other industries. The comparable ratio in 1958 was 99.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity and value figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary sumnary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry

Table 3A.-QUANTITY AND VALUE OF METAL CANS SHIPPED BY AL工 PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Metal Cans Industry but also by establishments

## (NA) Not available. (X) Not applicable.

A base box is an area of 31,360 square inches, equivalent to 112 sheets, $14^{\prime \prime} \times 20^{\prime \prime}$ in size.
A metal can is defined as a single-walled container constructed wholly of tinplate, terneplate, blackplate, waste plate, aluminum sheet or impact extrusions (slugs) designed for packing products. This definition excludes steel pails, defined as single-walled shipping containers having capacities of 1-12 gallons inclusive that are cylindrically constructed of steel sheet of 29 gauge and heavicr.
${ }^{3}$ The figures are not strictly comparable due to inconsistences in reporting on the two surveys.
4 The 1963 and 1958 figures represent, respectively, 4,582 and 4,762 thousand short tons of steel. The 1963 estimate is derived by use of the factor 23.5 base boxes per short ton of steel. The 1958 figure is derived by use of separate conversion factors for each type of can. These factors vary from 20.4 to 25.0 base boxes per short ton of steel depending on the type of can.
${ }^{5}$ Represents 43,321 short tons of aluminum.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Cutlery

SIC Code 3421

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Cutlery Industry shipped products valued at $\$ 254$ million, an increase of 42 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed no significant change from 1958 but decreased 10 percent from 1962 to a total of 12 thousand employees in 1963. Value added by maniufacture amounted to $\$ 185$ million in 1963, an increase of 46 percent from 1958 and 5 percent from 1962.

The Cutlery Industry includes establishments engaged in the manufacture of cutlery.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted $\bar{b} y$ obtaining a separate report for each establishment in the United States; however, manufacturing

(NA) Not available.
Include expenditures for plants under construction and not yet in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments incuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March,- May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Cutlery Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Cutlery Industry amounted to $\$ 254$ million. Of this total, $\$ 30$ million were products primary to other industries; and $\$ 7$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 88 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 225$ million of cutlery were shipped by all producers of these products. Of this total, $\$ 217$ million, or 96 percent, were shipped by plants classified in Industry 3421, Cutlery, while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was 98 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

${ }^{1}$ For 1963 , represents shipments of 20,140 thousand units.
${ }^{2}$ For 1958 , represents shipments of 15,872 thousand units valued at $\$ 8,978$ thousand; the remaining $\$ 3,458$ thousand had no quantity reported.

# 1963 CENSUS OF MANUFACTURES 

# Hand and edge tools 

SIC Code 3423

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Hand and Edge Tools Industry shipped products valued at $\$ 554$ million, an increase of 26 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 3 percent from 1958 but a decrease of 8 percent from 1962 to a total of 31 thousand employees in 1963. Value added by manufacture amounted to $\$ 355$ million in 1963, an increase of 33 percent from 1958 but a decrease of 1 percent from 1962.

The Hand and Edge Tools Industry includes establishments engaged primarily in the manufacture of files and other hand and edge tools for metalworking, woodworking, and general maintainence. Establishments primarily engaged in manufacturing saws are classified in Industry 3425.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not availle by
The digit industry for
Tha are estimates derived
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volunes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawail are not included.
March 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Hand andEdge Tools Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Hand and Edge Tools Industry amounted to $\$ 554$ million. Of this total, $\$ 50 \mathrm{mil}$ lion were products primary toother industries; and $\$ 50$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 531$ million of hand and edge tools were shipped by all producers of these products. Of this total, $\$ 453$ million, or 85 percent, were shipped by plants classified in Industry 3423, Hand and Edge Tools while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 85 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBL ICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Hand saws and saw blades

# preliminary report 

SIC Code 3425

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Hand Saws and Saw Blades Industry shipped products valued at $\$ 102$ million, an increase of 16 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 8 percent from 1958 and 4 percent from 1962 to a total of 5.1 thousand employees in 1963. Value added by manufacture amounted to $\$ 65$ million in 1963, an increase of 20 percent from 1958 and practically equal to 1962.

The Hand Saws and Saw Blades Industry includes establishments engaged primarily in the manufacture of hand saws and saw blades for hand and power driven saws. Establishments primarily engaged in manufacturing power driven sawing machines are classified in Major Group 35.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in l939 and l947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishnents canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and conplete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location'were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Hand Saws and Saw Blades Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Hand Saws and Saw Blades Industry amounted to $\$ 102$ million. Of this total, $\$ 20$ million were products primary to other industries; and \$1l million were receipts for miscellaneous activities. The industry shipments of primary products represented 78 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 82 percent.

The total value of shipments for the industry (i.e. the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 83$ million of Hand Saws and Saw Blades were shipped by all producers of these products. Of this total, $\$ 71$ million, or 85 percent, were shipped by plants classified in Industry 3425, Hand Saws and Saw Blades while the remainder was shipped by plants classified in other industries. The compa.rable ratio for 1958 was 90 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 ", and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample surrey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

Hardware, n.e.c.

# preliminary report 

SIC Code 3429

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Hardware, N.E.C., Industry had total shipments valued at $\$ 1,800$ million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 1 percent from 1958 but a decrease of 1 percent from 1962 to a total of 89 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,075$ million in 1963, an increase of 42 percent from 1958 and 8 percent from 1962.

The Hardware, N.E.C. , Industry includes establishments engaged primarily in the manufacture of miscellaneous metal products usually termed "hardware" and not elsewhere classified. Establishments primarily engaged in manufacturing bolts and nuts are classified in Industry 3452, nails and spikes in Major Group 33, cutlery in Industry 3421, hand tools in Industry 3423, and• pole line and transmission hardware in Major Group 36.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHI PMENTS

The value of shipments reported by establishments classified in the Hardware, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Hardware, N.E.C., Industry amounted to $\$ 1,800$ million. Of this total, \$160 million were products primary to other industries; and $\$ 75$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 89 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,679$ million of hardware, n.e.c., were shipped by all producers of these products. Of this total, $\$ 1,566$ million, or 93 percent, were shipped by plants classified in Industry 3429, Hardware, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable 1958 ratio was also 93 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary sumary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^53]
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Plumbing fixtures

SIC Code 3431

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Plumbing Fixtures Industry had total shipments valued at $\$ 235$ million, an increase of 10 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 11 percent from 1958 to a total of 11 thousand ermployees in 1963. Value added by manufacture amounted to $\$ 140$ million in 1963, an increase of 18 percent from 1958.

The Plumbing Fixtures Industry includes establishments engaged primarily in the manufacture of enameled iron, cast iron, or pressed metal sanitary ware. Establishments primarily engaged in manufacturing vitreous and semivitreous pottery sanitary ware are classified in Industry 3261; and those manufacturing porcelain enameled kitchen, household, and hospital ware in Industry 3461.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

[^54]and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Plumbing Fixtures Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Plumbing Fixtures Industry amounted to $\$ 235$ million. Of this total, $\$ 24$ million were products primary to other industries; and $\$ 18$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 204$ million of metal plumbing fixtures were shipped by all producers of these products. Of this total, \$194 million, or 95 percent, were shipped by plants classified in Industry 3431, Plumbing Fixtures while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 92.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing inảustry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary sumnary reports showing U.S. totals for each manufacturing
industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^55]
# 1963 CENSUS OF MANUFACTUR=S 

# Plumbing fittings, brass goods 

SIC Code 3432

## preliminary report

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS
The value of shipments reported by establishments classified in the Plumbing Fittings, Brass Goods Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Plumbing Fittings, Brass Goods Industry amounted to $\$ 333$ million. Of this total, $\$ 30$ million were products primary to other industries; and $\$ 28$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 329$ million of plumbing fittings, brass goods, were shipped by all producers of these products. Of this total, $\$ 275$ million, or 84 percent, were shipped by plants classified in Industry 3432 , Plumbing Fittings, Brass Goods while the remainder was shipped by plants classified in other industries. The comparable 1958 ratio was 83 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production, " as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. S series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each. State are being issued. Final industry reports and rinal area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Deparfment of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

USCOMM-DC

# U.S. DEPARTMENT OF COMMERCE bureau of the census WASHINGTON, D.C. 20233 

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

Heating equipment except electric<br>SIC Code 3433

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Heating Equipment, Except Electric, Industry had total shipments valued at $\$ 1,008$ million, an increase of 10 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 7 percent from 1958 and 5 percent from 1962 to a total of 42 thousand employees in 1963. Value added by manufacture amounted to $\$ 495$ million in 1963, an increase of 14 percent from 1958 but a decrease of 5 percent from 1962.

The Heating Equipment, Except Electric, Industry includes establishments engaged primarily in the manufacture of heating equipment for all purposes, other than power, including all gas, oil, and stoker coal fired equipment for the automatic utilization of gaseous, liquid and solid fuels. Establishments primarily engaged in manufacturing electric stoves and ranges are classified in Industry 3631; boiler shops primarily engaged in the production of industrial, power and marine boilers in Industry 3443; and industrial process furnaces and ovens in Industry 3567.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishrents. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals percentage standard errors in this column indicate the range of differences that can be expected between the estimates and coniple
because of sampling fluctuations. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }_{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification so that comparable data for prior years are not available.

[^56]U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

Far sale by the Bureau af the Census, Washington, D.C., 20233, and U. S. Deportment of Commerce Field Offices. 10 cents.
is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYFES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Heating Equipment, Except Electric, Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Heating Equipment, Except Electric, Industry amounted to $\$ 1,008$ million. Of this total, $\$ 229$ million were products primary to other industries; and $\$ 73 \mathrm{mil}-$ lion were receipts for miscellaneous activities. The industry shipments of primary products represent 76 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 81 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 887$ million of heating equipment products, except electric were shipped by all producers of these products. Of this total, $\$ 707$ million, or 80 percent, were shipped by plants classified in Industry 3433, Heating Equipment, Except Electric, while the remainder was shipped by plants classified in other industries. The comparable ratio in 1958 was also 80 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for arı industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports
will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

${ }^{5}$ Intregal unit-an intregal unit consists of a boiler or furnace, an automatic coal-feeding mechanism, accessories, and usually a metal enclosure, the whole assembly having been designed as a complete, compact and coordinated heating unit.
${ }^{6}$ Parts for unit heaters and unit ventilators are included with other heating equipment, except electric, and parts for other heating equipment, except electric, code 3433698 for 1958.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral lndustries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2 -digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4 -digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

> Volume 1, Summary Statistics
> Volume 11, Industry Statistics
> Part 1, Major Groups 20-28
> Part 2, Major Groups 29-39
> Volume 1ll, Area Statistics

## Mineral lndustries

Volume 1, General Summary and Industry Statistics

Volume 1l, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.
U.S. DEPARTMENT OF COMMERCE

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Fabricated structural steel <br> SIC Code 3441

 reportThis report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Fabricated Structural Steel Industry shipped products valued at $\$ 1,919$ million, an increase of 1 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 6 percent from 1958 and an increase of 8 percent from 1962 to a total of 86 thousand employees in 1963. Value added by manufacture amounted to $\$ 818$ million in 1963, a decrease of 1 percent from 1958 and an increase of 17 percent from 1962.

The Fabricated Structural Steel Industry includes establishments engaged primarily in the manufacture of fabricated iron and steel or other metal for structural purposes, for bridges, buildings; and sections for ships, boats, and barges. Establishments primarily engaged in manufacturing metal doors, sash, frames, molding, and trim are classified in Industry 34.42; and fabrication work done by construction contractors at the site of construction is classified in construction industries.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

Table l.--GENERAL STATISTICS FOR THE FABRICATED STRUCTURAL STEEL INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3441)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture (\$1,000) | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, <br> new ${ }^{1}$ $(\$ 1, \infty 00)$ | Standard error of estimate (percent) for number of employees colum ${ }^{2}$ |

(NA) Not available. (x) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may dirfer from the results that would have been obtaired from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of $^{3}$ sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and
195 are not comparable with those for earlier years.
"Excludes data for Alaska and Hawaii. Number of "all employees" in these two States was between 100 and 249.

## May 1965

edition of the Standard Incustrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Fabricated Structural Steel Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Fabricated Structural Steel Industry amounted to $\$ 1,919$ million. Of this total, $\$ 271$ million were products primary to other industries; and $\$ 232$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 84 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,590$ million of fabricated structural steel were shipped by all producers of these products. Of this total, $\$ 1,416$ million, or 89 percent, were shipped by plants classified in Industry 3441, Fabricated Structural Steel, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 91.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for $a_{1}$ industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment" and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing. activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -GENERAL STATISTICS FOR TTE FABRICATED STRUCIURAL STEEL INDUSTRY BY GEOCRAPHIC AREAS: 1963 AND 1958

# 1963 CENSUS Or MANUFACTURES 

## INDUSTRY SERIES

# Metal doors, sash, and trim 

SIC Code 3442

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Metal Doors, Sash, and Trim Industry had total shipments valued at $\$ 1,257$ million, an increase of 21 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 8 percent from 1958 and 6 percent from 1962 to a total of 63 thousand employees in 1963. Value added by manufacture amounted to $\$ 579$ million in 1963, an increase of 23 percent from 1958 and 7 percent from 1962.

The Metal Doors, Sash, and Trim Industry includes establishments engaged primarily in the manufacture of ferrous and nonferrous metal and metal covered doors and sash, window and door frames and screens, molding, and trim.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. . Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not apFlicable.
Includes expenditures for
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishnents canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard errors exceeding 15 percent. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
Nay 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYFES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee.figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March. May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Metal Doors, Sash, and Trim Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Metal Doors, Sash, and Trim Industry amounted to $\$ 1,257$ million. Of this total, $\$ 157$ million were products primary to other industries; and $\$ 74$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,084$ million of metal doors, sash, and trim were shipped by all producers of these products. Of this total, $\$ 1,026$ million, or 95 percent, were shipped by plants classified in Industry 3442 , Metal Doors, Sash and Trim while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 93.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. - CENERAL STATISTICS FOR THE METAL DOORS, SASH, AND TRIM INDUSTRY BY GEOCRAPHIC AREAS: 1963 AND 1958
(SIC code 3442)

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral lndustries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral lndustries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics<br>Volume 11, Industry Statistics<br>Part 1, Major Groups 20-28<br>Part 2, Major Groups 29-39<br>Volume 111, Area Statistics

## Mineral lndustries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Boiler shop products

SIC Code 3443

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Boiler Shop Products Industry had total shipments valued at $\$ 1,570$ million, a decrease of 6 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 20 percent from 1958 and 1 percent from 1962 to a total of 72 thousand employees in 1963. Value added by manufacture amounted to $\$ 772$ million in 1963, an increase of 2 percent from 1958 and 15 percent from 1962.

The Boiler Shop Products Industry includes establishments engaged primarily in the manufacture of power and marine boilers, pressure and nonpressure tanks, processing and storage vessels, heat exchangers, weldments and similar products, by the process of cutting, forming and joining ferrous and nonferrous plates, shapes, bars, sheet, pipe mill products and tubing to custom or standard design for factory or field assembly.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

Table 1.—GENERAL STATISTICS FOR THE BOILER SHOP PRODUCTS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3443 )

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value <br> added by <br> manufacture $(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new$(\$ 1, \infty 00)$ | Standard error of estimate (percent) for number of employees column ${ }^{2}$ |

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this columin indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included. Number of "All Employees" in these two states was between 100 and 249.
${ }^{4}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification so that the industry is not zomparable.
May 1965
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March.' May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified inthe Boiler Shop Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Boiler Shop Products Industry amounted to $\$ 1,570$ million. Of this total, \$150 million were products primary to other industries; and $\$ 148$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 89 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,510$ millionof boiler shop products were shipped by all producers of these products. Of this total, \$1,272 million, or 84 percent, were shipped by plants classified in Industry 3443, Boiler Shop Products while the remainder was shipped by plants classified in other industries. In 1958, the comparable ratio was 83 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^60]${ }^{9}$ This quantity was valued at $\$ 12,790$ thousand. The remaining $\$ 1,910$ thousand represents value for which no quantity was reported.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3-digit industrygroup. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will providegeneral statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Indusitry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and Stares. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3-digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume I, Summary Statistics
Volume 11, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume 111, Area Statistics

## Mineral lndustries

Volume 1, General Summary and Industry Statistics

Volume I1, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Sheet metal work

SIC Code 3444

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Sheet Metal Work Industry had total shipments valued at \$1,292 million, an increase of 20 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 5 percent from 1958 but a decrease of 5 percent from 1962 to a total of 61 thousand employees in 1963. Value added by manufacture amounted to $\$ 618$ million in 1963, an increase of 20 percent from 1958 with virtually no change from 1962.

The Sheet Metal Work Industry includes establishments engaged primarily in the manufacture of sheet metal work for buildings (not including fabrication work done by construction contractors at the place of construction), and manufacturing sheet metal stovepipes, light tanks, etc.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^61]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Sheet Metal Work Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Sheet Metal Work Industry amounted to $\$ 1,292$ million. Of this total, $\$ 132$ million were products primary to other industries; and \$138 million were receipts for miscellaneous activities. The industry shipments of primary products represented 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 88 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,294$ million of sheet metal products were shipped by all producers of these products. Of this total, $\$ 1,022$ million, or 79 percent, were shipped by plants classified in Industry 3444, Sheet Metal Work, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 82.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau. of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

POSTAGE AND FEES PAID U.5. DEPARTMENT OF COMMERCE

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Miscellaneous metal work, n.e.c. 

SIC Codes 3446 and 3449

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

Manufacturers in the Miscellaneous Metal Work, N.E.C. (including Architectural Metal Work) Industries had receipts during 1963 of $\$ 963$ million, according to preliminary results obtained from the 1963 census. Average employment in these industries was 39 thousand employees, while the value added by manufacture amounted to $\$ 429$ million.

During 1963, manufacturers in the Architectural Metal Work (SIC 3446) Industry had total shipments valued at $\$ 264$ million, a decrease of 18 percent
from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 29 percent from 1958 to a total of 15 thousand employees in 1963. Value added by manufacture amounted to $\$ 145$ million in 1963, a decrease of 20 percent from 1958.

The Architectural Metal Work (SIC 3446) Industry includes establishments engaged primarily in the manufacture of architectural and ornamental metal work of ferrous and nonferrous metals, such as stairs and staircases, open steel flooring (grating), fire escapes, grilles, railings, and fences and gates except wire.

During 1963, manufacturers in the Miscellaneous Metal Work (SIC 3449) Industry shipped products valued at $\$ 699$ million, an increase of 18 percent

[^63]over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 16 percent from 1958 to a total of 25 thousand employees in 1963. Value added by manufacture amounted to $\$ 284$ million in 1963, an increase of 29 percent from 1958.

The Miscellaneous Metal Work (SIC 3449) Industry includes establishments engaged primarily in the manufacture of prefabricated and portable metal buildings and parts, and miscellaneous metal work.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Industry 3449 has been amended to exclude manufacturers of architectural metal work. Such manufacturers areclassified in SIC 3446. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the Jnited States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the, average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Industry 3446 and Industry 3449 consist not only of products described above as primary to each industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc.

The total value of shipments and other receipts of establishments classified in the Architectural Metal Work (SIC 3446) Industry amounted to $\$ 264$ million. Of this total, $\$ 34$ million were products primary to other industries; and $\$ 15 \mathrm{million}$ were receipts for miscellaneous activities. The industry shipments of primary products represent 86 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 indicates that \$305 million of architectural metal work were shipped by all producers of these products. Of this total, $\$ 214$ million, or 70 percent, were shipped by plants classified in Industry 3446, Architectural Metal Work, while the remainder was shipped by plants classified in other industries.

The total value of shipments and other receipts of establishments classified in the Miscellaneous Metal Work (SIC 3449) Industry amounted to $\$ 699$ million. Of this total, \$'7l million were products primary to other industries; and $\$ 94$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 88 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 794$ million of miscellaneous metal work were shipped by all producers of these products. Of this total, $\$ 534$ million, or 67 percent, were shipped by plants classified in Industry 3449, Miscellaneous Metal Work, while the remainder was shipped by plants classified in other industries.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables $1,2 \mathrm{~A}$ and 2 B are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1, 2A and 2B) with product statistics (table 3) which show the shipmentsby all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value. added." Similar preliminary and final reports' will be issued for other industries during the coming months. Series of preliminary summary - reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Comerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will providegeneral statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3-digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4 -digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume I, Summary Statistics
Volume II, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume III, Area Statistics

## Mineral Industries

Volume I, General Summary and Industry Statistics

Volume II, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Screw machine products

## preliminary report

SIC Code 3451

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Screw Machine Products Industry shipped products valued at $\$ 590$ million, an increase of 39 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 16 percent from 1958 to a total of 37 thousand employees in 1963. Value added by manufacture amounted to $\$ 358$ million in 1963, an increase of 43 percent from 1958.

The Screw Machine Products Industry includes establishments engaged primarily in the manufacture of automatic or hand screw machine products from rod, bar or tube stnck of metal, fiber, plastics or other materials.

This report does not include figures for administrative offices, wärehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

| $1939{ }^{\circ}$ | 288 | (NA) | (NA) | (NA) | 10,571 | (NA) | 14,287 | 31,654 | 20,910 | 52,564 | (NA) |

(NA) Not available.
${ }^{\text {R Revised. }}$
${ }^{1}$ Includes expenditures for plants under construction and not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). Figures for production workers are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958 and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Screw Machine Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Screw Machine Products Industry amounted to $\$ 590$ million. Of this total, $\$ 35$ million were products primary to other industries; and $\$ 11$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 94 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 599$ million of Screw Machine Products were shipped by all producers of these products. Of this total, $\$ 544$ million, or 91 percent, were shipped by plants classified in Industry 3451, Screw Machine Products while the remainder was shipped by plants classified in other industries. The comparable 1958 ratio was 87 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are peing issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

# Bolts, nuts, rivets and washers 

SIC Code 3452

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Bolts, Nuts, Rivets, and Washers Industry had total shipments valued at $\$ 1,213$ million, an increase of 38 percent over 1958 and 5 percent over 1962, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 8 percent from 1958 but no change from 1962 to a total of 57 thousand employees in 1963. Value added by manufacture amounted to $\$ 693$ million in 1963, an increase of 37 percent from 1958 and 7 percent from 1962.

The Bolts, Nuts, Rivets, and Washers Industry includes establishments engaged primarily in the manufacture of bolts, nuts, screws, washers, rivets, formed and threaded wire goods, and special industrial fasteners.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years hut are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE BOLTS, NUTS, RIVETS, AND TASHERS INDUSTRY FOR SELECTED YEARS
(SIC code 3452)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, new ${ }^{1}$ $(\$ 1,000)$ | Standard error of estimate (percent) for number of employees column ${ }^{2}$ |

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in 'distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPITOYEES

The method of compiling figures for employees has varied somewhat. from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nomproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years itrepresents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels from 1958 to 1963.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Bolts, Nuts, Rivets, and Washers Industry consist not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Bolts, Nuts, Rivets, and Washers Industry amounted to $\$ 1,213$ million. Of this total, $\$ 102$ million were products primary to other industries; and $\$ 67$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 1,155$ million of bolts, nuts, rivets, and washers were shipped by all producers of these products. Of this total, $\$ 1,043$ million, or 90 percent, were shipped by plants classified in Industry 3452, Bolts, Nuts, Rivets, and Washers, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 87 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also
their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms shawing these reports and their prices may be obtained Irom any U.S. Department of Conmerce field offise or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963 , it was conducted jointly with census of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS
WASHINGTON. D.C. 20233

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Metal stampings

SIC Code 3461

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Metal Stampings Industry shipped products valued at \$2,651 million, an increase of 27 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 5 percent from 1958 but a decrease of 1 percent from 1962 to a total of 131 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,350$ million in 1963, an increase of 29 percent from 1958 and 3 percent from 1962.

The Metal Stampings Industry includes establishments engaged primarily in the manufacture of metal stampings by the use of tools, dies, jigs and fixtures to punch, draw, form, or otherwise modify materials under pressure in a machine (primarily punch and draw presses).

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. --GENERAL STATISTICS FOR THE METAL STAMPINGS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(NA) Not available. (X) Not applicable. revised.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figues for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Metal Stampings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Metal Stampings Industry amounted to $\$ 2,651$ million. Of this total, $\$ 396$ million were products primary to other industries; and $\$ 133$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 84 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 2,460$ million of metal stampings were shipped by all producers of these products. Of this total, $\$ 2,123$ million, or 86 percent, were shipped by plants classified in Industry 3461 , Metal Stampings while the remainder was shipped by plants classified in other industries. The comparable ratio in 1958 was 87 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.-GENERAL STATISTIGS FGR THE METAL STAMPINGS INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

## PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industrygroup. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will providegeneral statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral lndustries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics
$\begin{array}{cccc}\text { Volume } & \text { 1l, } & \text { Industry Statistics } \\ \text { Part } & \text { 1, Major Groups } & \text { 20-28 } \\ \text { Part } & \text { 2, } & \text { Major Groups } & 29-39\end{array}$
Volume III, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Fabricated wire products, n.e.c.

SIC Code 3481

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Fabricated Wire Products, N.E.C., Industry had total shipments valued at $\$ 1,014$ million, an increase of 16 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 1 percent from 1958 and 9 percent from 1962 to a total of 55 thousand employees in 1963. Value added by manufacture amounted to $\$ 528$ million in 1963, an increase of 20 percent from 1958 but a decrease of 6 percent from 1962.

The Fabricated Wire Products, N.E.C., Industry includes establishments engaged primarily in the manufacture of miscellaneous fabricated wire products from purchased wire. Rolling mills engaged in manufacturing wire products are classified in Major Group 33; establishments manufacturing nonferrous wire nails and spikes in Industry 3399; those drawing and insulating nonferrous wire in Industry 3357; and those assembling wire bedsprings or seats are classified in Major Group 25.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

bureau of the census, A. Ross Eckler, Director

For sole by the Bureou of the Census, Woshington, D. C., 20233, and U. S. Deportment of Commerce Field Offices. 10 cents.
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March,: May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALJE ADDED BY MANUFACIURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative, economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Fabricated Wire Products, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Fabricated Wire Products, N.E.C., Industry amounted to $\$ 1,014$ million. Of this total, $\$ 77$ million were products primary to other industries; and $\$ 53$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,389$ million of fabricated wire products, n.e.c., were shipped by all producers of these products. Of this total, $\$ 884$ million, or 64 percent, were shipped by plants classified in Industry 3481, Fabricated Wire Products, N.E.C., while the remainder was shipped by plants classified in other industries. The 1958 ratio was 63 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

BUSINESS CYCLE DEVELOPMENTS is published monthly for specialists concerned with the analysis of current business conditions. It summarizes many of the available economic time series in convenient form for short-term evaluation and interpretation and supplements other Department of Commerce reports on the economy. The features of this report are:

- The arrangement of series according to their usual timing relations during the course of the business cycle.
- The inclusion of special analytical measures and historical cyclical comparisons that help in evaluating the current stage of the business cycle.
- The speed with which the data are collected, assembled, and published. BCD is issued about the 22 d of each month covering data for the preceding month.
About 90 principal indicators and over 300 components are used for the different measures shown. The movements of the series are shown against the background of the expansions and contractions of the general business cycle so that "leads" and "lags" can readily be detected and unusual cyclical developments spotted. Since almost all of the basic data presented in this report are available in other published sources, the value of RCD lies in its analytical arrangement and speed of publication.
The presentation and classification of the time series in the BCD report follows the business indicators approach. The classification of series and the business cycle turning dates are those designed by the National Bureau of Economic Research which, in recent years, has been a leader in this field of investigation.

For sale by the Government Printing Office, Washington, D.C. 20402. $\$ 6$ a year ( $\$ 1.50$ additional for foreign mailing). Single copies, $60 ¢$ each.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Metal barrels，drums and pails 

This report is one of a series presenting pre－ liminary information on industries and products covered in the 1963 Census of Manufactures．The data will be superseded．in a final report which， in turn，will be included in Volume II，Industry Statistics， 1963 Census of Manufactures．

During 1963，manufacturers in the Metal Barrels， Drums and Pails Industry shipped products valued at $\$ 303$ million，an increase of 21 percent over 1958，according to preliminary results obtained from the 1963 census．Average employment in this industry showed an increase of 10 percent from 1958 to a total of 10 thousand employees in 1963．Value added by manufacture amounted to $\$ 120$ million in 1963，an increase of 24 percent from 1958.

The Metal Barrels，Drums and Pails Industry includes establishments engaged primarily in the manufacture of ferrous and nonferrous shipping barrels，drums，kegs and pails．

This report does not include figures for administrative offices，warehouses，garages，or other auxiliary units which service manufacturing establishments．The classification of establish－ ments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification （SIC）Manual，as amended to date．Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years．

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Metal Barrels, Drums and Pails Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Metal Barrels, Drums and Pails Industry amounted to $\$ 303$ million. Of this total, $\$ 30$ million were products primaryto other industries; and $\$ 8$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e, the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 307$ million of metal barrels, drums and pails were shipped by all producers of these products. Of this total, $\$ 265$ million, or 86 percent, were shipped by plants classified in Industry 3491, Metal Barrels, Drums and Pails while the remainder was shipped by plants classified in other industries. The comparable ratio for 1958 was also 86 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROTND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

${ }^{\text {Steel shipping packages, kegs, and pails are }}$
${ }^{1}$ Steel shipping packages, kegs, and pails are defined as single-walled shipping containers with a range of capacity from 1 to l2 gallons inclusive, constructed of steel sheet of 29 gauge and heavier. This definition does not include tin cans (packers' cans, general line cans, and beer cans), terneplate oil containers, fluid milk shipping containers, ice cream cans, gas cylinders, beer barrels, reconditioned barrels, and drums, or containers not comnercially usable in the transportation of comodities.
${ }^{2}$ Steel shipping barrels and druns are defined as singlewalled cylindrical or bilged shipping containers, with a range of capacity from 12 to 132 gallons, constructed of steel. This definition does not include tin cans (packers' cans, general line cans, and beer cans), terneplate oil containers, high and low pressure gas steel cylinders, fluid milk shipping containers, ice crean cans, or containers not commercially usuable in the transportation of commodities.

# 1963 CENSUS OF MANUFAGTURES 

## Safes and vaults

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Safes and Vaults Industry shipped products valued at $\$ 78$ million, an increase of 33 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 and an increase of 1 percent from 1962 to a total of 3.3 thousand employees in 1963. Value added by manufacture amounted to $\$ 56$ million in 1963, an increase of 42 percent from 1958 and 10 percent from 1962.

## preliminary report

The Safes and Vaults Industry includes establishments engaged primarily in the manufacture of fire and burglary resistive steel safes and vaults (except Concrete Grave Vaults, Industry 3272, and Metal Grave Vaults, Industry 3988) and similar fire or burglary resistive products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{2}$ Includes expenditures for
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volures for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March.: May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Safes and Vaults Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Safes and Vaults Industry amounted to $\$ 78$ million. Of this total, $\$ 13$ million were products primary to other industries; and $\$ 13$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 80 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 82 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 58$ million of safes and vaults were shipped by all producers of these products. Of this total, $\$ 52$ million, or 90 percent, were shipped by plants classified in Industry 3492, Safes and Vaults, while the remainder was shipped by plants classified in other industries. The comparable 1958 ratio was 97 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Steel Springs Industry shipped products valued at $\$ 158$ million, an increase of 31 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 7 percent from 1958 and 11 percent from 1962 to a total of 6 thousand employees in 1963. Value added by manuf acture amounted to $\$ 69$ million in 1963, an increase of 28 percent from 1958 but a decrease of 10 percent from 1962.

The Steel Springs Industry includes establishments engaged primarily in the manufacture of leaf springs, hot wound springs, and coiled flat springs. Establishments primarily engaged in manufacturing wire springs are classified in Industry 3481, and rolling mills manufacturing steel springs in Industry 3312.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE STEEL SPRINGS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3493)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new ${ }^{-}$$(\$ 1,000)$ | Standard error of estimate (percent) for number of employees colum ${ }^{2}$ |

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard errors exceeding 15 percent. See the Annual Survey of Manufactures volumes for futher discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.

## ESTABLISHVENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Steel Springs Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Steel Springs Industry amounted to $\$ 158$ million. Of this total, $\$ 16$ million were products primary to other industries; and $\$ 7 \mathrm{mil}-$ lion were receipts for miscellaneous activities. The industry shipments of primary products represent 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 81 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3,indicates that $\$ 201$ million of steel springs were shipped by all producers of these products. Of this total, $\$ 134$ million, or 67 percent, were shipped by plants classified in Industry 3493, Steel Springs, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 69.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^73]
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Valves and pipe fittings

SIC Code 3494

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Valves and Pipe Fittings Industry shipped products valued at $\$ 1,573$ million, an increase of 24 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 but a 2 percent decrease from 1962 to a total of 80 thousand employees in 1963. Value added by manufacture amounted to $\$ 929$ million in 1963, an
increase of 27 percent from 1958 and practically equal to 1962.

The Valves and Pipe Fittings Industry includes establishments engaged primarily in the manufacture of valves for controlling the flow of liquids or gases in pipe and mains, and for machinery. Establishments primarily engaged in manufacturing faucets, spigots, and similar plumbers' brass goods and fittings are classified in Industry 3432.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

Teble 1. -GENERAL STATISTICS FOR THE VALVES AND PIPE FITYINGS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(NA) Not available. (X) Not applicable. $r_{\text {Revised. }}$
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colunn indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

For sole by the Bureou of the Census, Woshington, D.C., 20233, and U.S. Department of Commerce field Offices. 10 cents.
edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuies for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Valves and Pipe Fittings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Valves and Pipe Fittings Industry amounted to $\$ 1,573$ million. Of this total, $\$ 207$ million were products primary to other industries; and $\$ 73$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 86 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 88 percent (revised).

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 1,510$ million of Valves and Pipe Fittings were shipped by all producers of these products. Of this total, $\$ 1,293$ million, or 86 percent, were shipped by plants classified in Industry 3494 , Valves and Pipe Fittings while the remainder was shipped by plants classified in other industries. The comparable 1958 ratio was 88 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary actịities of the establishments in that industry, but also
their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROTND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963; it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.-GENRRAL STATISTICS FOR THE VALVES AND PIPE FITTINGS INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral lndustries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

## Volume 1, Summary Statistics

Volume 11, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume 111, Area Statistics
Mineral Industries
Volume 1, General Summary and Industry Statistics

Volume 1l, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Collapsible tubes

SIC Code 3496

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Collapsible Tubes Industry had total shipments valued at $\$ 50$ million, an increase of 12 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 but a decrease of 2 percent from 1962 to a total of 4.0 thousand employees in 1963. Value added by manufacture amounted to $\$ 30$ million in 1963, an increase of 18 percent from 1958 and 3 percent from 1962.

нне Collapsible Tubes Industry includes establishments engaged primarily in the manufacture of collapsible tubes defined as cylindrical containers for viscous products, made of thin flexible metal, usually of tin, tin lined lead, lead, lead-tin alloy or aluminum, with integral shoulder and neck, provided with an appropriate size opening in the throat, and usually with a screw cap made of plastic material for closure over the neck.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inc-uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Collapsible Tubes Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Collapsible Tubes Industry amounted to $\$ 50$ million. Of this total $\$ 5$ million were products primary to other industries; and $\$ 1$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured products shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 44$ million of collapsible tubes were shipped by all producers of these products. Of this total, $\$ 44$ million, or 100 percent, were shipped by plants classified in Industry 3496, Collapsible Tubes. The 1958 ratio was also 100 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports
will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 " and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

WASHINGTON, D.C. 20233

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Metal foil and leaf

SIC Code 3497

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Metal Foil and Leaf Industry had total shipments valued at $\$ 184$ million, an increase of 92 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 46 percent from 1958 to a total of 5.1 thousand employees in 1963. Value added by manufacture amounted to $\$ 64$ million in 1963, an increase of 68 percent from 1958.

The Metal Foil and Leaf Industry includes establishments engaged primarily in the manufacture of gold, silver, tin, and other metal foil (including converted metal foil) and leaf. Establishments primarily engaged in manufacturing plain aluminum foil are classified in Industry 3352.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE METAL FOII AND LEAF INDUSTRY IN THE UNITED STATES: 1963 AND 1958

| Year | Establishments (number) |  | A11 employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1, \infty 00)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new ${ }^{1}$$(\$ 1, \infty 00)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | With 20 or more employees | Number | $\begin{aligned} & \text { Payroll } \\ & (\$ 1,000) \end{aligned}$ | Number | $\begin{aligned} & \text { Man-hours } \\ & (1,000) \end{aligned}$ | $\begin{aligned} & \text { Wages } \\ & (\$ 1,000) \end{aligned}$ |  |  |  |  |

$\mathrm{r}_{\text {Revised. }}$
${ }^{1}$ Includes expenditures for expenditures for plants under construction but not in operation.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such infornation in the final census reports. See annual survey of manufactures volumes for further explanation of the sanpling estimate.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrisl Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.

April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inc-uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classifiedin the Metal Foil and Leaf Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Metal Foil and Leaf Industry amounted to $\$ 184$ million. Of this total, $\$ 31$ million were products primary to other industries; and $\$ 8$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 82 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 312$ million of Metal Foil and Leaf were shipped by all producers of these products. Of this total, $\$ 144$ million, or 46 percent, were shipped by plants classified in Industry 3497 , Metal Foil and Leaf while the remainder was shipped by plants classified in other industries. The comparable ratio in 1958 was 52 percent (revised).

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted iointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

These figures are not comparable to data published in Current Industrial Reports Series M26F, "Converted Flexible Packaging Products," due to incansistencies in reporting on the two surveys. It is planned at a later date to resolve these dirferences.
${ }^{2}$ In 1958 these data are limited to laminated foil made from purchased aluminum foil.
${ }_{3}$ In 1958 these detailed data are converted aluminum foil are available $\begin{aligned} & \text { in Current Industrial Reports Series M34P, "Alunimun Foil Converted." That report }\end{aligned}$ contains data on poundages of aluminum foil converted by end-use. However, it is not possible to precisely compare the data in this industry with data in the annual Current Industrial Report. Some of the products for which aluninum foil consumption is reported in the annual survey are produced for use by the same company to package a comnodity. In such cases, the converted aluminum foil product is not included in this industry but is included as a portion of the value of the packaged cononodity.

4 Data for product code 3497034 included with product code 3497036.

# 1963 CENSUS OF MANUFACTUR=S 

## INDUSTRY SERIES

# Fabricated pipe and fittings 

SIC Code 3498

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Fabricated Pipe and Fittings Industry had total shipments valued at $\$ 310$ million, a decrease of 6 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 14 percent from 1958 to a total of 13 thousand employees in 1963. Value added by manufacture amounted to $\$ 147$ million in 1963, a decrease of 5 percent from 1958.

The Fabricated Pipe and Fittings Industry includes establishments engaged primarily in fabricating pipe and pipe fittings from purchased pipe, by cutting, threading, bending, etc. Establishments primarily engaged in manufacturing cast iron pipe and fittings, including cast and forged pipe fittings which have been machined and threaded are classified in Industry 3321; welded and heavy riveted pipe in Industry 3317; and seamless steel pipe in Industry 3317.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

[^77](SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 andsubsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and '1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value adaed avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Fabricated Pipe and Fittings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Fabricated Pipe and Fittings Industry amounted to $\$ 310$ million. Of this total, $\$ 25$ million were products primary to other industries; and $\$ 23$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 89 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 288$ million of fabricated pipe and fittings were shipped by all producers of these products. Of this total, $\$ 262$ million, or 91 percent, were shipped by plants classified in Industry 3498, Fabricated Pipe and Fittings, while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was 93.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of
the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## Steam engines and turbines

## preliminary report

SIC Code 3511

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963 manufacturers in the Steam Engines and Turbines Industry had value of shipments of $\$ 618$ million, a decrease of 36 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 32 percent from 1958 and 7 percent from 1962 to a total of 31 thousand employees in 1963. Value added by manufacture amounted to $\$ 381$ million in 1963, a decrease of 35 percent from 1958 and 7 percent from 1962.

The Steam Engines and Turbines Industry includes establishments engaged primarily in the manufacture of mechanical drive steam turbines, steam turbine-gear units, gas turbines, and steam turbine generator sets.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE STEAM ENGINES AND TURBINES INDUSTRY FOR SELECTED YEARS
(SIC code 3511)

(NA) Not available.
(X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction and not yet in operation.
${ }^{2}$ The data are estimates derived from a representative sample of manuracturing establishments canvassed in the Annual survey of Nanuractures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of cifferences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

January 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: All employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. Production workers are based on employment for the payroll period ended nearest the l5th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels from 1958 to 1963.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Steam Engines and Turbines Industry consist not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Steam Engines and Turbines Industry amounted to $\$ 618$ million. Of this total, $\$ 55$ million were products primary to other industries; and $\$ 44$ million were receipts for miscellaneous activities. The industry shipments of
primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 78 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 573$ million of steam engines and turbines were shipped by all producers of these products. Of this total, $\$ 518$ million, or 91 percent, were shipped by plants classified in Industry 3511, Steam Engines and Turbines, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 94.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in table l are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (table 1) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLITCATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 28th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.--GENERAL STATISTICS FOR THE STEAM ENGINES AND TURBINES INDUSTRY BY REGIONS AND STATES: 1963 AND 1958 (Not applicable for this industry)

Table 3.--QUANTITY AND VALUE OF STEAM ENGINES AND TURBINES SHLPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Steam Engines and Turbines Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

## (NA) Not available. <br> (X) Not applicable.

${ }^{1}$ Of this total, 27 had a rated capacity of $24,999 \mathrm{hp}$. or under and 51 had a capacity of $25,000 \mathrm{hp}$. or over.
${ }^{2}$ For 1958, the 456 units shipped had a rated horsepower capacity as follows: 20-199 hp., 96; 200-499 hp., 59; $500-999 \mathrm{hp} ., 218$; and 1,000 hp. and over 83. Comparable data for 1963 are not available.
${ }^{3}$ Includes the value of gears.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Internal combustion engines <br> SIC Code 3519 

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Internal Combustion Engines Industry hadtotal shipments valued at $\$ 1,458$ million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 7 percent from 1958 and 5 percent from 1962 to a total of 56 thousand employees in 1963. Value added by manufacture amounted to $\$ 721$ million in 1963, an increase of 39 percent from 1958 and 16 percent from 1962.

The Internal Combustion Engine Industry includes establishments engaged primarily in the manufacture of Diesel, semi-Diesel, or other internal combustion engines,not elsewhere classified, for stationary, marine, traction, and other uses.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. -GENERAL STATISTICS FOR THE INTERNAL COMBUSTION ENGINES INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3519)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, <br> new ${ }^{1}$ $(\$ 1,000)$ | Standard error of estimate (percent) for number of employees column ${ }^{2}$ |

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Internal Combustion Engines Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified inthe Internal Combustion Engines Industry amounted to $\$ 1,458$ million. Of this total, $\$ 164$ million were products primary to other industries; and $\$ 58$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 88 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receiptsof establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,422$ million of internal combustion engines were shipped by all producers of these products. Of this total, $\$ 1,236$ million, or 87 percent, were shipped by plants classified in Industry 3519, Internal Combustion Engines, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 82.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.-GENERAL STATISTICS FOR THE INTERNAL COMBUSTION ENGINES INDUSTRY BY GFOGRAPHIC AREAS: 1963 AND 1958 (Preliminary State and regional detail not available without further review)

## (X) Not applicable. ${ }^{r}$ Revised.

For these products, figures were also collected in the Bureau of the Census cormodity survey program. In lieu of asking for detailed statistics on these products in the census of mamufactures, respondents were asked to report only value of shipments for specified groups of products for which separate figures had previously been collected in the commodity survey. In most cases, the value figures reported in the census of manufactures for each group of products agreed closely with the corresponding figures reported in the commodity survey. However, there were minor differences between the census figures and the commodity survey figures. These variations were due primarily to the following reasons:
a. Better coverage in census of manufactures program. Coverage in the annual survey on Form MA-35L will be supplemented by ading responaients not currently in the survey but making the specified product according to their census of manufactures report.
b. Use of different reporting periods (calendar year vs. fiscal year).
c. Use of estimates in reporting figures on the commodity survey, whereas census of manuractures figures generally represent more exact shipment figures.
See current Industrial Reports Series M35L "Internal Combustion Engines" for more detailed product data.
${ }^{2}$ Dual-fuel engines shipped in 1958 were included with Diesel and Semi-Diesel (except automotive).
${ }^{3}$ Includes dual-fuel engines.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Farm machinery and equipment

# preliminary report 

SIC Code 3522

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Farm Machinery and Equipment Industry shipped products valued at $\$ 2,852$ million, an increase of 18 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 and 7 percent from 1962 to a total of 113 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,334$ million in 1963, an increase of 23 percent from 1958 and 11 percent from 1962.

The Farm Machinery and Equipment Industry includes establishments engaged primarily in the manufacture of farm machinery, including equipment and wheel tractors, for use in the preparation and maintenance of the soil; planting and harvesting of the crop; preparing, on the farm, crops for market; or for use in performing other farm operations and processes. This industry includes wheel tractors except contractors' off-highway type which are classified in Industry 3531.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturine establishments convassed in the Annual Survey of Manufactures. These
${ }^{3_{A}}$ revision in the definition of this industry was made in the 1957 Standard Industrial Classification so that data for the industry are not available for earifer years.
March 1965
edition of the Standara Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March.' May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Farm Machinery and Equipment Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Farm Machinery and Equipment Industry amounted to \$2,852 million. Of this total, $\$ 320$ million were products primary to other industries; and $\$ 120$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 88 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 2,535$ million of farm machinery were shipped by all producers of these products. Of this total, $\$ 2,411$ million, or 95 percent, were shipped by plants classified in Industry 3522, Farm Machinery and Equipment, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 94.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

${ }^{1}$ For these products, figures were also collected in the Bureau of the Census cormodity survey progran. In lieu of asking for detailed statistics on these products in the census of manufactures, respondents were asked to report only value of shipments for specified groups of products for which separate figures had previously been collected in the cormodity survey. In most cases, the value figures reported in the census of manuractures for each group of products agreed closely with the corresponding figures reported in the commodity survey. However, there were minor differences between the census figures and the commodity survey figures. These variations were due primarily to the following reasons:
a. Use of different reporting periods (calendar year vs. fiscal year).
b. Use of different bases for reporting value (company sales vs, factory production).
c. Use of estimates in

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Construction machinery

SIC Code 3531

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Construction Machinery Industry had total shipments valued at $\$ 2,639$ million, an increase of 25 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 9 percent from 1958 and 5 percent from 1962 to a total of 104 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,265$ million in 1963, an increase of 24 percent from 1958 and 11 percent from 1962.

The Construction Machinery Industry includes establishments engaged primarily inthe manufacture of heavy machinery and equipment used by the construction industries, such as bulldozers; concrete mixers; cranes, except industrial plant; dredging machinery; pavers and power shovels.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE CONSTRUCTION MACHINERY INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3531)

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Construction Machinery Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Construction Machinery Industry amounted to $\$ 2,639 \mathrm{million}$. Of this total, $\$ 180$ million were products primary to other industries; and $\$ 140$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 88 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 2,577$ million of construction machinery and equipment were shipped by all producers of these products. Of this total, $\$ 2,319$ million, or 90 percent, were shipped by plants classified in Industry 3531, Construction Machinery, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 90.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

- Represents zero, (NA) Not available. (X) Not applicable. revised.
${ }^{1}$ For these products, data were also collected in the census annual commodity survey program. In lieu of asking for detailed statistics on these products in the 1958 Census of Manufactures, respandents were asked to repart omly value of shipments for specified products or classes of products for which separate figures had previously been collected in the commodity survey. In most cases, the value figures reported in the Census of Manufactures for each product or class of products agreed closely with the corresponding figures reported in the commodity survey. However, there were some differences between the census figures and the cormodity survey figures. These variations were due primarily to the following reasons:
a. Use of different reporting periods (calendar year vs. fiscal year.)
b. Use of different bases for reporting value (company sales vs. factory production.)
c. Use of estimates in reporting data on the commodity survey whereas Census of Manufactures figures generally represent more exact shipments figures.
See current Industrial Reports Series M35D, "Construction Machinery," and M35S, "Tractors," for more detailed product data.
${ }^{2}$ Data for 1963 as published in the Current Industrial Reports Series M35D for selected products should be revised as follows:

${ }^{3}$ For 1958 , selected types of construction machinery for which figures were collected on Census Annual Form MA-35D or Quarterly Form M35D but which could not be published are included with code 3531411 . These products include scrapers, 2 and 4 -wheel, under 7 cubic yard standard struck capacity; winches (towing, logging and oil field types) for mounting on tractors; cranes for mounting on tractors; wheel tractors
(truck type), off-highway type, 2 and 3 axle models; and portabledrills, churn drill type, water well and blast hole.
${ }^{4}$ Data for 1958 exclude parts and attachments.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by moredetailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral 1ndustries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume I, Summary Statistics<br>Volume 11, Industry Statistics<br>Part 1, Major Groups 20-28<br>Part 2, Major Groups 29-39<br>Volume III, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expendirures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Mining machinery and equipment

## preliminary report

SIC Code 3532

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Mining Machinery and Equipment Industry had total shipments valued at $\$ 400$ million, an increase of 17 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 7 percent from 1958 to a total of 17 thousand employees in 1963. Value added by manufacture amounted to $\$ 205$ million in 1963, an increase of 24 percent from 1958.

The Mining Machinery and Equipment Industry includes establishments engaged primarily in the manufacture of heavy machinery and equipment used by the mining industries, such as coal breakers, mine cars, mineral cleaning machinery, concentration machinery, core drills, coal cutters, portable rock drills, and rock crushing machinery.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

Table 1. -GENERAL STATISTICS FOR THE MINING MACHINERY AND RQUIPMENT INDUSTRY IN THE UNITED STATES FOR 1963 AND 1958
(SIC code 3532)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures,$(\$ 1,000)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | With 20 or more employees | Number | $\begin{aligned} & \text { Payroll } \\ & (\$ 1,000) \end{aligned}$ | Number | $\begin{gathered} \text { Man-hours } \\ (1,000) \end{gathered}$ | $\begin{gathered} \text { Wages } \\ (\$ 1,000) \end{gathered}$ |  |  |  |  |
| $\begin{aligned} & 1963^{2} \ldots . . \\ & 1958^{3} \ldots \ldots \end{aligned}$ | $\begin{aligned} & 203 \\ & 173 \end{aligned}$ | 92 90 | 16,611 17,808 | 108,010 96,966 | 11,539 11,661 | 22,842 22,578 | 66,526 56,423 | $\begin{aligned} & 205,342 \\ & 165,831 \end{aligned}$ | 196,618 167,142 | $\begin{aligned} & 400,088 \\ & 342,035 \end{aligned}$ | 6,420 6,507 |

${ }^{1}$ Includes expenditures for plants under construction but not in operation.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manuractures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The standard errors associated with these estimates are published in the annual survey of manufactures volumes for this period.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.
March 1965
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel; purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establish_ ments classified in the Mining Machinery and Equipment Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of all establishments classified inthe Mining Machinery and Equipment Industry amounted to $\$ 400 \mathrm{million}$. Of this total, $\$ 85$ million were products primary to other industries; and $\$ 49$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 76 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 72 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that \$326 million of mining machinery and equipment were shipped by all producers of these products. Of this total, $\$ 266$ million, or 81 percent, were shipped by plants classified in Industry 3532, Mining Machinery and Equipments while the remainder was shipped by plants classified in other industries. The 1958 ratio was 77 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States. Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 GENSUS OF MANUFACTUR=S 

## INDUSTRY SERIES

## Oil field machinery

SIC Code 3533

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Oil Field Machinery Industry had total shipments of $\$ 624$ million, an increase of 7 percent over 1958, according to preliminary results obtained from the 1963 census. Average employennt in this industry showed a decrease of 12 percent from 1958 and 2 percent from 1962 to a total of 28 thousand employees in 1963. Value added by manufacture amounted to $\$ 378$ million in 1963, an increase of 12 percent from 1958 but a decrease of 1 percent from 1962.

The Oil Field Machinery Industry includes establishments engaged primarily in the manufacture of machinery and equipment for use in oil and gas fields, or for drilling water wells.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in l939 and 1947 and is not available by 4-digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. The figures shown in parenthesis either have associated standard errors exceeding 15 percent or are not consistent with related data. See the Annual Survey of Manufactures volumes for further discussion of sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

Ine method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Oil Field Machinery Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Oil Field Machinery Industry amounted to $\$ 624$ million. Of this total, $\$ 46$ million were products primary to other industries; and $\$ 83$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 539$ million of oil field machinery were shipped by all producers of these products. Of this total, $\$ 495$ million, or 92 percent, were shipped by plants classified in Industry 3533, Oil Field Machinery while the remainder was shipped plants classified in other industries. The 1958 percentage was 94.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Comerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Elevators and moving stairways 

SIC Code 3534

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Elevators and Moving Stairways Industry had total shipments valued at $\$ 319$ million, an increase of 65 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 29 percent from 1958 to a total of 12 thousand employees in 1963. Value added by manufacture amounted to $\$ 201$ million in 1963, an increase of 59 percent from 1958.

The Elevators and Moving Stairways Industry includes establishments engaged primarily in the manufacture of passenger or freight elevators, automobile lifts, dumb waiters, and moving stairways.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABIISHMENES

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March. May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VAIUE ADDED BY MANUFACIURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Elevators and Moving Stairways Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classifiedinthe Elevators and Moving Stairways Industry amounted to \$319 million. Of this total, $\$ 10 \mathrm{million}$ were products primary to other industries; and $\$ 75$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 248$ million of elevators and moving stairways were shipped by all producers of these products. Of this total, $\$ 234$ million, or 94 percent, were shipped by plants classified in Industry 3534, Elevators and Moving Stairways while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 80.

## INDEXES OF PRODUCTION AND UNIT VALUE

- Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Conveyors

SIC Code 3535

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Conveyors Industry had total shipments valued at $\$ 487$ million, an increase of 26 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of approximately 1 percent from 1958 and 3 percent from 1962 to a total of 21 thousand employees in 1963. Value added by manufacture amounted to $\$ 264$ million in 1963, an increase of 37 percent from 1958 and 6 percent from 1962.

The Conveyors Industry includes establishments engaged primarily in the manufacture of gravity conveyors, overhead trolley conveyor systems, pneumatic tube systems, portable conveyors, underground mine conveyors, and other bulk material and package (unit) conveyors, as well as parts and attachments for these products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

(N:) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation.
${ }^{2}$ The data are estimates derived from a representative sampli of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

January 1965
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. Production workers are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Conveyors Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries),
and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Conveyors Industry amounted to $\$ 487$ million. Of this total, $\$ 74$ million were products primary to other industries; and $\$ 77$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 82 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 81 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 407$ million of conveyors were shipped by all producers of these products. Of this total, $\$ 335$ million, or 82 percent, were shipped by plants classified in Industry 3535, Conveyors, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 78.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5
years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Titile 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Hoists, cranes, and monorails

SIC Code 3536

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Hoists, Cranes, and Monorails Industry shipped products valued at $\$ 220$ million, an increase of 19 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of approximately 1 percent from 1958 to a total of 9.6 thousand employees in 1963. Value added by manufacture amounted to $\$ 112$ million in 1963, an increase of 21 percent from 1958.

The Hoists, Cranes and Monorails Industry includes establishments engaged primarily in the manufacture of overhead traveling cranes, hoists, and monorail systems for installation in factories, warehouses, and other industrial and commercial establishments.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent

[^84]years but are not included for 1954 and earlier lyears.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll periods ended nearest the 15th of March. Production workers, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Hoists, Cranes, and Monorails Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total
value of shipments and other receipts of establishments classified in the Hoists, Cranes, and Monorails Industry amounted to $\$ 220$ million. Of this total, $\$ 39$ million were products primary to other industries; and $\$ 24$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 80 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 79 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 223$ million of hoists, cranes, and monorails were shipped by all producers of these products. Of this total, $\$ 157$ million, or 70 percent, were shipped by plants classified in Industry 3536, Hoists, Cranes, and Monorails while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 78.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Industrial trucks and tractors

SIC Code 3537

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Industrial Trucks and Tractors Industry shipped products valued at $\$ 438$ million, an increase of 63 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 18 percent from 1958 to a total of 17 thousand employees in 1963. Value added by manufacture amounted to $\$ 223$ million in 1963, an increase of 90 percent from 1958.

The Industrial Trucks and Tractors Industry includes establishments engaged primarily in the manufacture of industrial trucks, tractors, stackers (truck type) and related equipment, used in handling materials on paved surfaces in and around industrial and cormercial plants, depots, docks, and terminals.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

Table 1.--GENRRAL STATISTICS FOR THE INDUSTRIAL TRUCKS AND TRACTORS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

[^85](SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Industrial Trucks and Tractors Industry consists not only of producits described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Industrial Trucks and Tractors Industry amounted to $\$ 438$ million. Of this total, $\$ 34$ million were products primary to other industries; and $\$ 33$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 459$ million of industrial trucks and tractors were shipped by all producers of these products. Of this total, $\$ 371$ million, or 81 percent, were shipped by plants classified in Industry 3537, Industrial Trucks and Tractors, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 84.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A)which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary surmary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

SIC Code 3541

## preliminary report

 <br> \section*{Metal-cutting machine tools} <br> \section*{Metal-cutting machine tools}This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Metal-cutting Machine Tools Industry had total shipments valued at $\$ 1,056$ million, an increase of 55 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 15 percent from 1958 and 3 percent from 1962 to a total of 61 thousand employees in 1963. Value added by manufacture amounted to $\$ 695$ million in 1963, an increase of 65 percent from 1958 and 4 percent from 1962.

#### Abstract

The Metal-cutting Machine Tools Industry includes establishments engaged primarily in the manufacture of power driven machines, not supported in the hands of an operator when in use, that shape metal by cutting away chips; the rebuilding of such machine tools, as well as the manufacture of replacement parts for them. Metalworking, or primarily metalworking, machine tools designed primarily for home workshops are also included.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

Table 1.-GENERAL STATISTICS FOR THE METAL-CUTTING MACHINE TOOLS INDUSTRY IN THE UNITED STATES FOR SETECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1, \infty 00)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new ${ }^{1}$$(\$ 1,000)$ | Standard error of estimate (percent) for number of employees colum ${ }^{2}$ |

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August; and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March. May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Metal-cutting Machine Tools Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Metal-cutting Machine Tools Industry amounted to $\$ 1,056$ million. Of this total, $\$ 185$ million were products primary to other industries; and $\$ 70$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 81 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 85 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 918$ million of metal-cutting machine tools were shipped by all producers of these products. Of this total, $\$ 801$ million, or 87 percent, were shipped by plants classified in Industry 3541 , Metal-cutting Machine Tools, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 89.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATTON PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports
will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

INDUSTRY SERIES

# Metal-forming machine tools 

## preliminary report

SIC Code 3542

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers inthe Metal-forming Machine Tools Industry shipped products valued at $\$ 440$ million, an increase of 38 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 1 percent from 1958 and 5 percent from 1962 to a total of 22 thousand employees in 1963. Value added by manufacture amounted to $\$ 278$ million in 1963, an increase of 58 percent from 1958 and 5 percent from 1962.

The Metal-forming Machine Tools Industry includes establishments engaged primarily in the manufacture of power driven machines, not supported in the hands of an operator while in use, for pressing, forging, hammering, extruding, shearing, bending, or die casting metal into shape. The industry also includes rebuilding such machine tools and manufacturing repair parts for them.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

(NA) Not available. (X) Not applicable.
under construction but not in operation. This information was not collected in 1939 and 1947 and is not availle by 4-digit industry for 1954 .
The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequentiy, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected betweer the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.
March 1965

and Hawaii are included for 1958 and subsecuent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and $1958-1963$ value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE CF SHIPMENTS

The value of shipments reported by establishments classifiedin the Metal-forming Machine Tools Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Metal-forming Machine Tools Industry amounted to $\$ 440$ million. Of this total, $\$ 77$ million were products primary to other industries; and $\$ 31$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 81 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 82 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 423$ million of Metal-forming Machine Tools were shipped by all producers of these products. Of this total, $\$ 332$ million, or 79 percent, were shipped by plants classified in Industry 3542, Metal-forming Machine Tools while the remainder was shipped by plants classified in other industries. The comparable ratio in 1958 was 80.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing
industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(Includes quantity and value of these products reported not only by establishments classified in the Metal-Forming Machine Tools Industry but also by establishnents making these items as "secondary" products in other industries. See text under "Value of Shiprents")

See footnotes at end of table.

Table 3.-QUANTITY AND VALUE OF METAL-FORMING TYPE MACHINE TOOLS SHIPPED BY ALI PRODUCERS IN THE UNITED STATES: 1963 AND 1958—Continued

$\overline{1}$ Represents zero. (X) Not applicable. $r_{\text {Revised. }}$
${ }_{2}$ Includes data for product codes 3542411-98 and 3542511-37.
${ }^{2}$ For these products, detailed data were also collected on Quarterly Census Form M35W. In lieu of asking for detailed statistics on these products in the Censuses of Manufactures, respondents were asked to report only value of shipments for specified classes of products for which separate figures had previously been collected on the comodity survey form. In most cases, the value figures reported in the census of Manufactures for each class of products agreed closely with the corresponding figures reported in the quarterly survey. However, there were some differences between the Census figures and the commodity survey figures. These variations were due primarily to the following reasons:
a. Inclusion of parts shipped with complete machines in the Census of Manufactures, whereas such data may be excluded from the quarterly survey.
b. Use of different bases for reporting value (company sales vs. factory production).
c. Use of estimates in reporting data on the quarterly survey, whereas Census of Manufactures figures generally represent more exact shipments figures.
d. Better coverage in the Census of Manufactures progran. Current comodity survey detail for 1963 have been revised to reflect data from respondents not previously included.
Manually operated punching and shearing machines valued at $\$ 1,000$ or over are included with other punching and shearing machines
${ }^{4}$ Machines with an average value of under $\$ 1,000$ for codes 3542421 and 3542451 are included with product code 3542498.
${ }^{5}$ For 1963 , power type bending and forming machines with an average value of under $\$ 1,000$ are included with manual machines.
${ }^{6}$ For 1963, all machines with an average value of under $\$ 1,000$ for codes 3542212,3542213 , 3542215, 3542241, and 3542257 are included with code ${ }^{7}$ Figures for codes 3542255 and 3542258
${ }^{7}$ Figures for codes 3542255 and 3542258 are included in code 3542259.
${ }^{8}$ For 1963, all machines with an average value of under $\$ 1,000$ for codes 3542261 , 3542268 , and 3542274 are included with 3542279 , "All other hydraulic presses."
${ }^{9}$ For 1963, figures for codes 35422 '71, 3542272, 3542273, and 3542281 are included in code 3542279. For 1958, figures for codes 3542273,
and 3542281 are included with code 3542279.
Includes data for product codes 3542311-98 and 3542811-59.
${ }^{11}$ Some machines with an average value of under \$1,000 for code 3542811 are included with codes 3542855-59, "Spinning Lathes."

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will providegeneral statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral lndustries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics<br>Volume 11, Industry Statistics<br>Part 1, Major Groups 20-28<br>Part 2, Major Groups 29-39<br>Volume 111, Area Statistics

## Mineral lndustries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Special dies and tools

SIC Code 3544

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Special Dies and Tools Industry had total shipments of $\$ 1,424$ million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 7 percent from 1958 to a total of 89 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,070$ million in 1963, an increase of 37 percent from 1958.

The Special Dies and Tools Industry includes establishments engaged primarily in the manufacture
of special tools and fixtures for use with machine tools, hammers, die casting machines and presses. The products of establishments classified in this industry includea wide variety of special toolings, such as dies; punches; die sets and components, and subpresses; jigs and fixtures and special checking devices. Establishments primarily engaged in manufacturing metal molds for use with foundry, plaster working, rubber working, plastic working, glass working and similar machinery are also included.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABIISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inc...uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures is as follows: All employees represent the average number of production workersfor the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. Production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the zost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Special Dies and Tools Industry consists not only of products described above as primary to the industry, but also of the value of
secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Special Dies and Tools Industry amounted to $\$ 1,424$ million. Of this total, $\$ 106$ million were products primary to other industries; and $\$ 203$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that \$1,593 million of special dies and tools were shipped by all producers of these products. Of this total, \$1,115 million, or 70 percent, were shipped by plants classified in Industry 3544, Special Dies and Tools while the remainder was shipped by plants classified in other industries. The 1958 percentage was 68.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade; wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to
cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

# Machine tool accessories 

SIC Code 3545

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Machine Tool Accessories Industry shipped products valued at $\$ 787$ million, an increase of 54 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 but a decrease of 4 percent from 1962 to a total of 47 thousand employees in 1963. Value added by manufacture amounted to $\$ 559$ million in 1963, an
increase of 60 percent from 1958 but a decrease of 2 percent from 1962.

The Machine Tool Accessories Industry includes establishments engaged primarily in the manufacture of cutting tools, precision measuring tools, and attachments and accessories for machine tools and for other metalworking machinery, not elsewhere classified.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequentiy, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

For sale by the Bureau of the Census, Woshington, D.C., 20233, and U. S. Department of Cammerce Field Offices. 10 cents.
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establīshments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Machine Tool Accessories Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Machine Tool Accessories Industry amounted to $\$ 787$ million. Of this total, $\$ 130$ million were products primary to other industries; and $\$ 50$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 82 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 85 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 732$ million of machine tool accessories and measuring devices were shipped by all producers of these products. Of this total, $\$ 607$ million, or 82 percent, were shipped by plants classified in Industry 3545, Machine Tool Accessories while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 85.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries durang the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conuucted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

n.e.c. Not elsewhere classified.
${ }^{1}$ For 1958 , data for these products include tips sold separately but exclude blanks.
${ }^{2}$ For 1963, respondents were requested to use the following definitions of blanks, tips, and inserts:
Blanks are unground material, cast or formed, from which a solid tool or cutting tip can be made.

Tips are a finished or semifinished form ready to be brazed, soldered, or otherwise bonded to a shank to form a cutting tool.

Inserts are replaceable mechanically held cutting components of cutting tools, ground on all surfaces or on top and bottom.
The 1958 report form carried no definitions for these products.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral lndustries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures ( 2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral lndustries (about 45 reports). Separate reports for industries or for groups of industrien for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (5l reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures ( 2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral lndustries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics
Volume 11 , Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume III, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume 1l, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Metalworking machinery, n. e.c. 

SIC Code 3548

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Metalworking Machinery, N.E.C., Industry had total shipments valued at $\$ 793$ million, an increase of 32 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 14 percent from 1958 and 6 percent from 1962 to a total of 38 thousand employees in 1963. Value added by manufacture amounted to $\$ 469$ million in 1963, an increase of 41 percent from 1958 and 9 percent from 1962.

The Metalworking Machinery, N.E.C., Industry includes establishments engaged primarily in the manufacture of metalworking machinery such as rolling mill machinery and equipment, power driven hand tools, welding equipment, wire fabricating machinery and equipment, and automotive maintenance machinery and equipment.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

[^93]April 1965
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Metalworking Machinery, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Metalworking Machinery, N.E.C., Industry amounted to $\$ 793$ million. Of this total, $\$ 118$ million were products primary to other industries; and $\$ 69$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 84 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 698$ million of metalworking machinery, n.e.c., were shipped by all producers of these products. Of this total, $\$ 606$ million, or 87 percent, were shipped by plants classified in Industry 3548, Metalworking Machinery, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 85.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(S)
(X) Not applicable. $r_{\text {Revised. }}$
${ }^{1}$ Data for product code 3548235 are limited to pneumatic drills. Pneumatic screwdrivers and nut-runners are included with "Other pneumatic-powered hand tools.
${ }^{2}$ The data published in the 1958 report for these products have been revised. As a result of these changes, it is not possible to publish separate data for these products without revealing the operation of individual companies.
${ }^{3}$ For these products, data were also collected on Census Form M35W. In lieu of asking for detailed statistics on these products in the Census of Nanufactures, respondents were asked to report only value of shipments for specified classes of products for which separate figures had previously been collected on the quarterly Form M35W. In most cases, the value figures reported in the Census of Manufactures for each class of products agreed closely with the corresponding figures reported in the quarterly survey. However, there were some differences between the census figures and the quarterly survey figures. These variations were due primarily to the following reasons
a. Major differences due to better coverage in the Census of Manufactures program. Coverage in the quarterly survey on Form M 35 W will be supplemented by adding respondents not currently in the survey but making the specified product according to their Census of Manufactures report.
b. Census of Manufactures reports correctly including all accessories or attachments ordered and shipped with the machine. In some cases the quarterly survey represents only the value of the basic machine.
c. Use of different reporting periods (calendar years vs. fiscal year).
d. Use of different bases for reporting value (company sales vs. factory production)
e. Use of estimates in reporting data on the quarterly survey. Whereas Census of Manufactures figures generally represent more exact shipments figures.
${ }^{4}$ A major portion of this value represents metalworking assembly and automation equipment, not elsewhere classified.

# 1963 CENSUS OF MAMUFACTURニS 

## INDUSTRY SERIES

# Food products machinery 

SIC Code 3551

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Food Products Machinery Industry had total shipments valued at $\$ 616$ million, an increase of 35 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 10 percent from 1958 but a 4 percent decrease from 1962 to a total of 31 thousand employees in 1963. Value added by manufacture amounted to $\$ 365$ million in 1963, an increase of 36 percent from 1958 with virtually no change from 1962.

The Food Products Machinery Industry includes establishments engaged primarily in the manufacture of machinery for use by the food products and beverage manufacturing industries in the preparation, canning, or packaging of food products, as well as parts and attachments for such machinery.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequentiy, may differ from the results that would have been obtained from a complete eanvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and corplete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipnents (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured olus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Food Products Machinery Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Food Products Machinery Industry amounted to $\$ 616$ million. Of this total, $\$ 67$ million were products primary to other industries; and $\$ 113$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 507$ million of food products machinery were shipped by all producers of these products. Of this total, $\$ 436$ million, or 86 percent, were shipped by plants classified in Industry 3551, Food Products Machinery, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 84.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, itt was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

USCOMM-DC

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral lndustries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral lndustries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (5l reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures ( 2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral lndustries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

> Volume 1, Summary Statistics
> Volume 11, Industry Statistics
> Part 1, Major Groups 20-28
> Part 2, Major Groups $29-39$

Volume 111, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Textile machinery

SIC Code 3552

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Textile Machinery Industry shipped products valued at $\$ 543$ million, an increase of 44 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 5 percent from 1958 but a decrease of 7 percent from 1962 to a total of 36 thousand employees in 1963. Value added by manufacture amounted to $\$ 314$ million in 1963, an increase of 47 percent from 1958 but a decrease of 9 percent from 1962.

The Textile Machinery Industry includes establishments engaged primarily in the manufacture of machinery for the textile industries, and parts, attachments, and accessories.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^94]${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estinates and complete canvass totals bercentage standard errors in this column indicate the range of differences that can be expected between the estinates and complete canvass totars because of sampling fluctuations. Figures shown in pare
volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel; purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made ir
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Textile Machinery Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Textile Machinery Industry amounted to $\$ 543$ million. Of this total, $\$ 37$ million were products primary to other industries; and $\$ 37$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 498$ million of textile machinery were shipped by all producers of these products. Of this total, \$469 million, or 94 percent, were shipped by plants classified in Industry 3552, Textile Machinery, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 94.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value stàtistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Conmerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

\author{

## Woodworking machinery

 <br> SIC Code 3553}

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Woodworking Machinery Industry had total shipments valued at $\$ 251$ million, an increase of 17 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 2 percent from 1958 to a total of 12 thousand employees in 1963. Value added by manufacture amounted to $\$ 146$ million in 1963, an increase of 29 percent from 1958.

The Woodworking Machinery Industry includes establishments engaged primarily in the manufacture of machinery for sawriills, planing mills, cabinet and furniture makers, pattern makers and veneer workers

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^96]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operafing more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in Jctober). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Woodworking Machinery Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Woodworking Machinery Industry amounted to $\$ 251$ million. Of this total, $\$ 47$ million were products primary to other indus tries; and $\$ 23$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 80 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 78 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that \$219 million of woodworking machinery were shipped by all producers of these products. Of this total, $\$ 183$ million, or 83 percent, were shipped by plants classified in Industry 3553, Woodworking Machinery while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 86.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -GENERAL STATISTICS FOR THE WOODWORKING MACHINERY INDUSTRY, BY REGIONS AND STATES: 1963 AND 1958

| Region and State | 1963 |  |  |  |  |  |  |  |  |  |  | 1958 |  |

[^98]
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Paper industries machinery

SIC Code 3554

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics. 1963 Census of Manufactures.

During 1963, manufacturers in the Paper Industries Machinery Industry had total shipments of $\$ 402$ million, an increase of 30 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 18 percent from 1958 to a total of 19 thousand employees in 1963. Value added by manufacture amounted to $\$ 231$ million in 1963 , an increase of 91 percent from 1958.

The Paper Industries Machinery Industry includes establishments engaged primarily in the manufacture of machinery for the paper pulp, paper, and paper product industries.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. -GENERAL STATISTICS FOR THE PAPER INDUSTRIES MACHINERY INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3554)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufac ture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1, \infty 00)$ | Capital expend itures, newi$(\$ 1,000)$ |

|  | Total | With 20 or more employees | Number | $\begin{aligned} & \text { Payroll } \\ & (\$ 1,000) \end{aligned}$ | Number | $\begin{gathered} \text { Man-hours } \\ (1,000) \end{gathered}$ | $\begin{aligned} & \text { Wages } \\ & (\$ 1,000) \end{aligned}$ |  |  |  |  |
| 1963²... | 217 | 91 | 18,561 | 130,386 | 12,883 |  | 82,145 | 230,912 | 199,357 | 402,071 | 10,131 |
| 1958.... | 202 | 97 | 15,713 | 89,881 | 11,356 | 22,727 | 58,198 | 123,758 | 155,610 | 310,179 | 4,847 |
| $1954{ }^{3}$ | 169 | 98 | 15,003 | 73,713 | 11,516 | 23,745 | 50,057 | 109,803 | 92,479 | 206,951 | 4,916 |
| $1947{ }^{3}$. | 149 | (NA) | 17,088 | 57,749 | 13,398 | 29,782 | 41,523 | 81,358 | 69,727 | 151,085 | (NA) |
| $1939{ }^{3}$.... | 116 | (NA) | (NA) | (NA) | 5,570 | (NA) | 7,984 | 20,198 | 13,017 | 33,215 | (NA) |

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not avaliable by <-digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965

## ESTABLISHMENTS

the census of manuiactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Paper Industries Machinery Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Paper Industries Machinery Industry amounted to $\$ 402$ million. Of this total, \$44 million were products primary to other industries; and $\$ 49$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 346$ million of paper industries machinery were shipped by all producers of these products. Of this total, $\$ 309$ million, or 89 percent, were shipped by plants classified in Industry 3554, Paper Industries Machinery while the remainderwas shipped by plants classified in other industries. The 1958 percentage was 91.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing estab-. lishments in interim years.

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Printing trades machinery

## preliminary report

SIC Code 3555

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Printing Trades Machinery Industry shipped products valued at $\$ 448$ million, an increase of 45 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 8 percent from 1958 but a 2 percent decrease from 1962 to a total of 23 thousand employees in 1963. Value added by manufacture amounted to $\$ 286$ million in 1963, an increase of .52 percent from 1958 but a decrease of 1 percent from 1962.

The Printing Trades Machinery Industry includes establishments engaged primarily in the manufacture of machinery and equipment used by the printing and bookbinding trades.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial ir size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufac. ture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Printing Trades Machinery Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Printing Trades Machinery Industry amounted to $\$ 448$ million. Of this total, $\$ 15$ million were products primary to other industries; and $\$ 64$ million were receipts for miscellaneous activities. The industry shipmentsof primary products represented 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 396$ million of printing trades machinery were shipped by all producers of these products. Of this total, $\$ 369$ million, or 93 percent, were shipped by plants classified in Industry 3555, Printing Trades Machinery, while the remainder was shipped by plants classified in other industries. The 1958 percentage-was 92.

## INDEXES. OF PRODUCTION AND UNIT VALUE

Based on the cype of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary sumnary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 thr $\operatorname{lngh}$ mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing estabLishments in interim years.

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

# Special industry machines, n.e.c. 

SIC Code 3559

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Special Industry Machines, N.E.C., Industry had total shipments valued at $\$ 990$ million, an increase of 30 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 1 percent from 1958 but a 3 percent increase from 1962 to a total of 50 thousand employees in 1963. Value added by manufacture amounted to $\$ 568$ million in 1963, an increase of 32 percent from 1958 and 8 percent from 1962.

The Special Industry Machines, N.E.C., Industry includes establishments engaged primarily in the manufacture of special industry machinery, not elsewhere classified, such as smelting and refining equipment, cement making, clay working, cotton ginning, glass making, hat making, incandescent lamp making, leather working, paint making, rubber working, cigar and cigarette making, tobacco working, shoe making, and stone working machinery.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manuracturing establishments. percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complime

Data for Alaska and Hawaii are not included.
April 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inc-uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average númber of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Special Industry Machines, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primaryin other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Special Industry Machinery, N.E.C., Industry amounted to $\$ 990$ million. Of this total, $\$ 134$ million were products primary to other industries; and $\$ 117$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 969$ million of special industry machines, n.e.c., were shipped by all producers of these products. Of this total, $\$ 739$ million, or 76 percent, were shipped by plants classified in Industry 3559, Special Industry Machines, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 77.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of
the United States Code. This law requires that a census of manufactures by conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census willbe conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

General industry machines, n. e. c. sic code 3569

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the General Industry Machines, N.E.C., Industry had total shipments valued at $\$ 682$ million, an increase of 49 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 27 percent from 1958 and 8 percent from 1962 to a total of 36 thousand employees in 1963. Value added by manufacture amounted to $\$ 419$ million in 1963, an increase of 49 percent from 1958 and 48 percent from 1962.

The General Industry Machines, N.E.C., Industry includes establishments engaged primarily in the manufacture of machinery, equipment, and components for general industrial use, and for which no special classification is provided. Machine shops primarily engaged in producing machine and equipment parts, usually on a job or order basis, are classified in Industry 3599.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent

 able by 4 -digit industry for 195 L .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimate, consequently, may differ irom the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range or differences that can be expected between the estimates and complete canvass totals because of sampling fluctuation. Figures shown in parentheses have standard errors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling ectimate.
${ }^{3}$ A revision in the definition of this industry vas introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department af Commerce Field Offices. 10 cents.
years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing es tablishments inc-.uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures show in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the General Industry Machines, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products etc. The total value of shipments and other receipts of establishments classified in the General Industry Machines, N.E.C., Industry amounted to $\$ 682$ million. Of this total, $\$ 87$ million were products primary to other industries; and $\$ 129$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 84 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 662$ million of general industry machines, n.e.c., were shipped by all producers of these products. Of this total, $\$ 466$ million, or 84 percent, were shipped by plants classified in Industry 3569, General Industry Machines, N.E.C., while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 87.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBIICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Conmerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual conpanies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.
${ }^{1}$ Less than $\$ 500$ thousand.

Table 3.-QUANTITY AND VALUE OF GENERAL INDUSTRY MACHINES, N.E.C., SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the General Industry Machines, N.E.C., Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

[^102]
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Pumps and compressors

SIC Code 3561

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Pumps and Compressors Industry shipped products valued at $\$ 1,366$ million, an increase of 23 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 2 percent from 1958 and 4 percent from 1962 to a total of 59 thousand employees in 1963. Value added by manufacture amounted to $\$ 740$ million in 1963, an increase of 37 percent from 1958 and 9 percent from 1962.

The Pumps and Compressors Industry includes establishments engaged primarily in the manufacture of pumps, compressors, and pumping equipment for general industrial use.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^103]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantiel in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Pumps and Compressors Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Pumps and Compressors Industry amounted to $\$ 1,366$ million. Of this total, $\$ 160$ million were products primary to other industries; and $\$ 162$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 87 percent of the total manufactured products shipments, primary and secondary. The 1958 ratio was also 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,235$ million of pumps and compressors were shipped by all producers of these products. Of this total $\$ 1,044$ million, or 85 percent were shipped by plants classified in Industry 3561, Pumps and Compressors while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was also 85.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROTND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industiry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these re-
ports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not show separately in the above table was withheld either (a) to avoid disclosing figures for individual cormanies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic inportance in the State. (Additional publishable detail will appear in the final census report on this industry.)
(D) Withheld to avoid disclosing figures for individual companies.

Iess than \$500 thousand.

[^104]Table 3. -QUANTITY AND VALUE OF PUNPS AND COMPRESSORS SHIPPED BY ALL FRODUCEFS IN THE UNITED STATES: 1963 AND 1958--Continued

$i^{-}$Represents zero. n.e.c. Not elsewhere classiried. (NA) Not available.
(X) Not applicable. ${ }^{\text {r }}$ Revised,
${ }^{1}$ For these products, data were also collected on annual Form MA-35P, "Pumps and Compressors," or monthly Form M35G, "Farm Purps." In lieu or asking for detailed statistics on these products in the Census of Manufactures, respondents were asked to report only value of shipments for specified classes of products for which separate figures had previously been collected on the annual or monthly form. In most cases, the value figures reported in the census of manufactures for each class of product agreed closely with the corresponding figures reported in the controdity surveys. However, there were some differences between the Census figures and the conmodity survey figures. These variations were due primarily to the following reasons:
a. Use of different reporting periods (calendar year vs. fiscal year).
${ }_{b}$. Use of different bases for reporting value (company sales vs, factory production).
c. Use of estinates in reporting data on the commodity surveys, whereas census of manufactures figures generally represent more exact shipments figures.
${ }^{2}$ The value of drivers was reported only at the product class level. For each product line, value figures exclude, except as noted for codes 3561452-57, the value or drivers (electric motors or prime movers) shipped with that product. Separate data on the value of drivers are not available for product class 35613.
${ }^{3}$ Does not include hydraulic fluid power purps for power steering units in passenger automobiles. In 1958 such data are included.
${ }_{5}$ Included with product code 3561596 , "Other pumps."
${ }_{6}{ }^{5}$ Includes the value of drivers.
${ }_{7}{ }^{6}$ Includes cormpressors for air brake systems used in transportation equipment and pneumatic (air) power compressors and motors.
${ }^{7}$ Data reported in the census of manufactures differ from comparable figures reported in annual survey MA-35P chiefly due to companies not included in the annual survey. In addition, there were minor differences between figures for a few companies reporting in the twa surveys.

Represents "Other pumps and compressors" and includes dry vacuum pumps. No separate figures are available for "Other punps" compared with "Other compressors."

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures ( 2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4 -digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics<br>Volume 11, Industry Statistics<br>Part 1, Major Groups 20-28<br>Part 2, Major Groups 29-39<br>Volume 1L, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume 11, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Ball and roller bearings

## preliminary report

SIC Code 3562

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Ball and Roller Bearings Industry had total shipments valued at $\$ 1,001$ million, an increase of 54 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 13 percent from 1958 but a 2 percent decrease from 1962 to a total of 52 thousand employees in 1963. Valued added by manufacture amounted to $\$ 630$ million in 1963, an increase of 55 percent from 1958 and 1 percent from 1962.

The Ball and Roller Bearings Industry includes establishments engaged primarily in the manufacture of ball and roller bearings. Establishments primarily engaged in manufacturing bearings, except ball and roller, are classified in Industry 3566.

This report does not incluae figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volunes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Ball and Roller Bearings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classifiedin the Balland Roller Bearings Industry amounted to $\$ 1,001$ million. Of this total, $\$ 31$ million were products primary to other industries; and $\$ 34$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 963$ million of ball and roller bearings were shipped by all producers of these products. Of this total, $\$ 936$ million, or 97 percent, were shipped by plants classified in Industry 3562 , Ball and Roller Bearings while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 98.

## IENERAL STATISTTCS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables I and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Comerce field office or trom the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Represents zero. ${ }^{r}$ Revised.
${ }^{1}$ Of these totals, the following figures (in millions of dollars) represent the value of shipments of ball and roller bearings transferred from one plant of a company to another plant of the same company:

| $\begin{array}{c}\text { Product } \\ \text { code }\end{array}$ | 1963 | 1958 |
| :--- | ---: | ---: |
| $3562-$ | 116 | 86 |
| $\begin{array}{l}35621 \\ 35622 \\ 35623\end{array}$ | 20 | 21 |
| 35624 |  |  |$)$

${ }^{2}$ In 1963 represents 8,593 thousand units; for 1958 represents 4,911 thousand units (revised).
${ }^{3}$ In 1963 represents 944 thousand units: for 1958 represents 771 thousand units.

# 1963 CENSUS OF MANUFACTURES 

CHANGESHEET<br>FOR PRELIMINARY REPORT

BALL AND ROLLER BEARINGS
(SIC Code 3562)

The revised figures for the selected products shown below should be substituted for those previously published for 1963 in table 3 of the preliminary report "Ball and Roller Bearings" for the 1963 Census of Manufactures. Additional revisions of lesser significance will be showm in the final report.

Table 3.--QUANTITY AND VALUE OF BALL AND ROLLER BEARINGS SHTPPED BY ALL PRODUCERS IN THE UNITED STATES 1963

${ }^{1}$ Represents 8,043 thousand units.
${ }^{2}$ Represents 924 thousand units.

## U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary bureau of the census

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Blowers and fans

SIC Code 3564

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Blowers and Fans Industry shipped products valued at $\$ 318$ million, an increase of 17 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 3 percent from 1958 but an increase of 5 percent from 1962 to a total of 15 thousand employees in 1963. Value added by manufacture amounted to $\$ 179$ million in 1963, an increase of 24 percent from 1958 and 6 percent from 1962.

The Blowers and Fans Industry includes establishments engaged primarily in the manufacture of blowers, and exhaust and ventilating fans for general industrial, comercial and household use. Free air circulating fans for use on desks, pedestals, or wall brackets are classified in Industry 3634.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent

years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Blowers and Fans Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Blowers and Fans Industry amounted to $\$ 318$ million. Of this total, $\$ 64$ million were products primary to other industries; and $\$ 28$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 78 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 295$ million of blowers and fans were shipped by all producers of these products. Of this total, $\$ 226$ million, or 77 percent, were shipped by plants classified in Industry 3564, Blowers and Fans while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 79.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Industrial patterns

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Industrial Patterns Industry shipped products valued at $\$ 141$ million, an increase of 43 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 18 percent from 1958 to a total of 9.9 thousand employees in 1963. Value added by manufacture amounted to $\$ 113$ million in 1963, an increase of 44 percent from 1958.

The Industrial Patterns Industry includes establishments engaged primarily in the manufacture of industrial patterns.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. Production workers, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Industrial Patterns Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receiptsfor contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Industrial Patterns Industry amounted to $\$ 141$ million. Of this total, $\$ 6$ million were products primary to other industries; and $\$ 7$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 96 percent of the total manufactured product
shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 160$ million of industrial patterns were shipped by all producers of these products. Of this total, $\$ 128$ million, or 80 percent, were shipped by plants classified in Industry 3565, Industrial Patterns, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 74.

## GENERAL STATISTICS

The general statistics (employment, payrolls, zost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Power transmission equipment

SIC Code 3566

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Power Transmission Equipment Industry shipped products valued at $\$ 851$ million, an increase of 35 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 9 percent from 1958 and 4 percent from 1962 to a total of 46 thousand employees in 1963. Value added by manufacture amounted to $\$ 536$ million in 1963, an increase of 39 percent from 1958 and 8 percent from 1962.

The Power Transmission Equipment Industry includes establishments engaged primarily in the manufacture of plain bearings, variable speed changers, industrial high speed drives, fixed ratio speed reducers, gearmotor reducer elements, unmounted gears, pinions and racks, and other mechanical power transmission equipment, but excluding ball and roller bearings.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

(NA) Not available. (X) Not applicable.
${ }^{\text {i }}$ Includes expenditures for plants under construction but not in operation.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. Thes estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The
percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further explanation of the sampling estimate.
February 1965
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March. Production workers are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November .

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Power Transmission Equipment Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products,
etc. The total value of shipments and other receipts of establishments classified in the Power Transmission Equipment Industry amounted to $\$ 851$ million. Of this total, $\$ 116$ million were products primary to other industries; and $\$ 61$ million were receipts for miscellaneous artivities. The industry shipments of primary products represented 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry. (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 848$ million of power transmission equipment were shipped by all producers of these products. Of this total, $\$ 674$ million, or 80 percent, were shipped by plants classified in Industry 3566, Power Transmission Equipment, while the remainder was shipped by plants classified in other industries. The comparable percentage in $1953^{\circ}$ was 79.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and. 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary. and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963 , it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5
years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associsted industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.
${ }^{2}$ Less than $\$ 500$ thousand.

Table 3.--QUANTITY AND VALUE OF POWER TRANSMISSION EQUIPMENT SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Power Transmission Equipment Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of shipments")

U.S. DEPARTMENT OF COMMERCE bureau of the census WASHINGTON, D.C. 20233

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Industrial furnaces and ovens

SIC Code 3567

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Industrial Furnaces and Ovens Industry shipped products valued at $\$ 300$ million, an increase of 46 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 15 percent from 1958 to a total of 12 thousand employees in 1963. Value added by manufacture amounted to $\$ 146$ million in 1963, an increase of 52 percent from 1958.

The Industrial Furnaces and Ovens Industry includes establishments engaged primarily in the manufacture of industrial process furnaces, ovens induction and dielectric heating equipment and related devices.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE INDUSTRIAL FURNACES AND OVENS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3567)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manuracture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, <br> ${ }^{1}$ new $(\$ 1, \infty)$ |

[^110]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Industrial Fumaces and Ovens Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified inthe Industrial Fumaces and Ovens Industry amounted to $\$ 300$ million. Of this total, $\$ 40$ million were products primary to other industries; and $\$ 48$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 84 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 85 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 248$ million of industrial furnaces and ovens were shipped by all producers of these products. Of this total, $\$ 212$ million, or 85 percent, were shipped by plants classified in Industry 3567, Industrial Furnaces and Ovens, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 83.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A)which
show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROTND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these re-
ports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

USCOMM-DC

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

 <br> \section*{\title{Computing and related machines
}} <br> \section*{\title{
Computing and related machines
}}

SIC Code 3571

## preliminary report

The Computing and Related Machines Industry includes establishments engaged primarily in the manufacture of computing machines including electronic, accounting machines, and cash registers.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE COMPUTING AND REIATED MACHIIES INDUSTRY IN TEE UNITED STATES FOR SELECTED YEARS
(SIC sode 3571)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, new ${ }^{1}$ $(\$ 1,000)$ | Standard error of estimate (percent) for number of employees column ${ }^{2}$ |

[^111]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inc-uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figues for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Computing and Related Machines Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Computing and Related Machines Industry amounted to $\$ 2,045$ million. Of this total, $\$ 152$ million were products primary to other industries; and \$139 million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,863$ million of computing and related machines were shipped by all producers of these products. Of this total, $\$ 1,754$ million, or 94 percent, were shipped by plants classified in Industry 3571, Computing and Related Machines, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 91.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^112] able detail will appear in the final census report on this industry.)

Table 3.--QUANTITY AND VALJE OF COMPUTING AND REIATED MACHINES SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1Yク8
(Includes quantity and value of these products reported not only by establishments classified in the Computing and Related Machines Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

n.e.c. Not elsewhere classified. (NA) Not available. (X) Not applicable. ${ }_{\text {Revised. }}$
${ }^{1}$ For these products, data were also collected on annual Form MA-35R, "Office, Computing and Accounting Machines." In lieu of asking for detailed statistics on these products in the census of manufactures, respondents were asked to report only value of shipments for specified classes of products for which separate figures had previously been collected on the annual form. In most cases, the value figures reported in the census of manufactures for each class of products agreed closely with the corresponding figures reported in the annual survey. However, there were some differences between the census figures and the annual survey figures. These variations were due primarily to the following reasons:
a. Use or different reporting periods (calendar year vs. fiscal year.)
b. Use of different bases for reporting value (company sales vs. factory production.)
c. Use of estimates in reporting data on the annual survey, whereas census of manufactures figures generally represent more exact shipments figures.
${ }^{2}$ Figures include in some cases leased machines as well as machines sold outright. For leased machines the value reported in most instances represents the value placed on such equipment for tax, insurance, or similar purposes.
${ }^{3}$ Represents the number of complete systems.
${ }^{4}$ Includes billing machines with accounting registers.
${ }^{5}$ The number of cash registers shipped during 1963 and 1958 totaled 87,606 and 81,021 , respectively.
${ }^{6}$ Includes manual change makers, coin counting and sorting, currency counting, and payroll denominating machines.
${ }^{7}$ Computing and related machines not included on Census Annual Form MA-35R consist primarily of automatic voting booths, electronic toll collecting equipment, and pari-mutual computing devices for racetracks.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

Typewriters

SIC Code 3572

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Typewriters Industry had total shipments valued at $\$ 316$ million, an increase of 33 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 9 percent from 1958 but a 1 percent increase over 1962 to a total of 18 thousand employees in 1963. Value added by manufacture amounted to $\$ 243$ million in 1963, an increase of 44 percent from 1958 and 17 percent from 1962.

The Typewriters Industry includes establishments engaged primarily in the manufacture of typewriters and parts.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

| $1939^{3} .$. | 18 | (NA) | (NA) | (NA) | 16,195 | (NA) | 19,214 | 29,096 | 10,830 | 39,926 | (NA) | (X) |

(NO) Not available. (X) Not applicable.
${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March. May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Typewriters Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Typewriters Industry amounted to $\$ 316$ million. Of this total, $\$ 46$ million were products primary to other industries; and $\$ 8 \mathrm{mil}-$ lion were receipts for miscellaneous activities. The industry shipments of primary products represented 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 82 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 265$ million of typewriters and parts were shipped by all producers of these products. Of this total, $\$ 262$ million, or 99 percent, were shipped by plants classified in Industry 3572, Typewriters, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 99.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLIICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary sumnary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -GENERAL STATISTICS FOR THE TYPEWRITERS INDUSTRY, BY GEOGRAPIIC AREAS: 1963 AND 1958

| Geographic area | 1963 |  |  |  |  |  |  |  |  |  |  | 1958 |  |

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Scales and balances

SIC Code 3576

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Scales and Balances Industry shipped products valued at $\$ 98$ million, an increase of 26 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 2 percent from 1958 to a total of 5.5 thousand employees in 1963. Value added by manufacture amounted to $\$ 64$ million in 1963, an increase of 31 percent from 1958.

The Scales and Balances Industry includes establishments engaged primarily in the manufacture of weighing and force measuring machines and devices of all types, except those regarded as scientific apparatus for laboratory and experimental work.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the zost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the ralue of shipments which results from the use of rroducts of some manufacturing establishments as naterials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels from 1958 to 1963.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Scales and Balances Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Scales and Balances Industry amounted to $\$ 98$ million. Of this total, $\$ 7$ million were products primary to other industries; and $\$ 4$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 90$ million of scales and balances were shipped by all producers of these products. Of this total, $\$ 87$ million, or 97 percent, were shipped by plants classified in Industry 3576, Scales and Balances while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 97.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. - GENERRL STATISTICS FOR THE SCAIES AND BALANCES INDUSTRY, BY GEOGRAPHLC AREAS: 1963 AND 1958

[^114]
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Office machines, n.e.c.

SIC Code 3579

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Office Machines, N.E.C., Industry had total shipments valued at $\$ 355$ million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 9 percent from 1958 to a total of 17 thousand employees in 1963. Value added by manufacture amounted to $\$ 226$ million in 1963, an increase of 30 percent from 1958.

The Office Machines, N.E.C., Industry includes establishments engaged primarily in the manufacture of office machines and devices, not elsewhere classified. Establishments primarily engaged in manufacturing computing machines and cash registers are classified in Industry 3571 , typewriters in Industry 3572, and photocopy and microfilm equipment in Industry 3861.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuees for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Office Machines, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Office Machines, N.E.C., Industry amounted to $\$ 355$ million. Of this total, $\$ 58$ million were products primary to other industries; and $\$ 75$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 79 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 280$ million of office machines, n.e.c., were shipped by all producers of these products. Of this total, $\$ 222$ million, or 79 percent, were shipped by plants classified in Industry 3579, Office Machines, N.E.C., Industry while the remainder was shipped by plants classified in other industries. The comparableppercentage in 1958 was 84.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables $l$ and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report in this industry.)

Table 3.-QUANTITY AND VALUE OF OFFICE MACHINES, N.E.C。, SHIPPED BY ALL PRODUCERS IN THE UNJTED STATES: 1963 AND 1958
(Includes quantity and value of these products reported not only by establishments classified in the Office Machines, N.E.C., Industry but also by

n.e.c. Not elsewhere classified. (NA) Not available. (X) Not applicable. revised.
${ }^{1}$ For these products, data were also collected in the Census annual commodity survey program. In lieu of asking for detailed statistics on these products in the Census of Manufactures, respondents were asked to report only value of shipments for specified products or classes of products for which separate figures had previously been collected on the annual form.
${ }^{2}$ Includes dictating, transcribing and recording machines (disc, wire, and tape) designed as office machines (conference recording, combination dictating and telephone recording, etc.) but excludes wire and tape recorders.
${ }^{3}$ Includes cancelling, cutting, dating, endorsing, numbering, protecting, signing, sorting, and writing machines.
${ }^{4}$ Includes addressing and plate embossing machines; postage meters and postal permit mailing machines; shorthand writing machines; rebuilt office, computing, and accounting machines, n.e.c.; staplers; tape dispensers; envelope opening and sealing machines; label gummers; and price marking machines, etc.

POSTAGE AND FEES PAIO

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Automatic vending machines 

SIC Code 3581

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Automatic Vending Machines Industry shipped products valued at $\$ 235$ million, an increase of 65 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 45 percent from 1958 to a total of 11 thousand employees in 1963. Value added by manufacture amounted to $\$ 120$ million in 1963, an increase of 85 percent from 1958.

The Automatic Vending Machines Industry includes establishments engaged primarily in the manufacture of automatic merchandising units; also referred to as vending machines (excluding music, amusement, or gaming machines), and coin operated mechanisms for such machines.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE AUTOMATIC VENDING MACHINES INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3581)

[^116]April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified inthe Automatic Vending Machines Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Automatic Vending Machines Industry amounted to $\$ 235$ million. Of this total, $\$ 44$ million were products primary to other industries; and $\$ 6$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 80 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 206$ million of automatic vending machines were shipped by all producers of these products. Of this total, $\$ 184$ million, or 89 percent, were shipped by plants classified in Industry 3581, Automatic Vending Machines, while the remainder was shipped by plants classified in other industries. In 1958 the comparable percentage was 92.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for arı industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^117]Table 3. --QUANTITY AND VALUE OF AUTOMATIC VENDING MACHINES SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includec quantity and value of these products reported not only by establishments classified in the Automatic Vending Machine Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of shipments")

(X) Not applicable. $\quad r_{\text {hevised. }}$

I For these products, data were also collected in the Census annual commodity survey program. In lieu of asking for detailed statistics on these products in the Census of Manufactures, respondents were asked to report only value of shipments for specified products or classes of products for which separate figures had previously been collected on the annual form. In most cases, the value figures reported in the Census of Manufactures for each product or class of products agreed closely with the corresponding figures reported in the annual survey. However, there were some differences between the Census figures and the annual survey figures amounting generally to less than 1 percent at the industry level. These variations were due primarily to the following reasons:
a. Use of different reporting periods (calendar year vs. fiscal year.)
b. Use of different bases for reporting value (company sales vs. factory production.)
c. Use of estimates in reporting data on the annual survey whereas Census of Manufactures figures generally represent more exact shipments figures.
${ }^{2}$ These products are primarily coffee vending machines though they may also vend hot chocolate and/or hot soup from the same cabinet.
${ }^{3}$ In 1958 data for canned beverages are included with other vending machines for beverages.
Includes packaged milk (indoor and outdoor); milk (bulk or cup); beverage combination (hot and cold); hot beverages such as hot chocolate and/or hot soup (except canned soup) not sold in a combination machine with coffee; and package dry ingredients for mixing into beverages.
${ }^{5}$ Includes vending machines for such comnodities as apples; cookies, crackers, and biscuits; popcorn, pastry; ice cream; and package chewing gum. ${ }^{6}$ Includes vending machines for such products as cosmetics and toiletries, novelties, detergents, newspapers, and stationery supplies.
${ }^{7}$ Includes automatic vending machines and parts, not specified by kind.

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Commercial laundry equipment

## preliminary report

SIC Code 3582

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Commercial Laundry Equipment Industry shipped products valued at $\$ 137$ million, an increase of 14 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry remained virtually the same as in 1958 while registering an increase of 3 percent from 1962 to a total of 6.5 thousand employees in 1963. Value added by manufacture amounted to $\$ 71$ million in 1963, an increase of 8 percent from 1958 and 10 percent from 1962.

The Conmercial Laundry Equipment Industry includes establishments engaged primarily in the manufacture of laundry and dry cleaning equipment and pressing machines for conmercial and industrial use. Establishments primarily engaged in manufacturing household laundry equipment are classified in Industry 3633. Although the SIC classifies coinoperated household washing machines in Industry 3582, data for these machines are included in the 1963 Census of Manufactures in Industry 3633, as in 1958.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

[^118]April 1965
edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuies for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March,: May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Commercial Laundry Equipment Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Commercial Laundry Equipment Industry amounted to $\$ 137$ million. Of this total, $\$ 12$ million were products primary to other industries; and $\$ 9$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 130$ million of commercial laundry equipment were shipped by all producers of these products. Of this total, $\$ 116$ million, or 89 percent, were shipped by plants classified in Industry 3582, Commercial Laundry Equipment, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 95.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Refrigeration machinery

SIC Code 3585

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Refrigeration Machinery Industry had total shipments valued at $\$ 1,928$ million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 6 percent from 1958 and 15 percent from 1962 to a total of 72 thousand employees in 1963. Value added by manufacture amounted to $\$ 912$ million in 1963, an increase of 52 percent from 1958 and 35 percent from 1962.

The Refrigeration Machinery Industry includes establishments engaged primarily in the manufacture of equipment and systems utilizing the basic refrigeration cycle, including mechanical and absorption refrigerators for commercial and industrial use; refrigeration machinery; and complete air conditioning units for domestic, commercial, and industrial use. Establishments primarily engaged in manufacturing soda fountains and beer dispensing equipment are classified in this industry, and those primarily engaged in manufacturing household refrigerators and home and farm freezers in Industry 3632.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

(NA) Not available. (X) Not applicable. ${ }^{3}$ Revised.
includes expenditures for plants under construction but not
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufact wres. These estimates, consequently, mey differ from the results that would have been obtained from a complete canvass of all manufacturing estabiishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ The value of shipnents and cost of materials for this industry includes extensive duplication arising from shipments between establishnents in the same industry classification. For further explanation see text "Value of Shipments."
${ }^{4}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for $1958-1963$ are not comparable with those for earlier years.
May 1965
establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYBES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in Octover). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avolas the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENIS

The total cost of materials and total value of shipments of the Refrigeration Machinery Industry include extensive duplication resulting from the intra-industry shipments of certain products by some establishments for use as materials by others. For this reason, the"primary product specialization ratio," a measure of the extent to which plants classified in an industry "specialize" in making the products regarded as primary to the industry, has not been computed precisely. The ratio, however, is between 85 and 100 . Since this duplication is also included in the value of shipments shown in table 3, the coverage ratio for this industry has not been computed.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ant industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROINDD

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years
and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(NA) Not available. (X) Not applicable. $r_{\text {Revised. }}$
The total value of shipments of refrigeration machinery includes extensive duplication resulting from the use of products of certain establishments as materials by others within the same industry.
${ }^{2}$ Includes data on automobile air conditioners. In 1958, these units were included in class of product 35857
${ }^{3}$ For these products, data were also collected in the census annual comodity survey program. In lieu of asking for detailed statistics on these products in the census of manufactures, respondents were asked to report only value of shipments for specified products or classes of products for Which separate figures had previously been collected on the annual form. In most cases, the value figures reported in the census of manufactures for each product or class of products agreed closely with tbe corresponding figures reported in the annual survey. However, there were some differences between the census figures and the annual survey figures amounting generally to not more than 5 percent at the class of product level. These variations were due primarily to the following reasons:
a. Use of different reporting periods (calendar year vs. fiscal year.)
b. Use of different bases for reporting value (company sales vs. factory production.)
c. Use of estimates in reporting data on the annual survey whereas census of manufactures figures generally represent more exact shipments figures.
d. Better coverage in the census of manufactures program. Coverage in the annual surveys will be supplemented by adding respondents not currently in the survey but making the specified product according to their census of manufactures report
See Current Industrial Reports Series M35M "Air-Conditioning and Refrigeration Equipment" for more detailed product data.
LData for 1963 as published in the Current Industrial Reports Series for selected products should be revised as follows:

| Current Industrial Report Product Code | Shipments |  |
| :---: | :---: | :---: |
|  | Quantity (number of units) | $\begin{aligned} & \text { Value } \\ & (\$ 1,000) \end{aligned}$ |
| 3585112 3585713 | 13,691 | 6,468 |

${ }^{5}$ Includes data on automobile air conditioners. For 1963, these units are included with census product code 3585120 .

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (5l reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume 1, Summary Statistics
Volume II, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume 111, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume II, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Measuring and dispensing pumps

SIC Code 3586

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Measuring and Dispensing Pumps Industry shipped products valued at $\$ 159$ million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 9 percent from 1958 and 7 percent from 1962 to a total of 6.8 thousand employees in 1963. Value added by manufacture amounted to $\$ 92$ million in 1963, an increase of 42 percent from 1958 and 12 percent from 1962.

The Measuring and Dispensing Pumps Industry includes establishments engaged primarily in the manufacture of measuring and dispensing pumps commonly used in service and filling stations for dispensing gasoline, oil, and grease, including grease guns.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establish. ments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

Data for Alaska and Hawaii are not included.
April 1965

Far sale by the Bureau of the Census, Woshington, D. C., 20233, and U. S. Department of Commerce Field Offices. . 10 cents.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Measuring and Dispensing Pumps Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Measuring and Dispensing Pumps Industry amounted to $\$ 159$ million. Of this total, $\$ 37$ million were products primary to other industries; and $\$ 20$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 73 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 75 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 121$ million of measuring and dispending pumps were shipped by all producers of these products. Of this total, $\$ 102$ million, or 85 percent, were shipped by plants classified in Industry 3586, Measuring and Dispensing Pumps, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 89.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Conmerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

U.S. DEPARTMENT OF COMMERCE

BUREAU OF THE CENSUS U.S. DEPARTMENT OF COMMERCE WASHINGTON, D.C. 20233

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Service industry machines, n.e.c. 

SIC Code 3589

# preliminary <br> report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Service Industry Machines, N.E.C., Industry had total shipments valued at $\$ 386$ million, an increase of 57 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 35 percent from 1958 to a total of 16 thousand employees in 1963. Value added by manufacture amounted to $\$ 197$ million in 1963, an increase of 58 percent from 1958.

The Service Industry Machines, N.E.C., Industry includes establishments engaged primarily in the manufacture of machines and equipment, not elsewhere classified, for use in service industries, such as floor sanding machines, industrial vacuum cleaners, scrubbing machines, comercial cooking and food warming equipment, and comercial dishwashing machines.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Industry 3589

[^121]April 1965
has been amended to include manufacturers of industrial vacuum cleaners. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usua.lly in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Service Industry Machines, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Service Industry Machines, N.E.C., Industry amounted to $\$ 386$ million. Of this total, $\$ 49$ million were products primary to other industries; and $\$ 42 \mathrm{mil}-$ lion were receipts for miscellaneous activities. The industry shipments of primary products represented 86 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 327$ million of service industry machines, n.e.c., were shipped by all producers of these products. Of this total, $\$ 295$ million, or 90 percent, were shipped by plants classified in Industry 3589, Service Industry Machines, N.E.C. while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 83.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## U.S. DEPARTMENT OF COMMERCE

## GUREAU OF THE CENSUS

U.S. DEPARTMENT OF COMMERCE

WASHINGTON, D.C. 20233

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Electric measuring instruments

SIC Code 3611

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Electric Measuring Instruments Industry had total shipments valued at $\$ 745$ million, an increase of 11 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 to a total of 45 thousand employees in 1963. Value
added by manufacture amounted to $\$ 503$ million in 1963, an increase of 20 percent from 1958.

The Electric Measuring Instruments Industry includes establishments engaged primarily in the manufacture of pocket, portable, panelboard, and graphic recording instruments for measuring electricity, such as voltmeters, ammeters, watt meters, watthour meters, demand meters and other meters and indicating instruments. This industry also includes establishments primarily engaged in manufacturing analyzers for testing the electrical characteristics of internal combustion engines, radio apparatus, etc.

Table 1.- CHNERAL STATISTICS FOR THE ELECTRIC MEASURING INSTRUMENTS INUUSTRY IN THE UNITED STATES FOR SELECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | $\begin{aligned} & \text { Capital } \\ & \text { expend- } \\ & \text { itures, } \\ & \text { new } \\ & (\$ 1,000) \end{aligned}$ |

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
June 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard. Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Electric Measuring Instruments Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Electric Measuring Instruments Industry amounted to $\$ 745$ million. Of this total, $\$ 106$ million were products primary to other industries; and $\$ 61$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 85 percent of the total manutactured product shipments, primary and secondary. The 1958 ratio was 74 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 758$ million of electrical measuring instruments were shipped by all producers of these products. Of this total, $\$ 579$ million, or 76 percent, were shipped by plants classified in Industry 3611, Electric Measuring Instruments, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 81 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

U.S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS WASHINGTON, D.C. 20233

# 1963 CENSUS or MANUFACTURES 

## Transformers

SIC Code 3612

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Transformers Industry shipped products valued at $\$ 711$ million, an increase of 11 percent over 1958, according to preliminary results obtained from the 1963 census. Average employnent in this industry showed a decrease of 5 percent from 1958 and 7 percent from 1962 to a total of 33 thousand enployees in 1963. Value added by manufacture amounted to $\$ 374$ million in 1963, an increase of 3 percent from 1958 but a decrease of 7 percent from 1962.

The Transformers Industry includes establishments engaged primarily inthe manufacture of power, distribution, and specialty transformers. Establishments primarily engaged in manufacturing radio frequency or voice frequency transformers, coils, or chokes are classified in Industry 3679, and resistor welding transformers in Industry 3623.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

from a representative sample of manufacturing establishnents canvassed in the Annual Survey of Manuractures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and conplete canvass totals cause of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
May 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in Octoher). The figures for production workers, 1954 and 1958-1963 are based on employment for the payroll period ended nearest the 15 th of March, May, August and November. For 1957 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Transformers Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Transformers Industry amounted to $\$ 711$ million. Of this total, $\$ 60$ million were products primary to other industries; and $\$ 12$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 681$ million of transformers were shipped by all producers of these products. Of this total, $\$ 639$ million, or 94 percent, were shipped by plants classified in Industry 3612, Transformers, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 93 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## WASHINGTON, D.C. 20233

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Switchgear and switchboards

## preliminary report

sIC Code 3613

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Switchgear and Switchboards Industry had total shipments valued at $\$ 1,087$ million, an increase of 13 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 2 percent from 1958 but a decrease of 9 percent from 1962 to a total of 54 thousand employees in 1963. Value added by manufacture amounted to $\$ 632$ million in 1963, an
increase of 14 percent from 1958 but a decrease of 3 percent from 1962.

The Switchgear and Switchboards Industry includes establishments engaged primarily in the manufacture of switchgear and switchboard apparatus. Important products of this industry include power switches, circuit breakers, power switching equipment, and similar switchgear for general industrial application; switchboards and cubicles, control and metering panels, power fuse mountings, and similar switchboard apparatus and supplies. Establishments primarily engaged in manufacturing industrial controls are classified in Industry 3622, and those manufacturing current-carrying wiring devices in Industry 3643.

[^125]U. S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the pelative economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Switchgear and Switchboards Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Switchgear and Switchboards Industry amounted to $\$ 1,087$ million. Of this total, $\$ 143$ million were products primary to other industries; and $\$ 60$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 86 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 80 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry)should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,006$ million of switchgear and switchboards were shipped by all producers of these products. Of this total, $\$ 884$ million, or 88 percent, were shipped by plants classified in Industry 3613, Switchgear and Switchboards, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 90 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Motors and generators

## preliminary

report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Motors and Generators Industry shipped products valued at \$1,705 million, an increase of 22 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 1 percent from both 1958 and 1962 to a total of 94 thousand employees in 1963. Value added by manufacture amounted to $\$ 990$ million in 1963, an increase of 22 percent from 1958 and 2 percent from 1962.

The Motors and Generators Industry includes establishments engaged primarily in the manufacture of electric motors (except starting motors) and power generators; motor generator sets; railway motors and control equipment; and motors, generators, and control equipment for gasoline electric and oil electric busses and trucks. Establishments primarily engagedin manufacturing turbo-generators are classified in Industry 3511, and starting motors and battery charging generators for internal combustion engines in Industry 3694.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliaxy units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

(NA) Not available. (X) Not applicable.
${ }^{-}$Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manuracturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
May 1065
is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not inluded for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954 and 1958-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VA.LUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Motors and Cenerators Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Motors and Cenerators Industry amounted to $\$ 1,705$ million. Of this total, $\$ 268$ million were products primary to other industries; and $\$ 74$ million were receipts for miscellaneous activities. The industry shipmentsof primary products represent 84 percentof the total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,584$ millionof motors and generators were shipped by all producers of these products. Of this total, \$1,363 million, or 86 percent, were shipped by plants classified in Industry 3621, Motors and Generators, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 85 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary sumnary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Industrial controls

SIC Code 3622

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Industrial Controls Industry shipped products valued at $\$ 655$ million, an increase of 59 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 20 percent from 1958 and 2 percent from 1962 to a total of 33 thousand employees in 1963. Value added by manufacture amounted to $\$ 455$ million in 1963, an increase of 61 percent from 1958 and 11 percent from 1962.

The Industrial Controls Industry includes establishments engaged primarily in the manufacture of motor starters and controllers, control accessories, electronic controls, and other industrial controls. Establishments primarily engaged in manufacturing automatic temperature controls are classified in Industry 3822.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuies for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March.' May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Industrial Controls Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Industrial Controls Industry amounted to $\$ 655$ million. Of this total, $\$ 146$ million were products primary to other industries; and $\$ 25$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 77 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 79 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 620$ million of industrial controls were shipped by all producers of these products. Of this total, $\$ 484$ million, or 78 percent, were shipped by plants classified in Industry 3622, Industrial Controls, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 70 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 GENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Electric welding apparatus

SIC Code 3623
preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Electric Welding Apparatus Industry had total shipments valued at $\$ 319$ million, an increase of 29 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 7 percent from 1958 to a total of 9.2 thousand employees in 1963. Value added by manufacture amounted to $\$ 155$ million in 1963, an increase of 38 percent from 1958.

The Electric Welding Apparatus Industry includes establishments engaged primarily in the manufacture of electric welding apparatus and accessories. Establishments which coat only and those which draw the wire and coat it are also included. Establishments primarily engaged in manufacturing gas welding apparatus are classified in Industry 3548.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

Table 1. -GENERAL STATISTICS FOR THE ELECTRIC WELDING APPARATUS INDUSTEY IN THE UNITED STATES FOR SETECTED YEAPS

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ fram a representativc sample of manufacturing establishments canvassed in the annual survey of manufactures. These estinates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.

## April 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing es tablishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and Novernber, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Electric Welding Apparatus Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Welding Apparatus Industry amounted to $\$ 319$ million. Of this total, $\$ 18$ million were products primary to other industries; and $\dot{\$ 2} 22$ million were.receipts for miscellaneous activities. The industry shipments of primary products represented 94 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 314$ million of electric welding apparatus were shipped by all producers of these products. Of this total, $\$ 280$ million or 89 percent, were shipped by plants classified in Industry 3623, Electric Welding Apparatus, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 92 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the estabilishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities
(contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 GENSUS OF MANUFACTURES 

# Carbon and graphite products 

SIC Code 3624

preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Carbon and Graphite Products Industry had total shipments valued at $\$ 227$ million, an increase of 46 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 15 percent from 1958 and 5 percent from 1962 to a total of 10.2 thousand employees in 1963. Value added by manufacture amounted to $\$ 141$ million in 1963, an increase of 38 percent from 1958 and 10 percent from 1962.

The Carbon anu uraphite Products Industry includes establishments engaged primarily in the manufacture of lighting carbons; carbon, graphite, and metal graphite brushes and brush stock; carbon or graphite electrodes for thermal and electrolytic uses; and other carbon, graphite, and metal graphite products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

[^128]U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figues for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March,- May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALJE OF SHTPMENTS

The value of shipments reported by establishments classified in the Carbon and Graphite Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Carbon and Graphite Products Industry amounted to $\$ 227$ million. Of this total, $\$ 16$ million were products primary to other industries; and $\$ 4$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 216$ million of carbon and graphite products were shipped by all producers of these products. Of this total, $\$ 207$ million, or 96 percent, were shipped by plants classified in Industry 3624, Carbon and Graphite Products, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 95 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was witheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)

Table 3.-VALUE OF CARBON AND GRAPHITE PRODUCTS SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes value of these products reported not only by establishments classified in the Carbon and Graphite Products Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments"

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Electric industrial goods, n.e.c.

SIC Code 3629

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Electric Industrial Goods, N.E.C., Industry had total shipments valued at $\$ 219$ million, a decrease of 4 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 17 percent from 1958 to a total of 14 thousand employees in 1963. Value added by manufacture amounted to $\$ 141$ million in 1963, an increase of 2 percent from 1958.

The Electric Industrial Goods, N.E.C., Industry includes establishments engaged primarily in the manufacture of industrial and commercial electric apparatus and equipment, not elsewhere classified, such as fixed and variable capacitors, condensers, and rectifiers for industrial application. Establishments primarily engaged in manufacturing fixed and variable capacitors and condensers for electronic end products are classified in Industry 3679, and rectifiers for electronic end products in Industry 3674.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

n.e.c. Not elseriere classified.
I Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In adđition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high, Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.
May 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPTOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the periods 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. The figures for production workers, 1958 and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958 and 1963 value added;by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value, of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS
The value of shipments reported by establishments classified in the Electric Industrial Goods, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Electric Industrial Goods, N.E.C., Industry amounted to \$219 million. Of this total, $\$ 23$ million were products primary to other industries; and $\$ 12$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 71 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 251$ million of electric industrial goods, n.e.c., were shipped by all producers of these products. Of this total, $\$ 184$ million, or 73 percent, were shipped by plants classified in Industry 3629, Electric Industrial Goods, N.E.C., while the remainder was shipped by plants classified in other industries. The 1958 ratio also was 73 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also the ir activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURZS 

## INDUSTRY SERIES

## Household cooking equipment

## preliminary report

SIC Code 3631

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Household Cooking Equipment Industry had total shipments valued at $\$ 472$ million, an increase of 29 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 5 percent from 1958 and 2 percent from 1962 to a total of 19 thousand employees in 1963. Value added by manufacture amounted to $\$ 230$ million in 1963, an increase of 27 percent from 1958 and 19 percent from 1962.

The Household Cooking Equipment Industry includes establishments engaged primarily the manuffacture of household cooking equipment, such as stoves, ranges, and ovens. Establishments primarily engaged in manufacturing household cooking appliances, such as hot plates, grills, percolators, and toasters are classified in Industry 3634. Establishments primarily engaged in manufacturing commercial cooking equipment are classified in Industry 3589.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 editoon of the Standard Industrial Classification (SIC) Manual, as amended to date.

[^129]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activi’y at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For the period 1958-1963 value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Household Cooking Equipment Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Household Cooking Equipment Industry amounted to $\$ 472$ million. Of this total, \$58 million were products primary to other industries; and $\$ 29$ million were receipts for miscellaneous activities. The industry shipments of primary
products represent 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 88 percent.

The total value of shipments for the industry (i.e. the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 535$ million of household cooking equipment were shipped by all producers of these products. Of this total, $\$ 385$ million, or 72 percent, were shipped by plants classified in Industry 3631, Household Cooking Equipment, while the remainder was shipped by plants classified in other industries. The 1958 ratio was also 72 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 GENSUS OF MANUFACTURES 

# Household refrigerators 

## preliminary report

SIC Code 3632

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Household Refrigerators Industry had total shipments valued at $\$ 1,305$ million, an increase of 30 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 and 2 percent from 1962 to a total of 43 thousand employees in 1963. Value added by manufacture amounted to $\$ 629$ million in 1963, an increase of 45 percent from 1958 and 10 percent from 1962.

The Household Refrigerators Industry includes establishments engaged primarily in the manufacture of household refrigerators and home and farm freezers. Establishments primarily engaged in manufacturing commercial and industrial refrigeration equipment, packaged room coolers, and dehumidifiers are classified in Industry 3585.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manuiactures is conducted by obtaining a separate report for each establishnent in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee ftigure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE AUUED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Household Refrigerators Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Household Refrigerators Industry amountedto $\$ 1,305$ million. Of this total, $\$ 430$ million were products primary to other industries; and $\$ 44$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 66 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 74 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 832$ million of household refrigerators and home and farm freezers were shipped by all producers of these products. Of this total, $\$ 831$ million, or 99 percent, were shipped by plants classified in Industry 3632, Household Refrigerators, while the remainder was shipped by plants classifiedin other industries. The comparable percentage in 1958 was 98.

## GENERAL STATISTICS

The general statistics (empıoyment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Household laundry equipment 

SIC Code 3633

1963 CENSUS OF MANUFAC'IURES

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Household Laundry Equipment Industry had total shipments valued at $\$ 763$ million, an increase of 3 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 24 percent from 1958 and 12 percent from 1962 to a total of 19 thousand employees in 1963. Value added by manufacture amounted to $\$ 355$ million in 1963, an increase of 10 percent from 1958 and 3 percent from 1962.

The Household Laundry Equipment Industry includes establishments engaged primarily in the manufacture of laundry equipment such as washing machines, wringers, and dryers for household use. Establishments primarily engayed in manufacturing commercial laundry equipment are classified in Industry 3582. Athough the standard industrial classification for coin operated washing machines is Industry 3582, data for these machines are included in Industry 3633 in 1963 as in 1958.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Nanufactures. Theae estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of aampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
May 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March,- May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel; purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Household Laundry Equipment Industry consists not only of products decribed above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Household Laundry Equipment Industry amounted to $\$ 763$ million. Of this total, $\$ 81$ million were products primary to other industries; and $\$ 17 \mathrm{mil}-$ lion were receipts for miscellaneous activities. The industry shipments of primary products represent 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 763$ million of household laundry equipment were shipped by all producers of these products. Of this total, $\$ 665$ million, or 87 percent, were shipped by plants classified in Industry 3633, Household Laundry Equipment, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 91.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

In 1963 the value for product code 3633139 is between $\$ 200$ and $\$ 400$ thouaand.
${ }^{2}$ For 1958 , includes data for ironers, mechanical, including table, cabinet, and portable. The 1963 code for this product line is 3634310.

# 1963 CENSUS OF MANUFACTURZS 

## INDUSTRY SERIES

## Electric housewares and fans

SIC Code 3634

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Electric Housewares and Fans Industry had total shipments valued at $\$ 835$ million, an increase of 49 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 33 percent from 1958 and 11 percent from 1962 to a total of 39 thousand employees in 1963. Value added by manufacture amounted to $\$ 447$ million in 1963, an increase of 48 percent from 1958 and 11 percent from 1962.

The Electric Housewares and Fans Industry includes establishments engaged primarily in the manufacture of electric housewares for heating, cooking, and other purposes; and electric fans. Important products of this industry include electric air heaters, bed coverings, blenders, broilers, deep fat fryers, flat irons, food mixers, hot plates, percolators and coffee makers, roasters, toasters, desk and bracket fans, and hassock or floor fans.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

For sole by the Bureou of the Census, Woshington, D. C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

## ESTABLISHIENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EVPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Electric Housewares and Fans Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Electric Housewares and Fans Industry amounted to $\$ 835$ million. Of this total, $\$ 108$ million were products primary to other
industries; and $\$ 92$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that $\$ 791$ million of electric housewares and fans were shipped by all producers of these products. Of this total, $\$ 635$ million, or 80 percent, were shipped by plants classified in Industry 3634 , Electric Housewares and Fans, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 82 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Household vacuum cleaners

SIC Code 3635

## preliminary report

This leport is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Household Vacuum Cleaners Industry had total shipments valued at $\$ 175$ million, an increase of 23 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 6 percent from 1958 and 2 percent from 1962 to a total of 6 thousand employees in 1963. Value added by manufacture amounted to $\$ 116$ million in 1963, an increase of 38 percent from 1958 and 8 percent from 1962.

The Household Vacuum Cleaners Industry includes establishments engaged primarily in the manufacture of vacuum cleaners for household use. Establishments primarily engaged in manufacturing vacuum cleaners for industrial use are classified in Industry 3584.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not arailable by 4 -digit industry for 1954
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequentiy, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because or sampling fluctuations. See the Annual Survey of Manufactures volunes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPIOYEFS

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March. May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the zost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Household Vacuum Cleaners Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Household Vacuum Cleaners Industry amounted to $\$ 175$ million. Of this total, $\$ 23$ million were products primary to other industries; and $\$ 6$ million were receipts for niiscellaneous activities. The industry shipments of primary products represented 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 183$ million of household vacuum cleaners were shipped by all producers of these products. Of this total, $\$ 146$ million, or 80 percent, were shipped by plants classified in Industry 3635 , Household Vacuum Cleaners, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 83 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -GENERAL STATISTICS FOR THE HOUSEHOLD VACUUM CLEANERS INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958
(SIC code 3635)

| Geographic area | 1963 |  |  |  |  |  |  |  |  |  |  | 1958 |  |

# 1963 CENSUS OF MANUUFACTURES 

## INDUSTRY SERIES

## Sewing machines

SIC Code 3636

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Sewing Machines Industry had total shipments valued at $\$ 117$ million, an increase of 7 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 26 percent from 1958 to a total of 7.6 thousand employees in 1963. Value added by manufacture amounted to $\$ 98$ million in 1963, an increase of 59 percent from 1958.

The Sewing Machines Industry includes establishments engaged primarily in the manufacture of sewing machines for domestic and industrial use.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. - GENERAL STATISTICS FOR THE SEWING MACHINES INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3636)

|  | 86 | 17 |  |  |  |  |  |  |  |  |  |
| 1958. | 85 | 17 | 9,607 | 48,314 | 7,004 | 13,343 | 32,782 | 61,991 | 4,4,597 | 109,314 | 5,380 |
| $1994{ }^{3}$ | 82 | 28 | 12,414 | 56,552 | 9,443 | 19,142 | 40,697 | 70,339 | 38,796 | 114,185 | 3,045 |
| $1947{ }^{3}$ | 70 | (NA) | 15,305 | 48,484 | 12,647 | 26,095 | 37,926 | 68,681 | 28,880 | -97,011 | (NA) |
| $1939{ }^{3}$. | 39 | (NA) | 9,568 | 14,895 | 7,840 | (NA) | 11,157 | 21,096 | 8,611 | 29,707 | (NA) |

(NA) Not available.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the resultsthat would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations, For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus thr number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958 and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Sewing Machines Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Sewing Machines Industry amounted to $\$ 117$ million. Of this total, $\$ 8$ million were products primary to other industries; and $\$ 8$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that $\$ 104$ million of sewing machines were shipped by all producers of these products. Of this total, $\$ 101$ million, or 97 percent, were shipped by plants classified in Industry 3636, Sewing Machines, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 94 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries; retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Household appliances, n.e.c.

SIC Code 3639

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Household Appliances, N.E.C., Industry had total shipments valued at $\$ 431$ million, an increase of 14 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 10 percent from 1958 to a total of 13 thousand employees in 1963. Value added by manufacture amounted to $\$ 201$
million in 1963, an increase of 24 percent from 1958.

The Household Appliances, N.E.C., Industry includes establishments engaged primarily in the manufacture of household appliances, not elsewhere classified, such as hot water heaters, dishwashers, and food waste disposal units.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

Table 1.--GENERAL STATISTICS FOR TEE HOUSEHOLD APPLIANCES, N.E.C., INDUSTRY IN THE UNITED STATES: 1963 AND 1958

[^136]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. The figures for production workers, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958 and 1963 value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Household Appliances, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Household Appliances, N.E.C., Industry amounted to \$431 million. Of this total, $\$ 93$ million were products primary to other industries; and $\$ 17$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 78
percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 79 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 414$ million of household appliances, $n . e . c .$, were shipped by all producers of these products. Of this total, $\$ 321$ million, or 78 percent, were shipped by plants classified in Industry 3639, Household Appliances, N.E.C., while the remainder was shipped by plants classified in other industries. The 1958 ratio was 83 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Electric lamps

SIC Code 3641

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1953, manufacturers in the Electric Lamps Industry had total shipments valued at $\$ 580$ million, an increase of 39 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 11 percent from 1958 and 6 percent irom 1962 to a total of 24 thousand employees in 1963. Value added by manufacture amounted to $\$ 366$ million in 1963, an increase of 35 percent from 1958 but a decrease of 1 percent from 1962.

The Electric Lamps Industry includes establishments engaged primarily in the manufacture of electric bulbs, tubes, and related light sources. Important products of this industry include incandescent filament lamps, vapor and fluorescent lamps, photoflash and photoflood lamps, electrotherapeutic lamp units for ultra-violet and infrared radiation, and other electric light sources. Establishments primarily engaged in manufacturing glass blanks for bulbs are classified in Industry 3229; and lamp components, such as supports, filaments, lead-in wires and cold cathode fluorescent lamp electrodes in Industry 3699.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

[^137]May 1965
establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954 and 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Electric Lamps Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Electric Lamps Industry amounted to $\$ 580$ million. Of this total, $\$ 32 \mathrm{mil}-$ lion were products primary to other industries; and $\$ 22$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 94 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio also was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 549$ million of electric lamps were shipped by all producers of these products. Of this total, $\$ 526$ million, or 96 percent, were shipped by plants classified in Industry 364l, Electric Lamps, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 98 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Lighting fixtures

SIC Code 3642

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Lighting Fixtures Industry had total shipments valued at \$1,169 million, an increase of 41 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 15 percent from 1958 and 5 percent from 1962 to a total of 54 thousand employees in 1963. Value added by manufacture amounted to $\$ 595$ million in 1963, an increase of 50 percent from 1958 and 9 percent from 1962.

The Lighting Fixtures Industry includes establishments engaged primarily in the manufacture of lighting fixtures and equipment of any type, including electric and gas lighting fixtures; carbide, kerosene, and gasoline lamps; and metal reflectors and fittings. Establishments primarily engaged in producing glassware for lighting fixtures are classified in Major Group 32; and electric light bulbs, tubes, and related light sources in Industry 3641.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

Data for Alaska and Hawaii are not included.
July 1965

## U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figues for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. 'For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954 and 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Lighting Fixtures Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Lighting Fixtures Industry amounted to $\$ 1,169$ million. Of this total, $\$ 88$ million were products primary to other industries; and $\$ 40$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,120$ million of lighting fixtures were shipped by all producers of these products. Of this total, $\$ 1,041$ million, or 93 percent, were shipped by plants classified in Industry 3642, Lighting Fixtures, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 94 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROTIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Current carrying devices

SIC Code 3643

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the CurrentCarrying Devices Industry shipped products valued at $\$ 620$ million, an increase of 24 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed no change from 1958, totaling 36 thousand employees in 1963. Value added by manufacture amounted to $\$ 361$ million in 1963, an increase of 20 percent from 1958.

The Current-Carrying Devices Industry includes establishments engaged primarily in the manufacture of current-carrying wiring devices. Important products of this industry include attachment plugs and caps, convenience outlets, lamp sockets and receptacles, snap switches, conductor connectors, overhead trolley line material, rail bonds for both propulsion and signal circuits, lightning arrestors, and other lightning protective equipment.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

[^139]is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included in this report.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958 and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958 and 1963 value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Current-Carrying Devices Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for
contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Current-Carrying Devices Industry amounted to $\$ 620$ million. Of this total, $\$ 126$ million were products primary to other industries; and $\$ 35$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 78 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 85 percent(Revised).

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 550$ million of current-carrying devices were shipped by all producers of these products. Of this total, $\$ 459$ million, or 83 percent, were shipped by plants classified in Industry 3643, Current-Carrying Devices, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 79 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, a.s recently amended, to
cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 OENSUS OF MANUFACTURFS 

# Noncurrent carrying devices 

## preliminary report

SIC Code 3644

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the NoncurrentCarrying Devices Industry had total shipments valued at $\$ 479$ million, an increase of 16 percentover 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 3 percent from 1958 but a decrease of 3 percent from 1962 to a total of 20 thousand employees in 1963. Value added by manufacture amounted to $\$ 254$ million in 1963, an increase of 18 percent from 1958 and 10 percent from 1962.

The Noncurrent-Carrying Devices Industry includes establishments engaged primarily in the
manufacture of noncurrent-carrying wiring devices. Important products of this industry include conduits and fittings, electrical insulators and insulation materials, expect procelain insulators (Industry 3264) and glass insulators (Industry 3229); outlet, switch and fuse boxes; and pole line hardware.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manuractures volumes for further discussion of the sampling estimate.
${ }^{3}$ A revision in the definition of this industry was made in the 1957 Standard Industrial Classification so that data for this industry are not available for earlier years.

May 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers basedon 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, and 1958-1963, are based on employment for for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified inthe Noncurrent-Carrying Devices Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Noncurrent-Carrying Devices Industry amounted to $\$ 479$ million. Of this total, $\$ 106$ million were products primary to other industries; and $\$ 23$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 77 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 78 percent.

The total value of shipments for the industry (i.e., the total value of receipts fo establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 438$ million of noncurrent-carrying devices were shipped by all producers of these products. Of this total, $\$ 350$ million, or 80 percent, were shipped by plants classified in Industry 3644, Noncurrent-Carrying Devices, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 89 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample, survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

# Radio and TV receiving sets 

SIC Code 3651

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Radio and TV Receiving Sets Industry had total shipments valued at $\$ 2,288$ million, an increase of 48 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 23 percent from 1958 but a decrease of 1 percent from 1962 to a total of 82 thousand employees in 1963. Value added by manufacture amounted to $\$ 933$ million in 1963, an
increase of 57 percent from 1958 and 7 percent from 1962.

The Radio and TV Receiving Sets Industry includes establishments engaged primarily in the manufacture of electronic equipment for home entertainment. This industry also includes establishments primarily engaged in manufacturing public address systems, and music distribution apparatus except records. Establishments primarily engaged in manufacturing records are classified in Industry 3652; radio and television receiving type tubes in Industry 3671; and television receiving type cathode ray tubes in Industry 3672.

This report does not include figures for administrative offices, warehouses, garages, or

For sale by the Bureau of the Census, Washington, D. C., 20233, ond U.S. Department of Commerce Field Offices. 10 cents.
other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 thof March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958-1963 value added by manufacture ture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Radio and TV Receiving Sets Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classifiedin the Radio and TV Receiving Sets Industry amounted to $\$ 2,288$ million. Of this total, $\$ 288$ million were products primary to other industries; and $\$ 58$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 2,055$ million of radio and TV receiving sets were shipped by all producers of these products. Of this total, $\$ 1,942$ million, or 94 percent, were shipped by plants classified in Industry 3651, Radio and TV Receiving Sets, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 90 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and f'inal reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^141]
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Phonograph records

SIC Code 3652
preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Phonograph Records Industry had total shipments valued at $\$ 178$ million, an increase of 20 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 29 percent from 1958, to a total of 10 thousand employees in 1963. Value added by manufacture amounted to $\$ 123 \mathrm{million}$ in 1963, an increase of 32 percent from 1958.

The Phonograph Records Industry includesestablishments engaged primarily in the manufacture of phonograph records and pre-recorded tape.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE PHONOGRAPH RECORDS INDUSTRY IN THE THE UNITED STATES FOR SELECTED yEARS

For sole by the Bureou of the Census, Woshington, D.C., 20233, ond U. S. Deportment of Commerce Field Offices. 25 cents.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Phonograph Records Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Phonograph Records Industry amounted to $\$ 178$ million. Of this total, \$2 million were products primary to other industries; and $\$ 3$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 99 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 178$ million of phonograph records were shipped by all producers of these products. Of this total, $\$ 174$ million, or 97 percent were shipped by plants classified in Industry 3652, Phonograph Records, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 98 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities
(contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables I and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will
be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963 , it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

USCOMM-DC
U.S. DEPARTMENT OF COMMERCE

# 1963 CENSUS OF MANUFACTMRES 

# Telephone; telegraph apparatus 

SIC Code 3661

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Telephone; Telegraph Apparatus Industry had total shipments valued at $\$ 1,704$ million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 but decreased 11 percent from 1962 to a total of 89 thousand employees in 1963. Value added by manufacture amounted to $\$ 985$ million in 1963, an
increase of 33 percent from 1958 but a decrease of 4 percent from 1962.

The Telephone; Telegraph Apparatus Industry includes establishments engaged primarily in the manufacture of wire and wireless telephone and telegraph equipment, and parts especially designed for telephone and telegraph use.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

(NA) Not available. (X) Not applicable.
$i_{\text {The }}$ value of shipments and cost of materials for this industry include extensive duplication arising from shipnents between establishnents in the same industry classifications. For further explanation see text under "Value of Shipments."
${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.
${ }^{3}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manuracturing establishments. Tre percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard errors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling estinate.

4 For 1958, a number of small establishnents (umder 20 employees) may have been misclassified in Incustry 3661, Telephone and Telegraph Apparatus because of insufficient product information. Although this has a significant effect on the number of establishnents for this industry it has virtually no effect on any of the other statistics, $i . e$., number of employees, salaries and wages, value added, etc. It is estimated that the effect on these principal statistics is less than 1 percent.
${ }^{5}$ Data for Alaska and Hawaii are not included.
April 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figues for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954 and 1958-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

Data on cost of materials and value of shipments of the Telephone; Telegraph Apparatus Industry include extensive duplication resulting from the transfer of products such as telephone and telegraph components to establishments producing complete telephone and telegraph equipment. The value of such shipments are duplicated in the total value of shipments. A corresponding duplication enters into the total cost of materials. The data shown for value added by manufacture (value of shipments less cost of materials, etc.) avoid this duplication.

In view of the duplication in value of shipments, the exact "primary product specialization ratio" and the exact "coverage ratio" for this industry have not been computed.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the Trinited States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Radio, TV communications equipment

SIC Code 3662

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Radio, TV Communications Equipment Industry had total shipments valued at $\$ 7,071$ million, according to preliminary results obtained from the 1963 census. Average employment in this industry totaled 385 thousand employees and value added by manufacture amounted to $\$ 4,279$ million in 1963.

The Radio, TV Communications Equipment Industry includes establishments engaged primarily in the manufacture of ( 1 ) radio and television broadcasting equipment; (2) electric communication equipment and parts, except telephone and telegraph; (3) electronic field detection apparatus, light and heat emmission operating apparatus, object detection apparatus and navigational electronic equipment, and aircraft and missile control systems; and (4) other electric and electronic comunication and signaling products, not elsewhere classified. Establishments primarily engaged in manufacturing transmitting tubes are classifiedin Industry 3673.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years.

Establishments primarily manufacturing such individual instruments as those used for indicating air speed, rate-of-climb, angle-of-yaw, and similar flight characteristics, and gyroscopes
which are sold separately, are classified in Industry 3811, "Scientific Instruments." Establishments primarily engaged in providing complete instrumentation systems (for navigation, guidance, and check-out, etc.), in one package are classified in Industry 3662, "Radio, TV Communications Equipment." During the period 1958-1963 some of the large establishments which formerly manufactured individual instruments, and therefore were classified in Industry 3811 , began shipping complete navigational and guidance systems as their major products. These establishments have been reclassified into Industry 3662 for the 1963 Census of Manufactures.

However, it has not been possible to revise the annual survey of manufactures data for the years 1959-1962, inclusive, nor the 1958 census information. It is known thatseveral of the plants shifted from the production of instruments to complete systems during this period but remained classified by census in the Instruments Industry, 3811. Sometimes the change was abrupt and complete whereas in other instances the transition was a gradual one with both types of output continuing for a while. There was inadequate provision for systems in the product inquiries for the 1958 census and some respondents reported their output as instruments for lack of a better classification. It has not proven feasible for respondents at this time to identify the proportion of earlier years' output which consisted of systems rather than instrumentation.

This misclassification of systems and instruments was brought to light by the initiation by the Census Bureau of detailed commodity surveys in the fields of electronic products and instmumentation. The electronic and associated products report (MA-36N) was started covering the year 1961 and the instruments series (MA-38B) was broadened for 1963 to encompass most types of instruments following an introductory report for 1961 and 1962

## preliminary report

covering principally industrial process instruments and test and measuring equipment. Annual statistics from both reports are published in the Current Industrial Reports publications of the Census Bureau.

Therefore, a "statistical bridge" table has been prepared and included in table 1 of this report. That "bridge" presents general statistics for Industries 3811 and 3662, in combination. In view of the above, the annual data for 1958-1963 from the census and annual survey of manufactures are comparable only when Industries 3662 and 3811 are taken in combination. Accordingly, tables 1 and 2A show separate figures for Industry 3662 only for the year 1963. Combined data for industries 3662 and 3811 are also shown in table 1 for the 1958-1963 period and geographically for 1958 and 1963 in table 2B.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for all employees for 1963, represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. The figures for production workers for 1963 , are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1963 , value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Radio, IV Communcations Equipment Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Radio, TV Communications Equipment Industry amounted to $\$ 7,071$ million. Of this total, $\$ 1,203$ million were products primary to other industries; and $\$ 731$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 81 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that \$5,984 million of radio and IV commuications equipment were shipped by all producers of these products. Of this total, $\$ 5,137$ million, or 86 percent, were shipped by plants classified in Industry 3662, Radio, TV Communications Equipment, while the remainder was shipped by plants classified in other industries.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables $1,2 \mathrm{~A}$ and 2 B are reported for each establishment as a whole. Aggregates of such figures for mindustry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l, 2 A and 2 B ) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^145] in these or associated industries or areas, or (b) because these industries were of relatively minor econamic importance in the State. (Additional publishable detail will appear in the final census report on these industries.)

Table 3.-VALUE OF RADIO AND TV COMMUNICATION EQUIPMENT SHIPPED BY AL工 PRODUCERS IN THE UNTTED STATES: 1963 AND 1958
(Includes value of these products reported not only by establishments classified in the Radio, TV Conmunication Equipment Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

[^146]

BUSINESS CYCLE DEVELOPMENTS is published monthly for specialists concerned with the analysis of current business conditions. It summarizes many of the available economic time series in convenient form for short-term evaluation and interpretation and supplements other Department of Commerce reports on the economy. The features of this report are:

- The arrangement of series according to their usual timing relations during the course of the business cycle.
- The inclusion of special analytical measures and historical cyclical comparisons that help in evaluating the current stage of the business cycle.
- The speed with which the data are collected, assembled, and published. BCD is issued about the 22 d of each month covering data for the preceding month.
About 90 principal indicators and over 300 components are used for the different measures shown. The movements of the series are shown against the background of the expansions and contractions of the general business cycle so that "leads" and "lags" can readily be detected and unusual cyclical developments spotted. Since almost all of the basic data presented in this report are available in other published sources, the value of BED lies in its analytical arrangement and speed of publication.
The presentation and classification of the time series in the $B C D$ report follows the business indıcators approach. The classification of series and the business cycle turning dates are those designed by the National Bureau of Economic Research which, in recent years, has been a leader in this field of investigation.

## INDUSTRY SERIES

## Electron tubes, receiving type

SIC Code 3671

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Electron Tubes, Receiving Type Industry had total shipments valued at $\$ 314$ million, a decrease of 22 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 31 percent from 1958 and 3 percent from 1962 to a total of 26 thousand employees in 1963. Value added by manufacture amounted to $\$ 244$ million in 1963, a decrease of 17 percent from 1958 but an increase of 2 percent from 1962.

The Electron Tubes, Receiving Type Industry includes establishments engaged primarily in the manufacture of radio and television receiving type electron tubes, except cathode ray tubes. Establishments primarily engagedin manufacturing television receiving type cathode ray tubes are classified in Industry 3672; transmitting tubes in Industry 3673; X-ray tubes in Industry 3693; and electronic equipment for home entertainment, except tubes, in Industry 3651.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishnents. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.
April 1965
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Electron Tubes, Receiving Type Industry consists not only of products described above as primary to the industry, but also
of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Electron Tubes, Receiving Type Industry amounted to $\$ 314$ million. Of this total, $\$ 33$ million were products primary to other industries; and $\$ 15$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 89 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 282$ million of electron tubes, receiving type were shipped by all producers of these products. Of this total, $\$ 267$ million, or 95 percent, were shipped by plants classified in Industry 3671, Electron Tubes, Receiving Type, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 96 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of

Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 " and "7." Thus, the next
census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## INDUSTRY SERIES

## Cathode ray picture tubes

SIC Code 3672

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Cathode Ray Picture Tubes Industry had total shipments valued at $\$ 264$ million, an increase of 66 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed anincrease of 28 percent from 1958 to a total of 11 thousand employees in 1963. Value added by manufacture amounted to $\$ 123$ million in 1963, an increase of 83 percent from 1958.

The Cathode Ray Picture Tubes Industry includes establishments engaged primarily in the manufacture of television receiving type cathode ray tubes. Establishments primarily engaged in manufacturing other radio and television receiving type electron tubes are classified in Industry 3671; and transmitting tubes in Industry 3673.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. -GENERAL STATISTIGS FOR THE CATHODE RAY PICTURE TUBES INDUSTRY IN THE UNITED STATES: 1963 AND 1958
(SIC code 3672)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1, \infty 00)$ | Value of shipments$(\$ 1,000)$ | $\begin{aligned} & \text { Capital } \\ & \text { expend } \\ & \text { itures, } \\ & \text { new } \\ & (\$ 1,000) \end{aligned}$ |

[^147]
## ESTABLISHMENTS

The census of manutactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March. The figures for production workers, 1958 and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958 and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished prodmets and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure grailable for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Cathode Ray Picture Tubes Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for
contract work, resale of products, etc. The total tralue of shipments and other receipts of establishments classified in the Cathode Ray Picture Tubes Industry amounted to $\$ 264$ million. Of this total, $\$ 39$ million were products primary to other industries; and $\$ 5$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 96 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 249$ million of cathode ray picture tubes were shipped by all producers of these products. Of this total, $\$ 219$ million, or 88 percent, were shipped by plants classified in Industry 3672, Cathode Ray Picture Tubes, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 84 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of

Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next
census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 OENSUS OF MANUFACTURES 

# Electron tubes, transmitting 

SIC Code 3673

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Electron Tubes, Transmitting, Industry had total shipments valued at $\$ 301$ million, an increase of 16 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 6 percent from 1958 and 24 percent from 1962 to a total of 19 thousand employees in 1963. Value added by manufacture amounted to $\$ 204$ million in 1963, an increase of 23 percent from 1958 but a decrease of 26 percent from 1962.

The Electron Tubes, Transmitting, Industry includes establishments engaged primarily in the manufacture of transmitting, industrial, and special purpose electron tubes. Establishments primarily engaged in manufacturing radio and television transmitting equipment are classified in Industry 3662; radio and television receiving tubes in Industry 3671; television receiving type cathode ray tubes in Industry 3672; and X-ray tubes in Industry 3693.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

[^148]U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing es tablishments inc-uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March,: May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Electron Tubes, Transmitting, Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Electron Tubes, Transmitting, Industry amounted to $\$ 301$ million. Of this total, $\$ 52$ million were products primary to other industries; and $\$ 33$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 81 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 285$ million of electron tubes, transmitting were shipped by all producers of these products. Of this total, $\$ 216$ million, or 76 percent, were shipped by plants classified in Industry 3673, Electron Tubes, Transmitting, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 81 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURZS 

## INDUSTRY SERIES

## Semiconductors

SIC Code 3674

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Semiconductors Industry had total shipments valued at $\$ 680$ million, an increase of 172 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 140 percent over 1958 to a total of 56 thousand employees in 1963. Value added by manufacture amounted to $\$ 461$ million in 1963, an increase of 147 percent from 1958.

The Semiconductors Industry includes establishments engaged primarily in the manufacture of semiconductor (solid state) and related devices, such as semiconductor diodes and stacks, including rectifiers; transistors; solar cells; and light sensitive semiconductor (solid state) devices.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. This industry

Table 1.-GENERAL STATISTICS FOR THE SEMICONDUCTORS INDUSTRY IN THE UNITED STATES: 1963 AND 1958

[^149]June 1965

For sole by the Bureou of the Census, Woshington, D.C., 20233, and U. S. Department of Commerce Field Offices. 10 cents.
was not listed in the 1957 SIC Manual as a separate industry but has been separately provided for in the 1963 supplement to the SIC. Data for Alaska and Hawaii are included for 1958 and 1963.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958-1963 value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Semiconductors Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Semiconductors Industry
amounted to $\$ 680$ million. Of this total, $\$ 81 \mathrm{mil}-$ lion were products primary to other industries; and $\$ 32$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 87 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 614$ million of solid state semiconductor devices were shipped by all producers of these products. Of this total, $\$ 567$ million, or 92 percent, were shipped by plants classified in Industry 3674, Semiconductors, while the remainder was shipped by plants classified in other industries.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in table 1 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (table 1) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the-Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Electronic components, n.e.c. <br> SIC Code 3679

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Electronic Components, N.E.C., Industry had total shipments valued at \$2,252 million, an increase of 83 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 58 percent from 1958 to a total of 172 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,402 \mathrm{mil}-$ lion in 1963, an increase of 93 percent from 1958.

The Electronic Components, N.E.C., Industry includes establishments engaged primarily in the
manufacture of specialty resistors for electronic end products; inductors, electronic transformers, and capacitors; and other electronic components, not elsewhere classified. Establishments primarily engaged in manufacturing resistors, inductors, and transformers for telephone and telegraph apparatus are classified in Industry 3661. Also, establishments producing solid state semiconductor and related devices are now classified in SIC 3674, Semiconductor Devices.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

[^150]June 1965
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958 and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958 and 1963 value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENIS

The value of shipments reported by establishments classified in the Electronic Components, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Electronic Components, N.E.C., Industry amounted to $\$ 2,252$ million. $0^{\circ}$ this total, $\$ 200$ million were products primary to other industries; and $\$ 139$ million were receipts for miscellaneous activities. The industry
shipments of primary products represent 91 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 2,459$ million of electronic components, n.e.c., were shipped by all producers of these products. Of this total, $\$ 1,913$ million, or 78 percent, were shipped by plants classifiedin Industry 3679 , Electronic Components, N.E.C., while the remainder was shipped by plants classified in other industries.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## Storage batteries

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Storage Batteries Industry shipped products valued at $\$ 515$ million, an increase of 40 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 17 percent from 1958 and 8 percent from 1962 to a total of 18 thousand employees in 1963. Value added by manufacture amounted to $\$ 245$ million in 1963, an increase of 63 percent from 1958 and 16 percent from 1962.

The Storage Batteries Industry includes establishments engaged primarily in the manufacture of storage batteries for automobiles, trucks, farm tractors and busses as well as storage batteries for farm uses, commuications systems and railroad equipment. Parts for storage batteries are also included in this industry.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE STORAGE EATTERIES INDUSTRY IN THE UNITED STATES: FOR SELECTED YEARS

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volunes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

For sole by the Bureou of the Census, Woshington, D.C., 20233, ond U. S. Deportment of Commerce Field Offices. 10 cents.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March,: May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958 - 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Storage Batteries Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Storage Batteries Industry amounted to $\$ 515$ million. Of this total, $\$ 28$ million were products primary to other industries; and $\$ 24$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 94 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 99 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 477$ million of Storage Batteries were shipped by all producers of these products. Of this total, $\$ 463$ million, or 97 percent, were shipped by plants classified in Industry 3691, Storage Batteries, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 100 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which
show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Primary batteries, dry and wet

SIC Code 3692

preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Primary Batteries, Dry and Wet, Industry had total shipments valued at $\$ 195$ million, an increase of 41 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 to a total of 8 thousand employees in 1963. Value added by manufacture amounted to $\$ 114$ million in 1963, an increase of 51 percent from 1958.

The Primary Batteries, Dry and Wet, Industry includes establishments engaged primarily in the manufacture of dry and wet cell primarry batteries for flashlights, railroad lanterns, hearing aids, portable radios, farm radios, and general purposes as well as parts and supplies for primary batteries.

This report does not include figures ior administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table’l.--GENERAL STATISTICS FOR THE PRIMARY BATTERIES, DRY AND WET, INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

- (SIC Code 3692)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new ${ }^{1}$$(\$ 1,000)$ |

## (NA) Not available.

${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

Data for Alaska and Hawaii are not included.
February 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Primary Batteries, Dry and Wet, Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Primary Batteries, Dry and Wet, Industry amounted to $\$ 195$ million. Of this total, $\$ 5$ million were products primary to other industries; and $\$ 14$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 99 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 190$ million of primary batteries, dry and wet, were shipped by all producers of these products. Of this total, $\$ 176$ million, or 93 percent, were shipped by plants classified in Industry 3692, Primary Batteries, Dry and Wet, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 98 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also
their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## U.S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS WASHINGTON, D.C. 20233

 U.S. DEPARTMENT OF COMMERCE
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## X-ray apparatus and tubes

SIC Code 3693

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the X-Ray Apparatus and Tubes Industry had total shipments valued at $\$ 143$ million, an increase of 50 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 18 percent from 1958 to a total of 6.2 thousand employees in 1963. Value added by manufacture amounted to $\$ 86$ million in 1963, an increase of 47 percent from 1958.

The X-Ray Apparatus and Tubes Industry includes establishments engaged primarily in the manufacture of radiographic X-ray, fluoroscopic X-ray, and therapeutic X-ray apparatus and tubes for medical, industrial, research and control application. Establishments primarily engaged in manufacturing radio receiving type tubes are classified in Industry 367l; television 'receiving cathode ray tubes in Industry 3672; transmitting tubes in Industry 3673; and electrotherapeutic lamp units for ultra-violet and infra-red radiation in Industry 3641.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

(NA) Not available.
${ }^{1}$ Includes expenditures for plants mder construction but not in operation. Tnis information was not collected in 1989 and 1947 and is not available by 4 -digit industry for 1954

In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
May 1965
establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLJSHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represents the average number of production workers for the payroll period ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all enployees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, and 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958 and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the X-Ray Apparatus and Tubes Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the X-Ray Apparatus and Tubes Industry amounted to $\$ 143$ million. Of this total, \$18 million were products primary to other industries; and $\$ 38$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 83 percent of the total manufactured product shipments primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 109$ million of X-ray apparatus and tubes were shipped by all producers of these products. Of this total, $\$ 87$ million, or 80 percent, were shipped by plants classified in Industry 3693, X-Ray Apparatus and Tubes, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 82 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing
industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Comnerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 " and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -GENERAL STATISTICS FOR THE X-RAY THERAPEUTIC APPARATUS INDUSTRY, BY GEOGRAPHIC AREAS: 1963 AND 1958

| Geographic area | 1963 |  |  |  |  |  |  |  |  |  |  | 1958 |  |

U.S. DEPARTMENT OF COMMERCE

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Engine electrical equipment

SIC Code 3694

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Engine Electrical Equipment Industry had total shipments valued at $\$ 916$ million, an increase of 51 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 9 percent from 1958 but a decrease of 5 percent from 1962 to a total of 41 thousand employees in 1963. Value added by manufacture amounted to $\$ 502$ million in 1963, an increase of 42 percent from 1958 but a decrease of 6 percent from 1962.

The Engine Electrical Equipment Industry includes establishments engaged primarily in the manufacture of electrical equipment for internal combustion engines. Important products of this industry include starting motors and generators for automobiles and aircraft; and ignition apparatus for internal combustion engines including spark plugs, magnetos, coils, and distributors.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Industry 3694 has been amended to exclude manufacturers of nonignition automotive wiring hamess sets. Such

[^153]${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standarderrors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ A revision in the definition of this industry was made in the 1963 supplement to the 1957 edition of the Standard Industrial Classification, reclassfying establishments primarily manufacturing automotive wiring harness sets other than ignition from Industry 3694 to Industry 3714 (Census Industry 3717) "Automobiles and Parts." The statistics for 1958-1962 have been revised to take this reclassification into account. However, comparable data for this industry are not available for earlier years.

August 1965
manufacturers are classified in Industry 3714 (Census Industry 3717). Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of non-production workers for one payroll period (usually in October). The figures for production workers, 1954, and 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufecture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments
and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Engine Electrical Equipment Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Engine Electrical Equipment Industry amounted to $\$ 916$ million. Of this total, $\$ 120$ million were products primary to other industries; and $\$ 71$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 86 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 869$ million of engine electrical equipment were shipped by all producers of these products. Of this total, $\$ 725$ million, or 84 percent, were shipped by plants classified in Industry 3694, Engine Electrical Equipment, while the remainder was shipped by plants classified in other industries.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the-Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^154]
# 1963 CENSUS OF MANUFACTURES 

## Truck and bus bodies

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Truck and Bus Bodies Industry had total shipments valued at \$ 455 million, an increase of 48 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 19 percent from 1958 to a total of 23.8 thousand employees in 1963. Value added by manufacture amounted to $\$ 218$ million in 1963, an increase of 50 percent from 1958.

The Truck and Bus Bodies Industry includes establishments engaged primarilyin the manufacture
of truck and bus bodies, for sale separately or for assembly on purchased chassis. Establishments primarily engaged in manufacturing complete trucks and busses are classified in Census Industry 3717, and stamped body parts for truck and busses in Industry 3461.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^155]April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1954, 1958 and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954,1958 and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Truck and Bus Bodies Industry consists not only of products described above
as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Truck and Bus Bodies Industry amounted to $\$ 455$ million. Of this total, $\$ 52$ million were products primary to other industries; and $\$ 54$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 400$ million of truck and bus bodies were shipped by all producers of these products. Of this total, $\$ 350$ million, or 87 percent, were shipped by plants classified in Industry 3713, Truck and Bus Bodies, while the remainder was shipped by plants classified in other industries. The 1958 ratio was also 87 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports
will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retair trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## INDUSTRY SERIES

## Truck trailers

SIC Code 3715
preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Truck Trailers Industry had total shipments valued at $\$ 507$ million, an increase of 51 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 21 percent from 1958 but a decrease of 7 percent from 1962 to a total of 19 thousand employees in 1963. Value added by manufacture amounted to $\$ 202$ million in 1963, an increase of 54 percent from 1958 but a decrease of 8 percent from 1962.

The Truck Trailers Industry includes establishments engaged primarily in the manufacture of truck trailers and truck trailer chassis for sale separately, but not engaged in manufacturing complete trucks and busses.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. -GENERAL STATISTIGS FOR THE TRUCK TRAILERS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 37.5)

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture(\$1,000) | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new ${ }^{1}$$(\$ 1,000)$ | Standard error of estimate (percent) for number of employees column ${ }^{2}$ |

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants umder construction but not in operation. This inforration was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishnents canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a corplete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard errors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABL.LSHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll period ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954 and 19581963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.
'Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Truck Trailers Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Truck Trailers Industry amounted to $\$ 507 \mathrm{million}$. Of this total, $\$ 38 \mathrm{mil}-$ lion were products primary to other industries; and $\$ 26$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 A , indicates that $\$ 482$ million of truck trailers were shipped by all producers of these products. Of this total, $\$ 444$ million, or 92 percent, were shipped by plants classified in Industry 3715, Truck Trailers while the remainder was shipped by plants classified in other industries. The 1958 ratio was 93 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primery products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of production, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trad̦e, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

${ }^{1}{ }^{\text {For }}$ these products, figures were also collected in the Bureau of the Census commodity survey program. In lieu of asking for detailed statistics on these products in the census of manufactures, respondents were asked to report only value of shipments for specified groups of products for which separate figures had previously been collected in the commodity survey. In most cases, the value figures reported in the census of manufactures for each group of products agreed closely with the corresponding figures reported in the cormodity survey. However, there were minor differences between the census figures and the commodity survey figures. These variations were due primarily to the following reasons:
a. Better coverage in the Census of Manufactures program. This includes many small establishments excluded from the monthly survey.
b. Use of different reporting periods (calendar year vs. fiscal year).
c. Use of estimates in reporting figures on the cormodity survey, whereas census of manufactures figures generally represent more exact shipment figures.
${ }^{2}$ Includes small capacity trailers of special construction for the Defense Department, as well as auto transport, public utility trailers, converter dollies, and hoppers.

# 1963 CENSUS OF MANUFACTURES 

# Motor vehicles and parts 

SIC Code 3717

## preliminary report

This report is one of a series presenting preliminary information on industries and .products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Motor Vehicles and Parts Industry had total shipments valued at $\$ 36,149$ million, an increase of 73 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 19 percent from 1958

${ }^{1}$ Includes extensive duplication arising from shipments between establishments in the same industry classification.
${ }^{2}$ Includes expenditures for plants under construction but not in operation.
${ }^{3}$ The data are estimates derived from a representative sample of manufacturing establishments carvassed in the annual survey of manufactures. These estimates, consequently, may differ fram the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the amnual survey of manufactures volumes for further discussion of the sampling estimate.
${ }_{4}^{4}$ revision in the definition of this industry was made in the 1963 Supplement to the 1957 edition of the Standard Industrial Classification, reclassifying establishments primarily manufacturing automotive wiring harness sets other than ingition, from Industry 3694, "Engine Electrical Equipment" to Industry 3714 (Census Industry 3717). The statistics for 1958-1962 have been revised to take this reclassification into account. The data for 1954 and 1947 could not be revised to conform with this reclassification. Further, the 1954 and 1947 data are not strictly camparable with 1958-1963 because of changes introduced in the 1957 Standard Industrial Classification. However, the degree of non-comparability is less than 5 percent.
${ }^{5}$ Data for Alaska and Hawaii are not included.
September 1965
and 3 percent from 1962 to a total of 649 thousand employees in 1963. Value added by manufacture amounted to $\$ 12,290$ million in 1963, an increase of 88 percent from 1958 and 10 percent from 1962.

The Motor Vehicles and Parts Industry includes establishments engaged primarily in the manufacture or assembly of complete passenger automobiles, car bodies, trucks, commercial cars and busses (except trackless trolleys-Industry 3742), special purpose motor vehicles and motor vehicle parts and accessories. Establishments primarily engaged in manufacturing truck and bus bodies and assembling them on purchased chassis are classified in Industry 3713; motorcycles in Industry 3751; wheel type tractors, except contractors' off-highway types in Industry 3522; track laying tractors in Industry 3531; and combat tanks in Industry 1931.

In this report, based on the 1963 Census of Manufactures, as in 1958, the three Standard Industiral Classification Industries (3711, 3712, and 3714) have been combined because of a major problem of defining the reporting unit in terms of these industries. This difficulty arises from the fact that many large establishments have integrated operations which include the production of parts or bodies and the assembly of complete vehicles at the same location.

Included.in Industry 3717 are such parts as passenger-car bodies, motor vehicle engines (except Diesel), brakes, clutches, axles, radiators, differentials, transmissions, wheels and frames, windshield wipers, automotive bumpers, camshafts, connecting rods, crankshaft assemblies, cylinder heads, drive shafts, exhaust systems, fuel systems, heaters, hoods, horns, instrument board assemblies, lubrication systems, mufflers, power-transmission equipment, rear-axle housings, shock absorbers, steering mechanisms, tops (except stamped metal), universal joints, wheel rims, windshield frames, and automobile accessories, not elsewhere classified. A considerable number of components, parts and accessories for motor vehicles are not classified in Industry 3717 but are classified in other Standard Industrial Classification industries based on the characteristic of the product itself rather than the use to which it is put. Among the more important of these are automotive hardware, Industry 3429, Hardware, N.E.C.; automotive stampings, Industry 3461, Metal Stampings; Diesel and semiDiesel engines, Industry 3519, Internal Combustion Engines; sealed beam and other electric lamps, Industry 3641, Electric Lamps (Bulbs); motor vehicle lighting fixtures, Industry 3642, Lighting Fixtures; bearings, Industry 3566, Mechanical PowerTransmission Equipment; tires and inner tubes, Industry 3011, Tires and Inner Tubes; automobile glass, Industry 32Il, Flat Glass; ignition equipment such as spark plugs, distributors, switches, ignition coils, generators, cranks, motors, etc., Industry 3694, Engine Electrical Equipment; storage batteries, Industry 3691, Storage Batteries; automobile radios, Industry 3651, Radios and Related Products; and carburetors and pistons, Industry 3599, Machine Shops.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing
establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1954 and 1958-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

Data on cost of materials and value of shipments of the Motor Vehicle and Parts Industry include extensive duplication resulting from the transfer of motor vehicle parts to establishments producing complete motor vehicles. The value of such shipments are duplicated in the total value of shipments. A corresponding duplication enters into the total cost of materials. The data shown for value added by manufacture (value of shipments less cost of materials, etc.) avoid this duplication.

In view of the duplication invalue of shipments, the exact "Primary product specialization ratio" and the exact "coverage ratio" for this industry have not been computed.

## REPLACENENT PARTS

Manufacturers' shipments of replacement paxts for passenger cars, trucks, busses, and trailers during 1963 amounted to $\$ 2,327$ million. The comparable 1958 figure was $\$ 1,639$ million. These figures include parts made by establishments classified in the Motor Vehicles and Parts Industry as well as parts classified as primary products of other industries. They include the value of motor vehicle replacement parts such as spark plugs, ignition coils, storage batteries, carburetors, pistons and piston rings, headlights, fan belts, springs, hardware, mufflers, radiators and cores, water and fuel pumps, wheels, universal joints, cylinder heads, hub and drum assemblies, transmissions, shock absorbers, rear axle shafts, and clutch disc and facing assemblies.

These figures represent the shipments of these parts by parts manufacturers to other than motor vehicle manufacturers and shipments of replacement parts by motor vehicle manufacturers including parts which they purchased and resold in the same condition. No duplication is involved since parts manufacturers reported separately parts shipped to motor vehicle manufacturers and the latter figure is not included in this total. Value of shipments of tires and tubes and motor vehicle accessories such as radios, heaters, etc., are not included in this figure.

In order to arrive at an aggregate value for replacement parts without duplication, establishments producing replacement parts but. not engaged in manufacturing complete vehicles were requested to exclude from their shipments data on replacement parts all shipments to motor vehicle producers. Motor vehicle producers that reshipped such replacement parts were requested to report the value of these shipments, even though the parts were not made by such companies. The value of replacement parts in 1963 totaled the $\$ 2,327$ million referred to above.

Table 4 shows data for 1963 and 1958 on the total production of selected motor vehicle parts and the use of such parts in the assembly of new vehicles as well as the use of these parts for replacement and export. These data are not a precise measure of the sale of replacement parts in the United States since they include shipmentsof parts for export and are affected by inventory changes of parts during the year by both producers of parts and assemblers of vehicles.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROTND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

- Represents zero. (NA) Not available. (X) Not applicable. ${ }^{\text {R Revised. }}$

1 The total value of shipments of products classified in Industry 3717 includes extensive duplication arising from shipments between establishments in the same industry classification.
${ }^{2}$ Includes station wagons, ambulances, hearses, and taxicabs if produced on passenger car chassis. Value includes extra equipment billed with vehicles.
${ }^{3}$ Includes trucks such as pick-up, sedan delivery, panel, or other camercial cars made on passenger car chassis if these chassis were of own manufacture. Includes station wagons, hearses, and taxicabs if produced on truck chassis. Includes all truck chassis whether or not to be used for transportation of property, such as fire apparatus, street sprinklers, school busses, ambulances, etc. Excludes specialized road construction machinery and off-the-highway trucks.

4 The sum of values reported, for basic chassis and bodies (codes 3717201 through 3717218) and bodies and other equipment billed with basic chassis (codes 3717233,3717236 , and 3717239 ) represents the total value received from the sale of trucks, truck tractors, and truck chassis. Amounts reported for basic chassis values are based on average wholesale prices realized during 1963 and 1958. The amount reported for bodies and other equipment billed with basic chassis represents (1) the value received for bodies and other equipment shipped with the basic chassis: and (2) any plus oquipment billed with basic chassis represents (1) the value received for bodies and other equipment shipped with the basic chassis: and (2) any plus or minus differenc
${ }^{5}$ Separate figures are shown for fire department vehicles produced on purchased chassis (code 371.3077) and for fire department vehicles produced chassis of own manufacture (code 3717321 ). A small number of fire department vehicles, however, are produced on chassis furnished by customers.
${ }^{6}$ Product code 3717411 combined with 3717000 for security reasons, on advice fram the Bureau of the Budget.
${ }^{7}$ Data are limited to establishments of companies producing motor vehicles or bodies.
${ }^{8}$ Data are limited to establishments of companies which do not produce motor vehicles or bodies.
${ }^{9}$ This figure is limited to shipments of products classified in Industry 3717. There were additional shipments of motor vehicle parts by parts producers to other than motor vehicle manufacturers. This includes spark plugs, ignition coils, storage batteries, carburetors, pistons and piston rings, headlights, springs, and hardware which are classified outside the 3717 grouping and which approximated $\$ 564$ million in 1963 and $\$ 498$ million in 1958. Therefore, the total for 1963 was $\$ 2,327$ million. The camparable 1958 total was $\$ 1,639$ million (revised).
${ }^{10}$ For 1958 , product code 3717615 is combined with product code 3717600.

## (NA) Not available. $r_{\text {Revised. }}$

*These products are classified in industries other than Industry 3717
${ }^{1}$ For those products classified in Industry 3717 production figures exclude units produced by establishments in other industries. Although it is not possible to precisely measure the effect of this undercoverage it is believed to be minor for most products.
${ }^{2}$ The number of motor vehicle parts for the replacement, export and other markets was derived from the figures on "Total number of units produced" reported by parts producers and motor vehicle manufacturers and the figure on "Total number of units used in the assembly of new vehicles" reported by motor vehicle producers. Only new parts are included; rebuilt engines, carburetors, etc., are excluded. For those products classified in by motor vehicle producers. Only new parts are included; rebuilt engines, carburetors, etc, are excluded. For those products classified in industries other than Industry 3717 , these figures may include parts not specificall
busses). For those products classified in Industry 3717 , such parts are excluded.
${ }_{4}^{3}$ For these products, total number of units shipped were used instead of total number of units produced.
${ }^{4}$ In 1963 this product was described as "mufflers, including regular or standard, sports or glass pack and resonators."
${ }^{5}$ In 1963 this product was described as "pipes, including exhaust, tail, intermediate, connecting and crossover."

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures ( 2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to marketcategories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral lndustries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures ( 51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3-digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures ( 2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4 -digit industry on a national basis; State data on inventories will also be provided.

Mineral lndustries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume I, Summary Statistics
Volume II, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume III, Area Statistics

## Mineral lndustries

Volume I, General Summary and Industry Statistics

Volume II, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Aircraft

SIC Code 3721

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Aircraft Industry performed work and had other receipts valued at $\$ 6,294$ million, a decrease of 2 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 20 percent from 1958 and 8 percent from 1962 to a total of 302 thousand employees in 1963. Value added by manufacture amounted to $\$ 3,522$ million in 1963, an increase of 4 percent from 1958 and 5 percent from 1962.

The Aircraft Industry includes establishments engaged primarily in the manufacture or assembling of complete aircraft. This industry also includes establishments primarily engaged in factory type aircraft modification on a contract or fee basis. Establishments primarily engaged in manufacturing engines, propellers, and other aircraf't parts and auxiliary equipment are classified in Industries 3722,3723 , and 3729.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

(NA) Not available. (X) Not applicable.
For the period 1954 and 1958-1963, the adjusted value added figure for the Aircraft Industry has not beea adjusted for the change in inventory between the beginning and end of the year, since the figures reported by establishments in this incustry are value of woric done rather than value of shipments. It does include the value added by resales. For prior years this figure is unadjusted value added.
${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{3}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the annual survey of manufactures volumes for further discussion of the sampling estinate,
${ }_{5}$ Data for Alaska and Hawaii are not included.
${ }^{5}$ Total cost of materials and total value of shipments are not shown since these figures are not comparable to those of later years.
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954 and 19581963, are based on employment for the payroll period ended nearest the 15th of March,May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

Value added for this industry is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of work done on aircraft, the value of shipments for secondary products manufactured, plus receipts for services rendered.

Value added avoids the duplication in the value of work done which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF WORK DONE

The value of work done and other receipts reported by establishments classified in the Aircraft Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of work done and other receipts of establishments classified in the Aircraft Industry amounted to $\$ 6,294$ million. Of this total, \$1,793 million were products primary to other industries; and $\$ 253$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 70 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 81 percent.

The total value of work done and other receipts for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that $\$ 4,305$ million of receipts for work performed on aircraft was reported by all producers of these products. Of this total, $\$ 4,249$ million, or 99 percent, was performed by plants classified in Industry 3721, Aircraft, while the remainder was performed by plants classified in other industries. The 1958 ratio was 93 percent.

In Industry 3721 there is usually a significant difference between value of actual physical shipments and value of work done during a specified period. This is primarily due to lead time between the input of materials and labor and the shipments of completed aircraft. In evaluating the internal relationships of the Aircraft Industry, such as the ratio of cost of materials or payrolls to output, the value of aircraft shipments for the year is generally not meaningful and value of work done is therefore substituted. For the 1963 Census of Manufactures, establishments producing military and commercial aircraft were requested to report both the value of shipments of aircraft and value of work done during the year. This latter statistic included total costs (materials, labor, overhead, etc.) and reflected the value of work done during 1963, including work done on aircraft not accepted during the year, but excluding the value of work done in prior years.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishnents in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the-Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. --GENERAL STATISTICS FOR THE ALRCRAFT INDUSTRY BY GEOCRAPHIC AREAS: 1963 AND 1958
(SIC code 3721)

# 1963 CENSUS OF MANUFACTURES 

## Aircraft engines and parts

SIC Code 3722

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Aircraft Engines and Parts Industry had total shipments valued at $\$ 4,048$ million, an increase of 15 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 19 percent from 1958 and 6 percent from 1962 to a total of 190 thousand employees in 1963. Value added by
manufacture amounted to $\$ 2,199$ million in 1963, an increase of 36 percent from 1958 and 11 percent from 1962.

The Aircraft Engines and Parts Industry includes establishments engaged primarily in the manufacture of aircraft engines and engine parts.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

Table 1.-GENERAL STATISTICS FOR tHE AIRCRAFT ENGINES AND PARTS INDUSTRY IN THE UNITED STATES FOR SEIECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new$(\$ 1, \infty 00)$ | Standard error of estimate (percent) for number of employees column ${ }^{2}$ |

(NA) Not available. (X) Not applicable.
Includes expenditures for plants under constr
${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estinates derived from a representative sample of manufacturing establishnents canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
May 1965
(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is sonducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954 and 1958, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the sost- of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments_as
naterials by otner manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Aircraft Engine and Parts Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Aircraft Engines and Parts Industry amounted to $\$ 4,048$ million. Of this total, $\$ 481$ million were products primary to other industries; and $\$ 227$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 3,577$ million of aircraft engines and parts were shipped by all producers of these products. Of this total, $\$ 3,340$ million, or 93 percent, were shipped by plants classified in Industry 3722, Aircraft Engines and Parts, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 95 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports snowing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next sensus will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

${ }^{1}$ For 1958 , data on complete missile or space vehicle engines and/or propulsion units were included with aircraft engines.
${ }^{2}$ Statistics on shipments of aircraft engines for other than United States military customers were colleated monthly and published in Current Industrial Reports Series M37G. The total value reported in that survey for 1963 was $\$ 144,254$ thousand.
${ }^{3}$ For 1958 , data on missile and space vehicle engine and/or propulsion unit parts or accessories were included with aircraft engine parts and accessories.
${ }^{4}$ For 1958 , data on receipts for research and development on complete missile or space vehicle engines and/or propulsion units for United States military customers and, all other services on aircraft, missile or space vehicle engines and/or propulsion units for United States military customers were included with research and development on aircraft engines for United States military customers.
${ }^{5}$ For 1958 , data on receipts for research and development on complete missile or space vehicle engines and/or propulsion units for other than United States military customers and, all other services on aircraft, missile or space vehicle engines and/or propulsion units for other than United States military customers were included with research and development on aircraft engines for other than United States military customers.
${ }^{6}$ For 1963, data on research and development on aircraft engines for other than United States military customers are included with all other aeronautical services on aircraft engines for other than United States military customers to avoid disclosing figures of individual companies.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## preliminary report

SIC Code 3723 <br> \section*{Aircraft propellers and parts} <br> \section*{Aircraft propellers and parts}

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Aircraft Propellers and Parts Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Aircraft Propellers and Parts Industry amounted to $\$ 191$ million. Of this total, $\$ 96$ million were products primary to other industries; and $\$ 7 \mathrm{mil}-$ lion were receipts for miscellaneous activities. The industry shipments of primary products represent 48 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 75 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry)should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 indicates that $\$ 109$ million of Aircraft propellers and parts were shipped by all producers of these products. Of this total, $\$ 88$ million, or 84 percent, were shipped by plants classified in Industry 3723, Aircraft Propellers and Parts, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 95 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities oif the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

SIC Code 3729

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manuractures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Aircraft Equipment, N.E.C., Industry had total shipments valued at $\$ 3,255$ million, an increase of 7 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 16 percent from 1958 to a total of 178 thousand employees in 1963. Value added by manufacture amounted to $\$ 2,018$ million in 1963, an increase of 12 percent from 1958.

The Aircraft Equipment, N.E.C., Industry includes establishments engaged primarily in the manufacture of aircraft parts and auxiliary equipment, not elsewhere classified. Establishments primarily engaged in manufacturing or assembling complete aircraft are classified in Industry 3721, aircraft engines and parts in Industry 3722, propellers and propeller parts in Industry 3723, aeronautical instruments in Industry 3811, and aeronautical electrical equipment in Industry 3694.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

[^157]July 1965

## U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary BUREAU OF THE CENSUS

is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, an amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March. The figures for production workers, 1958 and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958 and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Aircraft Equipment, N. E.C.,

Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Aircraft Equipment, N. E.C., Industry amounted to $\$ 3,255$ million. Of this total, $\$ 886$ million were products primary to other industries; and $\$ 137$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 72 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 3,571$ million of aircraft equipment, n.e.c., were shipped by all producers of these products. Of this total, $\$ 2,232$ million, or 63 percent, were shipped by plants classified in Industry 3729, Aircraft Equipment, N.E.C., while the remainder was shipped by plants classified in other industries. The 1958 ratio also was 63 percent.

## GENERAL STATISTICS

The general. statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)

Table 3. --VALUE OF AIRCRAFT PARTS AND AUXILIARY EQUIPMENT, N.E.C. SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes value of these products reported not only by establishments classified in the Aircraft Equipment, No E.C., Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

[^158]
## U.S. DEPARTMENT OF COMMERCE <br> BUREAU OF THE CENSUS WASHINGTON, D.C. 20233

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Ship building and repairing

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Ship Building and Repairing Industry did work and had other receipts valued in total at $\$ 1,671$ million, an increase of 3 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 but a 2 percent increase from 1962 to a total of 114 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,005$ million in 1963, an increase of 10 percent from 1958 and 5 percent from 1962.

The Ship Building and Repairing Industry includes establishments engaged primarily in building and repairing all types of ships, barges, canal boats and lighters, whether propelled by sail or motor power or towed by other craft. This industry also includes the conversion and reconversion of ships.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE SHIPBUILDING AND REPAIRING INDUSTRY IN THE UNITED STATES FQR SELEGTED yEARS
(SIC code 3731)

[^159]${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{\text {TThe }}$ data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further'discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all emplovees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 , the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

Value added for this industry is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of work done on ships, the value of shipments for secondary products manufactured, plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF WORK DONE

The value of work done and other receipts reported by establishments classified in the Ship Building and Repairing Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of work done
and other receipts of establishments classified in the Ship Building and Repairing Industry amounted to $\$ 1,671$ million. Of this total, $\$ 121$ million were products primary to other industries; and \$61 million were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 93 percent.

The total value of work done and other receipts for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry made by all producers. The latter figure, appearing in table 3, indicates that $\$ 1,500$ million of ship building and repairing was done by all producers of these products. Of this total, $\$ 1,490$ million, or 99 percent, was performed by plants classified in Industry 3731, Ship Building and Repairing, while the remainder was performed by plants classified in other industries. The 1958 ratio was also 99 percent.

The value of ship building and repairing represents value of work done during the year. This provides a more adequate measure of the activity in this industry than value of vessels completed and delivered, primarily because of the length of the production cycle, which may be several years for some vessels. Value of shipments (deliveries) would result in a distortion for establishments working on a vessel all year, but not completing it during the year or, conversely, for establishments completing and delivering a vessel during a year when most of the work was performed in previous years. Respondents were requested to compute the value of work done by including the cost of labor, the cost of purchased materials and parts received during 1963, overhead and profits by one of the following methods: (1) estimating the percentage of completion during 1963, (2) reporting net billings for work done during 1963, or (3) reporting payments received for work done during 1963.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of work done, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the value of work performed by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of
such concepts as "industry," "establisnments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^160]
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Boat building and repairing

SIC Code 3732

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturersin the Boat Building and Repairing Industry had total shipments valued at $\$ 365$ million, an increase of 11 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 1 percent from 1958 to a total of 25 thousand employees in 1963. Value added by manufacture amounted to $\$ 184$ million in 1963, an increase of 17 percent from 1958.

The Boat Building and Repairing Industry includes establishments engaged primarily in the manufacture and repair of all types of boats, except rubber boats (Industry 3069). Establishments primarily engaged in cleaning and storing boats and in the rental of dock space, and yacht clubs are classified in nonmanufacturing industries.

This report does not include figures for administrative offices, warehouses, garages, on other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

Table 1. -GENERAL STATISTICS FOR THE BOAT BUILDING AND REPAIRDG INDUSTRY IN THE UNIIED STATES FOR SELECTED YEARS
(SIC code 3732)

| Year | $\underset{\substack{\text { Establishments } \\ \text { (number) }}}{\text { and }}$ (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expenditures, new $(\$ 1,000)$ |

| $1247^{3}$ | 808 | (NA) | 18,850 | 49,756 | 16,801 | 35,033 | 41,970 | 66,195 | 48,179 | 114,374 | (NA) |

(Na) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -aigit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

Data for Alaska and Hawail are not included
March 2965
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHIENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1954, 1958 and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENIS

The value of shipments reported by establishments classified in the Boat Building and Repairing Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Boat Building and Repairing Industry amounted to $\$ 365$ million. Of this total, $\$ 10$ million were products primary to other industries; and $\$ 27$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 indicates that $\$ 345$ million of boat building and repairing was done by all producers. Of this total, \$328 million, or 95 percent, was done by plants classified in Industry 3732, Boat Building and Repairing, while the remainder was done by plants classified in other industries. The 1958 ratio was also 95 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.--GENERAL STATISTICS FCR THE BOAT BUIIDING AND REPAIRING INUUSTRY, BY GEOGRAPFIC AREAS: 1963 AND 1958
(SIC code 3732)

Note: Each producing State not shown separately in the above table was withhela either (a) to avoid disclosing figures for individual companies,
in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census repori on this industry.)
${ }^{1}$ Less than $\$ 500$ thousand.

# 1963 GENSUS OF MANUFACTURES 

## Locomotives and parts

SIC Code 3741

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Locomotives and Parts Industry had total shipments valued at $\$ 438$ million, an increase of 7 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 6 percent from 1958 but a slight increase from 1962 to a total of 14 thousand employees in 1963. Value added by manufacture amounted to $\$ 186$ million in 1963 , an increase of 22 percent from 1958, but a decrease of 17 percent from 1962.

The Locomotives and Parts Industry includes establishments engaged primarily in building and rebuilding locomotives (including frames and parts, not elsewhere classified) of any type or gauge. Railroad shops rebuilding and repairing locomotives or building new locomotives are classified in nonmanufacturing industries.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^162]February 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthiy figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Locomotives and Parts Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Locomotives and Parts Industry amounted to $\$ 438$ million. Of this total, $\$ 70$ million were products primary to other industries; and $\$ 25$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 83 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 85 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 375$ million of locomotives and parts were shipped by all producers of these products. Of this total, $\$ 342$ million, or 91 percent, were shipped by plants classified in Industry 3741, Locomotives and Parts, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 90.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities
(contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "inaustry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will
be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963 , it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.-GENRRAL STATISTICS FOR THE LOCCMOTIVES AND PARTS INDUSTRY BY REGIONS AND STATES: 1963 AND 1958
(SIC code 3741)

## OFFICIAL BUSINESS

# 1963 GENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Railroad and street cars

SIC Code 3742

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

Luring 140 , , manufacturers in the Railroad and Street Cars Industry had total shipments valued at $\$ 927$ million, an increase of 65 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 26 percent from 1958 and 12 percent from 1962 to a total of 31 thousand employees in 1963. Value added by manufacture amounted to $\$ 359$ million in 1963, an increase of 114 percent from 1958 and 46 percent from 1962.

The Railroad and Street Cars Industry includes establishments engaged primarily in building and rebuilding railroad, street, and rapid transit cars and car equipment for operation on rails for freight and passenger service. This industry also includes establishments primarily engaged in manufacturing trackless trolley busses. Establishments owned and operated by railroads or local transit companies rebuilding, or repairing cars, or building new cars for their own account are excluded from this industry but are classified in Major Groups 40 and 41.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establish-

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colurm indicate the range of differences that can be expected between the estimates and cormplete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate,
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965

## U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

ments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inc-uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES
The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from
the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Railroad and Street Cars Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Railroad and Street Cars Industry amounted to $\$ 927$ million. Of this total, $\$ 85$ million were products primary to other industries; and $\$ 30$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 869$ million of railroad and street cars were shipped by all producers of these products. Of this total, $\$ 812$ million, or 93 percent, were shipped by plants classified in Industry 3742, Railroad and Street Cars, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 90 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, It was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^165]Table 3B, --QUANTITY AND VALUE OF NEW AND REBUIIT PASSENGER AND FREIGHT TRAIN CARS SHIPPED BY SHOPS OF OPERATING RAILROADS IN THE UNIIEED STATES: 1963 AND 1958

- Represents zero. (NA) Not available. (X) Not applicable.
${ }^{1}$ Values of railroad cars built by railroads for own use represents the anounts at which they were written into property accounts.
${ }^{2}$ A passenger and freight train car is defined as rebuilt when the cost of their dismantling, improvement and modernization is more than 50 percent of the replacement cost of a new unit of the same class and kind at the time of rebuilding. Conversions, reclassifications or units which were recon ditioned by replacing defective parts are not included.
${ }^{3}$ Excludes parts for passenger and freight cars, made in railroad car shops.
The 1963 product codes $3742111,3742198,3742245,3742298$, and 3742331 are included with the figure for "Other cars" (code 3742313 ).
$5_{\text {The }} 1958$ product code 3742211 is included in the figure of $\$ 74,067$ thousand.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Motorcycles, bicycles, and parts <br> SIC Code 3751 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Motorcycles, Bicycles, and Parts Industry had total shipments valued at $\$ 189$ million, an increase of 56 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 25 percent from 1958 and 5 percent from 1962 to a total of 9 thousand employees in 1963. Value added by manufacture amounted to $\$ 80$ million in 1963, an increase of 54 percent from 1958 and 8 percent from 1962.

The Motorcycles, Bicycles, and Parts Industry includes establishments engaged primarily in the manufacture of motorcycles, motorscooters, motorbikes, bicycles, motorized golf carts, and their parts.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relatuve economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Motorcycles, Bicycles, and Parts Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Motorcycles, Bicycles, and Parts Industry amounted to $\$ 189$ million. Of this total, $\$ 31$ million were products primary to other industries; and $\$ 9$ miliion were receipts for miscellaneous activities. The industry shipments of primary products represented 83 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry)should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 161$ million of motorcycles, bicycles, and parts were shipped by all producers of these products. Of this total, $\$ 149$ million, or 93 percent, were shipped by plants classified in Industry 3751, Motorcycles, Bicycles, and Parts, while the remainder was shipped by plants classified in other industries. The comparable percentage for 1958 was also 93.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value atatistics shown in table 3 A , indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also
their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Trailer coaches

SIC Code 3791

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Trailer Coaches Industry had total shipments valued at $\$ 697$ million, an increase of 51 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 36 percent from 1958, to a total of 25 thousand employees in 1963. Value added by manufacture amounted to $\$ 230$ million in 1963, an increase of 80 percent from 1958.

The Trailer Coaches Industry includes establishments engaged primarily in the manufacture of trailer coaches (mobile dwellings) for attachment to passenger cars.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value or finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geo-
graphic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Trailer Coaches Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Trailer Coaches Industry amounted to $\$ 697$ million. Of this total, \$19 million were products primary to other industries; and $\$ 13$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 99 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 668$ million of trailer coaches were shipped by all producers of these products. Of this total, $\$ 665$ million, or 99 percent, were shipped by plants classified in Industry 3791, Trailer Coaches, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 99.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, re-
pair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary surmary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through
mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Transportation equipment, n.e.c.

SIC Code 3799

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Transportation Equipment, N.E.C., Industry had total shipments valued at $\$ 160$ million, an increase of 73 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 62 percent from 1958 to a total of 8 thousand employees in 1963. Value added by manufacture amounted to $\$ 66$ million in 1963, an increase of 71 percent from 1958.

The Transportation Equipment, N.E.C., Industry includes establishments engaged primarily in the manufacture of transportation equipment, not elsewhere classified. Establishments primarily engaged in manufacturing industrial trucks, tractors, trailers, and stackers are classified in Industry 3537, and children's vehicles except bicycles in Industry 3943.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
May 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the l5th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figure for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure
available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Transportation Equipment, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Transportation Equipment, N.E.C., Industry amounted to $\$ 160$ million. Of this total, $\$ 12$ million were products primary to other industries; and $\$ 9$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 202$ million of transportation equipment, n.e.c., were shipped by all producers of these products. Of this total, $\$ 139$ million, or 69 percent, were shipped by plants classified in Industry 3799, Transportation Equipment, N.E.C., while the remainder was shipped by plants classified in other industries. The 1958 ratio was 73 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment" and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^171]
# 1963 GENSUS OF MANUFACTURES 

# Scientific instruments 

SIC Code 3811

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Scientific Instruments Industry had total shipments valued at $\$ 550$ million, according to preliminary results obtained from the 1963 census. Average ermployment in this industry totaled 33 thousand employees and value added by manufacture amounted to $\$ 357 \mathrm{mil}-$ lion in 1963.

The Scientific Instruments Industry includes establishments engaged primarily in the manufacture of laboratory, scientific, and engineering instruments such as nautical, navigational, aeronautical, surveying, drafting, and instruments for laboratory work and scientific research (except optical in-struments-Industry 3831). Establishments primarily engaged in manufacturing surgical and medical instruments are classified in Industry 3841; dental instruments and equipment in Industry 3843; mechanical measuring and controlling instruments in Industry 3821; machinists' precision measuring tools in Industry 3545; instmuments for indicating, measuring, and recording electrical quantities and characteristics in Industry 3611 ; watches and clocks in Industry 3871; and measuring and dispensing pumps in Industry 3586.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (S.IC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Establishments primarily manufacturing such individual instruments as those used for indicating air speed, rate-of-climb, angle-of-yaw and similar flight characteristics, and gyroscopes which are sold separately, are classified in Industry 3811, "Scientific Instruments." Establishments primarily engaged in providing complete instrumentation systems (for navigation, guidance, and check-out, etc.), in one package are classified in Industry 3662, "Radio, TV Communications Equipment." During the period 1958-1963 some of the large establishments which formerly manufactured individual instruments, and therefore were classified in Industry 3811, began shipping complete navigational and guidance systems as their major products. These establishments have been reclassified into Industry 3662 for the 1963 Census of Manufactures.

However, it has not been possible to revise the annual survey of manufactures data for the years 1959-1962, inclusive, nor the 1958 census information. It is known that several of the plants shifted from the production of instruments to complete systems during this period butremained classified by census in the Instruments Industry, 3811. Sometimes the change was abrupt and complete whereas in other instances the transition was a gradual one with both types of output continuing for awhile. There was inadequate provision for systems in the product inquiries for the 1958 census and some respondents reported their output as instruments for lack of a better classification. It has not proven feasible for respondents at this time to identify the proportion of earlier years' output which consisted of systems rather than instrumentation.

This misclassification of systems and instruments was brought to light by the initiation by the Census Bureau of detailed commodity surveys in the fields of electronic products and instrumentation. The electronic and associated products report (MA-36N) was started covering the year 1961
and the instruments series (MA-38B) was broadened for 1963 to encompass most types of instruments following an introductory report for 1961 and 1962 covering principally industrial processinstruments and test and measuring equipment. Annual statistics from both reports are published in the Current Industrial Reports publications of the Census Bureau.

Therefore, a "statistical bridge" table has been prepared and included in table l of this report. That "bridge" presents general statistics for Industries 3811 and 3662 , in combination. In view of the above, the annual data for 1958-1963 from the census and annual survey of manufactures are comparable only when Industries 3662 and 3811 are taken in combination. Accordingly, tables 1 and 2A show separate figures for Industry 3811 only for the year 1963. Combined data for Industries 3662 and 3811 are also shown in table 1 for the 1958-1963 period and geographically for 1958 and 1963 in table 2 B .

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

VALUE ADDED BY MANUFACTURE
For 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel,
purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Scientific Instruments Industry consists notonly ofproducts described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Scientific Instruments Industry amounted to $\$ 550$ million. Of this total, $\$ 25$ million were products primary to other industries; and $\$ 128$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 94 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 706$ million of scientific instruments, were shipped by all producers of these products. Of this total, $\$ 398$ million, or 56 percent, were shipped by plants classified in Industry 3811, Scientific Instruments while the remainder was shipped by plants classified in other industries.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables $1,2 A$, and $2 B$ are reported for each establishment asa whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l, 2A, and 2B) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.
PUBLICATION PROGRAM AND BACKGROUND
More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final. reports
will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the

United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(X) Not applicable. ${ }^{r_{\text {Revised }}}$
${ }^{1}$ Comparable data for 1958 not available. See text for more detailed explanation.
${ }^{2}$ The major difference between these two figures concerns the method of reporting parts and components for aircraft, flight, nautical, and navigational instruments and automatic pilots. Whereas, many respondents have included such parts under the broad heading in the census, parts were not covered in the $1963 \mathrm{MA}-38 \mathrm{~B}$ survey. While the exact value of such parts cannot be derived, it is approximately represented by the difference between the two sets of figures.
${ }^{3}$ Value shown is preliminary.

BUSINESS CYCLE DEVELOPMENTS is published monthly for specialists concerned with the analysis of current business conditions. It summarizes many of the available economic time series in convenient form for short-term evaluation and interpretation and supplements other Department of Commerce reports on the economy. The features of this report are:

- The arrangement of series according to their usual timing relations during the course of the business cycle.
- The inclusion of special analytical measures and historical cyclical comparisons that help in evaluating the current stage of the business cycle.
- The speed with which the data are collected, assembled, and published. $B C D$ is issued about the 22 d of each month covering data for the preceding month.
About 90 principal indicators and over 300 components are used for the different measures shown. The movements of the series are shown against the background of the expansions and contractions of the general business cycle so that "leads" and "lags" can readily be detected and unusual cyclical developments spotted. Since almost all of the basic data presented in this report are available in other published sources, the value of RCD lies in its analytical arrangement and speed of publication.
The presentation and classification of the time series in the BCD report follows the business indicators approach. The classification of series and the business cycle turning dates are those designed by the National Bureau of Economic Research which, in recent years, has been a leader in this field of investigation.

For sale by the Government Printing office, Washington, D.C. 20402. $\$ 6$ a year ( $\$ 1.50$ additional for foreign mailing). Single copies, $60 \hat{c}$ each.
U.S. DEPARTMENT OF COMMERCE bureau of the census

OFFICIAL BUSINESS

# 1963 GENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Mechanical and measuring devices

SIC Code 3821

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Mechanical Measuring Devices Industry had total shipments valued at $\$ 1,148$ million, an increase of 58 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 26 percent from 1958 to a total of 63 thousand employees in 1963. Value added by manufacture amounted to $\$ 732$ million in 1963, an increase of 60 percent from 1958.

The Mechanical Measuring Devices Industry includes establishments engaged primarily in the manufacture of industrial process instruments, for indicating, recording, measuring and controlling temperature (except automatic temperature controlsIndustry 3822), pressure and vacuum, fluid flow and liquid level, mechanical motion, rotation, humidity, density, acidity, alkalinity, and combustion; dial pressure gauges; physical property testing apparatus such as hardness, tension, compression, torsion, ductility; and, elasticity testing apparatus.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

[^174]June 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary
establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHVENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one. establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March.

## VALUE ADDED BY MANUFACTURE

For 1958 and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Mechanical Measuring Devices Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Mechanical Measuring Devices Industry amounted to $\$ 1,148$ million. Of this total, $\$ 225$ million were products primary to other industries; and $\$ 110$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 78 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 86 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 978$ million of mechanical measuring instruments were shipped by all producers of these products. Of this total, $\$ 812$ million, or 83 percent, were shipped by plants classified in Industry 3821, Mechanical Measuring Devices, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 76 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the-Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

| 3821000 | Mechanical measuring instruments, not specified by kind......................... | 17,228 | 19,147 |

(X) Not applicable.
${ }^{1}$ Value shown is preliminary. Detailed product statistics will be published later this year in Current Industrial Reports Series M38B, "Selected Instruments and Related Products."
${ }^{2}$ The major difference between these two figures concerns the method of reporting parts and components for industrial process instruments. Whereas many respondents have included such parts under the broad heading in the Census, parts were not covered in the 1963 MA-38B survey. While the exact value of such parts can not be derived, it is approximately represented by the difference between the two sets of figures.

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Automatic temperature controls

SIC Code 3822

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Automatic Temperature Controls Industry had total shipments valued at $\$ 527$ million, an increase of 47 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 24 percent from 1958 and 10 percent from 1962 to a total of 32 thousand employees in 1963. Value added by manufacture amounted to $\$ 379$ million in 1963 , an increase of 46 percent from 1958 and 13 percent from 1962.

The Automatic Temperature Controls Industry includes establishments engaged primarily in the manufacture of automatic temperature controls activated by pressure, temperature, level, flow, time, or humidity (including pneumatic controls) of the type principally used as components of air conditioning, refrigeration, and comfort heating, or as components of household appliances. Establishments primarily engaged in manufacturing industrial electric controls are classified in Industry 3622.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

(NA) Not available. ( X ) Not applicable.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard errors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.

April 1965
is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

For 1958-1963 value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Automatic Temperature Controls Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are
primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Automatic Temperature Controls Industry amounted to $\$ 527$ million. Of this total, $\$ 88$ million were products primary to other industries; and $\$ 32$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 82 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 88 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 431$ million of automatic temperature controls were shipped by all producers of these products. Of this total, $\$ 407$ million, or 95 percent, were shipped by plants classified in Industry 3822, Automatic Temperature Controls, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 94 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, buit also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTUR=S 

## INDUSTRY SERIES

# Optical instruments and lenses 

SIC Code 3831

This report is one of a series presenting preliminary'information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Optical Instruments and Lenses Industry had total shipments valued at $\$ 193$ million, an increase of 88 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 63 percent from 1958 to a total of 12 thousand employees in 1963. Value added by manufacture amounted to $\$ 130$ million in 1963, an increase of 115 percent from 1958.

The Optical Instruments and Lenses Industry includes establishments engaged primarily in the
production of optical lenses and prisms, and in manufacturing optical instruments such as microscopes, telescopes, field and opera glasses; and optical measuring and testing instruments such as refractometers, spectrometers, spectroscopes, colormeters, and polariscopes. Establishments primarily engaged in manufacturing eyeglass lenses, frames, or fittings are classified in Industry 3851; and those engaged in manufacturing sighting and fire control instruments, but not engaged in manufacturing optical components, in Industry 1941.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for 1939 and 1947 it represents unad justed value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Optical Instruments and Lenses Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Optical Instruments and Lenses Industry amounted to \$193 million. Of this total, $\$ 15$ million were products primary to other industries; and $\$ 21$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 267$ million of optical instruments and lenses were shipped by all producers of these products. Of this total, $\$ 157$ million, or 59 percent, were shipped by plants classified in Industry 3831, Optical Instruments and Lenses, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 66 percent.

## GENERAI STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROTND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary sumnary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^176]
# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Surgical and medical instruments

SIC Code 3841

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Surgical and Medical Instruments Industry had total shipments valued at $\$ 278$ million, an increase of 113 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 45 percent from 1958 to a total of 15 thousand employees in 1963. Value added by manufacture amounted to $\$ 164$ million in 1963, an increase of 92 percent from 1958.

The Surgical and Medical Instruments Industry includes establishments engaged primarily in the manufacture of medical, surgical, ophthalmic, and veterinary instruments and apparatus.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: the figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; figures for production workers are based on employment for the payroll period ended nearest the 15 th of March, May, August and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products)less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Surgical and Medical Instruments Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Surgical and Medical Instruments Industry amounted to $\$ 278$ million. Of this total, $\$ 26 \mathrm{milli}$ on were products primary to other industries; and $\$ 40$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 89 percent of total manufactured product shipments, primary and secondary. The 1958 ratio was 83 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 276$ million of surgical and medical instruments and apparatus were shipped by all producers of these products. Of this total, \$211 million, or 77 percent, were shipped by plants classified in Industry 3841, Surgical and Medical Instruments while the remainder was shipped by plants classified in other industries. The 1958 ratio was 76 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and !7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Surgical Appliances and Supplies Industry had total shipments valued at $\$ 592$ million, an increase of 28 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 14 percent from 1958 to a total of 28 thousand employees in 1963. Value added by manufacture amounted to $\$ 367$ million in 1963, an increase of 42 percent from 1958.

The Surgical Appliances and Supplies Industry includes establishments engaged primarily in the manufacture of orthopedic, prosthetic, and surgical appliances and supplies, arch supports, and other foot appliances; fracture appliances, elastic hosiery, abdominal supporters, braces, and trusses; bandages; surgical gauze and dressings; sutures; adhesive tapes and medicated plasters; electronic and electrical hearing aids; and personal safety appliances and equipment.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available for 4-digit industry for 1954 .
2 In addition to the data showm,
${ }^{2}$ In addition to the data show, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the resuits that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is pianned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

February 1965

For sole by the Bureou of the Census, Woshington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.
edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March. The figures for production workers, 1958 and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Surgical Appliances and Supplies Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Surgical Appliances and Supplies Industry amounted to $\$ 592$ million. Of this total, $\$ 104$ million were products primary to other industries; and $\$ 75$ million were
receipts for miscellaneous activities. The industry shipments of primary products represented 80 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i,e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 461$ million of orthopedic, prosthetic, and surgical appliances and supplies were shipped by all producers of these products. Of this total, $\$ 413$ million, or 90 percent, were shipped by plants classified in Industry 3842, Surgical Appliances and Supplies, while the remainder was shipped by plants classified in other industries. The 1958 ratio was also 90 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid1966. Order forms showing these reports and their
prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 GENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Dental equipment and supplies

## preliminary <br> report

sIC Code 3843

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in'a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Dental Equipment and Supplies Incustry had total shipments valued at $\$ 147$ million, an increase of 27 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 13 percent from 1958 and 9 percent from 1962 to a total of 8 thousand employees in 1963. Value added by manufacture amounted to $\$ 95$ million in 1963, an increase of 33 percent from 1958 and 8 percent from 1962.

The Dental Equipment and Supplies Industry includes establishments engaged primarily in the manufacture of artificial teeth, dental metals, alloys and amalgams, plus equipment, instruments and supplies used by dentists, dental laboratories, and dental colleges. However, dental laboratories constructing artificial dentures, bridges, inlays and other dental restorations on specifications from dentists are classified in service industries.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification

(NA) Not available. (X) Not applicable.
${ }_{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Nanufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The estimates, consequently, may differ from the results that would have been obtaine can be expected between the estimates and complete canvass totals percentage standard errors in this colum indicate the range of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

(SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories setween the beginning and end of the year. Unadjusted value added is obtained by subtracting the zost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Dental Equipment and Supplies Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Dental Equipment and 'Supplies Industry amounted to $\$ 147$ million. Of this total, $\$ 9$ million were products primary to other industries; and \$11 million were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 139$ million of dental equipment and supplies were shipped by all producers of these products. Of this total, $\$ 127$ million, or 91 percent, were shipped by plants classified in Industry 3843, Dental Equipment and Supplies, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 92 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary
reports showing $U . S$. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in l8uy. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing estab-1 lishments in interim years.

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Ophthalmic goods

SIC Code 3851

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Ophthalmic Goods Industry had total shipments valued at \$261 million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 11 percent from 1958 to a total of 20 thousand employees in 1963. Value added by manufacture amounted to $\$ 176$ million in 1963, an increase of 28 percent from 1958.

The Ophthalmic Goods Industry includes establishments engaged primarily in the manufacture of ophthalmic frames, lenses, and sunglass lenses.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulate in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAI STATISTICS FOR THE OPHTHALMIC GOODS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3851)

| Year | Establishments (number) |  | Al1 employees |  | Production workers |  |  | Value added by manufacture$(\$ 1, \infty)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | $\begin{gathered} \text { Capital } \\ \text { expend- } \\ \text { itures, } \\ \text { new1 } \\ (\$ 1,000) \end{gathered}$ |

(NA) Not available. ${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 ard is not available by 4 -digit industry for 1954.
${ }^{2}$ Data for Alaska and Hawaii are not ineluded.
January 1965

## ESTABLISHIENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 montinly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production vorkers, 1949-1963, are based on employment for the payroll period ended nearest the l5th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unad justed value added. Adjusted value added is equal to the value of ,shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unad.justed value added is obtained by suistracting the cost of materials, supplies, and containers, fuel, purchased electric energy ano contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic
importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels from 1958 to 1963.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Ophthalmic Goods Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Ophthalmic Goods Industry amounted to $\$ 261$ million. Of this total, \$ 42 million were products primary to other industries; and $\$ 8$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 83 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 229$ million of ophthalmic goods were shipped by all producers of these products. Of this total, \$2ll million, or 92 percent, were shipped by plants classified in Industry 3851, Ophthalmic Goods, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 98.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statisties shown in table 3 A , indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data vere available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, re-
pair work, etc.). This fact should be taken into account in comparing industry statistics (tables I and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming montis. A series of preliminary surmary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will
be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963 , it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

USCOMM-DC

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Photographic equipment

SIC Code 3861

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Photographic Equipment Industry had total shipments valued at \$1,837 million, an increase of 52 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 8 percent from 1958, to a total of 65 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,269$ million in 1963, an increase of 61 percent from 1958.

The Photographic Equipment Industry includes establishments engaged primarily in the manufacture
of (1) photographic apparatus, equipment, parts, attachments, and accessories, such as still and motion picture cameras and projection apparatus; photocopy and microfilm equipment; blueprinting and diazotype (white printing) apparatus and equipment; and other photographic equipment; and (2) sensitized film, paper, cloth, and plates, and prepared photographic chemicals for use therewith.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available for 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative saruple of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high, Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent the average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958, and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1939 and 1947, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Photographic Equipment Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments calssified in the Photographic Equipment Industry amounted to $\$ 1,837$ million. Of this total, \$81 million were products primary to other industries; and $\$ 196$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value ofprimary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 1,607$ million of photographic equipment and supplies were shipped by all producers of these products. Of this total, $\$ 1,561$ million, or 97 percent, were shipped by plants classified in Industry 3861, Photographic Equipment while the remainder was shipped by plants classified in other industries. The 1958 ratio was 94 percent.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an, industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Comnerce f'ield otfice or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries ( 2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume I, Summary Statistics
Volume 1I, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39
Volume III, Area Statistics

## Mineral Industries

Volume 1, General Summary and Industry Statistics

Volume II, Area Statistics

## 1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Watches and clocks

SIC Code 3871

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Watches and Clocks Industry had total shipments valued at $\$ 501$ million, an increase of 50 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 13 percent from 1958 and 11 percent from 1962 to a total of 27 thousand employees in 1963. Value added by manufacture amounted to $\$ 281$ million in 1963, an increase of 70 percent from 1958 and 17 percent from 1962.

The Watches and Clocks Industry includes establishments engaged primarily in the manufacture of clocks (including electric), watches, mechanisms for clockwork operated devices, and clock and watch parts. This industry includes establishments primarily engaged in assembling clocks and watches from purchased movements and cases. Establishments primarily engaged in manufacturing watchcases are classified in Industry 3872, glass crystals in Industry 3231, and unbreakable crystals in Industry 3079.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would bave been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska.and Hawaii are not included.
April 1965
is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954 and 1958-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of fínished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of
products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Watches and Clocks Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Watches and Clocks Industry amounted to $\$ 501$ million. Of this total, $\$ 98$ million were products primary to other industries; and $\$ 27$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 79 percent of the total manufactured product shipments primary and secondary. The 1958 ratio was 88 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 402$ million of watches and clocks were shipped by all producers of these products. Of this total, $\$ 376$ million, or 93 percent, were shipped by plants classified in Industry 387, Watches and Clocks, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 95 percent.

## GENERAL STATISTICS

The general statistics (emplcyment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary
reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Comnerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.--GENERAL STATISTICS FOR THE WATCHES AND CLOCKS INDUSTRY, BY GEOCRAPHIC AREAS: 1963 AND 1958

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Watchcases

SIC Code 3872

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Watchcases Industry had total shipments valued at $\$ 34$ million, a decrease of 3 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 2 percent from 1958 to a total of 3 thousand employees in 1963. Value added by manufacture amounted to $\$ 19$ millionin 1963 an increase of 5 percent from 1958.

The Watchcases Industry includes establishments engaged primarily in the manufacture of Watcheases.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE WATCHCASES INDUSTRY IN THE UNTTED STATES FOR SELECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new$(\$ 1, \infty 0)$ |

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954, 1958 and 1963, are based an employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified inthe Watchcases Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Watchcases Industry amounted to $\$ 34$ million. Of this total, $\$ 5$ miliion were products primary to other industries; and $\$ 1$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 80 percent.

The total value of shipments for the industry (i.e., the total value of receiptsof establishments classified in the industry) should be clearly distinguished from the total value primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 29$ million of watchcases were shipped by all producers of these products. Of this total, $\$ 28$ million, or 97 percent were shipped by plants classified in Industry 3872, Watchcases, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 98 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

# Jewelry, precious metal 

## SIC Code 3911

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Jewelry, Precious Metal Industry had total shipments valued at $\$ 484$ million, an increase of 48 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 13 percent from 1958 and 10 percent from 1962 to a total of 24 thousand employees in 1963. Value added by manufacture amounted to $\$ 236$ million in 1963, an increase of 41 percent from 1958 and 16 percent from 1962.

The Jewelry, Precious Metal Industry includes establishments engaged primarily in the manufacture of rings, women's and children's jewelry, watch attachments, school jewelry and emblems, and other jewelry made of precious metals.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not availIncludes expenditures for plant
able by $4-\mathrm{dig}$ it industry for 1954 .
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing estoblishments. The percentage standard errors in this colum indicste the range of differences that can be expected between the estimates and complete canvass totals because of sanpling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUF ACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Jewelry, Precious Metal Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Jewelry, Precious Metal Industry amounted to $\$ 484$ million. Of this total, \$4l million were products primary to other industries; and $\$ 63$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 396$ million of Jewelry, Precious Metals were shipped by all producers of these products. Of this total, $\$ 380$ million, or 96 percent, were shipped by plants classified in Industry 3911, Jewelry, Precious Metal while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 97 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, vaiue of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.) This fact should be taken into account in comparing industry statistics (tables 1 and 2)with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similiar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Conmerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Jewelers' findings and materials

## preliminary report

SIC Code 3912

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Jewelers' Findings and Materials Industry shipped products and had miscellaneous receipts valued at $\$ 71$ million, an increase of 24 percent over 1958, but 6 percent below the 1962 level, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 10 percent from 1958 but a decrease of 4 percent from 1962 to a total of 4.6 thousand employees in 1963. Value added by manufacture amounted to $\$ 33$
million in 1963, an increase of 22 percent from 1958 but a decrease of 16 percent from 1962.

The Jewelers' Findings and Materials Industry includes establishments engaged primarily in the manufacture of jewelers' findings, machine chain, and stock shop products, such as flat stock, wire, and tubing.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included in this report.

(NA) Not available. $r_{\text {Revised. }}$
${ }^{1}$ Includes expenditures for plants under construction but not in operation.
${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishnents canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The standard errors associated with these estimates are published in the Annual Survey of Manufactures volumes for this period. The figures shown in parenthesis either have associated standard errors exceeding 15 percent or are not consistent with related data. Thus, these estimates may be of limited reliability.
December 1964.

## ESTABLISHMENTS

The Census of Manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees is as follows: Figures on all employees represent the average number of production workers for the payroll period ended nearest the 15th of March, May, August, and November plus the number of all other employees for the payroll period ended nearest the 15 th of March. Production workers are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels from 1958 to 1963.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Jewelers' Findings and Materials Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Jewelers' Findings and Materials Industry amounted to $\$ 71$ million. Of this total, $\$ 6$ million were products primary to other industries; and $\$ 5$ million were receipts for miscellaneous activities, The industry shipments of primary products represented 91 percent of the total manufactured
product shipments, primary and secondary. The 1958 ratio was 90 percent (revised).

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should beclearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 70$ million of Jewelers' Findings and Materials were shipped by all producers of these products. Of this total, $\$ 60$ million, or 85 percent, were shipped by plants classified in Industry 3912, Jewelers' Findings and Materials while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 87 (revised).

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 28 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 " and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

Lapidary work

SIC Code 3913
preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Lapidary Work Industry had total shipments valued at \$57 million, an increase of 41 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 14 percent from 1958 to a total of 1.6 thousand employees in 1963. Value added by manufacture amounted to $\$ 15$ million in 1963, an increase of 5 percent from 1958.

The Lapidary Work Industry includes establishments engaged primarily in all types of lapidary work and cutting and polishing diamonds.

This report does not include figures for administrative offices, warehouses, garages, or otner auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE LAPIDARY WORK INDUSTFY IN THE UNITED STATES FOR SEIECTED YEARS

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ Data for Alaska and Hawaii are not included.
February 1965

## ESTABLISHIENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figues for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use ofproducts of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in the price levels from 1958 to 1963.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the LapiGary Work Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Lapidary Work Industry amounted to $\$ 57$ million. Of this total, $\$ 7$ million were products primary to other industries; and \$5 million were receipts for miscellaneous activities. The industry shipments of primary products represented 86 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 99 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified inthe industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 59$ million of lapidary work and cutting and polishing of diamonds were shipped by all producers of these products. Of this total, $\$ 45$ million, or 77 percent, were shipped by plants classified in Industry 3913, Lapidary Work and Cutting and Polishing of Diamonds while the remainder was shipped by plants classified in other industries. The 1958 ratio was 87 percent (revised).

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Silverware and plated ware

SIC Code 3914

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Silverware and Plated Ware Industry shipped products valued at $\$ 234$ million, an increase of 19 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 7 percent from 1958 to a total of 13 thousand employees in 1963. Value added by manufacture amounted to $\$ 130 \mathrm{mil-}$ lion in 1963, an increase of 18 percent from 1958.

The Silverware and Plated Ware Industry includes establishments engaged primarily in the manufacture of hollow ware, toilet ware, ecclesiastical ware, flatware and related products made of sterling silver; metal plated with silver, gold or other metal; of nickel silver; of pewter; or of stainless steel.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

[^181]and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments incuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE
For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as
materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Silverware and Plated Ware Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Silverware and Plated Ware Industry amounted to $\$ 234$ million. Of this total, $\$ 9$ million were products primary to other industries; and $\$ 18$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 212$ million of silverware and plated ware were shipped by all producers of these products. Of this total, $\$ 206$ million, or 98 percent, were shipped by plants classified in Industry 3914, Silverware and Plated Ware, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 98.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities
of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued.

Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## U.S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS WASHINGTON, D.C. 20233

## OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Musical instruments and parts 

SIC Code 3931

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Musical Instruments and Parts Industry shipped products valued at $\$ 314$ million, an increase of 33 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 25 percent from 1958 but a decrease of 4 percent from 1962 to a total of 20 thousand employees in 1963. Value added by manufacture amounted to $\$ 179$ million in 1963, an increase of 48 percent from 1958 and 24 percent from 1962.

The Musical Instruments and Parts Industry includes establishments engaged primarily in the manufacture of pianos, with or without player attachments; organs; other musical instruments; and parts and materials for musical instruments.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ble by 4 -digit industry for 1954.
2 The data are estimates derived
${ }^{2}$ The data are estimates derived fram a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained fram a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and camplete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
March 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nomproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel; purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Musical Instruments and Parts Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Musical Instruments and Parts Industry amounted to $\$ 314$ million. Of this total, $\$ 8$ million were products primary to other industries; and $\$ 13$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manuf actured product shipments, primary and secondary. The 1958 ratio was 98 percent (revised).

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 A , indicates that $\$ 319$ million of musical instruments and parts were shipped by all producers of these products. Of this total, $\$ 293$ million, or 92 percent, were shipped by plants classified in Industry 3931, Musical Instruments and Parts while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 91 (revised).

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Comerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# U.S. DEPARTMENT OF COMMERCE <br> BUREAU OF THE CENSUS <br> WASHINGTON, D.C. 20233 

## OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Games and toys

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Games and Toys Industry shipped products valued at $\$ 753$ million an increase of 38 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 15 percent from 1958 and 3 percent from 1962 to a total of 49 thousand employees in 1963. Value added by manufacture amounted to $\$ 415$ million in 1963, an increase of 44 percent from 1958 and 2 percent from 1962.

The Games and Toys Industry includes establishments engaged primarily in the manufacture of mechanical toys, model construction sets, metal, plastic, and wooden toys and complete games such as chess and checkers.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

BUREAU OF THE CENSUS, Richard M. Scammon, Director

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Games and Toys Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Games and Toys Industry amounted to $\$ 753$ million. Of this total, $\$ 52$ million were products primary to other industries; and $\$ 39 \mathrm{mil}-$ lion were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 752$ million of games and toys were shipped by all producers of these products. Of this total, $\$ 661$ million, or 88 percent, were shipped by plants classified in Industry 3941, Games and Toys while the remainder was shipped by plants classified in other industries. The 1958 ratio was 92 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Conmerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 " and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

OFFICIAL BUSINESS

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Dolls

SIC Code 3942

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Dolls Industry shipped products valued at $\$ 251$ million, an increase of 55 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 19 percent from 1958 to a total of 16 thousand employees in 1963. Value added by manufacture amounted to $\$ 139$ million in 1963, an increase of 81 percent from 1958.

The Dolls Industry includes establishments engaged primarily in the manufacture of dolls, doll parts and doll clothing. Establishments primarily engaged in manufacturing stuffed toy animals are also included in this industry.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE DOILS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

| Year | Establishnents (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures,$(\$ 1,000)$ |

(NA) Not available
${ }^{1}$ Includes expenditures for plants under construction but not in operation
able by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data show, estimates have been derived and generally published for 1959-1962 from a representive sample of establishments convassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaí are not included.
March 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthiy figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1934 and $1958-1963$ value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipnents (including resales of finished products) less the cost of finished products resold, mate:ials, supplies, fuels, electric energy, and contract work, plus the net change in the value of cinished products and work-in-process inventories jetween the beginning and end of the year. Unadjusted value added is obtained by subtracting the zost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHTPMENTS

The value of shipments reported by establishments classified in the Dolls Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Dolls Industry amounted to $\$ 251$ million. Of this total, $\$ 29$ million were products primary to other industries; and $\$ 54$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 85 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 194$ million of dolls and stuffed toy animals were shipped by all producers of these products. Of this total, $\$ 168$ million, or 87 percent, were shipped by plants classified in Industry 3942, Dolls, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 94.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ars industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKCROUND

More detailed figures for this industry will sppear in the final census reports. These reports
will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13, also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 OENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Children's vehicles

SIC Code 3943 report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Children's Vehicles Industry had total shipments valued at $\$ 77$ million, an increase of 10 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 to a total of 4.5 thousand employees in 1963. Value added by manufacture amounted to $\$ 35$ million in 1963, an increase of 11 percent from 1958.

The Children's Vehicles Industry includes establishments engaged primarily in the manufacture of baby carriages, strollers and gocarts; children's velocipedes and tricycles, coaster wagons, play cars, sleds, and other children's outdoor wheel goods and vehicles, except bicycles.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. -GENERAL STATISTICS FOR THE CHTTDREN'S VEHICLES INDUSTRY IN THE UNITED STATES FOR SEEECTED YEARS
(SIC code 3943)

| $1939{ }^{3}$. | 4. | (NA) | 4,952 | 6,172 | 4,319 | (NA) | 4,713 | 9,177 | 9,940 | 19,217 | (NA) |

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manfactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
Narch 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figues for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classifiedin the Children's Vehicle Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Children's Vehicles Industry amounted to $\$ 77$ million. Of this total, $\$ 22$ million were products primary to other industries; and $\$ 1$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 71 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classifiedin the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 83$ million of Children 's Vehicles were shipped by all producers of these products. Of this total, $\$ 55$ million, or 66 percent, were shipped by plants classified in Industry 3943, Children's Vehicles while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 78.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary sumnary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13
of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 " and "7." Thus, the next census willbe conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Sporting and athletic goods

SIC Code 3949

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Sporting and Athletic Goods Industry had value of shipments of $\$ 696$ million, an increase of 20 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 8 percent from 1958 to a total of 40 thousand employees in 1963. Value added by manufacture amounted to $\$ 358$ million in 1963 , an increase of 14 percent from 1958.

The Sporting and Athletic Goods Industry includes establishments engaged primarily in the
manuracture of sporting and athletic goods not elsewhere classified, such as fisning tackle; golf and tennis goods; baseball, football, basketball, and boxing equipment; roller skates and ice skates; gymasium and playground equipment; billiard and pool tables; and bowling alleys and equipment.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1. -GENERAL STATISTICS FOR THE SPORTING AND ATHLETIC GOODS INDUSTRY IN THE UNITED STATES FOR SEIECTED YEARS
(SIC code 3949)

(NA) Not available.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available for 4-digit industry for 1954
${ }^{2}$ In addition to the data show, estimates have been derived and generally published for $1959-1962$ from a representative sample of manufacturing establishments canvassed in the annual survey of manufacturies. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manuracturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
February 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments incuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Sporting and Athletic Goods Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classifiedin the Sporting and Athletic Goods Industry amounted to $\$ 696$ million. Of this total, $\$ 45$ million were products primary to other industries; and $\$ 58$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primaryand secondary. The 1958 ratio was 88 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 651$ milion of Sporting and Athletic Goods were shipped by all producers of these products. Of this total, $\$ 593$ million, or 91 percent, were shipped by plants classified in Industry 3949, Sporting and Athletic Goods while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 91.

## INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1
and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. A series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^186]
# 1963 CENSUS OF MANUFACTURES 

## Pens and mechanical pencils

## preliminary report

SIC Code 3951

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Pens and Mechanical Pencils Industry had total shipments valued at $\$ 185$ million, an increase of 23 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 3 percent from 1958 to a total of 12 thousand employees in 1963. Value added by manufacture amounted to $\$ 118$ million in 1963, an increase of 31 percent from 1958.

The Pens and Mechanical Pencils Industry includes establishments engaged primarily in the manufacture of pens, pen points, fountain pens, ball point pens, refill caxtridges, as well as parts for pens and mechanical pencils.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE PENS AND MECHANICAL PENCILS INDUSTRY IN THE UNTTED STATES FOR SELECTED YEARS
(SIC code 3951)

(NA) Not available.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequentiy, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuses for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the begirning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Pens and Mechanical Pencils Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Pens and Mechanical Pencils Industry amounted to $\$ 185$ million. Of this total, $\$ 25$ million were products primary to other industries; and $\$ 3$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 86 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished fram the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 172$ million of pens and mechanical pencils were shipped by all producers of these products. Of this total, $\$ 157$ million, or 91 percent, were shipped by plants classified in Industry 3951, Pens and Mechanical Pencils, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 93.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing incustry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Net selling values exclude discounts, sllowances, freight charges and - cise taxes.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Carbon paper and inked ribbons

SIC Code 3955

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Carbon Paper and Inked Ribbons Industry shipped products valued at $\$ 156$ million, an increase of 23 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 5 percent from 1958 to a total of 5.5 thousand employees in 1963. Value added by manufacture amounted to $\$ 68$ million in 1963, an increase of 16 percent from 1958.

The Carbon Paper and Inked Ribbons Industry includes establishments engaged primarily in the manufacture of carbon paper for business machines, sales books, etc.; spirit or gelatin process and other stencil paper; and inked ribbons for business machines.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^187]
## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 mariufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Carbon Paper and Inked Ribbons Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Carbon Paper and Inked Ribbons Industry mounted to $\$ 156$ million. Of this total, $\$ 7$ million were products primary to other industries; and $\$ 16$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3,indicates that $\$ 161$ million of carbon paper and inked ribbons were shipped by all producers of these products. Of this total, $\$ 133$ million, or 83 percent, were shipped by plants classified in Industry 3955, Carbon Paper and Inked Ribbons 'while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 89.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing UU.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## Costume jewelry

SIC Code 3961

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Costume Jewelry Industry had total shipments valued at $\$ 279$ million, an increase of 10 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 15 percent from 1958 to a total of 22 thousand employees in 1963. Value added by manufacture amounted to $\$ 150$ million in 1963, an increase of 9 percent from 1958.

The Costume Jewelry Industry includes establishments engaged primarily in the manufacture of costume jewelry, costume novelties, and ornaments made of all materials, except precious metal, precious or semiprecious stones, and rolled gold plate and gold filled materials.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not avail-
able by 4 -digit industry for 1954.
${ }^{2}$ Data for Alaska and Hawaii are not included.
February 1965
U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the l5th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industriés or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Costume Jewelry Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Costume Jewelry Industry amounted to $\$ 279$ million. Of this total, $\$ 19$ million were products primary to other industries; and \$24 million were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A,indicates that $\$ 252$ million of costume jewelry were shipped by all producers of these products. Of this total, $\$ 237$ million, or 94 percent, were shipped by plants classified in Industry 3961, Costume Jewelry while the remainder was shipped by plants classified in other industries. The 1958 ratio was 96 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURZS 

## INDUSTRY SERIES

## Needles, pins, and fasteners

SIC Code 3964

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Needles, Pins, and Fasteners Industry had total shipments valued at $\$ 333$ million, an increase of 51 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 13 percent from 1958 to a total of 20 thousand employees in 1963. Value added by manufacture amounted to $\$ 188$ million in 1963, an increase of 47 percent from 1958.

The Needles, Pins, and Fasteners Industry includes establishments engaged primarily in the manufacture of notions, such as machine and hand needles, pins, hooks and eyes, eyelets, buckles, and slide and snap fasteners.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[^189]U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figunes for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954, and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Needles, Pins, and Fasteners Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Needles, Pins, and Fasteners Industry amounted to $\$ 333$ million. Of this total, $\$ 25$ million were products primary to other industries; and $\$ 19$ million were receipts for miscellaneous activities. The industry shipments of primary products, represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 310$ million of needles, pins, and fasteners were shipped by all producers of these products. Of this total, $\$ 289$ million, or 93 percent, were shipped by plants classified in Industry 3964, Needles, Pins, and Fasteners, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 89.

## GENERAI STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFAGTURES 

## INDUSTRY SERIES

## Brooms and brushes

SIC Code 3981

preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Brooms and Brushes Industry shipped products valued at $\$ 321$ million, an increase of 16 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 3 percent from 1958 to a total of 17 thousand employees in 1963. Value added by manufacture amounted to $\$ 168$ million in 1963, an increase of 22 percent from 1958.

The Brooms and Brushes Industry includes establishments engaged primarily in the manufacture of household, industrial, and street sweeping brooms; and brushes such as paint brushes, tooth brushes, toilet brushes, and household, and industrial brushes.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE BROCNS AND BRUSHES INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

| Year | Establishments (number) |  | All employees |  | Production workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital <br> expend- <br> itures, new ${ }^{1}$ $(\$ 1,000)$ |

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified inthe Brooms and Brushes Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries) and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Brooms and Brushes Industry amounted to $\$ 321$ million. Of this total, \$24 million were products primary to other industries; and $\$ 63$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 89 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 247$ million of brooms and brushes were shipped by all producers of these products. Of this total, \$234 million, or 95 percent, were shipped by plants classified in Industry 3981, Broons and Brushes while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 94.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any
U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale
trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Hard surface floor coverings

SIC Code 3982

SIC

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Hard Surface Floor Coverings Industry had total shipments valued at $\$ 205$ million, an increase of 13 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 22 percent from 1958 and 3 percent from 1962 to a total of 6.2 thousand employees in 1963. Value added by manufacture amounted to $\$ 120$ million in 1963, an increase of 29 percent from 1958 and 8 percent from 1962.

The Hard Surface Floor Coverings Industry includes establishments engaged primarily in the manufacture of linoleum, asphalted-felt-base, and other hard surface floor coverings, not elsewhere classified.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable.
${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in l939 and 1947 and is not available by 4 -digit industry for 1954.

The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parentheses have standard exrors exceeding 15 percent. See the annual survey of manufactures volumes for further discussion of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.

For sole by the Bureau of the Census, Washington, D.C., 20233, and U. S. Deportment of Commerce Field Offices. 10 cents.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACIURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Hard Surf ace Floor Coverings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Hard Surface Floor Coverings Industry amounted to $\$ 205$ million. Of this total, $\$ 38$ million were products primary to other industries; and $\$ 2$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 81 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $\$ 168$ million of hard surface floor coverings were shipped by all producers of these products. Of this total, $\$ 165$ million, or 98 percent, were shipped by plants classified in Industry 3982 , Hard Surface Floor Coverings, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 98.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of
the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1963 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## U.S. DEPARTMENT OF COMMERCE <br> BUREAU OF THE CENSUS <br> WASHINGTON, D.C. 20233

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Morticians' goods

SIC Code 3988

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Morticians ' Goods Industry had total shipments valued at \$290 million, an increase of 22 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of less than 1 percent from 1958 to a total of 17 thousand employees in 1963. Value added by manufacture amounted to $\$ 158$ million in 1963, an increase of 23 percent from 1958.

The Morticians' Goods Industry includes establishments engaged primarily in the manufacture of
caskets, coffins, burial cases, and coffin shipping cases, whether of wood or other material except concrete (Industry 3272); morticians supplies and accessories, such as burial garments, gloves, slippers, casket linings, and embalming fluids; and morticians' paraphernalia and equipment.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.-GENERAL STATISTICS FOR THE MORTICIANS' GOODS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS
(SIC code 3988)

| Year | Establishments (number) |  | All employees |  | Froduction workers |  |  | Value added by manufacture$(\$ 1,000)$ | Cost of materials$(\$ 1,000)$ | Value of shipments$(\$ 1,000)$ | Capital expenditures, new ${ }^{1}$$(\$ 1,000)$ |

[^193]
## ESTABLISHIENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inc-uded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroli period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPNENTS

The value of shipments reported by establishments classified in the Morticians' Goods Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Morticians' Goods Industry amounted to $\$ 290$ million. Of this total, $\$ 12$ million were products primary to other industries; and $\$ 12$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3 , indicates that $\$ 268$ million of morticians' goods were shipped by all producers of these products. Of this total, $\$ 266$ million, or 99 percent, were shipped by plants classified in Industry 3988, Morticians' Goods, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 99.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment" and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufaczuring industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted
every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^194]U.S. DEPARTMENT OF COMMERCE

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

# Signs and advertising displays 

SIC Code 3993

## preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Signs and Advertising Displays Industry had total shipments valued at $\$ 636$ million, an increase of 39 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 18 percent from 1958 to a total of 43 thousand employees in 1963. Value added by manufacture amounted to $\$ 400$ million in 1963, an increase of 42 percent from 1958.

The Signs and Advertising Displays Industry includes establishments engaged primarily in the manufacture of electrical, mechanical, cutout, or plate signs and advertising displays, including neon signs and advertising novelties.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available.
Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.
${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the $1959-1962$ data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
${ }^{3}$ Data for Alaska and Hawaii are not included.
April 1965

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments inciuded in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the l5th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figurea. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in
the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Signs and Advertising Displays Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Signs and Advertising Displays Industry amounted to $\$ 636$ million. Of this total, $\$ 24$ million were products primary to other industries; and $\$ 63$ million were receipts for miscellaneous activities. The industry shipments of primary products represented 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 95 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 574$ million of signs and advertising displays were shipped by all producers of these products. Of this total, $\$ 549$ million, or 96 percent, were shipped by plants classified in Industry 3993, Signs and Advertising Displays while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 95.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for ar industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken-into account in comparing industry statistics (tables l and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports
will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809.

For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

## Ordnance and accessories (except missiles)

$\begin{array}{llllllll}\text { SIC Codes } 1911 & 1929 & 1931 & 1941 & 1951 & 1961 & 1999\end{array}$

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers' statistics in the Ordnance and Accessories (Except Missiles) Industries were as shown below.

The Ordnance and Accessories (Except Missiles) group consists of the following SIC Industries:

Industry 1911--Guns, Howitzers and Mortars: Consists of establishments engaged primarily in the manufacture of naval, aircraft, anti-aircraft, tank, coast, and field artillery having a bore over 30 mm (or over 1.18 inch), and components. Establishments primarily engaged in manufacturing small arms and parts 30 mm (or 1.18 inch) and below are classified in Industry 1951.

Industry 1929--Ammunition, N.E.C.: Consists of establishments engaged primarily in the manufacture of ammunition, not elsewhere classified os in loading and assembling anmunition over 30 mm ( o over 1.18 inch) for naval, aircraft, anti-aircraft, tank, coast, and field artillery; including component parts. This industry also includes establishments primarily engaged in manufacturing bombs, mines, torpedoes, grenades, depth charges, chemical warfare projectiles, and their component parts. Establishments primarily engaged in manufacturing small arms anmunition are classified in Industry 1961; explosives in Industry 2892; and military pyrotechnics in Industry 2899. This industry has been amended to include SIC 1921, Artillery ammunition and 1922, ammunition loading and assembling, which were defined as separate industries in the 1957 Standard Industrial Classification Manual. Also, establishments producing guided missiles and space vehicles are now classified in SIC 1925, Guided Missiles and Space Vehicles.

| SIC industry | Total shipments |  | Average employment |  | Value added by manufacture |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

May 1965

## U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

Industry 1931-Tanks and Tank Components: Consists of establishments engaged primarily in the manufacture or assembly of complete tanks, and specialized components for tanks. Establishments primarily engaged in manufacturing military vehicles other than tanks are classified in Group 371, and tank engines in Industry 3519.

Industry 1941-Sighting and Fire Control Equipment: Consists of establishments engaged primarily in the manufacture of sighting and fire control equipment, but which are not engaged in manufacturing optical lenses and prisms. Important products of this industry include bomb sights, percentage correctors, wind correctors, directors, and sound locators. Establishments engaged in manufacturing optical lenses and prisms, and also manufacturing sighting and fire control equipment, are classified in Industry 3831.

Industry 1951-Small Arms, 30 mm and Under: Consists of establishments engaged primarily in the manufacture of small firearms having a bore 30 mm (or 1.18 inch) and below, and parts for small firearms. Establishments primarily engaged in manufacturing artillery and mortars having a bore over 30 mm (or over 1.18 inch), and component parts are classified in Industry 1911.

Industry 1961—Sma11 Arms Ammunition: Consists of establishments engaged primarily in the manufacture of ammunition for small arms having a bore of 30 mm (or 1.18 inch) and below: Establishments primarily engaged in manufacturing ammunition except for small arms are classified in Industry 1929, blasting and detonating caps and safety fuses in Industry 2892, and fireworks in Industry 2899.

Industry 1999-Ordnance and Accessories N.E.C.: Consists of establishments engaged primarily in the manufacture of ordnance and accessories, not elsewhere classified. Guided missiles and space vehicles are classified in Industry 1925.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in
distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figuies for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15 th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

## VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALUE OF SHIPMENTS

The values of shipments reported by establishments classified in the Ordnance and Accessories (Except Missiles) Industries consist not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc.

SPECIALIZATION RATIOS

| Industry code | Industry and year | Value of shipments (millions of dollars) |  |  |  | Primary <br> product <br> speciali- <br> zation <br> ratio <br> col, b <br> col. b $+c$ <br> (percent) <br> (E) |

(NA) Not available. n.e.c. Not elsewhere classified. Revised.
${ }^{1}$ Detail may not add to total because of independent rounding.
${ }^{2}$ Combined with figures for Industry 1999.
${ }^{3}$ Figures on shipments of secondary products by small arms ammunition manufacturers are included in their miscellaneous receipts.
${ }^{4}$ Includes figures for Industry 1911. For 1958, figures for Industry 1999 include figures for old SIC 1922.

The total value of shipments for each of these industries (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of
primary products of each of the industries shipped by all producers. The latter figures appear in table 3.

| Industry code | Industry and year | Value of primary product shipments |  |  | Coverage ratio $\frac{\mathrm{col} . \mathrm{b}}{\mathrm{col} . \mathrm{a}}$ (percent) <br> (D) |

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in table 1 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (table 1) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROIND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "jndustry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each state are being issued. Final industry reports and final area reports will be published during the second half of 1965
through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses
of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[^196]
# PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES 

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

## PRELIMINARY REPORTS

## Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories-durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4 -digit industry and 2 - and 3 -digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

## Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral lndustries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

## Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2 -digit and selected 3 -digit industries, and for most individual counties on an "all manufacturing" basis.

## Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and
value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

## FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

## Manufactures

Volume I, Summary Statistics<br>Volume II, Industry Statistics<br>Part 1, Major Groups 20-28<br>Part 2, Major Groups 29-39<br>Volume 1II, Area Statistics

## Mineral Industries

Volume I, General Summary and lndustry Statistics

Volume II, Area Statistics

1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

## Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

# 1963 CENSUS OF MANUFACTURES 

## INDUSTRY SERIES

## Missiles and space vehicles

# preliminary report 

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Complete Guided Missiles and Space Vehicles Industry did work and had other receipts valued at $\$ 3,093 \mathrm{mil}-$ lion, an increase of 40 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 39 percent from 1958 to a total of 150 thousand employees in 1963. Value added by manufacture amounted to $\$ 1,934$ million in 1963, an increase of 68 percent from 1958.

The Complete Guided Missiles and Space Vehicles Industry includes establishments engaged primarily
in the manufacture of completely assembled guided missiles and space vehicles. Establishments ptimarily engaged in manufacturing guided missile and space vehicle engines and engine parts are classified in Industry 3722; space satellites, guided missile and space vehicle airborne and ground guidance, check-out and launch electronic systems and components in Industry 3662; and guided missile and space vehicle airframes, nose cones, and space capsules in Industry 3729.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Industry 1925

[^197]June 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

represents a newly defined industry. The type of operations covered by this industry are included in the 1957 edition of the SIC Manual as part of SIC 1929.

## ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

## EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15 th of March. The figures for production workers, 1958 and 1963, are based on employment for the payroll period ended nearest the 15 th of March, May, August, and November.

## VALUE ADDED BY MANUFACTURE

Value added for this industry is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of work done on complete guided missiles and space vehicles, the value of shipments for secondary products manufactured, plus receipts for services rendered.

Value added avoids the duplication in the value of work done which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

## VALJE OF WORK DONE

The value of work done and other receipts reported by establishments classified in the Complete Guided Nissiles and Space Vehicles Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of work done and other receipts of establishments
classified in the Complete Guided Missiles and Space Vehicles Industry amounted to $\$ 3,093$ million. Of this total, $\$ 147$ million were products primary to other industries; and $\$ 143$ million were receipts for miscellaneous activities. The industry shipments of primary products represent 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 74 percent.

The total value of work done and other receipts for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $\$ 3,858$ million of receipts for work performed on complete guided missiles and space vehicles was reported by all producers of these products. Of this total, $\$ 2,802$ million, or 73 percent, was performed by plants classified in Industry 1925, Complete Guided Nissiles and Space Vehicles, while the remainder was performed by plants classified in other industries. The 1958 ratio was 83 percent.

## GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in table 1 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (table l) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

## PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27 th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of

Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in " 2 " and "7." Thus, the next
census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2. -GENERAL STATISTICS FOR THE COMPLETE GUIDED MLSSILES AND SPACE VEHICLES INDUSTRY, BY GEOGRAPHIC AREAS: 1963 AND 1958 (Preliminary State and regional detail not available without further review)

Table 3.-VALUE OF WORK DONE ON COMPLETE GUIDED MISSILES AND SPACE VEHICLES BY ATL PRODUCERS IN THE UNITED STATES: 1963 AND 1958
(Includes value of these products reported not only by establishments classified in the Complete Guided Missiles and Space Vehicles Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Work Done")

| Product code | Product | Total value of work done ${ }^{1}$ $(\$ 1,000)$ |  |

    Data for Alaska and Hawaii are not included.

[^62]:    Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies,

[^63]:    (NA) Not available.
    Tnoludes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.

    Industry 3446 was not a separate industry in the 1958 Census of Manufactures but was part of SIC 3449, Miscellaneous Metal Work, N.E.C. However, data were published in 1958 for plants classified in SIC 34,49 specializing in the production of ornamental and structural metal work. This is the source of the separate data for Industries 3446 and 3449 . In like manner, data were published in 1954 for plants classified in SIC 3441 (1945 edition) specializing in those products now classified in Industries 3446 and 3449.
    ${ }^{3}$ For 1963 , a sizeable number of small establishments (under 20 employees) may have been misclassifiedin Industry 3449 , Miscellaneous Metal Work, because of insufficient product information. Although this has a significant effect on the number of establishments for this industry it has a very small effect on any of the other statistics, i.e., number of employees, salaries and wages, value added, etc. It is estimated that the effect on these principal statistics is less than 3 percent.

    May' 1965
    U.S.. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

[^64]:    Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies,

[^65]:    Represents zero. n.e.c. Not elsewhere classified. (NA) Not available. (X) Not applicable. ${ }^{2}$ Revised.
    ${ }^{1}$ Because of the lack of sufficient product detail on the reports for small establishments in the 1958 Census of Manufactures it was not possible to effect a precise distinction between fabricated structural iron and steel, not specified by kind (3441000) and miscellaneous metal work, not specified by kind. Accordingly, the value of such shipments, $\$ 130,111$ thousand, are included in the data for SIC 3441.

[^66]:    (NA) Not available. (X) Not applicable.
    Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.

    The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this colum indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. The figures shown in parenthesis either have associated standard errors exceeding 15 percent or are not consistent with related data. Thus these estimates may be of limited reliability. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[^87]:    See footnotes at end of table.

[^88]:    *Includes some machines with an average value of under \$1,00C. (NA) Not available.
    (X) Not applicable. ${ }^{r}$ Revised.
    ${ }^{1}$ For these products, data were also collected on Census Quarterly Fomm M35W. In lieu of asking for detailed statistics on these products in the Censuses of Manufactures, respondents were asked to report only value of shipments for specified classes of products for which separate figures had previously been collected on the Quarterly Fomm M35. In most cases, the value figures reported in the census of manufactures for each class of products agreed closely with the corresponding figures reported in the quarterly survey. However, there were sone differences between the Census figures and the quarterly survey figures. These variations were due prinarily to the following reasons:
    a. Census of manufactures reports correctly including all accessories or attachnents ordered and shipped with the machine. In some cases the quarterly survey represents only the value of the basic machine. This is the most significant factor for these differences.
    b. Use of different bases for reporting value (company sales vs. factory production).
    c. Use of estimates in reporting data on the quarterly survey, whereas census of manufactures figures generally represent more exact shipments figures.
    d. Better coverage in the census of manufactures program. Quarterly current cormodity survey detail for 1963 have been revised to reflect data from respondents not previously included.
    ${ }^{2}$ Some machines with an average value or under $\$ 1,000$ for codes 3541231,3541253 , and 3541261 are included with code 3541299 .
    ${ }^{3}$ Product code 3541439 includeó with "All other grinding machines."
    4 All machines with an average value of under $\$ 1,000$ for codes 3541433,3541451 and 354467 are included with "All other grinding machines."
    s"All other manufacturing and tool room lathes" included with "All other lathes." Also "All other lathes" includes brush and floor light duty type turret lathes with turret attachments.
    ${ }^{6}$ Data are limited to ram type turret lathes.
    ${ }^{7}$ Some machines with an average value of under \$1,000 for codes 3541533 and 3541551 are included with code 3541599 .
    ${ }^{8}$ Some machines with an average value of under $\$ 1,000$ for codes 3541626,3541629 and 3541695 are included with code 3541699 .
    Includes data for codes 3541711-3541799 and 3541811-3541891.
    "rvertical and other shapers and slotters" included with "All other metal cutting machine tools."
    12 All machines with an average value of under $\$ 1,000$ for codes 3541763 and 3541767 are included with code 3541769 . For 1958 , code 3541767 included with code 3541769.
    ${ }^{12}$ All machines with an average value of under $\$ 1,000$ for code 3541772 are included with code 3541779 .
    ${ }^{13}$ Bolt threading machines and all machines with an average value of under $\$ 1,000$ for code 3541777 are included with 3541778 .
    14 Includes for 1963 reaming machines (including rifling machines); screw and nut slotting machines; electro-erosion machines; ultrasonic machines; and electrolytic machines.

[^182]:    (NA) Not available. (X) Not apklicable.
    ${ }^{1}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954.
    ${ }^{2}$ The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. Figures shown in parenthesis have standard errors exceeding 15 percent. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.
    ${ }^{3}$ Data for Alaska and Hawaii are not included.

[^183]:    ${ }^{1} 2,355$ thousand units were shipped in 1963 and 2,397 thousand in 1958.

[^184]:    (X) Not applicable. Revised

[^185]:    - Represents zero. (NA) Not available. (X) Not applicable.
    ${ }^{1}$ In 1958, product code 3949225 was combined with product code 3949229 , "Other bowling alley playing supplies," to avoid disclosing figures for individual companies.
    ${ }^{2}$ Some products, e.g., pin setters, are not sold but are leased. The values reported for such products represents the valuation placed on them for
    tax, insurance, and similar purposes.
    ${ }^{3}$ In 1958, data for product codes $3949249,88,86,92,87,93,94$ and 91 are included with "Other sporting and athletic goods," product code 3949298.

[^186]:    n.e.c. not elsewhere classified.

[^187]:    (NA) Not available.
    ${ }^{2}$ Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4 digit industry for 1954.
    ${ }^{2}$ In addition to the data shom, estimates have been derived and generally published for $1959-1962$ from a representative sarmple of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
    ${ }^{3}$ Data for Alaska and Hawaii are not included.
    March 1965

[^188]:    $\mathrm{r}_{\text {Revised }}$.

[^189]:    (NA) Not available.
    ${ }^{1}$ Includes expenditures for plants under construction but not in operatior. This information was not collected in 1939 and 1947 and is not available by 4 -digit industry for 1954 .
    ${ }^{2}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative sarmple of manufacturing establishments canvassed in the annual survey of manufactures.     Therefore, the $1959-1962$ data have been withheld from this preliminary report. It is planned, however, to publish such information in the final Therefore, the $1959-1962$ data have been withheld from this preliminary report. It is planned, however,
    census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.
    ${ }^{3}$ Data for Alaska and Hawaii are not included.
    April 1965

[^194]:    (NA) Not available.
    (X) Not applicable.

[^195]:    (D) Withheld to avoid disclosing figures for individual companies. n.e.c. Not elsewhere classified. ${ }_{\text {Pevised }}$

    Includes expenditures for plants under construction and not yet in operation.
    ${ }^{2}$ Industry 1911 combined with Industry 1999 for 1963. However, a value of shipments figure for the products primary to this industry is shown in table 3.
    ${ }^{3}$ Excludes 1958 SIC 1922, ammunition loading.

[^196]:    n.e.c. Not elsewhere classified. (X) Not applicable. ${ }_{\text {revised. }}$
    ${ }^{1}$ Although general statistics for Industry 1911 have been combined with SIC 1999, the value of products primary to SIC 1911 is shown separately. Most of this value is accounted for by establishments in industries other than 1911.

    2Value of shipments for 1911 and 19292 included with 1999 for 1958.
    ${ }^{3}$ Value shown is preliminary. Final figures will be published later this year in Current Industrial Reports Series, M38B, "Selected Instruments and Related Products."

[^197]:    ${ }^{1}$ The adjusted value added for the Guided Missiles and Space Vehicles Industry does not take into account the change in inventory between the beginning and end of the year, since the figures reported by establishments in this industry are value of work done rather than value of shipments. It does include value added by resales.
    ${ }^{2}$ Includes expenditures for plants under construction but not in operation.
    ${ }^{3}$ In addition to the data shown, estimates have been derived and generally published for $1959-1962$ from a representative sample of manufacturing establishnents canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

    4 A revision in the definition of this industry was introduced in the 1957 Standard Industrial Classification. Accordingly, the data for 1963 and 1958 are not comparable with those for earlier years.
