

Expenditures and Sources of Funds for Mental Health Organizations: United States and Each State, 1986

Jonathan H. Sunshine, Ph.D.; Michael J. Witkin, M.A., C.P.A.;
Ronald W. Manderscheid, Ph.D.; and Joanne Atay, M.A.

Abstract

Expenditures

Expenditures by the 8 types of mental health organizations covered in this report totaled \$18.5 billion in 1986, for the United States and the Territories. Three States (California, New York, and Pennsylvania) accounted for one-third of this total.

Nationally, the largest proportion of total expenditures were the expenses of State and county mental hospitals (34 percent, down from 38 percent in 1983) and those of multiservice mental health organizations (20 percent). In all but 19 States, State and county mental hospitals (hereafter called State mental hospitals) had the largest expenditures of any type of mental health organization; in 10 of the remaining 19 states, expenditures of multiservice mental health organizations were largest. Nationally, separate psychiatric services of non-Federal general hospitals, private psychiatric hospitals, and VA psychiatric organizations ranked next, with 16, 14, and 7 percent of total mental health expenditures, respectively. At the other extreme, residential treatment centers (RTCs) for emotionally disturbed children, freestanding psychiatric outpatient clinics, and freestanding psychiatric partial care organizations accounted for 5 percent, 3 percent, and less than 1 percent of national total expenditures, respectively.

The \$18.5 billion expenditure in 1986 was a 28 percent increase over the 1983 figure, but when adjusted for inflation, the estimated increase was only 5 percent overall and 3 percent on a per capita basis. Constant dollar expenditures (1983 = 100) of most types of mental health organizations increased between 1983 and 1986, but those of freestanding psychiatric outpatient clinics were virtually

unchanged, and those of State mental hospitals and VA psychiatric organizations actually decreased.

Sources of Funds

In 1986, the funds received by mental health organizations totaled \$19.0 billion. Of this total, \$7.9 billion (41 percent) was provided directly by State governments, predominantly by the State mental health agencies. Direct Federal funds plus Medicare and Medicaid (including the State and local share of Medicaid) provided \$4.8 billion, or one-fourth, of total funding. Fees from clients (including private insurance) provided \$4 billion, or 21 percent, of total funding; direct local government funds provided 8 percent and all other sources 5 percent.

State governments provided 78 percent of the funds received by State mental hospitals and were also the largest single source of funds, although not so dominant, for multiservice mental health organizations, freestanding psychiatric partial care organizations, and freestanding psychiatric outpatient clinics. VA medical centers were funded by the Federal Government, while two-thirds of funding for private psychiatric hospitals came from client fees. Local and State governments shared equally as the primary funding sources for RTCs, and local governments also contributed substantially to the funding of multiservice mental health organizations, freestanding psychiatric partial care organizations, and freestanding psychiatric outpatient clinics. Client fees (including private insurance) and Federal funds (including Medicare and Medicaid) were the dominant sources of funds for psychiatric units of general hospitals.

NATIONAL INSTITUTE OF MENTAL HEALTH • Division of Biometry and Applied Sciences • Survey and Reports Branch

Introduction

This report presents the latest data available, both nationally and by State, on the amount spent by mental health organizations in the United States and on the sources from which these funds were obtained. The 1986 expenditure figures represent an update of similar data covering trends from 1969 to 1983, that have been reported in earlier NIMH publications (Manderscheid and Barrett, 1987; Redick et al., 1987). Data on sources of funds, however, have been available only since 1983. This report also examines whether recent increases in spending on mental health care have exceeded inflation and whether any major shifts have occurred since 1983 among the various types of mental health organizations in spending for mental health care.

The data presented here on expenditures and sources of funds were obtained from the Inventory of Mental Health Organizations and General Hospital Mental Health Services (IMHO-GHMHS), conducted in November 1986 by the Survey and Reports Branch (SRB), Division of Biometry and Applied Sciences (DBAS), National Institute of Mental Health (NIMH), with cooperation of the State mental health agencies and the American Hospital Association. The financial data from the IMHO-GHMHS refer to the organizations' latest fiscal year, typically a year ending on September 30, 1986, June 30, 1986, or December 31, 1985. Trend data for expenditures were obtained from similar NIMH inventories conducted in June 1984, covering the year 1983. This report covers the following 8 types of mental health organizations, each of which were included in the Inventory in both years:

- State and county mental hospitals (hereafter called State mental hospitals)
- Private psychiatric hospitals
- Separate psychiatric services of non-Federal general hospitals
- Separate psychiatric services of Veterans' Administration (VA) medical centers
- Residential treatment centers for emotionally disturbed children (RTCs for EDCs)
- Freestanding psychiatric partial care organizations
- Freestanding psychiatric outpatient clinics
- Multiservice mental health organizations

Except as otherwise noted, figures for the entire United States include the 50 States, the District of Columbia, and the territories of Guam, Puerto Rico, and the Virgin Islands.

Trends in Expenditures of Mental Health Organizations, 1983-86

Table 1 shows that total expenditures for all mental health organizations covered in this report rose from \$14.5 billion in 1983 to \$18.5 billion in 1986, an increase of 28 percent, while the total number of organizations in the 8 categories covered increased by 8 percent. Per capita expenditures¹ for all organizations covered increased 24 percent, from \$61.09

to \$76.30; and the average expenditure per organization increased 19 percent, from \$3.27 million to \$3.88 million.

Current dollar² expenditures increased between 1983 and 1986 for each of the 8 types of mental health organizations. However, expenditures by some types of organizations grew much more rapidly than those of others. Expenditure growth was most rapid for RTCs (expenditures increased by 70 percent), private psychiatric hospitals (53 percent increase), freestanding psychiatric partial care organizations (44 percent increase), and multiservice mental health organizations (39 percent increase). In contrast, State mental hospitals and VA psychiatric organizations showed the least growth, with expenditure increases of 15 percent and 2 percent, respectively.

As a result of differences in growth rates, the percentage of total mental health care spending accounted for by different types of organizations changed considerably between 1983 and 1986. Private psychiatric hospitals increased their share of total expenditures from 12 percent to 14 percent, while the share of RTCs increased from 4 percent to 5 percent. Meantime, the share of State mental hospitals fell from 38 percent to 34 percent, continuing a long-term decline, and the share of VA psychiatric organizations fell from 9 percent to 7 percent (table 1).

Some of the growth in spending between 1983 and 1986 was due to an increase in the number of organizations. Most notably, private psychiatric hospitals increased in number by 43 percent between 1983 and 1986, and RTCs increased in number by 34 percent during this period. Nonetheless, the average expenditure per organization increased for every type of organization (table 1).

Some of the increase in expenditures between 1983 and 1986 reflects inflation rather than a real increase in the quantity or intensity of services provided. Measuring expenditures in constant dollars³ provides an estimate of real changes rather than those attributable to inflation. Estimates of constant dollar expenditures (1983 = 100) (table 2) indicate that real total expenditures by all mental health organizations increased by only 5 percent between 1983 and 1986, from \$14.5 billion to \$15.3 billion, and that per capita constant dollar expenditures increased by only 2 percent. The average constant dollar expenditure per organization decreased by 2 percent, from \$3.27 million to \$3.20 million.

Although overall constant dollar expenditures increased for most types of organizations, they decreased 16 percent for VA psychiatric organizations, and 5 percent for State mental hospitals. For both types of organizations, this was a continuation of a decline that had previously occurred between 1975 and 1983 (Manderscheid and Barrett, 1987, p. 57). By contrast, even in constant dollars, expenditure increases were rapid for RTCs (constant dollar expenditures increased by 40 percent), private psychiatric hospitals (27 percent increase), freestanding psychiatric partial care organizations (19 percent increase), and multiservice mental health organizations (14 percent increase).

Types of Expenditures⁴ by Mental Health Organizations, 1986

Of the total expenditures by mental health organizations in 1986, 71 percent (\$13.1 billion) were for staff expenses, with 68 percent (\$12.5 billion) going for staff salaries and 3 percent (\$600 million) covering contract personnel expenses (tables 3 and 4). This represented a small decline from 1983 when 73 percent of expenditures went for staff expenses (Redick et al., 1987). Among the different organization types, the share of expenditures devoted to staff expenses varied somewhat, although it was the dominant expense in all. It ranged from 80 percent in State mental hospitals and 74 percent each in VA psychiatric organizations and in freestanding psychiatric partial care organizations, down to 57 percent in private psychiatric hospitals. Within the total spent on staff, the role of contract personnel was more variable. Expenditures for contract personnel ranged from 7 percent of total expenditures in freestanding psychiatric outpatient clinics and multiservice mental health organizations to 1 percent in State mental hospitals and VA psychiatric organizations.

Capital expenditures constituted 3 percent of the total expenditures by all mental health organizations in 1986 (table 4) and depreciation expenses, which are closely related, also were 3 percent of the total for all organizations. The sum of these 2 expenditure categories ranged from 11 percent of total expenditures for private psychiatric hospitals, to 2 percent of total expenditures for freestanding psychiatric outpatient clinics.

Expenses for contracts with other mental health organizations were 2 percent of the total expenditures by mental health organizations in 1986 (table 4). They were highest, 6 percent of total expenditures, in freestanding psychiatric outpatient clinics and multiservice mental health organizations, and their role in total expenditures was approximately twice that size in outpatient clinics and multiservice organizations owned by State or local governments. There expenses were lower, approximately 1 percent of total expenditures or less, in all other types of mental health organizations.

The remaining 22 percent of the total expenditures by mental health organizations in 1986 went to other operating expenditures (table 4). This expenditure category ranged from a low of 15 percent of total expenditures in State mental hospitals, to a high of 31 percent in private psychiatric hospitals, with those private psychiatric hospitals operating on a for-profit basis showing a figure of 35 percent. These figures generally represented slight increases from 1983, when other operating expenditures were 20 percent of expenditures by all mental health organizations (Redick et al., 1987).

Expenditures of Mental Health Organizations by State, 1986

Tabulations of the number and type of mental health organizations in each State and total expenditures for each

in 1986 appear in tables 5 and 6, respectively. Three States (California, New York, and Pennsylvania) accounted for one-third of the \$18.5 billion expended by all mental health organizations in the United States in that year (table 6). Per capita expenditure data (table 7) indicate that:

- Only 12 States and the District of Columbia had per capita expenditures for all mental health organizations that exceeded the U.S. average of \$76;
- Total per capita expenditures by State ranged from \$42 in South Carolina to \$156 in New York.⁵

Nationally, as noted above, State mental hospitals accounted for \$6.3 billion of the \$18.5 billion total expenditures by mental health organizations in 1986, or 34 percent of the total (tables 1 and 6). Multiservice mental health organizations ranked next with 20 percent of total expenditures, followed by general hospital psychiatric services (16 percent), private psychiatric hospitals (14 percent), VA psychiatric organizations (7 percent), RTCs (5 percent), freestanding psychiatric outpatient clinics (3 percent), and freestanding psychiatric partial care organizations (less than 1 percent).

Considerable variation in this national pattern was observed among the States. In 30 States, expenditures by State mental hospitals were larger than those of any other single type of mental health organization (tables 6 and 7). However, in 20 States spending by another type of mental health organization exceeded that of State mental hospitals. This was the case in Arizona, where spending by RTCs was largest; in California and Massachusetts, where spending by multiservice mental health organizations was nearly twice that of the next largest type of organization; in Vermont, where multiservice organizations were even more prominent; in Florida, Kentucky, Michigan, New Mexico, North Carolina, Utah, and West Virginia, where multiservice organizations also had the largest expenditures of any type of organization; in Idaho, Kansas, Nevada, New Hampshire, Rhode Island, and Texas, where private psychiatric hospitals had the largest expenditures; in Iowa and Minnesota, where spending by general hospital psychiatric services was largest; and in Wyoming, where VA psychiatric organizations were the largest.

Per capita expenditures for the various types of mental health organizations showed great variability from State to State (table 7). For example, excluding the District of Columbia and the Territories, per capita expenditures for State mental hospitals ranged from \$86 in New York to \$8.64 in Arizona. Per capita expenditures for multiservice mental health organizations were largest in Vermont (\$57) and smallest in Louisiana (\$3.55) and Nevada (with no multiservice organizations). Per capita expenditures for private psychiatric hospitals ranged from \$33 in New Hampshire to \$1.41 in Oregon and nothing in 3 States (Iowa, North and South Dakota) that did not have these hospitals. And per capita expenditures of general hospital psychiatric services ranged from \$27 in New York to \$1.78 in Nevada.

Sources of Funds⁶ for Mental Health Organizations, 1986

For mental health organizations other than psychiatric services of non-Federal general hospitals, State governments were the source of almost half (48 percent) of all funds received in 1986, with the bulk of these funds provided by State mental health agencies (tables 8 and 9). Client fees and Federal funds, exclusive of Medicaid and Medicare, ranked next in importance, providing, respectively, 17 percent and 10 percent of total funds received in that year. Among other funding sources, Medicaid was the source of 9 percent of funds, local governments contributed 8 percent, and Medicare 3 percent.

The importance of funding sources varied greatly by type of mental health organization (table 9). State government was the source of 78 percent of the funds of State mental hospitals, 51 percent of the funds of multiservice mental health organizations, and approximately one-third of the funds of RTCs, freestanding psychiatric outpatient clinics, and freestanding psychiatric partial care organizations. However, State government provided only 8 percent of the funds of psychiatric units of non-Federal general hospitals, 5 percent of the funds of private psychiatric hospitals, and none of the funds of VA psychiatric organizations. Essentially all of the funds of VA psychiatric organizations came from the Federal Government (other than Medicare or Medicaid), but this source contributed less than 1 percent of the funds of State mental hospitals and only 2 to 4 percent of the funds of most other types of mental health organizations. Client/patient fees (including private insurance, but excluding Medicare and Medicaid) were the source of 67 percent of the funds of private psychiatric hospitals and 41 percent of the funds of psychiatric units of non-Federal general hospitals, but were much less prominent among the funding sources of other types of mental health organizations. Local governments provided 36 percent of the funds of RTCs (slightly more than State governments provided), 25 percent of the funds of freestanding psychiatric partial care organizations, 21 percent of the funds of freestanding psychiatric outpatient clinics, and 16 percent of the funds of multiservice mental health organizations. However, local governments were the source of much smaller percentages of the funds of other types of mental health organizations.

Sources of Funds for Mental Health Organizations by State, 1986

As expected, State governments were the major source of funding for State mental hospitals in almost every State during 1986 (table 10). They were the source of 50 percent or more of the total funding for these hospitals in all but two States, North Dakota and Wisconsin. In most States, the State mental health agency was by far the dominant source of State funding for State mental hospitals, but in 5 States,

other State government sources predominated. Nationally, and in approximately 30 States, Medicaid ranked second to State government funds as the most important source of funding for State mental hospitals. In the remaining States, client fees or Medicare were most often the second largest funding sources.

As noted previously, nationwide, 67 percent of the funding for private psychiatric hospitals came from client fees in 1986 (including both direct payment and private insurance) (table 11). Among the 47 States (and the District of Columbia) that had private psychiatric hospitals in 1986, client fees were the most important single source of funding in all but 3 States. The exceptions were Indiana, where State funds were most important, Nevada, where the "all other sources" category was largest, and Oklahoma, where Medicaid was the most important single source of funding. Client fees as a percent of total funding ranged from 31 percent in Nevada to 86 percent in Connecticut and were the source of two-thirds or more of total funding in 27 States and the District of Columbia. Considerable variation occurred among States with respect to the prominence of other sources of funds for private psychiatric hospitals. Medicare, which was the second ranking source of funds for private psychiatric hospitals nationally, ranked second in only about one-third of the States.

Nationally, patient funds (including both direct payment and private insurance) and Federal funds (including Medicare and all of Medicaid) were about equally important in 1986 as sources of funds for the psychiatric services of non-Federal general hospitals. Each provided approximately 41 percent of the funds received by these units (table 12). Among the States, patient funds ranged from 15 percent of total funds in Wyoming to 59 percent in North Dakota, and were larger than Federal funds in 33 States plus the District of Columbia. Federal funds ranged from 24 percent of total funds in Nebraska to 57 percent in Idaho and exceeded patient funds in 17 States. Only in Arizona was a source of funds other than patient or Federal funds the largest source of revenues for the psychiatric services of non-Federal general hospitals. In Arizona, local government funds were most important. However, another source of funds was the second largest in 3 States. Specifically, in Louisiana and Nebraska, State government was the second most important source of funds, slightly ahead of Federal funds, while, in Wyoming, local government was the second most important source of funds, well ahead of patient funds.

State governments and local governments were the primary sources of funds for RTCs in 1986, with each providing slightly over one-third of the total funding for these organizations nationally (table 13). However, among the 48 States (and the District of Columbia) that had RTCs in 1986, only four States (Illinois, Kansas, Maine, and Oregon) showed a pattern in which State and local governments shared about equally as the major funding sources. In 27 of the remaining States and the District of Columbia, State governments contributed the largest percentage of funding; in 12 States,

local governments were the major contributors. In Arkansas, Medicaid was the largest single funding source; in Georgia, North, and South Carolina, the "all other sources" category was largest; and, in Iowa, client fees were the largest funding source. Other funding services for RTCs varied widely among the States in 1986, with the "all other sources" category often quite prominent.

Among the 43 States and the District of Columbia that had freestanding psychiatric outpatient clinics in 1986, State governments were the source of the largest percentage of funds for these organizations in a majority of States (table 14). However, client fees were the largest source of funds in 7 jurisdictions: the District of Columbia, Georgia, Idaho, Maine (where State funds were almost as large), North Carolina, Rhode Island, and Vermont. And local governments were the largest single funding source in another 7 States: Iowa, Kansas, Minnesota, Nebraska, New York, Ohio, and Virginia. Finally, contract funds from non-government organizations were the largest source of funds in Colorado, while, in Arizona, Connecticut, and New Jersey, the "all other sources" category was largest. Again, considerable variation prevailed among the States with respect to secondary sources of funding in 1986; client fees and local government were often prominent.

In all but 4 of the 49 States and the District of Columbia that had multiservice mental health organizations in 1986, State governments provided the largest percentage of the funding, with the State share ranging up to 89 percent in Hawaii (table 15). In all these States, funds from the State mental health agency predominated over funds from other State sources. In the remaining 4 States, Iowa, Minnesota, Nevada, and Ohio, local governments were the largest single funding source. Considerable variation existed among the States in the importance of secondary funding sources for multiservice mental health organizations. Local governments, Medicaid, and client fees were most often prominent.

- Redick, R.W., et al. Expenditures and Sources of Funds for Mental Health Organizations, United States, 1983. *Statistical Note No. 180*. DHHS Pub. No. (ADM) 87-1510. Rockville, Md. National Institute of Mental Health, 1987.

Text Footnotes

¹ Per capita expenditures are expenditures per individual in the general civilian population. The population used in the calculation of per capita expenditures is the civilian population of the United States and each state, as estimated by the U.S. Bureau of the Census, for the years specified.

² Current dollar amounts are actual amounts spent or received, unadjusted for inflation.

³ Constant dollar expenditures are the expenditures that would have occurred if inflation were completely eliminated or, in other words, expenditures that would have resulted if goods and services that cost \$100 in 1983 still could have been purchased for the same amount in subsequent years. To estimate constant dollar expenditures, it was assumed that the rate of inflation for services provided by mental health organizations was the same as that for services included in the medical care component of the consumer price index (CPI). Indices for the medical care component of the CPI, as published by the Bureau of Labor Statistics, are 100.6 for 1983 and 122.0 for 1986, with a base of 1983-84 = 100.0. Data on constant dollars for 1986 were computed by taking the ratio of 100.6 to 122.0 (.82) and multiplying by the current dollars for 1986.

The constant dollar estimates are only approximate, for they rest on the assumption stated in the previous paragraph and also treat the 1986 and 1983 data as separated by 3 full years. In fact, the Inventories from which these data were obtained were not fielded exactly 3 years apart. If anything, the estimates are likely to err in the direction of slightly exaggerating the effects of inflation and therefore slightly understate real growth.

⁴ Types of expenditures are:

Staff expenses—salaries of all personnel plus fringe benefits and payroll taxes, and expenses for contract personnel used by the organization.

Contracts with other mental health organizations—expenses for contracts entered into with other mental health organizations for the provision of mental health services by that organization.

Other operating expenses—all maintenance, supplies, ordinary repair costs, and contract expenses other than those listed above. Excludes depreciation expenses.

Depreciation expenses—allowances made in accounting for a decrease in value of property through wear, deterioration, or obsolescence.

Capital expenditures—cost for construction of buildings, additions, and purchases of durable equipment.

⁵ The figure for the District of Columbia, \$294, appears higher but is not comparable because the District's public mental hospital, which accounted for the largest proportion of expenditures, was Federally funded and provided care to many out-of-District patients.

⁶ Sources of funds are categorized as follows (except for psychiatric services of non-Federal general hospitals):

State government (exclusive of Medicaid)—

- State mental health agency funds
- Other State government funds

Client fees—

- Client fees that revert to State or other governmental agencies and are not available for expenditure by the organization.

- Other client fees include direct client payments, commercial insurance, Blue Cross and Blue Shield payments, and any other payments from nongovernmental sources, but exclude Medicaid and Medicare payments, vocational rehabilitation payments, Veterans Administration payments, CHAMPUS, and any other governmental payments.

Medicaid—The Federal-State medical assistance program designed to pay for health care services used by eligible people. It is operated and partially funded by the States under general Federal rules and with Federal financial assistance. The basic Federal Medicaid law is Title XIX of the Social Security Act, passed in 1965, and its amendments. Although changes have been made over the years, the essential structure of the program has remained unchanged since its creation. States have considerable flexibility in the design of their Medicaid programs.

Medicare—Medical care insurance for persons 65 years and over and disabled persons under the Social Security System.

Other Federal—VA payments, CHAMPUS, and other Federal payments.

Local government—Payments from county, city, and city-county governments and district/regional authorities.

Contract funds—payments from other nongovernmental organizations for the provision of mental health services to this organization.

All other sources—Foundation bequests; individual trusts; gifts and contributions of cash or liquid assets; United Fund, Mental Health Association, and other charitable campaigns. Excludes value of in-kind services.

Sources of funds for psychiatric services of non-Federal general hospitals are classified as follows:

Patient fees—Direct patient payments and payments from private third-party insurance such as Blue Cross and Blue Shield and commercial insurance. Excludes Medicare, Medicaid, and other governmental sources.

Federal Government—Medicare, Medicaid including State and local share, CHAMPUS, and other federal payments.

State mental health agency—Funds from State mental health agencies.

Other State government funds—Other funds from State government exclusive of Medicaid.

Local government—Funds from local government exclusive of Medicaid.

All other sources—Funds from all other sources.

Appendix

Types and Definitions of Mental Health Organizations and Ownership/Control Categories

Freestanding psychiatric outpatient clinic. An organization that provides *only* ambulatory mental health services on either a regular or emergency basis. The medical responsibility for all patients/clients and/or direction of the mental health program is generally assumed by a psychiatrist.

Freestanding psychiatric partial care organization. A freestanding organization that offers only day or evening partial care in a planned program of mental health treatment for individuals or groups of patients.

General hospital with separate psychiatric services. A non-Federal general hospital that routinely admits patients to a separate psychiatric service setting (e.g., any combination of inpatient, outpatient, or partial hospitalization), for the express purpose of diagnosing and treating psychiatric illness. A separate psychiatric unit is an organizational or administrative entity within a general hospital that provides one or more treatments or other clinical services for patients with a known or suspected psychiatric diagnosis and is specifically established and staffed for use by patients served in this unit. If this is an inpatient unit, beds are set up and staffed specifically for psychiatric patients in a separate ward or unit. These beds may be located in a specific building, wing, or floor, or they may be a specific group of beds physically separated from regular or surgical beds.

Multiservice mental health organization. An organization that directly provides two or more program elements (that is, inpatient, outpatient, day or other partial hospitalization) and is not classifiable as a psychiatric or general hospital or as a residential treatment center for emotionally disturbed children. To be considered part of a multiservice mental health organization a program element must be under the direct administrative control of the organization, which includes financial and staffing and clinical and programmatic responsibility.

Psychiatric hospital. An entity either operated as a public hospital by a State (e.g., State mental hospital) or licensed as a hospital by the State (e.g., private for-profit/not-for-profit psychiatric hospital) that is primarily concerned with providing inpatient care and treatment to persons with mental disorders.

Residential treatment center for emotionally disturbed children (RTC). An organization that must meet all of the following criteria:

- It is an organization, not licensed as a psychiatric hospital, whose primary purpose is the provision of individually planned programs of mental health treatment services in conjunction with residential care for its patients/clients.
- It has a clinical program within the organization that is directed by either a psychiatrist, psychologist, social worker, or psychiatric nurse who has a master's and/or a doctorate degree.
- It serves children and youth primarily under age 18.
- The primary reason for the admission of 50 percent or more of the children and youth is mental illness, which can be classified by DSM-II/ICDA-8 or DSM-III/ICD-9-CM codes, other than those codes for mental retardation, substance (drug) related disorders, and alcoholism.

Veterans Administration psychiatric organization. An organization operated and controlled by the Veterans Administration, which provides psychiatric services, for example, psychiatric services in VA medical centers, VA

outpatient psychiatric clinics, and VA multiservice mental health organizations.

For-profit—Control by corporations, partnerships, or individuals operating on a for-profit basis.

Ownership/Control Categories for Organizations

State-local government—Control by State, county, and/or city governments, or by district/regional authorities.

Nonprofit—Control by foundations, churches, or other non-profit groups.

The authors: Jonathan H. Sunshine, Ph.D., Private Consultant, partially developed this report under contract number 87-MO506781-01D from the National Institute of Mental Health. The DBAS staff members, Michael J. Witkin, M.A., C.P.A.; Ronald W. Manderscheid, Ph.D.; and Joanne Atay, M.A., prepared parts of the text, provided substantive analysis and the detailed statistical tables, and edited the entire report.

Table 1. Number of mental health organizations, total expenditures (in thousands of dollars), percent distribution of total expenditures, percent change in total expenditures, average expenditures per organization (in thousands of dollars), and per capita expenditures, by type of mental health organization: United States, 1983 and 1986

Type of organization	Number of organizations		Total expenditures (in thousands)		Percent distribution of total expenditures		Percent change in total expenditures 1983-86	Average expenditures per organization (in thousands)		Expenditures per capita civilian population
	1983	1986	1983	1986	1983	1986		1983	1986	
All organizations	4,464	4,774	\$14,491,816	\$18,531,971	100.0%	100.0%	+27.9%	\$ 3,265	\$ 3,882	\$61.09
State and county mental hospitals	280	288	5,502,203	6,345,861	38.0	34.2	+15.3	19,651	22,034	23.20
Private psychiatric hospitals	221	315	1,719,017	2,637,571	11.9	14.2	+53.4	7,778	8,373	7.25
Separate psychiatric services of non-Federal general hospitals	1,347	1,354	2,175,657	2,883,122	15.0	15.6	+32.5	1,615	2,129	9.17
VA psychiatric organizations	140	140	1,340,599	1,360,963	9.3	7.3	+1.5	9,576	9,721	5.65
Residential treatment centers for emotionally disturbed children	325	437	575,340	977,616	4.0	5.3	+69.9	1,770	2,237	2.43
Freestanding psychiatric partial care organizations	90	97	47,172	68,030	0.3	0.4	+44.2	524	701	0.20
