PREFATORY NOTE.

The demand for data concerning the climates of the provinces of Canada having exhausted the supply

of pamphlets and brochures which I have during many years as Director of the Meteorological Service

prepared for distribution both in Canada and abroad, I have been led on account of the impossibility of

devoting sufficient of my time to this branch of a rapidly growing Service, to arrange for the publication

of a series of booklets upon the climates of Canada under the editorship of A. J. Connor, the climatologist

of this Service. All the data arising from meteorological observations in Canada during the last seventy

years or more will be analysed and published in synoptical form with comment. This, the first of these

booklets, dealing with the temperature and precipitation of British Columbia, will be followed as soon

as possible by a similar publication dealing with the data of the Northwestern Provinces, and in due time

by others concerning the remaining provinces of the Confederation.

R. F. STUPART,

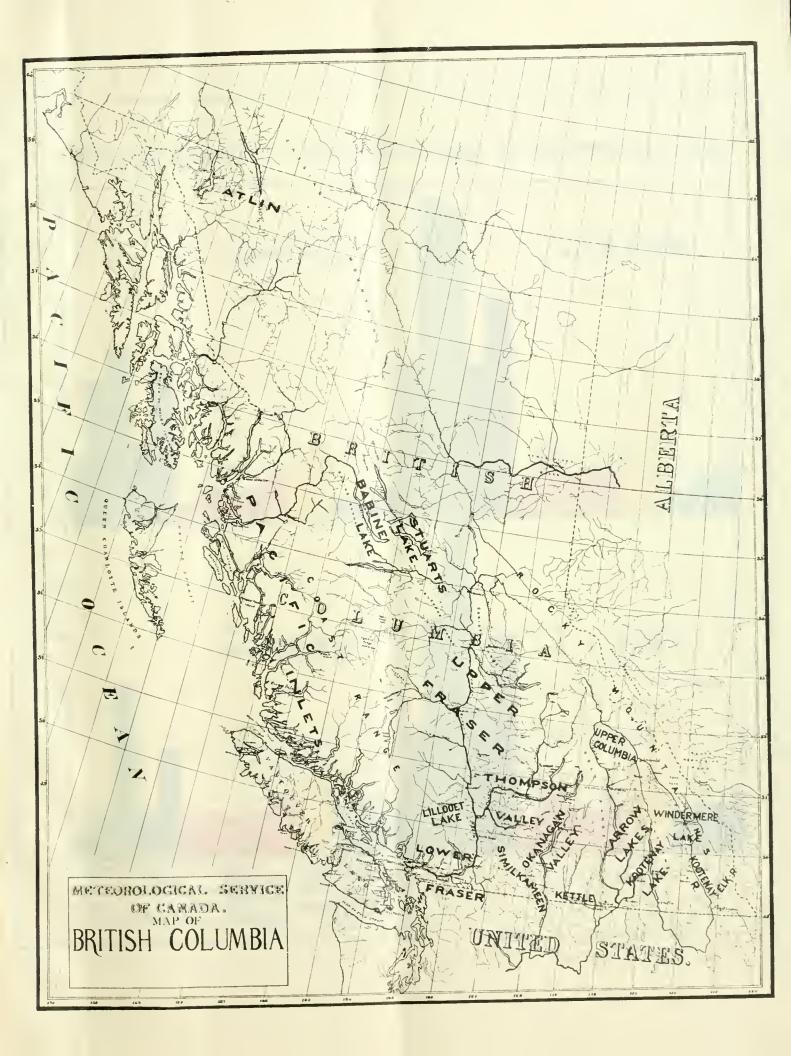

Director of the Meteorological Service.

Meteorological Office,

Toronto, April 1915.

# TYPES OF MEAN DAILY RANGE OF TEMPERATURE IN BRITISH COLUMBIA. (Range at London for comparison.)

PART I.

# The Temperature and Precipitation of British Columbia.

The province of British Columbia is preminently a country of mountain and valley. The great ranges are the Rocky Mountains, which separate it from Alberta, the Selkirks, the Gold and the Cariboo in the lower interior, the Cassiar Mountains in the far north, and the Coast Range which slopes towards the Pacific Ocean, and is, itself, parallelled by the partially submerged Island Range, which appears as Vancouver Island and Queen Charlotte Islands. In every depression there is to be found a stream of tortuous course, here and there broadening out into one of the lakes or arms which form such a distinguishing feature of the country. Many of these valleys are broad and fertile for they form the channels of all the principal rivers of the Pacific Coast of North America except the Colorado. But many of the smaller valleys, especially those of tributary streams, and the constricted portion of the Fraser Valley, afford for agriculture only a narrow strip, known colloquially as "bench-land", on either bank. Mining and lumbering, however, flourish in such districts. On the coast-line similar depressions are open to the sea and form the magnificent fiords of British Columbia, which surpass in grandeur those of Norway or of Scotland,

steeply rock-walled and winding mazily far into the interior.

The mountains, although they have so enormously reduced the arable area of the province, do to a certain extent make amends by their protection of the valleys from the severe cold waves which prevail in the same latitudes on the plains of the Northwest provinces: and on the other hand by their resistance to the eastward movement of the moisture-laden winds from the Pacific Ocean. By compelling the ascent of these saturated air-streams up their western slopes, they not only increase the rate of precipitation but they set free much of the latent heat of vaporization, and so warm the valleys as the drier air is forced down the eastern slopes. Naturally, the maximum benefit from these considerations accrues to those valleys which lie nearest the Ocean, and, besides, some depressions are so peculiarly situated that the precipitation is largely deposited upon the higher levels, the low levels remaining comparatively dry. But even in these less advantageous situations the run-off from the higher levels ultimately finds its way to natural reservoirs in the bottoms. From these reservoirs seepage provides natural irrigation for the bottom lands while artificial irrigation may be employed to water soil above the seepage-action. In some districts, as in the Upper Columbia valley, seepage has turned the low-lying land into marshes, but this has been successfully reclaimed by dyking.

Observations of temperature and precipitation have been made in British Columbia at stations of the Meteorological Service of Canada for many years, the bulk of the data, however, not antedating the year 1900. Few stations have maintained an unbroken record, and the greater number have very short periods of record. In the analysis of the results of these observations which is to be found in the following

pages, it was decided to group the stations by valleys and the monthly data by seasons.

In the grouping by valleys a station at a higher level or at a valley junction, which could be assigned to either one of two valleys, was assigned to that one to which its most distinctive climatological charac-

teristic seemed properly to link it.

In the grouping by seasons it was decided to take winter as the months of December, January and February; spring as March, April and May; summer as June, July and August; fall as September, October and November. This consideration of the data by seasons avoids that confusion of detail which is coincident with the examination of the twelve months individually, but the monthly figures are to be found in the tables of Part II.

i The general results of this analysis as regards mean daily temperature and total precipitation of the four seasons are tabulated below.

MEAN TEMPERATURE.

MEAN TEMTERATURE.

In the Similkameen Valley below Keremeo, it is probable that the same very hot summers prevail as are shewn by the temperatures for hairview which are the basis of the figures given for the Okanagan River-Osoyoos, Lake district.

Along the Elk and Kootonay rivers, the stations at Cranbrook, Ft. Steele, Fernie, and Gateway, are all cooler throughout the year than stations in the West Kootenay, but the station at Fruitlands Farm, east of Elko and Flagstone, on Tobacco Plains has a different climate and is listed under the latter name.

#### VANCOUVER ISLAND.

#### TEMPERATURE.

The averages derived from observations made at Carmanah, Clayoquot, Quatsino and Seasonal Cape Scott, when compared with those from observations made in the interior and at points Mean Temperature on the east coast shew that the summers are from 5° to 10° cooler on the west coast. Spring is 3° warmer on the east coast and in the interior while winter and fall are practically the same. It may be seen from the table here given, however, that the stations on the west coast do shew the effect of latitude, in winter, Quatsino and Cape Scott having a mean temperature for the season about 2° cooler than that of either Carmanah or Clayoquot to the south.

Station.	Winter.	Spring.	Summer.	Fall.	Year.

The interior and eastern littoral stations are subject to greater extremes of temperature Temperature than the western littoral. Temperatures of 90° are of very rare occurrence on the west coast but Extremes inland and at stations on the Gulf of Georgia maxima of 95° and higher do frequently occur. Alberni has recorded 99° in June, 103° in July, 106° in August and 101° in September. This station, although called Alberni, in the publications of the Meteorological Service, is really situated at Beaver Creek, inland from the Alberni canal and at a considerable elevation above sea-level. It has exhibited some very peculiar fluctuations from its established monthly normal temperatures.

In the interior and on the east coast, including Esquimalt and Victoria, temperatures below zero have been recorded at long intervals. In the year 1895, February, 1.5° below zero was the minimum at Victoria. In 1886, 1887 and in 1890, temperatures from 1° to 3° below zero were recorded at Quamichan. At Carmanah, on the other hand, the two lowest temperatures on record are 4° above zero and 6° above zero.

Although the area of Vancouver Island is great enough to warrant the supposition that Extreme stations in the interior would shew relatively great variations in monthly temperatures, while littoral stations would display but small amplitudes of variation, yet the collected results of Monthly observations fail to make this manifest.

Temperature

Differences in degrees between the temperatures of the warmest and the coldest month of the same name are as follows:—

	Nanaimo.	Quamichan.	French Creek.	Cowichan.	Clayoquot.	Carmanah.	Cape Scott.	Quatsino.
December January February March April May June July August September October November	10 11 8 8 6 5 4 8 7	12 13 17 10 10 7 8 6 9 8 6 7	6 5 6 8 8 5 6 9 10 6 14	7 9 6 7 5 5 5 5 4 4 12 7 7	10.914.18.94.19.94	64795355538313	6 13 6 10 5 2 4 3 5 5 13	9 9 7 9 5 5 5 6 7 4 5

The observations from which they tables were made, however, cover varying periods of time, some extending back to the cold winters of the late eighties and early nineties, while others do not. Synchronal observations for a long period might confirm the supposition. The Table serves, however, to give a general view of the absolute range of monthly temperatures over the whole island.

Average Mean Unity Range of Temperature

The table given below shows that the daily range is greater on the east coast and in the interior than on the west coast; since even over the small area, comparatively, of Vancouver Island, the modifying influence of the ocean is not powerful enough to obliterate the tendency to extremes engendered over land. Proximity to the continental land across the strait of Georgia prevents stations situated similarly to Nanaimo and French Creek from exhibiting true littoral characteristics in this respect. Another factor which increases the daily range of temperature on a portion of the island is situation on the slope facing the strait. By intercomparison of the ranges at Nanaimo on the shore with those of Quamichan, beyond which the slope rises to the westward while to the eastward lie a portion of the main island, and the considerable land areas of Salt Spring, Pender, Saturna, Mayne and Galiano Islands, and those of Cowichan very nearly at the crest of the slope, we arrive at the conclusion that the effect of a situation on the slope running down to the strait of Georgia is to increase the daily range by about 8° during the months of May to September inclusive. During the same period the daily range at Victoria is increased by 6° over that of stations on the unprotected west coast. In this connection it may be observed that the temperatures at Victoria shew that it occupies a more or less mean position between the true maritime type of the west coast and the land-influenced type of the interior and of the strait of Georgia.

Average Mean Daily Range of Temperature.										
	Quatsino.	Cape Scott.	Carmanah.	Nanaino.	Quamichan.	Kuper Island.	Victoria,	French Cveck.	Cowiehan.	
December January Pebruary March April May June July August September October November	9 9 9 10 13 12 13 14 15 14 11 9	10 9 11 13 12 11 10 11 12 14 9	8 9 9 12 13 12 13 11 13 11 13 12 8	8 10 11 15 15 18 48 19 19 19 16 13 9	17 16 17 22 22 25 28 33 31 29 24 20	10 11 13 16 19 23 22 26 25 20 15	7 8:5 9 12 14 15 16 18 18 15 11	9 10 13 17:5 20 20 20 23 24 21 16	7 10 14 17 21 21 21 21 24 18 17 13 9	
Means	11.5	11:3	11:0	14:3	23.7	17.7	12.6	17 · 1	17:7	

The annual mean of the average daily range at Quatsino, Cape Scott, Carmanah, and Victoria is, therefore, 11 6 and at the other stations, all in the interior or on the east coast, 18 1°.

Mean Daily Minimum.

The table appended will shew that the distinction between western littoral stations and Mean Daily inland-eastern stations in this regard is not the depression of the minimum but the elevation of the maximum points on the daily curve of temperature in the summer months, June, July, and August.

	Mean Maximum.	Mean Minimum.
Quamichan	76:7	45.9
Cowiehan		50.4
Kuper Island	72:9	49.1
Alberni	77 6	48.4
Nanaimo		52.4
French Creek	70.7	48:5
Means	73.4	49.1
Clayoquot	65.4	48-6
Carmanah		48.5
Quatsino	63 · 4	49:2
Cape Scott	59.7	48.6
Victoria		50.5
Means	63.7	49 1

The depression of the minimum on the west coast is, therefore, 0° but the elevation of the maximum in the interior-east coast is 9.7°. In the winter months, December, January, February, although the minimum is depressed 3.2° at the eastern-interior stations below that of the western littoral stations, the depression of the maximum is not proportional, being only 1°. The winter figures follow:—

	Mean Maximum.	Mean Minimum.
Quamichan	. 45°1°	28.7°
Cowichan	. 42.5	32.1
Kuper Island	. 44 5	33.5
Alberni		30.5
Nanaimo	. 42.7	33.2
French Creek	42.8	32.0
Means	43.3.	31.7
Clayoquot	. 46.5	35:0
Carmanah	. 4414	35 6
Quatsino	. 42.7	33:8
Cape Scott	. 43 4	3318
Victoria	. 44.5	36:2
Means	. 44.3	34.9

#### PRECIPITATION.

Precipitation on both the west and east coasts does, in general shew the same proportional Average Seasonal distribution. This proportion appears to be, roughly, winter, spring, summer, fall, Annual in the ratio, 10:5:2:8. But while the annual amount on the west coast averages nearly 110 Precipitation.

	Nanaimo.	Kuper Island.	(foldstream L.	Cowichan.	French Creek.	Alberni.	Denman Island.	Carmanah.	Cape Scott.	Quatrino.	Clayoquot.	Victoria.
Winter. '. Spring. Summer Fall Annual Snow.	10.00	7:28 8:14 3:21 2:54 13:06 10:89	3·53 21·46	18:34 5:92 2:92 13:01 40:19 26		12 82 4 41 21 22	3:49 19:44	26:36 7:02 31:37	9:01	11 45 35 91	25:07 9:79 39:43	13:95 5:58 1:94 6:46 32:49 14

The snowfall is included in the seasonal and annual figures, which embrace the precipitation from all causes. The anomalous totals are those for Goldstream Lake, Alberni and Victoria. Goldstream is not far from Victoria, but inland and at a great elevation, evidently high enough to precipitate moisture from the Pacific winds in the spring, fall, and winter at nearly the same rate as the west coast stations. Victoria has shewn in recent years a considerable diminution in rainfall; in fact the exposure of the instrument has undoubtedly been faulty. For when the gauge was at Esquimalt, about three miles westward, the observations would fix the annual precipitation at about 42 inches or the same as that of Kuper Island or Nanaimo. Observations at Alberni (Beaver Creek) are made five miles due north of Alberni town and at an elevation of approximately 300 feet. Another, but much shorter, set of observations was made at Alberni (Sumas River), apparently on the canal and practically at sea-level. Thirty-five miles to seaward, down the Sound from Alberni is Banfield where another set was made. A comparison of these three series is interesting.

	ist	···· On Sea, Banfield.	35 miles from Sea Alberni (Sumas River.)	40 miles from Sea (300') Alberni (Beaver Creek.)
Winter Spring. Summer Fall Annual		36 · 68 16 · 83 4 · 60 32 · 78 90 · 89	20°32 13°61 3°26 27°03 73°22	28-72 12-82 4-41 21-22 67-17

The gradually decreasing precipitation as we go inland from the ocean and up the Sound, which is most apparent in the annual amounts is also shewn in every seasonal amount except that for summer. We are led to the conclusion that the situation of Beaver Creek at the head of a Sound, looking seaward from an elevation, gives it a littoral precipitation, although we have already seen that it is far enough inland to have a temperature which places it in the list of interior stations.

## THE VALLEY OF THE LOWER FRASER.

#### TEMPERATURE.

Sensonal Mean Temperature The averages for the seasons in this valley are almost identical with those from the east coast of Vancouver Island. Vancouver although on Burrard Inlet is included in this valley on account of the general similarity of its climate.

	Winter.	Spring.	Summer.	Fall.	Annual
	degrees.	degrees.	degrees.	degrees	degrees
Vancouver New Westminster.	37 37	48	62 61	49	19
Lidner and a second of the sec	37	17 16	61 59	49	18
Steveston	36	18	61	49	18
Vgassizhilliwack	36	413 414	62 62	50 50	50 50
North Nicotuen	0.00	49	62	50	50
Means.,	-51	10	01	4.7	4.9

In the summer of 1908 an observer was appointed at Pemberton Hatchery on Lillooet Lake, and later one at Pemberton Meadows. While these stations were at first listed in the Monthly Weather Review with the Lower Fraser Stations, they really have a different elimate as the following six-year averages for the former station shew.

Pemberton Hatchery	Winter	Spring	Summer	Fall	Annual.
	26°	44°	61°	4.5°	44°

The summer season has practically the same temperature as the main valley, but the situation nearly 2° of latitude to the north and in a narrow valley running in a general north and south direction depresses the winter mean more than 10°, and the spring and fall means by about 5°.

Temperature

Temperatures of 90° have been registered at Agassiz every year since 1889 except in the year 1909 when the highest was 88°. In July 1898 100° was recorded and 103° in August of the same year. In ten out of twenty-five years 95° has been reached or exceeded. 98° has been recorded at Chilliwack, 99° at North Nicomen, 97° at Matsqui, 94° at New Westminster, and 92° at Vancouver. At Ladner and Steveston, however, 85° has not yet been exceeded. In fact high maxima are not nearly so frequent at stations near the mouth of the Fraser in the summer.

Temperatures below zero occasionally occur in January, at points some distance from the coast falling to 10° below zero. The mean of the extreme lowest readings in Januaries for twenty five years at Agassiz, is 10° above zero: the mean of the extreme highest temperatures of the same month for the same period is 52°: a non-periodic range of 42°. At Vancouver, which is 62 miles west of Agassiz, as the crow flies, and on the coast of the mainland, the corresponding figures are 50° and 16°, a non-periodic range of 34° only.

Extreme Variation of Monthly Mean Temperatures

The records at Agassiz and New Westminster covering practically the same period of about 25 years, the differences between the warmest and coldest months of the same name at these two stations present a fair idea of the amplitude of variation.

	Jan.	Feb.	March.	April.	May.	Junc.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
Agassiz New Westminster.		17	13	11 7	11 7	10 6	13 7	16 9	8 7	8	12 17	12 11

The greater variations appear to occur at the greater distance from the coast, and the records from the other stations do, in a general way, confirm this, although the lack of synchrony between the different series of observations is inhibitory to definite conclusions. A comparison of the

figures above with the similar table given for Vançouver Island shews that the magnitude of this variation is considerably smaller on the Island, especially in the summer months.

	Winter,	Spring.	Summer.	Fall.	Average Mean Daily Range of Temperature
	degrees.	degrees.	degrees.	degrees.	
Vancouver	9	16	21	13	
New Westminster	9	18	21	14	
Ladner	10	18	20	16	
Steveston	11	15	18	25	
Matsqui	12	19	23	16	
North Nicomen	10	18	22	14	
Chilliwack	12	19	23	19	
Agassiz	13	24	28	21	
			1		

While these ranges are in general considerably greater than those which obtain on Vancouver Island it is noteworthy that not until we have gone so far up the river as Agassiz do we find ranges comparable in magnitude with those at Quamichan on the eastern slope of the Island; and while the annual range at Quamichan is 27.3°, at Agassiz it is only 21.3°. This statement ignores the summer ranges at Hazlemere, three miles from the International Boundary and the same distance from Boundary Bay. It is not strictly in the valley of the Fraser and the record is short.

1	Sum	mer.	Wii	Mean Dail Maximum Minimum.	
-	Mean Minimum,	Mean Maximum.	Mean Minimum.	Mean Maximum.	
	degrees.	degrees.	degrees.	degrees.	_
ancouver	51	73	33	42

Means Vancouver Island (interior-east)	49	23	32	43	
Means Vancouver Island (west coast)	49	6.4	35	44	

If the figures for Ladner and Steveston, the two stations on the low-lying delta at the mouth of the river be omitted, the summer maximum for the lower Fraser becomes 73.5°, undoubtedly a truer approximation, and shewing the slight margin over the maximum for the interior of the Island, which would naturally be expected from topographical considerations.

The figures for Agassiz give some indication that at this point we begin to approach the easterly limits of the climatic district. East of this place, however, the only observations that have been made are those from Little Mountain (Hope P.O.) and these began in 1910. This record-period is too short to determine an average but we may note that for the winter mouths the mean minimum is 26° and the maximum 35°, while for the summer months the corresponding figures are, 51° and 74°. We may therefore, place the eastern limits of the lower Fraser River valley, climatographically, as not far from this last-named point, Hope, which lies at the confluence of the Coquihalla with the Fraser.

#### PRECIPITATION.

The most striking fact to be learned from the results of observations is that the least precipitation in the district is recorded at the very mouth of the river. Ladner and Steveston lie on either side of the South Arm of the Fraser where it debouches into the Strait of Georgia. The country immediately surrounding these stations is delta-land. Here the annual precipitation is little more than half that to which the higher land to the east is subject. At New Westminster on the North Arm and at Vancouver on Burrard Inlet, however, this comparative deficiency of precipitation does not obtain. It should be noted that Hazlemere, already mentioned with regard to temperature and lying about three miles north of Blaine, Washington, presents a somewhat similar falling-off in precipitation as Ladner and Steveston, but not to the same extent. Sixteen years of observation at Langley prairie, also shew that at that point the annual

Verage

ensound and precipitation is about six inches less than the general average. It is much to be regretted that ob ervations were not made at a greater number of points south of the river. Those we have, however, point to the probability that the region extending from the Deltà country about Ladner into the prairie district south of the Fraser is subject to less precipitation than points on the river and its north arm, the difference diminishing as we move eastward through the prairie country towards Sumas Lake.

	New West min ster. Vancouver	( " 4] 11 [ ].111	Langley.	Matsqui.	ladiner.	St. v. st.m.	N. Niconam.	Chilliwack.	, 1 12-12-41	lla jemere.

Note Snowfall is already included in the seasoned amounts, and annual total.

Annual Variability

Twenty-five years of observation at Agassiz give us an annual average of 63 inches precipitation. During this period the driest year shewed a deficiency of 16 inches as compared with Precipitation, the average, and the wettest year an excess of 20 inches. The differences from average throughout this period having been summed without regard to sign, we strike a mean annual variability of 8 inches, or 13% of the average amount. Practically the same period at New Westminster presents an average of nearly 59 inches for the annual amount. During this time the greatest yearly amount exceeded the average by 13 inches and the least yearly amount was in defect 17 inches. The mean annual variability is found to be 5 inches or 9% of the annual average. It seems a fair deduction that the annual variability for the region lying between these two stations is about  $10\frac{c_f}{b}$  of the annual average.

#### THE MIDDLE FRASER.

It has already been said that the records made at Hope, at the junction of the Fraser and Coquihalla rivers, indicate that the climate at this point is somewhat different from that of the region we have styled the Lower Fraser Valley. At this confluence the river-course turns sharply north and fifteen miles further in that direction passes Yale, the head of navigation. Between Hope and Spence's Bridge no records are available, and therefore, no data concerning the climate of Yale can be given here. The "Year Book of British Columbia" does, however, state that it possesses "Limited but excellent fruit-growing possibilities". Beyond Yale for fifty miles the river-valley continues northward to Lytton, where is the confinence with the Thompson. A great part of this course is canyon-like in character, with the Snowy Group on the west side, and the Anderson River Mountains, the Stoyoma and Kanaka Mountains on the east side. At a point about five miles below Lytton the basin widens, but there is very little "bench-land" throughout the valley. For all this district, of no great importance agriculturally, climatographic data is lacking.

#### THE THOMPSON RIVER VALLEY.

#### TEMPERATURE.

By this name we designate the country about the Thompson river from Spence's Bridge Seasonal to Shuswap Lake, including Nicola Lake, which drains into the Thompson at Spence's Bridge, Mean Temperature and also Shuswap River. In this region the winters are 12° colder than in the lower Fraser valley, while the summers are 3° warmer. At Nicola Lake, however, the summer temperature differs little from that of the southern valley, while the spring and fall are somewhat cooler than at Kamloops.

	Winter.	Spring.	Summer.	Fall.	Annual.
Enderby Spence's Bridge Nicola Lake Kamloops. Salmon Arm. Means Thompson Means Lower Fraser Difference.	24	degrees.  45 50 43 48 45 46 46 48 - 2	63 68 60 67 64 63 61 + 3	43 49 43 47 44 44 45 49 4	degrees.  44 48 42 47 45 45 49 - 4

Early in the year 1913 an observer at Vavenby, sixty-five miles north of Kamloops, on The North the North Thompson ten miles east of its confluence with the Clearwater, began to send in monthly reports of temperature and precipitation. While the observations have not progressed long enough to establish normal values for this northerly region, a month to month comparison with stations of ten-year records on the South Thompson enables us to present the following figures as a very likely approximation to the normal seasonal temperatures at Vavenby.

	Winter.	Spring.	Summer.	Fall.	Annual,
Vavenby	990	110	62°	43°	430 -

If we may rely upon these figures, the temperatures on the north branch of the Thompson differ very little from those at Enderby, except that the winters are slightly colder.

From the latter part of May to the middle of September maximum temperatures ranging Temperature from 90° to higher than 100° are very likely to occur on several days. 102° has been recorded extremes. in June, July, and August at Enderby, and 97° in May; at Salmon Arm 101° in July and 91° in May; 100° to 102° at Kamloops in all months from May to August, and 92° in April and September. At Spence's Bridge 105° was registered on the 20th of July 1883. Nicola Lake does not appear to be subject to such extreme heat as the other stations, since 93° is the highest on record at that point. It has recorded 91° in May and 86° in September. At Griffin Lake, east of Anstey Arm 108° in June, and 110° in July and August have been registered.

In the winter months the lowest on record at Nicola Lake ranges from 8° below zero in December to 41° below in January, while 19°, 31° and 25°, below, have been registered in November, February and March, respectively. At Salmon Arm the absolutely lowest is 27° below zero; at Kamloops, 31° below; at Enderby, 27° below; and at Spenee's Bridge 29° below. In February 1914, 24° below was registered at Vavenby, but the records at that point date only from 1913. At Griffin Lake a short record shews a minimum of 28° below.

Looking at the temperature extremes from another view-point we may consider only the extreme highest and extreme lowest temperature of a single month throughout a period of years, and strike an average of each. The difference between the two averages is the non-periodic range for that particular month. We may take Kamloops records for 23 years and treat them in this manner. The results follow.

1	Jan.	Feb.	Mar,	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.

Extreme Variation of Monthly Menn Temperature

The difference in degrees between the warmest month and the coldest of the same name is given in the table below.

												. 7
Station	Dec.	Jan.	Fob.	Mar.	Jir.	May	June.	duly.	Aug.	Sept.	Oct.	Nov.
		_										
	degr.											
Salmon Ariu.	9	20	15	13	7	7	10	12	7	10	8	21
Nicola Lake	16	31	24	20	7	8	10	10	11	7	11	29
Spence's Bridge	11	29	12	18	4	8	6	8	9	- 0	1	14
Enderby	13	17	11	15	- 6	T T	1 ~	- 6	11	5	4	21
Kamboops	11	31	20	18	36	W	9	12	14	9	11	31
Meuns	13	21%	11,	11,	7	1		19	10	-	8	23
Extremes	16	31	24	20	9	8	1.2	12	14	10	11	31

These results tend to show that the monthly temperature is less variable from year to year in this district in the summer-time than it is at Agassiz, and in this respect the amplitude is more comparable with the extreme variation from April to September at New Westminster. In the winter the variation is considerably greater in the Thompson district than in the Lower Fraser Valley.

To examine this point still further we select the month of July at both Agassiz and Kamloops and compute the variations of the mean temperature of this month from the average. We find that the average variation from the established normal July temperature is 3° at Agassiz and 2° at Kamloops, a result which verifies the first deduction. Treating the monthly temperatures of January in the same way, we have an average monthly variability of 3° at Agassiz but of 6° at Kamloops.

Average Mean Daily Range of Temperature

The summer ranges apparently increase as we proceed in an easterly direction along the river while the figures for Vavenby indicate that a similar increase obtains as we go north on the tributary. The daily ranges in this district exceed those along the Lower Fraser; by 6° in the spring and in the summer.

	Winter,	Spring.	Summer.	Fall.	Annual.

Mean Daily Minimum.

In the discussion of the seasonal mean temperatures it was seen that the mean temperature Maximum and of the Thompson Valley in the summer was 3° warmer on the average than the Lower Fraser Valley. The table given below shews that this is due entirely to the elevation of the maximum by 6°, the minimum remaining constant. In the winter, however, both elements are depressed, the minimum more than the maximum.

#### PRECIPITATION.

A great portion of this valley is a very dry district. Except at the eastern limit of the Average valley the annual precipitation has never exceeded 20 inches. The average seasonal amounts Precipitation follow.

	Winter.	Spring.	Summer.	Fall.	Annual.	Snow.
Kamloops	3:25 2:84 2:59 6:06 6:51	1 · 61 2 · 13 2 · 31 2 · 87 3 · 19	3:55 2:06 3:51 3:96 4:84	2:58 1:94 3:17 5:67 5:95	10:99 8:97 11:38 18:56 20:49 12:15 34:13	35 28 29 62 67

Note. - The snowfall (water equivalent) is already included in the seasonal and annual amounts.

Griffin Lake lies 23 miles almost due northeast of Sicamous, and is situated on the Eagle River which flows at Sicamous into the Anstey Arm, of the Thompson River system. Going upstream on the Eagle we climb from Sicamous, 1,156 feet above sea to Griffin Lake, 1,511 feet above sea, finally reaching the summit of the watershed near Clanwilliam at an elevation of 1,800 feet. The records at Griffin Lake covered a very short period between 1893 and 1900, and even that record is marred by frequent breaks. There seems no reason to discredit the averages obtained from this short record, in so far as they indicate much heavier precipitation on this slope. Moisture-bearing winds moving inland from the Pacific must be deflected sharply in a vertical direction upon meeting the western face of this range and according to the well known theory of dynamical cooling, a sudden increase in the rate of precipitation must result. Only in so far as the years covered by this record were synchronal with a greater than normal frequency of cyclonic movements tending to produce conditions favouring precipitation are we justified in reducing these figures. After such reduction is liberally made there remains an annual average amount of precipitation from all causes of 28 inches to 30 inches.

	Rainfall.		Snow	fall.	fotal.	
Kamloops Spence's Bridge. Nicola Lake. Salmon Arm. Enderby. Annis (Canoe Point). Griffin Lake.	Wettest  11:05 11:38 12:43 15:39 21:19 16:40 52:37	Driest.  5.75 1.68 3.40 7.87 9.96	Wettest,  55.6 5.8 19.4 40.3 68.3 50.3 123.2	Driest.  13:2 9:8 56:1 87:5 85:3	Wettest.  16   61   11   96   14   37   19   42   28   02   21   43   64   69	Driest,  7 07 2 066 9 01 16 02 18 09 38 55

Wettest and Driest Years on Record.

In the case of Griffin Lake the driest complete year in the records is given. Other years for which the figures for one or more months were lacking were probably much below the totals given above.

The driest region extends as far east as Niskonlith Reserve on the Little Shuswap, beyond which, easterly, the records from Salmon Arm, Annis, Tappen, Enderby shew that there is an increase of from 8 to 10 inches, annually, over the precipitation of the Kamloops-Nicola district. In this eastern district, moreover, there has not, at any time within our records, occurred such absolute droughts as have been noted at Spence's Bridge and Kamloops.

One of the most striking facts disclosed by the tables is that there has been (with the exception of Kamloops) everywhere a greater amount of snow in the driest year on record than in the wettest year. An examination of the thirty-six years of observations at Nicola Lake almost leads one to believe that there is some relation between the snowfall and the rainfall of this nature, the heavier snowfalls in general belonging to the years of lighter rainfall, and occurring in the winter preceding the dry summer. The records for most of the stations are too short however, to pursue the speculation further.

# THE SOUTHERN KETTLE RIVER VALLEYS.

#### TEMPERATURE.

Sca onal Me in Temperatures

The series of observations made in this region do not admit to the drawing of the chan very general conclusions from them, for the reason that the record cover thort period and are not wholly synchronous. Monthly comparisons with the record from Kelowin produced the figures here given. It is possible that the mean of the three at mons is nearer the true villey temperature than the individual figures. There is no marked difference from the mean perature of the Thompson River Valley, the more a pecially if we regard the summer mean at Greenwood as too low by about 2.

Observations at Midway have been discontinued. The station at Greenwood has been reopened, and that at Grand Forks is still in operation.

	Winter.	Spring.	Summer.	Pall.	Armud.
Midway Grand Forks Greenwood.  Means Kettle Valley Means Lover Fraser. Differences. Means Okanagan Valley Differences.	degrets.  22 24 25 24 37 13 26 2	de gree : 44   45   48   3   46   1	63 64 60 62 61 1 64 2	derrees.  44 41 42 43 49 6 46 - 3	le trees.  13 15 43 43 46 -2

The few degrees lower temperature in the Kettle River Valley in all seasons as compared with the Okanagan Valley, are accounted for entirely by the greater elevation above sea of the Kettle River stations, if we use the rate of fall in temperature with ascent as determined from the Ben Nevis observations in Scotland. The average difference in elevation of the two sets of stations is in the neighbourhood of 750 feet. The rate of cooling having been taken as .36° Fahr, per 100 feet, we have a result of 2.7° cooler in the Kettle Valley.

The observations at Midway cover the period from August, 1895, to April. 1903, as well as the months of January and February in the year 1904, and the months of November and December in the year 1909. During this time the highest temperatures recorded in the months from May to September have been, 95°, 98°, 100.5°, 104°, 92°, respectively; the lowest temperatures in the months from November to March, -31°, -23°, -42°, -39°, -13°, respectively.

The other two stations cover a period less than four years at the time of writing.

The records at Midway, only, are long enough to consider at all from this view-point. The

differences between the warmest and coldest months of the same name are:

 Jan.
 Feb.
 March.
 April
 May
 June
 July.
 Aug.
 Sept.
 Oct.
 Nov.
 Dec.

 11°
 14
 16
 7
 10
 6°
 7
 10
 9
 10°
 17
 24

These differences resemble those given for the North Thompson very closely except that for the month of December, which is much larger. This arises from the fact that the mean for the month of December in the year 1898 is computed from a mean minimum of 4° below zero. No other station in the province as far north as 55° latitude reported a temperature as low as this in that month. The readings of the thermometer in that month must be rejected, internal evidence being against their credibility as well. This being done the range of 24° given above becomes 16°. The January range appears too small and will likely be increased by 6° if the observations are resumed and carried over a long period.

Average Mean Daily Range and Dail: Max. and Daily Min

Temperature Extremes.

Extreme

Monthly Mean

Variation of

Temperature

		Winter.	6		Spring.		:	Summer			Fall.	
	Max.	Min.	Range.	Max.	Min.	Range.	Max.	Min.	Range.	Max.	Min.	Range.
Midway	31	degrees. 13 15 17	degrees. 18 19 14	d.:grees. 58 59 59	degrees. 30 28 34	degrees.  28 31 25	degrees. 82 79 80	degrees. 14 41 48	degrees. 38 38 32	degrees. 57 58 54	degrees. 30 27 33	degrees, 27 31 21

These ranges are considerably greater, especially in the summer and fall than those in the Thompson Valley, and are due mainly to the depressions of the minimum.

#### PRECIPITATION.

The observations at Midway produce averages very similar to those of the Okanagan Valley as regards the annual total but with the difference that the wettest season of the year is spring and not summer, as in the Okanagau. A longer series of observation might bring the two sets of figures into harmony.

For the period during which observations were made at Grand Forks, the mean differences from the corresponding observations at Kelowna were; winter, +.34, spring, +1.60, summer, +1.15, fall, +3.43. Applying these differences to the established normal precipitation at Kelowna we deduce the following normal precipitation at Grand Forks.

<u>.</u>	Winter.	Spring.	Summer.	Fall.	Annual.
Grand Forks. Mi lway Greenwood. Rock Creek. Mcans Kettle Means Okanagan	degrees. 4 15 2 67 1 85 3 11 2 95 3 07	degrees. 3 · 93 4 · 02 3 · 37 2 · 65 3 · 49 2 · 29	degrees, 4 : 68 2 : 98 6 : 08 4 : 78 4 : 63 3 : 87	degrees. 4:35 2:92 3:34 3:12 4:43 3:15	degrees. 17:11 12:59 14:64 13:66 14:50 12:38

The figures given above for Midway, Greenwood, and Rock Creek are simple means of the two to eight years data available, without any weighting by comparisons. They should not therefore be relied upon as giving an approximation to the true station normals. The mean of all four sets, in which we may hope positive and negative errors have largely neutralized themselves, is probably a good approximation to the general valley average. Regarding Grand Forks, the Year Book of British Columbia, 1911-1914, says: "Surrounding this point is a very fertile valley producing eereals and fruits." Regarding Midway it says: "The Kettle River valley in which it is situated has some good farming land suitable for irrigation."

For the upper portions of these valleys, as at Beaverdell, Carmi, and at Canyon, data of any sort is unobtainable.

## THE OKANAGAN AND SIMILKAMEEN VALLEYS.

The Okanagan Valley extends in a general north and south direction between the longitudes 119° W., and 120° W., occupying the major width of that interval. Its most northerly point is about 20 miles south of Salmon Arm in the Thompson district. For 60 miles of its length the lowest levels of the depression are occupied by the waters of Okanagan Lake, a narrow and sinuous waterway whose mean height above sea-level is 1,132 feet, and whose width varies from a little more than 4 miles to a little less than a mile. Numerous small streams flow into the lake from both the east and west sides, of which the most important is Mission Creek, about 30 miles in length, which debouches near the centre of the lake from the east.

The Similkameen Valley (the main valley) begins at a point 50 miles west of the centre of Okanagan Lake, the river flowing thence in a general southeast-by-south direction to finally meet the outflow from Okanagan Lake at a point just south of the International Boundary. Into the Similkameen flow several important tributary streams, the Tulameen, the South Similkameen (a north-flowing stream), the Ashmola, and several smaller. From these smaller valleys we have no observations. The average elevation above sea of points in the Similkameen Valley is probably about 300 feet higher than that of points in the Okanagan.

#### TEMPERATURE.

TESTI BRATORI	-J.					
	Winter,	Spring.	Summer.	Fall.	Annual.	Seasonal Mean Temperature
Okanagan Valley— Vernon (Coldstream Ranch). Kelowna. Summerland Penticton Means. Similkameen Valley— Princeton Hedley	degrees.  25 27 25 29 26 20 20 25	degrees.  45 46 46 47 46 43 46	degrees.  64 64 65 64 64 67	degrees.  45 45 46 48 46 43 46	degrees,  45 46 46 47 26  42 45	
Keremeos Means	26 24	48	68 64	47	47 45	

The station are arranged in early valley from north to outly of that a notable increase in temperature is visible as we make outhwards in the Simillanden. But in the Okanagan Valley there seems to be little changalong the lake. Vernen just north of the head of the waterway is cooler than place on the hore, while Pentieton at the extreme south point of the Lake appears to have a warmer winter, spring and fall.

Leaving Pentieton and moving outh we pass along the narrow river which drams Lake Okanagan, through the smaller Dog and Vascux Lake, until we reach Fairview, 25 miles south of Pentieton and at the opening of a alley of a mild tributery creek. Here the temperature is astonishingly high. Observations becan at Fairview in Mac, 1909, and ceased in March, 1912. Thus the records cover a regrettably hort period. From month to month comparisons with Kelowna of both maximum and minimum readings we are enabled to append the following values of the normal seasonal temperatures.

_	Winter.	Spring.	Summer.	Fall.	Annual.
Fairview		d grees. 52	degrees.	degrees.	degrees. 50

These temperatures are higher than those at Lakeside, at the otatlet of Lake Chelan, in the continuation of this valley in United States territory but 120 miles to the southward. I was at first inclined to discredit the Fairview readings altogether, but Mr. Baynes Reed, the Provincial Meteorological Agent at Victoria Observatory vouches for the carefulness of the observer, and reports that even during the short time the instruments were in position at Fairview, the heat so warped the wooden Stevenson screen that after its second summer it was found necessary to brace the angles with iron.

Temperature Extrenies At Princeton the extreme highest temperature of each year from 1901 to 1940 were, respectively, 95°, 92°, 93°, 101, 98°, 95°, 99°, 91°, 93°; at Kelowna for the same years, 93°, 91°, 93°, 95°, 96°, 95°, 93°, 96°, 92°, 93°. At Vernon the highest temperature recorded in July was 104°, and at Hedley 100°.

At Princeton the extreme lowest temperatures of the same ten years were, -21°, -26°, -21°, -27°, -32°, -8°, -45°, -25°, -49°, -26°. At Kelowna, -10°, —, -6°, -14°, -6°, +4°, -19°, -3°, -22°, -18°. For the seven years ending in 1913 the lowest temperature at Pentieton has been -10°.

These figures exhibit a greater tendency to extremes of temperature in the Similkameen, than in the Okanagan.

The differences in temperature between the warmest month and the coldest of the same name.

Extreme Variation of Monthly ( Mean Temperatures		Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Years of obser.

The lack of synchrony in observations allows no conclusions.

Average Mean Daily Range of Temperature		Winter.	Spring.	Summer.	Fa
		degrees.	degrees.	degrees.	degrees.
	Okanagan Valley—           Vernon.           Kelowna           Penticton.           Means           Similkameen Valley           Princeton           Hedley           Keremeos.           Means	14 13 11 15 20 15 12 16	23 24 25 27 29 24 22 25	30 28 25 29 34 25 20 25 20 25 20 25 20 25 20 25 20 25 25 25 25 25 25 25 25 25 25 25 25 25	20 20 20 20 20 25 21 17 21

The similarity of the ranges in the Okanagan to those at Agassiz, at the interior end of the lower Fraser Valley is very great. The ranges in the Similkameen appear to increase as we move upstream.

	Win	iter.	Spring.		Summer.		Fall.		Average Daily Max. and Min.
	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	
Okanagan Valley - Vernon Kelowna Penticton Maans Similkameen Valley — Princeton Hedley Keremeos. Maans	degrees. 32 33 35 36 30 33 32 32	18 20 24 21 10 18 20 16	degrees, 57 58 59, 58 57 58 59 58	degrees.  34 34 34 34 34 37 33	degrees, 79 78 78 77 78 77 78 79 78	49 50 50 44 50 56 50	degrees.  55 55 58 56 57 56 56	degrees.  35 35 35 38 36 30 36 39 35	

The minimum temperatures at Princeton and Keremeos are noteworthy: the first as shewing colder conditions in the Similkameen in the winter than obtain on the average in the Thompson Valley; the second as suggesting that the high minima at Fairview, already mentioned, may have foundation in fact. Keremeos as the crow flies or might fly if the mountain were not in the way, is 11 miles west of Fairview and about as far from the International Boundary also as Fairview. The decided elevation of the minimum from May to September at both places may be correct and if so is probably due to great absorption of heat by rocky ground in the day-time which is radiated into the narrow valley during the night, the mechanism of convection and filtering of cold air to the lower levels being faulty.

Before leaving this section of the country further consideration is to be given to the temperatures at Hedley. There are two observers at this place. One station is maintained at the offices of the Hedley Gold Mining Company, at an elevation above sca-level, variously estimated at 1,660 and 1,771 feet. The second station is at the Nickle Plate Mine, operated by this company at an elevation estimated at from 4,500 to 4,700 feet above sea. A comparison of the average temperature at the two stations is appended.

	Wii	iter.	Spi	ing.	Summer, Fa		ıll.	
	Mean Max.	Mean Min.	Mesm Max.	Mean Min,	Mean Max,	Mean Min.	Mean Max.	Mean Min.
Hedley Nickle Plate Difference	degrees. 32:5 28 4:5	degrees.  18 12 6	degrees. 58 44 14	degrees 33 5 24 - 9.5	degrees.  78 63:5 14:5	degrees. 50 40 5	degrees. 56 5 46 5	degrees, 35:5 29 6:5

The highest temperature recorded at Hedley was 100°; at Nickle Plate, 99°. The lowest temperature recorded at Hedley was -26°; at Nickle Plate, -35°. The difference between the annual mean temperatures is 9.4°. Taking the vertical temperature gradient (annual) from the Ben Nevis Observations as a basis of calculation, viz., .36° Fahr, for each 100 feet of ascent, we derive a vertical difference of 2,611 feet. Adding this to the height of the Mining Office. 1,771 feet, we obtain the height of the Nickle Plate Mine as 4,382 feet. I hope at a future date I shall be in possession of an accurate map, shewing the relative positions of the two stations on the watershed, from which in conjunction with the temperature observations an idea may be obtained of the temperature gradients in the valleys of this province,

#### PRECIPITATION

		1	*ric clut			
	Winter.	Spring	Summo	1 a(1.	Viii (=1	sporal.
The Okanagan Valley Vernon Kelowna Summerland Penticton Means The Similkameen Valley Princeton Hodley Keremees Means. The Okanagan River Fairview (Short Record.)	3 55 3 81 2 51 2 41 3 07 3 63 2 94 1 03 2 53 2 95	2 47 2 33 2 21 2 11 3 29 2 45 2 91 2 37 1 68	1 1) 3 .33 1 01 3 .77 3 .7 3 .21 3 .58 2 .10 3 .70 0 .81	3 C6 1 01 2 19 2 12 3 75 2 35 2 58 2 59 3 79	13 87 13 (5 11 22 10 71 72 13 09 11 12 8 11 70 & 9 23	10 8 22 4 16 7 10 6

It seems a fair conclusion from these figures that the precipitation decreases from north to south in both valleys. Since the snowfall diminishes in a similar ratio in the same direction, the total at Fairview has an anomalous appearance. The record here is very short but there seems good reason to believe that there are usually very heavy snowfalls at Fairview in December.

Wettest and Driest Years.

		Wettest year	•	Driest year.			
_	Rain.	Snow.	Total.	Rain.	Snow.	Total.	
Vernon Kelown Sommerland Pentieton Princeton Hedley Kerenneos Ueans	13:36 12:14 11:46 11:75 11:92 13:90 8:58 11:87	46 0 3815 3316 15 9 4715 12 9 18 8 3015	17 96 15 99 11 82 13 34 16 67 15 19 10 46 14 92	4 30 5 76 5 68 7 63 5 54 6:67 3 75 5 62	42 0 20 3 26 5 11 5 36 0 14 7 1 9 21 8	8 70 7 79 8 33 8 78 9 14 8 14 3 94 7 80	

Average Range between wettest and driest years: 7:12 or approximately 35 p. c. of the normal annual fall.

The observations made at the Nickle Plate Mine are not included in the table given above. The major portion of the precipitation at this higher level is snow. In fact as much as 218 inches of snow has been measured in the month of April and 102 inches in May. Even in the summer months, however, the rainfall alone is greater at the Nickle Plat: Mine than at Hedley. The averages are appended.

	Winter.	Spring.	Summer.	Fall.	Annual.	Wettest year.	Driest year.
Rain	0104	1 60	1.83	1:35	7 82	10:99	5 83
	6019	73 6	10.3	37:6	182+4	102:3	104 0
	6113	8 96	5.86	5:11	26+06	21:22	16 23

In the table above that year is chosen as the wettest year in which the rainfall was greatest. But if that year be chosen in which the total of rain and snow, combined, is greatest, we have rain: 9.63, snow: 353.8, total: 45.01.

## THE KOOTENAY AND ARROW LAKES COUNTRY.

#### TEMPERATURE.

					Seasonal Mean
	Winter,	Spring.	Summer.	Fall.	Temperature
77	. degrees,	degrees.	degrees.	degrees.

The cooler seasons are undoubtedly to be found in what is generally known as the East Kootenay, that is the country east of the Selkirks. But the records from Fruitlands, on the Tobacco Plains, shew that the seasons there are much the same as on Kootenay Lake. The area thus affected must be small for Gateway shews the characteristic East Kootenay depression of the minimum in the winter.

It should be noted that only a few of the stations listed above have long records; many of them in fact have been in operation but a short time. Those with longer records will be found listed in the complete tables at the end of the book.

In the whole Kootenay country the seasons are all a little cooler than in the Okanagan Valley.

		Lowest recorded.

David Landa	103	37	

The remaining figures are from short records.

Faddlet     99°     -13°     Athalmer     99°     -36°       Howser     90°     -7°     Fruitvale     96°     -20°       Kaslo     96°     -7°     Fruitvale     96°     -20°	Kaslo	ner	10° 33°
---	-------	-----	------------

Both the long and the hort record equally well the close that the ter-lowering of the maconum temperature in the winter month, in the Last Kooten is

The maximum of 115 at Wilmer in June, 1911 is open to doubt

The difference in degrees between the warmest month and the coldest of the am mame at such stations as have records of any length is tabulated below.

Latremo Variation of Monthly Mean Temperature		dan.	Feb.	Marcl	April.	May.	dime	Jils	101	Sept	Oct.		Dec.
	Rossland	deg. 15 19 9 9 23	deg.	(1+15°) 101 115 111 127	10 g.	дев 7 7 6 16	41 g.	0 (1) (1) (1) (1) (1) (1) (1) (1) (1) (1)	10 pt.	de gr.	de :	10 11 12 19 20	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Scant as this data is, we may conclude that the East Kootenay is subject to greater variations of temperature from May to September than is the West Kootenay.

Average Daily Range, Maximum and Minimum,			Winter.		Summer.				
		Mean Maxi mum	Mean Minimum	Range.	Meau Maximum	Minnaum	ttange.		
	Pilot Boy Rossland Nelson Cranbrook Fort Steele Fruitlands	34 28 33 28 31 32	deg.  24 21 23 9 11 19	deg.  10 7 10 19 20 13	deg. 75 71 77 81 78	deg. 52 49 50 42 13 48	deg.  23 22 27 35 38 30		

The tendency to lower minima in the East Kootenay, already referred to, is again made manifest in this table. The summer maximum of 81° at Fort Steele is probably 3° or 4° too high, and is derived from too short a period.

#### PRECIPITATION.

Seasonal and
Annual
Precipitation.

J	Winter.	Spring.	Summer.	Fall.	Annual.	Snow,
Creston. Pilot Bay and Crawford Bay Rossland Nelson Kaslo. Cranbroek Fort Steele. Fruitlands. Wilmer.	7 03	4:92	4 94	6 22	23°11	65
	11 00	7:98	8 35	7 48	34°81	73
	9 33	7:14	5 97	8 38	29°62	128
	8 20	5:10	6 73	7 60	27°63	79
	8 10	3:77	5 41	8 84	26°12	73
	5 73	3:72	3 43	3 78	16°66	62
	3 38	3:75	4 18	4 75	16°66	42
	4 13	4:33	5 68	4 30	18°14	43
	2 17	2:64	5 25	3 60	13°66	30

Note, — The snowfall is already included in the seasonal and annual totals.

These figures prove the East Kootenay to be considerably dryer than the West Kootenay, and that the Windermere Lake district is especially dry in the winter and spring. The figures given as for Creston were made at the Reclamation Works. Those for Pilot Bay and for Crawford Bay have been combined.

### ILLECILLEWAET---NORTH COLUMBIA DISTRICT.

#### TEMPERATURE.

	Winter.	Spring.	Summer.	Fall.	Annual.	Seasonal Mean Temperature.
Glacier. Golden Donald · · · · · · · · · · · · · · · · · · ·		degrees. 35 41 39 42	degrees. 54 59 59 61	degrees, 36 40 38 43	degrees. 36 39 38 43	

Donald and Golden are on the north-flowing Columbia, and Glacier lies near the headwaters of the Beaver which is tributary to the same stream, while Revelstoke lies to the west at the confluence of the Illecillewact with the south-flowing Columbia. Revelstoke is thus only 20 miles north of Arrowhead on the Upper Arrow and its winter temperatures very closely resemble those of stations on that Lake.

Station.	Highest Recorded.	Lowest Recorded.	Extremes of Temperature.

Lellowet Exvition Clute on Soda Creek. Quesnelle Forks Hydraulte Quesnelle Barke rville Fort George Fort St. James Babine Lake	24 24 24 20 17 15 22 22 20 19 17 12 13	177 166 279 388 183 39 40 40 30 30 30 30 30 30 30 30 30 30 30 30 30	G- (fr) ( 66 155 58 77 66 75 59 61 53 57 53 57	70 FT 0 411 422 37 41 40 43 40 35 35	0 12 0 50 51 7 51 10 52 12 52 15 52 52 53 55 54 25 55 35

These stations are arranged in order from north to south, and the general effect of latitude is clearly discernible. The temperatures for Soda Creek do not fit their latitude very well. These figures are based on observations made at that point in the years 1881-1886, and although an attempt has been made to reduce them, by comparisons, to the same period as the surrounding stations the summer temperature which results appears to be about 8° too high. The figures, given for Chilcotin are from observations made at a point on Big Creek and there seems no reason to doubt that the winter and fall at this point are colder than at Quesnelle. Barkerville which is situated on a plateau to the east of the Fraser at the headwaters of tributary streams is also colder than Quesnelle although practically in the same latitude. Clinton is listed with Upper Fraser stations because its seems most convenient to place it here on account of its temperature.

In some cases the temperatures tabulated above have been deduced from short records by comparison with synchronal temperatures at Barkerville, Quesnelle, and Fort St. James.

Extremes of Temperature

## PACIFIC COAST AND INLETS OF MAINLAND---QUEEN CHARLOTTE ISLANDS

#### TEMPERATURE.

	Winter.	Spring.	Summer.	Fall.	Annual.	Seasona Mean Temperatu
Rivers Inlet. Bella Coola. Swanson Bay. Kitimaat Port Simpson. Massett, Q C I	28 32 30 35	degrees.  44 44 41 45 43 44	59 60 55 60 55 57	degrees.  47 45 46 45 46 47	degrees.  46°5 44 44 45 45 46	

Bella Coola and Kitimaat, which are at the heads of inlets running a considerable distance inland have colder winters and warmer summers than those on the coast-line. Rivers Inlet, the most southerly of the group appears to benefit in all seasons from its position. But between Rivers Inlet and Port Simpson there are three degrees of latitude, while there is scarcely any difference in the annual temperatures of the stations lying within this interval.

	Highest Recorded.	Lowest Recorded.	Extremes of Temperature
Rivers Inlet. Bella Coola Swanson Bay. Kitimaat Massett, Q.C.I Port Simpson.	degrees. 91 99 87 106 84 88	degrees.  11 -18 - 9 - 9 - 9 4 -10	

The extremely high temperature at Kitimaat is astonishing, and may be doubted, yet temperatures exceeding 95° are very frequently recorded at Bella Coola. Temperatures below zero are of much more frequent occurrence at inlet stations than at Port Simpson, where they were recorded in two years only during twenty-one years of observation.

At Bella Coolizero or ower) been re-orded a some enternyent shift imperature of a or lower by classic stored in live of the remaining ten year.

The difference between the wormest month and the color to the one of the ulated below.

## THE ATLIN LAKE DISTRICT.

Atlin, on Atlin Lake, lies 30 miles south of the Yukon Boundary. Observations have been made at this point for nearly ten years. Although summer and fall have much the same temperature here as at Fort St. James, yet the winters are about 6° colder, and the springs 3° colder. During the ten years of observation the highest temperature recorded has been 81° and the lowest 50° below zero. Spring opens about the 20th of May, and winter sets in about the 15th of October, while frost has been recorded in every month of the year except July.

Precipitation is least in April, May and June, and greatest from July to December, the annual rainfall averaging less than 6 inches and the snowfall 56 inches, a total annually of  $11\frac{1}{4}$  inches. In the driest year the total precipitation was 8 inches and in the wettest year 13 inches.

A detailed summary of the observations will be found in the tables.

Note.—On account of differences in the methods of measuring snowfall there exist several discrepancies between the precipitation records kept in the observatory in Victoria, and those in the Head Office at Toronto. These differences are so small as to be of no practical moment for any purpose. The averages of precipitation for 39 years ending in 1914 show an ai nual total of 30°15 incher.
